A third way to measure round timber is, by rejecting so much of the cylindric circumference as will reduce it to a parallelo-pipedon; that is, by taking the square within the circular end or base, being such a square whose four angles will be contained within the circumference.

If the circumference of a circle be unity, the side of the square inscribed will be .2251: therefore, multiply the circumference by the said .2251, and the product will be the side inscribed, which squared, and that square multiplied by the length, will produce the content.

Otherwise note, If the diameter of a circle be unity, the side of the square inscribed will be .7071: therefore multiply the diameter by the said .7071, and the product will be the side inscribed, which squared, and that square multiplied by the length, will produce the content.

The circumference of a round piece of timber being given in inches, to find how much in length will make a solid foot.

THE RULE.

Multiply the number 2821 by the circumference, which will produce the side of a square equal; then multiply that side into itself for a divisor, and let 1728 be the dividend, and the quotient will be the length of a foot.

By the SLIDING RULE.

Set the circumference upon D, to 12 upon C; and, opposite to 42,53 upon D, will be found the length of a foot upon C.

2. When the circumference is not the same from one end to the other, that is, when the timber is tapering, as are masts, &c.

The rule for the true method, according to the utmost conical circumference.

Having found the diameters of the circumference at each end (as before taught) multiply them together, and to the product add $\frac{1}{4}$ of the square of their difference; the total whereof multiplied by .7854 (the area of a circle whose diameter is unity) will produce a mean area; which, multiplied by the length, will give the content.

But the usual way is, to take $\frac{1}{4}$ of the girt in the middle (or rather $\frac{1}{4}$ of the girts at each end, and add them together, and take $\frac{1}{4}$ of their sum) for the side of a mean square throughout, which multiplied into itself, and that product by the length, will give the content.—Many of the customary methods of measuring timber, &c. deviate from the true; but it is our business to give an account of practice. Those who would enter into the rationale of these things must be pretty well read in geometry. See the article MATHEMATICS.

MENTZ, an archbishopric and electorate in Germany. It lies on the banks of the river Mayne, between the electorate of Trier on the west, the Palatinate on the south, Franconia on the east, and the Wetteraw on the north. It is about 60 miles in length, from north-east to south-west, and about 50 in breadth.

A considerable part of the elector's revenue arises from the toll on the Rhine and the Mayne, and from the tax on the excellent wines produced in his country.

The chief towns of any trade are, 1. **MENTZ**, on the Rhine, near its confluence with the Mayne. This city claims a right to the invention of the art of printing, which certainly was first brought to great perfection here by Faust, or Guttenburg, about the year 1450.

Here is a very beautiful bay along the river, defended by several works, well fortified with cannon. That part of the city which extends towards the river is most populous. The best vineyards for Rhenish wines being in this neighbourhood, Mentz has a flourishing trade in that commodity more particularly; and its commerce is the brisker, by reason that all the merchandize which passes up and down the Rhine stops in its harbour, to change bottoms. In this neighbourhood is Hockhem, so celebrated for good wines, that the best Rhenish is from thence called Old Hock.

2. **BINGEN** is a pleasant small town, which stands in the district called Rhingaw, which is so populous, that it looks like one intire town, intermixed with gardens and vineyards. The rising grounds about it produce wines that are esteemed preferable to those of Baccharac, so much in vogue heretofore.

3. **ELFELD**, five miles west from Mentz, is a strong fortified town, on the north side of the Rhine, and the chief of the Rhingaw.—Here is Roderheim, a place noted for the growth of the best wines in these parts.

4. **WEISBADEN** lies between six and seven leagues from Frankfurt, and about five or six miles north of Mentz: it is the metropolis of a country belonging to the branch of Nassau-Saarbrack, and is famous for its mineral waters.

MERCANTILE ACCOUNTANTSHIP, or what is usually called **MERCHANTS ACCOUNTS**, according to the method of double entry, as practised by the most eminent merchants throughout the world.

Before the reader enters upon what follows, he is desired to consult the following articles, viz. ACCOUNTANTSHIP, ACCOUNTING-HOUSE, ANONYMOUS, BANKING, BOOK-KEEPING, DEBTOR and CREDITOR, and LEDGER, MERCANTILE ACCOUNTANTSHIP; all which, considered together, in the various lights there represented, will render what we have further to say very easy and intelligible, and make him a complete accountant in any kind of business whatsoever.

INTRODUCTION.

In keeping of mercantile accounts there are three principal books, the waste-book, the journal, and the ledger.

I. In the waste-book are entered, in the plainest manner, as bought, sold, received, paid, &c. all transactions of commerce, with their dates, sums, conditions, and every particular circumstance relating thereto.

II. The journal is, for substance, the same as the waste-book; but, as this must be more fairly written, so it must be expressed in a very different manner, more merchant-like, as it is a preparatory for the ledger. In this book the debit and credit are rationally fixed and settled, according to the principles of accountants; and, therefore, this requires the book-keeper's hand: and, because in journalizing the waste-book lies all the difficulty of account-keeping, we have exhibited the nature and reason thereof upon a single sheet, for the use of immediate inspection. Suppose, for example, that you have entered, in your waste-book, Received of A. B. in full 50l. To post this into your journal, look for the article money received for a bond, or, otherwise, cash is made debtor to the person that owed it you: therefore in the journal, after the date, say, Cash debtor to A. B. received in full 50l.

III. The ledger is the grand and principal book of accounts, which, when duly posted, regulates and adjusts all your concerns with respect to men, money, and merchandizes, and brings all things under their proper heads, and to their respective accounts. And, as this book gives you a comprehensive view of all your negotiations, so it does a complete balance of the whole year's traffic.

As the waste-book is posted into the journal, so the journal is into the ledger; and, if the waste-book be judiciously posted into the journal, with respect to its debtors and creditors in the proper journal phrase, as follows, under the letter (J) it will be very easy to post the journal into the ledger, if you remember the following

Directions to post journal entries into the ledger.

1. In every account there is a debit and a credit part; and, though the journal doth not express the credit part, yet it is understood, for the person or thing that follows the word (To) is the creditor, or, instead of the word (To) read creditor. Take the instance above; cash debtor to A. B. received in full 50l.—Or thus, debtor cash 50l. creditor A. B. 50l. Turn, therefore, to ledger to cash account, as suppose folio (1) and, in debtor side, write, Date Jan. (1) To A. B. received in full (fol. 9.) 50l. then turn to A. B.'s account (fol. 9.) and in credit thereof write, Jan. (1) By cash received of him in full (fol. 1.) 50l. From hence observe, besides the date in ledger-margin, that, after the word (To) in debit, follows immediately A. B. viz. he that must be made creditor; and after the date and word (By) in the credit-entry, follows cash, the name of the account that is made debtor; and that debtor and creditor counter-parts refer to each other, and stand in journal as before margin thus:

- (1) Debtor.
- (9) Creditor.

2. Observe, once for all, whatsoever you debit in one place in your ledger, must have an equivalent credit in another. And notwithstanding in sundry accounts there is one article debtor, and several creditors, as in letter (V) or several debtors and one creditor, as in letter (L) be that as it happens; yet debit and credit are always equal, or as much value as you debit you must credit, before your journal-entry is duly posted in the ledger.

3. Besides a reference column, another inside column must be kept for the quantity of goods, as hogsheds, pipes, bales, &c. On the debtor side must contain the quantity bought in, and on the credit the quantity sold out, by which you know at any time how much of each you have unfold, &c.

Note, Although we have described the nature and use of these three essential books, wherein a merchant's dealings might be all kept, yet, by many classes of traders, the waste-book may be omitted, and the journal and ledger be sufficient; for the book keeper might journalize at once every occurrence, without entering them at all in a waste-book. But, he not being always in the way, nay sometimes obliged to make entries in a hurry, it is proper, in general, to keep a waste-book, from which he may at more leisure correctly and fairly form his journal.

But to prevent those books filling up, merchants, by experience, find it necessary to keep other books subservient to them, as a cash-book, book of charges of merchandize, book of household expences, factory or invoice-book, the sale's-book; the nature and use of which are as follow:

IV. The

IV. The cash-book. This book is folioed, as the ledger, and kept to ease the account of cash there, and prevent receipts and payments being entered at all in the journal. On the left-hand side you make cash debtor to all you receive, and on the right-hand side cash creditor by all you pay.— And, at the end of the month, you may post it directly to the ledger, or, as usual, make two journal entrances, viz. cash debtor to fundries for all the receipts, and fundries debtor to cash for all the payments of the month: so, by the help of this book, you will have but 12 lines in the cash-account in the ledger on the debit, and 12 on the credit, for the 12 months. But some chuse to post their cash weekly, that they may more easily recollect any omission or mistake. Note, A book is said to be folioed, when, on opening, the right-hand side and left (though two pages) are but one folio.

V. The book of charges of merchandize is only paged, in which are entered down promiscuously the charges attending each sort of goods or voyage daily as they occur, whether belonging to yourself or others, or for company account. And the respective goods or voyages are made debtors for their proper share of charges to account of charges of merchandize. And, at the end of each month, your cash must have credit for the whole charges of the month.

VI. The book of household expences falls under the care of the housekeeper, who might put down the disbursements for family provisions, &c. house-rent, servants wages, schooling, &c. perishing goods, as earthen-ware (but durable goods, as beds, chests of draws, &c. do more properly belong to account of household furniture) this may be cast up once a month, or otherwise; and, having paid your housekeeper the month's disbursements, credit your cash as before; then add up your month's payments in the cash-book, which journalized, fundries (and among the rest these accounts, charges of merchandize, and house expences) will be debtors to cash their respective sums.

VII. The factory or invoice-book, is paged and used to copy out verbatim the invoice of goods you sent abroad, whether for your own or others, or company account.

VIII. The book of sales is folioed as the ledger, into which is copied an exact account of sales which you send your employer; the credit side whereof contains the sales when, to whom, what quantity and price, whether for cash, barter, or to M. and S. on time. On the debit the particular charges, abatements, commissions, and nett proceeds.

But we are far from thinking it necessary that a learner should have copies of these five last subservient books: such a multiplicity of books would serve to amuse, rather than to instruct; when a specimen of all these might be given him in one single sheet of paper. To these books might be added, the book for copying letters, the book for copying bills, a remembrancer or pocket-book, and the receipt-book; but, as these are generally known, so their names carry in them a sufficient description.

Note, To save the labour of opening an account in the ledger for every person, the merchant erects a general account, the debit whereof takes in those several small dealers that owe, their respective names, to what account, and sum. And, as they pay, he dischargeth each, mentioning his name on the credit side also; where the merchant likewise (in posting his journal) carries those little debts he owes, and, as he pays, debits the persons.

In like manner, the merchant opens an account of merchandize general, into the debit whereof he posts all those little parcels and sorts of goods he buys in, and not like to deal much in, and for which already he has no particular account opened in the ledger; and, as they are sold, he gives the said account credit, expressing the name of goods and quantity, in every entry, whether in debit or credit: by which, with a little trouble, he knows how much of any sort of these petty wares are left, as effectually, as though he had kept a particular account for each.

If at any time you make a wrong entry in the ledger, in debit or credit side, make a cross in the margin thus X, and write in the opposite side, To or By an error committed in credit or debit of this account, wrote off the sum, &c.

P A R T I.

A general Rule to be remembered. The RECEIVER is DEBTOR: The DELIVERER is CREDITOR. Also whatsoever Merchandizes or Money come into your Hands, are DEBTORS; what go from you, are CREDITORS.

I. To post your Waste-Book into your Journal; for a Foundation, at your Commencement in Trade, you must begin with the INVENTORY.

Inventory of all the { Ready money, merchandize by you, and debts and voyages belonging to you; make those several parcels or persons, D^r. to your stock, or general capital.
B { Debts owing to you, make stock, or general capital D^r. to those sundry persons*.

* The title stock, or general capital, is used instead of your own name.

Money received. { C For a bond, or book-debt, D^r. cash to the person that owed the same, for the sum received*.
D For a legacy, a wager won, or gains by lotteries, or the exchange of money: D^r. cash to account of profit and loss.
E For wares sold: D^r. cash to those respective wares (if more than one sort) each it's value.
F Taken up at { D^r. fundry { D^r. cash the sum took up } to the lender, for both principal and interest.
interest on { accounts, { D^r. interest, or profit and }
bond. } viz. { loss for the interest }
G For interest of money formerly lent, and principal continued: D^r. cash to account of interest, or profit and loss, (which you please).
H For freight of a ship, rent of a house, or estate: cash D^r. to such a ship, house, or estate.—Except the tenant has an account opened in your books, and he made D^r. already, to house or estate.—Then cash D^r. to the said tenant's account to discharge him.
I As an assurer, or insurer, for insuring another's ship, or goods at sea, &c. D^r. cash to account of assurance or insurance, or profit and loss.

* Mention whether in full or in part; also in exchanges. Observe to keep an inside column for the foreign specie, and, after having found it's value (by the rule of exchange) in the coin of that country you are in, carry it in the outward column, as in those instances given before under the article Ledger.

Money paid.

- K Which was due from you, whether on bond, debt, or goods, formerly bought, &c. D^r. the person to whom due, to cash the sum, &c.
- L For goods just bought, and paid for at delivery: D^r. the wares come in, to the money gone out.
- M For house expences, or with a son to apprentice, * house expences, or profit and loss D^r. to cash.
- N Lent at interest on bond: D^r. the { to cash the sum lent.
borrower to fundries. } to profit and loss for the interest.
- O For interest only, the principal continued: D^r. profit and loss, or account of interest, to cash.
- P For insurance of goods you sent to sea: D^r. voyage, &c. to cash.
- Q As by an insurer for a loss, &c. D^r. insurance account, to cash.—But if the loss is not paid presently—D^r. insurance to the person insured. And, then when you pay it, D^r. insured person to cash.
- R For another, as in behalf of your landlord, for reparation or taxes of the house you dwell in: make your landlord D^r. to cash.
- * These accounts, viz. house expences, interest, insurance, bottomry, profit and loss, though often kept distinct, are all of the same nature with the account of stock; for, whatever you lose by either of these, the respective account is made D^r. and C^r. when you gain. For, if you receive money for a legacy or portion, either make Cash D^r. to profit and loss, or rather to stock; because, on closing the books, you'll see by what means your stock is increased.

Merchandizes, &c.
bought and received.

- S For present money: D^r. goods bought, to cash for their cost and charges, if any, for carriage, freight, &c.
- T For time: D^r. goods received to the feller, (to pay at such a time, if a certain time was agreed on.)
- V For part money, part time: D^r. wares come in, { to cash, paid in part,
to sundry accounts, C. } to feller, rest unpaid.
- U To a ship, house, or estate bought, such a ship, house, or estate (with name or place for description) D^r. to cash or feller, &c.
- W For part money, part another's note, and part { to cash the sum paid.
time: D^r. wares received, to sundry accounts. } to the man you received the note of.
to selling-man the rest due.
- X By my factor A. at one place, per my orders, and shipped off to my factor B. at another place, voyage to, &c. consigned to B. D^r. to factor A. my account for cost and charges, &c.
- X Received from your factor, for your own account: write D^r. goods received, to factor [my account] current for cost and charges he paid thereon.

Merchandizes in
barter.

- Y Wares for wares, when of equal value: D^r. wares received to wares delivered.
- Z Bought for part money, part wares, of divers sorts: D^r. wares received to fundries. { to the respective wares delivered, their value.
to cash, to make up the rest.
- A Bought for part money, part wares, part time: D^r. wares bought to fundries — { to cash, the sum paid.
to wares you delivered, their value.
to your dealer, the rest owing him.
- B But, when several wares are bartered for several, then D^r. your dealer to fundries, viz. to each sort you deliver out, for it's value. And make sundry accounts, viz. each sort you receive, D^r. to your dealer for it's respective value.
- C Suppose you send goods to M. and left to his choice, whether to keep or return them: make account of suspense D^r. to goods sent M.—If he returns them again, reverse it. But if he keeps the said goods, make M. D^r. to account of suspense, for such goods sent him.
- D —So when you have an overplus in cash, as of 10 l. make cash D^r. to account of suspense 10 l.—When you recollect the person or account, that should have had credit.—Make account of suspense D^r. to said person on account, for said omission.

Account of suspense,
or bargains undetermined.

Goods sent to sea.

- E Voyage to, &c. consigned { to the respective wares for their value *.
to—&c. D^r. to fundries. } to cash, on charges of merchandize for customs, insurance, &c.
- F When you buy a cargo, for ready money, then D^r. voyage, &c. to cash at once, (these never having been entered in your books.)
- G When you buy goods for sea, to pay some time hence: then voyage,—&c. D^r. to person or persons you bought them of.
- H When for use, and † account of your friend, (in either of the last cases) then your friend [his] account current is D^r. &c.

* This cargo being taken out of your own wares, which have been entered in your books.

† It is [my account] when goods, &c. belong to me. And [his account] when they belong to my correspondent.

Goods sold.

- I For ready money, D^r. cash received to goods delivered out.
- K For time, D^r. the buyer to the several wares, for their values respectively.
- L For part money, part time: { D^r. cash, received in part.
D^r. fundries, viz. } D^r. the buyer for the rest owing. } to goods sold.
- M For part money, part { D^r. cash you received.
wares, part by another's bill, part time: { D^r. wares you received, their value. } to goods sold, for their values.
D^r. fundries, viz. } D^r. the person who is to pay the bill.
D^r. your dealer, due on time the rest. }
- N By advice from my factor: D^r. the factor [my] account current to voyage, for goods sold. (See the note above †.)

Charges.	O	On goods bought, fee (S) or sent to sea, fee (E) or to book a month's charges, fee description of charge-book—or on interest, fee (O) or on insurance, fee (P). As repairs or taxes on your own house, estate, or ships outfit: such house, estate, or ship, D ^r . to cash. But, if paid by you for your landlord, fee (R).
	P	Discounted by a tenant { out of rent due to you, D ^r . house or estate to tenant.—But, if for an estate to which you are executor in trust, D ^r . estate of A. B. deceased, to tenant. out of rent due to A. B. for whom you are steward: estate of A. B. D ^r . to tenant.

Abatements.	Q	Upon wares { Bought: D ^r . the person that sold them to the said wares you bought, the sum abated. Sold: D ^r . the wares you sold to your chapman that bought them, (so reversing the sales).
	R	Upon debts { Due to you: D ^r . account of profit and loss to the person you abate, the sum, &c. Owing to you: D ^r . the person that abates to profit and loss account*.

* Abatements, by your factor made for defect of goods, bad debts, or for any farther charges (after you had received your account of sale from him) make voyage D^r. to factor [my] account current. Abatements, by you as a factor, having before sent your employer his account of sales, make your employer his account current, D^r. to the man you abate, as also to charges on remitting money, postage, &c.

Affignments.	S	Of money received by affignation: D ^r . cash to the person that assigned it (not to him that paid it). Of R's bill or bond, who owes you 100 l. to M. whom you owe 200 l. make M. D ^r . to R. paid the said M. in part 100 l. by affignation.
--------------	---	--

Consignments.	T	Of goods to you as a factor: D ^r . goods consigned for account of A. B. that sent them, to cash or charges of merchandize for any custom, or charges at landing, &c. You send to a factor (see goods sent to sea) but he advising you he has sold them (vide goods sold).
---------------	---	---

Selling or buying goods, paying or receiving money for your employer, is booked as your own proper. The buyer D^r. to goods for account of A. B. &c. [always mentioning whose].

Goods in return, you ship off with charges: D^r. A. B. your friend his account current, to the several goods, charges, &c. you send, or to the person or persons you bought them of.

Bills of Exchange.	V	Remitted to you, { And paid at sight: D ^r . cash to the remitter, viz. He that sent it, mentioning whether for his or my account current. To be paid you at 1 or 2 usance (or months hence) D ^r . account of bills receivable, to the remitter, and when you receive the money for it: D ^r . cash to account of bill receivable. [Mind to keep an inside column for the foreign specie.] See the article LEDGER.
	W	Drawn on you, { And paid at sight: D ^r . the drawer to cash, or had you laid out for a bill to send D ^r . the same. Payable at time: D ^r . the drawer to account of bills payable, and when you have paid the said bill, then D ^r . account of bills payable to cash*.
	X	Drawn for my account, between my factors: D ^r . drawing factor [my] account current, to paying factor [my] account current.

* By these accounts you will see what bills you have to receive or pay.

Goods in company (as oil, or any thing.)	Bought Y	And paid for myself, I make oil in company between partner and me, naming our shares (as he $\frac{2}{3}$ and $\frac{1}{3}$ myself) D ^r . to cash; and immediately I make partner his account current D ^r . to his account in company, his $\frac{2}{3}$ share of the cost*. On time, the same as above: If I say oil in company between P. $\frac{2}{3}$ and $\frac{1}{3}$ myself: D ^r . to the seller, &c.
	Sold Z	I bring wares of { oil in company between P. $\frac{2}{3}$ and $\frac{1}{3}$ myself: D ^r . to oil of my own proper; and P's account current, D ^r . to his account in company; for his share of the value. For ready money, or to N. M. on trust: cash, or N. M. D ^r . to oil in company; and P's account in company, D ^r . to his account current, for his share of the value†.

* By which observe my partner must have two accounts, including his account in company, and his account current; the like for each, had I more partners.

† [Supposing myself to keep the accounts between partner and me] when I received money from him for his share, I laid out for him (as vide Y.) D^r. cash to partner's account current.

Goods in company sent to sea.	Voyage in company between, &c. D ^r . to sundries—	to seller for wares in company between P. $\frac{2}{3}$ and $\frac{1}{3}$ myself, &c. to cash, for charges, for shipping, insurance, &c.	then partner's account current D ^r . to his account in company, his $\frac{2}{3}$ share.
-------------------------------	--	---	---

Note, Advice of sale is entered as in private and factory accounts.—As also returns from factor (with this difference) regarding, as before, partner's account in company; and his account current*.

* Observe, the end of my partner's having two accounts in my ledger, viz. His account in company shews his particular share of all the goods bought, on creditor side; or sold, on debtor side. And partner's account current shews what he owes me, or I him.
In regard to posting into the ledger, we refer to the heads mentioned at the beginning of this article.

II. How to Close or Balance all Accounts in the LEDGER, and to carry the Foot of each to one General Account of Balance, and so to conclude your Old Books.

To balance an account in the ledger.	Of money—	Remaining, D ^r . account of general balance to cash.
	Of goods or voyages.	When not all sold (as you may see by comparing the debtor and creditor-side of the ledger) D ^r . balance to the said goods or voyage, for the quantity unsold, which * value at the prime cost or market-price; and credit the said goods or voyage by balance. So for stocks, annuities, &c.
		If loss thereon: D ^r . profit and loss to the goods or voyage.
		If gain: D ^r . goods or voyage to profit and loss. minding always the credit part, or counter entry, which follows the word (to.)
	Of interest, insurance, commissions, charges of merchandize, house expences, &c.	are balanced by profit and loss.
	Of men, or personal accounts.	Owing to you: D ^r . balance to the account of person owing.
		Owed by you: D ^r . person's account you owe, to the account of general balance.
	In company.	Make wares in company between, &c. D ^r . to sundry accounts, the whole advantage of closing this account,
		to profit and loss, my commissions, at so much per cent. And partner's account current, to his account comp. his part.
		to profit and loss, for my share of the common gain. to my partner (or partner's each) his account in comp. as for his share of gain.
	Of factorage.	If partners agree to divide the remaining goods, make each partner's account in company, D ^r . to wares in company for his part, and wares [my own proper or] balance, make D ^r . to wares in company for my share.
		Make goods of A. B. your employer, D ^r . to fundries.
		to cash or charge of merchandize for warehouse-room, cellarage, brokerage, abatements, &c. to profit and loss, your commission for sale, &c. at so much per cent.
	Of profit and loss.	to employer's account current, for the nett produce.
		If lost on the whole trade: stock D ^r . to profit and loss †.
	Of stocks.	If gained on the whole trade: D ^r . profit and loss to stock.
		D ^r . stock to balance, which being credited by stock, according to the 2d head, add up debtor-side and creditor-side of balance, and both will be exactly equal, and a proof that every article hath had it's double entry throughout your books; which will yield an agreeable satisfaction, as well as shew you, that this, of all methods, is the most excellent.
		But, if they do not exactly agree, it usefully informs you, that you have committed an error: then you, and another, must prick over your reference (till you find out the omission or mistake) which then will stand thus, : $\frac{1}{2}$.

* Debtor-side in ledger shews what goods cost, and quantity bought in. The credit side, what sold for, and the quantity sold out. All accounts are closed either by the account of profit or loss, or balance, or both.

† Profit and loss in the debit-side, are your losses; and credit-side, your gains. Observe that this account is balanced last, save stock account, and the account of general balance.

III. And lastly, How to begin a new Sett of Books, from the General Account of Balance of the Old Books.

You must draw an Inventory, as at first, and in your new Journal make all the Money, Persons, and Merchandize, in Debtor-Side of Balance, Debtors to Stock. Also make Stock Debtor to all you owe; and this is contained in the Creditor-side of Balance, not reckoning the last line, which only shews your Nett Stock at the Entrance on your New Sett of Accounts; which, for Distinction Sake, you may mark B. on the Cover of each. The next Sett C. &c.

OF ACCOUNTS in COMPANY.

INTRODUCTION.

There are three sorts of accounts opened in my ledger, when I keep the accounts of company, and have the disposal of the goods, viz. An account of goods in company—a particular account current—and an account in company for each partner.

I. Of a general account of goods in company, as, suppose wine, &c. I make wine in company, between such partners and myself (our parts) debtor for all that comes in, and creditor for all that goes out, as if it were for my own proper account.

II. Partner's account current (by some called his account proper, for this as any other man's proper account) shews what is due from him, or due to him.

III. Partner's account in company is only for order and regularity, and contrary to others; for the credit-side contains his share of stock or goods (brought into company) and his part of the nett gain, or loss at the close: but the debit accounts, for what (goes out) or balance of what I have remaining in my hand, and his part of the loss (if any) in the close of the company trade.

Note, Though, for brevity sake, I have only mentioned one partner's account current, debtor to, &c. in most places, it must be understood the same for every partner, except myself.—And in keeping company accounts, promiscuously with our own, we do not open a particular account in company, and an account current for ourselves, as well as for each partner, because our own proper accounts keep my part in regulation; for observe, when I receive money for goods, suppose 100*l*. I debit my account cash for the whole 100*l*. and, when I pay partner's half, I make his account current debtor for his 50*l*. and credit cash 50*l*. paid out: whence it is plain, that my cash remains debtor for my part 50*l*. I have still in hand. In like manner, when I carry partner's share of the gain, arising from goods or voyage in company, to his particular account in company, I carry my part to my own account of profit and loss, (R, S.) &c.

But, in keeping company accounts in books by themselves I open an account in company, and an account current, for myself, as well as for each partner: and then an account of stock in company, cash in company, profit and loss company, and balance in company, &c. As to the method of keeping these, it is the same, only observing, that I must do for myself, as for any other partner; so my part of the gains

I carry to my account in company, as my partner's to his, or theirs.

The accounts being duly balanced, according to the plain subsequent directions, given for that purpose, every partner's account in company will of course, if accurately stated and posted, balance itself; the debit and credit will be equal to a farthing, which will be an agreeable surprize to the young accountant, as well as prove the truth of the whole company transactions, without the trouble of balancing the whole books; and thereby make him amends for his trouble of keeping an account in company for each partner, which some chuse to omit, and my several partners accounts current will exactly shew what I owe them, or they me.

For the third and last part, we have treated of two other methods, whereby company accounts may be kept by double entry, without a particular account of company for each partner: these are so plain to any one that has but a small notion of debtor and creditor, by double entry, that they need very little explication, being much the same with private and factorage accounts.

As to the first of them, when I procure the goods, I make partner, as any other buyer, debtor for his part of the goods bought in, or sent to sea; and such goods, or voyage, debtor for my part, giving the seller credit by both.

And in the second, which I take to be plainest, I make goods, bought for company or voyage, debtor to the seller, for their whole cost, as in private accounts.—Then I make partner debtor to said goods or voyage, for his part, which, in effect, he buys of me.

And in both these ways, when the goods are disposed of, I give said account of goods or voyage credit for my part, and partner's account credit for his part, which is illustrated by example, in the latter part of this sheet.

These methods are used in ship accounts, and in many other transactions; as in glass-houses, pot-works, and the like, where there are many articles to books, or many partners concerned: but the first method is the way more generally used, by skilful and eminent merchants. And the knowledge of this method will qualify a person for any counting-house whatsoever; whereas, if he only understood the latter method, and he should fall into a counting-house, where the accounts were kept by the former, he would find himself greatly at a loss. It is useful, however, for an accountant to know all methods of stating accounts, that he may not be perplexed upon the sight of methods different to what he may have seen.

PART II.

A SCHEME of COMPANY ACCOUNTS according to the Italian Method of Double Entry.

It is supposed that I myself keep the accounts, and have the disposal of the company goods, &c.	Goods bought for company account	A If of myself, B If of partner, C If paid for me, D If on trust,	E Dr. goods in company	to goods for my own proper account, to partner's account (proper or) current, to cash, to seller,	F then Dr. each partner (his proper account, viz.) his account current to his account in company, for his part in the said purchase.
	Note, E	When partner brings into company just his own part of goods; then if I only Dr. goods in company, to his account in company; this is two lines shorter than to account it bought of him, as above (B); but, when partner finds over or under his exact part, or his own part and mine, enter the transactions as above (B); and, had the other been booked so too, it would have been right, though not so concise.			
	F	So, likewise, when I procure just my part of goods for company, I only Dr. goods in company, to goods for my own proper account; this is just the reverse of withdrawing my share (see L below): but, when I and partner bring in unequal parts, account is brought of self and him (vide A and B).			
	Sales of goods for company	G If to myself, H If to partner, I If for ready money, K If on trust,	L Dr. same goods for my proper account, Dr. partner's account current, Dr. cash, Dr. the buyer,	M to goods in company,	N then, in either case, Dr. partner's account in company to his account current, for his part of the sale.
	Note well,	when the buyer pays me, for company goods sold formerly,—only Dr. cash to buyer—for partner's account current had credit, for his part, at the sale (vide K.)			
	L	When partner and I agree to part remaining company goods between us, when they are divisible into equal parts—Dr. sundries to goods in company, viz. Dr. goods, for my own proper account, for my part. Dr. partner's account, in company, his part. This is the reverse of (F, E); but if partner took to all the goods, at a certain price, or under, or above his just part, and myself the rest, count it as goods sold (G, H.) which is generally plainest.			
	Charges, as carriage, interest of money, &c.	M Paid by partner, N Paid by myself,	O as (B). as (C).	P	As charges do augment the cost, so it must be booked as the cost.

Abatements. O { To us, { for goods } This is the { purchasing, { Dr. feller, to goods { Dr. partner's account in comp. to his ac-
P { By us, { in comp. } reverfe of { felling. { Dr. goods in comp. { count current, his share of abatement.
Q { By advice from our factor, just the reverfe of his adv. of sales (as G), only voyage to—between, &c.—Dr. to
Note, R So, in compounding for a debt, do as in (P), for the money we abate.—And, when dealer pays me his com-
pensation money, only Dr. cash to dealer (see "*" above).

Money. S { Received at sale of goods (see I), or for goods formerly sold, (vide "*" above).
T { Received of partner, { Dr. cash to partner's account current.
U { Paid to partner, { Dr. partner's account current to cash *.

* Note, when partner gives me a sum to lay out, with just as much of mine own, it is somewhat shorter to Dr. cash received, to partner's account in company—but carefully observe, when goods are bought, only make goods in company Dr. to cash; so then the account will stand as in (E).

Bills. W { If I draw on partner a bill, Dr. cash; or Z. the man I deliver it to, to partner's account current.
X { If partner draws on me, Dr. partner's account current to cash (if paid on sight). To account, of bills payable (if on time) *.
* (See returns per our factor.)

Barter. Y { Company goods delivered for others, which I take to myself, Dr. goods received for proper account; to goods in company, and Dr. partner's account in company, to his account current, for his part of sale.
Z { Sold my own goods for others, I bring into company, Dr. goods in company received, to goods for my own account delivered, and Dr. partner's account current, to his account in company, his part of purchase.

To admit a new partner into company. { Suppose A. and myself are already in company, each $\frac{1}{2}$, for 600l. and B. would be interested $\frac{1}{3}$ of our stock, so we agree to have each $\frac{1}{3}$. B. purchases of me 100l. and of A. 100l. in the said stock, to make up his 200l. or $\frac{1}{3}$. How must this be settled? First, let goods in company account stand as it is, 'till sold (inserting B. in thirds) except you will open an account of goods in company, between A. B. and myself $\frac{1}{3}$ Dr. to goods in company between A. and me $\frac{1}{3}$.—However, A's same account current and account in company will do (whether B. pays ready money or not) Dr. partner (A's) account in company, to his account current 100l. his half of the sale to B. If B. pays me my 100l. Dr. cash to B's account in company.—If B. pays A. his 100l. Dr. A's account current, to B's account in company.—If B. pays not ready money, Dr. B's account current, to his account in company 200l.—If B. paid all to A. Dr. (A's) account current, to B's account in company, 200l.—But, if B. paid all to me—cash Dr. to C B's) account in comp. 200l.

Goods in company sent to sea. A { If out of company goods, already booked, only Dr. voyage to —, &c. in comp. between —, &c. *
B { If bought on credit, { to feller. { then Dr. each partner's
C { If bought of a partner, { Dr. voyage in { to partner's account current. { account current to his
D { If bought of myself, { comp. be- { to goods for my proper account. { account in company
E { If my factor (per order) send to { tween, &c. { to my factor my account current. { in each of these cases.
Note, F For customs, freight, insurance, &c. if I paid as (D), (if instead of crediting goods my own proper account,) I lay, to cash or charges of merchandize.—If partner pays charges, exactly as (C).
* Partner's account current, to his account in company, was debited when these were bought in (therefore not now.)

Advice of sales of ditto. G { Dr. Ro. D. (our factor) at—for company account, between { No double journal entrance here, nothing being gone out, or come in, but only a change; factor charged, and voyage discharged.
Non-disposal. H { If we order our factor at { Dr. voyage to { to voyage to Barbadoes, it's value (to make { Dr. partner's ac-
Barbadoes, to send our { Virginia, to { one voyage discharge the other). { count current to his
goods he cannot sell, to { fundry ac- { to factor at Barbadoes, for any new charges, { account in comp.
our factor at Virginia, { counts. { shipping, &c. { his share only of new charges.

Returns by our factors. { In bills. I { If sent to partner, { Dr. partner's account current { to factor—at for { Then Dr. each partner's
K { If sent to me, and { Dr. cash { &c. our account { account in comp. to his
paid at sight. { current. { his part of the fame.
L { If sent me at usance, { Dr. bills receivable { current. { his part of the fame.
M { Goods for company between—Dr. to factor at—our account current; so let them rest till I
dispose of them. (For charges I pay on them, see above.)
In goods. N { If partner takes to them, { Dr. partner's account current, { to said goods in { Then Dr. partner's
O { If I take to them, { Dr. goods for my proper ac- { comp. or (if { account in comp. to
count. { not entered { his account current
P { If a buyer takes to them, { Dr. cash, or the buyer. { to factor. { for his part of sale.
☞ Before I close the account in company, kept by myself, I make a double journal entrance for any charges not yet booked, and my commissions.

My commissions. Q { Goods (or voyage) { to cash, or charges of merchandize, for cellar- { Then Dr. partner's ac-
in company, Dr. { room, &c. or other charges. { count current, to his
to fundries, { to profit and loss, my commissions, &c. (if not { account in company,
charged before,) { his part of both.

It is supposed that I myself keep the accounts, and have the disposal of the company goods, &c.

It is supposed that I myself keep the accounts, and have the disposal of the company goods, &c.

To balance company accounts in my ledger.

- Of goods, $\left\{ \begin{array}{l} R \text{ If we have gained Dr. goods } \left\{ \begin{array}{l} \text{to partner's account in company, his part of nett gains.} \\ \text{in company to fundries, } \left\{ \begin{array}{l} \text{to profit and loss, for my part of ditto.} \\ \text{to partner's account in comp. his part, } \left\{ \begin{array}{l} \text{to goods in} \\ \text{(as staved, stolen, \&c.) Dr. fundries, } \left\{ \begin{array}{l} \text{Dr. profit and loss, my part of loss, } \left\{ \begin{array}{l} \text{comp. \&c.} \end{array} \right. \end{array} \right. \end{array} \right. \end{array} \right. \end{array} \right.$
- Of voy- $\left\{ \begin{array}{l} T \text{ If we have gained, Dr. } \left\{ \begin{array}{l} \text{to partner's account in company, his part of nett gains.} \\ \text{voyage to fundries, } \left\{ \begin{array}{l} \text{to profit and loss, my part of ditto.} \end{array} \right. \end{array} \right. \end{array} \right.$
- ages. $\left\{ \begin{array}{l} V \text{ If we have lost, } \left\{ \begin{array}{l} \text{Dr. partner's account in comp. for his part of the loss } \left\{ \begin{array}{l} \text{to voyage to—, consigned} \\ \text{Dr. fundries, } \left\{ \begin{array}{l} \text{Dr. profit and loss, my part thereof, } \left\{ \begin{array}{l} \text{to—, between—, \&c.} \end{array} \right. \end{array} \right. \end{array} \right. \end{array} \right.$
- U $\left\{ \begin{array}{l} \text{If no returns yet made, } \left\{ \begin{array}{l} \text{Dr. partner's account in comp. for his part remaining, } \left\{ \begin{array}{l} \text{to voyage, \&c.} \\ \text{Dr. fundries, } \left\{ \begin{array}{l} \text{Dr. balance, for my part out-standing, } \left\{ \begin{array}{l} \text{between, \&c.} \end{array} \right. \end{array} \right. \end{array} \right. \end{array} \right.$
- Of our $\left\{ \begin{array}{l} W \text{ If he hath under-shipped our } \left\{ \begin{array}{l} \text{Dr. partner's account in comp. his part, } \left\{ \begin{array}{l} \text{to factor, at—, for comp.} \\ \text{nett proceeds, Dr. fundries, } \left\{ \begin{array}{l} \text{Dr. balance, my part in factor's hands, } \left\{ \begin{array}{l} \text{account, between, \&c.} \end{array} \right. \end{array} \right. \end{array} \right. \end{array} \right.$
- factor. $\left\{ \begin{array}{l} X \text{ If he hath over-shipped our proceeds, Dr. } \left\{ \begin{array}{l} \text{to partner's account in comp. his part due to factor.} \\ \text{our factor at—, for comp. to fundries, } \left\{ \begin{array}{l} \text{to balance, for my part of the overplus due to ditto.} \end{array} \right. \end{array} \right.$

Suppose partner keeps the account, and has the disposal of company goods, &c.

Note, $\left\{ \begin{array}{l} \text{When my partner has the disposal of company goods, I only keep an account of my own share in my books,} \\ \text{(viz. goods in hand of partner, Dr. \&c.) and when he has sold them, and given me an account of the sales,} \\ \text{I make him debtor for my part of the nett proceeds, (as I would a factor) to account of goods in his hands,} \\ \text{whereby these two accounts are balanced, as my proper accounts; for the profits arising from my account} \\ \text{of goods, in partner's hands, is carried to profit and loss. And if partner owes me, I, at the close of} \\ \text{books, make balance Dr. to, or Cr. by partner's account, as I would any other man's.} \end{array} \right.$

Y $\left\{ \begin{array}{l} \text{If partner finds my part} \\ \text{as well as his own,} \end{array} \right. \left\{ \begin{array}{l} \text{Dr. goods, in hands of} \\ \text{partner A. B. or, } \left\{ \begin{array}{l} \text{to partner, for} \\ \text{my } \frac{1}{2}, \text{ or } \frac{1}{3}, \&c. \end{array} \right. \end{array} \right.$

Z $\left\{ \begin{array}{l} \text{If I buy my part,} \\ \text{I may exprefs, or open this ac-} \\ \text{count in my books, either} \end{array} \right. \left\{ \begin{array}{l} \text{Dr. partner, my account} \\ \text{in comp. or, } \left\{ \begin{array}{l} \text{to cash, or feller.} \\ \text{Dr. voyage, if sent to sea, } \left\{ \begin{array}{l} \text{to goods, for my} \\ \text{proper account.} \end{array} \right. \end{array} \right.$

A $\left\{ \begin{array}{l} \text{If I find out of my own} \\ \text{goods my part,} \end{array} \right. \left\{ \begin{array}{l} \text{Dr. goods in comp. in hands of part-} \\ \text{ner, for my part, } \left\{ \begin{array}{l} \text{to goods proper, if out of my own stock.} \\ \text{to the man I bought them of, if had them on} \\ \text{trust.} \end{array} \right. \end{array} \right.$

B $\left\{ \begin{array}{l} \text{If I procure part-} \\ \text{ner's share, and} \\ \text{my own Dr. } \left\{ \begin{array}{l} \text{Dr. partner (as one that bought} \\ \text{fundries, goods of me) for his part, } \left\{ \begin{array}{l} \text{to cash, if I purchased with ready money.} \end{array} \right. \end{array} \right.$

See Part III. partners keeping accounts.

P A R T III.

COMPANY ACCOUNTS without a particular Account in Company for each Partner.

- Goods bought for $\left\{ \begin{array}{l} \text{Dr. fundries. } \left\{ \begin{array}{l} \text{Dr. A. B. my partner, for his } \left\{ \begin{array}{l} \text{to feller, if bought on trust.} \\ \text{half, } \left\{ \begin{array}{l} \text{to cash, if I paid for them.} \\ \text{viz. } \left\{ \begin{array}{l} \text{Dr. goods in comp. with A. B. } \left\{ \begin{array}{l} \text{to partner, if he paid for them.} \\ \text{for my half, } \left\{ \begin{array}{l} \text{to cash, and to partner, if we paid between us.} \end{array} \right. \end{array} \right. \end{array} \right. \end{array} \right. \end{array} \right.$
- Note, In this method, I only make each partner Dr. for his part of goods bought in, to the feller. And goods in comp. to feller, for my part; and, as I sell, give these accounts credit; so they will stand in my ledger as common or private accounts, and balance as such.
- II. Method, I might have made goods in comp. Dr. for the whole, and then made partner Dr. to goods in comp. for his part, and it would have come to the same.
- Goods sold in $\left\{ \begin{array}{l} \text{Dr. buyer, or cash, } \left\{ \begin{array}{l} \text{to partner A. B. for his half of sale.} \\ \text{company. } \left\{ \begin{array}{l} \text{to fundries, } \left\{ \begin{array}{l} \text{to goods in company, for my half of ditto.} \end{array} \right. \end{array} \right. \end{array} \right.$

I keeping the account, &c.

Goods in comp. $\left\{ \begin{array}{l} \text{My friend W. W. of London and I, are agreed to enter into copartnership, in a voyage to Jamaica: and there-} \\ \text{fore writes to me, to procure 100 duroys for said voyage.—Having 70 pieces of my own, which I charge at} \\ \text{sent to sea. } \left\{ \begin{array}{l} \text{26s.—and bought of R. S. 30 pieces more, at 26s.—and I have paid charges in packing, pressing, portorage,} \\ \text{\&c. till on board, 35s.} \end{array} \right. \end{array} \right.$

To journalize this account, you may say,—
Sundries, Dr. to fundries, 135 l. 00s. 10d. for 100 pieces of duroys, shipped on board the Sea-Horse, W. G. master, for Jamaica, for account of W. W. and self, each one half, consigned to R. D. viz.

II. Method, If I had made voyage, Dr. to fundries for the whole cost and charges,—	W. W. for his half	—	—	—	—	£.	S.	D.	£.	S.	D.
Then made partner W. W. Dr. to voyage, for one half thereof, this would have come to the same,	Voyage to Jamaica, for my half	—	—	—	—	67	10	05	67	10	05
	To duroys, for my proper account, 70 pieces, at 26s.	—	—	—	—	91	00	00	135	00	10
	To R. S. bought of him 30 pieces, at 26s.	—	—	—	—	39	00	00			
	To charges of merchandize,	—	—	—	—	1	15	30			
	To profit and loss, or account of commission for my provision, } at 2 and half per cent.	—	—	—	—	3	05	10			
						135	00	10			

Advice of sales of ditto goods. $\left\{ \begin{array}{l} \text{Our factor, R. D. sends an account of sales of the above adventure; the nett proceeds amounting to 202 l. 10s.} \\ \text{exchange at 135 per cent. make—sterling 150 l.—To book this—R. D. at Jamaica, Dr. to fundries,} \\ \text{150 l. for 202 l. 10s. being the nett proceeds of goods between W. W. and self, each half, viz.} \end{array} \right.$

To W. W. his half	—	—	—	—	—	£.	S.	D.
To voyage to Jamaica, for my half	—	—	—	—	—	75	00	00
						75	00	00
						150	00	00

When partner keeps the account, keep only an account of your own share, as taught in Part II. to which we refer you. I shall give the following example.

Partner keeping the account.

Goods sent to sea. $\left\{ \begin{array}{l} \text{My partner, W. W. of London, advises by my order, he has shipped on board the} \\ \text{Frederic, Matth. Van Holten, master, for Amsterdam, 100 pieces Norwich} \\ \text{stuffs, consigned to Adam Van Sculten, for account of W. W. and self, each} \\ \text{one half; which, with all charges, as per invoice, amounts to 103 l. 6s. 8d.} \\ \text{my half whereof, is 51 l. 13s. 4d.—which I book thus:} \\ \text{— Voyage to Amsterdam, Dr. to W. W. 51 l. 13s. 4d. for my half in 100 Norwich stuffs, } \\ \text{shipped by him, and consigned to—\&c. } \end{array} \right.$

Advice of sales. $\left\{ \begin{array}{l} \text{Partner W. W. of London, has sent me account of sales, which he received from Adam Van} \\ \text{Sculten, of Amsterdam, of the Norwich stuffs he sent on our account, the proceeds where-} \\ \text{of being 1624 guilders, 18 stivers, my half is 812 guilders, 9 stivers, exchange at 36s.} \\ \text{6 d. make sterling 74 l. 3s. 11 d.} \\ \text{— Partner W. W. Dr. to voyage to Amsterdam, 74 l. 3s. 11 d. for 812 guilders, 9 stivers, my } \\ \text{half of the nett proceeds of Norwich stuffs, as per account from Adam Van Sculten } \end{array} \right.$

See Part II. partner keeping accounts.

The BRITISH MERCANTILE COLLEGE,
humbly submitted to public consideration.

Novimus novitios quosdam, qui cum se mercaturæ vix dedierunt, in magnis mercimoniis se implicant, rem suam male gessisse. Et profecto imperitos mercatores multis captionibus suppositos, multorumque infidiis expositos experientia videmus. Mercatores actus sui rationem conficiant, & calamo non parcant.

Stracch. de mercatura, par. 2. p. 357.

L'ignorance des négocians vient, de ce que dans leur commencement ils manquent d'instruction, n'ayans pas fait leur apprentissage chez d'habiles marchands, qui ayent toutes les qualitez requises pour bien montrer le commerce. Il est impossible qu'un negociant réussisse dans ses entreprises, s'il ne sçait parfaitement sa profession.

Parfait Négociant de Savary.

Of the necessity of the establishment of a MERCANTILE COLLEGE in Great-Britain, for the education of BRITISH MERCHANTS, with greater advantages than they usually have.

In order to animate the French nation in general to the vigorous pursuit and cultivation of it's trading interest, that celebrated statesman Monsr. Colbert, prevailed on the late bishop of Avranches, a gentleman well read in antiquity, to write the history of the commerce and navigation of the ancients*; which had such happy effect in the kingdom, when communicated to the most distinguished persons in it, that, from being lukewarm in regard to the national interests of trade, they became it's strenuous advocates and zealous promoters.

* Histoire du commerce, & de la Navigation des Anciens. Par M. Huet, ancien évêque d'Avranches.

And, indeed, it appears from the writings of that learned and judicious prelate, that commerce when wisely cherished and encouraged, was the firmest support of the power of most of the illustrious states and empires in ancient story. The Phœnicians, the Carthaginians, the Athenians, and Rhodians, acquired immense treasure and power by the industry and ingenuity of their merchants, in extending their traffic. Nor did the Romans, though chiefly addicted to arms, neglect to carry on an extensive trade to Sicily, Spain, Egypt, Barbary, and the Euxine Sea; but their perpetual victories, and the rapidity of their conquests, made them lose sight of their commercial interests; which, if properly cultivated, might have maintained their power, even to the end of time.

Where the people of any state or empire depend altogether upon agriculture, and there are few or no traders in a nation, unless of the retailing and mechanic sort; and where the farmer and the planter are the most useful members of the community; the highest regard will always be paid to these orders of men. Accordingly we find, that in the inland provinces of Asia, they were formerly held in the most honourable estimation; and the nobles of these countries treated all traders with contempt; whilst in ancient Egypt, a country naturally formed for commerce and navigation, the shepherd and the farmer were looked on as a despicable rank of men, and traders maintained the principal dignity and superiority in the state. Among the Tyrians, they had so great a share of honour and power, that an inspired writer has told us, THEIR MERCHANTS WERE PRINCES.

In free states, such are the natural and happy effects of commerce, that it contributes at the same time to aggrandize the prince, and to preserve and extend the liberty of the subject: and arbitrary governments are so sensible of the benefits of traffic, that we see them earnestly bent on it's advancement, whenever their wisest and best ministers have had the management of their affairs. Inasmuch that I believe I may venture to say, that it is by a rivalryship in trade, that our nearest and most potent enemy carries on a kind of warfare against us, more certainly destructive than their arms*.

* This is demonstrated in various parts of our Dictionary of Commerce.

The peculiar importance of a well regulated and extensive commerce to the prosperity, or rather to the very being of these kingdoms, is so well understood, that it is now needless to carry these reflections home to ourselves. Trade, it is to be hoped, will ever be the chief object of our public care. But the wisest laws, and the best concerted encouragements, are not alone sufficient to carry our commerce to it's utmost extent, or to support it in a state of health and vigour: something will still be wanting, which lies beyond the reach of laws, and which private persons must acquire to themselves; I mean a proper mercantile education: for, unless merchants are skilful and judicious in improving and cultivating the practical arts of trade, the best laws will prove little better than a dead letter; it is the intelligent trader who must give them spirit, and render them operative and beneficial.

For erudition, in almost every other branch of science, it must be acknowledged, we abound with the best regulated institutions. I wish we could say the like in relation to the mercantile profession. But, what well established seminaries have we for the accomplishment of that most considerable part of the British community? Certain I am that we have none, which are properly adapted to the peculiar nature of their province, and it's supreme utility to the state in general. The cause to which they may be chiefly attributed, is not difficult to be discovered. Too many, who set out in the capacity of merchants, are apt to flatter themselves that they stand in need of little other qualification, than a round capital, and an adventurous disposition. Buying and selling, paying and receiving, exporting and importing, as they think, comprehend the whole circle and mystery of mercantile transactions.

When a low idea is thus entertained of the accomplishments necessary for this employment, it is no wonder that so little regard, in general, is had to the education of those who are intended for it. The consequences hereof are fatal to numbers who rush headlong into commerce, destitute almost of every one of those accomplishments indispensibly necessary, and become a sacrifice to their folly and temerity*.

* I knew a considerable trader in the city of London, who could neither write nor read; he made shift, however, to keep his head above water, for many years, though he swam with bladders, prepared by those who intended his drowning at last; and it is not to be admired that bankruptcy was his fate. And numbers of bankrupts, I have known, are shamefully deficient in the ordinary accomplishments requisite for the merchant; but, if every one who presumes to take upon him this respectable character, was obliged to pass an examination by a board of skilful merchants, before he was admitted to practice; I am persuaded, it would have as good an effect in regard to the interest of trade and traders in general, as the suffering no one to administer medicine in any shape whatever would have upon the lives of his majesty's subjects, 'till they had passed a due examination by the Royal College of physicians.

We daily see many, by their superior qualifications, from very slender beginnings, accumulate great riches by merchandizing; while others, from commencing with plentiful fortunes, have, in the same course, been reduced to the lowest penury. This seems strange to the undiscerning, but is easily accounted for; since they must have very little knowledge of the trading world, and less acquaintance with the practical arts of commerce, who can form a contemptible opinion of the qualifications necessary to the foreign trader.

Without acquaintance in the produce and manufactures of the commercial world, and in the laws of our own and foreign countries relative to general trade; without abilities to obtain the best intelligence, in order to strike the critical time when and where, exportation or importation from nation to nation, drawing, remitting, and negotiating foreign bills, invite to the best advantage: without knowledge of the duties, imposts, subsidies, drawbacks, bounties, and all other charges and allowances at home and abroad, to which trade is subject, it is impossible that any previous calculation can be made, whether an adventure will turn to account or not. If the merchant be not thoroughly skilled in foreign monies and exchanges, as also in foreign weights and measures, and the methods of reducing those of one nation reciprocally into those of others, how shall he be able to judge of foreign INVOICES and ACCOUNTS of SALES*? And, if he be not perfectly acquainted with the arts of arbitrating the foreign exchanges with accuracy, he cannot embrace those daily benefits by the negotiation of them, which their perpetual fluctuation affords. Nor is a knowledge of the intrinsic value of foreign specie less necessary than of the extrinsic par of exchange, in order to deal occasionally between country and country, in the export or import of foreign coins, and bullion gold and silver to the best advantage: in fine, the merchant destitute of this series of information, and talents to apply it to the most beneficial purposes in every shape, can never hope to reap any considerable profit from his profession; or sustain the character he bears with any sort of dignity. He must owe his success, if he has any, to fortunate hits, and unexpected advantages; things which no prudent man will chuse to depend upon, for the whole prosperity of his life.

* See the articles INVOICE, and ACCOUNT of SALES.

To the ignorant in these matters, commerce is but a game of chance, where the odds are against the player. But to the accomplished merchant it is a science, where skill can scarce fail of it's reward: and, while the one is wandering about on a pathless ocean without a compass, and depends on the winds and tides to carry him into his port, the other goes steadily forward, in a beaten track, which leads him directly, if no extraordinary accident intervenes, to wealth and honour.

Whoever turns his thoughts on the stupendious circulation of paper-property throughout the world, by inland and foreign bills; on the various customs and usages established among traders

traders in their money-negotiations, for the support of universal credit; on the numberless different transactions, which diversify the business of the merchant; as buying and selling, exporting and importing, for proper, company, or commission account; drawing on, remitting to, and freight-ing or hiring out ships for various parts of the world at the same time: whoever duly considers the skill in figures and accountantships*, requisite so to adjust and methodize this great variety of transactions, whereby such trader may always have the true representation of his affairs before him; together with the judgment to conduct such a complication of occurrences, and address to maintain a general correspondence in our own, or the more universal languages, cannot but see the extent of a course of education proper to form so distinguished a character.

* See the following PLAN of mercantile erudition.

Notwithstanding this, nothing is more certain, than that no gentlemen in the general labour under greater disadvantages in point of erudition.—To trace this matter more minutely. Few, very few, have more than a smattering of Latin and Greek, and a very superficial knowledge of figures and accounts. With this very small stock of useful literature, our tyro is turned into the practical counting-house; and, when he is there, the eager pursuits of interest in the master, who has not leisure to attend to his instruction, will not admit of his making a greater proficiency in mercantile knowledge, than what self-application shall lead him to. Here the flower of youth, we find, is oftener ripe for pleasurable impressions; and the generality of young people of plentiful fortunes are so far from spontaneously applying to the severity of business, that they rather look upon it in the light of hackney-drudgery*.

* This has been, and I am afraid daily is, the cause of the ruin of many gentlemen's sons of fortune.

Such indeed is the strength of natural discernment in some, and such sometimes the uncommon attention to business in others, that they make little difficulty in breaking through every obstacle to knowledge, if they obtain but a glimmering light: the case of the generality is far different.

But should a merchant, or his principal clerks on whom he depends, have both leisure and inclination to instruct a young gentleman, they may neither of them always have ability suitable. It is one thing to be capable of carrying on a proportion of business in a narrow branch, a very different, to qualify others for any, much less the most extensive.

Besides, it is not every one who is acquainted with mercantile, or any other branch of knowledge, is capable of training up others therein, and giving proper instructions.

It is not the practice of trade that will enable a merchant to teach his apprentice his art, though it furnishes materials for that purpose. It is a good general education, a course of regular study, and a genius for familiar explication, that fit men for the office of instructors. And to these qualifications must be added still other arts. During the fire and sprightliness of youth, there is no fixing the attention, but by wisely amusing it. This age is always upon its guard against bondage in every shape; and therefore, to give a true relish for knowledge, the arts of communicating it should be disguised under the form of pleasure.

Should it so fall out, as none will think impossible, that our young trader is bred under those, who themselves are unskilful; whose books are never duly stated, posted up, or fit for a balance: should it be the fortune of a young gentleman to be thus situated, and to receive the first impressions from so goodly an example, is he not likely rather to take an eternal dislike to the profession, than successfully to pursue what has been rendered so odious and disagreeable? Or, if he happens to be of an adventurous and self-sufficient turn, he may be rash enough to hazard his disgrace and ruin, by engaging in an employment he is no way qualified for.

Nor is want of leisure and ability the only cause of a youth being bred to merchandizing under every disadvantage. Interest may frequently prove the greatest motive to his obstruction. For, if a young gentleman of considerable fortune is let into the whole mystery of the business of the counting-house wherein he may happen to be bred, it is sometimes, I am afraid, surmised, that such a one might hereafter prove highly detrimental thereto? And, where there is any interesting inducement to keep him in ignorance, nothing is easier than to spread the veil of concealment. It is only chaining our novice to some appendage to the principal books, some labouring oar; or artfully shifting him from one auxiliary book to another, the more effectually to bewilder; and giving him an unwarrantable loose to his pleasures; and our young merchant shall turn out as completely qualified to be at the head of a counting house, as a hackney-writer at the head of the law.

The more extensive and universal the business may be, with less difficulty is every thing, to a stripling, rendered dark, mysterious, and unintelligible. Provided a youth, so circumstanced, proves one of strong parts and an inquisitive turn, he will probably, upon the general balance of the

books, be attentive to the general profits, from a principle of curiosity only: yet he may only view them in the gross; how, and in what manner those profits arose, or whether they are true or false, is easily obscured under some intermediate account to that of profit and loss; a matter easily practiced, to blind the eyes of one unacquainted with the niceties of accountantship en parties doubles*.

* Many have formed fictitious SETTS of ACCOUNTS, in order to deceive the public, and those who have been taken into partnership by such villains; of which I have been informed we have a late instance in a certain BANKRUPT of the city of London: others keep DOUBLE SETTS of BOOKS, to answer double purposes.

Let the transactions of a counting-house, therefore, be as important in particular, as infinite in diversity; let those transactions be judiciously conducted, and methodically adjusted, according to the nicest arts of mercantile skill; yet, if a youth is not furnished with pre-requisite knowledge to enable him to make the best advantage of what he sees transacted, he cannot be much the wiser for being placed in a counting-house of universal business. All that is transacted may be no more to him than a regular confusion, who is disqualified to view the connection of the whole, with an eye of understanding. Without being thoroughly knowing and expert in mercantile calculations and accountantship, and duly initiated into the arcana mercatorum****, what advantage can a young gentleman receive?

Every common sailor who takes a share in the toil, will hardly be presumed fit for command. Being placed in the center of practical business, and taking some inferior part in its transactions, is far from being sufficient to qualify a young gentleman to hold the rudder of large concerns hereafter. The mechanic artisan and manufacturer, it is true, may be insensibly disciplined to perform works of the hands with wonderful dexterity: even children, we know, may be trained to do extraordinary things that way, by reiteration of one and the same work. In like manner may the mechanical merchant be bred; but where so general a knowledge, such variety of accomplishments, so clear a head, and so much real judgment and address are absolutely necessary, no man, acquainted with the world, can imagine, that being bred in a parrot-like manner should, at this time of day, enable the young merchant to excel in the arts of commerce. We are not insensible there have been some gentlemen, who, destitute of all previous requisite mercantile instruction, have, from very trifling beginnings, struck into foreign commerce; and, by the uncommon strength of their natural abilities, prompted by great industry, and favoured by a series of fortunate events, have acquired great estates. Such as these we have known; and we have known likewise, that where this hath been done, without clandestine and dishonourable measures, those gentlemen have been of capacity and application as singular as their good fortune: they have indeed been persons rather to be admired than imitated. But traders, who, without their superlative talents, have been daring enough to follow such examples, if for a time they have happened to shine in the commercial world, it has been like those meteors in the natural; which, after furnishing matter of astonishment for a while, have soon destroyed themselves, and involved in their ruin all who have been unhappy enough to be within the sphere of their influence.

Though we have thus taken the freedom to signify our disapprobation of the usual methods of bringing up our young British merchants in general, yet we are sensible, very sensible, that too many youth, as well among merchants as other ranks of men of business, reap little advantage by the happy opportunities they sometimes enjoy, of excelling in their peculiar province. The best examples and instruction, the most interesting incitements to attention and assiduity, make little impression on the desultory and inconsiderate. The distinguished figure in trade some young gentlemen make, in comparison to others, sufficiently discriminates the superior benefits they have received from those counting-houses, wherein they have been happily bred.

But what advantage can such expect to receive, that are unhappy enough to fall into the hands of those who are capable, yet not inclined; or of those who are incapable, though well inclined, to do them justice? Instead of a constant succession of merchants, eminent for their skill and ingenuity, may we not rather expect to see a daily declension? And may not the kingdom be thus left destitute of a competent number to prosecute its foreign traffic, either with that emolument to themselves, or that benefit to the state it will admit of? Under such melancholy circumstances, it will be matter of no great admiration to hear woeful complaints and lamentations on the decay and badness of trade, when the defect and imperfection may manifestly lie in traders themselves.

Without expatiating on a matter so apparent to every one, who will give himself the liberty candidly and impartially to weigh and consider it, we shall only observe, That nothing seems more wanted than a proper place, or well regulated institution for mercantile education; where the theory and practice

practice of trade might be taught, as near as could be at the same time, and a general knowledge of commerce, and it's practical arts communicated, as the first step towards engaging in any branch of it.

And, as the reduction of the interest of money will have a tendency to induce many persons of mature years to strike into trade, as well as a greater number of young people to be trained up for it, in order to settle either at home or abroad: as the lowness of interest will certainly increase the number of British traders in Europe, and, it is to be hoped, the trade of the nation proportionably: and, as all other countries are increasing their trade and traders likewise, it follows, that the skill, address, and ingenuity of our British merchants, cannot, at present, be too great. Whereas, when the trade of our own nation, as well as that of others, was in a very few hands in comparison to what it is now, and the interest of money double and treble what it is at present: when these were the circumstances of public affairs, and the benefits of trading between the Exchange and the Exchequer were extraordinary, as well as the profits on trade in general, numbers acquired very great estates, without any great accomplishments. This great change in the state of our affairs, pointing out the reasonableness and necessity of the proposed institution, it is humbly presumed, that it will prove as acceptable to all wise and good men, as the same is zealously intended for the public benefit and utility.

The General PLAN Delineated.

Of the several particulars to be taught in the proposed COLLEGE.

It is proposed to take no young gentleman into this mercantile seminary, under fifteen years of age; nor any but such who are qualified in school-arithmetic, and masters of a tolerable current hand-writing*.

- * It is my intention, some time or other to draw up a plan for the education of the British merchant from his infancy, as preparatory to his admission into a college of this kind.

A thorough knowledge and expertness in mercantile computations being previously necessary to all other accomplishments, it is proposed to go through every distinct course relative thereunto; and that in so intelligible and scientific a manner, as the rationale of every thing may very clearly appear*. For as, from the whole of this design, we have in view the gradual exercise and improvement of the understanding, and insensibly strengthening the judgment, so nothing, it is conceived, will be more naturally conducive thereunto, than demonstrating the reason and foundation of all rules given in the courses of our mercantile calculations; skill in figures being founded in reason†, facility of operation in reiterated practice: which the professors should not be wanting duly to promote.

- * See our article MATHEMATICS.

- † See our article ARITHMETIC.

Knowledge in the foreign exchanges being very essential to the qualification of the merchant, this subject should be treated in all it's various lights.

That a clear idea may be formed of our intention with regard to this particular, it may be necessary to observe:

1. That the most concise and practical methods of converting the sterling money of England into the monies of exchange and of account of all places throughout Europe be demonstrated, according to the direct courses of exchange established for those purposes, and vice versa.
2. The methods of converting sterling money into those of all other places of commerce, wherewith England has no direct established courses of exchange, but is under the necessity of making use of the intermediate exchange of other places: together with the nature of the agios, and the manner of turning their bank monies into current, and the reverse.
3. The manner of calculating all the foreign monies throughout Europe into those of every other distinct country, either by direct or intermediate exchange; which makes a much greater variety of cases than those, who are not thoroughly acquainted with this extensive subject, can imagine.
4. The art of arbitrating* the prices of exchange throughout all Europe†.

- * Les arbitrages, en matière de change, ne sont autre chose qu'un présentiment d'un avantage considérable qu'un commerçant doit recevoir d'une remise ou d'une traite faite pour un lieu préférablement à une autre.

Le pair, ou l'égalité des monnoies courantes, ou le pair des places, qui est le point le plus délicat, le plus essentiel, & le plus innocent du commerce de change, & de banque, se prend en deux manières.

La première est au pair, qui suppose un juste rapport & une valeur exacte de la monnaie d'un pays avec celle d'un autre, comme quand 1 rixdale de 50 sols, monnaie courante de Hollande, ou d'Amsterdam, est comptée en égale valeur de 17 (a) de 60 sols Tournois de France, ou de 54 deniers, ou pence, ou 4 $\frac{1}{2}$ chelings d'Angleterre, & ainsi des autres places. Sans cette connoissance, on ne peut pas savoir le profit ou

la perte qu'on fait aux changes, ou sur les marchandises étrangères; car comme il y a un pair & égalité des mesures & des poids du monde, il est aussi nécessaire qu'il y ait un pair & égalité des monnoies; autrement un négociant ne sauroit ce qu'il ferait, ni si le prix qu'on lui demanderoit d'une chose, fût en change, ou en marchandise, seroit haut ou bas.

La seconde espèce d'égalité entre les places, est tirée des prix courans des changes, par laquelle on entend seulement cette proportion requise d'une place avec une autre place, par la connoissance d'une ou de plusieurs comparées entr'elles. Quelques uns pourront dire que la connoissance du profit & de la perte qu'on fait, sur des lettres de change, dépend du retour des sommes à leur principe, & que le pair est une spéculation inutile. On peut répondre à cela que, si la connoissance du profit; & de la perte qu'on fait sur les lettres de change, dépend du retour des sommes à leur principe, & du lieu d'où elles sont sorties, on ne peut pas dire la même chose de celles, qui ne retournent point, soit qu'elles soient employées, & consommées dans le pays même, soit pour achat de marchandises, soit pour pension, ou pour des affaires particulières.

D'ailleurs, s'il étoit nécessaire d'attendre ce retour, pour savoir le profit qui se fait sur une lettre de change, & que cette connoissance dépendit de l'avenir, il faudroit conclure que dans le tems que l'on donne ou que l'on prend de l'argent à change, on ne le sauroit pas, & s'il on ne le sauroit pas, ce seroit négocier sans connoissance de cause & au hasard, puis qu'on ignorerait le profit ou la perte qu'on y feroit. Idem.

- (a) Le lecteur est averti que cet ouvrage ayant été fait lorsque l'écu de France ne valoit que 60 sols Tournois, cet écu étoit au pair avec la rixdale de Hollande de 50 sols. Mais les monnoies de France ont changé souvent depuis, & sont sujettes à des variations continuelles; ainsi au lieu de marquer la valeur d'écu de France dans la présente année 1753, on le suppose toujours de l'ancienne valeur de 60 sols Tournois; à quoi on fera attention. Traité General du Commerce, par Samuel Ricard d'Amsterdam.

- † See our articles ARBITRATION OF EXCHANGES, EXCHANGES, ENGLAND, HOLLAND, HAMBURG, and such other heads to which from these we refer.

This is a subject of great delicacy, not only in point of computation, but in point of application to the purposes of drawing and remitting money, and negotiating bills of exchange throughout Europe, to the best advantage at all times. And what that advantage is, can never be known to any, except those who are skilled in this important and mysterious branch. Those merchants or negotiators of foreign monies by exchange, who may be only acquainted with a few places, whose exchanges they are capable of arbitrating, cannot be judges of the profits to be made by other places: and therefore, for want of an universal knowledge herein, we will presume to say, that daily opportunities, of no inconsiderable benefit, escape notice.

Although the instability of the exchange is justly enough compared to the wind, yet that instability is the very cause of the profit to be made thereby: and for this plain reason, because it is scarce ever possible, that the courses of exchange between several nations should ebb and flow in an equality of proportion.

And whoever trades as a merchant, that is to say, as an exporter and importer in Europe, must of necessity have to do with bills of exchange, and with drawing or remitting: and, if so, he should by no means be unacquainted with those arts of making the best advantages by so doing; but this is not possible to be done, without being thoroughly skilled in their arbitration, to a demonstrative exactitude.

The more general trade of a merchant is, the more universal should his knowledge in this particular be. And those who may have views in dealing largely by exchange, will certainly find their account beyond expectation, in being fundamentally grounded in this subject; for a trader of a good general foreign correspondence may, by this means, gain more by dint of credit and skill, than others, unacquainted herewith, can do, by dint of hard money*.

- * See our articles ARBITRATION OF EXCHANGE, HOLLAND, HAMBURG.

A knowledge also of the intrinsic value of foreign coins, or specie*, should go hand in hand with the knowledge of exchange†; the profit arising upon the exportation or importation thereof, from one foreign country to another, being grounded on the due consideration of both. To which should be added, the nature of dealing in bullion gold and silver to the best advantage; the various calculations necessary to that end, and the methods pointed out that are proper to be taken, in order to prevent imposition in regard thereunto†.

- * That a more lively idea may be obtained of dealing in foreign specie to the best advantage, we would recommend the collection of the several coins current throughout Europe, with the several standards affixed thereunto, for the use of the college.

- † See the article COINS.

- † See the articles ASSAY, AQUA FORTIS, AQUA REGIA, BULLION GOLD AND SILVER, FLUX, MERCURY, METALLURGY, MINEROLOGY, ORES, QUARTATION, REFINING, SILVER, TESTING.

That the young merchant may not be deficient in whatever has affinity with exchanges, there should be compiled a succinct collection of the essential customs and usages of British and foreign merchants relating to bills of exchange, together with the principal law-cases that have been determined in the courts of judicature in England and Scotland, and foreign countries*; which, with other occasional admonitions, may not a little contribute to prevent his being unwarily drawn into litigious broils; than which, nothing is less compatible with a life of traffic.

* See the article **BILLS of EXCHANGE**.

From the knowledge of these particulars, the collegian should be led to the comparison of foreign weights and measures, and the methods of converting those of one country into those of any other*.

* See **ENGLAND, HAMBURGH, HOLLAND, MEASURES, WEIGHTS**.

It is unnecessary to observe further upon this head, than that there is no possibility of understanding foreign invoices*, and accounts of sales, without being capable to reduce the standard weights and measures, as well as the monies of foreign countries, the one into the other. Nor without it can any previous computation be made, whether exportation or importation of merchandize, between nation and nation, will or will not turn to advantage.

* See **INVOICE, and ACCOUNT of SALES**.

Exportation and importation of domestic and foreign commodities leading to the business of the custom-house, the calculation of the duties, subsidies, drawbacks, and bounties, becomes a qualification not the least necessary in an undertaking of this nature; as it is below the dignity of the merchant to see wholly with the eyes of others, in what so nearly concerns his own interest*.

* See the **PRACTICAL BUSINESS of the CUSTOM-HOUSE**, at the end of each letter.

In regard to points of this nature, all due attention should be given to the tariffs, duties, imposts, and other charges, which are laid upon the British produce and manufacture in foreign countries; and to inculcate, at the same time, the prudential necessity of obtaining such satisfactory knowledge, by pro forma accounts of sales from foreign parts, before engagements are precipitately entered into*.

* See **ACCOUNT of SALES, TARIFFS, TREATIES of COMMERCE**.

To those who have not been early exercised in numbers, and are not become expert in their operation, this variety of calculations may appear something laborious. So it would be, if the method of instruction is not so peculiarly contrived as to render the whole rather an entertainment, than any thing like a disagreeable drudgery.

The minds of young persons are not to be touched by abstracted ideas; they have need of agreeable and familiar images; they cannot reason, or be brought to delight in business, without being pleasurably trained to them; and what is of the greatest moment must be rendered lovely, and represented under sensible and beautiful forms.

Yet what depends upon practice and exercise, can only be obtained by practice and exercise, though the rules and principles of that practice should be ever so well comprehended. 'I wish, says a wife man*, that Paluel or Pompey, the two famous dancing-masters of his time, could have taught us to dance and cut capers by only seeing them do it, without stirring from our places, as some pedants pretend to inform the understanding, without ever setting it to work; or that we could learn to ride, handle a pike, touch a lute, or sing, without the trouble of practice; or as these attempt to make us judge and speak well, without exercising us in judging and speaking†.'

* Montaigne.

† The great Mr. Locke speaks to the same purpose. We are born with faculties and powers, says he, capable of almost any thing; such, at least, as would carry us farther than can easily be imagined: but it is only the exercise of these powers which gives us ability and skill in any thing, and leads us towards perfection.—A middle-aged ploughman will scarce ever be brought to the carriage and language of a gentleman, though his body be as well proportioned, and his joints as supple, and his natural parts not any way inferior. The legs of a dancing-master, and the fingers of a musician, fall as it were naturally, without thought or pains, into admirable and regular motions. Bid them change their parts, and they will in vain endeavour to produce like motions in the members not used to them; and it will require length of time, and long practice, to attain but some degree of a like ability. What incredible and astonishing actions do we find rope-dancers and tumblers bring their bodies to! Not but that sundry, in almost all manual arts, are as wonderful; but I name those which the world takes notice of for such, because, on that very account, they give money

to see them. All these admired motions, beyond the reach, and almost the conception of unpractised spectators, are nothing but the more effects of use and industry in men, whose bodies have nothing peculiar in them from those of the amazed lookers on.—As it is in the body, so it is in the mind; practice makes it what it is, &c. *Locke's Conduct of the Understanding*, folio, page 375.

That the juvenile mind may not be disagreeably wearied with too continued an attachment to the same thing, the constitution of the college should be so modelled as to have interludes, by transition to matters of a lighter kind, which do not require that severity of attention, yet to such chiefly as have a close connection with practical business in a real life of trade.

Amongst these we look upon a facility in writing a plain, strong, sensible letter of business upon all occasions. As trade can only be carried on by an epistolary correspondence, a good mercantile style may, perhaps, be as necessary a part in the education of the merchant as any thing else. Thousands, in foreign trade, correspond for many years without ever seeing one another; but they can see the intelligent man of business as thoroughly by his letters as by his conversation; and sometimes better indeed; for many may get the light knock of prating, who are not able to write a correct and pertinent letter of business.

Letters of trade, wrote with judgment, and language suitable to the subject, beget respect and confidence. We have heard a worthy and ingenious merchant declare, That his being capable of corresponding in a manner something superior to the generality, was the means of getting him a very good estate, from a very small beginning; this talent having brought him very large commission business, a branch always desired, not only as it brings a secure profit, but as it proves the means of gaining the young merchant, especially, experience at the risk of others.

They must have little knowledge of language who can imagine, that the mere transcription of other persons letters, with precipitation, for the sake of copies only, will ever qualify a young gentleman, with a small share of literature, to carry on a judicious correspondence himself*. Nothing can effectually do this, but being properly put on the exercise of his own genius, and, from time to time, having his style corrected, with suitable admonition.

* Yet this is the only method taken to instruct them herein; which must be the reason why so few write grammatically or intelligibly; which I could shew by some thousands of merchants letters in my possession.

Though it is not necessary that the merchant should be a person of great learning, yet it is absolutely necessary he should be capable of writing grammatically, otherwise his sentiments are liable to be mistaken, which will be attended with consequences either injurious to himself or his correspondents. And young gentlemen of this class must certainly stand in need of some assistance in this respect, unless they can be supposed to have a miraculous advantage over other persons, and to obtain a facility to indite with brevity, fulness, and perspicuity, by instinct or inspiration.

Having arrived at a tolerable mastery in style, as well as computation, the scene should be discretionally diversified; variety in applications of the mind being as occasionally requisite as variety in diet to the body. To this end, the young merchant should be gradually initiated into a knowledge of the grand books.

That this part of his erudition may be rendered rather familiar and pleasurable than otherwise, we judge it necessary to commence with communicating a knowledge of every distinct auxiliary to the principal books, and of the form of every kind of voucher, and of every sort of instrument practised among merchants for their mutual security: such as **BILLS of LADING, CHARTER-PARTIES, POLICIES of INSURANCE**, and the like*.

* See these several articles.

We would not be understood to mean the giving only a superficial view of those kind of writings and instruments, but to inculcate the nature, legality, and utility of them; and, at the same time, to enforce the necessity of such writings and instruments being strongly and intelligibly drawn to prevent strife and litigations: as also shewing that, without such legal vouchers, the grand books are of no authority, either in cases of arbitration, or in the face of courts of judicature; these being no more than an artificial index to the original vouchers and testimonials.

From these instructions, so given as to make a proper impression, the next step should be to proceed, in a natural progression, to explain systematically the axioms and rational maxims and principles whereupon the whole art of accountship, as practised by the most skilful merchants, according to the method of double-entry, is grounded. At the same time, the superlative excellency of this art, in comparison to all others that have been adopted to answer the like purposes, should be amply illustrated, by apposite examples; as it always exhibits the true representation of a merchant's affairs:

and

and, provided the books are duly posted up, this excellent method is preventive of all destructive consequences, which attend irregularity and confusion in a trader's accounts *.

- * This method of instruction is widely different from the ordinary one that is practised.

It is not necessary, indeed, that a merchant engaged in large concerns should keep his own books, as he may probably employ his time to far greater advantage; but it is indispensably necessary that he should be capable of doing so: how is it possible, otherwise, that he should be able to judge when they are kept as they ought to be? Nor can he be capable of so inspecting them as to be duly acquainted with the state of his own affairs *.

- * There are many who have book-keepers, that are not judges whether their accounts are kept as they ought to be or not, according to the nature of their transactions. Is it at all extraordinary that such should be unsuccessful?

It is unbecomingly mean, not to say a consummate folly, in any man, whose fortune is daily at stake, to depend upon others to give him what they please for the state of his affairs. It is justly proverbial among the Dutch, That the man who fails, did not understand to keep his accounts: and it may be truly said, a merchant without that skill, is in as bad a situation as the mariner on the wide ocean, without chart or compass whereby to direct his course.

This inimitable method of accounts, being founded on the principles of reason, will prove a kind of practical logic to young people, when it is rationally and methodically communicated, not mechanically, and by rules depending on the memory only; which latter does not merit the name of instruction at all. And even rules, and the principles of reason whereon they are grounded, being ever so well understood, yet without the due application and exercise of those rules and principles to useful purposes, they are little better than a dead weight to the memory, and a clog to the understanding: whereas, when these rules and principles are duly applied, and made habitual, by being reduced to practice in matters of use, they are a whet to the genius, and strengthen the intellectual faculties *.

- * The common way of instruction of this class of people is by mere rules, without any reason or demonstration given of those rules; which is a mere mechanical and parrot-like way of teaching; whereas, were young people habituated to know the reason of every rule they go by, in the course of their education, it would infensibly lead them to pry into the reason of every thing else, which would prove of no little aid to their understandings in general.

In order to apply these rules and principles of reasoning to accounts, a concise introductory system should be formed, and that exemplified by transactions foreign and domestic, drawn from real business. And, that the young merchant may be completely grounded herein, he should be afterwards exercised in stating the real occurrences of some of the greatest and most universal merchants, from their original books.

Nor will such original books of accounts be of use only to ground a young gentleman to the utmost perfection in the art of accountancy, but will, at the same time, familiarize him to great a variety of interesting transactions in foreign trade, conducted with judgment and address, that will qualify him to launch into commerce with great advantage *.

- * To this end, I would propose that the college should be supplied with a great variety of complete sets of the real accounts of many distinguished and eminent merchants deceased; they being of no other use to executors after being a few years in their possession, there would be no great difficulty to obtain a great variety of these. If this seminary was furnished with the genuine accounts and letters relating thereto of the following merchants (a), who trod the Royal Exchange with supreme credit and dignity, the unexperienced might receive great benefit and advantage, by having judicious lectures read upon the same. For, by having the transactions of persons of great experience and discernment before us, and their motives nakedly laid open, as appears by their genuine mercantile letters, no one will doubt but great knowledge may be thereby obtained for the conduct of young people; to know only the several ways of trading of the skillful and prosperous, is of no little utility; but to be let into the motives of their measures, and the address whereby their many hazardous adventures have been conducted, is of no less benefit to the young trader than the genuine history of great statesmen and commanders are to those who shall aim at following their examples.

(a) The accounts we mean, are such as those of a Louvreure, St. Tinapey and Seignoret. Daniel Arthur, Brassey and Smith, Turton and Guiger, William Henry Cornillon, Coppins, Sir David Exeter, Sir Peter Meyer, Sir Theodore Janßen, Sir John Williams, Sir Randolph Knipe, Sir Peter Delmé, Samuel Sheppard, Sir Francis Eyles, James Milner, — Olmüß, Sir Samuel Clarke, Sir Alexander Carnes, Henry Carnes, Deborah Dunt, widow, Longuey and sons. Sir Henry Furness, Sir James Bateman, Sir James Dollyge, Sir William Chapman, Samuel Holden, and many of the other distinguished merchants of the city of London, and other parts of the kingdom, as well as of the British factories in foreign parts, and numbers of others who are now living in the highest credit.

About twenty years since, some mercantile accounts of no little consequence fell into my hands to audit and liquidate, between the late Samuel Holden, Esq; governor of the Bank of England, and some considerable merchants of Russia. In the examination of those accounts, it was necessary for me to consult the course of correspondence for many years back; and I must confess it not only gave me great satisfaction as well as advantage, from the perusal of Mr. Holden's letters in particular, for they were penned with great sagacity: Cicero himself, perhaps, had been bred a merchant, could not have formed a mercantile epistle more laconic, elegant, and perspicuous; whereas those of many of his correspondents were as mean and unintelligible as their business was injudiciously conducted.

Thus rationally introduced into this method of accounts, in all its ordinary forms, as practised by the most ingenious and experienced, our young traders should afterwards be instructed so to contract their accounts, as to have much less writing than is commonly used in most counting-houses. The auxiliary books should not only be contrived in a method far more concise than usual, but other parts of their accounts kept in a much shorter manner than is generally practised, and yet without the least deviation from the spirit and essence of this incomparable art.

The usefulness of the abridgment proposed, in this respect, will consist in keeping the books always duly posted up; without which it is impossible the merchant should, at all times, be so thoroughly acquainted with his affairs as he ought. But those who are not complete masters of this art, although they may perfectly understand the common methods, yet have so much writing therein, and thereby find it so laborious, that they frequently practise less accurate methods of accountancy, only to save so much writing; which is too often attended with no little disorder and confusion in their affairs.

That every advantage may be reaped which this art of accountancy will admit of, the student should be put also into the method of keeping, with very little trouble, an abstract of the state of his affairs, within the compass of a pocket-ledger, as a constant check and remembrancer for the due government of his concerns.

That no point of practice in any counting-house whatever may be concealed, the usual methods of making out accounts of sales, invoices, &c. should be laid open, together with the nature of all intermediate accounts, which are made use of in order to answer such purposes as may be thought necessary by the more skillful.

- * Though many of those arts are not strictly just and honourable, yet the young merchant should not be ignorant of them, lest he should be liable to daily imposition by others.

Method and regularity being the life of the trader's affairs in general, the same should not be neglected in every circumstance relating thereto. Thus the due arrangement and methodizing of the original vouchers of his transactions, for immediate reference, should be duly inculcated and exemplified. As the grand books are of no authority without them *, the one ought to be as regularly disposed as the other, in the way they will admit of. Neglects of this kind, either by misplacing or losing those testimonials, being productive of great perplexity and vexation in public business, order and regularity in all things cannot too early be made habitual.

- * Much deceit and knavery have been practised by subtle bankrupts and others, by forging formal waste-books, journals and ledgers, &c. seemingly very regularly kept, &c. which have too often passed for genuine, because the several vouchers have not been duly scrutinized into from whence those accounts have been formed.—This is what should be strictly examined into by the commissioners of bankrupts, and counsel in their pleadings, &c. and by those who enter into partnerships, &c.

Moreover, the trader, whose whole fortune, or more, is frequently embarked in business, and whose anxiety is often sufficiently engaged for the event of his enterprizes, should be accustomed, from his youth, to treasure up all knowledge relative to his profession; more especially so, since it frequently admits of a variety of occurrences, no less singular than interesting. It will, therefore, hardly be thought unnecessary to familiarize him to keep a well-contrived alphabetical register of all such essential occurrences, as may be requisite for him to have recourse to throughout the whole of his life. For it is little to the reputation of the trader to be obliged to ask information of others, in important transactions which relate to himself; and in such too, probably, as either passed through the counting-house where he was bred, or perhaps, his own; yet, for want of a proper memento, he may sometimes commit such egregious mistakes, as may prove an injury to his estate, as well as blemish to his character.

The next business should be to furnish the young merchant with some knowledge relating to the funds and stocks of this kingdom; negotiations of that sort, on the account of foreigners, and others, having multiplied with the increase of the national debt.

We would not be understood to mean the knowledge of the stock-jobber only, but such a knowledge of the funds, in their

their foundation on the public credit, and how they are affected ab extra, as well as ab intra, so as to distinguish the real from the fictitious causes of the fluctuation of their prices. However mankind may have been misled, and infatuated at times, yet doubtless there are touch-stones, whereby an observing person may pass a very good judgment when there is money to be got or lost, by this our standing lottery *.

- * There is so great variety of artifices practised at certain conjunctures, to raise and fall stocks for the private interest of jobbers, and those who are in the secret of public affairs and great companies, that they would take me up a volume to display in their proper colours. See the articles BUBBLES, STOCKS, STOCKJOBBER.

Provided this should be no otherwise serviceable than to prevent a rash and indiscreet dabbling in stock-jobbing, it may prove the saving, though it should not the improving of a fortune. The young trader may hereby receive information enough upon this head, to enable him to give such seasonable advice to correspondents, as may be the means of gaining him no inconsiderable commissions in that shape, though his own fortune should not admit of his occasionally trading in the stocks for himself.

In the course of this mercantile progress, the next step necessary should seem to be to give the young merchant a general survey of the trade and commerce of the world *.

- * See the several nations of the world throughout this Dictionary, and their principal provinces, countries, duchies, &c. for commerce.

However unnecessary some may imagine this general knowledge of trade, who look not beyond the circle of their particular branch, yet we cannot help thinking such knowledge may prove of no little advantage to the trader of genius: for it is the nature of foreign commerce to be variable and fluctuating; that branch which shall afford considerable profit at one time, may be scarce worth engaging in at another; by reason the greater the advantage is, the greater is the confluence of traders into that branch in particular: multitudes thus striking into one and the same trade, foreign markets are glutted, and the British, as well as other produce and manufactures, become a drug.

Other causes likewise conspire to this. All nations are now convinced that trade is the best source of wealth and of power: wherefore some are daily attempting either to supply themselves with what they took from others, or other nations are attempting to obtain a share in their supply.

But whoever considers in what manner the more skilful merchant prosecutes his trade, will hardly disallow the necessity of a pretty general knowledge therein. As, 1. Our national produce and manufacture being more than our consumption, a part is exported; and, in return, foreign goods, or bullion, or both, are brought home. 2. Selling the goods exported at one port, and loading there to sell at another, whereby a larger profit is made than if the goods exported had been carried directly thither. 3. Bringing away the produce and manufactures of other countries, from whence and when they are cheap, to supply countries when and where the same sell dear. 4. Bringing home the produce of other countries, and exporting the same in manufactures. 5. Freight and hiring out shipping to various parts of the world.

The merchant, by thus knowing how the several parts of the world are connected with each other in their mutual intercourse of commerce, how the redundancies of this country supply the deficiencies of that, will be capable of foreseeing when any ill consequences threaten either that branch of traffic in which he is particularly concerned, or the trade of his country in general. It will open to his view by what means several branches have been acquired; how some have been stagnated and lost; and what measures may be taken by the government, in concert with the practical merchant, to revive them, or supply the mischief, by opening new channels of commerce.

It is too little knowledge of trade, not too much, that will make the merchant rashly adventurous and projecting, upon weak and groundless foundations. A person, knowing in more branches than one, will of course embrace that which is the more suitable to his fortune, and the least hazardous. As many have been undone by rashly grasping at a greater share of business than they had either capital or ability to manage; so, on the other hand, many have been ruined by an unaccountable attachment to one branch, when common prudence cried aloud for their relinquishing a ruinous trade, and striking into the prosperous.

This part of the institution, therefore, it is presumed, may prove a sovereign preservative against each extreme of imprudence; our intention hereby being to prevent precipitate engagements, and too projecting a turn on the one hand, as likewise too contracted a view, and pusillanimity on the other. It is not by the merchant as by the particular mechanic or artisan. The potter cannot easily strike into the business of the shipwright, any more than the latter can into that of the watchmaker or the weaver, &c. This is not parallel in regard to merchant and merchant: for the exporter of woollen

goods can as easily export tin or lead, or hard ware, &c. and have his returns by exchange in dollars of Leghorn, or ducats of Venice, as well as in dollars of Spain, or millrees or moidores of Portugal, &c. Or cannot the merchant, who sent woollen goods to Spain or to Italy, send another species of woollen goods to Russia, and have his return in robes, Russia hemp, linen, rhubarb, or pot-ash, &c. as easily as in Spanish dollars, wines and raisins? In fine, the imports and exports to and from his own nation to all others, together with a knowledge of their monies, weights, and measures, duties, imposts, and all customary charges, ought to be familiar to the accomplished merchant; that, upon the declaration of any particular branch of national trade, he may apply himself to the more advantageous for the time being.

Or, even if the national trade in general should undergo a temporary declension, yet the trade of the world will afford the true-bred merchant eternal opportunities of advantage: such a one will find no difficulty to trade in various branches, from one foreign nation to another, as it were independent of his own, whilst all the profits are brought home, and center within himself.

We are not unaware it may be objected, that a merchant cannot have that universal knowledge in the qualities of commodities, necessary for variety of foreign markets, &c. and, therefore, cannot so easily turn himself from one branch of foreign trade to another. To which it may be replied: were merchants obliged to depend wholly upon their own judgment herein, there would be some weight in the objection. But this is not the case. For the reputation of manufacturers and warehousemen, and other dealers, in their negotiations with merchants, is not only at stake in one respect, but they can safely depend upon well experienced brokers and packers in others, to prevent impositions of this nature: so that there is not that necessity for the merchant to have so deep a knowledge in the qualities of goods in general, as if the case was otherwise. However, this matter should by no means be disregarded in a collegiate establishment; a mercantile museum, or repository, being indispensably necessary to such a design, which should be furnished with samples * of the unperishable staple commodities and produce of the principal trading parts of the world.

- * To these should be joined labels, describing the distinguishable characteristics of their several qualities, according to the degrees of comparison: this will accustom a young person to form some judgment in the qualities of those commodities wherein he may be hereafter induced to trade. If this expedient should have no other effect than to make a proper impression, that the merchant himself should not be wholly regardless of the qualities of those commodities wherein he may happen to deal, it may answer a very good purpose, but can prove no way detrimental: he may chuse whether he will regard any but those he may occasionally traffic in, and such he cannot be too well acquainted with. See the articles MANUFACTURERS, MECHANICS, MUSEUM.

Very far from raising an uncontrollable adventurous spirit, in causelessly rambling from one branch of trade to another, on the contrary, every measure should be used to check it, by throwing in such a weight of prudential knowledge as will ballast the most towering and extravagant disposition of that kind.

In view to which, the tutors should not be wanting to instill the necessity of guarding against casualties and injurious events, in every shape, so far as the extent of human foresight may be presumed to go in the train of business. Thus with regard to exportation for proper, or company account, the necessity of pro forma accounts should be duly enforced, before adventures are undertaken; as also the prudence of buying at best hand, and judiciously dividing the hazard, by not trusting too large a capital upon one bottom, or in one hand; not to trade beyond themselves, or leave their concerns too much to others; of prudentially insuring, not only from the danger of the seas, but from the danger of bad debts in foreign parts. For young people should be admonished rather to be contented with smaller profits, than not to allow the usual extra commission, for a good correspondent to remain the middle man upon those occasions, persons of experience well knowing the measures too often taken by factors, provided they have not this extra-allowance.

These, and all other such-like measures, should be duly regarded by the instructors; since not only the improvement, but the security of the merchant's fortune, as trading in the capacity of a principal for his own account, so greatly depends. And although, by pursuing measures so circumspect, our young merchant's profits, at first setting out for himself, may be less than those of more bold adventurers, yet he will much sooner grow rich than those who make too much haste to become so.

Acting likewise in the capacity of a factor does not require less precaution: for a just and honourable regard, had, in the way of trade, to the interest of others, seldom proves detrimental to our own. Whether this is not one, and even the most effectual means to increase commission business, we leave to the judgment of those who act as principals themselves. As trading in this shape

shape is the most beneficial and secure, so it is not the least delicate to conduct to the best advantage. In respect to a matter of this importance to the young merchant, the best advice should be inculcated. To which end, those measures should be pointed out that have been successfully taken by the more judicious to gain commissions.

No employment requiring a more ready use of the principal modern languages than the mercatorial, a collegial institution would be judged materially deficient, if destitute of professors to train up those students properly therein: wherefore, for whatever branch of trade the young merchant may be intended, he should, through the course of this education, be able to obtain either a knowledge of the French language, or the Italian, the Spanish, the Portuguese, or even the Dutch, High or Low; and, indeed, a facility in writing of several, or all of them, is necessary for the general merchant: for, although some may think that the French alone, from its universality*, sufficient, yet many foreigners will rather prefer a British correspondent, who writes his native language well, than that of him who only writes the French or the English.

* It has proved no mean stroke of the French policy to make their language so universal as they have done. Among their system of arts for the propagation of their commerce, there is no one, perhaps, that has more tended to render it universal than this, however some may slightly think of it. Where there is one book in the English language read throughout the world, there are doubtless many thousands of the French; and such is the vanity of that nation (a), that they are superlatively modest in decrying most others, in order to render their own the more superb in the eyes of strangers. The best of every thing is scarce any where to be found but in France; and they as arbitrarily govern the fashions of the world, in what shall be eat, drank, and wore, in other nations, as they are governed at home. Are not also the furniture, buildings, and even the pleasures of the rest of mankind, in a great measure, settled by this grand regulator of modes and fashions? How far this, with the universality of their language, has contributed to universalize their commerce, I am afraid has never been sufficiently considered in this kingdom. This is apparent from many parts of our work.

(a) See Mr. Addison's Freeholder, No. 30. and Bishop Spratt's Answer to that dilligenuous Frenchman Sorbiere.

What renders this the more necessary is, that such who are pretty general traders, and not capable themselves of writing in the modern languages, as their affairs may require, are under the daily necessity of applying to those who make it their business to translate for them, and write answers to their foreign letters. Now, besides the meanness and expence of such a practice, do not such merchants run the hazard of having the arcana of their business betrayed, and themselves therein supplanted? Nor are hired translators themselves always able to give the genuine sense of a letter, or to write a pertinent answer, with the proper turn of phrase. How injurious a practice of this kind may frequently prove, we leave those to consider whom it may concern. Moreover, When a merchant has established his credit among the trading world for worth, honour, and punctuality, there is no end of his correspondence. It is the common practice among merchants of honour, all over the world, to make mutual tenders of their services upon any natural occasion that offers, which is taken cordial and respectful: and, if they meet with a correspondent who writes their language well, and takes their sense clearly, it is frequently instrumental to produce profitable negotiations that, perhaps, might never have been the case, if the agreeable corresponding language had been wanting.

The most capital houses of mercantile trade throughout Europe being generally composed of several partners, for the greater satisfaction of foreign correspondents, it is customary for the one or the other of those partners to travel into foreign countries, in order to make the better judgment of the credit and fortune of their correspondents, cement ties of commercial friendship with others, and extend their traffic in general. Where such travelling correspondents meet with traders who speak their own language with propriety, it should seem to have a tendency to promote more harmony than is cultivated with those who do not; in the same manner as we observe strangers, who think alike, and between whom there is a similitude of manners, shall, at first sight, contract permanent and beneficial friendships.

As foreign merchants resort to England with this intent, so the English frequently take the tour into foreign countries. But, to go without language, he may almost as well be deaf as dumb: he stands but an indifferent chance to cultivate advantageous friendships, and promote the honour and interest of the house wherein he is concerned. Few foreigners speak English, which makes it the more necessary for the English to speak and write the language of foreigners with whom they do or are likely to correspond.

That a knowledge of geography is peculiarly necessary to the merchant, need not be urged; and that some skill in navigation

tion is likewise requisite, cannot be less obvious, seeing they have constant concerns with masters of ships and insurances, &c.

That the merchant should make some farther advance than this into the mathematical literature, will hardly be disputed, when we take a comprehensive view of the nature of his employment; for, although we suppose him to be an expert practical arithmetician, yet, methinks, he should not be mechanically so only: he should be habituated from his infancy to know the reason of all rules by which he works [see ARITHMETIC], for then he will apply his skill in figures pertinently to whatever occurs, which otherwise is scarce possible; and it is better to see with our own eyes than through the medium of others. A man, indeed, may content himself with the common theorems for gauging and mensuration, &c. yet to work only by line and by rule, illy becomes so high a character. We cannot therefore but think, that such a knowledge in algebra and geometry, as will lead the merchant into the rationale of every calculatory qualification for which he may have occasion, must be of use to prevent deception. How far also some knowledge in this science may be helpful to the improvement of the understandings in general of young people of this class, may deserve consideration. [See our article MATHEMATICS.] Likewise how usefully a knowledge in some parts of philosophy might contribute to his prosperity in many branches of trade wherein he may be engaged, appears from various parts of this work. See the article PHILOSOPHY.

The business of this class of traders being not only under the controul of the peculiar and municipal laws of their country, but to the established customs and usages of the mercatorial, as well as many branches of the civil law, and the laws of nations and commercial treaties; it will hardly be said, that the merchant stands in need of no knowledge of this kind. Certain it is, if he is ignorant of the penalties to which he is liable, and the rights and privileges to which his profession entitle him in any respect, he not only runs the risk of daily imposition, but of absolute ruin. It is therefore we have, throughout the course of this work, pointed out most of the laws and usages of every kind, to which this trader is liable.

As the public funds of this kingdom, and the great monied corporations established in consequence thereof, are chiefly under the management and direction of the most distinguished merchants of the city of London, does it not become necessary that they should be thoroughly informed in what relates to the support of the public credit, when the trust reposed in them is for no less than the property of 170 millions of sterling money? We do not intend, by what is here said, to signify the crafty skill of stockjobbing, we having before touched that point; we mean, that in this college should be taught, in a proper manner, a perfect knowledge of the public revenue in every branch thereof, all the laws relating thereto, and the several variations which the funds have undergone: upon the whole, here should be taught, scientifically, the real principles to preserve public faith and credit, the foundation on which the property of the monied interest stands, at present; what measures may be reasonably judged expedient in future, for the due security of so considerable a proportion of the wealth of the nation, as well as what are the most general eligible ways and means to raise the public supplies hereafter on all emergencies, the most for the general interest and honour of the kingdom. See the articles DEBTS [NATIONAL DEBTS], CREDIT [PUBLIC CREDIT], FUNDS, INTEREST OF MONEY, and MONEY.

The study of commerce, as well as that of the public funds and revenue in a national and political view, both in general, and as the several branches of it come occasionally under the consideration of the legislature, or the public, by intended regulations, becomes another principal particular to be cultivated in this seminary.

This part of knowledge will, we apprehend, be thought of no little importance to the mercantile prosperity, as it has been deemed a great merit in merchants, on public conjunctures, to have afforded satisfaction to their fellow-citizens, in their associations in this metropolis upon those interesting occasions; and the highest honour to have given the legislature satisfactory accounts in matters of concernment to the traffic of the kingdom.

The memorable defeat of the French bill of commerce, in the reign of the late queen Anne, is sufficient to confirm the truth of this*.

* When Great-Britain, under the conduct of the late duke of Marlborough, had reduced France to the necessity of suing for peace, there were two treaties set on foot, the one of peace, the other of commerce. But the treaty of commerce could not take effect, unless the parliament consented to reduce the high duties, and take off the prohibitions so wisely laid on French commodities. As this would have destroyed all the best branches of our trade, and deprived many hundred thousand of our manufacturers of their subsistence, it began to give an alarm; which became general amongst the merchants and traders, who knew the fatal

consequences of it. Many pamphlets were published, to convince our legislators, that the preserving our looms, and the rents of Great-Britain, were of greater consequence to the nation, than gratifying our palates with French wine. This treaty, however, was to be supported at any rate; which occasioned several ingenious merchants of long experience, and well skilled in trade, together with the late earl of Halifax and earl Stanhope, to use their utmost endeavours to defeat it; which they effectually did, by the satisfactory accounts thereof they laid before both houses of parliament, and from what they published from time to time, under the title of the *British Merchant, or Commerce preserved*.

Sir Charles Coke, merchant at that time, made so clear a defence of our trade at the bar of the house of lords and commons, that he was afterwards deservedly made one of the lords commissioners of trade and plantations, and chose a member of parliament.

Sir Theodore Janssen, Bart. also, furnished many useful materials, which contributed towards the carrying that national point.

James Milner, Esq; merchant, and member of parliament, made appear, before the house of commons, the great importance of our trade to Portugal, and of the treaty of commerce which supports the same, in opposition to the French bill of commerce.

Mr. Nathaniel Torriano, merchant, shewed the consequence of opening the French trade according to the proposed treaty, in so strong and so clear a light, as to convince even them who discouraged his speaking before parliament, of the destruction that must have inevitably fallen upon our country, had that treaty been rendered effectual by parliament.

Mr. Joshua Gee, Mr. Christopher Haynes, Mr. David Martin, and several other very able and distinguished merchants, well acquainted with the interests of the trade of the nation, were extremely helpful likewise in defeating that pernicious treaty, and therefore latest posterity will have their names in honourable remembrance.

But we need go no further than our present time for instances of this kind. We had a conspicuous example before us, in one of the late representatives of this great city in parliament; who upon all occasions, manifested so superlative a knowledge in the general commerce of the nation, as deservedly to be distinguished with the highest honour and applause: which, one would think, should animate every young merchant to endeavour, next to his province, to excel in this kind of knowledge.

And, although every one cannot expect to be blessed with the genius of a Barnard and a Beckford, yet every merchant of distinction should be emulous to exert himself in the service of his country, in a manner so consistent with his profession. Every trader having a private interest in the promotion of the general trade, and practical traders having greater opportunities than others of knowing the true interest of the nation in that respect, it seems a duty owing to themselves, as well as their country, to turn their thoughts sometimes that way. Beside, in regard to their own particular interest, if they are not thoroughly acquainted with the political nature of that peculiar branch of trade, wherein they are personally concerned, how is it possible they can duly support and defend it on any great exigencies, in the eye of the legislature?

For the proper instruction of the students in each of these branches, it is supposed, that the college is provided with tutors well accomplished to act their respective parts with all advantage to the collegians, and credit and honour to themselves.—It is supposed likewise, that the college is provided with a library of the best authors in all the modern languages, who have treated upon the several subjects before enumerated, and with a complete mathematical and philosophical apparatus for every purpose intended.

And now, if the reader will take a transient retrospect in his mind of what has been said, he will hardly scruple to grant, that merchandizing, and the united qualifications necessary to form this skilful British trader, have as good a claim to the appellation of an art or a science, as most that are so honoured and distinguished: should we say, that commerce is the grand support of most other arts that are solidly useful to mankind, it is no more than it deserves; and therefore it will not be thought unreasonable, that **PRACTICAL TRADE, and MERCANTILE NEGOCIATIONS** in general, should be reduced to as regular a method of institution, as it's inferior and dependent arts.

Of the PLAN of EXECUTION.

If the judicious reader should be candid enough to admit the preceding plan of particulars to be unexceptionable, and that there is nothing intimated therein, but what appears indispensibly necessary to train up the merchant suitably to his great employment; yet it may be said, this is no great advance towards the carrying such a design to it's desirable height of perfection, in point of execution: it is far easier to suggest the particulars requisite, than to obtain fit and ca-

pable persons for the office of instructors in an establishment of this kind. There is more difficulty attending this, perhaps, than there is in any other literary institution; for, if the distinct branches hereof were to be taught in the ordinary scholastic way, which is practised in public schools and other collegial seminaries, I am afraid it would frustrate the end proposed, and rather mar than forward the student in his accomplishments.

The merchant is expected to engage in trade for himself, and hazard his fortune therein, by the age of 23 or 24 at farthest: many are impatient to stay so long: whereas the learned professions, as they are distinguished, give the student, upon the general, above ten years more in his application, before he is judged capable to make any tolerable figure in life; and that by subsisting only on the interest of his fortune, if he has any, but not hazarding the principal money, as the young merchant is obliged to do, before he can raise any sort of reputation in the commercial world.

This being the case, and the skilful merchant standing in need of so great variety of knowledge, in order to preserve and improve his fortune, every expedient should be devised, every art practised, that will conduce to give him the greatest fund of useful knowledge in the least time.

Without entering into a critic upon the usual methods of education in England, which, indeed, have been sufficiently exposed by learned men already; we shall only endeavour to shew in general, wherein, we apprehend, the method for accomplishment of the merchant ought to differ from that which is commonly practised, in regard to the more learned classes of the community.

The life of the merchant being a conversable one, his employment leading him to transactions even from the mechanic and manufacturer to the minister of state, his method of erudition, methinks, should be as different from that scholastic way, as his profession is from all others: the man of business has not 20 years to devote to the mere study of languages, metaphysics, and criticism, &c. Prudence directs him to apply early to those things indispensibly requisite to prosperity in his employment; and what may adorn the learned professions, might spoil him for his own *.—When the merchants accomplishments are equal to, or above his employment, and not his employment superior to his accomplishments, then he may be at liberty to make what advances leisure and prudence will admit, in the belles lettres and the liberal arts; but to aim at this before, is acting as wisely as the peasant, who by turning star-gazer got smothered in a ditch.

* Sir William Temple gives it as his opinion, that even the men of learning may be so overlaid with learning, as to be weaker in point of judgment than if they had less.—So the merchant, if overstocked with that sort of literature which may be above or beside his province, he may be the worse merchant, though the greater scholar.—What Sir William says may deserve attention.—‘Who can tell, says he, whether learning may not even weaken invention, in a man that has great advantages from nature and birth; whether the weight and number of so many other men's thoughts and notions may not suppress his own, or hinder the motions and agitations of them, from which all invention arises; as heaping on wood, or too many sticks, or too close together, suppresses, and sometimes quite extinguishes a little spark that would otherwise have grown up to a noble flame. The strength of the mind, as well as of body, grows more from the warmth of exercise than of clothes; nay, too much of this foreign heat, rather makes men faint, and their constitution tender and weaker than they would be without them.’—Temple's Works, vol. i. fol. p. 158. If this observation of Sir William's should prove true, the merchant, with a share of learning suitable only to his profession, added to his conversable knowledge of the world, and the constant exercise of his own judgment in active business, may become a much wiser man; a more useful member to the community, than the profound scholar, whose understanding is drowned in the ocean of knowledge borrowed only from others.

Upon the whole, what we would mean to say is, that there should seem to be a certain pitch of literature, beyond which it is dangerous for the commercial man to advance; and really the field of knowledge, which the nature of the mercatorial employment requires, is not so scanty as some may be wont to think *: nor should the manner of communication of what is requisite be in the ordinary scholastic way, the merchant's time being limited, as before observed, to so few years, for the course of his erudition.

* See our Universal Dictionary throughout, in what relates to his accomplishments.

Nor will a profound knowledge, in every mercantile branch which we have particularized, answer the end: there are perhaps, many far more learned divines, lawyers, and physicians, who live in obscurity, than those who gain their thousands a year, and make a pompous figure in life: some study the externals, the knowledge of the world, and the craft of rising without merit, while others study only to deserve what they never arrive at.—The merchant must be the

man of the world, as well as skilful in the requisites of his profession; but his being immured in a college to converse only with the dead letter, and the jargon of the schools, will render him as unfit for his profession, as Sir Isaac Newton was for a dancing-master.

Wherefore the question is, what is the best method to train up this man of business? We say he must not be deficient in some of the principal modern languages, nor should he be incapable of reading a Latin author at least, though it may not be necessary for him to be a classical critic. If he enters the college with a childish smattering of this tongue only, he should not leave it, without such a fundamental mastery, that he can improve himself therein at intervals, even in the height of his mercantile concerns.

The business of languages, especially the learned ones, as they are eminently distinguished, is made an Herculean toil, in the packhorse road of an ordinary English education; yet no nation has better helps to facilitate their acquisition.—We abound with English translations, both literal and free, of the poets as well as profane authors, more than sufficient to enable a person to read any of the rest; sufficient, however, to capacitate the man of business to read any he may chuse; and he has scarce ever occasion to speak or write that dead language; though why the English, as well as foreigners, should not be accustomed to speak the Latin, there can be no substantial reason given, perhaps.—The English are remarkable for writing Latin inferior to none; and why they should not speak it equally well, if trained to it, is not easy to say. Because we can never be able, say some, from the change of customs, and the extraordinary difference of idiom, &c. to speak that language with a Roman elegance, are we therefore not to attempt it all? Would not a conversable use in this dead language, from our infancy, greatly expedite the acquisition of the modern, which have a near affinity therewith? This will hardly be gainsaid*.

- * If a man could be got, says our great Mr. Locke, who himself speaking good Latin, would always be about your son, talk constantly to him, and suffer him to speak or read nothing else (a), this would be the true genuine way, and that which I would propose, not only as the easiest and best, wherein a child might, without pains or chiding, get a language which others are wont to be whipped for at school, six or seven years together; but also as that wherein at the same time he might have his mind and manners formed, and he be instructed to boot in several sciences; such as are a good part of geography, astronomy, chronology, anatomy, besides some parts of history, and all other parts of knowledge of things, that fall under the senses, and require little more than MEMORY. For these, if we would take the true way, our knowledge should begin, and in those things be laid the foundation; and not in the abstract notions of logics and metaphysics, which are fitter to amuse than inform the understanding in it's first setting out towards knowledge.
- When young men have had their heads employed a while in those abstract speculations, without finding the success and improvement, or that use of them which they expected, they are apt to have mean thoughts, either of learning or themselves; they are tempted to quit their studies and throw away their books, as containing nothing but hard words and empty sounds; or else to conclude, that, if there be any real knowledge in them, they themselves have not understanding capable of it. That this is so, perhaps, I could assure you upon experience. Amongst other things to be learned by a young gentleman in this method, whilst others are only taken up with Latin and languages, I may also set down geometry for one, having known a young gentleman, bred something after this way, able to demonstrate several propositions in Euclid, before he was thirteen.

(a) This is the method by which the celebrated Montaigne was taught Latin, and from which very probably Mr. Locke might borrow the thought. What Montaigne says of himself may deserve regard:—'No doubt but Greek and Latin are very great ornaments, and of very great use, but we buy them too dear: I will here discover one way, which also has been experimented in my own Person, by which they are to be had better cheap, and such may make use of it that will. My father having made the most precise enquiry that any man could possibly make, amongst men of the greatest learning and judgment, of an exact method of education, was by them cautioned of the inconvenience then in use, and made to believe that the tedious time we applied to the learning of the languages of those people who had them for nothing, was the sole cause we could not arrive to that grandeur of soul and perfection of knowledge with the ancient Greeks and Romans: I do not, however, believe, that to be the only cause: but the expedient my father found out for this was, that in my infancy, and before I began to speak, he committed me to the care of a German, who since died a famous physician in France, totally ignorant of our language, but very fluent, and a great critic in Latin. This man, whom he had fetched out of his own country, and whom he entertained with a very great salary for this only end, had me continually in his arms: to whom there were also joined two others of the same nation, but of inferior learning, to attend me, and sometimes to relieve him, who all of them entertained me with no other language but Latin. As to the rest of his family, it was an inviolable rule, that neither himself, nor my mother, man nor maid, should speak any thing in my company, but such Latin words as every one had learnt only to gabble with me. It is not to be imagined how great an advantage this proved to the whole family; my father and my mother, by this means learning Latin enough to understand it perfectly well, and to speak it to such a degree, as was sufficient for any necessary use; as also those of the servants did, who were most frequent with me.—To be short, we

did Latin it at such a rate, that it overflowed to all the neighbouring villages, where there yet remain, that have established themselves by custom, several Latin appellations of artizans and their tools. As for what concerns myself, I was above six years of age before I understood either French or Perigordin, any more than Arabic; and, without ART, BOOK, GRAMMAR, or PRECEPT, WHIPPING, or the expense of a TEAR, had by that time learned to speak as pure Latin as my master himself. If, for example, they were to give me a theme after the college fashion, they gave it others in French, but to me they were of necessity to give it in the worst Latin, to turn it into that which was pure and good; and Nicholas Grouchi, who wrote a book de Committitis Romanorum, William Guirentes, who has writ a comment upon Ariotle, George Buchanan, that great Scotch poet, and Marcus Antonius Muretus, (whom both France and Italy have acknowledged for the best orator of his time) my domestic tutors, have all of them often told me, that I had in my infancy that language so very fluent and ready, that they were afraid to enter into discourse with me; and particularly Buchanan, whom I since saw attending the late marchal de Brillac, then told me, that he was about to write a treatise of education, the example of which he intended to take from mine, for he was then tutor to that count de Brillac, who afterwards proved so valiant and brave a gentleman. As to Greek, of which I have but a smattering, my father also designed to have taught it me by a trick, but a new one, and by way of sport; telling our declensions to and fro, after the manner of those, who by certain games, and tables and chess, learn geometry and arithmetic: for he, amongst other rules, had been advised to make me relish science and duty by an unforced will, and of my own voluntary motion, and to educate my soul in all liberty and delight, without any severity or restraint.

Besides the practice of conversation, as recommended by Mr. Locke and Montaigne, and indeed by all the learned men of other nations, the next means is translation; which, according to the learned Mr. Afcham*, who was preceptor to queen Elizabeth, ought to be double; that is to say, not only Latin into English, but the same English again into the original Latin, whereby learners have the classical authors to correct themselves by: which, being of the pure Roman phrase, is a far better standard for correction than the judgment of the generality of schoolmasters.

- * See the Schoolmaster: or, A plain and perfect way of teaching children to understand, write, and speak the Latin tongue. By Roger Afcham, Esq; preceptor to her majesty queen Elizabeth, corrected and revised, with an addition of explanatory notes, by the Rev. Mr. James Upton, A. M. rector of Brimton in Somersetshire, and late fellow of King's College in Cambridge. Printed in the year 1711, for Benjamin Tooker, at the Middle Temple Gate in Fleet-Street.—This I think one of the best books I ever met with to help youth forward in the Latin tongue, with great care and pleasure, and which I myself have experienced.

But, if such a man cannot be got, says Mr. Locke, who speaks good Latin, and, being able to instruct your son in all these parts of knowledge, will undertake it by this method, the next best is to have him taught as near this way as may be, which is by taking some easy and pleasant book, such as AEsop's Fables, and writing the English translation (made as literal as it can be) in one line, and the Latin words which answer each of them, just over it in another. These let him read every day over and over again, 'till he perfectly understands the Latin; and then go on to another fable, 'till he be also perfect in that, not omitting what he is already perfect in, but sometimes reviewing that, to keep it in his memory. And, when he comes to write, let these be set him for copies; which, with the exercise of his hand, will also advance him in Latin. This being a more imperfect way than by talking Latin unto him, the formation of the verbs first, and afterwards the declension of the nouns and pronouns perfectly learned by heart, may facilitate his acquaintance with the genius and manner of the Latin tongue, which varies the signification of verbs and nouns, not as the modern languages do, by particles fixed, but by changing the last syllables. More than this of grammar* I think he need not have, 'till he can read himself Sanctii Minerva, with Scioppius and Præizonius's notes.

- * The absurdity, says the late ingenious Mr. Clark of Hull, in his New Latin Grammar, of teaching the Latin tongue by a grammar in Latin, is so very gross, that one would wonder how it should ever enter into the head of any person of common sense, much more how it should ever become a national practice. But common custom, in most cases of importance, is so far from being the rule of right, that it is the very reverse of it, and in no case more flagrantly than this. The imposing of public prayers for the use of the people in a language they know not, as senseless and ridiculous a practice as it is, it is not more so than it is to pretend to teach a language by rules writ in the very language to be learnt, and which consequently the learner cannot understand, or make any use of, 'till they are rendered into a language he does know; and then it is the translation only, and not the original; that is of use to him. In short, the most rude and barbarous nations upon earth cannot furnish us with any instance of a custom that carries more of stupidity in the front of it. And therefore it is somewhat strange, that a practice so mischievous, as well as ridiculous, should not long since have had a stop put to it by law. Our legislators have almost all in their turns been considerable sufferers by it; and, unless they please by their authority to prevent it, their posterity after them are like to suffer on in the same manner to the end of the world. For public custom is seldom to be conquered but by authority, especially where people are got into the wrong way, so perverse or weak are

the generality of mankind. It is, therefore, very much to be wished, the legislature would take the matter under consideration, and, to save a deal of pain and plague, as well as a miserable waste of time to the youth of the nation, put an effectual stop to the senseless and barbarous custom of teaching the Latin tongue by a Latin grammar. They have highly merited of the people of Great-Britain, by delivering them from a grievance of a like nature, the use of the Latin tongue, or doggerel rather under that denomination, in the practice of the law.

Another act of that nature, in pity to the poor suffering youth of the kingdom, would, I dare say, be as kindly and thankfully received, by all true lovers of their country and good letters. Whether it may be reasonable or proper for authority to impose the use of any one grammar, I shall not take upon me to determine here; but this I shall be bold to say, that it is as reasonable to forbid by law the practice of teaching the Latin tongue by a grammar writ in Latin, as it is to forbid the use of that language in the public worship of God. Both practices are equally ridiculous, though not equally pernicious. For the thing proposed in both cases is utterly unattainable. Youth can no more learn by the help of a language they do not understand, than the people can pray to God in a language they do not understand, which every body sees to be impossible, and nonsense to pretend.—So far the ingenious Mr. Clark.

In teaching of children this too, I think, is to be observed, that, in most cases where they stick, they are not to be farther puzzled, by putting them upon finding it out of themselves; as by asking such questions as these, viz. which is the nominative case in the sentence they are to construe? or demanding what aufero signifies, to lead them to the knowledge what abtulerè signifies, &c. when they cannot readily tell. This wastes time only in disturbing them; for, whilst they are learning, and apply themselves with attention, they are to be kept in good humour, and every thing made easy to them, and as pleasant as possible*. Therefore, whenever they are at a stand, and are willing to go forwards, help them presently over the difficulty, without any rebuke or chiding; remembering, that, where harsher ways are taken, they are the effect only of pride and peevishness in the teacher, who expects children should instantly be masters of as much as he knows: whereas he should rather consider, that his business is to settle in them habits, not angrily to inculcate rules, which serve for little in the conduct of our lives; at least are of no use to children, who forget them as soon as given. In sciences where their reason is to be exercised, I will not deny, but this method may sometimes be varied, and difficulties proposed on purpose to excite industry, and accustom the mind to employ its own strength and sagacity in reasoning. But yet, I guess, this is not to be done to children whilst very young, nor at their entrance upon any sort of knowledge: then every thing of itself is difficult, and the great use and skill of a teacher is to make all as easy as he can. But particularly, in learning of languages, there is the least occasion for posing of children. For languages, being to be learned by *ROTE, CUSTOM, and MEMORY*, are then spoken in greatest perfection, when all rules of grammar are utterly forgotten. I grant the grammar of a language is sometimes very carefully to be studied, but it is only to be studied by a grown man, when he applies himself to the understanding of any language critically, which is seldom the business of any but professed scholars. This, I think, will be agreed to, that if a gentleman be to study any language, it ought to be that of his own country, that he may understand the language which he has constant use of, with the utmost accuracy. See Locke of Education.

* These sentiments of Mr. Locke have induced many to oblige the public with literal translations of several of the introductory classical authors, for the use of schools; and which, I doubt not, have proved extremely helpful; especially when the learners have been exercised by Mr. Ascham's method of double translation, and the grammar rules have been explained at proper times, in plain English. Many teachers of the dead languages are ridiculous and pedantic enough, to act in defiance of the opinion of Mr. Locke, Montaigne, Ascham, and other the most learned men in Europe, as might be easily shewn, and will not suffer youth to have all those helps for which these great men have so wisely contended: yet too many of these learned asses are obliged to make use themselves of these very auxiliaries, which they deny to children; in which a gentleman and myself once accidentally detected his son's schoolmaster at his own house.—Must not this be, with design to make the children believe, that their masters are so superlatively profound in these languages, that they stand in need of no expositors or annotators, when they really stand in need of them as much as the youths themselves? Or, must it not be with intent to lay every obstacle in the way of their improvement, that they may exert their perceptorial tyranny with less restraint? There cannot be too many helps for the acquisition of languages, both ancient and modern; and those, I am afraid, who the most strenuously oppose them, I shall always suspect, since the above accident, have the greatest occasion for them.

Monsieur Rollin, than whom few have better understood the method of training up youth in the learned languages, is of

the same sentiment: 'La premiere question, dit-il, qui se présente, est de savoir quelle méthode il faut suivre pour enseigner la langue Latine. Il me semble qu'à présent l'on convient assez généralement que les premiers régles que l'on donne pour apprendre le Latin, doivent être en François, parcequ'en TOUTE SCIENCE, en toute connoissance, il est naturel de passer d'une chose CONNUE & CLAIRE à une chose qui est INCONNUE & OBSCURE. On a senti qu'il n'étoit pas moins absurde, & moins contraire au bon sens, de donner en Latin les premiers préceptes de la langue Latine, qu'il le seroit d'en user ainsi pour le GREC, & pour toutes les LANGUES ÉTRANGÈRES.'

Those who would require greater satisfaction in relation to the method suggested for the speedy and familiar acquisition of languages, we refer them to consult not only those principal authors beforementioned, but such also who have followed the principles of those learned men, and wrote, since their time, upon the utility of the plainest and most literal translations (something in the way proposed by Mr. Locke) in order to facilitate the knowledge of the Latin tongue in particular*.—And, after the student is a master of these several authors; by the constant exercise of the method of double translation, and having the grammatical rules familiarly explained to him occasionally in plain English, he will be able of himself to read with pleasure several of the other classical authors; especially those with free and elegant translations, such as those wrote by Guthrie, Melmoth, Dunster, Dr. Martyn, and divers others; as also those commentators who have wrote in Latin upon the Roman classics. Upon the whole, however necessary some learned men may think it, that the youth of this nation, intended for the learned professions, should plod on in the old way of gaining a knowledge of the dead languages, it is to be hoped that the parents of those who are intended for merchants, will think it the worst method that can be taken for them: and what is the worst method for their attainment of a knowledge in the Latin tongue, can never be the best to be followed in relation to the modern languages.—They must be acquired by constant conversation with such who speak with propriety; by double translation, and by having the grammatical part easily explained in their native language, from the mouth of the tutor, and not by a multitude of rules got by heart, which only serve to burthen the memory, render learning disagreeable to youth, and retard their proficiency.—If I remember right, bishop Spratt, in the Life of Cowley, says, That he could never be brought to learn the Latin tongue by grammar rules, and yet few of the moderns have wrote that language with greater purity.

* The first that I remember to have appeared upon this occasion, was Mr. Philips, sub-preceptor to his royal highness the Duke. (2.) Mr. Clark, of the public grammar-school of Hull, author of two Essays on Education and Study, of A New Grammar of the Latin Tongue, and Literal Translations of several of the Introductory Latin Classics. (3.) Doctor Stirling. (4.) N. Bailey, Mr. Watson, and others.

Before we dismiss this point of language, we will take leave to make one observation more; which I have never met with in any of those authors who have wrote upon the best methods of obtaining a knowledge of languages. The reader, however, will please to take notice that what we are about to say is only intended as a requisite addition to what has been already proposed by Mr. Locke, Mr. Ascham, and those other authors before quoted, in regard to the usefulness of prepared literal translations, &c.

Another thing we desire the reader will please to observe, is, that we take it for granted no youth is admitted into the college before the age of 15 at least, and that he has been somewhat initiated into Latin and French, and can write his native language tolerably, together with a pretty good current hand.

Now, what we would humbly submit to further consideration is, in relation to the most natural method of making use of proper literal translations in the proposed college, in order to render the speaking and understanding of the Latin tongue, or any of the modern languages, very easy and familiar to the mercantile student: and what we have to propose is comprehended under the few following words:

The constant proper use of a *LIVING DICTIONARY*, and a *LIVING GRAMMAR*, and proper *LITERAL TRANSLATIONS*. That all literal translations may be made a proper use of, by the means of a living dictionary, it is proposed there shall be a kind of desk, elevated to a pitch proper for the purpose, wherein there shall always be one person constantly translating, with an audible voice, either Latin into English, or English into Latin; or French into English, or English into French; and the like of any other modern language to be learned; and those translations to be in as literal a manner as the different idioms of the languages will admit of, so as to be perfectly intelligible.—At the same time should be explained, viva voce, the peculiar customs and antiquities of the Romans, when any thing occurs that renders the same necessary to the better understanding the author which is thus publicly translating.

1. Let it be supposed, that, while such a constant translator, during the hours of education, is going on, a profound silence is preserved, and due attention is given by the students to such translation.

2. Let it be supposed, likewise, that one single day only in the fix is allotted for the explication of the rules of grammar, of any author that has been translated, in the same public way, relating to the peculiar language to be acquired.

These simple exercises being supposed to be steadily pursued, in regard to any language, what may we reasonably presume to be the consequence?

In this exercise, the reader will please to observe, that the ear and the memory of youth only are constantly employed, with respect to the point of double translation; and that the understanding is familiarly worked upon, in order to imbibe and retain the rules of grammar, without the least disagreeable application or fatigue.

It is by the constant use of the tongue, the faculties of hearing and the memory only, whereby mankind obtain the knowledge to speak, write, and understand their native languages; and if, in the public way of teaching any other languages, we can fall nearly upon the like measures, is it not very reasonable to hope and expect that any other languages may be thereby acquired as familiarly and insensibly as we do our mother tongues? That this must be the effect of such exercises, we have not only the judgment of so great a man as Mr. Locke, but the experience of a Montaigne, our great queen Elizabeth, and Madam Dacier.

By thumbing over the DEAD DICTIONARY and DEAD GRAMMAR, a youth of 15 shall, perhaps, make shift, with Herculean toil, and the help of his school-fellows, to hammer out, in a very pitiful way, thirty or forty lines of an author in a day, the greatest part of which he too often as soon forgets as learns: whereas, by means of the constant exercise of the LIVING DICTIONARY, and the LIVING GRAMMAR, and LITERAL TRANSLATIONS, he may, with great ease and pleasure, learn some hundreds of lines in a day, and retain the greatest part of the words and phrases in his memory.

Whether these exercises will be attended with advantages so superior to what the ordinary ones are, it may be necessary to enter into a further éclaircissement of the plan proposed.—To which end, the reader is desired further to observe, that The whole college is supposed to consist only, or chiefly, of young students who are designed for the mercatorial employment.—That their continuance therein is proposed to be from the age of 15 to 19, and that the whole number of them shall be divided into four or more classes; that is, those of the first year's standing should be of the first class, those of the second of the next, &c.

At the first commencement of this institution, the fresh men, who enter at 15, must be assisted, as much as possible, by the means proposed, for the first year, by the tutors; but, upon their entrance into the second year, those of the first year may, in a great measure, be instructed by the measures suggested, by their fellow students of the second year's standing; and those of the second year's standing be instructed by those of the third; and those of the third by those of the fourth year's standing; which will prove of no less ease to the tutors, than benefit to themselves.—To explain myself.

1. It is presumed that those students who enter into the second year have, in the way proposed, gone through two, three, or more of the introductory Latin classical authors, besides two or three French authors * which are proper for the occasion. At the same time, the reader is desired to observe, that there are stated times for their improvement in figures, and their mechanical hand-writing, and something of geography.

* The plainest prose authors we judge best to begin with.

2. That three or four, or more, of the most expert students of the second class should be constant public translators to those of the first class, the tutor always attending to explain difficulties, as they occurred.—Those of the third class to those of the second, and those of the fourth to those of the third class, &c.

3. This will refresh the memories again of the students with the authors which they had read in their prior class, habituate them to a graceful pronunciation and elocution, and prove of great ease to the lungs of the tutor, whom we cannot presume to be capable of continuing a public translation several hours in the day; but this may be very easily done by a requisite number of the students of a superior class, in the presence of the tutor appointed for the instruction of the class.

4. By these simple exercises, steadily and judiciously pursued, the students cannot trifle away a moment's time of the hours allotted for their instruction, which they do when left intirely to themselves, with the use only of their dead dictionary and grammar, and without any proper translation to assist them.

5. It is supposed, as before intimated, that there is a profound silence always preserved in the room of public translation; that is, nothing is to be heard but the continued voice of the public translator for the time being.—If any thing is capable of

VOL. II.

fixing the attention of youth, this method seems to bid very fair for it, because it is not attended with the least degree of toil or perplexity, every obstacle to their advancement being agreeably removed.

6. In order to judge whether due attention hath been given by every individual to the voice of the public translators, it should be an established rule for the tutor to cause, every day, such as he may suspect of inattention to mount the desk, and to retranslate publicly such a part of what has been done, perhaps, several times over by the appointed translators; and those who prove delinquents, and appear to be remarkably neglectful, will not only be thus ignominiously exposed, but they should be punished, by being that day confined to some extraordinary exercises, while their fellow students, who had behaved well, should be indulged in their diversions, and admitted to a table, for their meals, where there was something more delicate than at the table of such delinquents.—Something of this kind might be attended with very happy consequences to the youth, and of no little ease to the respective tutors.

We shall say no more in relation to languages.—The next points are those of FIGURES and ACCOUNTANTSHIP; and these, likewise, and such other parts of the mathematics, and, experimental philosophy, as we have touched upon, we would have taught as much in the same way as their peculiar nature will admit of; we mean, with relation to the rationale of the rules given for the practical operations of arithmetic, and the principles whereupon the art of accountanship by debtor and creditor, is founded, &c. together with proper lectures upon the mathematical and philosophic parts.—But, as the utility of the arithmetic and accountanship branches, in particular to the merchant, depends upon the ready and expert practice, the greatest variety of examples should not be wanting to exercise the several rules and principles thereof: yet these examples, also, we would have all performed in a public way, that the student should not have it in his power at all to trifle away his time: for that we judge a very essential point to be guarded against throughout the whole of this institution: but this can never be effectually done, provided a public lecturer, or demonstrator, is not constantly employed in those parts, as well as in the languages, and the silence and attention of the students are, at the same time, so diligently engaged as thoroughly to comprehend whatever they are thus publicly instructed in; and are able, also, to exercise the same in those practical uses which the nature of their employment may occasionally require: yet this cannot be effectually done, unless they have great variety of practical exercise in the several and respective branches *. Wherefore,

* That the fundamental principles of every branch may be duly impressed upon the mind, they should, together with proper examples, be fairly written, at the proper times appointed for that purpose, into books, by every individual student; and they should be also taught how to keep an alphabetical common-place book, wherein to register whatever they may hereafter have occasion to refer to.

The reader will please to observe, that another material and general principle, whereupon we propose the PLAN of EXERCISE to be founded, is, GREAT PRACTICE and EXERCISE, in every branch of erudition. And, to corroborate our opinion herein, we shall again appeal to the authority of Mr. Locke:

'No body is made any thing by hearing of rules, says he, or laying them up in his memory; practice must settle the habit of doing, without reflecting on the rule; and you may as well hope to make a good painter or musician extempore, by a lecture, and instruction in the arts of music and painting, as a coherent thinker, or strict reasoner, by a sett of rules; shewing him wherein right reasoning consists.' Locke's Conduct of the Understanding, vol. iii. p. 395.

With respect to the knowledge of the laws, customs, and usages relative to the employment of a merchant, those likewise, we apprehend, should be inculcated not only by PUBLIC LECTURE, but by FAMILIAR CONVERSATIONS upon the subjects of averages, baratries, bottomrees, bankruptcies, charter-parties, demurrages, exchanges [bills of exchange] and all other the variety of occurrences that arise in the course of practical business, all which will afford a wide field for improvement in matters of real use.—In relation to the method of instruction by public lecture, that is obvious enough to every one.—But what we mean by familiar conversation, may require some explanation. To which we shall only observe, that one or two evenings in the week, after the college exercises, should be set apart for those students, who are competently advanced, to give their opinion in the English language, or any other of the modern, in the presence of the proper professor appointed for this branch, upon any of the before-mentioned subjects, or any other relating to mercantile affairs; it being supposed, that the subject has been given out some days beforehand, in order for them to consult the proper books in the college, or their own libraries, for that purpose.

By this pleasing conversible exercise, the young students will be early inured to reflection, and retention of what they read, when they are under the necessity of communicating publicly

O o o

what

What authors they have consulted upon the occasion.—Besides, many of those points may lead to some debate; the professor may start objections, and ask their free opinions, when the subject is properly opened by him: and, by familiar interrogatories made from the chair, this will naturally draw out such answers as will shew who have, and who have not been assiduous in their applications to understand the subject from the books of authority.

The great Montaigne says, ‘ If I was compelled to chuse, I should sooner, I think, consent to lose my sight than hearing and speech. The Athenians and Romans held the exercise of familiar conference and debate in great honour in their academies.’ Mr. Locke had so high an opinion of it’s utility, as to recommend it in the following words: ‘ That there should be proposed to young gentlemen rational and useful questions, suited to their age and capacities, and on subjects not wholly unknown to them, nor out of their way: such as these, when they are ripe for exercises of this nature, they should extempore, or after a little meditation upon the spot, speak to, without penning of any thing: for I ask, if we will examine the effects of this way of learning to speak well, who speak best in any business, when occasion calls them to it, upon any debate, either those who have accustomed themselves to compose and write down beforehand what they would say; or those, who thinking only on the matter, to understand that as well as they can, use themselves only to speak extempore.’ And he that shall judge by this, will be little apt to think that accustoming him to studied speeches and set compositions is the way to fit a young gentleman for business.*

- Cicero, if I may be allowed once to mention such a name in a design of this nature, somewhere speaks of C. Curio, who had never read any books of eloquence, nor made any historical collections, nor understood any thing of the public or private part of the law; yet was so happy in expressing himself, as to be esteemed one of the best orators of his time. What gained him this applause, was a clear shining phrase, and a sudden quickness and fluency of expression, which was acquired purely by the benefits of his private education, being always used to a correct way of speaking in the house wherein he was brought up.

The same exercises of constant public lectures and public conversations, we also judge to be the most naturally adapted to the attainment of the other branches enumerated in the general plan, and, therefore, we shall only further observe,

1. The reader will please to remark in general, throughout the execution of every part of the proposed plan, we would recommend a similitude and uniformity of practice, viz. the constant exercise of the faculties of hearing, speaking, and registering by writing, the fundamental principles of whatever shall be taught in the college; and this without any retardment whatever to the progress of the student, every difficulty being agreeably removed as soon as it occurs.

2. The variety of capacities among youth, it is to be feared, is commonly too little attended to in their education: methods, suitably adapted to one genius, mar, blunt, and confound another. To prevent prejudicial consequences of this kind, our plan of execution is so devised as to suit any variety of capacities and dispositions. The flower genius and milder complexion will here have the fairest play to exert itself, without that awe and perplexity which often nips it in it’s tender bud. On the other hand, the strongest and most nervous capacity, the genius of the greatest sprightliness and vigour, will have every advantage to fix it’s fire, and agreeably mould and fashion it to application.

Emulation in youth, like ambition in men, exciting to the most laudable endeavours, no expedient should be wanting first to raise, and afterwards to cherish and support this noble passion.

One motive of this kind will be peculiar to these young gentlemen: which is, their being made sensible how easily they may advance each other’s credit and interest in the way of trade: but, without suitable qualifications to play skilfully into each other’s hands, they should be convinced that they can never hope to reap such benefit by their mutual intercourse of friendships.

The experienced well know how merchants properly situated at home and abroad may promote one another. This is often done by persons bred in separate practical counting-houses in the ordinary way: but, where young people are bred up together, in the like maxims and practices, and where personal friendships are contracted from their youth, they will more naturally fall upon measures for their common advantage: especially so, when such have been properly pointed out to them in the course of their collegial erudition, and deeply impressed in their tender years.

In carrying the whole of this design into execution, the natural and ordinary practices of men of sense and genius should be made the principal guide. From art should be only borrowed such helps as will aid and assist, no way cramp and suppress, the intellectual powers and faculties: and how far those powers and faculties will carry youth, under an institution whose sole foundation is to render every acquisition as pleasing

and delightful as possible, has, perhaps, scarce ever been duly experimented*. In the common methods of acquiring knowledge, men seem generally too intent upon the dead letter: whereas, if the real conversible practices of mankind, properly regulated and conducted, and improved by natural and engaging arts, were made the principal foundation in every kind of literary institution, we might indeed, have fewer pedants, but more truly useful members of the community.

- ‘ Un maître habile & attentif met tout en usage pour rendre l’étude aux jeunes gens agreable. Il prend leurs tems: il étudie leur goût: il consulte leur humeur: il mêle le jeu au travail: il paroît leur en laisser le choix: il ne fait point une règle de l’étude: il en excite quelquefois le desir par la refus même, & par la cessation, ou plutôt par l’interuption: en un mot, il se tourne en mille formes, & invente mille adresses pour arriver à son but.’ Rollin des Belles Lettres. Du Gouvernement des Colleges.

‘ I would not, says Montaigne again, have this pupil of our’s imprisoned and made a slave to his learning; nor would I have him given up to the morosity and melancholic humour of a four, ill-natured pedant. I would not have his spirit cowed and subdued, by applying him to the rack, and tormenting him, as some do, fourteen or fifteen hours a day, and so make a pack-horse of him. Nor should I think it good, when, by reason of a solitary and melancholic complexion, he is discovered to be much addicted to books, to nourish that humour in him, for that renders him unfit for civil conversation, and diverts him from better employments. — The place of education, adds he, should be painted with the pictures of joy and gladness, Flora and the Graces, as the philosopher Speusippus did his; that, where their profit is, they might there have their pleasure too.’

We would not have it signified, that these young gentlemen can be expected to arrive at so great a mastery in every thing we have suggested, as to become perfect proficient therein. The youth of many, and the shortness of time proposed for their continuance in the college, cannot well allow of this. But we take upon us to say, that all who have tolerable natural abilities can scarce avoid contracting so good a habitude of attention and application to business, as will grow up with them throughout the whole of their lives, and, indeed, qualify them ever after to be their own instructors. ‘ It is not, as Mr. Locke observes, the business of education, in respect to knowledge, to perfect a learner in all, or any of the sciences, but to give his mind that freedom, that disposition, those habits, that may enable him to attain any part of knowledge he shall apply himself to, or stand in need of in the future course of his life.’

It having been a dispute among the learned world, whether a public or a private education is to be preferred, it may be necessary to observe, that, according to the proposed institution, the end of both may be effectually answered at the same time: and that not only in regard to the point of mercantile accomplishment, but in regard also to the morals of young people; for such should be the discipline established for the conduct of this design, that every moment of time might be properly regulated, even that portion allotted for diversions, in order to render them innocent, at the same time that they are manly, pleasurable, and healthful.

Some of the wisest men in all ages have been of opinion, that there is no one living to whom nature has not given a capacity to understand some one science, or to be better formed to excel in one employment or profession, rather than in another. Many there are, who, to no purpose, applying to one branch of knowledge or business, have made very great proficiency by being turned to a different.

As many, we presume, are bred to merchandizing, or, as a learned divine expresses himself upon a similar occasion, have run their heads against a counting-house, who might have done their country notable service at a plough tail, the proposed institution will serve as a proper place of trial, in order early to discover whether a youth has, or has not, a suitable capacity for the merchant. This will be easily discernable in two years time, at furthest; and if he does not happen to be well turned for that employment, it will not be too late for a parent to think of some other, more agreeable to his son’s natural genius and capacity: for, however common it may be, it is never the less ridiculous, instead of adapting the studies or profession of a youth to his genius, to act the reverse, by adapting his genius to his studies or profession. To this it may be imputed, that many formed by nature to shine in some principal post, to be the envy of foreign nations, and admiration of posterity, and the honour and ornament of the age in which they lived, have been utterly lost to themselves and their country.

And so easy, familiar, and engaging, ought the manner of exercising, and reducing to practice every branch of the plan, that it will be scarce possible for a young person to have any latent abilities for a merchant, and those not to appear in the most conspicuous manner. So that our institution, considered in this light also, cannot but prove of great public utility, it having as happy a tendency to the saving estates, in private families, by keeping those out of trade who are unfit for it, as

to the raising great ones, by throwing others into it with every advantage.

The reason for proposing the regulation as well of the plan of execution as the general one, is, that, in case there should be occasion to call in assistants under the chief professors, the method of execution may, on no account whatever, be deviated from by such assistants; for that would be leaving them to a random way of instruction, without any check or controul, and suffering them to break in upon the several parts of the institution, as regulated for the acquisition of each branch: which would prove detrimental to the order and connection of the whole. Beside, nothing is more common than for inferior assistants, who are capable only to act some under-part, to have different methods of instruction, peculiar to themselves; and as the incapacity, or ill-conduct of those assistants, may make it frequently necessary to change them, was the method of instruction to be changed at the same time, it would eternally bewilder the young students and greatly retard their progress. But, by adhering inviolably to a well-digested plan of execution, as strict an eye will be kept over assistants, that they steadily perform their duty, according to the method prescribed to them, as is over the young people themselves; whereby it will not be in the power either of the one or the other to trifle away their time, and neglect the performance of what is daily expected of both *.

* Le principal est comme l'ame, qui met tout en mouvement, & qui préside à tout. C'est sur lui que roule le soin d'établir le bon ordre, de maintenir la discipline, de veiller en général sur les études & sur les mœurs. Rollin des Belles Lettres.

By this steady and uniform discipline in executing the whole, what may appear very difficult, and even impracticable to some, will be found quite otherwise to those who have a just idea of the happy and extraordinary effects of order and regularity; for those effectually preserve what the contrary absolutely destroy.

Merchants coming so early in life into the business of the world, have not time for the attainment of what is called a learned education. It is, therefore, our plan is so devised, as, in a great measure, to supply that deficiency. And what the intelligent reader will observe to be peculiar to it is, without young people who are intended for business running the hazard of being captivated with such refined and scholastic speculations as might not only prove detrimental, but absolutely ruinous to their way of life.

Nor is it less observable, that the utility of this institution does not altogether consist in the proper choice of matter, but in the manner of communication; the method of conducting the whole being such as will infensibly engage young minds in the habit of close thinking, steadiness, and attention, as well as inspire them with ambition to excel in their peculiar province. These are qualifications that cannot be set at too high a rate; for, while young people's minds are thus emulously engaged, their morals will be more effectually preserved, than by all other measures, perhaps, that could be taken for that purpose.

The time proposed for the continuance of these young gentlemen in the college, is from 15 to 19 years of age; in which they will be qualified to enter into any counting-house whatsoever, of the most extensive and universal trade; and there can be no doubt but their superior qualifications will prove an agreeable recommendation to the more skilful and ingenious merchants, though they may be quite otherwise to those of the opposite turn. Such a fund of pertinent knowledge will our young merchant be furnished with, and so expert will he be in every part of the business of the practical counting-house, that he cannot fail to form a right judgment of every thing he sees transacted during the time of his clerkship; nor will it be in the power of the ignorant or the artful, in any respect whatever, to perplex or misguide him. From having also such principles inculcated in his youth as serve to raise an emulation, excite industry, and fix the attention to business, no advantages will escape his notice, through negligence or want of discernment. On the contrary, he will be able to break through all obstacles to his advancement, and not only to make the most of every fortunate occurrence that falls in his way, but, if such are wanting, even to frame beneficial occasions for himself.

It may be reasonably enough presumed, that many who are already engaged; will regret their not being bred according to the proposed establishment. Such, however, may receive no little advantage, even by the perusal of these papers; at which we shall heartily rejoice. And if any of those gentlemen, after the expiration of their ordinary clerkships, should be inclined to think they might reap any benefit by this institution, they should be admitted, and treated in the most gentleman-like manner.

It is far from being the least disreputation to any gentleman to be instructed in what so nearly concerns his interest, and whereon the whole happiness of his life depends; especially so when he has never had proper opportunities of being suitably instructed before: but it is a very deplorable situation, for the young merchant to be liable to be daily over-reached

and outwitted, if not absolutely ruined, by correspondents more knowing than himself in the arts of negotiating business. It is most certainly, therefore, far more advisable for such, after the completion of their ordinary clerkship, to wait a year or two, if needful, for thorough qualification, before they rashly hazard their fortune. It may possibly too be as requisite for many to unlearn some things, as to acquire others before they turn self-adventurers. Young people, eager and ambitious to make a figure in trade for themselves, may think it lost time to wait at all for their due accomplishment. This is a great mistake. Let them consider, that, to save and improve their fortunes is gaining time, but to lose them quite otherwise.

ADVERTISEMENT.

If the public should judge it necessary to introduce any other kind of accomplishment into a college of this nature, that may be easily done, provided any thing of this kind should take place: I have only intimated those qualifications that are indispensably necessary.

That the public may be apprized for whom this institution is designed, it is proper to inform them, that it is calculated chiefly for the following classes of gentlemen.

1. For the sons of merchants designed for trade, whom their parents would chuse to have brought up according to the proposed plan; their own counting-houses not admitting of their being bred in so methodical and scientific a manner.
2. For others, intended for any particular branch of merchandizing whatever; as that of a Portugal, Spanish, Russian, Hamburgh merchant, &c. &c. who, after having been four years under this institution, will be qualified to enter, either at home or abroad, into any of those respective counting-houses, with all desirable benefit and advantage.
3. For such gentlemen who, having passed the usual time of their clerkship, think they may reap any advantage from this institution.
4. For the sons of American planters.
5. For the sons of such wholesale dealers whose engagements in trade, both at home and abroad, are often as extensive as those of very eminent merchants.
6. For gentlemen of maturity, who are possessed of handsome fortunes, and would gladly engage in trade as merchants for themselves, or in conjunction with others, could they be expeditiously accomplished in a genteel manner.
7. For such gentlemen who may have expectation of consulships, &c. wherein a knowledge in the practical arts, customs, and usages of merchants, is absolutely necessary.
8. For those gentlemen who have views of being settled in any of the chief branches of the public revenue, or for such who would be accomplished to superintend business they may think proper to carry on, by the means of clerks or agents, wherein a complete knowledge of figures and accountanthip is requisite.
9. For gentlemen who may chuse to carry on foreign trade, by being their own supercargoes, or for such who are intended for supercargoeships belonging to any of the capital trading companies.
10. For such young gentlemen of fortune, who may be expected hereafter to take a share in the government and direction of any of the great trading or monied corporations.
11. For young gentlemen intended to be called to the bar, to whom a knowledge in the practical mercantile arts and accountanthip may prove beneficial, in order to enable them the better to unravel such complicated cases in mercantile accounts, as may come before them in their pleadings, relating either to the foreign or domestic transactions of merchants *.

And

* Litigations among traders making so large a share in the business of the bar, a student of the law cannot have too minute and comprehensive a knowledge of the practical arts of merchants, as they relate both to their foreign and domestic negotiations.

To set this matter in it's proper light would require a distinct tract. As these learned gentlemen, however, are so thoroughly sensible of this, we shall only observe, what a celebrated lawyer, who had entered deeply into the study of practical trade, says upon the subject of the exchanges; which will be found to hold good also, in regard to other the principal parts of mercantile transactions.

After having recounted the names of many of his profession, eminent for their abilities, who have written on the exchanges; and having shewn the great importance of the subject: this writer speaks in the following manner:

' This subject of the exchanges contains many very knotty points, and is held among all the lawyers to be dark, difficult and intricate.

' 1. Because the method of exchanging, now in use, differs widely from the ancient practice.

' 2. Because controversies relating to exchanges are not so common as others, and therefore less understood.

' 3. Because of the concise abstruse terms, in which exchange-contracts are expressed, and which lawyers are quite strangers to.

' 4. Because of the daily new inventions, by which the matter has been rendered so intricate, that, besides the negotiators themselves, there are very few, even among

the

the men of literature, who understand it. And merchants have struck out so many arts in the negotiation of exchanges, that they exceed the keenness of most wits, that attempt to determine the controversies relating to them: and, indeed, the difficulties attending them are to be resolved only into the depth of mercantile skill and subtilty: so that it is no wonder, that Navar, in his tract of usury, a man of great learning, and especially conversant in subjects of this kind, confesses to have learnt the whole praxis of exchanges, of which he there treats, from the capital merchants of his city. Those who take depositions in cases of this kind, continue the same author, are often perplexed and confounded: wherefore persons, profoundly skilled in the practical arts of the exchanges, should be appointed to hear evidence on these occasions. Lawyers are, for the general part, wanting in the first rudiments and principles of these negotiations; and are at a loss to ascertain facts, from whence judgment should proceed. Intent on loosing the knot, whose texture they are unacquainted with, the more they labour, the firmer the tie. Since, therefore, they are so ignorant of the usages and customs which relate to merchandizing, wherein merchants themselves only are perfectly skilled, it is not to be admired, that traders in general, as I have heard many of them declare, had rather trust to their own judgment, than rest on the opinions of the ablest lawyers. Sigismundi Scaeciae Tractatus de Commerciis & Cambiis.

12. Lastly, For any young gentlemen of honour and fortune, to whom a practical knowledge of figures and mercantile accountship may be of use, as well in their private affairs * as those which concern them in a public capacity †: as also to give them a true idea of the art of merchandizing, in order the more familiarly to initiate them into the studies of the national commerce in general. Likewise to initiate young persons of quality into a well-grounded knowledge in the PUBLIC REVENUE, the TARIFFS in relation to merchandizes in foreign nations, and TREATIES of COMMERCE, subsisting between the several states of Europe; for all these might be regularly taught in this college.

* Merchants accounts, says Mr. Locke, though a science not likely to help a gentleman to get an estate, yet possibly there is not any thing of more use and efficacy to make him preserve the estate he has. It is seldom observed, that he who keeps an account of his income and expences, and thereby has constantly under view the course of his domestic affairs, lets them run to ruin: and I doubt not but many a man gets behind hand before he is aware, or runs farther on, when he is once in, for want of this care, or the skill to do it. I would therefore advise all gentlemen to learn perfectly merchants accounts, and not to think it a skill that belongs not to them, because it has received it's name, and has been chiefly practised by men of traffic.

† Besides, such is the excellency of this art, that whoever is fundamentally grounded in it's rationale, will as familiarly apply it to the accounts of the nation, as to his own personal affairs. None who are thoroughly acquainted with the extensive application of this method of account keeping, will think this is saying too much of it. See the article NATIONAL ACCOUNTS. Of what benefit this may prove to the nation, and how useful and honourable to themselves in a public capacity, need not be said.

Of the dignity of the MERCHANT, and the consequences of this institution to the PUBLIC.

The mercantile station, it is certain, affords as large a prospect for opulent acquisitions as any other; and estates got by trade have, perhaps, been far more numerous, than those by any other way whatsoever. [See the article COMMERCE.] As the relation also merchants stand in to the community, is not inferior to most in point of importance, so neither have they been behind-hand with any, in their zealous attachment to the interest of those countries and princes, that have duly protected and encouraged them in their commerce. History furnishes remarkable instances of this. At present we shall take notice of a few only, which are sufficient to endear the character of a merchant to every nation, that depends upon foreign trade for it's support.

Charles the Vth, emperor of Germany, being reduced to great distress by the unhappy expedition of Tunis, experienced a powerful success in money from the Fuggers, a single family of merchants only, but at that time the most opulent and distinguished traders of Aurbourgh. For the security and repayment of those large sums, wherewith they had supplied the government, his imperial majesty gave them written obligations, under his royal hand and seal.

To give a demonstration of their zeal to the interest of their country, and their inviolable attachment to the person of his majesty, those merchants requested the emperor, as he was one day taking an airing by their house, to do them the honour to regale himself, to which his majesty readily condescended. After the collation was over, those merchants desired permission of the emperor to burn a faggot of cinnamon in the hall, where the entertainment was made, not only with intent to administer all they could to his majesty's delight, but to give further proof of their hearty affection to

his person and government. Which they did, by bundling up those bonds of security they had taken for their money with the faggot, and set fire to them before the emperor's face. Another instance not less remarkable, is that of the memorable James Cœur, a merchant of Bourges. This gentleman alone, by the wisdom of his counsels and the certainty of his cash, humbled the house of Burgundy, secured the crown of France to the lawful heir Charles the VIth, and by him to the branches of Valois and Bourbon, who succeeded.

The conduct of the merchants of St. Malo is another example worthy attention. Those gentlemen being highly exasperated by the demand made at the congress of Gertruydenburgh to Lewis XIV. of employing his troops to compel his grandson Philip V. then king of Spain, to abandon the crown, united all their profits together, which they had made by trade in the Spanish colonies in America, and generously laid thirty-two millions in gold at the foot of the throne; and that at a time too, when the finances of France were totally exhausted, by a series of unsuccessful events: which succour, being timely applied, vigorously renewed the war, and answered the end of that nation.

Sir Thomas Gresham, our own countrymen, the founder of a college in London, for the promotion of the liberal arts, and of the Royal Exchange for the convenience of the traders of this metropolis, is another instance well deserving our notice, as it manifests how far it is in the power of merchants, even of one private merchant, to support governments under the greatest emergency.

This worthy citizen of London lived in the time of king Edward the VIth, who was considerably indebted to the merchants of Antwerp, for money borrowed at interest to supply the exigencies of the state. Payment of interest at that time being a great incumbrance to the nation, various expedients had been consulted by the king and his council, to discharge those debts; which, being due to foreigners, brought great contempt upon the crown, and the public credit of England. The measures which had been suggested for repayment, were, either to transport so much treasure out of the realm, or to remit the same by way of exchange.

The kingdom being already greatly exhausted of its gold and silver, the former was impracticable, without being ruinous to trade; and, the exchange between England and Antwerp being at no more than sixteen schillings per pound of our currency, negotiating the debt by foreign bills would have sunk the exchange still more to our disadvantage. By which means the exportation of our gold and silver in the way of trade, would have been more and more augmented. Yet for the nation to continue in debt, was still increasing the evil; more especially so, as the creditors were foreigners, and the interest sent out of the kingdom. Beside, the creditors insisted on their money, or a compliance with such usurious measures, for a prolongation of time, as would have brought such high indignity upon the nation, as to have disabled them from borrowing more money, but upon the most scandalous terms.

And yet, more money the government wanted, instead of being in a capacity to discharge the old debts. Under these circumstances the nation was greatly perplexed, and no measures could be thought of to extricate the kingdom from these embarrassments, till Sir Thomas undertook the affair. By whose great knowledge in trade and skill in the exchanges, he exonerated the nation from it's weighty incumbrances, without sending any money out of the kingdom.

And, although the exchange was then at sixteen schillings, he so wisely managed this negotiation, that he paid off the king's debts as they fell due, at an exchange of twenty and twenty-two schillings per pound. Whereby the king saved no less than an hundred thousand marks clear, by this great merchant's knowledge in the exchanges.

By thus raising the exchange also so much in favour of England, at that critical conjuncture, the price of all foreign commodities fell proportionably *. Which saved the kingdom in general, and that, in a very little time, no less than between three and four hundred thousand pounds sterling more: a round sum even at this time of day, but would now be near four times that sum, in proportion to the different values of money.

* Whoever desires to know the state of our foreign trade, or our situation as to transactions in money with other countries, unless where subsidies are paid to princes a-broad, armies or fleets maintained, or the dividends or state of our stocks belonging to foreigners, may have influence: unless in these cases, the course of exchange indicates the state of our commerce, as truly as the pulse does that of the human body. Sir Isaac Newton's Tables of the Affairs of foreign Coins. See the articles COIN, BALANCE of TRADE, EXCHANGE.

When exchange is against a nation, the goods exported from that nation are sold for so much less, and goods imported from the other so much dearer as the exchange is above the par; so that the exchange, being once against a nation, contributes to keep itself so. The exchange with Holland being

ing generally against England, in time of peace as well as war, affects this kingdom more than, perhaps, has been so thoroughly weighed and considered, as could be desired; for as Amsterdam is made the center of commercial correspondence between the several parts of Europe, the rate of exchange between us and Holland, must proportionably affect that between us and other countries with which we have dealings; more especially with those we negotiate bills with always through the medium of Holland. See the article HOLLAND.

Nor did the advantages to the nation from the eminent skill of this great English merchant, terminate here only. For, as, when the exchange was so greatly to the disadvantage of England, gold and silver were daily exported out of the kingdom in great plenty; so by wisely raising it, in the course of his money negotiations for the service of the state, he caused the same to be brought back again, to the general emolument of the whole trading interest.

Nor did the wisdom of Sir Thomas's counsels prove only of the highest honour and advantage to king Edward's reign, but to those of his successors, queen Mary and queen Elizabeth; both of these princesses having made choice of him for the management of their money, and their mercantile affairs. With queen Elizabeth he was in so high esteem, that she not only knighted him, a matter of very high dignity in those days, but honoured him in every respect; and came in person to the Exchange, which he had erected for the convenience of the merchants and honour of the city of London, and caused the same to be proclaimed by heralds and a trumpet, the ROYAL EXCHANGE: and Sir Thomas was afterwards honoured with the appellation of the ROYAL MERCHANT.

Thomas Sutton, Esq; another renowned English merchant, and founder of the Charter-House in London, an act of benevolence worthy of a great prince, a few years after the death of Sir Thomas Gresham, by being the grand-instrument of getting the Spanish bills protested at Genoa, in 1587, retarded, for a whole year, the sailing of the Spanish armada, designed to enslave these kingdoms, which proved the happy means of defeating the invasion.

These are some of the memorable feats performed by merchants, by private merchants only; and these, without particularizing more, are sufficient to evince the truth of what has been suggested to their eternal honour. And, although, great statesmen, admirals, and generals, with the aid of the public purse, and their thousands and their ten thousands to co-operate with them, may perform great achievements; yet we find that one family of merchants has been the support of an emperor in great distress; that another single merchant alone gave the crown to the house of Bourbon; that one was a principal cause of defeating the Spanish armada, and another the restorer of the public credit of England, and the honour of the crown, when in great contempt amongst all the princes of Europe: and may be truly said, in concert with that able minister Walsingham, to have laid the foundation of all the commerce and navigation we enjoy at present.

But it is not needful to go far back for instances of the eminent services that merchants have manifested to the British empire in particular; it is recent in every one's memory, that, in the late unnatural rebellion, the support of the public credit, and, in consequence thereof, the security of the establishment of the present most august, and illustrious royal family upon the throne of these kingdoms, was owing to that glorious and ever-memorable allocation of the merchants and traders of the loyal city of London.

The merit of persons of distinguished character in trade cannot, in the general, be measured, but by those who are well acquainted with their trading negotiations. As they pass through life without much éclat, the world is little acquainted with their important services and utility to the state; whilst the histories of men in great public capacities are transmitted to posterity with all the pomp and magnificence of representation. Yet certainly that is the more profitable admonition, which is drawn from the eminent virtues of men, who move in a sphere nearer levelled to the common reach, than that which is derived from the splendid portrait of the victories and transactions of great statesmen and commanders; which serve but for the imitation of few, and make rather for the ostentation, than the true instruction of human life. It is from the practice and example of persons of private condition, that we are more naturally taught to excel in our private capacities: and, had we the genuine histories of many eminent merchants, giving a lively idea of their rise and progress in business, and of the important service they have been to their respective communities, they would naturally incite the trading part of this nation to emulate their accomplishments: and this would prove a more effectual means to produce a race of skilful British traders, than romantic narratives a race of heroes.

Nor has the security of states and empires been only owing to the occasional zealous exertion of the wisdom and the power of merchants, but they are in a great measure the daily and perpetual support of all trading countries, For,

VOL. II.

as nations are at present circumstanced, those which are so situate, as to be obliged to subsist chiefly within themselves, and without any intercourse of commerce with others, can never be able to maintain so great a share of power, as those which carry on an extended foreign traffic. Domestic trade, only shifting property from hand to hand, cannot increase the riches and power of a nation; whilst foreign trade, under wise laws and regulations, bringing in a constant balance of treasure in favour of a nation, will proportionably augment its weight of interest, and at length give it the balance of power.

Great-Britain being encompassed with powerful nations, who are earnestly bent on cultivating the arts of commerce and navigation, with the utmost stretch of their address and policy; must she not soon become a sacrifice to those neighbouring potentates, if destitute of a race of ingenious and well accomplished merchants? For, as these are the only source of our maritime strength, she could not long continue, but by their means, that happy independent empire she is at present.

The philosopher may arrive to a high pitch of improvement in agriculture, arts, and sciences; the husbandman, the artisan, and manufacturer, may reduce this speculative knowledge to practical uses, with the greatest skill and dexterity on their parts; governments may enact the wisest laws, and give all desirable encouragement for the advancement of commerce, yet what will these avail, without the penetration and sagacity of the merchant, to propagate the produce of our lands, and the labour of our artists and manufacturers into foreign countries, with advantage to the state as well as to himself?

‘It is foreign trade, says a great lawyer*, that is the main sheet anchor of us islanders; without which the genius of all our useful studies, and the which renders men famous and renowned, would make them useless and insignificant to the public. When man has fathomed the bottom of all knowledge, what is it if not reduced to practice, other than empty notion? If the inhabitants of this island were learned in all the languages between the rising and setting of the sun, did know and understand the situation of all places, ports, and countries, and the nature of all merchandize and commodities, were acquainted with the order and motion of all the stars, knew how to take the latitude and longitude, and were perfectly read in the art of navigation, to what purpose would all be, if there were no foreign trade? We should have no ships to navigate to those countries, nor occasion to make use of those languages, nor to make use of those commodities; what would this island be but a place of confinement to the inhabitants, who, without it, could be but a kind of hermits, as being separated from the rest of the world: it is foreign trade that renders us rich, honourable, and great; that gives us a name and esteem in the world; that makes us masters of the treasures of other nations and countries, and begets and maintains our ships and seamen, the walls and bulwarks of our country; and, were it not for foreign trade, what would become of the revenue for customs, and what would the rents of our lands be? The customs would totally fail, and our gentlemen's rents of thousands per annum would dwindle into hundreds.’

* Molloy De Jure Maritimo & Navali.

† Every step that is made in the progress of knowledge, whether it proceed from reading, observation, or experience, ought to be applied to the affairs and transactions of life; for this is, in truth, the only proper use of all kinds of study; which, without it becomes not only an useless, but a troublesome sort of pedantry, more calculated to interrupt and confound, than to serve and promote a true genius. Essay on the Education of a Nobleman, printed 1736.

Since then it is so unexceptionably apparent, that foreign traffic is our grand preservative both by sea and land, and since, as lord chancellor Bacon justly observes, MERCHANTS AND TRADERS ARE IN A STATE, WHAT THE BLOOD IS TO THE BODY, the abilities and ingenuity of this part of the community is most certainly of the last importance to the whole British empire.

From these considerations there naturally arises the idea of dignity, as inseparably annexed to the character of the merchant; he being a principal party in the security and preservation, as well as in the constant support of the kingdom: and from hence we may presume it is, that family alliances have been so frequently contracted between the gentry and the trading part of the nation. [See the article COMMERCE.]

‘Nor, says the learned bishop Sprat, ought our gentry to be averse from the promoting of trade, out of any little jealousy, that thereby they shall debase themselves, and corrupt their blood; for they are to know, that traffic and commerce have given mankind a higher degree than any title of nobility, even that of civility and humanity itself. And at this time, especially above all others, they have no reason to despise trade as below them, when it has so great an influence on the very government of the world*.’

There

There are but few who are capable of distinguishing themselves in any eminent degree, in the grand leading debates of senates; much fewer of conducting fleets, armies, or the councils of princes. The talents of a Burleigh or a Colbert are very rare indeed, so are those of a Blake or a Marlborough. But every tolerable capacity may make a pretty good figure in trade, by being bred with the advantages of the proposed institution. And as amongst these there will be, doubtless, different degrees of capacities, as well as of assiduity and application, the young person who shall happily have an extraordinary turn for mercantile acquirements, may become a Gresham, a Barnard, a Gore, Vanneck, &c. whilst the same genius in the army, the navy, or any branch of the civil government, might have lived and died, perhaps, in obscurity.

As in these several capacities there is but one path to greatness, and few amongst a numerous gentry have opportunity or abilities to become eminent therein, many of the younger branches of our best families pass their days in an inglorious ease, quite lost to themselves, as well as the public: whereas, if they turned their eyes to commerce, it would furnish them with a thousand means, whereby they might promote themselves, and reflect a lustre on their ancient stock.

Merchants, it is true, have no exemption from those casualties, to which the whole human species is liable; yet, in the way of trade, these are often balanced by prosperous contingencies. When it happens otherwise, the really unfortunate scarce ever want succour in distress. Even when misfortunes have proceeded from unhappy mistakes in point of conduct, yet, where neither integrity and skill have been wanting, such rarely fail to rise again, in some reputable channel of business or other, dependent on merchants; of which there are numberless instances. For it is no undeserving encomium on the trading class of the community, to say of them, that no persons, under the heavens, shew greater humanity and generosity, towards an unfortunate yet upright fellow-trader: which consideration is no small inducement for the younger branches of our most honourable families to engage in commerce.

Moreover, when it so falls out, that any of our noble and honourable families enjoy a numerous progeny, and the patrimonial estate is greatly diminished by fortunes to the younger, wherein lies the indignity for the elder to be privately interested with a younger brother of abilities bred to merchandizing? Might not such measures contribute to free the family inheritance from too weighty incumbrances? If the fortune of the younger does not happen to be competent, wherewith to carry on that compass of lucrative commerce that presents itself, an additional capital will enable him to do it: and the elder, having a proportion of the profits for the hazards he runs, will afford him better interest for money than he can otherwise make at present. It is the constant practice in Holland and Italy, for those of the highest honour to be interested in this manner with merchants of eminence; and in France this practice has been thought so beneficial to the state, that it has been encouraged and enforced by several royal edicts*. And, perhaps, this has not been a stroke of policy the least refined for the advancement of the trade and navigation of that kingdom; such measures frequently supplying private traders with as large capitals in trade as they can employ therein, and those upon terms quite easy and agreeable. Engagements of this nature are called by the French Societez en commandites†. See the article ANONYMOUS.

* This edict is so remarkable as to deserve notice.

EDIT DU ROY,

Portant que les nobles pourront faire le commerce de mer, sans déroger à la noblesse. Donné à S. Germain en Laye, au mois d'Aoust 1669.

LOUIS par la grace de Dieu, roy de France & de Navarre: A tous presens & à venir, salut; Comme le commerce & particulièrement celui qui se fait par mer, est la source féconde, qui apporte l'abondance dans les états, & la répand sur les sujets à proportion de leur industrie, & de leur travail, & qu'il n'y a point de moyen pour acquérir du bien, qui soit plus innocent, & plus légitime: aussi a-t-il toujours été en grande considération parmi les nations les mieux polies, & universellement bien reçu, comme des plus honnêtes occupations de la vie civile, &c. &c. A ces causes, désirant ne rien omettre de ce qui peut d'avantage exciter nos sujets à s'engager dans le commerce, & le rendre plus florissant, & de notre grace spéciale, pleine puissance & autorité royale, nous avons dit, & déclaré, & par ces présentes signées de notre main, donnons, & déclarons, voulons & nous plait, que tous gentils-hommes puisant par eux ou par personnes interposées, entrer en société, & prendre part dans les vaisseaux marchands, denrées & marchandises d'iceux sans que pour raison de ce, ils soient censés & réputés déroger à noblesse, pourvu toutefois qu'ils ne vendent point en détail, &c. &c.

Signé LOUIS, & sur le reply par le roy, COLBERT.

This was strongly enforced again by another edict in December 1701, which is called Edit du roy, qui permet aux nobles, excepté ceux qui sont revêtus de charges de magi-

strature, de faire commerce en gros, & qui declare que les sont les marchands & les negocians en gros.

† Celui qui voudra faire société en commandite, doit jeter les yeux sur un marchand qui soit homme de bien, & capable des manufactures, ou du commerce qu'il veut entreprendre; car ce n'est sur sa fidélité, & son industrie qu'il doit fonder l'espérance qu'il a de profiter en lui conçant son argent, &c. Parfait Negociant, Savary.

Persons of low grovelling minds, and little industry themselves, are often strangely chagrined and irritated against those who attempt any thing new in the public service, though high commendable in itself, and the very attempt highly meritorious. With such fordid and pitiful spirits, the shadow of novelty, in any undertaking, is condemnation sufficient. As such deserve rather pity or contempt, we shall only comfort them with what that wise and public-spirited prelate, bishop Sprat*, has again observed; who, speaking of the first establishment of the Royal Society of London, says, 'That, if all things which are new be destructive, all the several means and degrees by which mankind has risen to the perfection of arts were to be condemned. If so, to be the author of new things, be a crime, how will the first civilizers of men and makers of laws, and founders of governments escape? Whatever now delights us in the works of nature, that excels the rudeness of the first creation, is new. Whatever we see in cities or houses above the first wildness of fields, and meanness of cottages, and nakedness of men, had it's time, when this imputation of novelty might as well have been laid to its charge. It is not therefore an offence to profess the introduction of new things, unless that which is introduced prove pernicious in itself, or cannot be brought in without the extirpation of others which are better.'

* Vide History of the Royal Society.

As nothing of this kind can be alleged against the present institution, it's novelty, with the judicious part of mankind, will render it the more praise-worthy; it requiring greater industry, and different talents to strike out new paths to knowledge, rather than supinely to plod on in the old, when much better can be found.

And, as there appears to be a glorious spirit in the legislature to promote the trade of the kingdom to the utmost; as his majesty himself has, by his royal speech from the throne, expressed his earnest recommendation of, and his hearty concurrence* with, every wise measure to advance the national commerce; we may reasonably hope, this our humble attempt will meet with the approbation of all true friends to our trading interest.

* 'Let me earnestly recommend to you the advancement of our commerce, and cultivating the arts of peace, in which you may depend on my hearty concurrence and encouragement.' His Majesty's Speech, Nov. 29, 1748.

It is no great honour to the British nation, that there should be a necessity for the younger sons of our nobility and gentry to be sent to Holland and elsewhere out of the kingdom, for mercantile qualifications. But, when we have an institution within ourselves far superior to any in other countries, it will be as little credit as advantage to British youth, to go abroad for what they can have much better at home.

And, if a young gentleman is intended to settle in a counting-house abroad, or to travel before he enters into trade for himself, his having spent a few years under this institution, will far better capacitate him to reap proper advantage by either, than the crude, immethodical, and narrow way can, in which the generality are bred at present.

It is easy enough to hit blots, and to point out evils highly detrimental to the community. The many wise may discern the grievance and lament it, but the remedy generally lies deep, and in the hands of few; and to those few is the world indebted, for the execution of all designs of public utility and happiness. Whether such is not the nature of the present, is submitted to those who are judges of it's merit and tendency.

Before I draw to the conclusion, I would desire the reader will please to suppose the following plain case, viz. that two young persons, of equal age and abilities, are placed in the respecting counting-houses of their own fathers, who are merchants inferior to none for eminence, skill, and ingenuity in their profession, and both equally solicitous that their sons should become so likewise: let it be further supposed, that the one of those young persons is bred, previously to his being taken into business under his father, a few years under the proposed institution, at the age proposed, and the other not, but is turned into his father's counting-house as raw and as ignorant as the generality really are; I would appeal to every man of sense and impartiality, who is a judge of the usefulness of our plan, and capable of setting a due value upon a proper mercantile qualification, which of those young people is likely to become the best accomplished merchant, and to be the most prosperous in his employment?

Could the experiment be fairly tried, is there not all imaginable reason to believe, that the one would be better qualified

for business, by being a single year afterwards only in his father's counting-house, than the other would in three, or perhaps in five years? The one would be capable of making a good judgment of all he saw transacted without any instruction, and thereby might naturally delight in business; while the other, for want of the like foundation, might never understand his business as he ought, and therefore take an invincible dislike to it; whereby, instead of becoming the complete merchant desired, he might, on the contrary, become only an eternal disquietude to the best of parents.

If this is not unlikely to prove the case, when a young person is bred, even under the eye of an own father, anxious for his son's welfare, what may we presume to be the consequence, when he has not the like happy opportunity of being trained up under a parent? When this is the case, is it not the most advisable for such a young gentleman to lay the best foundation he can, before he enters into any merchant's counting-house whatever? For, if he falls into the hands of a man of honour and skill, of one who does not intend only to take his money, but do him justice, will not a young person so previously accomplished, as we propose, be infinitely more capable of reaping the benefit of his situation, than one destitute of those advantages?

But if, on the other hand, a young person is not so happy as to fall into such a merchant's counting-house, is it not highly prudential, that he should be secure of a good foundation before-hand, in order to make the best advantage under the worst situation?

The reader will please to observe, that this institution is intended to train up the young merchant from 15 to 19 years of age, in order the better to prepare him than he is, by being bred in the ordinary way, for admission into any merchant's practical counting-house; wherein, if we suppose him placed for three or four years more, he may be then sufficiently accomplished to hazard his estate in trade, and not before. But,

That experienced merchant Sir Francis Brewster, who lived in the reign of king William the Third, has proposed a different way of breeding up young merchants of condition and fortune to practical commerce; which, as it seems to coincide in some respect, with our proposed institution of a mercantile college, the reader may not be displeased with that merchant's sentiments: and, indeed, if our young merchant was first regularly trained up in the literary mercantile college we would establish, his entrance into Sir Francis's college, if well regulated for the purpose, might, perhaps, as well, if not better qualify him for practical trade, than the ordinary way of going apprentice generally does.

"I think it a mortal distemper, says Sir Francis, in trade (nor to be cured, because in the first concoction) that we have so few men of university learning conversant in true mercantile employments: if there were as much care to have men of the best heads and education in it, as there is in the law, the nation would fetch more from abroad, and spend less in law-suits at home. We have it reckoned up by the infallible author, as the glory of a city, That her merchants were princes and nobles; their business and transactions in the world with such, is more than belongs to any other sort of men: would it not then be the honour of a nation, as well as profit, to have men of the best sense and learning in the foreign negociate of a kingdom? If such had been in the trade of these kingdoms, it seems reasonable to believe, we had not lost the most considerable navigating trade and employment of our seamen.

It would be an astonishing observation to men of any country but our own, to see more heads employed in Westminster-Hall to divide the gain of the nation, than there are heads on the Exchange to gather it together. I have sometimes thought, that, if these kingdoms lay not under the confusion and unintelligibility of understanding in trade, as the builders of Babel did in languages, we might, without the sin of those arrogant architects, erect such towers in trade, as might overtop the universe in that mystery.

We see how all arts and sciences have been improved in this kingdom within the compass of one century, but amongst them all the merchant's part the least: and the reason is plain, men of small learning and moderate understanding are generally put in it: for, though there are some excellent parts and clean heads among them, yet the major part are not so polished: I speak not this to abate the respect that I shall always think is due to the profession, and all men in it, but we know it is the vanity of the nation: scarce a tradesman but if he have a son that a country schoolmaster tells him would make a scholar, because he learns his grammar well, but immediately passes the approbation of his kindred, who judge it pity so hopeful a youth should be lost in trade, the university is the only soil fit for him to be planted in.

By such disposition of the youth of our nation, many a good tradesman is lost, and poor scholars in every respect made; and, if this humour prevails in mechanics, and men of ordinary quality, much more, and with better pretensions, it affects our gentry; to be sure the eldest son is above trade, and if the younger be of a quaint and studious temper, they are thought fit for the law, not many for the pulpit, which I confess I likewise think a mistake in our gentry: had we more of

them in the clergy, we should have fewer to despise, that might be better builders of houses than of the church.

But, to return to what I observe of the improvement in all the employments in the kingdom, I see none that have arrived to that vast increase as those in the law: this, perhaps, is accounted an evil, but I will not quarrel with that long robe; I hope it will be no offence to wish them among us, [the merchants] but not with their bar-gowns; they would, in my opinion, look better in a COUNTING-HOUSE than in the TEMPLE; and, had the humour of our ancestors run that way as much as it did for the law, there might have been as great an enlargement in maritime traffic and navigation, as there is now of the laws: I presume none will say, that they began with equal numbers; trade had the primogeniture, and set forth with the employment of the people, before there could be work for lawyers; and I believe those of best value amongst them do not think their growth and gain contribute to either in the advantage of the nation, though without the profession there can be no securing property; but, perhaps, the numbers make more work than there would be if they were less: Hamburg, though a place of great trade, allows but two: and, though our foreign plantations are filled with men of no better principles than they leave behind them, yet they have few among them who raise their fortunes by the law; for which no reason can be given, but that there is not a foundation and nursery for that profession to breed up men of learning and ingenuity in.

I have been the longer on this subject, because there seems to me an expedient in this matter; and that is, to make such provision for noblemen and gentlemen's children, as may be equally reputable with the inns of court, for young gentlemen to come to from the universities, and, with less charge than their expence in seven years studying the law, become expert in trade.

To be thus managed: in each maritime city and considerable port of the kingdom, to have a COLLEGE built, in which there may be some persons of experience in trade, to teach and direct in the mystery of it, to all parts of the world: and, that they may have the practice, as well as theory, that every person entering himself into the society may be obliged to bring in a thousand pounds stock, which will make a capital, perhaps, of 20 or 30,000 l. sterling, to traffic with in 30 cities, &c. in the kingdom: they to be obliged to spend five years in this society, and at the end of that term, to receive the principal they brought, allowing the casualty of profit and loss, as it happens: going thus out, they will be entered in trade, and probably have a fund to begin with; and, by this means, trade will fall into the hands of gentlemen, persons of learning and consideration in the nation, and likewise preserve from misfortunes numbers that now miscarry in their studies of the law, through ill conversation, and having no employments.

To this project (a word now traduced to contempt, though in itself of good signification both for peace and war) I foresee two objections that will be made against it, and they are these:

First, This will make too many merchants.

Secondly, That this will leave no room for younger brothers, that have nothing to prefer them in the world but a small sum to put them apprentice to a merchant, by which they often raise their fortunes in the world.

To the first I answer, That the evil of having too many merchants is in the numbers that are bred up from apprentices, many of which, coming into business without FUNDS, strain their credit, which to keep above water, they are forced to venture at all ways that have but a probability of success, to keep themselves in business, and then, to comply with their credit, often sell to loss, which in the end brings them to misfortune, and that begets an opinion that there are too many traders; whereas the true reason is the want of STOCK, not NUMBER of merchants.

The second objection, That this will hinder merchants from taking apprentices, is in part answered in the first, that their number prejudices trade: but there is a farther consideration in this matter, and that is, two sorts of youths stand candidates for a mercantile education, gentlemen with a capital, others of less quality, with none. I think it will admit of no question which shall be preferred, and that the other may be more profitably employed for the nation and themselves, in trades that require more labour and less stock.

But, after all I have said, my wishes are greater than my expectation, to see trade thus courted in a kingdom that treats it as some do their wives, considering them no farther than to the production of a legitimate posterity, reserving their cares and delights for a mis: so the humour of this age seems to incline, whilst foreign commerce is neglected, and mens thoughts and designs run after offices and employments in the state; to pay which, spider like, the nation spins out her bowels to catch flies; and the simile goes farther, such food turns into poison, where it feeds men faulty in their morals; and such too often supplant better men, or find ways to be preferred before them: to say this will be no offence to deserving men; and, for others, I shall only desire them to suspend their resentments until the second part comes forth, and then

then they will have more reason, because it will come in my way to be more particular, when I come to speak of the trade of Ireland; in which there have of late been such notorious demonstrations how ill men in offices and places of trust may ruin and destroy a kingdom, as admits of no defence. I have for this the authority of both houses of parliament, in their addresses to the king: and the infallible author tells us, That he who saith to the wicked, Thou art righteous, the people will curse, nations shall abhor him.' Sir Francis Brewster's *Essays on Trade and Navigation*, 1695.

And now it may be proper just to review what we may reasonably expect to be the obvious and apparent consequences of this institution to the public, which will be chiefly comprehended under the following particulars, viz.

I. It will raise a noble spirit of emulation among our young British merchants to excel each other in the arts of merchandizing; from whence the nation in general, as well as individuals, may reap unspeakably more benefit and advantage by trade and navigation.

II. It will enable our young merchants the better to cope with foreigners, in all the methods of negotiating mercantile business of every kind, which may prevent their being made the dupes of some of those subtle traders who are very artful in drawing young people of good fortunes into schemes of trade, which always prove beneficial to the one, but very often greatly injurious to the other.

III. It will qualify such young people who may be placed at several of the British factories abroad, to promote each other's interest in the way of trade, in a manner not so generally known and understood, as well as the interest of those who shall continue at home.

IV. It will capacitate them so to correspond with foreign nations, as to obtain the most useful kind of intelligence from time to time; whereby they will the better know when and where there is money to be got, by trading between one foreign nation and another, as well as between their own and others.

V. It will qualify them either to be particular or general merchants; or particular ones generally, and general ones occasionally; wherein consists the judgment, in some measure, of the most skilful and vigilant merchant.

VI. It may have a tendency to convince the younger branches of our most honourable families, that the art of merchandizing does not require such mean talents as some of them have been wont to think; but that, on the contrary, there is scope enough to employ the most capacious understanding, and the finest genius: and that foreign trade affords as large a field for profit and honour as any other employment whatever.

VII. It cannot fail to have the happiest tendency to prevent misfortunes and bankruptcies amongst those merchants who shall be thus regularly bred.

VIII. It may give the young merchant so good a knowledge of the fundamental principles and maxims of policy, whereupon the true interest of the national commerce is grounded, as to render them the better capable hereafter to distinguish themselves in the promotion of the same, upon all public occasions and emergencies.

IX. It may prove of benefit and advantage to the lawyer, the gentleman, and nobleman, in the lights wherein represented, to pass a year or two in this college, even after he has left any other university.

REMARKS upon this article of MERCANTILE COLLEGE.

1. The reader will please to observe, by the references we have made throughout this article, that our Dictionary of Commerce is eminently calculated for the accomplishment of the British merchant in whatever we have pointed out as the most essentially necessary for him to be instructed in, and may prove as helpful to the professors in such a college, as to the students themselves.

2. That an institution of this kind will raise the character of the merchant to such a degree of knowledge in this employment, as will render him capable of embracing or striking out every kind of honourable advantage which the nature of his employment will admit of, and thereby put him above the scandalous arts of robbing the public revenue, or breaking to grow rich upon the ruin of his creditors: in brief, a collegial course of erudition will excite the younger branches of the best families in the kingdom, with fortunes suitable, to commence merchants, and, consequently, will tend absolutely to exclude from this respectable profession all low-bred people, destitute of fortune as well as education.

3. That this institution is adapted to form persons of worth and quality in general, for the accomplished men of business * of any kind, the better to enable them to preserve and improve their estates, be they either in land, or in the public funds.

* The lord Verulam touches upon the DOCTRINE OF BUSINESS; which, notwithstanding he has considered it in a light something different to what the judicious reader will observe we mean by it, from the drift of our Dictionary; yet, having so near an affinity with what we aim at, that great man's sentiments may well deserve attention in this respect.

1. We divide the doctrine of business, says lord Bacon, into the doctrine of various occasions, and the doctrine of

rising in life. The first includes all the possible variety of affairs, and is as the amanuensis to common life; but the other collects and suggests such things only as regard the improvement of a man's private fortune; and may, therefore, serve each person as a private register of his affairs.

2. No one hath hitherto treated the doctrine of business suitably to its merit, to the great prejudice of the character both of learning and learned men: for from hence proceeds the mischief which has fixed it as a reproach upon men of letters, that learning and civil prudence are seldom found together. And, if we rightly observe those three kinds of prudence which we lately said belong to civil life, that of conversation is generally despised by men of learning as a servile thing, and an enemy to contemplation; and, for the government of states, though learned men acquit themselves well when advanced to the helm, yet this promotion happens to few of them; but, for the present subject, the prudence of business, upon which our lives principally turn, there are no books extant about it, except a few civil admonitions, collected into a little volume or two, by no means adequate to the copiousness of the subject. But, if books were written upon this subject, as upon others, we doubt not that learned men, furnished with tolerable experience, would far excel the unlearned, furnished with much greater experience, and outshoot them in their own bow (a).

(a) This may be extended to civil knowledge in general, so as to comprehend not only politics, conversation, and business, but also commerce, and the particular arts of agriculture, navigation, architecture, war, trades, &c. for a man of general knowledge, such as the author, or Mr. Boyle, for instance, must needs be more capable of improving any particular arts or sciences than a person wholly bred up to and employed about one business only. Shaw's note.

4. That, although a method of education, accommodated to the man of business in a manner so superior to what is generally given him, may be attended with a greater expence, yet, it is to be hoped, that will never be an objection against its public establishment, it being intended only for such people of condition and fortune who can and will cheerfully afford it.

It is the worse sort of husbandry, says the great Mr. Locke, for a father not even to strain himself a little for a son's education, which, let his condition be what it will, is the best portion he can give him.

He, as the same author continues, that at any rate procures his child a good mind, well principled, tempered to virtue and usefulness, and adorned with civility and good breeding, makes a better purchase for himself than if he had laid out the money for an addition of acres; spare it in toys and play-games, in silks, ribbons, and laces, and other useless expences, as much as you please, but be not sparing in so necessary a part as this. It is not good husbandry to make his fortune rich, and his mind poor; and I have often, with great admiration, seen people lavish it profusely in tricking up their children in fine cloaths, lodging and feeding them sumptuously, allowing them more than enough of useless servants, and yet, at the same time, starve their minds, and not take sufficient care to cover that which is the most shameful nakedness, viz. their natural wrong inclinations and ignorance. This I can look on as no other than a sacrificing to their own vanity, it shewing more their pride than true care of the good of their children: whatsoever you employ to the advantage of your son's mind, will shew your true kindness, though it be to the lessening of your estate. A wife and good man can hardly want either the opinion or reality of being great and happy; but he that is foolish or vicious can be neither great nor happy, whatsoever you leave him. I ask you, whether there be not some men in the world whom you had rather have your son be, with FIVE HUNDRED POUNDS per annum, than some others you know with FIVE THOUSAND?

Of the erecting of the proposed COLLEGE.

Do not the famous universities of this nation demonstrate, that there is no people in the world more liberal in their donations towards the building of colleges for every literary kind of institution? And shall we entertain an opinion that a MERCANTILE COLLEGE will not one day obtain an establishment in this kingdom, which may enable the nation the better to support all others? Shall we be daily very bountiful in our subscriptions towards the erection and support of infirmaries and hospitals, for the maintenance of the poor; and shall we not think of the erection of a college, which will empower individuals the more generously to contribute to the support of such laudable charities? Is there less wisdom in the establishment of a seminary to guard merchants against misfortunes, than to provide a college for them after their ruin? Shall the nation never have another GRESHAM nor a SUTTON? But, if no individual should ever think of an establishment of this kind, what is it that the merchants of this kingdom are not able to do from their own purses? Or, why may not their application to parliament be attended with the desirable success; if the public should be lukewarm to promote this design in another shape? Will it be less honour to the kingdom to build a college for the education of her merchants, than a repository for the productions of nature and arts? Is it not the industry and ingenuity

genny of the merchant that stamp a value upon those productions, and are the great support of all art and science? Is not the merchant daily called upon to take a share in the legislative power, and why shall not such a respectable member of the community be trained up with advantages equal to the other principal classes of people in the state?

MERCHANT-COURT, or COURT-MERCHANT. is a kind of judicatory power invested in merchants, chosen for that purpose in several parts of Europe, in order to decide and determine, in a summary way, all differences and litigations among themselves and their dependants.

Courts of merchants should be erected for the speedy deciding all differences relating to sea affairs, says the judicious Mr. Carey, which are better ended by those who understand them, than they are in Westminster-Hall, where all things are tried by the nice rules of law; and, therefore, after much attendance and expence, are often referred by the judges to such as are conversant in trade. By this means the merchants would soon see short ends to their differences; but no general rules can be given for these courts, which must be settled as they suit the conveniencies of trading cities.

I ask pardon of the learned gentlemen of the long robe, says the remarkable De Foe, if I do them any wrong, having no design to affront them, when I say, that, in matters of debate among merchants, when they come to be argued by lawyers at the bar, they are strangely handled. I myself have heard very famous lawyers make sorry work of a cause between the merchant and his factor; and, when they come to argue about exchanges, discounts, protests, demurrages, charter-parties, freights, port-charges, assurances, barratrics, bottomries, accounts current, accounts in commission, and accounts in company, and the like, the solicitor has not been able to draw a brief, nor the counsel to understand it: never was young parson more put to it to make out his text, when he's got into the pulpit without his notes, than I have seen a counsel at the bar, when he would make out a cause between merchants: and I remember a pretty history of a particular case, by way of instance, when two merchants contending about a long factorage-account, that had all the niceties of merchandizing in it, and labouring on both sides to instruct their counsel, and to put them in when they were out; at last they found them make such ridiculous stuff of it, that they both threw up the cause, and agreed to a reference; which reference, in one week, without any charge, ended all the dispute, which they had spent a great deal of money in before to no purpose.

Nay, the very judges themselves (no reflection upon their learning) have been very much at a loss in giving instructions to a jury, and juries much more to understand them; for, when all is done, juries, which are not always, nor often, indeed, of the wisest men, are, to be sure, ill umpires in causes so nice, that the very lawyer and judge can hardly understand them.

The affairs of merchants are accompanied with such variety of circumstances, such new and unusual contingencies, which change and differ in every age, with a multitude of niceties and punctilio's; and those again altering as the customs and usages of countries and states do alter, that it has been found impracticable to make any laws that could extend to all cases: and our law itself does tacitly acknowledge its own imperfection in this case, by allowing the custom of merchants to pass as a kind of law, in cases of difficulty.

Wherefore it seems to me a most natural proceeding, that such affairs should be heard before and judged by such as, by known experience and long practice in the customs and usages of foreign negoce, are of course the most capable to determine the same.

Besides the reasonableness of the argument, there are some cases in our laws in which it is impossible for a plaintiff to make out his case, or a defendant his plea; as, in particular, when his proofs are beyond seas, for no protests, certifications, or procurations, are allowed in our courts as evidences; and the damages are infinite and irretrievable by any of the proceedings of our laws.

For the answering all these circumstances, a court might be erected by authority of parliament, to be composed of six judges commissioners, who should have power to hear and decide as a court of equity, under the title of A Court-Merchant.

The proceedings of this court should be short, the trials speedy, the fees easy, that every man might have immediate remedy where wrong is done: for, in trials at law about merchants affairs, the circumstances of the case are often such, as the long proceedings of courts of equity are more pernicious than in other cases, because the matters to which they are generally relating, are under greater contingencies than in other cases, as effects in hands abroad, which want orders, ships and seamen lying at demurrage, and in pay, and the like.

These six judges should be chosen of the most eminent merchants of the kingdom, to reside in London, and to have power by commission to summon a council of merchants

VOL. II.

who should decide all cases on the hearing of both parties, with appeal to the said judges.

Also to delegate by commission petty councils of merchants, in the most considerable ports of the kingdom, for the same purpose.

The six judges themselves to be only judges of appeals; all trials to be heard before the council of merchants, by methods and proceedings singular and concise.

The council to be sworn to do justice, and to be chosen annually out of the principal merchants of the city.

The proceedings here should be without delay; the plaintiff to exhibit his grievance by way of brief, and the defendant to give in his answer, and a time of hearing to be appointed immediately.

The defendant, by motion, shall have liberty to put off hearing, upon shewing good cause, not otherwise.

At hearing, every man to argue his own cause, if he pleases, or introduce any person to do it for him.

Attestations and protests from foreign parts, regularly procured, and authentically signified in due form, to pass in evidence; affidavits in due form, likewise attested and done before proper magistrates within the king's dominion, to be allowed as evidence.

The party grieved may appeal to the six judges, before whom they shall plead by counsel, and from their judgment to have no appeal.

By this method, infinite controversies would be avoided, and disputes amicably ended, a multitude of present inconveniencies prevented, and merchandizing matters would in a merchant like manner be decided, by the known customs and methods of trade.—So far De Foe.

Notwithstanding there be in the capital of Spain, says a judicious Spanish author, a board of trade, composed of ministers of great merit, I apprehend it would be good policy to introduce into it a greater number of persons of understanding and skill in commerce, either from their own experience in mercantile affairs, or by being long employed in offices that have a connection with trade, or by having made this important interest their particular study. But, to explain these and other measures tending to make this board more extensively useful, it will be necessary to consider the thing more fully.

In several towns of France, and other kingdoms, there are consuls [see the article CONSULS] or courts made up of private persons, of good understanding, as well for the better conduct and advancement of commerce, as to decide SPEEDILY, and at SMALL CHARGE, all causes and disputes that may arise in business; a custom which it is our interest to imitate in those cities of Spain that have the best disposition for trade (as it has been ordered at Burgos, &c.) but it requires one to enter farther into particulars, in order to lay down such a plan as will secure to the public all those advantages it may receive from thence; and I shall advance no farther at present than to observe, that these courts should have a constant correspondence with the superior board or council of commerce residing in the capital, and to which they ought to be subordinate.

The substance of Sir Josiah Child's opinion in regard to the establishment of a MERCHANT-COURT.

I have conceived great hopes, says he, that this kingdom will at length be blessed with a happy method for the speedy, easy, and cheap deciding of differences between merchants, masters of ships, and seamen, &c. by some court or courts of merchants, like those which are established in most of the great cities and towns in France, Holland, and other places; the want of which in England is, and has ever been, a great bar to the progress and grandeur of the trade of this kingdom.

For instance, if merchants happen to have differences with masters and owners of ships, upon charter-parties, or accounts beyond sea, &c. the suit is commonly first commenced in the admiralty-court, where, after tedious attendance and vast expences, probably just before the cause should come to determination, it is either removed into the delegates, where it may hang in suspense till the plaintiff and defendant have empty purses and grey heads; or else, because most contracts for maritime affairs are made upon the land (and most accidents happen in some rivers or harbours here, or beyond sea, and are not in alto mari) the defendant brings his writ of prohibition, and removes the cause into his majesty's court of King's-Bench; where, after great expences of time and money, it is well if we can make our own counsel, being common lawyers, understand one half of our CASE, we being amongst them as in a foreign country, our language strange to them, and theirs as strange to us. After all, no attestations of foreign notaries, not even public instruments from beyond sea, being evidences at law, and the accounts depending, consisting, perhaps, of an hundred or more several articles, which are as so many issues at law, the cause must come into Chancery, where, after many years tedious travels to Westminster, with black boxes and green bags, when the plaintiff and defendant have tired their bodies, distracted their minds, and consumed their estates, the cause, if ever it be ended, is com-

Q q q monly,

monly, by order of that court, referred to merchants, ending miserably, where it might have had at first a happy issue, if it had begun right.

From whence follow these national inconveniencies:

1. It is a vast expence to the persons concerned.
2. It takes off men from following their callings, to the public loss, as well as the particular damages of the party concerned, that time being lost to the nation which is spent in law-suits.
3. It makes men, after they have once attained indifferent estates, to leave trading, and, for ease, to turn country gentlemen; whereas skilful and experienced men are the only persons that might match other nations in trade.
4. It is, in my opinion, a great cause of the prodigality, idleness, and injustice of many of our masters of ships in England, and, consequently, a wonderful bar to the growth of our English navigation; who knowing that their owners cannot legally eject them, especially if the master have a part of the ship himself: but that remedy to the owners will be worse than the disease, which occasions masters to presume to do those things, and be guilty of such neglects as naturally they would not, if they stood more upon their good behaviour. I could say much more of the damage this nation sustains by the want of a law-merchant; but that is so evident to all men's experience, that I shall not longer insist upon it, but proceed humbly to propose some particulars; which, being duly considered, may peradventure by wiser heads be improved towards the cure of this evil, viz.

1. That it be enacted, That there shall be erected, within the city of London, a standing court-merchant, to consist of twelve able merchants, such as shall be chosen by the liverymen of the said city, in their common hall, at the time, and in the manner herein after limited and appointed.

2. That the said twelve persons so to be elected, or any three or more of them, sitting at the same time and place, and not otherwise, shall be accounted judiciary merchants, and authorized to hear and determine all differences and demands whatsoever, which have arisen, and are not otherwise determined, or may any ways arise between merchants, tradesmen, artificers, masters and owners of ships, seamen, boatmen, and freighters of ships, or any other persons having relation to merchandizing, trade, or shipping, for or concerning any accounts of merchants, freights of ship or goods, bill or bills of exchange, or bills of bottomry, or for work done upon, or materials delivered to the use of any ship, or money due for sale of goods, or any other things relating to trade or shipping.

3. That any three or more of them, as the judges did lately at Clifford's-Inn, may proceed summarily to the hearing and determining of any such differences, and that their sentence shall be final, from which there shall be no appeal or review, otherwise than as is herein after-mentioned, nor any writ of error lie for the removal or reversal of the same.

4. That they, or any three of them, may so issue out summonses for convening all persons before them, as the judges did, &c.

5. That they be a court of record, as the judges were, &c.

6. That they take nothing for their own pains, directly or indirectly, but six-pence each for signing every final order in every cause whereof the value of money to be paid does not exceed 10*l*. and twelve-pence for all causes not exceeding the value of 100*l*. and only two shillings each for all causes exceeding the value of 100*l*.

The said fees to be due and payable only to such and so many of the said judiciary merchants as heard the said causes, and signed the judgments or final decrees.

7. That, for rewards to officers, the judiciary merchants do constitute a table of reasonable fees, to be confirmed by the two lord chief justices, and lord chief baron of the Exchequer.

8. That, in any case determined by a less number than seven of the said judiciary merchants, there may be an appeal to seven or more, as was lately practised in the afore-mentioned judicature.

9. That they may have power to levy execution upon estates real or personal, with such restrictions as the parliament shall please to appoint.

10. That the extent of the jurisdiction of the said court shall be to all places within 10 miles of London, or only to the late lines of communication, as the parliament shall think fit.

11. That the said judiciary merchants and their officers, before they exercise their authority, do take such oaths as the parliament shall please to appoint.

12. That, if any of the judiciary merchants be prosecuted for exercising any of the powers that shall be committed to them, they may plead the general issue, and give the act in evidence for their defence.

13. That no writ or writs of superseas, certiorari, or injunction, out of any of his majesty's courts, shall superseede or stay execution, &c.

14. The act to continue probationarily so long as the parliament shall think fit.

15. That the twelve judiciary merchants shall be chosen yearly, by all the freemen that are liverymen of London, in the Guild-Hall of the said city, or By so many of them as

shall be present at such elections, upon every Monday yearly before the feast of St. Michael, or as the parliament shall appoint, in manner following:

Every liveryman then present to deliver unto any two such aldermen and four commoners as the lord mayor and court of aldermen for the time being shall appoint, to take the view or scrutiny of election, a paper containing the names of such twelve persons as he thinks best to be elected for the purposes aforesaid, setting his the said elector's own name on the back-side of the said paper; and the next Monday after, in the said Guild-Hall, the said two aldermen and four commoners, or as many of them as shall have taken the scrutiny, shall publicly declare unto the lord mayor, aldermen, and commoners then present, who are the twelve persons chosen by the majority of votes, and how many votes each of them had.

16. If it happen that any of the judiciary merchants die before the end of the year, or refuse to undertake the trust, it be lawful for the liverymen to chuse another or others, toties quoties, and the lord mayor be enjoined to summon halls for that purpose.

17. That every year six of the old judiciary merchants go off in course, and be incapable of being re-elected, and six new ones chosen in their stead, viz. all the twelve to be re-chosen, but only six of the old ones, that had the most voices, to hold the next year, although more of them should happen to be elected for the next year.

Objection I. The objections that I can foresee will be made against this constitution are, that it thwarts that most excellent order of our English juries.

Answer I. I answer, That I hope there is no Englishman more in love with juries than myself; but it is evident that the common way of trials does not well reach the variety and strangeness of merchants cases, especially in relation to foreign affairs.

Answer II. What better jury can a merchant hope for, than twelve able and honest merchants, chosen by the collective body of the whole city, and such as shall all of them stand upon their good behaviour, to be turned out with ignominy the next year, if they do not equal right to all men?

Objection II. The admitting of no appeals from a court merchant seems too arbitrary.

I answer; while we chuse our judges ourselves for merchants cases, and may remove them ourselves, in my opinion, they can be no more too arbitrary than too much power can be given to referees, when both parties desire an end of their differences: besides, if their power be not great, the design of cheap, speedy, and short issues, will be lost. But, if it shall please the parliament, there may be in the act an appeal referred to the house of lords; the money condemned to be paid or deposited before the appeal be allowed.

An edict of Henry II. king of France, concerning the
MERCHANT-COURT of the city of Rouen.

The preamble only relating to the establishment of an exchange for the assembling of the merchants, we shall pass that over, and only take notice of what relates to the point under consideration.

And, for the greater ease and advantage of the merchants of our city of Rouen, and being desirous to gratify them in every thing, as far as it is possible, that they may not be distracted, and drawn off from their other business and affairs, by being obliged to give their attendance at sundry courts of judicature, by reason of suits and pleas occasioned by litigations and differences arising among them in their traffic: our will and pleasure is, that the merchants of our said town of Rouen, as well natives as foreigners, frequenting the said place, shall every year cause a society of merchants to meet in the lodge of the said bourse, at what time they think fit; out of which society of merchants they shall chuse three officers, viz. one Prior and Two Consuls, who shall remain in authority one year, at the end of which new ones shall again be chosen, by the plurality of voices: which election and nomination being fully ended, the said prior and consuls shall have present power in them to take knowledge, and to give judgment between all men, of what estate, quality, or condition soever they be, of all suits, controversies, and differences touching matters of MERCHANTIZING, or buying and selling, in manner as the conservator of the fair at Lyons, and the prior and consuls at Thoulouse do, as well for obligations, bills of debt, receipts, blanks, signed bills of exchange, securities, associations, and partnerships of merchants, either general or particular; also of assurances, accompts, transports and contracts for matters aforesaid, or any thing belonging thereunto; with all full power, and according to the manner, judgments, and condemnation of the said conservator of Lyons, and prior and consuls of Thoulouse; and the judgments and sentences, decrees and ordinances, commissions and commandments of the said prior and consuls of Rouen, by speeches, provisions, or sentences definitive, shall remain in as much force and effect for any matter judicially determined, as the causes which the conservator of Lyons, and prior and consuls of Thoulouse, and divers other of our judges do decide: and the same shall be executed by our sergeants and officers, in such manner and form as they are in their behalf above-

above-named, either by committing to prison, or by inflicting other punishments, if it be so decreed and ordained; and to that end shall our messengers and officers be bound to perform the executions, and our goalers and keepers of prisons shall likewise be bound to keep all such prisoners in such manner as if they were committed unto them by our above-said judges, with the like bond and penalty (if any escape happen) as they are bound to keep the prisoners to them committed by the authority of the said judges: for so we have enjoined, and do enjoin our messengers, and other officers, goalers, and keepers of prisons, upon such penalties as the case shall require, and according as by the said prior and consuls shall be limited and appointed with regard to the demerits of the offenders.

Moreover, we have permitted, and do permit, if need be, that our said prior and consuls do take unto them twenty of the said merchants, or a greater or a smaller number, as they shall think convenient, to assist them in their proceedings and judgments in causes of merchandize, bills of exchange, assurances and differences as aforesaid, and to cause to be executed their sentences, judgments, and ordinances of pledges and consignments, provisions, seizing of goods, and all other condemnations, sentences, or appointments, to proceed therein by cries and proclamations, giving notice to the parties concerned themselves, or leaving notice at their houses by proof, sales, depositings, deliveries, and definitive execution, as the case shall require.

And we likewise give them power to direct the same process, and to proceed therein according to the ordinances, as well in matters summarily as by provision, as acknowledgment of bills, subscriptions, and bills of exchange: and the like in regard to pledges and consignments, upon one only default, duly proved by summoning the person at his house, or fixing there a copy of the commission, or process, in all places where it is lawfully to be done.

And touching other matters, where two defaults shall be made, or persons twice summoned, they shall proceed, observe, and keep their course according to the king's ordinances. And for all matters wherein they shall give sentence of execution to pass in all places of our court of parliament at Rouen, and in all other places of our kingdom, where need shall require, without any disturbance or molestation to be made by any of our judges, justices, or officers, either against them or their deputies; neither shall they let or hinder any summons or arrest, exploit or assignment to be done before them: and to give their assistance in causes appertaining to, or touching matters of traffic, and all things thereunto belonging, against all merchants trading in our said city of Rouen, and their factors, agents, and dealers, sent by them into other countries, regions, or provinces, as well within as without our kingdom, countries, and dominions under our obedience for the cause of traffic, merchandize, and business of trade, and all things whatsoever thereunto belonging.

And we will and ordain, that they may bring their causes and proof for all matters aforesaid, before the said prior and consuls for the time being, whether it be for the rendering of account and satisfaction of part or of whole, or condemnation in penalties, or other condemnations for fines or trespasses, and for all other things that shall be requisite, concerning and belonging to trade and merchandize, according as they shall deserve; in which we have authorized them, and do give them power to use the same forms as the said conservator at Lyons, prior and consuls at Thoulouse, and others our judges do: and to cause execution to be served on the offenders, either by arrests, attachments, and sale of goods, or by imprisonment of the parties condemned, as they shall think good: prohibiting all our judges to take cognizance of any matter or plea thereunto belonging; which command shall be noticed unto them, and unto all persons to whom it shall appertain, by the first of our officers or sergeants that shall be required so to do, whom we enjoin to perform the same accordingly, to the intent that the **EXTRAVAGANT CHARGE AND EXPENCE** that merchants might be otherwise put to in prosecuting their factors and servants before other judges, may be by that means intirely avoided.

And we have further permitted, and do give authority to the prior and consuls to apply all such penalties of money as by them shall be inflicted upon persons for contempt, and other offences, the one half to our use, and the other half to the use of the aforesaid bourse at Rouen, allowing them, also, absolute liberty and power to chuse and constitute an advocate and an attorney, who shall by all lawful means labour to procure the benefit and advantage thereof, and defend the same, and shall direct all processes and causes as well before the said prior and consuls, as before all other judges. And to the end that merchants may assemble themselves, as well to consult of their common affairs as to constitute and appoint the said advocate and attorney, without being subject to repair to us or our judges for leave, when need shall require: We will and ordain, That all judgments that shall pass before the prior and consuls, being sealed with their seals, and signed by a clerk by them appointed, be it for imprisonment, sale, disposing of goods, or otherwise, shall be held for real and lawful, without any constraint to have our further commission or liking, according as was permitted by our most illustrious father the

king, unto the merchants of our city of Lyons, by their letters patents, given in the month of February, in the year of our Lord 1535; reserving unto our court of parliament, at our said city of Rouen, the jurisdiction and cognizance of the said discords and differences, by way of appeal, to our parliament in our aforesaid city of Rouen.

And to the end that all appeals proceeding from the judgments and sentences that shall be given by the said prior and consuls, may be speedily, and without delay, ended and determined in our said court of parliament: We have ordained, and do hereby ordain, all our loving and trusty presidents and counsellors (holding our said court of parliament) to appoint to the said merchants, without delay, one day in every week, such as they shall think convenient, to hear, determine, and decide the said appeals, as recorded. And, in regard to the process in writing, there shall another record be made, to the end that the said appeals may be ended, in the **SAME DAY**, to avoid the prolonging of suits, to the **RUINING** and **CONSUMING** of the **MERCHANTS**.

And to the intent that the said place for meeting of the merchants twice a day may be intirely quiet, and without any disturbance, our will and pleasure is, and we do strictly command, that none of our sergeants or officers presume to enter into the said place, nor to make any arrest (for any cause) of any person whatsoever, during the time of those two accustomed hours of meeting; and, if such arrest should be made during the said hours, we have declared heretofore, and do declare by these presents, the same to be void and insufficient, charging all our judges not to have any regard thereunto.

And as we are informed that the business of assurance is of late greatly improved by the merchants of the said city of Rouen, to the manifest advancement of the traffic and commerce thereof; to the end that the policies of assurance, and all other writings thereunto belonging, may receive full force and vigour, we have permitted, and do by these presents permit, that all merchants frequenting the said place (either now, or in time to come) may assemble themselves as often as it shall be needful to nominate and chuse by the plurality of voices, one trusty and expert merchant amongst them, such as they shall think meet and well understanding the business of assurance, who shall make and record the said policies; which the insurers shall under-write at all times hereafter, in the said place and liberties of the said city of Rouen; which merchant so chosen shall likewise (being thereto required) draw out accompts of such sums as shall happen to be due, receiving for his pains and time spent in performing the functions of his said office, according as shall be thought meet by the said merchants; of all which insurances he shall keep a perfect and exact record, to which record and copies thereof, and all other acts and writings by him made and signed concerning the matter of insurances, we will and ordain that all manner of credit shall be given before all judges and others, to whom it shall appertain: nor shall any other person or persons whatsoever have any thing to do or meddle in the said business of assurances, not being before chosen and admitted thereunto by the said prior and consuls, and by the said merchants as aforesaid.

And we do hereby command and give in charge to all persons holding our courts of parliament, great consables, admirals, vice-admirals, stewards, and their deputies, and to all other judges and officers whom it shall concern, that they do cause to be read, proclaimed, and registered this our present will, declaration, permission, and ordinance, and the same to be observed and kept by all persons accordingly, that the merchants may use and enjoy the force and benefit thereof, plainly and peaceably, without any contradiction: moreover, We do charge and command our attorney-general that he do with all diligence cause all these things to be plainly and truly executed, and that he do certify us of his diligence in so doing. For such is our pleasure; and that notwithstanding any ordinances, customs, statutes, privileges, prohibitions, &c. to the contrary; which in this case, without doing prejudice to them in others, we have made void, and do make void. And, because sundry persons may have occasion to use this our grant in divers places, our pleasure is, that credit shall be given to all such copies thereof as shall be made by any of our loving and trusty notaries and sergeants, or under-secretaries, &c. in as ample manner as to the original: and, to this effect, we do give you full power and authority, and especial charge and commission by these presents, commanding all our justices, officers, and subjects to obey you in this case. And to the end that this may remain established for ever (our own right in all other causes reserved) we have heretofore caused our seal to be put.—Given at Paris in the month of March, and in the year of our Lord 1556, and of our reign the tenth.

Signed by the **KING**, then in council, and sealed with green wax, &c.

R E M A R K S.

We have now seen the substance of what has been urged in favour of the establishment of a court-merchant in Great-Britain;

Britain; and how long since the same was first introduced into France, may be seen under the article *CONSUL*.

The great objection that hath been made against an establishment of this nature, is, that merchants are not sufficiently skilled in the laws, customs, and usages, which have relation to their own profession; and, therefore, they can never be competent judges in regard to every kind of litigation which may come before them. The experience, however, of other nations has shewn, that the mercantile world is contented at present, in the general, rather with the determinations of a judicatory of their own fraternity, than those of lawyers. But, although merchants, from their long attention to concerns of this nature, and the registering the reports of their predecessors, may, in time, become very knowing and judicious in determining differences between their brethren and their dependants, yet at the first commencement, they certainly must be very unexperienced.—But, if a mercantile college, as we have proposed, should ever take place in this nation, this would lay the proper foundation for training up merchants, as well in a knowledge of the laws, customs, and usages, relative to their employment, as in their other essential qualifications. See *MERCANTILE COLLEGE*.

MERCURY, is a mineral, or a ponderous metallic water, agreeable to most metals, and judged by some to be the original matter, whereof all are constituted; it more closely adheres to gold, than to any other, by its penetrating and dissolving quality.

Mercury, or quicksilver, is the most heavy of all fluids, totally volatile in the fire, and incongealable by any degree of cold hitherto known. Its gravity, compared with that of spirit of wine, the lightest of all fluids, is as 14,000 to 866; it comes the nearest in weight to lead, to which it is as 14,000 to 11,325. By bare agitation alone in a glass vessel, or by being exposed to a small heat, it yields a soft black powder, of a sharp brassy taste: a greater degree of heat changes mercury into a heavy, shining, red, friable powder, of a sharp nauseous taste. The black and the red powder, may be revived into fluid mercury, by a more intense heat. Quicksilver amalgamates with gold, silver, lead, and tin; with copper not so easily; with zinc and bismuth imperfectly; but has not been yet found to act on iron or the regulus of antimony. It is soluble in mineral acids, but with greater facility in some than another: vinegar, and the acids extracted from vegetables, have no effect upon it: neither have alkaline or neutral salts: the nitrous acid readily dissolves it into a pellucid liquor: neither the marine or vitriolic acid acts upon it, unless highly concentrated. It readily joins to sulphur, and sublimes along with it into a red powder; from this it is easily separated by absorbent earths, fixed alkaline salts, regulus of antimony, and all metals, except gold. It is sometimes to be found running in the veins of the earth, in the perfect form of quicksilver, but much the greater quantity of it is drawn from a mineral stone called natural cinnabar.

Of extracting mercury from the ore or mineral earth.

They first grind the mineral earth into powder, which done, they pour a large quantity of water thereon, stirring the whole briskly about, till the water becomes very thick and turbid. The water having stood till it be settled, it is poured off, and they throw on fresh, which they agitate as before. This they repeated till the water at length comes away perfectly clear: after which, all remaining at the bottom of the vessel is mercury, and other mineral matter.

To this mercurial matter is added the scoria of iron, putting the whole in large iron retorts, and so distilling it; by which means all the heterogeneous, mineral, and terrestrial part is separated therefrom, and the mercury left pure.

THE UTILITY OF MERCURY IN WORKING THE GOLD AND SILVER MINES IN SPANISH AMERICA.

Mercury is of great use in the West-Indies, because they cannot extract the silver from the native mineral without it, and therefore vast quantities are sent over from Old Spain every year. See the article *SILVER*.

No person is allowed to carry over quicksilver to the Spanish West-Indies, but the king; and the attempting the contrary is punished with death and forfeiture of goods, which does not altogether deter men from committing this offence. And, though his majesty might considerably increase his revenue, by selling it at a high rate, since the mines without it would turn to no account, yet it has been always ordered to be sold at the price it stands in, paying all charges. The quicksilver, taken out of the mine at Almaden, not sufficing formerly to supply the mines of New Spain, it was ordered, that certain quantities of this metal should be sent thither from the mines of Grancavelica in Peru, by the South Sea, and about 15,000 quintals, that is, 75 tons, were sent yearly, for three or four years. But this being found prejudicial, because under this pretence they carried great quantities of China and Spanish commodities from New Spain to Peru, which is very prejudicial to the trade of Spain, and had always been prohibited; therefore no more quicksilver was permitted to be carried from the mines of Grancavelica.

These mines falling in, and therefore yielding no quicksilver for some years, all the West-Indies were supplied out of Europe, which took up vast quantities; for the kingdom of Peru alone requires no less than 6000 quintals, that is, 300 tons: abundance was, therefore, brought out of Germany, and all the provinces of the West-Indies well stored; and, in the year 1628, there were 12,000 quintals, that is, 600 tons, in the king's warehouse, which made it doubtful how to send over so great a quantity. The commanders of the biggest ships, made a difficulty of carrying above 2000 quintals, that is, 100 tons of quicksilver. Though the expence in New Spain be not every year so much, 6000 quintals have been sent thither in one year. It is ordered, that 200 quintals, that is, 100 tons of quicksilver, be sent yearly to the new kingdom of Granada, and 100 to the province of Guatimala, but this is not regularly observed. This commodity being so absolutely necessary for the plate trade, when the Spanish fleet has missed being set out, two galleons have been sent with the quicksilver. Great interest has been made, that quicksilver might be sent by the way of Buenos Ayres, on pretence that it was very chargeable carrying that which is taken out of Grancavelica to the mines of Potosi, but it was never granted.

The quicksilver from the mine at Almaden, being brought very slowly to Seville, the commissioners of the India-House are often forced to send officers to hasten the carts and horses upon the road, and express to Almaden, to expedite their setting out. The putting it up for sea has been always left to the care of this court, but more particularly to the factor, which has been practised several ways; but, that now in use being the best, it will not be amiss to give an account of it in this place.

Every half quintal, or half hundred, is put into a sheep's skin, well bound with hempen cords, and that into a tight cask, nailed down; and three of these casks, containing a quintal, or an hundred and a half, into a chest, which being nailed and bound over with hempen ropes, is wrapped with coarse mats, and bound over again. Upon every chest is fastened the king's arms, painted on linen cloth, and those chests are for New Spain, for those carry but a quintal that are for the firm land. It would be proper they should not put it up before the galleons or fleet are ready to sail, because, if they lie long, the skins are in danger of rotting. A commissary is appointed to go into the ships that carry quicksilver, who gives bond to the factor for the delivery of them to the king's officers at the port they are designed for: and, to make good the deficiencies of the regular convoy-duty, the masters are obliged to pay for such goods as they take aboard. These commissaries are appointed by the president of the India-House, and, being brought before the chamber of direction, give security; and, for their trouble and hazard, are allowed 12 ducats for every 18 quintals, accounted a ton, which is paid by the king's officers where they deliver the quicksilver. This commodity pays the duty for convoys, but no other, and is never carried to the custom-house, but goes directly to the king's warehouse. See the articles *AZOGA SHIPS* of Spain, and *DIRECTION CHAMBER* of Spain.

Mercury is also used in the gilding of silver, and other metals.

CURIOUS OBSERVATIONS.

That the mercurial principles exist in vegetables.

There is a method, says a famous Chinese author, of drawing mercury from wild purslane. For this purpose you need only take the little leaves of purslane, bruise them in a mortar, with a pebble of the wood of Egyptian thorn; then expose them to the rising sun for about three days, and, when they are dry, toast them so as not to destroy their nature and virtues; put this mass in a well-varnished earthen vessel, which you must close well, and bury in the earth 49 days; after which, take out the vessel, and you find quicksilver in perfection.

Nothing is more certain than this secret; and in the shops of Pekin they sell two sorts of mercury, the one taken from mines, which is called *chapchoveir*, and the other obtained from plants, which is called *tsachonien*.

These different operations of the Chinese discover to us, that, in the principles of plants, there is iron, which may induce us to think that there may be mercury in certain plants; and, if we reflect on the nature of plants, and search for that which most probably contains quicksilver, we have reason to believe that purslane does so; for, in short, the Chinese herbalist, who in this agree with the greatest botanist of Europe, gives to purslane the virtues that are found in mercury. The purslane, says he, is cold in its nature, kills worms, and all sorts of vermin, and is usefully employed against noxious humours, which it dissipates; and because in its nature it is volatile, it removes obstructions in the vessels of the human body.

Be this as it will, it is very probable that quicksilver, drawn from plants by the solution and separation of their principles, would be free from several impurities which naturally attend that obtained from mines; for by being exalted into the minute parts of the plants, it must be freed from the ramous and sulphureous fibres, with which it abounds more or less, and from which it is separated by passing it thorough a sheep's skin.

Should

Should this receipt by experience be found true, we may reap from it a double advantage; the first of which is, that everywhere, and in a short time, we may procure a sufficient quantity of mercury. The second and most considerable is, that, by the quicksilver extracted from purlane, we may judge better of the different uses of this plant, and may determine more certainly for what time, and with what precautions, it may be used, according to the different situations of persons, whether in health or sickness. Besides, its juice, prepared in a certain manner, might act upon metals disposed to receive it.

MERIONETHSHIRE, in Wales, is bounded on the south by Cardiganshire, from which it is separated by the river Dôvy; with Montgomeryshire and Denbighshire on the east; Carnarvonshire and part of Denbighshire on the north; and the Irish Sea on the west, for a length of 35 miles. It is about 35 miles in length, from Aabyvy in the south to Llanfawr in the north-east; and about 25 in breadth, from Harlech in the west to the opposite part of it on the east.

The air of this country is bleak, and not very healthy, by reason of the vapour arising from the Irish Sea. The soil, being rocky, is generally as bad as the worst in Wales, bearing but thin crops of corn; yet there is pretty good pasture in the vallies for black cattle and sheep, which are the chief support of the inhabitants; and it is well furnished with deer, goats, fowl, and fish, especially herrings, which are taken on the coast in abundance.

HARLECH, or **HARLEGH**, in the north-west part of the county, has a harbour for ships, but no ships for the harbour.

DOLGELLY, at the foot of the mountain Idris, is an ordinary country-town, but of good account for the sale of Welch cottons, and has an indifferent market. Here are pretty commodious inns for travellers.

BALA is the only market-town of the mountains, and is situate near Pimble Meer.

METALLURGY, the art of smelting, refining, compounding, and working metals from the mineral earth to the utensil.

Under the articles **ALLAY**, **AQUA FORTIS**, **AQUA REGIA**, **ASSAY**, **CINNABAR**, **COPPER-MINES**, **FLUX**, **GOLD**, **SILVER**, and all the other metals, we have distinctly and amply treated of the divers metallurgical operations; to which we refer the reader. For what has further relation to this topic, see the articles **METALS**, **MINEROLOGY**, **MINES**, **ORES**, **QUARTATION**, **SMELTING**.

From what is said under the preceding heads, the following particulars are observable.

REMARKS ON METALLURGY IN GENERAL.

1. We learn from the foregoing enquiry, that different mineral and metallic matters bear different relations to melted lead in fusion: whence some of them will not mix therewith, but float on its surface: that others evaporate, and others vitrify in it; whilst silver and gold remain unaltered by it, and unimpaired. See the article **ASSAY**.

2. That the nobler metals have nearly the same relation to quicksilver as they have to melted lead; as being readily drank up by them both, so as thus to be separated from other heterogeneous matters. See the article **ASSAY**.

3. That testing, in the large way, is improveable by finding a properer matter than bone-ashes, for the making of tests, by working without bellows; and again by using pit-coal, and a well-contrived furnace. See *ib.*

4. That the art of assaying is hitherto imperfect, but capable of receiving considerable improvement from chemical and mechanical knowledge. *Ib.*

5. That the troublesome and expensive method of separating gold from silver, by quartation, may be advantageously superseded, by means of fusion, or a dexterous management of the fire. *Ib.*

6. That gold and silver are rarely rendered absolutely pure, or separated from all other kinds of metallic or mineral matters; and that to purify them in this manner requires the use of better methods than those commonly used for the purpose, though the thing is still performable by art, and a suitable process. *Ib.*

7. That the particular history of common metallic fusion is wanting, for the improvement of metallurgy. *Ib.*

8. That, when the ore of an imperfect metal is in immediate contact with the fire or fuel, especially if charcoal, it yields the more and the better metal than when contained in a crucible, or kept from touching the coals. *Ib.*

9. That a languid fire lessens the yield of an ore; but a brisk one, if not too long continued, increases it. *Ib.*

10. That the business of smelting in perfection depends, (1.) Upon using a degree of fire suitable to the ore. (2.) Procuring a quick and thin fusion of the scoria. And, (3.) A close contact of the metal with the fuel or coals. *Ib.*

11. That sulphur has different effects upon the different metals; which effects being well noted, rules of practice might be thence derived, for the farther improvement of metallurgy. *Ib.*

12. That metalline recrements, or the slags of metals once smelted, have been wrought over again to profit, on account

of the imperfect manner wherein the ores were originally treated for their metals. *Ib.*

13. That the ignobler metals are separable from each other by the application of proper degrees of heat, so as to make the more fusible melt away from the less fusible, at least with the assistance of lead. *Ib.*

14. That all metals are reducible, by burning or calcination, to terrestrial powders, or calces; which, by being melted with any inflammable matter, assume their metalline form again. *Ib.*

15. That the great enemies to ductility, or the true metallic nature, are sulphur, cobalt, and things compounded thereof [see **ORES**]; but that all unctuous and inflammable bodies are friendly to metals, and promote or restore their ductility, when melted therewith. See **ASSAY**.

16. That copper may be made to approach the colour of gold, and, at the same time, not lose, but increase its ductility, by being amalgamated with, and distilled from quicksilver; and that probably many artificial or compound metals are discoverable, by mixing various metalline and mineral bodies together, so as greatly to enrich and improve the art of metallurgy. See **METAL**.

17. That steel is made by a proper application of fire to iron, in a close place, so as to prevent the open air from communicating freely with the iron.

18. That metals receive particular alterations in their texture, or consistence, according to the nature of the solid substance, or liquor wherein they are quenched or cooled. See *ib.*

19. That, in general, ores are no more than a natural loose mixture of metallic matters, along with earthy and sulphureous ones: whence artificial ores, may be readily made, by calcining a metal with sulphur, and mixing it with earth; so as, with heat, to form solid lumps of ore, resembling those dug out of mines. See **ORES**.

20. That numerous experiments remain to be made, and facts of nature, or observations, to be registered, or the relation of bodies to be found, before this useful subjects of metallurgy can be brought to its ultimate perfection. See **ASSAY** and **METALS**.

METALS, are a species of very subtle, yet opaque earth, disposed to form a tenacious, and, consequently, a malleable, aggregate, which is fluid in the fire, more or less sonorous in the air, and of a great degree of ponderosity.

They are commonly divided into perfect and imperfect, and these again into complete and incomplete metals.

The perfect metals are supposed to be two, viz. gold and silver; and the imperfect ones four, viz. copper, lead, tin, and iron, which are otherwise said to be complete metals.

The incomplete metals are bismuth, zink, or spelter, regulus of antimony, and regulus of arsenic: which have weight, appearance, and fusibility at the fire, in common with real metals, but are brittle, and all more or less volatile.

Yet these are not exactly all the species of incomplete metals; for many other substances are found thus far metallic, though neglected, either because their manner of preparation and use remain unknown, or because they may be indirectly referred to some of the above-mentioned classes.

It has been a prevailing opinion, that the imperfect metals differ only by accident from the perfect, on account either of digestion, or the tenacious adhesion of heterogeneous substances.

By digestion or concoction we here understand rather the effect of the operation, than the operation itself, viz. a closer combination of those very attenuated particles, which in common mercury yet appear, as it were, individually distinct; whence, as single corpuscles, they prove unable to sustain the impulse of the fire, but are thereby raised in the form of a subtle fume into the air. Now, these very subtle and moveable particles may be conceived fixable two ways: first, by aggregation, so that several particles shall be tenaciously aggregated into one molecule. Something of this kind happens in mercury precipitated per se [see **MERCURY**]; which, tho' it was before exceeding volatile and fluid, so as to evaporate in a fume of exceeding fine parts, it is now made somewhat more fixed, and exhibits those very subtle atoms joined together into more sensible corpuscles, under the form of a dry powder. We do not, indeed, from hence infer, that mercury of itself is an immature metal, which, without the addition or separation of any other thing, may be reduced to a perfect metal: let it suffice to have shewn by this phenomenon, that a greater degree of fixedness may be derived from an aggregative connection of particles.

Nature, according to some, produces every metal almost instantaneously. If in the bowels of a mountain, say they, or any deep parts of the earth, a vapour should arise from a substance, utterly unknown to us a priori, that lay either there before, or is generated on the spot; or, if this substance itself, in the form of such a vapour, should successively rise and creep through the cavernous body of vast tracks of rocks, the veins and clefts of flints, or the interstices of huge beds of lesser stones, and every-where move about 'till it impinges upon a certain species of a subtle vitrescible earth, which is fitted to receive it, or to become one therewith, here it must lodge as in its matrix, 'till some more powerful impulse disturbs it.

We may the better conceive how this should happen, from an example of that mud found at the head of springs, which, as Becher remarkably observes*, receives and concentrates the aqueous vapour, notwithstanding the diurnal heat of the sun. And after the same manner do alkalies receive and tenaciously detain the humid vapours of the air.

* *Physic. Subterranean*. §. 11. cap. 3. §. 6.

And as vapours of a different kind, such as the mercurial, arsenical, sulphureous, &c. come to mix in certain proportions along with that original vapour, and fix therewith in a proper matrix, hence may proceed the various sorts of perfect and imperfect, complete and incomplete metalline bodies: or from any error in the ingredients, as to proportion, &c. wrong conformations or degenerate metals may arise.

That the metallic principles may thus wander through the earth, in the form of vapour, seems countenanced by the common observation of those mines which take their course near the surface of the earth. For, if a mineral vein lies shallow, it often gives manifest signs of being supplied with such a vapour, not only in summer, by changing the colour of the stones that lie over it, but also in winter, by dissolving the snow that lies along the tracks where it runs.

And this kind of exhalation is by the miners called the storm. The like vapours also frequently happen by the burrows and caverns of the mine, whilst they are digging the vein for the metal already formed therein, and sometimes make the place very hot, sometimes occasion coughs and hoarseness, and sometimes again when they are large, and mixed with other mineral vapours, they prove suffocative. The workmen have commonly notice hereof given them by their lights suddenly burning larger and brighter; upon which they immediately quit the place.

At least, therefore, it may more easily be conceived that metals should be thus, as it were, instantaneously generated, than that the imperfect metals should, as some suppose, be converted into the perfect, barely by a long-continued concoction in the earth, or by lying therein for some hundreds of years, without the addition of any new matter, or any diminution of the old. This seems very hard to conceive; but there is nothing absurd, in allowing, that, upon a due concurrence of the metalline principles, metals should be immediately produced: and that, if these principles meet improperly, either as to number, proportion, or heterogeneity, they should either remain perpetually in that wrong state of mixture they would then have, or at some time or other, whether sooner or later, upon the fortuitous or natural accession of some principle that was before deficient, they should be actually perfected or destroyed by the admixture of one that is heterogeneous.

Cases of this latter kind are sometimes met with in mines; where too large a proportion of mercurial, corrosive, saline, arsenical matter or vapour, coming upon and adhering to the truly metallic parts of the ores, especially those of the imperfect metals; the parts of such ores are thereby turned sometimes into running mercury, sometimes into cobalt, arsenic, tutty, cadmia, and sometimes into common sulphur.

And if, in such a case, the mercury thus dissolving and overflowing the metallic parts of these ores, be supposed to become the true mercuries of bodies, and to contain a quantity of the real metallic earth, so as sometimes to be nothing but gold overpowered and rendered fluid by too great a proportion of mercury, we have little to object to such a supposition: especially if we consider that it seems countenanced by the increased spissitude and sluggishness of these mercuries, their greater specific gravity in comparison of common mercury, and the golden spot they leave behind, when evaporated upon a silver plate.

The contents of a metallic vein are thus frequently perverted, at the time that a subterranean heat comes upon them; when, if the vein be superficial, the whole mass of metallic matter is corrupted, and thrown off into the air: whence the remaining veins are afterwards found to be nothing but an imperfect matrix, containing a rusty red earth, like the lapis hæmatites, that runs therein after the manner of an ore indeed, but yields no metal; whence such matter is by the workmen called dead metal.

This evaporation becomes sometimes sensible, though without flame, or any manifest odour; but may be distinguished from far, especially in a dewy morning, by the undulation and fluctuation it occasions in the air, over the whole track from which it rises. And if, after such a phenomenon, the vein be found empty of metal, the workmen in their language, say, the storm has carried it away. But, at other times, such an exhalation is attended with a violent flame, and the smell of burning sulphur reaching to the distance of a mile, or more; when all the adjacent grass, and other vegetables, are burnt up, and the workmen sometimes scorched or suffocated in the mines.

But farther, if the rock, stones, or other mineral matters dug in the mines, or if the stamped slag, or powdered scoria gained in the melting of the metal, be strewed upon the track of a vein, they have, after many years lying, been found impregnated with a metallic matter; probably because they af-

forded a commodious matrix for the mineral fumes or exhalations, which every-where breathe out along the track they were laid on.

It must be observed, that one kind of heterogeneous bodies either hinders the completion of metals more than another, or obscures them when they are complete. An example to which purpose we have in the gold ore that is intermixed with martial flints; where a dry, stypitic, powdery earth, preventing the fusion, detains the fine single particles of the perfect metal and separates and wears them asunder, when they would aggregate, and so prevents the ore from yielding its true quantity of metal by fusion, or all that is by aqua fortis found to contain.

Nor does it, perhaps, appear less strange that some ores which are mixed with sulphur, arsenic, and the like rapacious bodies, should afford a less quantity of pure metal, when these volatile substances are first driven from them by calcination with a naked fire in the open air, than when they are either totally, or very considerably, detained by corrosive alkalies, quick lime, glass, &c. for it is manifest, that such substances are not found to touch the substance of perfect gold brought into a body, much less to raise up or carry off any part thereof.

The truth of the case appears to be this: that those rapacious minerals do not, in the open calcination, so much affect or carry off the whole individuum, or complete atoms of the gold, as some one or other constituent part of such atoms, whether it be mercurial, that called sulphureous, or earthy.

R E M A R K S.

With relation to the separation of metals from their various ores, see the article METALLURGY.

Of the ARTIFICIAL or FACTITIOUS METALS.

The method of making PRINCE'S METAL.

Take six ounces of copper, and melt it in a wind furnace; add to it an ounce of zink; then, stirring the whole well together, pour out the metal. The copper and the zink may be put into the crucible together, if first covered over with the black flux [see ASSAY and FLUX] which prevents the avolation of the zink, or preserves it's metalline form.

R E M A R K S.

This is an expeditious method of making a fine kind of brass; whereas the common method, with lapis calaminaris, requires a considerable length of time, and a violent fire: for this purpose they calcine and powder the calamy, then mix it with a little charcoal-dust, and to seven pounds of this mixture add five of copper-plates, then, giving eleven or twelve hours fire, the copper imbibes about one third of it's weight of the calamy.

It is here remarkable, that the calamy, though no complete metallic body, nor malleable, should yet concrete along with the copper, so as not only to increase it's weight, but also to extend with it under the hammer; which zink, in making the prince's metal, does not do, though it appears in all respects of a more metallic nature than calamy.

The agreements and disagreements of these two bodies, zink and lapis calaminaris, may deserve to be farther enquired into by particular experiments. The inflammability of zink is very remarkable, for it burns durably of a bluish-white flame in the fire, and thus resolves into a white calx.

Many curious phenomena and unexpected results, happen upon mixing metallic and mineral bodies in the fire; all which deserve to be tried, and noted as FACTS that might at least direct to the discovery of several new and useful mixtures, or compositions of metals. We might be encouraged to prosecute this enquiry, from those pretty imitations of gold lately introduced, for the making of watches, buckles, cane-heads, snuff-boxes, &c. but, perhaps, a better imitation of gold, for these and other purposes may be obtained by M. Homberg's method of treating copper with quicksilver: for, if an amalgam be made of one part pure copper, and three parts quicksilver, and the amalgam be boiled in river water for two hours, then have the quicksilver distilled off, and cohobated once, the remaining copper, being now fused, will be found of a beautiful colour, and more ductile than common copper, so as to become well fitted for watch-work, gilding, and the finer machines and utensils.

For the methods of extracting metals from their ores, see METALLURGY.

OLD MEXICO, or NEW SPAIN. This country lies between north latitude 7. 30. and 30. 40. and is bounded on the south-east by the isthmus of Darien, or Panama; and on the north-west by New Mexico. It is divided into three audiences, or sovereign districts, governed by a viceroy appointed by the king of Spain.

The three districts, or courts of audience, are, 1. Guadalajara; which contains the provinces of Cinaloa, Culiacan, Chamephan, Xalisco, Guadalajara Proper, Zacatecas, and New Bisco. 2. Mexico; including the provinces of Mechocan, Mexico Proper, Panuco, Tlascala, Guaxaca, Tabaasco, and Ycatan. 3. Guatemala; containing the provinces

víncos of Chiapa, Sonocufca, Guatemala Proper, Vera Paz, Honduras, Nicaragua, Costa Rica, and Veragua. Though it lies for the most part within the torrid zone, yet the air is very temperate, and generally reckoned extraordinary wholesome. It produces divers sorts of grain, fruits, and herbs, rich mines of gold and silver, and good pasturage. Its chief grain is wheat, barley, pulse and maize; the chief fruits pomegranates, oranges, lemons, citrons, cherries, apples, figs, and cocoa-nuts; and its principal commodities are wool, cotton, sugar, silk, cocheneal, feathers, honey, balm, amber, salt, tallow, hides, tobacco, ginger, and various medicinal drugs.

The Spaniards, who have long been sole masters of this country, have taken such care to keep all foreigners out of it, that the lawful commerce between this part and Europe is in their hands, and subject to the direction of their crown.—To shew in what manner the same is carried on, it may be necessary to explain what so often occurs in our news-papers, by the appellations of galleons, the flota, the flotilla, register-ships, and guarda costas.

A galleon may be termed a very large old-fashioned man of war, of three or four decks [see the article GALLEONS] with a vast deal of room for merchandizes, which should be loaded only on the king's account, but are generally so much crouded with other goods, as to be in no condition to defend themselves. This fleet consists of eight such men of war, the five largest of which have 50 brass cannon, besides an advice-frigate of 40. There are from 12 to 16 merchantmen which sail with this fleet, with cargoes for the account of private persons, after having purchased their licences at a pretty dear rate; and each of them is one half bigger, at least, than is expressed in its schedule. The chief intent of the galleons is, to carry warlike stores, and other necessaries, for Peru: and this is what specially distinguishes the galleons from the flota.

The flota, which is intended for Mexico, consists of three men of war, which carry nothing but on the king's account; and the merchantmen that sail with them are usually about 16, from 400 to 1000 tons burthen. This flota, which sails about August, to have the favour of the winds that reign about November, to facilitate its passage to La Vera Cruz, commonly calls at Puerto Rico for fresh water and provisions; and, after passing in sight of Hispaniola, Jamaica, and Cuba, according to the season of the year, or the nature of the winds, passes either by the coast of Yucatan, or higher through the gulph of Mexico, to La Vera Cruz, at the bottom of it.—Its passage has been computed as follows, viz. from Cadiz to the Canary Isles 250 leagues, in about 10 days; to the Antilles 800, in 20 days: to the most western point of the Isle of Cuba 500 leagues, in 20 days; to La Vera Cruz 260 leagues, in about 12 days: in all 1810 leagues, in about nine weeks.—As the flota is designed to furnish not only Mexico, but the Philippine Islands, they are forced to stay there a good while, and sometimes to winter there.

The cargo they carry back to Europe is not so rich as that of the galleons, though it is said to be richer every year than other, because of the increase of the Spanish settlements in New Mexico.—The flota commonly leaves La Vera Cruz in May, but sometimes not till August; then it sails for the Havannah, from whence it generally returns, especially in time of war, with the galleons to Old Spain. See the article FLOTA.

As soon as the galleons and flota are arrived at the Havannah, the flotilla, or little fleet, so called, because it consists of some of the lightest and cleanest ships is detached to Europe; which, besides money and merchandize, carries an exact account thither of the contents both of the galleons and the flota, that the court may the better judge what convey is necessary to be sent for them, as well as to regulate the indulgo [see INDULGO] proper to be levied on the merchants, in proportion to their respective interests in the galleons and flota.

The flotilla consists commonly of five ships, from 20 to 44 guns, and is employed to guard the coast from free-booters, as also to convoy the plate to Panama. The great fleet remains so long at the Havannah for these two reasons chiefly, viz. waiting for a wind, or for the register-ships, which they are to convoy home.

A register-ship has its name from its being registered, with all the effects embarked in Spain, in books kept for that purpose in the chamber of Seville. For, when a company of merchants there think that the European goods are much wanted at some particular ports in the Spanish West-Indies, they present a memorial to the council of the Indies, praying permission to send a ship of 300 tons burthen, or under, to such port; and, having obtained it, they pay a certain sum, between 30,000 and 50,000 pieces of eight to the crown, besides presents of a considerable value to the king's officers. Then, to prevent any suspicion of fraud, they register their ship and cargo consistent with their petition and licence: whereas the same ship, so registered as under 300 tons, generally carries above 600 tons of goods, besides accommodation for passengers.—Copies from the registers are transmitted to the governor and royal officers at the port to which the register-ship is bound; and such is their diligence and integrity, that

when the ship is come to an anchor, they certify after a pretended narrow enquiry, that this ship of 600 or 700 tons does not carry quite 300 together, and send back such certificate, properly ascertained, with the ship to Europe, together with a bill of lading, in the same strain of computation*.—By these register-ships 2 or 300 per cent. is sometimes gained, which enables the owners to pay so liberally for cheating the king, after having first got the money by robbing the subjects.—These register-ships go yearly to Buenos Ayres, St. Martha, Porto Cavallo, and other places, to which neither the galleons nor flota come; yet they generally return with them, as they sometimes go out with them, though, when outward-bound, they leave them in a certain latitude. What gave rise to the Spanish guarda costas, as they are called, or guard ship, was the illicit trade said by the Spaniards to be carried on in those parts, some years since, by the Dutch and English, though notoriously by the former, partly with the connivance of the Spanish governors, and partly by force. The guarda costa, being stationed at Carthagena, put an end to this mischief for a short time, by sinking one of the interlopers, and taking two; the cargoes of which were worth above 100,000*l.* and by hanging all at once 16 Spanish merchants, that, on a signal given, came on board from the shore to trade with them†. But the captains of these guarda costas, instead of taking real contraband traders, infected the English commerce soon after, and took what they could, without distinction, under frivolous pretences at first, and at last without any at all. The governors reaping vast profit from the prizes which they brought into their ports, they sent such fallacious accounts of the captures to the court of Madrid, as produced that obstinacy of theirs which involved them in the late war with Great-Britain.

* If the officers belonging to the king of Spain will defraud their own crown of its revenues, in their concerns with Spaniards themselves, Spain cannot wonder that their officers should countenance and encourage an illicit trade with foreigners in the Spanish West-Indies; and, if the great fault lies at the door of the Spanish officers, the labouring oar to prevent such illicit commerce lies chiefly upon the court of Spain itself, and not upon those courts whose subjects are allured by their officers and subjects to carry on a contraband trade.

† Were the like measures steadily pursued, they would not only have put a temporary, but an eternal stop, to illicit trade. And does not this prove that the Spaniards have it in their own power to put a stop to this trade whenever they please?

Though the general accounts of New Spain place mines of gold and silver in almost all the provinces, yet we are assured that both are only found in the Province of Mexico. Of silver, it is published there are no less than 1000 mines in the Mexican empire; but gold only is found in Veragua and New Granada. There is an exceeding great quantity of sugar in this country, chiefly on the side of the gulph of Mexico, Guaxaca, &c. so that here are more sugar-mills than in any part of Spanish America; but it is chiefly consumed in the city of Mexico, and particularly the monasteries, in chocolate, sweet-meets, preserves, and confectionary wares; of which, however, there is a vast deal sent from Guaxaca, Guatemala, and other provinces, to Mexico and to Panama, from whence it is carried by sea to Lima, Guayaquil, and Baldivia. There is a great home trade in the goods manufactured of its cotton. They have the best indico in the world; and the trade in that of cocheneal is managed wholly by the merchants of Mexico and Carthagena, who buy to export them to Europe. Cocheneal is found in the governments of Talsaco and Guaxaca; dyers-wood in the bays of Campeachy and Honduras; and some pearl at Vera Cruz, and the Pearl Islands, &c. Nicaragua, Campeachy, and Guaxaca send great numbers of black cattle to Mexico. Large quantities of fluff are brought from the Havannah to Vera Cruz, and there sold to the merchants of Mexico. Cocoa, which is a great article in their merchandize, is chiefly produced at Guatemala, Vera Paz, Sozonuco, Ciudad-Real, and Guaxaca (which yield the best in America) and sent to Los Angeles and Mexico, Panama, Lima, Carthagena, Porto Bello, and from thence to Europe. The nuns of Guaxaca have the chief manufacture of chocolate from the nut, of which it is thought more is drank in the city of Mexico than all Old Spain.

It is said the people of Nicaragua and the Honduras employ 30,000 mules and horses to carry corn, sugar, &c. into the inland provinces, and particularly to the city of Mexico. And, when the galleons come from Old Spain, the numbers of carriages, men and horses employed to carry their treasure from Mexico, and the country of Pachuca, to La Vera Cruz, are incredible.

The carriage of the European goods that come by the galleons back again to other parts, is a very considerable article of trade, as is also the carriage of tobacco, sugar, and other produce of Guatemala and Guaxaca, which comes from the south coast by sea to La Vera Cruz, all which is said to employ 60,000 horses, mules and asses, besides a proportionable number of men. Cocheneal, in particular, is thus brought over the mountains from the country of Guadaluajara, 320 mile

miles north-west from Mexico. So much silver it also brought from Zacatecas, in the same province, that it is said 6000 mules are employed in the carriage.

Of the several audiences in MEXICO, or NEW SPAIN.

I. GUATIMALA. Joseph Acosta, who was on the spot, and gives the best account of New Spain, in that work called his *Natural and Moral History of the Indies*, makes this audience about 300 leagues in length, upon the South Sea; but it is indented by so many great bays in the North and South Seas, that the breadth is not half so much, it being in some places not 30 leagues, though in others 150. Acosta says it is in general a fruitful country, especially in Indian corn and cocoa, and abounds in cattle and good pasture.

VERAGUA. This, which is the first, though the least province of not only the audience of Guatimala, but of North America, joins on the west to Costa Rica; on the east to the government of Panama; and has the North Sea on the north, and the South Sea on the south.

SANTA FE', or **FOY,** in the middle of the province, is the place where the king of Spain keeps officers for casting and refining of the gold. It stands at the head of a river that runs into the North Sea.

PUEBLO NUEVO or the **NEW TOWN,** stands in a bay of the South Sea, betwixt Baja Honda and Chiriqui, seven leagues from each, and 60 miles south-west from Santa Fé, according to Moll, though others make it 75. Here is a large river, that falls into a sandy bay; and on the east side, where the true channel lies, there is a round hill.

Right before the mouth of the river is an island of the same name, about one league from the main. There is a low point just within, called Rhenchiera, where the Spaniards usually build ships.

It is but three leagues up the stream, and may be seen from the road.

Pueblo has been several times taken by the buccaneers.

CHIRIQUITA, or **CHIRIQUI,** on the same coast, 35 miles west of Pueblo Nuevo, stands in a plain of savannahs, surrounded with coppices and farms; and the chief trade of it is in tallow and leather. The harbour lies on a pretty large river, about a league from it's mouth, and three from the town, to which is a pleasant passage; but there is only one way to enter the river, and that dangerous. This river falls into the bay called Galfo-Dolce, which must be distinguished from that near the bay of Honduras.

VERAGUAS, which stands on the river of it's name, is a poor place, and drives no other trade than working the mines, where the slaves are compelled to dig and wash the earth in the neighbouring rivers, wherein bits of gold are often found as big as peas.

ST. JOHN DE CUEBLO, is an island upon this coast, which the buccaneers place 24 leagues west from Panama, and six from Pueblo Nuevo, and makes 12 leagues in compass. It is desert and mountainous, but full of wood, especially mast-timber, and has fine rivers.

COSTA RICA PROVINCE, or the **RICH COAST,** is so called from it's rich mines of gold and silver, those of Tinsingola being preferred by the Spaniards to the mines of Potofi: but otherwise it is mountainous and barren. It has Veraguas province on the south-east; and that of Nicaragua on the north-east, reaches from the North to the South Sea, about 90 leagues from east to west, and is 50 where broadest, from north to south.

CARTAGO, the capital, 10 leagues from the North, and 17 from the South Sea, on each side of which it has a port, and is 90 miles east of Nicoya. Mr. Gage says, that in his time there were rich merchants here, who traded by land to Panama, and by sea to Porto Bello, Carthagena, and the Havannah, and from thence to Spain.

NICOYA stands 30 miles west of the gulph of Salinas, a large bay of the South Sea, on the frontiers of Nicaragua. It is a pretty town, and the head of a Spanish district, near the mines, which was taken and plundered by the buccaneers in 1687. It stands on the river Cipanfo, which is navigable to it by large periaguas. The Spaniards trade from hence to Panama in salt, honey, maize, wheat, fowls, and a purple juice of a shell-fish in the neighbouring bay, with which they dye * their threads and wool, to mix with their Segovia cloth. This fish, which is, therefore, called the purpura, is not eatable. It lives about seven years, but hides itself about the rising of the dog-star. The shells, which the Indians are employed by the Spaniards to gather in the spring, about Chira, Golfo, Di Salinas, and other parts of this coast, being rubbed together, produce a slime like soft wax, made use of by the dyers: but the chief dye is in the mouth of the fish, and the finest juice in the white vein. The bay receives six rivers, has 20 islands, good anchorage and warehouses; and the banks of the rivers are full of villages, farms, and plantations of sugar canes.

* This is an instance that nature affords matters for dyeing that are little suspected; and it is very likely that we could easily do without logwood, if we had not an unquestionable right to cut it in the bays of Campeachy and Honduras.

The province of **NICARAGUA,** or the **NEW KINGDOM of LEON,** has Guatimala Proper, and the South Sea, on the west; the North Sea and Honduras on the north and east; and the South Sea, with Costa Rica, on the south and west. The winter here is rainy and tempestuous: in summer the air is excessive hot, but healthy. It is reckoned the most woody province in all New Spain. It produces good hemp and flax, and the wood used by dyers in Europe, called Nicaragua wood, but little wheat. It abounds with black cattle and hogs, but has few sheep. It has plenty of balm, cotton, sugar, axi, which is the American pepper, honey, and wax, liquid amber and turpentine, with which, and silver work, the inhabitants drive a considerable trade to Panama and Nombre de Dios. Whales and sea-monsters are frequent on the coast, but, as for the country, it is so pleasant as well as fruitful, that it is, as it were, the garden of America, the hills and rivers being full of gold, the trees and woods perfumed; and, when the Spaniards first came to it, they called it Mahomet's Paradise.

The other town is **GRANADA,** which stands on the south-side of the lake 60 miles south-east from Leon, where the Spaniards have mills for making of sugar, there being abundance of canes in the neighbourhood. It is the most frequented of any town in North America, for the merchants of Guatimala dispatch their goods from hence by the way of Carthagena, as thinking it safer than to send them by the gulph of Honduras, where they are often intercepted, in time of war, by the English and Dutch.

NEW SEGOVIA, is a city 30 leagues from both the former, to the north.

JAEN, at the mouth of the lake Nicaragua, 30 leagues from the North Sea. Here goods are usually lodged that come to or from the North Sea by the river, where they unload at the cataracts, and embark them in other vessels.

REALEJO, or **RIA LEAXA,** on a plain a league from the fort called Possession, and 15 leagues north-west from port St. Juan, stands on a river which falls into the South Sea 30 miles north-west from Leon, which city it serves as a harbour. It is capable of receiving 200 vessels, and the king of Spain's ships for the South Sea were formerly built here. There are intrenchments to defend the harbour, which is 3 leagues below the town, and very fine docks, but it has suffered much from the buccaneers. It's chief trade is in pitch, tar, and cordage, for which it is the most noted place in all Spanish America; they being exported from hence to Carthagena, Porto Bello, La Vera Cruz, and even to the Havannah. A fine river of the same name runs into the haven, which is safe from all winds, and has five islands within it fit for careening ships. The adjacent country is pleasantly watered with rivers, whereof that which runs into the haven has eight branches, whereby goods are carried to and from the villages, farms, and sugar plantations belonging to the inhabitants of this town and Leon. The port is the most in use for shipping of any in all these seas, especially between Acapulco and Panama, ships coming to it from all parts of the South Seas. It is sheltered by an island at the mouth of it that breaks off the sea, which would otherwise come rolling into the harbour, with waves as high as mountains. The island, lying thus in the entrance, forms two channels into it, one to the south-east, the other to the north-west, the last of which is by much the best for navigation; so that none but small craft go into the former.

The province of **HONDURAS,** or **CAMAAGUA,** extends east and west along the North Sea above 130 leagues, and in some places is near 60 leagues over from north to south, but it is narrower at both ends. It has the North Sea on the north and east, Nicaragua on the south, Guatimala Proper on the south-west, and Vera Paz on the west. The country consists generally of hills and deep dales, and has a good air. It is rendered the more fruitful, by the inundations of it's river about Michaelmas, when the natives carry the water by canals to their fields and gardens. In many parts of the country, the soil bears Indian corn thrice a year. It moreover yields European wheat and pease, and has excellent pasture, with honey, wax, and abundance of all sorts of provisions, besides mines of gold and silver. The country was once exceeding populous, till it was thinned by the Spaniards, who are said to have tortured and put many of them to death, to make them discover their gold and silver; besides many more whom they killed afterwards, by forcing them to work in the mines, and carry burdens beyond their strength.

The bay of Honduras, which, as was formerly that of Campeachy, is noted for cutting of logwood, and lies betwixt cape Honduras in north latitude $15\frac{1}{2}$, and cape Catoche, the easternmost point of Yucatan, in latitude $21\frac{1}{2}$. The great lake of Nicaragua runs into it, by a river called Rio d'Angeles or Angelos, which is only navigable by small craft. There are several small islands in the bay, of which we have no description, particularly the Pearl Island, a little to the north; but they do not fish up so much pearl here as formerly, nor so large. Into this bay a small river also runs from the province of Veraguas, which the Spaniards call Rio de Sucre, or the Sugar River, because of the sugar-works here; of which the country is so full, that, did not the Spaniards

niards consume such quantities of it in the sweet-meats, preserves, conferves, &c. which they spend here, and in those they send home as presents, besides what they use to sweeten their chocolate, limonades, and other luscious liquors, they might be able to send many ship-loads of sugar to Europe from these two provinces.

R E M A R K S.

As it may here be expected we should give an account of the cutting of logwood * by the English, &c. so much complained of by the Spaniards, and assigned by them as a just provocation for their depredations on our ships, before the commencement of the last war in 1740; we shall give it as brief as possible from Capt. Uring, who was sent over deputy-governor of the islands of St. Lucia and St. Vincent, by the late duke of Montague the governor, and from Mr. Atkins, in his Voyage to Guinea, Brazil, and the West-Indies.

- * Under the article Logwood, we have stated the nature of this trade, and the right that Great-Britain has to the cutting the same, as well in a certain part in the bay of Honduras, as in that of Campeachy: since the writing of which, an eminent merchant has obliged me with a map of the river Bellefe (a.) in the bay of Honduras, which I have particularly mentioned, drawn by Capt. Uring, who was a relation of his, and referred me to the perusal of the captain's voyages upon the logwood trade, I had, indeed, frequently met with those voyages quoted, and read the whole of his expedition to St. Lucia, but never before met with his map of the river Bellefe, nor with the account he himself gives of the logwood trade as carried on there. But what the captain says, upon this occasion, corroborates the information that I have intimated to have received from others: and, therefore, as what I have urged, in relation to the before-mentioned river Bellefe, proves to be matter of FACT; it is to be hoped, that some attention may be given to the expedient which I have done myself the honour humbly to suggest, with a view only to reconcile those unhappy misunderstandings, which still subsist between the crown of Great-Britain and that of Spain, in relation to the cutting of logwood in the bays of Campeachy and Honduras. The above was observed before the last war, and the DEFINITIVE TREATY of 1763.

(a) See Capt. Uring's Voyage from Madeira to Jamaica and the bay of Honduras, p. 354 and 362.

The country where the English cut their logwood is, says the captain, all a flat, and great part of it a morass, with several large lagunes, which are very often overflowed. In the dry season, when the logwood-cutters have found a great number of trees, they build a hut near them, where they live during the time of their cutting. When they have cut down the tree, they chip off the bark and lay it in heaps, making paths to each, that, when the rains come in, which overflow the ground, they are so many channels, where they go with small currents and land them, bringing them sometimes 30 miles to the Barcaderas, from whence the buyers come to fetch it at the price of about 5 l. a ton Jamaica money. During the floods, the logwood-cutters dwell at the Barcaderas, which are 42 miles up the river, where they have their huts built upon high banks, to secure them in the time of the floods. As soon as they have notice of any vessel's arrival at the mouth of the river, they flock down, in order to purchase what things they want, which are chiefly wine, rum, and all sorts of liquors, provisions, and small arms, powder and shot, cutlasses or hangers, and ozenbrigs, which is almost all their apparel, except hats and shoes; and their pavilions are also made of ozenbrigs, because of the multitudes of musketoos and other biting and stinging flies. Mr. Atkins observes, that the logwood-cutters were originally settled in the bay of Campeachy; but, being disturbed by the Spaniards, removed to the bay of Honduras, where they support themselves by force of arms, having, according to late accounts, 1500 masters and servants. The river that runs up to the Barcaderas, is not only narrow and full of alligators, but has a strong current from the land freshes, and the banks are so covered with shrubs, that it is difficult to row the boats which carry the effects. At the season for cutting logwood, which is once a year, they remove their tents sometimes many miles from their chief residence to follow the wood, which runs in a vein or line of some miles, perhaps like minerals in the earth, and they run over as many, perhaps, without finding a stick of it. They cut it in large pieces, and leave it on the ground 'till the land floods favour their bringing it into the river, from whence the canoes take it and carry it to their grand store at the Barcaderas. As they know what they must expect from Spanish clemency, they are always provided with good arms to defend themselves desperately against attacks, which are always by sea, but seldom here than they used to be in the bay of Campeachy. A servant, which is the first step with seamen into the trade, is hired at a ton of logwood per month, and, having one day in seven to himself, he makes about 10 l. a month; so that, if they are sober fellows, they in time become masters and join stocks, or trade independently. They have a king chose from among themselves, and his consort has the title of queen, and they are governed by certain

rules of their own making. The ships that come into the bay are on their guard alló, and fetch the logwood down in flat-bottomed boats. The crew of each is allowed on the voyage a bottle of rum and some sugar, and they row generally in the night because of the stinging flies, and rest in the day. See the article LOGWOOD.

TRUXILLO, or TRUGILLO, stands on an eminence in the north side of the province 45 leagues north-east from Valladolid, and one from the North Sea; it is situated between two rivers, the mouths of which, and some islands that lie before, form the harbour, which lies at the bottom of a bay called St. Giles, is above two leagues broad, and is defended by a castle; but it has been plundered several times by the buccaneers. It is said to be the only harbour on this coast capable of trade, but has very little: the town lies a league up one of the rivers. The harbour is deep and secure, the country exceeding fruitful, and the soil moist and rich; and, notwithstanding the hot climate, it is exceeding populous. It produces both corn and grapes twice a year, and the cattle brought from Spain increase here prodigiously.

GRACIAS A DIOS, stands at the mouth of a river, upon a rocky mountain, which has some gold mines in its neighbourhood, and was built the same year as Valladolid, from which it lies about 27 leagues to the west, to secure the miners. Mr. Gage says, that the neighbouring valley abounds with wheat, which is transported for the most part to Guatemala, and breeds very good mules and horses.

ST PEDRO, which Laët says is the residence of the farmers of the king of Spain's customs for this province, is above 30 miles north-east from Gracias a Dios. It lies in a hot unhealthy climate, but had a great trade before the discovery of Golfo Dolce, by which commodities are now carried up into the country. In 1666, the town was burnt by the buccaneers.

RUATAN, or RATTAN, is an island in the bay of Honduras, which was desert, and only the resort of pirates, 'till a few years ago, when the English began a settlement on it. It lies 8 leagues from the Mosquito shore, and about 200 leagues west by south from Jamaica; it is about 30 miles long and 13 broad, naturally fortified with rocks and shoals, excepting the entrance of it, which is so narrow, that only a single ship can pass it at a time, which was to be guarded by two forts. The view of this settlement was not only to secure a great trade in logwood, but to traffic with the Spaniards of Guatemala for cocheneal, indico, &c. For this purpose, 300 land forces, commanded by Major Cawfield, sailed from Jamaica the 13th of August 1742, under convoy of the Litchfield, and five other men of war, and on the 23d arrived at Port Royal harbour in this island, one of the finest in the world, where 500 sail of ships may always ride safe. This island is overgrown with wood, but remarkably healthful, and not near so hot as Jamaica, there being strong easterly winds here commonly to cool it. It has plenty of excellent water, a great number of wild hogs and deer, ducks, teal, pigeons, and parrots, and the sea abounds with fish of all kinds, particularly crab-fish and fine turtle*.

- * The possession of this island would have proved a great security to our logwood trade in the river Bellefe in the bay of Honduras.

The Mosquito, or Musquito Indians, are a nation on the continent betwixt Truxillo and Honduras, so situate between morasses or inaccessible mountains, and a coast full of rocks and shoals, that no attempts against them by the Spaniards, whom they mortally hate, could ever succeed. Nevertheless they are a mild inoffensive people, of much morality and virtue, and will never trust a man who had once deceived them. They marry only one wife, and never part with her, unless for adultery, which is seldom known among them; and so great a regard is shewn to matrimony, that even an elder brother, unmarried, gives precedence to a younger, if married. They have no kind of vice among them, nor any occasion for magistrates. When the duke of Albermarle was governor of Jamaica, these people put themselves under the protection of the crown of England, and their king received a commission from his grace, under the seal of that island, since which they have not only been steady in their alliance with the English, but warm in their affections, and very useful to them on many occasions. When their king dies, the next male heir goes to Jamaica, to certify that he is next in blood, and he receives a commission in form to be king of the Mosquito's, 'till which he was not acknowledged as such by his countrymen; though, after all, unless he is at war, he has no revenues nor guards, and very few prerogatives, being obliged, in time of peace, to fish and fowl for the support of himself and his family; yet he has presents sometimes from the government of Jamaica and the English traders, who often touch there. Nay, so fond are they of every thing that is English, that the common people are proud of every christian or surname given them by our seamen, who honour their general and other grandees with the titles of some of our nobility*.

- * These people likewise may be rendered very serviceable to the English in support of their logwood trade in the bay of Honduras.

The province of GUATIMALA PROPER extends, according to the Sanfons, 150 leagues along the coast of the South Sea, and 30 or 40 in breadth; but Capt. Cook makes the length only 70 leagues. It has the province of Honduras on the north-east, Vera Paz on the north-west, Nicaragua on the east, Sononufco on the west, and the sea on the south.

The soil in the vallies is exceeding fruitful in corn, indico, cocheneal, and other rich drugs for dyeing, as well as cacao, and other Indian fruits; produces balms, bezoar, liquid amber, choice gums, salt, brimstone; and has large fine pastures, so covered, says Mr. Gage, with cattle, that some graziers are said to have herds of 40,000 black cattle, and as many sheep. The cattle run wild in the mountains, where they are hunted by the blacks, and great numbers are sent annually to Spain. Here are also several plantations of sugar, and mines of silver. But Cook says, their grain does not hold a year.

The rivers of this province abound with all sorts of good fish. Cotton is a staple commodity, as is also wax; and their bees make honey as white as the comb itself.

ST JAGO DE GUATIMALA, the chief town and the old city, which was one of the finest in New Spain, was utterly destroyed by a dreadful hurricane and earthquake in 1541, when 120,000 Spaniards lost their lives. It was built at the bottom of a volcano, with two tops, from one of which fire issued, from the other water. The present city, which is not only the capital of this province, but also of the audience, the residence of the president, and the royal courts, the seat of a rich bishop, suffragan of Mexico, an university, and the center of commerce in all those parts, stands in a fine valley on a river, about three leagues from the volcano, and is reckoned one of the largest cities in North-America. It is well built and populous, being thought to contain about 8000 families; and the citizens carry on a great trade, not only through all the provinces of Mexico, but even into Peru, by the ports of La Trinidad and Realejo, the one 25 leagues, the other 46 from it; and it's trade with Spain is from Golfo Dolce, that runs into the North Sea at 60 leagues distance.

Many vast estates are got here by trade, and, when the merchants have left off, they go generally to reside at Mexico. The chief commodities in which they deal, are hides, indico, annatta, silvester, cocheneal, cacao, &c. and, indeed, no city can lie more commodious for an extensive trade, and be safer at the same time from pirates and privateers, for it stands 8 leagues (which Moñ and Sanfons call 40 miles) from the South Sea, and about 40 leagues from the gulph of Mexico, by which it drives alfo a great trade; but it is still liable to frequent earthquakes as well as to eruptions, from the volcano above-mentioned.

TRINIDAD, or LA SONSANATE, a port town on a bay of the South Sea, 4 leagues from Acaxatla, 65 miles south-east of Petapa, and 162 from Guatemala, consists of four or five hundred Spanish families, besides Mulattoes and Indians, and has five churches and a monastery. It is the place to which all goods are transported that are brought to Acaxatla from Peru and Mexico. It is 3 leagues from the harbour to the town, which is of great resort, it being the chief place of trade betwixt New Spain and Peru, and the nearest landing harbour to Guatemala for ships from Panama, Peru, and Mexico, but is a place of no defence. There are three volcanoes in the neighbourhood. The coast is low, and has good anchorage.

ST. SALVADOR, or CUZCATTAN. Moll places it at the head of a river, that runs about 47 miles, and falls into the harbour of St. Michael, 150 miles east from Guatemala. In the bottom where the town stands, there are manufactories of sugar and indico, and some farms of cattle.

VERA PAZ PROVINCE, has the bay of Honduras and the province of Chiapa on the north, that of Guatemala on the south, Honduras on the east, and Soconufco, with part of Chiapa, on the west.

The chief commodities are drugs, especially medicinal gums, sarsaparilla, China root, and mechoacan, achiotte, liquid amber which drops from trees, cacao, cotton, wool, honey, maize, wax, and feathers, of which the Indians make curious works.

CHIAPA is an inland province, having Tabasco on the north, Yucatan on the north-east, Soconufco on the east and south, Veraz Paz on the east, and Guaxaca on the west. Here are great woods of pine, cypress, cedar, oak, myrtle, and walnut-trees and wood-vines; trees that drop rosin, aromatic gums, balsam and liquid amber, tacamahaca, copal, and others that yield sovereign balsam. Here is no want of corn, pears, apples, quinces, cacao, and cotton, and cocheneal grows wild.

The chief of it's rivers is that of Chiapa, which runs from the north cross that part of this country, which is inhabited by the Queleenes, and falls into the sea at Tabasco. It is in short well watered, and drives a pretty brisk trade with the neighbouring provinces, especially in cocheneal and silk; wherein the Indians employ their wives, in making handkerchiefs of all colours, which the Spaniards buy and send home. Mr. Gage says, that, though the Spaniards reckon it

one of the poorest countries in America, because it has no mines or sand of gold, nor no harbour on the South Sea, yet it is bigger than most provinces, and inferior to none but Guatemala; that it is a place of great importance to the Spaniards, because the strength of all their empire in America depends upon it: and that it ought to be well fortified, because of the easy entrance into it by the river of Tabasco Puerto Real, and it's vicinity to Jucatan.

The places of chief note are two towns, both called CHIAPA. The one is inhabited by the Spaniards, the other by the Indians. It's chief trade is in cacao, cotton, wool, sugar, cocheneal, and small pedlars wares. The friars are the chief merchants of European goods, and the richest men both in the city and country.

The audience of Mexico.

This, which is the noblest part of the Spanish dominions, is bounded on the north with New Mexico, on the east with the North Sea, or gulph of Mexico, has the South Sea on the south and south-west, and on the south-east side it joins the provinces of Chiapa and Soconufco in the government of Guatemala.

It is divided into seven provinces, viz. Jucatan, Tabasco, Guaxaca, Mexico Proper, Mechoacan, Tlascala, and Panuco. The province of JUCATAN, or YUCATAN, is a peninsula, surrounded on the west and north by the gulph of Mexico, betwixt the bay of Campeachy on the south-west, and that of Honduras on the south-east, and has the little province of Tabasco on the south-west, and that of Vera Paz in the audience of Guatemala on the south. Here it is joined to the continent by an isthmus not 40 leagues in breadth, and runs out into the sea 100 leagues. It is in all respects a most noble country. It extends from north latitude 17 to 21, 30, and west longitude 88 to 92. The climate is pretty warm in the summer, which begins in April and ends in September. They have scarce any rain in the winter-season, which, however, is indifferently cool, excepting January and February, which are almost as hot as in the middle of summer; yet in the main it is a very healthy country, especially a mountainous tract, which runs from Salamanca on the west, quite across it to the east. The soil, when duly cultivated, bears plenty of corn, cotton, and indico, and abounds with all sorts of cattle, wild beasts, honey, wax, and fowls, and on the coasts are taken great pieces of amber: but, as no mines were ever found in it, the Spaniards have not been fond of settling here.

MERIDA is it's capital city, the seat of a governor, and the see of a bishop near the north side of it, betwixt the gulph of Mexico and Honduras, about 12 leagues from each.

CAMPEACHY, or as it is called by the Spaniards ST. FRANCISCO DE COMPEACHE, the see of a bishop, is 120 miles south-west of Merida.

It stands on the shore, in a small bending of the land, near the mouth of a river, which falls into it's bay on the south-west angle of this province; and is the only town on all the coast to cape Catouche, at the north-east point, that lies open to the sea. It makes a fine shew, the houses being built all of good stone. There is a dock and good fort at one end of the town, with a governor and garrison, which commands both the town and harbour; nevertheless, in 1659, the English stormed it and took it with only small arms, and it was taken again by surprise in 1678, by the English and buccaneers. The port is large but shallow. It used to be a noted market for logwood, as we observed in Honduras. See our article LOGWOOD.

The chief manufacture of the adjacent country, besides salt and logwood, is cotton cloth, which is the cloathing of all the natives, and even of the poorer Indians. Capt. Dampier gives this account of the bay: it runs in deep within land, betwixt cape Concededo on the east, and St. Martin's cape to the west, which is 120 leagues, and has many broad lakes that are navigable. From cape Concededo it is 15 leagues south to Salinas, where is a small harbour and a large pond near the shore, which yields abundance of salt that is transported to the gulph of Mexico. In May or June when the salt kerns, not less than 40 or 50 Indian families at a time come and rake it ashore in heaps: then covering them with dry grafs and reeds, they set fire to them, which burns the outside, giving it a black crust, which afterwards defend the salt against the rains.

TABASCO province is bounded with that of Guaxaca on the west, on the east by that of Jucatan, on the south by part of the audience of Guatemala, and on the north by the gulph of Mexico, on which it extends from east to west about 40 leagues. It being a narrow slip by the sea-shore, the climate is not very healthy, nor the soil exceeding fruitful, yet the people have good farms, well stocked with cattle, which yields them considerable profit; and moreover, they have great plenty of Indian wheat and cacao, which they send on the backs of mules to Vera Cruz. Most of the country is flat and moist, has marshes and lakes, abounding with fish, some of them very large, as manatees and tortugas.

GUAXACA province reaches from the bay of Mexico on the north to the South Sea, having the province of Tlaxcala on the north-west, and those of Chiapa and Tabasco on the south-east. It extends near 95 leagues along the South Sea, 50 along the bay of Mexico, and near 120, according to some, along the side of Tlaxcala, but not above 50 on that of Chiapa. The air is good and the soil fruitful, especially in mulberry-trees, so that it produces more silk than any province in America, except that called the valley of Guaxaca; most parts of it are mountainous, yet it abounds with wheat, cattle, sugar, cotton, honey, cacao, plantanes, and other fruits. It has rich mines of gold, silver, and lead, and all their rivers have gold in their sands; cassia, cocheneal, crystal, and copperas, likewise abound here; so that were the people industrious, they might be the richest in the West-Indies. But they are habituated to a slothful life by the clergy, who have 120 monasteries here.

The vanello, a drug so valuable for its perfume, and used to give a flavour to chocolate, is the produce of this province. It grows, indeed, in sundry parts of Mexico, but is no where so plentiful as here.

GUAXACA, the capital of this province, is a bishop's see, and the seat of a governor; 120 miles west of Spirito Santo, 230 miles south of Mexico, in the sweet valley of Guaxaca, which is 40 miles long, and 20 broad, and in the road which leads through Chiapa to Guatemala. It is a middling city, but has a great trade with both the North and South Seas.

The river here is not fortified, so that small vessels might easily sail up, and subdue the country. The best chocolate in America is made here by the nuns, and exported to Spain. In the neighbouring valley there are many rich towns, cloisters, and churches, an excellent breed of horses, and great herds of black cattle and sheep, which afford wool to the clothiers of Los Angeles, and hides to Spain.

ST. ILDEFONZO DE LAS ZAPATECAS is a town on a hill, 20 leagues from the former. Its territory is rich in gold, cotton, and Indian wheat; and the river Alvarado, or at least a branch of it, is navigable to it by banks.

SPIRITO SANTO stands at the foot of mountains, on the north coast, towards the frontiers of Tabasco. The inhabitants trade in cotton, maize, and gold.

TECOATEPEQUE lie at the bottom of a bay, in the South Sea, above 100 miles east from Guatulco. According to some, Mr. Gage says, that small vessels traded on this coast in his time, and that it was the chief fishing harbour in all this country. It had also rich merchants, who dealt not only to Mexico, but to Peru, and the Philippine islands, and by land, to Guatemala, to which there was a plain road along the coast.

TEPANATEQUE is a town at the foot of the mountains Quelenos, which, according to Gage, is one of the pleasantest in the country, and the best furnished with flesh, fowl, and fish, it lying near the sea and a river, and among rich farms, stocked with, from one thousand, to four thousand head of cattle a-piece.

TLASCALA province, or **LOS ANGELOS**, has also the advantage of lying both on the North and South Sea, having that part of the former, which is the gulph of Mexico, on the east; the province of Guaxaca, on the south-east; the Pacific Ocean, on the south; the province of Mexico Proper, on the west, and that of Panuco, on the north-west. Its climate, soil, and product, are much the same with those of Mexico Proper.

PUEBLOS DE LOS ANGELOS, the present capital of the province, and much the finest place in it. It even vies, for magnificence, with the city of Mexico; and the wealth of the place, or rather of the clergy, may be guessed at, from the yearly revenue of the cathedral and chapter, which amounts to three hundred thousand pieces of eight.

The best felts in the country are made in this city, and it has a mint, and a glass-house, the first that was known in all New Spain.

LA VERA CRUZ, the grand port of New Spain, on the North Sea. There was an old town of this name, which falling to decay, by reason of the badness of the port, and other causes, this new town was built at about 15 or 16 miles further to the east, there being a port, small, but safe, and so well situate, that it was capable of being effectually protected by a fort on a rock of a neighbouring island, which was accordingly built, and called St. John de Ulua.

This new Vera Cruz is not a place of very great extent, being not inhabited by any Spaniards of distinction, by reason of its unwholesome situation, between vast tracts of dry land on one side, and rank bogs on the other; yet, as to trade, this is one of the most considerable places, perhaps, in the world: it is the natural center of the American treasure, and the magazine of the bulk of the merchandize that goes out of New Spain, or is transported from Europe. It abounds, in a word, with the treasures of both the Indies. It receives a vast quantity of East-India commodities, overland, every year, from Acapulco. [See the article ACAPULCO.] At the same time, the warehouses are generally full of European goods; and, in fact, the merchants here

carry on as great a trade as it is possible for the Spaniards well to carry on throughout America.

This place has not only a very considerable commerce from Mexico, but by Mexico from the East-Indies; likewise from Old Spain, from Cuba, St. Domingo, Yucatan, and from Peru, by the way of Porto Bello; from Carthagena, and all the islands in the North-Sea; also by the river Alvarado, which goes up Zapotecas, St. Ildefonso, and towards Guaxaca, and by the river Grijalva, running up to Tabasco, Los Zeques, and Chiapa. The goods are sent from hence to Mexico, Puebla de los Angeles, Sacatecas, St. Martino, and other inland places, upon horses and mules, or in waggons drawn by oxen, and carts drawn by mules. The Barlovento fleet, which is a small squadron, employed to clear the coast from pirates; and interlopers come hither constantly in October.

When the *flota*, which is always obliged to winter here, arrives, and unloads the goods from Old Spain, and takes in those of Mexico, as well as the merchandize that comes from the Philippine islands, by the Acapulco ships, a fair is opened here, which lasts many weeks; sometimes 'till the ships are ready to depart: then this place may be said to be immensely rich; but the most wealthy merchants not only reside at the city of Los Angeles, the far greater part of the year, but also keep their plate there, till such time as the *flota* is just ready to go off, [see the article *FLOTA*,] which ought regularly to be in May, but is sometimes detained 'till August: therefore, the constant inhabitants of this place are only Mulattoes and Mestizoes, with a few Spanish factors, who, after a short stay, make vast fortunes; inasmuch, that he is reckoned an inconsiderable fellow, who is not worth an hundred thousand pounds. The inhabitants, slaves and all, are computed at about three thousand, and the city is about half a Spanish league in compass. The soil is barren, so that their provisions are far fetched, and dear bought. Vera Cruz having been taken and plundered by the buccaneers, several times, the Spaniards have built several forts, and keep centinels all along the coast.

The old town stands about a mile from the shore, and was called Vera Cruz, because Cortez landed here on Good Friday, in 1518.

The new town, which our sailors commonly call La Vera Cruz, stands 12 leagues to the north-west of the river Alvarado, according to Dampier, and 60 leagues south-east from Mexico, of which it is reckoned the eastern port, as Acapulco is the western. The men are haughty, and fond of state and ease; for which reason they are slothful, though they understand trade very well.

ALMERIA, called **VILLA RICA** by the Spaniards, because of the gold they found here on their arrival, lies on the coast above 20 leagues north of the former, has an indifferent port, and a better air than Vera Cruz, with a small river, good springs of fresh water, and a dry country behind it; all which are wanting in Vera Cruz. It is said that a great clandestine trade is drove here, between some Spanish merchants on shore, and the French of St. Domingo and Martinico.

The province of Mexico Proper has that of Tlaxcala on the east, that of Mechoacan on the west, that of Panuco on the north, and the Pacific Ocean on the south. The climate is very variable, yet both pleasant and temperate. The soil is remarkably fruitful, and all the necessaries of life extremely cheap. Its commodities are much the same with those of Mechoacan, only the mines yield much more silver, which sometimes also hold a very considerable portion of gold. It is said to excel all the provinces of America, in corn, cattle, and fruits; and it's lakes and rivers abound with variety of good fish, so that the tribute of the lake of Mexico alone, is above twenty thousand crowns a year.

The royal city, and archbishop's see of Mexico, is the capital of this province, of the audience, and of all New Spain, and the seat of the viceroy; it stands in the lake of its own name, on the east side of a valley, at the foot of a ridge of hills; and, according to the Spanish writers, lies in the latitude of 19, 40. That we may pass a good judgment of the opulence of this city, it may be observed, that the tenths, collected from the 11 suffragan bishops, under its archbishop, (viz. Puebla de los Angeles, Mechoacan, Guaxaca, Guadalajara, Guatimaga, Yucatan, Nicaragua, Chiapa, Honduras, and New Biscay,) are computed at about half a million of pieces of eight, those prelates receiving, at least, 1,200,000 pounds sterling a year. Though this may help us to form some idea of the wealth of the Mexicans, it may be still farther conjectured, from this observation, viz. that there was brought into the king's exchequer here, in 1730, more than a million of marks of silver, as the king's duty from the mines, which ought to be one fifth of the metal taken out of them. According to this, the whole produce of the mines must amount to five millions of marks; and a mark being equivalent to eight of our ounces, if we compute this silver at five shillings the ounce, then the inhabitants of Mexico receive TEN MILLIONS OF MONEY PER ANNUM FROM THEIR MINES.

As to the wealth of the merchants in particular, it may be more easily imagined than ascertained, considering that they pay five or six times more for European goods, than they are to be had for where they are manufactured. Thus, a piece of scarlet cloth, worth, in London, TWENTY-FIVE, OR TWENTY-SIX SHILLINGS A YARD, shall be sold here at SIXTY AND SEVENTY PIECES OF EIGHT PER YARD; and it is common for a Spaniard to give frequently A THOUSAND PIECES OF EIGHT FOR A NEW SUIT OF CLOATHS: so that when this is considered, and that the money they return, is in proportion to such a valuation, what must be said of the wealth of this place? In short, the warehouses of the merchants shew it, who, against the time they go to Vera Cruz, to meet the flota from Old Spain, hire a prodigious number of horses, mules, and carriages, to carry the silver they have ready to be shipped there, and to pay for such goods as they shall purchase; so that it is no wonder the galleons bring off, from sixteen to twenty millions of pieces of eight sometimes from St. John de Ulua. See the article GALLEONS.

In the goldsmith or plate-worker's street here, which is called the PLATERIA, next to the great square or market-place, the shops are furnished with such a variety of utensils and ornaments of gold, silver, and jewels, as is not to be paralleled in any other city in the world; for the very negroe wenches, that walk by the ladies coaches here, WEAR BRACELETS OF GOLD, AND PEARL NECKLACES, AND JEWELS IN THEIR EARS; and the black foot-boys are dressed in rich liveries, DAUBED WITH GOLD AND SILVER LACE. Here they are always making church and family plate, especially when the merchants are bespeaking goods against the arrival of the galleons, at which time the shops and warehouses are filled with chests of plate, designed for Old Spain, &c. piled up to the very ceilings. The glasses, or safes, like those of our goldsmith's shops, are full of gilt plate in services and sets; the cabinets filled with vast quantities of rubies, emeralds, and pearls, rings, large jewels, and numberless toys, but especially gold snuff-boxes enamelled and set with rubies and emeralds, of which, it is said, that ten thousand are sometimes to be seen in this street; and hardly a fleet departs for Old Spain, that does not carry off at least five thousand of them. The Mexicans have been perfected in the art of working plate by the Chinese, who come hither every year.

ACAPULCO lies in the south-east corner of this province, on a bay of the South-Sea, and about 210 miles south-east from Mexico, of which it is the chief port on this sea, as it is the chief mart on the coast. It is allowed to be an excellent harbour, far superior to any on this coast for it's being spacious, and withal so safe, that several hundred ships may anchor in it, without the hazard of damaging one another. The mouth of the harbour is crossed by a low island, about a mile and half long, and half a mile broad, which leaves a good wide deep channel at each end, where ships may safely go in and out with the advantage of the winds. They must enter with the sea wind, and go out with a land wind, which seldom or never fail to succeed each other, in their proper season of the day and night. The westernmost channel is the narrowest, but so deep, that there is no anchoring, and the Manilla ships pass in that way; but those from Lima enter through the south-west channel. This harbour runs in north, about three miles; then growing very narrow, it turns short about to the west, and runs about a mile farther, where it ends. The town stands on the north-west side, at the mouth of this narrow passage, close by the sea; and, at the end of the town, there is a platform with a great many guns. Opposite to the town, on the east side, there is a high strong castle, said to have forty guns of a very great bore. Ships commonly ride near the bottom of the harbour, under command both of the castle and platform.

The commerce of this place, with Peru, is not, as many writers have mistaken, confined only to the annual ship from Lima; for, at all other seasons of the year, except that wherein the Acapulco ship arrives, which is about Christmas, the trade is open, and ships of Peru come hither frequently, to sell their own commodities, and carry back those of Mexico: but, because the great importance of this place, is owing to the annual ships of Lima and Manilla, therefore some writers have been so mistaken, as to think that these are all the vessels which come hither: whereas, the only commerce which the Philippine islands have with the rest of the world, is by this port of Acapulco. Indeed, 'till within these thirty years past, there never was more than one annual ship, which passed between Manilla and Acapulco; but now there are two, one a prodigious unweildy galleon, of a thousand, or twelve hundred tons, and the other a frigate, or convoy, which carries betwixt twenty and thirty guns. This is the effect of that strict regulation, whereby the inhabitants are tied down, to send no more than this ship every year; which is laden with all the product of the East, such as ambergris, civet, bezoar, large oriental pearl, vast quantities of piece goods, and gold dust, to the value of one hundred thousand pounds sterling. This voyage to Acapulco is extremely dangerous; and the longest, by far, that can be made from land to land: they touch indeed at Guam,

one of the Ladrones islands, and, except a day or two's stay there, pass three thousand leagues, without seeing any thing but sea or sky; but no wonder such hazards are run, if it be considered, that the captain of the galleon makes forty thousand pieces of eight, the pilot twenty thousand, each of his two mates nine thousand, and every common seaman, with prudent management, a thousand.

They sail generally from Manilla towards the latter end of June, and arrive here always about ten days before, or after Christmas. About the same time comes the annual ship from Lima, laden with the richest commodities of Peru, as quicksilver, cacao, &c. and at least with two millions of pieces of eight, to be laid out in the purchase of Indian commodities, at the fair of Acapulco, which lasts sometimes thirty days; at which, such as come from the East-Indies, furnish themselves with European goods, brought hither over-land from Vera Cruz.

This ship from Lima stays 'till the Manilla ship arrives, and then returns. At this fair, Acapulco, which at other times is but a paucity town, consisting of two or three hundred thatched houses, becomes a populous city, crowded with the richest commodities of both the Indies, and with merchants from Mexico, Lima, Cusco, and all capital places of Peru, and even from Chili; inasmuch that every house is then an inn, besides the huts and tents erected without the town; and people pay a dollar per day for their ordinary.

When the fair is over, the goods belonging to the Mexican merchants are transported over-land by mules; those which are sent to Peru, are laden not only on the annual ship, but on many others, and the galleon as soon as possible, prepares for her return to Manilla. It is to be observed, that heretofore the Lima ship was only a small twenty-gun ship; but since the British privateers have found the way to the South Seas, this vessel carries not less than 40 guns; and is moreover allowed one tender, sometimes two. The galleon returns from hence to Manilla, in much less time than she comes; for in her passage from latitude 17 to 19, she runs away before the wind, and performs a voyage of about two thousand leagues, in ten, twelve, or thirteen weeks at most. She commonly carries ten millions of dollars from hence, out of which are paid all the king of Spain's garrisons in the Philippine islands, which amounts to no less than two thousand five hundred pieces of eight. Dampier says, the two Manilla ships make the voyage alternately; that in June, when that which sets out in April from Acapulco arrives at Manilla, the other sets out for Acapulco, and stretches to north latitude 36, or 40, 'till she meets with a wind that brings her to the American shore. She falls in first with California; and never fails of a wind to bring her from thence, south along the coast, to Acapulco, and sets her passengers for Mexico a shore at Salagua.

The ships fitted out from Acapulco to Manilla, formerly went one year, and returned the third year; afterwards once in two years; but the trade is so much increased since, and it is managed with such dispatch at the Philippine islands, that there are now two ships sent yearly from hence, which return about the end of the same year. These carry out no less than ten millions of pieces of eight every year: that is to say, in money and goods; of which last they carry great cargoes, both of European and American sorts. The goods they bring to Acapulco, from the Philippine islands, are white and painted calicoes and chints, diamonds, and elephants teeth; fine muslins, plain, striped, and flowered; India romalls, and especially attalasses, taffaties, and damasks; tea, especially bohea; cloves, of which they sometimes bring from sixty to a hundred ton at a time; nutmegs and mace, from twenty to thirty ton; cinnamon, of Borneo pepper, a greater quantity than ever; saltpetre and sulphur, quicksilver, sticklack, and several drugs; china ware, and laquered japan. These goods are dispersed from hence to all the coasts of Peru and Chili, which being so long, cannot but employ abundance of men, as well as ships, which generally return with gold from Chili, silver from Peru, and corn and fruits from both. See ACAPULCO.

PORT MARQUIS is a good harbour, a league to the east of Acapulco, where the ships from Peru generally run in contraband goods.

PACHUCA, 60 miles north from Mexico, noted for silver mines in it's neighbourhood, of which Gemelly says, that in the space of 6 leagues, there are not less than a thousand, one of them called the Trinity, at which one thousand men were employed every day, and from whence, in ten years time, they dug forty millions of silver; but that many of them were worn out, and others dangerous to work. When any person discovers a mine of gold or silver, he has the advantage of it, on paying the fifth of the product to the king; but if he forsakes it three months, without reasons approved by the court; it falls wholly to the king.

PANUCO province is bounded on the north, by Neuleon and part of the audience of Guadaluajara; on the east, by the gulph of Mexico; on the south, by the provinces of Tlaxcala and Mexico Proper; and on the west, by that of Mechoacan. It is situated under the tropic of Cancer, part in the

the temperate, and part in the torrid zone, about 55 leagues in length, and the same in breadth. That part next to Mexico is the best and richest, abounding with provisions, and having some veins of gold, and mines of salt, but turns out very little for want of hands. The part adjacent to Florida is wretchedly poor and barren. This country was one of the first discoveries of the famous Cortez, who took a great deal of pains to conquer and plant it, though it is a country rather fruitful and pleasant than rich, many of the inhabitants having chose to retire to Florida, rather than be slaves at home. This province is but indifferently peopled, and little notice taken of it in many authors, though it was a very extended sea-coast along the gulph of Mexico, with several roads and creeks, but no great ports. Its capital, which is the see of a bishop, is of the same name, and so is the river whereon it stands. The city lies about 17 leagues from the sea, and 60 north-west from Mexico. It was built in the year 1520, by order of Cortez, and called St. Itevan del Puerto. It contains about five hundred families. It is said to have a large harbour, but such a bar, that no great ships can enter; yet the river is navigable within land, by vessels of five hundred ton, which might, it is thought, reach the mines of Zacatecas.

MECHOACAN province is bounded on the north by part of Panuco, and the provinces of Zacatecas and Guadalajara; on the east, by another part of Panuco, and Mexico Proper; on the south, by the latter, and the South Sea, which together with Xalisco, also bounds it on the west and north-west. It extends 70 leagues along the sea, and is of a greater length up the land. It lies in an extraordinary good climate, and fertile soil, and is withal so wholesome a country, that sick people come hither for health, from other parts of Mexico. It has some medicinal waters, which have several degrees of heat, and abounds with rivers and streams of clear brackish waters, which are of admirable use; for though the meadows, through which they run, produce a rank kind of grass; yet, instead of prejudicing their cattle, it makes them exceeding fat and fine. Here is a numerous breed of good horses, both for the saddle and harness; likewise, plenty of honey and wax, and of all sorts of fish. Corn of all kinds grows here in plenty, so that it has sometimes come up to one hundred fold; and no country in the world is better furnished with trees, either for fruit or timber. Its commodities are farafaparilla, sulphur, indico, cassia, sassafras, cacao, ambergris, vanillas, hides, wool, cotton, silk, sugar, &c. But the chief commodity of all, is silver, of which here are several mines (besides others of gold and copper), and its roots, called mechoacan, and sometimes white rhubarb, from its colour and effects: which was formerly in very high repute, and sold in Europe at a great rate; but by reason of jalap being found to answer all intentions better, it is of late much sunk both in reputation and price.

Here are several kinds of trees, noted for their odoriferous gums and balsams. Besides their great and small cattle, here are herds of swine, without owners, wild boars, hares and rabbits, and, among others, that sort of goats in which the bezoar is found. And Francis Ximenes observes, there is a sort of bezoar found in the rivers, which he says, is washed down from the mountains, where there is a great store of bole-armoniack.

COLIMA is a large rich town, upon the South Sea, and near the borders of Xalisco, in the most pleasant and fruitful valley in all Mexico, producing much cacao, cassia, and other things of value, besides some gold. In the neighbourhood grows the famous plant alcacazan, which is reckoned a catholicon for restoring strength, and a specific against all poison. The natives apply the leaves to the part affected, and judge of the success of its operation by their sticking or falling off.

NATIVIDAD, in this neighbourhood, is said to be a good port, from whence ships sail for the Philippine islands; it lies not far from cape Corientes, and serves as a harbour to Colima.

GUADALAJARA audience, or the kingdom of New GALICIA, lies farthest to the north of the three audiences of New Spain, though it is on the coast of the South Sea. It extends betwixt north latitude 20 and 25. On the east and south it has Panuco, and several provinces of the audience of Mexico; on the north the kingdom of New Mexico; and, on the west it is washed by the South Sea and the gulph of California, on whose coast it stretches above 200 leagues, from south-east to north-west; but it is very irregular within land, and the north part especially is very narrow, yet in some places it is reckoned 500 miles broad.

Its climate differs much, by reason of its situation, partly in the temperate, and partly in the torrid zone; yet it is far more temperate than any other part of New Spain, and in the general, reckoned wholesome; so that it is common for people to live here to an hundred years of age.

The land, for the most part is so mountainous and woody, that the coast looks like a desert. It is said the Spaniards have deserted the coast on purpose, that if strangers should land they may not find any temptation to stay, because, besides the silver mines already mentioned, there have been some of gold lately discovered near Compostella, of very great va-

Vol. II.

lue: and they chuse to transport the ore by mules to Mexico, rather than expose so valuable a product to be intercepted by foreigners, if they ventured to send it in small vessels by sea. The country upon the whole, is pretty fruitful, and produces European and Indian grain in such plenty, that the former yields an hundred fold; though it is often destroyed by locusts.

Here are most sorts of vegetables, better than ours, plenty of sugar-canes, cocheneal, and bees without stings.

The pastures abound with all sorts of cattle, and the woods with venison, pines, and oaks, but are infested by wolves, and scorpions. Here are pepper, and medicinal herbs, that cure all sores, green stones, that are a specific against the gravel, fragrant flowers, valuable drugs, and rich mines of silver, copper, and lead. On the coast, also, there is a good pearl-fishery. The better sort of Spaniards are masters of the silver mines, and subsist by trade.

This audience is subdivided into seven provinces, as follow:

GUADALAJARA Proper, which is the principal province, and gives name to the whole audience, is bounded on the east and south by the province of Mechoacan; on the north by that of Xalisco; and a corner of it is washed by the South Sea on the west. Notwithstanding its situation under the torrid zone, it is healthful, temperate, and fruitful, producing not only good timber, but European and Indian wheat in great plenty, and all fruits of both countries, besides the vast treasures of silver commonly taken out of its mines.

XALISCO province, the most southern on the coast, is washed by the South Sea on the south and west; bounded by the provinces of Guadalajara and Mechoacan on the east; and separated from Chiamettan on the north, by a narrow slip of land belonging to the province of Guadalajara, and running out to the sea.

It abounds with Indian wheat and silver mines, but has very little cattle of any sort. According to Herrera, Menardes, and Laet, from this province is brought the oil, as the Spaniards call it, of the infernal fig-tree, which, among other excellent qualities, is good for dissolving tumours, and expelling wind and all cold humours, by anointing the belly, and taking a few drops of it in a glass of wine, as also by clysters. It is likewise of excellent use for ulcers in the head, and deafness.

Though **XALISCO**, an ancient city, is the capital, yet that which is the most considerable of the province is **COMPOSTELLA**, near the South Sea, about 30 miles to the north of it. It is a rich town, and has several mines of silver at St. Pecaque, in its neighbourhood, where the Spaniards keep many hundred slaves to work in them; but the city is a bad situation, the soil being so barren that there is no pasture for cattle.

CHIAMETTAN province lies under the tropic of Cancer, one half in the temperate, and the other in the torrid zone, stretched along the South Sea on the west; bounded by Zacatecas on the north-east; by Culiacan on the north-west; and by Xalisco and Guadalajara on the south and south-east. It is a fruitful soil, and yields much wax and honey, besides mines of silver. The river of St. Jago falls into the sea here. It is one of the chief on the coast, and is half a mile broad at the mouth, but much broader within, where three or four rivers meet together. It has 10 feet water on the bar at ebb.

The chief town here is **ST. SEBASTIAN**, on a river of the same name, towards the mines of Zacatecas, a little place, where they purify the silver ore.

ZACATECAS province, so called from its ancient inhabitants, is an inland country, well inhabited, and abounding with large boroughs. It has New Biscay on the north; Panuco on the east; Mechoacan, Guadalajara, and Chiamettan on the south; and part of Chiamettan and Culiacan on the west. It is, like the former, part in the temperate and part in the torrid zone, is about 100 leagues in length, and 45 where broadest. The west part of this province would not be inhabited were it not for its mines, which are many, and the richest in America, for in all other respects it is of no value, as having no water, and producing no sort of provision; but the east part abounds with fruit, corn, and has many woods full of deer.

NEW BISCAY province is bounded by New Mexico on the north; by part of Florida, and Panuco on the east; by Zacatecas on the south; and by Culiacan on the west. It is about 100 leagues from east to west, and 120 from north to south. Its being well watered makes it fruitful; and its situation a little above the tropic of Cancer renders it temperate. Though there is a mountainous barren part, called Topia, yet most of the country is pleasant, abounding with all manner of provisions; and though it has no communication with the sea, yet the inhabitants are very rich, not only in corn, cattle, &c. but also in silver mines and sugar works.

ST. BARBARA, **ST. JOHN'S**, and **ENDE**, are three little towns, built by the Spaniards for defence of the large silver mines in the neighbourhood, and are therefore well inhabited, particularly the first, which lies 243 miles north of Zacatecas. The second lies about 70 miles north of that, and is equally rich in mines and minerals; and the third, which is also rich in mines, lies 70 miles west of the second. These are the mines which Hennepin says M. De La Salle aimed at, when

T t t

he

he ranged the coast of Florida, on pretence of seeking the mouth of the Mississippi.

CULIACAN province has that of Cinaloa on the north; New Biscay, and the Zacatecas, on the east; Chiamettan on the south; and the gulph of California on the west. It abounds with all sorts of fruits. The great river La Sal, in this country, is well inhabited on each side. Dampier says, it is a salt lake, in which there is good riding, though it has a narrow entrance, and that it runs 12 leagues east, parallel with the shore. There are several Spanish farms and salt-ponds about it.

CINALOA province, which is the most northern of this audience, and stretches out farther to the west, has the gulph of California on the west; the province of Culiacan on the south; and the kingdom of New Mexico on the north and east. The air is serene and wholesome, and, besides pastures abounding with cattle of all kinds, the soil bears all sorts of fruit and grain, particularly Indian wheat, as also cotton, with the manufacture of which the natives cloath themselves, after the Mexican fashion.

NEW LEON, a province between New Biscay and the gulph of Mexico; but all the account we find of it is in Martiniere. He calls it a kingdom, and bounds it on the north and north-east by the Rio Brava, or Del Nort, which falls into the gulph above-mentioned; on the south by the province of Panuco, or the county of Guafteca; and, on the west, by New Biscay; but says it has no towns, nor any considerable settlements; yet has many mountains, in which there are mines, whereof the most known are those of Cinalao to the north, and Guanahate to the south.

NEW MEXICO, so called because of it's being discovered since the Old Mexico, or New Spain, which we last described, is sometimes stiled by the Spaniards a kingdom, and sometimes a province. It is bounded on the north by high mountains, beyond which is a country altogether unknown; by Louisiana on the east; by some of the provinces of New Spain on the south; and, on the west, by the gulph of California and the Rio Colorado.

But whether the limits on the north and east should be contracted or extended, is what we shall not pretend to determine, for there are no people that we know of to the north of New Mexico, nor is there a twentieth part of the country within the limits specified that is either cultivated or inhabited; nor is it any more certain how we might venture to extend the limits of it on the east side towards Florida, no one having attempted to fix the bounds between these two countries, except the French, who have introduced LOUISIANA into their maps, in the room of FLORIDA, bounding it with the British plantations on the east, and New Mexico on the west. The extent has not been discovered: however, this may be said, that what has been discovered extends 300 leagues north from New Biscay; and there is no less from the straits of California on the west, towards Florida and New France on the east.

As it lies in the midst of the temperate zone, it is a very pleasant climate; the summers are very warm, and the winters pretty sharp; but then the former are neither sultry nor unwholesome, and the latter are clear, without being intolerable. The weather, upon the whole, is, generally speaking, agreeable to the season, and refreshing to an European constitution.

The soil is beautifully interspersed with rising grounds, and with rivers well stored with fish; abounds both with fruit and timber-trees: produces turquoises, emeralds, and other precious stones, and has mines of gold and silver, and feeds all sorts of wild and tame cattle, especially cows. Here are also several flocks of fowl: and, in fact, it is said to be as pleasant, plentiful, and rich a country as any in the world. There are few great rivers in it, but several little ones run into the gulph of Mexico; and there are divers bays and creeks on that coast, which might easily be converted into ports.

The greatest part of this vast country is still in the hands of the natives.

Of the various nations in this large territory, mentioned by the Spaniards, the principal are the Apaches. These thinking themselves aggrieved by the Spanish government, about the close of the last century, made a general insurrection, and did a vast deal of mischief; but were at last suppressed, and have since been curbed by stronger garrisons. Mr. Dampier has more than once mentioned the POSSIBILITY OF PENETRATING HERE TO THE GOLD MINES, BY MAKING A DESCENT ON THE SHORE, OPPOSITE TO CALIFORNIA; AND, IT IS CERTAIN, ALSO, ON THE OTHER HAND, THAT THE SPANIARDS HERE WILL RUN NO LITTLE HAZARDS FROM THEIR NEIGHBOURS, THE FRENCH, [now the ENGLISH] if the latter should come to have numerous settlements on the RIVER MISSISSIPPI. See CALIFORNIA, MISSISSIPPI.

The particular nations of this kingdom, or province, being not distinguished from one another by any certain limits, we cannot give any particular division of it into provinces and towns, as has been our method almost every where else, with relation to the principal places of trade; we must content ourselves, therefore, with shewing the face of the

country, from the best general account that we can find of it, which is from the Spanish travellers.

The following description of this country, is taken from the accounts given by father Alonso de Benavides, printed an hundred years ago at Madrid, with some small additions, from other persons who travelled here, as well as he, and from later accounts, which may be seen in Laet, Herrera, and others since them.

The way to it's capital, Santa Fé, (of which we shall presently speak) is through the province of Conchos, which is parted from New Biscay by the river of the same name. Next follow the Tobosos, Tarrahumares, Tepoanes, Tomites, Sumas, Hanos, and other savage nations, for 100 leagues north and north-west. Next follow the Apaches, a mighty nation; and here again we meet the north river, where New Mexico properly commences, and extends 100 leagues north from St. Anthony of Seneca, the first town of the Biroros, to the town of St. Jerome, in the province of the Taoros. New Mexico, properly so called, contained several nations in this order. At the north river begins that of the Piros, a civilized people, who are clad, dwell in houses, are subjects to their chiefs, and have abundance of Indian wheat, other grain, and cotton; the soil being fruitful and the air wholesome. The Tebas are next, inhabiting 15 towns; then the Queres, seven; and next the TOMPIRES, 15; the chief of whom are the Chilili. Farther to the north are the Tanos, in five towns; and beyond them the Peicis, in one great town. Seven leagues west of them is the metropolis Santa Fé, where only 250 Spaniards, not above 50 of them soldiers, kept all this vast country in awe, only by the terror of their name; but their numbers are since mightily increased, not only there, but in all the other towns we mentioned. Not far from Santa Fé, towards the north river, live the Teoas, in eight villages, being the first who embraced Christianity, and most passionate lovers of the Spaniards. West of them are the Hemes; and to the north of them the Picaries; and beyond them the Taofts. Again, west of the Queres, is the town of Acoma, above-mentioned; and, 30 leagues farther west, the Zanis, in 12 towns; and, at the same distance, the Moquis: all of these are now Christians, whose lands are fruitful, and abounding in cattle and wild beasts, as do their rivers with excellent fish.

All this country of New Mexico, properly so called, is almost encompassed by the numerous and warlike nations of the Apaches, above-mentioned, differing from all the other natives in language, being clad in deer-skins, and living in tents, which they carry with them wherever they go.

Some geographers divide New Mexico into 15 provinces, many of the Spanish writers into 18, of which they give us barely the names; but the latest geographers seem to divide it only into five. On the other hand, some writers have subdivided it into 20, nay 25 provinces, and furnished us with the names of as many towns; but we find no description of any, but that which is by all agreed on to be the capital city, viz.

SANTA FE. It stands 130 leagues from the sea, near the source of that Rio Del Nort which runs a great way through the country southward, and then bending east, falls into the gulph of Mexico. It is said to be a rich city, regularly built, and is the see of a bishop, suffragan of Mexico, as well as the seat of the governor of the country.

California, though reckoned a part of New Mexico, yet we have treated it separately, for the sake of making such remarks which more particularly concern the interest of Great-Britain. See CALIFORNIA.

REMARKS before the last war, and DEFINITIVE TREATY of 1763.

From this view of Mexico belonging to the Spaniards, we may pass a good judgment of the immense treasures of this part of America; and, consequently, how unspeakably beneficial these extensive territories must prove to the Spanish monarchy, when the commercial system which that court has adopted shall be brought to maturity. See the articles BISCAY, CATALONIA, FISHERIES, INDIAN-HOUSE of Spain, SPAIN, and SPANISH AMERICA, ACAPULCO, AMERICA. The Spaniards, though an indolent nation, whose colonies were really so rich, so great, and so far extended, as were enough even to glut their utmost avarice, yet gave not over, 'till, as it were, they sat still, because they had no more worlds to search for; or, at least, 'till there were no more gold or silver mines to discover.

The Portuguese, though an effeminate, haughty, and, as it were, a decayed nation in trade, yet how do they go on daily increasing their colonies in the Brazils, in Africa, as well on the east side as on the west? And how do they increase their commerce in all those countries, by reducing the numerous nations in Melinda and Zanguebar, in Congo, in Angola, to the direction, œconomy, and to the government of commerce? whereby they subdue whole nations of savages to a regular life, and, by that means, bring them to be subservient to trade as well as to government.

But

But how little has Great-Britain done of this kind? How little have we gained upon the natives of America in all our colonies? How few of them are brought to live among us, how few to be subject to us? All our colonies seem to be carried on upon the mere strength of our own people, nor can we say that we have any one considerable nation reduced to intire obedience, and brought to live under the regularity and direction of a civil government, in all our plantations; a very few in New England only excepted.

As for new colonies and conquests, how do we seem intirely to give over even the thoughts of them, though the scene is so large, the variety so great, and the advantages so many? On the contrary, we seem to forget the glorious improvements of our ancestors, such as the great Drake, Cavendish, Smith, Greenfield, Somers, and, above all, the yet greater Sir Walter Raleigh, upon the foot of whose genius almost all the English discoveries were made, and all the colonies and plantations, which now form what they call the English empire in America, were established.—These we seem to fit down with, as if we had done our utmost, were fully satisfied with what we have, that the enterprizing genius was buried with the old discoverers, and there was neither room in the world, or inclination in the people, to look any farther.

Whereas, on the contrary, the world presents us with large scenes of trade, new platforms for business, enough to prompt our ambition, and even to glut our avarice; yet we seem to have little spirit for the adventure: and how should we, 'till our men in power are brought to revive this spirit? And the parliament, we are persuaded, will not want zeal to forward laudable endeavours.

Nor is there any want of people amongst us; on the contrary, here are thousands of families who want business, want employment, want encouragement; and many that want no flocks to carry with them, and are ready to go abroad, were the adventuring spirit revived, and some men fired with warmth for the undertaking, and but vigorous enough to make the beginning.

This is the way to raise new worlds of commerce, to enlarge and extend new funds of trade, to open doors for an increase of shipping and manufacture. The places are so many, and the advantages so great, for the making such attempts, that nothing is more wonderful of it's kind, than to see how backward we are to push on our own advantages, and to plant in the most agreeable climate in the world, in a manner so advantageous as never to be supplanted, and such as should make the English possessions abroad five times as great, as opulent, and as profitable to Old England, as they have ever been yet.

The description of these places, so proper for planting, so suited for commerce, and so qualified to enrich and aggrandize the British nation, is shewn throughout the course of this work; and, when the trading genius revives, and the adventuring spirit is restored amongst us, then it will appear there will neither want encouragement to such undertakings, or adventurers to embrace the encouragements which offer. Nothing is to me more evident, than that the civilizing the nations where we and other Europeans are already settled, bringing the naked savages to cloath, and instructing barbarous nations how to live, has had a visible effect already in this very article. Those nations call upon us every year for more goods than they did the year before, as well woollen manufactures as others. The Portuguese colonies in the Brazils, and on the east coast of Africa, are an unanswerable proof of this. The European manufactures now sent to those colonies, are above five times as many as were sent 30 or 40 years ago; and yet the European inhabitants in those colonies are not increased in proportion: we might give instances of the like in other places abroad, and that not a few: see in particular the articles EAST-INDIA TRADE in general, EAST-INDIA COMPANY of England, DUTCH EAST-INDIA COMPANY, AFRICAN TRADE, ENGLISH AFRICAN COMPANY, BRITISH AMERICA, CALIFORNIA.

New planting colonies, and farther improving those already settled, will effectually increase this improvement: for like causes will have like effects: cloathing new nations cannot fail of increasing the demand of goods, because it increases the consumption, and that increased demand is the prosperity of our trade.

Here then is an undiscovered ocean of commerce laid open to us; and many specimens are humbly suggested throughout this work, which, if entered upon with the authority, power, and vigour of the public, would open such new channels of traffic amongst us, as it would be very hard for our manufacturers to overstock the markets, and as no petty prohibitions in Europe could stop the current of it.—This, we conceive, is one essential part of the grand commercial system which this nation ought steadily and resolutely to pursue.

It is surprizing, that in a nation where such encouragements are given for planting and improving, where colonies have been settled, and plantations made with such success; where we may truly be said to have filled the world with the wonders of our growing possessions, and where we have added not provinces only, but kingdoms to the British dominions, and have launched out to so great an extent of commerce,

since the days of our great Elizabeth: that now we should, as it were, put a full stop at once to all our great designs, check the humour of increasing, and, from a kind of mysterious unaccountable stupidity, turn indolent in this respect, when other nations are pursuing the contrary measures; not as if we found no more room to launch out, for the contrary to that is apparent; but as if we had enough, and fought no more dominions wherein to propagate and extend our maritime commerce.

In all other cases, and among all other nations, success encourages men to go on; increasing they endeavour to increase, Crescit amor nummi, &c. so in trade, the enlarging the bounds of a plantation, the swelling and thriving of commerce, and the advantages to the merchant and planter in all those things, certainly increases the desire of planting, enlarges commerce, and fires the merchant with the desire of extending his adventures, searching out new colonies, forming new schemes of trade, and pushing at new discoveries, for the increase of his trading advantages.

REMARKS on our article MEXICO since the last war, and the DEFINITIVE TREATY of peace in 1763; occasioned by the reported infraction on the part of the Spaniards, of the XVIIth article of the said treaty, relative to our logwood cutters settled in the bay of Honduras. See our article LOGWOOD.

Let any gentleman peruse this our article of MEXICO or NEW SPAIN; let him consider only that part of it, LA VERA CRUZ, and he cannot but entertain a very high and exalted idea of the prodigious treasures of this part of NEW SPAIN: and must it not make the heart of a Briton glad, that he is soon likely to have an established near neighbourhood to a place as actually rich as it is represented, without exaggeration? Must not every Englishman rejoice, that now he is intitled to a situation in the BAY of MEXICO at all; a situation, though not at present in a very wealthy condition; yet from its proximity to MILLIONS of MEXICAN TREASURES, may prove lucky enough to become instrumental in some measure, to put Britons one day in possession of those very treasures, which have excited Spain to treat this kingdom so ill for many years past. For if the Spanish dons should shew their supercilious airs against Englishmen, and shall dare to commit depredations upon them as they did in the times of a pacific British administration; should our Spanish neighbours presume again to cut off the ears of Britons, as they heretofore have done, in the exercise of their rightful navigation to, and from their own colonies, and shall offer to search British ships on the high seas, and molest our logwood cutters in their privileges of carrying on that trade, which they have so lately acknowledged our right to do: if the treasures of Spain make them forget themselves, we hope they will remember, that that very nation who lately dispossessed them of the HAVANNAH is able to do so again; nay, we conceive, that we are in a much better capacity to do it now than we were before the last war. For can the Spaniards flatter themselves that, on another rupture with them, we shall not make the best use of our near neighbourhood to that key of the Spanish Indies? Can they suppose that this nation will not render the PORTS of ST. AUGUSTINE in the GULPH of FLORIDA, as well as PENSACOLA and MOBILE in the GULPH of MEXICO, and also the right of navigation to, and from the MISSISSIPPI, through that gulph, with their possession of the FLORIDAS, as beneficial as they will admit of? The Spanish ministry cannot think or suppose otherwise. And if the court of Spain should again resolve upon a fresh rupture with Great-Britain, we cannot doubt but the present near neighbourhood to the Havannah, will greatly contribute to enable us to retake the same, and that both at less danger and less expence than we were at in the last war. We may have a good fleet in the harbour of PENSACOLA, there being water sufficient for sixty gun ships; and even seventy gun ships, the largest requisite in that country in time of war, if they were built flat-bottomed, like the Dutch ships, might pass every where in that harbour. Nor would our situation at MOBILE be useless on such an occasion: and as the Floridas are likely to grow populous, and to receive strength from Georgia and South Carolina, &c. we should not be destitute of considerable aid of men and provisions to man and victual a good fleet, at far less expence than we have been obliged to do. Our fleets in the gulph of Mexico, together with another from Jamaica, would not find any great difficulty, we apprehend, to become once more masters of the Havannah; and if that should prove the case again, we can hardly believe that it would be in the power of Spain, and France acting in concert with them, to dispossess us: and if so, it is reasonable to think that the court of England will rather be inclined at any future peace, to keep it as a pledge for the future good behaviour of the Spaniards, than to restore it to them again; for Great-Britain, having for near these forty years experienced the maltreatment of the Spaniards, who have occasioned the nation to be burthened with MILLIONS upon MILLIONS of PUBLIC DEBTS and TAXES, cannot, consistent with her own safety and preservation, be supposed

confide in the Spaniards any more after their flagrant violation so suddenly of the DEFINITIVE TREATY. Nor would Spain dare to break the treaty, so soon especially, did they suppose, that we are not in a capacity to resent their treatment, and retake and keep the Havannah for ever after, with no less care than hitherto we have done our European Gibraltar; and if we determine to take and hold this key of the Spanish treasure, what hinders but we may become absolute masters of the whole Mexican gulph, and possess ourselves of the immense wealth of this part of America. We could then repossess ourselves of the bay of Campeachy on the one side of the gulph, as we are possessed of the Floridas on the other; and what hope could Spain have to dispossess us? The Mexicans could not resist the maritime force of England, and when we had the Havannah, France could not assist Spain to wrest it out of our hands; and therefore it seems no way unreasonable or visionary to suppose, that another immediate Spanish war, would put Great-Britain in the full possession of all the commerce and treasures of Mexico. Was this the case, such new acquisition of trade and wealth, would put us in a capacity to discharge those public debts, and annihilate those burthenome taxes, which the Spaniards have been instrumental to lay upon this kingdom: and without we do resolve to make ourselves amends for the prodigious expence this nation has put us to, since the peace of Utrecht, what will avail going to war with them more? We may as well set down tamely with insult after insult, 'till they shall repeat their depredations as formerly, search our ships on the high seas in their rightful navigation to and from our own colonies, and cut off the ears of Britons as they heretofore have done. We must expect a repetition of the like scene over again; and be contented with additional debts and taxes, 'till we can raise no more money to go to war at all, and then farewell the trade and navigation of these kingdoms!

After this nation has sustained the expence of 500 millions of money by the four last great wars, 'tis full time to think of reaping some equivalent compensation for so immense a burthen, which we have bore for so many years. And who is to intimidate us from possessing the treasures of Mexico for our reimbursement?

Our possessions in the gulphs of FLORIDA and MEXICO, seems to have laid a very good foundation for this further new acquisition; an acquisition, that would amply repay the expence if taken; and if the Spaniards once more, and so suddenly, and so ungenerously provoke us to quarrel with them, we are inclined to believe, it will prove of unspeakable benefit and advantage to this kingdom, by opening to us such new scenes of commerce we should never have thought of obtaining.

While this is writing, a letter from our colony of Georgia in North America concludes thus: 'We are certainly informed, that the French have ceded NEW ORLEANS, and all their territories on the west side of the MISSISSIPPI river, to the SPANIARDS; which is a very favourable event for these southern provinces, as the latter have no influence over the INDIANS, and are by no means that enterprising people which the French are: and, in short, we are under no kind of apprehension of their disturbing our settlements. By this cession the French have now no possession of any part of the continent of NORTH-AMERICA.'

We may therefore, be the more likely one day, to get and keep possession of the Spanish Mexican treasures, if they provoke the crown of Britain to a fresh rupture with the Spaniards. See our article LOGWOOD.

MIDDLESEX, a county in England, is divided from Surry on the south by the Thames, from Essex on the east by the river Lea, and the Meere ditch, from Buckinghamshire on the west by the river Coln and the Shore ditch, and it has Hertfordshire on the north. It is not above 21 miles in length, scarce 15 in breadth, and not above 80 miles in circumference. It comprehending the two great cities of London and Westminster, and those rich villages of Hackney, Highgate, and Hampstead, on the north-side of those cities and their suburbs, it is by much the most opulent and populous county in England.

It's air in general is sweet and wholesome; and, as the whole county is made rich by the neighbourhood of those two splendid cities, so it's soil is extremely improved by their compost.

LONDON is the metropolis of England, the capital of all the British dominions, and the most renowned city in the whole world, as well for the numbers as for the wealth of it's inhabitants: for it's universal commerce, it's admirable polity, it's establishments for learning as well as trade. It is situate on the north-side of the Thames, with a gentle rise from that noble river, and stands on a gravelly loamy soil, which greatly conduces to the health of it's inhabitants. It is environed with fine kitchen-gardens, delightful plains, and beautiful elevations, that are adorned with a great number of splendid country-seats of it's citizens.

The dimensions of London within the walls, are 3 miles and 165 feet, but, taking in that world of buildings from Blackwall in the east to Tothill-fields in the west, and beyond Grosvenor and Hanover-squares, they are in length from Knightsbridge beyond Hyde-park corner to Poplar, 7 miles $\frac{1}{2}$,

and from Poplar along by the Thames to Peterborough-house beyond Westminster horse-ferry, above 6 miles $\frac{1}{2}$; and it's breadth, from the stones-end at Newington-butts in Surry, to Jefferies's alms-houses in Kingland-road in Middlesex, 3 miles and 31 poles; though in other places, as from Peterborough-house to Montague-house, it is but 2 miles; and in some places not half a mile, as in Wapping. It's circumference, reckoning from Peterborough-house by Tothill-fields and the skirts of the town to Limehouse, is, at least, 18 miles. Various have been the conjectures as to the number of inhabitants. The most accurate accounts we have, reckon them between 7 and 800,000 within the walls, and it's dependencies without at 1,500,000.

Certain it is, that this city may boast itself to be the largest in extent, the most populous, and the best inhabited, and that by as civil, rich, and sober a people, their number being considered, as any in the world. And, for a general trade throughout the universe, all others must give her the precedence.

In order to give the reader a more distinct idea of the general commerce of this city, we shall subjoin an account of the several companies of the city of London, according to their precedence, beginning with the 12 principal ones, of one of which the lord-mayors have generally made themselves free at their election, if they were not so before; for they are not only the most ancient, but the richest, many of them having had the honour of kings and princes to be their members, the apartments of their halls being fit to entertain a monarch.

Companies.

Charitable gifts paid yearly, and privileges, &c.

1. Mercers	-	-	3000	Exclusive of 20 per cent. paid yearly to the widows of subscribing clergymen during life, pursuant to a proposal accepted in 1698, when they settled a fund of 14,000l. a year for that purpose.
2. Grocers	-	-	700	They had a privilege from Ed. IV. to inspect, try, and regulate all gold and silver wares throughout the kingdom, and to punish all workers in either that adulterated the same.
3. Drapers	-	-	4000	
4. Fishmongers	-	-	800	
5. Goldsmiths	-	-	1000	They were once styled Taylors, and Linen-Armourers. Were anciently styled Milaners, because that they dealt most in what came from Milan.
6. Skinners	-	-	700	
7. Merchant-taylors	-	-	2000	
8. Haberdashers	-	-	3500	In 1724, Mr. Betton, a Turkey merchant, left 26,000l. in trust; one moiety of the profits of it to be always applied to the ransom of British captives from Moorish slavery; the other for the poor of the company, and to the charity-schools in the city and it's liberty.
9. Salters	-	-	500	
10. Ironmongers	-	-	1800	
11. Vintners	-	-	600	Hen. VII. made their wardens inspectors of sheep, lamb, and calves leather throughout the kingdom. By act of parliament 25 Hen. VIII. their wardens had the inspection of pewter throughout England. In the reign of Hen. VIII. the surgeons of this company, then but 19, were exempted by parliament from ward and parish-offices, and from military service.
12. Clothworkers	-	-	1400	
13. Dyers	-	-	-	
14. Brewers	-	-	-	The Brasiers are united to this company. Queen Elizabeth incorporated the Pinners and Wire-drawers with them.
15. Leatherfellers	-	-	-	
16. Pewterers	-	-	-	
17. Barber-surgeons	-	-	-	The Brasiers are united to this company. Queen Elizabeth incorporated the Pinners and Wire-drawers with them.
18. Cutlers	-	-	-	
19. Bakers	-	-	-	
20. Wax-chandlers	-	-	-	The Brasiers are united to this company. Queen Elizabeth incorporated the Pinners and Wire-drawers with them.
21. Tallow-chandlers	-	-	-	
22. Armourers	-	-	-	
23. Girdlers	-	-	-	The Brasiers are united to this company. Queen Elizabeth incorporated the Pinners and Wire-drawers with them.
24. But-	-	-	-	

Companies.

Charitable gifts paid yearly, and privileges, &c.

24. Butchers

25. Sadlers

This company has been highly honoured by the late prince of Wales, not only in accepting it's freedom, but in condescending to be it's perpetual master.

26. Carpenters

27. Cordwainers

28. Painter-Stainers

29. Curriers

30. Masons

31. Plumbers

32. Innholders

All brass weights made in London, or three miles from it, must be sized with the company's standard, and have their mark; the avoirdupois to be sealed at Guildhall, and the Troy at Goldsmith's hall. And the company are empowered by charter to view and search all brass-weights, and brass and copper-ware made within the said district.

33. Founders

34. Poulterers

35. Cooks

36. Coopers

37. Tylers and Bricklayers

38. Bowyers

39. Fletchers

It is only a company by prescription.

40. Blacksmiths

41. Joiners and Cielers

42. Weavers

43. Woolmen

44. Scriveners

45. Fruiterers

46. Plasterers

This company, which also includes bookfellers, letter-founders, printers, and bookbinders, have a stock which is employed in printing almanacks, primmers, psalters, many school-books, &c. of which they have the sole privilege, by virtue of a grant from the crown. They pay about 300l. a year in pensions and other charities.

47. Stationers

48. Embroiderers

49. Upholders

50. Musicians

51. Turners

52. Basket-makers

53. Glaziers

The glaz-painters are incorporated with them.

54. Horners

55. Farriers

56. Pavours

57. Loriners

They are exempt from ward and parish offices, and have a spacious physic-garden at Chelsea; which, in 1721, was granted to the company for ever by Sir Hans Sloane, Bart. the lord of the manor, on condition of their paying a quit rent of 5l. and continuing it always as a physic-garden, and of presenting every year to the Royal Society 50 samples of different sorts of plants there grown, 'till they amount to 2000.

58. Apothecaries

59. Shipwrights

60. Spectacle-makers

61. Clock-makers

62. Glovers

63. Comb-makers

64. Felt-makers

65. Framework-knitters

66. Silk-throwers

67. Silkmen

68. Pin-makers

69. Needle makers

70. Gardeners

V o l. II.

Companies.

Charitable gifts paid yearly, and privileges, &c.

71. Soap-makers

72. Tin-plate-workers

73. Wheelwrights

74. Distillers

75. Hatband-makers

76. Patten-makers

77. Glaz-fellers and looking-glaz-makers

78. Tobacco-pipe-makers

79. Coach and harness-makers

80. Gunsmiths

81. Gold and silver wire-drawers

82. Long bow-firing-makers

83. Card-makers

84. Fan-makers

85. Woodmongers

86. Starch-makers

87. Fishermen

By a decree of the star-chamber-court in 1625, they obtained a privilege to keep a press in their hall, for printing the weekly bills of mortality, by a person appointed by the archbishop of Canterbury. They are, by their charter, to make a report of all the weekly christenings and burials in their several parishes every Tuesday.

88. Parish-clerks

89. The carmen are a fellowship by act of common-council, with the title of Free carmen of the city of London.

90. The porters, confining of tackle and ticket porters, are another fellowship.

91. The wherry-men and lightermen of this city and neighbouring places, were, by act of parliament in the latter end of the reign of king William, constituted a society, to be under the direction of the court of lord mayor and aldermen.

Upon the whole, it appears, that the companies are 91, and they have 52 halls, and the number of liverymen, according to the account made out in 1728, is 8217. The sums of money yearly distributed in charity, by 23 of the companies only above-mentioned, amount to 23,655l. And, if but 40l. each be also given to charitable uses yearly by the remaining 68, which seems to be no extravagant supposition, take them one with another, the whole would amount to no less than 26,375l. per ann.

Of the incorporated societies of merchants, and of the shipping belonging to the port of LONDON.

1. The first society we shall mention is the RUSSIA COMPANY, first incorporated by queen Mary, anno 1555, and not only empowered to carry on an exclusive trade to all parts of the Russian empire, but likewise to all such countries as they should discover in those northern parts; which they did soon after much to their advantage, viz. the Cherry Islands, Greenland, Nova Zembla, Davies's Streights, and Newfoundland: and, in consideration of those valuable discoveries, their privileges were confirmed by parliament, and enlarged by king James I. but the company is not, at present, so considerable as it was, private merchants being admitted into the trade on payment of 5l. which has greatly contributed to extend this commerce. The Russian merchants export from England, particularly from the city of London, coarse cloth, long ells, worsted stuffs, tin, lead, tobacco, &c. and England imports from Russia, hemp, flax, linen-cloth, linen-yarn, Russian leather, tallow, furs, iron, pot-ashes, &c. to a very considerable value. See the article RUSSIA.

2. The EAST-INDIA COMPANY, first incorporated by queen Elizabeth; but, about the beginning of the protectorate of Oliver Cromwell, it being imagined that the laying open their trade would be a very great benefit to the nation, it was therefore made general, and so continued 'till the year 1657, when the separate trade having proved fatal to the undertakers, they were, for the good of the whole, united to the company by the legislature. In 1698, a new East-India company was established by act of parliament, whereby the old company was dissolved, after a term of years; but, for the sake of their mutual interests, the companies were joined in 1702, and since styled, The United Company of Merchants trading to the East-Indies. The commerce of this great company being carried on from the city of London, has no little tendency to enrich that metropolis. For the nature and merits of this company, see the articles EAST-INDIA TRADE in general, and EAST-INDIA COMPANY in particular.

3. The **LEVANT, or TURKEY COMPANY**, was at first incorporated by queen Elizabeth, and their privileges confirmed and augmented in the reign of king James I. when they were empowered to trade to the Levant, or eastern part of the Mediterranean, particularly to Smyrna, Aleppo, Constantinople, Cyprus, Grand Cairo, Alexandria, &c. This trade is now open to every merchant who pays a small consideration. The whole is carried on from the city of London. The goods exported from hence to Turkey are chiefly broad cloth, long ells, tin, pewter, lead, steel, iron, &c. and the English merchants frequently buy up French and Lisbon sugars to transport thither, as well as bullion from Cadiz. The chief commodities imported hither from Turkey, are raw-silk, goat's wool, program-yarn, cotton-wool and yarn, dyeing stuffs of various kinds, rhubarb, galls, and other drugs, leather, cotton, &c. See **LEVANT TRADE**.

4. Here also the **AFRICAN COMPANY** is settled, which has proved more beneficial to this city and our American plantations, than to itself. See the article **ENGLISH AFRICAN COMPANY**.

5. The **HUDSON'S-BAY COMPANY**, incorporated by king Charles II. They carry on from the city of London chiefly, a profitable trade to all the places with Hudson's-Bay and Streights, where they have sundry factories, to which the natives bring their fine beaver, and other rich furs and commodities of the country, and exchange them for the English woollen manufactures, haberdashery, hard-wares, &c. See the article **HUDSON'S-BAY COMPANY**.

6. The most considerable by much of all the trading companies in this city, was that of the **SOUTH SEA**, established by act of parliament in the 9th year of queen Anne, for paying off a debt of 9,177,967 l. due from the government, and not provided for by parliament, for erecting a corporation to carry on a trade to the South Sea, and for encouragement of the fishery, &c.—By another the following year, the company (after the discharge of the debt due to them from the government) was made perpetual. In the year 1714, the capital of the company was enlarged by act of parliament to 10 millions, for which they received interest at 6 per cent.—In the never-to-be-forgotten year 1720, an act of parliament passed, to enable the said company to increase their capital, by redeeming several of the public debts. By the account of subscriptions upon this occasion, the capital stock of the company was increased from 10 to 33,543,263 l. 8s. 3d. For the effects hereof, see the article **SOUTH SEA COMPANY**, and **BUBBLES**.

By the first mentioned act, the corporation was vested in the sole trade to and from all countries on the east side of America, from the river Oroonoko to the southernmost part of Terra del Fuego; and on the west side thereof, from the southernmost part of the said Terra del Fuego, through the South Sea to the most northern part of America, not exceeding 300 miles from the continent on the said west side (excepting Brasil, &c. in possession of the king of Portugal, and Surinam in that of the States General) and the company was to be the sole proprietors of all islands, forts, &c. which they should discover within those limits, to be held under the annual rent of an ounce of gold.—By letters patent also from the crown, one pound in every hundred pounds capital stock, was directed to be raised by the members, and employed in improving, enlarging, and carrying on the fishery of this kingdom for the use of the company.—In pursuance of the said first act, the proprietors of navy-bills and tickets, and army-debentures, were incorporated by the name of The Company of Merchants of Great-Britain trading to the South Seas, and other parts of America, and for encouraging the fishery.—And, on the peace that followed in 1713, queen Anne transferred to the said company the benefit of the asiento contract made with Spain. [See **ASIENTO CONTRACT**.]

The company's application to trade with so large a capital, the effects of their traffic both to Greenland and the West-Indies, and causes thereof, and how much they might have contributed to the paying off, by the reduction of interest, the national debt, and establishing the sinking fund, will appear under the article South Sea company; where also will appear some secret history; which will shew how much the prosperity of this company has been regarded, and how greatly the trading interest of the city of London, as well as that of the whole kingdom, might have been promoted, in conjunction with that of the company. See **SOUTH SEA COMPANY**.

We now proceed to, though we mention it the last, the oldest of all the incorporated societies of merchants, who chiefly carry on their trade from the city of London; that is, the **Hamburgh company**. They were originally styled, the **MERCHANTS OF THE STAPLE**, i. e. of the wool-staple, and afterwards merchant-adventurers.—They were first incorporated by king Edward I. and, by leave of the duke of Brabant, made Antwerp their staple, or mart for the Low-Countries, where the woollen manufactures flourished more, at that time, than in any other country; for the company's

business, at first, seems to have been chiefly the sending of our English wool unwrought.

King Edward III. observing the prodigious trade of the Netherlands to proceed from that city's being made the staple for our wool, and what great sums were paid by England for the cloth that was made there of its own wool, removed the wool-staple, first to Calais, in his French territories, and then to several great towns in England, with a design to have our wool manufactured at home; but, unhappily for Britain, he was so deeply engaged in the French wars, that he did not pursue it.

Queen Elizabeth enlarged the trade of this company of adventurers, and impowered them to treat with the princes and states of Germany, for a proper place for the staple or mart of the woollen manufactures they exported, which was at length fixed at Hamburgh; from whence they obtained the name of the **Hamburgh company**. They had also Dort, in Holland, assigned them for another mart. This trade, at present, lies open for every merchant, on paying a trifling sum to the company; so that this society now have very little advantage from their incorporation. See the article **HAMBURGH**.

In order to encourage, and render the trade of this great city the more secure, both to the separate, as well as the joint adventurers, here is established, by act of parliament, two public offices, or corporations, for the insurance of ships and merchandizes, from hazards by sea, viz. The one called the **ROYAL EXCHANGE ASSURANCE company**, which is kept in a part of that building; and the other called the **LONDON ASSURANCE company**, kept near the Royal Exchange.—See the article **ASSURANCE**.

Besides these assurance offices from the hazards at sea, it may not be amiss to shew the splendor of this city, to take notice that there are other public offices established, for insuring both houses, goods and merchandizes, from loss and damage by fire; which keep a number of firemen in pay, with silver badges of their respective offices, to assist in quenching fires: there are others again, of insurance upon lives, from which the subscribing survivor very often has a comfortable dividend, upon the death of the relation or friend named in the policy, for paying a small yearly contribution while the deceased lived.

We shall now take a view of the **ENGLISH SHIPPING**, that trade to and from the port of London, from a list of all the ships that belonged to this city, which was taken in the year 1732. From the general register at the custom-house, it appears, that the total number of vessels is 1417, and of the men that navigate them, 21,797. And the number of ships that arrived at foreign parts, as well as from the several ports of Great-Britain, in one year from Christmas 1727, viz. British ships from ports beyond the sea, 1839, foreign ships, 213*, and coasters, 6837; in the whole, 8889. It is observed, that this number, prodigious as it is, has been considerably increased in divers years since: for in that part of the Thames, which is properly the harbour, and where the ships usually deliver and take in their cargoes, viz. that which is properly called the Pool, from Limehouse-reach to the custom-house quay, &c. there have been sometimes computed 2000 sail of all sorts, that really go to sea, besides barges, or lighters and yachts. And in the river, from London-bridge to Blackwall, are three wet-docks for repairing them, and 33 yards for building them; including the building of lighters, hoys, &c. but excluding all boat-building, wherry, and barge-building above-bridge.

* The average of the burthen of **FOREIGN SHIPS** has been pretty accurately computed at 86,094 tons, annually employed by **ENGLAND** (exclusive of those carrying provisions from Ireland). And the tonnage of British ships, belonging to England, in the foreign and coasting trade, at 320,000 tons; which, if actually employed, does not amount to four times the quantity of foreign tonnage; and hence a calculation may be formed, of the natural growing strength of our neighbouring maritime powers, so far as particularly relates to their trade carried on with England. See the article **NAVIGATION**.

Upon an estimate made of the share which London has in foreign trade, with regard to the rest of the kingdom, it has been judged to have about one fourth of the whole, at least, if a computation may be made by the produce of the customs, which are about three to twelve.

How considerable a figure this city makes in the government of the kingdom, appears by the influence her inclinations and actions have had upon the affairs of the whole nation, in past ages, as well as they have in the present. It is easy to perceive, that this city must have gradually arisen, from its first beginning to its present grandeur, through a long tract of successive times and ages, by the benefit of **TRAFFIC**, with the concurrence of the favour of princes, and likewise the convenience and advantage of its situation.

The number of people in London, render this city the center of foreign commerce; here a great quantity of goods, from all foreign countries, are brought in, because here is always a market,

market, and here they can be consumed; whereas, take all the other ports of England, many of them can send ships laden out, but few can bring them laden home; for example:

The city of Bristol is the most capable of this next to London, and even Bristol cannot always dispose of the loading of ships home; Yarmouth can send, perhaps, 8 or 10 large ships out to the Straights, viz. to Cadiz, to Malaga, to Leghorn, to Venice every year, laden with red-herrings. But if these ships load back with currants from Zant, oil from Gallipoli, silk and linen, raisins and oil from Messina, silk and wines, fine oils, anchovies, capers, &c. from Leghorn; silks, and pepper, and sulphur, and blocks of marble from Genoa, what shall they do with those at Yarmouth? They must all unlade, and deliver their cargoes at London, and in like manner of the rest; so that the bulk of London makes the trade of England, and those people are greatly mistaken, who imagine that the growing magnitude and splendor of this city, is too much for the whole country; alledging, that the nation is liver-grown, and must die of a pleura. The city, say they, drawing away the nourishment from the country, as a dropy swells the body, but draws the nourishment away from the extreme parts.—But this should seem to be a mistake; the simile will not hold; for this swelling the body of the city, makes it the grand center of nourishment to the whole nation; and, as every part of the kingdom sends up hither the best of their produce, so they carry back a return of wealth: the money flows from the city into the remotest parts, and furnishes them again to increase that produce, to improve the lands, pay rent to their landlords, taxes to their governors, and supply their families with necessaries; and all this is the apparent effects of trade, derived from the metropolis.

Nor should we know any thing considerable of this trade, if the greatness of the city did not cause it; here the manufactures, as well as produce of the several counties, are an-alled for sale, as well for the circulation of commerce at home, as the exportation to countries abroad.

Here ships from all parts arrive, and several of the most considerable branches of trade are confined to this city by law: the East-India trade is all settled here; the Greenland trade deliver all here; the Italian thrown silk is confined to be imported here, and here only, and at no other port in England: here the African company import a considerable part of their gold, as the South Sea company did also their silver when they carried on trade: in a word, London is the great gulph of the British trade; and, as it comes in here, so it goes out again from hence to all parts of the nation, circulating in home trade from the merchant to the consumer. Nor let us suppose that the influence of this city is small, at the remotest distances of the country, but just the contrary; for multitudes of people are employed in the extremest parts of England, for the supply of London, either with food or fuel, or manufactures, and that to a degree almost beyond credibility: for example:

COALS.

What a prodigy of trade does the bare bringing coals, from the north to London, keep up in the nation? Certain it is, that no less than 30,000 people are always employed underground, in digging them at Newcastle upon Tyne; a thousand sail of ships are employed in carrying them, and ten thousand seamen, lightermen, keelmen, and boatmen, in the loading, carrying, and unloading the coals.

PROVISIONS in general.

The trade carried on, with respect to the article of provisions only, is not the least considerable; the butter trade in Yorkshire and Suffolk; the cheese trade in Wilts, Gloucester, Warwickshire, and Cheshire, all remote from London, and all employed for the supply of London; where (according to the most moderate accounts) above fifty thousand tons of cheese is consumed in a year, and as much butter; with this difference only, that the butter is most of it made near London, that is to say, within 40 or 50 miles, the cheese generally from 70 to 150 miles.

The multitudes of people concerned in, and employed by these things in the most remote parts of the kingdom, are not to be conceived, much less calculated, but by those who understand the particular funds of provisions, and the places where they are made: how many lands do they cause to be cultivated and improved, by the vast stocks of cows fed on them? How many, by the numbers of black cattle fed in the farthest parts of England, every way, as in Lancashire and Westmoreland, the North riding of Yorkshire, the counties of Lincoln, Norfolk, Suffolk, Kent, and Sussex? And such cattle too, as are to be seen in no other parts of the world. Again, the prodigious extent of grounds, in the wilder and remoter parts of Scotland one way, and Wales another, and the mountains of Yorkshire and Durham another; all employed in breeding, as the other are in feeding the flocks of black cattle for the market in London.

The like may be said of the sheep, which take up whole coun-

ties and tracts of lands in several parts of the country; as in Leicester and Lincolnshire, Northampton and Bucks, the bank of Tees, and Rumney-marshes in Kent, all these for large sheep: Salisbury-plain, Dorchester, and Winchester, and Marlborough downs, and all the open country between, for near 50 miles square, for middling-sized sheep; as likewise the Cats-would-hills, Leominster-fields, the fourth downs in Sussex, Bansted-downs, Newmarket, and Lincoln-heaths, whose numbers are numberless, and all for the supply of London.

What an infinite number of people do these employ? what millions of acres of land do they improve? and how do they create and propagate trade, even in the remotest corners of the island, all moved, supplied, and the trade supported by the prodigious demand of all these things at the capital city? not half of which would be felt, if the capital city and its adjacent multitudes were separated, and dwelt in ten or fifteen several cities, remote from one another, and every one subsisting, as it were, by itself; I say, though there would be the same number of people to feed, there would not be half the trade or business occasioned to feed them.

It is ordinarily said, that there are 30,000 higlers, and travelling market folks, as we call them, about this city, a poor sort of people that are wholly employed to bring butter, eggs, pigeons, and poultry, &c. to the London markets, and bring veal, pork, and smaller things up and down, from house to house, and every one of them almost have a horse, some more, some carts, &c.—The like of gardeners, whose number is prodigiously increased, and who now keep carts, and whole teams of horses, or large luggage boats upon the river, and employ an incredible quantity of land, for 10 miles round the city.

These are some of the benefits of a capital city, as to trade: we might give a great many examples of other advantages, which a conflux of people necessarily brings with it; but the magnitude of the English inland commerce is a testimony of it; the influence of the city upon it all has evidently been, not the support only, but the very birth and foundation of the trade itself.

The article of malt, and malt-liquor, affords another extensive branch of trade in this city. The number of inns, and public drinking and eating-houses, which are to be seen in London, and the parts adjacent, is even so scandalously great, that, should it be made public, strangers would hardly think it credible: but if we also consider the number that depend upon them, such as maltsters, malt makers, brewers and their servants, horses, carriages, farmers, plowmen, &c. who all get their bread by the drinking trade in this city; reckoning from the sowing of the barley to the consumer of the liquor; how many thousands more would there still be, that would have their bread to seek, and new employments to look out for, if the drinking of malt-liquor was to be taken wholly out of trade, and the practice of it at once left off?

The city of Rostock, in the duke of Mecklenburg's country, is famous for its brewery, and for the great quantity of beer they brew there, and export to other countries; and, indeed, it is the principal trade of the whole port; yet I am informed, that there are two brewing offices in London, that brew a greater quantity of beer than all that city: and, if it is true, that there are two brewers in London, who brew each of them 1000 barrels a week, which make 104,000 barrels a year, I believe Rostock cannot go beyond it.

From the beer and ale, let us pass to the distillers of malt-spirits, who, in this city, do not consume less than 200,000 quarters of malt every year, besides 15,000 hogsheds of cyder, in the distilling or drawing spirits. Add to this, all the several quantities of spirits extracted from melasses, from eager, and damaged wines, and bottoms; whose number we cannot easily guess at.

Consider, likewise, the wines, brandy, rum, cyder, and other liquors consumed in this city, which, according to some, is not less than 50,000 tons of wine, and 10,000 tons of brandy, cyder, and all other liquors.

The quantity of the woollen manufactures, consumed and trafficked in within this city, is immense. The wool and the oil used, are the great principles of this manufacture in general, and are brought from different channels to the hands of the manufacturers; and, indeed, pass a long way in the ordinary course of trade, before they meet at the clothier's house.—The oil chiefly comes from Gallipoli, a city in the gulph of Otranto in Italy, and in the kingdom of Naples, as likewise from Seville and Cadiz in Spain, and from Faro, Figuera, Lisbon, and Oporto, in Portugal.—We need not add, that this is imported by the merchant, bought by the tradesmen, and sold to the manufacturer.

The wool has many channels, as well from abroad as at home.—Wool from abroad makes only two articles. 1. Spanish wool, of which we need say no more than is said of oil; it is mostly imported in large quantities from Spain, by London merchants, is bought by London tradesmen, sold again to the clothier; being mostly worked up with the English wool, and mixed together, the Spanish being too fine and short, to use by itself, except in some particular goods. 2. Irish wool,

admitted to be imported.—We have sometimes, and in small quantities, a good sort of wool from Barbary, the African wool being of good substance, a long full staple, and not very coarse.—We have also sometimes Carmania wool imported from Turkey, which is very good, but the quantity very small.—3. The English wool is the principal article of this manufacture.

The weavers of Spittlefields, London, send exceeding great quantities of wool into remote counties, to be spun; they particularly employ a great part of the poor of the whole counties of Cambridge, Bedford, and Hertford; nay, they even send large quantities into the north, as far as Westmoreland, to be spun, and the yarn is brought back in the same manner to London.

Besides the great consumption of the woollen manufactures in general, in London, the exports from thence to foreign nations is not less than three quarters of what is sent out of England.

The silk manufacture of Spittlefields is arrived to a greater degree of perfection, than that of any other nation. France long surpassed all countries in the world, and, indeed, engrossed a great part of the trade in Europe, in this general article of apparel; but, as we now vie with them in quality, it is to be hoped we may likewise do so in the cheapness; and then we cannot fail greatly to increase our exportations herein.

The hard-ware manufacture, and the trade in metals in general, within the city of London, and from that port to foreign countries, is an article of no little consideration. Our Birmingham hard-ware has arrived at so great perfection, that it beats that of the whole world, not only in the excellency of workmanship, but in point of cheapness also.—And, with regard to the quantities of tin and lead, these are not found in greater plenty, than they are in Great-Britain, in any state of Europe; and our exports, in these articles, from our metropolis, tend greatly to enrich the whole kingdom in general, as well as the citizens of London in particular.

The quantity of corn consumed in the city of London, and parts adjacent, is so great, and the way of it's being brought thither so different, that it is scarce possible to make an accurate computation of it: it is our felicity, in England, that, how great and grievous soever taxes have been, we are not yet come to a gabelle, or tax upon corn; as is the case of Italy, and many other countries, and may in time become our case, if wars and public perplexities increase upon us. Were that our case, an evil of this kind would have enabled us to have calculated, exactly, the quantity of corn brought to the London market, as well as to all the rest of the great corn markets in England.

It may suffice, at present, to observe, that besides the prodigious quantity of corn and meal, and malt, brought by sea, and by the navigation of the Thames, and other rivers; such as the Medway, the Lea, and several smaller rivers, to London, the like of which is not to be seen in the world; there is also a very great quantity, especially of meal and malt, brought by land-carriage, from the counties of Surry, Kent, Suffex, and Hampshire; for the wheat is carried by land, even beyond Winchester, to Farnham market, and from thence to the mills about Guildford, and all the adjacent country, and then to London by water.

In like manner wheat is brought from Northamptonshire; nay, from Harborough in Leicestershire, and from Bedford, to the great markets of Hempstead, St. Albans, and Hitchin; and being then ground at innumerable mills, in the county of Hertford chiefly, which abounds with such mills, is brought to London by land-carriage.

This vast carriage of corn and meal to London is a branch of trade, and is to be reckoned as such; for there are many farmers, and others that are not farmers, who keep teams of horses, on purpose to let them out, for the bringing of corn and malt to London; and generally these carriages return laden with coals, grocery, wine, salt, oil, iron, cheese, and other heavy goods, for shop-keepers, and tradesmen of the country, and it is a very great return they make for the mere expence of this carriage.

By the computations of the burials and christenings in this city, one may be enabled to compare the bigness and populousness of it with other great cities in the world. As, for example, in the year 1707, the christenings in the imperial city of Vienna, amounted to 3,963, and the burials to 4,354; whereas the burials in London, the same year, were 21,600, and the christenings 16,066.

Yet farther, to set forth the surpassing eminency of this city, on account of the vast numbers of people it consists of, Sir William Petty makes a comparison under divers heads, between that and Paris, now one of the most flourishing cities in Europe, and to exceed it in all these particulars following: I. In the wealth and great estates of the inhabitants, the number of their servants, and greatness of their equipages. II. In the wholesomeness of the air. III. In the cleanly and more convenient way of living. IV. In the preference of the river Thames to that of Seine, both in pleasantness and navigableness, and in the wholesomeness of it's waters, and the great bridge of London built over it. V. In the shipping and foreign trade; London therein incomparably exceeding both

Paris and Roan. VI. In the cheapness of all the most necessary sorts of food, and the great variety and plenty of all sorts of drink. VII. In the cheapness, likewise, and goodness of fuel, and convenience of stowage. VIII. In the magnificence of the churches; none at Paris being so great as St. Paul's hath been and now is, none so beautiful as king Henry the Seventh's chapel. IX. In the courts of inns and chancery, and the lawyers chambers. And, lastly, in the hospitals, so many and so richly endowed, and for the relief of multitudes of miserable and distressed people of all sorts.

Collected bodies of people are also a particular assistance to trade; and, therefore, to have one great and capital city in a kingdom is a very great advantage to trade, and much more than if the same number of people dwelt in several places. For example:

Suppose the city of London, and it's suburbs, to contain 1,500,000 people, as some have computed, though we believe that number to be much too large, it seems far more to the advantage of the whole kingdom, in respect to it's commerce, that it should be so, than that the same number of people were divided equally, and lived in 15 several cities, remote from one another.

It is the same as to navigation: it is much better that they have here one commanding port, one noble navigable river, than that they had, in their divided and remote situation, as above, 15 navigable rivers, one to every city.

Spain is a remarkable instance of this: there is no capital city, except that, or rather the village of Madrid, where the court resides, which is supposed to contain 300,000 people; but it has neither sea-port or inland navigation, no navigable rivers being near it; the highest is the Tagus, or Toledo, which is not only distant 12 leagues, at least, but does not open into the sea in the same dominions, but in Portugal; so that it is no navigation at all as to Spain.

Spain has abundance of other populous cities and sea-ports in it, dispersed and remote from one another, as Seville, Granada, Valencia, Toledo, Cordova, and several others.

Seville has at least 300,000 people in it also, and several of the rest from 100,000 to near 200,000, at Cadiz, Barcelona, Malaga, Saragossa, Valencia, Granada, which last city our best geographers reckon to be very near as populous as Seville or Madrid; the best accounts we can meet with from the Spaniards themselves are as follow:

1. Madrid, 24,000 families, half of which are of nobility and quality, having from 20 to 30 and upwards in family, the rest being of the ordinary rate.

Besides estimating the king's household at the Pardo, which, including the ordinary guards, is said to contain always 12,000 souls. 2. Seville, containing 60,000 families, at six in a house, 360,000 souls. 3. Granada, 50,000 families.

4. Malaga. 5. Cordova. 6. Valencia. 7. Barcelona. 8. Saragossa. 9. Cadiz. 10. Majorca; each of these 15,000 families; which, with the poor and the religious houses, make far above 100,000 in each city.

The reason of naming these cities will appear presently: put them all together, they are not supposed to contain more people than the city of London, and those adjacent towns to London which depend upon their supply of provisions from the city, including also the ships in the river.

Now as these cities stand all remote from one another, and most of them in the most rich and fertile soil, or near the sea-coasts, or on the banks of navigable rivers, their supply of provisions, fuel, cloathing, equipage, furniture, and take it of as many kinds as you please, does neither come with difficulty, call for multitudes of hands to be employed in raising, procuring, fetching, or carrying them; nor does it influence the country to any perceptible degree, except, perhaps, for 20 or 30 miles round them. But were all these cities, that is to say, the number of the inhabitants included in them, all joined in one capital, suppose Madrid, and though you were to suppose Madrid had a noble navigable river coming up to it, such as the Tagus, or the Ebro, or the Guadalquivir, it is evident the whole kingdom of Spain, large and spacious as it is, for it may be reckoned almost 500 miles square, would be engaged and influenced, more or less, in supplying that one city with provisions.

All the sea-coasts, and all the cities and ports upon those coasts, would be busied, and fleets of ships employed to furnish wine, corn, oil, fruits, and foreign importations of every kind, all to the capital port of Madrid.

All the inland provinces would be engaged and employed in ploughing and sowing the lands, to raise corn, planting vines and groves of olives, to make wine and oil for this great metropolis.

All the rich meadows and pastures would be improved to feed and fatten the black cattle, to nourish the cows, fuckle the calves, and furnish beef, veal, and milk, butter, cheese, &c. and all the mountains, the forests, and plains, for breeding the black cattle and horses before they come to those rich pastures; also the plains must be covered with flocks of sheep, which are now dispersed and scattered a few and few together: and thus, as it is in England, every province would be providing something for the capital.

Nor is it a just objection to say, the same number of people will consume the same quantity of provisions, in whatever situation they may be placed; for, though the quantity should be the same, yet the influence upon trade, occasioned by it's being all pointed to one center, is such as quite alters the case, and would put the whole body of the people into motion, as it is in England. What fleets would there be employed to bring oil from Seville and Majorca, wine from Cadiz, Malaga, Alicante, Barcelona, and Galicia, &c. fish, wrought iron and steel, all sorts of weapons, fire-arms and artillery, from Bilbao and St. Antonia, and silk and wool from Segovia and Valencia, and the like from other parts?

What an infinite number of horses, mules, and carriages, and carriers, must be employed by land from all the inland provinces, to carry the product of the earth directly to Madrid, or, if too remote for that, to carry them to the several seaports where those ships and fleets were to take them on board! How is this the cause of employing a thousand sail of ships, and; perhaps, three times as many in England, to bring the coals from one place, salt from another, cheese from another, lead from the north, block-tin from the west, corn from Hull, from Lynn, and from all the coasts of Norfolk, Suffolk, Essex, Kent, Sussex, and Southampton; fish from all the seas on the east and south sides of the island, and so of the rest?

How many thousands, I might say hundreds of thousands, of men and horses are employed in the carrying and re-carrying to and from London the growth of England, and the importations of foreign countries? And how many of these would stand still and want business (nay, want bread, perhaps) if this great city was divided into 15 cities; as above, and they were situated in so many different places, remote from one another, where the country within 20 or 30 miles round them would be sufficient for them, and able to supply them, and where every port would import their own goods from abroad.

In a word, we should have a general want of business; whereas now all the world (in this city) are in a hurry, and fully employed, in carrying out and fetching in.

Particularly observe another article, the number of people at London makes this city the center of foreign commerce: here a great quantity of goods from all foreign countries are brought in, because here is always a market, and here they can be consumed; whereas, take all the other ports of England, many of them can send ships laden out, but few can bring them laden home, as before shewn.

To bring this to our subject: all these provisions expended at Madrid, what do they for the country as to trade? Some benefit they are, it is true, to the neighbouring provinces; so is our city of Bristol to it's counties: but how far in the country from them does that employment extend? How far do they feel the influence? Perhaps in Spain the country may be concerned in furnishing corn 20 or 30 miles, and cattle 40 or 50; but, after that, we find little or nothing of it.

At Bristol, indeed, they carry corn a great way, by water, down the rivers Severn and Avon, out of Gloucestershire and Worcestershire, and from the vale of Evesham; they likewise bring cyder from Herefordshire, down the Wye, Cheshire cheese by the Severn, out of Shropshire, and butter from South Wales, by sea: and so Bristol may, in some degree, affect all those counties.

But their black cattle are supplied from Somersetshire and Wales, and their mutton and corn, cheese and bacon, from Wilts and Gloucestershire, all counties just adjoining; and, after 20 miles from them, even in those counties, you scarce find any mention of Bristol: nay, one way, there are other cities and great towns that intercept the provisions; so that very little comes that road, except beef; I mean Somersetshire, where there are the city of Wells, the city of Bath, and the towns of Bridgewater and From; the latter more populous, perhaps, than both the two former put together, though cities.

Thus trade receives but little influence from such places as Madrid in Spain, or Bristol in England, except it be just in the adjacent counties, and within 20 or 30 miles of the place.

But bring this back to the great city of London, and consider the multitudes of people there, and the exceeding numbers which are gathered southward into the counties and towns for 30 or 40 miles round London, almost every way; how all the country round is made populous by the vast run of business occasioned by the neighbourhood of the city; inasmuch that it is supposed, if there is a million and a half of people in London and it's suburbs, there is at least half a million more in Middlesex, and in those parts of Essex, Surrey, and Kent, which lie so adjacent to London as to be within about 10 miles of it: now, for the supply of these two millions of people, we find the whole kingdom more or less engaged, and the wheels of trade are set a-going by it almost all over the island.

We take this proposition about great cities, and the number of people collected together making trade, to agree in some measure with what you may observe in the spring of the year, from the variety of the seasons; take a time of drought, and, when the earth, for want of rain, is dried, hard, and parched up, comes a light flying shower, and wets the surface a little,

VOL. II.

and goes off; then comes a hot gleam from the sun, and licks it up; and by and by comes another dash of wet, and then more sunshine: and so on successively and alternately; several times a day, and for a week or a fortnight together.

These light flying showers answer no end, do little or no good; the sun dries it up as fast as it wetted; and, by the long intervals between, all the benefit is lost; the ground remains hard, sterile, and barren still; it is all one as a drought.

But would the same quantity of rain fall all in one shower, was there a weight of water sufficient to set nature at work, sink down to the root, and duly moisten the plants, give drink to the thirsty earth, and set the prisoners free, (I mean the seeds, which lie baked and blocked up in the earth, and cannot get out) then the earth is refreshed, and every thing thrives and flourishes as it should do.

I think the simile is pretty just: a small body of people do nothing as to this article of trade; they do not influence trade, even in proportion to their numbers; like a small stream of water to a mill, it not only will not make the wheel go at a proportioned rate, but it runs by, or under it, goes off in waste, and does not make the mill go at all; it runs all away to no purpose.

Here is a small city, and there a large town; they are good to depend upon the capital, and to have the capital, in many things, depend upon them; but they are not able to substitute a capital, and to stand in the room of it: when they come to have the general body, the whole nation's trade depend upon them, instead of a capital city, then they are nothing at all, they are of no importance.

They tell us France is so situated by the assistance of navigable rivers, that there are two and forty large cities which have all a communication with the great city of Paris by water, either by sea or river navigation; and what is the consequence? Not that these cities make Paris great and rich, but that all these cities are made rich and great by the city of Paris.

We say the same of London, though not as to river-navigation; but the whole kingdom of England, by it's communication with London, is the same; it is not the kingdom makes London rich, but the city of London makes all the kingdom rich. The country corresponds with the city, but the city corresponds with all the world; the country supplies the city with corn and cattle, that is to say, with provisions; yes, and if there was not such a city to take off and consume them, what would the country do? How must the product of the land be sold? How the rents paid? The land must lie waste and uncultivated, the cattle would run wild, and devour the country, or be starved and die: the country sends up their corn, their malt, their cattle, their fowls, their coals, their fish, all to London; and London sends back spice, sugar, wine, drugs, cotton, linen, tobacco, and all foreign necessities to the country; and, above all the rest, that useful drug called money: so that still it is the capital city that is the life of the country, and keeps them all in motion.

Again, the countrymen shear their sheep, sell their wool, carry it from place to place; the manufacturers set it to work, to combing, carding, spinning, winding, twisting, dyeing, weaving, fulling, dressing; and thus they finish their numberless manufactures. But what must they do with them? What could a Madrid or a Bristol do for them? Bristol could take off some, indeed, and does export a proportion with it's neighbours; but London is the center of the gross body of manufacture; London answers the end of every trade abroad, and of every manufacture at home; be it Manchester for cotton ware, Yorkshire for coarse cloth, kerseys, &c. Wilts and Gloucester for fine cloths; Norwich for stuffs; Wales for flannels; all goes to London, and all have their money in return from London.

London consumes all, circulates all, exports all, and, at last, pays for all; and this is trade: this greatness and wealth of the city is the soul of the commerce to all the nation; and, as there is the greatest number of tradesmen in this city that are to be seen in any place in the world, so they again support and supply an innumerable number of shopkeepers and tradesmen of every kind in the country, and in every part of the country.

It may be thought a little assuming to say, the city supports the tradesmen of the country, but the fact is plain; you cannot go to a shopkeeper of any note in the remotest town in England, but he holds some correspondence at London; or else he must be a mean tradesman, that buys his goods of some of his better-furnished neighbours, and they buy at London: so that the other may be said to buy at London too, only he does it at second-hand.

Nor is this all; but, as all these country tradesmen buy at London, so they all are in debt at London more or less; they all owe the London shopkeepers money; so that the whole country may in some respects be said to trade upon the city's stock, the London tradesmen giving them all credit.

It is, indeed, a little remote from the subject of inland trade, or else it is very remarkable and worth our observing, that the city of London trades with such an immense stock, that it may be said they give credit to all the world more or less; all the trades they carry on abroad, almost in every part of the world, are carried on by the strength of their stocks; they

X x x

do

do not receive the goods from abroad, and so make the returns back to the several countries from whence they come, but they send their own goods first out, and receive the goods of other countries back in payment.

Thus in all the ports of Spain, Portugal, Italy, and Turkey, the merchants of London have their houses (as they call them) there; the warehouses are piled full up to the ceilings with English bales; English stocks carry on the trade; in a word, we give credit to all the world.

Not a fleet of Portuguese ships from the Brazils, not the galleons or flota from New Spain, but a share of the gold of the first, and the silver of the last, is the product of English stocks, and belongs to London merchants, whose goods, sold upon credit at Lisbon and Cadiz, went first out to America to purchase that gold and silver.

Not a Turkey fleet, or a ship from Leghorn, Messina, or Genoa, how rich soever freighted with the finest raw and thrown silk, the choicest drugs and gums, but it is all the effects of the merchants of London, and in return for credit first given by the city of London.

It is the like in the plantation trade; all the New England trade, the Jamaica trade, the Barbadoes trade, it is all carried on by the stocks of the English merchants.

The sugars, the tobaccos, the furs, the turpentine, the cacao, the indico, and all the rest of the produce of our colonies, come home in return from all those islands for the goods long before confined to them chiefly from London; so that, in fine, almost all the plantations are managed upon the stock and substance of the citizens of London.

To bring it all back to what we have observed before: as this vast correspondence abroad is thus carried on by the city of London upon its own stock, and they give credit to all the world; so, when those returns come back, they disperse all those goods again among the country tradesmen, and give them credit too; and this is the effect of a capital city: a capital city carries on a capital trade, and enriches and employs the whole country; which, if the same people dwelt in a divided and separate capacity, would not be the case at all.

So many deductions must be made from the home trade, that thousands, nay hundreds of thousands of people now employed in collecting the commerce thus to one place, would then be left without business, and by consequence without bread; as in the country, if the sheep fed all about the farmers' houses as the swine do, or were domestics like their dogs, and not in flocks, requiring to be tended and directed, there would be no employ for all the shepherds, which in the west and northern parts of England are maintained by keeping, and waiting upon, and folding them; so the necessary attendance upon the trade, as it all goes up to, and comes back from London, how many thousands of people does it employ?

Moreover, this capital city is the grand source and support of the public credit of the whole state, as hath been experienced upon numberless occasions.—Here the circulating power of all the public funds, and the public revenue is constantly exercised, for the benefit of the kingdom in general, and for the convenience of its traffic.—This is the center of paper circulation, by the means of that national and noble establishment the bank of England, and the high credit of its eminent and opulent bankers, who are not interior, in point of wealth, honour, and sagacity, to those of any state or empire in the whole world.

What numbers of the greatest and most illustrious nobles of this kingdom have sprung from the city of London [see our article COMMERCE] and what some of the merchants of this capital have done for the support of the kingdom in general on the most critical emergencies, see our article MERCANTILE COLLEGE. However, to add another instance to what I have elsewhere said:—“The parliament granted, says Rapin, king Richard II. a subsidy for the maintenance of the war: but it was clogged with this condition (which shewed they were resolved to be upon their guard during the minority) that the money should be lodged in the hands of Philpot and Walworth, two very noted ALDERMEN of LONDON, who were ordered to take care that it should be expended only in repulsing the French and Castilians, in league against England.—In the mean time the duke of Lancaster, who was vexed to see money, granted the king by the parliament, in the hands of two citizens of London, hastened not the getting ready the ships necessary for the defence of the coasts. This affected negligence gave occasion to a great many complaints. But he pleaded in his excuse that he could not form any project, lest it should not be approved of by those who had the management of the money. In fine, he importuned the other regents upon that score, that the two aldermen were ordered to put into his hands the sums they had in charge. He promised, for his part, that the coasts should be better guarded, and the merchantmen protected. However, it was a good while before he sent a fleet to sea, because he expected from Bayonne some ships which were to join those he had equipped.

Whilst the fleet was getting ready, the earls of Arundel and Salisbury had orders to go to Normandy and take possession

of Cherbourg, which the king of Navarre had promised to deliver up to the English. Hardly were they got to sea, when they met some Spanish men of war, who fiercely attacked them, and did them some damage. Notwithstanding this, they put a garrison into Cherbourg, which opened the English an inlet into Normandy, as Calais did into Picardy. Before the fleet designed to guard the coasts was ready, a Scotch pirate, one Merier, seeing that the English neglected the northern seas, entered the port of Scarborough, and carried off the merchantmen that lay there. This success having inspired him with greater hopes, he cruized a long time in those parts, and took considerable prizes. The damages the merchants sustained, on this occasion, caused fresh complaints against the duke of Lancaster, who so ill performed his promise.

Philpot, whom I mentioned before, full of indignation to see the English merchants exposed to the ravages of this pirate, undertook to do, at his own EXPENCE, what the duke neglected to do with the public money. He fitted out some ships, on board of which he put a THOUSAND SOLDIERS, and, having found the Scotch pirate, he defeated him, took him prisoner, and returned in triumph to London. This action, which gained him the applause of the people, offended the regent, who thought it of dangerous consequence to suffer a private person to undertake a thing of that nature without the government's leave. But he vindicated what he had done, with such good reasons and with so much modesty, that he was acquitted.—This, among many others mentioned throughout this work, is a memorable action of a LONDON MERCHANT to preserve the commerce of the nation!

As king Richard the 2d of England was very fond of pomp and magnificence, his expences far exceeded his revenues, so that he was forced to make use of several illegal methods to supply his occasions. He had a mind once to try the affections of the city of London, by desiring them to lend him only a thousand pounds sterling: but, though it was no great sum, they bluntly denied him*; which so mortified him, that not long after, there being a tumult† in the city, occasioned by a baker's boy, he deprived the city of its privileges, turned out the mayor, established a warden in his room, and removed the courts of judicature to York; and it afterwards cost the city no less than 10,000*l.* to recover its charter.

* It is said that an Italian merchant, who offered to lend him that sum, was mobbed, and, according to Rapin, cut to pieces.

† Our historians tell us, that this was the occasion of the tumult; a baker's boy, passing through Fleet-street with a basket of bread, a servant belonging to the bishop of London, as Caxton says (but, as Sir John Hayward says in his Life of Henry IV. to the bishop of Salisbury, wherein he agrees with Hollingshead and others) took out a loaf, and abused the boy, who demanded it, in such a manner as raised a mob, that threatened to fire the bishop's palace, into which he retired for shelter, till the magistrates came and suppressed them.

An order to the courts of justice at Westminster, to remove to York, dated at Stamford, March 13, 1392.

The establishment of a warden of London, in the room of the deposed mayor, dated June 25, 1392, at Nottingham-castle*. A receipt for 10,000*l.* sterling, paid to the king by the city of London, to regain his good-will, dated February 28, 1393, at Westminster.

* This warden was Sir Edward Dalyngrugge, who, being thought too favourable to the citizens, was quickly removed, and Sir Baldwin Baddington, a person of a rougher temper, put in his place, who by his prudent conduct pleased both the king and the city. It appears by the account we have of this reign, in the Compleat History of England, vol. i. and in that called the Life and Reign of King Richard II. compiled by a person of quality, and from the accounts of Knighton and Walsingham, that the bishop of Salisbury, having an old grudge against the citizens, who were generally reckoned favourites of Wickliff's doctrine, took the opportunity of the riot before-mentioned, to stimulate and heighten the king's displeasure against the city to that degree, that he threatened to raze it to the ground; but, at the mediation of some of the nobility, sent for the mayor, sheriffs, aldermen, and 24 others of the ablest citizens to his court, then held at Nottingham; where, impeaching one another in hopes to curry favour with the king, the mayor was committed to Windsor-castle, and the rest to other goals. Mean time, the queen, the duke of Gloucester, the bishop of London, and other persons of distinction, interceding with the king heartily for the city, he was so pacified that he set out for London, being met from the city by 400 men on horseback, clad all in one livery, and innumerable multitudes on foot, a solemn procession of the clergy, and 500 boys in surplices, the balconies being hung with tapestry and pictures, the conduits flowing with wine, &c. Besides, they presented the king with a crown of gold of great value, and another of the same metal to the queen, together with a picture of the Trinity worth 800*l.* and several other great gifts, by which means they obtained all their old privileges: but, after all this, they were forced to pay 10,000*l.* or else they must have ventured the effects of the king's fresh

fresh displeasure. The bishop of London, who had such a great hand in the reconciliation, was not only highly honoured by the citizens all his life, but after his death; the mayor, aldermen, and companies, made nine processions a year to Westminster, where he lay buried, to pray for his soul. Mr. Rapin observes, that Richard lived to repent his severe treatment of this city, by which he entirely lost the citizens' hearts, who afterwards convinced him, how dangerous it is for a king of England to have that metropolis for his enemy. Rymer's *Fœdera*.

And, how zealous the citizens of London were in bringing about the revolution, upon the abdication of the late king James, appears from what follows*:

* See the Revolution vindicated; in answer to the two memorials, and the protestation against the peace of Ryfwic, and other papers published in king James's name. State Tracts of 1707, folio.

‘ About ten o'clock, the lords spiritual and temporal about the town, came to Guildhall, and, sending for the lord mayor and aldermen, agreed on a declaration, which among other things bears—‘ That they did reasonably hope that, the king having issued out his proclamation and writs for a free parliament, they might have rested secure under the expectation of that meeting: but, his majesty having withdrawn himself, and, as they apprehended, in order to his departure out of the kingdom, by the pernicious councils of persons ill affected to the nation and their religion, they could not, without being wanting to their duty, be silent under those calamities, wherein the popish councils which so long prevailed, had miserably involved these realms; they did therefore unanimously resolve to apply themselves to his highness the prince of Orange, who, with so great a kindness to these kingdoms, so vast expence, and so much hazard, had undertaken, by endeavouring to procure a free parliament, to rescue them, with as little effusion of Christian blood as possible, from the imminent dangers of popery and slavery; and declare, that they will, with their utmost endeavours, assist his highness in the obtaining such a parliament, in which their laws, and liberties, and properties, and religion, might be secured, and the protestant religion and interest over the whole world supported and encouraged, to the glory of God, the happiness of these kingdoms, and the advantage of all princes and states in Christendom that may be therein concerned.—And such a parliament they would endeavour to have with all speed, they say, and so it seems were resolved not to wait till king James's return.

It was signed by 31 lords and bishops, and sent to the prince by four of their number.

This declaration of the lords was followed the same day by two addresses to the prince, one from the LORD MAYOR, COURT of ALDERMEN, and the COMMON COUNCIL, and the other from the lieutenantancy of LONDON. The first bears thanks to God almighty for having blessed his highness's endeavours with miraculous success, and thanks to his highness for appearing in arms to rescue these kingdoms from slavery and popery, and to establish, in a free parliament, their religion, laws, and liberties, upon a sure and lasting foundation. That they had hitherto looked for some remedy for those oppressions and imminent dangers from his majesty's concessions, and concurrences with his highness's just and pious purposes expressed in his declaration. But, herein, finding themselves finally disappointed by his majesty's withdrawing himself, they presumed to make his highness their refuge; and, in the name of the CAPITAL CITY, they implored his protection, and begged that he would repair to the city, where they assured him he would be received with universal joy and satisfaction, as quickly after happened. The lieutenantancy or militia of the city, in their address, expressed the deep sense they had of what they owed to him. That without his undertaking they had been undone; that it was their firm resolution to venture all that was dear to them, to attain the glorious ends of his declaration: that they had put themselves into such a posture, as with the blessing of God was sufficient to prevent all ill designs, and to preserve the city in peace till his arrival; which they desired he would hasten, for the perfecting the great work which he had so happily begun, to the general joy and satisfaction of them all. How well this lieutenantancy stood affected to the late king, and had proved firm to him till now that he abandoned them, is known.

FURTHER REMARKS.

That the reader may entertain a just idea of the importance of this city to the commerce of the kingdom, we shall give him the description of the Royal Exchange of London, from our countryman, that inimitable writer Mr. Addison; for authorities have often more force than the strongest reasoning, or the clearest demonstration.

‘ There is, says he, no place in the town, which I so much love to frequent as the Royal Exchange of London. It gives me a secret satisfaction, and, in some measure, gratifies my vanity as I am an Englishman, to see so rich an assembly of my countrymen and foreigners consulting together upon the private business of mankind, and making this metropolis a

kind of emporium for the whole earth; I must confess, I look upon high change to be a great council, in which all considerable nations have their representatives. Factors, in the trading world, are what ambassadors are in the politic world. They negotiate affairs, conclude treaties, and maintain a good correspondence between those wealthy societies of men, that are divided from one another by seas or oceans, or live on the different extremities of a continent. I have often been pleased to hear disputes adjusted between an inhabitant of Japan and an alderman of London; or to see a subject of the Great Mogul entering into a league with one of the Czar of Muscovy. I am infinitely delighted in mixing with these several ministers of commerce, as they are distinguished by their different walks, and different languages. Sometimes I am jostled among a body of Armenians, sometimes I am lost in a crowd of Jews, and sometimes make one in a group of Dutchmen. I am a Dane, Swede, or Frenchman, at different times; or rather fancy myself like the old philosopher, who, upon being asked what countryman he was, replied that he was a citizen of the world.

Though I very frequently visit this busy multitude of people, I am known to nobody there but my friend Sir Andrew, who often smiles upon me, as he sees me bustling in the crowd, but at the same time connives at my presence, without taking any farther notice of me. There is, indeed, a merchant of Egypt, who just knows me by sight, having formerly remitted me some money to Grand Cairo; but, as I am not versed in the modern Coptic, our conferences go no farther than a bow and a grimace.

This grand scene of business gives me an infinite variety of solid and substantial entertainments. As I am a great lover of mankind, my heart naturally overflows with pleasure at the sight of a prosperous and happy multitude; inasmuch that, at many public solemnities, I cannot forbear expressing my joy with tears, that have stolen down my cheeks. For this reason, I am wonderfully delighted to see such a body of men thriving in their own private fortunes, and at the same time promoting the public stock; or in other words, raising estates for their own families, by bringing into their country whatever is wanting, and carrying out of it whatever is superfluous.

Nature seems to have taken a particular care to disseminate her blessings among the different regions of the world, with an eye to this mutual intercourse and traffic among mankind, that the natives of the several parts of the globe might have a kind of dependance upon one another, and be united together by their common interest. Almost every degree produces something peculiar to it. The food often grows in one country, and the sauce in another.

The fruits of Portugal are corrected by the products of Barbadoes, the infusion of a China plant sweetened with the pith of an Indian cane. The Philippine Islands give a flavour to our European bowls. The single dress of a woman of quality is often the product of an hundred climates. The muff and the fan come together from the different ends of the earth. The scarf is sent from the torrid zone, and the tip-pet from beneath the pole. The brocade petticoat rises out of the mines of Peru, and the diamond necklace out of the bowels of Indostan.

If we consider our own country in it's natural prospect, without any of the benefits and advantages of commerce, what a barren, uncomfortable spot of earth falls to our share? Natural historians tell us, that no fruit grows originally among us, besides hips and haws, acorns and pig-nuts, with other delicacies of the like nature; that our climate, of itself and without the assistance of art, can make no farther advance towards a plum than to a sloe, and carries an apple to no greater perfection than a crab; that our melons, our peaches, our figs, our apricots and cherries, are strangers among us, imported in different ages, and naturalized in our English gardens; and that they would all degenerate and fall away into the trash of our own country, if they were wholly neglected by the planter, and left to the mercy of our sun and soil. Nor has traffic more enriched our vegetable world, than it has improved the whole face of nature among us. Our ships are laden with the harvest of every climate. Our tables are stored with spices, and oils, and wines. Our rooms are filled with pyramids of China, and adorned with the workmanship of Japan.

Our morning's draught comes to us from the remotest corners of the earth. We repair our bodies by the drugs of America, and repose ourselves under Indian canopies. My friend Sir Andrew calls the vineyards of France our gardens, the Spice Islands our hot-beds, the Persians our silk-weavers, and the Chinese our potters. Nature, indeed, furnishes us with the bare necessities of life, but traffic gives us a great variety of what is useful, and at the same time supplies us with every thing that is convenient and ornamental. Nor is it the least part of this our happiness, that, whilst we enjoy the remotest products of the north and south, we are free from those extremities of weather which give them birth; that our eyes are refreshed with the green fields of Britain, at the same time that our palates are feasted with fruits that rise between the tropics.

For

For these reasons, there are not more useful members in a commonwealth than merchants. They knit mankind together in a mutual intercourse of good offices, distribute the gifts of nature, find work for the poor, add wealth to the rich, and magnificence to the great. Our English merchant converts the tin of his own country into gold, and exchanges his wool for rubies. The Mahometans are clothed in our British manufacture, and the inhabitants of the frozen zone warmed with the fleeces of our sheep.

When I have been upon the change, I have often fancied one of our old kings standing in person, where he is represented in effigy, and looking down upon the wealthy concourse of people, with which that place is every day filled. In this case, how would he be surprized to hear all the languages of Europe spoken in this little spot of his former dominions; and to see so many private men, who in his time would have been the vassals of some powerful baron, negotiating, like princes, for greater sums of money than were formerly to be met with in the royal treasury? Trade, without enlarging the British territories, has given us a kind of additional empire. It has multiplied the number of the rich, made our landed estates infinitely more valuable than they were formerly, and added to them an accession of other estates as valuable as the lands themselves.

It is said of England, by way of distinction, and we value ourselves upon it, that it is a trading country: and king Charles II. who, though he was not the best governor, was the best acquainted with the world of all the princes of his age, used to say, **THAT THE TRADESMEN WERE THE ONLY GENTRY IN ENGLAND:** his majesty spoke it merrily, but it had a happy signification in it. For

Our tradesmen, especially those of the great city we have been describing, are not as in other countries, the meanest of our people: some of the greatest and best families among not the gentry only, but even the nobility, have been raised from trade, owe their beginning and their estates to trade: and we may add, that these families are not ashamed, as they have no reason, of their original. See our article **COMMERCE**.

We have in England a numerous and an illustrious nobility and gentry, and it is true, also, that, not so many of those families have raised themselves by the sword as in other nations, though we have not been destitute of military heroes.—But trade and learning have been the true principal channels by which our gentlemen have raised their fortunes and splendor to the prodigious height we now behold them. As so many of our noble and wealthy families are sprung from trade, so it is true, that many of the younger branches of our gentry, and even of the nobility itself, have descended again into the spring from whence they flowed, and have become tradesmen: whence it is that we said above, our tradesmen in England, especially in London, are not, as in other countries, always of the meanest of the people. Nor is trade in this kingdom a mean employment: it is on the contrary, the readiest way for men to raise their fortunes and families: and, therefore, it is a field for men of figure and distinction to enter upon.

It reflects, therefore, not a little upon the understandings of those refined heads who pretend to depreciate that part of the nation, which is so infinitely superior in wealth to the families who call themselves gentry, and so infinitely more numerous. The wealth of the nation lies chiefly among the trading part of the people; though there have been a great many families raised by the late wars, by great employments, and by renowned actions abroad, to the honour of the English gentry; yet how many more families among the tradesmen have been raised to immense estates, even during the same period, by the attending circumstances of the wars? such as the cloathing, the paying, the victualling, and furnishing, &c. both army and navy? And by whom have the prodigious taxes been paid, the loans supplied, and money advanced upon all occasions? By whom are the banks and companies carried on? On whom are the funds levied, and by whom the public credit upheld? Have not the trade and tradesmen borne the burthen of the wars? Is not trade the inexhaustible fund of all funds, and upon which all the rest depend?

As is the trade, so in proportion are the tradesmen; and how opulent are tradesmen in almost all the several parts of England, as well as in London? How ordinary is it to see a tradesman go off of the stage, even but from mere shopkeeping, with from 10 to 40,000*l.* estate, to divide among his family?

On the contrary, take the gentry in England in general, what with high living, which is grown so much into a disease, and the other ordinary circumstances of families, we find few of the lower gentry, that is to say, from 6 to 700*l.* a year downwards, but they are in debt, and in necessitous circumstances, and many of much larger estates also. How are the ancient families worn out by excess and family misfortunes, and the landed estates possessed by a new race of tradesmen, grown up into families of gentry, and established by the immense wealth gained in the shop, the warehouse, or the counting-house? How are the sons of traders now ranked among the prime of the gentry? How are the daughters of London traders at this time adorned with the ducal coronets? Nay, many of our trading gentlemen at this time refuse to be ennobled, scorn being knighted, and content themselves

with being known to be rated among the richest commoners in the nation? And it must be acknowledged, that, whatever they may be as to court-breeding, and the external politesse, they, generally speaking, are inferior to none of the gentry in the knowledge of the world.

In how superior a port or figure, as we say, do our tradesmen live to what the middling gentry either do, or can support? An ordinary tradesman now, not in the city of London only, but in the inland counties, as well as the out-ports, shall spend more money by the year than a gentleman of 4 or 500*l.* a year can do, and shall increase his fortune every year too: whereas the gentleman shall, at the best, stand still, just where he began, nay, perhaps, decline; and as for the lower gentry, from 100*l.* a year to 300*l.* or thereabouts, though they are often high in their appearance, yet a shoemaker in London shall keep a better house, spend more money, cloath his family better, and yet grow rich too: is it not evident, therefore, where the difference lies? An estate is a pond, but trade is a spring.

This being the case in England, it is no wonder that our tradesmen fill the lists of our nobility and gentry; no wonder that the gentlemen of the best families marry tradesmen's daughters, and put their younger sons apprentices to tradesmen. And how often do these younger sons come to buy the elder brothers estates, and restore the family, when the head of the house, proving unhappy in his conduct, for want often of employment, has wasted his patrimony, and is obliged to make out the blessing of Israel's family, where the younger son bought the birth right, and the elder was doomed to serve him?

Trade is so far from being inconsistent with a gentleman in this kingdom, that it makes gentlemen, and has peopled this nation with gentlemen, and will continue so to do, while it shall be supported in proportion as it may be in neighbouring countries; for, after a generation or two, the tradesmen's children, or at least their grand-children, become as good gentlemen, statesmen, parliament-men, privy-counsellors, judges, bishops, and noblemen, as those of the highest birth and the most ancient families. See the article **COMMERCE**, and various other parts of this work.

They tell us a story of the old lord Craven, who was afterwards created earl of Craven by king Charles II. that, being upbraided with his being of an upstart nobility, by the famous Aubery, earl of Oxford, who was himself of the very ancient family of the Veres, earls of Oxford, the lord Craven told him, that he [Craven] would cap pedigreees with him [Oxford] for a wager: the earl of Oxford laughed at the challenge, and began, reckoning up his famous ancestors, who had been earls of Oxford for a hundred years past, and knights for some hundreds of years more. But, when my lord Craven began, he read over the family thus: I am William lord Craven, my father was **LORD MAYOR OF LONDON**, and my grandfather was the **LORD KNOWS WHO**; wherefore I think my pedigree as good as yours, my lord (meaning the earl of Oxford.) The story is to my purpose: for, let the grandfather be who he would, his father, Sir William Craven, who was lord mayor of London, was a wholesale grocer, and raised the family by trade; and yet no body doubts but that the family of Craven is, at this day, as truly noble as most.

In Italy, and especially at Venice, we see every day the sons of merchants, and other traders, who grow in wealth and estates, and can advance, for the service of their country, a considerable sum of money, viz. from 60,000 to 100,000 dollars, are accepted to honour by the senate, and translated into the list of the nobility; and in all ages the best princes have thought fit to reward the extraordinary merit of their subjects with titles of honour, and to rank men among their nobility who have deserved it by great and laudable actions, whether the dignity of their birth, and the antiquity of their families, intitled them to it or not.

The word tradesman, in England, does not sound so despicable as it does in other countries; and to say a gentleman-tradesman, is not so great an impropriety as some people are wont to think; and, indeed, as trade is now flourishing in England, the wealth of our tradesmen increasing, it is very probable a few years will shew us still a greater race of trade-bred gentlemen than ever England yet had.

The very name of an English tradesman will, and does already obtain in the world; and as our soldiers, by the late wars, gained the reputation of being some of the best troops in the world, and our seamen are at this day, and very justly too, esteemed the best sailors in the world: so the English tradesmen may, in a few years, be allowed to rank with the best gentlemen in Europe; and, as the prophet Isaiah said of the merchants of Tyre, That her traffickers were the honourable of the earth. Isa. xxiii. 8.

In the mean time, it is evident their wealth, at this time, out-does that of the like rank of any nation in Europe; and, as their number is prodigious, so is their commerce; for the inland commerce of England (and it is of those tradesmen and traffickers that we are now speaking of in particular, who carry on trade from the metropolis to the most remote parts of the kingdom) is certainly the greatest of it's kind of any of the globe; the consumption of all sorts of goods, both of our manufacture

manufacture, and of foreign growth being so exceeding great. All this confirms, that trade in England neither is or ought to be levelled with what it is in other countries, or the tradesmen depreciated as they have been in some nations, and as some of our gentry would pretend to in England; but that, as many of our best families rose from trade, so many branches of the best families in England, under the nobility, have been put apprentices to tradesmen in London, and set up and followed those trades, when they have come out of their times, and have thought it no dishonour to their blood.

If I might be permitted, not only without offence, but with a most respectful intention, these observations might not injudiciously or farcally be applied to the ladies of this kingdom, many of whom are so scandalized at that mean step, as they call it, of marrying a tradesman, even a London tradesman: it may be modestly told them, for their humiliation, that, however they think fit to act, sometimes those tradesmen come of better families than their own; and oftentimes, when they have refused and contemned them to their loss, those very tradesmen have married ladies of superior fortune to them, and have raised families of their own, who, in one generation, have been superior to those nice ladies, both in dignity and estate; and have, to their great mortification, been ranked above them upon all public occasions.

The whole glory and greatness of England then being thus raised by trade, and in a great degree, by that of its metropolis, it must be unaccountable folly and ignorance in us to lessen that one article in our own esteem which is the only fountain from whence we all, take us as a nation, are raised, and by which we are enriched, and maintained with dignity and splendor. The scripture says, speaking again of the riches and glory of the city of Tyre, which was, indeed, at that time, the great emporium of the world for foreign commerce, and from whence all the silks and fine manufactures of Persia and India were exported all over the western world, That her merchants were princes; and in another place, By thy traffic thou hast increased thy riches, Ezek. xxviii. 5. Certain it is, that our traffic has increased our riches and our power; and it is also certain, that one principal foundation of all our traffic is the grandeur and magnificence, as well as the wealth, the honour, and sagacity of its renowned citizens of London.

And here, in justice to the well-intentioned and judicious writer, I would beg permission to recommend to candid perusal a performance* lately published, which does no less honour to the author, than he zealously intends glory and advantage to the city of London.

* An Essay on the many advantages accruing to the community from the superior NEATNESS, CONVENIENCE, DECORATIONS, and EMBELLISHMENTS of great and capital CITIES; particularly applied to the city and suburbs of LONDON. Addressed to Sir John Barnard, Knt. senior alderman and senior representative in parliament of the said city. Printed for Mr. Whitridge, at the Royal Exchange, 1754.

‘The decorations and fine embellishments of cities, says this ingenious gentleman, more especially of great and capital ones, whilst they reflect honour, state, and dignity on their sovereigns, their country, and their own particular magistrates and citizens, will ever be found productive of perpetual accessions of wealth and commerce, of people, power, and influence; seeing a general resort to, and residence at, such finely-adorned cities, by persons of high rank and opulence, will necessarily occasion much money to be brought thither, and will as necessarily bring much employment to their people*.’—And again: ‘A season like the present, says he, of profound peace and tranquillity, is undoubtedly the only proper one for the subject of this essay; a subject, as herein peculiarly applied to our great metropolis, not before handled by any, as far as I know. Whilst almost every considerable city beyond sea, and many of our own at home (as Dublin, Edinburgh, Bristol, Gloucester, Bath, &c.) are diligently embellishing and adorning, justly perceiving the substantial benefits arising therefrom, shall the city of London remain any longer supine and inactive, until it be rivalled, and in some manner eclipsed, by cities both abroad and at home, not even so considerable as one of her single wards!

* See page 2.

‘Since the last general pacification, almost every nation in Europe is pushing into commerce, manufactures, and fisheries more than ever was known before. It therefore behoves us, who still hold the superiority in trade and navigation, not only to keep the ground which we gained by perseverance and industry, and have so long held, but which we are in no small danger of losing, by the indefatigable application of our most dangerous rivals in both; but likewise to study every means in our power to attract the rich and noble to resort to us, from every corner of Europe; whereby our commerce, manufactures, and shipping, our wealth and our people, would be greatly increased. These, and such-like considerations induced me to fall into this hitherto untrodden path*.’

* See Introduction.

In the application of these sentiments to the city of London in particular, the gentleman gives a summary view of the benefits which would result to the city from his design; which are comprized under the following particulars.

I. REPUTATION, singly considered, is unquestionably beneficial: but although the completion of our scheme be extremely well calculated for advancing our reputation and glory beyond seas, this would nevertheless be the least of its good consequences.

II. By the supposed general resort of foreigners to our metropolis, it is easy to conceive how great the additional demand would be for all the various necessaries, conveniences, and superfluities, whether for nourishment, cloathing, equipages, plate, jewels, pictures, books, toys, medals, &c. for all which London would then undoubtedly be the general mart and staple.

III. Very considerable, also, would the additional employment be of our manufacturers, artizans, farmers, shopkeepers, labourers, &c.

IV. All which would necessarily tend to the prosperity and increase of our foreign commerce, navigation, and plantations, and, consequently, of our seamen, as well as of all the various occupations dependent on commerce, shipping, and plantations.

V. Another obvious consequence from the premises would be a proportionable increase of the public revenues, of customs, excise, &c. whereby our heavy national debt would be the sooner discharged.

VI. The increase of the rents of houses (as well as of their number and goodness) in London, and even of the rents and improvements of lands in the country, would be also another necessary consequence.

VII. And, as our manufacturers, artizans, farmers, and labourers, would find fuller employment, both in town and country, this would necessarily lessen our poor rate, at present so exorbitant, and so grievously burthenfome to the bulk of our people.*

REMARKS in 1764.

Since the public spirited writer of the before-mentioned essay wrote the same, the city of London bears a different and more splendid aspect than what it did. The taking down the city gates has proved very ornamental; and the alterations about making to the Bank of England, are likely to add no little lustre to the center of our metropolis. Whether the first intimation hereof was derived from what the judicious gentleman observes in his essay, I cannot say; but it looks something like it. He says, ‘The Bank is a good house, but situated in too narrow a street; where a perpetual conflux of wheel-carriages of all kinds, occasions very frequent obstructions to business. This might in a good degree be remedied, if that prudent corporation would purchase and demolish four houses fronting their great gate; whereby a good coach and foot-way might be opened directly from thence into Cornhill, which would likewise open an advantageous view of the fine front of that structure.’

I cannot pass this essay over without noticing one thing this ingenious gentleman mentions, concerning ‘A MERCANTILE LIBRARY being placed in the MANSION-HOUSE to be consulted by all the citizens as occasion may require.’ I could wish that this our labour, might fall into the hands of this gentleman, and that he would turn to our article MERCANTILE COLLEGE, where he will find such a MERCANTILE LIBRARY as he recommends, might be of far more public utility than at the MANSION-HOUSE.

The duchy of MILAN in Italy. The Milanese is one of the fertilest provinces of Italy: it is bounded on the west by Piedmont, Savoy, and Montserrat, on the south by the Apennine mountains and the territory of Genoa, on the east by the states of Venice, Parma, and Mantua, and on the north by the territory of Valois, the Grisons, and Switzerland.

The whole country is well watered and very fruitful. Besides the rivers Tesino, Po, Adda, and Sessia, are many smaller, and several great lakes which furnish it with plenty of fish.

This duchy is commonly divided into the following 13 territories, viz

I. The MILANESE, properly so called, having the Comasco on the north, the Lodofan on the east, the Paviese on the south, and the Navarese on the west.

MILAN, the capital of the duchy, is not only well peopled, but is one of the most trading cities in Italy. Its principal manufactures are those of the filken and woollen, steel and iron work, prodigiously neat, especially sword hilts, snuff and tobacco-boxes, buckles, and the like. They likewise work very neat on a sort of rock-crystal, which is brought hither from the Alps, and Glacuris of Savoy, some pieces of which are large enough to be worked into fine looking-glasses of about 12 inches by 13: but this last kind is very difficult to work. The citizens here are very rich, and the gentry numerous.

- II. The PAVIESE hath the Milanese Proper on the north, the country of Bobbio on the south, the Lodiese on the east, and the Laumellinese on the west; and so fertile, that it is commonly sited The garden of the duchy of Milan. But here are no towns of any trade.
- III. The LODESAN lies along the river Adda, between the Cremonese and Comasco. It hath Milan Proper on the north, the Paviese on the west, and the Placentine on the south, and is a very fertile and well-peopled district. NEW LODI is a rich and populous town on the river Adda. They breed a vast quantity of cattle in the territory about it, and it is famed likewise for making excellent cheeses, and of a monstrous bigness, some of which weigh above 500 pounds, and far exceed the Parmesan in taste, as also for dried neats tongues, and a fine sort of earthen-ware, not inferior to the Dutch Delft.
- IV. The CREMONENSE has Parmesan on the south, the Mantuan on the east, Lodese on the west, and the Bresciano on the north. It is fertile in good wines and fine fruits. It's only place of note is the city of CREMONA.
- V. COMASCO, or the territory and county of COMA, lies between the Bergamese, the Grisons, the Valteline, and the four Italian bailiwicks belonging to Switzerland.
- VI. The county of ANGHIERA is situate at the foot of the Alps, between Switzerland and the territory of Valais on the north, Aosta on the west, and the Vercellese and Novarese on the south. It is small, but very fertile and well inhabited.
- VII. The NOVARESE lies between the Milanese Proper, Piedmont, Sessia, and the Vigevnese, and is a fertile and pleasant country.
- VIII. VIGEVANESE. IX. LAUMELLINESE. X. The ALEXANDRINO. XI. The TORTONESE. XII. The vallies of SESSIA. XIII. The BOBBIESE, or territory of BOBBIO, in none of which are any trading towns worth mentioning.

MINERAL is a compound fossil, wherein there is something discoverable like metal, but not malleable; it being joined or compounded with some other fossil, as salt, sulphur, earth.

To write of metals and minerals, intelligibly and with tolerable perspicuity, is a task much more difficult than to write of either animals or vegetables. For those carry along with them such plain and evident notes and characters, either of disagreement or affinity with one another, that the several kinds of them, and the subordinate species of each, are easily known and distinguished, even at first sight; the eye only being fully capable of judging and determining their mutual relations, as well as their differences.

But in the mineral kingdom the matter is quite otherwise. Here is nothing regular, whatever some may have pretended: nothing constant or certain. Inasmuch that a man had need to have all his senses about him, to use repeated trials and inspections, and that with all imaginable care and wariness, truly and rightly to discern and distinguish things, and all little enough. Here is such a vast variety of phenomena, and those many of them so delusive, that it is very hard to escape imposition and mistake. Colour, or outward appearance, is not all to be trusted. A common marcasite or pyrites shall have the colour of gold most exactly, and shine with all the brightness of it; and yet upon trial, after all, yield nothing of worth, but vitriol and a little sulphur; whilst another body, that hath only the resemblance of an ordinary pebble, shall yield a considerable quantity of metallic and valuable matter.

So likewise a mass, which to the eye appears to be nothing but mere simple earth, shall, to the smell or taste, discover a plentiful admixture of sulphur, allum, or some other mineral.

Nor may we with much better security rely upon figure, or external form. Nothing more uncertain and varying. It is usual to meet with the very same metal or mineral, naturally shot into quite different figures, as it is to find quite different kinds of them all of the same figure. And a body that has the shape and appearance of a diamond, may prove, upon examination, to be nothing but crystal, or fenelites: nay, perhaps, only common salt or allum, naturally crystallized and shot into that form.

So likewise, if we look into their situation and place in the earth, sometimes we find them in the perpendicular intervals, sometimes in the bodies of the strata, being interperfed amongst the matter whereof they consist, and sometimes in both. Even, if I may so speak, the gemmeous matter itself, with this only difference, that those gems, e. gr. topazes, amethysts, or emeralds, which grow in the fissures, are ordinarily crystallized, or shot into angulated figures: whereas, in the strata, they are found in rude lumps, and only like so many yellow, purple, and green pebbles.

Not but that even these, that are thus lodged in the strata, are also sometimes found crystallized, and in form of cubes, rhombs, and the like. Or if we have respect to the terrestrial matter, wherein they lie in those strata, here we shall meet with the same metal or mineral embodied in stone, or lodged in coal, that elsewhere we found in marl, in clay, or in chalk.

As much inconstancy and confusion is there in their mixtures

with each other, or their combinations amongst themselves. For it is rare to find any of them pure, simple, and unmixed, but copper and iron together in the same mass: copper and gold, silver and lead, tin and lead, yea sometimes all the six promiscuously in one lump.

It is the same also in minerals, nitre with vitriol, common salt in allum, antimony with sulphur, and sometimes all these together. Nor do metals only sort and herd with metals in the earth, and minerals with minerals, but both indifferently and in common together. Lead with spar, with calamine, or with antimony: iron with vitriol, with allum, with sulphur: copper with sulphur, with vitriol, &c. yea, iron, copper, lead, nitre, sulphur, vitriol, and, perhaps, some more, in one and the same mass.

In a word, the only standing test and discriminative characteristic of any metal or mineral must be sought for in the constituent matter of it; and it must first be brought down to that, before any certain judgment can be given. And, when that is once done, and the several kinds separated and extracted each from the other, the homogeneous mass of one kind is easily distinguishable from any other; gold from iron, sulphur from nitre, and so of the rest. But, without this, so various are their intermixtures, and so different the face and appearance of each, because of that variety, that scarcely any thing can be certainly determined of the particular contents of any single mass of ore by mere inspection.

I know that by experience and conversation with these bodies, in any place or mine, a man may be enabled to give a near conjecture at the metallic or mineral ingredients of any mass commonly found there; but this merely because he hath made trial of other like masses, and thereby learned what it is they contain. But, if he remove to another place, though perhaps very little distant, it is ten to one but he meets with so different a face of things, that he will be there as far to seek in his conjectures, as one who never before saw a native ore; until he hath here made his trial as before, and so further informed himself of the matter.

Metals being so very useful and serviceable to mankind, great care and pains hath been taken, in all ages, in searching after them, and in separating and refining of them. For which reason it is, that these have been accurately enough distinguished and reduced to six kinds, which are all well known.

But the like pains have not been taken in minerals, and therefore the knowledge of them is somewhat more confused and obscure. These have not yet been well reduced, or the number of the simple original ones rightly fixed; some of which are only compounds, the matter of two or more kinds being mixed together, and, by the different proportion and modulation of that matter, variously disguised and diversified, having been reputed all different kinds of minerals, and thereby the number of them unnecessarily multiplied. Of this we have an instance of the gem kind: where of all the many sorts reckoned up by lapidaries, there are not above three or four that are originals; their diversities, as to lustre, colour, and hardness, arising from the different admixture of other adventitious metallic and mineral matter. It is sufficient for my present design to remark in general, that those minerals, and ores of metals which are repositied in the bodies of the strata, are either found in grains, or small particles, dispersedly intermixed with the corpuscles of earth, sand, or other matter of those strata: or else they are amassed into balls, lumps, or nodules. Which nodules are either of an irregular and uncertain figure, such as are the common pyrites, flints, agates, onyx's, pebbles, cornelians, jaspers, and the more like: or of a figure somewhat more regular and observable, such as the belemnites: the several sorts of mineral coral, of the stelechites, and of the lapis mycetoides*: the astroites, or starry stone, as well that sort with the prominent, as that with the plane, and that with the concave stars: the fenelites, the echinated crystalline balls, with many more analogous bodies.

* Vulgarly called fungites.

Those which are contained in the perpendicular intervals of the strata are, either such as are there accumulated into a rude heap, without any particular form or order, being only included betwixt the two opposite walls or sides of the said intervals, which they wholly or partly fill, as there is a greater or less quantity of them; in which manner spar is usually found therein, and other minerals, as also the common ores of lead, tin, iron, and other metals, or else such as are of some observable figure. Of this sort are the sparry striae, icecycles, called stalactites*: the native saline icecycles, or sal stalacticum: the vitriolum stalacticum nativum: the vitriolum capillare: the alumen stalacticum, and capillare: minera ferri stalactica, which, when several of the cylindric striae are contiguous, and grow together in one heap, is called brush iron-ore: and, lastly, the argentum arborefcens & capillare.

* Or rather flagonite.

Hither also ought to be referred the crystallized ores and minerals, e. gr. the iron-rhombs: the tin grains: the munda-

dic grains: the tessellated pyrites, or ludis Paracelli: crystallized native salt, allum, vitriol, and sulphur. As likewise the gems or stones that are found in these perpendicular intervals, shot into cubes, into pyramidal forms, or into angulated columns, consisting sometimes of three, but most commonly of six sides, and mucronated, or terminating in a point, being either opaque or pellucid: or partly pellucid, and partly opaque and coloured, black, white, grey, red, purple, blue, yellow, or green, e. gr. crystal, the pseudo-adamantes, the Cornish stones, the Bristol stones, crystallized spars, the amethyst, the sapphire, the topaz, the emerald, and several others.

R E M A R K S.

With regard to the tokens and characteristics upon the surface of the earth, of such places as may be reasonably presumed to contain some kind of mineral or metalline earths of value, see the article MINEROLOGY.

MINERAL WATERS. These are chiefly of three kinds. Some are corporeal (we want a better word for it) others spirituous, and the rest both corporeal and spirituous. Those we call corporeal mineral waters, contain fixed and solid particles of minerals and fossils, which may be separated from the water, and seen with the naked eye; such as these are of two sorts: some carry large particles of minerals and fossils, which may be easily perceived in the water itself; nor are they, properly speaking, mixed with the water, and some have in them grains of gold, silver, &c. and, therefore, are called auriferous, argenteous, &c. but such are not properly termed mineral waters, because they have not those particles mixed with them, but separate; neither do they receive any property from them: yet, because men admire such rivers, and their explication hath a great affinity with the description of mineral waters properly so called, we thought fit to mention them under the same heads; to which may be added bituminous fountains, &c.

Corporeal mineral waters are such as contain solid particles of fossils, but so minute that they are intirely mixed, and cannot well be distinguished by the sight, unless they are made to subside by art, or a long space of time, or by concretion are brought to a visible mass; such as salt and sulphureous fountains, &c. and chemical waters, in which metals are dissolved.

Spirituous waters are those that contain only such a volatile spirit as is found in minerals, but have no fixed particles in them; and, therefore, their composition can never be made visible.

We call those waters both corporeal and spirituous which contain not only fixed and solid particles of minerals, but also volatile and spirituous; of all which we shall give examples.

How mineral waters are generated.

1. If the water be carried under-ground with a rapid course, among metalline and mineral earths, which is easily loosened, it is evident that it washes particles from it, and may carry along with it grains of these minerals: and this is the generation of these corporeal mineral waters that hold grains in them.

2. If the mineral waters are imperfect, and not so closely joined as vitriol, sulphur, &c. or even salt, which, of their own nature, easily mix with water; and, if a rivulet of water runs through beds or mines of such minerals, or be strained through them (without a channel or duct) the water, when it breaks out at the fountain, will have small particles of these minerals mixed with it, and will be corporeal mineral water, of a subtle composition, according to the smallness of the atoms. Now, whether the water can in like manner dissolve or unite with itself the particles of metals, is to be questioned, because they are hard and solid, and, therefore, are not easily blended with water. This may be done, but not with simple or common water, but by vitriolic and salt spirituous water, like aqua fortis [see AQUA FORTIS] for that dissolves metals into atoms, and easily unites them with itself, so that they do not subside at the bottom, unless they be separated by art: in like manner, when such water runs through a metallic earth, it may dissolve the metalline particles, and unite them with itself; and thus are the corporeal mineral waters of the second sort accounted for and explained.

3. Before metals are formed in the bowels of the earth, steams and vapours are condensed about the extant corners of the rocks, to which they adhere, being at first but of a soft substance, and afterwards hardened by degrees; if, therefore, the water should gleet through the places where such vapours are in commotion, it becomes impregnated with them: and thus spirituous mineral and metalline waters are produced. Imperfect minerals also make mineral waters of their own nature, after another method, viz. when, being heated by a subterraneous, or their own proper heat, they send forth spirits and vapours, as sulphur, vitriol, salt, coal, &c. and such exhalations is always stirred up, where there are such minerals, among which the permeating water is impregnated with the spirit. Some think these spirituous waters may be generated by being only carried through a metallic earth, or by having their receptacles in it, or in their mines; but it is found to

the contrary by experience, that water receives no quality from metals and minerals, though they should be immersed in it a great many years. Therefore, rejecting this opinion, it is most reasonable to suppose, that these waters receive a certain spirit from the first principles of metals, as we may call them; or we may say, that such waters are impregnated with the subtle spirits of vitriol, salt, &c. by the help of which a spirit is extracted from hard metals; but we do not lay so great stress upon this latter cause, for a question will arise again, about the generation of this spirituous, mineral, vitriolic, and salt water.

From these together it appears, how mineral waters, both corporeal and spirituous, are generated.

There are innumerable kinds of mineral waters, according to the diversity of the particles they receive from different minerals.

We have explained how mineral waters receive these particles, from which their extraordinary qualities arise. Now, because there are divers kinds of minerals, it hence follows, that mineral waters are various, and almost infinitely different in their qualities, not consisting of one kind of water impregnated with only one sort of mineral, but of various kinds, mixed with various sorts. Wherefore mineral waters are either simple or mixed; and the mixed have two, three, four, or more sorts of fossils in them.

Hence are, 1. Metallic waters, as of gold, silver, copper, tin, lead, iron, &c.

2. Salt waters, as of common salt, nitre, allum, vitriol, &c.

3. Bituminous waters, sulphureous, antimonial, as of coal, ambergris, &c.

4. Waters proceeding from various kinds of earth and stones, viz. as lime-stone waters, chalk, oker, cinnabar, marble, alabaster, &c.

5. Mercurial waters, &c.

All these kinds of waters are to be understood three ways, viz.

1. Some of them are corporeal, either sensibly so, or by a refined and subtle commixture. 2. Others are spirituous. 3. Others are both corporeal and spirituous.

These differences may be applied to the several kinds of mineral waters. For example: there are golden waters, which are, 1. Corporeal, that carry grains of gold of such magnitude, that, with small trouble, they are discernible, by reason of their gross or coarse mixture. 2. Corporeal, that carry very minute particles of gold, well mixed with them; and, though the smallest particles of gold do, of their own nature, sink to the bottom of water, yet that there are such, appears from the aqua regia [see AQUA REGIA] in which gold is dissolved into atoms; but this aqua regia is not a simple water, neither does any water carry atoms of gold in it, unless it be before impregnated with other mineral particles. 3. Spirituous golden waters, that have engendered a spirit and vapour in the earth, from which gold is produced.

4. Golden waters, that are both corporeal and spirituous, viz. that have both atoms of gold, and the spirit that produces it.

Thus we are to apply this four-fold variety to all sorts of mineral waters, whether simple or mixed (from whence innumerable species are produced); for either the bodies of fossils, or their spirits, or the body of one fossil with the spirit of another, are mixed or engendered in the water: so leaden waters are of four kinds, viz. 1. Visibly corporeal. 2. Corporeal by a subtle mixture. 3. Tinctured by the spirit of lead. 4. Impregnated both with the body and spirit of lead. And these four participations of minerals are to be applied to mercurial waters, &c. and more especially to salt, vitriolic, and sulphureous waters, because in these nature itself displays a four-fold variety; though it is to be doubted whether there be corporeal particles of a subtle grain in metalline waters.

Spirituous metallic waters are also very rare; but the water of salt, sulphur, &c. both corporeal and spirituous, is very common, because these fossils are found in greater plenty, and their particles are also sooner adapted to atoms, and dissolved by the water; beside, they frequently emit steams and vapours.

Let us explain this four-fold variety of participation by one example of gold.

In the country of Tyrol, and the neighbouring places, there are several rivers that carry grains of gold; and the Rhine, the Elbe, the Danube, and several other great rivers, do the like also, as other rivers do other metals and minerals. The Rhine carries grains of gold, mixed with clay and sand, in many places, but especially at these, viz. 1. Near Coire, in the Grisons country. 2. At Mayenfeld. 3. At Eglisau. 4. At Soking. 5. At the town of Augst, not far from Basle. 6. At Newburg. 7. At Saltz. 8. At Worms. 9. At Mentz. 10. At Bacherach. 11. At Bonn, &c. The auriferous rivulets which the Rhine receives, the reader may see in Thurnheuserus, and also those that run into the Danube and Elbe. Small grains of gold are found in the Elbe in these places: 1. At Lotomeritz in Bohemia. 2. At Purn. 3. At Dresden in Meissen. 4. At Torgau. 5. At Magdeburg. 6. At Lawenburgh tower, about five miles from Hamburg. Several other auriferous rivers are given an account of in the forecited book of Thurnheuserus; and such as carry other metals and minerals. And these are auriferous corporeal

real waters of the first kind, carrying visible grains, which are not so properly called mineral, or golden waters, because the golden grains are not mixed with the water, but only carried in it by its rapid motion, the water itself being un-compounded with it.

2. Corporeal golden waters of fine mixture, whose atoms are united with the atoms of gold, like the chemical aqua regia which dissolves gold, and unites it by atoms to itself: for since it is possible that there may be in nature such water as this of the chemists, which may run through golden earth, or gold mines, it is reasonable to suppose that it eats out particles, and dissolves them into atoms, and unites them to itself; and from this cause proceed those (or such-like) golden rivulets as are described by Thurnheuserus, in his account of the Danube, Rhine, &c.

3. Spirituous golden waters are but very few, some of which, perhaps, are enumerated among the rest by Thurnheuserus; but these are not so much known, because golden earth and gold mines are very scarce; besides, where there are such mines, there is such a mixture of other minerals, that they are not perceptible. Nevertheless, there are some rivulets in the high Alps of Bohemia, that are said to participate of these golden spirits, as in the Frichtelberg mountains in Silesia. The hot baths also in the bishopric of Coire are believed to be impregnated with this kind of spirit; yet, because of the mixture of other minerals in a greater quantity, this quality is rendered less perceptible.

4. Golden waters that carry both the atoms and spirit of gold, are some of those rivulets mentioned by the abovenamed Thurnheuserus.

Let us also give an example of salt waters.

1. Corporeal salt waters, which carry grofs and undigested particles of salt, are found in many places, and sufficiently known, as fountains, whose waters produce salt, and sea-water, from which salt is extracted by boiling.

2. Subtile corporeal salt waters, which contain salt dissolved in the minutest atoms, are such as are very salt, and yet very clear, as many salt fountains are, and sea-water that is thin and fine; though there is a great difference in this subtile mixture. Hereto may be referred the urine of all animals.

3. Spirituous salt waters, which do not contain the particles of salt, but only the spirit of it, are of such a nature, that, if several tons be ever so much boiled, they will not yield any salt. There are a great many of these in Germany, and other places, but they are seldom without mixture.

4. Corporeal and spirituous salt-waters, which contain the particles and spirit of salt. Almost all corporeal waters have some small portion of saline spirits in them, but few of them any quantity. Thus the fountains about the city of Saltzinge, near the Rhine, are saltier than other salt springs, and yet yields less salt, because their sharp and brackish taste is heightened by a spirit or volatile salt.

Hence it appears how this four-fold variety of participation is to be applied to the several kinds of mineral waters, viz. to vitriolic, allum, and lead waters, &c.

To enumerate the most remarkable varieties of mineral waters. In the foregoing propositions we have explained the kinds and differences of mineral waters, taken from their nature, which consist in having mineral particles in them, which they carry, or with which they are impregnated; but, because these varieties are not so perceptible to the senses, and there are several mixtures of minerals that cause various, and almost unaccountable properties in the waters, therefore they are not so easily known and distinguished by the vulgar; for waters (and other bodies) become famous among mankind, and receive their names from their manifest qualities, which strike and affect the senses, whose cause and explication are to be deduced from their composition and participation. There are, therefore, ten species of waters, or liquids, that flow out of the ground, which are commonly taken notice of by the vulgar: 1. Acid waters. 2. Bitter. 3. Hot. 4. Very cold. 5. Fat and oily. 6. Poisonous or deadly. 7. Coloured. 8. Boiling. 9. Waters that harden bodies, change their colour, or otherwise alter them. 10. Saline. 11. To these may be added such as are invested with other uncommon properties. All kinds of waters described by authors may be referred to one or other of these heads.

MINEROLOGY, that previous part of metallurgy, which teaches the ways of finding, judging, and digging of mines. Minerology is an art that requires a considerable compass of knowledge, before it can be practised to advantage: for, as this art includes the discovery, sinking, and working of mines, it requires a competent skill in the nature, effluvia, and effects of mineral matters, whether earths, salts, sulphurs, stones, ores, bitumens, gems or metals. It likewise requires a knowledge of the internal structure of the earth and its various strata, with a competent skill in subterraneous architecture, mensuration, hydraulics, levelling, and mechanics; without which, we can never judge what mountain, plain, or valley, is proper to be dug; in what manner to dig it; how to discharge the water that may flow in upon the works; how the beds of ore and stone will dip or run; how the various kinds of earths, marble, and other mineral or metallic matters, are to be cut through or broken; or how the gene-

ral process of mining should be conducted, in order to procure, with the least expence, or bring to open day, the principal matter or ore required.

And, even when all these difficulties are conquered, no more than half the work is effected; and the end can still be never obtained, without a tolerably exact knowledge of several chemical operations, viz. trituration, torrefaction, lotion, calcination, cementation, fusion, amalgamation, and the like; whence it may be laid down as a rule, that every directing metallist should not only be tolerably versed in the several parts of natural philosophy, but particularly be well acquainted with chemistry.

And, perhaps, it may not be improper to intimate, that many metallurgical attempts have miscarried, merely for want of a competent skill to conduct them. The under workmen, in this way, are generally a head strong ignorant people, that cannot be managed without the use of some good political rules, and a knowledge much superior to their own. Yet, how little soever the art of minerology may have been understood, history affords us numerous examples of plentiful fortunes and immense treasures raised from mines, as well by private persons, as particular states and kingdoms. But the vulgar, and even philosophers not versed in trade, generally esteem the business of mining precarious, uncertain, and unprosperous; especially when compared with agriculture, or other arts, exercised more in the open day.

The truth is, mines are liable to many contingencies, being sometimes poor, sometimes soon exhaustible, sometimes subject to be drowned, especially when deep, and sometimes hard to trace. Yet there are many instances of mines proving highly advantageous for hundreds of years: the mines of Potosi are, to this day, worked with nearly the same success as at first: the gold mines of Cremonitz have been worked almost these thousand years, and our Cornish tin mines are extremely ancient: in general, the profit of mines, compared with that of agriculture, is immensely greater in the same time, so as to compensate largely for their want of certainty. Even lead mines generally yield twice or thrice the returns of the richest soils, improved in the ordinary manner, either by nature or art. What then shall we say of the mines that are rich in the nobler metals? The net profit of the silver alone, dug in the Misnian silver mines of Saxony, in the space of eight years, is computed at a thousand six hundred and forty-four millions, besides seventy-three tons of gold*.

* See Pet. Albin. in Chronic. Misn. Miner. German.

Many mines have been discovered by accident: a torrent first laid open a rich vein of the silver mine at Fribourg in Germany. Sometimes a violent wind, by blowing up trees, or overturning the parts of rocks, has discovered a mine. The same has happened by violent showers, earthquakes, thunder, the firing of woods, or even the stroke of a plough-share, or a horse's hoof.

The art of mining does not wait for these favourable accidents, but directly goes upon the search and discovery of such mineral veins, ores, or sands, as may be worth the working for metal.

The artificial investigation and discovery of mines depend upon a particular sagacity, or acquired habit of judging, from particular signs, that metallic matters are contained in certain parts of the earth, not far below its surface.

The principal signs of a latent metallic vein seem reducible to general heads; such as (1.) The discovery of certain mineral waters. (2.) The discolouration of the trees or grass of a place. (3.) The finding of pieces of ore on the surface of the ground. (4.) The rise of warm exhalations. (5.) The finding of the metallic sands, and the like. All which are so many encouragements for making a stricter search, near the places where any thing of this kind appears. Whence rules of practice might be formed, for reducing this art to a greater certainty.

But, when no evident signs of a mine appear, the skilful mineralist usually bores into the earth in such places as, from some analogy of knowledge, gained by experience (or by observing the situation, course, or nature of other mines) he judges may contain metal.

This method of boring consists in the use of a sett of scooping-irons, made with joints, so as to be lengthened at pleasure; and thrust down to a considerable depth below the surface of the earth, so as, when taken out again, to bring back samples of the earth, or mineral matter, from the depth whereto the iron descended; much after the manner that samples of sugar are taken by the instrument called a REST, out of the hoghead.

After a mine is found, the next thing to be considered is, whether it may be dug to advantage. In order to determine this, we are duly to weigh the nature of the place, and its situation, as to wood, water, carriage, healthiness, and the like; and compare the result with the richness of the ore, the charge of digging, stamping, washing, and smelting. This is a matter of economical prudence.

Particularly the form and situation of the spot should be well considered. A mine must either happen (1.) In a mountain. (2.) In a hill. (3.) In a valley, or (4.) In a flat. But mountain

tains and hills are dug with much greater ease and convenience, chiefly because of the drains and burrows, as the miners call them; that is, the adits, or avenues, may be here readily cut, both to drain off the water, and to form gangways for bringing out ore, &c.

In all the four cases, we are to look out for the veins, which the rains or other accidental things may have laid bare; and, if such a vein be found, it may often be proper to open the mine in that place, especially if the vein proves tolerably large and rich: otherwise, the most commodious place for situation is to be chose for the purpose, viz. neither on a flat, nor on the tops of mountains, but on the sides: for the mineralist is always to exercise his judgment, in due choice of a place to begin the work.

The best situation for a mine is a mountainous, woody, wholesome spot, of a safe easy ascent, and bordering upon a navigable river. And, such a place as this being the standard of goodness, all others may be judged of as they approach to, or recede from it.

Wood is indispensibly necessary for making the necessary instruments, engines, and huts; as also for fencing the pits, or avenues, and supporting the rock, where large caverns are made, by digging away the ore: and again, for supplying fuel to the melting works, unless where pit-coal will serve the turn. But, though no wood or coal should grow upon the spot, it may often be supplied by means of a navigable river, or cheap carriage. And thus there are some rich mines in the hotter climates, without so much as a shrub growing near them.

Plenty of water should never be wanting, and is best supplied by a river; whence it may be commodiously derived by pipes, into the lavadero's, smelting-huts, &c. or even brought into the burrows themselves, and made to work the subterraneous machines. These are conveniences not constantly to be expected from casual rains, or the torrents of the mountains.

The roads and conveniences of carriage, to and from the adjacent parts, must be likewise regarded, as well for the sale of the metal produced, as the conveyance of goods, and the necessities of life to the workmen: for it rarely happens, that provisions are afforded upon the spot where metals are found.

The places abounding with mines are generally healthy, as standing high, and every way exposed to the air: yet some places, where mines are found, prove poisonous, and can upon no account be dug, though ever so rich. The way of examining a suspected place of this kind is, to make experiments upon brutes, by exposing them to the effluvia or exhalations, to find the effect.

But a considerable advantage may sometimes be made, without the labour and expence of digging: for, as springs and rivulets are frequently the outlets of mines, it may happen that the sand of such waters shall be worth the washing for metal, in which manner large quantities of gold-dust are often procured: and hence it appears to be, that the sands of many rapid rivers contain gold; and even the sand of the sea in some places, though the latter in so small a proportion as seldom to be worth the washing. But the sand of such rivers wherein stamped ores are continually washed, may frequently deserve to be assayed.

The veins of a mine greatly differ from each other, in depth, length, and breadth. Some stretch obliquely from the surface towards the central parts of the earth, and these are called deep veins: others lie shallow and circular, so as to encompass a large space; these are termed spreading veins: others possess a great part of the space they lie in, both in length and breadth, and these are called accumulated veins, being no more than a space possessed by a group of fossils of one certain kind. But to give the history of veins, and fibres, which are smaller veins, their differences, their directions, their intersections, their different goodness, their discontinuations, their rising, falling, &c. would be a large work. Let it, however, be observed, that these things seem to proceed in a certain order, though the laws of them have not been well observed, so as to afford the sure rules of practice: whence it sometimes happens, that, after a vein has been successfully tried for some time, it dips, breaks off, or takes a different course, leaving the workmen as it were at fault.

When a vein of ore is found, and all things prepared for the work, if the vein be of the deep kind, it is first to be laid bare and a pit to be sunk upon it, at the mouth whereof a shed is to be raised, and a crane, or barrel and winch fixed, for craning up the ore. The pit is to be sunk either perpendicular or oblique, according as the vein happens to run.

It is also usual, in this case, to cut a burrow or adit, into the side of the hill. This burrow is usually cut twice as high as wide, that the workmen may commodiously pass along it with their barrows and burdens, being for that purpose usually about seven feet and a half high, and almost four feet wide. If this side pit reaches to the first pit, it becomes a true burrow, open at both ends, and thus renders the work more facile and commodious, as the ore may be now wheeled out in barrows, instead of being craned up to the mouth of the pit. After the same manner it is usual to dig many caverns into

VOL. II.

the sides of the mountain, in order to scoop out the ore; so that sometimes there are thus several burrows made, to the ease and advantage of the work.

The art of digging the veins varies according to the nature of the vein, or according as it is soft or hard. The soft vein is generally dug with the spade, and turned out into wooden trays, placed underneath to receive it: but the hard veins are knocked out with a gad, or kind of chisel and hammer. But, if the ore is so hard as to be incapable of breaking in this manner, they usually soften it with fire, which has the power of rendering the hardest and most flinty stones brittle and friable. But a still more expeditious method is the working with gunpowder, by means whereof much of the hardest rock may be shivered and split in a very little time; a small parcel of powder being laid in a long hollow cut for that purpose, after the nature of a gun-barrel, and fired as it were at a touch-hole; a small vent, where the quick-match is applied, being left for the purpose, and the orifice being otherwise hard stopped up with clay.

The manner of pursuing and digging all sorts of veins, the ways of under-propping and discharging the water from the works, the sinking of air-shafts, curing of damp, and the like, to the best advantage, requires more philosophy than the generality of mere workmen, or the common miners have, though their experience may as much assist the theoretic philosopher, as the discernment of the latter may that of the former.

REMARKS ON MINEROLOGY.

We learn from the preceding enquiry, that, to practise mine-ology and metallurgy to advantage, a considerable knowledge in natural philosophy, as well as in the operations of chemistry, in relation to the point of metallurgy, is required. That many miscarriages, in mineral attempts, have been owing to the want of a competent skill of mechanics, hydraulics, and chemistry.

That the profit attending the scientific working of mines is generally greater, and upon the whole more considerable, than that of agriculture or merchandise.

That there are two ways of discovering mines, viz. by accident and by art: the latter whereof belongs to the intelligent mineralist.

That the art of discovering mines depends upon a certain sagacity, which may be acquired by use and practice; or upon the observation of particular signs, that generally denote a mine; and again upon the method of boring, according to some analogy of knowledge, gained by being conversant with the common appearances, situations, and other phenomena of mines.

That the art of discovering mines is reducible to rule, so as not to be mere conjecture, or guess-work.

That, in general, mines are to be first opened where a vein is, by accident, or otherwise, laid bare, especially if it prove large or rich: but, where no such encouragement appears, the side of the hill is principally to be chose for the opening.

That a deliberate consideration, and a competency of economical prudence, are usually required to determine beforehand, whether a mine, after it is discovered, may be wrought to profit.

That the most perfect situation of a mine is to be mountainous, woody, easy of ascent, healthy, bordering upon a navigable river, and good roads.

That metals may be sometimes obtained to advantage without digging, or barely by washing the sands of certain springs and rivers.

That mineral veins differ greatly from each other, and accordingly require different methods of digging, which may be reduced to standard rules of practice.

That the business of mining is improvable, by discovering better methods of preventing or curing the damp in mines, rendering poisonous mines wholesome, or defending the bodies of the workmen against their ill effects; as also by discovering better methods of raising or discharging the waters, following the veins, breaking the rock, getting up the ore.

Before we take leave of this article, what the learned Dr. Edward Browne says, with regard to the miner's compass, in his Travels through Hungary, Thessaly, Macedonia, &c. may deserve the attention of those, who may become adventurers herein.

‘ They [the miners] say he, work, towards one, two, or three of the clock; for the miner's differs from the mariner's compass, being not divided into 32, but into 24 points.— This is very true, not only in regard to the Hungarian and German miners, but with respect to our own coal miners: where, if you ask any of the workmen about the course of the veins, they answer you, that it dips towards six o'clock, which is utterly unintelligible to common people. The truth of the matter is, that the miner's and mariner's compass is founded upon different principles, though it is to be doubted, whether a method might not be found of using the mariner's compass to great advantage in mines; but at present we have not room to insist upon this, and shall therefore content ourselves with observing, that in the miner's compass the upper twelve o'clock answers to the meridian of the place

Z z z

where

where the mine is, and from thence the hours are marked on each of the femicircles; so that six o'clock makes a quadrant on each side, and each of the hour lines is distant from the other 15 degrees; so that, in fact, the miner's compass is a kind of dial; and, when they say they have worked to such an hour, they mean that they work to such a point as the sun bears from them at the time of the day which they mention.

* Kircher, in regard to this discovery of mines, says, we must allow, that all the signs for the discovery of mines, here mentioned, are founded on a weak bottom, and that there is none of those supposed marks, whereby one can be sure and certain, after you have discovered the place that contains ore, neither what quantity nor what kind it holds; for these signs will direct as well to sulphur, antimony, salt, mercury, lead, iron, copper, tin, as to silver and gold. But, by virtue of the WINCHEL-ROD, we may with confidence distinguish the one from the other, and know what kind of ore the mines contain: for, by holding in each hand a piece of gold, the rod which thereby attracts the atoms of the gold, will beat or move to no other metal; with silver it will do the same, as those who profess themselves professors of that art affirm: which we are afraid is a gross imposition, and that Kircher herein might be deceived by some of the artifices of miners, which leads us to take some notice of them.

* The operation with the virgula divina, says Mr. Gabriel Plattes*, is thus to be performed: some observe a set day and hour, with certain words and ceremonies at the cutting up of the fame, which I have found to be little to the purpose. Thus I worked about Midsummer, in a calm morning: I cut up a rod of hafel of the same spring's growth, almost a yard long; then I tied it to my staff in the middle, with a strong thread, so that it did hang even, like the beam of a balance: thus I carried it up and down the mountains where lead grew, and before noon it guided me to the orifice of a lead mine; which I tried, having one with me with an hatchet of iron, and a spade; and, within two hours, we found a vein of lead ore, within less than a foot of the grass: the sign that it sheweth is to bow down the root-end towards the earth, as though it would grow there, near unto the orifice of a mine: when you see it do so, you must carry it round about the place, to see that it turneth in the spring still to the place, on which side soever you stand.

* See his *Discovery of Subterranean Treasures*, p. 4. 5.

The reason of this attraction, continues he, I conceived to be of kin to the loadstone, drawing iron to it by a secret virtue, inbred by nature, and not by any conjuration, as some have fondly imagined.

And the reason of this my opinion was, because that, in divers of my practical experiments, I have observed an attraction betwixt several things, like that of the loadstone and iron; and, if it were to good purpose, I suppose that I could shew more experience of that kind than any man in England. —But the truth of the sure discovery of valuable mines or minerals by such-like means as here pretended, has not yet been made experimentally appear to the satisfaction of the learned world.

FURTHER REMARKS ON MINEROLOGY.

OF THE DECEITS AND IMPOSITIONS OF MINERS, AND OTHERS IN LEAGUE WITH THEM, IN ORDER TO GUARD THE PUBLIC AGAINST THEM.

1. After the practising every art to induce adventurers to hazard their money and give the miners employment, they uphold the adventurer's spirit, from time to time, by fair promises and plausible appearances: and, when they find that people begin to be quite wearied out, they then think it time to produce some ore; which they frequently have conveyed under-ground from some other mine, to engage the adventurers still to keep them employed.

2. But, when no more ore appears, then they amuse people with the notion, that what they had discovered was only a leader to some vein, and that the vein could not be far off: thus they lead their dupes on, 'till, perhaps, they do at length really discover a vein of ore: but, that they may make the most of it to their own advantage, they will then tell the adventurers, that they find it is in vain for them to go on in that place any longer, for that they see no likelihood of reaping any advantage. —Thus the first adventurers are imposed on to desist, when they might carry on the work to profit, as they were drawn in to continue it, when there was not the least view of advantage.

3. The miners fixing their private mark upon the surface of the earth where the vein was discovered draw others in, for a time, to hazard their money in other places; and at length apply to some persons to work where the real mine is, for a fortnight, three weeks, or a month, for nothing; for that they are, by certain secret signs, known only to themselves, convinced, that there is a good vein there; and, provided they shall have such an extra-consideration, if they, in that

time, discover a mine, and have the sole working thereof, they will engage gratis. This naturally draws adventurers, the mine is really found, and those reap the sole advantage of it, who never hazarded one shilling in it's discovery.

4. Artful and villainous projectors also are frequently in combination with the miners, to deceive people by the following arts:

1. These projectors prevail on the miners to give out that a valuable mine is discovered; samples of the ore are produced, and assays made by assay-masters of credit, who pronounce the ore to yield so much metal. This being confirmed by divers assays, numbers are seduced to hazard their money, in concert with the projector's emissaries, when the whole is sunk in the pockets of the infamous schemers and miners.

2. It has been said, that, in order to draw people into those adventures, some tons of ore have been often purchased from other mines, carried to places where there was none, and pretended to be there discovered. A wealthy gentleman, and of experience in mining in CORNWALL, was thus egregiously imposed upon by those villains, though he had the circumspection to go down into the mine himself, and see with his own eyes; and was, as I have been well informed, greatly reduced.

3. Another art said to have been practised by these deceivers is, the making of an artificial mineral, abounding richly with gold and silver. —This they do, by melting a portion of gold and silver with some sulphureous marcasite or mineral, and break the fame in such a manner as to appear like a native mineral; by which, upon the assay's yielding real gold and silver, people are imposed upon.

These are the shameful impositions to which persons are liable; so that unless they live in the neighbourhood of places that abound with mines, can depend upon the fidelity of the miners, and have sufficient judgement themselves, and will venture thier persons down into the mines from time to time, there is no great dependance to be made upon the report of others.

Certain it is, that many have got great estates by mining; and if they reside upon the spot, and have competent skill to guard themselves against fraud and delusion, people may often stand a good chance of great gain for very little hazard.

MINES, are places in the earth, out of which metals, minerals, and other kinds of earth are dug.

So many different kinds of fossils as there are, so many various names have their mines, viz. gold-mines, silver-mines, copper-mines, iron-mines, coal-mines, salt-mines, and such as produce gems, &c.

The most celebrated gold and silver mines, are

1. Those of PERU and CASTELLA DEL ORO, which are the richest in the world, yielding gold and silver in abundance, and not being destitute of other metals; inasmuch that the natives of Peru and the Spaniards used to boast, that this kingdom was founded upon gold and silver. [See the article PERU.]

Girava, a Spanish writer, affirms, that there were formerly mines about the town of Quitto, which produced more gold than earth. And, when the Spaniards made their first expedition into this golden country, they found several houses, especially in the regal city Cusco, which were all covered over within and without with plates of massy gold. And the officers of the Peruvian forces not only wore silver armour, but all their arms were made of pure gold. The most rich and advantageous mine of silver is in the mountains of Potosi, where 20,000 labourers are daily employed to dig it. These mines produce that vast quantity of gold and silver, which the king of Spain receives out of America every year, to the mortification of other kings and potentates; and which he therefore keeps fortified, with strong forts and garrisons.

2. There are excellent rich mines of silver in the JAPAN ISLANDS, whence they are called, by the Spaniards, the Silver Islands. There are also some mines of gold found there, but these are not so rich as formerly.

3. There were more plentiful gold-mines formerly in ARABIA, than at present.

4. In the mountains of PERSIA, and in CHINA, there are some silver-mines.

5. In GUINEA there are several mountains that produce gold, but they are remote from the shore, and the gold dust that is brought from thence, is not dug out of the ground, but gathered up and down by the natives. Their inland kings are however said each to possess his mine, the product of which he sells to the neighbouring merchants, and they again to others, 'till it reaches the sea-coast, where it is exchanged with the Europeans.

6. In MONOMOTAPA, there are found rich mines of gold and silver, and also in Angola, both of which are thought to be parts of one continued vein.

7. GERMANY excels the rest of the kingdoms of Europe for plenty of mines, of which some produce small quantities of gold, others abundance of silver, and a great many of them copper, iron, lead, vitriol, antimony.

8. SWEDEN

8. SWEDEN is enriched with the best copper-mine of any hitherto discovered, it is in a vast high mountain, which they call Kopperberg, out of which as much copper is dug as makes up a third part of the king's revenue. Here are also numerous iron mines, and some silver-mines, but the latter scarcely defray the expence of digging them.

9. There are mines of precious stones found in the island of CEYLON, and also in CONGO (where there is a silver-mine, and so much marble, that the earth under-ground is thought to be all marble) and in PERU, about PORTOVIGO, in SMARAGDINA, and in GUIANA, near the coast of which there is a small island called ST. MARIA, which yields a pretty deal of gold, if we may believe the Dutch. In the kingdom of GOLCONDA, there is a mine which yields precious stones, particularly diamonds in abundance, but it is not now dug.

10. In CHILI there are mines yielding gold, silver, and gems, but the warlike inhabitants, setting more by iron-weapons than gold or silver, have partly killed, and partly driven away, the Spaniards, and demolished the mines that were but newly begun.

11. The island of MADAGASCAR abounds in iron and tin, with a moderate quantity of silver, a little gold, but no lead. Wherefore the natives value leaden spoons above silver ones.

12. In the island of SUMATRA it is reported, that there are rich mines of gold, silver, brass, and iron, and that the king in one year, (viz. in 1620) received into his treasure 1000 pounds weight of gold.

13. In the PHILIPPINE ISLANDS, and in JAVA, HISPANIOLA, CUBA, and others, there are found mines of gold, silver, copper, and iron; and, in the mountains of SIAM, there are got gold, silver, and tin.

14. There are mines of salt in POLAND at POCHNIA, four miles from CRACOW (where large lumps of transparent white salt are cut out of the ground) in TRANSYLVANIA, in the county of TYROL, and in places near the CASPIAN SEA, not far from the river VOLGA, over-against the island KISTOWAT, where the Russians dig their salt and boil it to a more pure substance, and afterwards transport it to all parts of Russia. In CUBA, there is a whole mountain of salt. All the mountains in the island of ORMUS, at the mouth of the Persian gulph, are of salt, which may be gathered in any part of them, in such great quantities, that the very walls of their houses are built of crystalline salt. In a valley in PERU, about eighteen miles from LIMA to the northward, are found deep and large pits of salt, where every one may take away what quantity he pleases, because it continually increaseth, and seemeth impossible to be exhausted. In AFRICA there is no other salt used, but such as is dug out of pits or quarries, like marble, of a white, greenish, or ash-colour. All India fetch their salt from the great salt-mines of BAGNAGAR in COROMANDEL, &c.

In DERBYSHIRE, YORKSHIRE, FLINTSHIRE, in ENGLAND, there are considerable lead-mines, and some copper. CORNWALL abounds with tin-mines. SUSSEX, SOMERSETSHIRE, with iron, &c. SCOTLAND and IRELAND also, and the BRITISH PLANTATIONS in NORTH AMERICA, have numerous mines, many of which are wrought to great advantage.

Of the GENERATION of MINES.

Mines are commonly found in high mountains, because the heat does concenter and unite better there than in low grounds, and consequently there is a stronger fermentation for the production of metals.

The hardest, the weightiest, and most compact metals, are generated, when by fermentation there has been an entire separation of the gross parts; for they are only a coagulation of very subtil particles, and a strict union of these very small pores.

Metals lie in mines very often like great trees, which spread their branches towards all sides; whence it is, that many have thought they were nourished as plants and animals, by juices which run and circulate in the veins or vessels supposed to be within them; but, if the thing be examined narrowly, it may easily be conceived, that these branches of metals (which are called veins by those who deal in mines) happened only by the running of the metallic matter through several small canals, before it was coagulated; which may have been occasioned by the fermentation that swells the matter, and forces it to open the circumadjacent earth in divers places. This fermentation also raises very often (even to the top of the mountain where there is any metal) strings of some marcasite or metallic earth, which is taken as a great sign of metals by those who search after them.

Because it would be a very laborious and unpleasant work to dig for metals, without some reasonable assurance of finding them; therefore some have studied to know the several characteristics, by which it may be concluded, that such and such places do afford mines.

There are, indeed, sometimes mines, whose veins appear in the very surface of the earth, so that none can doubt of finding them. [See AFRICA.] But, if none others were sought after, we should not have such abundance of metals. Some

therefore of the following marks may be added to those already given for discovering mines.

First, It is to be considered whether the ridges and tops of mountains, their chinks, cavities, or pits digged in them, do yield any marcasites, or pieces of metal; for that is a sign there is a mine somewhere about: and, to find out the place, you must follow the string, or track, of these marcasites. Another sign of a neighbouring mine is, when there are found, in the sand of any rivulet, or spring, small pieces of marcasites; for those have been carried off by the waters, which commonly come out of mountains; and so, by tracing the rivulet or water to it's head, you may come at last to the mine itself.

A third mark of a mine is, when abundance of hot waters, or waters which have a mineral taste, flow from a mountain, or any other place: for the places where metals are generated are always invironed with these waters, which is the occasion of no small trouble and difficulty to those who dig in mines.

A fourth sign of a mountain's having a mine in it is, when it is bare and barren, without trees, and having very few plants upon it; or when those that grow there are pale, and without any fresh colour: for the mineral vapours which arise through the pores of this mountain, burn the roots of these plants.

Indeed, sometimes metals are found in very green and fertile mountains, where there are many trees, and other plants; for the metallic vapours do either arise there in a less quantity, or are of a different nature, and so do not hinder the growth of plants in these mountains: or, perhaps, the mines lie at the bottom of them, or may be covered with some hard stone, which intercepts the exhalation of the vapours from the plants. Finally, some very skilful in mines pretend to know, whether there be any in a mountain, by adverting to the reflection of the sun-beams. There being so much water in mines, which necessarily must be drawn off, therefore they commonly rather begin at the foot of the mountain than at the top, because the waters may this way be more easily drained.

Then they dig a vault near to the foot of the mountain, which ought to be continued, in a straight line, the nearest way to the body of the mine; but many do often amuse themselves with the small veins of the metal which they meet with, and upon that account leave the right way, and so both lose their time, and spoil their work: besides that, they expose themselves to great danger; for they shake the soft stones, which, by this means, fall down in great quantity, filling up what they had digged, and sometimes crushing the very workmen. To avoid this accident, they use to prop the roofs of their vaults, or rooms which they dig, with great rafters of wood, to prevent the falling of the loose earth and stones, and then they work by proper instruments for loosening the metal itself.

Metals differ from other minerals in being malleable, which the others are not.

They are accounted seven, gold, silver, iron, tin, copper, lead, and quicksilver; this last is not malleable of itself, but is so mingled with the others, that it is thought to be the feed of metals.

Astrologers have conceived that there was so great an affinity and correspondence between the seven metals before named and the seven planets, that nothing happened to the one but the other shared in it; they made this correspondence to happen through an infinite number of little bodies, that pass to and from each of them; and they suppose the corpules to be so figured, that they can easily pass through the pores of the planet and metal they represent, but cannot enter into other bodies, because their pores are not figured properly to receive them; or else, if they do chance to get admittance into other bodies, they cannot fix and stay there to contribute any nourishment; for they imagine that the metal is nourished and perfected by the influence that comes from it's planet, and so the planet again the same from the metal.

For these reasons they have given these seven metals the names of the seven planets, each according as they are governed: and so have called gold the sun, silver the moon, iron Mars, quicksilver Mercury, tin Jupiter, copper Venus, and lead Saturn.

They have likewise fancied that each of these planets has his day apart to distribute liberally his influence on our hemisphere: and so they tell us that, if we work upon silver on Monday, iron on Tuesday, and so of the rest, we shall attain our end much better than on other days.

Again, they have taught us that the seven planets do every one govern some particular principal part of our bodies; and, because the metals do represent the planets, they must needs be mighty specific in curing the distempers of those parts, and keeping them in good plight. Thus they have assigned the heart to gold, the head to silver, the liver to iron, the lungs to tin, the reins to copper, and the spleen to lead.

Thus you see, in short, what some of the most sober astrologers do fancy concerning metals; and they draw consequences from hence which it would be too long here to relate. I have told you what the soberest among them say; for nothing can be so absurd as what some of them would have us believe.—But this has been judged by the most esteemed philosophers mere whim and enthusiasm.

Never-

Nevertheless, if we could be satisfied that experience confirmed what these persons have offered to maintain, we might then have reason to think there were some likelihood in their doctrine, although their principles were found to be altogether false; but in truth there is nothing to confirm their opinion, and we find it every day plain enough, that the faculties and virtues are utterly false which they attribute to the planets and metals. The metals, indeed, are of good use in medicine, and excellent remedies may be drawn from them; but their effects may better be explicated by causes near at hand than the stars.

Working in metal is very ancient, even from the first age of the world; in the time of Tubal Cain, according to the testimony of Moses, they had got the art of working with a hammer, and they knew how to make utensils of tin and iron. It is very probable that, in the time of that lawgiver, they practised chemistry, because of the children of Israel, under Aaron, made themselves a golden calf; and Moses, after he came down from Mount Sinai, in a great wrath against the people, reduces this calf to ashes; which was, we may reasonably suppose, done by dissolution and precipitation, and mercury. See the articles METALS, METALLURGY, MINERALS, MINEROLOGY.

R E M A R K S.

As land produces more or less corn according to it's goodness or fertility, and the labour employed in manuring it; so the mines of iron, lead, copper, coal, tin, silver, &c. produce more or less according to the richness of the veins, and of the labour of digging, drawing off the waters, melting, refining, &c. The labour of the silver miners is the dearest, by reason of the danger and mortality attending it; and the silver miners are esteemed to live, at a medium, but five or six years in that labour.

The value of metals is like every thing else, proportionable to the land and labour that enters into their production; and the price of them varies according to the demand and consumption, which depends principally on the fancy and manner of living of the proprietors of land.

If all the tin that is drawn annually out of the mines of Cornwall, and which commonly sells at London for about 100,000*l.* has every year a constant consumption and vent, the land and labour that enter into it's production are equal to the land and labour that produce any other quantity of commodities which sell for 100,000*l.*

But if every body rejected the use of tin, and made use of earthen ware instead of it, it would cease to be in esteem, and to have a value, and the tin adventurers would discontinue the work of the tin mines.

Let us suppose in a state without foreign trade, that a regular and uniform quantity of copper is annually dug out of the mines for the common uses of life, as pots, kettles, pans, and kitchen ware, to replace the quantity of copper which is yearly consumed by fire, or worn away, and then that copper is begun to be made use of as money; this additional demand of copper will make it dearer, and encourage the digging out of the mines more of it than usual, and there will be more copper yearly required to replace that which is consumed.

All ordinary metals, as iron, lead, tin, copper, coals, &c. are consumed by fire, the computation of the land and labour that goes to their production. See the article LABOUR.

But silver and gold are not consumed by fire, and they wear out so slowly by friction and attrition, that they may be esteemed permanent metals in this regard, as well for their other qualities, as their volume, subdivision without waste, the impossibility of falsifying them, &c. They seem best fitted of any metals or commodities to serve for money.

If there were constantly an equal demand and consumption in a state of corn and wool, there would be also a constant proportion of value between them, supposing also an equal quantity of each to be constantly produced.

In this case, a measure of wheat would always bear a constant proportion of value to a pound of wool; and an accomptant might, by imagining aliquot parts, find out a common measure to know how much wool is worth so much wheat.

But, in regard the consumption of these and all other commodities, as well as their quantities in a state, vary frequently, or rather constantly, no accomptant or algebraist can fix any proportion of value between them.

Money alone (I do not here consider what is used for money) naturally finds out this proportion, and the quantity of money which is brought to market to barter for each kind of commodity, readily fixes the proportion of value that is between them all, *Quæ eadem uni tertio sunt eadem inter se.* Every body who brings his money to market knows what money he has to lay out, or, at least, what he intends to lay out for the expence of that day.

The working of mines is undertaken either by private persons, or by companies of such, or by corporations endowed with certain privileges, as the Mine-Adventurers, &c.

FURTHER R E M A R K S.

The substance of what has been suggested for the advancement of mining, seems to be reducible to what follows, viz.

There is not any method that appears so conducive towards effectually carrying on works of mining and smelting, as that which is established in Sweden; there the whole business is under the direction and management of commissioners, in the same manner as there is in this kingdom a board of trade and plantations, where the principal branches are under the nicest regulations imaginable: they have two persons who are principally employed, and under whose direction are put all the machine works belonging to their mines; these again have mechanics under them, who are very industrious, and continually aiming at some improvements; then, in order to promote discoveries, they appoint people in every province and county, who are called minor metal searchers; because their daily employment and constant business, is to survey the grounds, and examine the mountains, for all kind of metal-line ores, minerals, veins, beds, &c.

Whatever discoveries happen to be made by these, they are instantly reported to the grand board; to which, if they seem likely to prove beneficial, orders are issued out immediately, and miners are set to work in the most advantageous manner: after the same method are all the other branches of this science carried on, in which the same spirit prevails.

In order to facilitate and accomplish the perfection of this science, and to range it's laws in such a just order, so as to render the whole into a compleat body of mining and smelting, the following method, we apprehend, will not appear irrational or impracticable.

1. Both mining and smelting should be treated in an historical manner: a just account of them should be brought down from the earliest ages to this present time, in which particular notice should be taken, what improvements have been made, and what declensions and decays it has suffered, and in what ages and in what nations, they have happened.

2. A true theory must be established: the symptoms, which by experience have been confirmed to be characteristics, whether good or bad, should be laid down in their proper order; the rationale of them be given; those that are equivocal ranged under one class, and those that are univocal or pathognomic under another: it should be shewn likewise, how they are dependent upon each other, or how one is the necessary consequent of the other: taking care, that the whole be demonstrated in such a plain and easy manner, that it may justly be said to be adapted to the meanest capacity, though founded upon an exact system of natural philosophy; so that a proper regard is to be taken, that nothing is asserted, but what may, and is made evident from the same principles.

3. All the branches of the mechanical part of mining, or the various ways of working under-ground, should be familiarly particularized, and made as clear as possible; the different methods of different countries be faithfully represented; for from every one of them something may be collected, towards improving our own: wherefore we must not forget to mention the tools, which, with all curious under-ground structures, should be delineated in a lively and intelligible manner upon copper-plates.

4. Draughts of all machines appertaining to mine-works, should, in like manner, be exactly exhibited upon copper-plates: in this branch we need not be ashamed to borrow from foreigners; amongst those that have been invented by the Swedes, we shall find a great many worthy of our observation; for they have excelled all other nations, particularly in one, which, in all respects, answer the end in a very surprizing manner, without the assistance of ropes; as is particularly described by Mr. Swedenborg, in his *Regno Subterraneo*.

5. As the mineral veins of one country differ from those of another; for instance sake, we will mention two of the most material: veins on the continent are in long ranges and rakes, they are not there liable to bars or out-cuts; they, therefore, most commonly run pretty straight and certain, for as many miles as the course of the mountains will admit of; they are entirely unacquainted with beds and bellies in their mines, which are most commonly called Pipe-works: so on the contrary, in all islands, the ranges or rakes are seldom found to run in straight lines; their veins are very uncertain, seldom continue long; they are frequently impeded with bars or out-cuts of the rocks, and the ore is too often found in bellies and pipe-works: in fine, they have scarce any thing alike or common with those on the continent, except the underfets, which are generally the same in most places.

The same uncertainty and irregularity holds good, and extends itself even to the very rocks and mountains, which in this kingdom are different, in different counties; those in Flintshire are most commonly soft, those in Montgomeryshire hard, and those in Cardiganhire are in no respect like those of either place; these differences are ever to be cautiously weighed and considered, for they occasion a different method of scrutiny and examination, as well as a different one of working; nor can we borrow any light from our neighbours into this affair, the picture must absolutely be taken from the original: therefore, if any author should attempt to write a distinct treatise of this art, and describe the particular method of working which ought to be pursued in a particular county or soil, before he can pretend to render such an under-
taking

taking complete and beneficial to the inhabitants, and proficient of the place he designs it for; he must survey the mineral mountains very carefully, that he may be able to compose his *Geographia Subterranea* in a correct and skilful manner; for, if this is not done, how can he be supposed to form his maps exactly true? How will he be able to describe the labouring part? How will he be capable of distinguishing the promising symptoms from those that are otherwise? How will he manifest the product of the mountains, and point out the way by which they may be worked to the best advantage? Yet all these things must be diligently observed, and punctually prosecuted; these rules must be strictly regarded by every writer that designs his labour to benefit the nation, to serve the proprietor, and to instruct the ignorant. In fine, he must follow the example of the accurate coast-surveyor, that not only points out the safest roads and harbours, but likewise manifests the dangerous shoals and rocks; therefore, let the subterranean geographer describe the barren, as well as the fertile mountain, for by that he will give us to understand the promising ore-bearing signs, and vice versa; for a good guide ought not only to be acquainted with the main road, through which he is to conduct his traveller, but he should also know the bye ones, that he may not be at a loss to get into the main one, if by any accident he should happen to be thrown out of it.

6. When he comes to the smelting part, he must lay down a general history of the produce of nature in the caverns of the earth; he must give us a description of the various sorts of ores and minerals, by shewing us not only the different properties which essentially distinguish one species from another, but likewise the diversity that may be found in each species; these, according to their several degrees and natures, are to be distributed into proper classes, divided and subdivided under proper heads; giving to each its inseparable characteristics, whereby to distinguish it from the rest; telling us how and where they are commonly found, what appearances they afford when analyzed, what principles they are composed of, what mixed bodies they are incorporated with, what compositions and fluxes are most suitable to them, to free them from other heterogeneous mixture, and set at liberty their purest contents: in fine, it must be set forth after what manner they are to be treated, and what discoveries have been made in this respect in different ages; exhibiting exact draughts of furnaces that are and have been used in foreign countries as well as in our own, that choice may be made of those that are the best adapted for the purpose; pointing out their perfections and imperfections, that they may be farther improved, as the artist shall have occasion.

7. The mine and mineral manufactures are fully to be treated of, the materials that all are composed of be registered; how they are produced, and after what manner they are obtained in foreign countries, even in the common way of smelting, must be clearly set forth: these would make a considerable article in the trade and manufactures of this kingdom; for the materials of those commodities are to be met with in great abundance, in several parts of this country.

8. The whole work must be concluded, with giving compleat instructions on the art of assaying metalline and mineral ores in small quantities [see the article *ASSAY*]; nothing here should be omitted, which can in any shape be conducive to this purpose, for it is of very great and material concern. If a treatise should be executed, that laid out a plain plan, founded upon a solid theory, the whole confirmed and established by experiments, it might reasonably be expected, that mining and smelting would undoubtedly raise their head; it might justly be concluded, that these two arts would soon come into a flourishing state in this kingdom; that they would in a few years gain the ascendancy, even over those where the mines are worked to the greatest perfection yet known.

MINORCA, an island in the Mediterranean Sea, situate about 100 miles south of the coast of Catalonia in Spain, and about 20 miles east of the island Majorca, and is 30 miles long and 12 broad.

The soil of this island is of several kinds; that of the hills and upper grounds, is of a colour nearly approaching to black. It is light, fine, and extremely fertile; and, though it is very thinly spread over the face of the rock, it yet produces tolerable crops with very little cultivation. It has a small intermixture of sand, which disposes it to separate freely before the plough; a quality very advantageous to the Minorquins, as it saves them a world of labour as well as expence.

The soil of the plains is far less fertile than that of the rising grounds. It is cold and clayey, and equally unfit for agriculture and pasture; and produces only a four herbage, that is excessively distasteful to cattle, great plenty of spart (a kind of rushes) in many places, a variety of weeds. The vallies, indeed, have been enriched by the earth that has been washed on them from the adjoining hills to a great depth: but the hills have been impoverished by the same means, and in the same proportion. However, we frequently see stone-walls, that have probably stood many ages, run across the sides of the hills to detain the soil; and such hills yield good crops to

VOL. II.

the very summit, which must otherwise have had their rocky entrails laid bare, as is visible, wherever this caution has been neglected.

Iron ore is so plentifully dispersed over the whole face of the earth, that it is not surprizing we find it in Minorca. It's ferruginous colour and great weight distinguish it, in many flat masses, or from four to ten inches diameter, in most parts of the island. But it is not converted to any use here, either on account of it's unfitness to make iron alone, the scarcity of fuel, or the want of skill in the natives.

But of lead ore here is a mine at St. Puig, which has been worked to advantage within these 40 years, and the ore sent into France and Spain, for the use of the potteries of those countries. The proprietor discontinued his work on some small discouragement; and it must be owned, that these people are of all mankind the most easily put out of conceit with an undertaking, that does not bring them in mountains of present gain, or that admits of the slightest probability of disappointing their most sanguine expectations: nor will their purse admit of many disappointments; and thus their poverty co-operating with their natural despondence and love of ease, is the principal cause of their backwardness to engage in projects, though never so promising, for the improvement of their private fortune, and the advantage of the commerce of their country. This lead ore went under the name of Vernis among the natives, as it was wholly used by the potters in varnishing and glazing their earthen vessels.

There are few exports of any account, and they are obliged to their neighbours for near one third of their corn, all their oil and aguardiente, and such a variety of articles of less consideration, that nothing could preserve them from a total bankruptcy, but the English money circulated by the troops, which is exchanged for the daily supplies of provisions, increased by the multiplication of vineyards, the breeding of poultry, and the production of vegetables, in a proportion of at least five to one since the island has been in our possession. It will not require many words to enumerate their exports: they make a sort of cheese, little liked by the English, which sells in Italy at a very great price; this, perhaps, to the amount of eight hundred pounds per annum. The wool they send abroad may produce nine hundred pounds more. Some wine is exported, and, if we add to it's value that of the home consumption, which has every merit of an export, being nine parts in ten taken off by the troops for ready money, it may well be estimated at sixteen thousand pounds a year. In honey, wax, and salt, their yearly exports may be about four hundred pounds; and this comes pretty near the sum of their exports, which we estimate together at eighteen thousand one hundred pounds sterling per annum.

A vast balance lies against them, if we consider the variety and importance of the articles they fetch from other countries, for which they must pay ready cash. Here it may be necessary to withdraw some things from the heap, such as their cattle, sheep, and fowls, on which they get a profit; for the country does not produce them in a sufficient abundance to supply them, especially when we have a fleet of men of war stationed there.

Their imports are, corn, cattle, sheep, fowls, tobacco, aguardiente, oil, rice, sugar, spices, hard ware, and tools of all kinds, gold and silver lace, chocolate, or cacao to make it; tobacco, timber, plank, boards, mill-stones, tobacco-pipes, playing cards, turnery ware, seeds, soap, saddles, all manner of cabinet-maker's work, iron spikes, nails, fine earthenware, gla'ss, lamps, brassery, paper, and other stationary wares, copperas, galls, dye stuffs, painters brushes, and colours, musical instruments, music, and strings; watches, wine, fruit, all manner of fine and printed linens, muslins, cambrics and laces; bottles, corks, starch, indigo, fans, trinkets, toys, ribbands, tape, needles, pins, silk, mohair, lanterns, cordage, tar, pitch, rosin, drugs, gloves, fire-arms, gunpowder, shot and lead; hats, caps, velvet; cotton; stuffs, woollen cloths, flockings, capes, medals, vestments, lustrres, pictures, images, agnus Dei's, books, pardons, bulls, relics, and indulgencies.

REMARKS ON MINORCA.

The Spanish dons here are above trade, and the rest of the natives are unable to exercise it to any purpose. Yet if this infatuated people would set themselves seriously to make the most of their native produce, a few years industry would enable them to traffic with their neighbours to advantage, and even to provide exports of considerable value for an English market. To instance in a few: the cotton shrub has been tried here, and succeeds to admiration: they have spart growing in many places, in sufficient plenty to make all their own cordage, and to spare. The tunny fish abounds on their coast, and they might easily fall into the method of curing it: by this the French of Languedoc and Provence, their neighbours, make a vast advantage.

They have abundance of olive-trees, yet they make no oil of the fruit, and are utterly ignorant of the right method of pickling it.

Some capers they pickle; and might, from the frequency of the plant, improve this into a very valuable export.

Hemp and flax do extremely well, and might be increased, and manufactured for exportation. Their canes and reeds are of use in the clothiers trade, but they export none; and they have great plenty of excellent flate, but do not work it. It might possibly answer to send their cantoon stone to England as ballast; but certainly their marble would be a valuable commodity with us, of which no country can boast a greater quantity in proportion, nor of greater beauty or variety, than this poor island.

Squills they have in abundance, mastic, aloes, and some other drugs, which they neglect.

Their bees thrive well, and should be carefully managed, and increased as much as possible; their wax is inferior to none, and their honey cannot fail of being extremely delicate and fine in a country abounding with such a variety of aromatic plants, and is, therefore, in high esteem every where.

They raise a little tobacco, but seldom half the quantity they consume; and they make a kind of snuff, in small quantities, which is in no respect inferior to that of Lisbon.

Their neighbours of Majorca make good advantage of their plantations of saffron, which these people use in their cookery, and yet will not take pains to raise it.

Their palm-trees, for want of a proper cultivation, produce no dates; and they send none of their fruit abroad, though they have it in their power to supply us with as good figs, prunes, almonds, raisins, pomegranates, oranges, lemons, and several other kinds, as any country in Europe.

But we will close these hints of what an industrious people might do to enrich themselves, and this indolent generation of men carelessly overlook, with the mention of salt, a ready-money commodity every-where, and of which they might easily make a thousand times the quantity they now do. Their method requires little trouble. There are a great many places on the coast of the island, where the rock is but little higher than the surface of the sea, and is flat for a great way together. In gales of wind the sea is beat all over these levels; and the salts have, by degrees, corroded the softer parts of the stone, and reduced it's face to an infinite number of small cavities, divided from each other by the more solid veins, which have resisted their impression.

These cavities they fill with water from the sea, by means of scoops, and one day's sun suffices to evaporate the water, and leaves the concreted salt dry in the cells. The women and children gather it in the evening, and carry it home; and the cells in the rock are filled as before.

Having insinuated some of the natural produce of this island slighted by the inhabitants, which yet are capable of being improved into very valuable articles of commerce; we will attempt an estimate of the charge they are at in their importations.

From authentic papers, which contain an exact account of their harvests for thirty-seven years, it appears, that there are annually raised here 53,501 quarters of wheat, and, 22,683 of barley, one year with another.

Wheat is their only bread-corn, all their barley being given to their beasts. Of the last they seldom import any; but they have occasion for 35,000 quarters of wheat every year; which, at nine shillings each, amount to 15,750*l*. They import oil yearly to the value of 10,000*l*.

By an exact account of their agardiente for 14 years, we find they import annually of this spirit a quantity that costs them 9250*l*. allowing only 10 per cent. for the profit of the farmers; and this, at six-pence a quart, makes their yearly consumption of this spirit to be upwards of 1540 hogsheds.

They import tobacco to the amount of 1200*l*. a year.

We may compute that their imports in linen and woollen goods of all kinds do not come to less than 15,000*l*. It is not possible to make a nice calculation of the value of all the residue of their imports, but we may reasonably set them at 20,000*l*.

So that here we have an annual expence of 71,200*l*. from which if we deduct 18,100*l*. the amount of their exports, the remainder, 53,100*l*. sterling, is a clear balance of trade against them.

To enable these people, in some measure, to support the charge of this great balance, we are to reckon the large sum of money yearly brought into the island, and spent among them by the troops; a sum that falls but little short of their whole balance; the greatest part of which goes to market for the common necessaries of life.

Every vintage produces 18,000 hogsheds of wine; and, if we allow for the clergy 2000 hogsheds, and for all the rest of the natives 1000, the remaining 15,000 hogsheds are sold, to the English, for 27,825*l*. in ready money, the price of a hoghead, taken at a medium, being 35 shillings.

This is a very considerable article in their favour; and they are so sensible of the advantage they draw from their vineyards, that they are continually enlarging them and increasing their number, notwithstanding they are taxed to near half their value.

They are, indeed, tied down to a set price for their red wine, and the aforacion, or rate, is settled the beginning of the year; but, for the little white wine they make, they are at liberty to drive their bargain as advantageously as they can.

It is certain this people can never be rich, unless they become industrious; the sea is open to them, as well as to their neighbours, on every side, who thrive by a foreign commerce, and yet not one of them can victual or navigate their vessels near so cheap as these slothful Minorquins, who lie in the center of so many trading ports, that it is amazing how they can have so long overlooked their true interest, and suffered themselves to be supplied with so many of the necessaries of life in foreign bottoms.

The Minorquins are naturally listless, and, if they contrive the means to keep their families from poverty, they are but little solicitous to enquire into the arts and manufactures by which sudden fortunes are acquired on every side of them. Tell them the Maltese are enriched by the quantities of cummin and annise-seed they export; remind them that the plant which produces the canary-feed grows spontaneously all over the island; or that a gum is produced from the mastic-tree, of very great value abroad (and though this tree is an incumbrance which they eagerly root out of their grounds) they treat you as a visionary, and, with a shrug of contempt, seem to thank heaven that they have no turn to whims and projects, but are contented to jog on in the plain track which their fathers trod before them.

MISSISSIPPI, MESSASIPPI, or MESCHASIPPI, a country of North America, bounded by Canada on the north; the British plantations on the east; the gulph of Mexico on the south; and the principality of New Mexico on the west. Mississippi river, which gives the name to the country, rises in Canada, and runs to the southward, 'till it falls into the gulph of Mexico. It is a large navigable river, said to run above 2000 miles; to which, as well as the adjacent country, the French lay claim, and have possessed themselves of part of the country ever since the year 1712, giving the river the name of St. Louis, and the country the name of LOUISIANA, and have made great efforts towards planting it, as it is a most fruitful and desirable country, of vast extent; though the east part of it, in reality, belongs to Great-Britain [see LOUISIANA,] and the west to the Spaniards, who have planted part of these countries long since, and are every day extending their settlements into it. The French raised the expectations of their people so high in relation to the immense riches that were to be acquired by planting it, and being settled so contiguous to the Spanish mines in Mexico, in the year 1719, that every one was ready to throw his money into the stocks, which the company sold at upwards of 2000 per cent. But the government seized most of the money, and the adventurers were ruined; which put a stop to the planting this country at that time: but it has been encouraged since; and, if the English do not oppose their encroachments, before they are too powerful on that side, they are like to be very troublesome neighbours to the British plantations.

REMARKS on the MISSISSIPPI before the last war.

This French Mississippi scheme, as well as the English South Sea scheme, tending to the destruction of fair and honourable commerce, and to the ruin of the public credit of nations, it will be expected that we should not slightly pass over a matter of this nature, in order to guard posterity against the like enormous bubbles.—See the articles BUBBLES and ACTIONS. The short history of this remarkable scheme is as follows, viz.

The regent of France having nothing more at heart than to discharge the state-bills, which amounted in value to some hundreds of millions, bethought himself, among other expedients, of erecting a company that should have the sole privilege of the trade of Mississippi, a large fruitful country in North America. Mr. Law, a Scotch gentleman, whose genius always carried him to the study of trade and money, contrived the plan of this establishment, which was made in 1717, of which he was appointed the principal director.

Every body was admitted to subscribe to this company; and the stock first proposed to be raised, was only sixty millions of livres, to be subscribed in state-bills. Nevertheless, though this was no great sum, and though the state-bills might be bought at between 60 and 70 per cent. discount, and were received at par, or without any loss in the company's subscriptions; yet, at first, people were not forward to subscribe, because they were still ignorant of the advantages which might accrue to them from the company.

The sixty millions being at length completed, the state enlarged the capital to a hundred millions, and granted the company the farm of tobacco, which produced four millions per annum, for the paying the interest of the said hundred millions, at the rate of 4 per cent.

The grant of this farm gave such a sudden credit to the subscribed bills (since called actions, or shares) that their price rose to a hundred and twenty, Mr. Law having so well managed the farm of tobacco, that the company made thereby considerable profits. Some time after the actions fell even to par, but they rose again in a few days.

After this, a new creation of actions was made, for the sum of 25 millions, which were delivered at 110. The companies of India and China were incorporated with that of Mississippi

Mississippi in 1719; whereupon the price of the actions rose from 100 to 200. About that time, the Mississippi company assumed the name of the India company.

When it appeared that the people of France took a relish to these actions, 'till then unknown in that kingdom, and that they were eager to lay out their money this way, being persuaded the company would make great profits, which would be divided among the owners of those actions, Mr. Law, in concert with the regent, formed a mighty project for enlarging the credit and profits of this company. An arrêt of the council of state was published for circulating bank bills to the value of 25 millions in the Mississippi company. To this advantage the state shortly afterwards added a grant of the coinage for nine years, and other specious encouragements.

These privileges made the actions immediately run up to 500; but they fell afterwards to 445, only upon the news of Mr. Law's being taken with a slight indisposition. After this, the actions rose again in a few days to 610, and soon fell to 560. All this happened a little after Midsummer, 1719.

The company finding their credit so well established, proposed to advance to the king a loan of 50 millions, in 15 monthly payments; and, in order to raise this sum, they obtained an arrêt of council for the creation of 25 millions of actions, upon the foot of 200 per action. But, as there was a considerable time allowed for the payments, and that the actions sold for three times that price, the company reserved to themselves a power to dispose of them, at what times they thought fit: whereby they kept in reserve a fund sufficient to buy merchandize, to build necessary ships, and settle good colonies in Mississippi; for thus the proprietors expected to receive very great sums from the sale of part of those actions, made at different times; the other part thereof having been at first delivered to the chief proprietors of the old ones, according to the purport of the arrêt.

About the end of August, the company proposed to the king to make another loan of 1200 millions of livres, at 3 per cent. interest; and, at the same time, to take the five great farms, paying to the state three millions and a half more than was given by the person who then held the lease, that is, 52 millions yearly, for the space of nine years, the term of the lease granted to the company. Out of this sum, they were every year to receive 36 millions, for the space of 25 years, for the interest of 1200 millions they had engaged themselves to advance to his majesty, in order to reduce to 3 per cent. the interest of the state debts upon the town-house of Paris, and others, which used to carry 4 per cent. which reduction saved the king 12 millions of livres yearly. The company's privileges were then prolonged to the year 1770.

The French fondly hoping that the company would get immense profits by trade, and principally by the direction of the general farms, which, 'till then, had been very illly managed, ran more than ever into these actions; so that, in a few weeks, they advanced to 1200.

Every thing at Paris then assumed a smiling countenance; money grew so common, that people did not know where to put it out at 3 per cent; the public securities, which before were at great discount, now sold for 10, nay, 15 above their par; the tradesmen had a greater vent for their goods; the workmen were better paid for their work; the value of land about Paris rose to 50, and even to 60 years purchase; many noblemen repaired their broken fortunes, and others grew very rich, by the great advantages they made in dealing in the actions of this new company.

Numbers of people never known in the world, and who sprung from nothing, were all of a sudden seen riding in their coaches, only by striking into this trade, by which, in a very few months, they had gained vast sums.

As the company had undertaken to lend the king 1200 millions, they found it necessary, in the month of September following, to raise 500 millions, by the sale of 50 millions of actions, at the rate of 1000 per action, which was ten times the original value of the actions.

The subscriptions were filled in a few hours; nay, they were obliged to return a third part that was subscribed above the sums, which amounted to 775 millions. The subscribers were not obliged to pay the whole sum all in at once, but in ten monthly payments; which, however, was afterwards altered for their convenience.

The first payment of these new subscriptions was sold the very next day at cent. per cent. profit.

In a few days afterwards, books were again opened to take in subscriptions for the like sum, upon the same conditions and restrictions as the former; and they were filled in as short a time.

The company's cashiers were forbidden, by an arrêt of council, to receive for those subscriptions, or in the nine payments remaining to be made for the last, any money or bank bills, but only state bills, or other the king's debts therein specified; which greatly raised the value of the effects royaux, or public securities.

This way of borrowing money, or rather of bringing into the company near 1000 millions of livres of the king's debts, having succeeded perfectly well, the company again opened their books for 500 millions more, and with the like success.

About that time, every action was divided into two parts, each valued at 5000 livres; for the rest, the actions were on paper, payable to the bearer; so that the owners might at any time exchange them for ready money, or bank notes, which were altogether as good, and more convenient than money.

The first payment of these three subscriptions, far from falling, rose considerably, that it quickly went at 1, 2, and even 300 per cent. profit; so that such subscribers as were willing to transfer their new subscriptions to other persons, did, in a few weeks, double and tripple, nay quadruple the money which they had advanced for that first payment.

Nevertheless, these last subscriptions sunk the price of the old ones, though the old ones were of the same nature, and as good as the last. The old subscriptions fell almost at once to 760, because the subscribers to the last wanting money to answer the second payment, which was so near, were forced to sell their first subscriptions.

The company, in order to put a stop to this fall, caused notice to be given at the bank, that they would repay them at 900. This advertisement gave such a support to the credit of those old subscriptions, that, in less than a month, they went at 1200, as before, and even rose higher, while the new actions fluctuated about 1300.

But, what contributed to it most, was, an arrêt of the council of state, allowing a longer term for the first payments that were to be made upon the new subscriptions. The whole sum borrowed by the company in these three new subscriptions being 1500 millions, they represented to his majesty, that the loan they were to make to the state amounting to 300 millions more than they at first proposed, it was reasonable the company should be allowed an annual interest of 45 millions, after the rate of 3 per cent. instead of the 36 millions already granted: to which his majesty consented.

Upon the whole matter, the sums of the several subscriptions made at different times, are as follow:

60 Millions of the first subscription,
40 Millions of the second,
25 Millions of the third,
25 Millions of the fourth,
50 Millions of the fifth,
50 Millions of the sixth,
50 Millions of the seventh,

300 Millions, the total of the actions.

When these actions sold at 1000, their total value amounted to 3000 millions of livres, of which sum the king did not owe the company much above half, which made the real and intrinsic value of every action to be 550.

We shall now give you an estimate of the sums which the company were said to have in their power to divide yearly, by which the subscribers were made to expect very good dividends.

The company were to receive every year,		Millions,
Out of the king's revenue	- - -	45
By the farm of tobacco	- - -	3
By the management of that farm	- - -	4
By the profits of the five great farms	- - -	30

Without reckoning what some other branches were to produce, as the fishery, the refining and parting of bullion of gold and silver, the traffic of ingots of the same bullion, which the goldsmiths and merchants were obliged to buy of the company, and sell at a certain specified standard. So that the profits (schemed to arise from all this, were to have been above 25 millions: for the state were to support the credit of the company, though at the expence of yielding up the profits of the bank, and several other privileges.

The advantages proposed to accrue to the king from the establishment of the India company, were set forth as follow:

The establishment of the India company in France, say the memoirs of those times, has not only been of infinite advantage to the subjects of the kingdom, by opening the purses of the rich, that strove who should put their money in first, but the king also has gained by it very considerably; since all the branches of his revenues must bring sums into his coffers, infinitely beyond what was ever known before, by reason of the circulation of the species, which is certainly three times greater than ever, as is manifest from the price of provisions, land, and merchandizes. The regent has found in the subscriptions of this company a source almost inexhaustible, whereby he has made large gifts in actions to the officers of the army, and the king's household, and to a number of private gentlemen, by which means they are grown rich. Mr. Law on his part, has done service to vast numbers of people,

even

even to his enemies; in putting them in a way to make their fortunes. Since the circulation of the specie has been restored, the regent has taken off several taxes in Paris, and the provinces, so that all France shares the advantages of his happy administration.

By this scheme, the revenues of his most Christian majesty will increase 40 or 60 millions a year, and yet the people will be eased of many taxes, and of the burden of many useless officers, who have been actually paid back the money they gave for their places.

Now, if a judicious man will impartially judge of what hath passed, and what is now doing in France, in relation to commerce and the revenues, he must own, that from the remotest ages, history does not record any thing so inconceivable. One cannot reflect on this, without being brought to confess, that the prince who is at the head of affairs, knows how to make use of the readiest and most agreeable means of setting France in the most flourishing state it ever was in. Has not the world always said of him, that he had a superior genius, and fit for every thing? Besides the arts and sciences, to which he all his life devoted himself, he is a perfect master of accounts, without which he had never carried the affairs of France to the height they now are. Mr. Law's scheme had not succeeded so well under the reign of a prince, whose natural and acquired parts had been inferior to his who is now guardian of the royal authority.

The establishment of the royal bank of Paris.

Mr. Law set up the bank at Paris by the royal authority, some time before the establishment of the Mississippi. It was governed much like the bank of England, the regent having referred to himself the inspection of their accounts: there was at first some difficulty in establishing its credit, the French having no notion of the convenience of an establishment so advantageous. But, as the regent was convinced of the great benefit that would accrue to the public from it, his royal highness took all the care imaginable to make them sensible of it. In a short time there were several arrêts in favour of the bank, the chief of which was that which required the officers who levied the king's taxes, to receive the bank notes in payment of the revenues. The French, seeming at length to be sensible of the convenience of making payments in notes payable to the bearer, it was ordered in the beginning of the summer 1719, that the bank bills should be increased to the sum of four hundred millions. It was permitted by the same arrêt, to the royal bank to set up bank offices in all the mint-towns of the kingdom, except Lyons, which declared against receiving any; yet soon after the merchants of Lyons, of their own accord, very earnestly solicited to obtain the privilege of a bank in their city.

The increase of bank bills to the sum of 400 millions of livres not being sufficient, a larger quantity were delivered out about the close of the same summer for 120 millions of livres, each bill being for the sum of 10,000 livres.

But even this was found insufficient to answer the demands that were daily made, which moved the regent to issue out an arrêt in October following, ordering the bank to give out to the value of 120 millions more, and that the notes should be likewise for 10,000 livres each.

The sum total of all the bills which the bank had issued out at the end of the year 1719, amounts to six hundred and forty millions, which exceeded the value of the bills circulated by all the other banks in Europe put together.

It will not be amiss to observe, that there were bank notes for small sums as well as great; some of ten, some of a hundred, and others of a thousand livres; those of ten thousand amounting but to two hundred and forty millions of livres.

Likewise a new addition of three hundred and sixty millions was ordered in bank bills, which, with the six hundred and forty millions before, amounted to a thousand millions of livres, making then above 38 millions of pounds sterling, upon the par of exchange; for the crown in specie of France, which was then current in that kingdom for five livres and two fifths, or an hundred and eight of their pence, was worth in weight and fineness but four shillings and three halfpence English money.

An ARRET, ordering in what manner payments shall be made, as well in Paris as in the provinces, and regulating the difference between bank money and the current coin. December 21, 1719. Extracted from the registers of the council of state.

The king having caused the several arrêts issued concerning the bank and the lowering of the coin to be laid before him, his majesty judged, that it would tend to the good of the state, and the benefit of his subjects, as well as to the advancing of the public credit, to put his people in a way to avoid the losses which are ordinarily occasioned by the variation in the currency of the coin. To which end, his majesty being in council, by the advice of the duke of Orleans regent, has ordered, and orders,

I. That the bank money shall be and remain fixed at five per cent. above the value of the current coin, at which price

bank bills shall be delivered out as well at the general office in Paris, as at the other offices in the provinces; the bearers of the said bills, after they shall be given out by the bank, being left at liberty to negotiate them at such higher rate as they shall find convenient.

II. It is his majesty's will, that beginning from the day of the publication of the present arrêt in the city of Paris, from the first of March next, in those towns where are offices of the mint, and from the first of April following in the other towns and places of his kingdom, the gold and silver coins, as well those struck pursuant to the edict of May 1719, as those struck this present month of December, shall not be offered nor received in payments; that is to say, the silver coins, but for payments under the sum of ten livres, and the gold coins but for payments under the sum of 300 livres; and that the payments above the said sums shall be made in bank bills, on the penalty to the offenders herein of confiscation of the amount of the payments, and of a fine of 300 livres.

III. It is his majesty's intention, that the India company pay in bank bills the produce of the imposts and duties which they shall receive; and as to the payments that they shall make in money for sums under ten livres in silver, and 300 in gold, which their officers may receive, the said company shall pay five per cent. augmentation; his majesty authorizing them to receive the said five per cent. from the persons liable to those duties, upon payments of sums under ten livres in silver, and 300 in gold.

IV. It is also his majesty's will, that reckoning from the day of the publication of the present arrêt, the payments of foreign bills of exchange, shall be made in bank bills; and this notwithstanding the arrêt of the 27th of May last, from which his majesty derogates.—Done in the king's council of state, his majesty therein present, held at Paris the 21st of December, 1719.

The grand support of this scheme was the great territory of Louisiana, otherwise called Mississippi. See the article LOUISIANA.

That we may have a just notion of the nature of this remarkable project, the following further account of the proceedings in France, for raising a PAPER CREDIT, and settling the Mississippi stock, may not, perhaps, be thought altogether useless.

It was many years ago, say the writers of those times, since the French court regretted the height of the public credit in England. They looked upon it as the great, and perhaps, the only advantage we had over them in war; namely, that by the established reputation of the public funds here, and the authority of parliamentary credit, whatever sum of money was voted in England, though the funds did not produce it many years, and though the loans were prodigiously great, yet the public could command the money in a few days, perhaps, in a few hours.

This was as much the terror of our neighbours, as it was the honour and advantage of England; and foreigners have been heard to say, That there was no getting the better of England by battle, no, though victory was always on their side. That, while we had thus an inexhaustible storehouse of money, no superiority in the field could be a match for this superiority of treasure; for money being the finews of the war, it had long since been a received maxim, that the longest purse, not the longest sword, would be sure to conquer at last.

It was in vain that the late king of France, though he had an absolute command of the greatest, and, at first, the wealthiest nation in the world, tried all the arts that human wit could invent to raise a fund of credit in his kingdom; the whole council of France could never dictate to him the method how it should be done; this coy mistress, called Credit, could never be wooed; the more he pursued her, the faster she fled from him; and he had the continual mortification to see his national credit fall, even by the same methods which made our national credit rise; and our credit here grew daily, and at last increased to such a height, that from paying 12 and 14 per cent. for money, and struggling with infinite difficulties to get it brought in, we came to reducing the interest from 6 to 5 per cent. and after to have the public command of what money we pleased at 4 per cent. and had it brought in faster than we had occasion for it.

It is not possible to represent the projects, and infinite arts and practices, which the king of France used to command credit; all which were disappointed by the frequent exigencies of his affairs, forcing him to violate the faith and honour of his edicts: whereas in England, one parliament always voted the making good deficiencies, and no misapplication of money could be made, but every fund was kept sacred to its peculiar special appropriation: so that no man whatever having lent his money to the government on the credit of a parliamentary fund, has been defrauded of his property.

Thus the arbitrary government of the king of France, destroyed the very nature and fundamental principle of public credit; and the limited power of the crown of Great-Britain (the strings of the purse being in the hands of the parliament) has been the reason and foundation of such an immense boundless credit, that nothing can hurt or destroy it, unless

unless the parliament should invert their way of acting, and take into their hands the same absolute power, which it is their business to refrain, and wound and injure themselves; that is to say, the people whom they represent.

But fate and the fortunes of France, at the period we are speaking of, turned the tables, and we saw the same arbitrary power that in the late reign in France plunged them into an insuperable debt, and into an irrecoverable state of deficiency and discount, raised an inconceivable species of mere air and shadow, realizing fancies and imaginations, visions, apparitions, and making the mere speculations of things, act all the parts, and perform all the offices of the things themselves; and thus in a moment their debts were all vanished, the substance was answered by the shadow, and the people of France made the instruments of putting the cheat upon themselves: the name of the thing is made an equivalent to the thing itself, transposing the debts from the king to themselves, and being contented to discharge the public, owe the money to one another.

As this is the mere consequence of a boundless power in the king, by which he is made able to put every scheme, however impracticable in other places, in a course of operation there; so that every limitation of power, which is, in other cases our glory and advantage, is the reason why, let our credit be what it will, our debts remain, and must be diminished by the flow fire of parliamentary proceedings, and by no other way.

And thus for once in the world, tyranny has the whip-hand of liberty, for nothing can be done in England like this; even the parliament itself is limited, and there are its redeemable and unredeemable funds, the last of which are a burthen, nothing but the number ninety-nine (years) * can put an end to: but in France they have an unbounded liberty to act as they please.

* The reader will observe, that this was the state of our funds at the time we are speaking of.

Let no man mistake me here, says our author, as if I were bemoaning the incumbrances of national privileges, and suggest, that it was pity we should be a nation of liberty with such a burthen of debt; on the other hand, let us be, say I, a free nation deep in debt, rather than a nation of slaves owing nothing; and, indeed, even in this the condition of France and England stands in a posture much to our advantage when compared together; namely France, a kingdom immensely rich as a government, wretchedly poor as a people; England, a government embarrassed in debt, exhausted of funds, and not able easily to get out of debt; but as a people immensely rich, rich in the particular and private wealths of the subjects; poor, that is to say, encumbered in debt, speaking of the public state of things, as a government; and yet with all this, while the public credit is upheld, we can never be said to be poor.

It remains now, that we look into this flagrant delusion of paying a nation's debts, as it is practising upon the ignorant people in France: never, in my opinion, was any number of people so hooked in to put a sham upon themselves, and then call it paying of the king's, or the public debts; for it is no more than a parcel of fools discharging the king of his debts, and owing it to one another. And this is another reason of this piece of magic in France; for the very want of credit in France, has been the reason of their obtaining the credit of paying their debts. This paradox shall be unriddled immediately, thus: had not the public credit been bad, had not the state bills, that is to say, the public credit, run at 60 to 63 per cent. discount, the people would never have brought themselves to part with them for the bonds, or shares in a new company, a brat of state, which has its life in the king's breath, and must die whenever that breath pleases to determine it.

Mr. Law, being first acquainted with the solid immovable state of credit in England, and seeing the fluctuating manner of things in France, plainly saw also, how easy it was to push these things there, which he could not so much as think of in England, without apprehensions of being pulled in pieces by the rabble. He wisely concluded, that a foundation of credit must be laid, before any sufficient project could be founded upon it, and so the first thing he did was the raising of a royal bank in France, by the concurrence of the king, whose sanction there, as the parliament would be here, was absolutely necessary for such a work.

Now let the schemes engrafted since, or then designed to be engrafted upon the foot of this beginning be what they will, it is evident Mr. Law made a right judgment, and that nothing could be projected for the public service of any kind, without an established credit to center somewhere.

It was impossible this should be grafted upon the government, the endeavours to bring it to pass before having been rendered abortive, by the frequent exigencies of that state, forcing them to break in upon royal edicts and royal promises; by which means the few men that had any money were made cautious, and were grown too wise to put it into hands, which they could not depend upon for the demand of it again, when it should be wanted.

VOL. II.

It remained then to resolve, that credit could now be only raised upon the forming societies of private men, who were masters of cash, and able to support the credit they took, with whom it might be safe to venture the deposit of money, and who, by an exact currency of payments, might in consequence and by degrees, obtain the name and title of a safe fund, and become the basis of proper credit for the whole kingdom; a thing at that time greatly wanted, for the advantage of trade in France, as well as for the purpose designed by Mr. Law. This almost, by the nature of the thing, would be called a Bank, and would be managed by the first adventurers, in their own right, and independent of the king, or of any branch of the government; so that except by mere plunder, even all one as by ransoming the city of Paris, the king could never lay his hand upon any thing, which was put into their keeping.

This was a well laid design, had there been no more projected than was pretended. For, upon the credit and capital stocks of the first subscribers, there was immediately a clear prospect of a running cash, established upon just foundations, and sufficient to answer all the business of France. When this scheme was shewn to the regent, he was penetrating enough not to see immediately, that it was too beneficial a thing not to be encouraged, as well for the credit of the nation in general, as for the use of the government in particular; and, therefore, received it with open arms, and assured Mr. Law of his favour and protection: and, as they found his first scheme capable of great improvements, he was encouraged to employ his thoughts effectually to those improvements, that something might be brought to pass for the public good, and especially to restore credit to France. In prosecution of this confidence, the bank was established, the patents were expedited for its foundation; the king begins the subscription, the duke regent follows, and innumerable others; they are empowered to take in a hundred millions original stock, and to give out bills for current cash payable at demand, and to the bearer, just after the manner in England. They lent money upon jewels, plate, and things of real value, and upon mortgage of lands at 3 per cent interest; they discounted bills, and took in money, issuing bills of credit payable at demand; and it is inconceivable the mighty increase of business they had upon their hands in so little time, and the immense sums of money they had by them in specie.

Mr. Law having thus successfully finished this great affair, was at leisure to enquire what further projects might be founded upon this of a royal bank: he was too knowing not to have in his head the general idea of all those things which have happened since: but he knew, that such a fund of credit being once well established, nothing could miscarry that was founded upon it; for, as half the projects in the world become abortive, for want of ready money and credit, so when once a good project was supported with a flush of ready cash, they must be weak managers indeed, if they miscarry.

The first thing of moment he went upon, was the planting a colony in the West-Indies, or in North America. He knew, indeed, that the planting the Louisiana, or the country on the river Mississippi, would not produce any great effects, at least in his time: for the settling a colony, however prosperous in its beginning, is a work of time, and must take up ages. But Mr. Law, like a man of penetration, knew that two things would be absolutely necessary for this design: 1. To have the king approve it; and, 2. To make his scheme popular, to have something in view beyond not only what he could manage, but even beyond what he ever intended in the proposal. Having started the project of Mississippi, he branched it out in a different manner from all projects; for he did not descend from the Mississippi scheme as the general to the subsequent things as the particulars, but he ascended from the Mississippi scheme as a particular, to a West-India company as the general.

His next work was to propose the foundation on which the company was to be established, viz. a subscription of stock; and here he shewed his first masterly stroke, and that he had concerted all the steps and measures of his management from the beginning.

The public credit in France was still low, nor did the rising credit of the royal bank add any thing to it, but rather diminish it, and let the world see that private credit in France might revive, but public credit could not: the state bills, and annuities on the town-house loans, and all the paper circulation, were, at this time, exceeding low, namely, from 57 to 63 per cent. discount; it was, therefore, the easiest thing in the world to establish a fund for any new undertaking that was but tolerably promising, where the subscribers could be allowed to subscribe these dying credits at a par, and put that into stock at 100 livres, which cost the purchaser but 37 to 40 livres per cent. and this thing alone filled his first subscription.

We see the credit of the company rising to an immense height, by the assistance of the government, and the management of Mr. Law, their director; we see the following mysteries, or, indeed, miracles, wrought in the compass of a few weeks, things as incredible as the greatest impossibility in nature could

could be thought to be; things which, when done, were as a dream, even to those that saw them; even the people who have the money in their hands, and who have received their ancient debts, so long given over, look amazed, and consider again and again, whether they are awake or asleep; the particulars are as follow:

First, we have seen them bring the people to refuse or decline payment, of what they would before have given half the debt to be secured of.

Secondly, The state bills, that were before little better than waste paper, made worth 10 and 20 per cent. above par.

Thirdly, We have seen them gain 1350 millions of money in less than a month's time, by selling the air, and putting a real value upon an imaginary value.

Fourthly, We have seen the king's revenues augmented to millions a year, by abating the taxes on the people.

Fifthly, We have seen the general farms raised four millions a year to the king, and yet 12 millions a year paid less by the people.

Sixthly, We have seen them pay 1500 millions of debt for the king, without one penny of money.

Seventhly and lastly, We have seen a private gentleman raise himself, by the dexterity of this management, to be the greatest subject in the world; to have all the nobility, the princes, the public ministers, and even the government itself, at his beck, and above 300 coaches in a morning at his levee, himself behaving with all the modesty imaginable; not elevated by his good fortune, nor discomposed by the application to so much business, but calm and serene, and always present to himself, answering briefly and pertinently to every new discourse, receiving 6 or 700 gentlemen in a morning, dispatching every body's business with a readiness inimitable, and every day producing new wonders in the great affair of the public, which was upon his hands.

As the advantages of public business thus flowed in, the credit of the stock necessarily advanced; and we were surprized in England, to find that every post the price started up whole hundreds in a day, 'till at length we saw the stock up at 1150 and 1200 per cent. and, after that, to 2050 per cent. Now was the time for Mr. Law to give the blow he had in view.

The multitude of people who came every hour to Paris, and run their money into the stock, made this project not rational only, but natural, viz. that they might enlarge the capital stock, by engraving a farther subscription; and, that the new subscribers might have encouragement to subscribe, they should be allowed to subscribe at 1000 livres each, original stock. Pursuant to this resolution, an arrêt was published, empowering the company to take new subscriptions, upon the first foot of the stock for 50 millions, the subscribers paying 10,000 livres each; for which they had credit in the company's books, for one action, or share, of 100 livres original stock. Thus the company, receiving 1000 millions of livres for 50 millions original stock advance, were clear gainers by the subscription no less than 450 millions of livres; and this doubled by the second subscription of 50 millions, made the company's gain amount to 900 millions of livres; add to that a third, it made it 1350 millions.

Add to this, that the first stock of the company was much of it subscribed by the government itself, by the king, and by Mr. Law, as in the company's name; and, being sold afterwards at 1000 and 1100 per cent. put above 200 millions into their pockets, besides what Mr. Law was said to have gained for his private account.

From this time forward, the stock is grown up to a prodigy of 2050 per cent. It is true it sunk a little on the approach of the time of payment for the first three months, which was to be paid on the 1st of January, viz. 300 livres per share, and this, for want of money, sunk the stock to about 1850; but Mr. Law, who never wants a remedy for these diseases, immediately calls a meeting of the directors, and agrees to declare a dividend of profits, to amount to 6 per cent. upon the stock, which, though it be a trifle on the present advanced price, yet was really considerable in itself, and amounts to a very great sum, no less than six millions and upwards; however, it was agreed that the company really gained near 100 millions extraordinary, by selling her own subscriptions, and buying and selling her own stock; so that they were able very easily to divide 20 per cent. on the first stock, which would have been 1 per cent. upon the after-advance.

This is a brief account of the prodigious rise and greatness of the French India stock, to which we shall only add, that all the world ran to Paris; the prodigious sums strangers laid out in the stock, and the numbers that resorted to negotiate there, filled that city with money and people, and, consequently, with trade; and they tell us, there was nothing to be seen but new coaches, new equipages, new liveries, and buying new furniture; innumerable families were enriched by this surprizing advance of stock: in a word, there were no less than 1200 new coaches set up, and half a million of people more than was before; so that no lodgings were to be had; and they built new houses and streets in every place where they had room.

On the 30th of December, N. S. there was a general meeting of the India company, at the royal bank, at which were

present the duke of Orleans, regent of the kingdom, the duke of Chartres, and the duke of Bourbon. The company having first approved and confirmed what had been done in its name by the directors, since the last meeting, took into consideration several articles before them, and resolved, that the dividend for the year 1720 should be 40 per cent. upon the 300 millions of actions; and that the subscriptions, which made part of the 200 millions, should be intitled to the dividend of the years 1718 and 1719, at the rate of 4 per cent. per ann. as soon as they were full, and converted into actions. They likewise resolved, that, for the good of the public, and to give countrymen and foreigners an opportunity of buying and selling these actions, an office should be erected, wherein the company would buy and sell actions at fixed prices; which office was accordingly erected, the 2d of January, N. S. five days after, Mr. Law was sworn comptroller-general of the finances of France. But, whether his head turned giddy upon this stupendous elevation, it appeared soon after, by the various arrêts of council which he caused to be issued out, in relation to the coin, that he was not a little embarrassed.

REMARKS ON OUR ARTICLE MISSISSIPPI, SINCE THE LAST WAR, AND THE DEFINITIVE TREATY OF PEACE, 1763.

Under our article of LOUISIANA, particularly in our REMARKS since the DEFINITIVE TREATY of 1763, we have shewn the disadvantages, which our British colonies in North-America were under, in respect to their want of a sufficient quantity of good lands there, where y^e planters might raise variety of staple commodities, which we are, at present, obliged to take at a great expence from divers other countries, provided our people were situated in those fresh and good lands on the Mississippi for that purpose. Under this article, we shall continue the thread of our intended observations upon this material point.

Our article LOUISIANA is concluded, with observing, that if the present state and condition of our North-American colonies is not soon changed, by being put upon the planing and cultivation of such staple commodities as we are now compelled to take of other nations, we shall force these colonists into the arts of farming, manufactures, trade, and commerce, which would interfere with the commercial interests of Great-Britain.

Some of our colonies, perhaps, may imagine, they cannot subsist with these employments; which, indeed, would appear to be the case in their present state: but that seems to be as contrary to their true interest, as it is to their condition of British colonies. They have neither skill, materials, nor any other conveniences, to make manufactures; whereas their lands require only culture to produce a staple commodity, provided they are possessed of such as are fit for that purpose. Manufactures are the produce of labour, which is both scarce and dear among them; whereas lands are, or may and should be made, both cheap and in plenty, by which they may always reap much greater profits from the one than the other. That is, moreover, a certain pledge for the allegiance and dependence of the colonies; and at the same time makes their dependance to become their INTEREST. It has been found by frequent experience, that the making of a staple commodity for Britain is more profitable than manufactures, provided they have good lands to work. It were to be wished indeed, that we could support our interest in America, and those sources of navigation by countries that were more convenient to it, than those on the Mississippi. But that we fear is not to be done, however it may be desired.

We wish we could say as much of the lands in FLORIDA, and on the bay of MEXICO, as of those on the Mississippi: but they are not so good, any thing contiguous to the coasts, however convenient they may be in other respects to navigation.

The most convenient part of those countries seems to be about MOBILE and PENSACOLA; which are, as it were, an entrepôt between our ancient settlements and the Mississippi, and safe station for our ships. The port of ST. AUGUSTINE in the GULPH of FLORIDA, will also be of no little utility to our navigation in these parts; and what the lands may be deficient in, in many respects, near the coast, the situation of the above-mentioned ports may jointly contribute to supply.

As the harbour of PENSACOLA will appear to be a considerable acquisition to Britain, it may be of some use to give the following account of it from F. LAVAL, royal professor of mathematics, and master of the marine academy at TOULON; who was sent to Louisiana, on purpose to make observations in 1719; and had the accounts of the officers, who took PENSACOLA at that time, and surveyed the place.

The colonies of Pensacola, and of Dauphin island, are at present on the decline, the inhabitants having removed to settle at Mobile and Biloxi, at New Orleans, where the lands are much better; for at the first the soil is chiefly sand, mixed with little earth. The land, however, is covered with woods of PINES, FIRS, and OAKS; which make good timber as well as Ship-Island. The road of PENSACOLA is the only good

good port thereabouts for LARGE SHIPS, and SHIP-ISLAND for small ones, where vessels, that draw from 13 to 14 feet water, may ride in safety, under the island, in 15 feet, and a good holding ground; as well as in the other ports, which are all only open roads, exposed to the south, and from west to east.

Penfcola is in north latitude $30^{\circ} 25'$, and is, the only road in the BAY of MEXICO, in which ships can be safe from all winds. It is land-locked on every side, and will hold a great number of ships, which have very good anchorage in it, in a good holding ground of soft sand, and from 25 to 34 feet water. You will find not less than 21 feet water on the bar, which is at the entrance into the road, provided you keep in the deepest part of the channtel. Before a ship enters the harbour, she should bring the fort of Penfcola to bear between north and south $\frac{1}{2}$ east, and keep that course till she is west, or west $\frac{1}{2}$ south, from the fort on the island of St. Rose; that is, till that fort bears east, and east $\frac{1}{2}$ north. Then she must bear away a little to the land on the west side, keeping about midway between that and the island, to avoid a bank on this last, which runs out to some distance west-north-west from the point of the island.

If there are any breakers on the ledge of rocks, which lie to the westward of the bar, as often happens; if there is any wind, that may serve for a mark to ships, which steer along that ledge, at the distance of a good musket-shot, as they enter upon the bar, then keep the course above-mentioned. Sometimes the currents set very strong out of the road, which you should take care of, lest they should carry you upon these rocks.

As there is but half a foot rising on the bar of Penfcola, every ship of war, if it be not in a storm, may depend upon 19, perhaps 20 feet of water, to go into the harbour, as there are 21 feet on the bar. Ships that draw 20 feet must be towed in. By this we see, that ships of 60 guns may go into this harbour; and even 70 guns ships, the largest requisite in that country in time of war, if they were built flat-bottomed like the Dutch ships, might pass every where in that harbour.

In 1719, Penfcola was taken by Mr. Champmeslin, in the Hercules man of war, of 64 guns, but carried only 56; in company with the Mars, pierced for 60 guns, but had only 54; and the Triton pierced for 54 guns, but carried only 50; with two frigates of 36 and 20 guns*.

- * The admiral was on board of the Hercules, which drew 21 feet water, and there were but 22 feet into the harbour in the highest tides, so that they despaired of carrying in this ship. But an old Canadian, named Grimeau, a man of experience, who was perfectly acquainted with that coast, boasted of being able to do it, and succeeded; for which he was the next year honoured with letters of noblesse. DUMONT (an officer there at this time,) vol. ii. p. 22. BELLIN, from the French admiralty chests, makes but 20 feet of water on the bar of Penfcola. The difference may arise from the tides which are very irregular and uncertain on all that coast, according to the winds; never rising above three feet, sometimes much less. In 24 hours the tide ebbs in the harbour for 18 or 19 hours, and flows 5 or 6. LAVAL.

This road is subject to one inconvenience; several rivers fall into it, which occasion strong currents, and make boats and canoes, as they pass backwards and forwards, apt to run aground; but as the bottom is all sand, they are not apt to founder. On the other hand, there is a great advantage in this road; it is free from worms, which never breed in fresh water, so that vessels are never worm-eaten in it.

The many advantages that would ensue, from the well peopling of those southern parts of the continent with protestant foreigners, are hardly to be enumerated. We might thereby people and secure those countries, and reap the profits of them, without any loss of people; which are not to be spared for that purpose in Britain, or any of her dominions. This is the great use and advantage that may be made of the expulsion of the French from those northern parts of America. They have hitherto obliged us to strengthen those northern colonies, and have confined the people in them to towns and townships, in which their labour could turn to no great account, either to themselves or to the nation; by which we have, in a great measure, lost the labour of one half of the people in our colonies.

But as they are now free from any danger in their borders, they may extend their settlements with safety, disperse themselves on plantations, and cultivate those lands, that may turn to some account, both to them and to the whole nation. In short, they may now produce staple commodities for this nation, on which the interest of the colonies, and of the kingdom in them, chiefly depends; and which we can never expect from those colonies in their present situation.

The commodities which these southern parts of North-America promise to afford us, are HEMP, FLAX, and SILK, those great articles and necessary materials of very valuable manufactures; for which alone this nation pays at least a MILLION AND A HALF A YEAR, and could never get them

from all the colonies we have. COTTON and INDICO in plenty, are also estimable. Not to mention COPPER, IRON, POT-ASH, which with HEMP, FLAX, and SILK, make a great balance of trade against the nation, and not a little contribute to drain it of its treasure; when we might certainly have those commodities from our colonies for manufactures, and both supply ourselves, and others with them. WINE, OIL, RAISINS, and CURRANTS, &c. those products of FRANCE and SPAIN, on which this nation expends so much of her treasure, to enrich her enemies and rivals in trade, might likewise be had from those her dominions, and export in return her manufactures for them, equivalent in time to what she does to FRANCE and SPAIN.

Britain thereby might cut off those resources of her restless enemies, secure her colonies for the future, and prevent such calamities of war as we have experienced, and cultivate the arts of peace.

Some have said that LOUISIANA, &c. is never likely to turn to any account, because the French have made so little of it.

But that objection, however common, will appear to proceed only from the ignorance of those who make it. No country can produce any thing without labourers; which it is certain, the French have never had in LOUISIANA, in any numbers sufficient to make it turn to any greater account than it has hitherto done. The reason of this appears not to be owing to the country, but to their proceedings and misconduct in it. Out of the many thousand people who were contracted for by the grantees, to send to LOUISIANA in 1719, there were but 800 sent; and of these the greatest part were ruined by their idle schemes, which made them and others abandon the country entirely. The few again, who remained in it were cut off by an Indian massacre in 1729, which broke up the chief promising settlements they had in the country, those of the NATCHES and YASONS, which were never afterwards re-instituted. Instead of encouraging the colony in such misfortunes, the minister, Cardinal Fleury, either from an ill-judged spirit of economy, or because it might be repugnant to some other of his views, withdrew his protection from it, gave up the public plantations, and must thereby, no doubt, have very much discouraged others. By these means, they have had few or no people in LOUISIANA, but such as were condemned to be sent to it for their crimes, women of ill fame, deserted soldiers, insolvent debtors, and galley-slaves, 'who looking on the country only as a place of exile, were disheartened at every thing in it; and had no regard for the progress of a colony, of which they were only members by compulsion, and neither knew nor considered it's advantages to the state. It is from such people, that many have taken their accounts of this country; and throw the blame of all miscarriages in it upon the country, when they have been only owing to the incapacity and negligence of those who were intrusted to settle it*.'

* Charlevoix's Hist. N. France, Tom. iii. p. 447.

REMARKS on the MISSISSIPPI SCHEME.

That we may judge more fully of the effects of this extraordinary scheme, it will be necessary to consult the following French arrêts.

* The king having caused to be examined in his council, the condition to which the kingdom was reduced before the establishment of the bank, that he might compare it with it's present condition: it has appeared to his majesty, that the high rate of money had done more damage to the kingdom than all the expences which the late king had been obliged to be at during the several wars: the avarice of the lender having risen to that height, as to demand more interest for a month than the laws allowed for a whole year.

This usury had even so weakened the kingdom, that his majesty's revenues were not paid, but by multiplying compulsions on those who were liable to pay them. The price of the products of the earth being hardly sufficient to pay the charge of the culture and the taxes, the proprietors received nothing for their lands. This general misery forced part of the nobility to sell their estates at a low price, to maintain themselves in his majesty's service; and the other part of the nobility had their lands seized. The king's favours were their only resource, and his majesty was not in a condition to grant them, and even could not pay the salaries of officers, and the pensions which had been granted for the reward of services. The manufactures, commerce, and navigation, were almost at a stand; the merchant and trader were reduced to bankruptcy, and the artificer compelled to abandon his native country, to seek employment among foreigners. Such was the condition to which the king, the nobility, the merchants, and the people were reduced, while none but the lender of money lived in plenty; and the kingdom was like to fall into a general disorder, had not his majesty applied a speedy remedy to these evils.

By the establishment of the bank, and of the India company, the king has restored things to good order: the nobility have found, in the increase of the value of their lands, means to make themselves easy: manufactures, commerce, and navigation, are re-established: the lands are cultivated, and the artificer

artificer works. But, notwithstanding the visible advantages which those establishments have procured, there were persons malignant enough to form a design to destroy them: and this obliged his majesty to issue an arrêt of his council, of the 5th of March last, for supporting, by the decrying of money, the credit of those so useful and necessary establishments. By that arrêt his majesty reduced the different species of the India company's bills to one sort, and ordained that actions (or shares in the stock of that company) might be converted into bank notes, and those notes into actions, according to the proportion, which at that time was reckoned to be the most just with respect to the value of the coin. This decrying of money, and favouring of actions, empowered debtors to clear themselves. It remained for his majesty to find an expedient for employing the sums which were to be paid back to minors, to hospitals, to communities, and others the most privileged creditors: and, at the same time, for re-establishing the value of the coin in such proportion as might suit foreign commerce, and the vent of the products of the country. His majesty has provided for these several things by his arrêts, and particularly by his declaration of the 11th of March last, which orders the reduction of the value of the coin: but, as that reduction must necessarily produce a diminution, not only of the price of commodities, and of moveable goods, but also of the value of lands, and other immoveable estates, his majesty has judged the general interest of his subjects required, that the price, or nominal value of the India company's actions, and of bank notes, should be lessened, for maintaining them in a just proportion with the coin and other commodities of the kingdom, for hindering the too high value of coin from sinking the public credit; for giving, at the same time, to the privileged creditors, means for employing to the better advantage the sums which might be repaid to them; and, lastly, for preventing the losses which his subjects might suffer in commerce with foreigners. And his majesty has the more willingly resolved upon this deduction, because it will be even beneficial to the proprietors of the India company's actions, and of bank notes, for the dividends on them will be more to their advantage, and will be convertible into money of intrinsic value, which will produce at least 50 per cent. more in real coin, or bullion, after the reduction, than at present. Upon all which, the *Sieur Law*, the king's counsellor in all his councils, comptroller-general of the finances, having made his report, his majesty being in his council, with the advice of *Monsieur the duke of Orleans*, regent, has ordained and ordains:

Article I. That the actions of the India company shall be reduced, that is to say, beginning from the day of the publication of the present arrêt, to 8000 livres; on the 1st of July to 7500 livres; on the 1st of August to 7000 livres; on the 1st of September to 6500 livres; on the 1st of October to 6000 livres; on the 1st of November to 5500 livres; and on the 1st of December to 5000 livres.

II. That the bank notes shall also be reduced, so that they shall not be received in payments, that is to say, from the day of the publication of the present arrêt, those of 10,000 livres but for 8000 livres; those of 1000 livres for 800 livres; those of 100 livres for 80 livres; and those of 10 livres for 8 livres: that, on the 1st of July next, the said notes shall be reduced, viz. those of 10,000 livres to 7500 livres; on the 1st of August to 7000 livres; on the 1st of September to 6500 livres; on the 1st of October to 6000 livres; on the 1st of November to 5500 livres; the lesser notes in like proportion; and, on the 1st of December of the present year, the said notes shall remain reduced and fixed, viz. those of 10,000 livres to 5000 livres; those of 1000 livres to 500 livres; those of 100 livres to 50 livres; and those of 10 livres to 5 livres.

III. His majesty foreseeing that those of his subjects who are possessed of considerable sums in bank notes, may convert them with advantage into the India company's actions, and being willing to favour such persons as have not fortunes sufficient to employ them that way, his majesty ordains, that, during the course of the present year, and 'till the 1st of January, 1721, the bank notes shall be received by the receivers of the tallies and other taxes, at the office of his majesty's farms, and even at the salt warehouses, at the full value the said notes were at before the reductions ordained by the present arrêt, yet without the abatement for the future of the 4 sols per livre, or of the 10 per cent. granted by the arrêts of the 29th of January, the 5th of March, and the 28th of April last. The said bank notes shall likewise be received for their full value, at the office appointed for the distribution of contracts for annuities for life, pursuant to the arrêt of council of the 16th of the present month.

IV. His majesty's will is, that all bills of exchange drawn or endorsed in foreign countries to be paid in France, shall be paid in bank notes, according to the currency and value of the said notes, known in foreign countries the day of the date of the said bills of exchange: and, for avoiding abuses and disputes which might arise, because the greatest parts of the endorsement made in foreign countries are without date, his majesty's intention is, that the bills of exchange made and payable in France, and which shall be endorsed in foreign countries, shall be likewise paid in bank notes, according to

the currency and value of the said notes at the time of the date of the bills. Done in the king's council of state, his majesty present, held at Paris the 21st day of May, 1720.

Signed *PHELYPEAUX*.

R E M A R K S.

The stile and contents of the preamble of that arrêt shew, that the council of France thought their scheme beyond the possibility of miscarrying; and, therefore, begun to execute the last part of it, viz. to lower or raise their bank bills and actions of the company as they pleased, which they had substituted in the room of gold and silver. This did not succeed according to their expectation; for people refused to take bank notes; which occasioned so much disturbance and murmurings, that, on the 25th of May, the government was obliged to post guards in the market places, to prevent tumults. The parliament met extraordinarily, and sent deputies to make remonstrances against the arrêt aforesaid; and some of their deputies were appointed to confer with some counsellors of state, in the presence of the regent, to concert measures for preserving the public peace, and preventing the intire ruin of trade.

The first thing that was judged proper to be done, was to revoke the fatal arrêt of the 21st, which was accordingly declared void by an arrêt of the 27th, whereby the bank notes were declared to be current, as before the former arrêt. Commissioners were appointed to examine the books and cash of the bank, and the accounts of the India company; and, to proceed therein, payment was stopt at the bank the 29th of May, but they began to pay again the 1st of June.

On the 31st of May another arrêt was published for proroguing, to the 1st of July next, the lowering of the new species, which was to begin the 1st of June, pursuant to the declaration of the 11th of March, inserted above, and making current, for that time, the old species of gold and silver. By the same arrêt his majesty permits all his subjects, and others, to import gold and silver species bullion into the kingdom, which before was only permitted to the company. By another arrêt of the 1st of June, the prohibition published some time ago, forbidding people to keep by them above 500 livres in specie, and allowing the company to search all houses whatever, was taken off.

These dispositions removed, in part, the uneasiness of the people; and, in order to recover and support the public credit, which had been deeply wounded, the following arrêt of the council of state was published:

‘ Upon the petition presented to the king in his council, by the general directors of the India company, in the name of the said company, setting forth, That, by the accounts they have delivered, it appears, that, by their several operations, and the actions they have called in again, and have now in their possession, they have a fund of above 300 millions of livres: that, in respect to their commerce, they have undertaken great things, advantageous for the proprietors and state: that they have increased their ships already sent out, or ready to sail to 105, without including brigantines and frigates, and have sent rich cargoes; and that, notwithstanding the multiplicity and quickness of their operations, their books have been found in the most exact order: that as to the administration of the trust committed to them within the kingdom, they have increased, beyond what could be expected from them, the produce of the farms, and the general receipts of the finances, by the good order they have established therein: but that, in order to render more and more the establishment of the said company solid and advantageous to the proprietors, they are of opinion, it is necessary to lessen the number of the actions, and reduce them to 200,000, instead of the 600,000, which were created pursuant to the edicts of December 1717, and May 1719, and of the arrêts of the 27th of July, 13th and 28th of September, and 2d of October following: that the company having called in near 300,000 actions, and being in a condition to re-call what is wanting to make up that number, there remains nothing to be done for the execution of this project, but to suppress as well those 300,000 actions belonging to the company as the 100,000 belonging to his majesty; which said 100,000 actions being a profit made by his majesty, the company hope his majesty will give them this new mark of favour and protection, which will enable the company, by new operations, to discharge what they owe to his majesty and the bank, to call in, by these means, a considerable number of bank bills, and reduce them to the number his majesty shall think necessary for maintaining circulation and commerce: that with these views, and to second the intentions of his majesty in relation to the creation of rents or annuities on the town-house of Paris for 12,500,000 livres, making a capital of 500 millions, the said company offers to yield and make over again the 12,500,000 livres, part of the forty-eight millions which his majesty has assigned to the company on the aids and gabels, in deduction and for discharging the engagements contracted by the said company with his majesty: that the said company desire his majesty to authorize them to demand from the

the proprietors, a supplement of three thousand livres per action, which supplement is to be voluntary; but such proprietors who shall pay the same, shall have a dividend of 3 per cent. at the rate of 12,000 livres per action; and that such who shall not think fit to pay that supplement or additional sum, shall have only the dividend of 200 livres per action, which was granted by the resolution of the company of the 30th of December last: that the condition of the company is such, that they may look upon the dividend of 3 per cent. as a fixed and certain revenue; and, that the public may be sure of it, the directors and many of the most considerable proprietors, who have joined them, humbly desire his majesty to give them leave to form a society of insurance, which shall have a stock of 20,000 actions, amounting at the rate of 12,000 livres each action, to two hundred and forty millions, the profits of which are the principal, and shall be answerable for the dividend of 3 per cent. to be paid to the proprietors; who shall advance the supplement aforesaid, and shall insure the dividend on the foot aforesaid of 3 per cent. and likewise for the 200 livres per action to those who do not furnish the said supplement; upon condition nevertheless, that the overplus of the profits of the company, beyond the 3 per cent. and 200 livres per action incurred to the owners of the said actions, shall belong to the society of insurance.—That to perfect and put that plan into good order, and give all the security that can be desired, it would be necessary, that an exact account be taken by such commissaries of the council as his majesty shall be pleased to appoint, of all the subscriptions, premiums, and actions, called in by the company, and now in their possession, to be burnt at the town house, in the presence of the said commissaries, the provosts of merchants and eschevins.—That two hundred thousand bills, each of one action, with the dividends of three years, be made out, to be numbered from number 1 to number 200,000 inclusive, signed by one of the general directors and one of the commissaries appointed by his majesty, and sealed with the seal of the company, and that within a certain term, which shall be prescribed by his majesty, all the actions, in the hands of the public, be brought in to be converted into new actions, and that the old be afterwards burnt with the formalities aforesaid. For which his majesty being willing to provide, the report being heard, the king being in his council, with the advice of Monf. the duke of Orleans regent, has ordained and ordains.

This arrêt contains six articles, which are in substance as follow:

I. The king appointed commissaries to take an account of the number of the subscriptions, premiums, and actions, of the India company, which they have called in or converted into bank notes.

II. His majesty accepts the offers made by the said company, to make over again unto him the hundred thousand actions his majesty yielded to them by the arrêt of the 24th of February last, and in consequence thereof discharges the company from the nine hundred millions they had obliged themselves to pay to his majesty in ten years, for the cession of the hundred thousand actions aforesaid. And his majesty being willing to contribute, on his part, to the lessening of the number of actions, in order to reduce them to two hundred thousand, the number proposed by the company, ordains that the said hundred thousand actions shall be burnt, as also the three hundred thousand which the company proposed to suppress.

III. His majesty fixes the number of actions of the company to two hundred thousand, and declares they shall not be augmented upon any pretence whatsoever; and, to make up that number, orders two hundred thousand bills, of an action each, to be printed, with the dividend of the years 1721, 1722, 1723, numbered, signed, and sealed, as above, and all the old actions, premiums, and submissions, to be burnt in the presence of the commissaries of the council, provost of merchants, &c. Declaring farther, that all actions, subscriptions, or premiums, which shall not be brought in before the 1st of September next, shall be null and void by virtue of the present arrêt.

IV. The actions that are in the hands of the public, and those deposited and registered in the books of the company, are to be converted within that time into new actions.

V. The company is allowed to demand from the proprietors a supplement, or additional fund of three thousand livres per action, to be paid in six months; that is, five hundred livres per month; but such proprietors, who shall not think fit to furnish that additional sum, shall continue to enjoy their dividend of two hundred livres per action.

VI. His majesty approves and authorizes the society of insurance, proposed by the directors, to consist of the said directors, and as many proprietors of stock, as shall be willing to concern themselves therein: that the stock of the society be for twenty thousand new actions, which shall be forthwith deposited, for securing the payment of the dividend of such proprietors as will ensure the same therein, and the overplus of the said dividend is to belong to the so-

VOL. II.

society of insurance. Done in the council of state, June 3, 1720.

Signed PHELYPEAUX.

This reduction of two thirds of the actions, and the society for insuring the interest thereof, was regarded as the likeliest means to retrieve the public credit; but the people had been so frightened, that they would not meddle with bank notes, except in payment for their goods, which they raised four times above their real value, or upon a very great discount: but what effect this project had, we shall see hereafter; and shall here take notice, that Mr. Law resigned his office of comptroller-general of the finances on the 19th of May, and two officers of the Swiss guards were set upon him; but on the 3d of June they were ordered to leave him, and the duke D'Antin was sent to acquaint him, that he was to continue at the head of the bank, and of the India company: but, on the 7th of that month, the seals were taken from Mr. D'Argenson, and restored to the chancellor Daguesseau.

Soon after this, the government, finding that the public affairs did not take the turn they expected, seemed to be undoing by degrees what had been so lately done; and, at the same time, fell to using very extraordinary methods to oblige those who had remitted any money abroad, to re-call it into France, as will appear by the following unexampled ordinance.

The king's ordinance, requiring all his subjects who have remitted money into foreign countries to re-call the same, dated the 20th instant, is as follows:

His majesty being informed, that many of his subjects, who, in these latter times, have got considerable fortunes, forgetting what they owe to their country, instead of laying out their money in purchases in the kingdom, or promoting commerce and manufactures, have sent the greatest part thereof into foreign countries, and have concerned themselves in their trading companies; and that some others of his said subjects keep in the said foreign countries considerable sums in specie, with a design to place the same there, which has kept up the course of exchange to the advantage of foreigners, and has occasioned the exporting out of the kingdom a considerable quantity of specie: and his majesty, considering how much it is important to remedy an abuse so contrary to the laws of government, and at the same time so prejudicial to the state, and the necessity of providing against the same, however, without constraining the liberty of commerce, to which his majesty is always resolved to continue his protection; his majesty, with the advice of Monf. the duke of Orleans regent, has ordained and ordains, That in general, all his subjects, of what quality or condition soever they be, who are concerned in companies of commerce in foreign countries, shall be obliged to re-call their funds, and cause the same to be brought again into the kingdom within two months at the farthest, reckoning from the day of the publication of this present ordinance, which shall be likewise observed by those who have deposited any money out of the kingdom, excepting, nevertheless, the funds of bankers, which merchants and traders have there for their commerce, or for their own account, or the particular societies they have in the said foreign countries, upon a penalty to such as shall act contrary thereto, of double the sum they have remitted into foreign countries: which penalty, whereof one half is to belong to his majesty, and the other to the informer, shall not be remitted or reduced, or moderated upon any pretence whatsoever. His majesty forbids, most expressly, all his subjects, of what quality or condition soever they be, to interest and concern themselves in any trading companies in foreign countries, or to place any money therein without his special leave; requiring the lieutenant-general of the police of Paris, the intendants of the several provinces, &c. to cause these presents to be observed, and to be read, published, and affixed, where occasion shall require, &c. Done at Paris, June 20, 1720.

Signed LEWIS,
And lower, PHELYPEAUX.

Mean while the affairs of the finances fell into so great disorder, that the court, seeing little hopes of retrieving them, applied to the parliament, whose deputies and the ministers of state had several conferences together. But the parliament refusing to come into the measures the court had projected, this produced an open rupture between them, and the parliament was removed from Paris to Pontoise in the following manner. On the 1st of July, by three in the morning, the musqueteers, the life-guards, the French and Swiss guards, and the archers of the marshal's were in arms; and a strong detachment was sent to the palace where the parliament meets, with orders to suffer no assembly there; and about the same time letters, under the royal signet, were sent by musqueteers to all the presidents and other members of the parliament, requiring them to repair to Pontoise (a place within six leagues of Paris) in forty-eight hours.

Upon the whole, this remarkable scheme created far more confusion in France, than there is at present, and proved the most gross and enormous cheat and imposition upon the public,

lic, that ever was hatched; nor is it to be paralleled, except by the famous era of the South Sea year in England.

This tampering with the public credit, under colourable pretexts of raising mountains of treasures, always terminates in nought but empty bubble and chimæra, to the ruin of commerce and industry, and the useful arts, and therefore cannot be too much guarded against in all wise states: for which reason we have taken due notice of it. See the articles **ACTIONS**, **BUBBLES**, **CREDIT** [**PUBLIC CREDIT**], **DEBTS** [**NATIONAL DEBTS**], **FUNDS**, **MONEY** **INTEREST**.

MODENA, a duchy in Italy, composed of several principalities, viz. the duchy properly so called; those of Reggio, of Mirandola, and Correggio; the principality of Carpio; the feignories of Sassuolo, Triglia, and the greater part of that of Carfagnano — It is bounded on the north by the duchies of Mantua and Mirandola; on the east with the Bolognese, and the territories of the Church; on the south with Tuscany and the republic of Lucca; and, on the west, by the duchy of Parma.

This country is fertile and delightful, produces plenty of corn, wine, and other valuable commodities, sufficient not only to maintain, but to enrich its inhabitants, were they not so grievously loaded with taxes. But the misfortune is, that the dukes of it keep a court too splendid and magnificent for their income; so that they are obliged to rack their subjects, and reduce them almost to beggary, in order to vie with other princes in grandeur.

The duchy, or territory of Modena, properly so called, has its name from its capital; and, besides that and the dependencies of it, contains the country of Frignano, and part of Carfagnano. The chief towns of it are Modena, the capital, Bastia, Final, Frignano, Sestola, and Carfagnano.

MODENA is seated in a spacious plain, on a fine canal, between the rivers Panaro and Secchia, and is of a small oblong figure, nearer to a round. The city has nothing that shews the inhabitants to be rich, or to carry on any considerable commerce.

BASTIA is a small pretty town in the Modenese Proper, pleasantly situated on an island formed by the river Panaro, about 16 miles below the city of Modena.

FINAL, or **FINALE**, is likewise situated on an island made by the same river, on the north-east of Modena, and upon the confines of Mantua. It is often called Final Modenese, to distinguish it from a famed sea-port of that name on the coast of Genoa.

FRIGNANO, or **FRIGANO**, is a little city and territory in the same duchy, at the foot of the Apennines, on the frontiers of the Bolognese, near the spring head of the Panaro.

CARSIGNANO, **CARFENIANO**, **GRAFIGNANO**, the last territory in the Modenese Proper, situate at the foot of the Apennines, and between that duchy and the republic of Lucca. The territory runs on each side of the Secchia.

Its chief town, of no great note, is called **CASTEL NOVO DE CARSIGNANO**, with some other villages, part of which belong to the republic of Lucca.

CARPI, a city and territory in the duchy of Modena, with the title of principality; is fortified with a good castle, and did formerly belong to the house of Pio, who were lords of it. It is seated in a beautiful fertile plain, upon a canal cut from the river Secchia, about 11 miles north of Modena, and four from Correggio.

SASSUOLO, **SASSUOLI**, is situated on the river Secchia, and gives name to a lordship situate between Reggio, Modena, and Correggio, and is in the possession of a prince of the house of Este, who is commonly stiled **marquis De St. Martino**.

The principality of **REGGIO** takes its name from the city of that name, called **Regium Lepidi**, to distinguish it from Reggio, another famed town in Calabria. It is situate in a very fertile plain, is well inhabited, and very rich, though its air be not so wholesome as other parts of Italy.

The duchy of Modena, properly so called, comprehends one of the fairest and most fruitful countries in Italy, abounding with corn, wine, oil, and fruits, is very populous, and inhabited by an ingenious and industrious people. The small country of Frignano, bordering on the Bolognese, is annexed to it on one side, and part of the country of Carfagnano on the other, the rest belonging to the republic of Lucca. It is very mountainous, but far from being despicable, since in these mountains there are mines of great value; and the inhabitants are a race of people robust, hardy, and brave, as any in Italy. The duchy of Reggio lies west from that of Modena, and is by some accounted the more considerable duchy of the two, and, indeed, so it is, if we consider its dependencies, such as the principalities of Correggio and Carpi, the former heretofore possessed by princes of the same name, and the latter belonging to the family of Pio. In the north-west corner of this duchy stands **Bercello**, upon the Po, formerly a place of great strength, yielded by the late duke of Modena, in 1701, to the imperialists, to facilitate their military operation in Italy, and, for that reason, besieged, taken, and intirely demolished by the French in 1705; nor has it been ever since restored to its ancient condition.

The duchy of **MIRANDOLA**, including that of **CONCORDIA**, is about 20 miles in length, and five in breadth; it is a very

beautiful and a very plentiful territory, full of villages, and the country round about them thoroughly cultivated.

MIRANDOLA is strong by situation, and has been formerly well fortified.

The city of **CONCORDIA** stands on the Secchia, at the distance of six miles from Mirandola; between which cities there is a fine canal, called the **Navilio**, which facilitates the commerce of both.

These duchies were very great acquisitions to the family of Este, since their revenues are moderately computed at 100,000 crowns a year.

The whole estates of the duke of Modena have the duchies of Mantua and Guastalla on the north; the grand duchy of Tuscany on the south, together with the territories of the republic of Lucca; the Bolognese, and the duchy of Ferrara, on the east; and the duchy of Parma on the west. The extent of these countries, from south to north, is about 56 English miles, and they are about 50 miles in breadth, from west to east. The duke of Modena, in time of peace, enjoys a revenue of about 100,000*l.* sterling a year at least, which he maintains a very splendid court, and when his circumstances renders it requisite, can keep up a body of 8000 regular troops. The greatest inconvenience in the situation of his country is, that he has no communication with the sea; which might be easily removed, if he could recover, either by treaty or force, the duchy of Ferrara, which lies upon the gulph of Venice.

MOGUL EMPIRE. See **INDOSTAN**.

MOLDAVIA, a principality of European Turkey, bounded by the river Neister, which divides it from Poland, on the north east; by Bessarabia on the east; by the Danube, which separates it from Bulgaria, on the south; and by Walachia and Transylvania on the west; being 240 miles long, and 150 broad, situate in a good air and fruitful soil, producing corn, wine, rich pastures, a good breed of horses, oxen, and sheep, plenty of venison, game, fish, and fowl, and all European fruits, and is well watered with the rivers Danube, Pruth, Neister, &c.

The capital city is **JASSY**.

MOLUCCA ISLANDS. See **INDIAN ISLANDS**.

MOMBASA, a subdivision of Zanguebar, on the coast of Africa, a country subject to the Portuguese, which furnishes them with slaves, gold, ivory, rice, flesh, and other provisions, with which they supply their plantations in Brazil, &c.

MONEY.

Of the ORIGIN of MONEY.

In the most early ages, when trade was carried on, as there was no money, men used to barter one commodity for another, a custom that still obtains among the savage unpolished nations of Chili on the South Sea, in the land of Jesso in the East-Indies, and other barbarous countries. But, as such a method of bartering commodities was, on many occasions, attended with great difficulty, and always inconvenient, men agreed to make choice of one commodity, which being in general and constant esteem, an equivalent quantity of it might always remove the difficulty of bartering in kind.

The same opinion concerning the origin of money we find expressed very much to our purpose, in the first book of Aristotle's *Politics*, ch. 6. 'As all useful things, says he, could not, without great difficulty, be transported from place to place, it was resolved, by common consent, that, in bartering commodities, they should reciprocally give and receive some substance, which, being in its nature applicable to the purposes of life, might, at the same time, be easily carried about.' From which words of Aristotle it is very plain, that the introduction of money was owing to the difficulty of bartering, as human society could not subsist without the exchange of necessaries, nor could this matter be managed without the use of money.

To determine, therefore, this substance that should be in universal and constant esteem, they made choice of gold and silver, not only because they were more valuable than other metals, but also because, in the various uses to which they might be applied, they were particularly adapted to the support and improvement of human life. But, because there was a considerable difference in the nature of these two metals, and gold was more precious than silver, both by its intrinsic worth and greater scarcity, and also far exceeded the other in the expence that was necessary for working it, as appears by the tax that is paid to the sovereign lords of mines, who require no more than five in the hundred of gold, whereas they exact twenty in the hundred of silver; therefore a greater value was ascribed to gold. And, because the baser metal ought to be given in greater measure, that what was wanting in value might be made up in quantity; for this purpose it was necessary to fix the proportion between them, by a certain determinate rule: whence it is, that in the practice of commerce, though formerly the proportion of gold to silver was settled as ten to one, yet at present the matter is so regulated almost all over Europe, that one ounce of gold is reckoned equal in value to 15 of silver, or thereabouts. See the article **COIN**.

When

When this substance was agreed upon at first, as we have observed, the particular quantities of it were originally determined by their bulk and weight only; but afterwards, to save the trouble of proving this weight upon every occasion, it was coined into a certain form by public authority, and impressed with a mark of distinction, expressing the quantity each piece contained, so that it should always have the same determinate value, and be every-where the same, both for matter and weight.

In order to inquire more particularly into the nature of money, and the better to illustrate what we have further to offer concerning the effects it produces in trade, and the various advantages and disadvantages of one kingdom in respect of another, arising from money; it must be considered, that we are to distinguish two sorts of value in money; the one intrinsic, founded in the rate or value according to which it uses to pass; and though, in different places, on several pressing occasions, the extrinsic value of money may be raised higher, at the discretion of the supreme power, such is the nature of commerce, that in it money is never estimated but as to its intrinsic value; so that, in the course of trade, money can have no higher value than a mass of the same metal and quantity would have, if given in barter for any sort of goods. We must also observe further, that such is the custom of well-regulated kingdoms, that, when foreign money is suffered to pass current therein, so much is deducted from the extrinsic value as is necessary for defraying the charge of coining, and it never passes for more than its intrinsic value; and the intention of this regulation is, that the money of the state itself, which bears the stamp and authority of the prince, may always have the preference. From all which considerations it is extremely plain, that it is a matter of the utmost consequence that the system of money be settled under such fixed regulations, as that it may constantly keep pace with the course of trade, and never in the least deviate therefrom; it being certain, that no variation can ever happen in this respect, but it will, at the same time, produce a remarkable alteration in commerce.

After all, however certain it may seem that money is that which alone constitutes the riches of a nation, and it cannot be denied that, considered in itself, it has this prerogative, yet it will never discover its effects, if it is not put in motion by commerce; so that, as the body of a planet, being in itself opaque, would never discover to us its form and figure, if (according to that hypothesis) it did not revolve round the sun, whose light presents it to our view, we must form the very same judgment concerning money; which, it is certain, has in itself no power at all to increase and multiply, and thereby to form the riches of a kingdom, or even, on the contrary, to reduce it to poverty; for, if a prosperous or unfavourable motion were not communicated thereto by commerce, we should never be sensible of its effects. And, because we can no otherwise arrive at a clear and distinct knowledge of these effects but by a fixed and certain rule, which can shew with accurate exactness the situation of any kingdom, with regard to its internal and external commerce, that is, whether the balance of trade stands in equilibrio, or is inclined to either side: and seeing there is not a more infallible rule by which this knowledge can be attained than the course of exchange, see the article EXCHANGE.

REMARKS on the article MONEY.

OF THE INCREASE AND DECREASE OF THE ACTUAL QUANTITY OF REAL OR HARD MONEY IN A STATE.

Let us familiarly consider the land estate of a country, where the general circulation is carried on by 2000 ounces of silver: this money passes through several hands, and always returns into those of the undertakers, whom we suppose the proprietors of it.

Let us likewise suppose, these undertakers have received 2000 ounces more for a present from Americans, so as that each undertaker has double the quantity of money he had before, and that the quantity of money in all becomes 4000 ounces of silver.

Each undertaker will endeavour to enlarge and augment the quantity of his business: so the farmer's commodities will grow dearer in the alterations, by the greater demand made by the undertakers: but, perhaps, this will not immediately double the price of things, because some of the farmers will at first be satisfied with a greater price than usual, but afterwards the price will double in the alterations; each undertaker will desire to live better than he did before, since he has got his additional sum, and, consequently, he will consume in his family more wine and meat than usual; therefore wine and meat will grow proportionably dearer than bread; and the farmers will endeavour to have more of these kinds the next season, since they yield in proportion a better price than corn, and, consequently, the corn will become scarcer, and grow dearer also.

This increase of consumption of the produce of land, which, on the footing now introduced, cannot maintain all the inhabitants, will make it necessary for some of them to seek their livelihood elsewhere. These will be chiefly turned away

by the proprietor of the land, who, having but 6000 ounces per annum for his estate, cannot maintain his family as before, since all commodities are grown dearer. The labourers and journeymen, remaining, not being able to subsist upon their usual wages, must have an augmentation, as well as the remaining servants of the proprietor: and, in all the changes this new quantity of money produces, the farmers seem to be the only gainers, and the proprietors the only losers. The undertakers, who buy their commodities and materials dearer, will be for turning the loss upon the consumers: but, as they are themselves consumers with respect to one another, they will find the expences in their families increase beyond the additional consumption of meat, wine, &c. they intended; and, when the money introduced into barter shall gradually have doubled the price of every thing, they will be obliged to retrench the said additional consumption, since their double quantity of money carries on but the same undertakings their single quantities carried on before; otherwise they will turn bankrupts, and be ruined, which is commonly the case, in regard people do not often care to retrench their expences; and then others, who have saved money, will set up in their places.

The proprietor, at the expiration of his lease, will demand 12000 ounces for his rent, instead of 6000: since the price of the farmers commodities is doubled; and, if he returns to his former manner of living, he will call back his servants, whom he had sent away, or have others in their place; and the new undertakers will live upon the same footing of consumption as the first, the farmers will have the same profits out of the lands that the farmers had at first, and all the dispositions of this estate will turn nearly to its primitive state, with this difference only, that the farmers, who saved money are richer, and the undertakers, who ruined themselves, are forced to turn journeymen to others, who are set up in their room, and that 4000 ounces circulate instead of 2000.

These changes, or something like them, commonly happen in a state, when a sudden quantity of money is introduced into the general barter; but, because money most commonly increases but slowly and gradually, commodities rise in their value insensibly.

Let us again suppose there are silver mines on this estate, that an undertaker farms them from the proprietor, or from the farmers, that the veins are so rich that he shall quickly get out of them the additional quantity of 2000 ounces on our hypothesis.

This new quantity of money will cause much the same variation in the price of all commodities, as we observed in the preceding example. The undertaker, or mine-adventurer, will increase his expence, and give great encouragement to the miners and others he employs. The facility wherewith he gets money will make him generous, and he will more cheerfully than before bestow money on the poor. The doubt occurs he gives to those he employs will encourage them also to spend more than usual. All that are concerned under him feel the influence of his opulence, and consequently consume more commodities than usual. They will enhance the price of them in the alterations; and, which way soever these additional 2000 ounces of silver come into barter, they will raise the price of things. The circulating money will be 4000 ounces instead of 2000, and the price of commodities will be double.

It may be worth while to observe here, that we may distinguish several channels and walks of circulation at market. The corn, or bread market, is proportioned to all the inhabitants in general, since the meanest workman must have bread, as well as the greatest lord. The wine market corresponds to a smaller number of inhabitants, but yet is very considerable, since not only the proprietors of land and money pensioners and officers, but likewise several middling undertakers, tradesmen, and workmen, drink more or less wine. The butchers, or meat-market, is much the same. The wild fowl market, and that of rarities and delicacies, corresponds to a smaller number of inhabitants, as lords, wealthy proprietors, and others.

So that, if the additional money which is brought into a state is at first all in the hands of the wealthy sort, the price of wild fowl may very well rise, and continue high, without influencing the price of bread; and the price of wine and meat may rise long before bread grows dearer: but it will, at the long-run, affect the price of bread also.

Whenever the additional quantity of money decreases, it will create an additional expence proportionable, mediately or immediately, and enhances, consequently, the price of commodities.

If we suppose that 10 persons increase the expences of their family on the estate we mentioned before, that they raise the price of wine, meat, &c. in the alterations, without much affecting that of bread: the farmer will have another year more cattle and wines, and, consequently, less corn, and so corn will then grow also dearer.

There is generally a stock of every commodity in a nation exceeding the yearly consumption; which answers the sudden and extraordinary consumption; and, as that wastes, the commodities grow dearer, and the dearer again, if it continues, makes several families diminish their consumption, and

things,

things return to their primitive state as to the consumption. But the dearth of the commodities continues, since the quantity of money in barter corresponds to it, and a double quantity of money in the hands of undertakers, when the price of things is doubled, has but the same effect the single quantity had before.

If the additional quantity of money belongs to money-lenders, it will diminish interest, and at the same time increase the undertakings, which consequently will enhance the price of commodities, by an additional demand. The money-lenders will increase their expence and consumptions, and the additional undertakers will do the like; the demand for workmen in the several undertakings will raise the price of their wages; the price of things will keep up in barter, since the quantity of money continues to answer the advanced price, though several of the undertakers should break.

But, if an additional QUANTITY OF CREDIT * should by the acceleration of circulation, and barter by evaluation, make the 2000 ounces answer the same circulation as 4000, it will have pretty much the same effect as 2000 ounces increase of money. It will occasion an additional number of undertakers, who will increase the price of commodities, which will grow dearer in the alterations. These will enhance the consumption, &c. but, when some of them come to break, their example will stagnate circulation, and the ready money only will carry it on as before; and consequently money will grow scarcer, and commodities will grow cheaper, and the difficulties in circulation will make the undertakers sell cheaper than they bought, and several of them will break and diminish their consumption, &c. So that a sudden augmentation of credit may for some time answer the same ends and purposes, as the sudden increase of the quantity of money, but will not continue to keep up the price of commodities, as the real quantity of additional money does: but, when a quickness of circulation is gradually introduced into barter, and continues naturally in the manner and methods of carrying on the undertakings, we don't see why it may not have constantly the same effect in keeping up the price of things.

* This shews how injurious the effects of long personal credit are to trade in general. See the article CREDIT [PRIVATE CREDIT.] I cannot but think that a custom so injurious to trade in general, might and should be prevented.

I have enlarged upon these particulars and circumstances, to shew by what methods and steps in the detail of barter, an additional quantity of real money in a state increases the price of all commodities. As to the fact itself, it seems sufficiently proved by experience, and agreed upon by all hands. Mr. Locke lays it down as a principle, and frequently insinuates, that the price of all commodities is proportionable to the actual quantity of circulating money. But he seems to have clearly lost the view of this subject, when he supposes, nevertheless, that the profits and advantages made in a state increase without bounds, with the increase of the quantity of money: whereas it follows from his own principles, that, if the money is doubled, the price of commodities is also doubled, and consequently that a double quantity of money will buy but the same quantity of commodities, if they are doubled in their value. [For what occasions the rise of labour and commodities, see the articles DUTIES, DEBTS, [PUBLIC DEBTS], TAXES, LABOUR.]

Let us now examine how things find their proportion in a state, when the price of commodities rises, either by an additional quantity of money introduced into barter, or by the scarcity of commodities and bad years.

When there happens a great demand for any kind of commodities, several families will consume less of it than usual, by reason of it's dearth: a man who commonly eats three pounds of bread in a day, will subsist if he has but two pounds; and a state which maintains 1,000,000 of inhabitants, will, with little difficulty, and without any sensible hardship, maintain 1,100,000, and even 1,500,000 with difficulty and famine: but things will afterwards find their own proportion, and the inhabitants will proportion themselves in number to the means they find to subsist on, according to the manner of living of the place.

Hitherto we have not any where considered foreign trade; but, by a commerce with foreigners, a state may maintain a greater number of inhabitants than the land can maintain. For example:

The inhabitants of Provence may buy wool of the Spaniards, and pay the value of it with about a quarter part of the same wool manufactured; and export the other three quarters of it manufactured to Barbary, and bring home, in exchange for it, more corn than will answer the maintenance of all the workmen, undertakers, exporters, and importers, concerned in the whole commerce in question.

The little island of St. Dennis near Paris contains three parishes, the business of these inhabitants is mostly tanning of leather: the island produces nothing for their sustenance: they sell their labour in exchange for the produce of the lands of the continent, which maintains them: their tanned leather is mostly consumed at their doors [at Paris]. If it were

to be transported, and consumed in Italy, it would scarce maintain them, because of the expence of the remote carriage.

But the Dutch find means, by the cheapness of their navigation, to exchange their labour with remoter parts, where the produce of their labour is not voluminous; their manufactures of linen, their bleaching, their herring and whale-fishery answer the charge, and so does their sawed timber and shipping to some places; for their saw-mills, one with another, save the labour of 25 persons. See the article LABOUR. That circumstance contributes to the cheapness of their shipping, as well as the timber of the countries adjacent to the Meuse, Moselle, and Rhine, which falls down these rivers to them with little expence of carriage. So it is not surprising there are more inhabitants in Holland than their lands are able to maintain, but this cannot be increased in infinitum; but these latter considerations have insensibly carried me something from my subject.

The value of money, as well as of other commodities, arises from the quantity of, and demand for it. The quantity of silver, by the opening of the mines of Peru and Mexico being greater than gold, gave an extraordinary value to gold; and hence it was that in the 11th of king James I. the unity piece of gold was raised from 20 to 23s. On the contrary, a few years ago the demand for silver was so great, that we were obliged to lower the value of gold; and, in all probability, in a little time we shall think a farther diminution absolutely necessary. But it is not alone the quantity of gold and silver that lessens the demand for them, but the circulation too; a great trade, making a greater demand for industry and commodities than money, lessens it's value, and consequently raises the price of the other two.

Trade and credit, as they are inseparable in themselves, so they are the parents of circulation: money without these would be but a dead treasure in few people's hands, and consequently the community little the better for it. France is to England as 8 to 3, their specie perhaps proportionable, yet there is a greater shew of money in England than in France; but, if the circulation of France were equal to that of England, then she would appear of course so much the richer.

For more matter on this subject, see the articles BANKING, BARTER, CASH, CIRCULATION, COIN, GOLD, SILVER, BULLION, EXCHANGE.

MONIED INTEREST, or MONIED PROPERTY.

The chief subject of what is now meant by the monied interest in this kingdom, is the national debt, see DEBT [NATIONAL DEBT]; and it is called monied property, only in opposition to the landed, and because of the facility of turning it into money; not that any body is weak enough to imagine, that there does exist, or that it is necessary there should exist, money enough in the kingdom to answer what is due to the public creditors.

That we may give a just idea of this debt, we shall consider, (1.) What the public debt is. (2.) To whom it is due. (3.) Whence came the money lent to the public. (4.) How far the public is affected by it. (5.) How and where that money was employed before it was lent to the public. (6.) What has become of it since. (7.) What would be the consequence of paying it off. And, lastly, What will be the consequence of increasing it.

1. The public debt is a share out of the profits and expences of every inhabitant of Great-Britain; which he is bound to pay, without receiving any benefit or advantage for it, 'till the public shall be rich and honest enough to pay out of it's savings no less than eighty millions sterling.

Where a revenue consists in land, the owner feels, that, at two shillings in the pound, he gives away one tenth of his income; but does not so easily perceive, that he must still contribute out of the nine parts that remain: and a day-labourer is not sensible, that he gives a great at least towards the public debt, out of his hard earned shilling. He must pay for his shoes, his light his drink, his washing, &c. and, because he keeps no account with the exciseman, he never dreams that he contributes to his collections.

This tribute is squeezed out of the bowels of the people in the shape of taxes; and, besides what is applied to the national debt, like the wretch that is cast at law, they must pay for the expence of raising it, and must maintain a swarm of tax-gatherers; who, though they are, perhaps, as necessary as jack-catch, as an anonymous writer says, cannot fail to be looked upon as the instruments of oppressing the very country, which had a right to the benefit of their honest industry.

The public debt, then, is an absolute alienation, with privilege of redemption, of a considerable part of the means of subsistence of every individual in Great-Britain; which he would have a right to possess and bestow on himself and family, was it not for such debt, and which he is now obliged to pay to another because of that debt.

2. As to the second point, one must distinguish between those to whom the public debt is due at present, and those to whom it was originally contracted.

King William's war having involved this nation in an expence unknown 'till then, every invention was exerted to

find out new methods of raising money. After every tax that history or speculation could suggest was imposed on the people, it was so contrived, that the money raised came vastly short of the demands for it; and the government had recourse to anticipations, and delivered over the nation to the mercy of usurers. Clerks, agents, brokers, money-scriveners, commissaries, Jews, and members of parliament, were allowed 30 or 40 per cent. for pretending to advance the public the very money they had already received, or just robbed it of.

In those times, it was usual to contract with the public to perform a certain service, suppose for 30,000*l.* one third down, and the rest payable at two different terms. The contractor, after receiving his 10,000*l.* down, either sold his contract to great advantage, or perhaps performed the whole service on credit. When the remaining payments became due, he, by another hand, advanced to the public, at 30 per cent. premium, the very money it had paid him a few months before. Thus, without being one shilling out of pocket, he contrived to make the public 10 or 15,000*l.* in debt to him: so abundant a harvest drew reapers and gleaners from every quarter. Things were contracted and paid for that never were furnished. False musters were winked at by sea and land. Every one aimed at his share of the plunder: no man pretended to check another, and to establish a precedent that might make against himself: the maxim was, To live, and let live; and the nation, like a town taken by storm, was given up to plunder. It was at this time that the word *PÉQUISITE* grew into vogue. Those who did the real service, were forced to be content with their wages; but secretaries, paymasters, clerks, &c. had their perquisites.

The first proprietors, then, of that share of the profits of the industrious called public debt, were originally such who took advantage of the public folly; and, by furnishing them their own money at an extravagant premium, got annuities assigned them for it at 7 per cent. interest. These understood their trade too well, to spare ready money to those who had done real service. Instead of money, all such were obliged to receive debentures, which their necessities forced them to part with to usurers at 50 or 60 per cent. discount.

As soon as they found themselves possessed of these, they claimed all the merit and compassion due to the unhappy old soldiers, sailors, and other wretches they had starved out of them: and, instead of money, of which they knew they had left none unqueezed out of the present generation, they were so very obliging, as to content themselves with having posterity delivered over to them in security for 7 per cent. interest, to be paid 'till the principal, which they never advanced, should be refunded.

After the peace, these gentlemen had got too high, and the people of England too low, to admit of enquiries. Public credit grew a cant word, and the law being debarred from enquiring into their titles, their securities were preferred to land, and found real purchasers; who actually, and bona fide, paid a new premium for what had cost the sellers very little.

The money lent the public came from ourselves, the very people whose industry it was employed to purchase, furnished the price that bought it.

The notion, that money was brought from abroad to purchase our taxes, is less true than imagined. Where could it come from? Not from Holland, France, Spain, or Portugal. Happy for us, the three first nations were drove to the same extremity, and were selling themselves as fast as we were, and the Portuguese had not then discovered the mines of Brazil. Vast fortunes have been made in England by foreigners, as well as natives; but it will be difficult to instance many considerable ones that have been imported. When the public funds were established, the certainty of gain might tempt some foreigners to lay out their money here; and so much the worse for us, since for every shilling they brought in, they were sure to carry out two. The different nations in Europe have run in debt, or borrowed, as they term it, near FIVE HUNDRED MILLIONS STERLING, SINCE KING WILLIAM'S WAR. No body can be so unreasonable as to imagine, that that money was lent them from abroad.

REMARKS ON MONIED INTEREST.

Whoever has frequented the Groom-porter's, will be at no loss to conceive, how a few money-lenders, with 200*l.* of borrowed money, must infallibly pick up all the money played for, and must, in time, get into the estates of every constant gamester.

My lord duke A shall play against my lord B. They shall bring each 1000*l.* in their pockets. On Monday the run shall be against his grace: he loses all his ready money: his money-lender C is at hand, to supply him with a rouleau of 50. The run continues; C has t'other and t'other rouleau at his service. The luck turns; C receives back his 150*l.* with thanks, and three guineas due to his kindly succour. On Tuesday, lord B comes to be in the same situation. He too has recourse to his money lender D. This traffic is repeated every day through the year. Nothing so equal as luck: on casting up accounts, it will be found, that his grace and

VOL. II.

my lord are each 5 or 6000*l.* out of pocket; and that C and D have got it. His grace gets at last into so bad a run, that he is out 100 rouleaus to C; and finds good natured C, not only willing to accept of a mortgage on his grace's estate for the 5000*l.* borrowed, but ready to lend him 5000*l.* more on the same security. Thus his grace has lost all his ready money, and mortgaged his estate for 10,000*l.* Has my lord B got it? No; he is in the same situation. But C and D have got all the others have lost, though they have found no treasure, discovered no philosophers stone, nor imported a single farthing from abroad.

We know there were at least fourteen millions of specie in England, when king William's war broke out. Most of that money must have been employed in trade, there having been then no more profitable way of disposing of it. When the public demands took place, there was more to be got by supplying them; and of course every wise man would take his money out of trade, and carry it to the Treasury, as the better market. There was at that time at least 20 or 30 per cent. to be got fairly, by supplying the government; the money paid was sure to return again in a few years, and, being lent again on new securities, it can be no wonder, that so profitable a traffic has, from a moderate stock, produced even eighty millions in sixty years.

In short, the people, who had no conception that it was possible to grind above two millions a year out of them, were now taught to pay six, besides the sums annually borrowed; and those who received that six millions, or rather those with whom it stopped, brought it back again to the Treasury, and it then became public debt. So far were we from receiving money from abroad, that it can, perhaps, be demonstrated from the constant course of exchange, that the expence of beaten armies, subsidies, and, above all, the interruption of trade, occasioned the sending vast sums out of the kingdom.

The public debt is attended with every dreadful consequence that can accompany any national calamity, of which we shall hint only at the most obvious of such as distinguish it. If it was payable only out of the rents of land, and of such as live on their means, it might be pretended, that since the industrious farmer must pay his rent, it is the same thing to the nation, whether it is wholly possessed by the equire, or if one half of it is enjoyed by a stock-jobber. Even in that case, there would be a wide difference. But the rents of land are not in question: our taxes are chiefly paid out of the consumption of the industrious; and the farmer must pay his share out of his own particular profits, independent of what the equire pays out of his estate.

A tax of 5 per cent. on any commodity, must raise the price of it above 8, [see the article DUTIES;] and, as our tradesmen work under the disadvantage of paying taxes for almost every thing they consume, they cannot afford their labour so cheap as those who pay considerably less, and of course must be underfold in the foreign market. In other words, if an Englishman consumes to the value of 6*d.* a day, and must pay 3*d.* for the privilege of doing so, he cannot live so cheap as the foreigner, who enjoys that privilege for a penny.

We inhabit the most plentiful spot in Europe, our people are allowed to be naturally industrious, yet our poor want employment. We have not mouths at home to consume our produce. Foreigners can afford to smuggle our wool at a vast expence, and to undersell us even in that manufactory. If we have still some trade left, thanks to the provident care of our ancestors, who settled our colonies, and to the singularity of our taste, that can accommodate itself with Portugal wine, which has secured to us a part of the trade of that country; which, however, daily declines at present. See the article PORTUGAL.

To judge fairly of the bad effect of our taxes, let us suppose ourselves released from them, or let us suppose all the money paid to the stocks and sinking fund given back in bounties to the manufacturers and exporters, and then let one imagine how many hands would be set to work at home, and whether we should not undersell all the world abroad.

The public debt has, in a great degree, intailed immorality and idleness upon the people; and the civil magistrate, whose chief office ought to be to refrain vice, is forced to connive at it. The revenue cannot be supported without encouraging idleness and expence, and licensing numberless public houses; most of which are to be considered as so many academies, for the acquiring and propagating the whole science of iniquity. It is from these academies that Newgate is peopled, and Tyburn supplied; but it is likewise from these, that a great part of the revenue arises. Pulpits may thunder against vice, and juries may hang criminals to eternity, while every means of corrupting the morals of the people is thrown in their way, it is in vain to look for reformation.

The public debt has opened the iniquitous traffic of stock-jobbing, and introduced a spirit of gaming amongst all degrees of men. The attention of the merchant is too much taken off from solid trade; he engages in what he fancies the more lucrative business of Exchange-alley, and leaves export and import to such as have patience to follow it.

The trade of the Alley, consists too much in conspiring to pick the pocket of every body not in the secret. Those who are, can make stocks rise and fall at pleasure, and pocket the difference. A has 5000*l.* to lay out. India stock is at 180. B transfers 100*l.* to C. at 179. Next morning he transfers another 100*l.* at 178. The price is set, and A buys 5000*l.* at 178. In a week or two A wants to sell. If the object is considerable, an article in the Hague Gazette is made to confirm, that the emperor of Monomotapa desires to be comprehended in the alliance of Petersburg. C transfers his 200*l.* back to B at 180; the market is settled again, and A sells out at 180. Thus their industry brings 2 per cent. in a few weeks. But who do they get it from? From women, younger brothers, and all such of the well-meaning people of England as will dabble in stocks, without being in the secret. It is from this scandalous commerce, that numbers of these meer money-jobbers have, in a few years, acquired millions among them; and, what is most provoking, they have the impudence to dub themselves merchants, and some real merchants have the meanness to suffer them to assume that title. One would imagine, that nothing but our necessities could make us wink at a practice so iniquitous and detrimental; yet there are some men absurd enough to fancy, that we are extremely beholden to these jobbers, for condescending to set up their trade amongst us.

The city of Bristol, or Birmingham, might, with equal reason, think itself obliged to a set of sharpers, who should bring a fum of money along with them, and set a Faro bank for all the citizens to pont at. Nor would it be more ridiculous in a country esquire to think to improve his carp, by throwing in a parcel of pike amongst them. We can only increase our people as we do our game, by discouraging poachers and destroying vermin.

There is an inconvenience attending the public debt, not inferior to any mentioned, which has escaped the notice of most people. The public debt has produced a difference of interests in this country, that we have lately suffered by, and, if not remedied, can have no end. It is the interest of the stockholders to involve the nation in war, because they get by it: it is the interest of landed men and merchants to submit to many evils, rather than engage in war, since they must bear the chief burden of it: and, however contemptible one may think the weight of the former, in comparison of that of the latter, it was their superior influence that involved the nation in the late frivolous war with Spain. The greater the debt, the greater the weight of the public creditors, and the louder their cry. And we may expect, that these worthy patriots will, on every proper occasion, renew their endeavours to keep us in the thralldom.—Deplorably precarious must the situation be, where one set of men must be undone, even by a necessary war, and another, of perhaps equal influence, impoverished by the best peace.

Amongst the bad effects of the public debt, we must not omit the particular loss the nation suffers by the share of it belonging to foreigners residing abroad. If they possess 20 millions of it, there is a dead loss to the kingdom of 600,000*l.* a year. If England was obliged to pay a tribute of that amount to France, or any other foreign country, every body would pronounce that we could not hold it long without being undone: and yet that tribute stands on a footing at present still more destructive to the nation, because there is no probability of getting free from it, but by paying above 35 years purchase, and because the foreign stockholders have a temptation to increase the tribute due to them, by applying their dividends to buy up more stock; of which, that we are to pay the dividends is CERTAIN: but the benefits, that we are to receive from letting their money remain with us is DOUBTFUL. Men not used to think of these subjects, talk of money like a vegetable, as if it were the nature of it to grow and increase. No doubt the particular man, who lends it out at interest, feels himself grow richer, and, perhaps, the persons who borrow it may lay it out so as to bring in a return. But it must stop somewhere; and, considered in itself, it does not grow, but wears. More of it than what is sufficient for the circulation and commerce of a nation is of no use, and brings no profit to the nation in general.

The fifth point to be enquired into is, how and where the money was employed before it was lent the public. It has already been explained, that the money supposed to be lent came chiefly out of the pockets of the very people who now pay interest for it: the public debt being an annuity out of the profits and consumption of every individual, before it was established, every body possessed and enjoyed all his gains. There was then no Exchange-Alley: those who frequent it had no existence; and, had there been no opportunity of exercising their genius that way, their necessities would probably have pointed out to them some other branches of industry, in which many of them might have been of use to the public, which they now prey upon. The ready money which circulates in the Alley, and, by being tossed backwards and forwards, is found sufficient, in such hands, to draw into it all the wealth of the kingdom, was, and, without our debts, would be employed in trade, in improving and extending our colonies, in public works, for use as well as ornament, and

might then draw in the wealth of other countries, where now it operates only on our own.

As to the sixth article, if money was brought from abroad to supply our demands, so I admit, that none has gone out on that score, further than so far as foreigners have taken advantage of our situation since that time, by buying in cheap, and selling out dear; for few of them shared in our general plunder: or, as our debt was contracted to support foreign wars, and to pay foreign subsidies, a great part of the money laid out that way may have remained abroad. Our debt affects us not so much by carrying our money abroad, as by putting it out of our power to work our goods cheap enough to get money for them in the foreign market. What makes it likely that our specie is greatly diminished within these 60 years is, that ten parts out of eleven of all the silver in circulation is either of king William's coinage, or before it; but paper currency makes a little money to do the business of a great deal; and it is certain there remains specie enough in the kingdom for all our occasions.

It follows, from what has been said, that, if the public debt was paid off, the profits of the manufacturer would be all his own. He would be exempted from paying at least 40 per cent. out of his gains. It would be equal, in every respect, to a bounty to that amount on all our productions, and of three-pence a day to the day labourer, and so in proportion. With that advantage, we should be able to undersell our neighbours: our people would of course multiply: our poor would find employment: even the aged and disabled might earn enough to live upon: new arts and manufactures would be introduced, and the old ones brought to perfection: our most barren lands would be cultivated, and the produce of the whole insufficient to supply the demands of our people. See the article MANURE.

The stock-jobber, when paid off, would find employment for his money in trade and manufacture, and would find that turn to better account than their preying on the vitals of their country. He would then become an useful member of society. Rents would rise, and the country gentleman would be able to provide for his younger children. We should be able to restore morality amongst our people; and the immense increase of trade would furnish employment for every industrious man. Our colonies would share in the benefit; and many causes of jealousy between them and their mother-country would vanish. We should become formidable to our neighbours; for, besides the increase of our naval power, in case of a just cause of war, we should be able to advance much more money within the year than we have ever done by anticipation. Such of our blood-suckers as had no taste for honest industry, would probably go with their millions, and prey on our enemies, to our great emolument, and their perdition.

It may probably be objected, by men of narrow conceptions, that there was a time when we owed no debt, and yet this country was never richer, nor had it more trade than at present. Let such men recollect the state of this nation 60 or 70 years before king William's war, with respect to numbers, trade, shipping, wealth, and manufacture; and let them compare it with our situation when that war broke out, and then let them give a reason why we have not increased in the same proportion since that period. Trade was then in its infancy; our colonies were hardly established; those times had all the expence of them; and we all the profit; Ireland was then but little better than our settlements in America are now; we had no union with Scotland, and Portugal afforded but little money; each of these has opened a new source of wealth to us; and, with such advantages, ought we not to have thrived in the same proportion we did in the former period? Had it not been for the public debt, there can be no doubt but our improvements for the last 60 years must have surpassed those of the 60 years preceding.

If our debt does not diminish it must increase; and, if it does, one may pronounce with certainty, that nothing can preserve us but our neighbours being in the same unhappy situation, and that we shall only continue a great nation as long as they are so.

The stock-jobbers have the words PUBLIC FAITH and PUBLIC CREDIT constantly in their mouths; and want to establish it as a maxim, that they are both engaged to support their monopoly, at the expence of the whole body of the people.

The advanced price of stocks is more a proof of the folly, than of the faith of the public; and, if people did not depend more on the first than the last, a redeemable annuity could never rise above par. The excessive premiums are owing to an opinion, that we want either the means or inclination to pay off our debts; such an opinion would not add to the credit of a private man; and how it should increase that of the nation, is difficult to be comprehended by those who do not clearly discern the consequences of these things.

Some people tell us too, that paying off our debts is annihilating so much property. On the contrary, it is purchasing at par, for the national benefit, what is supposed to be worth a great deal more; and the subject is not annihilated, but only transferred to the public from a private man, who might have employed it to the public detriment.

When

When the art of funding was first introduced, the common talk of mankind was, that the people of England must be undone. Some tell us, that the event has proved the vanity of that apprehension. The prediction has been verified, perhaps, in the strictest sense. All that could be meant by the assertion was, that the then possessors, and their posterity, must be undone, and their inheritance given away from them, and become the property of other men. It could never be their meaning, that the land would run away, or cease to be occupied by some body. At present, that is, 60 years after the Revolution, one tenth of the land of England is not possessed by the posterity or heirs of those who possessed it at that time; and if the extermination (as it may be justly termed) is not universal, it is only because there were a few overgrown estates, such as the Devonshire, Bedford, Curzon, &c. which were proof against the waste of luxury and taxes. Suppose the Turks were to over-run England, it might certainly be affirmed with propriety, that, if we did not drive them out, England must be undone; and yet, if they should prevail, the land would still remain, would still be occupied and cultivated, and possibly the trade of England would receive some advantages from the favour of other Mahometan nations, who are all great customers for the woollen, and most other manufactures: and it is more than probable, that a greater proportion of the property of the country would remain in the possession of the original inhabitants 60 years after such a conquest, than is now to be found in the posterity of those to whom it belonged at the Revolution. As the cause, I mean the public debt, still subsists, the present possessors must not expect a more durable establishment. Was the plague to rage in a city, and all the rich to perish, the poor would get possession of the houses and effects; but, if the infection continued to prevail, they would soon make way for others in their turn.

Let no body imagine that the people of England will suffer things to come to extremity, without making some effort to relieve themselves. If they have made no attempt of that sort hitherto, it has only been from the hopes that their burden would soon be made lighter, and from the just confidence they have had in those at the helm.

REMARKS on the MONIED INTEREST before the last WAR.

This is the strain of reasoning of many, in relation to the public debts of the nation, and particularly so in a late enquiry into the original and consequences of the public debt, said to be drawn up by a person of distinction. This piece being drawn up with too much severity against the public creditors, we have stripped it of a great part of its malignity, and yet have thought proper to retain so much of the substance thereof, as may give an idea, how obnoxious the monied interest is in the sight of some.

Suppose, however, that all, and much more in the like strain, might be true, with respect to the proprietors of the public stock; it can never be consistent with the general interest of the nation, to annihilate at once, as that writer proposes, the whole 80 millions of properties, which now belongs to the public creditors of the nation. This would be of infinitely worse detriment to the public, than the Mississippi or South-Sea schemes were; and would for ever after disable the nation from borrowing more money on the most pressing exigency, by giving such a blow to the public faith.

There is some use and advantage, notwithstanding, to be made of this gentleman's suggestion; and that is the only reason for our taking notice of it: the public creditors may be hereby warned of what may possibly enter into the heads of some other people, as well as into that of the author of this piece; and therefore this ought so to alarm the public creditors, as to excite them to think of every measure to obtain the lessening of the public debts, in a manner the least dangerous and oppressive to them; for, if they continue to increase, and remain undiminished, the taxes occasioned thereby, upon the trade and navigation of the kingdom, may one day be thought to render their property so highly detrimental to the public interests, that men in power may take it into their heads to relieve the nation from the weight of its taxes and incumbrances, by an absolute annihilation of all the monied property in the kingdom, occasioned by the funds. For, the writer before-mentioned strongly excites to a conduct of this kind, when he says, 'That in a like extremity, when the clergy had engrossed too large a share of the property of the country, Henry VIII. was obliged, for the relief of the people, to seize on their temporalities; and had the approbation of every lover of his country. That the grievance was by no means so intolerable at that time as now; because the clergy contented themselves with possessions in land, without pretending to a share in industry.'

'That as to violation of laws and public faith, it is in vain to urge these in cases of necessity. The first of all principles is self-preservation; nor could the ties of law and public faith be stronger in favour of stock-jobbers now, than of the clergy at the Reformation. That, as to public credit, we should have no more occasion for it; since the

'people, relieved from so heavy a burden, would, on an emergency, by submitting to the former taxes, be better able to raise money within the year, than can now be brought in by anticipating. And the greatest advantage of abolishing the debt would be, that it would secure us against running in debt for the future.'

'It may be said, continues this writer, in objection to this scheme, that it would be dangerous to drive so powerful and so rich a body of people, as the owners of eighty millions, to despair. True it is, they are powerful at present, and their cry is loud, because they are possessed of eighty millions: but, when stripped of that, as would then be the case, they would be as inconsiderable, and as little listened to, as any other set of beggars. I do not say it would be wise or just in a prince to act this part. I only imagine it would be popular.'

How the public debts may be equitably and honourably discharged, without ever being obliged to come to such extremities, as what this author proposes; see our articles CREDIT, [PUBLIC CREDIT], DEBTS, [NATIONAL DEBT], FUNDS, INTEREST.

This gentleman's way of reasoning may be made use of, some time or other, to reduce the interest of the public creditors, still lower than it is: unless they co-operate with the public, not only to prevent the further increase of the public debts, but the gradual diminution of the greatest part, if we cannot get rid of the whole of these we have; lest the oppressive taxes occasioned thereby, should one day stir up a spirit in the nation, to make use of a SPUNGE instead of a SINKING-FUND.

REMARKS on the MONIED INTEREST since the last WAR, and the PEACE of 1763.

The last war having increased our PUBLIC DEBTS, from about 80 MILLIONS to upwards of 140 MILLIONS, and multiplied TAXES in proportion thereto, the MONIED INTEREST have in consequence augmented their stock property in the public funds. Were the taxes of the kingdom mortgaged to ourselves only, and the public debts contracted solely amongst the subjects of this realm, the whole of the interest money annually paid for our debts, would be property of his majesty's subjects, and would circulate amongst ourselves. Were our affairs so happily circumstanced, it would prove an extraordinary alleviance of our weighty incumbrances; tho' was that the case, it would be no reduction of the weight, which our whole commerce and navigation at present sustain: and if the circulation of the interest money in Great-Britain increased the spending money of the nation, and that increased our imports proportionably from foreign countries, the nation would be never the richer than it is, whilst we pay interest to foreigners for a proportion of our debts due to them. For however fashionable it may be for some people to magnify the increase of our trade, from the increase of the REVENUE OF CUSTOMS, this is no sure criterion thereof; such people deceive themselves and others too, unless that they can demonstrate the great increase of that branch of the revenue proceeds from the greater increase of our exports, rather than our imports. If, on the contrary, it should appear that we expend more money in the purchase of foreign wares than we receive by the sale of ours to foreigners, the kingdom grows annually poorer and poorer; and the higher the duties of imports swell, the greater confirmation it will be that we really do so.

Indeed, the advantages we receive from the article of freight, and the employment of shipping, will be some diminution of the evil, when our own shipping is engaged in our imports, pursuant to the act of navigation, and consistent with all our laws made for the encouragement thereof. But provided our exports decrease, these advantages may not be an equivalent compensation for our imports; we may still buy more than we sell upon the whole, and when what foreign goods are smuggled into the nation, are added to our legal imports that pay duties, our purchases are thereby still augmented, and the domestic consumption of our native commodities diminished.

These disadvantages under which our trade labours, are most certainly owing to the excessive pitch to which our tax-incumbrances are arrived; for the heightening the price of the necessities of life, and the labour of our industrious poor in general, occasion such a superiority in the prices of our native commodities and manufactures in general; and while this continues to be the case of these kingdoms, our exports must diminish, while those of our rival nations, who can afford their goods in general considerably cheaper than we can ours, will increase. Such are the effects of increasing the public debts and taxes; and as some people, and those no bad judges, are of opinion that foreigners have not so little as one quarter part of our national debts divided amongst them, and that they do not drain off so little as A MILLION a year for interest money; this is a great drawback upon the national profits of our trade.

The only provision we have at present made by parliament for the discharge of the public debts, and the reduction of

our taxes, in that of the SINKING FUND. But as this fund, which, was to have been the redeemer of all others, is become mortgaged, and is now a collateral security for new contracted debts, since the year 1716; our hopes of the efficacious operation of that fund are blasted, and that whole fund may be sunk for interest of new debts, instead of sinking the principal of the old, as was originally intended: so that this sacred fund, which was designed to redeem others, stands in need of redemption itself, before the public can experience it's long wished for effects.

In the year 1733, such was the state of public credit, that the national creditors dreaded nothing more than to be obliged to receive their money from the sinking fund; interest was made to the administration by our monied corporations, which of them should be paid the last. Of which the ministry took advantage, and applied 500,000 l. out of the sinking fund: and this may be the case again, perhaps, should we be in a condition to discharge TWO OR THREE MILLIONS a year of the public debts. So that if we may judge from past experience, we ought to think of more effectual means to reduce our taxes, and not to wait the slow and precarious operation of the sinking fund. See INTEREST. That this is practicable, the author of this work is of opinion; and may be effected in less than half a dozen years, and that without any detriment to the public credit, without any alarm given to the public creditors, and with very great benefit to trade: and if his other avocations will admit of his turning his thoughts to a design of this nature, without personal injury to his private affairs, he may one day communicate himself upon this interesting occasion: otherwise he leaves those things, to those who are sure of being well recompensed for their application, the author of this performance never having been so; which will not be thought an encouragement to any one to concern himself about the public welfare, but to attend to his own.

Some Maxims relating to the Funds, and the Public Credit, by Sir JOHN BARNARD, Knt. published just before the Peace of AIX LA CHAPELLE.

I conceive that the prices of the funds do not in the least depend on the quantity of them, either taken in the gross, or any particular sort of them; that if they were double to what they are now, it would necessarily follow, that the prices would be lower; nor yet, if they consisted but of half what they do now, would the price be from thence increased.

It is therefore the quantity brought to market, compared with the purchasers, which rises or falls the prices of the funds.

Thus, if the quantity be so sold, exceeds the money to be laid out, the price may fall, until that fall produces purchasers, who would not be such at higher prices.

So, likewise, if the purchasers exceed the quantities to be sold, stocks must rise, until that rise produces sellers, which before were not sellers.

When the government have a necessity to create new funds, they must dispose of them at such prices as buyers may be found; and should use such methods in the sale, as are most likely to invite the greatest number of such purchasers as design to keep them.

When funds are sold directly, by the government, to persons who design to keep them, they are immediately out of the market, and affect the price no more than all that quantity of the public funds, which remains in the hands of persons who never think of selling them.

When funds are sold by the government to traffickers in stocks, who design to sell them again, the market continues in agitation, until the funds, by degrees, become settled in the hands of buyers, who keep them.

Those traffickers who buy to sell again, will have more encouragement, than is necessary to be given to those who buy with a design to keep: or else there would be no profit arising to them.

If, therefore, the government should deal directly with persons who buy to keep the funds, a good part at least of that immense profit, which is now made by these traffickers, would remain to the government.

There must be found, at least, buyers with an intention to keep; or else the traffickers could not get rid of what they buy.

Purchasers, with a design to keep, would much more willingly buy of the government, at any certain price, than they would buy of the traffickers at such price; because they would have a reasonable expectation, that it would be the lowest price that year.

If timely notice were given every year, there would probably come in buyers, with a design to keep, sufficient to take off all the funds created that year, provided they may come in freely at the original price.

If new-created funds were thus taken off every year, they would but very little affect the prices of funds at market.

One or two per-cent. under the market-price, together with some ease in payment, may be sufficient to induce buyers,

with a design to keep, or take off all the funds to be created in a year.

It is not proper, that any of the payments should be fixed too near the end of the year, because it will interfere with the money to be raised the next year.

How many sorer the payments may be, or whatever the times of payment, it is proper to allow a reasonable discount to those who will pay in any money before the times fixed; which discount may be saved, by not issuing of tallies on the land and malt.

It is more for the interest of the public, to have the money paid at such times as best suit the purchasers (which will be done, if a discount be allowed), than to have it remain to be paid at certain fixed times.

When the purchasers are not allowed a discount, they are unwilling to pay their money long before the prefixed days; and so lay out their money in something to bring interest in the mean time.

When, by this means, large sums are to be paid at certain times, if any accident happens, which casts a damp on public credit, people being under a necessity of bringing something to market to raise the money; this contributes greatly to hurt public credit.

There will be always large sums to be laid out in the funds, and more especially when they are lower than they have been at former times; which sums arise, in part, from the following causes:

Amongst people who live on their income, whether by estates in land, or in the funds, or in mortgages, there will be many who are always saving part of their income, and want to lay it out.

People, who thrive in trade, are willing, as they can spare money, to lay it out in something to support them more at their ease.

As war necessarily contradicts trade, and consequently so much money cannot be employed therein, as in times of peace, those who have large estates in trade, must have money gradually coming in; which, when the funds are reasonable, they may choose to lay out therein; and some, from this beginning, go on to draw all their money out of trade, to place it in the funds.

What is mentioned relating to people in England, holds the same with regard to people abroad; who, if the particular friends, with whom they correspond here, can procure for them new-created funds, on the original prices at which the government sells them, will give orders to those friends to purchase for them such funds.

The raising the rate of interest on new funds, occasions the fall in price of the old funds; which is a great prejudice to those who happen to be under a necessity of selling out.

It likewise raises the rate of interest between private persons, and also lowers the value of land; so that the whole community suffers thereby.

No money should be raised on the subjects, but what is absolutely necessary for the public good.

As the necessary money cannot now be raised without borrowing, the higher rate the interest is at, the more must the people pay.

If a higher rate of interest should ever be given to traffickers in stocks, than it might be raised at by open subscription, the people will receive a double injury, both by paying more taxes than are necessary, and also by being deprived of their just right of purchasing funds on the same terms with their neighbours.

The credit of the public depends much on the opinion of the people, and therefore great regard should always be had to preserve in the people a good opinion. Economy in management, and impartially in letting all persons alike into the purchase of the funds, will be the best means to keep up a good opinion in the people.

All people love to have a liberty of being purchasers at the original prices, whether they make use of it or not.

As all are partakers of the burden of new taxes, so none ought to be deprived of sharing in whatever benefits the public may find it necessary to give, to raise money on them.

Nothing contributes more to the revolutions in the prices of stocks, than the methods of late used, of contracting, with a few persons, for raising the supplies in a lump; and those persons having the sharing it out as they please.

Those revolutions, in the prices of stocks, make the proprietors uneasy, and out of humour, to see their property bandied about, for particular persons to get great estates.

This uneasiness begets a disgust in people to stocks: they see them yearly falling, and from thence apprehend greater falls; from whence many sell their stocks.

Those who are in a sort of possession of bargaining for new funds, at their own prices, whilst they can depend on having a good bargain every year, can have no interest to keep up the prices of the funds, any longer than until they sell good part of their bargain; and, as for the remainder, it may serve them to throw down the prices, against the time of a new bargain.

What cannot be done by barely selling out their stocks, they have other ways to bring about.

Let

Let the price at market be never so low, although it may be by their own management, whilst they can make persons believe the money cannot be raised without agreeing with them, they will be sure to agree much under the market-price, and consequently run little or no risk of losing, and have a strong probability of excessive gains.

Some remaining part of what the traffickers purchase, being sold out at proper times, to lower the prices of stocks, likewise gives them a pretence to say, that the bargain was not so good as it was taken to be.

If money be raised by a lottery, large enough to let in every one, or by subscriptions open to every one, on the best terms for the public, all mankind will be on a level.

Those persons who keep their stocks, let the price be higher or lower, certainly act the most for the public good, and ought to receive the greatest encouragement.

Those dealers in stocks, who have large sums of money in hand, have certainly acted against the public good, by selling out their property in the funds; and yet are often the persons most favoured, and admitted to annual bargains.

The best way of supporting the prices of the funds will be, to let the people know, that for the future the money wanted shall be raised on the lowest terms possible, with an equal liberty to all persons to be purchasers.

If this method be constantly practised, such persons who sell their funds, in hopes to come in again cheaper, may find themselves mistaken.

This is certain, that the public selling new funds too cheap, tends to make all mankind have a worse opinion of the funds in general, than they would otherwise have.

If a person who has goods to sell, does not put a value on them himself, how can it be expected that others will value them?

Whenever the government shall have no occasion to create new funds, the money which will necessarily come to market to buy stocks, will inevitably raise the prices of all, let the quantity in being be never so large.

Therefore, it must be cheaper for the government, at any time, in compliance with the necessity of the times, to give a higher interest redeemable, than an interest something less with any part of such interest irredeemable; because, in the first case, they may reasonably expect, in a very few years, to reduce the interest on a level with the other funds.

If any should be of opinion, that giving a high interest for new funds will reduce the other funds in price, in proportion to the different rates of interest, I conceive it to be a great mistake.

If there were different funds, at the rates of 3, 4, and 5 per cent. all irredeemable, they would generally sell in exact proportion one to the other.

But, suppose the same funds all redeemable, they will never sell in proportion one to the other; because people will have in view the reduction of interest.

Suppose any quantity of new funds to be created, and sold in any one year, it will not occasion there being less money the next year, than if no such funds had been created; because as the government issues out all the money received, the same quantity of money will still be in private persons hands, as the year foregoing.

As the same quantity of money will be in being one year as the former, although it have shifted hands, the question with the possessors of it will be, what is the best use that they can make of it? And probably there will be persons enough disposed to come into the purchase of funds, to take off any new-created quantity, if it be free for every one to purchase at the government's price.

It is a very great hardship on merchants, who have foreign correspondents, when they cannot execute such correspondent's orders for new funds, on the same terms with their neighbours here, as by that means they are in danger of losing their future commissions, even in other affairs.

If the interest of the nation, in it's public capacity, the interest of the creditors of the nation, and the interest of the individuals of the nation, are all promoted by open subscriptions, it must appear very strange, that the interest of a few persons, who have been acting against all three, should be preferred.

If the government should think it necessary to give advantageous terms for raising of money, equity would require, that it should be given to those who suffer most thereby; and, consequently, that the present proprietors of the funds should have the pre-emption before those who have sold their funds, and thereby contribute to create that necessity.

If no-body sold their property in the funds, but out of necessity, the prices would keep up very well, notwithstanding the annual creating of new funds.

Those persons who sell their property in the funds may be easily known, and whatever pretence they may make of zeal for the government, their actions speak the contrary: and although it would not be right to hinder any person from selling their property in the funds, in a fair way; yet surely there is no reason to reward them for so doing, by giving them fresh funds, immoderately under the market-price.

I think those persons who were large subscribers to the bargain, for raising the money for the year 1745, should have

made it appear, that they were in possession of their subscriptions, before they were admitted to be large subscribers for the year 1746.

If persons are admitted to subscribe largely one year, when they are known, or might have been known, to have parted with the sums subscribed for the former year, what is this but encouraging them to go on with a traffick highly detrimental to the nation?

Whenever, by any means, there happens to be a run on the Bank, it occasions many persons, although well-affected, to join in the run, for fear of losing their money; and gives an alarm to the Bank: and, if the Bank call on their subscribers for circulation, it adds to the difficulties.

I am of opinion, that as the Bank is now constituted, it is scarce possible for them to be drained of their money: many of their notes are so dispersed; that they cannot come in for payment for a good while; and men of sense, and affection for the government, will always do what lies in their power to support them: which, in some time, will put a stop to the run.

If the Bank find it necessary, they may give interest to those who will bring in money voluntarily, to be paid at a fixed time: which method will not affect credit, like a call to the subscribers; many of whom are not able to pay their money; or they may, at last, allow interest on their cash-notes, which I have seen practised with success.

But if, at worst, the Bank should be forced to stop payment, the inconvenience to the public would not be so much as some may imagine; because the debt owing by the government, is a sufficient security to their creditors, for the principal and interest, which, in that case, it be reasonable to allow; and would give such a currency to their notes, as few persons would refuse to take them in payment; which would, by degrees, restore their credit.

A proper quantity of exchequer-bills might be every year issued on the land and malt-taxes, at a reasonable interest, to be sunk, in course, by the produce of the taxes on which they were issued.

The issuing such exchequer-bills, would supply, in some degree, the want of money; and could never occasion any run on the exchequer, not being payable on demand.

The inconvenience which arose, in former times, from issuing exchequer-bills, proceeded from the quantity being too large, and there not being a fund to sink them in a reasonable time.

People would be glad to take such bills in payment; because thereby they would be enabled to make interest of their running cash.

Those who contract with the government, would be glad to agree to have their payments in such bills; which would keep navy and victualling bills from being at discount; and, consequently, the government would buy their goods cheaper than when the contractors are at an uncertainty what they shall be paid in. See the articles MONIED INTEREST, DEBTS, [NATIONAL DEBTS,] CREDIT, [PUBLIC CREDIT,] FUNDS.

MONEMUGI, a kingdom in the south of Africa, has Zanguebar on the east, Monomotopa on the south, Motamba and Makoko on the west, and Abyssinia on the north, and partly to the east; though it's boundaries that way cannot be exactly ascertained. It is divided into the following parts, viz. **MUJACO** borders on Congo westward, on Nubia northward, on Abyssinia, and on Makoko southward. That the extent of this monarchy is very great, appears by the distant countries it's confines extend to, and the sovereign's great power, by his being in continual war with his neighbour the king of Makoko. The people of Congo travel hither for elephants teeth.

MAKOKO, otherwise called **ANZICO**. It's boundaries northward, eastward, and southward, cannot be well ascertained. The people here do not till the ground, have no property, nor any settled habitation; but, like the Arabs, they wander from place to place, and subsist by plunder. They traffic in the kingdom of Angola, whither they carry slaves from their own country; and from Nubia, which they exchange for salt, glass-beads, silk, knives, and other wares. See the article **BARBARY**, and my **REMARKS** particularly.

GINGIRO, a potent kingdom, lies between Narca, the most southern kingdom of Abyssinia, and Makoko, and Cambate; north and east of the first of them, and west of the latter. The great river Zebee, that runs down to Makoko, almost invirons it. When the king here purchases any thing of foreign merchants, he pays them in slaves, and these are the sons and daughters of any family, which he takes at pleasure, without contradiction.

CAMBATE joins to this kingdom on the west, has Abyssinia on the north; Alaba, or the country of the Galas, on the east; and Makoko on the south. The country pays some acknowledgements to the emperor of Abyssinia, which is only voluntary.

ALABA, another large kingdom, still to the eastward of Cambate, inhabited by a cruel people, called Galas, and reaching to the coast of Zanguebar.

MONEMUGI PROPER, so called, lies in the torrid zone, and about the equinoctial line south of Makoko, west of Zanguebar, north of Monomotopa, and east of Congo, and of the northern parts of Monomotopa. To ascertain its extent, is too difficult a task, being a country so little frequented. The country known, abounds with gold, silver, copper mines, and elephants. The natives clothe themselves in silks and cottons, which they buy of strangers, and wear collars of transparent amber-beads, brought them from Cambaya, which beads serve also instead of money; gold and silver being too common, and of little value among them. Their monarch always endeavours to be at peace with the princes round about him, to keep an open trade with Quitoa, Melinda, and Mombaza, on the east, and with Congo on the west, from all which parts the black merchants resort thither for gold. The Portuguese merchants report, that on the east side of Monemugi there is a great lake full of small islands, abounding with all sorts of fowl and cattle, and inhabited by negroes. They relate also, that on the main land eastward, they heard sometimes the ringing of bells, and that one could observe buildings, very much like churches; and that from these parts came men of a brown and tawny complexion, who traded with those islanders, and with the people of Monemugi.

This country of Monemugi affords also abundance of palm-wine, and oil, and such great plenty of honey, that above half of it is lost, the blacks not being able to consume it. The air is generally very unwholesome, and excessively hot, which is the reason why no Christians undertake to travel in this empire. De Lisle gives the division of this country as follows: 1. The Maracates, the Messaguaries, the kingdom of the Buengas, the kingdom of Matti, and that of Maravi.—But we are not acquainted with any particulars relating to these nations or kingdoms.

MONMOUTHSHIRE, in England, is bounded by part of Herefordshire on the north, Gloucestershire on the east, Glamorganshire on the west, and is washed on the south by the Severn, and is about 84 miles in circumference.

It's air is temperate and healthy, and the soil fruitful enough in general, producing as good wheat as any county in the kingdom, great quantities of which are shipped by the Bristol merchants for Portugal, and other countries. Coals are so plentiful here, that a horse-load costs but two-pence at the pit's mouth. The principal manufacture of the county is flannels.

MONMOUTH, the shire town, is a populous, handsome, and well built town. It's principal traffic is with the city of Bristol, by means of the Wye.

CHEPSTOW is the port for all the towns that stand on the rivers Wye and Lug. Ships of good burthen may come up to it, and the tide comes in here with the same rage as at Bristol, it rising commonly 6 fathoms, or more, at the bridge.

ABERGAVENNY, on the river GAVENNY, is a handsome, well-built town, and drives a great trade in flannel.

PONTIPOLE, is a small town, noted only for its iron mills.

MONOMOTOPA, a country in Africa, has the maritime kingdom of Sofala on the east, the river del Spiritu Santo on the south, the mountains of Caffraria on the west, and the river Cauma on the north, which parts it from Monemugi.

The air of this country is very temperate, the land fertile in pastures, and all the necessities of life; being watered by several rivers; on the banks of which grow many fine trees, and sugar-canes, without any culture: and yet this fine country is not peopled throughout.—The inhabitants are rich in black cattle, which they value more than gold. There are here no beasts of burthen, but a vast number of elephants, as appears from the great quantity of ivory that is exported from this country.

There are here a great many gold mines; and the rivers that run through their veins, carry a great deal of gold dust along with their streams. The inhabitants dive to the bottom of the rivers and lakes, take up the sand, and carry it on the banks to separate the gold from it.

The negroes here, are tall, well-shaped, strong and healthy. They are much more lively than the people of Mozambique and Melinda. They are lovers of war, which is the trade followed by all those who do not apply themselves to commerce.

This country is divided into 7 provinces, or petty kingdoms, vassals to the king. They are Monomotopa Proper, Quiteve, Manica, Inhambana, Inhemiur, Sabia, and Sofala. The places where there is any thing of trade, are

MANICA, which has Quiteve on the north, Sabia on the east, the river del Spiritu Santo on the south, and Caffraria on the east. The capital town is also called Manica, and to the south of it are gold mines.

SOFALA kingdom has Sabia on the south, Monomotopa Proper on the east, the river Cauma on the north, and the gulph of Sofala, which is part of the channel of Mozambique, on the east. From the mouth of the river of the Holy-Ghost, to cape Corientes, the soil is very even, barren, and desert; but from that cape to the mouth of the river Cumena, the country is fruitful, and very populous. The coast is very

low, and mariners discover their approach to it, not so much by their sight as by their smell, it abounding with fragrant flowers. Here are elephants, lions, and other wild beasts. The inhabitants assert, that their gold mines yield above 2 millions of metigals per annum, each amounting to 14 livres French money; that the ships from Zedein and Mecca, carry off above 2 millions a year in time of peace; and that the governor of Mozambique, whose office lasts but three years, has above 300,000 crowns revenue, without reckoning the soldiers pay, and the king of Portugal's tribute: from hence Moquet concludes this to be the Ophir, whither Solomon sent ships every three years from Eziongeber to fetch gold; Eziongeber being thought to be Suez, a sea port on the Red Sea. This conjecture is supported by several edifices, which seem to have been built by foreigners. Some think this to be confirmed by the authority of the Septuagint, who translate the word Ophir (2 Kings ix. 28.) by the word *Σοφίρα* [Sophira]. And, since liquids are often put one for another, Sophira does not differ much from Sofala. Besides, Thomas Lopez, in his India voyage, relates, that the inhabitants of this country boast that they have books which prove, that in the time of Solomon, the Israelites sailed every third year towards these parts to fetch gold. The inhabitants of Quitoa, Mombaza, and Melinda, come to this country in little boats, called zambues, with stuffs of blue and white cottons, silk stuffs, yellow and red ambergris, which they exchange with the people here for gold and ivory, and there sell them again to the subjects of Monomotopa, who give them gold in return, without weighing it. It is said, that when the Sofalese see ships coming, they light up fires, to signify that they shall be welcome. They know how to make stuffs of white cotton, but cannot dye them; and when they would make party-coloured stuffs, they unravel the dyed cloths of Cambaya, and mix them with white thread.

The capital city here, and the only one of note, is also called Sofala. It stands on a river of the same name, about 6 leagues from the sea-coast. The Portuguese are masters of this town, and built a strong fortress there, ever since the year 1500. Their chief trade here consists in ambergris, gold, slaves, and silk stuffs. The Portuguese likewise take care to have those mines worked, which lie to the south of the town.

REMARKS.

This is a spacious country, and little known to any but the Portuguese; and they appear to be wiser in relation to the conduct of their trade in Africa than any other of the European potentates, they having not contented themselves with erecting a few forts and factories, but have settled themselves upon the continent in great numbers, and brought the natives to clothe according to the European mode; which has created a considerable and profitable commerce to them. See the articles AFRICA, ENGLISH AFRICAN COMPANY, and PORTUGUESE AFRICAN TRADE.

MONOPOLIES are allowances of the king by grant, or otherwise, for the sole dealing in any thing, by which others are restrained from any freedom they had before. Though a monopoly may be more truly defined a kind of commerce usurped by few, and sometimes but by one person, to his or their private gain, and to the detriment of others.

Those used in this kingdom have been distinguished by three classes; first, reasonable, of trifles, as cards, or the like; unreasonable, as of flesh, fish, butter, or other things needful for man's sustenance; indifferent, of velvets, silks, spices, and other delicacies indifferent to be used or not. But all monopolies are contrary to the ancient and fundamental laws of this realm, and against the freedom of trade, &c. Wherefore it hath been held, that the king's grant to any corporation for the sole importing any merchandize, by our common law, is void.

Some are satisfied if it be by act of parliament; as when a society of private merchants have a privilege, by that authority, to sell or import certain commodities, and all others are excluded: but if by the king's prerogative, they take it to be a monopoly. Others would have all things at large in the course of trade, and no societies for any places of trade; for, by way of partnership, merchants might, say they, associate to make any voyages, without any regard to our trading companies, some of which are of great antiquity. And others make a difference between companies dealing in a joint stock or apart; affirming the management of a joint stock to be within the compals of a monopoly; yet would be content to tolerate it for the employment outward, but for returns would have a particular division of the goods they receive.

Judge Vaughan says, That, if the export or import of a commodity, or exercise of a trade, be prohibited only generally, by parliament, and no cause expressed, the king may grant a licence to one or more persons to export or import, or exercise the trade: for, by such general restraint, the end of the law is no more than to limit the over-numerous exporters, &c. in that kind, by obliging them to procure licences; which, therefore, shall not be accounted monopolies; the law implying

plying it, as well as if the prohibitory law had been, that no such exportation, &c. should be without the king's licence. Vaughan's Rep. 345.

Having given the substance of various opinions concerning what is monopoly, or not so, we shall now take particular notice of the great case of monopolies in the reign of Q. Elizabeth, as delivered by Sir Edward Coke. Queen Elizabeth intending that her subjects being fit for husbandry, should be exercised therein, and not in making playing-cards, by which card-playing was become more frequent, and especially among servants, apprentices, and poor artificers; by her letters patents of the 13th of June, in the 30th year of her reign, granted to R. B. Esq; full power, by himself, servants, &c. to provide and buy in any foreign parts, all such playing-cards as he thought good, and to import and sell them in this kingdom, and to enjoy the whole trade for 12 years. On an action of the case brought by the patentee against one for importing and making cards, contrary to these letters patents, notwithstanding the glorious preamble and pretence, it was resolved that this grant was void: for it is a monopoly, and against the common law, and divers acts of parliament; for all trades which prevent idleness (the bane of the commonwealth) and exercise men and youth, for the maintenance of themselves and their families, and for increase of their substance, to serve the queen when occasion shall require, are profitable to the realm: and the sole trade of any mechanic art, or any other monopoly, is not a damage to those who exercise the same, but to all other subjects, the end of them being the private gain of the patentees: and there are three inseparable incidents to every monopoly, the price of the same commodity will be raised; it is not so good and saleable as it was before; and it tends to the impoverishment of divers artificers, and others.

And it is evident, by the act of 3 Edw. IV. cap. 4. that the importation of foreign cards was prohibited, at the grievous complaint of the poor card-makers, who could not live at their trades if such cards should be imported; and the said act provides remedy for maintaining the trade, because it maintained many families by their labour and industry; and the like provision is made in 1 Rich. III. cap. 12. and persons may not be restrained from exercising any trade but by parliament. Now, when the wisdom of the parliament has restrained, for public good, the importation of foreign manufactures, that the subjects may be employed therein; to grant the sole importation or them to one for private gain, or to divers without limitation, is a monopoly against the common law: and, therefore, the licence to have the sole importation and trade of cards, notwithstanding the act 3 Ed. IV. is utterly against law. Adjudged Trin 44 Eliz. 11. Co. Rep. 84, 85.

King Edward III. by letters patents, granted to one John Peeke the sole importation of sweet wines into London; which grant, by stat. 50 Ed. III. was declared void. And queen Elizabeth having granted to certain patentees the sole coinage and transportation of all the tin in Cornwall and Devon, for 21 years, under a large yearly rent to be paid at the Exchequer, it was adjudged that this patent was a monopoly, anno 13 Jac. I.

In an action the plaintiff set forth, that, in the reign of Henry IV. there was a society of merchant-adventurers in England, and queen Elizabeth did incorporate them by that name, with privilege to trade to Holland, Brabant, Flanders, &c. prohibiting all others not free; and that the defendant did trade there without their leave, and imported goods to their damage, &c. To which the defendant pleaded the stat. 15 Ed. III. That the seas shall be open to all merchants to pass with their merchandize whither they please: the question was here, whether the king could restrain his subjects from trading to particular places? This case was not determined; but the better opinion was, that such a grant was void, it agreeing with lord Coke's definition of a monopoly: it is against the stat. of Ed. III. and expressly against the statute 21 Jac. I. The case of the East-India company is not like this, because that patent restrained the subject from trading with infidels, without leave; if it had been to restrain them from trading with Christians, it had been void. 3 Mod. Rep. 126.

By stat. 21 Jac. I. cap. 3. all monopolies, grants, letters patents, &c. for the sole buying, selling, and making of goods, and manufactures, shall be void: and persons grieved by the putting them in use, to recover treble damages and double costs, by action on the statute: and persons causing such action to be stayed before judgment, by any order, warrant, &c. except of the court where depending; or, after judgment had, causing execution to be stayed, by means of such order, &c. save only by a writ of error, incur a præmunire. But this act extends not to grants confirmed by act of parliament, nor to any charter to any corporation, company, &c. nor to grants of new manufactures, made to the inventors by patents for 14 years, nor to any grant of privilege for printing, or making salt-petre for gun powder, or for casting ordnance, &c. and certain patents granted to divers persons are excepted.

And patents heretofore made for 21 years, or under, to the inventors of any new manufactures, not contrary to law, or

hurtful, by raising the price of commodities at home, are excepted.

All matters relating to monopolies, grants, &c. shall be examined and determined by the common law of the realm; and the using or procuring any unlawful monopoly, is punishable by fine and imprisonment at common law. 3 Co. Inst. 181.

It is held, that a new invention to do much work by an engine, is contrary to the statute, as turning many men to idleness. [See the article LABOUR.] And, concerning inventors of new manufactures, &c. on this statute it hath been determined, that they must be substantially new, and not barely an IMPROVEMENT of any old one, to be within the statute. 3 Inst. 184.

A grant of a monopoly may be to the first inventor, by the 21st of Jac. I. and, if the invention be new in England, a patent may be granted, though the thing was practised beyond sea before; the act being intended to encourage new devices useful to the kingdom, whether acquired by experience and travel abroad, or by study at home. 2 Salk. 447.

A person had a grant by patent from king Charles II. for the sole printing of blank writs and bonds, &c. for the term of 30 years; and one Dorrel, a stationer, having printed 500 blank bonds, an action was brought against him, who pleaded, That the company of stationers, for 40 years last past, had constantly printed them, and so made a general conclusion. It was argued, That the king hath a prerogative in printing, and may grant it exclusive to others; and that such grants had been made ever since printing was invented, of which several instances were given. Now the statute against monopolies, doth not reach this case, because of the proviso to exempt all grants of sole printing; and the king's inherent prerogative herein, when exerted, binds up all who were at liberty before. To this was answered, That the king hath such prerogative, but it must be in cases where no others can claim a property in it. On considering printing as an art exclusive from the thing printed, this patent is not good; for, if a man invents a new art, and another learns it before he obtains a patent, if afterwards granted, it is void: and this considered in relation to the blank bonds printed, it is not a new invention, and therefore the patent is void; for, where the invention is not new, trade shall not be restrained. And sole printing is a manufacture, an art the king cannot restrain; but, where it is of public concern, the prerogative may interpose.

The court of King's-Bench made a difference in this case, between things of a public use, and those public in their nature; and the court inclined the patent was not good. 3 Mod. 75, 76, 78. 2 Nels. Abr. 899.

It is agreeable to our common law, and the fundamental laws of all nations, to grant inventors of useful things privileges for 21, 14, 11, or 7 years; and as to the time granted, the thing itself should make the difference. But the general intention of all grants for manufactures, should be to set people on work, to recompense the inventor of the art, and that things may, in some respect, be cheaper to the subjects.

Patents may be granted to reward a projector, and be no monopoly, though the public liberty may seem restrained by it, but rather a common distribution, whenever it brings a general good to the nation. The statutes restraining from exercising divers crafts all who have not served an apprenticeship to the art they would exercise, do it to no other end, but that those arts might be brought to better perfection, and the things be good and serviceable.—These are the chief principles of law in relation to monopolies.

REMARKS.

Under the article COMPANIES, we have shewn the origin of those, which have related to our foreign trade; and, under the respective articles of such of those companies which are now in being, we have endeavoured, with all candour and impartiality, to state the reasonableness, or otherwise, of their being endowed with any sort of exclusive privileges.—[See the article ASSIENTO] particular REMARKS.

In regard to the case of the East-India company, in particular, we have, in general, considered the constitution of that corporation; and, although we have urged the necessity of supporting that company, yet we have also shewed, that, if they do not trade to all places within their charter, where it may be done to the advantage of the nation, private people should not be excluded from such traffic: they should, on the contrary, be encouraged therein to the utmost. See the articles EAST-INDIA COMPANY, and COMPANIES; see also the other particular companies that subsist.

It has been said, if that trade were enlarged, it would increase such a demand for woollen goods, for iron ware, and for every other branch of business in England, as would employ all the manufacturers, who are now starving, and thereby relieve the poor, by making them no longer so.—This might be demonstrated, by the many places that are not yet traded to by the English. The company trades in the Red Sea but to one port, that is, Mocha; but the Habazines empire, or that of Ethiopia, which lies on the west side of that sea, is not attempted to be traded to, although it is inhabited by many Christians.

Christians, and abounding with gold, myrrh, senna, aloes, civet, and numbers of rich dyeing and medicinal drugs, and other commodities; and they have no iron nor woollen goods but what are carried to them over-land from Egypt or Turkey, and which is mostly manufactured by the French, or at Damascus.

The company doth not trade to Siam, a rich and great kingdom; nor to Pegu, a kingdom that produces rubies, gum-lac, gum-dragon, and all the materials of the fine Indian varnish: the inhabitants are very industrious, and great trade might be made there. Tonquin is also a kingdom full of industrious people; and the kingdom of Cochinchina would give vent to a great number of commodities. The kingdoms of Japan and Corea are amongst the richest in the world; and with these the East-India company are said to have no commerce; and yet they abound in raw silk, gold, silver, spice goods, tea, porcelain, japan, &c. nor need the company strive to gain access, since they have more trade already than they can turn their hands to.

The many spice islands unpossessed by the Dutch, and Mindanao, and other islands near the Philippines, unpossessed by the Spaniards, are a glorious field for the English commerce; numbers of adventurers might make their fortunes by such a trade, and hundreds of ships might be employed therein, to the great national emolument.—It is necessary for us to think of these things; for, if we do not, the Prussians, or others, will, the gain being so great; and the company cannot use their charter against foreigners, who are so saucy as not to obey an English act of parliament.—It has been further said, upon this occasion, That, if Scotland and Ireland had the liberty of trading to all parts of the globe, they, by the cheapness of their labour, and the number of their hardy and industrious people, among the former in particular, would under-trade foreigners, and open many markets, that are, at present, unthought of; and that this would increase the shipping and wealth of Great-Britain to an immense degree.

The attempts of the Scots nation before the Union, to open a trade to the East-Indies and America, particularly their settlement at Darien, were glorious; and the barbarous treatment they met with will ever be ignominious; for, had the Scots maintained the isthmus of Darien, and a free passage between the North and South Seas, within a colony of their own, Britain might, by this time, have been so powerful in America, as would have prevented the French from breaking the treaty of Ryfwick, and, consequently, have prevented those wars which have been attended with so weighty an incumbrance on our whole trade. These disadvantages have been attributed to monopolizing companies; for, while the South Sea company subsisted as a trading corporation, they had a monopoly, though, perhaps, not so nationally injurious as some others, if we consider all the peculiar circumstances thereof. See the articles ASSIENTO, and SOUTH-SEA COMPANY.

But if the Scots, as well as the English, are excluded by the court of Spain from trading directly to Spanish America, it has been doubted whether our own East-India company have it in their power to exclude any ship trading to Japan from Edinburgh and Glasgow. It seems, that the company have never traded to Japan since their charter was confirmed by act of parliament; and, surely, if they thought it within their charter, they would have certainly attempted that trade, which is, perhaps, much more advantageous than any they now carry on. Certain it is, that trading to these countries would highly tend to the benefit of Scotland; and, therefore, it has been thought reasonable to require an explanation of what parts of the globe the people of North Britain are debarred trading to, by charters granted before the Union, or by acts of parliament made before or since; or whether the subjects born and dwelling in North Britain and Ireland are bound by any act, unless it should mention those countries particularly.

The substance of what has been further urged in this kingdom against MONOPOLIES in general.

Besides the misfortunes arising from our taxes, we have some monopolies very destructive to a trading nation, and inconsistent with a free one, which encourage idleness, villainy, and extravagant demands for wages; whereby the many are deprived of their rights, without having committed any crime to forfeit them, and for the benefit of a few only: a country that suffers them cannot send it's goods so cheap to a foreign market as it's neighbours who should not, for never yet was a monopolized trade extended to the degree of a free one; therefore any country abounding in monopolies must decline in trade.

To apply this to Britain.

The trade of exporting woollens, and some other sorts of goods, with the trade to some particular countries given to companies, we monopolize to ourselves, and, in our abundant wisdom, pay all the charges of government; our fellow-subjects in Scotland pay but a trifle to the general support; in Ireland and the plantations nothing at all; these trade under the protection of fleets that cost them not a farthing: our land wars to maintain the ballance and liberties of Europe, at the risk of our own, cost them not a doit; all that we en-

deavour is, to starve them without expence, and ourselves with; for that is the case, we drive one part of our people out of trade by monopolies, and the other by taxes. We bleed ourselves almost to death, and think to recruit our spirits by devouring three millions of starved Irish and Americans, and, by excess of cunning, make the ruin general.

Exclusive companies prevent the increasing the vent of our manufactures abroad, consequently they starve our poor, as will appear by the following reasons:

By being all of them confined to London, the prices of the woollens they export are enhanced by long land-carriages up to town, with the additional charges of commission, warehouse-rent, portage, &c. much to the prejudice of their sale; and what materials of manufacture they import are dispersed over many parts of the kingdom, by the like expensive conveyance, to the great disadvantage of the nation in general.

It is not the interest of the East-India company to increase the quantities of the woollens they export, but rather to contract them (which we suppose was the reason for obliging them by their charter to export woollens to a certain value) for at all markets where there are any demands for goods, the smallness of the quantity naturally enhances the price; and, if the company can gain as much on 5000 cloths as on 10,000, is it not their interest to prefer the lesser quantity, on account of the less disbursement and risk? Though it is plain the nation would lose the sale of one half of the manufactures capable of being vended; whereas private traders pushing against one another, study to increase the vent of their goods, by selling at moderate profits, and making the quantities answer to themselves and their country.

The large charges the East-India and South-Sea companies, when the latter traded, are forced to be at for the salaries of the directors, governors, supercargoes, &c. besides what may slip through their fingers sometimes, must make these companies neglect all trades that will not yield extraordinary profits to defray them; which trades private merchants would be glad of, and turn to good account for themselves and their country, were they not debarred by exclusive charters. See a distinction, with regard to the South-Sea Company in particular, under the articles ASSIENTO [REMARKS], and SOUTH-SEA COMPANY.

Exclusive companies buying at home by directors, and selling abroad by servants, who may have an eye to their own or friends interest, and the foundation of all being the company's money, they cannot naturally be supposed to be so industrious, as those who trade only on their own stocks; therefore companies can never extend trade like private dealers, but it must decay where interlopers are admitted, of which our late Royal African company was a strong instance. What confirms the whole, is the prohibition of the East-India company against their servants carrying out cloth, which would be needless, did they not know that their servants can undersell them, for the company wants no money to supply all the cloth that can be vended with the usual profit. In the year 1741, a seizure was made in one of the out-ports of a large quantity of cloth designed for India, belonging to one of the company's servants, when at the same time, by the decay of our woollen trade, the poor's rates were at 8s. in the pound, in some of our clothing towns; from whence this absurdity arose, that whilst our clothiers were starving, the exportation of cloth was thereby made a contraband trade. It is impossible to make any enquiry into our companies, without taking notice of their vast villainies; which, as they have been made sufficiently public, few can be ignorant of; therefore the bare mention of them is enough, such as the fatal South-Sea scheme, that ruined thousands of families.—See the articles ACTIONS, and BUBBLES.

We need not to mention former directors, receiving salaries from companies, and, though contrary to law, being notwithstanding concerned in the Ostend trade to India, whereby they were cutting the throats of their benefactors; the selling goods by false samples, and buying them for their private accounts; carrying on private trade contrary to treaty, and bribing officers to wink at them with the company's money, and charged to account by the genteel name of presents, subjecting thereby the company's effects to seizures, and their country to perpetual jars. The rapaciousness of governors abroad, who, by engrossing goods, nay, even the necessities of life, have oppressed the people by arbitrary prices, and drove away our trade. Supercargoes, cheating by false invoices. Captains, quitting or losing ships, to defraud insurers and bottomry lenders: are not these things written in the books of their chronicles? But the greatest mischief of all is, that the honesty of the people hath been corrupted, by having presented to their eyes roguery lightly punished, if not triumphant.

These companies have prevented the increase of our navigation, by their exclusive charters, debarring us from a free trade to 2 parts of the known world. The dominions of the Grand Seigneur, in Europe, Asia, and Africa, were, till lately, confined to the Turkey company. All South, and part of North America, from Vera Cruz to Carthage, from Buenos Ayres round Cape Horn to California, that vast extent

tent of coast, were also, 'till lately, the portion of the South Sea company. Yet we have not found, that the nation is any thing the better for the annihilation of this latter monopoly; it is hoped, however, we shall in time, some how experience the benefit of it.

All the coasts of Africa, Asia, from the Cape of Good Hope to Japan, are the lot of the East-India company. And, what a small number of ports did they all trade to, and what a trifling navigation did they all maintain? There is a greater quantity of ship tonnage employed in the trade of the free port of Leghorn only, than all these three companies ever employed in their monopolies to $\frac{2}{3}$ parts of the world; like the fable of the dog in the manger, not eating themselves, but preventing those who would. For more matter, having an affinity herewith, see the article PATENTS.

MONTEFERRAT, a duchy in Italy, is bounded on the north by Savoy, on the east by the Milanese, on the south by the territory of Genoa, and on the west by Piedmont. It is computed to be 26 miles in length, and 48 in breadth, and was formerly divided into the Mantuan and Savoyard Monteferrat. Both countries are very pleasant and fertile, though hilly; and besides the great plenty of all necessaries, afford vast quantities and variety of game. It abounds in silk, corn, wine, and oil, wherein it has a pretty considerable trade.

MONTGOMERYSHIRE, in Wales, is bounded on the east with Shropshire and Radnorshire, on the south with Cardiganshire and Radnorshire, with Merionethshire on the west, and with Denbighshire, and part of Merionethshire and Shropshire on the north. It is computed to be in length from east to west 30 miles, in breadth from north to south 25 miles, and it's circumference 94.

The air is sharp and cold on it's mountains, but wholesome and pleasant in the vallies. On the north and west sides, where the former are most predominant, the soil is stony, and not very fruitful, except in the vallies between them, which are very pleasant, and afford corn, and plenty of pasture; but the south-south-east and north-east parts, which are more level, are exceeding fruitful, especially those parts that lie on the banks of the Severn, and are sometimes overflowed by it.

It's chief commodities are corn, cattle, horses, fish, and fowl. It has been long remarkable for a peculiar breed of horses, which are still larger here as well as their black cattle, than in some of the neighbouring Welsh counties, and are much valued in England.

It's principal rivers are the Severn, the Tanat, and the Turg.

MONTGOMERY TOWN stands in a healthy air, is large and handsome, but the buildings are generally very indifferent, except a few fashionable houses that belong to some considerable families.

LLANIDLOS lies near the head of the Severn, and it's parish, which is noted for mines of lead and copper, belongs to the diocese of Bangor: it has fairs in July and September.

MACHYNLETH, an ancient town in the diocese of St. Asaph, and has fairs on June 27, July 25, Sept. 29. and Nov. 13.

LLAVELLING, or **LHEN VYLLYN**, a considerable town, and has a good market for cattle, coney-wool, and other provisions, but stands low. It's fairs are in June, July, and September.

WELSHPOLE, a large well built corporate town, where is a noted manufacture of flannel. It has a fair in August.

Upon the whole, there is scarce a finer county in England, than these parts towards the Severn side.

MONTSERAAT, one of the smallest of the Caribbee Islands, in the Atlantic Ocean in America, subject to England. See **BRITISH AMERICA**.

MORAVIA MARQUISATE, a principality of the kingdom of Bohemia, bounded by Silesia and Poland on the north and east, Austria and part of Hungary on the south, and Bohemia on the west. The north and west parts are woody and mountainous, but the rest is fair and champaign good soil, yielding much corn of all sorts, with wine, both red and white, and abounding with spacious towns and villages.

The pastures are filled with horses, black cattle, sheep, and goats; and the woods with hares, foxes, wolves, and beavers. It's rivers abound with trout, crayfish, barbels, eels, jack, perch, and many other sorts of fish.

OLMUTZ, it's metropolis, is 20 miles west from the borders of Silesia, 28 north-east of Brin, 80 north of Vienna, 45 south-west of Teschen, and 94 south of Breslaw. It is a small, but neat, well built, strong, and populous city; and has a trade, by means of it's river Morawa, with Bohemia, Hungary, Poland, Silesia, and Austria.

BRIN is a pretty large well built town, and is held by some to be the capital.

IGLAW, or **GHLAWA**, is a pretty large, strong, well built, and populous town, on the borders of Bohemia. It's principal trade is in beer and coarse woollen cloth, which they make and dress themselves.

ZNAIM, or **ZNOGMO**, on the river Taya, not above 5 miles from the borders of Austria, has a pleasant soil and wholesome air; and being on the road from Prague to Vienna, brings a tolerable trade to it. There are many vineyards in the neighbourhood, which afford a pretty palatable wine.

VOL. II.

MOROCCO and **FEZ EMPIRE**, in Africa, comprehending the kingdoms of Fez and Morocco, is bounded by the Mediterranean Sea on the north, by the river Fulvia, which divides it from Algiers on the east, by Bildulgerid on the south, and by the Atlantic Ocean on the west, being about 500 miles long and 200 broad. It is a fine country, consisting of mountains and vast extended plains, none of them unfruitful: of the mountains, those of Atlas are the chief, extending from Algiers in the east to the ocean in the west, which from them has obtained the name of the Atlantic Ocean. Their soil produces good wheat, rice, and barley, and would yield a great deal more, if well cultivated, but only the Jews plant the vine; the olive also thrives here, and yields excellent oil. They have also dates, figs, almonds, lemons, oranges, pomegranates, and a variety of other fruits; nor do they want flax or hemp; but wood, especially timber, is scarce here. They have no ships of war, only some small piratical vessels, which they crowd with men, and take great prizes sometimes, especially the Saltee rovers; but as for merchant-ships, or foreign trade, they carry on none on their own bottoms.

REMARKS.

No flourishing trade or improvements can be carried on under a government so despotic, oppressive, and rapacious. The land is judged capable of producing a hundred times more than the inhabitants can consume, yielding three crops a year; yet, except within 3 leagues of a town, it has no proprietor; there is generally corn in the emperor's possession underground to serve the whole country five years. They who have a little money, are afraid to let it out upon interest, lest they should be reputed wealthy, and consequently become a prey; so they bury it with any furniture of value, nothing being seen in their houses but a mat or two to lie on, and a few ordinary things. Their traffic is of a piece with their agriculture; besides, the Moors having no immediate commerce with any foreign nation, nor any trading vessels of their own, the navigation is by European ships, and the Jews are the chief traders and factors, and by their immense profits make themselves amends for the exorbitant impost with which they are loaded.

The chief exports are tin, copper, wax, hides, wool, cordovans, honey, dates, raisins, olives, almonds, indico, gum arabic, gum sandric, elephants-teeth, ostrich feathers, and fine masts. The exportation of corn is absolutely prohibited, as contrary to Mahomet's precept, though it is encouraged at Algiers and Tunis.

The duties on goods exported, are on wax, per hundred weight, twenty-five ounces; old copper, twelve; red Morocco skins, per half dozen; one ditto other colours, two blanquilles. Hides tanned or raw, each two ditto; wool, dates, almonds, gums, soap, per quintal, three ounces, talow six ounces; mats per bale; six goat-skins in hair per bale; six calve-skins dressed or raw, one blanquille; sheep-skins per half dozen; two blanquilles are two-penny pieces, and four, when full weight, pass for an ounce; but they are so thin, clipped, and cracked, and the people so fraudulent that a stranger should provide himself with a pair of their scales, to weigh all he receives.

The most usual imports are linens, cloths, iron in bars, hard ware, brimstone, gunpowder, arms, and lead, which pay a duty of about ten per cent.

Their inland trade chiefly consists of caravans, two of which set out every year from Fez to Mecca and Medina, viz. one every six months, carrying woollen manufactures, of which they make some exceeding fine and beautiful, indico, cochineal, skins, and ostrich-feathers.

The English might put a stop to this trade from Mecca, by transporting silks from Turkey to Barbary by sea; and the emperor would certainly countenance the scheme, on account of the ten per cent. custom, on the importing these goods in European bottoms, and likewise as it would prevent so many people going to Mecca, where they often settle, accounting the Turks milder tyrants, and so of two evils prudently chusing the least.

They likewise send caravans to Guinea every year, consisting of many thousand camels, which the difficulty of the passage through deserts, without fodder, provision, or water, renders it necessary that every other camel be loaded with those necessaries. They carry to Guinea, salt, cowries, woollen manufactures, silks and oil, which they exchange for gold-dust, ivory, ostrich-feathers, and negroes. Some Turks of Algiers and Tunis trade thither in silks, cottons, striped stuffs, and fine fashes, from the Levant, and grow rich, as their birth exempts them from the common exactions. The tyranny of the government is said to be the motive of the Arabians continuing a wandering life, lest by living in fixed habitations, they should forfeit all property and liberty by the rapaciousness of the officers.

The ships trading to the Morocco dominions, pay one barrel of gunpowder for entrance, with twelve for loading and anchorage, and twelve to the captain of the port; vessels trading to and from Gibraltar, pay but half this duty, by in-

dulgence of Muley Ishmael, who, though so savage that he could neither read nor write, had a particular kindness for the English, on account of their frankness and bravery. English and French consularage is eight dollars. A French or Spanish vessel likewise, pays three dollars to a fraternity of Spanish friars, who assist them in spiritual offices.

Their whole navy consists of but three or four ships, mounting sixteen or twenty small guns, and a few row-boats; accordingly about thirty years ago, a single English small frigate, with an active commander, by taking some, and running others ashore, struck such a terror, that, as is related of other formidable warriors, the Saltee women used to quiet their untoward children, by telling them Delgarno was coming for them: yet the Christian powers, though the Barbary pirates are such a detriment to their commerce, are kept from exerting themselves with due force against these enemies, lest their suppression should be an over-balancing advantage to any particular state. It is a happiness that all the Morocco dominions do not afford one tolerable harbour; that of Saltee, which is the best, being almost dry at low, and not twelve feet deep at high water, besides a very inconvenient bar: better ports might be an inducement to their making a figure at sea, and become a greater annoyance.

The policy in the Moors is, that they will trade with any ship (though of a state at war with them) which comes to their ports. A convent of Spanish friars is likewise tolerated at Mequinez, for a yearly acknowledgement.

The emperor has a tenth of all corn, cattle, fruits, and produce of the soil; likewise the tenth of prizes, and all the captives. His whole revenue, ordinaries and extraordinaries, is computed at five hundred quintals of silver, each worth 385 pounds sterling: If the revenue of a monarch can be stated, who holds not his subjects lives and fortunes by the tenure of unmeaning addresses, or the good-will of a parliament, but frequently confirms his absolute prerogative, by the ruin and death of the most dignified persons in his dominions:

Of the union of the Christian powers, to extirpate these piratical states.

In speaking of Africa as it once was the seat of commerce for the whole world, we must look back as far as to the flourishing state of the Carthaginian government, but it shall be as short as can be desired.

It is true, as has been observed by a well informed writer on this subject, that the Romans (like the Turks in our time) were no friends to trade; they carried on their war for glory; like mere soldiers, they fought to conquer, and conquered to plunder, not to plant and people the world: so far were they from encouraging or improving the commerce and wealth of the nations they subdued, that they overthrew and destroyed the greatest trading cities in the world: such as Corinth, Syracuse, Carthage, and all the cities of Egypt and Africa: instead of encouraging trade and navigation, they murdered the merchants, burnt their ships, and carried away the people, which are the life and support of manufacture and trade.

On the other hand, the Carthaginians, as they had the richest soil and a numerous people (for Africa was then infinitely populous) they improved the first, and employed the last, to the utmost: their people were as rich as they were numerous; they carried on trade to all the parts of the world, planted colonies, built cities abroad, and ships at home: and wherever they came, whether by conquest or by consent, they planted the country not destroyed it, carried people to it, not away from it; and, in a word, made them rich, not plundered and starved them. Carthage and Corinth at that time, were the two great emporiums of the world; this carried on all the commerce of the west, and that of the east: Corinth managed the commerce of Asia, Persia, and India, and brought the wealth of the East-Indies, the spices, the silks, the calicoes, the gold, the diamonds, and, in a word, the whole Indian and Persian trade in caravans; part from Ormus and the gulph of Persia, to Bassora and Bagdat by water, and thence by caravans to Aleppo and Scanderoon; and so by sea to the gulph of Cenchreae and Corinth, another part of Trapezond in Armenia, and by the Euxine Sea through the Straights of Bosphorus and the Hellespont, and through the Archipelago to the same gulph, and so to Corinth. Carthage, on the other hand, planted colonies, and extended their possessions upon the coast of Spain, as well within as without the Straights; built cities from New Carthage, now called Carthagena in Spain, to the Groyne, as well in the Mediterranean as in the ocean, and from Tangier, then a populous city of 100,000 inhabitants, to the Cape de Verde on the west side of Africa, and from thence into America itself; which, there is no room to doubt, was discovered, if not peopled, from Africa, by the indefatigable Carthaginians; and had never been lost and forgotten to this part of the world, if the Romans, those destroyers of commerce and navigation, had not so utterly ruined Carthage, not the city only, but the very nation, as not to leave them a name under heaven, and so of course caused all their remotest settlements to be abandoned, and, in consequence, at last for-

gotten; but that, by the way, it requires, and, indeed, deserves too long a digression for this place.

Now, when these two cities of Corinth and Carthage fell, (for they were destroyed by the Romans within a year of one another) the trade of the whole world received a mortal wound; and, as those cities never recovered, so the trade which was fixed among them, was divided and scattered, and, in effect, lost, for it never fully recovered itself.

The colonies which the Carthaginians planted, sunk and died away, and many of them lie in ruins to this day, especially on the side of the ocean from the Straight's mouth to cape None; for, as the Carthaginians planted colonies for trade, the trade being lost by the overthrow of the merchants in the mother-city Carthage, the new planted cities, and the sea-ports, were ruined of course, and perished, as a child starves when a nurse is taken from it.

It is true, the city of Carthage was rebuilt, and recovered itself in some degree, under the government of the western emperors; and especially as those emperors were Christians, and were encouragers of the industry and application of their subjects: then, indeed, the trading genius revived very much, especially in Africa; and the climate and soil of that country being particularly productive of many valuable things, and those things adapted to trade, the African merchants carried on a very considerable business; navigation also being their peculiar talent, they traded by sea to all the known parts of the world, but nothing like what they did before.

The principal branches of their commerce in those times, as we gather from the histories of the neighbouring countries, consisted, first, in exporting the growth of their country, and the manufactures of their people, just as it is with us in Britain: for the nature of commerce is ever and every-where the same. And, secondly, in importing again the product of other countries, either for their own consumption, or for re-exportation to remoter parts, which had not the same product. Their own product consisted chiefly in corn and cattle, and among the last, chiefly horses, of which they furnished great numbers to mount the Roman cavalry; for the Numidian horse were then, as the barbs and jennets (which are the same) are now, famed for their beauty, swiftness, and fine shapes, through all the Roman empire.

But above all, their products the most valuable were their wax and copper, in both which they still excel the whole world; also their corn, fruit, drugs, and rich gums, all which remain to them.

For manufactures, we do not, indeed, read much of their woollen manufactures: but the Carthaginians as well as the Egyptians (and both were Africans), are famed for the product of fine linen, and, it is to be supposed, the soil produced a very fine kind of flax, which, as the fund of that manufacture, they improved to great advantage, but that part is now lost.

As to their importations, we are assured they fetched tin and lead from Great-Britain, gold and wine from Spain, for Old Spain ever produced much gold; silks and fine East-India goods from Corinth and Alexandria; what trade they had with Gaul (France) we do not find, but the other was very considerable, and is sufficient to our purpose. Thus stood their condition, flourishing in wealth and commerce, when the Romans, to the eternal infamy, not glory, of their very name, destroyed them all.

As by that the trade of the world received a mortal wound, so when it revived under the Roman and Grecian emperors, it was apparent all their recovery and increase, was owing to their commerce; that alone restored them, and enriched them; and they were, in Justinian's time, the most valuable branch of the western empire, with respect to the taxes they paid, and the many regiments, or rather legions, they raised, for recruiting the Roman armies under Belisarius, and other generals; and this continued long afterwards, even in the most declining times of the western empire.

But this rising wealth of Africa was too rich a bait for the times; the deluge of barbarous nations, which overthrew the Roman empire, broke in upon them also; and the Vandals over-running Spain, spread themselves into Africa, wasted and over-run the fruitful plains, and destroyed the populous cities; and, in a word, trade sunk a second time, under the unsupportable burden of war, the Vandals, over-running all, ruined and possessed the country.

As the Vandals came in over the bellies of the native inhabitants, so some ages after them, the Saracens, Arabians, and Mahometans, came in over the heads of the Vandals.

With these, not the old Africans only were rooted out; not only religion, but at last trade too, sunk quite out of the country; for, as the followers of Mahomet are, wherever they come, like the Romans, the destroyers both of commerce and cultivation, so it was here.

Trade being thus, as it were, rooted out of Africa, the Moors spread themselves, by a rapid and irresistible torrent, over Spain and Portugal; and as for Africa, they have, by a strong hand, kept possession there ever since.

To apply this to our present purpose: These Mahometans, as we have said of the Turks, have very little inclination to trade; but, dwelling on the sea-coast, and being a rapacious

and tyrannical people, void of industry or application, neglecting all culture and improvement, it made them thieves and robbers, as naturally as idleness makes beggars: they disdained all industry and labour; but being trained to rapine and spoil, when they were no longer able to plunder and destroy the fruitful plains of Valencia, Granada, and Andalusia, they fell to roving upon the sea; they built ships, or rather seized them from others, and ravaged the coasts, landing in the night, surprizing and carrying away the poor country people, out of their beds into slavery.

This was their first trade, and this naturally made pirates of them; for, not being content with mere landing and plundering the sea-coast of Spain, they, by degrees, being grown powerful and rich, made bold and audacious by their success, they armed their ships, and began to attack, first the Spaniards upon the high seas, and then all the christian nations of Europe, wherever they could find them: thus this detestable practice of roving and robbing began.

What magnitude they are since that arrived to, what mischiefs they have brought upon the trading part of the world, how powerful they are grown, and how they are erected into states and governments, nay into kingdoms, and, as they would be called, empires, (for the kings of Fez and Morocco call themselves emperors) and how they are, to the disgrace, even of all the christian powers, treated with as such, is matter of history, and we shall meddle no more with it here, than is necessary to our present occasion.

The first christian prince, who, resenting the insolence of these barbarians, and disdaining to make peace with them, resolved their destruction, was the emperor Charles V. He was moved with a generous compassion for the many thousands of miserable christians, who were, at that time, kept among them in slavery: and, from a benevolent principle of setting the christian world free from the terror of such barbarians, he undertook singly, and without the assistance of any other nation, to fall upon them with all his power.

In this war, had he been joined by the French and English, and the Hanse-Towns, (as for the Dutch, they were not then a nation) he might have cleared the country; at least he might have cleared the sea-coasts of the whole race, and have planted colonies of christians in all the ports, for the encouragement of commerce, and for the safety of all the European nations.

But Francis the first, king of France, his mortal and constant enemy, envied him the glory of the greatest and best enterprize that was ever undertaken in Europe; a thousand times beyond all the cruises and expeditions to the Holy-Land, which cost Europe a million of lives, an immense treasure, during one hundred and twenty years, to no purpose. Though the emperor was assisted by no one prince in Christendom, the Pope excepted (and his artillery would not go far in battering stone-walls); yet he took the fortresses of Goletta, and afterwards the city, and the whole kingdom of Tunis; and, had he kept the possession, it might have proved a happy fore-runner of farther conquests; but miscarrying in his attempt against Algier, and a terrible storm falling upon his fleet, the farther attempt was laid aside, and the kingdom of Tunis returned to its former possessors, by which means their piracies are still continued.

There seems to be a necessity, therefore, that all the powers of Europe, especially the maritime powers, should unanimously determine to free themselves from the insolence of these rovers; that so their subjects may be protected in their persons and goods, from the hands of rapine and violence; their coasts secured from insults and descents, and their ships from capture on the sea.

But this cannot be done effectually, but by rooting out these nests of robbers on the coast of Africa, or at least driving them from the possession of any of the towns, ports, and harbours, so that they may have no more ships to appear upon the sea.

The conquest, it has been apprehended, could not be attended with any great difficulty, if the English, Dutch, French, and Spaniards would unite to join their forces and fleets, and fall upon them in separate bodies, and in several places at the same time.

The general benefit of commerce would immediately follow, by settling the government of the sea-coast towns, in the hands and possession of the several united powers; so that, every one should possess the least in proportion to the forces employed in the conquests of it. The consequence of the success would soon be sensibly felt by the interested parties. For, certain it is, that the coast of Africa, some few places excepted, is a fruitful rich country; and though by its latitude it must be exceeding hot, and that (especially on the easternmost parts of it) there are many deserts and waste places given up to salt and sand, and fit only for the retreat of wild beasts, &c. yet, even in that part, there are valleys and plains interspersed among the wildest deserts, and which are fruitful, yield corn in abundance, and cattle, with several fruits and other productions, fitted not for the use of the inhabitants only, but for merchandize, and in quantities also sufficient for both.

The general product of the country, and in which the chief

wealth consists, and upon which a trade with them might be settled, if the country was in the hands of christians, is as follows; corn, salt, wool, horses, wax, honey, coral, copper, skins of beasts, drugs and gums, almonds, pomegranates, ostrich feathers, lions and leopards, provisions of sundry kinds. If the quantity of all these is so considerable as we find it to be, even now, under the indolence and sloth of the most barbarous people in the world; how may we suppose all those valuable things to be increased in their quantity by the industry and application of the diligent Europeans, especially the French, or Dutch, or English; all which nations joining in the conquest, we might reasonably suppose, should have their several and separate allotments of territory upon the coast, and in the country adjacent.

We might also reasonably suppose, that the Moors being, in the consequence of such a conquest, driven up farther into the country, (for we have not been proposing the rooting them out as a nation, but only the supplanting or removing them from a situation, which they have justly forfeited by their depredations upon other nations) and being obliged to seek their subsistence by honest labour and application; we may reasonably suppose, that even these may be taught to apply themselves to the cultivation of the earth, by the necessity of their circumstances, and be brought to increase the product, by their labour, for all those christian nations.

As the product of the country would thus be increased, and multitudes of people, encouraged by the advantages of the place, to go over and settle upon it, the manufactures and merchandizes of Europe would soon find a great additional consumption, and the many new ports and harbours, where those christian nations might settle, would be so many new markets for the sale of those manufactures, where they had little or no sale or consumption before: and the finding out new markets for the sale or vent of merchandize, where there were none for those goods before, is the great principle whereon to found the general advancement of commerce.

It may be said, indeed, that to vend our goods at new, or different ports only, may be no increase of commerce; or to lend them to new and different places, because they may still be sent from thence to the same people, and to the same nations as the last consumers, who consumed them before.

Thus sending our English manufactures to Jamaica, to be sold there by the sloop-trade; that is, by clandestine commerce with the Spanish smugglers, or to the Spaniards of Carthagena, and the coast of Caraccas, is no new consumption, though it be a new market; because it is only selling to the same people, who would otherwise call for the same manufacture, and other goods from Old Spain, and they from England; so that it is as water issuing out of the same fountain, and running into the same gulph or pond, only by new channels.

Thus likewise the East-India company sending English broad cloth to the gulph of Persia, to be sent from thence to Ispahan, to Georgia, and other places in that country, to be sold to the Persians, and others, as the last consumers, is only supplying the same people, who were supplied before, with the same goods from Aleppo and Scanderoon; so that it is only taking the trade from the Turkey company, and transferring it to the East-India company, which is no increase of commerce, the last consumers being the same.

But this would not prove the case of the Barbary trade: it is true, we have some trade there now, and some places might, in some respects, be called the same markets: but, suppose these barbarians to be removed as above, from the populous cities and provinces of Algiers, Tunis, Tripoly, &c. and driven up the country, in order to suppress piracy and robbers; and suppose those cities, &c. peopled with a new nation, or new nations made rich by commerce, and the country adjacent cultivated and peopled after the manner of Europe, and those people living, cloathing, furnishing their houses and equipages, and feeding after the manner of Christian nations, let it be answered, what kind of commerce would there be then? Would it not be twenty times what it is at present? Besides, would not the success hereof be delivering Europe from the depredations of powerful thieves, and their commerce and navigation from the rapine of a merciless crew, who are the ruin of thousands of families, and in some sense the reproach of Christendom. The proposal is great, but far from impracticable: it is worthy being undertaken by the princes and powers of Europe, and what would bring infinitely more glory to the Christian name, than all their intestine wars among each other; which are the scandal of Europe, and the only thing that at first let in the Turks, and other barbarians among them. See ALGIERS, TUNIS, TRIPOLY.

MORTALITY [BILLS OF MORTALITY.]

Under the articles ANNUITIES, LEASES, INTEREST, LIVES, we have considered the doctrine of annuities, according to the principles and computations of the learned Dr. Halley, De Moivre, Lee, &c. and others, who have treated the most judiciously on this subject. But, as the ingenious Mr. Simpson since their time, has considered this matter in another light, we think it necessary to add his sentiments also to what

we have already said; all which together, will comprehend in miniature, the substance of what has been communicated upon this head.

The value of an annuity for life, says he, depends upon the interest which money bears, and the probability of the life continuing a longer or shorter time; the former of which is generally settled by law, but the latter must be determined from observation.

Of all that has been hitherto offered for estimating the probability of the duration of life, nothing seems deduced with greater judgment and exactness, than the tables published by Dr. Halley and Mr. Smart for this purpose; which nevertheless, are both liable to several objections.

The doctor's table, being grounded on observations at Breslau, a place where the generality of people live to a greater age than at London, (as appears by comparing the bills of mortality here with those observations) can be no just measure of the probability of life in this place; and as to that of Mr. Smart, though it is indeed free from this objection, and founded on a very large number of observations, yet the great and continual afflux of people from all parts up to town, renders the deductions from those observations considerably different, in one part of life, from what they would otherwise be; and this Mr. Smart seems not, in his table, to have considered, or made any allowance for.

For these reasons, though I had determined to depend on, and make use of, this last gentleman's observations, in the ensuing pages (as, undoubtedly, the best for the city of London and parts adjacent); yet have I deemed it necessary to make some alterations, in the table of the probability of life from thence derived.

In doing this, I have supposed the number of persons coming to live in town after 25 years of age, to be inconsiderable, with respect to the whole number of inhabitants: and therefore the probabilities of life, for all ages above 25 years, the same as this author has made them; but they have increased the numbers of the living, corresponding to all ages below 25; so that they may, as near as possible, be in the same proportion one to another, as they would be, were they to be deduced from observations on the mortality of those persons only, that are born within the bills. Which was done, by comparing together the number of christenings and burials, and observing, by help of Dr. Halley's table, the proportion which there is between the degrees of mortality at London and Breslau, in the other parts of life, where the ages are greater than 25. I shall here subjoin the table, altered as above, then proceed immediately to the uses thereof.

A TABLE, shewing the probabilities of LIFE, from observations.

Note, The numbers marked * are supposed to die off yearly, and are what, in the succeeding pages, are called the decrements of life.

No. of Ages persons curr.	No. of Ages persons curr.	No. of Ages persons curr.	No. of Ages persons curr.

462—20	294—40	130—60	29—80

Now, in order to shew the use of the foregoing table by an example, let it be required to find the probability, that a person of 36, lives 30 years longer, or attains to the age of 66 years; look in the table against 36 years and 66 years, and corresponding thereto, you will find the numbers 331 and 93 respectively; shewing, that out of 331 persons living of 36 years of age, only 93 of them arrive to the age of 66: therefore, seeing the whole number of persons living at the beginning of this term, is to the number remaining alive at the end of it, in the ratio of 331 to 93; the number of chances that a person of 36 years of age has to live 30 years longer, will be to the number of all the chances, that he has both to live beyond, and die within 30 years, in the same ratio of 331 to 93; and therefore $\frac{238}{331}$ is the measure of the probability required; the probability of the happening of any event, being always to be considered as the ratio of the chances which that event has to happen, to all the chances which it has both to happen and fail.

This being understood, suppose it were now required to find the value of an annuity of 100 l. for a life of 20 years of age, interest at 4 per cent.

Because the present value of 100 l. due at the end of one year (discount being allowed) is 96.15, it is plain, that so much would be the value of the first year's rent, was the purchaser sure to receive it; but the probability of his living one year, appearing from the table to be only $\frac{238}{331}$, the aforesaid sum 96.15, in order to make a just deduction out of it, for the contingency of his dying before the end of one year, ought to be diminished in the ratio of 462 to 455, or multiplied by $\frac{455}{462}$, which will reduce it to 94.70, equal to the true value of the first year's rent. After the same manner may the value of the second year's rent be calculated; for, since the probability of receiving this rent, or living two years is $\frac{112}{331}$, let this be multiplied into 92.45, the present value of 100 l. to be received at the end of two years, and the product 89.65, will be the true value of the second year's rent. And, by a like way of proceeding, the value of the 3d, 4th, 5th, &c. years rents, to the utmost extent of life, may be determined; and the sum of all these will be the required value of the annuity, which will be found to come out 1480 l. very near.

40	14.7	16.6	19.1	75	7.8	8.2	8.7

Here follow the practical solutions of several problems, depending on the foregoing tables.

4 G

PROBLEM

M O R

PROBLEM VIII.

To find the value of an annuity for an assigned life.

SOLUTION.

Look out the given age in Tab. I. and against it, towards the right-hand, under the proposed rate of interest, will stand the number of years purchase, which an annuity upon that life is worth.

EXAMPLE.

Let the given age be 18 years, and the rate of interest 4 per cent. then looking against 18; under 4 per cent. I find 15.2, equal the number of years purchase required.

PROBLEM IX.

To find the value of an annuity upon two assigned joint lives.

SOLUTION.

CASE I.

If the two lives be equal, see Tab. II. with the common age, and against it you will have the value required.

CASE II.

If the given ages be unequal, but neither of them less than 25, nor greater than 50 years, take half the sum of the two for a mean age, and proceed as in Case I.*

* This and the following solutions are so contrived, as to be always depended on to less than $\frac{1}{4}$ of a year's purchase.

CASE III.

If one or both ages be without the limits above-mentioned, but so that the difference of the values corresponding to those ages, be not more than $\frac{1}{2}$ of the lesser; let $\frac{1}{4}$ of that difference be added to the said lesser value, and the sum will be the value sought.

Generally, be the difference of the values what it will, multiply it by $\frac{1}{4}$ the lesser of the two values, dividing the product by the greater; then the quotient, added to the lesser value, will give the true answer very near.

EXAMPLE OF CASE I.

Let the two given ages be each 18, and interest at 5 per cent. then in Tab. II. against 18, under 5 per cent. is 10.5 years purchase.

EXAMPLE OF CASE II.

In which the rate of interest is supposed as above, and one of the two ages 34, the other 48, therefore the half sum of the ages is 42, against which stands 7.1.

EXAMPLE OF CASE III.

Where one age is supposed to be 15 years, the other 29; here against 15 years will be found 11.0, and against 29, 8.8, the difference of which two values is 2.2, and $\frac{1}{4}$ thereof, equal to 0.88; this therefore, added to 8.8, gives 9.68, or 9.7, for the answer.

EXAMPLE OF CASE IV.

Let the rate of interest be 4 per cent. and one age 11 years, the other 68. The values corresponding to these ages, are 12.9 and 4.6, their difference is 8.3, which multiplied by 2.3, will be 19.09, this divided by 12.9, quotes 1.5, which therefore, added to 4.6, the lesser value, gives 6.1, equal the value sought.

PROBLEM X.

To find the value of an annuity upon two lives, that is to continue as long as either of them is in being.

SOLUTION.

CASE I.

If the lives be equal, find the given age in Tab. III. and against it, under the proposed rate of interest, will be the number of years purchase required.

CASE II.

If both ages be between 25 and 50, take half their sum for a mean age, and proceed as in Case I.

CASE III.

If one or both ages be without the limits mentioned in the last case, but the difference of values corresponding to those ages, as found in Tab. III. be not more than $\frac{1}{2}$ part of the

M O R

lesser, take half the sum of those values for the value required.

Generally, let the given ages be what they will, find the value of the two joint lives by Case IV. Prob. IX. which subtract from the sum of the values of the two single lives, and there will remain the required value of an annuity upon the longest life.

EXAMPLE OF CASE I.

Wherein the two given ages are each supposed 50 years, and the rate of interest 4 per cent. Here against 50 years, in Tab. III. under 4 per cent. stands 13.3, shewing the number of years purchase which an annuity is worth for two such lives.

EXAMPLE OF CASE II.

Suppose one age 30 years, and the other 46, then the half sum of the ages will be 38, answering to which, under 4 per cent. stands 15.3.

EXAMPLE OF CASE III.

Let the two proposed ages be 6 and 21 years; then against 6 years will be 19.7, add, against 21, 18.2, the half sum whereof is 18.95, equal to the number of years purchase required.

EXAMPLE OF CASE IV.

Let one age be 11 years, the other 68, and the rate of interest as in the preceding examples; then the value of the two joint lives, by Case IV. of the last problem, will be found 6.1, and the values of the single lives, by Problem VIII. equal to 16.3, and 6.7, the sum of which two, decreased by 6.1, is 16.9, equal to the value required.

PROBLEM XI.

To find the value of an annuity upon three joint lives.

SOLUTION.

CASE I.

If all the lives be equal, find out the given age in Tab. IV. and against it, under the proposed rate of interest, will be the number of years purchase required.

CASE II.

If all the three ages be between 15 and 55 years, and the difference between the greatest and least of them not more than 15 years, take $\frac{1}{3}$ part of their sum for the mean age, and proceed as in Case I.

CASE III.

If one or more of the proposed ages be without the limits mentioned in the last article, but the difference of the values answering to the greatest and least of them, not greater than half the least; then to the sum of the two greater values add twice the least, and take $\frac{1}{3}$ of the sum for a mean value required.

Generally, be the ages what they will, multiply the sum of the three corresponding values by the square of the least of them, reserving the product; multiply the two greater values into each other, and to the double of the product add the square of the lesser values; divide the reserved product by this sum, and subtract the quotient from twice the lesser value; the result will be the value sought.

EXAMPLE OF CASE I.

Let each age be 35, and the rate of interest 3 per cent. then in Tab. IV. against 35, under 3 per cent. stands 7.6, which is the number of years purchase that an annuity is worth for the three joint lives.

EXAMPLE OF CASE II.

Let the three given ages be 20, 25, and 33 years. Here $\frac{1}{3}$ of the ages will be 26, corresponding to which, under 3 per cent. stands 9.0.

EXAMPLE OF CASE III.

Where the proposed ages are 7, 15, and 33 years; against these stand 11.9, 11.2, and 7.9, therefore the sum of the two greater values is here, 23.1; this added to twice the lesser, gives 38.9, the $\frac{1}{3}$ of which, or 9.725, is the value sought.

EXAMPLE OF CASE IV.

Let the three ages be 13, 31 $\frac{1}{2}$, and 53 years, and interest 4 per cent. then the values answering to those ages will be 10.5, 7.3, and 5.0; the sum whereof is 22.8, which multiplied by 25, the square of the least of them, gives 570, to be reserved. Again, the two greatest values multiplied into each other, produce 76.65, the double of this added to 25, the square of the least, will be 178.3, by which dividing 570, the reserved product,

product, there comes out 3.2; this subtracted from 10, the double of the least value, leaves 6.8 for the value required.

PROBLEM XII.

To find the value of an annuity upon the longest of three lives.

SOLUTION.

CASE I.

If the lives be all equal, seek the common age in Tab. V. and against it, under the proposed rate of interest, will be the number of years purchase required.

CASE II.

If none of the ages be less than 10, nor greater than 60 years, and the difference between the greatest and least of them not more than 15 years, to twice the sum of the two least add the greatest, and take $\frac{1}{3}$ part of the sum as a mean age.

CASE III.

If the difference of the greatest and least values, found against the proposed ages in Tab. V. be not more than $\frac{1}{4}$ of the least, then, to twice the sum of the two greatest values, add the least, taking $\frac{1}{4}$ part of the sum for a mean value. Generally, find the value answering to the greatest of the given ages in Tab. III. and the values corresponding to all the three several ages in Tab. V. and let the difference of the two values, answering to the greatest age, be taken and reserved; let the square of the greater of these two be divided by the product of the two other remaining values; multiply the square of the quotient by the reserved difference, then this last product, added to the value of an annuity for the two youngest lives, will be the value required.

EXAMPLE OF CASE I.

Let the three ages be each 35 years, and interest 4 per cent. then in Tab. V. against 35, under 4 per cent. stands 17.3; for the number of years purchase required.

EXAMPLE OF CASE II.

Let the proposed ages be 16, 24, and 30 years, then will the mean age be 22 years, and the number of years purchase required 19.4.

EXAMPLE OF CASE III.

Suppose the three ages to be 28, 35, and 44, then the three corresponding values will be 18.3, 17.3, and 16.0, and therefore twice the sum of the two greater added to the lesser, is 87.2, which divided by 5, quotes 17.44 for the answer.

EXAMPLE OF CASE IV.

Let the given ages be 20, 36, and 60; and interest as in the preceding examples: here, the value found against 60 years in Tab. III. is 11.2, and those against 20, 36, and 60, in Tab. V. 19.7, 17.2, and 12.7, respectively; wherefore, taking 11.2 from 12.7, we have 1.5 for the difference to be reserved: now the square of 12.7, divided by the product of 19.7, and 17.2 is 0.5, the square of which, multiplied by 1.5, the reserved difference gives 0.375; this added to 17.0, the value of an annuity for the two youngest lives (as determined by Case II. Prob. X.) will give 17.375, or 17.4, for the number of years purchase, which an annuity is worth upon all the three lives.

REMARK.

That the reader may not entertain any scruple concerning the exactness of the methods of solution hitherto laid down, for estimating the values of annuities upon two or more unequal lives, I shall here, according to my promise, endeavour to make it appear, that those solutions may be always depended on as very near the truth. In order to this it will be requisite to resume the two hypotheses laid down in Corol. II. and IV. Prob. I. wherein the probabilities of life are supposed in a geometrical and in an arithmetical progression, and to compare the values of equal fictitious lives, computed according to those hypotheses, with the corresponding values in the tables, for real lives, computed from actual observations, and then to consider from thence, how the values ought to differ in lives that are unequal. Accordingly, let the value of each of the equal lives, whether considered as real or fictitious, be supposed equal to any number of years purchase, as 7, 8, 9, 10, 11, 12, 13, 14, and 15 successively; and let the rate of interest be at 4 per cent. then will the corresponding value of two equal joint lives be as in the following little table; whereof the first column expresses the value of each of the single lives, and the second, third, and fourth columns, the value of the joint lives, according to observations, and the two foregoing hypotheses respectively.

Value of one single life.	Value of two joint lives, per Tab.	Value of two joint lives, per 1st hypot.	Value of two joint lives, per 2d hypot.
7	4.7	3.9	4.9
8	5.4	4.6	5.6
9	6.1	5.3	6.4
10	6.8	6.1	7.1
11	7.6	6.9	7.9
12	8.5	7.8	8.8
13	9.5	8.7	9.7
14	10.5	9.7	10.6
15	11.5	10.6	11.6

Now, by inspecting this table, we may observe, first, that the value of the joint lives, according to the last of the two hypotheses, is a small matter greater than the value of the same lives, as deduced from real observations, but never by more than about $\frac{1}{10}$ of a year's purchase; and, secondly, that, on the other hand, the value of the joint lives, according to the first hypothesis, is always less than the true value deduced from observations, and that at least by $\frac{1}{10}$ of a year's purchase. Hence we may infer, that the probabilities of life, as given in the table of observations, do not come so near a geometric progression as to an arithmetic one (which, in some measure, appears from the table itself) and, consequently, that the value of an annuity upon real lives, whether equal or unequal, will differ little from the value derived from the last hypothesis, but something more from the former. Let us, therefore, now see what the differences will be, in two unequal joint lives, by the general rule before given (in Prob. IX.) from whence we shall be enabled to judge of the exactness of that rule. What these differences are, may be seen by the following table, which exhibits the values of the joint lives, according to each of the three foregoing ways; wherein the value computed by the rule, compared with those derived from the hypotheses, appears to agree so exactly, throughout the whole table, with what has been above observed, with respect to the true value, as to sufficiently prove, that the rule itself must be very near the truth. But if this rule be near the truth, the two particular ones preceding it must be so too, being so contrived as to always bring out nearly the same value with the general one; but with this difference, that as the general one, for the most part, gives the answer a little too small, the first of these always makes it a little too great, though neither of them scarce ever err by more than $\frac{1}{10}$ of a year's purchase.

Value of the two single lives.	Value of the two joint lives, per rule.	Value of the two joint lives, per first hypoth.	Value of the two joint lives, per second hypoth.
6 and 8	4.5	3.8	4.7
6 10	4.8	4.3	5.0
6 12	5.0	4.6	5.2
6 14	5.2	4.9	5.4
6 16	5.4	5.2	5.5
8 10	6.0	5.3	6.2
8 12	6.4	5.8	6.7
8 14	6.7	6.3	7.0
8 16	6.9	6.7	7.2
10 12	7.5	6.8	7.8
10 14	8.0	7.5	8.3
10 16	8.4	8.1	8.7
12 14	9.3	8.6	9.5
12 16	9.9	9.4	10.1
14 16	11.4	10.6	11.5

In the same manner it may be made to appear, that the other rules for three joint lives, and the longest of two or three lives, are likewise very near the truth; but I shall content myself here with giving one or two instances, in annuities upon three joint lives. Let there be three equal lives, and the value of an annuity upon each of them 14 years purchase, and interest at 4 per cent. then will the value of the joint lives, by Tab. IV. come out 8.3, but, by the two hypotheses, 7.3, and 8.5, respectively. Again, let the lives be supposed very unequal, so as to be worth 6, 10, and 16 years purchase, then will the value of the joint lives be, by the general rule, 4.5, but, according to the hypotheses, 3.84, and 4.63; which examples, agreeing so well with each other, and with what has been above said, tend greatly to evince the accuracy of the rules, or, at least, to shew that they are consistent with the table of observations. Simpson's Annuities upon Lives.

MOSKITO COUNTRY, is situated in North America, between 85 and 88 degrees of west longitude, and between

13 and 15 degrees of north latitude; having the North Sea on the north and east; Nicaragua on the south; and Honduras on the west; and, indeed, the Spaniards esteem it a part of the principality of Honduras, though they have no colonies in the Mosquito country. When the Spaniards first invaded this part of Mexico, they massacred the greatest part of the natives, which gave those that escaped into the inaccessible part of the country an insuperable aversion to them; and they have always appeared ready to join any Europeans that come upon their coasts, against the Spaniards, and particularly the English, who frequently come hither, and the Moskitomen being excellent marksmen, the English employ them in striking the maratee fish, &c. and many of the Mosquito Indians come to Jamaica, and sail with the English in their voyages.

R E M A R K S.

These people are so situate between morasses and inaccessible mountains, and a coast full of rocks and shoals, that no attempts against them by the Spaniards, whom they mortally hate, could ever succeed. Nevertheless they are a mild inoffensive people, of great morality and virtue, and will never trust a man who has once deceived them. They have so great a veneration towards the English, that they have spontaneously put themselves and their lands under the protection and dominion of the crown of England. This was first done when the duke of Albemarle was governor of Jamaica, and the king of the Moskitoes received a commission from his grace, under the seal of that island; since which time, they have not only been steady in their alliance with the English, but warm in their affections, and very useful to them on many occasions.

When their king dies, the next male heir goes to Jamaica, to certify that he is next in blood, and receives a commission in form from the governor of Jamaica to be king of the Moskitoes, till which he is not acknowledged as such by his countrymen. So fond are these people of every thing that is English, that the common people are proud of every christian or surname given them by our seamen, who honour their chief men with the titles of some of our nobility.

Queere, Might not some valuable settlements be made by the English among these people, that would produce logwood and other dyeing woods, and many valuable commodities besides? See the article LOGWOOD.

MUNSTER, in Ireland. This province lies open to the Vergivian Sea on the south and south-west, and the Atlantic on the west; and is bounded on the east and south-east with the Ocean and province of Leinster; and, on the north, with the province of Connaught: its circumference, including the great windings and turnings, is above 600 miles.

It enjoys a mild temperate air, has many excellent bays and havens, and rich towns, and the soil, in general, fruitful. Its commodities are cattle, wood, wool, and fish; of which last it abounds with all sorts, especially herrings and cod. It is divided into the five counties following, viz.

I. **WATERFORD** county, which has Wexford on the east; Cork on the west; the ocean on the south; and the river Shure on the north, by which it is parted from Kilkenny and Tipperary. In some parts it is pleasant and fruitful, but mostly mountainous, and of a barren coarse soil.

WATERFORD is as conveniently seated for trade as any port in the world; it has a good harbour, and ships of burthen come up close to it's fine key, though it is a good distance from the sea, Galloway contends with this city for priority, and claims the preference as to trade; though, as Waterford outdoes it in bulk and people, so it is thought it does in commerce; particularly Waterford drives a very great trade with England, which Galloway cannot have, by reason of it's situation.

DUNGARVAN stands upon a bay of it's own name, with a narrow tide haven, and a commodious road for ships; but it is a town of no consequence, and of little business.

TALLAGH is a handsome flourishing town, in a fine fruitful vale, near the river Bride, which being navigable from hence to Youghal, renders this a place of good trade.

II. The county of **CORK**, has Waterford on the east; Kerry on the west; Limeric on the north; and the Vergivian Ocean on the south. It is partly woody and mountainous, and partly fenny, yet has many good towns, abounds in fine rivers and good harbours, is both rich and populous, and the inhabitants industrious. A copper mine was lately discovered near Cork, which is likely to turn to very good account.

The first considerable sea-port, next to Waterford, is **YOUGHAL**, or **YOUGHIL**, a place of good trade, at the mouth of the Broadwater. The convenience of the harbour, which has a good well-fenced key, and the fertility of the adjacent country, draws so many merchants hither, that the town is pretty populous and rich.

CORK is a fine, large, populous, and wealthy city, being thought the richest in Ireland except Dublin. The town stands up the river, about 15 miles from the sea, where the mouth of the harbour is two miles broad. The great ships generally ride at a place called Passage, about six miles below the city; but smaller vessels come quite up to the key. It is the chief port for merchants business in the kingdom; and there is

more beef, butter, and tallow shipped off here, perhaps, than in all the other ports put together, as well for our own colonies as for France, and the butter for Flanders and Holland in particular. This occasions a great resort of ships always to this port, particularly those bound to Jamaica, Barbadoes, and all the Caribbee Islands, which put in here to complete their lading.

KINSALE is a populous and rich town, in a fruitful soil, near the mouth of the river Bann, or Bandon, with a trade the most considerable of any on this side of the island, next to Cork. Many good ships belong to it, and a great quantity of provisions is exported from hence to Flanders, Holland, France, and the English islands in the West-Indies. It has an admirable harbour, and a good bay without it.

DOWNHAM'S BAY, so called from a neighbouring village, is a large and commodious retreat for ships in a storm, and lies on the north side of the Miffen-Head.

III. The county of **KERRY**, has that of Cork on the south and east; Limeric on the north; and the Atlantic Ocean on the west.

TRALEY is a thriving corporation, and the shire-town; it stands on a bay of the same name.

DINGLE has a good harbour, very convenient for trade; the bay near it is one of the largest in Ireland, and has several harbours.

MAIR, or **KILMARE** river, is a bay on the south-east corner of the county, which is a safe harbour for the greatest ships.

KILLARNY is a thriving pretty market-town, near which is a considerable lead mine.

IV. The county of **LIMERIC** has Tipperary on the east; Cork on the south; part of Tipperary on the north; and Kerry on the west. It is fruitful in all sorts of corn and rape, has a large breed of cattle, and is well inhabited, but has few remarkable towns.

The city of **LIMERIC** stands on the Shannon, which is navigable very near to it for ships of burthen, though it stands almost 50 miles within the point called Louphhead. It is a rich and populous city. Though here are some merchants to whom belong ships, it is not so famous for it's wealth as it's strength. The chief trade it used to drive was to France, but a pernicious one to the fair trader, viz. the carrying out wool, and bringing in wine and brandy by stealth.

V. The county of **TIPPERARY** is bounded on the west with that of Limeric; on the east with Queen's county and Kilkenny; on the south with those of Cork and Waterford; and, on the north, with King's county. The fourth part is fruitful, and well inhabited; the west is well watered, and both abound in good pastures, and furnished with the greatest and best flocks in Ireland; the north part is barren and mountainous.

CLONMELL is a rich and populous town, with a market of good resort, on the river Shure.

MUSÆUM, originally signified a place in the palace of Alexandria, which took up a fourth part of the city; so called, as being destined to the Muses, and the Sciences. Here were lodged, in colleges, a great number of learned men, who were of various sects, and applied to different sciences; and each college had a handsome revenue appropriated to it. The Ashmolean Museum, at Oxford, is a magnificent pile, erected at the expence of the university, for the promotion of several parts of curious and useful knowledge.

The museum of the late Sir Hans Sloane, Bart. contains a great variety of the production of nature and art, and has been lately purchased by the public, for the benefit of the nation; and, as it may be rendered of no less general benefit to trade, than to the advancement of natural knowledge, and experimental philosophy, our readers may not be displeased if we give a genuine account of

The NAMES and NUMBERS of the several things contained in the MUSÆUM of Sir HANS SLOANE, Bart.

The library, including about 347 volumes of drawings and illuminated books, 3516 volumes of manuscripts, together with the books of prints, consists of about 50,000 volumes.

Medals and coins, antient and modern, about	32,000
Antiquities, viz. urns, instruments, &c.	1,125
Seals, &c.	268
Cameas and intaglio's, &c. about	700
Precious stones, agates, jaspers, &c.	2,256
Vessels, &c. of agates, jaspers, &c.	542
Crystals, sparrs, &c.	1,864
Fossils, flints, stones, &c.	1,275
Metals, mineral ores, &c.	2,725
Earths, sands, salts, &c.	1,035
Bitumens, sulphurs, ambers, ambergreese, &c.	399
Talcs, micæ, &c.	388
Testacea, or shells	5,843
Corals, sponges, &c.	1,421
Echini, echinites, &c.	659
Asteriæ, trochi, entrochi, &c.	241
Crustacea, or crabs, &c.	363
Stellæ marinæ, &c.	173
Fishes,	

Fishes, and their parts	-	1,555
Birds, and their parts; eggs and nests of different species,	}	1,172
Vipers, serpents, &c.	-	521
Quadrupedes, &c.	-	1,886
Insects	-	5,439
Humana, as calculi, anatomical preparations, &c.	-	756
Vegetables, as seeds, gums, woods, roots, &c.	-	12,506
Hortus ficcus, or volumes of dried plants	-	334
Miscellaneous things, natural, &c.	-	2,098
Pictures and drawings, &c. framed	-	310
Mathematical instruments	-	55

All the above particulars are entered and numbered, with short accounts of them, and references of several writers who have heretofore wrote about them, in 38 volumes in folio, and eight in quarto.

REMARKS.

Nature, and all her wonderful productions, having ever been looked upon by the wisest and best men as the great book of God, it becomes a duty incumbent on mankind to read and study that book, which we are assured can never mislead or deceive, if we are happy enough to understand it. Natural history describes numberless of the productions of nature, which the various parts of the known globe afford; and those who have judiciously collected any variety of particulars in the fossil, vegetable, and animal kingdoms, have contributed to render this divine book [the universal scripture of the Supreme Being] the more intelligible: and those who have modestly studied to understand the qualities and uses of but few of these infinite productions, have conspicuously discovered the digitus Dei in whatever exists throughout the whole creation: and such searchers into the works of the Almighty, have not only contributed to give mankind in general more just and exalted ideas of the first cause, but have themselves generally proved the most useful, the wisest, and best of men, and their great example has influenced numbers to follow it.

So wonderfully numerous are the distinct particulars of universal nature, that I can hardly think we have yet made any great progress in her alphabet; and much less do we know, I am afraid, of her syllables and sentences; for, 'till we well understand our christ-cross-row, we shall not be able to read to any great purpose.

What I would be understood to mean by the alphabet of nature, is not only the numberless distinct specified matters of nature, but the real properties and qualities of subjects; for it is not the mere collection of the works of nature, that will afford just ideas of their inherent excellencies, and, therefore, we shall ever be at a loss thoroughly to understand their usefulness, unless we are equally assiduous to comprehend the properties of particulars, because, without that, we shall always remain ignorant of their general uses.

The little knowledge we have of this kind seems to be included under the two articles of agriculture and medicine; for in those arts there may be some small degree of certainty, upon ordinary occasions; but, if any thing extraordinary happens, how are the wisest baffled and confounded? The greatest physicians confess their ignorance in the infallible cure of diseases, the greatest philosophers own their insufficiency to prevent a blight, and thereby preserve nature's productions against natural inclemencies, &c.

If therefore, we could exhibit to one view, on the surface of the earth, all subterranean productions within her bowels; if we had before us all vegetable nature, from the hyssop on the wall to the cedar of Lebanon; if the myriads of animals were collected together into one ark: if nature was thus ranged, as it were, in array before us, for contemplation, should we not rather be lost in astonishment, at the unspeakable variety, than be able, by MERE INSPECTION, to judge rightly of the qualities of the simplest and most contemptible matter before us? We might, perhaps, by racking our brains for ages, make shift to give names in all languages to a few of those wonders; but what advance would this be to the discovery of their general virtues and uses throughout all nature? We are delighted with the sight of a diamond of the first water and magnitude, and may use it as an external ornament; so we may be pleased with the appearance of gold, which too much captivates us all; but to look upon these things in a trafficable light only, and as they are subservient to the mere grandeur of life, is highly undervaluing these objects of nature.

It is true, one principal use of these collections is, the consideration of their being objects of traffic; but, if their natures and qualities were more studied, as their uses to mankind would multiply in proportion, the same objects would administer an infinite greater variety in point of commerce.

But, notwithstanding all those collections that have hitherto been made, in all repositories both at home and abroad, we have grounds to believe that very much more matter, which has been yet unhandled, may still be brought to light, even in the most civil and most peopled countries; whose underground treasures have been accurately pried into, whose cities, islands, rivers, and provinces, have been described by the labour of geographers: it is not to be doubted, we conceive, but still there may be an infinite number of creatures over our heads, round about us, and under our feet, in the large space of the air, in the caverns of the earth, in the bowels of mountains, in the bottom of seas, and in the shades of forests, which have hitherto escaped all mortal senses. In this the microscope alone is enough to silence all opposers. Before that was invented, the chief help that was given to the eye by glasses was only to strengthen the dim sight of old age; but now, by the means of that excellent instrument, we have a far greater number of different kinds of things revealed to us than were contained in the visible universe before; and even this is scarce yet brought to perfection.

As a trading nation, we cannot be too assiduous in searching after these productions of nature, which will afford objects of traffic in any shape, or materials for the improvement of the old, or the invention of new manufactures.—But the mere external form of things does not always signify to us what properties they may have, and in what variety of cases they may be importantly, beautifully, and profitably applied.—There is no great matter, therefore, to be learned by these productions, by mere inspection only; and the greatest repository would prove of little benefit to the community, if it is to be considered only as a raree show, or for the virtuoso to ramble over, and merely to repeat the names of, as if he was really knowing in all the qualities, uses, and applications of these things in nature, which he affects to be so familiar with.

—The natural historian, and the collector of nature's works, are very serviceable, as they bring the objects of creation to light, which otherwise might remain for ever hid from our view.—Wherefore the mere naturalist, who studies nature no further than her outside, is not the most useful philosopher; such an one would scarce be instrumental to the breeding of a lapidary or a smith, much less to the inventing of new manufactures or new arts, to the advantage or delight of mankind. A Bacon, a Boyle, a Boerhaave, would look upon the objects of nature with a far different eye to what the mere external naturalists do; they only burthen their memory with the names of things, and affect to be knowing in them; whereas the others would inform us of the qualities and beneficial applications thereof in all respects, and shew themselves to be thoroughly knowing, while the others only pretended to be so. Such may dub themselves with the titles of connoisseurs and virtuoes, and make great parade of their extraordinary knowledge; but when we enquire of what use they have been to society, what valuable discoveries they have made in nature to benefit mankind, their talents to the community are far less serviceable than those of the lowest mechanic.

What I would infer from hence is, that those repositories we have for the productions of nature are made a very mean and a scandalous use of, if they are maintained with great shew and expence, only for the amusement of the useless and superficial virtuoso. However, we have great reason to believe that this will not be the case of the Sloanean Museum, lately purchased by the public, for the public use and advantage, it being under the direction and management of so many honourable persons, and especially many of those of the Royal Society, who have given testimony of their talents to make useful and important experiments upon the works of nature, for the benefit, delight, and ornament of mankind.

Nor are the collections with regard to the works of art to be less attended to in a commercial state, than those of nature; for having all curious machines, &c. ranged with relation to every distinct mechanic and manufactural art, and proper admission given to all artists, or improvers of art, they might, from narrowly inspecting those that had been invented, make either considerable improvements thereupon, or from thence derive such notions as might enable them to discover new ones of divers kinds.—But, as we shall have occasion to speak more at large upon this point, under the article ROYAL SOCIETY, we refer the reader thither.

The PRACTICAL BUSINESS of the CUSTOM-HOUSE continued.

W I T H respect to **MALT**, see the article **CORN**.

MALT imported from beyond sea, forfeited, or the value, pursuant to the annual malt act.

The bounty is to be allowed after the rate of thirty quarters, and no more, for every twenty quarters of barley, or other corn or grain entered and made into malt, for exportation; as shall appear by certificate from the proper officer, with whom the corn or grain, intended to be made into malt for exportation, was entered. 3 Geo. II. cap. 7. §. 14, 15.

Relanded in Great-Britain is forfeited, with treble the value, besides the penalty of the bond. 3 Geo. II. cap. 7. §. 15. and since continued yearly with the malt act.

WITH REGARD TO MARINERS.

MARINERS. No mariner, or person, serving on board any privateer, or trading vessel, employed in any of the British sugar colonies in America, or being on shore there, or at sea in any of those parts, shall be liable to be impressed by any officer belonging to a man of war (unless such mariner shall have deserted from such ship of war) under the penalty of 50*l*. 29 Geo. II. cap. 30. §. 1.

Every master of a trading vessel or privateer in those parts, before he receives any mariners into his service, is to make diligent enquiry, whether such mariner hath deserted from any of his majesty's ships of war; any master receiving a mariner who hath deserted, without reasonable endeavouring to discover the same, to forfeit 50*l*. 29 Geo. II. cap. 30. §. 2.

Every master of such trading vessel or privateer, before departure from any port in the said sugar colonies, is to deliver to the chief officer of the customs an exact list of all his men, containing names, ages, and description of persons; neglect thereof, the master to forfeit 10*l*. for each man so

omitted; the officer of the customs to return to the said master an attested copy of such list: on the death or alteration of any seaman, such list to be immediately altered accordingly, and delivered to the naval officer, or chief officer of the customs in any port where the ship may arrive. All such lists to be produced, and shewn to the captains and other officers of his majesty's navy. 29 Geo. II. cap. 30. §. 3, 4. For more matter hereon, see our article **MARINERS**.

OF MEDITERRANEAN PASSES at the Custom-House.

MEDITERRANEAN PASSES. Counterfeiting, altering, or erasing them, or knowingly uttering or publishing such counterfeited, altered, or erased, passes, is felony without benefit of clergy. 4 Geo. II. cap. 18. §. 1.

OF MERCHANTS AT THE CUSTOM-HOUSE.

MERCHANTS put out of their turns, without express order or approbation of the superior officers, penalty double costs and damages. 13 and 14 Car. II. cap. 11. §. 34.

One of the bills of every entry inwards and outwards must, in order to prevent the colouring of strangers goods, be subscribed by the **MERCHANT**, his own servant, factor, or agent, with the mark, number, and contents of every parcel of such goods, as are rated to pay by the piece or measure, and the weight of the whole parcel of such goods as are rated to pay by the weight. 13 and 14 Car. II. c. 11. §. 10.

Cockets, or certificates outwards, to be in the **MERCHANT's** possession, after he has paid the duty, till he ships his goods, and then to be delivered, with the marks and numbers to the searchers. See rule 25, at the end of letter A. See also latter end of letter G, and ditto of S, and ditto of P.

N.

N A P

NAPLES, a kingdom of Italy, and by far the largest state there. It is bounded on the north side by the Adriatic Sea, on the south by the Tuscan, on the west by the Ecclesiastical State, and on the east by the mouth of the Adriatic and the Mediterranean.

The air, soil, &c. are extremely delightful and excellent in most places, and the country in general is very rich, fertile, and well watered with rivers and springs, which flow through it from both sides of the Apennines; these rivers are, indeed, commonly so rapid, that they may rather be called torrents. The land produces excellent wines, especially that emphatically called *lachrymæ Christi*. They have likewise in several parts, plenty of corn, oil, rice, and pretty good pasture; and the Neapolitan horses are in no small request. Their almonds, olives, figs, citrons, oranges, granates, grapes, and other fruits, are very good, and in great plenty; and so is their flax, hemp, pulse, anise, coriander, and other seeds. The air is, indeed, in some places, excessively hot, especially on the south side of the Apennines, where the mountains reflect the sun's heat with such vehemence, that it is hardly to be borne in the three or four hot months of the year, but the north side of them is quite temperate, healthy, and delightful. They are sometimes annoyed with the locust.

The far greater part of the provinces into which this kingdom is divided, have an advantage peculiar to themselves. For instance, the air of the hither principality, is so serene and healthy, that people live in it to a prodigious age; and the farther principality abounds in cattle more than any other, and all its fruits are excellent. The Basilicate is famed for its fine saffron, honey, and wax; Calabria for its plenty of good manna; and the hither, for corn, wines, and mulberries, and the farther for its fine honey and beautiful horses. Otranto is said to produce as much oil, as would supply all Italy. Molise abounds with such quantity of venison, that it sells cheaper there than beef or mutton. The territories of Lavoro, Campania, and some others, are blessed with so rich a soil, and excellent temperature, that they produce the same flowers twice a year. The Abruzzo, especially the hither, besides being the coolest part of the kingdom, produces great quantity of corn, wines, oil, and saffron. The other three provinces not only come short of all those conveniences mentioned in the rest, but have, moreover, some grievous disadvantages peculiar to them: as in the Capatmate the soil is dry, sandy, and in many places barren, and the climate unhealthy; in Apulia the heat is so excessive, and the people and cattle plagued with such swarms of venomous flies, that it is scarce inhabitable. In the province of Bari the air is pretty temperate, but the people are greatly infested with scorpions, vipers, and serpents, especially the tarantula, which renders their territory as uncomfortable as that of Apulia.

Of the COMMERCE of NAPLES and SICILY.

Naples, the capital of the kingdom of the same name, is a very considerable trading city, and the goodness of its port draws thither a great quantity of foreign shipping: they are daily, under the present reign of Don Carlos, endeavouring to render the same more and more grand and magnificent: its principal trade consists in divers sorts of silk stuffs, raw silk, knit silk stockings and waistcoats, such whole cloaks are of silver and gold, oils of various sorts, sulphur after the Calabrian manner, rosemary flowers, anniseed and coriander seed, dried raisins, raisins of Corinth, figs and olives, tartar, soap, dried orange and citron peels, essences and quintessences of all kinds.

The weight of Naples is called *rottolo*, and is of two kinds, as that of Lucca, but of different weight.

100 *rottolo*s great weight, make a little more than 185 pounds $\frac{1}{2}$ at Paris and Amsterdam, and 100 *rottolo*s small weight, make but 65 $\frac{1}{2}$ pounds in those two cities; so that 100 pounds in Paris and Amsterdam, make but 54 *rottolo*s great weight, and 152 small weight.

The *canne* is the measure for silk and woollen stuffs; the *canne* is 8 palms, 100 *cannes* or 800 palms make 310 ells of Amsterdam, and 30 *cannes* $\frac{1}{2}$, or 258 palms $\frac{1}{2}$ of Naples.

N A P

The palm at Amsterdam makes $\frac{3}{4}$ of an ell, and four lines $\frac{3}{4}$ French royal measure, and the *canne* three ells $\frac{1}{2}$ and six lines less, of the same measure.

Corn, and other grain, are sold by the *carro*, of 36 *tomoli*, being 20 *rottolo*s great weight; one *carro* and a half, or 54 *tomoli*, make a last of Amsterdam.

They keep their accounts in ducats, tarins, and grains; the ducat is five tarins, and the tarin 20 grains: thus the ducat of the kingdom is 100 grains, and 12 *piccioli* the grain; there are also *carlins*, 10 of which make one ducat.

All bills of exchanges between Amsterdam and Naples are negotiated by the way of Leghorn, Venice, or Genoa. The par of exchange with Genoa is 118 ducats per 100 *piastres* of eight rials, bank money, or four *livres* 10 *fol*s of Genoa, bank money, per ducat.

REMARKS.

A treaty of peace, commerce, and navigation, concluded at Constantinople the 7th of April, 1740, between the kingdoms of Naples and Sicily, and the Ottoman Porte, by Chevalier Finochietti, minister plenipotentiary of his Neapolitan majesty to the Porte.

Art. I. All trade shall be free between the subjects of the contracting powers, and it shall be permitted to them to trade with the same liberty and privileges as all other allies in friendship; to sell their merchandizes repair damages sustained by their shipping at sea, or other accidents, and purchase provisions, &c.

II. Our subjects and their shipping shall pay, in all the ports of the Ottoman empire, 3 per cent. at the custom-house, as well as the other duties paid by other powers; and the subjects and ships of the sublime Porte shall in our dominions, pay the same duties, and in the same manner, as those of other powers do.

III. Our minister residing at the Porte shall be allowed to establish consuls in all the ports and maritime places of the Ottoman empire, and be granted all prerogatives and franchises due to his rank, and our consuls interpreters, and those dependent on them, shall have the same privileges that other nations enjoy.

IV. In case of the death of any merchant, or other of our subjects, in what place soever of the Ottoman empire, his effects shall not be confiscated, nor shall any one seize or possess themselves thereof; but the effects of the deceased shall be remitted to our minister or consuls, to be disposed of according to the will of the deceased; and, if he died intestate, to the partners of the deceased residing in the same place; and, if there be no consuls or partners in the place, his effects shall be intrusted with the judge of the place commonly called the *cadi*, who shall afterwards remit the whole to such person as our minister at the Porte shall appoint, and nothing shall be paid to the *cadi* but what is called the *resmi*: the same shall be practised towards the trading subjects of the Ottoman empire.

V. If any dispute, or law-suit, happens between our consul and interpreters, and the sum amounts to 4000 *aspers*, the suit shall not be brought before any tribunal of the provinces, but be referred to the sublime Porte. Merchants, and other of our subjects, or those who shall be under our banner, who have any law-suits or controversies with those of the Ottoman Porte, be it on account of the sale, purchase, or any other negotiation of merchandizes, or for whatever other reason, shall be obliged to have recourse to the judges: if none of their interpreters be present, the judges shall not receive the information, nor determine the affair; and, if the debts or securities are not legally proved by authentic vouchers, the debtor shall not be molested. If any differences happen between our merchants, they shall be examined and determined by our consuls and interpreters, according to our law and ordinary constitutions. And the like practice shall be followed towards the subjects and merchants of the Ottoman empire who may reside in our dominions.

VI. The Ottoman Porte shall be allowed to establish in our territories an attorney-general, commonly called *sach-bender*, for

for the security and protection of their trading subjects who shall reside in our dominions, and he shall dwell at our capital of Messina.

VIII. Pilots, and others skilful in the art of navigation, being in our respective ports, shall give, as soon as required, all aid and assistance to ships that have suffered by a tempest; and the merchandizes, shipwrecks, and other effects, belonging to those that have been cast away, shall be intrusted to the most neighbouring consuls, to be afterwards restored to the masters of such ships.

XIII. No persons, merchandizes, or effects, belonging to our subjects, or those under our banner and protection, shall be molested, unless they have been engaged with the corsairs, enemies of the Ottoman empire, or insisted into their service; but they shall be permitted to pass freely with their effects. And, in case a ship provided with our licence, happens to be taken by a corsair of the Ottoman empire, the merchandizes, subjects, and effects shall be restored.

XV. If any of our subjects be caught in a contraband trade, they shall be used no worse than the subjects of other nations are upon the like occasions. Our merchants shall, in their way of traffic, make use of such brokers as they think fit; and whosoever forcibly interferes therein, shall be severely punished. Our ships sailing to the scales of the Levant, or to the ports of the Dardanelles, shall not be searched otherwise than those of other friendly powers.

XVI. Ships belonging to the Ottoman empire shall not be pursued or molested in the sight of our coasts; nor shall they pursue or molest those in friendship with us.

XVII. The sublime Porte shall strictly forbid all her subjects, especially those of Dulcigno, Albany, or others, sailing, from committing any hostilities against our ships or vessels of any kind; which, on the contrary, shall be received as friends in all the scales and ports of the Levant; and those nations shall be permitted to trade freely in our dominions.

The sublime Porte shall communicate these articles to the regencies of Algiers, Tripoli, and Tunis, and they shall take all proper measures to regulate a free and unmolested commerce and navigation between our kingdoms; and there shall be sent, as well on the part of the Porte as of ours, a minister, who shall jointly treat upon the plan of the present articles.

XVIII. It shall not be permitted, in time of war, to arm foreign vessels in the respective ports of the contracting powers, nor any privateers to take out commissions to serve under the banner of the enemy. In case one of these vessels are taken, the commander, as an example to others, shall be hanged at the mast of his ship, which also shall be good prize, with all her effects, and the sailors shall be enslaved.

Neither the one or the other of the contracting potentates shall grant commissions but to their own subjects, or to those who are settled in their states.

XIX. Our minister and consuls shall be allowed to demand the ordinary duty of consular on all the merchandizes which pay the duty of custom, and which are imported under our banner, in the same manner as it is demanded on the part of other friendly powers; nor shall our subjects be hindered from loading merchandizes on board their ships, except, nevertheless, powder for cannon, arms, and other contraband goods.

XX. The sale and purchase of merchandizes shall be carried on by our subjects, and those who are under our protection, in the same manner as those of other powers in friendship do. They shall not be obliged to use other monies than those which are generally current, nor shall any duty but what is common be required on the exportation of monies.

XXI. Any ship loaded and ready to depart, shall not be detained on account of any intended law-suit, but the dispute shall be determined without delay by the consul.

Our subjects shall be treated in all cases expressed, or otherwise, in this treaty, in the same manner as those of all other nations in friendship with the Porte.

If we cannot prevent the vessels of Malta, of the Pope, of the Genoese, and those of the Inquisition of Spain, with commission from his Catholic majesty, from sailing in the Archipelago, we will give advice thereof to the Porte by writing, that they may take their measures in conformity. This article shall be inserted in the treaty. See *LEVANT TRADE*.

Of SICILY in particular belonging to the kingdom of Naples.

SICILY, the largest of the Italian islands, is situate between 12 and 16 degrees of east longitude, and between 37 and 39 degrees of north latitude, being about 170 miles long, and 100 broad. It lies in a warm, but pleasant and healthful climate. It is separated from Calabria in Italy only by the straight or fard of Messina, which is not seven miles over in the narrowest part; but from Messina on the coast of Sicily, to Reggio on the continent, which is the usual passage, it may be 12 or 15 miles over. The country is divided into mountains and vallies, in which there are abundance of springs and rivulets, that make both hills and vallies exceeding fruitful, and which occasioned it's being called the granary of Rome. The produce of the island is corn, wine, oil, silk, and excellent fruits, of which they export great quantities, but chiefly in foreign bottoms; their present monarch, of

French extraction, applies himself with great diligence to increase their shipping and foreign commerce, and has opened a trade with Turkey, which they never had before, being, like the Spaniards, perpetual enemies to the Turkish empire. Mount Ætna in this island is a vulcano, which, by it's fiery eruptions and earthquakes, has overturned several of their cities, particularly those of Syracuse and Catania, on the eastern coast of the island. This mountain is so high, that it is surrounded with a circle of snow towards the top, great part of the year; but, advancing a little further, we come to the grand vulcano, from whence there issues flame and smoke. This is a basin, or cavity, about six miles in circumference, the sides whereof are incrustured with sulphur, from whence there sometimes issues a pure flame; and the noise of this burning pit is inconceivably dreadful. This hill is much larger than mount Vesuvius in Naples, viz. about 70 miles in circumference at the bottom; and the eruptions from it have been more frequent and more terrible than those of Vesuvius. The kingdom of Naples, as well as this island, was anciently called Sicily; whereupon Don Carlos has revived the former name, and styles himself king of the Two Sicilies.

MESSINA is the greatest trading city in all Sicily; the great trade carried on there in silk, and the good situation of it's port for all shipping from the Levant, draws thither a great number of foreigners, which makes the trade flourish. There was no appearance of it's losing it's reputation, when it passed under new dominion, by the treaty of Utrecht; and the manufactures that the duke of Savoy established at Turin, and in several places of his ancient territories, excited the jealousy of the workmen of Lyons and Tours, and was prejudicial to the sale of their finest stuffs.

But the revolutions in Sicily, occasioned by the Spaniards invasion thereof in 1717, and which afterwards, by the cession of the duke of Savoy, passed under the dominion of the house of Austria, drew the foreign trade to Sicily, which was yielded to him by the treaties of Utrecht and Rastadt.

Sicily changed masters again in the year 1735, in favour of Don Carlos, his present Neapolitan majesty, the son of Philip V. king of Spain; and the trade of this island has greatly flourished under his sovereignty.

The greatest part of the silk manufacturers dwell in the suburbs of Messina, which spreads itself along the sea-coast, on the side of the fard; and there is a very spacious place, encompassed with workhouses, for the organzine silk, which is a very estimable branch of that manufacture.

The Genoese, Florentines, and Lucasians, are chiefly masters of the whole silk trade of Messina, which draws foreigners there in great numbers.

Another disadvantage to foreigners attending this commerce, is, that the Messinians are principally their own factors, and will not suffer, as is done at other places, strangers to settle there for that purpose; there are, notwithstanding, some French and English families, and those of other nations, who have houses of trade among them.

The trade in linens of all sorts, both for apparel and the table, imported, is very extensive, and carried on with great facility for credit, the Italians having first introduced the custom of trading generally on credit, at two, three, or six months for their imports, but sell their own goods for ready money.

The payments for silk, and other merchandizes, is commonly made in Spanish rials, brought from Spain, Genoa, and Leghorn.

When the merchants do not chuse to risque specie by sea, they may take bills of exchange for Messina and Palermo; where you may easily draw for the fair of Novi in Genoa, with little disadvantage; you may likewise occasionally remit from Lyons to Novi, with some profit.

The chief trade of the city of PALERMO consists in silk and silk manufactures, crude sulphur, tartar, and fine sponges; a great quantity of wheat also comes from thence, and many other parts of Sicily; from whence Marseilles, and the greatest part of the cities of Italy supply themselves.

There comes from hence likewise a great quantity of manna. The rottolo is the weight of Palermo; it is of two sorts, the small and the great weight; 100 rottoloes great weight make 141 pounds $\frac{2}{3}$ of Paris and Amsterdam, and 100 rottoloes small weight make only 65 pounds of the same cities.

The canne is their long measure. It is divided into 8 palms; they measure silks and cloths indifferently therewith, which is not very customary in Italy: 100 cannes of Palermo make 287 ells $\frac{1}{2}$ of Amsterdam, and 100 ells of Amsterdam make 33 cannes $\frac{2}{3}$ of Palermo.

There are three measures for grain of all kinds, the salme, the tomolo, and the mandilo; 16 tomoli make the salme, and 4 mandiloes the tomolo.

10 Salmes $\frac{1}{2}$
117 Tomoli $\frac{2}{3}$
685 Mandiloes $\frac{1}{4}$ } make the last of Amsterdam. Savary.

A new memoir upon the general trade of Sicily, from Savary.

Their accounts in Sicily are kept in ounces, tarins, and grains; an ounce is worth 30 tarins, and the tarin 20 grains: besides, there

there is a crown consisting of 12 tarins, or two crowns and a half, which make an ounce.

Formerly, the ounce was imaginary, nevertheless, while the Germans were masters of that kingdom, they coined both silver and gold money, and the gold coin is current under the present government.

There are two kinds of weight in Sicily, the great and small weight, both of which are called cantarre: the cantarre is composed of 100 rottoloos; the great weight is of 33 ounces; each rottolo of the small weight has but 30 ounces, which makes a difference of 10 per 100; they reckon 100 rottoloos or cantarres small weight, to a little less than 200 pounds of Marseilles weight.

There is besides the pound, which is composed of 12 ounces; so that two ounces and a half, make one rottolo small weight, or two pounds $\frac{1}{2}$ make the rottolo great weight.

Their merchandizes commonly are sold by the rottolo, and very little by the pound, among which are silk and some fine drugs. Those which are sold by the great weight are all sorts of salt-fish, cheese, and fruits: there are nevertheless some little towns, where the small weight only is used.

The following coins are current in Sicily, besides those of foreign countries, viz.

All Portugal money: also the Spanish pistole is worth 45 tarins, or one ounce and a half; the old French pistole, and that of Savoy, is worth one ounce and 14 tarins, or 44 tarins. The French pistole d'or sol, is worth one ounce 23 tarins, and 10 grains.

The Venetian sequin rupee being full weight, is worth 26 tarins, according to the order of the king; nevertheless, there is always an agio more or less, as they are wanted, which never advances beyond 25 tarins and a half. The other Venetian sequins are worth 26 tarins, for which there is very seldom an agio. They take sometimes the Genoese sequins for 24 tarins, though they make some difficulty.

The Florentine and Hungarian sequins are also current there, and are worth 25 tarins; very few of the first are seen there, because there is some loss in their importation.

The genouines are worth 17 tarins, the ducaton 14 tarins 8 grains, the philippes 12 tarins 16 grains, the lenterines 12 tarins, the rose piastres 11 tarins and a half, the sevillanes 12 tarins.

All the coins are weighed, and they pay what they are deficient, viz. 7 grains for a pistole that wants a grain, and so in proportion; observing, that if they are too light by 12 or 15 grains, they are not passable. It is the same for silver coins, and they pay a grain for every two grains deficiency, but they generally refuse to take them when they are not full weight.

Of the MEASURES of SICILY.

Corn is measured by falmes, the same as barley, large and small beans, pease, and small nuts. There are two kinds of falmes, the general falme, and the great falme, which differ from one another $\frac{1}{3}$; so that one great falme makes 1 and $\frac{1}{3}$ of the general falme; nevertheless, when it is spoken of falmes principally for corn, it is always understood the general falme, and if of the great falme it is explained; all pulse is sold by great falmes. The general falme makes 1 and $\frac{1}{3}$, or 100 general falmes make 175 charge at Marseilles.

Oil is measured by cassis, which weigh commonly 12 rottoloos $\frac{1}{2}$ great weight, and 5 cassis and $\frac{1}{2}$ make the millerolle of Marseilles. There are some places where it is sold by the cantarre, and prices are fixed in proportion.

Wine is measured by the falme, but there are falmes of different qualities: the falme of Messina holds 126 measures, which are called cartouches, and weigh from 22 to 24 ounces. That of Syracuse differs $\frac{1}{4}$, so that 1 falme and $\frac{1}{4}$ of Syracuse makes 1 falme of Messina. There are some other different falmes, nevertheless these two falmes are made use of, in case of exportation, which commonly is done from Mascali, Melazzo, Syracuse, or the Faro of Messina, which are the places where they load, and the measure is different only at Syracuse.

All the cloths, silks, and linen, are measured by the canne of 8 pans, each pan making 10 inches and 2 lines: the French ell makes 4 pans and $\frac{1}{2}$, and 3 Holland ells make a little less than one canne of Sicily.

REMARKS.

The balance in Italy is thought to concern the interests of Great Britain; [see the article MEDITERRANEAN] to which we have hitherto shewn a just and laudable regard; and indeed, distance in this respect is of little consequence, more especially to a maritime power. Our commerce in the Mediterranean and in the Levant, is of very high importance, and we cannot but be sensible, that whatever alterations have been felt in the Italian balance, have likewise affected those branches of our commerce in a very sensible degree; so that whatever steps we have taken, either during the continuance of peace by negotiation, or in time of war, by supporting the only prince in Italy, who declared for the common cause, and was true to his own interests, which were likewise ours, were right and just measures, and have no doubt left those

VOL. II.

impressions, which we hope will never be effaced by any art or intrigues whatever.

The injuries our merchants not long since sustained, and the great insult offered to the nation by the corsairs of Barbary, will not allow us to doubt, that it is our true interest to keep the Italian states firmly united to us, and that when occasion requires, they may afford us all the conveniences in their power towards chastizing these infidel states, as our using vigorous measures in such cases, and sending a powerful fleet occasionally into the Mediterranean, will contribute not a little to make us respected by the Italian potentates, as well as to obtain justice from those pyratrical governments, which is a thing scarce to be expected from milder measures. See the article MOROCCO.

In the Spanish war, in the year 1742, the Neapolitans experienced the weight of the naval power of Great-Britain. The behaviour of France in protecting the Spanish fleet occasioned us to take every advantage we were able. The king of Naples had then joined his father's troops with his forces, which amounted to 20,000 men, and they were, in every respect, in much better condition than those of Spain. It was, therefore, of great importance at this time to oblige the king of Naples to adhere strictly to that neutrality which he professed. For this purpose, admiral Matthews dispatched captain Martin, as commodore, with a squadron of ships, with bomb-vessels, and tenders, to the bay of Naples, with a message from his Britannic majesty, importing, that his Sicilian and Neapolitan majesty, having violated his neutrality by joining his forces with the declared enemies of Great-Britain, of the queen of Hungary, and the king of Sardinia, with whom his Britannic majesty was in alliance, he, the commodore, was sent to require the king of Sicily, not only to withdraw his troops from acting in conjunction with those of Spain, but to promise, in writing, not to give them any further assistance in any respect; adding, that if his Sicilian majesty should delay giving the proposed satisfaction, he had orders to bombard Naples.—But the court of Naples thought proper to comply with the spirited demands of the British court. For it is incredible, into what a consternation our fleet threw the capital of that monarch. The history, perhaps, of no country can parallel the quickness, the decision, and the importance of this expedition, which was undertaken with so inconsiderable a force, against a powerful prince, sitting in his capital, and surrounded by 300,000 subjects. It is an illustrious proof, how unavailing the pride of the finest city in the world, is against the very frown of a people that has the command of the sea. See NAVAL POWER, and SEA BRITISH.

NATIONAL ACCOUNTANTSHIP.

Under the articles ACCOUNTANTSHIP, BANKING, DEBTOR and CREDITOR, LEDGER, MERCANTILE ACCOUNTANTSHIP, I have endeavoured naturally to introduce the reader into this useful art, by representing the same in variety of familiar lights, with a view to shew him how it was applicable to every kind of business, from the most distinguished merchant and tradesman, to the private gentleman and greatest nobleman.

If what we have said under the several heads enumerated be duly attended to, and thoroughly comprehended, no gentleman of distinction can be at a loss to understand, what may further be said, in relation to the best method of keeping the ACCOUNTS OF THE NATION, the surest way of unravelling any accounts of this nature, and discerning every kind of misapplication of the public money, and every designed misconstruction of acts of parliament, in order to alienate the national funds from the real design of their primitive establishment, and thereby to occasion such alteration in those funds, that has defeated, or may hereafter defeat any the most wise and upright intentions of the legislature to maintain the public credit, and honourably to discharge the public debts. Nothing can more apparently shew the necessity of something of this kind, than the great debates for many years together, both within doors and without, during the administration of the late Right Hon. Sir Robert Walpole, afterwards Lord Orford, more particularly in regard to the application of the SINKING FUND, to other purposes than the redemption of the principal money debt; for, had the primitive sense of the acts of parliament been immediately significantly explained, in the adjustment, regulation, and stating the public accounts of the nation, there could not have been a possibility of mistaking the original meaning of the acts of parliament; for such is the supreme excellency of the art of accountantship, that if the MONEY AFFAIRS of the kingdom are justly and faithfully stated in the PUBLIC ACCOUNTS according to the true and solid principles of that art, I will presume to say that no such-like intemperate debates could ever happen as then did, the natural and pristine cause of the rise and establishment of any fund could never be mistaken, and no party feuds and animosities take place among our representatives, in their deliberations upon the nature of the funds, and the uses and application thereof at all times, and upon all occasions. And how this may be done, I intend one day to shew, and to do myself the honour must humbly to submit a NEW SCHEME OF NATIONAL ACCOUNTANTSHIP, to the consideration

consideration of the honourable house of commons. For the present I shall only refer to the article REVENUE [PUBLIC REVENUE].

NAVAL AFFAIRS. Not only the preservation of that share of commerce we possess, but its future advancement, depend on the good condition and the wise regulation of our naval affairs, and not only so, but the very being of Great-Britain as an independent empire and a free people, depend upon the constant superiority of its maritime power.—We should be held inexcusable, therefore, if in a work of this kind, we passed over an article of such high concernment to the interests of commerce.

Whoever would be fully informed concerning the figure which England has made in all ages in maritime affairs, may find abundance of curious matter in Selden's *Mare Clausum*, and from his time to ours, we may trace a series of facts, in Lediard's or Burchet's *Naval Histories*. I shall take notice of two remarkable periods of our ancient maritime story, because some useful observations may be made in comparing them, both with other nations and with ourselves, in our present situations.

We are told that Edgar, king of this island, had four thousand ships; by the terror of which he subdued Norway, Denmark, all the islands of the ocean, and the greatest part of Ireland. These instances of his power, are specified in a record * cited by that great lawyer Sir Edward Coke, in the preface to his fourth Report. This monarch made a naval progress yearly round this island, and once took it in his head to cause eight conquered kings to row his barge on the river Dee. But it seems that some of his successors have had such ministers, as either neglected to keep our fleets in repair, or were afraid to make use of them: for, at several periods of time, since the days of king Edgar, we find that this kingdom has been miserably insulted on the seas, and even successfully invaded by other nations.

* *Altitonantis Dei largiflua clementia, qui est rex regum & dominus dominantium, ego Edgarus Anglorum Basileus, omniumque insularum oceanique Britanniam circumjacent, cunctarumque nationem quæ infra eum includuntur. Imperator & dominus, gratias ego ipsi Deo omnipotenti regi meo, qui meum imperium sic ampliavit & exaltavit super regnum patrum meorum qui licet monarchiam totius Angliæ adepti sunt a tempore Athelstani, qui primus regum Anglorum omnes nationes, quæ Britanniam incolunt sibi armis subegit nullus tamen eorum ultra fines imperium suum dilatare aggressus est, mihi tamen concessit propitia divinitas cum Anglorum imperio, omnia regna insularum oceanicum suis ferocissimis regibus usque Norvegiæ, maximamque partem Hiberniæ cum sua nobilissima civitate de Dublinia Anglorum regno subjugare. Pref. to 4th. Co. See also Rapin's History of England, in the life of Edgar.*

The British Neptune slept, or slumbered, most part of the time, from the reign of king Edgar, to that of queen Elizabeth: in her days he sprung up with vigour, being roused by Spain, which was then the greatest maritime power on earth. From queen Elizabeth to our time, our naval strength has gradually increased, inasmuch that at this day, the Spanish fleets opposed to ours, would make a very contemptible figure on the ocean: we now have it in our power to lord it over the watery world. It may be worth our enquiry, to know how these fluctuations have happened in the dominion of the seas.

The tasks and course of life of seafaring men are not to be learned in an instant; their employment is a laborious and dextrous employment, to be acquired only by application and industry. Money will buy all naval stores except mariners, but unless a succession of them be preserved, no wealth will be able to purchase them. The surest, the cheapest, we may justly say, the only profitable method of supporting such a succession, is to have perpetual occasion for a multitude of seamen in a course of foreign traffic. It is indeed probable, that Edgar's amazing power at sea was, for the most part, owing to his own great genius, attended with indefatigable endeavours in training up, and year by year augmenting the number of his mariners; for in those days, England had no great share of foreign commerce, people generally contenting themselves with the produce and manufacture of their native country. This great prince must, therefore, have grievously oppressed his vassals to enable him to keep up so great an armament; and it is no wonder that it dwindled in succeeding reigns, because it had not that solid aliment, trade, to nourish it.

The success of the Spaniards in America, caused their shipping to increase beyond all their neighbours; they had occasion in their beginning there, for great numbers of transports, to carry not only men, but also horses and other cattle, and stores of every kind, to their new conquests. Add to which that Sicily, and a great part of Italy belonged to them at that time. The communication with these last-mentioned places was by sea, so that they had a considerable part in the increase of the Spanish naval power. In this flourishing condition they continued for a great part of the long reigns of their Philip the 11d, and of our Elizabeth. She had not a fleet

able to give their armada battle: her ships, indeed, were light and nimble, the Spanish, though larger and more numerous, were unwieldy; therefore the lighter vessels being in no danger of a chase, fought or stood off as they saw occasion. But this advantage would not have been sufficient, if Providence had not interposed a tempest for the protection of England.

The queen knew to what causes she owed her danger and her deliverance, and became more attentive than ever to plant colonies in America. Death prevented her from executing her great designs; but some of her best and wisest subjects, and most gallant seamen, had entered so deeply into the plan, and laid it so nearly to their hearts, that what she had intended in the settlement of Virginia, was in a good measure effected in the reign of king James the 1st, though the undertaking was a great & difficulty upon his timorous councils, because the Spaniards, of whom he stood in servile awe, did not approve of it. But his shame, with much debate, barely got the better of his fears, and that mine of treasure was opened to Great-Britain.

† See a Short Collection of the most remarkable passages from the original to the dissolution of the Virginia company.

This, with what else has since been executed in favour of England, both on the continent and in the islands of that new world, has added such a weight of maritime force to the natural strength, which we owe to our situation, that we are able, by wise management, to give law to the ocean. Spain indeed, has greater countries and more subjects in America, than we have, and yet does not navigate in that trade a tenth part of the shipping that we do. By a lucky kind of poverty, our dominions there have no mines of gold or silver: we must be, and ought to be, contented to deal in rum, sugar, rice, tobacco, horses, beef, corn, fish, lumber, and other commodities that require great stowage; the perpetual carriages of these, employ above 100,000 tons of shipping. The value of 5000l. in these wares loads a vessel, which in the Spanish trade would be freighted homeward with half a million of pounds sterling.

Thus has the Almighty placed the true riches of this earth on the surface of it, our sugars, rice, and tobacco, &c. are more real and permanent wealth, than their richest minerals. They are wealth, which create a power to defend our possession of them: and, without a sufficient force to defend that, the possession of all wealth is precarious. Should not Great-Britain, therefore, be ever attentive to the true interest of our American plantations? Will not such measures prove an eternal increase to the tonnage of British shipping? See BRITISH AMERICA.

The Dutch were esteemed all the last century, the only match for England on the seas; but, as a great part of their strength was merely artificial, it subsides like the vivacity of a wretch, who has raised his spirits with a dose of opium. Commerce, and that wealth and power which attend it, may be either absolutely in the power of a state or empire, considered in and by itself, without regard to its neighbours, which we call natural wealth, power and commerce; or they may depend upon treaties with other states, or be owing to their connivance, which, pro tempore, amount to a tacit agreement: these latter species may be called technical wealth, &c. Such was the fishery of the Dutch, which they enjoyed by the inactivity of some of our English kings: and this must decline of course, if we vigorously support our fisheries of every sort, because of our superior treasures of this kind on the banks of Newfoundland and on our own coasts. Another branch of their artificial strength was, that by the indolence of all nations, they were for a time the carriers of the universe: but the world is grown wiser, other nations begin to work for themselves; and the Netherlands will sadly find, that this temporary fund of strength must also fail them. Their only natural foreign wealth and strength is their East-India trade; part of this is truly their own, because the land that produces spice is in their possession: but when the two former branches shall be cut off, they will find that possession every day more and more precarious.

Thus the British empire has a natural wealth in itself, and in its dependent members, but it has also for many years past, enjoyed an adventitious, or artificial traffic. We have been employed by all the world in the woollen manufacture, but other nations have begun of late to clothe themselves and their neighbours too. It is a fond fancy in us to imagine, that there are no fleecy sheep in the world but our own, or that the rest of mankind will not learn the mystery of working in wool.

We feel this trade decreasing daily, and yet there are those among us, who would argue against demonstration. But when they hope, by any laws of Great-Britain to hinder foreign nations from falling into the woollen manufacture, they may as well solicit an act of parliament to prevent their grass to grow, and to intercept their sunshine. We will consider one objection before I leave this point, because some imagine that we are secure in this trade, against the endeavours of all foreigners: say they, we make better goods than can be made with any foreign wool, unless it be mixed with ours.

ours. Be it so. But then, does our great wealth and income by that trade consist only in our finest goods? Have not the English merchants complained, that Ireland has unfolded us in coarse goods at Lisbon; that because their wares are coarse, they can be afforded cheaper, therefore they have a ready market, while ours, that are finer, but dearer, may rot in the warehouse? What says our Russia Company? Has not Prussia supplanted us in the clothing of the Muscovite army? Who can be ignorant of the extensiveness of the woollen manufactures of France, if they consult what I have said, under the article FRANCE? We have sent armed sloops to check the Irish, but who will restrain the French, Germans, and Prussians? The multitude don't much value the fineness of their garments, they only desire to be warm; it is the cloathing of the millions that produces millions of money, and this is what other countries will certainly have their share in.

Is not this a time to cast our eyes upon our natural wealth, and to augment it as fast as possible? If Muscovy supplies it's own woollen goods, or is supplied by any other foreigner, it ought to make us resolve to bring our naval stores from North America; if Spain and Italy refuse our drapery, we may reject their silks, their raisins, oil, wine, olives, and divers other merchandizes, and be supplied from Carolina and Georgia, with proper management.

We have been credibly informed that a gentleman, not long since deceased in this kingdom, was the first person who made pitch in America; the people whom he conversed with then, looked on this experiment as a chimera, but it proved so real, as to reduce that commodity above one half in it's value.

France has not the same advantage as Great-Britain, in it's situation for maritime affairs: that country is extended wide within land, and has not the benefit of being penetrated by many deep creeks, or navigable rivers; on half it's borders it is bounded with the continent, and the good harbours of France are but few, compared with the numbers of ours. See BRITAIN [GREAT-BRITAIN]. These reasons of our capacity for constant superiority over them in maritime affairs in general, served to prevent their increasing in North America as fast as we did; and there is another special reason, viz. we have had the navigation of North America in us, by the larger traffic of our early settlements, and even of the French sugar-colonies; which we supply in a great measure, with lumber, horses, and provisions, though this trade may not be so nationally beneficial as some are wont to think. We have five souls on the continent for one of theirs; their principal settlement is in a climate too cold, and not very fruitful; and yet they contrive all imaginable methods of augmenting their numbers: they intermarry with the natives, and convert them; and the French king supplies 2000 persons yearly with money to enable them to go thither, without being afraid that he shall drain his country of people.

It is easy to demonstrate, that we can afford to send people abroad better than France and Spain. They have in each of those kingdoms more than 100,000 cloistered females, not permitted to propagate their species; and the number of males in a state of celibacy is still abundantly greater, as it comprehends their secular and regular clergy, and a considerable part of their great armies, who resolve against marriage, because of the uncomfortable prospects they have with regard to their progeny.

It may be said indeed, that though these do not marry, yet many of them get children; but it must be admitted, that the usual fate of that kind of propagation is, to be destroyed secretly, either before or after the birth; and the former of these crimes frequently procures barrenness in the women. We have entered into the consideration of the loss by the celibacy of their males, that nobody may imagine the computation of their deficiencies should be made upon their cloistered females only.

And yet let us take a short view of their losses upon that calculation, allowing a monk, or a priest, for an husband to each immured woman. The most exact rules in this kind of arithmetic are as follow:

First, the people who go on in an ordinary course of propagation and mortality, and are not visited with some extraordinary destructive calamity, grow double in their number in 100 years.

Secondly, thirty-three years are a sufficient allowance for a generation, or three generations to 100 years. Now, Since the Reformation, we will say, about 200 years are elapsed, at which time celibacy was abolished in England.

Therefore, in that time, France has lost more than five generations of it's inhabitants, at the rate of 200,000 in each generation, besides the accumulated numbers of cent. per cent. for each hundred years, which loss must be reckoned upon the second century, as interest upon interest; so that the 200,000 individual persons who were under the vow in France, 180 years ago, will, 20 years hence, be a negative upon their numbers to the value of 800,000 people.

They who understand a little arithmetic, may divert themselves by computing the amount of all the parts of this loss of people in the five generations.

My aim, from what has been said, is to rectify the notions of some of my countrymen, upon an affair so important as our commerce; to point out the differences between a natural and an artificial trade; to instance them in our neighbours compared with ourselves; to shew the industry of the French to rival us in America; in spite of their geography and their religion; and to inculcate that our strength depends on our SHIPPING, and our shipping on our wide-extended colonies, which have neither gold nor silver, and, for that very reason, confirm us the more powerfully in the dominion of the seas.

It is an observation worthy the serious attention of every Englishman, that empire has always followed trade, travelling, as it were, from one part of the world to another, as commerce has shifted it's station; and, in all countries, still growing or declining in power in proportion as traffic has been encouraged or disregarded.

Cicero ad Attic. says, Qui mare teneat eum necesse rerum potiri. This is the opinion of a very great man, who had been at the head of affairs in a most powerful state, above 1700 years ago and the practice of all great princes who have lived since that time, and have ever designed either to extend their dominions, or to render themselves considerable to their neighbours, fully proves the observation to be true.

The Romans (who aspired to nothing less than universal empire) while their conquests were confined within the narrow bounds of Italy, were so much prejudiced with the notion of a landed interest, that, as Livy relates, they thought it scandalous for a man of fashion to exercise any merchandize: and in consequence of that prepossession, they were not in a capacity to make any figure by sea, an element little practised by them, and less understood. But this notion lasted only 'till they had an opportunity to look more abroad into the world; then experience taught them, as they came to quarrel with the Carthaginians (who at that time, were the great trading people) that commerce was necessary to establish their empire; and that not only their conquests were at an end, but the possession of the territories they had conquered were precarious, unless they could acquire and secure to themselves the dominion of the sea.

If the dominion of the sea is absolutely necessary to a people who aim at empire, of how much greater moment is it to a nation whose grandeur, whose wealth, whose very being depends upon COMMERCE and NAVIGATION? It is with the highest reason, therefore, that we ought to look upon every wrong done to our trading subjects, and on every attempt towards establishing a NEW MARITIME power in Europe, as the most fatal, and, therefore, the most unpardonable injury to a nation, whose glory consists in being mistress of the sea, and whose strength lies in trade.

The nations recorded in history to have been at any time possessed of the empire of the sea, have always esteemed a neighbouring prince's offering to set up a naval power, by building more ships of war than were requisite to secure the trade of his subjects from piracies, &c. to be as just a foundation of political jealousy, as the raising of new forts upon his frontiers, or the levying of a formidable army in a time of profound peace: and, therefore, they have always taken measures either to prevent such attempts, or to destroy them in their birth. This was the practice of the Romans: and this has been the policy of his majesty's royal predecessors, the kings of England.

The Romans, as soon as they had acquired the sovereignty of the sea, (which they thought not dearly purchased with the loss of above 700 ships) immediately entered upon measures to preserve so valuable an acquisition. They grew watchful over their new dominions, and were soon alarmed by the smallest umbrages, from any power that did but seem to interfere with them in naval affairs. It was from these political considerations, that they would not admit the Carthaginians to fit out any fleets, and that they forbid Antiochus (at that time the greatest king in the east) to build more than 12 ships of war. See the articles AUSTRIAN NETHERLANDS, and OSTEND EAST-INDIA COMPANY.

It is not an empty title which the kings of England have always taken to themselves, of being supreme lords and governors of the ocean surrounding the British shore, but a right which they have constantly maintained at the expence of numerous fleets. In that famous accord made between our great king Edward I. and Philip the Fair of France, it appears, that the French king was by him called to an account for piracies committed by his subjects within the British seas: and, by that memorable ordinance made at Hastings, in the reign of King John of England, the hoist of the flag (ever claimed by the English) is decreed to take place universally, not barely as a civility, but as a right to be paid (cum debita reverentia) with due deference.

There is no occasion for troubling my readers with a detail of examples to the present purpose, since nothing is more known in our English history, than that our kings have ever been jealous of their neighbours making use of any pretext to increase their naval strength; and have accordingly judged it of the greatest importance to frustrate such designs though at the

risque of a war: for what left did our immortal queen Elizabeth risque, when she sent to the French king, to prohibit his building any more ships of war than what he then had, without her leave first obtained. This was an instance of wisdom and resolution worthy a prince who claimed the sovereignty of the sea.

Maritime trade, and in wholesale, has nothing in itself but what is honourable. Antiquity furnishes us with illustrious testimonies in favour of those who practised it. Solomon, king of Israel, according to scripture history, carried on a great trade abroad. Solon, that great legislator of Athens*, who was of one of the noblest families in that flourishing republic, being, by the father's side, descended from Codrus, the last king of Athens†, in order to repair the decays of fortune, into which his family was fallen, by the excessive liberality of his father, chose rather to carry on trade, than to take money from rich persons, who offered him large sums, and promised never to allow him to be in want.

* He lived 598 years before Christ.

† Plutarch's life of Solon.

Now at that time, says Plutarch*, after Hesiod, no handicraft was shameful; no art nor trade made any distinction between men. Merchandize especially was honourable, because it opens a communication with barbarous nations, affords the means of making friendship and alliance with kings, and leads to the knowledge of an infinite deal of things, which would be unknown without it. There have been merchants founders of great cities; as Proteus, who founded Marseilles, after having gained the friendship and esteem of the Gauls who lived upon the banks of the Rhône. We are told also, that the wise Thales and Hippocrates, the mathematicians, applied themselves to commerce, and that Plato defrayed the charges of his journey into Egypt, by selling oil in that country.

* M. Dacier's translation.

Cato the censor*, that Roman Demosthenes, a man of such rigid and delicate sentiments of virtue and honour, thought it not below him to acquire an estate by commerce: wholesale trade, he said, depended chiefly upon the mind, whereas trade in retail gave only employment to the hands. As all the arts of the mind are noble, the laws, which have neglected the distinction and illustration of trade in retail, for certain moral reasons, have honoured and distinguished wholesale trade.

* Plutarch's life of Cato; he lived 196 years before Christ.

As a proof that commerce had nothing in it base and derogatory among the Romans, the emperor Pertinax exercised it the greatest part of his life, and even after he was emperor. Caracalla*, in the cruel massacre he caused to be made at Alexandria, had great regard to the body of merchants, who were very numerous in that city: in giving orders to all foreigners to remove from it, he excepted the merchants, and allowed them to stay there at liberty. Alexander Severus, from a view to make trade flourish in Rome, and to bring in merchants thither, granted them large immunities. Maximinus himself carried on trade with the Goths, &c.

* History of the Commerce and Navigation of the Ancients, by M. Huet, cap. 57. no. 9, 11, 12, and 13.

We have given occasionally a multitude of other examples, throughout the course of this work, which shew us that great men have thought it no disparagement to them to acquire great estates by trading: such examples are common among the Greeks and Romans; these people had as delicate notions of honour as we. The Venetians, in order to train up the sons of their nobility in the knowledge of the navy, oblige the merchant ships that sail into foreign countries to take always two of them, whom the captain is obliged to maintain at his table, without being bound to any work, but only to take notice how the ship is wrought, and what observations are made by the pilots.

In fine, trade was so honourable among the Ancients, that the emperors granted it a particular protection. They honoured the cities that signalized themselves in commerce, or in building ships, or that were famous for some considerable sea-port. These cities caused their medals to be stamped either with a ship, or with a prow, or sometimes with a Neptune and his trident, or with a dolphin. Such were the medals of Tyre* and Sidon, of Byzantium, of Leucate, Chelidonium, Syracuse, &c. History of the Commerce and Navigation of the Ancients, chap. xlvii. no. 15. p. 273.

* The Scripture, Ezek. xxvii. furnishes us with a glorious testimony of the riches and maritime forces of the city of Tyre, which the prophet extols, as well as her sailors, her shipping, her great trade. &c. But this might be the old Tyre; the new city far surpassed it, according to the late M. Huet, in his History of the Commerce and Navigation of the Ancients, chap. viii. no. 4. p. 33. According to Herodotus, the Tyrians came from the Lydians.

REMARKS.

How the French regard their maritime affairs.

'France', as well as the Roman empire, says Monsr. Dutot, has maritime and trading towns that deserve medals, and are undoubtedly of consequence to be honoured and protected, because they have signalized themselves in trade, and by building of ships. Nay, she has some that has done more; and, though they have neither lands nor manufacture, have found a way to carry on navigation. They are accustomed to hazards; their ships have braved the dangers of the main; they have grown formidable to their neighbours, by harassing them continually, and by weakening them to such a degree, that those enemies, in revenge of their losses, swore the destruction of one of those cities; and, for that effect, invented that formidable machine, so celebrated, which was to reduce it into ashes. What wonders have been done by the courageous inhabitants of that city, equally distinguished in its warlike and trading capacity, in defiance to all the efforts of the enemies to the crown? Bound to some rocks, they had found a way to render it inaccessible on all sides; to build fortresses, which secure their port; in a word, to make the rocks a prodigy of art, and an eternal monument of a genius for war, matched with a genius for trade. How many excellent sea captains have been produced in that city, and some others like it, which cultivate trade! How many ships have they built and fitted out! What noble sailors! What excellent artists! How many young combatants have they trained up*! And then how much gold and silver have they brought into the kingdom! Their ships happily arriving from the South Sea in 1709, brought home gold and silver bullion to the amount of thirty millions, which was a supply to the state of so much the more importance, as those cities lent the king fifteen millions in a very pressing exigence. This is what we are told by the minister of the finances himself, in the 13th page of his Memoirs. What spoils of the enemy have those trading towns brought home, ruining the commerce of our neighbours, and securing our own! Shall the nobility then [hear the Frenchman, Britons!] most of whom live idly in their castles, be thought more serviceable to the state, more brave, more warlike, than those heroic citizens? How would the republics of Greece and Rome have heaped honours and rewards upon citizens so worthy of that name!

* I shall take leave to remark here, that several of the privateers and seamen whom the city of St. Malo made use of during the course of queen Anne's wars, were Normans. Among them who manned their ships, and distinguished themselves in fight, there were many from that province: at this day several Maloine families are natives thereof.

The maritime forces of the Romans contributed not a little to their great power. Accordingly we see in the Digests, some laws which inform us how much they applied themselves to sea affairs in certain conjunctures, even during the heat of their wars. The exemptions from all municipal charges, which they granted to the citizens to invite them to build ships and cultivate trade, are invincible proofs of their having been perfectly sensible, that maritime force and commerce were necessary to the preservation and advancement of their power.

Cardinal Richlieu, who had so extensive views for aggrandizing the state, found no way more effectual to promote the power of the king, and the riches of the nation, than to improve navigation and trade; and, indeed, there is no other that can bring us in gold and silver. That great statesman shews us very well the necessity and usefulness of a power by sea*. According to him, trade has a necessary dependence upon that maritime power.

* The Political Testament, chap. 9. sect 5. l. 6.

After having shewn the advantages which the English would have over us, if our weakness by sea should cut us off from all means of attempting any thing to their prejudice, our author cites, by way of example, the insult offered by that proud nation [observe monsieur again] to the duke of Sully, sent by Henry IV. into England, in quality of ambassador extraordinary; and he counsels Lewis XIII. to put himself in such a posture, that he may not suffer the like again. He shews all the advantages of a powerful navy; he proves the usefulness of it and of trade, by the example of the Dutch, who owe their power only to their navy and their trade. It was in the time of his ministry, that Lewis XIII. made that glorious statute of February 1, 1629; where, in order to induce the subjects to carry on sea-trade, he declared by the 452d article, That the gentlemen, who should apply themselves to that commerce in their own persons, or by substitution of others, should DEROGATE NOTHING FROM THEIR NOBILITY, &c.

It was upon these same principles that the great Colbert, that faithful minister, protected arts and manufactures. Here were at that time in France a great many factors and commissioners from foreign traders, and very few merchants. He looked

looked upon societies or companies * as the most proper means to engage the French to carry on trade by themselves: and, as among all the examples of commerce that are extant in the several parts of the world, there is none richer nor more considerable than that of the East-Indies; he discovered thereby the importance of navigation and of long voyages; he observed that those voyages not only were indications of the power of a state, but also an infallible means of introducing plenty into it. He was of opinion, therefore, that it suited with the glory of the king, and the interests of his people, to undertake that trade, which Henry IV. and Lewis XIII. could not carry to it's perfection. He determined the king to form the same design in 1664, and to spare nothing for the accomplishment of so great a work, which might be ranked among the most famous transactions of the reign of Lewis le Grand. He formed the East-India company, he protected it with all his power, assisted it with his money, and took upon himself the heaviest charges of the execution, though he would have no share in the profits of the success. You will even find in father Charlevoix, the edit's History of Japan, that knowing the Japanese received in their ports only Dutch ships, and would traffic neither with the Spaniards nor the Portuguese, upon account of their professing the Catholic religion, whereby they became odious to them, this minister proposed that the emperor of Japan should be told, that the king of France had a great many subjects who followed the religion of the Dutch; and that if he thought fit, the king would send ships to him manned by none but those of that religion †. This is called thinking like a minister. The project, however, did not succeed, by reason of the prejudice of the Japanese government, which is terribly apprehensive of strangers, having got intelligence of what passed in the East and West-Indies.

* This is the first step by which all maritime nations cut out their branches of foreign trade; and it is the best way for all new branches to be first established, because companies will hazard what private men will not.
† See Observations upon modern writings, Tom. X. p. 305.

In this manner did that great minister encourage traders to apply themselves to maritime commerce, and to build ships proper for long voyages. That company was not the only one he formed; he established one for the West-Indies, for the trade in the Levant, and for that in the North Seas. He laid out himself for the improvement of the old manufac-

tures, and established new ones; in fine, he gave powerful protection to trade, arts, and manufactures, which he justly considered as the most effectual means to increase the power of the king, and the riches of the kingdom. And, indeed, to say it over again, there is no other way that can bring us in gold and silver.

M. Colbert had the satisfaction to see, that his pains and endeavours were not fruitless, he left trade in a flourishing state: but after him, the face of things very much changed, commerce was ruined, and all the expences he had laid out for the establishment of the East-India company, and what were laid out since his time by his successors, who were no longer sufficient to make that trade advantageous.

Navigation, which is the soul of commerce, procures always a vast profit to the state. The building of ships, their victualling and stores, considerable articles of expence, which, being laid out within the state, furnish several inhabitants with the means of living and enriching themselves. It employs all the inhabitants of the sea-coasts, who can hardly be useful in any other way; and, for want of this navigation, are in a manner necessitated to serve in foreign countries; this is what happened, whenever we gave over sea trade. By losing them we sustain a double loss; our coasts become desolate, our navigation languishes, and that of our foreign neighbours increases at our expence. Prohibitions against SAILORS going out of the kingdom are useless: they are born only for failing, the sea is their element; if we do not employ them that way ourselves, no prohibitions will prevent their going elsewhere to seek for employment.

But we are told, the maintenance of a powerful navy costs the state immense sums of money, which it is unable to support.

To remove this prejudice, we must shew by an accurate and well calculated detail, what was the monthly expence of the French navy in 1681, the most flourishing one that France ever had. Here is an exact summary thereof below *.

This navy, as we know, was as splendid and magnificent as it was powerful. It consisted of 115 ships, of the first, second, third, fourth, and fifth rates, of 24 small frigates, 8 fire-ships, 10 barca longas, and 22 pinks, making in all 179 ships; consisting of 7080 pieces of cannon, 1028 major officers, 7955 marine officers, 20,618 mariners, 10,904 soldiers, the whole crews being 39,477 (the 1028 major officers not included).

* The SUMMARY.

Rate of the ships.	No.	Guns.	Maj. officers.	Marine offic.	Sailors.	Soldiers.	The whole crews.	Pay per month.	Victualling per month.	Cost of the equipment per month.
Rate -	12	1080	108	1232	4132	2486	7850	118,086l.	65,483l. 10s.	183,569l. 10s.
Rate -	21	1518	189	1719	4470	2661	8850	142,776 10s.	74,782 10s.	217,559
Rate -	36	1928	251	2350	6142	3008	11,500	188,329	98,105	286,434
Rate -	26	1088	156	1167	2713	1570	5450	93,942	46,758 15s.	140,700 15s.
Rate -	20	608	119	681	1427	682	2790	55,091	24,356	79,447
Totals	115	6222	823	7149	18,884	10,407	36,440	598,224 10s.	309,485 15s.	907,719 5s.
all frigates	24	400	125	446	937	497	1880	42,397 15s.	16,721 5s.	59,119
re-ships	8	74	16	80	160	240	6064	2130	8194	
arca longas	10	43	20	90	190	280	6204	2475	8679	
nks	22	341	44	190	447	637	14,253	5838	20,091	
Totals	179	7080	1028	7955	20,618	10,904	39,477	667,143 5s.	336,650	1,003,793 5s.
allies	30					3010	3010	72,322 15s.	26,930	99,252 15s.
the whole navy thereof cost							42,987	739,466	363,580	1,103,046

Whose monthly pay when they were equipped, amounted to the sum of	667,143 00 00	
And the victuals per month cost		336,650 00 00
Which makes the sum of		1,003,793 00 00
The 30 galleys, all of them likewise armed, whose whole crew were 5600 slaves, 2400 sailors of one class, 935 of another *, and 3010 soldiers, cost for their pay and victualling	99,252 15 00	} 208,220 10 00
Pay and victualling extraordinary	108,067 15 00	
The expence of that whole navy armed and equipped, would therefore cost per month the sum of		1,212,013 10 00
Supposing the whole to be equipped for six months of the year, a thing which never happens every year, that formidable navy would cost		7,272,081 00 00

* Mariners de rang and mariners de rambades, names taken from the parts of the galley to which we have nothing correspondent in English.

Had all things risen in proportion to the specie in France, says our author, we might say that this expence at present would amount to 12,933,920 livres; because 7,272,081 livres of that time, are exactly equal to 12,933,920 livres of the present. But all things have not risen in proportion to the specie: the salaries or pay of the sea-officers, are much the same as they were in 1681; a seaman of the first class has no more than 15 livres per month; those of the second 13 livres 10 sols, and so of the rest. Provisions are not dearer at this day than they were. This being the case, the pay and

victualling of 39,477 men, who were in the aforesaid 179 ships (not including 1028 major officers) and of the 10,985 men, who were in the above-mentioned galleys, making 50,462 men, which amount, as we have seen, to 7,272,081 livres of that time, would hardly cost more at this day. The additional expence, if it can be called one, will only respect the construction and equipment of the ships and galleys, which we don't comprehend in this calculation, and which, to a mere trifle, might be made up by the saving of those years, when only a part, or at least not the whole, of that navy is

armed, for the whole navy is not armed or equipped every year; when at sea, it is there for ordinary only six months of the year; or when it is not, or but a part of it, the expence is not so high; what is short of it amounts to a good deal, and at the long-run, perhaps, more than compensates the charges of the construction, rigging, and arming of those ships.

Another CALCULATION.

It is agreed among those who know what the construction and equipment of ships is, that a man of war of 60 guns, equipped and victualled for a year, pay, &c. costs 600,000 livres.

	Livres.
Now the pay and victualling for a crew of 500 men for one year, and the pay of the major officers, amount to 160,000 livres, at least they exceed 159,000 livres	160,000
This sum subtracted from the 600,000 livres above, the remainder 440,000 livres is for the construction, the equipment, guns, &c. of the ship. And the common duration of a ship is 20 years, we must therefore reckon for every year only	22,000
A ship of 60 guns, completely equipped in war, costs therefore per annum at most but -	182,000
Consequently 100 ships of that kind would cost 18,200,000 livres per annum: but such a navy is at sea at most but six months of the year. A man of war of that kind, is able to carry provisions for 500 seamen, only five or six months at most. Now the pay and provisions of that ship for six months amount only to	80,000
The construction and rigging as above	22,000

It would therefore be only - - - 102,000

And for 100 ships, 10,200,000 livres per ann. supposing the whole to be equipped six months of the year, which never happens every year; thus we may say, that a navy of 100 ships of 60 guns, would not cost ten millions, communibus annis, all things included; an expence not to be laid in the balance with the honour and advantage, which would accrue from thence to the nation.

In 1681, the expence of 7,272,081 livres, was not more than France was able to bear; the king, however, at that time, had only 116,873,476 livres of revenue *. He enjoys now at least 200 millions: therefore, you will say, he is better able to support that expence, than he was in 1681. That is true if we look only to the tale of pieces, which is at present more than it was then by 83,126,524 livres: but, if we consider that these livres are not the same, we shall find our error.

* See Chap. II. art. 5.

	Marks.
For the 116,873,476 livres in 1681, at 28 livres the mark of silver, made to Lewis XIV. a yearly sum of	4,174,052½
And the 200 millions of livres which Lewis XV. enjoys at present, consist of livres, whereof 491. 16s. go to the mark; consequently his present majesty receives only the sum of	4,116,466
Therefore Lewis XV. receives the yearly sum of 7,865,825 livres less than Lewis XIV. received, amounting to	57,586½

Lewis XV. is therefore really less rich with his larger tale of 200,000,000, than Lewis XIV. was with his smaller one of 116,000,000, though the people are not thereby more eased, abstracting from the price of commodities which has risen. This is a very plain proof, that the rise of the numerical value of money has been disadvantageous to the king and people as debtors. But this does not hinder France from being able to furnish out the expences of a powerful navy; it will be easy for her, if she has a mind, even without burdening the people with new taxes, to find 8, 10, and 12,000,000 a year, if they be necessary for the maintenance of that navy. This expence is the more necessary to France, as she never will be powerful, respected, nor feared by her neighbours, 'till she is mistress of the sea. All the forces she may or can have by land, will never produce the same effect. An army of 20,000 men upon that liquid plain, would procure to her more honour and profit than 200,000 men by land. The Ancients knew, that their power and riches absolutely depended upon maritime forces. They were no less persuaded than Themistocles had been, and than Pompey was afterwards, of the truth of this great maxim, He who is master of the sea, is master of all *.

* History of the Commerce and Navigation of the Ancients, chap. xvi. No. 14. And the French Mercury, Tom. III. p. 226.

The answer given by the oracle of Delphi to the Athenians, to fortify their city with wooden walls, to defend themselves

against the invasion of Xerxes, is an advice which all conquerors have taken to themselves, and which Lewis XIV. made use of so successfully, that his power by sea was become formidable to the English, Dutch, and Spanish, as that his grandfather was weak and contemptible; witness the affront offered by king James to the duke of Sully, which we have mentioned above.

* Notes of Amelot de la Houffaye, p. 238. of the second volume of cardinal d'Orléans's Letters.

The indispensable necessity France lies under to maintain a powerful navy, is also fully confirmed by a discourse upon that subject, delivered by an old servant of the crown, quoted in the 13th tome of the French Mercury, p. 209, & seq. By the letter of cardinal d'Orléans of the 16th of October 1590 to M. de Villeroy, minister and secretary of state *; by the counsel which Antony Perez gave to Henry IV. and by the which cardinal Richlieu gave to Lewis XIII. as we see it in the 9th chapter of the second part of his Political Testament, sect. 5. Now, if in order to be more powerful by land, we must be stronger by sea, and if the prince who is the master of the sea is infallibly umpire of his neighbours, there is no room for demurring: whatever expence a powerful fleet may cost, we ought to lay it out preferably to other things which are less important, since the interest and grandeur of the king the good of his people, and the security of the state require it France may have 100,000 seafaring people, the soldiers of the navy not included. It is her interest to employ and maintain these seamen, they are useful and valuable subjects to their country. I shall here give a particular account of all those who were through the several coasts, and in all the districts of the kingdom, according to the reviews of them which were taken by the commissaries in the month of January 1713, amounting to 92,450 men, viz.

* It is the 84th in that collection of letters published in 5 volumes in 12mo, with notes, by Amelot de la Houffaye p. 237. & seq. of the 2d tome.

	{ Captains, masters	5585
	{ For working the ship	3225
	{ For the steerage	1577

Invalids ditto		12,360

Total of all the seafaring people in all the districts of the kingdom. } 99,450

* They receive no more pay at this day. Provisions, or grain in general, is not dearer now than in 1681. Thus the additional expence cannot fall upon the pay and victualling it can only respect the building and rigging of the ships.

Now the major officers, such as lieutenant-generals of naval armies, commodores, captains, lieutenants, ensigns, &c. of ships, are not included in this calculation; thus we have more than a HUNDRED THOUSAND SEAMEN, without reckoning the soldiers and the gardes marines *.

* These are gentlemen distributed through the several ports, to be instructed at the king's expence in the knowledge of navigation, and whatever belongs to it, who serve as volunteers, out of this body the sea-officers are generally chosen. Is it not very surprising to hear people say, that the French cannot man a fleet equal to that of Great-Britain?

The land forces cost much more than this powerful navy, and they are neither capable of bringing us so much honour nor profit; they can neither make the French flag be respected nor feared so far; they are no sort of protection to our foreign trade, which is the only means of aggrandizing and enriching the state. All the forces we can have by land, will never free us from subjection to maritime powers, nor put us in a condition to humble the pride of those haughty islanders, who believe and call themselves the kings of the sea. [Observe how Britons are here treated!] This we are only to look for from a powerful navy, able to dispute that empire with them, and to oblige them to pay the first honour to the FRENCH FLAG; an honour which is due to it by a just claim, as we shall endeavour to make appear. Attend, Britons, again!

Cæsar, in his Commentaries, speaks of the northern Gauls *

* These are at this day the inhabitants of Normandy and of the Low-Countries. They have always been famous for navigation. See Thuanus's History. According to the geographical state of Normandy by Maffeville, Tom. II. p. 688. we owe to the Normans. The discovery of Guinea, found out by the inhabitants of Dieppe in 1364.

The conquest of the Canaries, by John de Bethencourt, lord de Grainville in the county of Caux, in 1420, and not in 1348, as the author of the History of Navigation alleges, Tom. I. p. 69. In 1479, the privateers of that province took from the enemy 80 ships loaded with corn and herrings. The History of Normandy by Maffeville, Tom. IV. p. 318.

The discovery of the third continent of the world, known under the name of Terra Australis, made in 1504, by Capt. Gouneville of Lisieux.

The discovery of Canada, made anno 1508, by Thomas Aubert of Dieppe.

According to Mezeray, Tom. II. p. 665 of his large History, Guillemot's edition, the people of Dieppe have always had the glory of the sea among the French; and anno 1556, with 19 ships they beat 22 Flemish, larger and better provided in artillery and fireworks, they carried several of them to Dieppe. He adds, that the Normans had more men, that the Dutch were wont to fight with cannon-shot, and the Normans with short arms and by boarding. Thuanus gives the same account of them. And it was by order of king Henry II. that they set out and attacked that fleet. Geographical State of Normandy by Maffeville, Tom. I. p. 142. According to the History of Navigation, Tom. II. p. 19. chap. IV. Nambue, a cadet, of a good family in Normandy, and captain of a king's ship, was the first of all the Europeans, who projected the design, with success, of forming a colony in the American islands, anno 1625.

And, in five, the discovery of Louisiana, made in the year 1676 or 1680, by La Salle Cavalier of Rouen.

We might place at the head of the achievements of the Normans, their conquest of England, anno 1066, and that of the kingdoms of Naples and Sicily, made anno 1070, by the lords of Houteville, of the diocese of Coutances.

as those who understood commerce and navigation, the best of any who were then known, without even excepting those of Marseilles. He highly extols the dexterity of their pilots; he glories in having transmitted to the Romans the manner of building ships, and of navigating, as practised by the northern Gauls. Vegetius has written upon their naval discipline. Sidonius speaks to the advantage of their mariners; he makes them as expert as the pilots of other nations; he says, they know how to obey, as they know how to command. At that time the English knew nothing of navigation; Cæsar says, they had only little canoes of ozier for their fisheries, and for navigating along their coasts.

It is very much to the honour of our nation, that ancient historians find there the oldest and the most expert sailors. Ought not this to put it beyond debate that the first honour is due to the French flag?

At that time, commerce was not looked upon as derogatory to the nobility; it was, on the contrary, the original and support thereof. The Gauls made no distinction in the affair of commerce and navigation; the nobles, as well as the plebeians, traded equally. The trading people, far from being excluded from offices and employments, were, on the contrary, invested with them, as having greater ability and experience than others; for, as commerce and navigation enrich persons, so they make them, also, more capable than others of MANAGING AFFAIRS, and, consequently, fitter for posts and offices*.

* Father Lamy, in his Dissertations upon the Sciences, says, There are none who reason in general with so much good sense and justice, as a merchant does with respect to the affairs of commerce. The reflections and calculations which he is continually obliged to make, accustom him to think. See our article MERCANTILE COLLEGE. And quere, Whether such a course as I have there humbly proposed, would not accomplish persons of distinction for the greatest posts of trust and honour in the state, better than the ordinary scholastic method of education? And whether being a few years conversant with real traffic, would not prove the most useful college for such men of public business?

But the wars with which the Gauls were harrassed for several ages, having too much distinguished from others those who bore arms, by their services and posts, as by the riches which they acquired by the spoils of the enemy; and these having given over commerce, to devote themselves solely to arms, commerce remained only with the populace. A distinction so rivetted by long use, that, whatever laws the kings have made to engage those whom we call the nobles, to cultivate maritime and wholesale trade, by making it compatible with the privilege of their birth, they have always preferred to an honourable commerce, a dull inactive life of IGNOMINIOUS POVERTY, despising the examples of the Ancients, of the English, the Dutch, the Genoese, &c. who, considering commerce in a quite other light than we, live in a happy plenty.

It is navigation and commerce that renders Great-Britain so rich, so powerful, and have enabled that island to counterbalance all the powers of Europe; and yet that country is not equal in extent to the half of France.

It is also navigation and commerce that makes Holland so powerful, though its dominion extends only over seven little provinces, which produce not the twentieth part of what is necessary to the inhabitants; and yet they put to sea a prodigious number of ships, and maintain considerable armies by

land; which has made that small country, as it were, the general treasury of all the nations which their policy has found a way to unite against us; and who, without the assistance of money from Holland, would not be long of breaking their union*.

* That nation has at all times artfully improved every occasion that offered in favour of their commerce, and remarkably the interest that we had in 1678 to disunite her from her allies. This unhappy circumstance determined the king to grant her a renewal of old treaties, and to allow her to explain them as she pleased; which she joyfully accepted, and, in consequence thereof, the treaty of Nimeguen was agreed to, April 10, 1678.

After having said, in the sixth article of that treaty, that the subjects on either side should enjoy a full and intire liberty of commerce in Europe, in all the bounds of each other's dominions, the Dutch added to the former ones that we find in the seventh article: this article is of so much importance and advantage to them, that they have again extended it in the treaty of commerce made at Utrecht, April 11, 1713. This particular regard which the Dutch shew to this article, lets us see that they hold for almost nothing the rest of the treaty, provided we put in execution this article, which is as favourable to them as it is contrary to the interest of our commerce: for this article they made no scruple to withdraw from their allies at Nimeguen, and to be the first who signed the treaty of Ryfwick.

By means of this article, the Dutch enjoy the fertility of our country, and all the advantages of the French subjects: they make a very advantageous use of it, to the prejudice of the natural subjects, and without contributing in any thing to the support of the state. Besides the advantages which this article procures them, they take from the king even the liberty of granting any particular favour to his own subjects, unless, at the same time, he gratifies with it the Dutch merchants: and, by the ninth article, we, in a manner, renounce the Levant trade in favour of the Dutch, who are become the masters of it. The Dutch are not ignorant, that, upon the remonstrances and complaints of the subjects, the sovereign, who owes them justice, preferably to foreigners, is always in the right to make what regulations he thinks proper for the good of the state. To conclude, this article included in the treaty of Utrecht, was limited to 25 years, and consequently it expired April 11, 1738.

Genoa, that formerly magnificent city, has but a small compass of dominion; would she ever have been in a condition to support so many wars, were it not for the riches that commerce and navigation procured her? In what vast expence has she been engaged for many ages, to resist the Venetians, and other people in Italy, to whom her prosperity gave umbrage? How many seditions at home amongst her inhabitants? How many tumults and commotions excited by those famous names of Guelphs and Gibelines? How much must all these have cost her? What vast expence has she been put to by the rebellion of Corsica for these many years past? That article alone, we are assured, amounts to upwards of 30 millions: she is still flourishing after all, and abounds with every thing; in the mean time, she has no other resource but from commerce.

There are numbers of other examples we might cite; but these I take to be sufficient to shew us, that France would reap vast advantages from commerce and navigation, if the taste for commerce could be further promoted in France*. What noble families would then be raised!

* The erection of the India company is a pretty sure means to engage the French to carry on our commerce, and to give them a taste for it; this is a blessing to the state. The maritime trade, which it carries on with success enough, sets us at liberty from the servile tribute we paid to our neighbours before its erection, to be supplied with things we wanted: they took advantage of our supineness, to enrich themselves at our expence.

At all times, the English and Dutch have endeavoured to get us to demolish any considerable sea-ports we have had in the channel. These ports give umbrage to them, and extremely incommode their commerce. But their continual opposition is an invincible proof, that it would be beneficial to our commerce and navigation to have at least one secure retreat for our ships, towards the middle of that bay. Cardinal d'Ossat was sensible how necessary this was; for, in his 90th letter, dated December 18, 1596, he says to M. de Villeroy, to whom he writes, That it is of very great importance to us, that we have men of war in that strait. Now, we can have no ships there without a port for their retreat; I have always heard it said, that, with a little expence, we might make an excellent one at La Hogue, in Lower Normandy. This is the place in the world most proper for raising an important fortress, either for commerce or for ships. It would hold a great many of them; there they would lie in security, and sheltered from every dangerous wind, by making a mole of about 2 or 300 toises, of the great or small redoubt of Morfalines, towards the port of La Hogue, leaving, at the foot of that fort, a convenient entrance for the port, and by digging the bay which the mole would inclose.

We might even cause the port to be cleaned by the river Saire, which is but about the distance of six or seven toises from

from it, and which might easily be turned into it. That port would then be very considerable, and well situated; it has an admirable road; and all who are acquainted with the affairs of the navy, and with navigation, agree; that we ought to labour at it, and improve the advantages of that place, notwithstanding the opposition of our neighbours; for, the more they fet themselves in opposition to it, the more ought we to be sensible that it tends to our advantage. We ought by no means to be afraid of them; this would be to do them too much honour: in a word, there it is we must have a port. The late marshal de Vauban was of this mind; he has, as I am told, laid down the whole plan and scheme of this work. The low jealousy of other sea-ports towns has opposed it; perhaps the interest of the state, and of commerce in general, has not been sufficiently consulted, which ought always to prevail over private motives; but private interest has always numbers of advocates, and the general interest has but few. To make peace, in order to procure to ourselves all the advantages of an extensive commerce, is to make war upon our enemies. Let us have no more to do, therefore, with those victories that are gained by ruinous means; let glory sleep and be at rest. It is in the heart of our plains that industry shall open to us easy paths to greater conquests. May propitious heaven preserve to us a prince whose wisdom measures his glory by the happiness of his people, and a worthy minister, who second his views with so much zeal and extensive discernment. France, superior by the advantages of her commerce, shall make neighbouring states know, that she is as capable of raising her power by peace as by war.*

REMARKS ON NAVAL AFFAIRS before the last war.

We have now seen what has been urged in France*, to spirit up that notion to use every endeavour to augment their maritime prowess; and we have no little reason to fear that they will one day arrive at so great a height therein, as may give them the superior dominion over the seas, which they have so long struggled for. Our author insists, that every power ought to bow down to the French flag, and that this is a right and an homage due by all the powers upon earth to the fleets of this Grand Monarch. Many, too many, I am sensible, will laugh at this, and treat it as the mere galconade of a Frenchman; others, who are really acquainted with the extent of the maritime commerce of the kingdom, the number of seamen they can raise for the equipment of their fleets, and the daily increase of their royal navy, by the almost constant purchase and building of ships abroad and at home, will not think so meanly as some are wont to do, who ought to know better of the naval strength of this neighbour kingdom. Before the last war, was it not sanguinely propagated by some, that the French had no trade, none that ought to give Great-Britain the least umbrage? Has not experience taught us the contrary? Some will yet say, that France has no seamen to man a fleet any thing formidable, nor any ships fit to look the British navy in the face. I am afraid these people talk without book.—Under this head we can only touch the outlines, as it were, of a matter of this concernment; we shall resume the subject hereafter, under the articles SALLORS, SEA DOMINION, and SHIPPING, where we shall endeavour to give an authentic account of the French marine, and of the whole constitution of their naval affairs, leaving others to make comparisons. The author is the last person in the kingdom who would wantonly spread groundless alarms; he has taken some pains to inform himself, not only of the commercial policy of this nation, but of the foundation now laid to raise it's maritime power to a pitch that may some time make Britain tremble, however omnipotent she may think herself by sea at present.—The consequence hereof, I cannot help owning, as a friend to the liberties of mankind, appear to me with an aspect I should not chuse to describe at present.—It is my business to state what is represented to me for facts, before the public; if the danger is at greater distance than we can presume to foresee, none will blame our vigilance, and honest zeal for the public interests, who really wish well to the trade and liberties of these kingdoms.—Do we not see the greatest part of Christendom enslaved by ecclesiastical, civil, and military tyranny? Have we not long enough experienced the refractory politics of the court of Spain? What cardinal point has the nation gained of Spain, from the treaty of Hanover to that of Aix la Chapelle, to make us any compensation for the numerous millions they have occasioned us to spend, and for the thousands and ten thousands of lives they have obliged us to sacrifice? Rather than act with cordiality and justice towards Great-Britain, in consideration of what she has as well borne from her, as done for her, are not depredations still made on our merchants? And we wish that she may not appear ready to join with the first power that may draw the sword against us, instead of doing us right in point of our trade and navigation? Glad shall we be if these apprehensions prove groundless. We, however, think it our duty not to conceal them, but modestly submit them to others.

* See Reflexions Politiques sur les Finances & Commerce de France.

Under the article BRITISH AMERICA, we have set forth the

claims and encroachments of the French in the new world.—We have experienced, by our recent accounts from North-America, that our fears on that occasion have not been chimerical; and what will be our fate in relation to the negotiations touching the adjustment of limits upon the continent, as well as in regard to our island colonies, we do not yet seem to be satisfied.—Under the articles FRANCE, FRENCH AMERICA, and divers other parts of this work, we have represented from facts indisputable, the nature and extent of the French commerce and navigation, and what strides they have actually made to universal empire: we have done the like under the chief provinces of Spain, and shewn, that, instead of doing right to the trade of these kingdoms, she is only studying to advance her own, and that she is absolutely changing her system, from a passive to active commerce, and increasing her maritime strength; all which forebodes still greater and greater evils to this nation in particular.—In regard likewise to the barrier of the Dutch, we have represented, under the article HOLLAND, how importantly necessary it is to secure, without delay, a good BARRIER to the States-General.—Their marine, we well know, is far from being in a respectable condition: so that if France and Spain should unite their naval forces against us, we must stand, as it were, alone; we can have no timely and effectual aid by sea from our natural allies, and very little by land, if their barrier continues unsettled 'till a fresh war breaks out; their councils seem some how perplexed and distracted, by machinations that are apparent to every man who will vouchsafe to open his eyes.—In a word, we wish the affairs of a certain nation may not be so conducted as they are, with a view chiefly to throw dust in the eyes of another nation, that she may be lulled into a lethargy, or diverted from the pursuit of her own safety and preservation, 'till the PROPER TIME may come for the great blow to be struck, by the secret increase of a maritime force, that may prove formidable to all Europe.—Hitherto, all other means have failed them; their military alone they find will not effectually answer their restless intentions; nothing will humble the haughty islanders but a superior naval force, and that they seem determined, at all events, to have, and therefore have been, imperceptibly, at it were, augmenting the same, ever since the late peace, by purchasing English ships, building others both at home and abroad, and filling their magazines with naval stores.—These things have been doing, and are daily doing; but that we should not clearly discern their doings; that this nation should, as much as possible, be kept in ignorance of those measures, and our sight eclipsed from seeing the gradual rise of their naval power, we wish that pretended, instead of real schemes of distraction, may not have been hatched and kept alive, 'till they think the happy crisis is come.—We wish these conjectures may prove visionary; but is it not right rather to be upon the Qui vive than otherwise? In our negotiations since the peace, have we met with that cordiality and disposition necessary to adjust and terminate these misunderstandings between the two crowns? On the contrary, have we not just cause to suspect that they mean nothing less than to settle those points amicably? Upon the whole, Great-Britain should seem, as she is at present circumstanced, to have nothing to trust to but the increase of her naval power; and, if we take the proper measures to supply ourselves with NAVAL STORES of every kind, the money we spend on this occasion will spring from ourselves, and circulate among ourselves, and thereby our very NAVAL EXPENCES may be made instrumental to the increase of the riches of the nation, while they are augmenting it's NAVAL POWER.

However paradoxical this, at first sight, may appear, it is nevertheless true: for, if our naval stores are all raised within ourselves and our plantations, will they not all spring from our own lands, and the labour of our own people? And are not the produce of our lands, and the arts and labour of our people, the great source of all our treasures? Suppose, in order to maintain the British navy in a state of superiority, requisite to encounter every danger wherewith we might be surprized, the nation was to be at an extraordinary expence of half a million a year, for ten years together; if we took no article whatever which concern our naval affairs from foreign nations, this would be half a million a year clear and absolute gain to the nation, and such a real increase of her treasures; for if our own lands were so cultivated as to produce every species of timber necessary for the occasion, as well as we have all provisions within ourselves; and if we could provide ourselves with all pitch, tar, turpentine, and hemp for cordage and sail cloth; if we could also supply ourselves amply with iron of all kinds, proper for the purpose, and every other individual article, from the shipwright and grazier, even to the very ship chandler; would not every one interested in the supply be gainers, in proportion to the additional national expence, from the landed gentleman to the very caulker and rigger by such increase of naval strength? And, while the nation actually possessed an increase in her quantity of shipping, equivalent to the additional expence incurred, we do not see how the nation could be any greater loser by such extra-expence, than what may be allowed for wear and tear, &c. because the

the whole is the additional produce of our lands, our own labour, and our own arts.

If, indeed, by our contracts for 'naval stores, the nation is imposed upon, and made to pay 50, or cent. per cent. more for them than they are intrinsically worth; in such case, the loss to the nation is so much more than the article of mere wear and tear, as the nation is actually defrauded of.—Now, if this be the true state of the matter, we have no reason to apprehend that such an additional expence incurred, and paid within the year, could ever prove injurious to the nation, unless the taxes for that purpose were so laid, as to prove a clog and incumbrance upon our trade; for if thereby the price of our labour, arts, and manufactures, was increased in proportion to the yearly incurred national expence, then the nation might lose in the vent of it's commodities at foreign markets, more than it gained by the augmentation of it's royal navy.—This, among numerous other reasons given throughout our work, should seem to shew, that the present constitution of the public revenue is as little calculated to promote the increase of our naval, as of our commercial power; and, therefore, that it may one day become necessary to think of so gradually changing the present system of the revenue, that it's necessary plight and condition may ever go hand-in-hand with the advancement of our trading interest, as well as the increase and splendor of our royal marine.—This is what all wise and honest men, who are true friends to their country, wish to see happily accomplished; and this is one great point that we shall most sincerely endeavour to promote, with due submission to the judgment of the public.

Certain it is, that the surprizing success of the French in navigation (to which, but in our fathers days, they were almost absolute strangers) is, in our opinion, principally owing to the excellent laws and ordinances which have been established, within little more than half this century, in that kingdom, for the regulation of all maritime affairs; in which their summary and easy method of proceeding has been found to be very beneficial to all that have had occasion to be concerned in it: for the government finding that the only means to have a powerful navy, was to encourage trade and navigation amongst private persons, nothing was omitted that could, in any manner, tend to the advancement of commerce.

And, indeed, if we consider the prodigious increase of the naval strength of France within these 70 years last past, we are obliged to acknowledge, that they have been very industrious in promoting trade; and if, likewise, we examine the measures they have used, we shall find them to be such as seldom, if ever, missed of the desired success, because particular care has been taken to remove every impediment that might obstruct the progress and improvement of their navigation; and the good execution of whatever ordinances they made for that purpose.

We can hardly suppose that any man of sense can take amiss what we say here to the advantage of the naval laws and constitutions of France, as if we hereby seemed to have less respect than we ought to have for those of England. Though the French be enemies to us, we should not be so much enemies to ourselves, as to reject the use of good laws; merely because they are in force amongst them, or have been devised by them. Whatever our practice may be, I can assure you, that they are nevertheless taken with good laws that are enacted in bad governments; and they have, in their affairs of trade, consulted all the laws and statutes in force in every part of Europe, and, by retrenching what therein was superfluous or inconvenient, and supplying what was deficient, with proper regulations for every subject, they have certainly compiled the most complete system of laws for trade and navigation that ever Europe saw. Nor would it in the least derogate from our honour to follow their example in many things worthy of imitation, since all the world acknowledges the reasonableness of that useful maxim,

Fas est & ab hoste doceri.

The French are now so thoroughly convinced of the folly of their forefathers, in despising and neglecting commerce, that, at the beginning of queen Anne's war, an edict was published, tolerating gentlemen to trade by wholesale, either in the mercantile, or any other way, which, till then, was never heard of in France: on the contrary, if a gentleman only married a merchant's daughter, he derogated from his quality, of which they were so ridiculously jealous, that neither merit nor money could induce them to marry below their own condition: but, by the above-mentioned edict, traffic is made consistent with nobility; which has had as successful effects as that nation could desire.

Nor is there, at present, a shorter way for a man to make his fortunes in France, than by projecting any thing that may tend to the benefit of commerce. The famous Colbert was indeed raised to the post of sur-intendant of the finances, by the character that cardinal Mazarine gives of his extraordinary talents for that employment; but his capacity in advancing the interest of the kingdom, by the improvement of commerce and navigation, rendered him a man so necessary at court, that the king neither undertook, nor suffered others

VOL. II.

to undertake, any thing considerable of that nature, without his advice and approbation. He was the principal contriver of the excellent regulations for exchange and commerce in France: and, in a word, being acknowledged by all to be a competent judge of all such matters, a perfect deference was ever had to his opinion about every thing that had any relation to trade.

However, that accomplished minister being sensible, that (considering the other great affairs of state, with which the manifold dignities he deservedly possessed at court necessarily obliged him to be taken up) he could not apply himself so much as he desired to the improvement of the national traffic, which was his darling study; yet he so highly encouraged the industry of other fit persons, and so favourably received every proposition made for it's advancement, that the hopes of preferment setting people's brains a working, the naval and mercantile polity of France was soon reduced into such a system, that could not fail to render it flourishing and prosperous almost all the world over.

Amongst other methods that have been taken for the prosperity of navigation, and the increase of navigators, schools are erected in several places of the kingdom, in which all persons that will repair thither, are taught the theoretical part of sailing, and all things belonging thereto, by the most accomplished mathematicians that the kingdom can afford, who have very HANDSOME SALARIES FROM THE GOVERNMENT FOR THAT SERVICE, which they must perform gratis to all that desire to be instructed: and, what is more, so very desirous are they of providing themselves with able and skilful seamen, that, upon the humble request of any young man desirous to learn navigation, and wanting means to subsist without some other business, during the time that must be employed in that study, A COMPETENT SUBSISTENCE IS ALLOWED HIM BY THE GOVERNMENT; so that instead of paying for the knowledge he acquires in such a useful art, by which he procures a certain livelihood for his life-time, he is paid for his trouble in learning a profession which may easily enable him to subsist handsomely, and frequently to make his fortune. Thence it is that France is very well provided with a great number of able and sufficient PILOTS, GUNNERS, MASTERS, &c. and all other sea officers, both for the service of the king and the merchants; and whether we consider the strength of the French navy, the number of their merchant ships and mariners, or the state of their foreign plantations, the extraordinary effects of the means they have used to encourage navigation will be obvious.

Upon the whole; from an impartial survey of the commercial and naval affairs of this kingdom, one of the greatest causes to which we may justly attribute all the advantages of the French in trade, is the wisdom of their mercantile and naval laws; whereby all persons have been encouraged to engage their money in trade, and so have extraordinarily improved both their own and the public treasure.

REMARKS ON NAVAL AFFAIRS since the last WAR, and the DEFINITIVE TREATY of 1763.

By our successes during the last war, and the new acquisitions obtained by the peace, both from France and Spain on the American continent, and likewise of the NEUTRAL ISLANDS, that are annexed to the crown of these kingdoms; we may rationally enough hope for an increase of our mercantile shipping, by the general increase of our North American commerce, as well as that of the islands of the GRENADOES, ST. VINCENT, TOBAGO, and DOMINICA: and whether that of France may not decrease in proportion as our trade and navigation shall augment, in consequence of the losses they have sustained in America, is a matter that nearly concerns us. For if it does not, and France shall keep up and preserve the same degree of general trade and mercantile navigation, and thereby uphold as great a degree of royal naval power as they possessed before the last war, we have obtained no advantage over them; on the contrary, by entailing on ourselves, so great an increase of PUBLIC DEBTS and TAXES as the last war has cost us, we have so loaded and encumbered our whole commerce, while that of France has not been so to the like degree; though it is to be feared, the GREATER CHEAPNESS OF FRENCH COMMODITIES, and the GREATER DEARNESS OF ENGLISH ONES, will enable France to increase their foreign trade in proportion as ours shall diminish.

To prevent which effectually, it is to be wished that our rulers will embrace every possible measure that can be suggested to give IMMEDIATE RELIEF to our trade, by exonerating the same from as much of the burthen of taxes, as can be devised, and found practicable. For if that is not done, and without delay too, France will soon gain more by dint of COMMERCE, than they have lost by the war; foreign nations giving those the preference in their dealings, who can afford to sell their commodities the cheapest; and the imensity of our present debts and taxes rendering English commodities so much dearer than those of France, whose expences during the last war bore no proportion to those of Great-Britain, their wares in general must necessarily be

to much cheaper compared with ours, that foreigners will not be able to purchase ours, and therefore must be obliged to have those of our commercial competitors: the consequence must inevitably prove the loss of all our trade with foreign nations; and what then will avail all our plantation improvements, be they ever so much extended? If they are enlarged to a degree to enrich and aggrandize the continent of America, may not this in the end ruin the mother-kingdoms? Will not such riches in America, enable the Americans to manufacture every material they shall be able to produce? If they do, will not their greater cheapness of commodities be as detrimental to this nation as that of France? That this injurious effect also, may not follow from our new acquisitions, too much care cannot be taken to prevent those colonies turning to any sort of manufactures that shall at all interfere with those of Great-Britain and Ireland; every improvement that must be suffered to be made on the continent of America, must be restrained to the MATERIALS FOR MANUFACTURES, and those such only that the three kingdoms are not able to afford themselves, and that we are under the necessity of importing from foreign nations: and even with regard to this point, it must be considered, that unless we will take some proportion of the produce of foreign nations, they will cease to take any of ours, and there will be an end of our reciprocal commercial connections.—It must not be forgot neither, that if we diminish greatly in our importations of foreign commodities, our public revenue, the REVENUE OF CUSTOMS, will immediately feel the effects of it, and what will become of the PUBLIC CREDIT? And as we shall decline in our imports from foreign nations, as we may increase in them from our own American plantations, and still keep up the same DUTIES OF CUSTOMS on the one, as we have done on the other, this may prove a great discouragement to our improvements on the American continent.—These things are not suggested to intimidate us from attempting every wise improvement that can and ought to be made in America; these observations are made, with no other intent than to manifest, that the most consummate wisdom is at this time requisite in the conduct of our commercial interest, consistent with those of every other kind.

NAVAL STORES comprehend all those particulars which are made use of, not only in the royal navy, but likewise in every other kind of navigation: as timber and iron for ship-building, also pitch and tar, hemp, cordage, sail-cloth, gunpowder, ordnance, and fire-arms of every sort; also all ship-chandlery wares, &c.

REMARKS.

The principal support of this nation, and the preservation of its commerce and liberties, depending upon the constant respectable plight of its mercantile, as well as royal marine, nothing can be more desirable than for the nation to be in a condition to furnish and supply itself amply and cheaply with every kind of naval stores; for, if we could once be happy enough to effectuate this, even the public by such like national debts, provided they remained in the hands of the subjects of Great-Britain, and no interest money for the same was carried out of the kingdom, could sustain no greater detriment thereby, than what arose from the weight of such interest-money lying, by way of taxation, upon our commerce.

It is well known, that we formerly received our supply of pitch and tar from Sweden; but the Swedish merchants, knowing that the best tar and pitch was made in their country, thought they had an opportunity given them to engross it to themselves, and to send it abroad in their own shipping, and sell it to their neighbours at their own prices. In order thereto, they formed a tar-company, who engrossed the whole; and several severe laws were enacted, that no makers should sell to any but them, and that no ships, either foreign or their own, should load any but for their account, and by their order.

This monopoly gave great uneasiness to our merchants, who thought it a hardship to be debarred bringing home what pitch and tar they had occasion for in their own shipping; for losing that navigation, was putting a number of ships out of employment, and, consequently, paying our neighbours for work whilst our people were unemployed.

They made several complaints, but to no purpose, 'till the year 1703, a war being then declared with France, and, consequently, a royal navy to be fitted out.

Upon examination it was found, that there was not then pitch and tar enough for an immediate supply.

Hereupon several letters were wrote to Dr. Robinson, afterwards bishop of London, then queen Anne's envoy at the court of Sweden, upon that occasion: to which the doctor returned an answer from Warsaw, the 4th of August, 1703, to Sir Charles Hedges, then secretary of state. This letter was copied out, and given to several merchants, that they might see how much it was in the power of the king of Sweden either to forward the fitting out the royal navy of England, or to keep it in harbour.

That we may judge from FACTS what has been our case, I have transcribed the letter.

SIR,

I just now received your honour's letter, of July the 6th, with orders that I should earnestly press the king of Sweden to give such directions about the delivery of pitch and tar, as that her majesty may know what she has to trust to therein.

Upon this subject I humbly take leave to repeat what I have formerly writ your honour, that, on the 27th of March last, I transmitted to the king of Sweden her majesty's letter about this business, and sent it, with a large deduction, to count Piper; whereupon, on the 20th of March, his majesty writ to the college of commerce at Stockholm, that they should give all due assistance to the English factors employed to buy up that commodity for her majesty's service; that for ready money they should be supplied as well with what was wanting for the two former years, as what was desired for this: which letter I sent to Stockholm, where it was in due time received.

Not long after, count Piper told me, The directors of the tar trade had represented it to the king as a great grievance, that they should be obliged to deliver at Stockholm any pitch or tar for the use of the English navy, for that they could to much more advantage carry it thither, and sell it themselves.

I pressed the count very earnestly, that at least the king's letter, which was already sent, might be complied with for this year, and that, if the like was desired for the future, we should give them time for deliberation, whether they thought fit to gratify the queen therein or not.

I had hopes this fair request would not have met with any difficulty; but have lately heard from Mr. Jackson, it has been wholly rejected, and that the directors of the tar trade have declared they will export to England, and elsewhere, all their pitch and tar for their own accounts, and that her majesty's navy shall be supplied at the market-price fixed. This I take to be all her majesty has to trust to on that side; and my humble opinion is, no relief from hence can much mend the matter.

For as it can hardly be expected any new order from the king of Sweden (if procured, which is uncertain) can arrive at Stockholm 'till some time in September; so it is not sure it will then be obeyed more than hitherto, especially considering that, by that time, the transportation of pitch and tar from Finland to Stockholm will be almost over, and the directors will have to say, that they have not the quantity desired.

It would also fall into a hazardous winter voyage, and, in all human appearance, not answer her majesty's occasions; wherefore I am much in pain what resolutions to take.

To repeat her majesty's request to no purpose, and where there may be a tolerable pretence for not complying with it, seems to me to be very improper; and I humbly hope your honour will be of that mind.

Mr. Jackson writes me, in his letter of July 1, That a good sum was then offered to facilitate the matter, but he had no hope it would succeed; I also believe it will not, the count Wrede being so little inclined to contribute, in any case, to a good intelligence between England and Sweden, and none else having any authority in those matters: and, therefore, if these endeavours also fail, I cannot perceive her majesty can, with any certainty, be supplied otherwise than either by buying pitch and tar of those directors, at such a price as they will sell it at in England, or by seizing what they send, whether found by sea or in port, and taking it at a reasonable price. The king of Sweden did the same last year by lead bound for Dantzick; and our merchants there write me, they apprehend it may be so this year also.

The reclaimers, not insinuating upon the advantage they might have had by carrying their lead to Dantzick, offered it at the same price the admiralty of Sweden paid for the last lead they bought; but, instead of that, were obliged to let fall one sixth, and without any composition for the bringing up and detention of their ships. Against this may be objected, That thereby the present occasion may be served, but the uncertainty become greater for the future.

To this I can only answer, That the Swedes must always, by themselves or others, ship out their pitch and tar; and we shall, therefore, hereafter be at so much certainty as now. Besides, as those directors have for many years monopolized and reserved to themselves the transportation of all pitch and tar that goes to Holland; so I judge they intend to do in regard to England also, which, if so, would fall hard both on our traders in that commodity, and on our shipping employed hitherto in a good proportion to fetch it: beside that the price in England would be what the monopolizers pleased.

These inconveniences will, I hope, be considered, and remedied one way or other. I am also of opinion, that, if the war with Muscovy be of any long continuance, and inroads be made into Finland, as most probably will, Sweden will not have such quantities of pitch and tar to send abroad as the occasions of Europe require. Courland furnished some formerly; but, while the Swedes are masters there, none can be expected thence.

It is but very little, and not good, that Norway yields; and I suppose there is but very little certainty it can be had from Muscovy.

What difficulties there are in making and bringing it from New England, I am not acquainted with, but take it for granted, England had better give one third more from thence, than have it at such uncertainties, and in so precarious a manner, from other countries, &c.—The end of Dr. Robinson's letter to Sir Charles Hedges, secretary of state, the 4th of August, 1703.

Further REMARKS before the last WAR.

The Swedes were so fond of their new monopoly of pitch and tar, that an English ship had not been there for six or seven years: and that, when some of our merchants residing there made application to the tar company for a loading of pitch and tar upon an English bottom, offering them their own price in ready money, no interest could prevail, unless the captain would give security not to carry the said loading to London, Lisbon, or any other port where the company had a factory.

The people of England soon took the alarm; the merchants made strong application for making these commodities in our plantations, and therefore that matter was brought before the parliament, who gave encouragement for importing pitch and tar from our plantations, which soon produced very great quantities from thence; they so much increased therein, that we received twice as much as the nation could consume, and were thereby enabled to export great quantities to the Straights, Spain, Portugal, Holland, Bremen, and Ham-burgh.

The bounty given by the government, amounted to a large sum yearly; but what we re-exported and sold to our neighbours, made the kingdom amends for that disbursement; and it brought down the price so low, that both pitch and tar have been sold with us for one third part of the price we once paid for Swedish pitch and tar: and, if this way of supplying ourselves from our own plantations had not been fallen upon, nobody knows how high the Swedes might have raised their price upon us, besides the uncertainty of having them at any price. What was feared soon came to pass, a war in the Baltic was begun, great numbers of our ships were seized on frivolous pretences, and carried into Swedish ports, and condemned as prize, to the unspeakable damage of the merchants of this kingdom.

The lords commissioners of trade being sensible of the great advantage of supplying ourselves with pitch and tar from our own plantations, sent to the merchants to give them an account what other naval stores might be produced and brought from thence.

Their lordships were informed, that if encouragement were given, and the people put in a proper way to begin, all other sorts of naval stores, as well as pitch and tar, might be brought from thence; that the Swedes had laid a new duty on iron of near 25 per cent. and that the interruption of our trade in the Baltic had greatly distressed our iron manufactures for want of iron to carry on their business: and farther, that the Danes had raised their boards from eight or nine dollars, to eighteen dollars per hundred: that undertakings of this nature (as in the case of pitch and tar) would at least lower the prices, and lessen the imports of Danish and Swedish commodities, which then drew from us a most prodigious sum of money. And lastly, it was manifest, that unless we imported about 20,000 tons of foreign iron per ann. our manufactures could not be completely carried on.

For, in the two years before the war began in the Baltic, viz. 1714 and 1715 (in which years we had a free trade with Sweden) above 40,000 tons of iron were imported; and, though in the two following years above 23,000 tons was imported, yet that being short of a sufficient supply, it created terrible complaints among the manufacturers.

Now 20,000 tons of iron, at 12l. per ton, comes to 240,000l. and the boards and timber we received at their advanced price, came to 200,000l. more; and, if they found we could not otherwise be supplied, they would raise the price on us.

Besides all this, it was further urged, that the Danes and Swedes had usually the navigation of all their own boards and timber, &c. in their own shipping; which employment qualified them to breed up seamen, and consequently upon any irruption, to fit out ships for war and privateers to annoy our trade; and, if so great an advantage as bringing the said commodities from our plantations could be brought to pass, it would augment our navigation to the plantations to more than double what it then was, and not only be an additional employment to our ship-builders, and all others concerned therein, as well as to our sailors and seamen, but increase the consumption of our provisions, and other necessaries for victualling and fitting out the said ships; and that as our navigation increased, that of Sweden and Denmark must of course decline, and our new supply of seamen prove a proportionate additional strength to the naval force of this kingdom, which sailors will be ready on all occasions to man out our fleets.

That in the navigation we then carried on to our plantations, it often happened that the crops of tobacco and sugar, &c. fell short, so that many of the ships were forced to come home dead freighted, and some lie a whole season for the next crop, which (if encouragement was given for bringing timber and naval stores from our plantations) would, upon such disappointments, be sure of a loading.

These accounts were received with great satisfaction by their lordships; and the merchants, to promote so good a work, waited on the ministry at the board of trade, who heard and thoroughly examined what the merchants had to offer.

After their lordships had been attended at a great many meetings, and received full satisfaction, that it would be greatly for the advantage of this nation, to be supplied with naval stores from our own plantations, and very much enlarge the exportation of our woollen and other manufactures to these plantations, a motion was made for bringing a bill into the house; which was accordingly agreed to, and passed the commons with a clause, That no person or persons within the said plantations, or any of them, shall manufacture any iron wares, of any kind whatsoever, out of any fows, pigs, or bars whatsoever, under the penalty of one part to such person or persons as shall seize or sue for the same, to be recovered in any of his majesty's courts of record at Westminster, or court of Exchequer in Scotland, courts of admiralty, or other courts of record in the plantations, &c. the proof to lie on the possessor. By this clause, no smith in the plantations might make so much as a bolt, or spike, or nail.

This clause must, indeed, have put the colonies into a most miserable condition, the smith being above all other trades absolutely necessary for carrying on all other employments: among the rest, that of ship-building had by it been utterly destroyed, though by this article they make a great part of their returns to England for purchasing our manufactures. And there was another clause added in the house of lords, That from and after the 25th of December 1719, no forge going by water, or other work whatsoever, shall be erected or kept up in any of the said British plantations, for the making, working, or converting any fows, pigs, or cast iron, into bar or rod iron, upon pain, that if any person from thenceforth erect or keep up, or cause to be erected or kept up, any such forge, or other work, for the use or purpose aforesaid, such person so offending, being thereof lawfully convicted in any of his majesty's courts of record at Westminster, or in the court of Exchequer in Scotland, or in the court of admiralty, or other court of record held in such plantation, where the offence shall be committed, at the pleasure of the informer, shall, for such his or her first offence, suffer six months imprisonment without bail or mainprize, and for every other such offence shall suffer six months imprisonment without bail or mainprize; and all governors or commanders in chief of the said plantations, and every of them, now and for the time being, are hereby strictly required not to suffer such forge, or other work to be erected, or kept up, in any of the said plantations within their respective governments, contrary to the true intent and meaning hereof; and, if any of the said governors or commanders in chief, shall willingly or wittingly offend or be negligent in doing his duty herein, upon complaint and proof made thereof before his majesty, his heirs and successors, or such as shall be by him or them thereunto authorized and appointed, by the oath of two or more credible witnesses, the said governor, or commander in chief, so neglecting or offending, shall be removed from his government.

This second clause must have ruined all those iron works in the colonies, to the great loss of the proprietors of them, and given the French a much fairer handle to tempt them into their settlements which join to ours, than the scarcity of iron gave them to entice away our artificers.

Which being duly considered, those persons that were solicitous for the benefit of the public, desired the bill should be dropped that session, that the members of both houses might have time fully to inform themselves of the advantages thereof. Those gentlemen who chiefly opposed this undertaking, were concerned in iron works, who, on the before-mentioned interruption of the trade with Sweden, raised their iron to an extraordinary price: they did all they could to obstruct the bill; they reported, it would hinder the exportation of wrought iron to the plantations, that it was only a trick of some stock-jobbers, and that it was carried on by some persons that had a grant from the crown of some part of Nova Scotia, &c.

All which were groundless insinuations; for there never was a design of making a stock of it, nor were any stock jobbers ever concerned in the soliciting it, much less did any person concerned whatsoever, think of a grant from the crown; neither was Nova Scotia the place intended for carrying on the aforesaid business, or thought to be proper for the said undertaking.

But, as the people of New England, New York, Pennsylvania, Carolina, &c. were under great necessities for English manufactures, and an incapacity of providing commodities to pay for them, preventing the English merchants from send-

ing them those large quantities that might be a sufficient supply; and, as inevitable necessity put them upon manufacturing for themselves, therefore this NEW EMPLOYMENT OF PROVIDING NAVAL STORES, WAS PROPOSED TO TAKE THEM OFF THE MANUFACTURES THAT INTERFERED WITH OUR OWN.

At length, however, the wisdom of parliament judged it expedient to grant a bounty on pitch and tar, which we shall see hereafter.—This was but a small advance to supply ourselves with naval stores in general.

Hemp and flax are so useful in navigation and trade, that we cannot possibly do without them; the first for cordage of all sorts, the latter for making sail-cloth, as well as for the linen manufactures that are carried on in this kingdom; and the late Czar of Muscovy being sensible we must have our supply of hemp, &c. from him, did, as the Swedes by their pitch and tar, make a monopoly of it in a manner; and the Russians had their own price for it, in ready money or bills of exchange, and the rest in such goods as they thought fit.

Upon which it was urged by those who understood the public interests; (1.) That the necessity we were under for those commodities, ought to put us upon all imaginable care and study how to provide them, lest we should happen to be under the same necessity for them, that we were in the year 1703 for pitch and tar, when the government of Sweden, as observed, absolutely refused to let us have them for our ready money, otherwise than in their own shipping from their tar-company here at their own price, and only in such quantities as they thought fit. Upon that disappointment, the government, by allowing a considerable encouragement for carrying on the manufactures of pitch and tar, had sufficient quantities from our own plantations; and it is greatly to be desired, the like encouragement was given for raising hemp and flax; for since we have plantations where hemp and flax and all sorts of naval stores may be raised, with so many and so great advantages to this kingdom, it would be unaccountable to leave us dependent and at an uncertainty for them, and to be supplied only by a prince that will be paid for them just as he pleases.

(2.) That it is very well known, our land in general is too dear for raising hemp and flax, and what is grown here (though it is tough and makes strong linen) neither dries so kindly, nor whitens so well as that which grows in warmer climates. In Russia the best hemp and flax grow in the southernmost parts of the kingdom, where the summer is hot, and the air clear, and yet the flax is not accounted so good as that which grows in Egypt or Italy.

Egypt has always been esteemed for its linen, and now supplies Leghorn with quantities, and the coast of Syria, Asia Minor, Smyrna, Constantinople, and other great cities, have a supply of hemp and flax from thence.

All our colonies (which run twelve or fourteen hundred miles in length, and all the way border upon the sea) have very hot summers, the southernmost parts of them lie near the same latitude with Egypt, and the north part much about the same with Ancona, or Bologna in Italy, where excellent hemp and flax grow, therefore we have the greatest prospect to receive mighty supplies of hemp and flax from them. Part of the land in the colonies is very rich, and of so small value, that there will be opportunity of breaking up fresh as often as there is occasion to change the ground; which, if laid down, will recover itself again without the charge of manuring, as we do here, to the very great damage of our ploughing lands. Nothing impoverishes land more than hemp and flax, and though it is manured, that alone will not do so well, for the land ought to be changed after three or four crops, and generally the finest and fattest pieces are converted to that use.

Those great conveniencies of having land so very cheap, and so fine a climate, which we know produces excellent hemp and flax, so commodiously situated along the sea-coast, with such numbers of large rivers running up the country to the most inland settlements, where provisions may be raised at so small a charge, and where work may be done by the labour of slaves, almost as cheap as it is in India, give ground to hope, that we may manufacture linen here cheaper than any part of Europe can import them upon us; and the colonies be as profitable to us, by raising rough materials to carry on the linen manufacture, as the Susses and other downs are for supplying wool for that manufacture, the profits of which we have valued ourselves so much upon, that we have set the rest of Europe to be our competitors therein.

However, a great deal of the value we set upon it proceeds from mistake, we think abundantly more of it than it really is; the foreign linen and Flanders lace, linen yarn, and naval stores imported into this kingdom, being supposed to amount to more than the exports of all our woollens. The manufacture of linen in Britanny, and other parts of France, forty years ago, was thought to be better to them than the woollen to us; for it was generally allowed we took above a million a year from them, and Portugal, Spain, and the Spanish West-Indies, twice that value, besides what other countries took.

Indeed, they have in some measure lost their trade with us; we now receive little from thence, but what comes by stealth, or under the denomination of Swiss linen through Alsatia,

their cambrics excepted, of which I have elsewhere taken notice. And now the emperor of Germany's hereditary countries, and other parts of the empire, have gained the supplying of us, which has made them very rich and powerful. Now, as the woollen manufacture, especially the coarse part, has spread itself of late into several parts of the kingdom, which has exceeded the demand, and caused great stocks to lie by, if those rough materials of hemp and flax were prepared in our plantations, the people in North-Britain and Ireland, &c. would soon find the advantage of falling upon and advancing that manufacture; the laborious and coarse part being performed abroad, the rest would invite not only the poor and necessitous, but people of better circumstances to employ their time in it.

If these propositions are heartily put in practice, we may hope; that by providing the aforesaid rough materials, we should have the delightful prospect of seeing trade flourish; for, as the silk and linen manufactures, where brought to perfection, are altogether as profitable to those nations, as the woollen now is to us; and as we increase in our linen manufactures, those of Silesia, and all the emperor's hereditary countries, from whence we take such quantities, must abate of course; their people will also resort to us, and help to carry them on; for it has always been observed, where new manufactures are set up, and take away part from another country, the manufacturers will likewise remove: this was the case of the Flemings, when queen Elizabeth gave such great encouragement to have the woollen manufacture removed hither; and ours when we had that inundation of China and India wrought silks, our weavers went to Holland, Flanders, France, &c. and several streets in Spitalfields were almost desolate; and when those silks were prohibited, the manufacturers returned again.

It has been computed, that the Russians export to England and all other parts, in hemp and flax, above the value of a million a year. If hemp and flax be so valuable a product for merchandize with them, there seems to be much greater prospect of enriching ourselves, by raising them in our plantations.

1. Because they will not be subject to any land-carriage, but shipped immediately from the place of growth.

2. Because land is much cheaper in our plantations than in the four parts of Russia.

3. The climate being equal with that in Egypt and Italy, is supposed to produce hemp and flax preferable to theirs.

Sir Josiah Child says, That in the plantations of sugar and tobacco, every white man there employs four persons at home; he means, we suppose, in providing clothes, part of their food, and all sorts of utensils for carrying on their business. If sugar and tobacco employ such a number of hands at home, certainly every person employed in the plantations in raising and dressing hemp and flax, must, by his labour there, return more than twice the advantage that can be produced by sugar and tobacco; for they are manufactured in the plantations, the refining the sugar, and cutting tobacco, with the little quantity that is rolled, excepted; whereas flax and hemp are materials for employing all idle hands, and of consequence the poor's rate will soon be abated, and the nation will find in a little time what they save yearly thereby, will be more than sufficient to encourage the people to begin that employment.

We mention part of the poor's rate, because they must be maintained by our lands, if employment is not provided for them; and abundance are thrown upon the parishes for want of work, others make that a pretext for their begging from place to place: but, where workhouses have been built, though materials for employing the poor are scarce, yet some public-spirited men have there maintained them for half the expence they were at before those workhouses were erected. [See the article POOR.]

This shews what good oeconomy can do, and the happiness it is to those places, which have such gentlemen to direct and assist them. We may observe here, that together with the produce of hemp and flax, silk may be raised by the same hands, [see the article SILK,] and not interfere the one with another; for, after the sowing of hemp and flax, the mulberry-leaves come to be in perfection for feeding the silk-worms; and the silk-harvest (as it is called) is over before hemp and flax are ripe: thus the persons employed in the silk may turn their hands to that of hemp and flax, the breaking and dressing of which, may be work for them all the rest of the year. The stocks and utensils to be employed in them, will cost but a small matter. If such a public spirit prevailed now for promoting the general interest of the nation, as did in our nobility and gentry upon the first settling of our plantations, I am persuaded, that we may raise sufficient quantities of rough materials for carrying on all our home manufactures.

And, if once we come to be amply supplied with hemp and flax by the aforesaid methods, every place will be filled with flax-dressers, and the overseers of the poor of every parish, where the wool-spinning trade is not carried on, may very easily come at hemp and flax, which they will find as profitable to them, as the woollen is to the other; and the more distinct

distinct the employment is, the better, for many inconveniences have attended one manufacture interfering with another; beside, there will be an intercourse of trade created, by one part of the kingdom supplying the other with their distinct manufactures; this will give full employment to the whole kingdom, and an universal cheerfulness to every body: for the poor are never happier, nor their minds easier, than when they have full employment; and when they are employed, riches are diffused over the nation.

It has been a common opinion, that we have above a million of people in the three nations destitute of work; but, if those rough materials should come to be raised in our plantations, there need not be one idle person. Suppose that one million of people were put upon manufacturing those rough materials, and each person earned but 1 d. a day, and allowing but 300 working days in a year, it would amount to 1,250,000 l. Now, as we have already said, the importation of foreign linen, Flanders lace, and naval stores in general, amount to more than all our woollens exported; it is astonishing that so wise a nation as this, does not take care to regulate those matters effectually, and have the greatest part of those sinens made in the three kingdoms. See the article LINEN. All other nations of Europe are so wise, as to make linen enough for their own use, Portugal, Spain, and what is imported into Italy, excepted; and, if the government does not take care to put those poor people into proper regulations and employments, they must continue in misery and want.

Setting up the making of pitch and tar in our plantations, was very advantageous; there was, indeed, very great encouragement given to begin that undertaking, which had it's desired end, and vast quantities of pitch and tar were imported; and it is hoped the proper encouragement will be given for every other kind of naval stores, that the Swedes and Russians, &c. may not retain so considerable a share of the importation of that commodity upon us.

Our plantations in America abound with vast quantities of timber, and the navigation from New England, Nova Scotia, or Newfoundland, is not more tedious, nor at a greater distance from us than the bottom of the Bothnic gulph, or Peterburgh: but those places have been long in trade, and having a constant demand from us for that commodity, they always have great stocks of timber ready squared, and boards lying ready to load a ship of five or six hundred tons in ten or twelve days; but hitherto we have never had stocks lying ready in our plantations, nor due encouragement for building large bulky ships, such as are used by the Danes and Swedes, who sail with a few hands, and at a small charge. What timber we have had hitherto come directly to England, has been rather put on board to fill up, when tobacco or other merchandize has not been to be had; and therefore, no care has hitherto been taken to make a regular trade, which may deserve further consideration. See the article TIMBER.

They have iron-stone all along the Continent, from the southernmost parts of Carolina, to the northernmost part of New England, in great plenty; some of it, upon trial, has made extraordinary good tough iron, and very good steel.

No part of the world abounds more with prodigious quantities of wood, nor has more rivers and streams than that part of the Continent. There is so much wood, that the great charge of the planter is to clear the ground.

And, as no one undertaking consumes so much wood as plenty of iron works, if they were erected, the land would be cleared of the wood, the air purified, the ground made fit for hemp and flax, and the best timber might be preserved for bringing home.

In charcoaling the wood, there will be a very good opportunity of drawing pitch and tar out of the pine-trees; and no wood, according to the best observation, makes better charcoal for iron works: and all this without any other charge, than providing fuel for the iron works; such a dependency have these operations one upon another.

And, as there are so many circumstances that attend the making iron in our own plantations, if due and effectual encouragement be given*, it may be brought to a very great perfection, and such quantities made, as to exceed in value any other product of our plantations.

* It is but within these few years that they have had any encouragement for the making of pig and sow iron, which is extended to pig.

Iron is a commodity of universal use, staple, and certain in all parts of the known world; consequently as much to be valued as silver or gold; a commodity that will be carried every-where as ballast, at little or no charge.

And, whereas the Dutch do supply Portugal, the Straights, and Turkey, with great quantities, if we could be so happy as to have a full supply from our own plantations, either by adventurers from hence, who would lay out their estates in erecting iron works, or in exchange for the woollen or other manufactures, which we export to those places; we should not only ballast our ships with iron, but export great quantities, not only all over the Straights and Turkey, but even

VOL. II.

to India and Africa, and soon become masters of a good part of the trade.

And, as we were once dependent on the Swedes for pitch and tar, we must remain so still to them for iron, as we must to Norway and to them for boards and timber, and to Muscovy for hemp, unless some effectual care is taken to relieve us from such a dependency: it may one day prove highly dangerous, as it heretofore has done, to depend upon any power whatever, for any essential branch of our naval stores.

Further REMARKS on the benefits we may reap from North America, by the DEFINITIVE TREATY of 1763.

That our plantations are really able to furnish a sufficient quantity of hemp, flax, tar, pitch, turpentine, fir, timber, deal-boards, masts, yards, pipes, and hoghead-staves, fully to supply the whole demand of Great-Britain and Ireland, has been taken for granted by many; so as that we should suffer no scarcity, or want of those goods, though we should absolutely prohibit their importation from any other place, after they become once well established, in regard to NAVAL STORES in general.

By being able to furnish ourselves, must be understood thus; for we must not speak more for them, than our plantations do for themselves; and it is necessary to be very exact and explicit, in what we call the first principles: we would not be understood to mean, that, at present, they have hands enough to fell and cut out the quantities of timber, &c. draw and extract the tar and turpentine, split out the staves, &c. raise the hemp, and make the iron necessary for our ample supply; for that may still be a difficulty for want of hands, but that this is not invincible, see the articles PEOPLE and POOR; but we mean that the country and the woods, have a sufficient quantity of all these; that they are not to be planted, or waited for till grown; they have a boundless extent of woods, as well on the hills as on the plains, unexhausted, and, indeed, unexhaustible; which are sufficient for all our demands, and much more.

Likewise we do not say or insist, that they do now produce or plant a sufficient quantity of hemp and flax to supply our demand; but that they have land enough, sufficient in strength of soil, and sufficient in quantity, and which, by cutting down the woods, would daily increase: this we think is undoubted.

The countries where this supply of timber and naval stores would be produced, are, in a word, the whole English part of the continent of North America, viz. New England, New York, East and West Jersey, Pennsylvania, and all the country, whether possessed or no, upon the great river of Delaware, as far as that river is navigable.

All the colonies of Virginia and Maryland, to the bottom of the bay of Chesapeake, all the colonies of North and South Carolina, and all the rivers thereof; in which last colony alone, they tell us, there is as much fir timber growing, as in all the kingdom of Norway.

Likewise it is to be added, that, mutatis mutandis, the coin and value of payment considered, they will be able to furnish all these things as cheap as the east country and Norway trade does furnish them.

These things granted, the proposal for amply supplying ourselves with naval stores, has been reduced to a narrow compass; for it has been urged, that all the difference then between England (the market) and our colonies, the producers of these goods, lies in the price of the freight, occasioned by the distance of the place, and length of the voyage; how to bring this to a par, is the whole of the enquiry: and this is to be done by the several methods following.

N. B. Bounties and payments of dead money to the importer for encouragement, has been rejected by some, as being a mere charge upon the nation, though not upon the particular buyer of the goods, and is not by any means to be called a lessening the disparity, only it removes the burthen from private hands to the public, which is not sufficient; and should it extend to all the importations, would be a burden too heavy to bear, even for the whole nation.

The only weight, therefore, we would lay, say the proposers, on the public, and even that but for a while, is to take off the duties entirely from all those species of goods (not to repeat them) and prohibit the importation from other places; and not this last part neither, till the colonies were fully entered into the trade.

Then for the freight; we are to suppose, that the freight of all these articles, from the east and north seas, stands now at a medium of forty to fifty shillings per ton, call it more or less: and suppose the freight of the same goods from the colonies should then stand at a medium of six to eight pounds per ton, so that the freight would be three times as much one way as the other: it is true, this is a very considerable article, and especially considering them likewise to be all bulky goods. But two articles will immediately contribute towards, if not be a full equivalent to, this excess of freight.

First, Taking off the duty upon importation here, which being very high, suppose it for argument sake to be 20 per cent.

may fairly be calculated at one half of the difference, and must be found by the importer in the price of his goods at market.

Secondly, Laying an impost, suppose it to be about ten per cent. upon all the importations of English goods into those colonies, and this, we conceive, will be equal to the other half: the money so raised to be paid to the commanders of the ships, in such proportions as shall be adjudged by the public, and upon so much tonnage only, as is laden upon them of such particular goods.

The colonies will never complain of such a duty, because it is in a manner paid to themselves, and is but taking the money out of one pocket, and putting it into the other; the growth of their country will be exported (indeed the waste growth, for they burn a great part,) their own people will be employed, and will be prodigiously increased, and these two are of the last importance to them; that give them but an assurance of these, they may give you assurance, that in a few years they will be the greatest, and most prosperous colonies in the world.

I acknowledge, I despise (with the utmost contempt of their ignorance) the suggestions of those times, when this glorious scheme of New England's prosperity was laid aside some years ago, from a pretended jealousy of those colonies growing too powerful, and making themselves independent; insinuating, because they were independent in a religious profession, they wanted to be so in government; whereas first, the very thought, besides a worse principle it began in, viz. of party malice, was to the last degree weak and foolish; since it is evident, the prosperity, and, indeed, the very being and subsistence of New England in matters of trade, consists in, and depends wholly upon their union with, and subjection to Great-Britain, as the principal growth of their country, which is the only article that supports their commerce, is taken off but by the English, and the same of the rest: for example,

The provisions of North America are the mere growth of the country, such as flour or meal in barrels, pease, malt, rice, and tobacco; beef and pork, pickled and barrelled; sheep and horses alive; beer in casks and in bottles; white fish salted and dried; and salmon barrelled; besides lumber, for building and repairing as well houses as ships, and ships and sloop ready built and finished.

These all are the product of the country, and the labour of the people in the colonies of New England, New York, the two Jerseys, Pennsylvania, Virginia, and Carolina; without this export, those colonies would perish. It is true, the islands would starve for want of the provisions too, at least at first: but, on the Continent, if the islands did not take off their product, the lands, which they have been at a vast expence to cure, and clear, and plant, would lie useless and uncultivated; the swine, which the woods feed for them by thousands, would over-run them with their multitude, and be worse to them, in time, than the bears and the wolves; their plantations would produce more of every thing than their mouths could devour, or than they could find markets to vend them at; their timber would stand, indeed, where it was, for no body would fell it to have it, and they may set their woods on fire, as they did formerly, to clear the land of them.

In a word, this being their case, their interest ties them to England, though their duty should not; and, to separate from England, would be to be undone.

Then carry the same argument on to the purposed commerce, for timber, naval stores, &c. this would still bind them the faster to their dependance on England, for no nation in Europe could give them the same encouragement. We need not enlarge upon this article here, it is evident to all that understand trade.

Let us then return to the proposal: having thus stated the equivalent, by which the government may be reimbursed what they shall be out of pocket for the complete trial, it remains only to give a brief account of the advantages of such a commerce: take them in a few short heads.

I. Instead of the trade for deals and timber, tar, masts, &c. which we carry on now with Norway, almost all for ready money, and which carries out more silver in specie, nay, in our very coin, crowns and half-crowns, than the East-India company itself, however little notice has been taken of it: we say, instead of this disadvantageous trade, we should then receive all the same goods in exchange for our own manufactures, and they would be purchased of, and produced by the labour of our own people, the industrious planters, subjects to the government of his majesty of Great-Britain.

II. Instead of having at least two-thirds of these goods brought over in foreign bottoms, Danes and Swedes, and the ships navigated by foreign seamen, to whom we pay dead freight in the like ready money, and which they carry away in specie, as before intimated, it would be wholly brought to us in our own ships, New England built, and navigated wholly by our own seamen.

III. Instead of a very few English ships, which now use the Norway trade, this new commerce would at least employ a thousand sail of ships every year, and all the year, and most

of them ships of burden: so that, besides the benefit of building, repairing, and fitting out so many ships, it would be a new nursery of seamen to us, having always 15 to 20,000 seamen employed therein.

IV. The colonies would be increased in people beyond expressing; and, consequently, not only the consumption of provisions would be increased there, which is, as said before, the grand fund of their prosperity, but the consumption of manufactures, and all European exportations to them, would be increased in proportion.

By the calculations which have been made, it is supposed that not less than 100,000 men would be employed in the woods, in cutting and felling timber, deals, masts, yards, &c. in the managing and planting of hemp and flax; in the extracting and drawing off the tar; and in preparing all the articles mentioned, to be fetched from thence on account of this trade; and besides the building ships among them, an article so considerable, as well deserves to be handled by itself.

V. It would effectually furnish those colonies with returns for England, which they are now greatly distressed for, in order to pay the balance of their trade with England; the quantity of our manufactures which they take off, infinitely exceeds what they have of their own growth to send us in return: whereas, in case of such a trade for the produce of their country, they would be at about a par with us, and we should always be able to call for as much goods from them as would pay ourselves.

VI. By this means they would receive silver in great quantities from Jamaica, and the other islands, for all that trade would be clear gain to them; and that silver also would remain with them, which now it cannot do, the bulk of it being snatched up for returns to England in specie, though it be sometimes to their great disadvantage; so that, in consequence of this commerce, there would be a circulation of current money in the colonies on the Continent, a thing they have too long been strangers to.

It would take up a volume by itself to lay open all the glorious schemes of improvement in trade which would be the consequence of such a business, and particularly THE INCREASE OF OUR MANUFACTURES HERE, BY THE DEMAND OF GOODS FROM THENCE, WHEN THE NUMBERS OF PEOPLE IN THOSE COLONIES SHOULD BE THUS INCREASED: let any one calculate that is able to judge of these things by what it is already, what it must necessarily be on an increase of people: let them compute the exportations to the colonies on the continent at present; let them consider those exportations to be as they really are, one intire improvement, derived from mere nothing, or next to nothing, in the LAST HUNDRED YEARS, for then it was all an embryo, and some of them were not in being as to trade, viz. New York and the Jerseys, conquered but in 1666 from the Dutch, Pennsylvania not above 70 years growth, Carolina and Georgia less.

Let them tell us, or but guess at for us, what a glorious trade to England it would be to have those colonies increased with a MILLION OF PEOPLE, TO BE CLOATHED, FURNISHED, AND SUPPLIED WITH ALL THEIR NEEDFUL THINGS, food excepted, only from us; and tied down for ever to us, by that immortal, indissoluble band of trade, their interest, which wisely regulated, need never injure, but unspcakably benefit that of the mother-kingdom.

Let them consider, that all those people must fetch from Great-Britain only, their cloaths, woollen, linen, cotton, and silk; all their haberdashery; all their manufactures of hard ware, wrought iron, brass, &c. all their heavy ware, such as cast iron and brass, guns, mortars, shot, shells, pots, cauldrons, bells, battery, &c. all their clock-work, watch-work, even so much as their toys and trinkets; all their house-furniture, kitchen-furniture, glass-ware, upholstery ware, tin-ware; in a word, almost every thing we make, and every thing we import: it would be endless to repeat it.

How preposterous must those notions be, and how oddly must they think, if they can be said to think at all, who suggest mischief from the increase of our colonies! Do any other nations act thus? Do even the Spaniards think their empires of Mexico and Peru, Chili and St. Martha, too many and too great, though a hundred times as large as those we are naming, and though they drain even Spain itself of people? Were the French jealous of the number of their people in the vast countries of Canada and Louisiana before they lost them? Did they not, and do they not study, by all means possible, to increase them, and to extend their plantations? See the articles BRITISH AMERICA and FRENCH AMERICA. Might we not with wise management have people enough to spare? Do we not increase 'till we are ready to eat up one another, we mean in trade? And can we not spare enough of the unprofitable part of our people, those who are rather said to starve among us than to live? who, if they were well settled there, would be industrious, thrive, and grow rich; and it is by the industrious that trade is supported, and wealth increased.

Let us no more amuse ourselves, and raise the vapours with our phlegmatic thoughts about every little German incroachment on our manufactures, and the prohibitions of a few petty princes in the North: here we can raise a consumption

N A V

of our manufactures, superior to all the obstructions they can give us; here our manufactures will never be prohibited; here the demand for ever will be increasing with the people; it is like a mill built by the lord of the manor, it grinds for all his tenants, and is kept going by his own stream; so that on one hand, it can never want work, and, on the other, can never want water.

We have no room to say more, though we scarce know when to leave off. We will conclude with observing, in a few words, that here is the greatest opening for a very great advancement of our trade, and the easiest to put in practice, that ever was proposed, or perhaps can be proposed to this nation; and, till we enter heartily and vigorously into it, in its full latitude, we ought never to complain of the decay of our trade, or of the want of a vent for our manufactures.

As the increase of commerce and people in our colonies is, in consequence of our property in them, an increase and improvement of our trade in England, and, in particular, an increase of the consumption of our manufactures; so it is a natural inference, and evident to demonstration, that an increase of colonies must have the same effect, PROVIDED, I MEAN, THAT OUR COLONIES ARE DULY REGULATED IN SUBSERVENCY TO THEIR MOTHER-KINGDOM, BUT NOT OTHERWISE.

We may, therefore, lay it down as a fundamental maxim, that additional colonies, where the people may plant and settle to their advantage, is a visible improvement to our national trade.

Employment of our people, or, as we call them, our poor, is the great support of our VERY BEING AS A NATION; without it, the poor will eat us up, the parish-rates will devour not the produce of our land only, but the land itself; and the church-wardens will call upon you for 20s. in the pound for your beggars.

This employing of the poor is the effect of OUR MANUFACTURES; but, as our manufactures employ the poor, so trade carries off THE MANUFACTURES, or else they would soon over-run the consumption, and come to a full stop: THE MANUFACTURES SUPPORT THE POOR, FOREIGN COMMERCE SUPPORTS THE MANUFACTURES, AND PLANTING COLONIES SUPPORTS THE COMMERCE.

Here you dispose of your increasing numbers of poor; they go there poor, and come back rich; there they plant, trade, thrive, and increase, even your transported felons, sent to Virginia instead of Tyburn; thousands of them, if we are not misinformed, have, by turning their hands to industry and improvement, and, which is best of all, to honesty, become rich substantial planters and merchants, settled large families, and been famous in the country; nay, we have seen many of them made magistrates, officers of militia, captains of good ships, and masters of good estates.

This way, therefore, we may dispose of the growing numbers of our poor to an inexpressible advantage, as well to a public as a private one: it is a private advantage, as it is really a benefit to the poor that go freely and voluntarily. We would not be thought to insinuate the transportation of the poor; that would be sending them away because they are poor; but those who being destitute of employment here, that are willing to seek it abroad, would have a visible advantage, and would soon give encouragement to others to follow them, and thousands of such families would raise themselves there by their industry, and grow rich; for, WHERE WAGES ARE HIGH, AND PROVISIONS LOW, as is the case there, the labourer must be idle, or extravagant, or thrive, and grow rich; and the consequence of the diligent labouring man there is always this, that, from a MEER LABOURER, HE BECOMES A PLANTER, and settles his family upon the land he gains, and so grows rich of course.

The advantage of the public we have spoken of, though but briefly: we shall only add here, that, besides the increase of commerce and people, it necessarily makes an increase of seamen; all this growing commerce, to and from our colonies, must be carried on by sea; all the commerce they can have there, one colony with another, must be the same: the first by large ships of force, the last by sloops, ketches, and small ships. The increase of the people increases the trade; the increase of the trade increases the number of ships, and the increase of ships calls for an increase of seamen: thus your strength, as well as wealth, grows with your colonies, the climax is very agreeable in prospect.

Whence that the advancement of our established colonies, and settlement of new ones must prove highly beneficial; which is, without question, extending the commerce; it is enlarging the field of action; it calls in more hands to assist in the public prosperity; it employs profitably the unprofitable numbers of your poor, and lays a foundation of more extended trade, INDEPENDENT OF ALL OTHER NATIONS; WHICH IS NOW BECOME A PRINCIPLE OF POLICY TO BE THE MORE STEADILY PURSUED, AS OTHER NATIONS ARE DAILY ATTEMPTING TO INJURE OUR TRADE, BY SETTING UP ARTS AND MANUFACTURES FOR THEMSELVES, AND PROHIBITING THE IMPORTATION OF OURS.

N A V

The PREMIUMS, or BOUNTY, that have been granted by parliament on NAVAL STORES imported.

I. From the British plantations in America.

By 3 and 4 Ann. cap. 10. §. 1, 8. first granted from 1 Jan. 1705, to 1 Jan. 1714.

By 12 Ann. cap. 9. §. 1. thence continued to 1 Jan. 1725. By 8 Geo. I. cap. 12. §. 1. hemp only further continued to 1 Jan. 1741.

2 Geo. II. cap. 35. §. 3, 18. granted from 29 September 1729, to 29 September 1742.

13 Geo. II. cap. 28. §. 1. thence continued (as to masts, yards, and bowsprits, tar, pitch, and turpentine) to 25 December 1750; and from thence to the end of the then next session of parliament.

During the aforesaid terms of years, the several sorts of naval stores hereafter mentioned, imported directly from any of the British plantations in America, in any ship that may lawfully trade, manned as by law is required, are to enjoy the following bounty, viz.

	l.	s.	d.
Hemp, water-rotted, bright and clean, the ton containing 20 hundred weight	6	0	0
Masts, yards, and bowsprits, the ton, allowing 40 feet to each ton, girt-measure, according to the customary way of measuring round bodies	1	0	0
Clean, good, merchantable, well-conditioned, clear of dross or water, and fit in every respect for making of cordage, the ton, containing 8 barrels, and each barrel to gauge 31 1/2 gallons, to be well hooped and fitted up	2	4	0
Tar, Clean, good, merchantable, well-conditioned, clear of dross or water, and fit in every respect for making of cordage, made from trees prepared according to the directions hereafter mentioned, the ton, containing 8 barrels, and each barrel to gauge 31 1/2 gallons, to be well hooped and fitted up on the exportation thereof	4	0	0
Pitch, clean, good, merchantable, and well conditioned, not mixed with dirt or dross, the ton, containing 20 gross hundreds nett pitch, to be brought in 8 barrels of equal size	1	0	0
Turpentine, clean, good, and merchantable, clear of dross and water, the ton, containing 20 gross hundreds nett turpentine, to be brought in 8 barrels of equal size.	1	10	0

Which premiums are to be paid by the commissioners of the navy, by bills to be made out for the same, and delivered to the importers within 20 days after the discharge, or unloading of the ship, in order to be paid in course, upon certificates of the respective chief officers of the customs where imported; to whom a certificate has been produced, under the hands and seals of the governor, lieutenant-governor, or collector of his majesty's customs, and naval officers, or any two of them, residing within any of his majesty's said plantations, testifying, that, before the departure of the ship, the person lading the same had made oath before them, That the said stores were truly and bona fide, of the growth and produce of his majesty's said plantations; and, with respect to the high bounty on tar, expressing, That it has appeared to them, the persons so certifying, by the oath of the owner, or maker of the tar, which certificate was granted, that the tar therein mentioned was made from green trees prepared for that purpose, after the following manner: that is to say, that, when such trees were fit to bark, the bark thereof was stripped eight feet, or thereabouts, up from the root of each tree, a slip of the bark of about four inches in breadth having been left on one side of each tree; and that each tree, after having been so barked, had stood during one year at the least, and was not before cut down for the making of tar; and that the said tar was made without mixture of any other tar therewith: as likewise, upon oath to be made by the master of the ship, at the port of importation in Great-Britain, That the same were shipped within some of his majesty's plantations in America, and that he knows, or believes, that the said stores were the produce of the said plantations. 3 and 4 Ann. cap. 10. §. 1, 2. 12 Ann. cap. 9. §. 1. 8 Geo. I. cap. 12. §. 1, 4. 2 Geo. II. cap. 35. §. 4, 12.

But the aforesaid certificates of the chief officers of the customs are not to be made out for the premiums on pitch, until the same be freed from dirt or dross; nor for any tar that is not fitting to be used for making of cordage, and shall not be freed from dross and water; and unless such pitch and tar be clean, good, merchantable, and well conditioned. 5 Geo. I. cap. 11. §. 16. 2 Geo. II. cap. 35. §. 11.

And the said officers of the customs, before they make out such certificates, are to examine the pitch, by opening the heads of the barrels, sawing of the staves in the middle, and breaking

ing the barrels, or by such other means as they shall think proper, to discover whether the said pitch is good and merchantable, not mixed with dirt or dross; and also to examine and search the said tar, to discover whether the same is clean, good, merchantable, well-conditioned, and clear of dross or water, and fit for making of cordage. 5 Geo. I. cap. 11. §. 17. 2 Geo. II. cap. 35. §. 11.

II. From North Britain, or Scotland.

By 12 Ann. cap. 9. §. 2. first granted from September 1713, to 1 January 1725.

By 8 Geo. I. cap. 12. §. 1. hemp only further continued to 1 January 1741.

By 2 Geo. II. cap. 35. §. 13. granted from 29 September 1729, to 29 September 1742.

By 13 Geo. II. cap. 28. §. 1. thence continued (as to masts, yards, and bowsprits) to 25 December 1750, and from thence to the end of the then next session of parliament.

During the aforesaid terms of years, the naval stores hereafter mentioned, imported from North Britain into South Britain, in any ship built in Great-Britain, are to enjoy the following bounty, viz.

Hemp, water rotted, bright and clean, the ton containing 20 hundred weight	1. s. d. 6 0 0
Trees of 12 inches diameter and upwards, fit for masts, yards, or bowsprits, regularly converted, and turned at least into eight squares, sound, fresh, and in good and merchantable condition, the ton, allowing 40 feet to each ton, girt measuring, according to the customary way of measuring round bodies	1 0 0

Which premiums are to be paid by the commissioners of the navy, by bills to be made out for the same, and delivered to the importers within twenty days after the discharge or unloading of the ship, in order to be paid in course; upon certificates of the respective chief officers of the customs where imported; to whom a certificate has been produced, under the hands and seals of the comptroller and collector of the customs, and the naval officer, or any two of them, residing at the port or ports of exportation in North Britain, testifying, That before the departure of the ship, the persons concerned or employed in cutting down the aforesaid trees, or any two of them, had made affidavit in writing, before such comptroller and collector, and naval officer, or any of them, that such trees were truly and bona fide, of the growth and produce of North Britain; and specifying in the said affidavit, the particular number, quantity, and quality of the trees, together with the time when they were cut down, the names of the proprietors, and the places where the same did grow; as likewise, upon oath to be made by the master of the ship, at the port of importation in South Britain, that the same were truly laden in North Britain, and that he knows or believes, that the said trees were of the growth of North Britain. 12 Ann. cap. 9. §. 2. 2 Geo. II. cap. 35. §. 13. Persons counterfeiting, or making false affidavits, or certificates, of the growth of the trees or hemp, in order to obtain the premium, are to suffer as for wilful and corrupt perjury, and to forfeit 100l. 12 Ann. cap. 9. §. 4. 2 Geo. II. cap. 35. §. 14. Comptrollers, collectors, or naval officers, making false certificates, are to forfeit their office and 50l. to be imprisoned a year without bail, to suffer such corporal punishment as the court of Exchequer shall think fit, and to be incapable of serving again in the customs. 13 & 14 Car. II. cap. 11. §. 8. 12 Ann. cap. 9. §. 4. 2 Geo. II. cap. 35. §. 14. Masters or owners of ships knowingly importing foreign trees fit for masts, &c. as of the produce of North Britain, in order to obtain the bounty, are to forfeit 100l. together with the ship and furniture. 12 Ann. cap. 9. §. 5. 2 Geo. II. cap. 35. §. 15.

From the British plantations and Scotland.

Upon the landing of the aforesaid stores and trees, the pre-emption or refusal must be offered and tendered to the commissioners of the navy; and, if within twenty days after such tender, they shall not contract for the same, the importers may otherwise dispose of them. 3 & 4 Ann. cap. 10. §. 4. 12 Ann. cap. 9. §. 3. 8 Geo. I. cap. 12. §. 3. 2 Geo. II. cap. 35. §. 6, 13.

No fee, gratuity, or reward, may be demanded or taken by the officers of the customs, for the examining, viewing, or delivering any of the aforesaid naval stores, or for making or signing certificates, in order to receive the premium; upon forfeiture of office and 100l. and to be rendered incapable of serving his majesty. 5 Geo. I. cap. 11. §. 18. 2 Geo. II. cap. 35. §. 11.

And, if any of the aforesaid naval stores (except hemp) or trees, shall be again exported, the exporter must, before entry thereof, produce to the collector, &c. of the customs, at the port of exportation, a receipt from the treasurer of the navy, or his cashier, subscribed by his comptroller, or his

chief clerk, signifying that the full amount of the aforesaid premium had been repaid to him; on failure whereof, such stores may not be exported: and, if such stores are fraudulently exported without repayment of the premium, they are forfeited, and double the value. 2 Geo. II. cap. 35. §. 7, 9, 16.

And if, upon the exportation of the aforesaid stores, doubts shall arise concerning the growth, product, or manufacture, the onus probandi shall lie on the owner or claimer thereof, 2 Geo. II. cap. 35. §. 10, 16.

By an act of the 24th of Geo. II. entitled, An act to continue several laws therein mentioned, &c. there is the following clause for continuing the like encouragement on the importation of naval stores, from the year 1750 to 1757. This act is further continued to 1764.

During the late war, an act passed in the year 1745, to allow the purchase for his majesty's use, of naval stores brought into this kingdom on board neutral ships, by any of his majesty's ships, and to allow such stores to be landed and entered during the continuance of the wars with France and Spain, or either of them. See the end of this letter N, for the BUSINESS OF THE CUSTOMS, &c.

NAVARRRE, is a kingdom in Spain, divided from France on the north by the Pyrenees, which also cut it into two parts, distinguished into Upper and Lower; the former, much the larger, and on the Spanish side, is the kingdom we shall particularly speak of; the other, beyond these mountains, by much the smaller, and belonging to France, is bounded by the territory of Labour on the north; by the Pyrenees, which divide it from Spanish Navarre, on the south-west; and by the principality of Bearn in Gascony on the east; and is about 30 miles long, and 15 broad, and one of the barrenest provinces in France.

Spanish Navarre borders upon Biscay and Old Castile on the west; on Castile and Arragon on the south; and eastward upon Arragon. Its length is about 90 miles from north to south, and about 80 in breadth, from east to west. It is divided into five districts, viz. Pampelona, Tudela, Estela, Olite, and Longueva, which are parted by prodigious high and uncouth mountains, yet yielding good corn and grain, wine, oil, honey, fruit and herbs, and affording plenty of food and pasture for their cattle, besides an infinite number of fowl, both wild and tame. The mountains produce, also, metals and minerals, and had formerly several rich silver and gold mines, though, at present, they are either neglected or exhausted.

NAVIGATION.

Of the practical art thereof, in relation to ship-failing.

What a complete treatise of that art ought to contain, according to Sir William Petty.

1. What arithmetic, in whole numbers and fractions, as also in decimals and logarithms, is necessary for the same; and what books are best for teaching so much thereof. 2. What vulgar, practical, mechanical geometry, performable by the scale and compass, is sufficient. 3. What trigonometry, right-lined and spherical, will suffice. 4. How many stars are to be known. 5. What instruments are best for use at sea, with the construction of them, and the manner of using them. 6. The whole skill of the magnet, as to the directive virtues thereof, and all the accidents that may befall it. 7. The hydrography of the globe of the earth, the perspective of the coasts, and the description of the under-water-bottom of the sea. 8. The knowledge of winds and meteors, so far as the same is attainable. 9. The history and skill of all sorts of fishings. 10. The art of medicine and surgery peculiar for the sea. 11. The common laws of the admiralty, and jurisdiction of the sea. 12. The several victuallings and cloathings fit for seamen. 13. The whole science of ebbing and flowing, as also of currents and eddies at sea. 14. Dromometry, and the measures of a ship's motions at sea. 15. The building of ships of all sorts, with the several riggings and sails for each species, and the use of all the parts and motions of a ship. 16. Naval oeconomy, according to the several voyages and countries. 17. The art of conning, rowing, sailing, of all the several sorts of vessels. 18. The gunnery, fire-works, and other armatures peculiar to sea and to sea-fights. 19. The art of loading and unloading the chief commodities to the best advantage. 20. The art of weighing up sunk ships and goods, as also of diving for sunk goods in deep water. 21. The general philosophy of the motion and figures of the air, the sea, and of seasons; of timber, iron, hemp, brimstone, tallow, &c. and of their several uses in naval affairs. 22. An account of five or six of the best navies of Europe, with that of the arsenals, magazines, yards, docks, &c. 23. An account of all the shipping able to cross the seas belonging to each kingdom and state of Europe. 24. An account of all the chief commercial parts of the world, with mention of what commodities are originally carried from, and ultimately to, any of them. 25. An account of the chief sea-fights, and all other naval expeditions and exploits, relating to war, trade, or discovery, which have happened in this last century. 26. Of the most advantageous use of telescopes for several

several purposes at sea. 27. Of the several depths of the sea, and heights of the atmosphere. 28. The art of making seawater fresh and potable, and fit for all uses in food and physic at sea.

REMARKS.

I am not acquainted with any book written upon the subject of navigation according to this extensive plan proposed by Sir William Petty. The best book that has fell in my way upon this subject, is that lately wrote by the judicious Mr. J. Robertson, F. R. S. the mathematical master at Christ's Hospital, London; to which we refer the reader, after giving an extract therefrom upon one of the most material parts relating to practical navigation.

Of a ship's reckoning, in regard to the art of conducting of ships from one part of the world to another.

A ship's reckoning is that account whereby, at any time, it may be known where the ship is; and on what course or courses she is to steer to gain her port.

Dead-reckoning, is that account deduced from the occurrences wrote on the log-board.

The log-board is a painted black board, whereon is wrote in chalk whatever is thought worthy of note from day to day; and, for a proper disposition of such notes, the board is divided into five columns: the left hand one contains 24 hours, from the noon of one day to the noon of the next; in the second and third columns are the knots and fathoms the ship is found to run per hour, set against the hours when the log was hove; the fourth column contains the courses the ship steers; and in the fifth, or right-hand column, is wrote the winds; the alteration of the sails, the business doing aboard, and what other remarks the officer of the watch thinks proper to insert: for it should be observed, that it is usual to divide a ship's company into two parts, called the starboard and larboard watches, who alternately do the duty of the ship, for four hours and four hours.

The log-book is a book ruled like the log-board, in order to contain the daily copies of the remarks wrote on the log-board; which is the only authentic record of the ship's transactions; and these are, by the persons who keep journals, transcribed every day at noon into their log-books, from whence they make the necessary deductions relative to the ship's place.

But, as the ship's motion is liable to be disturbed from a variety of causes, such as continual deflection from the course set, by the ship's playing to the right and left round her center of gravity, and the unequal care of the helmsmen; the distance being faulty, on account of tumbling seas, rolling with or against the ship; the unsteadiness of the wind, unknown currents, sudden storms, and many other impediments, which seem impossible to be surmounted; consequently her place, according to the dead-reckoning, may be justly doubted, and, therefore, mariners try every day to find the latitude their ship is in, by observations on the sun or stars; and, if the latitude obtained by observation, and that found by the dead-reckoning, agree, it is presumed the ship's place is well determined; but, if they disagree, the account of LONGITUDE MUST BE CORRECTED*; and, for the latitude, that found by observation is always to be depended on.

* The latest method, and the simplest, that has ever been proposed for this purpose, is that lately communicated by the Rev. Mr. Richard Locke; the certainty or uncertainty of which, if I am rightly informed, is now trying experimentally. See the articles COMMANDERS OF SHIPS and LONGITUDE, where what Mr. Locke has hitherto offered to the public is given at large: and, if it should prove true in practice, will certainly render the whole practical art of navigation extremely easy and secure, and bids fair, according to some, for the real discovery of that great desideratum, the Longitude at Sea: but the certainty hereof being doubted by some mathematicians, the matter must be left to repeated and infallible experience, where we leave it.

Various methods of correcting the reckoning or longitude.

Consider whether the difference may not have been occasioned by a current; and, if it is possible, try it (by the method described below *) or make such an estimate of it's setting and drift as may be judged reasonable; then with the setting and drift, as a course and distance, find the difference of latitude and difference of longitude, with which increase or diminish the dead-reckoning; and if the latitude, thus corrected, agrees with the latitude by observation, then the longitude thus corrected may be safely taken as true, and so the ship's place determined.

* Of sailing in currents.

A CURRENT, or TIDE, is a progressive motion of the water, causing all floating bodies to move that way towards which the stream is directed.

The setting of a tide or current, is that point of the compass towards which the waters run; and the drift of a current is the rate it runs per hour.

The setting and drift of the most remarkable tides and currents are pretty well known; but, in unknown currents, the usual way to find the setting and drift is thus:

Let three or four men take a boat a little way from the ship, and by a rope fastened to the boat's stern, let down a heavy iron pot, or loaded kettle, into the sea, to the depth of 80 or 100 fathoms, where it can be, whereby the boat will ride almost as steady as at anchor: then heave the log, and the number of knots run out in half a minute will give the miles which the current runs per hour; and the bearing of the log shews the setting of the current.

Exam. Suppose a ship, in 24 hours, finds, by her dead-reckoning, she has made 96 miles of diff. latitude north, and 38 miles of departure west; but, by observation, finds her difference of latitude is 112, and on trial finds a current, which, in 24 hours, make 16 miles of diff. latitude north, and 10 miles of departure east: required the ship's departure?

Diff. lat. by account 96 m. N. Depart. by acc. 38 m. W.
Diff. lat. by current 16 m. N. Depart. by curr. 10 m. E.

True diff. lat. 112 m. N. True departure 28 m. W.

Here the dead-reckoning, corrected by the current, gives the diff. latitude 112 miles, which is the same as found by observation; therefore the departure, 28, is taken as the true one.

The error in the dead-reckoning is usually attributed to unknown currents; for, by various causes yet undetermined, there are many counter-motions of the water in the open seas, as well as those observed near the shores, where the motions may be tolerably well accounted for. Some of the observed currents in the great seas may, perhaps, be owing to the tide's following the moon, and to the libratory motion the waters may have thereby; and the unsettled setting and drift of these currents may possibly depend on the change in the moon's declination: however, it is well known from observations, that the trade-winds occasion a considerable current within their limits, particularly within the torrid zone, where the motion is perpetually towards the west, at the rate of about eight or ten miles a day: but, at the extremities of the trade-winds, or near the latitudes of 30 degrees north and south, it is likely that the currents are compounded of the said western motion, and of one towards the equator: therefore all ships sailing within these limits should allow a course each day for this current.

If, when all currents have been allowed for, there should still be a difference between the observed latitude; and that given by account, then a further correction must be made.

The business of correcting a sea-reckoning is a very precarious operation, and, at best, is little more than guessing; for, by ought that appears, the ship may be either to the eastward or westward of the point wherein the reckoning places her, and the mariner not be able to pronounce with certainty whether; however, the following methods are usually taken: if the difference of latitude is much more than the departure, or the direct course has been within three points of the meridian, then it is most likely the error is in the distance. And if the departure is much greater than the difference of latitude, or the direct course is within three points of the parallel, or more than five points from the meridian, the error may be ascribed to the course.

But, if the courses are in general near the middle of the quadrant, the other may be either in the course, or in the distance, or in both.

For, to cause an alteration in the difference of latitude, the first of these cases requires a greater error in the course than can well be supposed to have been committed; in the second case, the distances must be so faulty as would scarce escape observation; and, in the last, it is often doubtful whether to attribute the error to the course or distance, but is as usually corrected in both.

First method.

When, by the dead-reckoning, the difference of latitude is more than once, and a half the departure: or, which is the same, when the course is less than three points: to the difference of latitude, and the departure by account, find the course. With this course, and the difference of latitude by observation, find a new departure. With the new departure, and the co-middle latitude, find the difference of longitude.

Exam. Yesterday noon we were in latitude $39^{\circ} 18'$ north, and, by an observation, are this day noon in latitude $37^{\circ} 48'$ north; our dead-reckoning gives 106 miles of southing, and 64 miles of easting: required the ship's true difference of longitude?

By the traverse table.

The difference of latitude 106, and the departure 64, gives the course $2\frac{1}{2}$ points. The course $2\frac{1}{2}$ points, and the difference of latitude by observation 90, gives a departure of 54. The co-middle latitude $51^{\circ} 27'$, and true departure 54, gives the difference of longitude 69.

Second method.

When, by the dead-reckoning, the departure is more than once and a half the difference of latitude, or the course is more than five points.

With the difference of latitude and departure by account, find the distance. With this distance, and the difference of latitude by observation, find the true departure. With the co-middle latitude and true departure, find the difference of longitude.

Exam. Yesterday noon we were in latitude $48^{\circ} 52'$ north, and were to-day noon in latitude $50^{\circ} 18'$ north; our dead-reckoning shews we have made 68 miles of northing, and 112 miles of westing: required the true difference of longitude the ship has made?

By the traverse table.

The difference of latitude 68, and departure 112, gives 132 for the distance. The distance 132, and difference of latitude by observation 86, gives the true departure 100. The co-middle latitude $40^{\circ} 25'$, and true departure 100, gives 155 miles for difference of longitude.

Third method.

When the difference of latitude and departure by account are nearly equal, or the direct course has been between three and five points of the meridian.

To the difference of latitude and departure by account, find the distance. With this distance and difference of latitude by observation, find another departure. Take the half sum of the two departures for the true one. With the co-middle latitude and true departure find the difference of longitude.

Exam. These last 24 hours we have made 84 miles of northing, and 76 of easting; we were yesterday noon in latitude $52^{\circ} 40'$ north, and are this noon in latitude $54^{\circ} 22'$ north: what difference of longitude has the ship made?

By the traverse table.

To the difference of latitude 84, and departure 76, the distance is 113 miles. With the distance 113, and difference of latitude by observation 102, find a departure 47.7. The sum of the two departures 76 and 47.7 is 123.7, it's half is 61.8. To the co-middle latitude $36^{\circ} 29'$, and true departure 61.8, the difference of longitude is 103.

The difficulty of finding the longitude at sea has inclined many persons to attempt the solution of this most useful problem: some with no other view than the great advantage which the art of navigation would derive from their labours; others, and by much the greatest numbers, who have exhibited their thoughts on this subject, were visionary whimsical men, only lured by the hopes of the appointed reward: but Dr. Halley having collected a great multitude of observations made on the variation of the needle in many parts of the world, he, by the help of the latitude and longitude of the places of those observations, was enabled to draw on a mercator chart certain lines, shewing the variation of the compass in all those places over which they passed at the time he published, in the year 1700; and, consequently, the longitude of any of those places could be found by the chart, having it's latitude, and the variation of the needle in that place given.

Fourth method.

To find the longitude at sea by the variation chart.

Find the variation of the compass, for which see art. 1076, in Mr. Robertson's tract. Draw a parallel of latitude on the chart, through the latitude found by observation; and the point where it cuts the curved line, whose variation is the same with that observed, will be the ship's place.

Exam. A ship finds, by a good observation, that she is in the latitude of $18^{\circ} 20'$ north, and that the variation of the compass is 4° west: required the ship's place?

Take from the graduated meridian the distance between the equator and the latitude of $18^{\circ} 20'$ north; lay a ruler along the equator, and slide one point of the compasses along it's edge, till the other point cuts the curve of 4° west variation, and the intersection gives the ship's place, whose longitude will be found to be about $27^{\circ} 10'$ west from London.

There are two considerable inconveniencies which attend this method.

First, That, wherever the variation lines run east or west, or nearly so, this way of finding the longitude becomes imperfect: but, among all the trading parts of the world, this imperfection is at present found chiefly on the west coasts of Europe, between the latitudes of 45° and 53° ; on the eastern shores of North America, and in some parts of the Western Ocean and Hudson's Bay, lying between the said shores; therefore, for the other parts of the world, a variation chart may be esteemed as of the greatest use.

But the variation curves, even where they run east and west, may be sometimes applied to good use in correcting the latitude, when meridian observations cannot be had, as it frequently happens on the northern coasts of America, in the Western Ocean,

and about Newfoundland: for, if the variation can be obtained correctly, then the east and west curve, answering to that variation on the chart, will shew the latitude.

Secondly, As the deflection of the magnetical meridian from the true one is subject to continual alteration, therefore a chart, to which the variation lines are fitted for any year, must in time become useless, unless new lines, shewing the state of the variation at that time, be drawn on that chart: but, as the change in the variation is very slow, therefore new variation charts being published every 10 or 12 years, will answer the purpose wanted.

In the year 1746, Mr. William Mountaine, F. R. S. and Mr. James Dodson, fitted the variation lines to Dr. Halley's chart, for the year 1744. As these gentlemen had collected several thousands of observations to work upon, they were enabled to perform this business with great correctness; inasmuch that, wherever their chart has been used, it was found of very great importance, even to the saving a ship in the Indian Ocean; and it is much to be wished they were in more general use.

Fifth method.

To find the longitude from celestial observations.

The difference of longitude between two places may be determined by knowing the difference between the times that any remarkable appearance in the heavens is seen in those places.*

* The difference of longitude between two places is estimated by the difference of time, allowing an hour to every 15 degrees of longitude, and one minute of time for every 15 min. of a degr. or a degr. for every 4 min. of time.

Example. Having at 6 h. 48. p. m. observed at sea a certain appearance in the heavens, which I knew was seen the same instant at 3 h. 25 m. p. m. in London: required the difference of longitude between the places of observation.

From	6 h. 48 m.	3 h. = 45 degr.
Take	3 35	13 m. = 3 15

Leaves	3	13 = diff. time.	Sum	48	15 = diff. lon.
--------	---	------------------	-----	----	-----------------

And, because the hour of appearance at London was least, therefore I knew myself to be at the eastward of London.

For, as these appearances consist in the appulses, that is, the approaches of the heavenly bodies to one another, or their passage by one another; and these appulses when they happen, are seen at the same instant of absolute time to all parts of the earth where they are visible: therefore, by knowing the relative times of the day when such appearances are seen in two distant places, the difference between those times is known, and consequently the difference of longitude between those places.

There are every year published several almanacks, or ephemerides, wherein are noted the eclipses of the sun and moon, the times of the planets rising, setting, and southing; the eclipses of Jupiter's satellites, and the times when other celestial appearances may be seen at the places for which those ephemerides are calculated: now a mariner having one of these almanacks, if he observes at what time any of these appearances happen in any part of the world he may be then in, will readily know his longitude.

Among the satellites of Jupiter, one or more is eclipsed almost every night; for they disappear either in going behind Jupiter, or in passing before him; and the instants of such immersions and emersions may be seen by a refracting telescope of about 8 or 9 feet long, or by a reflecting one of about 9 inches focal length. The reflecting telescope is much more commodious at sea, on account of it's shortness; but the metals are very subject to be tarnished by the moist air.

To determine the longitude of any place from celestial observations, it is necessary that the time of the day be well known in that place where the observation is made; and among the various methods proposed for this purpose, none seems more fit to be practised at sea, than the method by equal altitudes; for no regular deductions can be made, without knowing the precise time of noon. Now, as clocks and watches undergo considerable alterations from the motion of a ship and the change of the climate, they ought to be carefully examined, and their gain or loss per day ascertained, whenever they are to be used in the correcting of the longitude; and this need not be done very often, only at such times when the ship may be supposed through storms or bad weather, to be considerably out in her dead-reckoning.

At such times, the ship lying by, let the sun's altitude be taken at any time in the forenoon, set down that time and altitude: in the afternoon, watch for the sun's having the same altitude exactly, and note down that time; then the half sum of these two times, is the time shewn by the clock or watch when it was noon in that place.

As it is possible that an altitude, equal to one taken on the eastern side of the meridian, cannot be observed on the western side by the interposition of clouds, it is therefore best to take several in the forenoon, or on the east side, in order to have the greater probability of securing a corresponding altitude on the western side, or afternoon; and, if several observations

uations of equal altitudes can be made on both sides of the meridian, it will be best to take the mean time corresponding to each pair of equal altitudes; and if the means all agree, it is an evident sign that the observations were well made: but should they disagree half a minute or so, then it is best to add together all the times of noon, and divide the sum by the number of times, and the quotient may be taken for the true time of noon in that place, as shewn by the clock or watch.

In the taking of these equal altitudes of the sun, it will be most convenient to have them at a distance from one another not exceeding 4 or 5 hours; because then there will be no occasion to correct the latter altitude, by the alteration in declination during that time.

The true time of noon being obtained, then the time that any planet, or other celestial body passes the meridian, may be thus known: on the evening following, let one or more altitudes of the planet be taken, which set down with their respective times; and on the next morning, note down the times when that planet has the same altitudes: the half sum of these two times, will be the time when the observed planet passed the meridian of that place; and, if several observations have been taken, find the mean of them, as before for the sun: but, if the planet observed be the moon, whose declination may be considerably altered between the times of the observations, then let a proportional part of her daily variation in declination be added to, or subtracted from, the time found for her passing the meridian, according as the moon is receding from, or approaching to, the elevated pole. And, if there is reason to suspect that the clock or watch gains or loses every day, let the times of two equal altitudes of the sun be taken next day, and the noon thereby determined: then the difference between the times of noon both days, as shewn by the clock or watch, will be it's daily variation; and the time of the planet's passing the meridian, must be increased or diminished by a proportional part of that variation.

Now, by having a table or an ephemeris, containing the times when the moon passes the meridian of a certain place, and by having from observation the time when she passes the meridian of any other place, the difference between the longitudes of those two places may be thus found:

Seek in the ephemeris for the time of her southing on the given day, and that of the following day, and take their difference; also take the difference between the times of the tabular southing and the observed one, on the same day; then say:

As the daily difference is to the observed difference, so is 360 degrees to the difference of longitude sought.

For, as the whole difference arises in a day, or by the running through 360 degrees, consequently any part of that difference will require a proportional part of 360 degrees.

Example. Suppose at sea, the moon was observed to pass the meridian on the 18th day of June 1753, at 57 minutes after one in the morning: required the longitude of that place?

At London the moon passes the meridian on the 18th of June, at 1 hour 47 minutes, and on the 19th day, at 2 hours 31 minutes, the difference is 44 minutes; and the observed time is 10 minutes later than at London.

Then as 44 min. : 10 min. :: 360° : $\left(\frac{3600}{44} = 81\right)$ 81 degr.

49 min. Which shews that place to be 81 deg. 49 min. to the west of the meridian of London.

As the tables of the moon's motions are not yet arrived at the wished-for accuracy, consequently the times of her passing the meridian of any place, as shewn by an ephemeris, are not so true as they might be, and therefore the difference of longitude found by the time of the moon's southing, may err about 2 degrees; and should the time of her passing the meridian be ill observed: the error may be much greater: it has therefore been proposed to keep an account of longitude by a time-keeper, or kind of clock, that should always shew the true time under the meridian of some one place; consequently, was the time of the day found in any other place, compared with the time then shewn by such a clock, the difference of longitude between those places would be determined: but the difficulties attending the construction of such an instrument, have been hitherto found too great to be overcome. Indeed, the ingenious Mr. Harrison has removed some of, if not all, the capital obstructions; and his judicious friends suspect he will entirely perfect his most elaborate machine: he has received some gratuities from the public, for the advances he has already made towards the solution of this intricate problem of the longitude; and it is wished he may merit the whole reward allotted by the government for the discovery of this so much desired acquisition in navigation.

Upon the whole, it appears that there are many means by which a ship's place may be found at sea, nearly exact enough for navigating her to places whose longitudes are almost as incorrectly known as the ship's place; and, was the method of finding the longitude at sea correctly known, the ships must then keep as good a look-out for land as they do now,

and also keep their account of dead-reckoning: therefore; would seamen put in practice all the precepts that are given them for this purpose, they might proceed on their respective voyages, and (which is suspected now to be the case) have very little concern about the perfecting the discovery of the longitude.

OF A SEA-JOURNAL.

A sea-journal is a book, wherein is truly entered the most remarkable daily occurrences relating to the ship during her voyage outward and homeward. There are various ways of keeping sea-journals, according to the different notions of mariners concerning what articles are to be entered.

Some writers direct the keeping such a kind of journal, which is only an abstract of each day's transactions, specifying the weather, what ships or lands were seen, accidents on board, the latitude, longitude, meridional distance, course and run: these particulars are to be drawn from the ship's log book, or that kept by the person himself, for most good mariners keep private log-books.

Other authors recommend the keeping but of one account, including the log-book and all the work of each day, with the deductions drawn therefrom: this method is used in Mr. Robertson's treatise, on account of representing to the beginner the whole of each day's work: but when he is well versed in this method, he may abridge what part of it he pleases: although it is conceived that a journal neatly kept, with all the particulars of the work commodiously ranged, would give more satisfaction to those who might have occasion afterwards to inspect it, than a journal containing the heads only, and all the intermediate parts suppressed.

The method chose by Mr. Robertson to introduce the young mariner into this most capital part of navigation, is, by shewing him first how to work a few separate days works independent one of the other, and then to proceed to a continued journal of several successive days works; for the doing of which, it was judged necessary to premise the following observations.

I. That the day is supposed to begin at noon, and the day's work relates to the transactions done in the time between the noon of one day and the noon of the following day.

II. If there is an observation for an amplitude or an azimuth, let that amplitude or azimuth be worked as shewn between art. 1070 and 1076, in Mr. Robertson's treatise, and then find the variation as shewn at art. 1077 in the same tract; taking care in these operations, that the declination of the day be fitted to the proper time and longitude, as shewn art. 964, 965, in the same author.

III. Correct each course by the variation thus found, as at art. 1078, also correct these corrected courses by the proper allowance for lee-way, as shewn at art. 1080, 1081.

IV. Write these corrected courses in a traverse table, sum up the knots and fathoms belonging to these hours the ship kept on the same course, and write the several sums as distances in the traverse table against their respective course.

V. Complete the traverse table as by art. 695, find the present latitude and longitude, as shewn in art. 786, 787, of Mr. Robertson, and the examples, in art. 1128, & seq. and then will the ship's place be obtained by dead-reckoning. See Mr. Robertson's treatise, entitled the Elements of Navigation: containing the Theory and Practice, with all the necessary Tables. To which is added, A treatise of Marine Fortification. For the Use of the Royal Mathematical School at Christ's Hospital, and the Gentlemen of the Navy.

REMARKS.

That the reader, who is desirous of understanding the art of navigation, either to the perfection of the theory to which it has hitherto been brought, or only to understand the same in a mere practical light, without concerning himself with the mathematical elements whereupon the art is grounded, we recommend him to the above-mentioned excellent treatise, in the commendation of which too much cannot be said. But, as the learned author has himself given a just idea of his own performance in few words, we cannot give it its due recommendation in a better manner, than introducing his own

ADVERTISEMENT.

As it may be expected that four kinds of readers will look into this book, it was thought convenient to point out to some of them, the places where they may meet with what they more particularly want.

First, Those who have made a proficiency in the mathematics, will, it is likely, examine in what manner the subjects are here treated, and whether any thing new is contained therein: it is conceived, that such readers will find some things which may recompense them for their trouble, in almost every one of the books.

Secondly, Those learners who are desirous of being instructed in the art of navigation in a scientific manner, and would chuse to see the reason of the several steps they must take to acquire it: to such persons, it is recommended that they read the whole book in the order they find it. Or, if the learner is very young, he may omit the fourth book 'till after he is master

master of the fifth and sixth. Adult persons, and those under the direction of a master, may, if they please, read the eighth book immediately after the fifth, and read the sixth, seventh, and ninth books in succession.

Thirdly, That class of readers, which, with too much truth may be said, comprehend most of our mariners, who want to learn both the elements and the art itself by rote, and never trouble themselves about the reason of the rules they work by: as there ever will be many readers of this kind, they may be well accommodated in this work; thus, if they are not already acquainted with arithmetic and geography, let them read the five first rules of arithmetic, to page 20; thence proceed to the definitions and problems in geometry, from page 42 to 55. In the book of trigonometry, read pages 83, 84, 85, 86, 92, 93, and from 98 to 108: the whole of book V. In book VI. he may read to page 267, and as much more as he pleases. In book VII. let him read the sections III, IV, V, VI. from page 368 to page 407. In book VIII. he may read section III. and as many problems in the Vth and VIth sections as he can, and let him read the whole of the ninth book.

Fourthly, That set of readers who will not be at the pains of learning any thing more than how to do the practice of a day's work, such may herein meet with the practice almost independent of other knowledge. Let such persons make themselves acquainted with section VIII. of book V. and the use of the table at page 200; then learn the use of the traverse table at the end of book VI. which he will find exemplified between pages 243 and 274; also he must learn the use of the table of meridional parts at page 423: after which he may proceed to book IX. where he will find ample instructions in all the particulars which enter into a day's work. But, as with this scanty knowledge of things he will not clearly see every part of book IX, he may omit the articles 1059, 1091, 1106, and the XIth and XIIth sections.

NAVIGATION.

Some of the principal LAWS that have been enacted, relating to the trading NAVIGATION of ENGLAND.

According to the common right of mankind, the navigation through the world, is no less free and open to every one, than the air; and hence it proceeds, that passage by sea to and from all Christian countries, is and hath been so indifferently permitted to all nations, not being professed enemies: and none can be prohibited to sail in the main sea, unless in places where the waters are as royalties, which the Venetians claim in some of their territories and jurisdictions, and other princes and states by prescription. *Lex Mercat. Malines, 124, 130.* If a ship bound for Venice do enter into the river of Lisbon, and there deliver goods or merchandizes, and afterwards entering into the straits of the Mediterranean Sea, be driven by contrary winds to some other place or island in the said seas, and after that make her discharge at Venice, all this time of the voyage is considered as one navigation, and the master of the ship hath committed no fault, if he departed from the first port at the time limited. *Ibid. 124.*

As to ships in general, there have been many statutes made for increasing and preserving them, and improving the navigation of this kingdom: by 5 Rich. II. c. 3. it was enacted, That none of the king's subjects should bring in or carry out any merchandize, but in English ships, on pain to forfeit all merchandize otherwise conveyed, or the value thereof. But 6 Rich. II. c. 8. ordains, That the statute before-mentioned shall only take place where able ships of the king's allegiance may be found, otherwise the merchants may hire other ships, notwithstanding that statute.

By 4 Hen. VII. c. 10. No Gascon or Guiene wine, &c. shall be imported into this realm but in English vessels, on pain of forfeiture: and none shall freight any merchandize in any stranger's ship, if he may have sufficient freight in the same port, in a denizen's ship, under the penalty of forfeiting all merchandize not thus shipped, to be divided between the king and the seizer. This act shall not extend to any ship having merchandize on board, that is forced by tempest into any port of this kingdom, so as the owner thereof make no sale of the merchandizes here, except only for necessary victuals, or repairing of the ship and tackle.

The stat. 32 Hen. VIII. c. 14. ordains, That Gascon or Guiene wines, or Thoulouze woad, may be brought into this kingdom in any other ships, as well as English, notwithstanding the act of 4 Hen. VII. And by this statute, a rate was ordained of what should be paid for the freight or portage of the several sorts of merchandizes, in ships from the port of London to other places, and from thence to London. By 1 Eliz. c. 13. If any owner of any merchandize, shall in the time of peace, embark or unload any part thereof (masts, pitch, tar, and corn only excepted) out of or into any ship, other than an English bottom, he shall pay custom as an alien: and no Englishman shall cross the sea in any hoy, &c. with any goods or merchandize, on pain to forfeit the same, to be divided between the king and the prosecutor. But merchants, at their several shippings of cloth out of the Thames twice in the year, may embark merchandize in a

stranger's ship, so long as there are not English ships enough and convenient to convey such merchandize into Flanders, Holland, Zealand, or Brabant, &c.

By the act of navigation, 12 Car. II. c. 18. it is enacted, That no goods shall be imported into, or exported out of, any territories belonging, or which may hereafter belong, to his majesty, his heirs and successors, in Asia, Africa, or America. in any other ships but such only as belong to the people of England, or Ireland, Wales, or town of Berwick upon Tweed, and whereof the master and three fourths of the mariners are English, on pain to forfeit all the goods and commodities, and the ship or vessel with all its furniture; one third part whereof to the king, another third to the governor of the country where such default shall be, if seized there, otherwise that third also to the king, and the other third to him that will seize or sue for the same. And commanders at sea, having commission from the king, are to bring in as prize, ships offending contrary hereunto; and in such case of condemnation, one moiety shall be to the use of such commanders and their companies, and the other moiety to the king.

No goods of the growth or manufacture of any countries belonging to Muscovy, or of the produce of the Turkish empire, shall be imported into England, Ireland, Wales, or town of Berwick, in any ship or vessel, not English built, or not belonging to the people of some of them, and navigated as aforesaid; except vessels of the built of that place of which the goods are, or of such port where they can only be, or usually are shipped; the master and three fourths of the mariners being of the said country, on pain of forfeiting the ship and goods, to be divided and disposed as above-mentioned: and all wines of the growth of France or Germany, and divers goods and merchandize from Spain, Portugal, Russia, &c. which shall be imported in the places aforesaid, in any other ship than what doth belong to England, Ireland, &c. and are navigated as aforesaid, shall be deemed aliens goods, and pay accordingly. *Stat. ibid.*

And no foreign built vessel shall pass as a ship belonging to England, Ireland, Wales, &c. till the owner makes appear to the chief officers of the customs, in the port next to the place of his abode, that he is not an alien, and take an oath that it was bona fide bought of such persons, expressing the sum given, and the time and place, when and where, &c. and that no foreigner hath a share therein. Also none shall load in any bottom, whereof strangers are owners, part owners, or master, and of which three fourths of the mariners at least are not English, any goods whatsoever from one port or creek of England, Ireland, Wales, Guernsey, Jersey, or town of Berwick, to another port of the same, on pain to forfeit such goods and vessel. *Ibid.*

The 22 and 23 Car. II. c. 11. ordains, That where any goods shall be laden on board any English ship of the burthen of 200 tons or upwards, and mounted with sixteen guns or more, if the master yields up such ship or goods to any Turkish vessel, or any pirate, without fighting, upon proof thereof in the admiralty, he shall be incapable of taking charge of any English vessel, &c. And masters of English ships, though not of that burthen, nor mounted as aforesaid, that shall yield to a Turkish ship or pirate (not having at least double number of guns) without fighting, shall be liable to the penalties of this act: if any inferior officers or mariners of a ship, shall refuse to fight when commanded, or utter words to discourage others, they shall lose all their wages due, and be imprisoned, not exceeding six months, &c. and mariners laying violent hands on their commanders to hinder them from fighting in defence of their ships, shall suffer death as felons.

When any English ship shall have been defended by fight, and brought to her port, in which fighting any of her men have been wounded, the judge of the admiralty, or his surrogate, &c. where the ship shall arrive, upon the petition of the master and seamen, may call so many as he shall be informed to be adventurers or owners, and by advising with them, levy upon the respective owners such sums as himself and the major part of them then present shall judge reasonable, not exceeding two per cent. of the ship and goods; which money shall be distributed among the master, officers, and seamen, or the widows and children of the slain, according to the direction of the judge, with the approbation of three or more of the owners or adventurers. *Ibid.*

By the 5th and 6th W. and M. c. 24. Every person that shall within such a time, build, or cause to be built, any ships of three decks, containing 450 tons, and mounted with 32 pieces of ordnance, having ammunition, &c. proportionable, shall, for the first three voyages, which the said ships shall make to any foreign parts, receive one tenth part of the customs called the subsidy of tonnage and poundage, payable for merchandizes exported and imported in such ships: but if, after the end of the three first voyages, any of the ships so built, shall be altered or put into another form of building, whereby they shall become less defensible than they were at first, then they shall be forfeited and lost.

By 2 Ann. c. 9. During the war with France, owners of ships might navigate with masters, and one half of the mariners English, as if the master and three fourths of the men

had been so: also by 3 and 4 Ann. c. 13. any ships might be navigated by foreign seamen; and foreigners serving on board any English ship for two years, were to be deemed natural-born subjects, &c.

By 4 Geo. I. c. 12. and 11 Geo. I. c. 29. If any captain, master, officer, or mariner, belonging to any ship or vessel, shall wilfully cast away, burn, or destroy the ship to which he belongeth, or in any wise direct or procure the same to be done, with intent to prejudice a person that shall have underwritten any policy of insurance thereon, or any merchant who shall load goods therein, or any owner of such ship or vessel, the persons offending being lawfully convicted thereof, shall be adjudged guilty of felony without benefit of clergy. See the article ASSURANCE.

The 5th of Geo. II. c. 20. enacts, That no commander of any ship outward bound shall receive on board any gunpowder, either as merchandize, or store for the voyage (except for his majesty's service) before such ship shall be at Blackwall in the river Thames; and all masters of ships coming into the river, shall put on shore all powder, either before the arrival of their ships at the said place, or within 24 hours after they came to an anchor there, upon pain of forfeiting 5 l. for every 50 pounds weight of gunpowder found on board, and in the like proportion for a less quantity. And no guns shall be kept loaded with shot in merchant-ships between London-bridge and Blackwall, or fired before the rising, or after the setting of the sun, under the penalty of 5 l. and for every gun so fired 10 s. And if any pitch, tar, rosin, or other combustible matter, shall be heated or melted by fire in any ships, every person so offending, shall for every offence forfeit 5 l. And the ships are liable to search by an elder brother, appointed by the master, wardens, and assistants of the Trinity-house at Deptford.

And, in case any ship shall be laid up or moored in the mouth; or any other part of St Saviour's dock (except ships as shall be loading or delivering their cargoes, and others not exceeding two at one time, that shall lie at Shipwright-Yard at the north-west corner of the said dock, during the time they shall be repairing) the master of every such ship shall forfeit 20 s. for every day the same shall continue to be laid up and moored, to be recovered and levied as the other penalties inflicted by this act, before two justices of peace, subject to appeal to the quarter sessions.

By 6 Geo. II. c. 29. Masters of ships lying in the river Thames, having occasion for ballast, shall pay 12 d. per ton coiliers, other ships 15 d. and foreign ships 19 d. to the corporation of the Trinity-house at Deptford, who shall pay ballast-men 9 d. a ton for raising and carrying it, &c. And such ballast-men delivering more or less ballast than mentioned in tickets, or without order, shall forfeit 2 s. 6 d. per ton. Also working in lighters not marked and allowed, or counterfeiting any gauge-mark, they shall forfeit 10 l. leviable by two justices of peace, by distress, &c. And it shall be lawful for any master of a ship to appoint two persons, whereof his mate to be one, to go on board any lighter bringing ballast to such ship, to inspect the marks thereof; and every ballast-man shall immediately before the delivery of ballast to any ship, trim such lighter, so as to make the same swim at equal marks, at the stem and stern, and pump all the water out, &c. And the master, wardens, and assistants of the Trinity-house, are to make good to the master the quantity or value of ballast which shall be found deficient, or forfeit 50 l. one moiety to the poor, and the other to the person suing for the same.

The 7th of Geo. II. c. 15. ordains, That no owners of any ship shall be liable to answer any loss by reason of embezzlement, by the master or mariners, of any goods or merchandize which shall be shipped on board, or for any act done by them without the privity or knowledge of such owners, further than the value of the ship, and amount of the freight during the voyage, where such embezzlement, or other malversation of the master or mariners, shall be committed: and if several persons shall suffer damage by the means aforesaid, and the value of the ship, &c. shall not be sufficient to make compensation, then the freighters shall receive satisfaction in average, in proportion to their respective losses, to be ascertained on a bill in equity exhibited for a discovery thereof, and of the value of such ship and freight, &c.

But nothing in this act shall discharge any remedy, which any person may have against the master and mariners, in respect of any embezzlement. See the articles SHIPPING, SEA LAWS, MARINE TREATIES, OLERON'S LAW, RHODIAN LAWS, FREIGHT, ASSURANCES, and particularly the BUSINESS OF THE CUSTOMS, at the end of every letter.

A MEMOIR that may be necessary to be referred to occasionally.

The case of British merchants, owners of ships, and others, relative to the employment and increase of BRITISH SHIPPING AND BRITISH NAVIGATORS.

The spirit and tendency of all the laws which have been made in relation to the navigation of these kingdoms, clearly shew, that the principal view and aim of the legislature, has ever

been to increase and encourage BRITISH SHIPPING AND BRITISH NAVIGATORS.

That nevertheless, THE FREIGHTS between these kingdoms and several countries in Europe, have been almost wholly engrossed by FOREIGN SHIPS, because foreigners will always give the preference to ships of their own country; and those who are merchants or factors residing here, having connections, or perhaps engagements, with some of their countrymen at home, who are owners of shipping, always have employed their OWN SHIPS BEFORE OURS, not only when the prices of both were the same, but even in some instances, when British ships have been offered to load at a CHEAPER RATE THAN FOREIGNERS WOULD AGREE TO. From which it may be inferred, that the prices paid for freighting ships with those goods, are a sufficient encouragement for our owners, and that such freighting voyages would be sought after by them. Nor is it to be apprehended, that the exportation of merchandize can be lessened, by confining it in some measure to BRITISH VESSELS, because few or none of those foreign owners are the freighters, but merchants (who are unconcerned in shipping) are the real proprietors of these cargoes.

And the necessity of contriving some means for maintaining our wonted superiority, as a MARITIME POWER, appears the more evident at this juncture, when an universal spirit and uncommon ardour for IMPROVING TRADE, NAVIGATION, and NAVAL STRENGTH, PREVAILS THROUGHOUT EUROPE; which is manifested, by the various nations thereof purchasing ships from us, and by the great number of hands employed in building new ships of their own; and it may not be improper to observe, that their own built ships are allowed different degrees of remission from DUTIES AND CUSTOMS ON THEIR CARGOES, IN PROPORTION TO THE NEWNESS OF THE VESSEL, 'till they have been occupied sixteen years. And such like bounties and encouragements, may in time ENABLE FOREIGNERS TO OUTVY US IN SHIPPING; for, in proportion as the number of their ships and sailors increase, ours must become unemployed, and consequently diminish. And, indeed, had it not been for the NAVIGATION ACTS, our merchants shipping would, at this time, have been very inconsiderable.

That the increase of our sailors is not the only advantage that depends upon the increase of our shipping; for our shipwrights, caulkers, and sailcloth-makers, would meet with full employment and encouragement at home, and have no occasion to seek their bread in foreign countries; and, in general, all trades depending upon the building and employment of shipping be proportionably benefitted, to the great augmentation of the inland revenues, and advantage of the landed interest, which always rises and falls with the increase and decay of trade. Besides, a greater importation of pitch, tar, hemp, timber, and other commodities used in building and equipping ships would be promoted, which must increase his majesty's customs. Whereas none of these advantages accrue FROM FOREIGNERS, who never REFIT OR VICTUAL THEIR SHIPPING HERE, but in cases of absolute necessity.

That our knowledge and acquaintance with the navigation in foreign seas and on foreign coasts (some of which for want of experience we are unacquainted with) will consequently be improved in proportion to the greater DIVERSITY OF OUR VOYAGES; by which means seamen may be trained up capable of navigating ships of war in those, at present unfrequented, seas and coasts; which may in some measure countervail the advantage foreigners have, in being so generally acquainted with ours.

That bounties and debentures, in the original institution of them, were calculated for the benefit of trade in general; and under that general head, must certainly be included the shipping and navigation of these kingdoms, which ought therefore to have the benefit and advantages arising from such encouragements, and which they undoubtedly will, by limiting and confining the exportation of goods, on which bounties and debentures are given, TO BRITISH SHIPS AND VESSELS. And when any government thinks proper to grant an encouragement to the exportation of some particular species of goods, it is but reasonable that the advantages resulting from it should be enjoyed by its own subjects only, and not by foreigners.

The frauds committed upon the revenue, by the relanding of BOUNTY AND DEBENTURE GOODS, would be more easily detected, if British vessels were obliged upon their return home to produce vouchers of the DELIVERY OF THEIR CARGOES, or be punished for fraud or neglect; whereas foreigners, that never return to a British port, may practise THESE FRAUDS UPON THE REVENUE with impunity.

That the liberty allowed to foreigners to export OUR BOUNTY AND DEBENTURE GOODS, with other SORTS OF MERCHANDIZE by way of back freight, and the profit arising from it, is manifestly the encouragement and inducement to them to load so considerably in these kingdoms; whereas were that liberty (as to bounty and debenture goods) allowed to British ships only, we might ourselves enjoy the great profit which they now draw from us, and at the same time the manufactures and goods of this country, on which there are NO

BOUNTIES OR DRAWBACKS, might continue to be exported on FOREIGN BOTTOMS. Nor will these reasons be invalidated by objecting, that a British ship would with difficulty, or perhaps not at all, get a back freight from the port to which she might carry our bounty and debenture goods; because it has been found by experience, that a vessel, after she has once undergone the expence of her first out-fit, might even go in ballast to another port for a back freight, with sufficient profit; as in the case of many of our CORN SHIPS, whose cargoes being landed in the Mediterranean, or other places, they proceed thence to British America in ballast, in order to procure a lading home. Another advantage arising from the increase of our shipping, which would be occasioned by this limitation is, that our discharged seamen and marines will meet with immediate employment, and a more EXTENSIVE PLAN BE LAID FOR THE TRAINING UP OF SEAMEN FOR THE BENEFIT OF THE PUBLIC IN CASE OF EMERGENCY. Benefits which, without such a limitation, will naturally result to foreigners, to the proportionable diminution of the navigation and security of these kingdoms.

That the EXPORTATION OF PROVISIONS FROM IRELAND HATH been almost ENTIRELY ENGROSSED BY FOREIGNERS in foreign bottoms, whereas were that trade to be confined to BRITISH SHIPS ONLY, it would tend manifestly to the employment and increase of British shipping; nor would the exportation of provisions from thence at all be lessened, because foreigners cannot be so well supplied from any other country: neither would this be any impediment to foreigners, for few of them take in provisions at Ireland on voyages to their plantations or settlements, but send ships to Ireland merely to carry provisions to their own European ports, and there victual out their vessels for their voyages and settlements; which freight would employ a considerable number of OUR OWN SHIPPING. And should it be objected, that those limitations in time of war may be a disadvantage to trade, yet this objection may easily be obviated, by vesting a power in the crown to dispense with, alter, or enlarge the limitation during such war; and perhaps too it may be objected, that such a limitation may be of dangerous consequence to the trade and commerce of these kingdoms: but this limitation is not to be considered as a general prohibition, for it is proposed to extend no further than the exportation of SOME PARTICULAR GOODS, on which BOUNTIES AND DEBENTURES HAVE BEEN GRANTED BY PARLIAMENT, and to IRISH PROVISIONS, and would leave the navigation in other respects as free and open as ever to foreign ships, for the exportation of all other goods and manufactures.

That freights will not be enhanced by these limitations, since the number of vessels at present unemployed, and numbers of others which would be built in consequence of this encouragement, would always be sufficient to export those kinds of goods, upon as easy or easier terms than they are at present exported by foreigners, who frequently come here in ballast, in order to export bounty or debenture goods, and of that species with which of necessity they must provide themselves from hence, as being only to be had of us.

Should it be alledged, that the profit of freightage is the only inducement foreigners have to take some kinds of goods from it, yet inducements of so pernicious a consequence should be avoided, as this trade tends so manifestly to increase THEIR SHIPPING, and of course their NAVAL POWER, whereby they may soon become our equals, and compel us to increase OUR MARITIME FORCE, though for no other use than to PREVENT THEIR SUPERIORITY, even when we are (from our natural resource) less able to support or bear the expence of such an increase.

That importations into these kingdoms will be more considerable in British vessels, which by these means may afford to freight back upon easier terms than foreigners, without any diminution of foreign commerce, since FOREIGN COMMODITIES are imported into these kingdoms without any regard to the vessel that brings them, but merely for the benefit arising from our markets.

That confining the exportation of CORN TO BRITISH SHIPPING, has been productive of no loss or inconvenience to us, but on the contrary many good effects have been experienced from it, by the number of our shipping, which has been, and

is employed therein; whence it may be reasonably concluded, that a GENERAL LIMITATION OF BOUNTY AND DEBENTURE GOODS TO BRITISH SHIPPING, will be of a still further and proportionable advantage to these kingdoms.

And experience has shewn, that seamen employed in the European navigation have ever enjoyed a greater degree of health, and better constitutions, than those employed in the East-India, West-India, American, or African trades, which have been fatal to a great number of young, stout, and valuable seamen; and the devastation occasioned by the mortality of seamen in those climates, has been supplied only by the nurseries of seamen in Europe; and, as those distant countries import and send hither merchandize entitled to a drawback on exportation, our European navigation should be employed in such exportation; otherwise we have no equivalent relative to our navigators, for supplying the trade of India, Africa, and America, with such numbers of seamen. That the most valuable seamen for the service of the public in the navy, are those bred up in the MERCANTILE EMPLOY, who are no expence to the nation, but a considerable benefit; because by their labour they maintain themselves and enrich their employers, and also serve as a natural resource for the defence and protection of this island. It is not quite certain how many ships are employed by this nation, but it is generally believed, that the number belonging to England trading over sea, is about 2000 sail great and small, amounting in the whole to about 170,000 tons; and the coasting vessels in England may consist of about the like number, and contain about 150,000 tons; and, by the list annexed is shewn, to what foreign countries or states the ships therein mentioned belong, together with the number of their voyages, their names, and the tonnage of each foreign ship employed in bringing goods to England, in one year before the war in 1741, one year during the war, and one after the peace of AIX LA CHAPELLE: which list is brought to a head, and shews the total of those particulars, and also the tonnage of the repeated voyages, added to that of the first voyage. It likewise ascertains the whole foreign tonnage of each year, the voyages and tonnage that have increased since the war, by being compared with the year before the war, and an average made on the three years; by which may be formed a calculation of the ships belonging to England, with the foreign ships really employed in carrying freights for England.

The average of the burthen of foreign ships is 86,094 tons annually employed by England (exclusive of those carrying provisions from Ireland); and the tonnage of British ships belonging to England in the foreign and coasting trade is 320,000 tons, which, if actually employed, does not amount to four times the quantity of foreign tonnage: and hence a calculation may be formed of the natural GROWING STRENGTH OF OUR NEIGHBOURING MARITIME POWERS, so far as particularly relates to their trade carried on WITH ENGLAND. Upon the whole, therefore, it will surely appear, that, by limiting the exportation of BOUNTY AND DEBENTURE GOODS TO BRITISH SHIPPING ONLY, no prejudice will arise to the trade and commerce of these kingdoms; but on the contrary, the happiest and most desirable effects will result from it, in the greater encouragement which will be necessarily given to artificers in general, to our manufactures of British sail-cloth, to all trades depending upon the building and employment of shipping; and by it the skill and experience of our seamen will become more extensive, and even universal IN THE NAVIGATION OF FOREIGN SEAS, and a less encouragement will be given to foreigners to INCREASE THEIR SHIPPING: and thereby also the revenues of the crown from inland duties and customs will be more considerably improved, and frauds in the latter more easily detected, and the landed interest in general will partake of these benefits arising from it; and (which is of the utmost importance to the nation) a foundation will be laid, not only for THE INCREASE AND EMPLOY OF BRITISH SHIPPING, but also of BRITISH NAVIGATORS, trained up and made a able and skilful for the service of the public in all emergencies; from whence the necessity of an act of parliament, as a foundation for producing these beneficial consequences, is very apparent.

An ACCOUNT of all the Foreign Shipping which have entered in at the several Ports of Eng-land, fet forth in Columns, under the Title of the Nation or State to which they belong, for two several Years, ending at Christmas 1743 and 1747, and one Year ending at Lady-Day 1749; which is one Year before the French War, one Year in the War, and one Year since the War.

NEGROLAND. See AFRICA, ENGLISH AFRICAN COMPANY, ANTILLES ISLANDS.

NETHERLANDS, [The UNITED NETHERLANDS,] or the UNITED PROVINCES of the NETHERLANDS.

Previously to the perusal of this article, the reader is desired to consult what we have said under AUSTRIAN NETHERLANDS, FLANDERS, and HOLLAND.

The United Netherlands consist of the several provinces of Holland, Zealand, Friesland, Groningen, Overijssel, Gelderland, with Zutphen and Utrecht, and are bounded by the German Sea on the north and west, by the circle of Westphalia in Germany on the east, and by Flanders, Brabant, and the dukedom of Cleves on the south, lying between 3 degrees 20 min. and 7 degr. 30 min. east long. and between 51, 35 min. and 52 degrees 40 min. north lat. and are about 50 miles long, and much the same in breadth; including the Zuyder Sea, which takes up a considerable space within these limits. This is a level country, and cut through with numerous canals, which form numerous small islands, subject to be overflowed by inundations of sea and land floods, which are kept out, at a great expence, by the means of dykes. As a part of the country has been lost by inundations, so much more has been gained by damming out the sea. Sir William Temple says, that the sea may one day have it's own again. The air of this country is very bad, by reason of abounding

with so great a degree of humidity. As to the soil of the provinces which lies near the sea, particularly on the west coast of Holland; their meadow and pasture is most of it under water in winter, which, in summer, is either dried up, or the water thrown out with wind-mills, and leaves a fat slime, which makes the soil very fruitful, whereon they fatten the lean cattle they purchase in the north, and make prodigious quantities of butter and cheese; but the country does not produce corn enough for their subsistence: yet they have as great plenty of it as any nation in Europe, and likewise of the produce of every country; these provinces containing magazines of every thing the earth produces, that is trafficable. But in regard to their trade, we shall begin with their

FISHERIES. See our general article FISHERIES, and HERRING-FISHERY, and HOLLAND Emanuel Van Meteren, the Dutch historian, informs us, that in 1610, there went from Holland 1500 buffes upon the herring-fishery. The author of Batavia Illustrata tells us, that one year with another, the number of these buffes does not exceed 800; but those are from 30 to 50 tons, whereas in Van Meteren's time, they were only from 20 to 30 tons: so that though the number of vessels that may be now employed be not so great, yet this is more than made up in their size: there is a greater quantity of fish taken at present, more hands than ever employed, and a proportionable consumption

consumption of every thing that depends on their fishery. The importance of the herring-fishery will appear very great to any one that considers how many different parts of commerce it gives motion to, and how great a number of people depend on each of them. There are here two seasons of the herring-fishery; the first continues for a month or five weeks, on the coast of Scotland, from the latter end of June to the latter end of July; the second holds from the middle of September to the latter end of November, on the coast of England, about Yarmouth and Leostoff.

The inland fishery of the Dutch is also of no little consequence to them. Their lakes and rivers afford all kinds of fresh-water fish; and those proper to the sea, are taken on every part of their coast, with which their markets are plentifully supplied: what is more than competent for home consumption, is pickled, and added to their cod and herrings for exportation.

What the trade of the United Netherlands was, in the time of Sir William, we have in his account thereof; which, with remarks suitable to it's present state, will give the reader a good idea of it's present compared with it's former condition, will also shew the difference, and point out the cause.

'Tis evident, says Sir William, to those who have read the most, and travelled farthest, that no country can be found, either in this present age, or upon record of any story, where so vast a trade has been managed, as in the narrow compass of the four maritime provinces of this commonwealth; nay, it is generally esteemed, that they have more shipping belongs to them, than there does to all the rest of Europe. Yet they have no native commodities towards the building or rigging of the smallest vessel; their flax, hemp, pitch, wood, and iron, coming all from abroad, as wool does for cloathing their men, and corn for feeding them.

Nor do I know any thing properly of their own growth, that is considerable, either for their own necessary use, or for traffic with their neighbours, besides butter, cheese, and earthen wares. For havens, they have not any good upon their whole coast: the best are Helvoetsluys, which has no trade at all; and Flushing, which has little, in comparison of other towns in Holland: but Amsterdam, that triumphs in the spoils of Lisbon and Antwerp, (which before ingrossed the greatest trade of Europe and the Indies) seems to be the most incommensurable haven they have, being seated upon so shallow waters, that ordinary ships cannot come up to it without the advantage of tides, nor great ones without unloading.

The entrance of the Texel, and passage over the Zuyder-sea, is more dangerous than a voyage from thence to Spain, lying all in blind and narrow channels; so that it easily appears, that 'tis not an haven that draws trade, but trade that fills an haven, and brings it in vogue. Nor has Holland grown rich by any native commodities, but by force of industry; by improvement and manufacture of all foreign growth; by being the general magazine of Europe, and furnishing all parts with whatever the market wants or invites; and by their seamen being, as they have properly been called, the common carriers of the world*.

* The Dutch have lost a very considerable part of this beneficial traffic since the peace of Utrecht.

Since the ground of trade cannot be derived from havens, or native commodities, (as may well be concluded from the survey of Holland, which has the least and the worst; and of Ireland, which has the most and the best of both) it were not amiss to consider, from what other source it may be more naturally and certainly derived: for if we talk of industry, we are still as much to seek, what it is that makes people industrious in one country, and idle in another.

I conceive the true original and grounds of trade to be, great multitudes of people crowded into a small compass of land, whereby all things necessary to life become dear, and all men who have possessions, are induced to parsimony; but those who have none, are forced to industry and labour, or else to want. Bodies that are vigorous, fall to labour; such as are not, supply that defect by some sort of inventions or ingenuity. These customs arise first from necessity, but increase by imitation, and grow in time to be habitual in a country; and wherever they are so, if it lies upon the sea, they naturally break out into trade, both because whatever they want of their own, that is necessary to so many men's lives, must be supplied from abroad; and because, by the multitude of people, and smallness of country, land grows so dear, that the improvement of money, that way, is inconsiderable, and so turns to sea, where the greatness of the profit makes amends for the venture.

This cannot be better illustrated, than by it's contrary, which appears no where more than in Ireland; where, by the largeness and plenty of the food, and scarcity of people, all things necessary to life are so cheap, that an industrious man, by two day's labour, may gain enough to feed him the rest of the week; which I take to be a very plain ground of the laziness attributed to the people: for men naturally

prefer ease before labour, and will not take pains, if they can live idle. Though when, by necessity, they have been inured to it, they cannot leave it, being grown a custom necessary to their health, and to their very entertainment: nor, perhaps, is the change harder, from constant ease to labour, than from constant labour to ease.

This account of the original of trade agrees with the experience of all ages, and with the constitutions of all places, where it has most flourished in the world; as Tyre, Carthage, Athens, Syracuse, Agrigentum, Rhodes, Venice, Holland, and will be so obvious to every man, that knows and considers the situation, the extent, and the nature of all those countries, that it will need no enlargement upon the comparisons.

By these examples, which are all of commonwealths, and by the decay or dissolution of trade in the six first, when they came to be conquered, or subjected to arbitrary dominions, it might be concluded, that there is something in that form of government proper and natural to trade, in a more peculiar manner. But the height it arrived to at Bruges and Antwerp, under their princes, for four or five descents of the house of Burgundy, and two of Austria, shews it may thrive under good princes and legal monarchies, as well as under free states.

Under arbitrary and tyrannical power, it must of necessity decay and dissolve, because this empties a country of people, whereas the others fill it; this extinguishes industry, whilst men are in doubt of enjoying themselves with what they get, or leaving it to their children; the others encourage it, by securing men of both; one fills a country with soldiers, and the other with merchants, who were never known yet to live well together, because they cannot trust one another. And as trade cannot live without mutual trust among private men, so it cannot grow or thrive, to any great degree, without a confidence both of public and private safety, and consequently a trust in the government, from an opinion of it's strength, wisdom, and justice; which must be grounded either upon the personal virtues and qualities of a prince, or else upon the constitutions and orders of a state.

It appears to every man's eye, who hath travelled Holland, and observed the number and vicinity of their great and populous towns and villages, with the prodigious improvement of almost every spot of ground in the country, and the great multitudes constantly employed in their shipping abroad, and their boats at home, that no other known country in the world, of the same extent, holds any proportion with this in numbers of people; and if that be the great foundation of trade, the best account that can be given of theirs, will be by considering the causes and accidents that have served to force or invite so vast a confluence of people into their country. In the first rank may be placed the civil wars, calamities, persecutions, oppressions, or discontents, that have been so fatal to most of their neighbours, for some time before, as well as since their state began.

The persecutions for matter of religion, in Germany, under Charles V. in France, under Henry II. and in England, under queen Mary, forced great numbers of people out of all those countries, to shelter themselves in the several towns of the seventeen provinces, where the ancient liberties of the country, and privileges of the cities, had been inviolate under so long a succession of princes, and gave protection to these oppressed strangers, who filled their cities both with people and trade, and raised Antwerp to such an height and renown, as continued 'till the duke of Alva's arrival in the Low-Countries.

The flight of this man, and the orders he brought, and arms to execute them, began to scatter the flock of people that for some time had been nested there; so as, in a very few months, above a hundred thousand families removed out of the country.

But when the seven provinces united, and began to defend themselves with success, under the conduct of the prince of Orange, and the countenance of England and France, and the persecutions for religion began to grow sharp in the Spanish provinces, all the professors of the reformed religion, and haters of the Spanish dominions, retired into the strong cities of this commonwealth, and gave the same date to the growth of trade there, and the decay of it at Antwerp.

The long civil wars, as first of France, then of Germany, and lastly of England, served to increase the swarm in this country, not only by such as were persecuted at home, but great numbers of peaceable men, who came here to seek for quiet in their lives, and safety in their possessions or trades; like those birds that, upon the approach of a rough winter-season, leave the countries where they were born and bred, fly away to some kinder and softer climate, and never return 'till the frosts are past, and the winds are laid at home. The invitation these people had, to fix rather in Holland, than in many better countries, seem to have been, at first, the great strength of their towns; which, by their maritime situation, and the low flatness of their country, can, with their sluices, overflow all the ground about them, at such distances, as to become inaccessible to any land forces. And this natural strength has been improved, especially at Amsterdam,

Amsterdam, by all the art and expence that could any ways contribute towards the defence of the place.

Next was the constitution of their government; by which neither the States-General, nor the prince, have any power to invade any man's person or property within the precincts of their cities. Nor could it be feared, that the senate of any town should conspire to any such violence; nor if they did, could they possibly execute it, having no soldiers in their pay, and the burghers only being employed in the defence of their towns, and execution of all civil justice among them.

These circumstances give so great a credit to the bank of Amsterdam; and that was another invitation for people to come and lodge here, what part of their money they could transport, and knew no way of securing at home. Nor did those people only lodge monies here, who came over into the country, but many more who never left their own: though they provided for a retreat against a storm, and thought no place so secure as this, nor from whence they might so easily draw their money into any parts of the world.

Another circumstance was, the general liberty and ease, not only in point of conscience, but all others that serve to the commodiousness and quiet of life; every man following his own way, minding his own business, and little enquiring into other men's; which, I suppose, happened by so great a concourse of people of several nations, different religions and customs, as left nothing strange or new, and, by the general humour, bent all upon industry; whereas, curiosity is only proper to idle men.

Besides, it has ever been the great principle of their state, running through all their provinces and cities, even with emulation, to make their country the common refuge of all miserable men, from whose protection, hardly any alliances, treaties, or interests, have ever been able to divert or remove them. So as, during the great dependance this state had upon France, in the time of Henry IV. all the persons disgraced at that court, or banished that country, made this their common retreat; nor could the state ever be prevailed with, by any instances of the French ambassador, to refuse them the use and liberty of common life and air, under the protection of their government.

This firmness in the state has been one of the circumstances that has invited so many unhappy men out of all their neighbourhood, and, indeed, from most parts of Europe, to shelter themselves from the blows of justice, or of fortune.

Nor, indeed, does any country seem so proper to be made use of upon such occasions, not only in respect of safety, but as a place that holds so constant and easy correspondencies with all parts of the world, and whither any man may draw whatever money he has at his disposal in any other place; where neither riches expose men to danger, nor poverty to contempt; but, on the contrary, where parsimony is honourable, whether it be necessary or no; and he that is forced, by his fortune, to live low, may here alone live in fashion, and upon equal terms (in appearance abroad) with the chieftest of their ministers, and richest of their merchants: nor is it easily imagined, how great an effect this constitution among them may, in course of time, have had upon the increase both of their people and their trade.

As the two first invitations of people into this country, were the strength of their towns, and nature of their government, so two others have grown with the course of time, and progress of their riches and power. One is the reputation of their government, arising from the observation of the successes of their arms, the prudence of their negotiations, the steadiness of their councils, the constancy of their peace and quiet at home, and the consideration they hereby arrived at among the princes and states of Christendom. From all these, men grew to a general opinion of the wisdom and conduct of their state, and of it's being established upon foundations that could not be shaken by any common accidents, nor consequently in danger of any great or sudden revolutions; and this is a mighty inducement to industrious people to come and inhabit a country, who seek not only safety, under laws, from justice and oppressions, but likewise, under the strength and good conduct of a state, from the violence of foreign invasions, or of civil commotions.

The other is, the great beauty of their country (forced in time, and by the improvements of industry, in spite of nature) which draws every day such numbers of curious and idle persons to see their provinces, though not to inhabit them. And, indeed, their country is a much better mistress than a wife, and where few persons, who were well at home, would be content to live; but where none, that have time and money to spare, would not for once be willing to travel; and as England shews, in the beauty of the country, what nature can arrive at, so does Holland, in the number, greatness, and beauty of their towns, whatever art can bring to pass. But these, and many other matters of speculation among them, filling the observations of all common travellers, shall make no part of mine, whose design is rather to discover the causes of their trade and riches, than to relate the effects.

Yet it may be noted hereupon, as a piece of wisdom in any kingdom or state, by the magnificence of courts, or of public structures; by encouraging beauty in private building, and the adornment of towns with pleasant and regular plantations of trees; by the celebration of some noble festivals or solemnities; by the institution of some great marts or fairs; and by the contrivance of any extraordinary and renowned spectacles, to invite and occasion, as much and as often as can be, the concourse of busy or idle people from the neighbouring or remoter nations, whose very passage and intercourse is a great increase of wealth and of trade, and a secret incentive of people to inhabit a country, where men may meet with equal advantages, and more entertainments of life, than in other places. Such were the Olympicks and other games among the Grecians; such the triumphs, trophies, and secular plays of old Rome, as well as the spectacles exhibited afterwards by the emperors, with such stupendous effects of art and expence, for courting or entertaining the people; such the wiles of New Rome; the jousts and tournaments formerly used in most of the courts of Christendom; the festivals of the more celebrated orders of knighthood; and, in particular towns, the carnivals and fairs; the kermesses, which run through all the cities of the Netherlands, and, in some of them, with a great deal of pageantry as well as traffic, being equal baits of pleasure and of gain. Having thus discovered, what has laid the great foundation of their trade, by the multitude of the people which has planted and habituated industry among them, and, by that, all sorts of manufacture; as well as parsimony, and thereby general wealth: I shall enumerate, very briefly, some other circumstances that seem, next to these, the chief advancers and encouragers of trade in their country.

Low interest, and dearth of land, are effects of the multitude of people, and cause of so much money to lie ready for all projects, by which gain may be expected, as the cutting of canals, making bridges and causeys, levelling downs, and draining marshes, besides all NEW ESSAYS at FOREIGN TRADE, which are propoised with any probability of advantage.

The use of their banks, which secures money, and makes all payments easy, and trade quick.

The sale by registry, which were introduced here and in Flanders, in the time of Charles V. and makes all purchases safe.

The severity of justice, not only against all thefts, but all cheats and counterfeits of any public bills (which is capital among them), and even against all common beggars, who are disposed of either into workhouses, or hospitals, as they are able or unable to labour. See the article POOR.

The convoys of merchant-fleets into all parts, even in time of peace, but especially into the Straights; which give their trade security against many unexpected accidents, and their nation credit abroad, and breeds up seamen for their ships of war.

The lowness of their customs, and easiness of paying them, which, with the freedom of their ports, invite both strangers and natives to bring commodities hither; not only as to a market, but as to a magazine, where they lodge 'till they are invited abroad to other and better markets.

Order and exactness in managing their trade, which brings their commodities in credit abroad. This was first introduced by severe laws and penalties, but is since grown into custom. Thus there have been above thirty several placarts about the manner of curing, pickling, and barrelling herrings. Thus all arms, made at Utrecht, are forfeited, if sold without mark, or marked without trial. And I observed in their India-House, that all the pieces of scarlet, which are sent in great quantities to those parts, are marked with the English arms, and inscriptions in English; by which they maintain the credit gained to that commodity, by our former trade to parts, where it is now lost or decayed.

The government managed either by men that trade, or whose families have risen by it, or who have themselves some interest going in other men's traffic, or who are born and bred in towns, the soul and being whereof consists wholly in trade, which makes sure of all favour, that from time to time grows necessary, and can be given the government.

The custom of every town's affecting some particular commerce or staple, valuing itself thereupon, and so improving it to the greatest height: as Flushing, by that of the West-Indies; Middleburgh, of French wines; Terveer, by the Scotch staple; Dort, by the English staple and Rhenish wines; Leyden, by the manufactures of all sorts of stuffs, silk, hair, gold and silver; Haerlem, by linen, mixt stuffs, and flowers; Delft, by beer and Dutch porcelain; Surdam, by the built of ships; Enchuyfen and Mazlandsluys, by herring-fishing; Friesland, by the Greenland trade, and Amsterdam, by that of the East-Indies, Spain, and the Straights. The great application of the whole province to the fishing-trade, upon the coasts of England and Scotland, which employ an incredible number of ships and seamen, and supplies most of the southern parts of Europe with a rich and necessary commodity. See the articles FISHERIES, and HERRING-FISHERY.

The last I shall mention, is, the mighty advance they have made towards engrossing the whole commerce of the East-Indies. [See the article DUTCH EAST-INDIA COMPANY] by their successes against the Portuguese, and by their many wars and victories against the natives, whereby they have forced them to treaties of commerce, exclusive to all other nations, and to the admission of forts to be built upon freights and passes, that command the entrances into the traffic of such places. This has been achieved by the multitude of their people and mariners, that has been able to furnish every year so many great ships for such voyages, and to supply the loss of so many lives, as the changes of climate have cost, before they learnt the method of living in them: by the vastness of the stock that has been turned wholly to that trade, and by the conduct and application of the East-India company, who have managed it like a commonwealth rather than a trade, and thereby raised a state in the Indies; governed, indeed, by the orders of the company, but otherwise appearing to those nations like a sovereign state, making war and peace with their greatest kings, and able to bring to sea forty or fifty men of war, and thirty thousand men at land, by the modestest computations. The stock of this trade, besides what it turns to in France, Spain, Italy, the Straights, and Germany, makes them so great masters in the trade of the northern parts of Europe, as Muscovy, Poland, Pomerania, and all the Baltic; where the spices, that are an Indian drug, and European luxury, command all the commodities of those countries, which are so necessary to life, as their corn; and to navigation, as hemp, pitch, masts, planks, and iron.

Thus the trade of this country is discovered to be no effects of common contrivances, of natural dispositions or situation, or of trivial accidents; but of a great concurrence of circumstances, a long course of time, force of orders and method, which never before met in the world to such a degree, or with so prodigious a success; and, perhaps, never will again. Having grown (to sum up all) from the situation of their country, extended upon the sea, divided by two such rivers as the Rhine and the Maes, with the vicinity of the Ems, Weser, and Elbe; from the confluence of people out of Flanders, England, France, and Germany, invited by the strength of their towns, and by the constitutions and credit of their government; by the liberty of conscience, and security of life and goods (subjected only to constant laws); from general industry and parsimony, occasioned by the multitude of people, and smallness of country; from cheapness and easiness of carriage, by convenience of canals; from low interest; and dearth of land, which turn money to trade; the institution of banks; sale by registry; care of convoys; smallness of customs; freedom of ports; order in trade; interest of persons in the government; particular traffic, affected to particular places; application to the fishery; and acquisitions in the East Indies.

It is no constant rule, that trade makes riches; for there may be a trade that impoverishes a nation: as it is not going often to market, that enriches the countryman; but, on the contrary, if, every time he comes there, he buys to a greater value than he sells, he grows the poorer the oftener he goes: but the only and certain scale of riches, arising from trade in a nation, is the proportion of what is exported for the consumption of others, to what is imported for their own.

The true ground of this proportion lies in the general industry and parsimony of a people, or in the contrary of both. Industry increases the native commodity, either in the product of the soil, or the manufactures of the country, which raises the stock for exportation. Parsimony lessens the consumption of their own, as well as of foreign commodities; and not only abates the importation by the last, but increases the exportation by the first; for, of all native commodities, the less is consumed in a country, the more is exported abroad; there being no commodity, but, at one price or other, will find a market, which they will be masters of, who can afford it cheapest: such are always the most industrious and parsimonious people, who can thrive by prices, upon which the lazy and expensive cannot live.

The vulgar mistake, that importation of foreign wares, if purchased abroad with native commodities, and not with money, does not make a nation poorer, is but what every man, that gives himself leisure to think, must immediately rectify, by finding out, that, upon the end of an account between a nation, and all they deal with abroad, whatever the exportation wants in value, to balance that of the importation, must of necessity be made up with ready money. By this we find out the foundation of the riches of Holland, as of their trade by the circumstances already rehearsed: for never any country traded so much, and consumed so little. They buy infinitely, but it is to sell again, either upon improvement of the commodity, or at a better market. They are the great masters of the Indian spices, and of the Persian silks; but wear plain woollen, and feed upon their own fish and roots. Nay, they sell the finest of their own cloth to France, and buy coarse out of England for their own wear. They send abroad the best of their own

butter, into all parts, and buy the cheapest out of Ireland, or the north of England, for their own use. In short, they furnish infinite luxury, which they never practise; and traffic in pleasures, which they never taste.

The gentlemen and officers of the army change their cloaths and their modes like their neighbours. But among the whole body of the civil magistrates, the merchants, the rich traders, and citizens in general, the fashions continue still the same; and others as constant among the seamen and boors: so that men leave off their cloaths, only because they are worn out, and not because they are out of fashion.

Their great foreign consumption is French wine and brandy; but that may be allowed them, as the only reward they enjoy of all their pains, and as that alone which makes them rich and happy in their voluntary poverty, who would otherwise seem poor and wretched in their real wealth. Besides, what they spend in wine, they save in corn to make other drinks, which is brought from foreign parts. And, upon a pressure of their affairs, we see now for two years together, they have denied themselves even this comfort, among all their sorrows, and made up in passive fortitude, whatever they have wanted in the active.

Thus it happens, that much going constantly out, either in commodity, or in the labour of seafaring men; and little coming in to be consumed at home, the rest returns in coin, and fills the country to that degree, that more silver is seen in Holland, among the common hands and purses, than brass either in Spain or in France; though one be so rich in the best native commodities, and the other drain all the treasures of the West-Indies.

By this account of their trade and riches, it will appear, that some of our maxims are not so certain, as they are current, in our common politics. As first, that example and encouragement of excess and luxury, if employed in the consumption of native commodities, is of advantage to trade: it may be so to that which impoverishes, but it is not to that which enriches a country; and is, indeed, less prejudicial, if it lie in native than in foreign wares. But the custom or humour of luxury and expence, cannot stop at certain bounds; what begins in native, will proceed in foreign commodities: and though the example arise among idle persons, yet the imitation will run into all degrees, even of those men, by whose industry the nation subsists. And besides, the more of our own we spend, the less we shall have to send abroad; and so it will come to pass, that while we drive a vast trade, yet, by buying much more than we sell, we shall come to be poor: whereas, when we drove a very small traffic abroad, yet, by selling so much more than we bought, we were very rich in proportion to our neighbours.

This appeared in Edward the Third's time, when we maintained so mighty wars in France, and carried our victorious arms into the heart of Spain: whereas, in the 28th year of that king's reign, the value and custom of all our exported commodities amounted to two hundred and ninety-four thousand, one hundred and eighty-four pounds, seventeen shillings and two pence. And that of imported, but to thirty-eight thousand, nine hundred and seventy pounds, three shillings and six pence. So as there must have entered that year into the kingdom in coin, or bullion (or else have grown a debt to the nation), two hundred and fifty-five thousand, two hundred and fourteen pounds, thirteen shillings and eight pence. And yet we then carried out our wools unwrought, and bought in a great part of our cloaths from Flanders.

Another common maxim is, that if, by any foreign invasion or servitude, the state, and consequently the trade, of Holland, should be ruined, the last would of course fall to our share in England. Which is no consequence: for it would certainly break into several pieces, and shift, either to us, to Flanders, to the Hanse Towns, or any other parts, according as the most of those circumstances should any where concur to invite it (and the likeness to such) as appear to have formerly drawn it into Holland, by so mighty a confluence of people, and so general a vein of industry and parsimony among them. And whoever pretends to equal their growth in trade and riches, by other ways than such as are already enumerated, will prove, I doubt, either to deceive, or to be deceived.

A third is, that if that state were reduced to great extremities, so as to become a province to some greater power, they would chuse our subjection rather than any other; or those, at least, that are the maritime, and the richest of the provinces. But it will be more reasonably concluded, from what Sir William has said in his former discourses on this state, that though they may be divided by absolute conquests, they will never divide themselves by consent, but all fall one way; and, by common agreement, make the best terms they can for their country, as a Province, if not as a State: and before they come to such an extremity, they will first seek to be admitted, as a Belgic circle, in the empire (which they were of old) and thereby receive the protection of that mighty body, which (as far as great and smaller things may be compared) seems the most like their own state in its main constitutions, but especially in the freedom or sovereignty

verignty of the imperial cities. And this I have often heard their ministers speak of, as their last refuge, in case of being threatened by too strong and fatal a conjuncture.

And, if this should happen, the trade of the provinces would rather be preserved or increased, than any way broken or destroyed by such an alteration of their state, because the liberties of the country would continue what they are, and the security would be greater than now it is.

The last I will mention is of another vein: that if the prince of Orange were made sovereign of their country, though by foreign arms, he would be a great prince, because this now appears to be so great a state. Whereas, on the contrary, those provinces would soon become a very mean country. For such a power must be maintained by force, as it would be acquired, and as, indeed, all absolute dominion must be in those provinces. This would raise general discontents, and those perpetual seditions among the towns, which would change the order of the country, and anger the property of private men, and shake the credit and safety of the government: whenever this should happen, the people would scatter, industry would faint, banks would dissolve, and trade would decay to such a degree, as probably, in course of time, the very dignities would be no longer maintained, by the defences of a weak people against so furious an invader; but the sea would break in upon their land, and leave their chiefest cities to be fisher-towns, as they were of old.

Without any such great revolutions, I am of opinion, that trade has, for some years ago, past its meridian, and begun sensibly to decay among them: whereof there seems to be several causes, as first, the general application that so many other nations have made to it, within these two or three and twenty years. For, since the peace of Munster, which restored the quiet of Christendom in 1648, not only Sweden and Denmark, but France and England, have more particularly than ever before, busied the thoughts and councils of their several governments, as well as the humours of their people, about the matters of trade.

Nor has this happened without good degrees of success; though kingdoms of such extent, that have other and nobler foundations of greatness, cannot raise trade to such a pitch as this little state, which had no other to build upon; no more than a man, who has a fair and plentiful estate, can fall to labour and industry, like one that has nothing else to trust to for the support of his life. But, however, all these nations have come, of late, to share largely with them; and there seem to be grown too many traders for trade in the world, so as they can hardly live one by another. As in a great populous village, the first grocer or mercer that sets up among them grows presently rich, having all their custom, 'till another, encouraged by his success, comes to set up by him, and share in his gains; at length so many fall to the trade, that nothing is got by it; and some must give over, or all must break*.

* This would be just, if the world did not afford a perpetual increase of traffic.

Not many ages past, Venice and Florence possessed all the trade of Europe; the last by their manufactures, the first by their shipping; and the whole trade of Persia and the Indies, whose commodities were brought (those by land, and those by the Arabian Sea) to Egypt, from whence they were fetched by the Venetian fleets, and dispersed into most of the parts of Europe: and in those times, we find the whole trade of England, was driven by Venetians, Florentines, and Lombards. The Easterlings, who were the inhabitants of the Hanse-Towns, as Dantzic, Lubec, Hamburg, and others upon the coast, fell next into trade, and managed all that of these northern parts for many years, and brought it first down to Bruges, and from thence to Antwerp. The first navigations of the Portuguese to the East-Indies, broke the greatest of the Venetian trade and drew it to Lisbon: and the revolt of the Netherlands, that of Antwerp to Holland. But in all this time, the other and greater nations of Europe concerned themselves little in it; their trade was war; their councils and enterprizes were busied in the quarrels of the Holy Land, or in those between the popes and the emperors (both of the same forge, engaging all Christian princes, and ending in the greatness of the Ecclesiastical State throughout Christendom): sometimes, in the mighty wars between England and France, between France and Spain: the more general between Christians and Turks; or more particular quarrels, between lesser and neighbouring princes. In short, the kingdoms and principalities were in the world, like the noblemen and gentlemen in a country; the free states and cities, like the merchants and traders: these at first despised by the others, the other served and revered by them; 'till, by the various course of events in the world, some of these came to grow rich and powerful by industry and parsimony; and some of the others, poor by war and by luxury: which made the traders begin to take upon them, and carry it like gentlemen, and the gentlemen begin to take a fancy of falling to trade.

By this short account it will appear no wonder, either that

particular places grew so rich and so mighty, while they alone enjoyed almost the general trade of the world; nor why not only the trade in Holland, but the advantage of it in general, should seem to be lessened by so many that share it.

Another cause of its decay in that state may be, that, by the mighty progress of their East-India company, the commodities of that country are grown more than these parts of the world can take off; and consequently, the rates of them must needs be lessened, while the charge is increased by the great wars, the armies, and forts, necessary to maintain or extend the acquisitions of that company in the Indies. For, instead of five or six East-India ships, which used to make the fleet of the year, they are now risen to eighteen or twenty (I think two and twenty came in one year to the United Provinces). This is the reason why the particular persons of that company in Holland make not so great advantage of the same stock, as those of ours do in England; though their company be very much richer, and drives a far greater trade than ours, which is exhausted by no charge of armies, or forts, or ships of war: and this is the reason, that the Dutch are forced to keep so long and so much of those commodities in their magazines here, and to bring them out, only as the markets call for them, or are able to take off; and why they bring so much less from the Indies, than they were able to do, if there were vent enough here: as I remember, one of their seamen newly landed out of their East-India fleet, in the year 1669, upon discourse in a boat between Delft and Leyden, said, he had seen, before he came away, three heaps of nutmegs burnt at a time, each of which was more than a small church could hold, which he pointed at in a village that was in sight.

Another cause may be the great cheapness of corn, which has been for these dozen years or more, general in all these parts of Europe, and which has a very great influence upon the trade of Holland. For a great vent of Indian commodities (at least the spices which are the gross of them) used to be made into the northern parts of Europe, in exchange for corn, while it was taken off at good rates by the markets of Flanders, England, France, Spain, or Italy; in all which countries it has of late years gone so low, as to discourage the import of so great quantities, as used to come from Poland and Prussia, and other parts of the north. Now, the less value those nations receive for corn, the less they are able to give for spice, which is a great loss to the Dutch on both sides, lessening the vent of their Indian ware in the northern, and the traffic of corn in the southern parts.

The cause of this great cheapness of corn seems to be, not so much a course of plentiful and seasonable years, as the general peace that has been in Europe since the year 1659 or 60; by which so many men and so much land have been turned to husbandry, that were before employed in the wars, or lay wasted by them in all the frontier provinces of France and Spain, as well as throughout Germany, before the peace of Munster; and in England, during the actions or consequences of a civil war: and plenty grows not to a height, but by the succession of several peaceful as well as seasonable years.

The last cause I will mention, is the mighty enlargement of the city of Amsterdam, by that which is called the New Town; the extent whereof is so spacious, and the buildings of so much greater beauty and cost than the old, that it must have employed a vast proportion of that stock, which in this city was before wholly turned to trade. Besides, there seems to have been growing on for these later years, a greater vie of luxury and expence among many of the merchants of that town, than was ever formerly known: which was observed and complained of, as well as the enlargement of their city, by some of the wisest of their ministers, while I resided among them, who designed some regulations by sumptuary laws; as knowing the very foundations of their trade would soon be undermined, if the habitual industry, parsimony, and simplicity of their people came to be over-run by luxury, idleness, and excess. However it happened, I found it agreed by all the most diligent and circumspect enquiries I could make, that in the years 1669 and 70, there was hardly any foreign trade among them, besides that of the Indies, by which the traders made the returns of their money without loss; and none, by which the common gain was above two or three in the hundred. So, as it seems to be with trade, as with the sea (it's element) that has a certain pitch above which it never rises in the highest tides, and begins to ebb, as soon as ever it ceases to flow; and ever loses ground in one place, proportionable to what it gains in another.

REMARKS before the last WAR.

There is nothing clearer, than that it is the true interest of this republic to live in perfect harmony with Great-Britain, inasmuch as both countries have continually reaped the greatest advantages, when this union has subsisted; and have both felt the bad effects of being set at variance, and employing their maritime forces against each other, through the intrigues of their common enemies. It is, indeed, true, that each of these powers have an equal interest in commerce; but

but while they live upon good terms, and consult their respective interests only, they can, without any difficulty, regulate the views of their subjects, so as to prevent their clashing with each other; and for the common benefit of both, which in the present situation of things is far easier than in former times; and of greater consequence than ever, considering the new schemes that are every day formed, and forming in different parts of Europe, with a tendency equally prejudicial to the trade of both.

Under the articles **FLANDERS** and **HOLLAND**, we have in our observations thereon shewn the necessity, the absolute and indispensable necessity in Great-Britain, to contribute all in her power to support and maintain a good barrier for the preservation of the Netherlands against the dominion of France: to enforce which principle still the more sensibly, we have also under the article **FRANCE**, shewn the extraordinary encroachments of that nation in point of territory since the time of Mons. Colbert, as well as the surprizing increase of their commerce and navigation from that period.—And, as the barrier of the Dutch still remains unsettled, it still remains necessary to corroborate what we have urged under the heads before-mentioned.—This we shall do from the authentic transactions of the parliament of England.

The sense of the commons upon this occasion, can no way be better seen, than from their own journals, and therefore I shall give the reader a short abstract of them.

In the beginning of 1677, the commons did directly, and in very pressing terms, represent to the king, that the minds of his people were very much disquieted with the dangers arising from the manifest growth and power of the French king; especially by the acquisitions made, and like to be made by him, in the Spanish Netherlands: in preservation and security whereof, say they, we humbly conceive the interest of your majesty, and the safety of your people, are highly concerned; and therefore we most humbly beseech your majesty to take the same into your royal care, and to strengthen yourself with such stricter alliances, as may secure your majesty's kingdoms, and preserve the said Spanish Netherlands, and thereby quiet the minds of your majesty's people.

And when the lords, who concurred with the commons in this address, would have had particular mention likewise made of Sicily, it being of great importance to our trade, that Sicily be not in the hands of the French king; the commons disagreed to it for this reason, because, 'the special mentioning of Sicily, would seem to put less weight upon the preservation of the Spanish Netherlands; the conservation of which they conceive to be of much more moment to his majesty's kingdoms, than that of Sicily. For though it may be of great importance to our trade, that Sicily be not in the hands of the French king, yet the safety of his majesty's kingdoms is not so immediately endangered thereby, and therefore it ought not to be equally insisted on.'

The king agreed with his parliament, in owning the great importance the conservation of Flanders was of to England; but the rest of his answer, which shewed his aversion to enter into a war for its defence, was so little satisfactory, that a motion was immediately made for a second address to his majesty, to enter into a strict and speedy alliance with the confederates; and, in pursuance of this motion, the house did about a fortnight after (March 30) in a second address implore his majesty, 'that he would be pleased to take timely care to prevent those dangers that may arise to these kingdoms by the great power of the French king, and the progress he daily makes in the Netherlands and other places; and that he would not defer the entering into such alliances as may obtain those ends, promising fully to assist his majesty if he should be engaged in a war in pursuance of such alliances.'

Within three days after the king's answer to this address, April 13, the house made a third address, to assure his majesty, that 'they would with most cheerful hearts proceed both then and at all other times, to furnish his majesty with such large supplies upon this occasion (to preserve the Netherlands and check the growth of France) as might enable him, by God's assistance, to maintain the alliances they had advised, against all opposition whatsoever.'

This address, upon the king's answer to it, was immediately followed by a fourth, April 16, assuring his majesty of their duty and affection; and that he might not only depend upon the supply he desired, but upon all such assistances as the posture of his affairs should require: 'in confidence whereof, say the commons, we hope your majesty will be encouraged in the mean time to speak and act such things as your majesty shall judge necessary, for attaining those great ends we have formerly represented to your majesty.'

These repeated addresses from so loyal a house of commons, sufficiently shew how much the nation was alarmed, upon the dangers to which they saw the Netherlands exposed.

The commons were so bent upon this point, as a matter of the last consequence, that they would take no denial: which made the court resolve upon adjourning them for five weeks. But what passed in this interval, did not make the commons alter their sentiments, or less earnest in the pursuit of them.

When they met again, May the 21st, they fell into very warm debates, and resolved to advance still one step farther in a matter of so great concern; which was, to address his majesty to enter into a league offensive and defensive with the States, and to make other fit alliances against the growth and power of France, and for the preservation of the Spanish Netherlands: and in this address they tell his majesty, how highly sensible they are of the necessity of supporting, as well as making, the alliances desired in their former addresses; 'which we still conceive, say they, so important to the safety of your majesty and your kingdoms, that we can't, without unfaithfulness to your majesty, and those we represent, omit upon all occasions humbly to beseech your majesty, as we now do, to enter into a league offensive and defensive with the States, &c.' And that no time might be lost in doing this, they give his majesty this reason among others, the great danger and charge which must necessarily fall upon your majesty's kingdoms, if, through want of timely encouragement and assistance, the States, or any other considerable part of the confederates, should make a peace with the French king (the prevention whereof hitherto, say they, must be acknowledged to be a singular effect of God's goodness to us); which if it should happen, your majesty would afterwards be necessitated with fewer, perhaps with no alliances, to withstand the power of the French king, which has so long and so successfully contended with so many and potent enemies; and whilst he continues his overbalancing greatness, must always be dangerous to his neighbours; since he would be able to oppress any one confederate, before the rest could get together, and be in so good a posture of offending him as they are now, being jointly engaged in a war; and if he should be so successful as to make a peace, or disunite the present confederation against him, it is much to be feared, whether it would be possible ever to reunite it. At least it would be a work of so much time and difficulty, as would leave your majesty's kingdoms exposed to much misery and danger. Having thus discharged our duty in laying before your majesty the dangers threatening your majesty and your kingdoms, and the only remedy we can think of for preventing it, and quieting the minds of your people; we most humbly beseech your majesty to take such resolutions, as may not leave it in the power of any neighbouring prince, to rob your people of that happiness they enjoy under your majesty's gracious government. Then they oblige themselves not only by their promises with great unanimity renewed in a full house, but by the zeal and desires of those they represent, and by the interest of all their subjects, most cheerfully to give his majesty speedy and plentiful supplies.

This earnest and importunate address, which was presented May the 26th, expressed not only the sense of a very full house, but indeed of the whole nation; which gave it so much weight, that the court saw they should be forced to comply with it, unless they betook themselves to the last refuge in such cases, and immediately put an end to the session. The parliament, therefore, was accordingly dismissed, and not suffered to sit again 'till the end of January 1677-8. But, though the court could interrupt the sitting of the parliament as they pleased, it was not possible to change their sentiments; and they no sooner met again, but they resumed their former debates with more earnestness, if possible, than before. For as that long interval, in which they had not been suffered to have an opportunity of interposing their councils with his majesty, had given the French so much farther leisure to finish their designs upon the Netherlands; the nation was so much the more alarmed, and in a new address Jan. 31, they 'humbly desire his majesty, with the highest zeal for his honour, and the safety of his people, not to admit of any treaty of peace, whereby the French king shall be left in possession of any larger dominions and territories, or of any greater power than what he retained by the Pyrenean treaty; less than which, they conceive, can't secure his majesty's kingdoms, and the rest of Europe, from the growth and power of the said king, but that he alone may be able to disturb the peace thereof whensoever he is inclined to attempt it.—And they farther desire, 'that in all treaties in order to the obtaining that end, his majesty would be pleased to provide, that none of the parties that shall join with him in making war for that purpose, may lay down their arms or depart from their alliances, until the said king be reduced, at least, to the said treaty.'

The commons had reason to hope for a compliance with this address; the king having in his speech acquainted them, that he 'had made, according to their desire, such alliances with Holland, as were necessary for the preservation of Flanders; that since a good peace could not be had by fair means, it should not be his fault if it were not obtained by force of arms; that if he be supported by them, he will not be weary 'till Christendom be restored to such a peace, as it shall not be in the power of any prince alone to disturb.'

But, whatever influenced the councils of the court, this address met with no better reception than their last. They had been then told, that 'what they did was an invasion of the prerogative;' and now they were told, not only the same thing, but, what is more surprizing, that 'the king having asked

asked the advice of both houses, can't act upon any that does not come jointly from both.' The commons, however, not rebuked with his treatment, persevered; immediately voted a good supply, and upon March 14th resolved to address his majesty, 'That to quiet the minds of his subjects, and encourage the confederates, he would be pleased immediately to proclaim and enter into an actual war against the French king, promising constantly to stand by and assist his majesty with plentiful supplies:' to which address they desired the concurrence of the lords; but, before it could be entirely obtained, they were adjourned to the middle of April, and from thence to the 29th; when the lord chancellor acquainted them in the king's name, 'That the States, whom he had long found weary of the war,' (and, indeed, had made so, for they were quite discouraged from expecting help from England, when they saw the zeal and spirit of the nation entirely defeated and eluded by the court) 'were making haste to get out of it, and were entered upon considerations of accepting such a peace as France had thought fit to offer, though it be without his majesty's consent or privy; a peace as ill for themselves and the rest of Christendom, as their enemies could wish.' And in this difficult conjuncture the king desires their advice (when it is too late) and resolves to pursue it now; though their giving it before in time, when it would have been of the greatest consequence, was made a high crime. It is not my business to expose the inflexibility of the court in this whole affair: they who would see this, need only read Sir William Temple's Letters and Memoirs; a person of undoubted reputation and authority, and who was in those times his majesty's ambassador in the Low-Countries.

But I cannot but observe from these words, what a character the king gives of that peace that was a little after concluded at Nimeugen; and what made that peace so ill a one, was the leaving so much of Flanders in the possession of France, and the remainder so much exposed by a weak and insecure barrier.

But to proceed: the commons, who were willing to hope, that if the court were sincere, things might be yet retrieved, came, May 4, to two resolutions, which they laid before the king, without staying to put them into the usual form of address, by reason of the importance of the affair, and the exigency of the time. In the first, they 'declared the league made with the States to procure a peace between the two crowns upon certain terms therein specified, not to be pursuant to their addresses, nor consistent with the good and safety of the kingdom;' and yet by these terms (had France been obliged to accept them) Tournay, Condé, and Valenciennes, were to be restored, together with the dukedom of Lorraine. The other resolution was, to desire his majesty 'forthwith to enter into the confederacy for the vigorous carrying on of the present war; and, particularly, that effectual endeavours might be used for continuing the States in the confederacy; and that no peace might be made with France, without general consent first had.' And, upon the king's refusing to give any answer 'till he had the concurrent advice of both houses, they immediately resolved to address his majesty to give a speedy answer to their last address, and to remove those counsellors who advised the answers to their former addresses of the 26th of May and 31st of January, or either of them; 'by which answers, they say, his majesty's good subjects had been infinitely discouraged, and the state of his affairs reduced to a most deplorable condition:' they mean the progress of the French in Flanders, and the great jealousy and uneasiness that gave the nation. And, notwithstanding the king told them May 23, that things were driving violently on towards a peace, yet still, to prevent so much of Flanders remaining in the hands of France, they resolved, if his majesty would then enter into a war against the French king, they were, and always would be, ready to assist him. But these and all the other efforts the commons could make, could not force the court into right measures, or prevent an ill peace; and served only to vindicate themselves to posterity, from having any hand in it; and this I presume it will be allowed they have done.

It is impossible to read this short account of the proceedings of the commons, and not observe of how very great importance they thought the saving of Flanders was, to the safety and security of this nation. This was so plainly the known and certain interest of England, that all the arts the court could use, could not divert them from pursuing this point. This was the first parliament that was chosen after the Restoration, which continued sitting above 17 years; and cannot be suspected either of not having a true regard for the prerogative, or a due deference for the sentiments of the court. But the interest and safety of their country was so much concerned in the preservation of Flanders, that this consideration carried them into these measures in opposition to the ministry, in which they steadily and unalterably persevered, and the nation was entirely with them; the point they pressed against the court, having apparently no other foundation, than their hearty zeal and concern for it's true interest. And the king himself thought fit, when it was too late, to express at least the same concern they did, and to concur in the same sentiments; as appears from his speech to them not long after, in

which he opens his heart freely to them, and tells them he was, 'resolved to save Flanders, either by a war or a peace, as the greatest FOREIGN INTEREST of this nation.' The nature and importance of a good barrier to the Netherlands, will be best judged of from the barrier treaty itself, of which at present we should by no means lose sight.

The BARRIER TREATY between her majesty queen Anne and the States-General.

Her majesty the queen of Great-Britain, and the lords the States-General of the United Provinces, having considered how much it concerns the quiet and security of their kingdoms and states, and the public tranquillity, to maintain and to secure on one side the succession to the CROWN OF GREAT-BRITAIN, in such manner as it is now established by the laws of the kingdom; and, on the other side, that the said States-General of the United Provinces should have a strong and SUFFICIENT BARRIER * against France and others, who would surprize or attack them, and her majesty and the said States-General, apprehending, with just reason, the troubles and mischiefs which might happen, with respect to this succession, if at any time there should be any person or any power who should call it in question; and, if the countries and states of the said lords the States-General, were not secured by such a barrier: † for these said reasons, her majesty the queen of Great-Britain, though in the vigour of her age, and enjoying perfect health (which God preserve to her many

* [Against France and others.] These words [and others] ought not, it was said, by those who did not like it, to have been added in the treaty, the design of the treaty being to secure the barrier of the States against France only. That the first and chief design of a treaty for the barrier, was to secure it against France, I readily allow, because the first and chief danger is from thence; but if it is the interest of England that it should be secured at all, it is certainly the interest of England that it should be secured against others as well as France. If the barrier be lost for want of such security, whoever the invaders be, England as well as Holland loses the protection it gives them against France; and therefore it is our interest, as well as theirs, that it should be secured on all sides, and exposed to the least danger possible.

And, since the States oblige themselves to assist in maintaining the Protestant succession, not only against France, but against all others that shall attempt to disturb it; there is the same reason her majesty should give as full a guaranty to the States, for securing their barrier against all that shall attack it. The interest of both is reciprocal, and therefore the engagement ought to be so too. Nor can any inconvenience arise, from making the guaranty general against all invaders; because the obligations of mutual assistance, cannot by this treaty take place on any other occasion, but then only, when her majesty or the States shall be attacked on account of the succession or barrier. And therefore if the barrier be not attacked, though the States be invaded in any other part, her majesty is not engaged hereby. It will be pretended, perhaps, that there is no reason to apprehend any danger from any power besides France: but first, that is not true; for France, by her intrigues, has formerly engaged some princes of the empire in a war against the Dutch, and may do so again. But if it were true that nothing was to be apprehended from any other power than France, it is necessary the treaty should be made general, if it were only to guard against the mean and pitiful evasions that crowns are always ready to make use of to carry on her ambitious designs. Of which it will be sufficient to give one memorable instance, which is to the present purpose. In the year 1701, when the French forces had seized the whole Spanish Low-Countries, and had by lines and forts entirely couped up the States on that side; not content with this, to cut off the States from all communication with the empire, France sent, in concert with the elector of Cologne, a great body of troops into most of the strong towns belonging to that elector, and yet at the same time declared they would observe the peace and treaty of Ryswick, and therefore these troops were called auxiliary troops of the circle of Burgundy. Where now is the difference whether the king of France attack the Dutch in his own name, or whether his troops do it under the name of any body else? The troops are the same, and the danger all one. If this treaty therefore were not made general against all invaders, such an evasion might defeat the intention of it even against France itself. Thus much for the reason of this addition; and that the reader may be further satisfied, he need only have recourse to the 16th article, by which the defence of the succession and the barrier, is left general and unlimited.

† The reason why these words [and the above-said queen, &c. duly reflecting upon the advantage which France has always made use of, &c. for want of necessary and reasonable preliminaries being well established among the allies] were left out in the treaty, will appear by observing, that the counter-project then made was formed before the preliminary treaty in 1700, whereas this of the barrier was not made 'till after it; and therefore this clause was properly left out, the intention of it having been fully answered and complied with in the preliminary treaty, signed by the Queen, the Emperor, and the States.

years), out of her usual prudence and piety, has thought fit to enter, with the lords the States-General of the United Provinces, into a particular alliance and confederacy; the principal end and only aim of which, shall be the public quiet and tranquillity; and to prevent, by measures taken in time, all the events which might one day excite new wars. With this view it is, that her British majesty has given her full power, for agreeing upon certain articles of a treaty, additional to the treaties and alliances that she already has with the lords the States-General of the United Provinces, to her ambassador extraordinary and plenipotentiary, Charles viscount Townshend, baron of Lynn Regis, privy counsellor of her British majesty, captain of her said majesty's yeomen of the guard, and her lieutenant in the county of Norfolk: and the lords the States-General of the United Provinces, to the Sieurs John de Welderen, lord of Valbrugh, great bailiff of the Lower Retuwe, of the body of the nobility of the province of Guelder; Frederic baron of Reede, lord of Lier, St. Anthony and Tirfec, of the order of the nobility of the province of Holland and West Friesland; Anthony Heinfius, counsellor pensionary of the province of Holland and West Friesland, keeper of the great seal, and superintendant of the fiefs of the same province; Cornelius Van Gheet, lord of Spanbroek, Bulokestein, &c. Gideon Hocuft, canon of the church of St. Peter at Utrecht, and counsellor elect in the states of the province of Utrecht; Hessel Van Sminia, secretary of the chamber of accounts of the province of Friesland; Ernest Iterfum, lord of Osterhof, of the body of the nobility of the province of Overijssel; and Wicher Wichers, senator of the city of Groningen; all deputies to the assembly of the said lord the States-General, on the part respectively, of the provinces of Guelder, Holland and West Friesland, Zealand, Utrecht, Friesland, Overijssel, and of Groningen and Ommeland; who, by virtue of their full powers, have agreed upon the following articles.

ARTICLE I.

The treaties of peace, friendship, alliance, and confederacy, between her British majesty and the States-General of the United Provinces, shall be approved and confirmed by the present treaty, and shall remain in their former force and vigour, as if they were inserted in it word for word.

ARTICLE II.

The succession to the crown of England having been settled by an act of parliament passed the twelfth year of the reign of his late majesty king William III. the title of which is, An act for the further limitation of the crown, and better securing the rights and liberties of the subject: and lately, in the sixth year of the reign of her present majesty, this succession having been again established and confirmed by another act made for the greater security of her majesty's person and government, and the succession to the crown of Great-Britain, &c. in the line of the most serene house of Hanover, and in the person of the princess Sophia, and of her heirs, successors, and descendants, male and female, already born or to be born. And, though no power has any right to oppose the laws made upon this subject by the crown and parliament of Great-Britain; if it should happen nevertheless, that under any pretence, or by any cause whatever, any person, or any power or state should pretend to dispute the establishment which the parliament has made of the said succession in the most serene house of Hanover, to oppose the said succession, to aid or favour those who shall oppose it, whether directly or indirectly, by open war, or by fomenting seditions and conspiracies against her or him to whom the crown of Great-Britain shall descend according to the acts aforesaid; the States-General of the United Provinces, engage and promise to assist and maintain, in the said succession, her or him to whom it shall belong by virtue of the said acts of parliament, to aid them in taking possession, if they be not then in possession, and to oppose those who would disturb them in the taking such possession of the said succession.

ARTICLE III.

Her said majesty and the States-General, in consequence of the fifth article of the alliance concluded between the emperor, the late king of Great-Britain, and the lords the States-General, the 7th of September 1701, shall employ all their forces to recover the rest of the Spanish Low-Countries.

ARTICLE IV.

And further, they shall endeavour to conquer as many other towns and forts as they can, in order to their being a barrier and security to the said lords the States.

ARTICLE V.

And whereas, according to the ninth article of the said alliance, it is to be agreed amongst other matters, how and in what manner the States shall be secured by means of this barrier, the queen of Great-Britain shall use her endeavours to procure, that in the treaty of peace it may be agreed, that all the Spanish Low-Countries, and what else shall be found necessary, whether of conquered or unconquered places, shall serve as a barrier to the States.

ARTICLE VI.

That to this end their high-mightinesses shall have the liberty

to put and keep garrison, to change, augment, and diminish it as they shall judge proper, in the places following: namely, Newport, Furnes, with the fort of Knocke, Ypres, Menin, the town and citadel of Lille, Tournay and its citadel, Condé, Valenciennes, and the places which shall from henceforward be conquered from France. Maubeuge, Charleroy, Namur and its citadel, Liere, Hali to fortify, the ports of Perli, Philippe, Damme, the castle of Gand, and Dendermonde; the fort of St. Donas being joined to the fortifications of the Sluice, and being entirely incorporated with it, shall remain and be yielded in property to the States. The fort of Rodenhuyfen on this side Gand shall be demolished.

ARTICLE VII.

The said States-Generals may, in case of an apparent attack, or war, put as many troops as they shall think necessary in all the towns, places, and forts, in the Spanish Low-Countries, where the reason of war shall require it.

ARTICLE VIII.

They may likewise send into the towns, forts and places, where they shall have their garrisons, without any hindrance, and without paying any duties; provisions, ammunitions, arms and artillery, materials for the fortifications, and all that shall be found convenient and necessary for the said garrisons and fortifications.

ARTICLE IX.

The said States-General shall also have liberty to appoint in the towns, forts, and places of their barrier, mentioned in the foregoing sixth article, where they shall have their garrisons, such governors and commandants, majors and other officers, as they shall think proper; who shall not be subject to any other orders, whatsoever they may be, or from whomsoever they may come, relating to the security and military government of the said places, but only to those of their high-mightinesses (exclusively of all others); still preserving the rights and privileges, as well ecclesiastical as political, of king Charles the IIIrd.

ARTICLE X.

That besides, the said States shall have liberty to fortify the said towns, places, and forts which belong to them, and repair the fortifications of them, in such manner as they shall judge necessary, and further to do whatever shall be useful for their defence.

ARTICLE XI.

It is agreed, That the States-General shall have all the revenues of the towns, places, jurisdictions, and their dependencies, which they shall have for their barrier from France, which were not in the possessions of the crown of Spain, at the time of the death of the late king Charles the IIrd; and besides, a million of livres shall be settled for the payment of one hundred thousand crowns every three months, out of the clearest revenues of the Spanish Low-Countries, which the said king was then in possession of; both which are for maintaining the garrisons of the States, and for supplying the fortifications, as also the magazines, and other necessary expences, in the towns and places above-mentioned. And that the said revenues may be sufficient to support these expences, endeavours shall be used for enlarging the dependencies and jurisdictions aforesaid, as much as possible; and particularly for including with the jurisdictions of Ypres, that of Cassel, and the forest of Nieffe; and with the jurisdiction of Lille, the jurisdiction of Douay, both having been joined before the present war.

ARTICLE XII.

That no town, fort, place, or country of the Spanish Low-Countries, shall be granted, transferred, or given, or descend to the crown of France, or any one of the line of France, neither by virtue of any gift, sale, exchange, marriage, agreement, inheritance, succession by will, or through want of will, from no title whatsoever, nor in any other manner whatever, nor be put into the power or under the authority of the most Christian king, or any of the line of France.

ARTICLE XIII.

And whereas the said States-General, in consequence of the ninth article of the said alliance, are to make a convention or treaty with king Charles the IIIrd, for putting the States in a condition of safety, by means of the said barrier, the queen of Great-Britain will do what depends upon her, that all the foregoing particulars, relating to the barrier of the States, may be inserted in the aforesaid treaty or convention; and that her said majesty will continue her good offices, till the above mentioned convention between the States and the said king Charles the IIIrd, be concluded, agreeable to what is before-mentioned, and that her majesty will be guarantee of the said treaty or convention.

ARTICLE XIV.

And, that the said States may enjoy from hence forward, as much as possible, a barrier for the Spanish Low Countries, they shall be permitted to put their garrisons in the towns already taken, and which may hereafter be so, before the peace be concluded and ratified. And, in the mean time, the said king Charles the IIIrd, shall not be allowed to enter into possession of the said Spanish Low-Countries, neither entirely
nor

nor in part; and during that time the queen shall assist their high-mightinesses to maintain them in the enjoyment of the revenues, and to find the million of livres a year above-mentioned.

ARTICLE XV.

And whereas their high-mightinesses have stipulated by the treaty of Munster, in the fourteenth article, That the river Schelde, as also the canal of Sas, Swyn, and other mouths of the sea bordering thereupon, should be kept shut on the side of the States.

And in the fifteenth article, That the ships and commodities going in and coming out of the harbours of Flanders, shall be and remain charged with all such imposts and other duties, as are raised upon commodities going and coming along the Schelde, and the other canals above-mentioned:

The queen of Great-Britain promises and engages, That their high-mightinesses shall never be disturbed in their right and possession, in that respect, neither directly nor indirectly; as also that the commerce shall not, in prejudice of the said treaty, be made more easy by the sea ports, than by the rivers, canals, and mouth of the sea, on the sides of the States of the United Provinces, neither directly or indirectly:

And whereas by the 16th and 17th articles of the same treaty of Munster, his majesty the king of Spain, is obliged to treat the subjects of their high-mightinesses as favourably as the subjects of Great Britain and the Hanse-Towns, who were then the people the most favourably treated; her Britannic majesty and their high-mightinesses promise likewise, to take care that the subjects of Great-Britain, and of their high-mightinesses, shall be treated in the Spanish Low-Countries, as well as in all Spain, the kingdoms and states belonging to it, equally, and as well the one as the other, as favourably as the people the most favoured.

ARTICLE XVI.

The said Queen and States-General oblige themselves to furnish, by sea and land, the succours and assistance necessary to maintain, by force, her said majesty in the quiet possession of her kingdoms, and the most serene house of Hanover in the said succession, in the manner it is settled by the acts of parliament before-mentioned, and to maintain the said States-General in the possession of the said barrier.

ARTICLE XVII.

After the ratification of this treaty, a particular convention shall be made of the conditions by which the said queen, and the said lord the States-General, will engage themselves to furnish the succours which shall be thought necessary, as well by sea as by land.

ARTICLE XVIII.

If her British majesty, or the States-General of the United Provinces, be attacked by any body whatsoever, by reason of this convention, they shall mutually assist one another with all their forces, and become guarantees of the execution of the said convention.

ARTICLE XIX.

There shall be invited and admitted into the present treaty, as soon as possible, all the kings, princes, and states who shall be willing to enter into the same; particularly his Imperial majesty, the kings of Spain and Prussia, and the elector of Hanover. And her British majesty, and the States-General of the United Provinces, and each of them in particular, shall be permitted to require and invite those whom they shall think fit to require and invite to enter into this treaty, and to be guarantees of its execution.

ARTICLE XX.

And, as time has shewn the omission which was made in the treaty signed at Ryswick in the year 1697, between England and France, in respect of the right of the succession of England, in the person of her majesty the queen of Great-Britain now reigning, and that, for want of having settled in that treaty this indisputable right of her majesty, France refused to acknowledge her for queen of Great-Britain, after the death of the late king William the Third, of glorious memory: her majesty the queen of Great-Britain, and the lords the States-General of the United Provinces, do agree and engage themselves likewise, not to enter into any negotiation or treaty of peace with France, before the title of her majesty to the crown of Great Britain, as also the right of succession of the most serene house of Hanover to the aforesaid crown, in the manner it is settled and established by the before-mentioned acts of parliament, be fully acknowledged as a preliminary by France, and that France has promised, at the same time, to remove out of its dominions the person who pretends to be king of Great-Britain; and that no negotiation nor formal discussion of the articles of the said treaty of peace shall be entered into, but jointly, and at the same time, with the said queen, or with her ministers.

ARTICLE XXI.

Her British majesty, and the lords the States-General of the United Provinces, shall ratify and confirm all that is contained in the present treaty, within the space of four weeks, to be reckoned from the day of the signing. In testimony whereof, the under-written ambassador extraordinary and plenipotentiary of her British majesty, and the deputies of the lords the

States-General, have signed this present treaty, and have affixed their seals thereunto.

At the Hague, the 29th of October, in the year 1709.

The separate article.

As in the preliminary articles signed here at the Hague the 28th of May, 1709, by the plenipotentiaries of his Imperial majesty, of her majesty the queen of Great-Britain, and of the lords the States-General of the United Provinces, it is stipulated, amongst other things, that the lords the States-General shall have, with intire property and sovereignty, the Upper Quarter of Guelder, according to the 52d article of the treaty of Munster, of the year 1648; as also that the garrisons which are or hereafter shall be on the part of the lords the States-General in the town of Huy, the citadel of Liege, and in the town of Bonne, shall remain there 'till it shall be otherwise agreed upon with his Imperial majesty and the empire. And as the barrier which is this day agreed upon in the principal treaty, for the mutual guaranty between her British majesty and the lords the States-General, cannot give to the United Provinces the safety for which it is established, unless it be well secured from one end to the other, and that the communication of it be well joined together; for which the Upper Quarter of Guelder, and the garrisons in the citadel of Liege, Huy, and Bonne, are absolutely necessary: experience having thrice shewn, that France having a design to attack the United Provinces, has made use of the places above-mentioned, in order to come at them, and to penetrate into the said provinces. That further, in respect to the equivalent for which the Upper Quarter of Guelder is to be yielded to the United Provinces, according to the 52d article of the treaty of Munster above-mentioned, his majesty king Charles III. will be much more gratified and advantaged in other places, than that equivalent can avail. So that, to the end the lords the States-General may have the Upper Quarter of Guelder, with intire property and sovereignty, and that the said Upper Quarter of Guelder may be yielded in this manner to the said lords the States-General, in the convention or the treaty that they are to make with his majesty king Charles III. according to the 13th article of the treaty concluded this day; as also that their garrisons in the citadel of Liege, in that of Huy, and in Bonne, may remain there, until it be otherwise agreed upon with his Imperial majesty and the empire. Her majesty the queen of Great-Britain engages herself, and promises by this separate article, which shall have the same force as if it was inserted in the principal treaty, to make the same efforts for all this as she has engaged herself to make, for their obtaining the barrier in the Spanish Low-Countries. In testimony whereof, the under written ambassador extraordinary and plenipotentiary of her British majesty, and deputies of the lords the States-General, have signed the present separate article, and have affixed their seals thereunto.

At the Hague the 29th of October, 1709.

(L. S.) W. Wichers.

The second separate article.

As the lords the States-General have represented, that in Flanders the limits between Spanish Flanders and that of the States, are settled in such a manner as that the land belonging to the States is extremely narrow there; so that, in some places, the territory of Spanish Flanders extends itself to the fortifications, and under the cannon of the places, towns, and forts of the States, which occasions many inconveniencies, as has been seen by an example a little before the beginning of the present war, when a fort was designed to have been built under the cannon of the Sas Van Gand, under pretence that it was upon the territory of Spain. And as it is necessary for avoiding these and other forts of inconveniencies, that the land of the States upon the confines of Flanders should be enlarged, and that the places, towns, and forts should, by that means, be better covered; her British majesty entering into the just motives of the said lords the States-General in this respect, promises and engages herself, by this separate article, that, in the convention that the said lords the States-General are to make with his majesty king Charles III. she will so assist them as that it may be agreed, that, by the cession to the said lords the States-General of the property of an extent of land necessary to obviate such-like and other inconveniencies, their limits in Flanders shall be enlarged more conveniently for their security, and those of the Spanish Flanders removed

moved farther from their towns, places, and forts, to the end that these may not be so exposed any more. In testimony whereof, the under-written ambassador extraordinary, and plenipotentiary of her British majesty, and deputies of the lords the States-General, have signed the present separate article, and have affixed their seals thereunto. At the Hague, the 29th of October, 1709.

REMARKS, on this article of NETHERLANDS, since the last WAR, and the DEFINITIVE TREATY of 1763.

In the late war from 1740 to 1748, the Dutch lost their chief barrier; and although the States-General remained neuter, and looked on with indifference, while an unnatural rebellion was carried on in this kingdom in favour of a popish pretender to the British crown; yet when the peace of Aix la Chapelle was concluded, Great-Britain gave up the capital conquest of CAPE BRETON made that war from France, to the end that the States General of the United Provinces, might be put again in full and peaceable possession, such as they enjoyed before that war, of the towns of Bergen-op-Zoom, and Maestricht, and of all they possessed before the war in Dutch Flanders, Brabant, Holland, and elsewhere. And the towns and places in the Low Countries, the sovereignty of which belonged to the empress queen of Hungary and Bohemia, wherein their High Mightinesses have the right of garison, were evacuated by France to the troops of the republic at the same time. With article of the TREATY of AIX LA CHAPELLE made in the year 1748.—Thus Great-Britain expended THRESCORE MILLIONS of money, and thereby run THIRTY MILLIONS more in debt during that war, and entailed proportionable TAXES upon her trade in general, without receiving any advantage by that war, not so much as securing to herself the RIGHT OF NAVIGATION TO AND FROM HER OWN COLONIES, without being SEARCHED BY THE SPANIARDS, nor securing her RIGHT TO THE LOGWOOD, which were the points for which we entered into that war with Spain.—In this manner have these kingdoms increased their PUBLIC DEBTS and TAXES, and made themselves TRIBUTARIES TO FOREIGN CREDITORS!

In the last war likewise, the Dutch acted a part to the advantage of our enemies, by carrying on and protecting their trade for them, while they did all the injury they well could to that of Great-Britain during that war: so that during the two last great wars, we have been deprived of the alliance of the Dutch, while they have reaped the full advantage of a neutrality; and we have trebled our NATIONAL DEBTS and TAXES since the peace of Utrecht, and have thereby reduced our whole commerce and navigation almost to a state of ruin and destruction, unless we preserve them by means of the last DEFINITIVE TREATY of 1763, and now in time of peace, reduce those IMMENSE TAXES with which the nation is loaded. If this essential point is not accomplished, and that too without delay, our ENGLISH COMMODITIES will continue so EXCESSIVELY DEAR, that foreigners will not be able to purchase them, while those of France will be EXCESSIVELY CHEAP, in comparison thereto, that those of the latter will find their way into every nation in the world, and ours continue a drug upon our hands. By these means, France will gain the DOMINION IN UNIVERSAL TRADE, though we have gained it in territory, and thus the nation must at length be undone. See our last REMARKS on our article NAVAL AFFAIRS, FLANDERS, HOLLAND, DUTIES, LABOUR.

NEUFCHATEL and VALLENGIN COUNTIES, are bounded by the bishopric of Basil on the north; by the lake of Neuchattel on the east; by the canton of Berne on the south; and by the Franche Comté in France on the west; being about 40 miles long, and 20 broad, subject to the same prince, and form together one little state; for they are a free independent people, though they have a prince at their head. No laws are made but by the three estates; no taxes raised, or magistrates appointed, but by the states. The whole country is of the reformed religion, except two Roman Catholic villages. Upon the death of the duchess of Nemours, sovereign of Neuchattel, anno 1707, there were many competitors, but the states made choice of the king of Prussia to succeed her, who derived his title from the house of Orange and Châlons. The country produces some good wine, but is for the most part a maintainous barren soil.

in America; between 55 and 61 degrees of west longitude, and between 47 and 52 degrees of north latitude, and separated from New Britain, or Eskimaux, by the narrow straight of Belleisle on the north, bounded by the ocean on the east and south, and by the bay of St. Lawrence on the west, lying about 40 miles north east of CAPE BRETON, now belonging to Great-Britain. See AMERICA for the treaty of 1763. This island is of a triangular form, 350 miles in length from north to south, and 200 miles in breadth at the base, from east to west, where broadest.

The seas adjacent to Newfoundland produce an infinite store of WHITE FISH, which the English and French catch upon the banks or sands, so called, overagainst the island. They bring them on shore to cure and prepare for market, and so sell them to other merchants, who come in other ships to buy the fish, and carry them to the Straights, to Spain, and Italy, as also to Portugal. The French are allowed by the treaty of Utrecht to cure their fish on some parts of the island: and by the last treaty of 1763, they have acceded to them the small islands of Miquelon and St. Pierre, for the shelter of their Newfoundland fishermen, on express condition that they are not to erect any fortifications at either of these small islands, nor to keep above 50 men there for the police. The property and sovereignty of the whole island of Newfoundland belongs to the British government.

The cod fishery here is very great. See our article Cod Fish. The quantity of salmon also is very great here, and the fish large and good. These fisheries occasion several buildings for the cure of the fish, and as well of dwelling-houses as warehouses and fish houses, on the banks of the creeks and rivers, where the fisheries are erected; and they have their several boundaries in these rivers made out by ships and wears, for ascertaining the property of the places respectively, as also for the more easy taking the fish.

These buildings increasing, were not the cold so excessively severe, and the country itself so inhospitable and barren, that it discourages the people from planting, would certainly cause towns of villages to be built in those places, and would bring numbers of people to settle there, rather than go back to England every winter, and return again every spring; which is, besides the hazard of the sea, exceeding chargeable and troublesome to the fishermen themselves.

But it cannot be avoided, unless numbers of people resolved to settle together, and to assist one another as a company, as was the case in the first planting the colonies New England and Virginia, and other places; where, till a sufficient quantity of land was cured and planted, the people could not subsist themselves without constant supplies from Europe; both of men, cattle, and provisions.

The British fisheries at Newfoundland is chiefly carried on by the merchants in the west of England, of Pool, Weymouth, Lime, Southampton, and other parts there.

N. B. Those who go to the banks to fish, that is, to catch and cure, are called fish-boats, and Newfoundland ships; or, in the seamen's language, Newfoundland men, or bankers: but those vessels sent by the merchants to buy fish, and carry it off from thence to Spain, Italy, &c. as above-mentioned, are distinguished by sack-men, and the voyage is called going FOR A SACK: and when a master of a ship says he is bound for Newfoundland, or for the banks, 'tis customary to ask him, What, do you go to fish, or go for a sack? that is to say, to catch fish, or to buy.

REMARKS since the last War, and Treaty of Peace of 1763.

In the late petition of the merchants and traders concerned in the British Newfoundland trade, to the honourable the house of commons, it was represented that there were employed in the fisheries 1500 fishing boats, which remain at Newfoundland, above 150 banking vessels of the larger size for catching the fish, and 300 sail of other mercantile shipping generally employed, in carrying the fish and the oil produced therefrom to foreign markets and to the British plantations, and in bringing home the returns from thence, either in the produce of foreign countries, or of that of our American colonies, or directly carrying the produce of our plantations, pursuant to acts of parliament made to tolerate the same directly to foreign markets.—That these several branches of trade connectively considered, did not employ fewer than 20,000 of his majesty's subjects in every office relative to this capital fishery.—That so wisely had the legislature regulated this branch of the British navigation, as to render it a constant nursery for the increase of seamen, the same breeding at least between 5 and 6000 fresh seamen annually. For that by the acts of parliament made in the 10th and 11th years of the reign of king William III. it is enacted, That masters of ships bound to Newfoundland, shall carry at least one fresh landman in five; in bye fishing boats and vessels, the masters shall carry at least two fresh men in six; that is, one who has never been at sea before, and one who has made no more than one voyage: and the said masters of ships and fishing vessels are obliged to make oath thereof accordingly before the collector of the port, who is to give them a certificate of their compliance with the said acts of parliament;

parliament; which shew how considerable a maritime nursery for British seamen these fisheries have proved to these kingdoms.—That upon the whole, there was not fewer than 16,000 persons employed in the catching, the curing, the forting, and packing of the fish, in such a merchantable manner as to preserve the credit and reputation of this fishery throughout Europe and America; and that the said 16,000 persons by means hereof, became thorough bred-seamen; and that the shipping employed as bankers, or the larger sized fishing vessels on the banks of Newfoundland, together with the shipping also employed in carrying the fish and oil to market, and bringing the returns, do not employ less than 4000 seamen more.—That the British merchants and traders, who provide so large a number of fishing vessels, and other shipping, to transport the fish to the Straights and Italy, Spain and Portugal, and to the British plantations, in general, and who are at the expence of maintaining so many thousand of his majesty's subjects, erecting stages, flukes, wharfs, warehouses, and dwelling houses for the residence of the inhabitants on the island, who purchase all manner of utensils, and salt for curing the fish, and hire artists experienced in the best methods of curing, forting and packing them to the best advantage, must necessarily occasion a considerable capital stock to be engaged in this trade at Newfoundland.—That this commerce gave daily bread to a large body of the inhabitants in, or neighbouring upon the chief towns in the west of England, from whence this trade is principally carried on: as ship-carpenters, smiths, sail and canvas-makers, caulkers, block-makers, rope-makers, line and twine-makers, net-makers, tunnel-makers, pump-makers, compass-makers, basket-makers, fish-hook-makers, butchers, brewers, bakers, ironmongers and nailors, shoemakers, hatters, and all concerned in the clothing way, both in linen, woollen, and hosiery, and numerous other kinds of tradesmen and mechanics, whose chief subsistence depends on the towns of Pool, Dartmouth, Topham, Tinnmouth, Bristol, and all along the coasts of Devonshire and Dorsetshire, from Southampton to the land's end; also in the islands of Guernsey and Jersey, and the isle of Wight, where there reside many merchants and traders, who are interested in this trade.

The whole of this petition, which was signed by many hundreds of the merchants and traders in the west of England therein concerned, manifests the importance of this trade to the nation in general.

By the treaty of peace concluded at Paris the 10th day of February 1763, the 5th article declares, that 'the subjects of France shall have the liberty of fishing and drying on a part of the coasts of the island of Newfoundland, such as is specified in the 13th article of the treaty of Utrecht; which article is renewed and confirmed by the present treaty (except what relates to the island of CAPE BRETON, as well as to the other islands and coasts in the mouth and gulph of St. Lawrence;) and his Britannic majesty consents to leave to the subjects of the most Christian king, the liberty of fishing in the gulph of St. Lawrence, on condition that the subjects of France do not exercise the said fishery, but at the distance of three leagues from all the coasts belonging to Great-Britain, as well those of the continent, as those of the islands situated in the said gulph of St. Lawrence. And as to what relates to the fishery on the coast of the island of CAPE BRETON, out of the said gulph, the subjects of the most Christian king shall not be permitted to exercise the said fishery, but at the distance of fifteen leagues from the coast of the island of CAPE BRETON; and the fishery on the coasts of NOVA SCOTIA or ACADIA, and every where else out of the said gulph, shall remain on the foot of former treaties.'

By the 6th article of the said treaty, 'the king of Great-Britain cedes the islands of St. Pierre and Miquelon, in full right, to his most Christian majesty, to serve as a shelter to the French fishermen; and his said most Christian majesty engages not to fortify the said islands, to erect no buildings upon them, but merely for the convenience of the fishery, and to keep upon them a guard of fifty men only for the police.'

By the 18th article of the said treaty, 'his Catholic majesty desists, as well for himself as for his successors, from all pretensions which he may have formed, in favour of the Guipuscoans, and other his subjects, to the right of fishing in the neighbourhood of the island of Newfoundland.'" See FISHERIES, COD FISHERY.

NEWS-PAPERS are too well known to need description. They are become so numerous in Great-Britain, and her plantations, as to afford employment to many, to be instrumental in the consumption of large quantities of paper, and tend, by the stamp and advertisement-duties thereon, to the benefit of the public revenue.

REMARKS.

On the use of NEWS PAPERS.

The curiosity of mankind, to know what passes in the world, naturally leads them to the perusal of these papers; and the

VOL. II.

more authentic the accounts given, the greater reputation has such news-papers. Besides the gratifying a laudable curiosity, these papers frequently convey the materials of obtaining a good knowledge of men and things, even in their mere narratives of the ordinary occurrences, and thereby furnish numbers, especially among the busy world, with constant topics of conversation; wherein they would often be at great loss to bear a share, were it not for these diaries of public intelligence: and, indeed, they frequently afford notable subjects for engaging amusement, as well as exercise of the understanding; for they sometimes contain extraordinary phenomena of nature, and such occurrences that draw the attention, even of the philosopher, statesman, and divine. The political contents of these papers, as they respect the transactions and negotiations of foreign states as well as our own, are not wholly useless to those who have discernment to make proper advantage of them, and more especially so, when FACTS are offered to public consideration. And that the people have a right to be informed of whatever nearly concerns the interest and honour of the nation, should seem to be inferred, from the establishment of the paper called the Gazette, which is published by authority.

Most nations, at present, turning themselves to the advancement of their commerce and navigation, it becomes necessary that the people of Great-Britain should be well informed of the measures which they shall, from time to time, take upon these occasions, our interest, as a commercial state, being so nearly, and so importantly concerned: for if the people of England are kept in ignorance of the progress which her competitors make in trade, how can they keep pace with them? How can they guard against the greatest evils that may thereby attend various branches of their traffic? If the mischief take root before they are apprized of it, it may be too late to apply to the legislature for requisite encouragement to counteract their rivals, or prevent the ill effects spreading to a degree they might for want of timely information. The trade of the nation may be as much injured for want of this, as the wisest measures of an able minister defeated for want of seasonable intelligence.

The necessity and reasonableness hereof, will hardly be doubted by any; but the question is, how we are to come at such preservative information? We cannot have more convenient channels to convey such intelligence through the kingdom, than news-papers; but to come at that which is authentic, and can be safely depended on, is more to be desired, I am afraid, than expected. Yet the difficulty to obtain such, will soon vanish, if we put in execution the proper means; on which I shall give my humble opinion.

The thorough knowledge of trade is no such light and trivial matter, as too many are wont to think; which we conceive is sufficiently demonstrated throughout the course of this work; it requires some talents as well as application, to be well grounded in these studies. And who shall be able to give the people of Great-Britain a just and right state of the trade of foreign countries, but those who understand it? Persons who do not, are disqualified to represent matters of this nature in their true view, so as to answer interesting designs towards their country: the mere dead narrative of a political measure will not always fully convey the consequences, detrimental to us, that may attend it. Matters of trade are greatly involved in circumstance, and of a very complicated nature; and to represent them comprehensively, they should be displayed in every aspect and relation; otherwise the omission of a single circumstance may misguide a whole nation.

Those who represent his majesty at foreign courts in the supreme capacity, are not, we are afraid, always the best accomplished to transmit the true state of affairs of this nature to their own country. They generally move in a sphere too distant from the converse of traders, and think it beneath them, either to associate with mercantile people, or think once seriously of the subject of commerce; which they esteem as much below them, as they do the traders practically concerned therein.

The ministers who bid the fairest to communicate useful intelligence of this kind, are those who act in the capacity of consuls; for they generally not only act in the capacity of merchants, but likewise in a judicial capacity, and have daily opportunities of experiencing what advantages in trade competitors may have over us in foreign nations: and the experienced merchants, with a tolerable share of letters, should seem to be the best qualified to answer these desirable national purposes. See our articles CONSUL and CHAMBER OF COMMERCE, and MERCHANT'S COURT, or COURT MERCHANT.

That many of these gentlemen are duly accomplished to give the nation the best information of this kind, if they had encouraging appointments, I know from my own experience; having held a correspondence with several of them for these twenty years past, as I do at present. Nor can I but think, as before intimated in my REMARKS on the article CONSUL, that the office of consulship is the best preparative to accomplishment for the ambassador, where our commercial interests are to be taken care of. The secretaryship to an

+ T

ambassy

ambassy is, at present, esteemed the principal qualification of experience, requisite as introductory to the ambassadorship. But if the ambassador knows nothing of trade himself, the secretary will find little of that kind in his dispatches from whence he can derive any useful knowledge. We think no men so well qualified for an admiral or a general, as those who have run through the channel of inferior offices; nor can any one make an able minister of state, without having passed through all the proper requisites to his information, and his experience in public business.

That some one should reside in foreign nations, who can give proper accounts of the state of trade, will hardly be gained by any; nor should those accounts be secreted from the people, will be affirmed, we believe, by few. How then are they to be communicated to the public? As this should be done by authority, that the nation may not be misled, nothing can be a more proper channel of conveyance than the *Gazette*. But when have we any thing of this nature contained therein? Whether this would not prove one of the most important uses of a news-paper, is submitted to those who may think proper to take notice of it.

The usefulness of these vehicles of intelligence is in nothing more obvious, than by the advertisements contained therein, which relate to general trade, and shipping, and other conveniences of the public business. It is not many years since it was thought mean and disreputable, in any tradesman of worth and credit, to advertise the sale of his commodities in a public news paper; but as these apprehensions were founded only on custom, and not on reason, it is become now fashionable for very eminent tradesmen to publish their business, and the peculiar goods wherein they may deal, in the news-papers, by way of advertisement: nor do I see what disgrace there can be in this. For do not the great trading corporations apprise the public of their sales, in the public news-papers? Do not the monied companies find it the easiest, the most effectual, and the least expensive way to inform the proprietors of the public funds of their transactions by this channel? Nay, do we not, by this means, receive all our intelligence from the several great offices in the state, belonging to the public revenue? Is not even such intelligence as the government itself thinks proper to communicate to the people, done by the *Gazette*, a news-paper published by authority? In a word, advertisements in these papers seem, on the general, to be of no less utility to the public, in the concerns of real business, to the trading and busy world, than the common news is to the meer saunterer and gossip; the former furnishes matter of profit to some, the latter matter of amusement and chit-chat to others.

Besides these uses, there is another in these papers, which should by no means be passed over in silence. We mean the essays that are, from time to time, communicated to the public therein. And the articles of news seem to be a natural decoy to draw great numbers to the reading of those short dissertations, who, perhaps, scarce read any thing else; and who, indeed, was it not for our news-writers, might happen to forget to read at all; whereby our churches might be much thinner than they are, when some thousands of the people should be quite ignorant of the discipline of their common-prayer-book. So that, in this sense, our news-writers are of advantage to the cause of religion; and truly it must be acknowledged, that, for many years past, the public have had many excellent though concise lectures wrote to them in news-papers upon the subject of moral virtue, religion, and the conduct of life in every capacity. And numbers are induced, over their coffee, to throw their eyes, for a few minutes, on a short essay, wrote with wit and vivacity, who scarce read any thing else in the twelve-month. We need not intimate the advantages that the public in general has received from our essay-writers in this shape; the mere mention of the *Tatler*, *Guardian*, *Spectator*, and numerous other very judicious and excellent performances since, sufficiently prove it.

Nor have we derived less benefit, in the general, from occasional writings in this mode, upon government and the administration of public affairs. The *Freholder*, *Cato's Letters*, and many other admirable pieces, in defence of liberty and public virtue, leave this no matter of doubt. The privilege of writing and speaking his sentiment, on matters of religion and the affairs of government, is esteemed by the Briton the great palladium of liberty, although that glorious privilege may be sometimes shamefully abused, and prostituted to the most ignominious purposes. This is only the abuse of the most invaluable right, and the law is open to punish libellous offenders when they merit it; and this, together with the privilege of the press, being allowed to antagonists, are the only antidotes that can ever be administered to check the poison, consistent with the enjoyment of public liberty; for when once any administration in this kingdom, endeavours to suppress by violence, what they cannot do by law, there is an end of all our liberties, and we may as well be governed by French arrêts, edicts, and lettres de cachet, and the inquisition, as by such ministerial tyranny, which strikes at the root of all that is dear to us.

Of the Abuses of NEWS-PAPERS, with respect to public affairs.

It is not to be admired that in the ordinary way of collecting news, there should be frequently committed some mistakes, from misinformation; and what of this kind is personal and injurious to any man's reputation, is punishable by law; and the expence, as it ought, falls upon the proprietors of the paper, unless the printer is circumspect enough to be indemnified for the defamation he is induced to publish: but nothing tends more to the ruin of a paper, than it's being the vehicle of scandal.

The forging of false news, in relation to public affairs, by fictitious paragraphs of news formed abroad, and translated from the foreign papers, or by pretended accounts of things transmitted in private letters, and put into our news-papers, is another abuse of a very enormous nature; for if this political lying be practised to make the people believe, that our foreign affairs are in a better situation than they really are; this public deceit can have no good consequences, but may prove highly detrimental; because it may possibly misguide some of our representatives, who might be instrumental, by their counsel in parliament, or otherwise, to set our affairs with other nations to rights, when they happen not to be so. But while they are kept in the dark by delusion, and amused from day to day, and year to year, with such accounts from foreign courts, which the event proves to be grossly fallacious, these mean temporary expedients can only more and more embarrass the nation, instead of extricate it from any difficulties under which it may labour.

We would not be understood to suggest that it is always necessary, the public should know the great arcana of state; this might be attended with still greater evils than deluding the people with lies and forgeries; for such openness of conduct might, and certainly often would, give other nations an opportunity to defeat the best laid designs for the honour and interest of the kingdom. Wherefore, at critical conjunctures, it may be more for the public interest, to let the people know nothing, than to be amused and deceived by false appearances. For in this nation, where the proprietors of our public funds possess so large a share of the national wealth, the stocks are, at certain times, suddenly affected with almost every puff of news; and if they are raised by artifice, this proves injurious to all but those who are in the secret, who make their advantage by the delusion of the rest. See the articles *STOCK-JOBBER*, and *BUBBLES*, and *ACTIONS*. However, making things better than they are, is not so detrimental to the public, as making them worse than they really are. For, if, by the artifices of malevolent men, such news shall be coined, and pretended to be authentically transmitted to them from foreign courts, as may distract our affairs, and occasion the nation to lose all our weight at foreign courts; if this should be the case at any extraordinary crisis of the public affairs, such conduct, practised by men of weight and influence with the people, may be attended with very dangerous consequences; it may clog and impede our negotiations, augment the public expence, and give other nations advantages over us, that may prove highly derogatory to the honour, and unspeakably detrimental to the commerce and navigation of the kingdom.

That the public interests have, on certain occasions, greatly suffered by such like practices, I am afraid there is too much reason to believe; and especially during the period of the administration of the late right honourable Sir Robert Walpole, afterwards lord Orford. During that time no minister ever met with a more violent opposition, both from within doors and without. Whether there was sufficient cause for such conduct towards that gentleman, I shall not take upon me here to determine; certain it is, that his adversaries have been charged extremely home with the forgery of a series of FALSE NEWS, with regard to our foreign affairs, which they published in their paper called the *Craftsman*; and they have been charged also with making this FALSE NEWS the chief pretext and foundation of the greatest part of all their political dissertations, to inflame the passions of the people, and to hunt down that able minister.

The tract wherein the gentlemen in the opposition at this time, were charged with such conduct in their public news-paper before-mentioned, is intitled the *D'ANVERIAN HISTORY* * of the affairs of Europe, for the memorable year 1731, &c. As the author takes into consideration, the principal articles of what he calls the forged news contained in the *Craftsman* for a whole year together, we must refer the reader to the pamphlet itself, we not having room to do justice to the performance in that respect. However, as there is one passage therein, which I think is quite new, and seems to have a tendency as well to preserve the liberty of the press, as to detect those who shall, at any time hereafter, abuse that invaluable privilege against future administrations; it may,

* If I am rightly informed, the writer of this piece was the late Mr. Lyons, the author of the *Infallibility of Human Judgment*, &c. The *D'anverian History* was printed for J. Roberts, London, 1732.

perhaps,

perhaps, prove very acceptable to many to meet with it in this work; for it is as much every honest man's duty to protect and vindicate able and upright ministers of state, as to expose and worry down, by the power of the liberty of the press, those who deserve the contrary character.

The author, after charging the writers of the Craftsman with a long series of falsehoods, observes as follows, viz.

'This is what passes among the greater part of the common people, for the state of our affairs, and the transactions of the government. This is the D'anverian way of proving ministers of state weak and wicked! this is the use these good patriots have made of the liberty of the press! and thus have they put it in the utmost hazard of being lost; for some thousands of those deluded people have votes for members of parliament, and with this account of the conduct and actions of the king and ministry, do they design to send them into the field of election, in order to distress the government, either by choosing such representatives as may represent the passions and emotions they have worked the electors up to, or to inflame them into immediate tumults and insurrections; and that this cannot be prevented, they hope, by any way but suppressing the Craftsman, and consequently all others, who shall write on government affairs.'

'Thus is this estimable liberty of the press come to it's crisis, if not to a period; and this dangerous attack is made upon it by these treacherous patriots, who make a noise with the word Liberty, while they are tricking and betraying us out of that valuable branch of it, which conduces so much to the security and defence of the rest. For, in their popular news-paper, they have brought it to this, either they will impose such things of their own invention for the transactions of the king and ministry, as may bring them into contempt with the people; or they will force them to refrain the liberty of the press, and then they have it done more effectually.'

'And what more exquisite joy can these envious patriots feel after several years vain attempts, than to have it in their power to say, this king, parliament, and ministry, have made such an infringement on liberty; for thus do they make it difficult to carry on any political affairs abroad, or civil at home, under such bold insults and interruptions as they work people up to, and, indeed, boast they have worked them up to; and this is the last desperate effort of persons raging with disappointed malice.'

After this the author comes to his expedient.

'But, I think, they may be yet once more disappointed; for there is one remedy, or an expedient at least untried, which may, perhaps, preserve to us this liberty of the press, and yet prevent their mischievous proceedings. We have an office called a Gazetteer, in the secretary of state's office, whose business we expect should be to transmit things of this nature to the people; and he, or one in his office, may be appointed, or at least permitted, to observe these abuses in intelligence, and take the same method to prevent the people from being imposed on, and the government from being misrepresented, as all others do, from noblemen down to the meanest mechanic, who do themselves justice in the same news-paper, in which they find themselves wronged by short advertisements upon the facts.'

'For example, we find the Craftsman of Dec. 11, 1731, which we last examined, insinuates, by way of reproach, that the new works of Dunkirk were not demolished: durst he have had the thought of affirming such a thing a year and a quarter after this demolition, if he knew the Gazetteer would have sent either that letter of Dec. 11, 1730, or that of Feb. 26 following, and half a guinea with it, or whatever should be the price of an advertisement of that length, and obliged him to publish it: and let it be considered what effect this must have had on his long railing political letters, as well as on his false news: and here is no occasion for one word of introduction or argument, only the bare narrative inserted and published from any other disinterested news-paper. I shall here take the liberty to shew, that this is not only a proper and natural way, but it is the way which must be taken, or something worse will, under another administration; that is, a total suppression of any news-paper but what the court shall think proper. For, though this ministry have struggled through business (not without great difficulty) in spite of these interruptions; having a reputation established by many years, and a series of success, very much owing to the steadfastness and uniformity of his late and present majesty; yet another ministry, who cannot at first have these advantages, will never venture on any material and doubtful affairs in difficult times, with the power in their avowed enemies hands of engrossing near all the intelligence; and with this D'anverian precedent, of the use which may be made of it: and ministers of state never want enemies, and those too of the most turbulent and daring spirit, nor do the common people inclination, to hear and credit every ill thing which can be said of them; the mischief is therefore arrived to that height and danger,

that a remedy must be speedily had, and that the methods hitherto taken are none we shall soon see.

1. The prosecuting the offender, as Mr. Francklin, the printer of the Craftsman, lately was, brings no remedy nor removal of the grievance, rather increases it, as appears by his printing more in number, after his trial, than a little before; for his paper has got the ascendancy of attention, and he securely persists in it, that he is unjustly dealt by, as in the last we examined of Dec. 11, where he justifies his news, and complains to the people, that he is prohibited from giving them such foreign intelligence as he conceives they ought to have; and if he had not some thousands who credit this, so many thousands of his journal would not continue to be sold. Therefore, to make such prosecution have it's due effect, the generality of the people are to be convinced that the indictment is just; that is, that such libel is false, malicious, and scandalous, the falsity must appear to them; but whilst he commands very near all the intelligence they have, how can they see the falsity? And out of these deceived people the jury is chosen. But if, in May last, after it had been perceived that he had several weeks omitted to insert the treaty of Vienna, (for I would have given him some time, on purpose to have exposed him the more) the heads of it had been published for him in his own paper; where he would have found vindicators of this Hague letter, for which he was prosecuted, and the other vile accounts of things, which then would have appeared to be false in fact, though he continued to justify it by them? Whereas, for want of this, nine tenths of the people do not know to this day, but that he was prosecuted only for some bold and indecent reflections and freedoms, taken with the king and ministry, on certain negotiations and treaties, little imagining that it was for FORGING and INVENTING treaties and negotiations.

2. These prosecutions do not put a stop to their proceedings. Mift and Wolf, the present principal proprietors of Fog's journal, are fled their country; yet their journal is still carried on, and as virulently as ever, and it's gain is rather outdone than rivalled by the prosecution, than interrupted or reduced by any Craftsman, of the proprietors: it may now, indeed, bring in not above four or five hundred pounds a year, instead of eighteen hundred, or more, which it once did: but it is a scandal-shop, ready to receive and vend sedition in, and will never be laid down while there is an enemy to the British constitution capable of writing scandal in English; and such a comfortable livelihood is produced by it, though the present proprietors and writers may die, or be removed. So that we have at present these two principal weekly papers (for there are others of lesser note who find a gain in it) whose professed course, and openly avowed intention, is to bring the government into contempt; and what use any foreign nation, whose interest and design it is to be our enemies, and embarrass our affairs, by dividing us among ourselves, may make of them, I have already observed, page 67.

3. The taking them up by the messengers, and binding them over for three terms, has contributed more than any other thing to make the paper popular, and increase it's gain; and this costs them, at most, but four guineas: and this piece of journal-craft has been often practised, purposely; when the paper has seemed a little dull, and sunk in number, then get something wrote which may provoke a secretary of state to send the king's messengers for the printer or publisher, it makes a new noise, and revives again. Another piece of this art and mystery of journal-craft, is to procure an answer; if it is by some eminent or popular hand, it does excellently well for the proprietors; for then, perhaps, a new edition of the journal (wrote against) is printed, and as many sold as at first; besides, that the writer is, by this means, thrown into a thread of argumentation, which makes his writing easy, and, by the additional gain, more pleasant too. Not that I would be understood that these answers and arguments have not been of great use; for some have been convinced by them: besides, that they are sure to furnish friends of the government with proper materials for defending it; but to think of convincing these patriots out of their malice, or the writers and proprietors out of 1600 or 1800 l. per annum, is a jest.

Here has been now one prosecution against him, I admit a chargeable one too, on which he is fined 100 l. and a year's imprisonment, which (by the way) is in the King's-Bench, where he has the liberty of the rules; I say, all this chargeable prosecution cannot amount to above a quarter of a year's gain of the paper. I have no occasion to enter into the progress of an exact calculation, except it was disputed, it is sufficient to allow, in a round computation, 10,000 in number weekly, and three farthings per paper clear profit; but their usual number was not less than 12,000, or 13,000 for a long time, even 'till since May 22, 1731; when, in a course of dispute with the author of the Free Briton, and others, his patrons were detected in so many falsities in facts, as well in his journals as other pamphlets, that his paper lost a great deal of it's credit, sinking

in a short time near 4000 in number; that is, from 13,000 to less than 9000: about the time of his trial, it rose a little again; but, notwithstanding this prosecution, the paper is still carried on in it's utmost malignancy, thus profitable, and thus popular, being read by no less than four hundred thousand of the good people of Great-Britain, allowing no more than 40 readers to a paper.

4. These prosecutions are no remedy for his omissions; and this mischievous artifice seems hitherto to be unserved: he has worked his readers up to an opinion, that his paper contains a much more perfect account of the state of the nation, both at home and abroad, than any other; besides scandalizing most with being partial and ministerial papers: and this is generally credited, because it is wrote under the patronage of gentlemen of distinction, whose understandings they cannot doubt, and whose fortunes set them above writing for gain; which is indeed true: but the people are not aware that the gentlemen trouble themselves very little with putting things in form, though they may often furnish materials and protection to the writer. But the course of the paper is performed by an hireling, who does it for gain and a livelihood; and it is he we mean, when we mention the secretary or the author: and if this author will not insert some things, who can force him? And by what law is he punishable? Thus he thinks it not proper to tell his readers of a negotiation at Moscow, where the differences relating to trade are adjusted, nor of the utter abolition of the Ostend East-India trade,—nor of the discharging the Hessian troops,—nor the Spaniards breaking and imprisoning their governors in the West-Indies, for encouraging the depredations of the guarda costas,—nor of the care which has been taken to make Gibraltar invincible and inaccessible, and abundance of such things which he, as proprietor of his paper, may omit without breach of any law; and what remedy have we for this, but writing them in his own paper for him? But then, what would Mr. D'anvers do for subjects for his fine harangues and declamations, and what a deal of his excellent wit and satire should we be deprived of?

5. This method can be of no use to a weak and corrupt administration; for, if real evil and foolish things are transacted, there is no concealing them, while the bold spirited anti ministerial writer has his liberty of relating and commenting upon them, which by this means may be preserved, and even further indulged and protected, and there is no fear of wanting such: for bad ministers, as well as good, have their opposers. However, for the better preserving this liberty, the government's intelligencer may be restrained not to take up more than half a column; or, suppose a column at most, which is a twelfth part of one of these journals; and if he paid for the space he occupied, as other advertisers do, here can be no trespass on the proprietor's room for writing, nor invasion of his property; and I never yet saw a case which would take up above half this room, nor can I perceive there would be occasion for this ten times in a year: for the expectation of such a contradiction would be almost a sufficient check upon these forgers of false news.

Some object to me, that they would refuse such advertisement, and laugh at such an offer; and really, I am of the objector's opinion; if it is in their power to refuse it, and should continue long so; any enemy of our constitution would laugh to see us so fond of liberty in the nation, and prostitute it to the caprice of every angry malecontent, who shall attempt to destroy the government, which is the defence of it, by dividing us amongst ourselves, and against it, whilst we not only stand idly by and see this, but encourage these incendiaries and traitors to it, by permitting them to get such ample revenues as a thousand or two thousand pounds sterling per ann. for doing it, and we to have neither ingenuity nor authority to prevent the mischief. This would, indeed, make such an one laugh, but other laugh than this I can't see. Suppose, for example, he had been desired to have published an extract of the declaration done at Seville, June 6, 1731, (which see in it's proper place) and money had been sent to have paid for the room it would occupy, as for an advertisement, there is no doubt but he would have refused it if he could, for it would have confuted more than half the papers he wrote for two years: but in what manner would he have laughed at this? And in what manner, or for what reasons, would he have told his readers he refused this?

He would also most certainly have refused to publish a pre-
sentment of the Craftsman and Fog's Journal, and other libels, by the grand jury of Middlesex, on July 7, 1731. But I should, nevertheless, think it highly necessary, that his readers, and in his own paper too, should (as well as other articles of London news) see some such extract of it as follows.

Complaining of that presumptuous and unprecedented licence, which has been assumed by some state-incendiaries for a few years past, of inflaming by false, seditious, and scandalous libels, the minds of the common people with pretended grievances, and alarming them with imaginary dangers;—from whence such mischiefs may flow, as may be of

pernicious consequence to this nation and people, by fixing in foreign powers an opinion that we are divided among ourselves, which may give grounds to extravagant demands in negotiations on their parts, and thereby occasion an increase or continuance of our taxes, in order to secure our own rights, and preserve his majesty's honour.* See the D'an-
verian History, from whence this is quoted.

* See more reasons for thus advertising, as well as examples of it, in a pamphlet by the same author, price 6 d. entitled. Liberty and Craftsman, published in December, 1730.

The principal LAWS relating to NEWS-PAPERS and PAMPHLETS.

I. Stat. Westm. 1. 3 Edw. I. cap. 34. None shall publish or counterfeit any false news, whereby discord or slander may grow between the king and his people, or the great men of this realm. And he that so does, shall be kept in prison, until he hath brought him forth into the court which did speak the same.

II. Stat. 2 Rich. II. stat. 1. cap. 5. Of counterfeiters of false news of prelates, dukes, earls, barons, and other nobles and great men of the realm, and also of the chancellor, treasurer, clerk of the privy-seal, steward of the king's houses, justices of the one bench or of the other, and other great officers of the realm; it is defended that none contrive or tell any false things of prelates, lords, and others aforesaid, whereof discord or slander might rise within the realm; and he that doth the same shall be imprisoned, till he have brought him forth that did speak the same.

III. Stat. 12 Rich. II. cap. 11. When any such mentioned in the statute Westm. 1. cap. 34. and 2 Rich. II. cap. 5. is taken and imprisoned, and cannot bring him forth that did speak the same, he shall be punished by the advice of the council. By stat. 10 Ann. cap. 19. All papers called pamphlets, shall for every half sheet pay a halfpenny; if larger than a half sheet a penny, and if larger than a whole sheet, and not six sheets in octavo, or in a less page, or not exceeding twelve sheets in quarto, or twenty sheets in folio, 2 s. sterling for every sheet of paper in one printed copy; and for every advertisement in the London Gazette, or other printed paper made weekly public, one shilling. And they are to be stamped accordingly.

Offences in printing, selling, or exposing to sale, any pamphlet, &c. against this act, may be heard and determined by two or more justices within their jurisdiction. At any time within three months after the offence, upon complaint made, they may summon the offender and witnesses, and may examine them on oath; or for not appearing, upon proof of notice given, may proceed, though the offender doth not appear and give judgment. And, if convicted either upon view of the justice, or upon such information, may issue warrants to levy the penalty of 10 l. on the goods of the offender by distress and sale, if not redeemed within six days: and if such distress cannot be had, may commit him till the penalty is paid. Those who are grieved may appeal to the next quarter-sessions, who may examine witnesses upon oath, and finally determine, and may then issue warrants to levy the penalty.

The penalty may be mitigated by the justices, but then the officers and informers must be allowed their reasonable costs and charges over and above the said mitigation, and so as the mitigation must not be less than a fourth part of the fine over and above the said cost and charges.

Persons sued for putting the act in execution, may plead the general issue, and give this act and any special matter in evidence, and if he recover shall have treble costs.

Printing a pamphlet above one sheet, published within the weekly bills of mortality, and not carrying it within six days to the head office for stamping; and if printed elsewhere, and not brought to the head collector of the stamp duties within fourteen days, the printer and publisher shall lose the profit of the copy of such pamphlet for which the duty is not paid, and shall forfeit 20 l. with full costs.

If the printer's or publisher's name is not printed thereon, the penalty is likewise 20 l.

One moiety of these penalties is to the crown, the other to the informer. But some news-writers taking advantage of the paragraph in the act 10 Ann. cap. 19. wherein for all pamphlets larger than one whole sheet, and not exceeding twenty sheets in folio 2 s. for every sheet of paper in one printed copy, and no more, was to be paid, contrived their news-papers so as they took up one whole sheet, and one half sheet, and no more; by which means they for many years paid only 3 s. for each whole impression of their news-papers. Which being taken notice of in parliament, a clause was inserted in a statute made 11 Geo. I. whereby all journals, mercuries, and news papers, printed on one sheet and half a sheet of paper, shall not for the future be deemed or taken as pamphlets, to be entered and pay only 3 s. for each impression thereof; but there shall be paid for every sheet of paper on which any journal, mercury, or other news-papers whatsoever shall be printed, a duty of one penny, and for every half sheet thereof one half-penny, during the term mentioned

NIT

mentioned in the act 10 Ann. cap. 19. to be levied in the same manner, and subject to the same penalties, &c. as in the said act of 10 Ann. cap. 19. or any other act relating to those duties is contained.

Since this another act of parliament has taken place, laying an additional duty on news-papers; and yet there appears no less propensity after news than before, and the number of news-papers have increased, as well as that of advertisements in general. See ADVERTISE.

NEW SPAIN, see MEXICO.

NICARAGUA, see MEXICO.

NICOBAR ISLANDS, situate in the Indian ocean in Asia north of the island of Sumatra, at the entrance of the bay of Bengal; 300 miles west of the further peninsula of India, between 92 and 94 degrees of east longitude, and between 7 and 10 degrees of north latitude; the largest of these islands, which gives name to the rest, and lies farthest south, is 40 miles long and 15 broad. This country is almost covered with wood, and produces no corn; but they have a fruit which they boil, and serves them instead of bread; they have also cacao-nuts, plantains, and other tropical fruits, on which they live with the fish they take, but seem to slight flesh, though they have hogs and poultry enough, with which they supply the ships which touch here: and yet these people, as well as their neighbours of the Andaman islands, were reported to be cannibals, when the Europeans first visited them. The natives, in return for the provisions they furnish ships with, take iron, tobacco, and linen, and don't seem to have any commerce with the nations of the adjacent continent.

NIGRITIA, see AFRICA.

NITRE, or SALT-PETRE. It is probable, that the nitre of the ancients, was either the Egyptian natron, or a salt, found in the earth in a gray compact mass, or else the natural borax, or the salt which is drawn from the water of the river Nile, and many other rivers. And it may be, that all these salts are divers kinds of their nitre, but the nitre of the moderns is nothing else but salt-petre, and this is that of which we shall speak.

Nitre is an acid salt impregnated with abundance of spirits out of the air, which render it volatile; it is taken from among the stones and earth of old ruined buildings. Some of it is likewise to be found in cellars, and several other moist places, because the air doth condense it in those places, and easily unites it with the stones.

Nitre is also sometimes made by the urine of animals, falling upon stones and earths. Nay, some have thought, that all salt-petre comes from that cause, whereas we see every day, that some of it is taken out of places, where there never came any urine at all. There is also found in dry weather in hot countries natural salt-petre, against the walls and rocks in small crystals, which are separated by sweeping softly those places with a broom; this is preferable to the ordinary salt-petre for the making of gunpowder, it must be chosen neat in crystals, easily taking fire upon kindled coals.

A good and well esteemed salt-petre is imported from the East Indies, principally for gunpowder; it is said, that the same is found in great quantities near Pegu, and that it is observed to elevate from certain barren lands in white crystals, as near one another as the grass, so that one may easily gather and purify the same, which is like to our purified salt-petre.

The great and violent flame which happens so soon as salt-petre is flung upon the coals, and the red vapours which it yields when reduced into a spirit, have caused the chemists generally to believe that this salt is inflammable, and consequently fully loaded with sulphur; because sulphur is the only principle that flames; but, if they had suspended their judgments herein, until they got more experience on this subject, they would not only have known that salt-petre is not at all inflammable in its nature, but they would even have doubted whether or no any sulphur does enter into the natural composition of this salt; for, if salt-petre were inflammable of itself, like sulphur, it would burn where there is no sulphur, for example, in a crucible heated red-hot in a fire; but it will never flame therein, use what quantity of it you please, and let the fire be ever so great. It is true, indeed, if you throw salt-petre upon kindled coals, it makes a great flame, but this is only through the sulphureous fuliginosities of the coals, which are violently raised and rarified by the volatile nature of nitre.

As for any sulphur that is thought to be contained in salt-petre, it can't be demonstrated by any operation whatever; for the red vapours that come from it are no more inflammable than the nitre, when they are not mixed with some sulphureous matter; and it is far from probable, that this salt contains no sulphur, if we consider its cleanness, transparency, acidity, and cooling quality, which have no manner of affinity with the effects of sulphur, which are commonly to make a body opaque, to take off acidity, and to heat.

Of the purification of salt-petre.

To purify salt-petre, is to deprive it of part of its fixt salt, and of a little bituminous earth which it contains.

VOL. II.

NIT

Dissolve ten or twelve pounds of salt-petre, in a sufficient quantity of water; let the dissolution settle, and filtrate it; then evaporate it in a glass or earthen vessel, to the diminution of half, or until there begins to appear a little skin upon it; then remove your vessel into a cool place, stirring it as little as may be, and leave it there 'till the morrow, you'll find crystals which you must separate from the liquor; evaporate this liquor again to a skin, and set the vessels in a cool place to get new crystals, repeat the evaporations and crystallizations, until you have drawn all your salt-petre.

Note, That in the last crystallizations, you'll have a salt altogether like unto sea salt, or sal gemme, keep it apart, it may serve to season meat with.

The first crystals are the pure salt-petre.

You may, if you please, dissolve and purify salt-petre several other times in water, observing every time what I said before, for to render it more white, and purify it from its sea-salt.

Salt-petre purified is a great aperitive, it cools the body by fixing the humours that are in too much motion, and drives them by urine. It is given in fevers, in gonorrhoeas, and many other diseases; the dose is from ten grains to a drachm in broth, or some appropriate liquor.

REMARKS.

The first purification that is given to salt-petre is this: the stones and earths that contain it are grossly powdered: they are boiled in a great deal of water, to dissolve the salt-petre: the dissolution is filtrated, and then poured upon ashes, to make a lixivium; after it hath been poured upon the ashes several times, it is evaporated and crystallized.

If instead of pouring the dissolution of salt-petre upon ashes, one is content to let it evaporate upon the fire in a cauldron or other vessel, 'till it adheres to the skimmer, which must be soaked in it, and 'till it appears in the consistence of oil of a yellowish or brown colour, it will be a greasy and thick liquor, which the artists call mother of salt-petre, or water of the sea.

The salt of the ashes which mixes with the salt-petre augments its fixed part, for notwithstanding the salt is alkali, yet it changes nature, because its pores have been filled by the acid of the salt-petre. This nitre salt, drawn by this first purification, is called common salt-petre; the last salt taken thence must not be mixed with the first, because it is almost fixed, and not so good: if one distils the same in the manner as salt, an acid spirit will be drawn thence, which is a species of aqua regia; or a dissolvent of gold.

The earth from whence one has drawn the salt-petre being exposed to the air, and stirred from time to time, impregnates again with the same species of salt.

The long crystals which we see in salt-petre come from its volatile part, for that which crystallizes itself last, is fixed like sea-salt, and retains the figure thereof.

The salt-petre, though never so well refined, always contains a salt like to mineral salt, or sea salt, but in less quantity.

When salt-petre is boiled a long time in water, and over a great fire, some part of the spirit evaporates, and there remains at last nothing but a salt like unto sea salt, or sal gemme, which serves to prove that salt-petre is only a sal gemme, fuller of spirits than the other.

When you would crystallize a salt, you must dissolve it in a convenient proportion of water; for if there should be too much, the salt would be weakened too much, and not able to coagulate; and if, on the contrary, there should be too little, the crystals would be confused. Therefore, to make them fair, you must take your vessel off the fire, when you perceive a little skin upon the liquor, which is a mark to shew, that there remains a little less liquor than is convenient to keep all the salt dissolved, and thus when it comes to be set in a cool place, it will not fail to fix.

Acid salts, and among them the volatile, do crystallize in much less time than others.

In purifying a great quantity of salt-petre, put it into one or more great and tinned cauldrons, and pour upon it a necessary quantity of common water to dissolve it, put fire underneath, and when the salt is melted and the liquor begins to boil, take off with a skimmer the first scum, which is called the dirt of salt-petre; continue to boil this liquor softly, 'till it has acquired more consistence; afterwards put in a little white vitriol or alum in powder to clarify it, and there will appear at the superficies a black scum, which will thicken; this must be separated by little and little with a skimmer, as exactly as possible: when the liquor is cleared of this scum, pour it boiling with great lades or otherwise, into another high and strait vessel, which is to be covered with a piece of cloth, to preserve its heat for some time, and hinder its cooling too soon; and it must not be stirred in an hour and half or two hours; during which time it precipitates to the bottom of the vessel yellow dregs like lees, and the liquor becomes clear and good; which is afterwards separated from these dregs, whilst it is yet somewhat warm, pouring the same by inclination into earthen bowls or basons. These vessels are to be covered with a cloth, and the liquor is not to be stirred in a day or two, 'till the salt-petre is congealed in great, fine, clear,

clear, white, and transparent crystals, which are ordinarily of a six angular form; afterwards these crystals are taken out of the bowls, and are put into a tub pierced at the bottom, where they are drained: this is the refined salt-petre.

Let the remaining liquor evaporate upon the fire about one half, and then let it cool, and there will be formed crystals not quite so fine as the first; the same proceeding is continued 'till all the salt-petre is taken away, but the last crystals, which are in a little quantity, must be set apart, because they contain much fixed salts.

The same refined salt-petre is purified a second time, not only to separate from it some small portion of filth, which, perhaps, sticks there, but also to clear it of it's fixed part, then it will not so easily be subject to run with moisture.

The salt-petre must be chosen well refined, in long, neat, and transparent crystals, cooling the tongue when applied to it, and much flaming when thrown upon burning coals.

Salt-petre cools the body, by reason that being an acid it depresses the humours, which by their too great motion did hurt the body, and so precipitates them by urine; for the volatile salts and sulphurs that all bodies are full of, are easily fixed and quieted by acids.

Of the spirit of nitre.

Spirit of nitre is a liquor very acid and corrosive, drawn from salt-petre.

Powder and mix well together two pounds of fine salt-petre, and six pounds of potter's-earth dried; put this mixture into a large retort, either of earth or glass luted, set it in a close reverberatory furnace; set to it a great capacious basin, or receiver, and give a very little fire to it for four or five hours, to make all the phlegm come forth, which will distil out drop by drop. When you perceive there will distil no more, throw the phlegm away that is found in the receiver, and having refitted it, lute the junctures, and increasing the fire by little and little to the second degree, there will come forth spirits, which will fill the receiver with white clouds; then keep the fire two hours in the same degree, after that increase it to the greatest violence you can give it, and so the vapours will come red; continue the greatest fire 'till there come no more, the operation will be ended in about fourteen hours. When the vessels are cold, unlute the junctures, and pour your spirit of nitre into an earthen bottle, which you must stop with wax.

Spirit of nitre is used for the dissolution of metals, it is a good aqua fortis [see AQUA FORTIS]; and the corrosive virtue of other waters of this nature, doth chiefly proceed from the nitre that enters into their composition.

R E M A R K S.

You might, as some do, mix four parts of potter's-earth with one part of nitre, when you would draw it's spirit; but you will succeed better, and with less difficulty, by observing the preceding directions; for the earth does here serve only as an intermedium to separate the parts of this salt, to the end that the fire operating more easily upon it, may draw it's spirits; and therefore it is a very needless business, to use more of the earth than is necessary towards this effect. Besides, this over great quantity of earth may serve to weaken the spirits, and by taking up too much room, may hinder the drawing such quantity, as otherwise you would with the same retort. The phlegm is thrown away, because it only serves to weaken the spirit. The white vapours proceed from the volatile part of the salt-petre, and are a weaker sort of spirit; but the red ones proceed from the fixed part, and are the strongest spirit: for which reason, the fire is made so very violent towards the latter end. Of all salts, nitre is the only one that yields red vapours.

When you use here the best salt-petre, there remains nothing in the retort but only earth.

On boiling several times in water a good while the earth that remained after the distillation of the spirit of nitre, and after evaporating of the filtrated decoction, you will find no salt at bottom. But sometimes a little vitriol, in the same manner as in several clayey grounds.

It has likewise been observed, that out of two pounds of purified nitre, a pound and fourteen ounces of liquor, in phlegm and spirit, may be drawn.

A third part of the retort, wherein the operation is performed must remain empty, and the receiver must be very large; for otherwise these spirits coming hastily forth, would break all to-pieces for room to move in.

NIVERNOS, or NEVERS, a province in France, bounded on the east by Burgundy; on the south by Bourbonnais; on the west by Berry; on the north by Gâtinois. It is pretty fertile in wine, corn, and fruit: there are also many woods, and mines of iron. It is watered by several rivers, three of which are navigable, namely the Loire, the Allier, and the Yonne. It's extent is about 17 leagues, from north to south, and about 12 from east to west. The only place where there is any considerable trade is at

NEVERS, the capital city, situate on the river Loire, near it's confluence with the Allier and the rivulet of Nierre. This city is famous on account of the great quantities of glass white iron, and fine earthen ware manufactured here.

NORFOLK, in England, has Suffolk on the south; Cambridgeshire on the west; is washed by the German Ocean on the east and north, and is in circumference about 140 miles. The air is of various temperatures in the several parts of it, and has a greater variety of soil than is, perhaps, in any other county; but even it's worst, namely the fens, marshlands, and sandy heaths, are exceeding profitable.

The chief rivers of this county are the Yare, Thyrn, Waveney, Ouse, and Bure, all abounding with fish, the last of which is noted for excellent perch. There is a great herring-fishery on the coast, which begins in September, and brings great trade and treasure to Yarmouth: mackarel are also caught here in the spring in vast quantities; so that here are every year two great markets for herrings and mackarel. Woollen and worsted stuffs, with stockings, are their chief manufacture; and they are in most places so diligent in nourishing and increasing their stocks of bees, that honey in these parts is very plentiful. Jet and ambergrease are sometimes found on it's coast.

NORWICH city stands near the conflux of the Winther and Yare, which is navigable from hence to Yarmouth, 30 miles by water. The inhabitants are wealthy, and the city populous, having a great trade itself, and adds not a little to that of Yarmouth, by the vast cargoes of coal, wine, fish, oil, and all other heavy goods, which it has from thence by the Yare. It's manufactures are, generally speaking, sent to London, though they export considerable quantities also to Holland, Germany, Sweden, Norway, and other parts of the Baltic and Northern Seas. They consist in great variety of worsted stuffs, as says, bays, serges, shallons, &c. in which they carry on a vast trade; and are lately come to weave druggets, crapes, and other curious stuffs: of all which it is said, this city tends to the value of no less than 100,000l. a year. All hands are daily employed, and even children earn their bread in this manufacture. Eight wardens of the worsted-weavers, four out of the city, and four out of the neighbouring country, are annually chose, and sworn to take care that there be no frauds in spinning, weaving, or dyeing the said stuffs. Here is another company of woollen manufacturers, called the Russia company. The weavers here employ all the country round in spinning yarn for them, of which they use many thousand packs from other counties, even as far as Yorkshire and Westmoreland. A calculation was lately made, from the number of looms then at work in this city only, that there were not less than 120,000 people employed, in and about the town, those who spin the yarn included. There is a stocking manufacture also here, which has been computed at 60,000l. a year.

GREAT YARMOUTH is a large, well-built, populous town, much increased of late years in buildings, shipping, and people, and greatly superior to Norwich in situation, traffic, and wealth; it's great commerce to France, Holland, and the North and East Seas, and, above all, it's herring-fishery, make it the greatest town of trade on all the east coast of England, except Hull; for, besides all it's other trade, it has the whole herring-fishery, where, including the little town of Leostoff, 50,000 barrels, which some magnify to 40,000 lasts, containing no less than 40,000,000 of red herrings, are generally cured in a year. These are mostly exported by the merchants of Yarmouth, the rest by those of London, to Italy, Spain, and Portugal. During the fishing-season, all vessels that come for that purpose from any part of England, as great numbers do from the coasts of Kent and Sussex, Scarborough, Whitby, &c. are allowed to catch, bring in, and sell their fish, free of all toll or tax, as the freemen of Yarmouth are.

They have also a fishing-trade to the North Seas, for white-fish, called the North Sea cod, and a considerable trade to Norway and the Baltic, for deals, oak, pitch, tar, hemp, flax, canvass, sail-cloth, and all manner of naval stores, which they consume, for the most part, in their own port, where they build a great number of ships every year.

LYNN is seated at the mouth of the Ouse, where it falls into the sea, little after it has received several lesser rivers, which gives it a navigation for trade into the very heart of the kingdom, almost as high as Northampton; by which means it commands the trade of several inland counties, which it supplies, especially with coals and wine, this being the greatest port of importation for those articles of any place on all the eastern coast of England, from London to Berwick. In return for this, Lynn receives back all the corn which those counties produce, and therefore is, next to Hull, the greatest port for the exportation of that commodity. The merchants of Lynn have the fame of a great correspondence, and of carrying on a considerable foreign trade, especially to Holland, Norway, and the Baltic, and also to Portugal and Spain. The harbour is safe when ships are entered into it, but difficult to come at, by reason of the many flats and shoals in the passage.

CROMER, on the coast, is a pretty large town, chiefly inhabited and frequented by fishermen, especially for lobsters, which are caught here in great quantities, and carried to Norwich, and sometimes also to London.

WORSTED is remarkable for the invention and twisting of that sort of woollen-yarn and thread which is from this place so called, as cambrics and calicoes take their names from the towns where they were first made. Here is also a manufacture of worsted stuffs and stockings, both knit and wove.

ST FAITH'S, a village between Norwich and Cromer, is noted for a fair of lean cattle, scarce to be equalled in the kingdom, they being brought hither in great droves out of the north of England and Scotland, and fold to the Norfolk graziers.

CLAY has a harbour for ships, on the same coast as Cromer, and large salt-works, where very good salt is made, and sent all over the country, and sometimes to Holland and the Baltic.

MARHAM and **WELLS** are two towns on the same coast, in each of which there is a very considerable trade carried on with Holland for corn, which this part of the county is very full of, besides the great trade drove hither from Holland in return.

WIMONDHAM, or **WINDHAM**, is a little town, whose inhabitants, both old and young, are generally employed in making spigotts and faucets, spindles, spoons, and the like sort of wooden ware.

Peculiar laws relating to Norwich and Norwich stuffs.

By 13 and 14 Car. II. cap. 5. in Norwich, and the county of Norfolk, there must be 12 wardens and 30 assistants chole, who, within 14 days after notice thereof, must take an oath before the mayor faithfully to discharge their office. If they refuse, or die within the year, the master weavers may choose others. Raym. 192.

Half of the wardens are to be chosen on Whitfun-Monday, by the greater part of the master-weavers in the city; half of the assistants on the same day, by the greater part of the weavers of the county.

Seven of the wardens and assistants may meet when they please, or as often as desired by the assistants. Fourteen days before they intend to meet, the wardens of the city must give notice to those in the county when they intend to meet, by setting such notice upon the door of their sealing-hall.

Two of them may search in the public places for sale, and seize defective yarns, and, within 20 days afterwards, bring them to a trial by jury, who may impose fines on the yarn not exceeding half the value, to the use of the poor of the trade. By-laws being made and confirmed by the mayor and two justices of the city, and three of the county (quorum unus) must be published four times in a year, at four assemblies for trade, and may impose fines not exceeding 10s. for every offence.

Any one disturbing them, convicted by oath of one witness, or by his own confession, before the mayor, or a justice of peace of the city or county, forfeits 40s.

At their four assemblies for trade, they are to account before the mayor and one justice of the city, and two of the county, for what fines and forfeitures they have received, and what they have expended about the trade, and what remains, by the said mayor and justices to be divided as they shall direct, between the poor of the trade of the city and county.

The jury must consist of 12 artificers, half of the city, and half of the county, and must be empanelled by precept from the mayor or deputy; and, if any being summoned, refuse to appear, forfeits 5s. to the poor of the trade.

All stuffs in which there is wool, must be under the regulation of wardens and assistants, and must be brought to Weavers-Hall in Norwich, before they are exposed to sale; and, if found good, then sealed; if defective, they must be tried by a jury, &c. who may set fines not exceeding half the value of the stuffs, for the use of the poor of the trade, and detain them till paid, and sell them, if not paid within 40 days after trial.

They in whose possession unsealed stuffs shall be found, forfeit 40s. per piece, and the maker or seller 4s. for selling them unsealed, to the use of the poor of the trade.

If wardens seal stuffs which shall be found defective by jury, such jury may set fines on the wardens of 40s. for every stuff, but wardens shall have double damages for unjust vexation.

Persons convicted before the mayor, or a justice of the city or county, by confession, or oath of two witnesses, of counterfeiting the seal, or sealing therewith, or removing the seal from one piece to another, forfeit 20l. Every one must have his proper mark upon every piece made by him, or forfeit 3s. per piece to the poor of the trade.

The forfeitures are to be levied by distress, &c. by warrant from the mayor or justice, or by action of debt, indictment, or information. All yarns and woad must be reeled on a reel of a yard about, and every reel-stuff must have fourteen leers.

By stat. 9 Geo. I. cap. 9. it is enacted, That all manufacturers; or makers of stuffs made of wool, or in which there is any mixture of wool, and all makers of worsted into yarn, who are not journeymen or servants for hire, master-weavers and master woolcombers, and all persons dealing or employing servants and journeymen in any such manufactures, or

having any interest, share, or partnership therein, living in Norwich, shall be made free, and admitted freemen of that city, on their request to be made at any assembly of the corporation of the said city, paying not exceeding 5l. for such admission and freedom; and all persons to be made free shall take the usual oaths, or, being Quakers, shall take the solemn affirmation.

If any person (except servants and apprentices during their service) who is any such manufacturer or dealer, &c. presume to exercise any of the said manufactures, or be otherwise interested therein, not being made free, and being convicted thereof on a prosecution commenced within six months after the fact committed, he shall forfeit 10l. for every calendar month he shall exercise any of the said manufactures, or be concerned therein, next after the third quarterly assembly of the said corporation, to be recovered by action of debt, &c. brought by the chamberlain, for the use of the mayor, sheriffs, citizens, and commonalty of the city, in any court of record at Westminster.

NORMANDY, in France. This province, or duchy, is bounded on the north by the British Channel; on the west by part of the same, and by Brittany; on the south by Maine, Perche, and Beauce; and on the east by the Isle of France and Picardy: its whole circuit being of about 240 leagues, the greatest part of which is on the sea-coast. This country abounds in pastures, and is extremely fruitful in corn, flax, and several kinds of fruit; and has also mines of iron, and some of copper, and other metals. They have a considerable trade in corn, timber, coals, hay, cattle, and herbs proper for dyeing, as madder, woad, &c.

ROUEN, the capital of the province, is situated on the north bank of the river Seine, in which the tide flows so high, that ships of above 200 tons can come to the key here. The trade carried on in the city and district is very considerable and extensive: it consists in woollen and linen cloths, leather, hats, paper, and a great many other merchandizes. The woollen manufactures, which employ many thousand workmen, are very advantageous to the province; but, as they are here chiefly sold within the kingdom, are only so far profitable to the nation in general as they prevent the money being sent abroad. But the linen manufactures of many sorts, which are exported into Spain, are extremely so, because the returns are generally made in cash.

ELBEUF, a large and populous borough on the river Seine, famous for the manufactory of cloths set up here in 1667.

DIEPPE is a noted sea-port on the shore of the British Sea, at the mouth of the river Betune. The town is reasonably large, and inhabited by seafaring men, reckoned skilful in their profession; mechanics that make curious works in ivory; and merchants who drive a considerable trade to foreign parts, especially Newfoundland in America. The chief trade here consists in herrings, with which they supply Paris, and the province of Normandy: they also fish for whittings, mackerel, and oysters. There is also a manufactory where they make tobacco-rolls, which employs daily some hundreds of hands.

HAVRE DE GRACE is a strong sea-port, at the mouth of the Seine, and a place of good trade, several merchants inhabiting here who trade to Newfoundland, and other places.

CAUDEBEC is a pretty well peopled town. A small river runs through it, divided into several canals, on which stand divers mills of great use to the tanners and leather-dressers here: among other manufactures, they make here a kind of hats, which are very much esteemed on account of their resisting the rain.

FESCAMP is situated on a little river, eight leagues from Havre, and 12 from Dieppe. Their trade consists in woollen cloths, serges, linens, laces, hats, and tanned leather. They also send some ships to Newfoundland, and a few barks to the herring-fishery.

EU, on the banks of the river Bresle, has a pretty good trade, by means of their manufactures of serges, and other woollen stuffs, linens, and laces.

ST. VALERY is a large sea-port town, on the coast of the British Channel. They make here also linens and woollen stuffs, and send some vessels to the herring and cod-fisheries.

AUMALE is seated near the river Bresle. The serges made here are very much esteemed: they make also a coarse sort of woollen stuff, called frocks, for the use of the common people.

LISIEUX is a fair and large city. Several manufactures of linen and woollen stuffs afford the inhabitants a competent livelihood.

HONFLEUR, at the mouth of the Seine, has above 60 ships belonging to it that trade to Newfoundland and the French colonies in America. They make here also a great many laces.

BAYEUX is an ancient city, on the river Aure. They had set up here manufactures of cloths, serges, and stockings, which succeeded extremely well; but the high taxes the merchants were forced to pay, obliged them not only to abandon these manufactures, but also to leave the city, and to settle elsewhere.

CAEN is a large and well-built city, and a place of good trade, vessels of burthen coming up to the bridge.

VIER is a neat city, on a river of the same name, with a considerable trade, consisting chiefly in drapery goods manufactured here: they have also paper-mills.

COUTANCES is a pretty large and populous city. There is here a large suburb, inhabited by a great number of tradesmen, particularly tanners and dyers.

The chief trade of GRANVILLE, a good sea-port town, consists in salt-cod, which they fish and cure on the coast of Newfoundland, and oysters and other fish, which they catch on the neighbouring coast.

CARENTAN has some trade, because vessels of a pretty large size can come up here at high water.

CHERBURG is a small port, but pretty good, admitting vessels of 300 tons: they build here some merchant ships.

ALENÇON, on the river Sarthe, in a fruitful plain, is a fair and large city, and chief place of a generality*, which is not less considerable than the two others of the same province, with regard both to the variety and importance of its trade.

* Besides the geographical division of France into provinces, there is, for the better administration of the king's finances, another division of the kingdom into what they call generalities, of which there are 24, according to Monsr. Faretier, in each of which there is an office of the treasuries of France, with a receiver-general of the finances, and an intendant of justice, or commissary.

The manufactory of the linens which are called cloth of Alençon, because they are wove in that city and in its neighbourhood, is still considerable, though the flourishing condition in which it was formerly, has suffered great alterations by the long wars, and the want of hemp, which was either bought up for the sea-service, or which the husbandmen cease to sow their lands with, to put corn in its stead.

The brionnes, another sort of linen very much esteemed, though somewhat dear, are made at Bernay, at Lisieux, and at Brionne, from which last place they have got their name.

In the whole election, or district, of this last town, as also at Ponteau de Mer and Bernay, they make a great many linens of flax, which are sold under the name of blancards.

The linens of which the warp is of hemp, and the woof of flax, and which they call cretonnes, are manufactured at Lisieux.

At Domfront, Vientiers, and in their neighbourhood, they make none but coarse linens, which they sell before they are bleached; they are sometimes called canvass, but improperly, the true canvass being much coarser and more ordinary.

Of all those linens, the finest, strongest, and whitest are sent to Paris; the clearest are designed for Rouen, whence they are exported to Cadiz, to be sent from thence into Spanish America; and the coarsest are kept for the use of the country.

The manufactory of French point, which, in the generality of Alençon, they call velom (velin), because of the velum or parchment on which it is wrought, have also been affected by the long wars of the reign of Lewis XIV; it is, however, still kept up with some reputation at Alençon, and in its neighbourhood, the magnificence, or the luxury, of the French being sufficient to support it, even in time of war; but it flourishes chiefly in time of peace, by the great quantity of those points that is exported into foreign countries.

There is also a great deal of drapery and woollen stuffs manufactured, in the generality of Alençon, as the reader will see in the several articles of the most considerable towns within this division.

The woollen stuffs called a frock by the French, which serve for dressing the common people, are made at Lisieux, Bernay, Orbée, and in the villages of Ferveques and Tardonet, whence they are sent into the provinces of Perche, Maine, and Poitou. Besides the wool of the country which is used in those several manufactories, the weavers get a great deal also from the neighbouring provinces. They make in this generality, one year with another, 50 or 52,000 pieces of woollen stuffs, of which there above 15,000 marked or stamped every year at the fair of Guibray only.

The pins made at Laigle and at Conches, the iron, steel, copper, and brass wares made in the last-mentioned town, the tanneries of Argenton, Vomontiers, Conches, and Verneuil, the manufactory of wooden shoes, the large timber, boards, and small timber, conveyed to the sea by the rivers Drac and Tonques; the fattening of fowl, of which they send vast quantities to Paris, as also of butter and eggs, and the salt-petre of the election of Argenton, are pretty considerable branches of the trade which is carried on in the generality of Alençon. But there are two other branches of commerce which procure greater profits still to this part of Normandy; these are the manufactories of glass, and the iron-forges.

As for the manufacturing of glass, it is esteemed a noble profession, none but gentlemen having the liberty to keep glass-houses: they may be interested in this manufacture without derogating from their nobility.

The chief glass-houses in this generality are, that of Nonant, in the forest of Exines, that of Fortissambert, in the forest of Montpinson, and the two which have been set up in the little district of Thimerais.

In the two former of these glass-houses they make crystal glass, with the stone called by them chambourin, and fern-glass: in the two last they make hardly any but fern-glass, and a few crystal works.

As for the forges, the most considerable are at Chansegay, Varennes, Carouges, Rannes, Conches, and Bonneville; this last, though it has been set up only since the beginning of the eighteenth century, equals, if it does not surpass the old ones, with regard to the good quality of its iron, and of the works made there.

The neighbourhood of Domfront, and the little country of Houlme, are the places where the mines abound most, and from which they take the greatest quantity of mineral matter for the keeping up of those forges.

We ought also to reckon as a pretty considerable branch of the commerce of this generality, the great number of horses which they feed in the pastures of the country of Auge, and which are sold at the fairs of Caen and Guibray: nor ought we to omit the fattening of cattle, which is afterwards sent to Paris, or to the markets of Seaux, Roan, Neubourg, and the other chief cities of Normandy. We speak of the horses of this province in other places.

The manufactories of the city of Alençon, are of strong serges, $\frac{3}{4}$ of a French ell wide, of flammes $\frac{1}{2}$ an ell wide, of crapes of the same breadth; but they make not much above 100 pieces of all these stuffs together per annum. They have nevertheless a pretty considerable trade in small woollen stuffs, as druggets, tiretaines, and flammes of several stuffs: but these are wove in other places, and there are marked or stamped above 800 of them, one year with another, at the hall or office of Alençon.

We have already mentioned the manufactory of French point; we shall only add here, that most of the women in this city work at it, besides a great many more, who are dispersed in the neighbouring villages: so that above 800 persons are employed in that manufactory, which affords a trade of above 50,000 livres per annum. Most of this point is sold at Paris, whence they send part of it to the chief cities of the kingdom, and into foreign countries.

The manufactory of linens, which from this city are called linens of Alençon, is still pretty considerable there, though much less than it was before the Protestants of France were forced to leave their native country; there being a great many of them among the weavers, and among the merchants who dealt in those linens. They reckon, however, that the produce of this trade amounts still to above 60,000 livres yearly, and this manufactory employs above 400 workmen in the city only, besides those of the country parishes. Most of these linens are sent to Paris.

The tanneries of Alençon are pretty much esteemed; they are of the number of those, whose leather, according to the regulations, is to be sent to Paris.

There are three considerable fairs kept at Alençon: the one on Candlemas day, the second the first Monday in Lent, and the third at Midlent. The markets are kept three times a week, namely, every Monday, Thursday, and Saturday.

TALAISE is a small town, situate on the little river Ante. They make here and in the adjacent villages, light woollen stuffs, fine linen cloths, laces, and other works, for which they have a pretty good trade, and the neighbouring lands produce plenty of corn.

ARGENTON is situate on the banks of the river Orne. The trade of this city consists chiefly in corn, linen cloths, hats, and tanned leather.

EVREUX is seated in a very fruitful plain near the river Eure. It is a very ancient city. The inhabitants trade in cloth, serges, and other woollen stuffs; they also make here linen cloth, and sell a great deal of corn.

BEAUMONT LE ROGER, is a borough where they make woollen stuffs and linen cloth. This town is separated only by a stone bridge over the Rille, from a large borough called Vienne, in which they bleach a vast quantity of linen.

VERNEUIL on the river Aure, trades chiefly in drapery wares, buttons, and corn.

VERNON, on the Seine, is a place of trade, which consists chiefly in corn, wine, linen cloths, and woollen blankets.

NORTHAMPTONSHIRE is an inland county, situate in the centre of the kingdom of England, and bounded on the south by Buckinghamshire, on the west by Warwickshire and Oxfordshire, on the north by Leicestershire, Rutland, and Lincolnshire, and on the east by the counties of Bedford, Huntingdon, and Cambridge; and is in circumference about 120 miles.

The air is exceeding pleasant and wholesome, and the soil very fruitful, both in tillage and pasturage, and abounds with sheep and other cattle, wool, pigeons, and salt-petre. Its manufactures are serges, tammies, shalloons, boots, and shoes.

PETERBOROUGH, reckoned the least city in the kingdom, stands on the river Nen, which is navigable to it by barges, in which they import coals, corn, &c. and export to the amount of 6000 quarters of malt in some years, besides many other goods; but especially of the woollen manufacture, either of cloth or stockings, in which the poor are constantly employed.

NORTHAMPTON, the county-town, stands at the conflux of the Nen, and another rivulet. The horse-market here is thought to exceed any other of the kind in England, being reckoned the center of all in the kingdom, both for saddle and harness. It's most famous manufacture is shoes, of which great quantities are sent beyond sea; and next to that stockings. It is the dearest town in England for fuel, where, till the river Nen be made navigable, which is now undertaken to Peterborough, no coals can come by water, and little wood grows on the land.

WELLINGBOROUGH, on the same river, is a large populous trading town; the greatest trade it carries on is in corn, for which it's market is risen on the decay of that of Higham-Ferrers. Nevertheless, here is also a manufacture of lace, so considerable, that it is said to return 50l. a week into the town, one with another, and therefore may be reckoned the second town in the county.

TOWCESTER is a handsome populous town. The inhabitants here, of all ages, are employed in lace, and a manufacture of silk.

KETTERING is also a handsome town of good trade, pleasantly situate by the river that runs into the Nen. Near 2000 hands are said to be employed here in the manufacture of ferges, shalloons, and tammies, especially shalloons.

NORTH CAROLINA. Under the article **BRITISH AMERICA**, we have given a succinct account of the commerce of the colonies in America belonging to these kingdoms; and have, among the rest, taken notice of North Carolina; but it seems, from the information I have since received from some honourable persons, well acquainted with that province, that the account I have given thereof, is imperfect, and therefore I have here taken the first natural opportunity that has offered, to supply that deficiency from the authentic materials which I have had the honour to receive for that purpose through the hands of the **ATTORNEY GENERAL** of that province.

This province, says my intelligence, is divided into 21 counties, all of them being large and extensive; and they are settling very fast by the outellers of the other colonies, whose vicinity to the Indians in the French interest, rendered their situation very precarious and dangerous. By an accurate computation made in the year 1751, the white inhabitants then amounted to 35,000 at least; but the negroes did not exceed 5000.

There are six principal thriving towns in it, which are rightly named and placed in our map of North America. See the **MAP** at the end of the first volume. In the northern and southern parts of the province, the soil is different, the former being a rich mould, and the latter mostly sandy; which makes their produce different likewise. The commerce of the southern district consists chiefly in pitch, tar, turpentine, and lumber; and lately they have attempted to make indigo, and raise rice with good success.

Their only port is Cape Fear, which is a very safe and short navigation; and will easily admit vessels of 500 tons. Upon this river are the two towns of Brunswick and Wilmington situated; the first containing about 50, and the other about 100 houses. In both these are very good wharfs, and safe lying for shipping.

Nearly in the center of the province is Newbern, the metropolis, situated on Neuse river; which, being lately made the seat of government, is a very prosperous place, and consists of 200 houses at least; their commodities are the same as at Cape Fear; but their navigation is not near so good: to remedy which, there is a proposal now in agitation for cutting a canal, between 2 and 3 miles, in order to make a water communication with Port Beaufort, which will not only admit vessels of very large burthen, but is situated so near to the ocean, that, in an hour's time, vessels of any burthen may be cleared out to sea.

The commerce of the northern district consists chiefly of tobacco, beef, and pork, which they salt and send to the West-Indies; also Indian corn, very good English grain, some lumber, and naval stores; and here likewise are raised hemp and flax, which will soon become a considerable article of their trade.

Their port, though at a good distance, is an excellent one, called Ocacock; but between this and them there is shallow water, where there are always lying convenient vessels for lightening such ships as draw too great a depth of water. This port serves for the three towns of Newbern, Bath Town, and Edenton. Bath is situated on Pamlico river, and the nearest to the ocean of the three; has an agreeable aspect from the river, and has some good houses in it. But the most beautiful situation of all, is that of Edenton, or Albemarle Sound. In this town the general assembly of the province, and courts of justice were formerly held; and at this time it is the great rendezvous of the Virginia merchants, who find their account in carrying on a very large trade with the northern parts of this province.

The trade of this district to England, is chiefly in the hands of some Liverpool merchants, who supply them with negroes and European goods, in exchange for their commodities. The timber is so plentiful and good, and there are so many

convenient streams, that the building of vessels must turn to good account, and doubtless will be attempted by and by. Some samples of excellent silk have been sent home from this place; but for this, as well as other profitable articles, there is wanting a public purse, or fund, to enable particular persons to support the expence and hazards of their first essays; without which, it will be the work of after-ages to make it a particular branch of their trade.

The government of this province is constituted after the true model of that of England, and consists of his majesty's governor, the council, and the representatives of the several counties and towns. The chief justice, attorney general, secretary, and other officers are appointed from home, and have their respective salaries out of his majesty's royal revenue of quit-rents.

By the following list, we shall perceive how considerable a place of trade this is at present; and, from the particular kinds of produce, may be judged what it must soon be. As few years ago, it was almost scandalous to be known to be of this country. It was the jest and scorn of the other colonies, but is now a growing rival, and become an object of their envy and jealousy.

An account of the number of ships and vessels entering inwards, and clearing outwards in the several ports of North Carolina, for the years 1750 and 1751.

A true list.

Ben. WHEATLEY, Naval-Officer.

REMARKS before the last WAR.

The attentive reader will observe, that, throughout the course of this work, after the representation of the state of trade, we have shewed the danger our colonies on the continent of America are in, from the near neighbourhood of the French, and from their encroachments upon the British rights there, and the American Indians in alliance with them: we have likewise shewed the insecure and precarious state of our island colonies, provided the pretensions of the French upon St. Lucia, St. Vincent, and Tobago, should be complied with by the crown of Great-Britain. What we have urged upon these important and interesting points, may be found under the following articles, viz. **BRITISH AMERICA**, **CANADA** or **NEW FRANCE**, **COLONIES**, **FRENCH AMERICA**, **LOUISIANA**, **MISSISSIPPI**, **PLANTATIONS**. And still further to evince the real political system, that the court of France has steadily pursued, from the time of Monf. Colbert to the present day, see the articles **FRANCE**, **FLANDERS**, **NAVAL AFFAIRS**, and also the article **MAP**.

And whether the present system of the court of Spain, towards that of Great-Britain in particular, does not perfectly coincide with that of France in these respects, whereof we have treated under the several preceding heads, may be judged by consulting the following articles, **BISCAY**, **CASTILLE**, **CATALONIA**, **FLORIDA**, **LOGWOOD**, **MEXICO**, **MEDITERRANEAN**, **SPAIN**, **SOUTH SEA COMPANY**, **WEST-INDIES**. And if it shall be found, upon due attention given to our plain and faithful representations, that these two courts seem, at least, to act in concert, in order to distress and ruin, if it be in their power, the whole BRITISH COMMERCE AND NAVIGATION IN AMERICA, it is certainly needful that we should be upon our guard, and take the alarm. Some mistaken people may, perhaps, suspect me of a design to plead for a war, under pretence of asserting the BRITISH RIGHTS. But I most solemnly protest a thought of that nature is so contrary to my intentions, and so foreign to my inclinations, that I heartily and sincerely wish, if consistent with our honour, interest, and safety, we may ever avoid one. Nor can any one, who has done me the honour (as numbers of the greatest personages in this, and other kingdoms have done) to peruse, with candour and impartiality, what I have humbly submitted to the public consideration, have the least reason to entertain any such suspicion of my intentions: on the contrary, we might shew, not only from a variety of palpable instances, but from the general tenor of the work, that nothing more remote ever entered into our thoughts. We have endeavoured to shew the folly and insatiation of going to war, till every other measure in our power is tried to avoid one. We have shewed that we have never yet got any thing by wars, but a LOAD OF DEBTS AND TAXES; for the honourable

nourable redemption of which we have ever pleaded; but this cannot be done in a time of war.—It is true we have displayed the policy of France, in relation to their acquisitions, and the foundation laid for the increase of their commerce and maritime power, in a light wherein they never before appeared in this nation. Can any one uncandidly judge this to be done with a view to quarrel with that kingdom? We have laid open their commercial policy, with intent to point out what therein may deserve our imitation; as well as to put the nation upon it's GUARD AGAINST THE CONSEQUENCES, which must inevitably attend such wise and profound measures as that kingdom has taken for the prosperity of their trade, and the rise of such a NAVAL POWER, as may one day make this nation tremble.

In this light the policy of the French appears to me, from entering very minutely, as occasion offered, into their conduct, in regard to these capital points: and, indeed, to talk about that, or any other state in general, as we have hitherto always been wont to do, is to deceive ourselves; and, therefore, the more particular and distinct our knowledge is of the COMMERCIAL POLICY OF OTHER NATIONS, the less shall we be ever liable to be misled and imposed on in our public conduct towards them. But nothing of this kind, perhaps, could have been so effectually done, as in a work of this nature, and that conducted upon the plan whereupon I have endeavoured to execute it; because one part of the work explains, illustrates, and confirms the truth of the other, though considered in various and different lights; than which, nothing of this kind can admit of a greater degree of probability, if not of certainty.

That we have no intention to embroil the nation, either with France or Spain, &c. the reader is desired to turn to our articles DUTCH WEST-INDIA COMPANY, LOGWOOD, and MEXICO, and he will meet with an expedient, under the article LOGWOOD, humbly submitted to consideration, to reconcile those misunderstandings amicably, that we have so many years had with the court of Spain; and time will shew, whether our suspicions are ill-grounded. In relation also to France, we have only spoken plain truths, with great decency and moderation, and as often with great honour to the wisdom of that kingdom, as with contempt of their insincere conduct towards Great-Britain and other nations on certain occasions. See our article PLANTATIONS, relative to the perfidy of France, for above this century past.

We have judged necessary to mention these things here, lest what we are about further to urge against the conduct of the French in North America, should be misconstrued. For what we have foreseen for some years since, in regard to the insecurity of our colonies on the continent of America, seems to draw towards the fulfilment; which appears from the following authentic speech of the honourable Robert Dinwiddie, Esq; his majesty's lieutenant-governor, and commander in chief of the colony of Virginia, to the general assembly of the said colony, on the 14th of February, 1754. And, as North Carolina is a near neighbourhood to Virginia, and this is a very recent occurrence, and confirms our suspicions, with respect to the candour and uprightness of French measures, we judge it useful to introduce the same under this head; and we shall give the speech at large, as it has been transmitted to England from Virginia.

Gentlemen of the council, Mr. Speaker, and gentlemen of the house of burgesses.

‘ Nothing less than a very important concern, could have induced me to call you together again, after so short a recess; but the dignity of the crown of Great-Britain, the welfare of all the colonies on this continent, and more especially of this dominion, engage me to have your advice and assistance, in an affair of the greatest consequence.

Major Washington, who was sent by me to the commandant of the French forces on the river Ohio, being returned, informs me he found that officer at a fort they had erected on a creek running into the Ohio, and that they were then preparing all necessities for building another fort on that river; that they had two hundred and twenty canoes made, and many more rough hewed to be made, in order to transport, early this spring, a great number of regular forces, not less than fifteen hundred men, with their Indians in friendship with them, down the river Ohio, in order to build many more fortresses on it; and that they proposed Loggs town to be the chief place of their rendezvous.

Major Washington further reports, that he asked why they had seized the goods of the traders, and sent their persons prisoners to Canada; to which the commandant answered, “ that his orders from their general, the governor of Canada, were, not to permit any English subjects to trade on the waters of the Ohio, but to seize their goods and send them prisoners to Quebec.” He also asked the reason of taking Mr. Frazier's house from him, which he had built and lived in upwards of twelve years? He said, “ that man was lucky that he had made his escape, or he would have sent him prisoner to Canada.”

These transactions are entirely inconsistent with the treaties, subsisting between the two crowns, and contrary to my in-

structions from his majesty, whereby I am directed to prevent any foreign power, settling or building any fortresses on his majesty's lands.

Add to the afore-mentioned unjustifiable insults of the French, the cruel and barbarous murder, in cool blood, of a whole family in this dominion, man, wife, and five children, no longer ago than last month; and very lately a poor man on the fourth branch of Patowmack, robbed of his son. These depredations were said to be done by the French Indians; but if I be rightly informed, some of the French subjects always go with the Indians on these incursions, and are both privy to, and instigators of, their robberies and murders.

How compassionate must then be the distressful situation of that poor unhappy family; surrounded by a crowd of miscreants, dreadfully running on to perpetrate the most savage barbarities, inexorable to the parent's intreaties, insensible to the cries of the tender infant, basely determined to destroy, without provocation, those who could not resist their violence. Think you see the infant torn from the unavailing struggles of the distracted mother, the daughters ravished before the eyes of their wretched parents; and then, with cruelty and insult, butchered and scalped. Suppose the horrid scene completed, and the whole family, man, wife, and children (as they were) murdered and scalped by these relentless savages, and then torn in pieces, and in part devoured by wild beasts, for whom they were left a prey by their more brutal enemies.

But how must your indignation rise when you extend your view to the abettors of these villainies! Such are the people whose neighbourhood you must now prevent, or with the most probable expectation think to see, in the bosom of your country, these evils, that you as yet have only the melancholy tidings of from your frontiers.

Consider the bloody villains, stealthily lurking about a man's plantation, and where they dare not attack like men, basely, like vermin, stealing and carrying away the helpless infant, that happened to wander, though but a little distance from his father's threshold.

I assure you, gentlemen, these insults on our sovereign's protection, and barbarities on our fellow-subjects, make deep impressions upon my heart; and I doubt not, as you must hear them with horror and repentment, but you will enable me, by a full and sufficient supply, to exert the most vigorous efforts to secure the rights and assert the honour and dignity of our sovereign; to drive away these cruel and treacherous invaders of your properties, and destroyers of your families, and thereby to gratify my warmest wishes in establishing the security and prosperity of Virginia, on the most solid and permanent foundation.

I must earnestly recommend to you his majesty's commands, for a proper supply, the immediate necessity whereof, at this time, I desire you will seriously consider, and by a ready and effectual compliance, recommend yourselves and the country to his royal favour.

This is your part, gentlemen.—What I could, before your meeting, I have done, for the public; and by the advice of the council I have arrayed some part of the militia, which I have ordered up to the Ohio with all possible expedition, to build a fort there, at the forks of Monongahela. And as his majesty's gracious present of thirty pieces of cannon, eighty barrels of powder, and other ordnance stores suitable are arrived, I have sent ten of the cannon, and a proportion of ammunition to Alexandria, to be from thence transported as soon as possible to the Ohio.

I have wrote to the neighbouring colonies for their aid and assistance, which I have good reason to expect; but I must observe to you, that their eyes are fixed on your proceedings, and I hope you will engage them, by a laudable example, to contribute sufficiently for the common cause.

The late occasion having suggested to me some defect in the “ act for making provision against invasions and insurrections,” I think proper to observe to you, that the pay is very unequally proportioned, being too high for the soldier, and too low for the officer; and there is no provision made for a doctor, a commissary of stores, and several other requisites.—I think it would be better to pay the militia in money than tobacco, by which there may be a saving to the country, and the men better satisfied.

Gentlemen of the council, and gentlemen of the house of burgesses.

I look upon the safety and welfare of Virginia to depend on your counsels and determinations, at this critical juncture, which, therefore, ought to be uninterrupted by any avocations from prejudice, or unreasonable divisions, at all times the bane of public consultations, but which, at present, would be particularly fatal; and I doubt not, when you seriously consider the importance of what is laid before you, you will find duty, honour, and your own preservations, all united, to engage you to exert your efforts equal to the occasion.

The season for entering upon action being so near at hand, your session can be but short; and I desire to conclude with an earnest exhortation to concord and expedition, lest if we be divided, or slow in deliberation, our enemies may seize the time we lose, and render any future efforts ineffectual.

And

N O R.

And in all measures for his majesty's service, and the good of this colony, you will have my ready and zealous concurrence.'

February 16, 1754.

To the honourable Robert Dinwiddie, Esq; his majesty's lieutenant-governor, and commander in chief of the colony of Virginia.

The humble address of the council.

SIR,

We his majesty's faithful and loyal subjects, the council of Virginia, now met in general assembly, beg leave to return your honour our hearty thanks, for your kind speech at the opening of this session.

We cannot forbear to express our just indignation at the unwarrantable encroachments, and hostile proceedings, of the French; and, at the same time, to testify our approbation of the prudent steps already taken by your honour, for the defence and security of the colony.

Our ardent zeal for the support of his majesty's crown and dignity, and our tender regard for the welfare and prosperity of our country, will incline us, by a cheerful concurrence with the house of burgesses, to exert our most vigorous efforts to support and effectuate your honour's proceedings, in what we agree to be the common cause of all the British colonies upon the continent, and more especially of this dominion: and we assure your honour, that in all our consultations, we will proceed with that harmony and dispatch that the importance of the subject, and advanced season require.

We cannot conclude without our earnest prayers, that your honour's constant labours may be crowned with their deserved success; and our warmest wishes, that our country may long continue to flourish under your honour's administration; from whence we may with reason hope to see her security and prosperity established, on the most solid and permanent foundation.'

To which his honour was pleased to return the following answer:

Gentlemen of the council,

I return you my sincere thanks for your kind address, and do assure you it gives me great pleasure, that the steps I have taken in the present situation of our affairs meet with your approbation.

Your ardent zeal for his majesty's crown and dignity, and your regard for the prosperity and welfare of our country, with your intentions of concurring with the house of burgesses, to exert the most vigorous efforts for supporting me in my proceedings against the enemy, call for my most unfeigned thanks.

And I have not the least doubt of your proceeding with harmony, dispatch, and resolution, on the present emergency.—I am much obliged for your prayers for success to my endeavours, which I assure you shall always be with a view for the welfare and prosperity of this dominion; and I hope, by our conduct, that our enemies will see we are not disunited, but closely connected in defence of our rights and liberties.'

Virginia, ff.

By the Hon. Robert Dinwiddie, Esq; his majesty's lieutenant-governor, and commander in chief of this dominion.

A proclamation for encouraging men to enlist in his majesty's service, for the defence and security of this colony.

Whereas it is determined that a fort be immediately built on the river Ohio, at the fork of Monongahela, to oppose any further encroachments or hostile attempts of the French, and the Indians in their interest, and for the security and protection of his majesty's subjects in this colony: and, as it is absolutely necessary that a sufficient force should be raised to erect and support the same, for an encouragement to all who shall voluntarily enter into the said service, I do hereby notify and promise, by and with the advice and consent of his majesty's council of this colony, that over and above their pay, two hundred thousand acres of his majesty the king of Great-Britain's lands, on the east side of the river Ohio, within this dominion (one hundred thousand acres whereof to be contiguous to the said fort, and the other hundred thousand acres to be on or near the river Ohio) shall be laid off and granted to such persons, who by their voluntary engagement, and good behaviour in the said service, shall deserve the same. And I further promise, that the said lands shall be divided amongst them, immediately after the performance of the said service, in a proportion due to their respective merit, as shall be represented to me by the officers, and held and enjoyed by them, without paying any rights, and also free from the payment of quit rents, for the term of fifteen years. And I do appoint this proclamation to be read and published at the court-houses, churches, and chapels, in each county within this colony, and that the sheriffs take care the same be done accordingly.

N O R

Given at the council chamber in Williamsburg, on the 19th day of February, in the 27th year of his majesty's reign, anno dom. 1754.

ROBERT DINWIDDIE.

GOD save the KING.

That we may judge of the intended measures of the French in relation to our North American colonies, it is confidently said, that by letters lately received from Virginia, brought over by the ship Seahorse, Capt. Jump, we are informed, that the French have erected FIVE FORTS, and garrisoned them with 1500 regular troops, on the part of the British territory at the back of Virginia, which is nearest to Quebec, contrary to treaties. It is imagined that this breach of faith will be attended with very serious consequences.

REMARKS ON NORTH CAROLINA since the last WAR, and the DEFINITIVE TREATY of 1763.

This work was first began soon after the treaty of AIX LA CHAPPELLE; and having pretty vigilantly attended to the conduct of the court of France from that time, towards GREAT-BRITAIN, we thought it our duty to give a faithful representation thereof, from time to time, as we proceeded herein, to the end, that where our COMMERCIAL INTEREST was likely to be concerned, the nation might be duly apprized and alarmed, when that interest was in imminent danger. Our conduct in this respect, was regarded by many, and commended as becomingly zealous; others put a less favourable construction upon it, and declared our apprehensions of a fresh war with France, so soon as we did, after the peace in 1748, were chimerical and visionary, and that our labours were rather of the incendiary kind than otherwise: all which have proved mistakes on our censurers' sides; yet we have not a little suffered in our private affairs by our honest declaration of bold truths, all which the event has proved to be true, so far as they related to the injurious intentions of France towards our North American colonies.

I had also, so far as the same regarded our commercial speculations for the benefit and advantage of these kingdoms, attended to the conduct of the court of Spain, and from thence likewise prejudged, that court would join France sooner or later, after the commencement of the French war; which was condemned by some as a premature suggestion, though verified by the event: nay, so minutely had we observed the conduct of the Spanish court, that we apprehended they would revive the claim of the Guipuscoans to a share in the Newfoundland fisheries, which came to pass accordingly, and by the xviiiith article of the DEFINITIVE TREATY of 1763, his Catholic majesty desists, as well for himself as his successors, from all pretensions which he may have formed, in favour of the Guipuscoans, and other his subjects, to the right of fishing in the neighbourhood of the ISLAND OF NEWFOUNDLAND.

These things are not intimated, to induce our readers to entertain any extraordinary opinion of our foresight: they are noticed only to excuse ourselves in the eye of those, who judged once unfavourably of our occasional observations; and who, on that very account, have done us unspeakable personal injury, for which they can never make us a compensation were they disposed so to do: but this we never expect. We still live, and perhaps, we may preface some other things, that may not be less disagreeable to those who regard their own interest, and their own ambition in preference to that of the public good and prosperity: and if events should hereafter happen to turn out as we apprehend they will, we can only attribute it to our honest impartiality in representing things as they appear to us, from the evidence of FACTS and EXPERIENCE. See our article MEXICO, FLORIDA, INDIAN AFFAIRS, and others to which from thence we refer.

NORTHUMBERLAND in England, is a maritime county bounded on the south by the bishoprick of Durham, on the north by Scotland, on the west by Cumberland, and part of Scotland, and on the east side it is washed by the German Ocean, and is about 150 miles in circumference. The air is in general pleasant and healthy; as for the soil it is various, being very fruitful on the sea-coast if well manured and cultivated. The west parts are indeed mountainous, but afford good pasture for sheep.

It abounds more with coal, especially about Newcastle, than any other county in England. It is almost impossible to express the vast trade brought into this county by the exportation of coals to all parts, inasmuch that London alone, before there was half the number of brewers and distillers that there is now, was said to consume 600,000 chaldrons in a year.

It's chief rivers are the Tyne and Tweed, which last so abounds with salmon, that the fishermen often take great numbers of them at one draught.

NEWCASTLE, the county town, stands on the north bank of the river Tyne.

By the sale of it's coal to other parts of England, and other merchandize, it is become the great emporium of the north parts

parts of England, and a good part of Scotland, and is the fairest and largest town of the north next to York. Ships of any reasonable burthen load and unload at it's key. But the coal-ships generally load below, between the town and Shields, or at Shields, which is seven miles distant, the coals being carried to them in large lighters called keels, of which so many are employed, that the keelmen are reckoned above 6000. The town is extremely populous and very wealthy, and is said to have the greatest public revenue in it's own right, as a corporation, of any town in England, it being computed at no less than 8000*l.* a year.

This place is famous for grind-stones, much better than those that used to come from Spain, which are of too soft a grit, and therefore not so useful for many purposes. There is such a demand for them, that scarce a ship stirs from this port without them. Besides many glass-houses, a considerable manufacture has been lately set up here, of hard ware and wrought iron, after the manner of that at Sheffield.

MURPETH, on the river Wentbeck, has a good market on Saturday for corn, cattle, and all necessary provisions; but that on Wednesdays is the greatest in England for live cattle, except Smithfield.

BERWICK, at the mouth of the Tweed, is the last town in the north of England, a county and town of itself, and though situate on the north side of the river, is included in Northumberland. It is a large well built populous town. Here is a noble salmon-fishery as fine as any in Britain, they being the fish that are carried by land on horses to Shields, to be cured, pickled, and sent to London, where they are cried for Newcastle salmon. Here is also a considerable manufacture of fine stockings. The harbour is but mean, neither is there any good riding in the offing near the bar, for the shore is steep and rocky.

NORTH SHIELDS, is a populous town at the mouth of the Tyne, chiefly inhabited by sailors and masters of ships, as such port-towns generally are. The river here forms a little bay, which is a deep safe road for the colliers, of which 400 fail are sometimes lying here laden.

NORWAY, is bounded on the south by the entrance into the Baltic, called Schager-Rack, or Categate, on the west and north by the Northern Ocean, and on the east it is divided from Sweden by a long ridge of mountains, called at different parts by different names; but they are commonly by historians filed the Dofrine Mountains.

This country lies between the 5th and 31st degrees of longitude east of London, and between the 57th and 71 30 of north latitude, so that it extends about 5 degrees and a half beyond the polar circle; and the longest day in the most northern parts, is above two months. It's length, all along the coast, from Wardhus in the north-east, to the Naze in the mouth of the Baltic, is about 1080 miles; but it's breadth is unequal, being about 180 miles in some places, and not near so much in others. It's situation, chiefly in the most northern part of the temperate zone, and partly in the frigid zone, renders the air extremely cold, and the soil barren. It produces little or no corn, which is imported thither from other countries to Berghen, the only town which has the privilege to distribute it into the rest of the kingdom.

The most southern parts, indeed, produce some wheat; but the rest of the country is sandy and gravelly, and has nothing but rocks, woods, and mountains; so that it's wealth consists chiefly in the vast forests and mighty fir-trees, whose usefulness in building, makes the merchants of England, Holland, and other nations, flock thither to purchase them. The earth has mines of iron, copper, and some silver, which, with pitch, tar, and fish, whereof great quantities are taken on the coast, are the commodities of this country. In the vallies they have a good breed of black cattle, and of small horses, very swift, and capable of fatigue.

Norway is divided into four governments, or prefectorships, which are those of Aggerus, Berghen, Drontheim, and Wardhus; besides that of Bahus, which is subject to Sweden, and the several islands depending on Norway.

The province of AGGERUS is the south-east part of Norway, and is situated between the province of Berghen on the west, from which it is separated by vast mountains, Dalscarlia and Bahus which belong to Sweden on the east, the mouth of the Baltic, called the Categate on the south, and the province of Drontheim on the north. It's extent from south to north is about 350 miles, and from east to west in the south part about 120; but it grows narrower northward, 'till it ends in a point. The land is mountainous and woody, but the vallies are tolerably fruitful, being watered by many lakes and rivulets, which pass through the country, and fall into the Baltic: it is divided into six particular governments, viz. Agdesfunden, Hallingdal, Hammer, Hannemark, Rommeritkir, and Tellemack. There are several sea-ports, particularly Fleckesen, where the fishing-trade affords a pretty considerable income.

CHRISTIANA, the chief city of this province, seated at the bottom of a narrow bay, and is 30 miles distant from the Baltic, and about 110 from Schagen cape in Jutland, to the north. This is a place of good trade for fir-timber, pitch, &c. Great quantity of mackarel is caught here, and much

pearl; of which Henricus Arnoldi, a Dane, gives the following account. Their shells are like those of muscles, but larger, and the fish like an oyster, which produces a great cluster of eggs, like those of cray-fish, some white and some black. These eggs when ripe are cast out, and grow like the shell, from whence they came: but sometimes it happens, that one or two of those eggs stick fast to the side of the matrix, and are voided with the rest; which being fed by the fish, in time they grow into pearls of different sizes, and imprint a mark, both in the fish and in the shell, of the same figure with themselves.

FREDERICKSHALL stands on the Categate, at the mouth of the river Glammen, which Mr. Voltaire calls Tistendall, which rises in the Dofrine mountains, in the province of Drontheim, and having passed through that of Aggerus, falls here into the sea, and by the conveniency thereof affords this city a pretty good trade. It is about 50 miles distant from the town of Aggerus towards the south-east, and is very well fortified and of such importance, that it is reckoned the key of this kingdom.

SALTZBERG is a small town on the river Drammon, which falls into the bay of Christiana, from which city it is about 15 miles distant to the north. It has a pretty considerable trade from the neighbouring copper and iron mines.

SKEN, or SCHEN, a few miles from Tonsberg, stands on the Categate; both these towns are places of good trade, by means of the above-mentioned mines. A silver one was discovered in the neighbourhood under the reign of Christian IV. but it appears it is no rich one, since it is not worked at present.

BERGHEN province, takes up the most southerly, and almost the whole westerly part of Norway, and is surrounded by the sea on the south, south-west, west, and north.

The chief towns of trade here are as follow:

I. BERGHEN, an ancient and famous sea-port, stands on a crooked bay called Jelleford, into which vessels enter by a narrow straight named Carmesundt, which is bordered on each side with high rocks for several miles together. This town is 137 miles distant from Christiana, to the north-west. The bay here is so deep, that vessels of above four hundred tons can enter it, and come to load and unload before the merchants warehouses.

The inhabitants are partly natives of this country, and partly Germans and Danes, whom the conveniency of this town for trade has drawn thither, this being the principal mart and magazine for several merchandizes; divers sorts of fine furs, vast quantities of hides, tallow, fir-timber, &c. being brought hither from the neighbouring provinces, and shipped off to foreign parts. The inhabitants drive also a considerable trade in stock-fish, which are taken on these coasts and in the lakes in January, and dried in the open air.

The privileges granted by the king of Denmark to strangers make them flock to this town, and import thither those necessities of life which the country does not produce; as wheat, rye, biscuits, beer, wine, brandy, &c. which they exchange for the merchandizes above-mentioned. There is at Berghen a factory called the cloister, in which a community of merchants live, who are filed monks, though they wear no particular habit, and have nothing in common with monks, except that they are not married.

STANANGER, the chief town of the district of the same name, stands in the bay called Buckenford, which is very spacious, and full of small islands, and is 180 miles distant from Berghen to the south, and 100 from Christiana to the west. The harbour is very large and safe, and it would have a greater trade than it has, were it not for the neighbourhood of Berghen.

DRONTHEIM is the largest government of Norway, it lies along the coast of the North Sea, being about 500 miles in length, from south to north. It has the North Sea on the west, the government of Wardhus on the north, that of Berghen on the south, and on the east it is separated from Sweden by a long ridge of mountains. It extends from the 61st to the 69th degree of latitude: it's greatest breadth from east to west, is not above 120 miles, and in many places it is much less. The country is mountainous, woody, cold, and barren; so that though it be large, the towns are not very considerable. This whole country is very thinly peopled, and not cultivated but along the sea shore, 'till within 25 or 30 miles from it.

The most considerable towns here are as follow:

DRONTHEIM, formerly the capital of Norway, is seated on the coast of the Northern Ocean, on a little gulph at the mouth of the river Nidar, from whence it was anciently called Nideofia. It is about 220 miles distant from Berghen to the north-east. It has a harbour pretty well frequented by small vessels, though very incommodious for large ones, the entrance being obstructed by rocks. This town has a pretty considerable trade, consisting in small matts and fir deals. They also ship off here a large quantity of copper, the mines of which are eighteen or twenty miles distant from this town, near the village of Steckby. At the distance of six miles from those mines, there is a silver one belonging to the king. The other merchandizes exported from thence are, iron, tar, furs,

NOR

furs, ashes, goat-skins, &c. and they import in exchange, spices, wine, brandy, vinegar, cheese, tobacco, coarse cloths, and a great many old rixdollars. The country round about is very barren; and even wood is so scarce, that a little beyond the town, the people are obliged to use fish-bones for fuel, and for several utensils.

LEERSTRAND is about 10 miles distant from Drontheim to the south.

STRONDEN lies on the river Nider, 40 miles above Drontheim towards the south-east.

SCOERDALE is about 20 miles distant from Drontheim to the north west, on the other side of the same bay.

OPDAL lies at the bottom of a narrow bay, 40 miles from the ocean, and about 65 from Drontheim to the south.

ROMSDAL, or ROMSDALEN, stands on the bottom of another bay, 40 miles from Opdal to the west, and 70 from Drontheim to the south-west.

SOLENDAL stands on another bay, about 30 miles from Romf-dael to the south-west.

These are all places of some trade.

Between the islands of Sallere and Vero, is the famous gulph or whirlpool called MÆLSTROM, in lat. about 68 degrees, said to be 40,000 geometrical paces in circumference. Seamen call it the Navel of the sea, Umbilicus maris. Several authors give the following description of it: it is, say they, fatal to ships that come too nigh in the time of flood, when the sea, for two leagues round, forms such a terrible vortex, that it swallows up every thing that comes near it; and during the six hours of ebb, it throws out the water with such violence, that the heaviest bodies cannot sink if thrown into it, but are cast back again by the impetuous streams. Vessels swallowed up by this whirlpool are cast up again shattered to-pieces, being dashed against the rocks within it. Between the ebb and the flood there is an interval, during which ships can safely sail over it, the water being then still, but, during the ebb and flood the water makes, they say, a prodigious noise. Francis Neri, an Italian, who travelled into Norway, observes, that there is no whirlpool here, but only a rapid current, which makes a great noise during the six hours of flood, which noise is occasioned by the water's dashing against several small islands, or rocks, which repel the streams now to the south and then to the north, so that they seem to whirl about. During the ebb the water is so still, that small boats can cross from one island to another without any danger. This account is more rational, and more agreeable to truth, than the poetical relations given us by several travellers, and particularly by the German author of the *Curiosus Antiquarius*, who give us a most frightful description of this pretended whirlpool.

WARDHUS is bounded on the north and west by the ocean, on the east by Muscovite Lapland, and on the south-west by the government of Drontheim. It's extent from east to west is about 310 miles, and 200 from south to north, that is to say, to the north cape, including the islands. It is divided into two parts: the western and maritime is called Finmark, and the east and southern Norwegian, or Danish Lapland. It being the most northern part of Norway, we cannot expect here much produce of the earth, or plenty of people, and consequently no cities or considerable towns that make any figure in history.

WARDHUS, situated in an island called Ward, from whence this province has it's name. It is the seat of the governor, and is, properly, nothing but a castle, with a street or small town of cottages, inhabited by fishermen. The island lies on the north-east point of Norway, near the borders of Muscovite Lapland, and is small, being but 14 or 15 miles in circumference. It is about 3 or 4 miles distant from the continent. The castle is so old that it falls to ruin, and has no manner of fortifications, though it was built to protect the fishermen's huts, of which there are great numbers along the coast. The inhabitants of this and the neighbouring islands, live upon dried stock-fish, and have neither bread nor beer but what is brought them from other parts by the English and Dutch ships, that come this way for fish.

BAHUS, though yielded to the Swedes in 1658, by the treaty of Roschild, is yet reckoned a part of Norway, for which reason we think it proper to give an account of it in this place. It is the most southern province of Norway, and is a narrow track of land, lying on the coast of the Schager-Rack, or Categate, about 90 miles in length from south to north. It has West-Gothland on the south, Dalia on the east, the government of Aggerus on the north, and the Categate on the west. It's breadth is not proportionable to it's length, being in some parts but ten miles broad, and in none above 25. The country is fruitful enough, but a great part of it is taken up by large lakes. It is divided into two parts, Island and Wickiden.

The chief places are,

MARSTRAND, or MARSTRAND, the capital of Wickiden, is a strong town built on a rock, is a kind of peninsula, about 10 miles below Bahus; it is a place of great trade for herrings, and other sea fish.

There are a great number of islands besides those we have already mentioned, along the coast of Norway, but they are

VOL. II.

NOR

not considerable enough to deserve a particular account. See DENMARK.

Trade between ENGLAND, NORWAY, and DENMARK.

Norway and Denmark take from England guineas, crown pieces, and bullion, a little tobacco, and a few coarse woollens of small value.

England imports from Norway, &c. vast quantities of deal-boards, timber, spars, and iron. We pay them a very great balance, and their rebuilding great ships of burthen, destroyed in the war between them and Sweden, has again pretty well re-established them in the navigation and freight of their timber, and greatly increased their balance upon this nation. See NAVAL STORES, and DENMARK.

REMARKS before the last WAR.

Frederic IV. king of Denmark, was always inclined to promote the welfare and trade of his subjects, and took care of every thing that might contribute to their benefit; but, towards the end of his life, it was thought he listened too much to projectors, who induced him to enter upon schemes which were not always attended with the consequences he expected from them. He died, however, at the age of 60, greatly regretted, on the 2d of October, 1730.

His son, the late king Christian VI. ascended the throne of his ancestors with universal reputation. He had, in his father's life-time, been very attentive to the concerns of the East-India company, and had been, in a great measure, the support of it, which induced the people to hope that a particular regard for trade would be the principal view of his reign; and so indeed it proved.

At his accession to the government he made many changes, but all of them in such a manner as to give great satisfaction to his subjects, who were particularly pleased with his abolishing a farm that had been established in his father's time, for vending wine, brandy, salt, and tobacco, which was very burthenfome to the subject, however advantageous to the prince. Such as were interested in the farm offered to advance larger sums if it might be continued; but the king answered, It brought in but TOO MUCH, since his subjects complained of the EXACTIONS which it occasioned.

He soon after erected a COUNCIL of TRADE, whose business is to examine all proposals that are made for extending it, in order to give such encouragement as may be necessary for carrying them into execution. He likewise sent for workmen out of Holland, and other countries, at his own expence, to establish manufactures in Denmark, and took every other step for their encouragement that his people could either desire or expect. Amongst others, he erected a ROYAL BANK, which has been attended with many advantageous consequences; was always careful to keep his fleet and army in a proper condition to render him respected by his neighbours; and, to prevent the expence occasioned thereby from becoming burthenfome to his people, he from time to time also made treaties of subsidy with foreign powers, which brought in large sums, without exposing him to the necessity of taking any share in the quarrels either in the North or Germany.

His son, Frederic V. the present possessor of the throne, succeeded to it July 26, 1746, in the 23d year of his age; he espoused, about three years before, the princess Louisa of Great-Britain, by whom he has an heir apparent, born January 18, 1749. Upon his first taking the reins of government into his hands, he thought fit to make a few alterations, very judicious in themselves, and acceptable to his subjects. He has steadily pursued his father's maxims, in maintaining peace, improving the trade, and encouraging the industry of his subjects. His application to business, joined to a constant and well-regulated œconomy, has enabled him not only to live within the bounds of his revenue, but to make very considerable savings. In this, however, he has conducted himself as a wise and good prince, or rather in such a manner as to become a model to those of his own rank, who generally aspire to so sublime a character; for he has demonstrated that this did not arise from avarice, or a natural nearness of temper, but from a noble and true royal principle of doing whatever might contribute to the public good: for in those provinces of his dominions that have suffered by inevitable calamities, such as the mortality among their cattle, and the inclemency of seasons, he has remitted even his just rights. He has expended very considerable sums for encouraging and promoting NEW MANUFACTURES, and he has discharged a large debt due from the crown.

This, though in itself very extraordinary, considering the sum, and the short time he has reigned, has been attended with a circumstance too singular to be omitted. The creditors of the crown, as soon as they were informed of his majesty's design, endeavoured to prevent it, by humbly representing, that, if he was displeased at the largeness of their interest, they were content to accept of 4, instead of 5 per cent. which had been hitherto paid them; but his Danish majesty answered, That having the money in his coffers, where it could be of no service to the public, he

chose to discharge their obligations; but that he would take it as a favour done to himself if they would lend the money he now paid them, at a low interest, to his subjects, which might enable them to extend their COMMERCE, and improve the NEW MANUFACTURES.

It is incredible to what a degree his own and his father's peaceable and prudent administrations, have contributed to the benefit of the countries belonging to the crown of Denmark, and how much the face of affairs is changed within so short a time. NEW PORTS have been opened, which has been owing to the opening NEW CHANNELS OF TRADE; the shipping of the Danes has been more than doubled, and the revenues of the crown have increased in the same proportion within that small space. The court is splendid without profusion, the king rich without oppression, the ministers attentive to the duties of their respective stations, not only from the example of their master, but from the sense they have that a contrary behaviour would infallibly draw upon them immediate disgrace. Adored at home, and respected abroad, the king is only attentive to preserve and promote the happiness of his subjects, in which he places his own.

The laws of this country have been deservedly in reputation, as lying within a very narrow compass, a moderate quarto containing them all; and the administration of justice is so well looked after, that suits of law in this country are but few, and those very speedily determined. The king makes and repeals laws, as to him appears necessary for the good of his subjects; but the crown has always used this power with much moderation and discretion: so that, as Denmark may be truly said to be the only legal absolute government in Europe, perhaps in the world, the people have had less reason to regret the change made by themselves than could well have been expected; and, if their monarchs copy after the example of their present king, the Danes will feel fewer evils from the want of liberty, than in other nations are produced by the abuse of it.

The kingdom of Norway, which remains united to that of Denmark, is of great consequence; and, under the last and present reign, there have been great improvements made in it's trade, and the inhabitants have been used with more indulgence than formerly. The same thing may be said in regard to Iceland, and other islands belonging to the crown of Denmark, which have been of late years put in all respects into a much better condition than they were; so that their commodities come to a better market, their manufactures are in a much better flourishing condition, and the number of their inhabitants, towns, and shipping, is continually increasing; whereby, in the space of another century, if no wars break out, or unforeseen confusions happen, the Danes will become quite another people, and their monarchs make a greater figure than they have for some ages past *.

- * We have in this month of October 1764, an account from Copenhagen, that upwards of 1400 persons were daily employed in the Danish royal woollen manufactory; that they produced last year 66 pieces of good cloth; and in other woollen fabrics there are, in the whole, about 4000 men at work. There are likewise 16 silk fabrics, where 938 persons are at work; of the said 16 the royal is the largest, there being 105 looms, which employ 335 persons.

REMARKS ON NORWAY since the last WAR, and the DEFINITIVE TREATY of 1763.

The balance of trade between England, Norway, and Denmark, being reckoned at least to the disfavour of this nation 300,000 l. per ann. it is to be hoped now, that no measures will be left unpractised to furnish ourselves from North America, with every species of TIMBER that continent will produce, either requisite for HOUSE-BUILDING in England; or for SHIP-BUILDING; and thereby save that balance, we have so long paid to Denmark for Norway timber. Most certainly we may; and the building of large bulky ships for that purpose, will prove an additional valuable nursery for our seamen, and enable us the better to keep and preserve, and make proper advantage of our new acquisitions on the American continent.

It is allowed by those that knew the plantations, that the most proper places in the colonies for supplying the royal British navy, are the provinces of Main, New Hampshire, and the Massachusetts in New-England. Therefore, if those three provinces were entirely appropriated to that use, the other parts of our extended colonies would sufficiently supply not only Great-Britain and Ireland, but even Portugal and Spain, with the same quantities that they now use, or may use, perhaps, to the end of time, provided we admit and encourage young trees to grow, after we have cut down the old; which will take us up centuries to do.

It may be observed, that the little quantity of land that is accessible in that mountainous rocky country of Norway, has supplied not only Great-Britain and Ireland, Spain, Portugal, France, and Flanders, with timber; but even Holland itself with piles for their dykes, sea-walls, and foundations

for houses, which are thought to be more than are growing upon all the accessible ground of Norway. The greatest part of Europe is supplied with pipe, hoghead and barrel staves from Germany, and the Dutch with oak timber for building their ships, and manufacturing into clapboard and wainscot by their saw-mills, with which they not only supply this nation, but several other parts of Europe; and yet the Germans are so far from apprehending any danger of not being supplied with the increasing growth of their oak timber, that they would esteem it a particular happiness to have their people employed in cutting it down, and hauling it to places of navigation. The forest of mount Libanus, which is but a small tract of land, the wooded part of it not so big as Yorkshire, has supplied amazing quantities of timber. Solomon, in his time, employed a great number of hewers of wood for building the temple. The Tyrians, Sidonians, and all that coast, were supplied with timber from thence for their BUILDINGS and SHIPPING; and history tells us, that Alexander the Great was supplied with timber from thence, for carrying on his bank from the main land to the island of Tyre; and all succeeding ages have been constantly cutting down the timber, and yet, it is said, there is as good there as ever.

If those places have furnished Europe and Asia with such vast quantities for so many ages, and the timber cut down constantly supplied with a growth of new, what may not be expected from so large, so immensely large a tract of ground, so well replenished with trees and navigable rivers as our plantations are? These instances are given to obviate the mistakes some gentlemen are under, who think our forests in America can be hurt by cutting down our timber.

Some have made it a doubt, whether it is prudent in us to let Portugal, Spain, or the Straights, have boards and timber from our plantations; alledging, that if they are supplied, they may build merchantmen and ships of war, and may, in time, interrupt our trade and navigation; forgetting, we must suppose, that the Dutch will supply them with as much German oak as they want.

The Spaniards themselves have great quantities of extraordinary oak, and fine large pine-trees fit for masts, especially in Aragon and Catalonia, near the Ebro and Segra; but such is their indolent temper, that if they can purchase what they want with money, they care not to stretch out a hand to help themselves; and it might not be good policy in us, to stir them up to a necessity of becoming industrious.

The value of timber among ourselves has given gentlemen that notion, because it fetches a great price in this island, it must consequently be valuable all over the world. But if they were in America, and there beheld the great labour of the planters to clear the ground of the wood, and the vast number of fine timber trees that are hauled together and burnt, before it can be fit for any use, they would certainly think it abundance of prudence to have it cut up into boards and other uses, and transport to Portugal and Spain what we could not dispense with amongst ourselves in Great-Britain, and the money remitted to England; for there is no merchandize more profitable to the nation than timber, being the most bulky, and consequently employing the greatest number of SHIPS and SAILORS, with a very small part of the NATIONAL STOCK, which is sufficient to give it all imaginable encouragement.

This merchandize is what has bred the king of Denmark so many sailors, and enabled him to fit out a ROYAL NAVY, and his subjects of NORWAY to build so great a number of BULKY SHIPS, by which they have enriched themselves to a much greater degree than the farmers of the fertile country of Poland have done by their corn. If this TIMBER TRADE has been so advantageous to them, why may it not be rendered so likewise to England, by means of her vast colonies now on the American continent? We have for the most part the same markets; we shall thereby have opportunities exceedingly to enlarge and extend our navigation; and the wages of a sailor very much exceed those of a ploughman, labourer, or manufacturer; their food and cloathing are from ourselves; and if they carry a loading of timber from the plantations to Spain, Portugal, or the Straights, &c. and RETURN TO ENGLAND, not only the merchant's profit, but the profit of the owner's of the ship, and the sailors wages, would be all brought home, and spent here.

The advantage a TIMBER TRADE would be to us between our plantations and the Straights, &c. would be considerable. We cannot see but a thousand acres of TIMBER GROUND in America, may be made more beneficial to England than a thousand acres of CORN LAND within ourselves. Let us suppose a thousand acres of corn land may produce thirty crops of corn in fifty years; and that every crop may yield in Holland, being our most certain market for corn, 4000 l. for every year of the said thirty years, which is 120,000 l. We will suppose, that twenty acres of WOOD-LAND in America may afford timber enough to load four ships of six hundred tons each, and their cargoes carried to Spain or Portugal, &c. and each sold for 900 l. each. These thirty-six hundred pounds are all produced by the manufacture and labour of our own poor, and national stock in this shipping.

These

These 1000 acres, suppose it would take fifty years in cutting, and fifty crops, at three thousand six hundred pounds per crop, is one hundred and eighty thousand pounds.—We have allowed double the quantity of land necessary to produce four ships loading of timber. It is very well known there is such a propensity in the land of America to run into wood, that when it has been tilled so long, that it would bear nothing, yet it has, within the space of thirty years, been loaded with a vast number of trees, many of them above a yard and a half in girth, six feet from the ground. Timber grows there so very quick, as we are informed, that they are at their full growth in a few years. The clearing the lands in America, in places the most advantageous to navigation, would not only be thoroughly beneficial to these kingdoms, &c. and save us the balance which we now pay to Denmark, but would bring us in a very considerable one in our favour: and not only so, it would tend to lay the country open in time, and put the Indians more in our power, there appearing an absolutely necessity to do this to bring them into subjection, if no amicable means will avail to that purpose. This, with our navigation on the river St. Lawrence, the Ohio, the Mississippi, and in the bay of Mexico, will enable us to collect vast quantities of timber, and produce us the like of pitch and tar, and the under-wood make charcoal for our iron furnaces there. All which together must be of no inconsiderable emolument to Great-Britain, and will prove instrumental with the raising other materials for manufactures in England, to give constant employment to all the inhabitants we can people our new and old acquisitions with, and thereby keep and preserve them in a due and reasonable state of dependence and subfervency to their mother kingdom.

NOTARY PUBLIC, is a person, usually a scrivener, who takes notes, or makes a short draught of contracts, obligations, or other writings and instruments. Stat. 27 Ed. III. cap. 1. At present we call him a notary public who publicly attests deeds or writings, to make them authentic in another country, but principally in business relating to merchants: they make protests of foreign bills of exchange, &c. [see **BILLS of EXCHANGE**;] and noting a bill, is the notary's going as a witness, to take notice of a merchant's refusal to accept or pay the same.

R E M A R K S.

The learned civilian Domat observes, That a distinction between a voluntary and a contentious jurisdiction, obliges us to take notice of a particular kind of officers, whose functions are of a very great and very frequent use, and who have a kind of voluntary jurisdiction, without any share of the contentious jurisdiction, which are the public notaries: for the function of notaries imply two characters of a voluntary jurisdiction: the first consists in this, that their presence and their signature serves as a proof of the truth of the acts which are sped in their presence; and that whereas in the writings, which are called private, that is to say, which are signed only by the parties, their signatures being unknown in courts of justice, it is necessary to verify them, if they are called in question; the signatures of notaries, who are public officers, carry along with them the proof of the truth of the acts which they sign; and the second of these characters consists in this, that the acts which contain some obligation of one party towards another, being signed by a notary public, give a right of mortgage on the estate of the person who is bound, which a private bond or obligation, signed only by the party, would not give: and since it is in France the authority of justice that gives the mortgage, it is by virtue of a kind of jurisdiction that notaries have this function, that a mortgage is acquired by the means of their signature; and it is because of this voluntary jurisdiction, that, in some of the provinces of France, it is usual for the notaries to insert in the acts sped in their presence, that those who are parties to them have duly submitted themselves, and are condemned to perform what they promise: by which words they intend to signify this voluntary jurisdiction, to which the contracting parties submit themselves*.

* The function of notaries, in France, implies this kind of jurisdiction, which is signified by the royal seal, of which they are the depositaries for sealing the acts: and this seal is presupposed in the acts which are not sealed.

Il n'est rien de plus beau qu'un Notaire honnête homme,
Mais dans ce corps on a vu de tout tems
Se glisser des fripons parmi d'honnêtes gens:
Bour. Elope. Richelet.

NOTTINGHAMSHIRE in England, has Lincolnshire on the east, Leicestershire on the south, Derbyshire on the west, and Yorkshire on the north; and is in compass 110 miles. It enjoys as healthy, mild, and pleasant an air, as any part of England. It is well watered with rivers, the chief of which are the Trent and the Idle. The soil is various, the east side being very fruitful both in corn and pasture; but the west is generally woody, in some places producing nothing but coal, and some lead. The chief commodities are cattle, corn, malt, wool, coal, wood, liquorice, cheese, butter,

leather, and tallow. The chief manufactures are stockings, glass, and earthen wares; and it is noted for strong ale.

NOTTINGHAM, which gives name to the shire, and a town and county of itself, is reckoned one of the neatest in England, and has as good a trade as most inland towns. It stands on the river Trent, which has at a great expence been made navigable to it by barges. Glass and earthen wares are made here; but its chief manufacture is weaving frame-stockings: the best malt is made here of any town in these parts.

EAST RETFORD is an ancient borough, in the midst of a large plantation of hops, in which, and in barley, it drives a great trade, though not so considerable as formerly, because Work-sop has got much of it away.

NEWARK UPON TRENT is a handsome well-built town, of pretty good trade in corn, cattle, wool, &c.

MANSFIELD is a large populous town, in the forest of Sherwood, which drives a great trade in malt, and has a market well stocked with corn, cattle, and other marketable goods.

WORKSOP is a small town, near the head of the river Ryton, with a market noted for plenty of liquorice and malt.

NOVA ZEMBLA, or **NEW LAND**, which the Dutch call the island of **VEYGATS**, is situated in the North or Frozen Ocean, between 50 and 80 deg. of east long, and near the north pole; separated from the province of Samoieda, in Russia, by a narrow streight called the Streights of Veygats. Whether it be an island, or part of some great continent, is uncertain, no ships having ever passed to the northward of it, though many attempts have been made to find out a north-east passage to China that way. The Dutch, indeed, passed the Streights of Veygats, south of Nova Zembla, and wintered on the east side of it, anno 1596, but did not find it practicable to sail further, for the fields of ice they met with. There are no constant inhabitants here; but the Samoieds and Offsiacs climb over the mountains of ice in the freights, when they are frozen over, and hunt elks and rein-deer here, at proper seasons.

NOVOGOROD, in Russia. This duchy is situate on the east of Pleskow, and the lake of Ladoga on the north; on the east the duchy of Belozeca, and Twere; and the province of Rzeva on the south.

It is called Novogorod Veliki, or Superior, to distinguish it from the Inferior, or Nizi Novogorod. Its extent from east to west, on the southern part, is computed to extend near 250 miles, but grows more and more narrow towards the north. Its chief produce is corn, flax, hemp, wax, honey, and leather; in all which it drove a considerable traffic, when it was governed by its own princes, though, even then, it was very often obstructed by its wars with Muscovy; but, since it is become under its subjection, it is much decayed of its flourishing condition.

The city of **NOVOGOROD VELIKI**, capital of this province, called by the French **NEUGARD**, and by the Dutch **NEW GARTEN**, stands on the Wolchova, and is a large and considerable place, very populous, and well fortified.

NOYONNOIS, a province in France, was formerly a part of Picardy, but under the government of the Isle of France, and is bounded on the north by Vermandois, part of which belongs to the election of Noyon; on the east by Laonois; on the south by Soissonois; and on the west by the bailiwick of Roye in Picardy. There are here but two cities of any note, viz.

NOYON, situate on the declivity of a hill, of an easy descent, on the rivulet Vorse, which, at a quarter of a league's distance, falls into the Oise. It is seven leagues distant from Soissons to the north-west, five from Laon to the west, and 16 from Paris to the north. It is a pretty large city, containing about 4500 inhabitants, and is well situated for inland trade, which consists here in wheat and oats, which they send to Paris; they have also manufactories of linen cloths, lawns, and tanned leather.

CHAUNY is situated on the river Oise, near the borders of the Isle of France, three leagues distant from Noyon to the east, and something less from La Fere to the south. It is a royal city, and the seat of a castleward.

NUBIA, the kingdom of, in Africa, is bounded on the north by Upper Egypt; on the east by the Red Sea; on the south by Ethiopia, from which it is separated partly by the Nile, and partly by a long ridge of mountains, and the desert of Gorham; and on the west it is bounded by the kingdom of Goaga.

This country, though under so hot a climate, being wholly within the torrid zone, is yet in many places, especially on each side of the Nile, very fruitful, the inhabitants being much given to agriculture, and producing some fine fruits, plenty of corn, and sugar-canes; but of this last they seem not to know the use rightly, so that it bears little or no value, either among the natives or foreigners.

The chief commodities this country affords, are gold in great quantity, and very fine musk, ivory, sanders, and other medicinal woods.

DONGALA, the metropolis of the kingdom, is said to be very populous, and to contain about 10,000 houses, but most of them meanly built, of wood and mud only. The inhabitants, however, are rich, and drive a considerable commerce

with

their own commodities, more especially sanders and musk, for arms, linen cloth, and other wares.

SENNAR, another large city, said to contain 100,000 souls, stands on the western bank of the Nile, about 250 miles south of Dongala. They trade in gold, musk, elephants teeth, and other commodities, for which they receive in exchange spices, silks, cottons, and other merchandizes from India; for they make no use of money in all their commerce, though they have variety of coins among them. See AFRICA.

NUTMEG. The nutmeg is an aromatic nut, the kernel of a fruit, of the size of a green walnut.

The nutmeg is of two sorts, the male, or long nutmeg, and the female, or common nutmeg.

The tree that bears the nutmeg is of the bigness of the peach-tree, and the leaves have a very near resemblance to those of the same tree, except that they are shorter and narrower; after which comes the fruit.

This tree, according to Mr. Tavernier, is not planted, but grows by means of certain birds, or fowls, which swallow the nutmegs whole, and throw them out again, without having digested them; and the nutmeg being then covered with a viscous and gluey matter, and being cast upon the ground, takes root, and produces a tree, which it would not have done if set in the manner of others.

The nutmeg is likewise a commodity which none but the Dutch are masters of, because it grows no where but in the isles of Nero, Lentour, Poulcay, Rofgain, Poleron, Granaping, and Dame island, in the great island of Banda in Asia.

It is remarkable, that so little a quantity of land should furnish all the world with nutmegs; but it is not hard to be believed, when one considers that these isles are so stocked with nutmeg-trees that it is almost incredible; and besides, they lie in so good a climate, that the trees are always laden with flowers and fruit, and they have three crops a year, viz. in April, August, and December; but that of April is much more valued than those which are got in August or December; and the climate is so temperate, that the men live to a hundred and twenty years of age, and have nothing to do but eat, drink, and sleep, and walk about, while the women employ themselves in separating the outer fruit from the nutmeg, drying the mace, and breaking the shells wherein is the nutmeg, being the chief commodity of the country, and almost all they live by.

The nutmegs we sell are nothing but the kernels of the fruit, which are covered with a hard, thin, and blackish shell; without this shell there is found a covering, which is thin and reddish, of a sweet smell, and aromatic taste, and is what we call mace, but vulgarly, and improperly, the nutmeg-flower. After the mace, there is a green pulpy fruit, that is of no use. From this it is to be observed, that the nutmeg has three wrappings, or coverings, viz. the shell, the mace, and the pulpy fruit, and not barely two, as a late author has observed; and the thing is so evident, that, if any person will give himself the trouble to cut a preserved nutmeg in two, he will find the three parts which I have been speaking of above.

The trees which bear the female, or common nutmegs, grow not but in cultivated, or improved lands; but those which produce the long nutmegs grow in woods and forests, which makes the Dutch call them wild nutmegs; but they are little used, because they are almost without taste or smell, and void of any virtue; and for this reason they are seldom brought hither.

As to the common nutmegs, we ought to chuse such as are heavy, firm, hard, and of a full plumpness, of a light grey, whose inside is finely marbled, and reddish, and such as are of a fat oily body, which are the signs of their newness, and which, being grated, afford a sweet flavour, and, put into the mouth, yield a warm, piquant, aromatic taste. As to the little hole that is met with so very common in nutmegs, it is a vulgar error to believe that that makes them lose their virtue, for there is no nutmeg without it, as may be seen when the thin rind is raised.

The use of the nutmeg is so well known, it would be needless to say any thing of it; we shall only add, that it is valued in medicine, and being beat up with sugar, there is a powder made of it, which is admirable, taken in warm white wine, for curing of catarrhs and rheums, that proceed from cold causes; and this is called the Duke's Powder. The usual quantity is to put two ounces of nutmegs to a pound of sugar, and some add cinnamon.

The inhabitants of the isle of Banda make a confection of the green nutmegs, which is brought to us by the way of Holland, sometimes with syrup, and sometimes without. These are one of the best preserves we have, being very proper to strengthen and invigorate the stomach, and to restore a natural heat to age; but their chief use is to carry to sea, particularly by the inhabitants of the northern parts, where they are much esteemed, the people there being great lovers of these sorts of warm sweet-meats.

As to the oil of nutmegs by expression, that which is brought us frequently from Holland is no better than fresh butter; for which reason the apothecaries ought to make it themselves, rather than buy it at such a cheap rate, when it is good for nothing. The true oil of nutmegs ought to be of a thick consistence, of a golden yellow, a sweet aromatic smell, and a warm poignant taste.

The manner of making this oil is so easy, and hath been so long known to every artist, that it would be superfluous, at this time of day, to pretend to teach it; only this may be observed, that, when it is expressed, it will be liquid and clear; but, when cold, it coagulates, and becomes yellowish, of a solid consistence, and that it will yield a double quantity of oil this way, from the same weight of any other spice, fruit, or seed whatever.

There is likewise another oil, made by distillation, which is a white clear oil, very fragrant, and has double the strength and virtue of the former; and whatever the nutmeg has singly in itself, is hereby highly exalted; so that four or five drops is a dose, in any proper vehicle, wherein it becomes cephalic, neurotic, stomachic, cordial, hepatic, uterine, and alexipharmic; it is good against all cold diseases of the head, nerves, womb, &c. expels wind, and cures griping of the guts.

The mace that grows round the nutmeg has all the same virtues; disperses wind, helps concoction, cures stinking breaths, strengthens the child in the womb, stops fluxes and vomiting; it is of thinner parts than the nutmeg, and, therefore, more piercing. The oils by expression and distillation are made the same way as those of nutmegs. Chuse such as have the largest blades, the highest and freshest colour, and the cleanest you can get.

As to the bark of the trunk, and the branches of the nutmeg-tree, it is so little used, that it is not worth speaking of, and is seldom brought hither, by reason of its great likeness to the white costus, both in figure and taste. Some sell costus for the nutmeg-bark, but of this beware.

The PRACTICAL BUSINESS of the CUSTOM-HOUSE continued.

With regard to NATURALIZATION.

NATURALIZATION by act of parliament—Provision must be expressly made in the bill exhibited for that purpose, that the persons therein mentioned, shall not be thereby enabled to be of the privy-council, or members of either house of parliament, or to take any offices or places of trust, or to have any grants of lands, tenements, or hereditaments from the crown. 1 Geo. I. c. 4. § 2.

Aliens, or persons not born within his majesty's allegiance, or naturalized, or made free denizens, may not be merchants or factors in the plantations, upon forfeiture of all their goods and chattles; $\frac{1}{4}$ to the king, $\frac{1}{4}$ to the governor, and $\frac{1}{2}$ to the importer. 12 Car. II. cap. 15. § 2.

With regard to NAVAL STORES.

NAVAL STORES imported from the British plantations and

Scotland, for the premium and regulations, see NAVAL STORES. NAVAL STORES if afterwards exported, the said premium must be repaid,

—Imported from Russia—A true account thereof to be laid before both houses of parliament every session, by the commissioners of the customs, under their hands. 10 and 11 W. III. c. 6. § 4.

With regard to the NEWFOUNDLAND TRADE.

NEWFOUNDLAND TRADE, free to all his British subjects. 10 and 11 W. III. c. 25-§ 1.

—Masters of ships bound thither, to carry at least one fresh man in five; of by-boats, to carry at least two fresh man in six; that is, one that has made no more than one voyage, and one that never has been at sea before; and are to make oath accordingly before the collector of the port, who is to give them a certificate thereof. 10 and 11 W. III. c. 25. § 9, 10.

O.

O A K

O A K

OA K. The oak is a tree, known to all the world, as well because of it's durableness, as for the different uses made of it. This tree is the emblem of virtue, strength, firmness, and duration, and was therefore, by the Ancients, dedicated to Jupiter. Some pretend that this tree is a mortal enemy to the olive and the walnut-tree; so that neither of them can live near it.

The first thing, and the most considerable we have from the oak, is the mistletoe, which is an excrescence that is found growing to the said tree: this production appears extraordinary, in that the oaks do not produce the mistletoe in all places: there are few that I know of, in this respect, like those that are met with betwixt Rome and Loretto; especially near a little village named Poligni, about the midway. This excrescence resembles the branch of trees, and is of a solid, heavy substance, of a greenish brown outwardly, and of a yellowish white within.

The branches are hard and compact, and bear several little sprigs which intermingle with each other, and from whence arise a great many longish, thick leaves, that are semicircular, of a pale green; the berries are white, resembling our little white currants; and these berries contain a viscid humour, which the Ancients used to make glue with. The mistletoe continues always green, during the time it remains upon the tree; chuse the largest, heaviest, and best fed; you may know, if it be true, by the deep colour within, but the surest way is to see that some part of the oak hangs to it. They attribute a great many virtues to the mistletoe of the oak, and the Ancients revered it, and held it sacred, as well as the tree itself. Julius Cæsar and Pliny say, that the Druids assembled themselves under these trees to perform their devotion; these Druids inhabited the countries we now call Villa de Dreux, near Chartres, whence it is evident, that there have been oaks which bore mistletoe in France.

This mistletoe, taken inwardly, is esteemed an excellent remedy against the palsy, apoplexy, falling sickness, and worms: it is also an ingredient, in many compositions, for external uses, as ointments, plasters, &c. as a resolvent. The berries are acrid and bitter, and their juice is good to ripen abscesses, and hasten their suppuration.

Mistletoe is also the basis of the pulvis ad guttatem.

It is found growing upon many other trees, as well as the oak; but it's virtues are supposed not to be so great when it is taken from any other tree.

All the parts of the oak contain a great deal of oil and essential salt; the bark and leaves are astringent and resolvent, good in the gout, sciatica and rheumatisms, used in fomentations, and taken inwardly in decoctions to stop diarrhoeas and hæmorrhages.

The second thing we have from the oak, is a little plant we call polypody of the oak, which is like what we have from walls: this sort of plant grows from places where the branches of the oak are forked, by means of some small earth that lights there, and the water which drops upon it: it grows likewise upon the stump of the said tree. We rarely use this polypody, because it is not so proper, since that is much better which grows upon old walls; which is the sort that is sold about Paris. Chuse the root such as is new, plump, dry, brittle, of a reddish tawny colour on the outside, and greenish within, sweet and sugar-like, inclining something to a liquorish taste.

Quercus vulgaris, the common oak, is a thick, strait, durable tree, spreading it's branches wide; the trunk is covered with a thick rugged bark; the leaves are large, longish, and broad, deep slashed or indented, hanging upon short stalks; the flowers are in long shells or husks, composed of little threads hanging upon one another by a fine fiber or string; these husks leave no fruit behind them, the fruit growing in other parts, which are the acorns, that are about the size of the olive, of an oval, or cylindrical figure, contained in a hard grey cup, called in Latin, *cupula seu calix*; this acorn is covered with a hard rind, that is smooth and shining; green at first, but yellowish as it grows riper: within this rind we meet with a sort of kernel, or hard fleshy seed, composed of

VOL. II.

two lobes. The acorns hang upon the tree by long or short slender stalks, and their taste is astringent.

All the parts in the oak contain in them a good deal of oil and essential salt: the acorn, called in Latin, *glans quercina*, is likewise employed in medicine. Chuse such as are large and plump, separated from the rind, and dried gently; but take care of worms, to which they are subject; let them be reduced to powder before using: they are astringent, and proper to appease wind cholicks, and the fluxes of women newly delivered.

Polypodium, or common polypody, hath a root, taking a very slight and superficial hold of the earth; it is pithy and brittle, about the third part of an inch thick; within it is of a pale green colour, but outwardly a little reddish, and covered over with fine thin scales, when it is fresh and green; but being dry, it becomes of a more red colour: it is knotty, or full of round knobs, and adorned with several small filaments like hairs: it's pith is sweetish, with somewhat of a sharp, austere, or styptic taste. The leaves spring out of the knots, or hollow knobs of the roots; they are single, about nine inches in length, and parted into several jaggs or scallops, cut close into the ribs; they are sharp pointed, of a light green colour; it bears no flowers, but there arise several small knobs, like blisters, upon the lower or under part of the uppermost jaggs of the leaves, ranked in a double order; they are round, and about the sixth part of an inch thick, consisting of a fine dust, that is first a little yellowish, and turns of a bright golden colour; every grain of this dust is a sort of small seed-vessel, being of a round figure, and membranous, which, when ripe, breaks into two equal parts, and pours forth several seeds, so small that they can scarcely be discerned by the naked eye.

Polypody grows upon rocks, old walls, and ancient decayed trees; but that which grows upon old oaks is reckoned the best; upon which account, polypody of the oak is commonly prescribed, and is ranked among the purging medicines: yet Dodonæus denies it's cathartic quality; neither ought we to dissemble the matter, for the decoction of it scarcely moves the belly; but the powder of it does something, being given from one dram to two drams.

This root contains a great deal of oil, and no small quantity of an acid phlegm; but this is, as it were, suffocated by the oil, which is the cause that it produces no alteration of colour on blue paper, when it is dipped in the infusion of it. There is likewise a large quantity of earth extracted from polypody, by a chemical resolution. It is from the earth that it's styptic and brackish taste proceeds. The roots are very properly administered in all distempers proceeding from a saltish disposition of the blood: such as the scurvy, rickets, and hypochondriac passions; they also help to abate an inveterate cough, when it is attended with a saltish spittle. They are prescribed in potions and apozems.

Take of polypody of the oak, two ounces; salt of prunella, one dram; infuse them in a quart of warm water; strain it: to be taken by cupsful or spoonfuls, as an apozem. Or take polypody of the oak, one ounce and a half; clecampane-roots, three ounces; infuse them all night in a quart of warm water: in the strained liquor add two ounces of Calabrian manna; mix and make a pisan to be drank. Take of the decoction of polypody-roots, six ounces, in which infuse two drams of sena-leaves; in the strained liquor dissolve the electuary of diacarthanum, three drams; mix and make a purging potion. Polypody-roots are used in the catholic-electuary, the lenitive-electuary, the confection of hamech, the panchymagog extract of Hartman, Quercetan's pills of tartar, and in the hiera of colocintinda.

The oak, whose bark, &c. are used in medicine, is the *quercus vulgaris*, Ger. 1156. *Quercus latifolia*, Park. 1086. The mistletoe is the *viscus quercus & aliarum arborum*, J. B. 1. 89. *Viscum vulgare*, Park. 1392.

And the polypody is the *polypodium vulgare*, C. B. Park. &c.

It is to be observed, that both these are much more frequently found on other trees, than on the oak.

The other species of the oak, mentioned in the catalogues of officinal trees, are,

1. The phagus, five eculus, Park. 1387. J. B. 1, 2, 74, the eculus, or sweet oak, the acorn of which is eatable, not being so bitter as those of the rest.
 2. The Cerrus Aldrov. Dendr. 253. Cerris majore glande, Ger. 1162. Quercus calyce echinato, glande majore, C. B. Pin. 420. The bitter oak. And,
 3. The robur tertia Clusii, J. B. 1, 2, 76. Robur five galla major altera, Ger. Em. 1314. The gall oak.
- The common oak grows naturally in many kingdoms; the eculus is found in Greece and Dalmatia, the cerrus in Italy, and the last in Smyrna and other places. Pomet.

REMARKS.

There are five sorts of oak in England; but we shall only recommend two kinds of them to be planted for timber. The best is the upright-oak, which grows more erect than any other; the other is the large spreading oak. We have many instances of these kinds, that have attained to such prodigious greatness of stature, that the timber alone of one tree has been sold for upwards of 50l. The oak doth not only afford us the utmost serviceable timber for naval architecture, but also for other building. Its bark is useful to tanners, and the oak is therefore cut down about April, when its bark will peel. The acorns are excellent food for hogs. This tree delights in moist ground of a good depth, and will prosper in the coldest clay, and, as Mr Evelyn says, in gravel also.

Some oaks having been sown in hedge-rows, have, in the space of 30 years, borne a stem of a foot diameter. There have been some seedling oaks, of 20 years growth, of near that substance, which have never been removed from the place where they were sown; and every plantation of oaks should be set with acorns, on the very spot where they are to remain, and we should be careful to chuse our acorns from thriving, vigorous trees. The distance between them ought to be about 33 feet, and the space between the oaks should be intertorn for underwood.

The oak is an estimable tree or plant, in a proper situation, for the benefit of posterity. There is no part in husbandry which men commonly more fail in, neglect and have cause to repent of, than that they did not begin planting betimes. And indeed, such persons who have been deaf to demonstration at the first possession of their estates, and are afterwards convinced of the vast advantages to be reaped by an early plantation, either from the experience of their neighbours or themselves, must have a pungent retrospect upon this occasion.

Every man is naturally willing to enjoy the profits of the works, as we may say, of his own hands; and he, therefore, who begins at 50 to be sensible that he has lost many a fair thousand, by neglect of improving his estate between 20 and that age, is to himself indeed a loser, but a warning to others to avoid that folly. See the articles EARTH, HUSBANDRY, MANURE, NORWAY, BRITISH AMERICA, MISSISSIPPI, INDIAN AFFAIRS.

OATHS. [CUSTOM-HOUSE OATHS, AND OTHER REVENUE OATHS.]

I. Of the Oaths taken by the Officers of the Customs.

THE COMPTROLLER.

* Who, as well as the customers, were to be chosen from amongst the best and most sufficient men, and not to be made for affection or reward, or upon any solicitation, but upon desert; and were to sit with the customers, and in all things to cheque and imitate their transactions: and, as the customers were wont to write their accounts in rolls, the comptrollers were to keep counter-rolls; which counter-rolls, or accounts, they were to deliver into the exchequer yearly, upon oath. And now there are collectors appointed, to receive and account for the king's duties; they are likewise to cheque all their transactions, by examining and signing all accounts, dispatches, &c. and by keeping the like books of accounts: and they are to be privy to all orders of the commissioners, and to be confuted with, in the whole management and business of their respective posts, and to join with the collectors in all their proceedings.

* 12 Rich. II. cap. 2. § 1.

And for the due and faithful discharge and execution of their duties, these comptrollers were, at their admission, to take the following oath, viz.

‘Ye shall swear, That well and truly ye shall serve the king, in the office of comptroller of the king's customs and subsidies, in the place of customer; and truly ye shall enter all the goods and things customable, the which shall come to the said port, or shall pass from the same: and that ye shall no gift take for to do your office, nor for any thing that may fall in disadvantage of the king; nor any merchandize, nor any other thing customable, ye shall not suffer to pass out of the said port, without custom due be paid: and ye shall do the office yourself, and dwell thereupon in your proper person,

without making any substitute or deputy under you: and ye shall write the rolls with your own hands; and the king's profit ye shall wait and do, inasmuch as ye may, after your knowledge and power: as God you help and his saints.’

Some rules, in regard to Oaths in particular, that are to be observed by the officers of the customs in general.

1. * That no persons are to be employed in the business of the customs, till they had given security, and have taken their corporal oaths in the following form, viz.

Deputation dated the ———, I, A. B. (his employment) do swear ———, surities, to be true and faithful in the execution and discharge (to the best of my D. E. ——— of ——— knowledge and power) of the trust E. F. ——— of ——— committed to my charge and inspection, in the service of his majesty's apud ——— I, juravit customs; and that I will not take or corum nobis. receive any reward or gratuity, directly or indirectly, other than my B. C.—Collector. salary, or what is or shall be allowed C. D.—Comptroller. me from the crown, or the regular fees established by law, for any service done, or to be done, in the execution of my employment, upon any account whatsoever. So help me God.

A. B.

* 13 and 14 Car. II. cap. 2 § 33. 4 and 5 W. and M. cap. 5. § 25. But note, this act does not direct who shall administer this oath.

Which oath is to be administered by the principal officers of every out-port, or any two of them, and to be entered or registered in a book to be kept in the custom-house for that purpose: and if the security be given at the port, the bond must be returned to the commissioners, and the sufficiency of the sureties, with their places of abode, certified to the examiner of securities.

2. * That all persons employed in the customs, in any out-port, must, at their admissions, likewise take the aforesaid oath, before two justices of the peace, in the county, town, or place where their employments shall be, upon forfeiture of their employments, for refusal or neglect: and the said justices must certify the taking of this oath, to the next general quarter-sessions.

* 6 and 7 W. and M. cap. 1. § 5, 6.

And when any officer, having taken these oaths, is thereupon to be admitted, the collector and comptroller are to deliver him his deputation or commission, taking a receipt for the same, in a book to be kept for that purpose, and also at the foot of the copy of his instructions annexed to his bond, which are to be transmitted together to the commissioners.

THE CUSTOMERS.

* Who were to be chosen from amongst the best and most sufficient men to be found, to the lord treasurer's estimation, and not for affection or reward, nor upon any solicitation, but upon desert: and by the king's letters patent, under the great seal of England, were appointed collectors of the great and petty customs, as also of the subsidy of tonnage and poundage: which office they were not to have for life, or term of years, but only during the king's pleasure; and if their patents were made to the contrary, they were to be void.

* 12 Rich. II. cap. 2. § 1.

† 14 Rich. II. cap. 10. § 1.

1 Hen. IV. cap. 13. § 1.

17 Rich. II. cap. 5. § 1.

31 Hen. IV. cap. 5. § 1.

And for the due and faithful discharge and execution of their duties, these customers were, at their admission, to take the following oath, viz.

‘Ye shall swear, That ye shall make continual abiding in the port ———, and shall oversee the charge of wool, leather, and wool-fells, and all other merchandizes and things customable, and the number of sacks in the said port; and, in as much as in you is, ye shall not suffer that the king have hurt or loss there; and that true account thereof ye shall yield; and of the issues of the said customs, truly ye shall answer, without faulxim or fraud, to be done in any point: as God you help, and his saints.’

* They were, upon ten days notice given them in writing, by the king, or six of his privy-counsellors, to declare what money due to the king, was in their hands, and to make ready and full payments, upon forfeiture of office; and † they were to swear to their accounts in the exchequer.

* 7 Edw. VI. cap. 1. § 13.

† 4 Hen. IV. cap. 13. § 1.

But now there are particular officers appointed, by the name of collectors, who receive the king's customs, subsidies, &c. and account for them to the comptroller-general; so that customers

customers have only the accounts to keep, which they still deliver into the Exchequer, yearly upon oath.

II. The SEARCHERS or FINDERS.

* Who were to be chosen as the customers were, and were appointed for their assistance in the business of the customs, without doors, to see that no goods were imported or exported without due payment of duty; and not being allowed any salary, were to take the moiety of all forfeitures and seizures for their pains: and they were to keep entries of all cockets, &c. passed to them from the customers, and likewise of their own seizures, and were to account yearly for the truth of their transactions.

* 12 Rich. II. cap. 2. § 1.

And, for the due and faithful discharge and execution of their duties, these searchers were, at their admission, to take the following oath, viz.

• Ye shall swear, that ye shall serve the king well and truly in the office of the searchership in the port of ———, and do the king's profits in all things that belongeth to you to do, by way of your office: and well and truly ye shall make due search of all the ships and vessels coming in or passing out of the said port, and truly answer the king of all that shall belong unto him in your said office, without fraud or malice, after your wit and power: as God help you, and his saints.

REMARKS.

Under the article AFFIDAVIT, we have considered the ill consequences which, is greatly to be feared, may attend the multiplicity of oaths that are required to be taken in this nation by traders, in relation to the public revenue. If the constitution of the public revenue was such, that no oaths need be required to be taken but by the officers concerned in the collection, it might prove far less injurious to the public, by removing the motive to perjury; which is grown to such a pitch among us, that all wise and good men lament it as one of the greatest evils that can attend the community.

This consideration alone is inducement sufficient, methinks, to point out the necessity of so CHANGING THE SYSTEM OF THE PUBLIC REVENUE, that there might be no occasion for any oath to be taken in regard thereunto, except by the officers concerned in it, and not even by them. How this might be happily effectuated may be easily inferred from what has been urged relative to the revenue throughout this work. In the interim, we shall only make some short observations on oaths in general, while the revenue continues in its present state and constitution.

As the imposition of an oath was always esteemed to be the greatest tie and obligation that could be contrived, for the discovery of the truth of any fact; and the usual confirmation of all oaths, being in the most solemn manner to call upon, and appeal to, the almighty God, who knows the secrets of all hearts, to judge of, and be a witness to, the truth thereof, and to beg his help, upon no other terms, than that what is there asserted be true, and in testimony thereof kissing his holy gospel: I should think that none but the most profligate, or the most ignorant of mankind, would be so hardy as to dishonour God's name, by thus taking it in vain, which must either suppose that he knows not whether we speak true or false, or else, that he will countenance our solemn lies and perjuries.

And, with respect to the persons thus affirming the truth of any fact or thing upon oath, it must be considered, that if he knows that there is not perfect truth in that he swears, he is guilty of wilful and downright perjury; as he also is, if he swears to the positive truth of that whereof he is wholly ignorant, nay, or only doubtful; for, though the same should be true, yet such swearing is but at a venture, to what might as well be false. And, as all persons making oath to the truth of any thing, are supposed to perfectly know the whole affair, and to have carefully informed and satisfied themselves in every particular circumstance, which may occasion the least doubt; it is not only very silly, but very wicked, to sooth themselves with the poor evasion, that the fact or case might be so for OUGHT THEY KNOW, because they KNOW NOTHING OF THE MATTER. And of this abominable nature, is that shameful excuse for those perjuries, which it is to be feared, are but too frequently committed at the custom-house, viz. That it is but a CUSTOM-HOUSE OATH; as if God, who is omnipresent, did not see, and was not equally offended at profaning his name there, as at any other place whatsoever: but let these offenders remember the punishment, which is denounced against them in the third commandment. Since, therefore, oaths are of such a sacred and solemn nature, they ought to be administered with all imaginable reverence, and not slightly and with indifference; but, after having interrogated the person concerning every particular circumstance, and being satisfied that he understands the nature of an oath, and does not offer to swear ignorantly or rashly, and not having any reason to doubt his sincerity, the

whole oath should be maturely, deliberately, distinctly, and reverently rehearsed to him.

And, as the multiplicity of oaths in the business of the revenue, particularly in the customs, does, it is to be feared, in a great measure, lessen that awe and just regard that ought to be paid to such solemn and sacred ties; it is much to be wished, that fewer oaths were necessary; and therefore we would recommend, that any superfluous oaths should not by any means be exacted; but only such as are either expressly enjoined by the letter of the law, or are absolutely necessary for the discovering or ascertaining any thing for the service of the revenue, which cannot be obtained by any other means.

As to the persons to which the oaths are to be administered, it must be carefully observed, that they who offer to swear, are the proper persons in the eye of the law; and where the laws have not particularly directed, that they be such persons as are the most proper, according to the nature of the case, as being either principally concerned, or the most knowing in the whole affair; provided they are not boys, or such ignorant persons as are not capable of understanding the nature and consequence of an oath.

Besides the oaths before-mentioned, there are likewise promissory or obligatory oaths, particularly in the report of a ship outwards, concerning the not relanding of goods intitled to a drawback, bounty, &c. the breach of which is not less criminal, than of any other oath; and, if the master at the time of making such oath, has no real intention to make it good, or whether he then has or not, if he afterwards breaks the same, he certainly must be deemed guilty of perjury.

And lastly, as to the oaths in general, it must be remembered, that they are always to be taken according to the common and usual interpretation of the words, and in the same sense that they are known to be designed, and not with any private reserve or evasion. See OFFICERS of the CUSTOMS.

OFFICERS of the CUSTOMS. The officers principally employed in the management of the customs in an out-port, were originally no more than three, viz. a customer, a searcher, a comptroller.

I. The CUSTOMERS,

* Who were to be chosen from amongst the best and most sufficient men to be found, to the lord treasurer's estimation, and not for affection or reward, nor upon any solicitation, but upon DESERT: and, by the king's letters patent under the great seal of England, were appointed collectors of the great and petty customs, as also of the subsidy of tonnage and poundage.

* 12 Rich. II. cap. 2. § 1.

Which office they were not to have * for life, or term of years, but only during the king's pleasure; and, if their patents were made to the contrary, they were to be void.

* 14 Rich. II. cap. 10. § 1.

17 Rich. II. cap. 5. § 1.

1 Hen. IV. cap. 13. § 1. 31 Hen. VI. cap. 5. § 1.

And, for the due and faithful execution of their duties, these customers were, at their admission, to take the following oath, viz.

• Ye shall swear, That ye shall make continual abiding in the port of ———, and shall oversee the charge of wool, leather, and wool-fells, and all other merchandizes and things customable, and the number of sacks in the said port; and in as much as in you is, ye shall not suffer that the king have hurt or loss there; and that true account thereof ye shall yield; and of the issues of the said customs, truly ye shall answer, without faulxim or fraud, to be done in any point: as God you help, and his saints.

* They were upon ten days notice given them in writing, by the king, or six of his privy-counsellors, to declare what money due to the king was in their hands, and to make ready and full payment, upon forfeiture of office; and † they were to swear to their accounts in the Exchequer.

* 7 Edw. VI. cap. 1. § 13. † 4 Hen. IV. cap. 20. § 1.

But now there are particular officers appointed, by the name of collectors, who receive the king's customs, subsidies, &c. and account for them to the comptroller-general; so that customers have only the accounts to keep, which they still deliver into the Exchequer yearly upon oath.

And these customers * were to be resident upon their office, without making deputies, and to be sworn to do the same, and not to be absent by three weeks at the most, unless otherwise in the king's service of record, upon loss of office, imprisonment, and forfeiture of 100l. to the king: but now † the customers of every head-port, must have one able and sufficient deputy or servant at the least, to reside at all members and creeks, appointed by commissions out of the court of Exchequer, for the entering, clearing, passing, &c. of ships and merchandizes.

* 1 Hen. IV. cap. 13. § 1.

4 Hen. IV. cap. 20. § 1.

13 Hen. IV. cap. 5. § 1.

† 1 Eliz. cap. 11. § 8. 13 and 14 Car. II. cap. 11. § 14.

In

In some of the out-ports, there is a customer inwards and another outwards, but in most ports the same person is customer both inwards and outwards; and these customers are scarce ever known to act themselves, unless where they are collectors likewise; but in the smaller ports do usually appoint the collectors to be their deputies, and in the larger ports they have distinct deputies; to whom they are obliged to allow at least 20*l.* per ann. or else to relinquish to them the whole fees.

For the principal other regulations concerning customers, see the business of the custom-house in general throughout the work.

II. The SEARCHERS or FINDERS,

* Were originally to be chosen in the manner of the customers, and were appointed for their assistance in the business of the customs without doors, to see that no goods were imported or exported without payment of duty; and not being allowed any salary, were to take the moiety of all forfeitures and seizures for their pains: they were also to keep entries of all caskets, &c. passed to them from the customers, and likewise of their own seizures, and were to account yearly for the truth of their transactions.

* 12 Rich. II. cap. 2. § 1.

And, for the faithful execution of their duty, these searchers were, at their admission, to take the following oath:

‘Ye shall swear, that ye shall serve the king well and truly in the office of the searchership in the port of ———, and do the king’s profits in all things that belongeth to you to do, by way of your office; and well and truly ye shall make due search of all the ships and vessels coming in or passing out of the said port; and truly answer the king of all that shall belong unto him in your said office, without fraud or malice, after your wit and power: as God help you, and his saints.’

* They were to be sworn not to let their offices to farm, nor to appoint deputies, but to be resident thereon themselves, and not be absent by three weeks at the most, unless otherwise in the king’s service of record, upon loss of office, imprisonment, and forfeiture of 100*l.* But now,† the searchers of every head port, must have one able and sufficient deputy or servant at the least, to reside at all members and creeks, appointed by commissions out of the court of Exchequer, for the passing, shipping, clearing, &c. of ships and merchandizes: and it is the practice for the searchers likewise to appoint deputies at the principal ports, scarce any of them acting themselves; and these deputies in the smaller ports are often the same persons that are appointed land-waiters, but in the larger ports it is usual to have distinct deputies to whom they are obliged to allow at least 20*l.* or else to relinquish to them the whole fees.

* 4 Hen. IV. cap. 20. § 1. 4 Hen. IV. cap. 21. § 1.
13 Hen. IV. cap. 5. § 1.

† 1 Eliz. cap. 11. § 8. 13 and 14 Car. II. cap. 11. § 14.

Though the business of a searcher seems originally to have been not only to attend at the shipping of goods designed to be exported to foreign parts, but likewise at the landing of goods imported from foreign parts, and also at the shipping and landing of goods coastwise; yet now there being particular officers appointed by the names of land-waiters for the landing, examining, and delivering of all foreign goods imported, and coast-waiters for the examining, landing, and shipping of goods, brought and carried coastwise; the searchers are only concerned in the examining and shipping of goods designed to be exported to foreign parts, and even in that part of the business, the land-waiters are mostly joined with them.

For other regulations relating to this officer, see the business of the custom-house throughout the whole work.

III. The COMPTROLLERS,

* Were originally, as well as the customers, to be chosen from amongst the best and most sufficient men, and not to be made for affection or reward, or upon any solicitation, but upon DESERT; and were to fit with the customers, and in all things to cheque and imitate their transactions: and, as the customers were wont to write their accounts in rolls, the comptrollers were to keep counter-rolls; which counter-rolls or accounts, they were to deliver into the Exchequer yearly, upon oath. And now there are collectors appointed to receive an account for the king’s duties, they are likewise to cheque all their transactions, by examining and signing all accounts, dispatches, &c. and by keeping the like books of accounts: and they are to be privy to all orders of the commissioners, and to be consulted with, in the whole management and business of their respective ports, and to join with the collectors in all their proceedings.

* 12 Rich. II. cap. 2. § 1.

And, for the faithful execution of their duty, these comptrollers were, at their admission, to take the following oath, viz.

‘Ye shall swear, that well and truly ye shall serve the king in the office of comptroller of the king’s customs and subsidies, in the place of customer; and truly ye shall enter all the goods and things customable, the which shall come to the said port, or shall pass from the same: and that ye shall no gift take for to do your office, nor for any thing that may fall in disadvantage to the king; nor any merchandize, nor any other thing customable, ye shall not suffer to pass out of the said port, without custom due be paid: and ye shall do the office yourself, and dwell thereupon in your proper person, without making any substitute or deputy under you: and ye shall write the rolls with your own hands; and the king’s profit ye shall wait and do, inasmuch as ye may, after your knowledge and power: as God you help, and his saints.’

* They were to be sworn as above, to be continually resident upon their offices, without making deputies, and not to be absent by three weeks at the most, unless otherwise in the king’s service of record, upon loss of office, imprisonment, and forfeiture of 100*l.* to the king: but now the † comptrollers of every head-port must have one able and sufficient deputy or servant at the least, to reside at all members and creeks, appointed by commissions out of the court of Exchequer, for the entering, passing, clearing, &c. of ships and merchandize: and it is the practice of the comptrollers likewise, to appoint deputies at the principal ports, scarce any of them acting themselves; and these deputies in the smaller ports, are often the collector’s clerks, but in the larger ports it is usual to appoint distinct deputies; to whom they are obliged to allow at least 20*l.* per ann. or else to relinquish to them the whole fees.

* 1 Hen. IV. cap. 13. § 1.

4 Hen. IV. cap. 20. § 1.

13 Hen. IV. cap. 5. § 1.

† 1 Eliz. cap. 11. § 8. 13 and 14 Car. II. cap. 11. § 14.

And the persons who officiate as comptrollers are, by the honourable the commissioners of the customs, appointed comptrollers of the duties on coals, culm, and cinders, brought coastwise, for which they are allowed poundage.

For other regulations relating to this officer, see the general business of the customs throughout this work.

Having thus given a short account of the officers, which, by the old laws, seem to have been originally entrusted with the management of the customs, I shall now proceed to treat of the several officers, which, by the great increase of business, have since been found necessary to be added, and are now actually employed in that revenue: the principal whereof are,

I. The COLLECTORS.

Though the customers were originally the collectors of his Majesty’s customs, &c. and are still so stiled in their patents, yet of later years, there have been new and distinct officers appointed for that purpose, by the titles of Collectors, who are entitled the officers of the commissioners of the customs; by whose deputation they act, and under whom they have, at their respective ports, the whole management and direction of levying and collecting his Majesty’s customs, and other duties on goods and merchandizes imported and exported, and of the duties on coals, culm, and cinders, brought coastwise; and also the direction of all the other officers employed in that revenue, deputed by the said commissioners: and are also, by the same authority, empowered to inspect the behaviour of the patent-officers, or their deputies, that in case of any misbehaviour, they may represent the same to the said commissioners.

II. The SURVEYORS,

Are a kind of inspectors and supervisors of the whole business of the customs without doors, as well by land as by water; though in the larger ports there are separate officers appointed by the names of Tide-surveyors, to execute that duty by water: but in all ports they are to attend, at the shipping and landing of goods, as well to and from foreign parts, as coastwise, to see that the proper officers regularly discharge their respective duties, and to adjust the tares of goods, &c. and they are likewise to examine and jerque the land-waiter’s books [see the article JERQUE]: and though they are not required to send up quarterly accounts of the imports and exports, as the collectors, customers, and comptrollers do; yet they are to compare the original warrants granted for the landing of all goods imported, and copies of all caskets granted for the shipping of all goods exported, with the collector’s quarter-books which they send up, and to attest under their hands, that the true qualities and quantities of all the goods, landed and shipped off during that quarter, are truly entered therein.

III. The LAND-WAITERS,

Are to attend at the landing of all goods imported from foreign parts, and take an account thereof, in order that his Majesty’s full duties may be paid for the same: and in some ports they also execute the office of a coast-waiter. They are likewise stiled Searchers, and are to attend with the patent-searchers, in the execution of all caskets for the shipping

shipping of goods to be exported to foreign parts : and in all cases where drawbacks or bounties are to be paid on the exportation of any goods, they as well as the patent-searchers, are to certify to the shipping thereof on the DEBENTURES. See the article DEBENTURES.
For instructions in the method of examining and delivering of foreign goods imported, see the business of the customs throughout this work.

IV. The COAST-WAITERS,

At their respective ports, are to attend at the landing and shipping of all goods coming from, or going to any other port within Great-Britain, to take an account thereof, and see that they exactly agree in quality and quantity, with the preferences granted for the landing or shipping ; so that under the colour of bringing or sending one sort of goods coastwise, any other sorts may not be fraudulently imported or exported, to the prejudice of his Majesty's revenue.

V. The TIDE-SURVEYORS,

Are at all times, when his Majesty's service requires it, to attend the same by water, to visit all ships from foreign parts, upon their arrival into port, in order to put tide-waiters on board, and to rummage for prohibited goods, or goods concealed, and are frequently to call upon the said ships, to see that the tide-waiters are on board, and do keep their watch ; and when it is signified to them that the ship is wholly discharged, they are to go on board and rummage the same, and if they do not find any goods on board, they are to take off the tide-waiters.
They are likewise to place tide-waiters on board outward-bound ships, whereon there have been laden any goods intitled to a drawback or bounty, to prevent the same from being reloaded ; and are frequently to visit the said ships, to see that the officers on board do their duty : and, when the said ships have been regularly cleared in the custom-house by the collector, &c. and are ready to sail, they are to discharge the tide-waiters.

VI. The TIDE-WAITERS, or TIDESMEN,

Are to be placed by the tide-surveyors on board all ships laden with goods from foreign parts, to prevent the fraudulent landing or conveying of them away without payment of his Majesty's duties, which is to be signified to them by a note under the land-waiter's hands : and, when they have received such note, order, or warrant, from the land-waiters, for permitting any goods to be unladen, they are to take an account of the marks, numbers, and outward package, in a book to be given them for that purpose : but they may fend all small parcels of goods liable to be run, to the king's ware-

Port of | District.
Southampton. | From A—— to B—— |

Journal of B. C. officer at D——, for the month of

Day of the month.	When travelling.			When attending.		Wind and weather.	Transactions and observations, viz.
	Place from whence, and hour of the day when set out.	Places arrived at, and hour when.	Distance of the place.	Place where attended.	From and to what time attended, and when returned.		What officers met, and where ; what informations of goods run, or intended to be run, and what methods taken to prevent the same, what seizures made ; what ships observed on the coast, and which way they sail, and what notice of such ships given to the next officer ; what signals observed from the commander of the smack ; and also whatever happens in the day, evening, or night, that may be fit for the commissioners knowledge.

X. The SURVEYORS, WAITERS, and SEARCHERS,

Are appointed to reside at creeks, to execute the offices of surveyors, tide-surveyors, land-waiters, coast-waiters, and searchers, in the same manner as those distinct officers are to execute the same at the principal and member-ports : and they are likewise to perform the duties of riding officers, and to keep journals of their daily actions and proceedings, with their motions from place to place ; to be delivered to the collectors, in order to be by them transmitted to the commissioners.

XI. The MASTERS of SMACKS,

Are appointed to command vessels to cruise on the coasts of Great-Britain, and are diligently to attend on board, and to keep their vessels in constant motion within their respective districts, or stations, unless in cases of necessity, or pursuit of suspected vessels : and, in cruising, they are to speak with all ships or vessels which they shall meet at sea ; and, if they have any reason to suspect they have goods on board designed to be smuggled, they are diligently to watch their motions, and keep them company 'till they are clear of the coast within their respective districts, in order to prevent the fraudulent landing any such goods.

VOL. II.

house, for security of the duties, without any order, having first entered them in the said books. And during the time that they are on board, they are to prevent wines from being filled up, or the package of any goods opened, and endeavour to discover all goods concealed, as likewise any bulk tobacco, or any other prohibited goods, and to seize the same.

They are likewise to be placed on board outward-bound ships, whereon there have been laden any goods intitled to a drawback or bounty upon exportation, to prevent the fraudulent reloading : and during the time they continue on board, they are to take care that the packages of any goods be not altered.

VII. The BOATMEN or WATERMEN,

In some ports, are appointed only to row and give their attendance in the tide-surveyor's boats ; but in most ports they likewise, when occasion requires, officiate as tide-waiters, by watching on board ships, &c.

VIII. The COAL-METERS,

Are to attend at the delivery of all ships coming coastwise with coals, culm, or cinders, to mete, measure, or weigh the same, and to take account of the full quantities delivered, in order that his Majesty's duties may be fully paid.

IX. The RIDING OFFICERS,

Are appointed to reside at, or near some particular places on the sea-coasts, and have certain districts allotted them ; some part whereof they are to visit daily, in order to discover any vessels hovering on the coasts, with a design to land or take on board any prohibited or uncustomed goods, which they must by all means endeavour to prevent ; and in case of the fraudulent landing or shipping of any goods, to seize the same, with the vessels, boats, &c.
They are to enter each day's transactions and proceedings, with their motions from place to place, in a proper book to be kept for that purpose ; from whence at the end of each month, two journals are to be transcribed, and sent or delivered to the collector ; one whereof to be preserved in the office, and the other to be transmitted to the commissioners, in order to be examined by the persons appointed for that purpose.
But, before these journals are thus transmitted, the collector is, on the back thereof, to make his observations how far the officers have performed their duty. And, as there will be no necessity to mention these officers hereafter but occasionally, we shall here add the forms of their books and journals, which must be as follow :

And they are likewise to endeavour to prevent the exportation of such goods as are prohibited to be exported out of this kingdom ; and, in case they discover any such goods to have been shipped, or shipping for foreign parts, they are to seize the same, with the vessels, &c. For the due navigation of each of these vessels, there are likewise appointed a mate, and a sufficient number of mariners, who are to be under the direction of the said masters.
And, for the victualling of these vessels, the commanders are allowed nine-pence per diem for themselves and each mariner ; whereof notice is to be affixed on the mast, that, if good and sufficient provisions are not provided by the commanders, the mariners may complain to the collector and comptroller.
These masters and their mates, are to keep journals of their daily transactions, with their motions from place to place, to be delivered monthly to the collectors of their respective ports, in order to be transmitted to the commissioners.
And, by way of distinction, all smacks, yachts, or vessels employed in the service of the customs, are to wear a jack and ensign, with the seal of office thereon, the mark in the ensign being twice as large as that in the jack ; but not to wear a pendant.

The aforementioned officers are those which are chiefly concerned in the execution of the custom laws, &c. in an out-port; for as to the more inferior, such as weighers, watchmen, &c. their very titles bespeak their employments, so that they need no definition; and though, in some ports, they are executed by distinct persons, yet in many, especially the smaller, the tide-waiters and boatmen officiate.

REMARKS.

The foregoing is only a short general account of the nature of the employments of the several officers of the customs; but, for the methods of executing their respective employments, we must refer to the several branches of the business of the customs, where they are occasionally treated of. And as what has been said relates only to the respective employments of the officers, we shall next give an account of what other regulations they are subject to; the which are likewise to be observed by all other officers of the customs in general.

RULES to be observed by the OFFICERS of the CUSTOMS in general.

I. * That no persons are to be employed in the business of the customs till they have given security, and have taken their corporal oaths in the following form, viz,

* 13 and 14 Car. II. cap. 11. § 33. 4 and 5 Will. and Mar. cap. 5. § 25. But note, this act does not direct who shall administer this oath.

Deputation dated the -----
Sureties,
D. E. ----- of -----
E. F. ----- of -----
Penalty ----- l.
Juravit apud -----
die ----- coram nobis
B. C. --- Collector,
C. D. --- Comptroller.
* I A. B. [his employment] do swear to be true and faithful in the execution and discharge (to the best of my knowledge and power) of the trust committed to my charge and inspection, in the service of his Majesty's customs; and that I will not take or receive any reward or gratuity, directly or indirectly, other than my salary, or what is or shall be allowed me from the crown, or the regular fees established by law, for any service done, or to be done, in the execution of my employment, upon any account whatsoever. So help me God.'

A. B.

Leave to be absent from duty, requested by established officers.

5th of January.
I desire leave to be absent from my duty for six days, for }
the recovery of my health
Granted—B. C. Collector,
A. B. Surveyor.
8th of January.
I desire leave to be absent from my duty for six days, on }
my own private affairs
Granted—B. C. Collector,
C. D. Landwaiter.

Leave further continued for ten days, by commissioners letter of the 13th of January.

And from this side of the book is to be transcribed an account in the same form, in order to be transmitted to the commissioners of the customs, the next post after the end of each month, with the monthly abstracts.
And, with regard to mariners employed on board any vessels in the service of the customs, it must be observed, that they may not be absent above three days, except in case of sickness; and that, in all cases of absence, the commanders and mates are to give a certificate of the occasion, to the collector and comptroller.
IV. That a provision may be made for the maintenance of such officers of the customs as have behaved well, and through age or infirmities are become superannuated, or by some accident rendered incapable of the service, a deduction of sixpence in the pound must be made quarterly, out of the salaries and day's pay of all such established officers of the out-ports, whose salaries do not exceed 60l. per annum, and whose taxes are repaid by the crown, except collectors and their clerks, and patent officers, or their deputies, who have no salaries on the establishment: but no officer is to be in-

Which oath is administered by the principal officers of every out-port, or any two of them, and entered or registered in a book to be kept in the custom-house for that purpose: and, if the security be given at the port, the bond must be returned to the commissioners, and the sufficiency of the sureties, with their places of abode, certified to the examiner of securities.

II. * That all persons employed in the customs in any out-port, must, at their admission, likewise take the aforesaid oath, before two justices of the peace in the county, town, or place where their employment shall be, upon forfeiture of their employments, for refusal or neglect; and the said justices must certify the taking of this oath, to the next general quarter-sessions.

* 6 and 7 Will. and Mar. cap. 1. § 5, 6.

And when any officer, having taken these oaths, is thereupon to be admitted, the collector and comptroller are to deliver him his deputation, or commission, taking a receipt for the same, in a book to be kept for that purpose, and also at the foot thereof the copy of his instructions, annexed to his bond, which are to be transmitted together to the commissioners.

III. That his Majesty's revenue may not suffer by the officers absenting themselves from their respective duties, it must be observed, that they may not presume so to do without particular leave: and, therefore, when any officer's private affairs, &c. require their absence, the collector may, upon their application, give them leave for any time not exceeding a week; and, if that is not sufficient, the commissioners must be applied to for longer time. But, notwithstanding such leave to be absent for longer time than a week, two-thirds parts of their salaries must be deducted, and applied to the fund for paying pensions to superannuated officers: and if any officers are absent for longer time than for what they had leave, they are to forfeit two days pay for each day so absent, to be applied to the said superannuation fund; upon refusal or neglect whereof, their salaries to be stopped.
And if an established officer officiates for any other established officer absent by leave, the officer so officiating is not to have an additional allowance, unless put to any extraordinary charges: but, if an extraordinary man officiates, he is to be paid by incidents.
For the due regulations of such established officer's absence, a book must be kept after the following manner:

An Account of the absence of established officers in the month of -----

Officers names.	Titles of office.	When absent-ed.	When return-ed.	Time of ab-sence.	Occasion of absence.
A. B.	Surveyor	5th Jan.	11 Jan.	6 days	Recovery of health
C. D.	Land-waiter	8th Jan.	24 Jan.	16 days	Private af-fairs

titled to this allowance who has any other means of subsistence from the government, or otherwise, or is capable of getting subsistence any other way.
And to the same use is likewise to be applied the two-thirds parts of the salaries of the absent officers, and the money deducted out of the officers salaries, by way of mulct for misdemeanors: upon neglect or refusal of the payment whereof, their salaries are to be stopped.
Which deductions are to be made by the collector, upon payment of the respective officers salaries, and to be preserved in the king's chest, under the joint care of the collector and comptroller, and accounted for in each month's abstract: and the collector is to keep a separate account of the money collected on the superannuation-fund, and remit the same immediately after the end of each quarter, to Mr -----, the present receiver; of which remittance the comptroller is to send a duplicate to -----, Esq; the comptroller-general, in order that he may cheque the said -----, and control the accounts. The form of the account of the collector of this fund must be as follows:

OIL

OIL.

Of the nature and quality of OIL in general.

What the chemists call oil, or sulphur, is not a simple substance, but a body compounded of fire, water, earth, and salt; but we chuse to say something of it here, as it is most commonly separated intire in the operations of chemistry, and is with some difficulty resolvible into it's component principles.

It may be defined to be a fluid, viscid, inflammable, transparent body, without taste or smell (though by mixing it differently with salts, these sensible qualities are produced) compounded of fire, water, earth, and salt, and it may be conceived to consist of many flakes, or flocculi, each of which is again made up of very small flexible filaments, formed of the four principles beforementioned, by fermentation, as well in the bowels of the earth, as in the bodies of vegetables and animals: thus an aromatic plant growing in water, will, by distillation, yield an oil, which could never have been obtained from the water in which it stood; and all oils may by art be resolved into water, earth, and salt. From these fila-

ments, variously concerted, arise the flakes already mentioned, which are of different thickneses, and in the pores thereof is lodged the element of fire, which also runs in rivulets thro' their interstices.

Upon these depend the specific levity, inflammability, and fluidity of oil; but as, notwithstanding the intestine motion caused by the element of fire, the flocculi still adhere, in some measure, together, this fluid must be more viscid than any other.

From what has been said concerning the nature of alkaline salts, and the figure and structure of the oily flocculi, it is easy to conceive why all alkilies dissolve sulphurs; for, since the alkaline particles are spherical and prickly, they cannot enter the interstices of the flocculi without carrying away some of them from the rest, and thus by degrees thoroughly dissolving them.

But the dense, rigid, and pointed moleculae of acids being forced into these interstices, increase the density, and strengthen the texture of the flocculi; and, from the diversity of these, and of the acid spicula mixed with them, arise the different kinds of sulphurs. Sulphurs formed in the earth

of

of fire, acid salt, water, and a very fine earth, are termed bitumens.

Thus bitumens dissolved in a large quantity of water, form the mineral oils, or petrolea.

But, if they are mixed with earth and salt, the solid bitumens are produced, differing from one another in degrees of purity, according to the quantity or grossness of the earth, or different degrees of mixture. Thus fossil coals, jet, amber, and the common bitumenous, and bitumeno earths are produced.

If there be but a small quantity of earth, and much acid salt, the common mineral sulphur, or brimstone, is formed.

If the mineral original bitumen is joined to a fusible earth, capable of vitrification, it communicates to it a metallic form, that is, the sound, brightness, softness, ductility, malleability, and all the other sensible qualities of metals.

This origin of mineral bitumens may be confirmed by many experiments. If a mixture of equal parts of oil of vitriol and oil of turpentine be digested together for a considerable time in a very gentle heat, and afterwards distilled in a retort, there will come over first a yellowish liquor, resembling petroleum both in smell and consistence.

What remains in the retort is at first a soft bitumen, and afterwards turns into a hard black mass, easily inflammable, and, when burnt, smelling exactly like fossil coal. But, if the distillation be continued, a white acid liquor will next be obtained, which, by standing, lets fall a grey powder, which is true common brimstone, a yellow substance of the like nature adhering likewise to the neck of the retort; what is left behind being a black, shining, light substance, disposed in thin disgregated strata, like talc, in which, by the help of the load-stone, iron may be discovered.

Thus, therefore, all those bitumens may be artificially produced; and the analysis of the natural ones further confirm the manner of their formation.

Thus the chemists have shewn that metals are nothing but bitumenous substances, which have undergone a long digestion; for, by depriving them of their sulphur, they are reduced to ashes, and then to glass.

This is easily seen in the imperfect metals.

For, if any of them be exposed to a long heat, and especially to the rays of the sun collected by a large burning glass, the sulphureous principle flies off, and only a calx, or ashes, will be left behind, which in a more vehement degree of fire, are presently vitrified; and, by restoring the sulphur, this glass may again be reduced to metal.

The inflammable substances in animals and vegetables consist of a different combination of the principle of sulphur and acid salt; for the oil or sulphur in these is formed by a small portion of earth, joined to the elementary fire, acid salt and water; this oil, when joined to an acid salt, produces gums; when joined to a fine acid, and a new accession of fiery particles, it produces essential oils and inflammable spirits; but, if the acids are more gross, by reason of a large quantity of earth joined to them, it forms resins, as we learn from the artificial composition of all these substances: by mixing spirit of wine with volatile spirit of urine, we obtain a mucilaginous concretion, or thin gum. Oil of olives, and salt of tartar, melted together, make a kind of soap, or thick gum; and, if spirit of wine be digested for a long time, with oil of vitriol, and then distilled, an inflammable oil is obtained, resembling, in smell and other qualities, the essential oils of plants, a true resin being left behind in the retort.

In animals, the same oleaginous principle forms the fat, and other glutinous or gelatinous substances, these last being composed of an acid volatile salt and oil, as appears from their analysis; but fat is made of the same oil and acid salt; for, if oil of olives and spirit of nitre be mixed together and digested, a substance will be formed, in every thing resembling the fat of animals.

Sulphurous substances found in bodies are either fixed or volatile.

The fixed sulphurs are either solid, such as fat, resin, or the bitumens; or fluid, as oils.

Volatile sulphurs are such as fly off with a small degree of fire, and have an appearance compounded of that of oil and water. Such are inflammable spirits, obtained from the flowers and fruits of plants.

OIL, [OLIVE OIL,] in general, is an unctuous inflammable matter, extracted from natural bodies. It is sometimes applied to the juices which naturally exude from plants and trees, as balm, &c. but is more strictly applied to those juices drawn by expression * from fruits, grain, or seeds, as olive-oil, nut-oil, &c. There are no little variety of oils, whose properties, and manner of expression, are different. Oil of olives being the most universal, and that chiefly used in medicine, food, and manufactures, we shall give an account of the method of preparation of the olives.—There are inferior, which are used in manufacture, not food and operations; sorts, that are prepared in the second and third medicine.

* Expressed oils are such as are procured by bodies only by pressing; as olive, almond oils, and the like.

Quere. As we are under the necessity of taking large quantities of olive-oil from other countries, may it not be worth while to endeavour to produce the olive in some of our own plantations? Does not this deserve to be seriously thought of?

According to Columella, the beginning of December, for the most part, is the middle season for gathering of olives, and making oil; for, before this time, the bitter oil, which is called summer oil, is made; and, about this month, they press the green oil; then afterwards the ripe oil: but it is not for the interest of a master of a family to make bitter oil, because the olives yield but very little of it, except the berry fall to the ground by tempestuous weather, and it be necessary to gather it up, lest it be eaten up and destroyed by tame cattle or wild beasts. But it is of very great advantage to him to make of the green sort, because the olives both yield enough of it, and by its price it almost doubles the income of the owner: but, if the olive-yards are very large, it is necessary that some part of them be reserved for ripe fruit.

A loft to carry the olives into is very necessary.

Nevertheless, because sometimes the immoderate multitude of berries overcomes the labour of them that attend the press, and are more than they can manage, there must be a store-room in the upper part of the house, where the fruits may be put: and this loft ought to be like a granary, and to have as many small bins, or distinct partitions, as the quantity of olives shall require, that so the gathering of each day may be put apart, and laid up by itself.

The floor, or bottom of these small partitions, must be paved with stones, or tiles, and made so sloping, that all the moisture may run quickly out of them, by gutters or pipes; for the lees are very hurtful to the oil, which, if they remain in the berry, corrupt and spoil the taste of the oil. Therefore, when you have built the partitions with judgement, place upon the floor small boards, half a foot distant from each other, and lay reeds upon them, that are carefully and closely woven, so that they may not let so much as a berry pass through, and be able to support the weight of the olives. But hard by all these small partitions, in that part where the lees run out of them, under the very pipes, the floor must be concave, after the manner of little trenches; or there must be a hollow stone, wherein may stand whatever liquor shall flow out of them, and from whence it may be drawn.

Moreover, you must have fats, or barrels, ready prepared within doors, which may receive the lees of every kind of olives apart by themselves, whether they be such as flow from the olives pure, without any mixture, or such also as have received salt; for both of them are fit for many uses.

But mills are more useful than the presses, for the making of oil; and the press than the canals, and the solea *. The mills are very easily managed; for, according to the bigness of the berries, the mill stones may be either lowered or raised, that so the kernel, which spoils the taste of the oil, may not be broken: moreover, the press dispatches more work, and more easily, than the solea and canals. There is also a machine, like an erect threshing instrument, which is called a beetle; and that does the work not incommodiously, except that it is frequently spoiled, and out of order; and, if you throw a little too many berries into it, you stop it. Nevertheless, the aforesaid machines are made use of according to the state and condition, and custom of the countries: but that of mills, as also of the turning-press, is the best. I thought it necessary to premise these things, before I discoursed of making the oil.

* Columella mentions several machines, wherewith the oil was squeezed out of the olive-berries; but gives no particular description of any of them, so that it is not easy to form any distinct idea of them. Cato, indeed, in his 22d chapter, gives a particular description of the trapezum; but it is not very intelligible, perhaps because of the incorrectness of the text; and learned men differ in their opinions about it. Varro says, that the trapeta were oil-mills made of hard rough stones; and Columella seems to make the mola and the trapezum two distinct things: perhaps by the last he means a press for squeezing the olives, which had its name from the turning of the screws. We have no account at all, that I can find, of the canals and solea: nor is it any great satisfaction to be told by antiquarians, that they were certain machines, used by the Antients for making oil, since they give us no account of their structure.

Now we must come to the thing itself, although we have omitted many things; which, as before the vintage, so, before the gathering of the olives, and making the oil, must be all ready prepared; such as plenty of wood, which must be brought home a long time before, that so, when the thing is wanted, the labourers may not be called away from their business: ladders also, small baskets, and sowers baskets of ten modii and three modii each, wherein the berries, which are gathered off the trees, are received; frails, hempen and Spanish

nish-broom ropes, iron ladles, wherewith the oil is emptied from one vessel to another; covers or lids, wherewith the oil-vessels are covered; sponges, greater and smaller; pitchers, in which the oil is carried out; cane or reed mats, into which the olives are gathered. All these ought to be in great number, because they perish with the using, and become fewer; of which, if any one thing be wanting when there is occasion to use it, the work is at a stand.

As soon as the berries shall begin to be of different colours, and some of them are already black, yet more of them white, the olive must be gathered by hand, when the weather is fair, and sifted and cleaned upon mats or reeds spread under them: then, after they are cleansed, they must be presently carried to the place where the presses stand, and shut up intire in new straws, and put under the presses, that they may be squeezed as little a while as may be. Afterwards, when their thin rinds are opened, they ought to be softened, by adding two sextarii of whole salt to each modius of olives; and the mats of bruised olives ought to be squeezed out, either in oblong square boards, if it be the custom of the country, or in new straws at least: then that which shall first flow from the press into a round vat (for that is better than a square leaden vessel, or a receiver made of stone or brick with two divisions in it) let the leader empty it presently, and pour it into great earthen pans prepared for this use.

But, in the oil-cellar, let there be three rows of pans, that one of them may receive the oil of the first note, that is, of the first pressing; the second, that of the second; and the third row, that of the third: for it is of great importance not to mix that of the second, much less that of the third pressing, with that of the first; because that is of a much better taste which flows from the olives with least force of the press, as if it dropped from them of its own accord. When, therefore, the oil has stood a little in the first pans, the lader ought to strain and empty it into the second, and then into the next, 'till he comes to the last; for the oftener it is ventilated, and worked, as it were, by emptying it from one vessel into another, the clearer it becomes, and the more it is freed from its dregs. But it will be sufficient to place thirty large pans in each row, except the olive-yards be very large, and require a greater number.

But if, with the colds, the oil shall be congealed with the lees, you must, in that case, certainly use a little more toasted salt; that thing resolves and loosens the oil, and separates it from every thing that may hurt or corrupt it. Nor is there any reason to fear, that the oil will become salt or brackish; for whatever quantity of salt you shall put to it, yet the oil does not receive the taste of it. But even thus, the oil usually does not dissolve, when greater colds than ordinary come on suddenly; therefore they toast nitre, and bruise it, and sprinkle it upon the oil, and mix it with it: this liquifies the lees. There are some, though very careful oilmen, who do not put the berry under the press whole, without breaking it, because they think that some part of the oil is lost by so doing; for, when the berry receives the weight of the press, the lees alone are not pressed out of it, but they attract something of the fatness of the oil with themselves.

But I have this direction to give upon the whole, that neither smok nor soot be admitted into the place where the oil press stands, or into the oil-cellar, as long as the green oil is making there; for both these are very prejudicial to this affair, and the skilfullest oilmen scarcely suffer their work to be done at the light of one single lamp: wherefore, both the place where the oil-press stands, and the oil-cellar, must be situated towards that quarter of the heavens which is most sheltered from cold winds, because the heat of the fire is not at all required. Moreover, the barrels and jars, into which the oil is put, must not only be carefully cleansed, and put in order, at the time when the necessity of bestowing the fruit forces to do it; but, when they are emptied by the merchant, care ought to be taken, that if any dregs or lees have fallen to the bottom of the vessels, they be immediately cleaned out, and washed with a lee of ashes, not very hot, lest the vessels throw off and lose their wax; and let it be done once and again: then let them be gently rubbed with the hand, with lukewarm water, and often rinsed, and so let all the moisture be dried up with a sponge.

There are some who dissolve porters clay in water, like liquid dregs, and, after they have washed the vessels, daub them on the inside with this sort of gruel, as you may call it, and suffer it to dry upon them: afterwards, when they have occasion to use them, they rinse them with pure water. Some wash the vessels thoroughly all over with lees of oil first; then they wash them with water, and dry them: afterwards they examine whether the barrels want new wax; for the Antients said, that it was necessary to wax them almost every sixth year, at the time of making the oil, which I do not understand how it can be done: for, as new vessels, if they be heated, easily receive the melted wax, so I cannot believe, that such as are old will bear waxing, because of the juice of the oil; which very waxing, nevertheless, the husbandmen of our times, have wholly laid aside, and have been of opinion, that it was better to wash the new barrels all over with liquid gum, and to suffumigate them with white

wax when they are dried, that they may not lose their good colour, and tarnish: and they judge that this fumigation ought to be done, as often as either the new or old vessels are cured and seasoned, and prepared for the new oil. Many, when they have daubed their new barrels or jars with gross fat gum, are satisfied with one gumming for ever: and, indeed, a vessel which has once imbibed the oil, does not admit of a second gumming; for the fatness of the oil refuses any such matter as that of gum is.

After the month of December, about the beginning of January, the olive-berry must be gathered in the same manner as above, and the oil presently pressed out of it; for if it be laid up in a loft, it quickly grows hot; for, with the water-rains, it breeds a greater quantity of lees, which are very hurtful to oil. Therefore you must beware of making oil for eating of this kind of berry, which may, by this one way, be avoided; if, as soon as the berry is brought out of the field, it be ground, and put into the press, and the oil pressed out of it, and managed as we have said above. All husbandmen, for the most part have believed, that if the berry be laid up within the house, the oil will grow in the loft; which is as false, as that corn of any sort grows in the threshing-floor:

and this falsehood that antient author, Porcius Cato, refutes thus; for he says, that the olive grows wrinkled in the loft, and becomes smaller: for which reason, when the husbandman has laid up such a quantity in the house, as is sufficient for one making; and, after many days, has a mind to grind it, having forgotten the first quantity that he had brought in, he supplies out of another heap, which he had in like manner placed apart by itself, as much as is wanting to each quantity; and by this one making, the berry that has rested for some time, seems to yield more oil than that which is fresh and newly gathered, whereas he has taken a greater quantity of olives to it. Yet, suppose that were exceeding true, nevertheless there is more money raised by the price of green fresh oil, than by the great quantity of that which is bad: which thing Cato also said. And thus, indeed, whatever addition of weight or measure is made to the oil, if you would compute the quantity of berries, added to that which you reckon to one making, you would think it not an increase and advantage, but a real loss: wherefore we ought not to hesitate to grind the olives, and put them under the press, as soon as possible after we have gathered them.

Nor am I ignorant that a secondary oil, for common eating, must also be made; for when the olive, which is gnawed by the little worms, falls off the tree; or has, by storms and rains fallen into the dirt, they have recourse to warm water for a remedy; and the calcron ought to be made hot, that the dirty berries may be washed. But this must not be done with exceeding hot water, but with that which is moderately warm, that the taste of the oil may become the more agreeable; for if the agreeable taste be boiled out of it, it attracts the taste of the little worms, and of any other sorts of nastiness whatsoever: but when the olive has been thoroughly washed, the other things ought to be done as directed above. But the purest and best oil, and that of the secondary sort for common use, must not be pressed in the same straws; for old straws ought to be set a-part for such olives as fall off the trees of their own accord; and those that are new, for the oil of the first note; and when they have served for pressing out the oil of every particular making, they ought always to be presently washed, twice or thrice, in exceeding hot water: then, if there be any brook, or running water, they must be sunk in it, by having stones put into them, that they may be pressed down and detained by the weight thereof; or, if there be no river, they ought to be soaked in a lake or pond, of the purest water you can find, and afterwards beaten with rods, that the dirt and dregs may fall off them, and then they must be washed a second time and dried.

OIL OF SWEET ALMONDS, drawn without fire, is prepared various ways. Some peel them before pounding, others pound without peeling. Some steep them in lukewarm water, others in balneo mariae; some only bruise them, others beat them to a paste. There are a great variety of different ways to prepare this oil.

The best method is esteemed this: pound your almonds dry and new in mortars, pass them through a coarse sieve, lay them in a hair-cloth, and put them under the press between two plates of steel; press them gently, and when all the nutritious part is expressed, you will have a sweet oil without sediment, which is scarce avoidable by any of the other methods.

TRAIN OIL, is that generally procured from the blubber of the whale, by boiling. There is some also drawn off the livers of the cod at Newfoundland, which livers are thrown up in heaps when the cod is cured; and from thence is drawn all the oil which comes from that part of America.

GALLIPOLI OIL, is that sort which we import from Naples, in large quantities for the use of our woollen manufactories.

OLDENBURG, a county of Germany, in the circle of Westphalia; bounded by the German sea on the north, by the duchy of Bremen on the east, by Osnabrug on the south, and by Embden, or East Friesland, on the west; being 50 miles long and 20 broad, consisting chiefly of bogs and marshes,

marshes, where they breed a small sort of cattle less than the Welch. The inhabitants are wretched poor, living in dirt houses, and subject to Denmark.

OLERON, west longitude 1. 20, latitude 46, an island of France, near the coast of Poitou, and territories of Aunis, situated 14 miles south-west of Rochelle, being about 15 miles long and 6 broad, and containing 10,000 people. The ancient inhabitants of this island, had such a reputation for their skill in navigation, that their rules became a model for other maritime powers to make their laws by, in relation to sea affairs; and these were called the laws of Oleron.

The soil of this island produces plenty of corn and wine, and they make a great deal of salt of the sea-water. There is a light-house on this island, for direction of ships.

OLERON LAWS, of NAVIGATION and COMMERCE.

An abstract of the naval laws of Oleron, instituted by Richard I. king of England, in his return from the Holy Land, in the end of the eleventh century, for the better regulation of merchants, owners and masters of ships and mariners, and all seafaring persons in maritime affairs. To which is added, some observations upon them, taken from several authors.

ARTICLE I.

When several joint owners make a man master of a ship or vessel, and the ship or vessel departing from her own port, arrives at Bourdeaux, Rouen, or any other such place, and is there freighted to sail for Scotland, or some other foreign country; the master, in such case, may not sell or dispose of that ship or vessel, without a special procuration from the owners: but, in case he wants money for the victualling, or other necessary provisions of the said vessel, he may, for that end, with the advice of his mariners, pawn or pledge part of the tackle or furniture of a ship. [See HYPOTHECATION.]

OBSERVATION.

The title of master is so honourable, and the command of a ship of such importance, that great care has been taken by all maritime nations, that none may be employed but honest and experienced men. By an ordinance of the admiralty in France, A. D. 1584, every master of a ship, before he took upon him that trust, was to be examined, whether he was fit for it. The Spanish naval laws require the same thing; el maestro de la nave, para serlo, ha de ser marinero y examinado. Cedula real del anno 1576. Impresa con las de India quatro toms. The ordinances and regulations of the Hans Towns do not only demand experience and capacity, but honesty and good manners: And none was to be admitted into the service of any citizen aboard his ship, without a certificate of his qualifications, as to his honesty and capacity. See their book of ordinances, book 6. art. 1.

Although the government of the ship is intrusted, he cannot sell the ship itself, nor any of her tackle or furniture, without the order or consent of the owners. However, in case of necessity, when he is in a far country, he may pawn or pledge her tackle for provisions; and if that will not do, he may borrow money on the ship's bottom, though not without the consent of his officers and seamen. According to the ordinances of Wisbuy, art. 13 and 15, and Philip II. king of Spain's ordinances in the year 1563, art. 12. Those of the Hans Towns forbid a master of a ship, notwithstanding he is part owner, not only to sell, but to do any thing, even to buy tackle or victuals, without acquainting the other owners of it, unless it be in a strange country, and in a case of necessity, well and lawfully attested, art. 3, 4, 5, & seq.

By the ordinances and customs of the sea it appears, that formerly it was not thought safe to intrust a master of a ship with the vessel and cargo, unless he was a freeman of that city, and part owner of the ship; and if he was part owner, when he had betrayed or abused his trust, the other owners might turn him out of the ship, paying him what his part of her came to, at the same price he gave for it, according to the ordinances of the Hans Towns, art. 14. And if he pretended he had sold his part to another person, for more than it was worth, the other owners might have it appraised, and take it to themselves, paying him what it was valued at by such appraisement, art. 53.

The master commonly took care of every thing belonging to the ship, from the poop to the main-mast: he was obliged to understand the art of piloting and navigation, that he might know how to controul the pilot, and mind how he steers the ship, y si el maestro no fuere piloto es obligado a uevar un marinero diestro en la navegacion, tel que, pueda regir la nave a falla de piloto, according to the ordinances of Spain. The mate's command reached from the stern to the mizen-mast, the latter included. It will not be thought improper by the curious to mention here the several officers of a ship, either men of war or merchantmen, as they were distinguished abroad, a century ago.

In royal navies, the first officer was the admiral; then the vice-admiral; then the captain-major, or chief of a squadron. In every man of war, the first officer was the captain, the second the pilot, who enjoyed that place in honour of the science he professed and practised; next to him was the

master, who had the charge of the tackle and furniture, and then the captain and lieutenant of the soldiers. In a merchant-man, the first officer was the master, the second the pilot, the third the mate, the fourth the factor or supercargo; then his assistant, accomptants, the surgeons, the steward, four corporals, the cook, the gunner, the cockswain; the gunner and cockswain used to work before the mast, as well as the rest of the ship's crew, but their wages were more.

There is a great deal of difference between the order of precedence on board of ships now, and what was formerly: for the captain and lieutenant of the soldiers would think it very hard to give place to the pilot and master of a ship; and the factor or supercargo will as difficultly be persuaded to own the master of a vessel's superiority, except in what relates to the navigating the ship.

ARTICLE II.

If a ship or other vessel be in port, waiting for weather and a wind to depart, the master ought, when that comes, before his departure, to consult his company, and say to them; gentlemen, what think you of this wind? If any of them see that it is not settled, and advise him to stay till it is; and others, on the contrary, would have him make use of it as fair; he ought to follow the major part: If he does otherwise, and the vessel happens to miscarry, he shall be obliged to make good the same, according to the value upon a just appraisement.

OBSERVATION.

It is a maxim, or a general sea-law, that a master of a ship shall never sail out of a port, never weigh or drop anchor, cut masts or cable, or, indeed, do any thing of consequence, let him be in whatever danger may happen, without the advice of the major part of his company, and the merchants, if there are any aboard: he must call all together to consult. Wisbuy, art. 14. See WISBUY LAWS.

ARTICLE III.

If any vessel, through misfortune, happens to be cast away, in whatsoever place it be, the mariners shall be obliged to use their best endeavours for saving as much of the ship and lading as possibly they can: and if they preserve part thereof, the master shall allow them a reasonable consideration to carry them home to their own country; and in case they save enough to enable the master to do this, he may lawfully pledge, to some honest persons, such part thereof, as may be sufficient for that occasion. But if they have not endeavoured to save as aforesaid, then the master shall not be bound to provide for them in any thing, but ought to keep them in safe custody, until he knows the pleasure of the owners; in which he may act as becomes a prudent master; for if he does otherwise, he shall be obliged to make satisfaction.

OBSERVATION.

The ship's crew are obliged to do all that lies in their power to save things from shipwreck, and gather up what they save, on pain of losing their wages; and those that hinder or dissuade them from it, shall be severely punished. This law is very well explained by an ordinance of king Philip II. of Spain, in the year 1563. By which it is ordained, that the seamen shall be bound to save as much as they can from shipwreck; and, in such case, the master is bound to pay them their wages, and to give them a further reward for their labour out of the goods: but if the seamen refuse to do their endeavour to save the goods, they shall neither have pay nor reward. Hans Towns, ord. art. 44. Wisbuy, art. 15.

ARTICLE IV.

If a vessel departing with her lading from Bourdeaux, or any other place, happens in the course of her voyage to be rendered unfit to proceed therein, and the mariners save as much of the lading as possibly they can; if the merchants require the goods of the master, he may deliver them if he pleases, they paying the freight in proportion to the part of the voyage that is performed, and the costs of the salvage: but if the master can readily repair his vessel, he may do it; or, if he pleases, he may freight another ship to perform his voyage. And if he has promised the people who helped him to save the ship, the third, or the half part of the goods saved, for the danger they ran, the judicatures of the country should consider the pains and trouble they have been at, and reward them accordingly, without any regard to the promises made them by the parties concerned in the time of their distress.

OBSERVATION.

This law does not relate to an entire loss, but only to salvage, or rather not to shipwreck, but to the disabling of a ship, so that she cannot proceed in her voyage without refitting. In which case, the merchants may have their goods again, paying the freight, in proportion to the way the ship made. If the merchant has not money to pay the freight, and the master will not credit, the latter may take his goods in payment at the market price. Wisbuy, art. 33. The emperor Charles the fifth's ordinance, art. 40.

If the master can, in a little time, refit his vessel, and render her fit to continue her voyage; that is, if he can do it in three days time at the most, according to the Hans Town laws; or if he will himself take freight for the merchandize aboard

aboard another ship bound for the same port to which he was bound, he may do it; and, if the accident did not happen by any fault of his, the freight shall be paid him, by the Rhodian laws, Numb. 42. secundo & ultimo tomo juris Græco-Romani in fine. Wisbuy, art. 16, 37, and 55. King Philip II. of Spain's ordinance, under the head of averages, art. 30.

As for the charges of salvage, there are very great allowances made to the salvors, *Lege Rhod.* Secundo tomo juris Græco-Romani, num. 45 & 47. *Harmenopolus in promptuario juris*, lib. 2. tit. 6. By this law there was adjudged to the divers and salvors, the half, the third, or the tenth of the things saved, and that according to the depth of the water out of which they were fished, fifteen, eight, or one fathom; as also a tenth part for salvage on the coast, and the fifth to him that saving himself, carries and saves something with him. The promises that are extorted in danger upon this account, ought always to be regulated according to justice, with reason and proportion, without keeping to the expressions of such promises; for this there are several laws in France, and an instance of it is thus recorded. A gentleman named La Mothe, embarked at St Machaire with two horses in a boat, going for Bourdeaux; as they were in their passage, one of the horses grew furious and leaped overboard. La Mothe held him by the bridle, the horse splashed the water up in his face, and the gentleman pulling his handkerchief out of his pocket to wipe it off, at the same time pulled out a purse that had thirty pistoles in it, which fell into the water. The boatmen came, and La Mothe desired them to take notice of the place, by observing the trees and buildings that were near it, and when the tide was out, to seek after the purse; promising if they found it, to give them a pistole for their pains. The boatmen excused themselves; nevertheless, when they had put La Mothe and his horses ashore, they went to look for the pistoles when it was low water, and one of them found them where they were dropped. His companions demanded their share of them, but he who had the good fortune to find the purse would not let them have any of the gold, and there was a law-suit about dividing it, before the judge of St Machaire. Monf. La Mothe hearing of it, came thither, and put in his claim to the purse and pistoles, but the judge gave it against him. He then appealed to the seneschal of Guyenne's court, but with no better success; at last he appealed to the parliament of Bourdeaux, and that court decreed, he should have his pistoles, but should pay 60 livres to the boatmen for their pains and trouble.

ARTICLE V.

If a vessel departing from one port, laden or empty, arrives at another, the mariners shall not leave the ship without the master's consent: if they do, and by that means she happens to be lost or damaged, they shall be answerable for the damage; but if the vessel be moored, and lying at anchor, with a sufficient number of men aboard to keep the decks and landing, they may go without the master's consent, if they come back in good time, otherwise they shall be liable to make satisfaction, if they have wherewithal.

OBSERVATION.

In regard to this article relating to seamen, it will not be unacceptable to the reader to observe, what other customs and ordinances we have met with concerning them.

Mariners are obliged to look carefully after every thing that relates to the preservation of the ship and goods, *Wisbuy* art. 47. For which reason, they ought not to go ashore and leave the vessel, without the master's or mate's permission: if they do, they are bound to answer to all the damages that happen to the ship or merchandize in their absence. *Wisbuy*, art. 17. The emperor Charles the Vth's ordinance in the year 1552, art. 9 and 10. Conformable to the Rhodian law, secundo tomo juris Græco-Romani, num. 20. The regulations of the Hanse-Towns, art. 40, ordain, That if any seamen go ashore without licence, and if in his absence the ship happens to be lost for want of hands, the seaman thus absent shall be apprehended, and kept a year in prison on bread and water; and, if any one should be killed or drowned in his absence, and that be the cause of it, he shall be corporally punished. The same ordinances condemn those mariners that lie out of their ship all night, to pay all the damage that shall happen while they are absent. Those of the Hanse-Towns, art. 22 and 23. add imprisonment. Some laws forbid them to undress themselves, and the Hanse-Towns, art. 32. to lie with their wives aboard. The reason is, that they may always be ready to assist their fellows in the discharge of their duty, in the preservation of the ship and goods. The obligation of the mariner to the master, begins as soon as he is hired and terms are agreed, and ends when the voyage is finished and they are returned. The obligation of the mariner to the merchant is from the beginning of his charge, and the mariner is obliged to stow and unlash the goods according as the place they are in is commodious or not, to keep them from damaging, and promote or hinder the ship's trimming; and if by their refusing to do so, the merchandize is damaged or spoiled, they are bound to make the damage good. *Wisbuy*, art. 48. *Philip II.* art. 19. By the laws of *Wisbuy*, they are also bound to unlade some goods with the

shovel, and some to hand ashore, for which they are to have no extraordinary allowance; but for letting things up or down, they are by the same laws to be allowed something extraordinary, that is, above their wages. The laws are very severe against those seamen, that run away from ships after they are hired. In men of war desertion is punished with death: in merchantmen, by the Hanseaticque laws, or those of the Hanse-Towns, they are to be marked in the face with a red-hot iron, that they may be known, and be infamous as long as they live. If the mariner runs away before the voyage, when he is taken he ought to refund half as much as the master was to have paid him for the whole voyage. If he hires himself to two masters, the first may demand him; and by the Hanseaticques, art. 1. is not bound to pay him any wages. Provision is made for such seamen as run away, only because the master has used him ill. By the same laws, if any master entices away a mariner hired before by another, the last master shall forfeit to the first 25 livres, and the mariner half the wages he was to have had of the master that so enticed him.

That master who knowingly hires a mariner who was hired before, shall pay double the wages he was to pay the mariner, and the latter be bound to follow and serve the first master. However, a mariner may demand, and ought to have his discharge, either before or during the voyage, for these four reasons; in case he is made master or mate of another ship; if he marries, and then he is obliged to refund what he has received; if he made any proviso in his bargain for quitting the ship; if the voyage is finished, the ship disarmed, unloaded and light, the sails, tackle, and furniture, taken away and secured. See the laws of *Wisbuy*, art. 54 and 63. If the master gives a mariner his discharge, without any lawful cause, and for his pleasure only; in case he does it before the voyage, and while the ship is in port, he ought to pay half as much as he was to give him for the whole voyage; but if he discharges him after the ship is sailed, he ought to pay him all his wages. *Wisbuy*, art. 3.

By the Hanseaticques, the master is to pay a third of the wages only, and not to bring it to his owner's account. He is obliged also to pay him not only all his wages, if he discharges him in his voyage, but to defray the charges of his return. If after a bargain is made between the master and mariner, if the voyage happens to be hindered by war or pirates, or any other lawful account, the mariner, according to king Philip's laws, art. 9. shall have a quarter part of the wages that were promised him for the voyage, and the master by a French law shall have half the freight.

A master may turn off a mariner if he finds he is ignorant in maritime affairs, and incapable to perform the voyage, particularly a pilot, to whom in such cases, he is not bound to pay any wages, and at his return may have him punished for his rashness, according to king Philip's and the Hanseaticque laws.

If it happens, that the master finds out the pilot or mariner's ignorance when he cannot discharge them, they shall be obliged at their return to refund all the money he had advanced to them, and pay the master besides, half what he had promised: but if the pilot declares at first he is dubious, and cannot depend on his knowledge, that he is out of the way, and does not very well understand his business; if it is when he is outward-bound, he shall be paid half what was promised him, if homeward-bound, all.

If the master finds that any officer or seaman aboard his ship has any infectious distemper that is dangerous, he may put him ashore at the first place he comes to, without paying him any thing, but then he must prove it by two or three witnesses. He may also turn away any thieving mariner, or any quarrelsome or factious fellow; but as to the latter, he should have a little patience, to see if he can be brought to reason. By the Hanseaticques, art. 29. and the laws of *Wisbuy*, art. 25.

ARTICLE VI.

If any of the mariners hired by the master of any vessel, go out of the ship without his leave, and get themselves drunk, and thereby there happens contempt to their master, debates, or fighting and quarrelling among themselves, whereby some happen to be wounded: in this case, the master shall not be obliged to get them cured, or in any thing to provide for them, but may turn them and their accomplices out of the ship; and if they make words of it, they are bound to pay the master besides: but if by the master's orders and commands, any of the ship's company be in the service of the ship, and thereby happen to be wounded or otherwise hurt, in that case they shall be cured and provided for at the costs and charges of the said ship.

OBSERVATION.

By the laws of *Wisbuy*, art. 18. Those mariners that are mutinous and quarrelsome, are obliged to refund all they have received, and pay besides what the master is forced to give to others whom he hires in their places above the wages he was to give them.

The laws of Charles V. art. 28. & seq. ordain certain punishments, according to the heinousness of the offences and crimes committed by seamen. If the mariners are wounded,

or any wife hurt in serving the master of the ship, they shall be cured, taken care of, and indemnified at the charge of the ship. *Witbuy*, art. 18. *Hanseatiques*, art. 39. Charles V, art. 27 and 28. Philip II. art. 16. If the mariners are taken by corsairs in his and his ship's service, the master is bound to redeem them, and besides that, to pay them their wages during their captivity, as much as if they had all that time been in his service. This law is in the *Consulat*, chap. 182. If in defending himself, or fighting against an enemy or corsairs, a mariner is maimed or disabled, to serve on board a ship for the rest of his life, besides the charge of his cure, he shall be maintained as long as he lives at the cost of the ship and cargo, according to the *Hanseatiques*, art. 35. An instance of this follows:

In the year 1621, Giles Esteben, a citizen and merchant of Bourdeaux, loaded a vessel of 36 tons with wine for Calais, and gave the charge of the cargo to one Fiton his servant. The vessel set sail, and when she was at sea met with a Turkish rover. The corsair came up with her and took her, but did not meddle with the vessel or the wine, either because the alcoran forbids the Mahometans to drink or deal in wine, or because he held intelligence with the master of the vessel, who was a Scotchman; for he did him nor his crew any manner of hurt, but took away Finton, and sold him in Barbary for a slave. He remained there four years and a half in great misery and poverty; at last he was redeemed by alms in the year 1625, and paid for his ransom 780 livres. Fiton returning to Bourdeaux, found that his master Esteben was dead; however, he entered an action in an inferior court against the widow for his wages, as well for the time he was detained in slavery, as for that before his captivity, as also for the reimbursement of his ransom money, his losses and interest. The widow removed the suit to the higher courts, and from thence it came before the parliament, who decreed, that the widow should pay Fenton 1000 livres in full for his wages, redemption, expences, loss and interest.

ARTICLE VII.

If it happens that sickness seizes on any one of the mariners while in the service of the ship, the master ought to set him on shore, to provide lodging and candle-light for him, and also to spare him one of the ship's-boys, or hire a woman to attend him, and likewise to afford him such diet as is usual in the ship; that is to say, so much as he had on ship-board in his health, and nothing more, unless it please the master to allow it him, if he will have better diet, the master shall not be bound to provide it for him, unless it be at the mariner's own cost and charges; and if the vessel be ready for her departure, he ought not to stay for the said sick party: but if he recover, he ought to have his full wages, deducting only such charges as the master has been at for him. And if he dies, his wife or next a-kin shall have them.

OBSERVATION.

The 19th article of the laws of *Witbuy*, the 45th of the *Hanseatiques*, the 27th of Charles V. and the 16th of Philip II. which he compiled for the Low-Countries, were all founded upon this law of Oleron, in what relates to a sick mariner, and agree exactly with it, both if he recovers his health, or dies in the voyage. The Spaniards have another custom in the West-India voyages: for in case a mariner falls sick, he must substitute another in his place, otherwise he loses all his wages for the time in which he could not work. By the *Hanseatiques*, art. 45.

If a mariner is detained ashore by sickness, the voyage ought not to be retarded on his account. By Charles the Vth's ordinances, if the mariner dies as he is outward-bound, his wife and heirs shall receive half his pay: if, as he is homeward-bound, they shall have all, deducting the charge of his funeral if there has been any.

In ships of war, the custom in some places has been more favourable to sailors; for we find in a treatise written by Francis Pyrarde de Laval, intitled, *Avis pour aller aux Indes Orientales*, That if a man died the first day of the voyage, his heirs were to be paid as much as if he had completed it.

ARTICLE VIII.

If a vessel be laden to sail from Bourdeaux to Caen, or any other place, and it happens that a storm overtakes her at sea, so violent, that she cannot escape without casting some of the cargo overboard for lighting the vessel, and preserving the rest of the lading, as well as the vessel itself, then the master ought to say, Gentlemen, we must throw part of the goods overboard; and if there are no merchants to answer him, or if those that are there approve of what he says by their silence, then the master may do as he thinks fit; and if the merchants are not pleased with his throwing over any part of the merchandize and forbid him, yet the master ought not to forbear casting out so many of the goods as he shall see to be for the common good and safety; he and the third part of his mariners making oath on the holy evangelists, when they arrive at their port of discharge, that he did it only for the preservation of the vessel, and the rest of the lading that remains yet in her. And the wines, or other goods, that were cast overboard, ought to be valued, according to the just value of the other goods that arrive in safety: and

when these shall be sold, the price or value thereof ought to be divided *livre à livre* among the merchants.

The master may compute the damage his vessel has sustained, or reckon the freight of the goods thrown overboard at his own choice. If the master does not make it appear that he and his men did the part of able seamen, then neither he nor they shall have any thing. The mariners also ought to have one ton free, and another divided by cast of the dice, according as it shall happen, and the merchants in this case may lawfully put the master to his oath.

OBSERVATION.

Of two evils, to chuse the least is the law of nature as well as of nations; and when a ship is in danger of perishing, the lives of the seamen, and the safety of the rest of the cargo, make the throwing part of it overboard the least evil: but that the master's ignorance or fear might not hurry him to do any thing to the detriment of the merchant, without good grounds for it, he must consult the merchants, passengers, or mariners aboard his ship, and, according as the necessity of it appears to them, to throw the goods overboard. This he is warranted to do by the Rhodian law. *Secundo tomo juris Græco-Romani*, num. 9. and by 20th, 21st, and 38th articles of that of *Witbuy*. The 20th and 38th articles provide also, That if the merchants alone are against the proposition of throwing the merchandize overboard, and the rest, who have their lives and goods also to lose consent to it, the master and third part of the seamen purging themselves as soon as they come ashore by oath, that necessity forced them to do it, and that otherwise they could not have been saved, may do it, and shall then be justified for what they did.

The master is not obliged, when he comes to this extremity, to throw his own goods overboard first. The custom of the Levant is, the passenger or merchant first flings out something of his own. Philip the II'd's ordinances, under the title of *Averages*, require, That the ship's utensils should be first thrown overboard; such as old cables, fire-wood, anchors, and guns, which weigh heavy, and are not of the greatest service; then the chests belonging to the ship's crew, as being of the least value. All those things which are thrown overboard come into an average, except those that belong to the sovereign. See *AVERAGE*.

By the 38th article of the laws of *Witbuy*, the clerk of the ship ought to register all the goods that are thrown overboard; and if there is no clerk aboard, it is convenient for the mariners to make attestation of them at the first port they come to. By the Rhodian laws, the goods that are damaged by the storm come into an Average. By the same laws, if the master by overloading his ship, is the occasion of the goods being thrown overboard, he shall make good the damage. The laws of *Witbuy*, art. 46. except in this case those goods, which were so laden with the consent of the merchant. See *RHODIAN LAWS*, and *WISBUY LAWS*.

If the master has let out more freight than he has stowage for, he must not therefore overload his own ship, but by the Consulate is bound to find freight for them in another. If the merchants, passengers, or mariners, have any plate or other precious goods in their chests or cabinets, they ought to inform the master and clerk of it, otherwise their chests will not be liable to any average, for any thing more than what is known to be within them.

Persons never are reckoned in an average, but all sorts of goods whatsoever. Vintualls belonging to the ship are exempted from the laws for throwing goods overboard, and privileged from paying contributions in averages. Seamen's wages are not liable to averages. By the *Hanseatiques*, art. 28. these wages ought to be paid by three payments, a third part before the ship goes out of the port, a third part when she's unladen, and a third part at her return.

By the Rhodian law, the sailors ought to have a ton freight free from contributions in average, when goods are thrown overboard. To explain this it will be necessary to observe, that sailors were used to hire themselves out for a voyage for several considerations: some had a certain sum of money for the whole voyage, or so much a month, or so much a day; others hired themselves for such a proportion of the freight, or a liberty to load so much goods aboard, or let out so much freight to others: but the most common way, and the best of hiring themselves, was for part in wages, and part in freight, either for themselves or to let out. Those seamen who had wages only, contributed nothing to the average for goods thrown overboard. Those who had goods contributed, unless those goods were bought with their wages, and they had only one ton exempted. The merchants who hired their freight of them, had the same privilege by it as themselves.

Having had occasion to make mention of *livre à livre*, an explanation of it will not be unacceptable to the reader. The civilians considered every thing as an whole; as for example, an inheritance composed of several parts, makes together one whole or mass, of whatever importance it may be, great or small, as if the whole of this inheritance made one livre, one pound, as hereditatis. This pound divided into twelve equal parts, is named ounces. The merchants and masters of ships, in case of averages for goods thrown overboard or damaged

damnified in storms, have the same view ; that is, they consider the ship and cargo together as one pound, and the goods lost or damnified as another ; so that he who had a tenth in the pound of the cargo, a fifteenth or any other share, must carry a tenth, a fifteenth or any other share to the pound of the average ; and this proportion of one pound to another, is what is called by the French naval laws, *livre à livre*, pound to pound.

ARTICLE IX.

If it happen, that by reason of much foul weather the master is like to be constrained to cut his masts, he ought first to call the merchants, if there be any aboard the ship, and such as have goods and merchandize in the vessel, and to consult them, saying, Sirs, It is requisite to cut down the masts to save the ship and lading, it being in this case my duty. And frequently they also cut their mooring cables, leaving behind them their cables and anchors to save the ship and her lading. All which things are reckoned and computed *livre by livre*, as the goods are that were cast overboard. And when the vessel arrives in safety at her port of discharge, the merchants ought to pay the master their shares or proportions without delay, or sell or pawn the goods, and employ the money he raises to satisfy by it the same, before the said goods be unladen out of the said ship : but if he lets them go, and there happens controversies and debates touching the premises, if the master observes collusion therein, he ought not to suffer, but is to have his complete freight, as well for what goods were thrown overboard, as for what he brought home.

OBSERVATION.

No merchant is obliged to pay average for goods thrown overboard, unless the master can prove he did it for the safety of his own and his mens lives, and the preservation of the ship and the rest of her cargo. What loss happens by accidents, breaking the masts, or burning the sails, or pirates taking part of the goods, shall not come into the common average. By the Rhodian laws, every merchant shall bear his own loss, and the master shall do the same. See also the 12th article of the laws of Wisbuy. Averages are by that to be paid for damages done within the ship, and not for those without ; therefore the master and mariners are obliged to purge themselves by oath, how the damage came, in the first court of admiralty they come to, and that it was done in very great necessity. Indeed, if pirates take the ship and cargo entire, and both are redeemed for a sum of money, the average for that shall be common, and all the concerned shall pay contribution. If the merchants and passengers aboard the ship, desire the master to put into any port out of his way for fear of pirates, and in going out of that port he loses anchors or cables, those who desired him to put in there shall pay for them, and the ship ought not to pay any thing towards that loss. After a general shipwreck, there is no average or common contribution, but save who save can, as is vulgarly said on this occasion. If any goods that were thrown overboard in a storm, to lighten the ship, happen to be recovered, the owner of them ought to restore what he had recovered for damages by average to those that paid him, deducting for the loss he may be at by his merchandizes being damnified. The Rhodian law enjoins this.

ARTICLE X.

The master of a ship, when he lets her out to freight to the merchants, ought to shew them his cordage, ropes and slings, with which the goods are to be hoisted aboard or ashore : and if they find they need mending, he ought to mend them ; for if a pipe, hoghead, or other vessel, should happen, by default of such cordage, or slings, to be spoiled or lost, the master and mariners ought to make satisfaction for the same to the merchants. So also if the ropes or slings break, the master not shewing them before-hand to the merchants, he is obliged to make good the damage : but if the merchants say the cordage, ropes, or slings, are good and sufficient, and notwithstanding it happens that they break, in case that they ought to divide the damage between them ; that is to say, the merchant to whom such goods belong, and the said master with his mariners.

OBSERVATION.

By the 12th article of the laws of Wisbuy, and the 7th of king Philip's, The master when he lets his ship out to freight, is bound to shew her to the merchant or their agents. The consulate requires the same, and that the master should let the merchants visit not only the ropes, but all the ship above decks and below, that they may see what is wanting, and have it mended ; and if it is not mended, and the merchandize is damnified, the master shall make good the loss. The 49th article of the laws of Wisbuy, enjoins the mariners to give the master notice of the faults and defects in the cordage ; otherwise they shall be responsible for all accidents that may happen : and if after such notice given, the master does not take care to have them mended, he shall answer the damage out of his own pocket.

The Rhodian laws, secundo tomo juris Græco-Romani, num. 11. wills and ordains, That the merchant who loads a

ship, shall inform himself exactly of every thing, diligenter interrogare debent mercatores qui prius in ea navi navigaverunt. The law says, he should enquire of those that have sailed in her before ; but that is of little use, except as to her sailing, for ships grow daily more and more out of repair, and should be always viewed by the person that is going to be concerned in them, without trusting to the information of others.

ARTICLE XI.

If a vessel being laden at Bourdeaux with wines, or other goods, hoists sail to carry them to some other port, and the master does not do his duty as he ought, nor the mariners handle their sails, and it happens that ill weather overtakes them at sea, so that the main-yard shakes or strikes out the head of one of the pipes or hogheads of wine, this vessel being safely arrived at her port of discharge, if the merchant alleges, that by reason of the main-yard his wine was lost, and the master denies it, in this case the master and his mariners ought to make oath (whether it be four or six of them, such as the merchant hath no exception against) that the wine perished not by the main-yard, nor through any default of theirs, as the merchants charge them, they ought then to be acquitted thereof ; but if they refuse to make oath to the effect aforesaid, they shall be obliged to make satisfaction for the same, because they ought to have ordered their sails aright before they departed from the port, where they took in their lading.

OBSERVATION.

This article is explained by the 23d of the laws of Wisbuy, which ordains, That if the cargo is ill stowed and the ship ill trimmed, and the mariners do not manage their sails rightly, and any damage happens by it to the ship or goods, they shall be responsible for the damages as far as they have wherewithal to do it. There were formerly in several ports of Guyenne certain officers called *arrameurs*, or stowers, who were master carpenters by profession, and were paid by the merchants, who loaded the ship. Their business was to dispose right and stow closely all goods in casks, bales, boxes, bundles, or otherwise ; to ballance both sides, to fill up the vacant spaces, and manage every thing to the best advantage. It was not but that the greatest part of the ship's crew understood this as well as these stowers, but they would not meddle with it, nor undertake it, to avoid falling under the merchant's displeasure, or being accountable for any ill accident that might happen by that means. There were also *facquiers*, who were very ancient officers, as may be seen in the 14th book of the Theodosian Code, *Unica de saccharis portus Romæ*, lib. 14. Their business was to load and unload vessels laden with salt, corn, or fish, to prevent the ship's crew defrauding the merchant by false tale, or cheating him of his merchandize otherwise.

ARTICLE XII.

A master having hired his mariners, ought to keep the peace betwixt them, and to be as their judge at sea ; so that if there be any any of them that give another the lie, whilst they have wine and bread on the table, he ought to pay four deniers ; and if the master himself gives any the lie, he ought to pay eight deniers ; and if any of the mariners impudently contradict the master, he also ought to pay eight deniers ; and if the master strikes any of the mariners, he ought to bear with the stroke, be it with the fist or open hand ; but if the master strikes him more than one blow, the mariner may defend himself : and if the said mariner doth first assault the master, he ought to pay five sols, or lose his hand.

OBSERVATION.

This law restrains the correction of the master to one blow with his fist, which the mariner ought to bear, and no more. The Consulate, chap. 16. explains how far the mariner is bound to suffer the master's assaulting him, in these terms ; the mariner is obliged to obey the master, though he should call him ill names, and is enraged against him, he ought to keep out of his sight, or hide himself in the prow of the ship ; if the master follows him he ought to fly to some other place from him ; and if he still follows him, then the mariner may stand upon his defence, demanding witnesses how he was pursued by the master, for the master ought not to pass into the prow after him.

The 24th article of the laws of Wisbuy punishes the giving the lie. The same article is very severe against the mariner that strikes the master. The mariner that strikes, or lifts up arms against his master, was to lose half his hand in a very painful way. If the mariner has committed a crime too great for the master's authority to punish, then the master and his officers ought to seize the criminal, put him in irons, and bring him to justice at his return.

ARTICLE XIII.

If a difference happens between the master of a ship and one of his mariners, the master ought to deny him his mess and

before he turn him out of the ship, or discharge him thereof; but if the said mariner offer in the presence of the rest of the mariners to make the master satisfaction, and the master be resolved to accept of no satisfaction from him, but to put him out of the ship, in such case the said mariner may follow the said vessel to her port of discharge, and ought to have as good hire or wages, as if he had come in the ship, or as if he had made satisfaction for his fault in the sight and presence of the ship's company; and if the master take not another mariner into the ship in his stead, as able as the other, and the ship or lading happens thereby to be through any misfortune damaged, the master shall be obliged to make good the same if he hath wherewithal.

OBSERVATION.

To deny him his mefs is in the original, *Offar la touaille*, an old Gascon phrase, which signifies to deny him the tablecloths or victuals for three meals, by which is understood a day and a half. The *Witbuy* law, art. 25. provides for the master's making satisfaction for the damages that may happen through the want of the mariner he turns off. And the *Hanseaticques*, art. 27, require the master not to give the seamen any cause to mutiny; not to provoke them, call them names, wrong them, nor keep any thing from them that is theirs, but to use them well, and pay them honestly what is their due. Some French laws ordain, That no mariner should be admitted under 18 years, nor above 50. The choice of the crew is entirely in the master; the reason is, that he ought to be himself very well assured of his seamen's ability, and not to take it upon trust by report of others.

ARTICLE XIV.

If a vessel being moored lying at anchor, be struck or grappled with another vessel under sail that is not very well steered, whereby the vessel at anchor is prejudiced, as also wines, or other merchandize in each of the said ships damaged. In this case the whole damage shall be in common, and be equally divided and appraised half by half; and the master and mariners of the vessel that struck or grappled with the other, shall be bound to swear on the holy evangelists, that they did it not willingly or wilfully. The reason why this judgment was first given, being that an old decayed vessel might not purposely be put in the way of a better, which will the rather be prevented when they know that the damage must be divided.

OBSERVATION.

This law agrees exactly with the 26th, 50th, 67th, and 70th, articles of the ordinances of *Witbuy*. The dividing the loss in halves is, to prevent any cheat; for an old vessel that is worth little or nothing, might else be put in a new one's way: and if she runs against her, more damage be pretended than the old ship might fairly be valued at.

ARTICLE XV.

Suppose two or more vessels in a harbour where there is but little water, so that the anchor of one of the vessels lies dry, the master of the other vessel ought in that case, to say unto him whose anchor lies dry, Master, take up your anchor, for it is too high us, and may do us a prejudice: if neither the said master nor his mariners will take up the said anchor accordingly, then may that other master and his mariners (who might be otherwise thereby damaged) take up the said anchor and let it down at a further distance from them; and if the others oppose or withstand the taking up of their anchor, and there afterwards happens damage, thereby, they shall be bound to give full satisfaction for the same; but if they put out a buoy or anchor-mark, and the anchor does any damage, the master and mariners to whom it belongs are not bound to make it good; if they do not, they are; for all masters and mariners ought to fasten such buoys or anchor-mark, and such cables to their anchors, as may plainly appear and be seen at full sea.

OBSERVATION.

The 28th and 51st articles of the ordinances of *Witbuy*, require masters to put out buoys, to warn others where their anchors lie, on pain of making satisfaction for whatever damage may happen for want of them: for anchors hid under water may do a great deal of mischief at ebb and low water. If any master spies them, and they lie near him, he may remove them, and prevent any damage coming to his ship. *Harmenopolus* in *promptuario titulo de rebus nauticis*, licet in discrimen adductis, qui se aliter explicare non possunt, alius navis anchoras salutis suae causa præcidere. The buoys that are made use of, are either empty barrels, or pieces of the trunk of a tree, or any other light wood, with baskets that swim on the top of the water, and shew where the anchors lie.

ARTICLE XVI.

When a ship arrives with her lading at Bourdeaux or elsewhere, the master is bound to say to his company, when she is ready to load again, Gentlemen, will you freight your own share yourselves, or be allowed for it in proportion with the ship's general freight: the mariners are bound to answer one or the other. If they take as the freight of the ship shall happen, they shall have proportionably as the ship hath; and, if they will freight by themselves, they ought to freight so as the ship be not impeded or hindered thereby: and, if it so happen, that they cannot let out their freight, or get goods themselves; when he has tendered them their share and stowage, the master is blameless; and if they will there lade a ton of water, instead of so much wine, they may: and, in case there should happen at sea an ejection, or casting of goods overboard, the case shall be the same for a ton of water as for a ton of wine, or other goods, livre by livre. If they let out their proportion of freight to merchants, what freedom and immunity the said mariners have, the said merchants shall also have.

OBSERVATION.

This article has some relation to the 8th, which treats of mariners wages, and their freight aboard. The 30th article of the laws of *Witbuy* is founded upon it. By the seamen's immunity is meant, the privilege of being the last to be thrown overboard in a storm, and having a ton free from all average. The mariners freight should be first full, for the master is not obliged to stay for them when his cargo is all aboard.

The reasons given by our author, why, in case of throwing overboard, the mariners ton of water shall come in equally in the average, livre à livre, for a ton of wine, are, a mariner may make what use he pleases of his stowage, because he takes it as part of his pay: besides, in such case, the water he has aboard lightens the ship as much as if it was wine; and the mariner, by throwing over his water, which by his privilege he may refuse to do, not only helps to save the ship and cargo, but to save the latter the more entire: for, if any thing the merchant had aboard of more value than wine, stood before his ton of water, it must have gone first, and his throwing his water overboard being so much for the common interest of the ship and cargo, he is allowed to come in upon an average, as if it had been a ton of wine. How far this law of Oleron prevails in our maritime courts now, the civilians must determine; but, by the common law of England, a ton of water would never be rated livre à livre, pound by pound, with a ton of wine.

ARTICLE XVII.

The mariners of Britany ought to have but one meal a day from the kitchen, because they have beverage going and coming; but those of Normandy are to have two meals a day, because they have only water at the ship's allowance; and, when the ship arrives in a wine country, there the master shall procure them wine to drink.

OBSERVATION.

The custom of giving every man a certain allowance is very ancient; and, to prevent jealousies, complaints, and disorders, that allowance is settled at so much a head, and exactly delivered out to all alike. As to the allowance of wine and meals by this article, the 29th of the ordinances of *Witbuy* agrees with it. In those voyages where wine is to be had, the master is bound to provide it for the mariners, and then they shall have but one meal a day: but, when they drink water only, they shall have two meals, Charles V. and Philip II'd's laws ordain, That the master shall order the mariners to have three certain meals a day; and, if they would have more meat, they shall only have what was left at their meals, unless upon extraordinary occasions. By the 52d article of the *Hanseaticques*, the master of German ships bound for France and Spain are not to provide victuals for their mariners when they are outward bound; but, when they are homeward bound, if the ship is let out to freight and loaden, the masters are obliged to maintain their mariners; if they return light and empty, they are not obliged. The Portuguese, in their East-India voyages, maintain both mariners and soldiers outward-bound, and allow each a pound and a half of biscuit, three pints of wine, and three pints of water a day, and 31 pounds of salt fish a month, some dry fish, garlick and onions; but, in their homeward-bound voyages, they have only biscuits and water to the Cape of Good Hope, and, after that, they live every man on his own provision.

Facilis descensus ad Indos:
Sed revocare gradum, veteremque evadere ad orbem,
Hoc opus, hic labor est.

OLE

In cases of necessity, when provisions fall short, those that have victuals aboard ought to communicate to those that have not, by the Rhodian law.

ARTICLE XVIII.

When a vessel is unladen, and the mariners demand their freight, some of them having neither bed, chest, nor trunk aboard, the master may lawfully retain part of their wages, 'till they have brought back the ship to the port from whence she came, unless they give good security to serve out the whole voyage.

OBSERVATION.

The 31st article of the ordinances of Wisbuy agrees exactly with this. The seamen's wages are not regularly due, 'till after their work is intirely done, or the time they hired themselves for expired, except there are any private agreements to the contrary. The 28th article of the Hanseaticques ordains, that their wages should be paid at three several payments; one third when they set sail upon a voyage, one third when they arrive at their port of discharge, and the other third when the ship is returned home.

ARTICLE XIX.

If the master hires the mariners in the town to which the vessel belongs, either for so much a day, week, or month, or for such share of the freight, and it happens that the ship cannot procure freight in those parts where she is arrived, but must fail further to obtain it: in such case, those that were hired for a share of the freight ought to follow the master, and such as are at wages ought to have their wages advanced course by course, that is, in proportion to the length of the voyage, in what it was longer than they agreed for, because he hired them to one certain place; and, if they go not so far as that place for which the contract was made, yet they ought to have the whole promised hire, as if they had gone thither; but they ought likewise to bring back the vessel to the place from whence she at first departed.

OBSERVATION.

This article is explained by the 8th and 16th, and what is said upon them. The 32d of the laws of Wisbuy, the 12th and 13th of Charles V, and the 24th of the Hanseaticques, are to the same purpose. By the 9th article of Philip II's laws, if the voyage is broken off by wars, pirates, or the command of the sovereign, the seamen ought to have a quarter part of the wages they agreed to have if they had completed it. In the year 1626, about October, all the English ships that were then in the river of Bourdeaux were stopped, by order of Monsieur de Luxemburg, governor of Blaye. Several of these ships were laden with wine, and some with other merchandise. They were forced to return to Bourdeaux and unload; after which the masters demanded the whole freight of the merchants who had freighted them, by virtue of the law Colonis §. novem conduxit. D. locati, inasmuch as it was not their faults that they did not make their voyage, and carry the goods to their intended port: the freight was then 15 or 16 livres a ton: the admiralty-court adjudged them a quarter part of it: they appealed to the sovereign court, who, after two hearings, set aside their appeal.

ARTICLE XX.

When a vessel arrives at Bourdeaux, or any other place, two of the mariners at a time may go a-shore, and take with them one meal of such victuals as are in the ship therein cut and provided, as also bread proportionably, as much as they eat at once, but no drink: and they ought very speedily, and in season, to return to their vessel, that thereby the master may not lose his tide; for if so, and damage comes thereby, they are bound to make satisfaction; or, if any of their company be hurt for want of their help, they are to be at such charge for his recovery as one of his fellow mariners, or the master, with those of his table, shall judge convenient.

OBSERVATION.

The reason of this law ceases now for Bourdeaux, for which place it was originally intended: for the river is so full of eating houses and taverns on both sides, that it is not likely sailors will carry any of their salt provisions on shore, when they can get fresh.

ARTICLE XXI.

If a master freight his ship to a merchant, and set him a certain time within which he shall lade his vessel, that she may be ready to depart at the time appointed, and he lade it not within the time, but keep the master and mariners for the space of eight days, or a fortnight, or more, beyond the time

OLE

agreed on, whereby the master loses the opportunity of a fair wind to depart: the said merchant, in this case, shall be obliged to make the master satisfaction for such delay, the fourth part whereof is to go among the mariners, and the other three-fourths to the master, because he finds them their provision.

OBSERVATION.

The 34th article of the ordinances of Wisbuy, and the 39th of the emperor Charles V, are intirely agreeable to this law. By the laws of the Hanseaticques, and Philip II's, the merchant is obliged to pay the whole freight, if he does not load the ship in 15 days after the time agreed upon; and, by the Theodosian Code de Navicularis, when a vessel arrives in a port laden, the merchant to whom the cargo belongs must unload in 10 days; but in our times, on account of holy-days and Sundays, the common time for unloading a ship is 15 days; but that should not hinder the paying the freight, which ought to be cleared in eight days, whether the ship be discharged or not. The master for his pay cannot detain the merchandise aboard; but, when they are in the boat or lighter, he may stop them 'till he is satisfied.

ARTICLE XXII.

When a merchant freights a vessel at his own charge, and sets her to sea, and the said vessel enters into an harbour, where she is wind-bound, so that she stays 'till her monies be all spent, the master, in that case, ought speedily to write home to his own country for money, but ought not to lose his voyage on that account; for, if so, he shall be obliged to make good to the merchant all damages that shall ensue. But the master may take part of the wines, or other merchants goods, and dispose thereof for his present necessities: and, when the said vessel shall be arrived at her port of discharge, the said wines that the master hath so disposed of, ought to be valued and appraised at the same rate as the other wines shall be commonly sold for, and accordingly be accounted for to the merchant: and the master ought to have the freight of such wines as he hath so taken and disposed of for the use and reason aforesaid.

OBSERVATION.

The 35th and 69th articles of the laws of Wisbuy are to the same purpose as this; but, by the 68th article of those laws, if the ship happens afterwards to be cast away, the master shall pay the merchant for the wines, or other goods he sold in a case of necessity, without pretending to deduct any thing for the freight. The Hanseaticques forbid any master to borrow any money on any other security but the ship's bottom, that, if she should be lost, the debt might be paid; nor do they allow him, when he is at home, to borrow any thing on her bottom, or otherwise, without acquainting the owners with it. By the 45th article of the laws of Wisbuy, the ship is bound to the merchant whose goods the master has sold in this manner, to make him satisfaction, though she should be herself sold, and have other owners.

ARTICLE XXIII.

If a pilot undertakes the conduct of a vessel, to bring her to St Malo, or any other port, and fail of his duty therein, so as the vessel miscarry by reason of his ignorance in what he undertook, and the merchants sustain damage thereby, he shall be obliged to make full satisfaction for the same, if he hath wherewithal; and, if not, lose his head.

ARTICLE XXIV.

And if the master, or any of his mariners, or any one of the merchants, cut off his head, they shall not be bound to answer for it; but, before they do it, they must be sure he had not wherewith to make satisfaction.

OBSERVATIONS on the two foregoing articles.

The original calls these pilots lockmen; for, when those laws were written, there were officers aboard all ships, called pilots, who went the whole voyage, whereas the lockmen were like our pilots, mariners hired at every river, to guide the ship; for, dwelling on the place, the lockman was supposed to know the shore better than the ship's pilot, who perhaps was never there before; for which reason he commonly required the master to have a lockman, to avoid rocks, shelves, shoals, and sands, which he must be well acquainted with by long using the river. That of Roan is very dangerous on this account, and there are sworn pilots every two leagues, to guide ships up the Seine: they are very necessary all over Brittany. The 44th and 59th articles of the ordinances of Wisbuy oblige the master to take a new pilot, if his own and the ship's crew demand one of him. The master finds him maintenance, and the merchant pays him, by the 60th article of the ordinances of Wisbuy. The loss of the pilot's head,

head, if through his ignorance or negligence the ship is lost, is taken from the Consulate, chap. 250, and answers to that known maxim in the law, *Qui non habet in aere, luet in corpore*.

A R T I C L E XXV.

If a ship, or other vessel, arriving at any place, and making in towards a port or harbour, set out her flag, or give any other sign to have a pilot come aboard, or a boat to tow her into harbour, the wind or tide being contrary, and contract be made for piloting the said vessel into the said harbour accordingly, but, because of an unreasonable and accursed custom in some places, that the third or fourth part of the ships that are lost shall accrue to the lord of the place where such sad casualties happen, as also the like proportion to the salvors, and only the remainder to the master, merchant, and mariners: the persons contracting for the pilotage of the said vessel, in order to ingratiate themselves with their lords, and to gain to themselves a part of the ship and lading, do, like faithless and treacherous villains, sometimes even willingly, and out of design to ruin ships and goods, guide and bring her upon the rocks, and then feigning to aid, help, and assist the now-distressed mariners, are the first in dismembering and pulling the ship to pieces, purloining and carrying away the lading thereof, contrary to all reason and good conscience: and afterwards, that they may be the more welcome to their lord, do with all speed post to his house with the sad narrative of this unhappy disaster; whereupon the said lord, with his retinue, appearing at the place, takes his share; the salvors theirs; and what remains the merchants and mariners may have. But seeing this is contrary to the law of God, our edict and determination is, that, notwithstanding any law or custom to the contrary, it is said and ordained, The said lord of that place, salvors, and all others that take away any of the said goods, shall be accursed and excommunicated, and punished as robbers and thieves, as formerly hath been declared: but all false and treacherous pilots shall be condemned to suffer a most rigorous and unmerciful death, and high gibbets shall be erected for them in the same place, or as high as conveniently may be, where they so guided and brought any ship or vessel to ruin as aforesaid, and thereon these accursed pilots are with ignominy and much shame to end their days: which said gibbets are to abide and remain to succeeding ages on that place, as a visible caution to other ships that shall afterwards sail thereby.

A R T I C L E XXVI.

If the lord of any place be so barbarous as not only to permit such inhuman people, but also to maintain and assist them in such villainies, that he may have a share in such wrecks, the said lord shall be apprehended, and all his goods confiscated and sold, in order to make restitution to such as of right it appertaineth, and himself to be fastened to a post, or stake, in the midst of his own mansion house, which being fired at the four corners, all shall be burned together, the walls thereof shall be demolished, the stones pulled down, and the place converted into a market-place for the sale only of hogs and swine to all posterity.

OBSERVATIONS on the two foregoing articles.

These two laws were made upon account of that inhuman droit de bris sur les naufrages, the right of lords of coasts to shipwrecks; by which those miserable wretches who were cast away, their very persons, and the goods that were saved, were confiscated for the prince who was lord of the coast. In the barbarous times men used to put this law in practice, especially the Gauls, who took all strangers for their enemies, and not only robbed them of their goods, but of their lives, sacrificing them to their false gods. From which bloody custom Hercules brought them off, according to Diodorus Siculus, lib. v. Hist. cap. 2. Pomponius Mela, lib. iii. de situ orbis, cap. 2. The Romans, though they were covetous to excess, and greedy after other mens goods, never approved of this cruelty, but condemned and abrogated the use of it to the utmost of their power, toto titulo de incendio, ruina & naufragio. Et de naufragis, libro undecimo. Codicis, leg. 1. & leg. 9. But the empire degenerating in its decadency, when so many barbarous nations poured in upon it out of Scythia and Scandinavia, and tore it to pieces, this wicked droit de bris sur les naufrages was renewed, particularly on the coasts of Gaul, called Littus Saxonicum, on account of the frequent invasions of the Saxons there. Sidonius Appollinaris, lib. viii. epist. 6. & carmine septimo. Afterwards the Normans being by chance thrown upon that coast, were immediately dispatched by the inhabitants; and, in course of time, this pretended right insinuated itself, and prevailed not only against enemies and invaders, but against any persons that were shipwrecked. Quicquid evaderebat ex naufragis totum sibi fiscus lege patriæ vindicabat, passioque naufragium miserabilis violentia principis spoliabat quam procella, as says Hildebertus Turenensis archiepisc. epist. 32 & 65.

At last the counts and dukes of Armoreck, Bretagne, and Gaul, were obliged by civility, and the request of the neighbouring people of Bourdeaux and Rochelle, to change this barbarous custom of slavery and confiscation into a tax for all such as procured licences from them; of which licences there were three sorts, brief de fauvette, brief de conduite, and brief devictuelle: the two first were to save them, in case of shipwreck, from the old forfeitures to the lord, and exempt them from the cruel droit de bris. The third was for liberty to buy provisions in Bretagne. The dukes of Bretagne established an office and officers for giving out these licences, as at Rochelle and other places. The droit de bris was also practised in Guienne, Saintonge, Artois, and Poictou, but much more civilly and humanely than it was used in Bretagne; for the lords of the coasts took only a third or a quarter part, according to the several customs; the salvors as much, and the rest was restored to the poor wretches that were shipwrecked, and their persons were free.

This barbarity is abolished in England, Italy, Germany, Spain, and France, unless it be practised against the enemies of the state, infidels, or pirates: but the Spaniards observe this custom beyond the Line against all but natural Spaniards. This droit de bris, which was not, however, so cruelly executed in Guienne as in Bretagne, was solemnly abrogated by Henry III. king of England, and duke of Aquitaine and Guienne: his edict to this purpose is registered and preserved among the rolls at Bourdeaux.

As to that part of these laws requiring traitorous pilots to be hanged on the shore, in some eminent place, to be a warning to all mariners, Andronicus, emperor of Greece, who reigned about the year 1150, ordered the same, or the like punishment, for such as made spoil of wrecks, as Nicetas reports, in the second book of his Annals. The lord Verulam, in his History of Henry VII. writes, that it was heretofore the custom in England to leave the dead bodies of pirates on gibbets near the water-side, for a warning to seafaring men.

The hanging such as are condemned for crimes committed at sea by the water-side, and some of the most criminal in chains, has been practised since in this kingdom. Those malicious fishermen who in the night make fires in dangerous places, to attract mariners thither, to the loss of their ships, by making them believe they are near ports and inhabited places, deserve the same punishment.

The word in the French which is rendered caution in English, is *belise*, properly a beacon; but in this place it is used metaphorically: for a gibbet would be an odd sort of beacon in our language. There are several sorts of these *belises*, or beacons at sea, set up to direct mariners to the right course they ought to take to avoid danger. These are very necessary in those parts where there are bars, that is entrances, where there must be high tides to carry ships over them. Sometimes buoys are made use of for *belises*, and sometimes trees, light-houses, and other things.

The burning the criminals houses mentioned in these two articles, and all that is in it, shews what an opinion the legislature had of the heinousness of the crime. Coiners were in France burned in old times, and their false money with them; their buildings were levelled with the ground, their woods felled and rooted up, and the places that belonged to them condemned and strewed with salt, as was the town of Poitiers in the reign of king Dagobert.

A R T I C L E XXVII.

A vessel being arrived at her port of discharge, and halled up there into dry ground, so as the mariners, deeming her to be in good safety, do take down her sails, and so fit the vessels aloof and aft, the master then ought to consider an increase of their wages, kenning by kenning; and if in hoisting up of wines, it happens that they leave open any of the pipes, or other vessels, or that they fasten not the ropes well at the ends of the vessel, by reason whereof it slips and falls, and so is lost, and falling on another both are lost, in these cases the master and mariners shall be bound to make them good to the merchants, and the merchants must pay the freight of the said damaged or lost wines, because they are to receive for them from the master and mariners, according to the value that the rest of the wines are sold for; and the owners of the ship ought not to suffer hereby, because the damage happened by default of the master and mariners, in not making fast the vessels or pipes of wine.

OBSERVATION.

Kenning by kenning, *veu par veu*, is a phrase used by mariners, as is also course by course, in the 19th article of these laws. These phrases are very ancient, and kenning was particularly used when navigation was performed by views, and by observation on the land from one prospect to another, Plin. lib. vi. cap. 13. which was before the invention or knowledge of the use of the compass. It signifies what the logicians, or metaphysicians, called agreement, the arithmeticians and geometicians proportion, and others express otherwise.

ARTICLE XXVIII.

If two vessels go on a fishing design in partnership, as for mackrel, herrings, or the like, and do set their nets, or lay their lines, at Olonne, St Gilles, Survie, or elsewhere, the one of the vessels ought to employ as many fishing-engines as the other, and so shall go in equal shares as to the gain, according to the agreement between them made. And if it happens that one of the said vessels, with her fishing instruments, engines, and crew, perish, and the other escaping, arrives in safety: if the surviving friends of those that perished, require of the other to have their part of the gain, as also of their fish, fishing-instruments, and boat, they are to have, upon the oaths of those that escape, their part of the fish and fishing instruments; but they shall not have any part or share in the vessel itself.

ARTICLE XXIX.

If any ship, or other vessel sailing to and fro, and coasting the seas, as well in the way of merchandizing as upon the fishing account, happen by some misfortune, through the violence of the weather, to strike herself against the rocks, whereby she becomes so bruised and broken that there the perishes, upon what coasts, country, or dominion soever, and the master, mariners, merchant, or merchants, or any one of these escape, and come safe to land; in this case, the lord of that place or country where such misfortune shall happen, ought not to let, hinder, or oppose such as have so escaped, or such to whom the said ship or vessel, and her lading belong, in using their utmost endeavours for the preservation of as much thereof as may possibly be saved; but, on the contrary, the lord of that place or country, by his own interest, and by those under his power and jurisdiction, ought to be aiding and assisting to the said distressed merchants or mariners, in saving their shipwrecked goods, and that without the least embezzlement, or taking any part thereof from the right owners. But, however, there may be a renunciation, or consideration, for salvage to such as take pains therein, according to right reason, a good conscience, and as justice shall appoint; notwithstanding what promises may in that case have been made to the salvors, by such distressed merchants and mariners, as is declared in the 4th article of these laws: and, in case any shall act contrary hereunto, or take any part of the said goods from the said poor, distressed, ruined, undone, shipwrecked persons, against their wills, and without their consent, they shall be declared to be excommunicated by the church, and ought to receive the punishment of thieves, except speedy restitution be made by them: nor is there any custom or statute whatsoever that can protect them against the aforesaid penalties, as is said in the 26th article of these laws.

OBSERVATION on the two foregoing articles.

The civil law almost every where allows all shipwrecked persons a right to gather up their shipwrecked goods. The Codex and the Rhodian laws are particular in this matter, so is king Henry III's charter beforementioned.

ARTICLE XXX.

If a ship, or other vessel entering into harbour, happens by misfortune to be broken and perish, and the master, mariners, and merchants which were on board her, be all drowned, and if the goods thereof be driven ashore, or remain floating on the sea, without being sought after by those to whom they belong, they being ignorant of this sad disaster, and knowing nothing thereof: in this most lamentable case, the lord of that place or country ought to send persons to save the said goods, which he ought to secure and to put into safe custody, and give the relations of the deceased persons who were drowned notice of it, and to satisfy for the salvage thereof, not out of his own purse, but of the goods saved, according to the hazards run, and the pains taken therein; and what remains must be kept in safe custody for one year or more; and if, in that time, they to whom the said goods appertain do not appear and claim the same, and the said year be fully expired, he may publicly sell and dispose thereof, to such as will give most, and with the monies proceeding from the sale thereof he ought to give among the poor, and for portions to poor maids, and other charitable uses, according to reason and good conscience. But if he assumes the said goods, either in whole or in part unto himself, he shall incur the curse and malediction of our mother the holy church, with the aforesaid pains and penalties, without ever obtaining remission, unless he make satisfaction.

OBSERVATION.

The keeping such goods a year is in the civil law, 1, 2 Cod. Naufragis: but the parliament of Paris, in the year 1584, pretended to reduce the time to two months, which time was to commence from the day of proclaiming such goods in pub-

lic market, and fixing a placart of it on the doors of the parish-church. The consulate provides for the salvors more largely, allowing them half of the goods saved, and the lord and the poor the other half, cap. 252. By some laws in France, as long as the goods are in being and unalienated, the merchant to whom they belong has a claim to them, paying the charge of salvage: but if, after a lawful time, they are sold, and become another's property, he has no claim to them. The casuists are of opinion, That, if he who finds them is rich, he ought to give all to pious uses; if poor, to keep all himself, Hostiensis in summa de poenitentia; and the 36th article of the laws of Oleron agrees with the judgment of the casuists.

ARTICLE XXXI.

If a ship, or other vessel, happens to be lost by striking on some shoar, and the mariners, thinking to save their lives, reach the shoar, in hope of help, and instead thereof it happens, as it often does, that in many places they meet with people more barbarous, cruel, and inhuman than mad dogs, who, to gain their monies, apparel, and other goods, do sometimes murder and destroy these poor distressed seamen; in this case, the lord of that country ought to execute justice on such wretches, to punish them as well corporally as pecuniarily, to plunge them in the sea 'till they be half dead, and then to have them drawn forth out of the sea, and stoned to death.

OBSERVATION.

To plunge them in the sea, plonger en la mer, is what the French now call *bailler la cale*, and we keel-hauling. The Goths heretofore used to practise it as a sport or exercise, Olaus Magnus Historiæ Septentrionalis, lib. 5. and lib. 10. cap. 16. And one may conceive an idea of the barbarity of the northern nations, when that was a diversion to them, which was a punishment to others; as it was of old among the Celtes and Franks, and is now among the modern navigators.

Lazy and scandalous persons had some such sort of punishment, by the customs or laws of the old Germans, Tacitus de Moribus Germanorum, num. 5. Turnus Herdonius was punished thus to death, for abusing and railing at the king. Tarquinius Superbus, T. Livius, lib. primo decadis primæ. Bawds and whores are served so at Bourdeaux; and scolds something like it in England, when they are put into the ducking-stool.

ARTICLE XXXII.

If by reason of tempestuous weather, it be thought expedient, for the lighting of any ship or vessel at sea, or riding at anchor in any road, to cast part of the lading overboard, and it be done accordingly for the common safety, though the said goods so ejected and cast overboard, do become his that can first possess himself thereof, and carry them away: nevertheless, it is here to be further understood, that this holds true only in such cases, as when the master, merchants, and mariners have so ejected or cast out the said goods, as that they give over all hope or desire of ever recovering them again, and to leave them as things utterly lost, and given over by them, without ever making any enquiry or pursuit after them: in which case only, the first occupant becomes the lawful proprietor thereof.

OBSERVATION.

The property of things thrown overboard remains in the merchants, and the finder has no right to them, unless they were thrown out with an intention to leave them there and look no more after them, c. 2. in fine, l. qui lavandæ D. Lege Rhodia, l. quod ex naufragio, D. acquirenda vel amittenda possessione Neptunus fastidiosus ædilis est. Si quæ sunt improbæ merces jactat omnes; as Plautus says in Stichot. The sea drives all things to land: maris hæc est natura, ut omne immundum, stercoreumque in littoribus impingat. Seneca naturalium quæst. lib. 3. cap. 26. On this assurance, every one that flings his goods overboard in time of danger, hopes and desires to recover them again after seeking for them, and those things non sunt in derelicto, sed in deperdito, l. si quis Merces, D. pro derelicto. It is true, what is abandoned through contempt or carelessness, belongs to the first occupiers; quod dominus ea mente abiecit, ut in numerum rerum suarum esse nolit, qui primus occupaverit statim dominus sit jure naturali. Instit. de rerum divisione 5. qua ratione, & lege 1. D. pro derelicto.

ARTICLE XXXIII.

If a ship, or any other vessel, hath cast overboard several goods or merchandizes, which are in chests well locked and made fast; or books well clasped and shut close, that they may not be damaged by salt water: in such cases it is to be presumed, that they who did cast such goods overboard, do

still retain an intention, hope, and desire of recovering the same. For which reason, those who shall happen to find such things, are obliged to make institution thereof to him who shall make a due enquiry after them, or put them to pious uses, according to his conscience, and the advice of some prudent neighbour.

OBSERVATION.

Well clasped; this is conformable to the gloss on the last law. D. Lege. Rhodia.

ARTICLE XXXIV.

If any man happens to find any thing in the sea, or in the sand on the shore, in floods or in rivers, if it be precious stones, fishes, or any treasure of the sea, which never belonged to any man in point of property, it belongs to the first finder.

ARTICLE XXXV.

If any searches the sea-coasts to fish, or find gold or silver, and he finds it, he ought to restore it all without any diminution.

ARTICLE XXXVI.

If any going along the sea-shore to fish, or otherwise happens to find gold or silver, he shall be bound to make restitution thereof, deducting for his own pains; or, if he be poor he may keep it to himself; that is, if he knows not to whom to restore it; yet he shall give notice of the place where he found it, to the neighbourhood and parts next adjacent, and advise with his superiors, who ought to weigh, and take into consideration the indigence and poverty of the finder, and then to give him such advice as is consonant to good conscience.

OBSERVATION on the three preceding articles.

There are three sorts of goods, which the sea naturally drives to land: as entire wrecks, for which the *cruet droit de bris* was in old times established by pernicious and barbarous custom: but humanity, licences, and passports have abolished it in ours. The second is what is flung overboard, for the preservation of mens lives, the ship, and cargo. Neither of these, by law nor the custom of the sea, change their proprietors; but may be claimed and recovered by them, within the lawful time appointed by ordinances and customs to claim, even while the goods are in being and unfold, as appears by what has been said in and upon the 30th art.

The third sort comprehends the two first, which are not owned and demanded by the proprietor; and besides that, includes all the treasures of the sea, which come out of it's bowels, and it naturally drives ashore; as aromatic amber, on the coast of Guienne; amber succinum, in the German ocean; red, black, and white coral, on the coast of Barbary; precious stones, fish-shells, and other riches, which the sea produces, and which, in the 34th article of these laws, are called *herpes marines*, in English, treasures of the sea, for it cannot be otherwise so fully expressed. The word *herpes* was taken from an old Gaulish term *herpir*, which signifies to take, and it's contrary, *voetpir*, is to leave.

Nor is he who first lays his hand on them, obliged to give those that are there with him a share of what he has found, unless he pleases to do it out of courtesy, notwithstanding the constitution of the emperor Leo, which is contrary to it. This is the law of nature; but princes and lords of the coast have usurped this privilege, and laid claim to all the treasures of the sea, that it throws on their royalties. The lords of the coasts, that is, of the manors or lands on the coasts of France, were notorious usurpers in this, till the reign of Lewis XIII. when cardinal Richlieu, by an order of the council, bearing date the 13th of December, 1629, took away the pretended rights of several lords, or very much abridged them; but he did not restore the law of nature in this case: he only enlarged his own and his successor's privileges and authority, he being great master, and superintendent-general of the navigation and commerce of France. This regulation of council occasioned great disorders, and the count de Olonne was particularly so enraged at it, that his officers by main force drove away those of the admiralty, who came upon his royalty. But the French kings were now masters of their subjects lives and fortunes, and it would have been in vain for such counts to, have disputed the king's edict with these words in it, *car tel est nôtre plaisir*, the standing reason of the French laws at this time.

ARTICLE XXXVII.

Touching great fish, that are taken or found dead on the sea-shore, regard must be had to the custom of that country, where such great fish are taken or found. For, by the custom, the lord of that country ought to have his share; and with

good reason, since the subject owes obedience and tribute to his sovereign.

OBSERVATION.

This law declares, that by the antient customs of countries, as well sovereigns, as all particular lords of royalties, to whom duties and tributes were due, had both heretofore certain rights to the *espaves de mer*, strays of the sea. The *coutumier de Normandie*, under the article of *Varech*, specifies what belongs to the one, and what belongs to the other; and particularly that whales and other oil-fish belong to the particular lord of the royalty where they were found; that is, off whose land they are taken on the shore: in the original it is, *a l'rive de la mer*; and how far that is to be understood to belong to the lord of that royalty, may be found in the above-mentioned *coutumier*, where the *varech* understands as far as a man on horseback can reach with his lance: for if the fish is found farther off the shore, the lord has no right to it, though it be brought or driven ashore afterwards.

ARTICLE XXXVIII.

The lord ought to have his share of oil-fish, and no other, according to the laudable custom of the country where they are found; and he that finds them is no further obliged than to save them, by bringing them without the reach of the sea, and presently to make it known to the said lord of the place, that he may come and demand what is his right.

OBSERVATION.

The *coutumier de Normandie* mentions two sorts of fish; the royal fish, which are the dolphin, the sturgeon, the salmon, the turbot, the sea-dragon, the sea-barbel, and, in general, all fish fit for a king's table: and oil-fish, as whales, porpusses, sea-calves, and the like, of which oil may be made: all other fish are the property of those that take them in the sea, near the shore, or afar off. The duke of Epsernon, which is the capital of a little territory called de Buch, had a right to the eighth penny of all the fish sold in the market at Bourdeaux, that were taken within his precinct of de Buch, the fishermen having been heretofore vassals to the lords de Buch. And further, whatever part of the province of Guienne the duke was in, those fishermen were on all fast-days bound to supply his table with fish for himself and his family; but then the duke must pay a reasonable price for them, and allow them something for their trouble. This right is called *bian*, and was, 50 years ago, in use.

ARTICLE XXXIX.

If the lord of the place pleases, and it be the custom of the country where the fish is found, he may cause the same to be brought, by him that found it, to the public and open market-place, but no where else; and there the said fish shall be appraised by the said lord, or his deputy, according to custom. And the price being set, the other party that made not the price, shall have his choice, either to take or leave it at that price; and if either of them, whether *per fas* or *nefas*, be an occasion of loss or damage to the other, though but to the value of a denier, he shall be obliged to make him restitution.

ARTICLE XL.

If the cost and charges of carrying the said fish to the said market-place would amount to a greater sum than the fish itself may be worth, then the said lord shall be bound to take his share at the place where such fish was found.

ARTICLE XLI.

The said lord ought likewise to pay his part of the afore said costs and charges, because he ought not, by another's damage, to enrich himself.

ARTICLE XLII.

If, by some chance or misfortune, the said fish happens to be stolen away, or otherwise lost from the place where it was found, after or before the said lord has visited it; in this case, he that first found it shall not any ways be obliged to make it good.

ARTICLE XLIII.

In all other things found by the sea-side, which have formerly been in the possession of some or other, as wines, oil, and other merchandise, although they have been cast overboard, and left by the merchants, and so ought to appertain to him that first finds the same; yet herein also the custom of the country is to be observed, as well as in the case of fish. But if

if there be a presumption that these were the goods of some ship that perished, then neither the said lord, nor finder thereof, shall take any or convert any part of it to their own use; but, as has been said, distribute the money it produces amongst the poor and needy.

ARTICLE XLIV.

If any ship, or other vessel at sea, happens to find an oil-fish, it shall be wholly theirs that found it, in case no due pursuit be made after it; and no lord of any place ought to demand any part thereof, though they bring it to his ground.

ARTICLE XLV.

If a vessel, by stress of weather, be constrained to cut her cables or ropes by the end, and so to quit and leave behind her both cables and anchors, and put to sea at the mercy of the wind and weather; in this case, the said cables and anchors ought not to be lost to the said vessel, if there were any buoy at them; and such as fish for them shall be bound to restore them, if they know to whom they belong: but they ought to be paid for their pains, according to justice. And if they know not to whom to restore them, the lords of the place shall have their shares, as well as the salvors; but, for preventing further inconveniences, every master of a ship shall cause to be engraven, or set upon the buoys thereof, his own name, or the name of his ship, or of the port or haven to which she belongs: and such as detain them from him shall be reputed thieves and robbers.

ARTICLE XLVI.

If any ship, or other vessel, by any casualty or misfortune, happens to be wrecked and perish; in that case the pieces of the bulk of the vessel, as well as the lading thereof, ought to be reserved and kept in safety for them to whom it belonged, before such disaster happened, notwithstanding any custom to the contrary. And all takers, partakers, or consenters, of or to the said wreck, if they be bishops, prelates, or clerks, they shall be deposed, and deprived of their benefices respectively; and if they be laymen, they shall incur the penalties aforesaid.

ARTICLE XLVII.

This is to be understood only, when the said ship or vessel so wrecked, did not exercise the trade of pillaging; and when the mariners thereof were not pirates, sea-rovers, or enemies to popery; but if they are found to be either the one or the other, every man may then deal with such as with rogues, and dispoil them of their goods, without any punishment for so doing.

OBSERVATION on the three foregoing articles.

Every one has a droit de bris against pirates. *Piratæ communes generis humani hostes sunt, quos ideo omnibus rationibus persequi incumbit, says the lord Verulam de Bello Sacro.* For which reason, according to the Civilians, *sunt ipso jure diffidati, cum quibus publice bellum habemus.* Strachia in tertia parte de nautis; and again, it is cruelty to have any mercy towards pirates, *solum pietatis genus est in hac re esse crudelem.* There is no right of action amongst them, and they have none to bring against one who attacks them or robs them. *Quia in omnium furum persona constitutum est, ne ejus rei nomine furti agere possint, cujus ipsi fures sunt.* *Lege cum qui § quarto. lege qui re sibi § primo. Lege qui res. § Si ego. De furtis, &c.* They have no action amongst themselves. *Communi dividendo lege communi §. Inter præciores. D. communi dividendo.* On the contrary, for one pirate to take from another is very lawful, and will bear no action. *Lege sed ipsi nautæ, &c.*

The text of these laws in this copy is, 'Witness the seal of the isle of Oleron, established for all contracts in the said isle, the Tuesday after the feast of St Andrew, in the year one thousand, two hundred, sixty six.'

REMARKS.

This date of 1266, is too modern, and does not agree with the time when this piece was put forth, as the learned and curious Selden, libro secundo, capite 24, de dominio maris, very well observes: so that it is thought, that this date of the time of the delivery of the copy, from whence the edition printed at Rouen was taken, as the text, and the seal established for contracts in the isle of Oleron, denotes, that it was a copy taken out by a notary from the original.

ORCADES, or the Islands of Orkney in Scotland, are divided on the south, from that part of the main land called Caithness, Pentland or Pictland Firth; which is twenty-four miles long, and from twelve to sixteen in breadth. They have the Caledonian sea on the west, the German on the east, and the sea that parts them from Shetland on the north. They are reckoned about thirty in number, and contain, ac-

cording to Mr Templeman, an area of six hundred square miles, but they are not all inhabited; the rest, which are called Holmes, being used only for pasturage for sheep and goats. The longest day amongst them exceeds eighteen hours by some minutes. Their winters are not so subject to snow as to rain, which falls sometimes in violent spouts, and the wind is often boisterous. As these islands are larger, and have more inhabitants than those of Shetland, the soil is better and more improveable; and as they are so much nearer to Scotland, there is more commerce, and much more conversation; for here are several gentlemen, of good families, who have good mansion-houses on the island where their estates lie.

The principal islands of the Orcaades, are South Ronaldsha, Swinna, Hoy, Barra, Lambholm, Flotta, Faira, Cava, Gramsay, Main-land, or the Chief Island, Copinsha, Strapinsha, Damsey, Inghallo, Stronfa, Papa-Stronfa, Sanda, North Ronaldsha, Eda, Roufa, Wire, Garfa, Eglesha, North Faira, Westra, Papa-Westra.

The chief difference betwixt these islands, is in their situation, or their being more or less mountainous. The soil in some places is extremely dry and sandy, in others wet and marshy. They produce corn in abundance, but the chief of it is oats for bread, and barley or beer corn; for they have no wheat, rye, or pulse, except in the gentlemen's gardens. They have, however, all sorts of wild fowl, partridges, moor fowl, plover, duck, teal, widgeon, rabbits, &c. and they want neither fish nor venison: so that the inhabitants have every thing to make life comfortable, except better bread, and warmer weather.

It is a very pleasing prospect to stand on the shore and behold the sea in calm weather, in the narrow sounds and passages between the islands; how the different tides run as from a sluice, as well one way as the other, and to see a boat fly upon them, like an arrow out of a bow, it being as impossible to row against them, as to shoot London-bridge against a steep fall.

In the Pentland firth, behind the island Swinna, are two great whirlpools, called the Wells of Swinna, which are sure to swallow up any vessels that come within the draught; and the passage of the firth is of itself very dangerous, because of the many strong tides, which are not less than twenty-four, and make the sea go very high upon the least contrary wind. These whirlpools are most dangerous in a calm, for if there be any wind, and the boat under sail, they are passed without danger. If the mariners, who carry passengers between the main land and the isles, happen to be drove near them by the tides, they throw a barrel, a bundle of straw, or some other bulky thing into the whirlpools, which make them smooth enough, till the vessel has passed them; and what is thus cast in, is generally found floating a mile or two off. Mean time the natives on both sides, who know the proper seasons, pass this firth every day very safe, except when the weather is tempestuous.

The trade of the Orkneys differs from that of Shetland, only in not depending upon the resort of strangers, but on their own produce. They export annually a very great quantity of corn, black cattle, swine, and sheep, as also of butter, tallow, and white salt, together with seal-skins, otter-skins, lamb and rabbit-skins, &c. Also stuffs and great quantities of very good down, feathers, writing-quills and pens, hams and wool.

Their corn in particular is sold as far as Edinburgh, from whence they bring what goods they want in exchange. But the chief of their commerce consists in their fishing for herrings, and white fish, and in their corn and cattle. *Hving NOT MERCHANTS TO EXPORT THEIR FISH WHEN TAKEN, THEY FISH FOR THE DUTCH, AND THE MERCHANTS OF INVERNESS, &c.* And though upon this account, they sometimes go far from home, yet as they are an adventurous hardy people, and good sailors, they make no difficulty of fishing in the darkest nights, though at a great distance from the island; and yet their boats are none of the best.

Their white fishing trade lies chiefly on the west side of the islands, towards those which we call the western islands.

There have been several attempts, by the merchants both of England and Scotland, to establish a fishery both in the Orkneys and the western islands; but the extraordinary expence of building warehouses, fishing vessels, &c. always rendered it fruitless till lately; besides that, the taking of the herrings in those seas, does not turn to so good an account as those taken on the east side of Scotland, the markets being more remote. Indeed, the Glasgow fishing-boats generally come up as far north as the Leuzes, and fish for herring, as do likewise the fishermen from Londonderry, Belfast, and other ports of Ireland, by whom the people of the islands are supplied with many necessaries, especially tobacco, wine, brandy, and other liquors, and some manufactures also for cloathing; but they meet with few or no returns, except fish and some oil, which the islanders make by killing porpoises, seals, and such creatures.

ORDNANCE, see ARTILLERY.

ORES. Experience daily teaches us, that metals and minerals for the most part, superabound with sulphur and arsenic, which

which are separated from them in the smelting furnace, and that the body does not become truly metallic, 'till after this separation. In reversing this operation by chemical experiments, we find, that if sulphur and arsenic be added to a metal, a mixture is produced, which no longer resembles metal, but rather an ore or mineral mass. By these sort of experiments, metal is brought back to the form of a mineral, therefore the operation is called mineralizing, and this name of mineralization is given to the action of the sulphur and arsenic upon the metal.

True it is, we cannot always produce a matter that shall resemble natural minerals, for the chemical production will often retain but a very small appearance of them: from sulphur and lead the true lead ore is produced: and from sulphur and silver a real ore, known in our mines by the appellation of glafs ore.

Sulphur and regulus of antimony will re-produce antimony; sulphur and mercury will make cinnabar, which is the ore of quicksilver; and iron and arsenic will compose a mixture of different colours. Of orpiment, filings of iron and sulphurated copper, may be made a kind of pyrites. But, from sulphur and iron, sulphur and copper, sulphur and pewter, no true ore is produced.

The two first mixtures produce nothing but a kind of mineral gravel, and the last makes a sort of pewter ore which is not natural. The celebrated Mr Henckel has already observed, that there was no occasion to employ sulphur in it's separated form for mineralization, as antimony, cinnabar, and pyrites, may be used for the same purpose. If that great man had pushed his researches still farther, and applied the same reasoning to the arsenic, he might have been, perhaps, more happy in counterfeiting the mineral which he sought (I know not for what reason) with such eagerness.

Thus it hath been concluded from experience and observation, that sulphur and arsenic are the two substances which reduce metals to the state of ore, and preserve them in that form. Yet we think, 'that sulphur and arsenic are the only two substances by which metals are found in the state of ore.' On the contrary, are there not certain kinds of earth, without any appearance of sulphur and arsenic, which nevertheless are capable of preserving metals in the form of ore, and of mineralizing them by chemical operations?

If the true and natural mineralization of the metallic particles does not absolutely depend upon the force of the acid, but rather is mechanically performed, as in all probability it is, a certain earth may insinuate itself between the metallic leaves and particles, and keep them separate as well as sulphur and arsenic. Now, if this earth is neither fluid nor thinning, the ore will not be looked upon as a mineral, and very little metal will be extracted from it in the assay. If, on the contrary, this earth is tinged by the metal which it contains, and appears brown, red, yellow, green, or blue, then the colour testifies that it is impregnated with metal. From these sorts of earth the assay-makers produce gold, silver, copper, &c. and it cannot be denied that these metals are mineralized in these earths, although they contain no sensible portion of sulphur or arsenic; for these two matters soon manifest themselves where they really are, by the fumes and scent which they exhale upon the fire.

It will, perhaps, be alledged, that these earths are formed of ore which has been altered by time, which hath expelled the sulphur and arsenic by which they were formerly mineralized; but to this allegation it may be answered, that at least something vitriolic should remain from the sulphur, and that the arsenic should leave a kind of rust which is found in other minerals, though no such thing is found in these earths: besides, these earths are extremely compact, so that we cannot presume they have been altered by time, which generally renders them altogether porous and juicy: and they are moreover properly and naturally situated in forms of beds and layers, a circumstance that is not to be observed in earth, which has been altered by time and air.

To these natural indications, let us add the operations of art, which represent something of the same appearance. A mineralization of metals, resembling that which we have mentioned, is made between pewter and lead. Pewter reduces lead to a kind of earth or ashes: zink mineralizes gold, though in a different manner: but we shall here confine ourselves to pewter and lead. Pewter being very earthy, partaking very little of the nature of glafs, and having besides very large pores, it's phlogiston easily evaporates in the fire: when mixed with lead, it likewise deprives that metal of it's phlogiston, which it allows to evaporate.

This example will explain what is properly understood, by the mineralization of metals, by means of earths; but, if we would examine this matter to the bottom, let us consider how the crocus of Mars, when mixed in a metal, not by the art of man, but by accident, hinders it from being refined in the fusion.

A sulphur abounds with vitriolic acid, and arsenic is a violent corrosive, which likewise exercises it's acid by corrosion, it is plain that these two matters mineralize metals in quality of acids. This may be granted, without contradicting what has been advanced above: for, when a metal is melted, or

very compact and solid in it's texture, certain it is all earth cannot penetrate this mechanic texture, and insinuate itself into it's pores, which can only admit a subtle, fluid, acrimonious earth: now, this subtle, fluid, acrimonious earth, is no other than an acid; consequently an acid, as such, mineralizes metals. Whence may we not enquire, whether sea salt, which likewise contains an acid, many not mineralize metals?

This salt reduces lead and regulus of antimony to ashes in the fire; but, as every body will not allow that this change into earth is a mineralization, we will quote other examples to be seen in the same manner, in these three matters, namely, in a mineral, in a metal mineralized, and in a metal strictly allied with the acid of kitchen salt.

This last is a Luna cornua, or again, a Saturnus cornuus, which after these metals are dissolved in aqua fortis, have been precipitated by kitchen salt or it's acid. With regard to the two first of these matters, we may chuse, for example, a mineral, or metal mineralized, and make the trial upon either, and we may be certain that the experiment will not fail, if properly conducted.

The effects of the mineralization by nature and art, are these.

(1.) Part of the metal is volatilized in the fire. (2.) The minerals will not amalgamate with mercury. (3.) They will not be dissolved by mercury. And (4.) part of the metal enters the scoria. Lead and silver which resemble the cornua, produce the same effects, the fourth of which is likewise produced by salt upon copper and iron.

Indeed the possibility and imitation of mineralizing metals by the acid of kitchen salt, is manifested by the preceding experiments: but it is not enough to know these effects, for the principal point is to learn, if nature acts in this manner of herself; consequently we must change the question, and endeavour to know, whether there are not actually in nature, metallic ores which have been mineralized by the acid of kitchen salt?

We shall first speak of iron ore, which in some shape ought to be divided into two kinds; for, when dissolved, it becomes a reddish or yellow earth. We mean it's natural, rather than artificial solution. Every body knows, that when iron ore continues long exposed to the vicissitudes of dry and wet weather, it in time degenerates and dissolves into a kind of earth and clay.

In this condition it is frequently found in the earth, where we see it some times degenerated through and through, or at least externally, and changed into a red or yellow earth, which ought to be considered as a crocus martis naturally formed, and the colour ought to ascertain the saline quality with which it is mixed. Now, we know from chemistry, that iron treated with sulphur or vitriol, yields a red crocus. The colcothar, or caput mortuum of vitriol, is no other than such an earth of iron, &c. Chemistry likewise teaches us, that iron dissolved in the acid of kitchen salt, appears yellow in the solution, and that in drying or precipitating it exhibits a yellow earth or clay. These experiments should seem to demonstrate the causes of the red and yellow iron ore; the first seems allied with the acid of sulphur, and the yellow with the acid of kitchen salt; whence it results, that kitchen salt preserves mineralized metals even in their natural state.

It will perhaps be objected, that we have quoted the only example that is to be found in nature: but, provided the truth of this example is granted, it ought to serve in the same manner, with regard to a great many other minerals, since we find abundance that contain such a yellow iron earth in their texture; consequently, where-ever it is found, we may presume there is an acid of kitchen salt. We shall, therefore, proceed no farther in minerology, otherwise we might deduce the same proofs from the blue, and bluish minerals of the copper.

Almost all the minerals of lead would confirm the proof; for it precisely resembles what is called lead ore, and of consequence can be no other than the mineral of lead corroded by an acid. Nor is it more difficult to determine what that acid is, which thus corrodes it's mineral through it's whole extent; for the small pieces of pyrites found still in their natural state within the mineral, prove that the acid, which formed this natural lead mine, must not have been of the strongest kind, since it could not dissolve the pyrites. But as all we propose in this place is by way of question, we do not pretend to decide upon any thing.

I shall, however, answer another objection, which may be made even by those people who are most conversant with minerology: they may alledge, that the vitriolic acid and arsenic, each simply considered as an acid, are not capable of effecting a mineralization; but, both being combined with an inflammable earth, they derive principally from thence, the power of producing the form of a mineral; but, they will add, where shall we find the acid of common salt combined with an inflammable earth, so as to produce the same effect? To this question it may be replied, that art combines the acid of kitchen salt with a phlogiston, when the phosphorus is made; and this instance will serve, when they would push the proposition still farther, and confirm it by experiment. 'But in the earth (say they) no phosphorus is either made

* made or found.' True, but in lieu of it, we find in sea-coal, the acid of kitchen salt abundantly charged with phlogiston: a convincing proof, that it is also naturally found in a condition not at all improper for naturalization.

In fine, some person may ask what purpose can be served by these theoretical questions, and subtle enquiries? It would be easy to assign a very good reason, if the questions we have proposed were answered. But, that no body may think they are thrown away, without having any view to manifest utility, either in theory or practice; we shall observe, that perhaps, by a precise solution of these questions, mineralogy might be reduced to better order, and carried to much greater perfection. Minerals are commonly divided into certain classes, according to the metals and demi-metals; but as each class includes a good many kinds, there is a necessity for inventing a great number of sub-divisions. Would not the best way be to divide the mineral of each metal according to its mineralizing substance? For example, the minerals of silver are mineralized sometimes by sulphur, sometimes by arsenic, and sometimes by the acid of kitchen salt, &c.

Thus we speak more conformably to nature, and this order may be observed in ranging them afterwards, according to the kind of rock, the limits of the mine, the layers of the earth, &c. Now as hitherto, nothing has been written or said of any matter or mineralizing substance, except sulphur and arsenic, and as we here give some concise instruction touching a third mineralizing acid, which is kitchen salt, it is easy to conclude that mineralogy by this means, gains an increase of one third; and that in the sequel, we may discover a number of other minerals of this new division, which are not now known to be so, or at least, cannot be ranged in any class. By this likewise we give the key to an infinity of minerals, about which disputes have been hitherto maintained, to know if they are true minerals or only crude productions of mountains: we mean, all kinds of volatile minerals, or such as cannot be put in fusion or separated, and those which appear in veins, as well as others in the mine, but are taken out in form of grains, &c. in which it is agreed that there is gold, silver, copper, &c. These are looked upon as unripe, as well as the pyrites found at a distance from gold and silver, the minerals of talc, &c.

In regard to influences of this nature, the reader may remember what has been said above, concerning the mixture of common salt with the phlogiston, and of the sea-coal thence formed; and add to this, after the lights with which we are furnished by natural history, that agat is (if I may be allowed the expression) the noblest kind of pit-coal; hence we perceive, that the same acid may represent a mineral either in form of coal, or as a black stone that shines like ice.

We know, that all these observations will appear to some as so many dreams of the imagination, and may be received as such by our ordinary miners: those especially who boast of the productions of mountains, as of mineral metals, neither say nor prove any thing of their natural state, mineralization, separation, &c. The greatest part of them, repeat only what they have heard from other people, and utter what they have been told, without having made any reflections or researches of their own: thus a good cause is often very illy defended. On the other hand, those who decry the same minerals, pretend to have made unsuccessful trials of them, and think they have a right to dispute on the strength of their experiments, which are for the most part unskillfully made. But if we would not overthrow all historical certainty, since proofs are to be found even at this day, the places from which the minerals have been taken, the minerals themselves, and the descriptions which several people have given of them, in the course of so many ages, which agree perfectly well together, we ought at least to suspend our judgment in this respect. We are willing they should compare past times' to a dream, provided they will endeavour to shew that they themselves are now thoroughly awake.

We ought likewise to say something of the practical utility of these theoretical researches. According as mineralogy is divided, so the forges ought to be disposed: we ought carefully to attend to this point, which is of great consequence for a good theory and system in the science. At first, people were obliged to divide the forges according to the metals and demi-metals, and even according to the salt-pits; it is of no consequence, though silver, copper, and lead, be worked in the same forge: this they are obliged to do in those places where these metals are found together, but where each metal is alone, it is wrought by itself, and then there is a natural process of the font for each.

Now, as the minerals of each metal are divided according to their different mineralizing principles, so the processes of the font ought to be different, according to the mineralizing principle which is mixed in each. There is a particular kind of font for those minerals which contain sulphur, and this is what is called working rough or plumb. The arsenical minerals are of this number, but they must first pass through the fire, and then they can no longer be properly reckoned among the arsenical minerals. But, a method of fusion quite different is required for metals, which are entirely arsenical, without any mixture of sulphur: and a different method of

fusion must likewise be observed with antimonial minerals. Consequently, a particular method must be used with minerals that are mineralized by the acid of kitchen salt.

We shall not expatiate upon this, for it is easy to conceive with what eye certain workmen of forges will regard us, if we undertake to introduce what they have never thought of. That, therefore, is not our intention. We shall content ourselves with having shewn by example, how much theory might influence practice, and to have explained, in a few words, that by improving the science of mines, the revenues of these works might be considerably augmented. Some may slight these suggestions to their loss. While in working a mine, every thing remains upon the old footing, and people are satisfied with finding from time to time, some little new advantage; certain it is, the profit can never become very considerable: but, if we could discover new kinds of minerals, and invent proper methods for melting and separating them, such discoveries would become very important, and furnish fresh matter for more useful speculation. I will not presume to say that we are capable of making such discoveries, but think that it would be no difficult matter to attain to such improvement, by a more careful cultivation of the science of ores, minerals, and mining, than that which is at present practised.

It is with this view, that we endeavour to put the sentiments of the most judicious in their proper light, in order to lay the foundation for such improvement, in form of questions and problems: and with some reason for believing, that these principles may be found true by undoubted experience. We leave the solution of them to those who are our superiors in point of knowledge. After all, practice alone must decide the matter. It is she who confirms all arguments, and rectifies all systems; and we know nothing positively, until it hath been sanctioned by her. But we ought to acknowledge at the same time, that she must be preceded by rational theories, which are the lights that conduct her researches into the secrets of nature. Without their assistance she gropes along, blindly following a beaten track; and whatever progress she makes, must be owing to chance, from which she ought to claim no merit.

For what further relates to the whole business of ores and metals, see the following articles, viz. *AQUA FORTIS*, *AQUA REGIA*, *ASSAY*, *BULLION*, *COPPER MINES*, *LEAD*, *TIN*, *IRON*, *MERCURY*, *SILVER*, and *GOLD*; also *FLUX*, *METALS*, *METALLURGY*, *MINES*, *MINING*, *MINERALS*, *MINEROLOGY*, *SMEETING*.

O R I E N T A L T R A D E. Under the article *LEVANT TRADE*, we have shewn, from the principal authentic royal arrests, edicts, and ordonnances, issued by authority in France from time to time, from the year 1665 to the year 1749, what measures the French have taken for the regulation of the Levant trade of that kingdom; whereby it appears from *FACTS*, to what causes the present flourishing state and condition of that commerce in France may be attributed, and by what steps this rival nation has supplanted the English in this branch of traffic. We have likewise under the same article, represented the genuine regulations of the Dutch, in relation to their Turkey trade. The policy of other nations being fairly laid before us, and compared with our own, we may be enabled to make a right judgment, whether the measures taken by our competitors, are preferable or otherwise to our own, and wherein our defects may be so supplied, as, at least, to empower us to carry on this commerce in the Ottoman empire, upon a footing not less advantageous than that of other states. And, without our taking these things into due consideration, this kingdom can never be capable of regulating her commerce in any branch to the best advantage, or to an advantage equal to that of other countries. People may declaim and controvert to eternity, concerning the necessity of this or the other measure being requisite to be taken by the legislature, but without having the policy of rival states fairly laid before them, they will be ever liable to be misled and deceived in matters of the last importance to the interest of trade. And yet it is to be feared, that as well in the solemn deliberation of the great council of the nation, as in our disputes without doors, these matters are, in the general, too little enquired into, notwithstanding they are the essentials whereby to steer and direct the public judgment.

As under the article of *LEVANT TRADE*, we had not room to state our own case in regard to this branch of trade, we have referred to the articles *O R I E N T A L T R A D E* and *T U R K E Y T R A D E*, that all facts and materials necessary may be exhibited before the public, whereon to bottom their judgment with respect to the means requisite to be taken by this nation. Wherefore,

Here we shall give an historical view of the conduct and proceedings of our own Turkey company.

AN HISTORICAL VIEW OF THE CONDUCT AND PROCEEDINGS OF THE TURKEY COMPANY.

The company trading to the Levant Seas having subsisted, as an exclusive society, one hundred and forty-seven years, the most impartial and certain method of attaining to a clear

and perfect knowledge of the advantages, either of continuing the exclusion, or opening the trade, is to take an historical view of their conduct and proceedings, from their first establishment to the present time. For, though arguments may be controverted, and reasonings opposed, yet plain facts are unanswerable, and will speak for themselves: therefore, it was thought proper to lay before the world in this public manner, especially before the honourable members of both houses of parliament, the true state of the case, as drawn from the books of the company themselves, and from other authentic evidences, for the use of the committee of the honourable house of commons, in the year 1743-4. This committee was appointed the 16th of February, in consequence of several petitions sent up to parliament, from divers parts of the kingdom, complaining of the great decay of the English trade to Turkey, and the increase of the French on the ruin of ours; and ascribing both these national evils to the monopolizing view of a few individuals, who checked and restrained the natural course of trade, by means of their exclusive powers.

The company likewise presented a petition in their own behalf, setting forth the nature of their charter, their exclusive privileges, manner of trade, and the like: but as these things will occur in the course of the subsequent narration, it will be needless to insert them here. The narration proceeds as follows:

This company now exists, by virtue of letters patent granted by king James II, bearing date the 14th day of December, in the third year of his reign, 1606.

And of king Charles the II, bearing date the 2d of April, in the thirteenth year of his reign, 1661.

King James, by his letters patent, did (among other things) grant to several persons therein named, and to their sons, and such others as should then after be admitted, or made free, that they should be one fellowship, and one body corporate and politic, by the name of the Governor and Company of Merchants of England trading to the Levant Seas, and should have perpetual succession: and did direct, That all persons, subjects of this realm, being then mere merchants, which then were, or after the date of the said letters patent should happen to be, under the age of 26 years, or not out of his or their apprenticeship, should be admitted into the freedom of the said company, if he or they should demand the same, within one year next after he or they should attain the age of 26 years, or within one year after the end of his or their apprenticeship; and should pay to the said governor and company, for his or their admittance, the sum of 25l. And did further direct, That all persons subjects of this realm of England, being mere merchants, above the age of 26 years, should be admitted into the freedom of the said company, upon paying a fine of 50l. And did also direct, That all and every the sons of such as were or should be free of the said company, and also all their apprentices employed in that trade, for the space of three years or upwards, within the limits of the said letters patent, should, after the end of their apprenticeships, be admitted into the freedom of their said company, on payment of the sum of 20s. only. Company's books, viz. Letters patent, p. 1, 2, 3, 6, 7, 8, 9.

And, as the petition of the said company sets forth, several other privileges were granted by the said letters patent, to the said company.

Amongst which, all persons who traded to the said Levant Seas, and were not free of the said company, were obliged to pay to the said company 20 per cent. upon the value of the goods, Page 22.

And they had power, at a general court, of making by-laws, for the good rule and government of the said governor and company, &c. and a power of revoking the same, as occasion should require; which were to be performed and kept, under the pains and penalties therein mentioned, so as the same were not contrary or repugnant to the laws and statutes of this realm, or derogatory to any treaties or leagues made, or to be made, with any other prince or potentate, nor tending to the hindrance of the trade or traffic of any of the said company, behaving him or themselves duly and orderly, as becometh good merchants of the said company, without any fraudulent or disordered attempts or practices. Page 16.

King Charles, by his letters patent, did ratify and confirm the said letters patent of king James; and did further direct, That no person residing within 20 miles of the city of London, should be admitted into the said company, or have any benefit of the privileges thereof, unless he was made free of the said city. Page 36.

Now, under pretence of making by-laws for the good rule and government of the members of this fellowship, the said company (or rather the greater part of them) have frequently exercised a power of restraint upon their own members (tending to the hindrance of trade and traffic), by making orders to lay a broke [penalty] of 20 per cent. upon their goods, if they sent them to Turkey at any other times, or in any other ships, than those appointed by the company, which are called joint or general ships; so that if any merchant (though a member of the company) had never so large a quantity of cloth by him, and the want of cloth in Turkey

was never so great, he could not send it, but at such times, and in such ships, as the said company appointed, by reason 20 per cent. is equal to a prohibition.

Some remarkable instances of which, as well in early as late times, will appear, by copies of orders of general courts, which are hereafter stated, as also the method in which the trade has, from time to time, been carried on.

There was an order of general court, That no manufactures or commodities of this kingdom should be sent from hence, or from Leghorn or Messina, or any other parts of the Straights, to Constantinople, Smyrna, Scio, or Scanderoon, but in joint ships appointed by the company, under the penalty of a broke of 20 per cent. upon the value of all such manufactures or commodities, to be levied where any such goods were landed; but foreign commodities, as spices, pepper, &c. were excepted, and allowed to be carried in what shipping any man pleases. In 1625, 6 April (Company's books, page 127.)

It was ordered, according to an order of the last court, That no ship go from hence for any of the ports of Turkey, before the going of the joint shipping, which is appointed to be at Michaelmas next. In 1627, 2 Aug. (Page 172.)

And for that there were then great quantities of cloth to be sent thither, it was conceived fit, that a restraint for a certain time should be made for all other shipping, that so the markets might not be overcharged with commodities, to the undue valuing thereof in the sale: it was resolved, upon the question, by erection of hands, That no ship should depart for any of the ports of Turkey, laden with English commodities (tin excepted), after the departure of the next general shipping, without the consent of the company, at a general court, until Michaelmas come twelve months, under the penalty of a broke of 20 per cent.

And that no private ship do go from Leghorn to the Levant with money, &c. to engross the commodities, and to prevent the company's market, upon the abovesaid penalties.

It was the opinion of the court (i. e. the court of assistants), That, both for the keeping up the price, and maintaining the cloth, and other English commodities, in good esteem in Turkey, and so advance the sales thereof there, and the returns at home, &c. the trade to Turkey should be restrained to joint shipping; and it was ordered (if the next general court should confirm the same) That no particular ship should be freighted by any member of the company, and no English commodities laden (tin excepted) to any part in Turkey (Petrass excepted), but upon joint ships, as the company should at their general court appoint, under the broke of 20 per cent. In 1630, 2 March (page 231.)

This order was confirmed by a general court, 9 March, page 232.

But see the effects of these restraints; for by a letter of the 13th of June 1631, from the consul at Aleppo, it appears, that there was but a small quantity of cloth in the factors hands at that place; and that it was probable, all would be sold before any supply could get there

This letter being read in a general court, it became their consideration, Whether they should dissolve the act of restraint, and to give liberty to send ships to all the parts of Turkey? But they only ordered one general ship for Aleppo, to depart from Gravesend before Christmas-day. In 1631, 5 Octob. page 243.

The said order was taken into consideration, and a further order made to send a ship to Constantinople, to depart by the last of March; and it was ordered, that at Christmas come twelve months, That a ship shall go to Constantinople, and another to Aleppo; and so constantly, from and after that time yearly, unless the company should, upon weighty reasons, think fit to order otherwise. 20 Octob. page 244.

The bad effects of these restraints still continuing; The court fell into discourse, among other things, of the inconveniencies likely to ensue by the long forbearance of sending ships and goods into the several parts of Turkey; whereby the French, and other strangers, have the advantage, and take occasion to supply those places with commodities; which will redound to the great prejudice of this company and their trade, if some speedy course be not thought of for preventing thereof: and hereupon it was moved, That there might be a yearly shipping resolved on; or, in regard there is like to go very great quantities of goods upon the next ships, that another shipping might be appointed to go away at Michaelmas come twelve months, and yearly from that time, &c. but nothing was then determined, but left to the next general court. In 1633, 9 Jan. page 104.

The proceedings of the general court, among other things of the 9th instant, were read, approved, and confirmed. 14 Jan. page 105.

This last proceeding of the general court is mentioned to shew, That even in these early times, when the French

French or other foreigners had little or no share in this trade, the members of the company, who had the public good at heart as well as their own welfare, foresaw the bad consequences that would ensue from these restraints; and would have remedied the same, if the private gain of the rest of their fellowship had not overbalanced the general good of the trade.

However, from this time to the 10th of May 1649 (see the orders 12 Jan. 1635, 17 Febr. 1637, and 27 Octob. 1645) the trade was carried on by general annual shipping; and then it was resolved, That the trade should be open for every member of the company to lade when, and in what ships he pleased, under such restrictions as the company should see fitting 1635, 12 Jan. page 209. 1637, 17 Febr. page 296. 1645, 27 Oct. page 192, 1649, 10 May, page 31. From this time to the 6th of August, 1655, it was carried on by general annual ships (see the orders of the 25th of August, 7th of December, and 25th of January, 1654) when general ships, to depart at such times as the company should appoint, were resolved on. 1654, 25 Aug. page 216. 7 Dec. page 232. 25th January, page 235. 1655, 6 Aug. page 256.

But this restraint was thought too great; and there being two private ships laden for Smyrna, it was resolved, on the 3d of September, 1656, That liberty be given to any of the company to ship when he pleased. 1656, 3 Sept. page 289. From this time to the 30th of November, 1660, the trade was carried on by private ships; and then it was confined to general ships under the usual penalty of 20 per cent. on all goods, and so continued 'till the 4th of October, 1664, when it was resolved, That the company would adhere to their former order for annual shipping. 1660, 30 Nov. page 7. 1663, 11 Sept. page 156. 1664, 4 Oct. page 229. From this time to 1683, the trade was carried on by annual and general ships: and, from 1683 to 1713, sometimes by private ships, and sometimes by general ships.

From the 5th of June, 1713, in the 12th of queen Anne, since the conclusion of the then war, to the latter end of the year 1717, the trade was carried on by what is usually called an open trade; that is, by such ships as the respective members did appoint to carry away their cloth, and the cloth or such other members as might be pleased to load upon them, to depart at such seasons of the year as was found to be most convenient, which was usually in autumn, or by Christmas; and the cloth ship, in 1717, departed about that time.

And many members of the company, expecting the trade would continue to be carried on in the same manner, went on in buying and finishing of cloth, as usual, for the year 1718:

But, on the 26th of March, 1718, it being under the consideration of the general court, whether the trade should be carried on by general shipping, it was resolved in the affirmative, and the further consideration thereof adjourned to another general court to be held on that day month, being the 23d of April next. 1718, 26 March, page 213.

N. B. General ships, you will please to observe, by the aforesaid orders, are always chosen by the company as a body collective, and do depart at such seasons as they think proper to appoint.

The said resolution was considered and confirmed; and it was also resolved, That the said order should not be revoked without the previous notice of a month given to the members of the company. 1718, 23 April, page 215, and 216.

Then it is recited, 'Whereas the trade from hence to Turkey hath been carried on, for some years past, to a very great extent, in cloth and other woollen manufactures, and in money, in far greater quantity and value than that country hath usually taken off, whereby the markets there are over-stocked, and our commodities depreciated, and the price of raw silk, and other returns, very much advanced there, and fallen here, to the great detriment of this trade in general, and of this company in particular; and to the end that a proper time may be given to our factors, to dispose of our estates in Turkey to advantage, and for reducing the prices of goods usually sent for returns, it was resolved, That, if any member of the company should import into Turkey from hence, or from any part in Christendom, any cloth, or any gold or silver, in coin or bullion, by other than general ships, to be appointed by the company, shall be liable to a broke of 20 per cent. upon the full value thereof, to be levied into Turkey.'

Upon this Sir John Eyles informed the court, 'That he had bought up 500 cloths, and desired that, notwithstanding the resolutions now agreed on, the company will please to give him leave to send the same to Turkey: and a motion was thereupon made, that the question be put, Whether leave be given to such members of this company as have

provided cloth for Turkey, upon their affirming, upon the oath they have taken to the company, That they had bought the same before they had any intimation of the said resolution? And, a debate arising thereupon, the previous question was put, Whether the question be now put? and it passed in the negative: and it was resolved, That the company would, on the 23d of October next, and not before, consider at what time it may be most proper to take ships into the company's service.'

This order was confirmed. 1718, 30 April, page 217.

The 23d of October elapses; and, on the 6th of November, 1718, the court was called to consider what time would be most proper to take ships into the company's service; and it was resolved to defer it until some time longer. 1718, 6 Nov. page 232.

Then a motion was made to affix the time to which this consideration should be deferred; and one week, one month, two months, and three months being proposed, the question was put for each time mentioned; and it was resolved to be deferred for two months longer.

Upon this further delay, a representation was made to the then ministry, who were so sensible of this extraordinary proceeding; and the prejudice it must be to the common good, that Mr Secretary Craggs sent for the company, and informed them, That he had received such a complaint, and recommended it to the company to come to such resolutions as would prevent the consequences which might attend the said complaint, should it come before his Majesty and his council, or before the parliament.

This matter came under the consideration of a general court, held on the 4th of December, and they resolved, That, on the 8th, they would proceed on the election of general ships for Turkey. 1718, 4 Dec. page 237.

And, at the same time, a committee was appointed to wait on Mr Secretary Craggs, to return him thanks for the respect he had shewn the company.

Instead of appointing ships, it was resolved only to receive proposals for ships; and a committee was appointed to view them, and make a report on Thursday the 22d. 1718, 8 Jan. page 247.

It was resolved, That the company would adhere to their order for their driving the trade by general ships. 1718, 22 Jan.

Then it was proposed, That a sufficient number of ships be taken up to carry the cloth, that was then ready, to all parts of Turkey, by the first opportunity of convoy to the Mediterranean; and it passed in the negative: and it was resolved That the company would very suddenly chuse general ships to all parts of Turkey, to be ready to depart by the 1st of July next.

N. B. The 1st of July was then generally understood to mean winter, as the ships usually had departed at that time, which would have completed two years prohibition.

This being the case, several members of the company, who had provided large quantities of woollen cloth, and other goods, for Turkey, applied to the house of commons; and, on the 24th of January, 1718, a committee was appointed to consider of the state of the woollen manufacture of this kingdom, and particularly in relation to the exportation of woollen cloth.

This committee sat, in pursuance of their appointment; and, on the 3d of February, the complainants attended, and delivered to the committee a representation, setting forth the then state of that trade, and the inconveniences arising from the delay of shipping; which is signed by P. Delmé, John Lock, Ro. Radcliffe, Edward Radcliffe, James Lock, John Hanger, and Joseph Eyles, who were some of the most considerable merchants in the Turkey trade at that time; which paper has been in the custody of Mr Kenn ever since, who attended the said committee as clerk; no report being made, the complainants being made easy by the governing part of the company, at the intercession of Mr Secretary Craggs.

This application occasioned a general court to be held; on the 6th of February; and then it was resolved, That the trade should be carried on by a general annual shipping. 1718, 6 Feb. page 254.

And a general court was held; and, at the desire of the complainants, two general ships were chosen, and appointed for Smyrna and Constantinople, to depart from Gravesend the 15th of March, 1715; which makes the prohibition two years and a quarter. 1718, 12 Feb.

The last order is recited; and also that it was intended, that other general ships be in like manner chosen and appointed for Scanderoon, and for Smyrna and Constantinople, if desired by any member of the company to depart the 1st of July. 1718, 24 Feb. page 271.

And it was resolved, That from and after the departure of the aforesaid general ships, no other general ships should be appointed until Midsummer, 1720.

It is recited, That the trade was carried on to greater advantage by general than by private ships, if annually appointed : to the end, therefore, that the said trade may again revive, It is resolved, That, for the future, general ships shall be annually chosen, and the time of their departure to be about Michaelmas :

And that, if the company shall not appoint such ships, it shall be lawful for any member of the company to send cloth, or other woollen manufactures, by any ship, to depart from Gravefend on or before the last day of October ; provided such ships be not less than 200 tons, British-built, &c.

The same orders continued : 1722, 8 June.

And the trade was carried on by annual general ships, 'till the 2d of June, 1731, when the choice of general ships was suspended for twelve months longer. 1731, 2 June, page 226.

From that time, to the 14th of May, 1734, it was carried on by annual general ships ; but, on the 25th of October, 1733, it was ordered, that the ship sent out this year to Scanderoon should not be allowed to bring home any silk, or mohair yarn. 1733, 25 Oct. page 219.

And on the said 14th of May, 1734, it was resolved, That the trade should be carried on by general ships. 1734, 14 May, page 7.

And the order of the 21st of October, 1724, for the general court to chuse ships, was repealed ; as also the article for the time of the ships departure :

And the 10th article for allowing private ships, when no annual general ships were appointed :

And it was resolved, That the company will, at a proper time, agree when they will take up ships for the service of the year.

From this time to 1735, the trade has been carried on by general ships :

And, from the 17th of June, 1735, to 1743, by general annual ships ; with a proviso, that, if the several ships were not provided to depart at the stated times, it should be lawful to send cloths, or woollen manufactures, by any other ships, provided such ships be not less than 200 tons, British-built, and to carry 15 men for every 100 tons they are in burden. 1735, 17 June, page 48.

N. B. These are called act ships (vide the 14th of king Charles II.)

So that the trade to Turkey, from 1718 to 1743, has been restrained to annual general ships, to be appointed at stated times ; or general ships, to be appointed when the company should think fit ; notwithstanding the strong reasons given against carrying on the trade under such restraints, in the representations delivered to the committee of the house of commons in 1718 ; which representation is as follows :

The complainants do admit, That the company have, time out of mind, carried on their trade to Turkey sometimes by private ships, sometimes by general ships : they desire only to remind the honourable committee, that, by the whole tenor of those old records by the company produced, it does appear, that they themselves have frequently thought the delay of shipping of so dangerous a consequence, that, if they departed not annually, liberty was then given to each and every member, to export his own goods in such manner, and by such ways, as he should think proper :

And the complainants think it unnecessary to enter into the consideration what trade was, or how driven, 50 or 100 years ago, in it's infancy ; or whether the Dutch or the French had any or no trade in those days :

They desire to come to the present times ; and to consider in what methods of trade the company have been, since the conclusion of the last war, and the alterations they have lately made : and it appears to have been carried on by what is usually called an open trade, that is, by such ships as the respective members did appoint to carry away their respective cloth, and the cloth of such other members as might please to load upon them, to depart at such seasons of the year as were found to be most convenient, which was usually in autumn, or by Christmas.

Accordingly, the last cloth ships did depart about that season of the year, anno 1717 ; and many members of the company expecting the trade would continue to be carried on in the same manner, went on in buying and finishing cloth, as usual, for the year 1718 :

But, on the 26th of March, 1718, the company in a court resolved (as they themselves have related it) that their members, for the future, should trade only by general ships ; which was understood to be, by ships chosen by themselves, as a body collective, and to depart at such season as they should think proper to appoint :

And, on the 23d of April, 1718, they resolved, That if any members should, in any other manner, send cloth to Turkey they would levy 20 per cent. on such members cloth in Turkey ; and added, that they would consider of general ships on the 23d of October following, and not before :

And in their own preamble (as it was here read) they give this remarkable reason for their alteration, That it was in order to raise the value of English manufactures abroad, and

silk at home ; hereby evidently demonstrating their private advantage, that of the nation, doubtless, lying more in a large confume than in a large price, as the one may beat our neighbours out of the trade, whilst the other must necessarily give them a share in it. Now, although many members thought all this a great hardship, yet did they acquiesce, in full expectation that, at that time, they should be permitted to export their cloth (at least) in the company's own way : But, on the 6th of November, they resolved to adjourn the further consideration of shipping for two months longer ; and this made that evident, which was before suspected, that they really intended no shipping at all :

Whereupon, a representation of this grievance was made to the ministry, who became so sensible of this their extraordinary way of proceeding, and it's so highly interfering with the common good, that Mr Secretary Craggs sent for the company (as they themselves have observed) and desired them to reconsider this matter :

Which the company did, in a general court on purpose assembled, on the 4th of December ; when they resolved, that they would chuse ships for the immediate exportation of cloth, on the 8th of January following, and appointed a committee to attend Mr Secretary with this their resolution :

But, when the 8th of January came, they, by a majority of one vote only, instead of chusing ships, ordered a survey of ships, and a report to be made on the 22d of January.

When the report was made, on the 22d of January, they then resolved, That they would, in proper time, chuse ships, but not to depart before the first of July next : now that 1st of July was then generally understood (before this application) to mean winter ; and, in that case, it would have completed two years prohibition of trade.

Now this irregular and uncertain proceeding of the company, was the cause that your complainants, thought the interposition of the honourable house of commons, in this case most proper, in order to their relief, in the exportation of that great quantity of cloth which has been so long prevented, to their own, and, as they conceive, to the nation's prejudice :

And they humbly offer the following reasons for it :

That the company's charter does not warrant them in such a prohibition, or restraint of trade ; the clauses particularly relating thereto are submitted to the judgment of this committee, and will be spoken to by some of them.

Nor will Westminster-Hall (it is conceived) warrant their levying 20 in the 100 upon their members estates ; and therefore they always exercise this power in Turkey :

Nor can such restraint be for the common good of the woollen manufacture of this kingdom, but evidently the contrary, as it necessarily encourages the French and Dutch trade to Turkey ; and it is so advised at this very time, and letters are ready to be produced in proof of it :

Nevertheless it is granted, that there may be other letters, approving of this restraint, and advising that there was cloth remaining unfold, and particularly at Aleppo ; but there is very good reason to believe that it may, by this time, be all sold ; and had most of it been long since sold, had there not been an understanding between the managers here and there, in order, as the company's preamble sets forth, to raise the price of cloth abroad, and the price of silk at home.

☞ This restraint may be also a great cause why so much wool, at this time, is sent to France ; because they have a vent to Turkey, and we have none.

And the hindering the exportation of woollen goods to Turkey at this critical conjuncture, when none can go either to Old or New Spain, may deserve consideration.

And the complainants do hope, that it will be found by this committee, that such members of the company as are willing to trade, ought to trade, and have a right to trade, even by the charter itself.

It has been objected, That the trade has been over-driven ; and be it so : will not that, in the nature of the thing, reduce the exportation as far as may be needful, without a forcible restraint ? And doth it not appear very odd, that a majority of the company, some of whom are unconcerned in the trade, and others but little, should have more regard to the welfare of their largest trading members than they have for themselves ?

Our legislature never thought the over-driving the trade to Portugal, Spain, or Italy, a sufficient reason to intrust those traders with a power of restraining it at their pleasure.

It must be allowed, that the present situation of affairs has made great alterations in almost every thing.

Low interest raises land, enlarges trade, and reduces profit : but this is the evil ; and, therefore, the remedy proposed by these restraints steps in, viz. that cloth may be bought the cheaper at home, and sell the dearer abroad :

That silk may be bought the cheaper abroad, and sell the dearer at home.

But, all this while, the French and Dutch are encouraged to supply the woollen trade abroad ; and to supply (in a larger degree) the silk manufactures at home :

And our own manufacturers, in the mean time, both in wool and

and silk, so far deprived of their employments.—But should the merchant lose, yet the nation must gain.

It has been further objected, That, by a delay, more cloth will be exported; and so, probably, there may, should the ships be yet detained twelve months longer.—But then the company should take care to prohibit the French and Dutch, and the Turks too, who, at this very time, are carrying on a cloth manufacture of their own:

But there can be no doubt but the speedy sending abroad what is now provided, will be a greater encouragement to the buying more cloth than the detaining it can be; in that most of this must be sold before another supply can follow it.

But were it otherwise, it is presumed that those who industriously have laid out their estates in cloth, ought not to be detained for the sake of those who have neglected it; and it is believed, it may be granted, that the complainants are as likely to buy more cloth as any other members whatever.

Although the company have frequently practised this way of trading by general ships, yet it has occasioned frequent misunderstandings between the members themselves, and also the manufacturers. Two instances hereof may be offered, one, upon a like occasion with this: some members made application to king Charles in council; the company were heard, and pretended many difficulties: the king himself asked the question, Whether there might be any members that, notwithstanding, were willing to trade? It was answered, There might: Then, said the king, they shall; and ordered trade to be opened.

The other was a complaint of the manufacturers to the house of commons, upon a delay of shipping; when an annual shipping for Turkey, in summer for Aleppo, in winter for Smyrna and Constantinople, had probably been enacted, had not the company, by large promises of doing the thing, prevented it.

Now whether this pretended power to stop trade be warrantable, or whether it has been exercised for the common good, is humbly submitted to this honourable committee.

P. DELME,
JOHN LOCK,
RO. RADCLIFFE,
EDWARD RADCLIFFE,
JAMES LOCK,
JOHN HANGER,
JOSEPH EYLES.

The CASE of the GOVERNOR and COMPANY of MERCHANTS of ENGLAND trading to the LEVANT SEAS, as laid before the PARLIAMENT by the TURKEY COMPANY, in the year 1743, in order to prevent the trade being laid absolutely open, as was then aimed at.

If the Levant company saw reason to hope the bill, as now framed, which is depending, could answer the ends proposed, of enlarging as well as regulating the Trade to Turkey, they should think themselves guilty of breaking the trust reposed in them, if they did not use their best endeavours to further it's being passed into a law: but they owe to the public the setting their charter in a true light, and the bearing testimony against attempts, how specious soever, which threaten the nation with the loss of the remains of this valuable trade.

The charter cannot be said to establish a monopoly, or exclusive trade: the company is already open to all manner of persons not below the degree of mere merchants: it is expressly declared, That the trade shall not be confined to one port; and it is certain that none of the petitioners for the bill ever applied for their freedom of the company and were refused: all merchants, of what place or port soever, have a right to be admitted to their freedom, every person above 26 years of age paying a fine (for the use of the company) of 50*l.* and every one under that age, 25*l.* all sons and apprentices of freemen are admitted upon paying 20*s.* only.

There is, indeed, a condition required by a second charter of king Charles II, of those merchants dwelling in London, or within 20 miles of it, that they shall be free of the city: but this extends to them only, and does not, nor can be pretended, to affect persons dwelling at a greater distance.

The fine taken upon admission, with regard to the company, is not worth mentioning, further than observing, that the sum cannot be deemed onerous to any one in a condition of engaging in a trade, which from it's distance, and other circumstances, is of a very tedious circulation, and requires a large stock: it is small with regard to the share it admits to of the fruits of past very great expences, and is rather an advance made to the company than a fine; for, as it goes to the public stock, he who pays this fine, or advance, has his share of it, by a proportionable less duty levied on his trade, and also of all other fines levied after his admission.

The limitation to mere merchants is expressed, by the charter, to be for preventing the disorders and inconveniences which had then been found by experience, and must arise from the too great resort of low mean people, to places where the customs and laws are so intirely different from their own; where they must themselves be exposed to a variety of hazards and dangers, and by any fraudulent attempts, or even by

VOL. II.

their irregularities and follies, may offend the Grand Signior, and involve themselves and others in troubles and dangers. When irregularities happen, if they are carried before a magistrate, expence must be the inevitable consequence; and, no doubt, these irregularities would multiply upon a greater resort of low people: and particular instances have fallen out, with regard to every nation established in the Levant, where the lives and estates of the subjects of each nation, then resident in Turkey, have been in danger, from the absurdity or villainy of one man.

The quarrel between Sir Kenelm Digby and the Venetian admiral, in the bay of Scanderoon, cost the Turkey company above 20,000*l.* A dispute with Sir Sackville Crew cost above 80,000*l.* A pretence that a quantity of pieces of eight were not of the true alloy, cost 7 or 8000*l.* A detention of the capitulations by a vizir, and other little disputes about the same time, cost as much: the roguery of a captain, who had taken a freight at Alexandria, cost the English at Cairo a great deal of money, and had like to have occasioned the murder of them all: and the indiscretion of a young man, under Dutch protection at Aleppo, within these few years, caused an insurrection in that city, which threatened the lives and estates of all the foreigners there: and, lastly, the company have been obliged to pay the Turks, as an indemnification for captures made on them by British privateers, during the last war, no less a sum than 12,000*l.* These are a very few of the many instances that are to be met with.

The trade to Turkey is carried on under the protection of the capitulations, or treaty of friendship and commerce between his Majesty and the Sultan; which was procured, and has been since upheld and renewed, at great expences to the company.—By this treaty, the British subjects are put upon a much better foot, in point of trade, than even any of the Sultan's own subjects, by paying less customs, as well as in other respects.—These exemptions must, no doubt, give uneasiness to the farmers of the customs, and the Sultan's subjects that are traders; so that it requires a very even and steady conduct to avoid giving occasions of offence, which seldom escape animadversion; and often slight ones are taken, or feigned ones urged, to extort money; and the greatest care is taken by the company to support the credit of this nation through the Grand Signior's dominions, by the most exact punctuality in all their dealings with the people of the country; and, more particularly, they have always guarded, in the most effectual manner, against all attempts to run customs, or to cover subjects or other strangers goods: but if room is left for every one to become adventurers in this trade, to carry it on as they themselves shall please, bad and perverse people, free of all restraint, will break in upon all order, endanger the quiet and security of every body, and every thing, and endanger the total loss of this still valuable branch of the British commerce.

As the company stands at present, it cannot be properly called any thing more than a body established for the well and orderly management of the trade into the Levant, and providing for the support of the necessary expences attending it; which are, the maintenance of the king's ambassador at the Porte, the consuls, and other necessary officers and servants, at the places of trade, and the obtaining and supporting the capitulations granted by the Porte at different times to the king's subjects; [see LEVANT TRADE] and the company have, at great expence, obtained very valuable privileges for the king's subjects from the Ottoman emperors, and hitherto supported them through many struggles.—They have established proper settlements for the management of their affairs; they have, for many years, carried on a considerable trade, greatly advantageous to the nation, in exporting it's manufactures and produce, and importing unmanufactured goods, though often under difficulties and discouragements to themselves; and have at this time great dependencies abroad.

If it be true, as the petitioners for the bill set forth, that the trade of this company is decayed, it is an unwarrantable conclusion that the management under the present charter is the cause of it: but still the Turkey company is ready to own, and desirous it should be known, that their trade is lessened, and under difficulties, and the French trade increased; and they have made heretofore proper representations of it, but the remedy is far out of the reach of any thing attempted by this bill, as the laying the trade between England and Turkey more open will not be the means to increase it, but probably quite the reverse; which may be fairly inferred from the case of our neighbours the Dutch, where the trade to Turkey is open and free, and yet very inconsiderable, scarce any at all: and that the French trade does not owe it's increase to it's being more open or more free than the English, is plain from it's being under much more strict regulations: [see LEVANT TRADE] a chamber of commerce has the superintendency of this branch of commerce in France.—The cloth is exported only from one port there, viz. Marseilles: no Frenchman goes to Turkey but with a licence; nor is permitted by the French government to settle in Turkey, without first giving security in France for his good behaviour in the Grand Signior's dominions: The number of houses for the sale of their cloth in Turkey is limited; the prices of their cloths are fixed in France, from

which they cannot depart ; and they are not at liberty to undersell one another in Turkey ; and when one house has sold its quantity allotted, that house can sell no more 'till the other houses have sold theirs : so strict are their regulations. The French cloth-trade has gained ground by the encouragement and assistance it receives from the public : that manufacture was established in Languedoc, by Mr Colbert, on purpose for the Turkey trade ; and at so vast an expence, that he exposed himself to great censure by that measure, though the event has shewn the wisdom of his views. These cloths are chiefly made of Spanish wool : there is a premium allowed by the public on every piece of this cloth ; and, besides, there are several establishments (which are called royal manufactures) made at the expence of the public, or the province where there are conveniences for making a piece of cloth from the wool, to its being packed to put aboard the ship ; and a clothier is put into one of those rent-free, on the sole condition of making a certain number of pieces of this cloth in a year. This is the most visible reason why they can sell cloth, made of those fine materials, at a lower rate than we can sell our cloth ; and however the French cloth may want the substance of ours, it has a preferable appearance, takes a beautiful colour, and is lighter than ours, and serves several of their purposes ; and though many repeated attempts have been made to imitate it in England, they have proved ineffectual. See the article MANUFACTURERS.

The next principal article of the Turkey trade, and the great branch of returns from thence, is silk : one half of that commodity used to come from Persia through Turkey ; but the continual wars that have raged in Persia, for many years past, have cut off all supplies of silk from thence ; and if things should return to their former quiet state in Persia, and the silk provinces to the flourishing condition they were once in, it is uncertain whether this branch of trade would return to the Levant company, since it has been thought expedient to open another channel for it ; and the returns of silk from the Levant are, at this time, confined to the raw silk of the produce of Turkey, of which the company buy almost the whole that comes to market in Turkey, for exportation ; and that the company purchase with English cloth, and other products, bartered in exchange : and if they were to send money (which they many years ago made a by-law to prohibit, out of a regard to the public good) they would not get more silk, would sell little or no cloth, and the French would get that money in exchange for their cloth.

As to mohair-yarn, which is another considerable article of return, the company buy constantly as much as hath always been a full supply for this market ; and there is a considerable decrease (arising from the alteration of fashions) in the consumption of that commodity at home : and, to shew the company's readiness of embracing every opportunity that offers of increasing their trade, they have, in the article of cottons, which they found a demand for in England, and a supply in Turkey, increased their imports of that commodity from 400 bales to 5,000, within these few years ; which may serve to compensate for some of the articles their trade is decreased in.

The latitude given by the bill, in exporting and importing, renders impracticable the restraints that may be necessary to obviate dangers of infection ; and the liberty given to import goods to all manner of persons in the Levant, is putting all sorts of strangers upon the same foot as natural-born subjects ; and is, at least, giving away the advantage of commission : it also may raise dangerous disputes about capitulations, and endanger the loss of them.—Nay, by this latitude, the French factors may find means to send hither goods bought abroad with their manufactures.

But if the wisdom of the legislature shall think fit to attempt the enlarging or retrieving the Levant trade, some more probable methods may be found out, and not liable to the same objections with those in this bill ; such as a proper encouragement, in whatever shape may be thought fit, for making such sorts of cloth as the French send ; or the assisting the company in the burden of their expences, which run high upon the trade, as the same, or a greater sum, is to be raised upon the remains of it, than when it was in its most flourishing condition : but as, to the means proposed by the bill, some of them could not have any effect at all, and others may have very fatal consequences. All which is humbly submitted to the consideration of the legislature.

An abstract of what has been argumentatively urged, in opposition to the Turkey company, in order to lay that branch of trade quite open to all his majesty's subjects, by a very ingenious gentleman*.

* Reflections on the Expediency of opening the Trade to Turkey, &c. Printed for T. Trye, near Gray's-Inn Gate, in Holborn, London, 1753.

I. All the powers in Europe are endeavouring to extend their commerce ; and if Great-Britain cannot extend her's in proportion, she will be no longer able to preserve that figure she has hitherto preserved †.

† This is a true maxim, but that laying the Turkey trade absolutely open, is a measure conducive to that end, has been denied by many, and particularly by another very judicious gentleman, Mr. Hanway, in his travels, and his answer to the appendix of a pamphlet, entitled Reflections upon Naturalizations, Corporations, and Companies, &c. as this subject is occasionally mentioned in Hanway's travels.—By the author of these travels. Printed for Doddsley and Millar.

II. Many of these countries, Spain in particular, which used to admit great quantities of English merchandize, are now setting up manufactures of their own, and laying burdens on ours, to prevent their introduction : so that it is become more expedient than ever, to seek out as many new markets as we can*.

* That this is matter of fact, is shewn throughout divers parts of our dictionary. See the articles BISCAY, CASTILLE, CATALONIA, INDIA-HOUSE OF SPAIN, SPAIN, SPANISH-AMERICA.

The Turkey company are not able, were they willing, to sell the English manufactures so cheap as they might be rendered by a free trade : For,

(1). If no ships are allowed to be employed, but the general ships of the company appointed by the managers, a private member has no choice, but must submit to all the expences and discouragements which the managers will lay upon him.

(2). The carriage of the goods up to London, the gains of factors, warehouse-keepers, &c. are taxes heavy enough on the manufacture, to turn the ballance in favour of the French.

(3). The expence of package, portorage, hallage, loading and unloading, &c. are more exorbitant in London, than in any part of the kingdom.

(4). The dearth of victualling and manning of ships in the port of London, is another material article ; whereas many ports are not only cheaper, but more commodiously situated, as being nearer the places where the goods are manufactured.

IV. The gains of an exclusive company can never coincide with the welfare of the public ; inasmuch as monopolists, established by law, are thereby secured from rivals ; so that their particular interest consists in selling as dear as they can : whereas the interest of private adventurers is to sell as cheap as possible, in order to get custom by rivaling each other. Thus the public is benefited by emulation, as it promotes the circulation of labour and universal plenty ; but is hurt by monopolists, who are a check to industry, to the circulation of labour at home, and its exportation abroad ; and whose only view is to sacrifice the general interest to that of a few.

V. The Turkey company is a monopoly in every sense, as no private member is allowed to fit out a ship when he pleases, to export and import what quantities of goods he would chuse.—As the trade is confined to the expensive port of London.—As the freedom of the company is limited to merchants by profession, and has been obstructed under frivolous pretence.—As the members themselves are fettered with by-laws.

VI. This exclusive society not only exports a much less quantity of English labour than would be, were the English trade free, but also imports the less of raw materials, so necessary for several manufactures, and the employment of the poor.—That important article, raw silk in particular, which should always be brought to market at the lowest price possible, has by monopolies, been raised so high, as greatly to injure the silk manufacture. And this arises from two causes :

(1). The Turks will deal with those that supply them with goods on the cheapest terms ; consequently not with the English ; and sell to those, who give the highest price, [i. e. the greatest quantity of labour in exchange] which an exclusive society will not do : therefore, our English company neither will, nor can make great returns in Turkish goods.

(2). After the goods are brought to England, the company keep up the price of their sales as high as possible, in order to get immense profits on small imports. And this they do with safety, because there are none to rival them.

VII. Our woollen manufacturers are ready to make it appear, from the specimens they have seen of the cloth of Languedoc designed for the Levant, that they are able to out-rival the French, provided this commerce has a free course, and every adventurer is permitted to ship off from what port he pleases.

VIII. Were such liberty obtained, they have reason to conclude, that they could render their goods still cheaper.

(1). Because those drugs for dyeing, which now pass through the hands of a company, would be sold at a more reasonable rate.

(2). Because the oils and ashes for making Castile soap could be purchased on such advantageous terms, as would induce the English to set up that branch of manufacture : which soap is made at present chiefly at Marseilles, thence sent to Leghorn, and from Leghorn imported into England ; by which means the English manufacturer is burdened with an heavy

heavy additional expence.—Nor is this the only evil; for our colonies in America are now wholly supplied with French soap from Martinico, and the other islands belonging to that crown, and even from France itself (the present English soap made of tallow not being fit for their climates): by which means several other species of French manufactures are introduced into our fugar islands and northern colonies, to the great detriment of the commerce, revenue, and navigation of Great-Britain: But,

(3.) Another reason why the woollen cloths, designed for the Levant, might be vended cheaper, is, because a considerable saving is to be made in the expence of dyeing. For were this trade to have a free course, the manufacturer might dye his own cloth at such a season as would not interfere with his other business, and contrive every thing to the best advantage: whereas, at present, the cloth is sent up white to London, and dyed there in haste, and at an exorbitant charge, both as living and wages are dearer, and as those journeymen, who have not constant business, must have the higher wages while they are employed.

IX. All other parts of a cargo for the Turkish dominions, as well as woollens, might be rendered much cheaper, as the expence of carriage, shipping, &c. would be considerably less.—Moreover, there is the strongest probability, that great demands would arise from the manufactures of iron, steel, brass, and copper, for cutlery and Birmingham ware; for the produce of the looms of Manchester, Coventry, and Norwich; for printed linens, paper-hangings, and such kinds of ornaments; as most of these articles might be exported from several places, at less charges than from London.—And as the English are known to excel other nations, both in fabric and cheapness: so that, were the trade free, the port of Marseilles would labour under such difficulties from those circumstances, as the advantage of its situation could by no means compensate.

X. Add to this, that the freight, and insurance, and navigation of ships are much dearer, in proportion, at Marseilles, than in England. The interest of money is also 6 per cent. and the price of tin and lead, and shot, must necessarily be much higher, so that the prodigious increase of their Levant trade, cannot possibly be ascribed to any other cause, than to the monopolies and exclusions of the English against their own countrymen, in favour of the French. And therefore it should be duly considered by every true patriot, and lover of his country, that the chief competition, in this struggle for the liberty of commerce, is not between one English merchant and another,—but between Great-Britain and France.

XI. Were the trade laid open, the Turks, Greeks, and all the nations of those vast territories would find a greater demand for their respective commodities, and then they could afford to buy greater quantities of ours:—whereas, at present, they neither are able to purchase much, nor, if they were, are they inclined to do it, on account of the excessive dearth of the English merchandize.

XII. An increase of the exportation of our own manufactures must create an increase in the excise, and all inland duties; for the government is infallibly a gainer by every scheme that finds employment for the people, encourages labour, and promotes wealth, as these things necessarily occasion the greater consumption of all commodities that pay duties:—on the other hand, an increase of the importation of such foreign materials, as excite the industry of the natives, is doubly advantageous, both by the customs they pay at first landing, and the hands they employ afterwards. Therefore, the increase of such a trade is desirable in every light, both to the government, and to the people.

XIII. If any of the merchants, belonging to the out-ports, should happen to bring in such raw materials as are not wanted on the spot, the advantages they receive in other respects would enable them to pay the expence of carriage to a proper market. And, indeed, the carriage of raw silk, camels hair, cotton, wool, &c. from Bristol to Coventry, from Liverpool to Manchester and Derby, from Yarmouth to Norwich, &c. would not be so dear, as it is now from London to those places. Besides, it is natural to suppose, that as the trade increased, other towns in the north and west, and middle of England, and in Scotland also, would set up manufactures. So that every part of the united kingdom ought to consider itself as interested in opening this monopoly.

XIV. Whatever regulations are judged necessary, under the inspection of proper persons, either at home or abroad, for the good government of a free trade, or the preservation of health, and security from the plague, they will be gladly received, and thankfully submitted to. And an open trade might be very easily put under much stricter examinations, not only as to the goodness of the manufactures exported, but also in relation to bills of health, and performing quarantine, [see QUARANTINE] than what the company have been subject to for many years past.—Though a plague in London would have been much more fatal, than in any other part of the kingdom.

XV. Were the trade to Spain or Portugal now in the hands of a company, and an attempt made to render it free, great pains would be taken, as there are now in the present case, to set forth the danger of permitting shopkeepers and low tradesmen to go over to Spain or Portugal.

‘They will raise the jealousy of the populace, by interfering with their trades,—or inflame the zeal of bigots against countenancing hereticks:—low and indiscreet people will import prohibited books, and so draw down the power and vengeance of the Inquisition,—will give offence, by their behaviour, while the host is passing by,—perhaps ridicule some of their religious processions, and so cause tumults and insurrections:—or, in general, they will not fail to excite an universal odium, by the diversity of their dress and customs, and great licentiousness of manners. — Therefore, by attempting to throw the trade open, we shall infallibly lose it all.’

Thus it appears, that objections much more plausible might be raised against opening the trade to Spain and Portugal, were it now in the hands of a company, than against the revocation of any exclusive grant now subsisting. But, indeed, we must consider all these kinds of objections as the mere dialect of monopolists, who use it, *mutatis mutandis*, against opening any trade, in order to carry their own private interest, under an appearance of public good.

But common sense and daily experience are continually exposing the fallacy of such suggestions. And were the trade opened to Turkey, there is no degrees of probability, that shopkeepers and low people would be fond of going there:—and if they did go, they certainly would agree with the natives, as well as the English sailors do now.

XVI. If the trade to Turkey had a free course, what reason is there to imagine, that it would be engrossed by the Jews? And why must it be supposed, that the English in particular would suffer in this respect, more than the French, Dutch, or Italians? Besides, as the Jews might insist upon the freedom of the company, as well as others, provided they are merchants by profession; and as they reside chiefly in London, and are a rich united body of merchants, this very objection might be urged with greater force against the confining such a trade to a company, than against laying it open;—especially as the English Jews, by means of their connection with their brethren in Turkey, who are the only brokers in that country, might be the better able to form a combination to ingross the whole trade themselves, and execute it with success. But, in fact, this objection betrays its own weakness, and would never have been brought, if a stronger could be found; and it is the first time that the Jews were accused of being injurious to the interests of a trading nation.

XVII. It is equally incredible, that the government and people of Turkey should be displeased at the dissolution of the present monopoly. And what grounds are there for such a supposition? For, in an open trade, English manufactures would be imported in greater quantity and variety, and on cheaper terms,—more Turkish goods be taken in barter, and a larger revenue would arise to the government. But, in a confined trade, fewer manufactures are imported, more exorbitant in price, demanding fewer goods in exchange, and paying less to the customs. And can we imagine, that the Turks would once hesitate, to which side the preference is due? Or have we ever found, that any of those other nations, to whom we once traded by exclusive companies, have complained at the dissolution of these destructive monopolies, and desired their restoration?

To confirm this, we have a remarkable speech recorded in Camden's Annals of one of the Czars of Muscovy, when that country was thought to be over-spread with ignorance and barbarism; which is mentioned by the reverend and ingenious Mr Smith, in his Memoirs of Wool, vol. i. p. 114, viz.

Theodore Joannides succeeding to the empire, granted to all merchants, of what nation soever, free access into Russia. And being oftentimes solicited by the queen [Elizabeth] to confirm the privileges granted by his father to the Muscovy company of English merchants, to wit, that only Englishmen of that company should come into, or trade into the north parts of Russia, and that custom free, in regard they were the first that discovered the passage thither by sea: he thereupon desired her to give liberty to all the English to trade into Russia; for, to permit some, and deny others, was an injustice. Princes, says he, must carry an indifferent hand between their subjects, and not convert trade (which by the law of nations ought to be common to all) into a monopoly, to the private gain of a few. As for his customs, he promised to exact less by one half of that company than the rest, because they first discovered the passage thither by sea. In other matters he confirmed their former privileges, and added some few more, out of his respect to the queen, and not for any desert, as he said, of the company, many of whom he found had dealt fairly with his subjects.

XVIII. But when an exclusive grant is once obtained, it must be defended by some kind of arguments, however weak and inconclusive. Now the Turkey company was first erected, and afterwards established in such times, when the principles

of trade, and the nature of the landed and commercial interests of a kingdom were not understood;—or, if understood, not sufficiently regarded;—in such times when monopolies and exclusions carried all before them. Of the truth of which assertion, we need only consult Rymer's *Fœdera*, and the common historians for the reigns of queen Elizabeth, king James I. and king Charles I. to find sufficient evidence; many of which monopolies were again renewed by king Charles II.—And, at the time of the Revolution, were grown too powerful to be attacked with safety.

For, as to foreign trade, there was an exclusive company to Hamburgh and the Baltic,—to Muscovy and Greenland,—to Germany and Flanders,—to France,—to Spain, and Portugal,—to Italy,—and to Africa.

Special licences were also to be purchased for the importation, or sale of madder, logwood, deal-boards, wine, and tobacco:—likewise, for the exportation of corn, leather, and butter. And, 2dly, As to our domestic commerce, there were pre-emptions, or monopolies for tin, salt, and coals: exclusive patents for sea-weed, kelp, and glass,—salt-petre and gunpowder,—soap and starch,—gold and silver lace,—beaver hats, and demi-castors,—dyeing and dressing of cloth,—making of allum,—and even for gathering of rags.

Special licences were also necessary to be obtained for making iron, and cutting down wood for charcoal,—making of butter casks,—using of wine casks for ale and beer;—also for making of malt,—and brewing of ale for public vent.

Moreover, the gardeners, for six miles round London, were incorporated into an exclusive company, as were also the traders and artificers within the district of three miles.

Now all monopolies and exclusions (and many more might be enumerated) set out with pompous titles, and great professions of zeal for the public welfare. They were all established, either for the increase and good government of trade,—or to keep up the credit of the English manufactures in foreign markets,—or for preventing the ignorant and unwary from being imposed upon at home.—But the true reason of their establishment remains yet to be told, viz. **JOBS and MONOPOLY.**

This was the æra in which the Turkey company had it's birth and education. And all the others, while in being, had just the same pretensions of public good to alledge in their favour: but time has shewn, that we are much happier without them.

XIX. As London is the capital of the British empire, and the centre of the body politic, every accession of wealth, trade, manufacture, navigation, and numbers of inhabitants, to other parts of the kingdom, must redound to the advantage of the metropolis. For the centre in the body politic, is like the heart in the natural body, which receives benefit itself, by the brisk and regular circulation of blood in the extremities. But if any one should doubt of this parallel, let experience and matter of fact determine. For when almost the whole trade of the kingdom was circumscribed by exclusive grants, and those monopolies confined to the single city and port of London, this city made a very mean and inconsiderable appearance, to what it doth at present: but, in proportion, as the inland countries, and the out-ports began to shake off some of their fetters, and extend their commerce; in the same proportion did the metropolis increase in wealth and grandeur, number of inhabitants, and extent of buildings. In short, if there was an accession of wealth to the farthest isles of Scotland, it would, sooner or later, find it's way to London. [See our article **MIDDLESEX.**]

XX. Upon the whole, therefore, the continuation of this exclusive company, is no other in effect, than the payment of a very large tribute annually to France;—together with this mortifying reflection, that this is a tribute we are not forced to pay, but do it voluntarily; though we know, that some of her best provinces are supported by it, some hundreds of ships employed in the navigation, and the government enabled to turn the wealth and strength, acquired by our indolence and mismanagement, to our own destruction.

XXI. The landed gentlemen, in their respective counties, are more particularly concerned to exert themselves on this interesting occasion; because of the rents of lands and houses will be higher, and the demand for the produce of estates, corn, wool, sheep, cattle, butter, cheese, wood, coal, &c. &c. will be greater, in proportion as the inhabitants of any country do increase in numbers, riches, and manufactures. The poor also would be less numerous, as there is more employment,—the weight of taxes will be lighter, when more persons share in the burthen,—and the tenants, by having better markets, will be better able to pay their rents: but these advantages cannot be obtained, while the present difficulties, which prevent industry, and stop the circulation of labour, are suffered to remain.—In one word, all monopolies are so many combinations against the landed interest. And the more violently they are contended for, the more clearly may the gentlemen of landed property discern, whose interest is promoted, and whose is sacrificed.

The principal points to be proved at the bar of both houses, are the following:

1. That the English manufacturers can rival the French Turkey cloth.
2. That the port of London is the dearest in the kingdom, both for exporting and importing of goods.
3. That not only woollens, but almost all other parts of a cargo to the Levant, can be purchased on cheaper terms in England, than at Marseilles.
4. That freight and insurance are very high at Marseilles, as is also the interest of money.
5. That the exclusive powers of the Turkey company, by restraining and lessening the exports of English manufactures, lessen the labour, and of course, the wealth, power, and navigation of Great-Britain.—And, by lessening the imports of foreign raw materials, greatly obstruct the manufactures of those materials.

R E M A R K S.

This is the substance of what has been urged to lay the Turkey trade absolutely open.—But what may be said, on the other side of the question, we have not room to consider here; we shall defer that to the article **TURKEY TRADE**, where we shall also consider the late act of parliament, made in relation to this commerce, and conclude the subject, from an impartial review of what has been represented, as well under the article **LEVANT TRADE**, and this, as what shall be further said under the article **TURKEY TRADE**.

And, in relation to the **EAST-INDIA** trade in general, as also our **EAST-INDIA COMPANY** in particular, see the articles **EAST-INDIA TRADE** in general, and **EAST-INDIA COMPANY**, **DUTCH EAST-INDIA COMPANY**, **FRENCH EAST-INDIA COMPANY**. But as it is rumoured, that people of weight and distinction will exert themselves to lay the **EAST-INDIA TRADE** open to all his majesty's subjects, and to annihilate absolutely our East-India Company, as an exclusive trading corporation, we shall lay all the evidence impartially together, that we have been able to accumulate, on both sides of the question, that a right judgement may be made, whether such a measure would or would not be expedient, and tend to the public interest or not. Wherefore, besides the peculiar heads to which we have before referred, we shall also, in order to give this matter due consideration, refer our readers to the article **OSTEND EAST-INDIA COMPANY** also in it's place.

ORLEANOIS, in France. In this government are the seven following distinct provinces, viz.

I. ORLEANOIS, properly so called, bounded on the north by Upper Beauce, on the east by Gassinois, on the south by Sologne, and on the west by Dunois and Vendomois.

ORLEANS, the capital city of this province, and one of the most considerable in France, is situated on the river Loire, by means of which, the trade it carries on is very considerable; it consists in all sorts of corn, wine, brandy, sugar, silks, woollen-stuffs, oil, iron, steel, fresh and salt fish, fruit, timber, broads, and a great many other merchandizes. They have also some manufactures, viz. of stockings, both knit and wove, of prepared leather, of refining and baking sugar, &c.

BEAUGENCI, on the same river, has a manufactory of serges and other woollen stuffs.

II. SOLOGNE. The limits of this province are not distinctly set down.

RAMORENTIN, on the little river Sauldre, has a considerable manufactory of serges and woollen cloth, which serves to clothe the army, so that they have a very good trade of it.

III. BEAUCE, lies between Orleanois, Blaisois, Perche, and the isle of France.

CHARTRES, the capital of this province, is situated on the banks of the river Eure. The chief trade here is that of corn. They have also some manufactures, for which the water of the Eure is reckoned very proper.

PLUVIERS, a small town on the rivulet Oeuf. The neighbouring fields produce corn, of which they drive here a considerable trade. The soil produces also wine and saffron.

IV. DUNOIS. This little province has Orleanois on the east, Blaisois on the south, Vendomois on the west, and Lesser Perche on the north.

CHATEAU-DUN, stands on a hill near the river Loire. They make cyder here; and, in some parishes of this district, are manufactures of woollen stuffs, which they sell at Tours, Orleans, and Paris.

V. VENDOMOIS, is bounded on the north by Perche, on the east by Dunois, on the south by Turrenne, and on the west by Maine.

They have in this duchy manufactures of woollen cloth, and gloves. There are also embroiderers and tanners; but the trade of gloves is by far the most considerable. Vendome, the capital, is situated on the Loire.

MONTOIRE, on the same river, is famous for the vast quantity of linen cloth made here.

VI. BLAISOIS, has Beauce on the north, Orleanois on the east, Berry on the south, and Touraini on the west.

BLOTS, on the Loire, is it's capital. The chief trade here consists in wine and brandy, which they send to Orleans, Paris, Tours,

Tours, Angers, Laval, and into Holland. It is also noted for the best watches in the kingdom.

VII. GASTINOIS is bounded on the north by Beauce, on the east by Senonois, on the south by Auxerrois, and on the west by Hurepois. Part of it belongs to the government of Orleans, and the rest to that of the Isle of France. There are abundance of vineyards in this province, and a great many walnut-trees, of the fruit of which they make oil; the soil produces also a great deal of saffron.

CHATEAU-REGNARD, has a manufactory of woollen-cloth, proper to cloath Soldiers. They have also a trade of coarse linen cloths, made in the neighbourhood of Montargis, Cofne, and St Fargeau. The Germans used formerly to trade hither for saffron.

OSTEND, east longitude 2, 45, lat. 51, 15, a city and port town of the Austrian Netherlands in the province of Flanders, situate 12 miles from Bruges. See AUSTRIAN NETHERLANDS.

OSTEND EAST-INDIA COMPANY.

The late emperor Charles VI. attempted to establish an East-India company at Ostend in the year 1718, but was compelled to desist from the design by the English and Dutch. See AUSTRIAN NETHERLANDS.

In order to give posterity a just idea of this company, and how jealous the Dutch and the English were at this time of the establishment of a new maritime power in Europe, to interfere with their Oriental commerce, it will be necessary to lay before our readers,

A MEMORIAL presented by M. Pefters, resident at the court of Brussels on the part of their high-mightinesses the States-General of the United Provinces, to his excellency the lord marquis de Prie, grandee of Spain, knight of the order of the Anunciada, privy counsellor of state to his imperial and catholic majesty, and minister plenipotentiary for the government of the Austrian Netherlands.

To his excellency,

The undernamed their high-mightinesses resident, is commanded to have the honour to communicate to your excellency the remonstrances, which the directors of the privileged East-India company, as also those of the West-India company established in Holland, have lately renewed, about the navigation and trade which those of the Austrian Netherlands, particularly those of the town of Ostend, still carry on in the Indies, to the great prejudice of the said companies, and of their grants, confirmed and made prohibitory by the treaty of Munster, as well for the subjects of Spain, as for those of the Republic, who out of the said companies, are not allowed to navigate, or carry on any trade within the districts of their grants.

It is upon these fresh remonstrances of the said directors, that their high-mightinesses have charged their envoy extraordinary to his imperial and catholic majesty, to represent to him anew, That having the honour to live in good correspondence and amity with his imperial majesty, and having nothing more at heart than the preservation and continuance of the same good correspondence and harmony, which at all times have subsisted between the subjects on both parts, cannot behold, without grief, that the inhabitants of those countries, subjects to his imperial and catholic majesty, are undertaking matters that may disturb and ruffle that good correspondence, tending to the greatest prejudice with the Republic can suffer, and contrary to the treaties subsisting between his imperial and catholic majesty and their high-mightinesses, so that they have strong and just reasons to complain of the same; the rather, because all the instances made on their part for redress, have proved ineffectual; and that on the contrary, the said inhabitants extend daily their enterprizes, in which they seem the more encouraged by the grant, which according to the public news, they have obtained of his imperial and catholic majesty, freely to navigate and trade to the Indies.

Their high-mightinesses foreseeing the unavoidable troubles that must attend this affair, if, on the one hand, his imperial and catholic majesty, contrary to all expectation and equity, should permit his subjects to proceed in their undertakings with respect to their new navigation and trade to the Indies, against the express tenor of treaties; and if, on the other hand, their high-mightinesses making use of their right acquired by the said treaties, should oppose the same; and desiring nothing more than that such inconveniencies and troubles may be prevented, their high-mightinesses could not avoid representing afresh to his imperial and catholic majesty, That by the treaty concluded in 1648 at Munster, between his majesty the king of Spain then reigning and his successors, on the one part, and their high-mightinesses on the other part, the navigation and commerce to the East and West-Indies were regulated and limited, with regard to the subjects of Spain, on the foot they then exercised and enjoyed their navigation and commerce to the East-Indies, without power of extending the same further; and with regard to the subjects of the Republic; it was agreed that they should refrain

VOL. II.

from the places possessed by Spain. That these articles have always been religiously observed, and the inhabitants of the Spanish Netherlands have never been permitted to trade to the Indies: that the said Netherlands being at present under the dominion of his imperial and catholic majesty, have not in that respect, acquired more right or privileges than they had before; nor can it ever be imagined, that their high-mightinesses after having made so great efforts, and contributed so much to the recovery of the said Netherlands, and other parts of the monarchy of Spain, in favour of his imperial and catholic majesty, pursuant to the engagements entered in on that behalf, could possibly depart from the charters they had granted, and from the right they have for ever acquired by the said treaty of Munster, to maintain the said charters; or that his imperial and catholic majesty had any intention in recovering the said Netherlands, to make any alterations there, much less design, contrary to the stipulations therein so plainly expressed, to cause so great a prejudice to the state, in a point so essential and important to the Republic, and which was so strongly insisted upon in the negotiations at Munster, that had it not been obtained, the treaty would never have been concluded: to which it must be added, that by the 26th article of the barrier treaty it is expressly stipulated, That commerce, and all that depends on it, in the whole and in part, shall remain upon the foot established, and the manner appointed by the articles of the said treaty of Munster, inasmuch that the treaty was confirmed by that of the barrier, under the guarantee of the king of Great-Britain, even at the time his imperial and catholic majesty was already in possession of the Netherlands. [See NETHERLANDS.]

And that the right of the States in this particular, being so manifest, their high-mightinesses can but expect, both from the amity, and from the great equity and justice of his imperial and catholic majesty, that he will not any ways infringe it, and therefore earnestly desiring and requiring that the patent which is said to have by him been granted for the establishment of the navigation and commerce of these countries to the Indies may not be published, but rather revoked, or at least rendered ineffectual; and that such orders may be issued out by his imperial and catholic majesty, that such kind of navigation and commerce, with or without patents, may not be carried on any longer, and that the treaties made on that behalf be executed.

This, Sir, is the substance and purport of the orders transmitted by their high-mightinesses to their envoy extraordinary to his imperial and catholic majesty, and those received by the under-named resident direct him, to import the same to your excellency, together with the remonstrances of the directors of the said two companies of the East and West-Indies, which he has the honour to lay before your excellency, with a translation of the same in French, being moreover charged to use the most earnest endeavours to incline your excellency, by your good offices with his imperial and catholic majesty, to second the good and just intentions of their high-mightinesses on the behalf above-mentioned, and to take care that things may not be carried to any extremity, 'till his majesty's further resolution. Done at Brussels this 5th of April 1723. Signed E. Pefters.

REMONSTRANCE II.

Of the directors of the East-India company of the United Provinces, to their high-mightinesses the lords the States-General of the United Provinces.

With all due respect, the directors of the privileged East-India company of this country shew, That in the years 1720, and 1721, they had the honour to inform your high-mightinesses by several memorials and representations, of the great loss the company had already suffered, and should still sustain, by the establishment of the new navigation and commerce of the Austrian Netherlands, and particularly of the town of Ostend, in the Indies, since the said Netherlands were separated from the crown of Spain, and restored to his imperial and catholic majesty, directly contrary to what was stipulated by the treaty of peace, concluded at Munster 1648, between the king of Spain of glorious memory, and this state; the principal object and view of which treaty then was, conformably to the instructions of your high-mightinesses ministers plenipotentiary (in the manner they were given, according to the remarks on the same, found in the books of Acit-zema, in the year 1645, which agree with the report of the said ministers plenipotentiary) above all things, to secure the commerce and navigation of the said company in the East-Indies, and to cause the charters granted by your high-mightinesses to be maintained and observed even in Spain; and that each of the contracting parties, that is, both the Castilians and the subjects of this state, should freely enjoy the limits or districts of their commerce, with all the towns, forts, lodges, and fortresses therein situate, and that it should not be permitted to the one to trade or traffic in the district of the other, not only in such places the property whereof belonged respectively to either, but not even in those, which being possessed by neither in property, and remaining their

own masters, might grant liberty of trading to other nations: which last point was, indeed, looked upon by Spain as unreasonable, as may be seen by the report of M. de Meynderwyk, inserted in that of the negotiations of Munster, dated February 7, 1647, since the ministers of Spain alledged at that time, that it was not reasonable to pretend to hinder the king from making conquests in Brasil and in the Indies upon the Portuguese, his rebellious subjects, and to extend his dominions in other parts of the said Indies, whose inhabitants are their own masters, and may give liberty of trade; but which, however, was obtained, and very expressly stipulated on the part of this state, upon the pressing instances of its ministers plenipotentiary, as is contained in the 5th and 6th articles of the treaty of Munster, viz.

That the navigation and commerce to the East and West-Indies shall be maintained, pursuant and conformably to the charters already granted, or afterwards to be granted, and that the present treaty of peace, and the ratifications that shall be given thereupon on both sides, shall serve as security thereof; that pursuant thereto, the Spaniards shall reserve and retain their navigation, in the manner they had it then in the East-Indies, without power of extending themselves further, and that the inhabitants of the United Provinces shall likewise refrain from frequenting the Castilian places in the East-Indies. The petitioners, by their first memorial presented to your high-mightinesses in 1720, have shewn, that the three principal points agreed on in the said articles, to wit, 1st, The peaceable possession of the towns, castles, forts, fortresses, and rights of sovereignty, that were yielded to them, and which the subjects of this state have acquired in the East-Indies. 2dly, The regulation of the limits of navigation and trade in each district, according to the partition that was made, together with the solemn promise of maintaining the grant of the East-India company. 3dly And lastly, The prohibition made to the subjects on both sides, not to attempt any thing to the prejudice of the said convention in their respective districts, nor to set up any new trade, or make any settlement there by new fortresses and lodges, all which is comprehended in the words, not to extend themselves further, have subsisted and been so well observed, that since the conclusion of the said treaty of peace, nothing has been done or attempted, either on the part of Spain, or on the part of the East-India company, from which any consequence may be drawn to the prejudice, or the invalidating of the said convention; but that, on the contrary, the Spaniards have kept to their navigation, as they exercised it at the time of the said treaty of peace, and continued it from Europe by the straits of Magellan in America, and from thence to the Philippine Islands, or Manilles, in the East-Indies, without either extending themselves further, or frequenting or carrying on any trade in the towns, forts, or lodges situate within the limits of the grant of the said East-India company, much less did they erect there any new settlements, fortresses, or factories, not even in the places the inhabitants whereof being their own masters, may permit others to trade, such as Bengal, Siam, &c. as on the part of the said company, navigation and trade have still been carried on towards the east of the Cape of Good Hope, to Batavia and Java, the Red Sea, the coasts of Asia and the Indies, as also in the seas, rivers, and islands, situate between the Manilles and the isle of Java, as far as Japan and the Moluccas inclusively, without extending to the Manilles, or any other places where the Spaniards trade.

Matters between Spain and this state, or the East-India company, would, in all probability, have stood on the same footing without any occasion of complaint, had not the Spanish Netherlands been restored to his imperial and catholic majesty, which has given a handle to many subjects of the said Netherlands very erroneously to maintain, that the emperor is not bound by the treaty made with the king of Spain, his imperial and catholic majesty's predecessor, and that upon that foundation, they had acquired a new right and liberty of trade, which they never had before, viz. to traffic in the Indies, territories, ports, and harbours, which the king of Spain, with respect to navigation and commerce, ever held, out of the limits of Europe; that is to say, out of the common liberty of commerce, as it is expressed in the 4th article of the treaty of truce of the year 1609, because the Castilians, and the king's subjects naturalized, who were reputed Castilians, had solely a right to traffic there, exclusive not only of the other nations, but also of all the other subjects of Spain, as is explained more at large by the Spanish civilian, John Evia de Bolano, in Curia Philippica, lib. 1. De Commerc. Terr. cap. 1. where he says, Ningun extranjero del reino puede tractar en las Indias. No aliens, who are not subjects of the kingdom, can trade in the Indies; naming afterwards the king's other subjects; for instance, the Aragonese, Neapolitans, Sicilians, extranjeros de las Indias, that is to say, such as not being Castilians, have no right to trade in the Indies; which is also confirmed by the said report of the negotiation of peace, dated December 14, 1646, wherein it is said, on the part of the ministers of Spain, That the trade to the Indies was by no treaty granted to any foreign nation; the rather, because it was not so

much as permitted to the subjects of England, Denmark, and to the Portuguese, while they were under the king's obedience, nor to France before the war, nor to those of Aragon, Naples, nor even to the inhabitants of the Spanish Netherlands, to carry on any commerce in the East-Indies, inferring from thence, that this Republic could not be allowed to enjoy what was denied to the king's own subjects.

This difference between the king's subjects, particularly with respect to the Flandrines and those of Brabant, has been observed, and was in very strong terms expressed, in the deed of cession made in favour of this infanta Clara Isabella Eugenia, the 6th of May 1598, whereby the king yields and makes over to her the Spanish Netherlands upon certain conditions, and no otherwise, as may be seen in the 8th article of the said deed, viz. That neither the infanta nor her consort, nor any of her successors, to whom the said countries should devolve, shall carry on any manner of commerce or trade in the East or West-Indies, nor shall send into those countries any sort of shipping, under what title, name, or pretence soever, upon pain, in case of contravention, of forfeiture of the said countries. And if any of the subjects of the said Netherlands shall, contrary to this prohibition, transport themselves to the Indies, that the sovereigns of the said Netherlands shall be obliged to punish them for it, by confiscation of their estates, and greater penalties, even by death. An instance of the efficacy of this article is to be found in the history of Emanuel de Meteren, among the occurrences of the year 1641, where he says, that those of Antwerp being by the king suspected of trading indirectly to the Indies, a commissioner from court was sent into that city to inspect the merchants books, and to prosecute those who should be found guilty of such a contravention, till at last, to prevent many difficulties and prosecutions that would have ensued, the sum of 600,000 ducats was to be paid, to buy off the king's displeasure. Which therefore clearly shews, that the subjects of the Spanish Netherlands never had a right to trade in the Indies, as will be further evinced anon; that although they changed masters at the time of the last barrier treaty, they cannot be deemed to have changed, or bettered their condition; and that the supposition, that his imperial and catholic majesty is not bound by the treaty of Munster, or that being a sovereign, he may grant to the subjects of the said countries such a new right, to the prejudice of the said treaty, ought to be looked upon as erroneous and illusory, for the following reasons:

First, Because the king of Spain, by the deed of cession in favour of the said infanta, and by the treaty of Munster, not only bound himself and his heirs, but also in general, all his and their successors, in what right soever the succession may fall, not to permit, or suffer them to carry on that trade. Secondly, Because all the motives which, at that time induced the king of Great-Britain as well as this state, to enter into an alliance with the emperor against France and Spain, had no other foundation, and that the said alliance was made and concluded with no other view, than to recover the crown of Spain for his imperial majesty, as having a right to it, in the whole or in part, with the same obligations and engagements which the said crown had contracted with Great-Britain and this state, and which subsisted at the time of the demise of the late catholic king of glorious memory, and in the same manner the said monarchy was then constituted; which is a consequence both by the said engagement of the king of Spain for himself and his successors, according to the treaty of Munster, and, according to law, from the nature of the thing itself; to wit, That he who by right of succession inherits and takes the place of the deceased, stands bound and engaged to observe and perform all the treaties and engagements which the deceased had contracted with others. And the rather, because his imperial and catholic majesty was to engage himself thereto, in a special manner, by the 26th article of the barrier treaty, in receiving the Spanish Netherlands only upon this express condition, viz.

That trade and all that depends upon it, either in the whole or in part, shall remain on the foot established by the treaty of Munster, and in the manner appointed by the articles of the said treaty.

Which articles were, in the year 1715, confirmed between his imperial and catholic majesty and this state in such manner, that no alteration having been made in them, the said Netherlands cannot be considered or deemed, both with respect to the said prior engagements, and to the privileges they enjoyed, but as belonging still to the said sovereign, and as if they never have been severed from the crown of Spain.

Which your high-mightinesses (with due submission be it said) may the rather urge, because having spent so much blood and treasure to recover the Spanish Netherlands to the obedience of his imperial and catholic majesty, you ought not to undergo so great a hardship, as that the said Netherlands or their inhabitants, should at present be allowed to undertake, to the detriment of your high-mightinesses, what they were not permitted to do before, and what they were forbid to do by a solemn treaty.

It may even be maintained, That his imperial and catholic majesty in his great equity and justice, understood and meant it

it fo, as has been observed in former memorials; since in the patents or paffes which his Majesty has granted to thofe of Brabant and Flanders, there is a claufe, whereby they are prohibited to trade on the coasts of Africa, &c. In fuch places where, according to treaties, his imperial and catholic Majesty's fubjects are not permitted to trade.

Which or other like claufe, cannot always refer to any other treaties, but that of Munfter and to the barrier treaty, fince there are no other treaties that any body knows of, concerning the navigation to the Indies, that regard either his imperial Majesty or his fubjects.

It may alfo be asserted, that the treaty of Munfter had never been concluded, nor peace made at that time, between Spain and this ftate, had it not been for the prefervation and maintenance of the India Trade, in favour of the fubjects of this ftate.

All which evinces, that the fubjects of the Spanifh Netherlands, not having had before the liberty of trading to the Indies, were left in the fame ftate and condition they were put in, both by the prohibition of that commerce, and by the exclusive treaty made on that behalf with this ftate, as alfo afterwards by the right of fucceffion of his imperial and catholic Majesty, and by the barrier treaty concluded on the fame foot; and that, confequently, it would be the greateft abfurdity to maintain, that at the time of the barrier treaty, a point fo very important as the trade to the Eaft-Indies, and the maintenance of the grant made to the company, fhould have been omitted or given up by this ftate, fince the confirmation of the faid trade, was the principal and greateft object of the treaty at Munfter, as was observed before, and as appears befides, by what the minifters plenipotentiary of France wrote to their king, the 21ft of December, 1646, as is related in the book intituled Memoirs and feeret Negotiations of the court of France, touching the peace of Munfter, &c. in thefe words:

‘ Another thing that puzzles us, is the Spaniards yielding about the Indies, which undoubtedly is one of the moft confiderable articles of the treaty, in which the Hollanders find an advantage they had not expected, and which could not be granted them but upon fome extraordinary motive. The king of Spain confents to abridge himfelf of the power of extending his limits in the Eaft-Indies, and to refrain them to what he poffeffes there at prefent.

It is very remarkable, that the minifters plenipotentiary have, in their relation, made ufe of the words of *extending his limits*, without determining or refraining them to certain countries, towns, or fortrefles: which proves that the diftrict given up by Spain to the faid Eaft-India company, does not only confift of certain countries or places, whole property the company had acquired, but in a diftrict of trade, or extent of limits, under which are alfo comprehended fuch countries where the inhabitants are their own mafters, and may permit others to trade, as was fhewn before.

The petitioners have alfo evinced, by their former memorials, that both reafon, and the law of nations, as it is observed now a-days, diflate and juftify, that navigation and commerce, which antiently were common, open, and free, are, at prefent, looked upon as limited, proper, and divisible, infomuch that trading nations ought reciprocally to refrain from trafficking in the diftricts of others.

It was with this view that the charters granted to the Eaft and Weft-India companies, and all the treaties of peace made with the Crown of Spain, from the firft treaty of truce, have been couched in fuch terms, as plainly fhew that the prohibition of trade and navigation was not foely refrained to the diftrict or neighbourhood of fome towns, lodges, or fortrefles, with the adjacent lands, as one may fay, as far as one's eyes can reach, or within cannon-shot; but, on the contrary, fuch words and expreffions have been ufed, as fhew the reafon and neceffity both of the treaties and of the thing itfelf, which do not admit that they who are at the charge and expence of fortifications, maintenance of garrifons, and keeping up factories, be obliged to fhare them with others, which would, however, come to pafs if the fubjects of the Auftrian Netherlands had, as they claim by the antient law of nations, the liberty of navigating and trading within the diftrict of the Eaft-India company of the United Provinces, even in all places where the Caftillians were not permitted to trade, and whither they neither navigated or trafficked, from the treaty of Munfter to this prefent time.

So that, according to their opinion, the fubjects of this ftate fhould be and remain bound, with refpect to the Caftillians, to refrain from their diftricts in the Indies, and they, on the contrary, (although fubjects of Spain, and comprehended both in the treaty of Munfter, and in the barrier treaty) fhould have acquired a new right of navigating and trading every where within the diftrict of the company of the United Provinces, as they actually do, not only in China, but alfo at Surat, Bengal, Coromandel, Malabar, the Red-Sea, and elfewhere, defigning and endeavouring to erect factories in any of thofe places, and to do all that may enervate or vacate the grant of the faid Eaft-India company, by enticing the fubjects to become fharers in this new trade, and employing on board their fhips feamen that have been in the fervice of the faid company;

labouring to gain it's officers in the Indies, to engage them againft their oaths and duty, to aid and abet their enterprizes; and, in a word, to fupplant the company; a thing which the Spaniards would never have thought of; fince the late king of Spain ever did maintain the company's grant, in all it's parts, according to the treaty of Munfter, both with refpect to the partition of the limits of commerce, and to the rights of fubjects on both fides, not fuffering that the Caftillians, or any of his fubjects, fhould attempt or undertake what was by treaties forbid to the fubjects of this ftate, within the diftrict of the Spanifh Indies, but that they fhould abide by what had been ftipulated, for greater and further fecurity, by the 15th article of the treaty of navigation made with Spain in the year 1650, viz. That the fubjects of either of the powers fhould not be allowed a larger licence than the other for their navigation and trade, but that in this, and in all things, there fhould be a reciprocation and equality on both fides.

And it is moft certain, that this reciprocation and equality could not abfolutely have their effect, according to the faid article, if either of the parties were obliged exactly to conform itfelf, and the other fhould let it alone, upon pretence either of having changed mafters, or becaufe the antient law of nations (according to which navigation and commerce were free every where, and to every one) ftill actually fubfifts, although nothing is more notorious, as was hinted before, than that pretended law of nations was changed by the general confent, and unanimous practice of the moft civilized nations of Europe; and that, even in relation to the prefent cafe, there is a fpecial treaty contrary thereto, and whereby the king of Spain has promifed not to extend himfelf that way, or not to fuffer that diftrict to be frequented for any trade, upon an exprefs renunciation and derogation to all laws, customs, and all other things thereunto contrary, binding and engaging, for the fecurity and execution of the treaty, all his fubjects, inhabitants, kingdoms, and dominions, both in and out of Europe.

Which being thus fettled by treaty, and the Spanifh Netherlands, with their inhabitants, being found to perform the fame, by the fovereign, as duke of Brabant and earl of Flanders, as the fubjects of this ftate are likewise bound and obliged to all that has been promifed to the Caftillians, viz. not to navigate or trade within the diftricts of their commerce in the Indies: it would be the greateft hardfhip in the world for the Eaft-India company to ftand bound and engaged towards the Caftillians, whilft, on the other hand, thofe of the Auftrian Netherlands fhould be difengaged from all ties and obligations, and fhould do the company more hurt and prejudice than the Caftillians themfelves could, in cafe they would break the engagements of the treaty of Munfter, and extend themfelves further in the Indies than they are allowed to do; for befides that, in fuch a cafe, the Eaft-India company might do the like, and extend it's commerce within the diftricts of the Caftillians; the Spaniards have not, by much, the fame occafion with thofe of the faid Netherlands, by reafon of their fituation and neighbourhood, to allure and draw the fubjects of this ftate to their intereft, to the prejudice of the company's grant.

Moreover, if the pretentions of the fubjects of the faid Netherlands fhould take place, the Eaft-India company, by the recovery of the faid Spanifh Netherlands for his imperial Majesty, fhould not only lofe all the efficacy of the treaty of Munfter, which was obtained with fo much trouble, but would be in a worfe condition than if that treaty had never been concluded with Spain.

And as the petitioners are daily more and more fenfible of their loffes, by the fall of the price of their goods, occafioned by the great quantities of the fame imported into Europe, and by the great number of competitors; and forefee that, in time, little more may be left to the Eaft-India company than the charge of maintaining and keeping up their forts, garrifons, and factories, and the grief to fee the profits carried off by others, even by thofe who, according to the treaties and charters, have no manner of right to this trade, efpecially if it be true (what public and private news pofitively affirm) that his imperial and catholic Majesty has already granted a patent for the fettlement of an Eaft and Weft-India company in the Auftrian Netherlands, and that notwithstanding the representations made and repeated on the part of your high-mightineffes, in order to maintain the right of the company of the United Provinces againft the faid commerce; his imperial and catholic Majesty does nevertheless endeavour, by his power and authority, to countenance and confirm a navigation and trade which, at all times, were prohibited to thofe of the faid Netherlands, and from which they were fo carefully excluded.

Therefore the petitioners again prefume to remonftrate the whole matter to your high-mightineffes, and to juftify more at large what they have already offered in their former memorials, moft humbly praying, That, in confideration of the great prejudice which the licensed Eaft-India company has already fuffered, and will fuffer more and more, by the grant of the faid new patent, and by the notorious incroachments on their right to the Eaft-India trade, your high-mightineffes

nesses may please to cause your ministers at the courts of Vienna and at Brussels, to continue and repeat the most earnest and most effectual instances to engage his imperial and catholic Majesty, in his great equity and justice, to put a stop to the navigation from the Austrian Netherlands to the East-Indies, not to put in execution the said patent, and not to grant any new commission or patent for their trading thither; and that your high-mightinesses may please to use both this method, and all further means, which in your great wisdom, and more extended lights, you shall judge more convenient and effectual to oppose this unlicensed trade, and prevent its progress, that the petitioners may quietly enjoy the effect and benefit of their charter: and the petitioners, &c.

REMONSTRANCE III.

Or petition of the directors of the East-India company, to their high-mightinesses the lords States-General of the United Provinces.

The directors of the licensed East-India company of this country, in all duty shew, That it is with great regret they have found themselves obliged to apply several times to your high-mightinesses, and from time to time to complain of the endeavours used in Brabant and in Flanders towards establishing a new navigation and trade both to the East and West-Indies; that your high-mightinesses may remember, that the same has occasioned the taking and confiscating of some vessels on both sides; and, of late, of the taking of the ship called the Cornman, by the Ostend privateers, for which loss a due recompence has hitherto, against all reason, been denied; but that the petitioners have, at least, had this satisfaction, that, since the taking of those prizes, a stop has been put to the sending out ships to the West-Indies and Africa, apparently because it has been acknowledged, by the representations made on that subject, that the said navigation is notoriously contrary to the 5th and 6th articles of the treaty of Munster; that the petitioners thought they might hope, that, although they should still be denied amends for the said loss, they should not, at least, have fresh matter of complaint given them: but, instead of that, it appears by the public news, that there is a design to begin again, and to carry on with more vigour than before, the said navigation and commerce to the West-Indies and Africa, and that in order thereto a patent has already been obtained of his imperial and catholic Majesty.

That this undertaking is so prejudicial to the general West-India company established in this country, and so directly contrary to the said treaty of Munster, that the petitioners, without any further representation of the right to them belonging, by virtue of the said treaty, and of the engagements entered into by his imperial and catholic Majesty, as successor of king Charles II. of glorious memory (mentioned several times before, and sufficiently known) cannot forbear applying again to your high-mightinesses, most humbly to pray your powerful protection, towards the putting a stop to the said new navigation to the West-Indies and Africa, and that the said patent of his imperial and catholic Majesty, may not have its effect; and that his said Majesty be desired not to grant, for the future, any new commissions or passes; as also that your high-mightinesses be pleased to take such further measures as your high-mightinesses may think most effectual to obtain the same of the Emperor, most dutifully referring themselves to what your high-mightinesses shall find proper to do therein. Done at Amsterdam, the 22d of March, 1723, by order of the abovesaid directors, and signed

JOHN DE LA BASSECOUR.

REMARKS.

By the steady resolution of the States-General, in concert with the crown of Great-Britain, the abolition of this Ostend East-India company was effectuated: but so great is the change in the system of Europe since this time, that neither the States-General nor England seem to concern themselves much about the establishment of new East-India companies with, as encouraging privileges and immunities as England formerly granted to her trading corporations. And is not this very natural to be attempted by other nations, they knowing, from the experience of England, France, and Holland, that this measure has been attended with so great success and prosperity to the commerce and navigation of those respective potentates? Quere, therefore, Whether it may not require the most mature and deliberate consideration, before we absolutely abolish our own East-India company, while other states are establishing and vigorously supporting the like kind of companies?

If it was really for the advantage of England and Holland to suppress the late Ostend East-India company, by reason only that it proved manifestly detrimental to both, can it be believed, from the same principle of reasoning, that the total annihilation of our East-India company could tend to the trading advantage of the nation? Would not France, and perhaps Holland, and some other potentates, rejoice as much at the destruction of our East-India company, as the Dutch

and English, and even the French, did at that of the Ostend company?

We have, from the best of our judgment, stated the case of our East-India company, with all impartiality [see the articles EAST-INDIA TRADE and EAST-INDIA COMPANY]: and so far have we been from pleading in favour of this company, and attempting to justify them for not trading to all places within their charter, where it can be done with benefit to the nation, and without injury to themselves; I have urged every thing argumentative that has been said against them in this respect, and shewed the reasonableness of private traders being admitted to traffic in those parts of the East-Indies where the company do not: for the company have been roundly charged with cramping, instead of extending, their commerce within their charter.

As I have occasionally introduced what matter has been started in opposition to the conduct of the company in this respect, so it is a duty on the impartial man to represent fairly what reply has been made to a charge of this nature, that the public may be able to make a right judgment of the matter before them.

The first charge against the East-India company, says Mr Rammell, is their not attempting to trade on the west side of the Red Sea, which is said to be inhabited by Christians: to which I reply, continues that gentleman, that, as I lived six years in the company's factory at Mocha, it cannot be supposed but that I have some share of knowledge of the trade in the Red Sea, and the ports frequented by the merchants on both the shores.

The first place where I know of any trade in the Abyssine country, is at Zelah, a small port a little without the Baabs; it is under the jurisdiction of the Mocha governor; there is a small fort, and garrison of Arabs: at proper seasons of the year boats go from Mocha with an ordinary cargo of piece goods, and, in return, bring back hides, sheep, and clarified butter; there is some small places within the Baabs on that coast, which the Banians of Mocha trade to in boats, but they employ Abyssinians for their factors, of whom there is a great number always at Mocha; the boats crew are of the same country as the factors, for the Arabs are not fond of putting themselves in the power of so uncivilized a people: there is no port, I believe, on what is called the Abyssine country, within the Baabs, large enough for a trade to be carried on there by shipping; but on the Ethiopian coast there is, but they are possessed by the Turks, the Christians living all inland, and I believe the country they possess is filed the interior Ethiopia, and the nearest sea-port to their territories is, if I mistake not, called Mussoah, and, as I observed before, is in the possession of the Turks, so I leave the world to judge, if there is any manner of prospect of the European Christians carrying on a trade with the Christians in Ethiopia by sea, whilst the Turk keeps possession of the avenues to the country. I have known a small Mahometan ship from Surat make a voyage to that port with piece goods, &c. and have brought back elephants-teeth, some civet, and a small quantity of gold dust. During the time of my residence at Mocha, the chief of the French factory sent a small vessel thither, with Mahometan sailors in her, and a Greek for the supercargo, who had lived many years amongst the Turks and Arabs, (and I believe had been circumcised) but the voyage turned to so indifferent an account, that I have not heard of any vessel belonging to the Christians going thither since. The Mahometan governments in the Red Sea are much prejudiced against the Christians, on account of their religion (which may be owing to the vicinity of their prophet's tomb) and frequently treat them ill, without the least occasion, as I have often experienced. One of the governors of Mocha, in my time, issued out his orders that the centinels at the town gates should knock down any of the French, Dutch, or English companies servants that should presume to ride in or out of them, though, at the same time, they were free for all others to pass unmolested: this order was in force several months. The governor of Mocha always insisted on having the company's lead at his own price (and I believe the iron likewise) which was very low, so that it used to be sent from thence to Bombay or Surat: the myrrh and drugs that are the product of Abyssine and Ethiopia, are brought to Mocha in small boats; but their aloes are no better than those which grow on the Arabian shore, which are in little esteem in Europe; those that used to be purchased on the company's account were brought from the island of Socatra.

The next article is, that the company doth not trade to Si-am, a rich and great kingdom, nor to Pegu, a country that produces rubies, gum-lacque, gum-dragon, and all materials of fine India varnish, the Indians being industrious, a great trade might be carried on there. The objectors then go on, and mention Tonquin, Cochin-China, the kingdoms of Japan and Corea: I shall give for answer to the foregoing, that I think the reason is very obvious, which is, that the managers thereof are well satisfied that it would not answer their purpose, and therefore it would be injuring the proprietors to carry on a losing trade.

As to the trade of Siam, I shall not pass it over without saying something relating thereto: I remember that about six or seven-and-thirty years ago, I was concerned in an adventure shipped on board the *Morning Star*, Capt. Alexander Hamilton commander, bound from the ports of Surat and Bombay to Siam, at which port he met with a ship from Fort St George; the commander of whom, or some other person belonging to the ship, instigated the government of Siam against the said Capt. Hamilton in such a manner, that they were the cause of his being arraigned for his life (for no other reason but to overset his voyage) and though Capt. Hamilton escaped the executioner's hands, it answered the others purpose as well as if he had been hanged, for he was not permitted to do any business there; so that he failed down the river with his ship, and anchored off the port, where he continued several days, with a full resolution of taking a prize, in order to reimburse the owners for what they were like to be sufferers by his not being permitted to dispose of his cargo in the port; (the particulars of this affair may be read in the said Hamilton's Voyages, printed about 23 years ago) but at last was obliged to quit his station without any booty, on account of the changes of the seasons, or want of provision, I can't tell which. Now, for argument's sake, I will suppose he had taken a Siam vessel, or the ship from Fort St George (which I am almost positive I have heard him declare he would have attempted, had he failed out whilst he lay before the river's mouth) with Siam, or other India merchants freighters on board: had, I say, this been the case, the said merchants would, in all probability, have received some satisfaction for the outrage committed against them by the said Capt. Hamilton; but had there been no English East-India company subsisting, and he had been on his return to England instead of Bombay, I don't see that it would have been in the power of all the king's governors abroad to have done justice to the poor injured Siamers; but suppose it was, 'tis most likely that the king of Siam would have gone a much shorter and surer way to work, than to complain to them about the affair, by making reprisals on the next English ship that put into his port: for the trade in Asia, and it's policy, is not of a piece with that of Europe, where, if the subject of one nation is ill treated in another prince's dominions, the minister or consul of the nation he belongs to, will, on a proper application being made to him, endeavour to get him redressed: but, as I have observed, it is otherwise in the East-Indies; so that it is very probable, if the trade thither was laid open, the English would soon be involved in disputes and broils with several potentates in India (where the king of Great-Britain had no garrisons) whilst the French, and other nations from Europe, would carry on their trade uninterrupted, and the English would be looked upon no better than pirates, through the indiscretion and hot-headedness of some of the English commanders; which there is no danger of whilst things are on the present footing, by reason that, if any of the present commanders employed in that trade should commit a rash or an unjust action, whilst trading from port to port in the East-Indies, on his return from the port he set out from, or to the port where he is to take in his loading for England, the affair would come to light, and all the English settlements apprized thereof, as soon as conveniently they could, that they might take their measures accordingly. It was rivalry in trade that gave rise to Hamilton and Quarrel, the ships belonging to different employers: and the same cause will always exist, if the East-India company is laid aside, and no doubt will frequently be attended with the like consequences.

As for the port of Pegu, the India company used to have a resident in that king's dominions, but, by reason of troubles in the country, I believe there has not been one for some years past; but I have of late heard talk that their governor at Fort St George had instructions from the company about settling that place again: though Pegu, and some other countries, may produce commodities proper for an Europe market, yet the sending one of their ships for them would so enhance the price of the goods, that, in the end, they would stand them in more than they could expect to sell them for. The Tonquines may be an industrious people, but I have been told that they are so very poor, that they never have a stock of goods by them; and those that expect to meet with a cargo there, or indeed, any quantity of goods fit for the Europe markets, should go with a resolution of staying a considerable time at that port. I remember that a little ship called the *Fame*, Capt. Gregory commander, failed from Bombay to that port, where he and both the supercargoes were murdered in their house on shore; the ship got safe back again to Bombay; and, though I continued 14 years in India after this affair happened, I can't call to mind that the gentlemen at Bombay sent any other ship thither.—The trade to Cochin-China is in a manner prohibited to all Europeans; and although I have been acquainted with India affairs for 40 years past, I don't remember to have heard but of one ship belonging to Europeans making a voyage thither, and that was commanded by one Capt. Pearce, or some such name, and was fitted out either from Madras or Bengal; but the voyage did not answer: the year before that he intended his voyage,

he by some means or other (the particulars, though he told them me, I can't recollect) procured the king's grant, or permission, to come to his country: it was wrote, or stamped, I believe on a piece of solid gold, of about five or six inches long, and about two inches broad, whereon was inscribed the captain's name, and the number of men and guns his ship carried.—As for a trade to Japan and Corea, I am well satisfied that, if any of the English governors, or free merchants abroad, had thought it worth their attempting, they would not have admitted it (and I can't call to mind of any experiment being made in my time); for whatever the gentlemen in England may think of the matter, I am well satisfied, that, amongst the company's servants and free merchants abroad, there is not wanting men of abilities, fortunes, or inclinations, to trade to every creek or port in India, where there is but any prospect of success; which is to be done for less than half the expences by what is called country ships, than can be performed by ships from England. And, as an undeniable proof of the flourishing condition the private trade was in when I lived at Surat (and may be so still for any thing I know to the contrary) I declare on my own certain knowledge, that, at that port only, it amounted to about 250,000 l. per annum. This I infer to shew what a spirit of trade reigns amongst the English in the East-Indies. The author of the paragraphs in some public papers, on which I have made the foregoing remarks, desires the candidates at the approaching general election to enquire into the matter, and to use their endeavours for laying the trade to the East-Indies open; and concludes the paragraph by saying, That, in a little time, the parishes might be discharged from the poor's tax: to which I reply, That I suppose the company at present employs as many ships to the East-Indies as is consistent with prudence, and they all go out with their full loading of Europe cloth, &c. It is not at all unlikely, but that if the trade was open, there would for the first year or two be a greater quantity of woollen goods carried thither than what the company at present export; but, if the returns back did not answer, it cannot be expected that the profits on cloth out would bear any proportion to the expence of sending a ship to the East-Indies: the difficulties of procuring cargoes for the return of the ships to England, is an article perhaps not much considered, or known properly to those gentlemen who are not concerned in the trade to India; for, notwithstanding that the company send orders to their governors, &c. abroad, a year at least beforehand, of the tonnage they may expect out, and that the proper cargoes may be got ready against the ships expected in India arrive, yet it sometimes happens that some of their ships are obliged to be employed a year or two in India, for want of a loading. When the company's orders reach India, their governors, &c. send for the black merchants, and contract with them to make the investment, and generally advance a good part of what it will amount to for the carrying it on. In the pepper settlements, likewise, they frequently are under a necessity of advancing part of the money before the crop is gathered. If the king's governors were to be put in possession of the company's garrisons and factories, the trade could not be supported or carried on, but by persons on the spot having very considerable sums of money by them, to buy up the pepper, as well as to advance money for the cloth investment, otherwise the black merchants would quit the English bounds, and settle elsewhere. In such case, I desire to know what benefit our fortifications, &c. would be of?—As I have shewn the improbability of the India trade being carried on with success without very great sums being left there yearly, it next falls under consideration who is to advance it; no private person is capable of doing it; and if it is to be the concern of several merchants in conjunction, pray what is that but a little new company, of which I doubt not but several would by degrees spring up, out of the ruins of the old, who would soon be at variance with each other, and prove each other's ruin: for the more bidders there are at any market, the greater price must they be obliged to give for the commodity they want: and when they dispose of their Europe cloth, &c. they will be under as great a disadvantage; for, when the India merchants have several warehouses to go to at the same place, they will not be wanting to beat down the price, and our people must be content, especially the most needy ones, to sell their goods for the most the market will afford them, whether they get any thing by the sale or not. It is well known, that, during the time the old and new East-India companies had each their factory at Surat, the price of the goods they wanted at that market rose considerably, and that they frequently incensed the country government against each other, of which they took advantage, and fleeced both in their turns.

I am now come to the last paragraph, wherein is recommended the incorporating the black merchants with the white, which has already been done by his Majesty's most gracious charter; and those that now live on the island of Bombay, or within the company's bounds at Bengal or Fort St George, are intitled to the same privileges and immunities, and governed by the same laws, as the English. If the scheme takes place, of the trade to India being laid open, some people

take upon them to advance, that the English residing in India will not only be able to defray their own charges (as if they had not done it hitherto) but give assistance towards paying off the national debt. This last is a noble thought, and breathes the true air of patriotism; but, to make the success more certain, I beg leave to recommend the sending out with the king's governors and officers, one million of the nation's cash, to provide cargoes for the ships they may expect from England, and for trading from port to port in the East Indies; for there is no doubt but they will prove most excellent merchants. I have now finished my remarks on what was published in regard to the East India company's not trading to Ethiopia, &c. and have likewise set forth some of the evils that I apprehend will accrue to this nation in case the company should be abolished; my design herein being an honest endeavour to undeceive the deceived.

Jerusalem Coffee-House.

THO. RAMMELL.

OVERISILL, in the United Netherlands. This province is bounded on the north-west by Friesland, and part of the Zuyder Sea; on the west by that part of Guelderland called the Veluwe; on the south by the county of Zutphen; on the east by the bishopric of Munster; and on the north by the province of Groningen. The soil in many places is barren, being full of sands, heaths, and marshes; but, in some parts, they have good corn and pasture: it is the worst peopled of any of the provinces, partly on account of its barrenness, and because their situation is not convenient for trade.

ZWOL stands on the river Aa, which falls here into the Vecht, and runs into the Zuyder sea, making a channel, into which the tide flows, which advances the trade of the town: it consists chiefly in timber, cattle fattened in the neighbouring pastures, Bentheim stones, wool, corn, butter, and cheese.

CAMPEN stands on the Ifsel, a little above where it falls into the Zuyder Sea. Its trade is decayed of late, the harbour being fo choked up with sand, that it does not admit large vessels. It has two suburbs, inhabited chiefly by fishermen, there being plenty of fish in its neighbourhood.

VOLLENHOVEN, on the Zuyder Sea, has a great market for corn from the Baltic.

BLOCKZYL, on the same sea, at the mouth of the river Aa, is a place of considerable trade, and very populous: its harbour will hold above 200 vessels.

OXFORDSHIRE, an inland county of England, bounded with Buckinghamshire on the east; with Gloucestershire on the west; on the north, where it terminates in form of a cone, it has Northamptonshire on one side, and Warwickshire on the other; and, on the south, it is separated from Berkshire; and is about 130 miles in circumference.

Fuel here is scarce, that it is commonly sold by weight in the city of Oxford, and other towns in the north part of the shire. Though many parts of the country bear corn very well, it abounds most with meadows and pastures.

The city of **OXFORD** stands at the conflux of the Charwel and Isis, in a plentiful country: its chief trade is in sending malt by barges to London.

WOODSTOCK has a manufacture of fine steel chains for watches, and other things of polished steel.

HENLEY UPON THAMES is a town of good wealth and building: its chief trade is in malt, of which, and of other corn, it is thought above 300 carts are sold here on some market-days; the inhabitants being generally mealmen, maltsters, and bargemen, who live by carrying corn and wood to London.

WHITNEY has a trade in spinning for the neighbouring clothiers; but its greatest manufacture is rugs and blankets, which last are commonly from 10 to 12 quarters wide, and so preferred before all others for their whiteness, that they have in a manner engrossed the whole trade of the nation for that commodity. They have 150 looms almost continually employed in it, with above 3000 people, from eight years old and upwards; and it is said 100 packs of wool are spent in it every week. They scour them in the river Windrush, whose waters, some think, have a more absterfive nitrous quality than others. They also make duffels here, which are a yard and $\frac{1}{2}$ wide, and exported to Virginia and New England, for cloathing the Indians. Cuts for hammocks, and tilt-cloths for bargemen, are likewise made here; and there is a great number of fellmongers in the town, who having dressed and stained their sheep-skins, make them into jackets, breeches, &c.

BAMPTON lies on a river navigable by boats; and its market is noted for the great quantity of fellmonger's wares, as leather jackets, gloves, breeches, stockings, &c. brought hither from Whitney, and sold here into Berkshire, Wiltshire, and Dorsetshire, no town in England having such a trade for these wares.

OYSTERS.

The history, the generation, and ordering of **GREEN OYSTERS**, commonly called **COLCHESTER OYSTERS**.

In the Month of May the oysters cast their spawn (which the dredgers call their spat) it is like to a drop of candle, and about the bigness of an half-penny.

The spat cleaves to stones, old oyster-shells, pieces of wood,

and such-like things, at the bottom of the sea, which they call cultch.

It is probably conjectured, that the spat in 24 hours begins to have a shell.

In the month of May the dredgers (by the law of the admiralty court) have liberty to catch all manner of oysters, of what size soever.

When they have taken them, with a knife they gently raise the small brood from the cultch, and then they throw the cultch in again, to preserve the ground for the future, unless they be so neww spat that they cannot be safely severed from the cultch, in that case they are permitted to take the stone or shell, &c. that the spat is upon, one shell having many times 20 spats.

After the month of May, it is felony to carry away the cultch, and punishable to take any other oysters, unless it be those of size, that is to say, about the bigness of an half-crown piece, or when the two shells, being shut, a fair shilling will rattle between them.

The places where these oysters are chiefly caught, are called the Pont, Burnham, Malden, and Colne waters, the latter taking its name from the river of Colne, which passeth by Colne-Chester, gives the name to that town, and runs into a creek of the sea at a place called the Hythe, being the suburbs of the town.

This brood, and other oysters, they carry to creeks of the sea at Brickle Sea, Mersey, Langs, Fringreggo, Wivenho, Tolebury, and Salt-Coast, and there throw them into the channel, which they call their beds, or layers, where they grow and fatten, and, in two or three years, the smallest brood will be oysters of the size aforesaid.

Those oysters which they would have green, they put into pits about three feet deep, in the salt marshes, which are overflowed only at spring tides, to which they have sluices, and let out the salt water until it is about a foot and a half deep.

These pits, from some quality in the soil co-operating with the heat of the sun, will become green, and communicate their colour to the oysters that are put into them, in four or five days, though they commonly let them continue there six weeks or two months, in which time they will be of a dark green.

To prove that the sun operates in the greening, Tolebury pits will green only in summer; but that the earth hath the greater power, Brickle Sea pits green both winter and summer: and, for a further proof, a pit within a foot of a greening pit will not green; and those that did green very well, will in time lose their quality.

The oysters, when the tide comes in, lie with their hollow shell downwards, and, when it goes out, they turn on the other side; they remove not from their place unless in cold weather, to cover themselves in the oufe.

The reason of the scarcity of oysters, and consequently of their dearth, is, because they are, of late years, bought up by the Dutch.

There are great penalties, by the admiralty court, laid upon those that fish out of those grounds which the court appoints, or that destroy the cultch, or that take any oysters that are not of size, or that do not tread under their feet, or throw upon the shore, a fish which they call a five fingers, resembling a spur-rowel, because that fish gets into the oysters when they gape, and sucks them out.

The reason why such a penalty is set upon any that shall destroy the cultch, is because they find that, if that be taken away, the oufe will increase, and then muscles and cockles will breed there, and destroy the oysters, they having not whereon to stick their spat.

The oysters are sick after they have spat; but in June and July they begin to mend, and in August they are perfectly well. The male oyster is black-sick, having a black substance in the fin: the female white-sick (as they term it) having a milky substance in the fin. They are salt in the pits, falter in the layers, but saltest at sea.

There are various other species of oysters, which are so well known, that it is needless to enlarge upon this article.

The LAWS of ENGLAND in regard to OYSTERS.

I. Stat. 10 Geo. II. cap. 30. § 2. All oysters imported from France shall be rated at 7d. per bushel strike-measure, according to the Winchester corn-bushel, and shall pay the old subsidy according to that rate, and not according to the values affirmed by the importers.

II. Sect. 3. Where the said oysters are subject to the further subsidy, the one-third subsidy, the two-thirds subsidy, the additional impost, or the duty payable upon goods imported from France, according to the values set thereon for the old subsidy, the same shall be paid according to the values set thereon for the old subsidy aforesaid, and not according to the oath of the importer.

III. Sect. 4. Upon exportation of the said oysters, the duties shall not be drawn back or allowed.

IV. Sect. 5. The several duties upon the said oysters shall be paid, or secured, by such ways, and under such penalties, &c. as are mentioned in the several acts of parliament which granted or continued the same.

THE BUSINESS OF THE CUSTOMS CONTINUED FROM
LETTER N, WITH REGARD TO OFFENCES AGAINST
THE STATUTES.

OFFENCES against penal statutes may be prosecuted, tried, &c. by way of action, &c. before justices of assize, nisi prius, goal-delivery, oyer and terminer, or justices of peace for the county, &c. where committed. 21 Jac. I. c. 4. § 1.

—Informer or plaintiff not proving the offence by evidence to the jury, the defendant to be found not guilty. 21 Jac. I. c. 4. § 2.

WITH REGARD TO OFFICERS OF THE CUSTOMS.

OFFICERS OF THE CUSTOMS.—Not to obtain their offices for gift, favour or affection, but for desert, as being of the best and most lawful men, and sufficient to their estimation and knowledge. 12 Rich. II. c. 2. § 1.

—Not to have their offices for life on term of years, but during the sovereign's pleasure only; and the said officers to remain in his hands, under the government of the treasury: And,

—LETTERS PATENTS, charters, or grants, made otherwise are void. 14 Rich. II. § 1. and 17. Rich. II. c. 5. § 1. and 1 Hen. IV. c. 13. § 1. and 20 Hen. VI. c. 5. § 5. and 31 Hen. VI. c. 5. § 1.

—To reside by themselves, or their sufficient deputies, at the several head ports, members and creeks, on penalty of 100l. loss of office, and imprisonment. 1 Hen. IV. c. 13. § 1. and 14 Hen. IV. c. 20. § 1. and 13 Hen. IV. c. 5. § 1. and 1 Eliz. c. 11. § 8. and 13 and 14 Car. II. c. 11. § 14.

—No person may bargain or sell any office, or the deputation thereof, or any part thereof, nor receive any money, fee, or reward, or any promise, agreement, or assurance for any office in the customs, upon penalty of forfeiting the place by the seller, and buyer to be adjudged incapable to enjoy the same, and the bargain, sale, &c. to be void. 5 and 6 Edw. VI. c. 16. § 2, 3.

—Or their deputies or clerks, not to have any ships of their own, nor to freight any ships, nor to buy or sell any merchandize, nor to have any wharfs or keys, nor hold any common hosteries, or taverns, nor to be factors for any merchant, denizen or alien, or host to any merchant alien, on forfeiture of 40l. 14 Rich. II. c. 10. § 1. and 4 Hen. IV. c. 21. § 1. and 11 Hen. IV. c. 2. § 1. and 20 Hen. VI. c. 5. § 1.

—No person to be customer, comptroller, or searcher in any port, where he is common officer, or deputy to such common officer, upon forfeiture of 40l. for every half year he executes both offices. 3 Hen. VII. c. 7. § 1.

—Two of the commissioners first named in the commission are, before the chancellor, or chief baron of the Exchequer, or master of the Rolls; and every other of the commissioners, patent-officers, their deputies, clerks, or servants, and all other officers of the customs in the port of London, are, before any two of the said commissioners, upon their admission, to take their corporal oaths for the true and faithful execution of their trusts and employments, to the best of their knowledge and power, and that they will not take or receive any reward or gratuity, except their salaries, and what is allowed them from the crown, or their regular fees established by law. 6 and 7 W. and M. c. 1. § 5, 6.

—Officers in the OUT-PORTS at their admission to take the like oath before two justices of the peace.

—Refusal or neglect of taking such oath, is forfeiture of office.

—The taking of such oath to be certified to the next general quarter sessions. 6 and 7 W. and M. c. 1. § 5, 6.

—Deputies, clerks, and servants before employed in the customs, are to take their corporal oaths before the commissioners and principal officers in the port of London, or the principal officers in the out-ports, or any two of them, for the true and faithful execution and discharge of their trust and employments, to the best of their knowledge and power, which oaths are to be entered and registered in the custom-houses of the respective ports where the persons are employed. 13 and 14 Car. 2. c. 11. § 33.

—In England.—To receive the sacrament of the Lord's supper, according to the usage of the church of England, in some public church, upon a Lord's day, within three months after admission, under the penalties, forfeitures, and disabilities as in article 16. 25 Car. II. c. 2. § 2. and 1 Geo. I. c. 13. § 24.

—A certificate thereof, under the hands of the minister and churchwardens, must be produced in the court where the oaths mentioned in the following article are directed to be taken; and there confirmed by the oaths of two creditable witnesses at the least. 25 Car. II. c. 2. § 3.

—At any time before the end of the next term, or general quarter-sessions, after admission, are to take and subscribe the oaths of allegiance, supremacy and abjuration (in the words prescribed by 1 Geo. I. cap. 13.) if they reside within

London or Westminster, or within 30 miles thereof, in the courts of Chancery, King's Bench, Common-Pleas, or Exchequer, or else at the general quarter-session of the county, &c. where they reside, between the hours of nine and twelve in the forenoon, upon forfeiture of office, unless it be in inheritance, and a deputy be appointed, who qualifies himself, and is approved by his majesty under his privy-signet. 25 Car. II. c. 2. § 2, 4, 5. and 1 Ann. c. 22. § 5. and 1 Geo. I. c. 13. § 1, 3, 9, 10, 20, 29. and 2 Geo. II. c. 31. § 3, 4.

—Executing their office after the expiration of the time, without compliance, are disabled to sue in course of law, or to be guardian to any child, or executor, or administrator to any person, and rendered incapable of any legacy, or deed of gift, or of enjoying any office, or of voting for members of parliament, and to forfeit 500l. 25 Car. II. c. 2. § 2, 4, 5. and 1 Ann. c. 22. § 5. and 1 Geo. I. c. 13. § 1, 3, 9, 10, 20, 29. and 2 Geo. II. c. 31. § 3, 4.

—But upon compliance, after forfeiture, may be capable of a new grant either of the said office, or any other, if not granted to, or enjoyed by another person. 25 Car. II. c. 2. § 14. and 1 Geo. I. c. 13. § 16, 27.

—Persons not bred up in Popish religion, and professing themselves to be Popish recusants, suffering their children to be educated in the said religion, are incapable of any office. 25 Car. II. c. 2. § 8, 9.

—Such children likewise incapable, 'till they are converted to the church of England, and have taken the oaths of allegiance and supremacy, and subscribed a declaration against transubstantiation, before the justices of the peace, at the quarter-sessions, and have received the sacrament after the usage of the church of England, and obtained a certificate thereof under the hands of two or more of the said justices. 25 Car. II. c. 2. § 8, 9.

WITH REGARD TO SCOTLAND.

—IN SCOTLAND.—To take and subscribe the oaths of allegiance and abjuration, and subscribe the assurance, in the court of session, justiciary, exchequer, or quarter-sessions, within three months after admission, under the same penalties, forfeitures, and disabilities, as the officers in England. 1 Geo. I. c. 13. § 1, 4, 5, 9, 10, 16, 20, 29.

—The deputations or authorities granted to collectors, surveyors, or other inferior officers of the customs, not void by the death or removal of the commissioners who granted them. 12 Ann. c. 8. § 13.

—Taking a bribe, or conniving at a false entry of any goods, to the prejudice of his majesty, or suffering prohibited goods to pass, are incapable of any office for the future, and to forfeit 100 l. and the person giving the bribe, or offering any bribe, whether it is accepted or not, to forfeit 50l. 13 and 14 Car. II. c. 11. § 19. and 9 Geo. II. c. 35. § 24.

—But the offenders revealing their offences within two months, to the treasurer of England, the chancellor, undertreasurer, or barons of the Exchequer, are to be acquitted. 13 and 14 Car. II. c. 11. § 20.

—Illegally detaining goods, or neglecting or refusing to make repayments and allowances, or after notice given, not giving out and executing their warrant, liable to double costs and damages. 13 and 14 Car. II. c. 11. § 34.

—Or their deputies, may go on board any ships, and there remain 'till all the goods be discharged. 13 and 14 Car. II. c. 11. § 4.

—Upon oath made before the lord treasurer, or any of the barons of the Exchequer, or the chief magistrate of the place, that goods liable to duties have been landed or conveyed away without due entry, they may issue out a warrant to enable any officers of the customs, with the assistance of a sheriff, justice of the peace, or constable (within one month after offence committed) to enter into any house in the day time; and in case of resistance, to break them open, and to seize the said goods. 12 Car. II. c. 19. § 12.

—The information upon such house false, the party injured may recover full costs and damages against the informer. 12 Car. II. c. 19. § 4.

Authorized by writ of assistant out of the court of exchequer, may in the day-time (at any time after the offence) with a constable, &c. enter any house, shop, &c. and in case of resistance, break open doors, chests, &c. in order to seize and bring away prohibited and uncustomed goods, and secure them in his majesty's storehouse of the port. 13 and 14 Car. II. c. 11. § 5.

—Forcibly hindered, affronted, abused, beaten, or wounded in the due execution of their office, the next justice of the peace, or other magistrate, may commit the offender to prison, till the next quarter-sessions; when the justices may punish him by fine, not exceeding 100 l. and the said offender is to remain in prison 'till discharged of the fine and imprisonment by the court of exchequer, or he discovers the person that set him on work. 13 and 14 Car. II. c. 11. § 6.

—Eight or more armed persons, tumultuously assembled, so offending, to be transported to the British plantations for any term not exceeding seven years. 6 Geo. I. c. 21. § 34.

—Such

—Such offenders returning into Great-Britain, or Ireland, before the expiration of the said term, to suffer as felons. 6 Geo. I. c. 21. § 35.

—Offenders discovering two or more of their accomplices to the commissioners of the customs, within two months, are to be acquitted, and to receive 40 l. for each, to be paid by the receiver-general of the customs, upon a certificate of their conviction, under the hand of the judge or justice of the court. 6 Geo. I. c. 21. § 36, 38.

—The like, besides other rewards and advantages, for other persons discovering within three months. 6 Geo. I. c. 21. § 37.

—A member of the house of commons may not, by himself or deputy, or any other person in trust for him, enjoy or execute any office relating to the customs, upon penalty of being incapable of sitting or voting in the said house. 12 and 13 W. III. c. 10. § 87, 88. and 6 Ann. c. 7. § 25.

—May not in any manner endeavour to persuade or dissuade any elector in his vote for the choice of a member to serve in parliament, upon the penalty of 100 l. one moiety thereof to the informer, and the other to the poor of the parish, and incapacity to hold any office under his majesty. 12 and 13 W. III. c. 10. § 89.

—Customs and comptrollers to take bonds from, and give oaths to gentlemen or officers in the army, going over sea to serve foreign princes, that they will not turn papists, nor enter into conspiracies against his majesty; receiving for every bond 6 d. and to return a register thereof yearly into the exchequer, upon forfeiture of 5 l. for every bond, and 20 s. for every oath not certified. 3 Jac. I. c. 4. § 19, 20, 21.

—Granting a warrant for, or suffering any of the enumerated goods from the plantations, to be carried to any other country, until first landed in Great-Britain, forfeit their places, and the value of the goods. 15 Car. II. c. 7. § 9.

—Or other razing, counterfeiting, or falsifying any cocket, transire, let-pais, certificate, or other custom-house, forfeit 100 l. and such dispatch to be void. 13 and 14 Car. II. c. 11. § 8.

—Granting a false coast-certificate, forfeit their office, and 50 l. to be imprisoned a year without bail, and to suffer such corporal punishment as the court of exchequer shall think fit, and to be incapable of serving again in the customs. 33 Hen. VIII. c. 7. § 5. and 13 and 14 Car. II. c. 11. § 8.

—Viz. Customs, not mentioning the colour, length, content, weight, and value of foreign goods in coast-certificates, are to forfeit their office, and to be fined at the king's pleasure. 3 Hen. VII. c. 3. § 1.

—Viz. Customs and collectors of the customs, within ten days notice from the king, or six of his privy-council, are to declare what money due to the king is in their hands, and to pay the same when commanded, upon forfeiture of office. 7 Edw. VI. c. 1. § 13.

—Viz. Customs, upon yielding their accounts in the exchequer, to be sworn thereto. 5 Hen. IV. c. 20. § 1.

—Viz. Customs, collectors, and comptrollers, concealing the customs duly entered and paid, forfeit treble the value of the goods, and are to make fine and ransom. 4 Hen. VI. c. 3. § 1. and 18 Eliz. c. 9. § 5.

—Viz. Collectors detaining public money, are to pay interest for the same, after the rate of 12 l. per cent. per annum, with treble damages to the person grieved, and to be dismissed. 20 Car. II. c. 2. § 1.

—Viz. Collectors, diverting or misapplying the money received on the branches therein appropriated, are to be dismissed, rendered incapable to serve his majesty, and to forfeit double the sum diverted or misapplied, and 12 per cent. interest. 9 Ann. c. 21. § 14.

—Appointed for managing, collecting, &c. the respective branches, refusing or neglecting to pay the monies into the Exchequer, or diverting or misapplying any part thereof, are to forfeit their offices, and to be rendered incapable of serving his majesty in any place of profit and trust, and to

forfeit double the value of the sum diverted or misapplied.

—Collectors detaining any monies received for any of the said duties, are to be dismissed, and to be charged with interest at 12 l. per cent. per annum, and be liable to treble damages. 9 and 10 W. III. c. 44. § 42. and 4 Ann. c. 6. § 10. 5---c. 19. § 12 and 5---c. 19. § 12 and 6---c. 11. § 7 and 8---c. 4. § 12. and 8---c. 7. § 37. and 9---c. 6. § 20. and 9---c. 11. § 48 and 9---c. 12. § 29. and 10---c. 19. § 122. and 10---c. 26. § 76. and 12---c. 9. § 32. and 6 Geo. I. c. 11. § 22. and 10 Geo. I. c. 10. § 45.

—Viz. Customs, collectors, receivers, &c.---All lands, tenements, profits, commodities, and hereditaments, which any officer, whose whole receipt from the beginning, or yearly receipt, exceeds 300 l. hath or shall have, whilst he remains accountable, shall be liable to the payment of his arrearages or debts, and may be put in execution for the same, by way of extent. 13 Eliz. c. 4. § 1, 10.

—If arrearages are not paid within six months after the account be finished, or debt known, the king may, by letters patent, make sale of so much of the lands, &c. as will satisfy the debt. 13 Eliz. c. 4. § 2, 3.

—Such sale may be made, though the officer be dead, if the account be stated, or debt known within eight years after his death; unless such officer had a quietus est, or a discharge in his life-time. 27 Eliz. c. 3. § 2, 3.

—Lands, &c. purchased after the person became an officer, if for his own use, though in the name of another person, yet to be liable to the crown's debts. 13 Eliz. c. 4. § 5.

—The crown's debts being fully, or in part satisfied, by sale of the lands, &c. the officers foreties are to be discharged accordingly. 13 Eliz. c. 4. § 15. and 27 Eliz. c. 3. § 5.

—Who sit above stairs in the custom-house, their time of attendance,

—To dispatch merchants in their turns.---Rule 13th at the end of letter A.

—Below stairs, their attendance.

—Embezzling any lodged in any warehouse in their custody, are to forfeit double the value, and full costs. 8 Ann. c. 13. § 27.

—May not exact unlawful fees.---Vide FEES.

—But may take such recompence for extraordinary service and attendance at times and places not required by law, as the commissioners in the port of London, and the collector, customs, and comptroller of the out-ports, or any two of them, shall determine. 6 and 7 W. III. c. 7. § 15.

—of the Excise.---Attempting to corrupt them, the penalty is 500 l. 11 Geo. I. c. 30. § 40.

—Or their assistants, being resisted or molested in the execution of their duty, by persons passing armed with prohibited or uncustomed goods, may oppose force to force in defence of themselves, and execution of their duty; and if apprehended for beating, maiming, or killing any person so resisting them, are to be admitted to bail. 9 Geo. II. c. 35. § 35.

—Either by patent, grant, or otherwise, are not void by the demise or death of his majesty, his heirs and successors, but are to continue in force for the space of six months after, unless sooner superseded, or made void by the successor: but the officers not required to take any oaths, de novo, in respect of being continued for such six months only. 1 Ann. c. 8. § 2. and 4. and 5 Ann. c. 8. § 0. and 6 Ann. c. 7. § 8, 18. 1 Geo. II. c. 5. § 2. and c. 23. § 7.

—Of the customs, excise, and stamp duties, severally continued for ever; with a proper number of commissioners, and a comptroller, in each of them. 9 Ann. c. 21. § 12.

—Of profit, and all other payments from the crown, are liable to a deduction not exceeding 6 d. in the pound, which his majesty may, by warrant under the great seal of Great-Britain, privy-seal, or royal sign manuel, cause to be made, out of all salaries, fees, wages, and other payments, or any arrearages thereof from the crown, for the use of his majesty's civil list. 7 Geo. I. c. 27. § 19. and 11 Geo. I. c. 17. § 19. and 12 Geo. I. c. 2. § 26.

P.

P A I

PACKERS. This is esteemed a very reputable trade, though they are really what their title expresses, packers as well as pressers of all sorts of bale-goods (intended for exportation) for the great trading companies and merchants, for which they are answerable, if they should happen to receive any damage through bad package: besides this, several of them are considerable dealers.

PAINTERS. There are four sorts of painting, which are properly called trades.

1. House-painting, which is mostly plain work within and without.
2. Ship-painting, which is also for the most part plain, but with a great deal of carved-work, and gilding sometimes.
3. Sign-painting, which is mostly rough figure-work: there are also shop-keepers, who are also a sort of carvers and joiners, and make and sell all sorts of wooden signs; but there are some also of pewter, which is the pewterer's work to cast, and the sign-painter's to draw.
4. Coach-painting, which is partly plain, and partly in figures, and some of it very curious: there are also arms-painters, which are much used on coaches, &c. House and ship-painter's work is by far the most populous, but the heaviest and most unwholesome.

PAINTING.

OF PICTURE-PAINTING.

Whoever would apply himself to painting, says that celebrated Italian painter Leonardo da Vinci, must, in the first place, learn perspective*: this will enable him to dispose things in their proper places, and to give the due dimensions to each: having done this, he must learn to design; chusing for that purpose some able master, who, at the same time, may give him an insight into the colours of figures: he ought then to consult nature, to confirm himself in what he has already learnt; and, lastly, let him apply himself to the study and imitation of the greatest masters, in order to get a habit of reducing what he has learnt into practice.

* That perspective is an essential requisite in a good painter, is attested by all our most eminent artists, and is moreover confirmed by almost every author, who has wrote with judgment upon painting; nay, the very term painting implies perspective. For, to draw a good picture, is to draw the representation of nature, as it appears to the eye; and to draw the perspective representation of any object, is to draw the representation of that object, as it appears to the eye: therefore, the terms painting and perspective seem to be synonymous, though I know there is a critical difference between the words. Yet this will serve, at least, to shew the near alliance between painting and perspective; that if the one doth not comprehend the other, perspective, however, may be said to be the basis upon which painting is built; and therefore, he who attempts to paint a picture, without having a general knowledge of it, will always wander in the mazes of uncertainty, be subject to the greatest errors, and his works, like those of Boticello, will be the less regarded. And what is said of the usefulness of perspective to painters in particular, may be applied to artists in general; such as engravers, architects, statuary, chasers, carvers, &c.

To design well, and to dispose the lights and shadows of figures suitably to their situations, being the most considerable parts of this art, and those on which the greatest stress depends; it is in these that a painter, who would make any great proficiency, ought principally to exercise himself.

Of all animal operations, we plainly perceive fight to be the most quick: it moves with incredible velocity, and discovers a thousand objects in an instant. But then it sees them very confusedly, and, in effect, does not discern above one at a time. For instance, if you glance your eye over a page of this book, you will immediately perceive it full of different characters; but what these characters are, or what is intended by them, will be still a secret: inasmuch, that to gain any determinate knowledge of what you have seen, you must consider them by piece-meal, forming the letters into words,

P A I

and those again into periods; so a man who would mount to the top of a building, is content to go up step by step, as knowing it impossible otherwise to reach it: in the same manner, a person who would attain to skill in painting, must begin with the parts of objects, before he can proceed to represent them entire; and must take them in order, never advancing to a second, before he has got a good habit of doing the first: for, otherwise, his time will be thrown away, or at least, his advances rendered extremely slow and imperceptible. He must further inure himself to work with patience and steadiness, always remembering, that a slow diligence will out-strip a hasty negligence.

Some people have a fancy for painting, who yet want the necessary dispositions thereto: this is easily discoverable in children, who amuse themselves with drawing imperfect sketches, never troubling themselves to shadow any thing they undertake.

A painter deserves but a small share of reputation, who only succeeds in some one branch of his art; as for instance, in painting a nudity, a head, drapery, animals, landscapes, &c. since the heaviest genius, by incessant plodding on the same thing, cannot fail, at length, of performing it well.

A painter must therefore be universal, and apply himself to the study and consideration of all objects; but so as to attend in a particular manner to those parts of each, which are the most beautiful and perfect: by this means his imagination will become like a mirror, representing every thing laid before it, in it's proper character and colour.

But further, a painter, who is not equally pleased with all parts of his art, will never become universal. Boticello, for instance, had a peculiar pique against landscapes, and thought them much beneath his application; the effect of which was, that being a very sorry landscape painter, his merit, in other matters, was the less regarded. It was a saying of his, that a palet full of colours being thrown against the wall, would leave a stain behind it properly enough representing a landscape. It is true, indeed, that by help of a strong fancy, one may spy heads, battles, rocks, seas, clouds, woods, &c. in a wall so smeared; it being here, as in the ringing of bells, where every body is at liberty to make them say what he pleases.

But then, though such a fortuitous mixture of colours may start a hint, or give rise to a new invention, yet it will not furnish the least assistance towards the execution, or finishing any thing that is occasioned.

A painter who would appear universal, and please people of different tastes, must set off several figures in the same piece, both with very deep and very soft shadows; taking care by the way, to make the reason of such diversity apparent.

A painter ought to have his mind continually at work, and to make remarks on every object, worthy of notice, that he meets. He ought even to stand still, in order to view them with the greater attention; and afterwards to form rules on what he has observed, with regard to lights, shadows, place, and other circumstances. Let him make himself a master of the theory, before he meddles with the practice, and be very curious in comparing the limbs and junctures of different animals with one another; taking minutes of every thing he learns, the better to fix them in his memory.

A painter who has no doubts in his studies, makes but a small progress in his art; it being an infallible sign, where all this appears easy, that the workman is insufficient, and the work above his pitch. But when once a painter has got a just sense of the whole difficulties of his work, every new reflection he makes, will give him new strength to surmount them; inasmuch, that if he perseveres in it, every day will contribute something towards his improvement and perfection.

Let a novice in the first place exercise his hand, in copying the designs of some able master; after he has got a habit of doing this, he may proceed to relievos, designing after them with proper application.

The first sketch of a history piece must be very slight, and the figures very imperfectly formed, your principal regard being to the justness of their situation: having adjusted the

ordonnance * of the piece, you may finish the members at your leisure.

* Ordonnance is the placing regularly the figures, in respect of the whole compofure ; or the particular difpofition of figures, as to the different groupes, mafles, contrafts, decorum, afpect, and fituation.

Whenever either your own reflection, or the information of your friends, points out any fault in your work, correct it immediately ; left in expofing the piece to the world, you expofe your own weaknefs : nor flatter yourfelf, that what reputation you lofe by letting it efcape, may be retrieved in your next performance. It is not with painting as with mufic, which dies in the breath that gives it birth : painting is of a more durable nature, and whatever over-fights of this kind you make public, will be ftanding reproaches to you ever afterwards.

Nothing deceives us more than the judgment we form of our own works, nor are the opinions of our friends much more to be relied upon : a friend is, in effect, a fecond felf, and therefore to be held in the fame degree of fufpicion. It is the critic of our enemies, that we ought to form ourfelves by : this is ufually fincere, which is more than I can fay, either for myfelf or my friend.

Among other things, I fhall not fcruple to deliver a new method of affifting the invention ; which, though trifling in appearance, may yet be of confiderable fervice in opening the mind, and putting it upon the fcent of new thoughts ; and it is this ; if you look at fome old wall covered with dirt, or the odd appearance of fome ftreaked ftones, you may difcover feveral things like landfhips, battles, clouds, uncommon * attitudes, humourous faces, draperies, &c. out of this confufed map of objects, the mind will be furnifhed with abundance of designs and fubjects perfectly new.

* Attitude implies little more than action and pofture ; though it is fometimes ufed, where neither of thefe would be proper : for inftance, action is not applicable to a dead corpe : nor do we fay, that fuch a figure is in a handsome pofture, but in a graceful attitude or difpofition,

I have often found it for ufe to recollect the ideas of what I had confidered in the day, after I was retired to bed, and incompaſſed with the f Silence and obfcurity of the night. For by thus repeating the contours, and other parts of figures which require a clofer attention, their images are ftroglly impreſſed on the memory, and familiarized to the mind.

If you intend to become a proficient, be fure never to defign any thing flightly, or in haſte ; but take time to confider, with regard to lights, which parts receive the ftrongeft, and, in fhadows, which are the deepeſt ; obferve how thefe mingle together, and in what quantity, ftill comparing the one with the other. As to the contours, confider towards what part they are to be directed, what quantity of light and fhadow meet within the lines, where they are more or lefs ftrong, larger or fmallier ; and, laſtly, take care that your lights and fhadows do not terminate abruptly, but that they fall foftly into one another, and at laſt loſe themſelves infenſibly, like ſmoke. After you have once habituated yourfelf to be thus punctual and exact in your designs, expedition and difpatch will come a-pace.

While a painter is employed either in defigning or painting, he ought to liſten with attention to the different fentiments which different people entertain of his performance : there being no body, how ignorant in painting foever, but who underſtands the ſhape of a man, and can readily tell whether he be hump-back'd, crooked-legg'd, have any thing monſtrous in his hand, or any the like blemifh : why may not a perſon then, who can fo well diſtinguiſh the defects of nature, be allowed to judge of thoſe of arts ?

It is ridiculous in a painter to confide fo far in his memory, as think it capable of retaining all he has ſeen and obſerved in nature : the memory is a faculty too weak, as well as too narrow for that purpoſe ; and the only fure way is to copy, as much as poſſible, from nature herſelf.

A painter loſes a great deal of his dignity, by confining his genius, and never venturing out of his ordinary courſe : there are ſome, for inſtance, who apply themſelves to the painting of nudities ; but fo as ſtill ſtrictly to obſerve the fame proportions, and never introducing the leaſt variety. Whereas, they ſhould confider, that a man may be well proportioned, whether he be thick or ſlender, ſhort or tall. By diſregarding this diverſity of proportions, a painter ſeems to caſt all his figures in the ſame mould, which is an error of the firſt magnitude.

A painter well acquainted with the theory of his art, may, without any great difficulty, render himſelf univerſal. For all terreftrial animals have this in common with each other, that their members are compoſed of mufcles, nerves, and bones ; the only difference between them lying in their different lengths and thickneſſes, as is demonſtrated by the anatomifts. As to aquatic animals, in which indeed there is a great variety, I think a painter who is well adviſed, will not trouble himſelf about them.

Thoſe who venture on the practice, without firſt qualifying themſelves in the theory, are like mariners putting out to ſea without either helm or compaſs, ignorant what courſe to take. The practice ought always to be built on a rational theory, of which perſpective is both the guide and the gate, and without which, it is impoſſible to ſucceed, either in deſigning, or in any of the arts depending thereon.

A painter ſhould never tie himſelf to imitate the * manner of any other ; his buſineſs being not to repreſent the works of men, but thoſe of nature ; who at the ſame time is ſo abundant in her productions, that it is ridiculous to have recourſe to her ſervants, who have nothing but what they borrowed from her, when the miſtreſs herſelf is ſo ready to entertain them.

* Manner is the habitude that painters have acquired, not only in the management of the pencil, but alſo in the three principal parts of painting, viz. invention, deſign, and colouring : it is by the manner in painting that we judge this piece to be Titian's, Tintoret's, or Vinci's hand ; as by the ſtile in writing, we gueſs this book to be this or that author's.

To deſign after nature, or the life, you muſt be removed from the object, three times it's magnitude ; taking care, as you draw each ſtroke, to obſerve what parts of your * model meet under the principal, or perpendicular line.

* The model is generally taken for any natural object that preſents itſelf to be drawn ; in particular, it ſignifies a ſtatue, nudity, or the like, ſet up in the academies, to be copied by the novices in painting.

To judge of the goodneſs of a picture, drawing, or print, ſays Mr Richardſon, it is neceſſary to eſtabliſh to ourſelves a ſyſtem of rules, to be applied occaſionally : theſe are no other than thoſe which he that is to give ſuch judgment, would have been directed by, had he been to have made, what now he is to judge of.

And theſe rules muſt be our own ; whether as being the reſult of our own ſtudy and obſervation, or by others examined and approved by ourſelves.

To aſſiſt the judgment herein, the following rules have been laid down.

I. The ſubject muſt be finely imagined, and, if poſſible, improved in the painter's hands ; he muſt think well as an hiftorian, poet, philoſopher, or divine, and moreover as a painter, in making a wife uſe of all the advantages of his art, and finding expedients to ſupply it's defects.

II. The expreſſion muſt be proper to the ſubject, and the characters of the perſons. It muſt be ſtrong, ſo that the dumb-ſhew may be perfectly well, and readily underſtood. Every part of the picture muſt contribute to this end ; colours, animals, draperies, and eſpecially the actions of the figures, and above all the airs of the heads.

III. There muſt be one principal light, and this, and all the ſubordinate ones, with the ſhadows and repoſes, muſt make one intire harmonious maſs ; the ſeveral parts muſt be well connected and contraſted, ſo as the tout-enſemble muſt be grateful to the eye, as a good piece of muſick is to the ear. By this means the picture is not only more delightful, but better ſeen and comprehended.

IV. The drawing muſt be juſt ; nothing muſt be flat, lame, or ill-proportioned, and theſe proportions ſhould vary according to the characters of the perſons drawn.

V. The colouring, whether gay or ſolid, muſt be natural, beautiful, and clean, and what the eye is delighted with, in ſhadows, as well as lights and middle tints.

VI. And whether the colours are laid on thick, or finely wrought, they muſt appear to be done by a light, and accurate hand.

Laſtly, nature muſt be the foundation that muſt be ſeen at the bottom ; but nature muſt be raiſed and improved, not only from what is commonly ſeen, to what is but rarely, but even yet higher, from a judicious and beautiful idea in the painter's mind, ſo that grace and greatneſs may ſhine throughout ; more or leſs, however, as the ſubject may happen to be. And herein conſiſts the principal excellency of a picture or drawing.

Theſe few plain rules being thoroughly comprehended and remembered, which may be done with a tolerable meaſure of good ſenſe, a little trouble in readings, and a good deal of obſervation on nature and pictures, and drawings of good maſters, may greatly contribute to enable a perſon to be a tolerable judge in theſe matters, as being derived from, and founded upon, reaſon ; and though not deſtitute of abundant authority, yet neither borrowed from thence, or at all truſting to that for their ſupport.

For, whatever authorities there are for any propoſition, their value conſiſts in their being derived from reaſon, and they weigh with men of ſenſe in proportion only as they ſee they do ſo ; they then become our own, and we have no occaſion to produce the author but the reaſon : or, (if that be obvious) leave it to be obſerved by the reader.

The matter would terminate here, though we had a book of rules for painting, said to be written by Appelles himself; and it were allowed that what Appelles said were infallibly true; for then, instead of saying, are these rules good, are they founded upon reason? the question would only be, are they really of him? Their authority then will rest, not upon the credit of Appelles, but upon the testimony of those that say they are his. Which we shall not want, if we find the rules to be good, and if we do not, it will be insufficient; and all this without the least prejudice to the profound respect we have for Appelles, nay it is a necessary consequence of it.

To judge of the degrees of goodness of a picture or drawing, it is necessary that the connoisseur should be thoroughly acquainted, and perpetually conversant with the best. For how perfectly soever he may be master of the rules of the art, he will know that those are like what divines call precepts of perfection; that is, they are given as what we should endeavour to go by, as far as we are able. The best things we know will be the standard by which we shall judge of those, and all the rest. Carlo Maratti and Guiseppe Chiari, will be a Raphael and Giulio Romano, to him who has never seen better; and then an inferior master will make a good Carlo. We have been surprized to observe what pleasure some connoisseurs have taken, in what another looked upon with little, if not with contempt, 'till we have considered one was not so well acquainted with the works of the best masters as the other, and that accounts for it sufficiently.

All the different degrees of goodness in painting may be reduced to these three general classes. The mediocre, or indifferently good, the excellent, and the sublime. The first is of a large extent, the second much narrower, and the last still more so. I believe most people have a pretty clear and just idea of the two former, the other is not so well understood; which we take to consist of some few of the highest degrees of excellence in those kinds, and parts of painting, which are excellent: the sublime therefore must be marvellous and surprizing; it must strike the mind powerfully, and captivate it irresistibly.

The sublime may be confined to history and portrait-painting; and these must excel in grace and greatness, invention, or expression. Michael Angelo's great stile intitles him to the sublime, not his drawing; it is that greatness, and a competent degree of grace, and not his colouring, that makes Titian capable of it: as Corregio's grace, with a sufficient mixture of greatness, gives this noble quality to his works. Vandyke's colouring nor pencil, though perfectly fine, would ever introduce him to the sublime; it is his expression, and that grace and greatness he possessed (the utmost that portrait-painting is capable of), that sets some of his works in that exalted class; in which, on that account, he may, perhaps, take place of Raphael himself in that kind of painting, if that great man's fine and noble ideas carried him as much above nature then, as they did in history, where the utmost that can be done is commendable, a due subordination of characters being preserved; and thus Vandyke's colouring and pencil, may be judged equal to that of Corregio, or any other master.

REMARKS.

The management of the pencil, and the mixture of colours, with the knowledge of perspective, and a habit of designing, wherewith most painters seem to content themselves, make but a part of the art, according to the sentiments of the most celebrated artists. To these the assistance of other arts must be called in; anatomy, optics, meteorology, mechanics, &c. searching attentively into the power of nature, in order to form an art that may imitate her; and, from the depths of philosophy, drawing means for the improvement of painting. It is not in painting alone, but in philosophy likewise, that the most eminent have excelled their brethren of the pencil; nor does it appear improbable, but that it was from uncommon skill in the latter, to which, in great measure, they have owed their success in the former. These are two faculties that may be nearer a-kin, than every one, perhaps, is aware of; nor would there be any thing daring in the assertion, should it be affirmed, that philosophy is absolutely necessary, by way of preliminary to painting.

To paint, it is allowed, is to imitate nature; but is not the knowledge of nature requisite to the imitation of her beauties? Must it not be pleasant to see men about to represent natural objects, who are unacquainted with the nature and properties of the objects to be represented? Quacks, indeed, there may be in painting, as well as in other professions; but to become a regular painter, it is indispensably necessary, that a man serve an apprenticeship to philosophy.

We have people who pretend to cure diseases, without knowing any thing of the animal œconomy, or of the powers of medicines; we have others, who would be thought to paint by the mere mechanism of a hand, and the motion of the pencil: but, as the college will never allow the former to be physicians, so there is no reason why the latter should be complimented with the title of painters.

That this art requires suitable institutions for its advancement and encouragement in this nation, may be naturally urged,

if we consider it only in the commercial light. For there may be great pecuniary advantages accrue therefrom, such as ought to engage the attention of the mere merchant. If we had more regular artists, and in greater number, not only much money, which is now sent to France and Italy, might be saved, but a very profitable exportation might be made of those works that were not purchased by our own connoisseurs. If we consider the great number of foreign statues, paintings, and prints, that are brought into this kingdom, the prodigious price that is given for some, and the more than equitable price that is given for all; must not the consideration suggest to us, that this article is highly disadvantageous to the nation? We often hear of a sum given for a single piece, the work of an antient or foreign master, that equals the annual revenue of a gentleman's estate. And, sometimes, the ignorance of the purchaser, or the confident knavery of the seller, imposes on us a copy of little value, instead of an original. And whatever is paid for one of these extravagant articles of luxury, more than it will sell for again at a foreign market, is so much loss to the common national stock, as well as to the private fortune of the immediate sufferer.

That we have annually a great many of these losing articles, will scarce be disputed; and whatever one nation, by such means, draws from another, must contribute proportionably to its advantage. The smallest branch of trade, if carried on to our disadvantage, must, in time, contribute to impoverish us, and enrich those who deal with us on the beneficial side.

But, if the British artists became superior to the French and Italian, and could raise a tribute on those nations for any curious productions, we should not only save all the balance against us on this account, but draw into the nation as much more to their disadvantage. This would be adding continually to our wealth, and consequently to our strength and influence.

But what would this be, compared with the great influx of riches that would accompany persons of distinction from foreign nations? Do we visit Italy for the purity of its religion, or superiority of virtue and wisdom? Or France for the freedom of its government? An Italian or Frenchman will not say this, unless he be ignorant, and a bigot. Is it because they are commercial nations, more than ourselves? Neither can that be admitted. Why then is it, but because the cities of Italy abound with temples and palaces, venerable and antient in themselves, and enriched with all the profusion of art by the greatest masters? But because France is in the road to Italy, whom she has robbed of many of her treasures, and whom she rivals in expensive projects, though not in the beauty of execution. Had we as curious works of our own, in the same abundance, should we be at so much expence, and, perhaps, loss of time, to visit those of our neighbours? They who are loudest against the folly and abuse of travel, can scarcely be of this opinion: there would be no pretence for the fops and fools, if the men of taste and good sense did not meet with some entertainment. Admitting, therefore, that the greatest part of our travellers are of the former class, those of the latter must, in this respect, always lead the fashion. Travel will always be commendable in men of taste and real curiosity, while neighbouring nations have these means of instruction or delight, which we are deficient in ourselves: but could we only rival our neighbours in the elegant and polite arts (as we already confessedly do in literature) the same motive would not remain: the men of sense would not waste the time which they esteem precious, and the grand tour of our petits maitres would not be justified by grave example.

The Lacedæmonians were certainly a brave, and history has called them a wise, people; yet they forbade travel to their youth, as it contributed, in their opinion, to soften and corrupt their manners. If we have not been already too much softened and corrupted, the comparisons made betwixt former ages, and the present, are unjust. But do not all who make these comparisons, ascribe the difference to the bad habits we have learned from foreigners, whom, in point of bravery, our ancestors would have despised? Not only the culture of our lands, and the manufactures of our productions, but the arts of peace and war were known to those ancestors: what then do most of our young gentlemen learn? Are the dancing a minuet, and humming an Italian air, so great excellencies? Admitting they were, the care of the present age has provided masters capable of teaching both, even at home. No body can say that we are not, in this and other respects, shameful to mention, sufficiently Frenchified and Italianized. See the article DANCING MASTER.

All that we would aim at is, to spirit up our own country, as well to excel in the art of painting, as in all other the polite arts, which contribute either to the wealth, or to the delight or ornament of the nation; that we may at least draw foreigners of merit and distinction into our own country, in the like proportion that they draw Britons of figure and worth into other countries. See the articles DESIGN and ENGRAVING.

PALATINATE of BAVARIA, or the UPPER PALATINATE, in the circle of Bavaria, in Germany, sometimes

sometimes called the Nortgow, from its northern situation, in respect of the elector of Bavaria's other dominions. It is bounded by Voigtland in the circle of Upper Saxony on the north, by Bohemia and Austria on the east, by the river Danube, which separates it from the Danube of Bavaria on the south, and by Swabia and part of Franconia on the west, being about 70 miles long and 40 broad; a mountainous, rocky country, but in some places their vallies produce good corn and pasture. They have also some vineyards, but their wine has a sharp, unpleasant taste. In their hills are rich mines of copper, silver, and iron; and the forges and manufactories of iron, are very considerable in this country.

PALATINATE of the RHINE, situated in the circle of the Lower Rhine, in Germany, is bounded by the archbishoprics of Mentz and Triers on the north, by the circles of Franconia and Swabia on the east, and by Alsatia and Lorraine on the south and west, being upwards of 100 miles long, and from 50 to 70 broad. The Rhine, the Neckar, and other fine rivers running through it, contribute to render it one of the pleafantest and most fruitful provinces of Germany; only unhappy in lying on the frontiers of France, whose princes have burnt and plundered this country, and demolished its fine towns several times during the wars. It is always obliged to subfist large armies of friends as well as enemies, whenever there happens a quarrel between France and the German princes. The revenues of the Palatinate arise by a toll on all vessels going along the Rhine, Neckar, and other rivers; and from the duties on corn, wine, and other provisions; the whole estimated at 300,000*l.* per annum. That prince keeps up a body of 6 or 7000 men in time of peace, and in the late wars maintained 12,000 regular forces many years. There is a dispute subsisting between the elector Palatine and the elector of Hanover, about the titular office of arch-treasurer of the empire.

PALM, a measure taken from the extent of the hand. The modern palm is different in different places where it obtains.—At Rome it contains 7 inches $\frac{1}{2}$: at Naples 8 inches: at Genoa 8 inches $\frac{1}{4}$: at Morocco and Fez, 7 inches $\frac{3}{4}$: in Languedoc and some other parts of France, 8 inches $\frac{1}{2}$.—The English palm is 3 inches. At Leghorn there are two kinds of palms, the one for woollen, the other for silks: the first one third shorter than the latter.

PALESTINE, a part of Asiatic Turkey, is situated between 36 and 38 degrees of east longitude, and between 31 and 34 degrees of north latitude, bounded by mount Libanus, which divides it from Syria on the north, by mount Hermon, which separates it from Arabia Deserta on the east, by the mountains of Sier and the deserts of Arabia Petraea on the south, and by the Mediterranean Sea on the west; so that it seems to have been extremely well secured against foreign invasions. It was called Palestine, from the Philistines, who inhabited the sea-coasts. It was called also Judea, from Juda; and the Holy Land, from our Saviour's residence and sufferings in it: and it is called Canaan, and the Promised Land, in the scriptures. It is 150 miles in length and upwards, and 80 in breadth; and, in the time of Solomon, it seems to have extended from the Mediterranean Sea to the river Euphrates. It is generally a fruitful country, producing plenty of corn, wine, and oil, where it is cultivated; and would be able to supply its neighbours with corn and wine, as it did formerly, if the present inhabitants were as industrious. The country about Jerusalem is the most mountainous and rocky; but these mountains feed great herds of cattle, abound in milk and honey, and produce excellent wine and olive-oil where they are cultivated, as the vallies between the mountains do good crops of corn.

PAPER, a thin flexible matter, usually white to write upon, and other sorts for divers other uses.

Paper owes its origin to the necessity that mankind were always under, to communicate their sentiments when at a distance from one another, and to the desire of transmitting their thoughts to posterity. For this purpose they first thought of carving or painting upon the bark or leaves of trees, the characters which they used. The natives of America still use the same expedients, and these may be looked upon as a living proof of what is recorded of the first men of the old world. They found inconvenience in having books composed of small bits of bark strung upon twisted leaves, or on one piece of bark or leaves rolled up, and endeavoured to find another matter which might be more commodiously used. The Egyptians, who first settled a well governed state, were likewise the first who endeavoured to procure this advantage; nevertheless it was not (according to Pliny) till the time of Alexander's victories, that they made this discovery. They fell upon a method of making, from a kind of dog-grass, a substance, which soon became a considerable and lucrative branch of trade, and this manufacture was the first thing that deserved the name of paper.

Rome, as much as it was possible, furnished itself with this paper, and as often as the Gauls could procure it, they gave it the preference to the birch bark; but the difficulty of bringing it from such a distant country as Egypt, weighing too equally against its property of taking any desired form, and of being folded together in sheets, the Gauls, and other

nations endeavoured, in like manner, to find the means of supplying it among themselves. They accordingly found the method of making it with cotton: and according to Mont-faucon, in his Essay upon the Egyptian paper, inserted among those of the academy of the Belles Lettres, at the end of the ninth century, this destroyed the Egyptian paper manufacture through all the east; and this discovery led to that of our paper, which is made of rags; the æra of which, as settled by Montfaucon, is in the twelfth century.

Yet long before that period, the Chinese (according to P. du Halde) made it with cotton-rags. He says, in the article of Chinese paper, that in the 95th year of the Christian æra, a mandarine of the palace manufactured paper of the bark of different trees, old rags of silk and hemp that had been used. Be that as it will, as soon as the rag paper appeared, it ruined the Egyptian paper in the west, as the cotton paper had formerly ruined it in the east. We must own, however, that the advantages of paper made of rags, ought not to have been so fatal to that of Egypt; but on the contrary engaged their manufacturers to bring it to perfection. Every thing seemed to lead the way.

The different kinds of paper had always been made of plants: and although the birch bark and the prepared leaves, were, not properly speaking, of that species, yet the facility of folding and rolling, shewed a flexibility in the fibres, capable of that preparation which is given to rags. It may be observed, that these very rags are no other than fibres of a plant, which had suffered a kind of decomposition, which had not happened to those that they made use of. It was therefore natural to think, that if they had undergone the same preparation, they would have produced such a paper, or at least a kind that would have resembled our own.

Let us not seek for matter of reproach against the Ancients. Their occasions for paper were not probably so pressing as ours; since, notwithstanding the quantity of rags which is collected, the price of it sometimes rises so high, that the manufacturers are desirous of finding other materials for the same purpose, or compelled to have recourse to expedients which are prohibited, in some countries, by the regulations touching paper-works, though they always find means to conceal them from the vigilance of the inspectors.

When the rags that are proper for making white paper become scarce, they employ those which at other times are used for the coarse paper, and prepare them with chalk-water. By this preparation they consume, and indeed destroy the foreign bodies which are in these coarse materials, but at the same time decompose the fibres of the rags, so that there must certainly be a great waste. If we should do no more then, but find a method for preventing this waste, and procure such materials as the workmen at such times desire to have, should we not gain a great advantage to the paper works? This new matter might be used for coarse paper, and the other enter into the composition of white paper, and of consequence the price of fine rags would fall, or at least never become excessively dear. In my opinion, therefore, we ought to have been for a long time, employed in search of a remedy for those times of dearth, and in preventing the consequences so naturally drawn from the manner in which we now manufacture our paper.

It is not from the workmen we are to draw such consequences. He himself who makes any discovery, very rarely perceives all its consequences: the novelty often blinds us, touching what is already discovered, and makes us despise it, instead of engaging us to bring it to perfection. It therefore requires men who, together with a discerning understanding, have a desire to bring the arts to perfection, and to enable mankind to enjoy them at a small expence.

M. de Reaumer, in an essay published in the year 1719, upon wasps, seems to perceive these consequences. Wasps build habitations, the outward parts of which seem to be of paper or strong pasteboard: in such a manner do they prepare bits of rotten wood, as to make them assume that consistence.

M. de Reaumer took a hint from this observation, touching the perfection of paper-works. He in his essay explains his own idea of that substance, and wishes those who have an opportunity would examine, if it is such as he has conceived it to be: and this subject he has renewed in the sixth volume of his history of Insects.

Seba likewise, in the first volume of his Natural History, has invited the curious to prosecute the same project in these words. 'This country, says he, does not seem to want trees fit for making paper, if people would give themselves the necessary trouble and expence. Alga marina, for example, which is composed of long, strong, viscid filaments, might it not be proper for this purpose, as well as the mats of Muscovy, if they were prepared as the Japanese make their timber? The curious may at least try the experiment.' Whether there are no people, as Seba demands, who have opportunities of prosecuting this work, or that every body is averse to go to work, except upon his own plan, I know not one author who has communicated any thing upon this subject.

P. du Halde, in the first volume of his History of China, pretends that the Chinese make paper of the second bark of bamboo,

bamboo, of the bark of different trees, particularly the mulberry, of flraw, rue, and hemp. Kœmpfer, in his voyage to Japan, and after him Seba, in the aforementioned book, report, that paper is made in that country of the inner bark of a kind of mulberry-tree.

M. de la Loubaire says, that the Siamese make it of old cotton cloth, or the bark of a tree called toncoë. Flacourt describes the manner in which the inhabitants of Madagascar make theirs of a kind of mallow, which they call avo. Finally, all the travellers to India as well as to America, recount with emphasis, the advantages drawn from the palm-tree for making stuffs, of which, when they are worn, it would doubtless be easy to make paper. The opportunity which the paper-mills in the neighbourhood of Etampes, seemed to afford me, of fulfilling the wish of some, and verifying what hath been said by others, touching our trees and plants that are analogous to those mentioned by the authors above, has induced me to collect several of these plants. After having surmounted all the difficulties, which we always find among workmen, when any novelty is introduced among them relating to their occupation, I have at length succeeded so far as to have tried some experiments, and flatter myself which being able to continue those which I have in view.

Hitherto I have only spoke, as if paper was made of nothing but vegetable substances, and that no materials could be taken from animal nature. Nevertheless, it is doubted whether in China, paper is not made of silk. Pere du Halde says, that they gather the refuse cods, when they are unwound in the silk manufactures, and make paper of them; but, notwithstanding the assertion of that author, the fact has been always considered as problematic.

I will relate an experiment which may help to explain this question: but before I describe my success, I believe I had better distinguish the different plants I have mentioned above, and present them in a methodical manner. By these means the public will have a botanical history of paper, and see the plan of the work proposed.

The materials for paper then may be divided into two general classes, namely vegetable substances, and those that belong to the animal kingdom.

In the great number of plants used for making paper, or of which people suppose it might be made, a regular order may be found. People of different countries, have been conducted by a kind of natural analogy. They have not sought to employ plants that were very different from those already in use. They have taken them of different classes, in different kinds, but always in some of those which had been before used, though probably they were ignorant of that circumstance. In effect, the greatest part of plants seems to be composed of long, longitudinal fibres, nearer or closer to one another, and covered with a substance which fills up the intervals: such are the palmiferous, the gramineous, and the liliaceous.

The class of the palmiferi is one of those, which have been of most service to the Indians, Asiatics, and Americans, in furnishing them with cloathing, cordage, sails and other utensils; almost every part of these trees has served some of those uses, though they do not indifferently take every part of the same tree. These people have in the palm-tree, which they found among them, chosen what was most susceptible of manufacture. In some they chose the spathe, which envelops the regimen of fruits before they are ripe, or that which sustains the young leaves: and in others they employed the down which surrounds the fruit. The young and tender leaves have been preferred to this wool or down, which was not considerable in other kinds; and when all these could not be compared to the bark for goodness and quantity, they made use of this last.

The down of the fruit of the cocoa-nut-tree, the spathe, the leaves and bark have been used, as several travellers relate. Rumphius, in his History of the Plants of Amboyna, says as much of the calapa: the pinanga, the wild lonturus, the tetum, the hakum, the wanga, all different kinds of the palm-tree, furnish in their leaves a thread more or less fine, of which those people make stuffs.

They have even prepared the leaves of the hakum, and forbe, and used them instead of paper. The advantages which the Indians drawn from the palm-tree being already sufficiently important, I shall not probably be blamed for not having inserted what is mentioned by Ray after some authors: he reports, in his History of Plants, that the cocoa-tree contains, in lieu of pith, a quire of paper of fifty or sixty sheets, on which people may write. This is like that which is found in the middle of a fruit of Peru, mentioned by M. Frezier, author of a Voyage to the South Sea. All this wonderful phenomenon, when reduced to it's just value, is in my opinion, no more than that the pith of the palm-tree and the pulp of that fruit, may be easily made into sheets in the same manner as that of the Chinese alder, which is made into those fine artificial flowers that are brought from that country, or the books made of the roots of a kind of mallow, which requires no more than to be artfully dried and cut in leaves. The musa or banana-tree, has been employed for such-like purposes.

The class of the liliaceous includes the aloes, the yucca:

VOL. II.

from the aloes is obtained the thread of pitte, known by the use to which it is put.

Father du Tertre, in his Natural History of the Antilles, describes the manner in which that thread is got. Sir Hans Sloane, in his Catalogue of the Plants of Jamaica, likewise mentions these aloes. In the number of synonymous names which he recites, some of them are taken from the use that is made of those plants, and which I cannot help, for that reason, repeating in this place.

The second species of that author, is by Gaspar Bauhin, in his Pinax, p. 20. called the eleventh species of papyrus, employed for paper. Clusius, in his treatise of Exotic Plants, p. 6. mentions a ball of thread made of the bark of a tree, which according to Sloane, is this aloes. John Bauhin, tom. i. p. 384. copies Clusius, and says, this thread is very fine and extremely white. The third species of aloes, according to Sloane, which nevertheless is a true species of yucca, is known to Luet, p. 645. under the name of an excellent kind of hemp or flax, which even approaches very near to the fineness of silk.

Seba in the first volume of his work, has given the figure of two leaves of a plant, which he calls the aquatic bullrush of Surinam, composed of innumerable threads or filaments. This bullrush, says that author, ought to be examined with regard to it's utility.

It was from the gramineous class, as already said, that they obtained materials for the first paper, which deserves that name. Michilli, in his New Genera of Plants, has inserted in the number of rushes, the plant called by Gaspar Bauhin, in his Pinax, p. 19. and in his Theatre of Plants, p. 333. the paper of Syria or Sicily. Is this the species formerly employed in Egypt? The figure and description of it given by Prosper Alpinus, namely that of Veslingius and the Antients, leave it doubtful, whether this last plant be a rush or not. Prosper Alpinus says, it is the paper called beid by the Egyptians.

M. de Jussieu, at whose house people will always find lights in all doubts that can occur upon these subjects, and who finds pleasure in communicating instruction, hath shewn an Egyptian plant that seems to be a true rush, and when compared with that of Michilli, exhibits no difference.

Dodo considers the flag as a plant proper for paper, and gives it the name of papyrus. We have observed above, that Pere du Halde says, the Chinese made paper of straw or the blades of rice. Bamboo is likewise employed in the same country for a kind of paper; and, according to the same author, is the reed-tree of Gaspar Bauhin, in his Pinax, p. 18.

The birch, which is of the class of cat's-tail flowers, was one of the first trees, upon the bark of which people wrote. As the word bark may be deemed equivocal, it will not be amiss in this place to fix it's signification. Are we to understand by this word bark, that part of trees which covers externally the trunk and branches? Or, is not rather that interior layer, which ought to become woody, and is called liber? Without all doubt, it must be this inner covering which we are to understand by the bark of birch; it seems also, that in this sense it ought to be understood in those authors, who treat of the different kinds of paper used by different nations. Most of these writers say, it is the second bark which is used. Others have only said, that they used the bark; but the preparations which they describe, plainly shew, that it was this inner part that was employed.

Rumphius describes two trees with cat's-tail flowers, one of which he calls the domesticum gneumon, and the other gneumon campestre. The inhabitants of Amboyna, according to that author, obtain a thread from the bark of the boughs, which they beat a little; and this thread is proper for making nets, which they boil in a certain infusion, to make them stronger and less apt to rot in the water. This ought the more carefully to be examined, as the knowledge derived from such enquiry, may serve to bring to perfection the cordage of ships, as well as that of which the fishers make their nets.

Here we ought to recal the idea which M. de Reaumur has produced upon the subject of rotten wood; an idea so much the more happy, as it furnishes others upon abundance of substances easily got: the forest presents but too many of them sometimes. The shops of our carpenters supply us with cuttings, which, by their thinness, are in a condition to undergo, in a little time, the necessary degree of rottenness; for here, as in every other thing, there is a proper degree which must be laid hold on. When the wood is too rotten, it's fibres are too much divided, they have lost that binding which connects their parts, they become too earthy, and I believe it would then be difficult, not to say impossible, to bind them together: therefore the waps do not use indifferently all sorts of rotten wood, but know how to distinguish that which is proper for their purpose.

The nettle, the mulberry, and the hemp, are ranked in a class which is called incomplete, because these plants want the flower, or the calix, or the petala, or both these parts. Kœmpfer, in his Catalogue of the Plants of Japan, mentions one which in the Japonese idiom is called white hemp, and to which that author has given the appellation of the great common nettle, which bears real flowers, and yields strong

thread proper for linen and other works. The same author calls the mulberry, which is employed for paper, the papyrus, whose fruit resembles that of the mulberry, and whose bark is made into paper. Seba has given it the name of the mulberry-tree, which affords paper, and is cultivated at Japan. Pere du Halde says, tom. ii. p. 212. that before the mulberry branches, with whose leaves the Chinese feed their silk-worms, are destined to the fire, some people strip off the thin bark from these branches, and make of it a kind of paper, which is strong enough to cover their ordinary umbrellas, especially when it is oiled and coloured. I do not here join the other plant which the Japanese employ, because Kœmpfer leaves it uncertain under what class it ought to be ranged. He calls it the papyrus, which lies upon the ground, yields milk, has plated leaves, and a bark proper for making paper. For the same reason we likewise mention here a tree, which Sloane calls the tree with broad, long, jagged, smooth, shining leaves, like those of the laurel, whose interior rind may be extended into a fine cloth like muslin for ruffles; this tree is commonly called *lagetto*, tom. ii. tab. 168, 169. The people among whom this tree is found, make cloaths of it. It is needless to mention the use of hemp in making paper, every body knows we use it for that purpose; but hitherto no paper has been made of hemp, until it had passed through the state of rags. Yet Peru du Halde reports, that at Nangha, paper is made of hemp beaten and mixed with lime-water, tom. iv. p. 373. And this confirms the notion I entertained, that the stalks, or what falls upon the form in dressing hemp or flax, might serve for the same purpose. We shall speak of this below.

The malvaceous species dispute the preference with all the other classes, for this kind of employment. All the kinds of the mahot, yield a sort of thread proper for cordage. Sloane mentions two mallows, one of which he names the mallow-tree on the sea-shore, with round, small, prickly leaves, white below, which bears a yellow flower, and a bark that may be made into thread. Catalogue of the Jamaica Plants, p. 95. This is one of the mahots of father du Tertre. The other is mentioned by the name of the mallow-tree with round leaves, a very large flower of a fine red colour, like the fleur de lys, and a bark which yields thread. Ibid. This is another of du Tertre's mahots. It would be unnecessary to mention the different kinds of cotton which are used in making paper. I have observed above, that cotton-paper was invented in the east, and that in China, paper was made of cotton-rags; and, indeed, these are not neglected even in our manufactures. Although I have advanced, that people have never sought after plants that were far removed from those classes which had been formerly used, I think I ought to except the flax, the linden-tree, and the thistle.

Linen-rags have entered, and now enter, into the composition of paper: the workmen, in picking the rags, reject only those which are produced from woollen stuffs and hides of animals: they pretend that these stuffs cannot be beaten, but this they say, perhaps, because they are beaten with more difficulty than produced from the fibres of plants, the parts of which are more easily divided. They do not reject the others in those paper works where coarse grey paper is made; the business then is to have a very fine paste, and the hair may be beaten sufficiently, to incorporate with the fibres of other rags, although they may not be so well bruised.

Veslingius, in his little treatise upon the Utility of cultivating Plants, pretends that the down of certain thistles has been used in making stuffs: *ex acantii lanugine demptis spinis, vestes effecerunt*, says that author. By the word acantium we must understand a kind of thistle. The ancients often employed the word in this signification. The linden-tree was and is used in making ropes, a circumstance that denotes a flexibility in the fibres of that tree, capable of undergoing the necessary preparation for making paper.

What Veslingius, whom we have mentioned, has writ concerning the *luffa Arabum*, which may be considered as a kind of cucumber, ought to induce us to examine several plants. He says, that the inside of the fruits when the seeds are taken out, is no other than a little net that seems to be made of flax; whence he conjectures, it would yield a thread like that which the Ethiopians and Indians, according to Theophrastus, made of their cotton-apples, and the Arabians, according to Pliny, of their gourds.

I know no author but Seba, who has suspected that paper might be made of sea-plants and alga marina. When I read that part, I recollected that I had been struck with the whiteness which it will assume, bleached no doubt by the spray of the sea-water, by the rains and dews, and losing that glue with which all the marine plants are covered. Upon the sea-coasts, the fucus is used for dunging the vines and circumjacent lands; and I have observed that this, when transported to the grounds, likewise acquires a certain degree of whiteness, and, like the alga, preserves its figure, together with a strong consistence, nothing is so common on the sea-shore as the fucus, which in some places covers the coast, and nothing can be more easily collected.

There is another plant which is likewise found on the sea-shore, but more commonly in ponds, and the basins of gar-

dens; it is the *conserva* of Pliny, and in some authors bears a name that seems to promise considerable utility. Imperatus calls it the sea-flax. Lœfel, in his Catalogue of the Plants in Prussia, gives it the name of aquatic moss, composed of very fine silky filaments. I can scarce doubt, that some people have attempted to spin this plant. When it is wet, it has a flexibility that deceives people, and the great quantity of it found in those places that favour its multiplication, and by which means the fibres are interwoven in such a manner, as to produce a kind of stuff like coarse camblet, must have more than once induced people to try to make the plant useful in the commercial arts. I know that a great princess, struck with the quantity and fineness of this plant, was desirous of having it spun; but it becomes too brittle when out of the water, to be susceptible of this operation. I shall, in the sequel, relate the success I had in treating it, with a view to the paper manufacture.

I thought it necessary to enter into a circumstantial detail of the plants which have been used in the composition of paper, and those which may be used for that purpose, in order to give, as before observed, a botanical history of that manufacture; and by the different classes which I have described, the public sees the plant which relate to it. At the same time it must be owned, that some of these classes are not so rich here as in foreign countries. We are altogether strangers to the class of the palmiferi: but by way of recompence, the gramineous class is in greater abundance. The course of some rivers is retarded by a kind of forest of reeds, rushes, and flags; and in some places nothing is so common as mallows: there is scarce a person among us, who is not sometimes incommoded by the quantity of nettles and thistles. Cotton is nothing but a kind of down that furrounds the grain of that plant. I have therefore included in this design, the down of different plants, such as that of willows and linagoftris. The grounds planted with willows, are covered at one season with the fall of the cat's tails of these trees; and some meadows, especially those that are barren, are full of the linagoftris.

The stalks of hemp and flax are composed of two parts, the filamentous and that which partakes of the nature of pith. We cannot possibly doubt the utility of the first, which indeed composes our paper. Nevertheless, this thread is rejected as useless. It would therefore be a great advantage to render that part useful, even though the other never could serve any purpose. What prodigious quantities of materials would be acquired by these means! We know how much hemp is brought from Berry and Champaign in France. In the rope-works, and especially those of the arsenals belonging to the sea-ports of that kingdom, great resources would be found; they are now made into tow, which often amounts to such a quantity, that they are obliged to throw it away, or make use of it as dung for the beds in their garden; in all the Lower Poitiers, there is scarce a peasant who does not reserve a piece of ground for flax-seed.

It is not therefore for want of materials, that we do not endeavour to procure a paper which may vie in beauty with our white paper, or at least furnish us with a kind proper for covers and bundles. Perhaps I may be thought to have found too many plants susceptible of this operation, and seem inclined to transform every thing into paper. Although what is related of foreign plants, may be a prejudice strong enough to inspire a notion of the utility we may reap from our own plants, I know at the same time, we may be imposed upon by analogy, which is always deceitful. In other respects, the experiments which I wish we could attain, give reason to perfection to which I have made, although far from that hope, that one day we may acquire a certain degree of that perfection.

Thinking I ought first of all to examine the stalks of hemp as the most common materials, and those from which I thought I had reason to expect some success, I caused them to be steeped in water for a certain time, that they might acquire a degree of rottenness, which would facilitate their trituration. When they were supposed to be sufficiently rotten they were beaten, but by a mistake, which by the bye, I had endeavoured to avoid, these stalks were beaten with mallows and nettles, which I had ordered to be gathered and left to rot in a separate place. Yet these different substances incorporated together: though it must be confessed, that their connection was not very strong, but, on the contrary, produced a very imperfect tissue.

I look upon this essay, as scarce deserving to be recounted: yet it shews, that the leaves of plants as well as the filaments, may unite and incorporate; and that, if those different parts had been beaten separately, and a proper degree of trituration bestowed upon each, so as to form a well-binding paste, something better might have been produced. I will even venture to say, this doubtless would have been the case, having observed what happens in ponds and marshes. Nature, more tranquil than art, frequently forms a very fine paper of plants that rot in those watery places. I have found in some of the pools of water of the forest of Dourdon, when they have been entirely dried up, masses of a substance that altogether resembles paper. They were composed of several lamina or leaves,

leaves, easily separated from one another; they tore like paper, and, though I could not then determine whether they were formed of rotten leaves, or only a kind of byffus, it seemed to me that, if any of this last plant entered its composition, there was likewise in it part of leaves, trees, and other plants. I have not fulfilled the aim which this observation inspired me with; diverted by a variety of other occupations, I could not bestow upon this work the time, attention, and necessary precision it required. It was more easy for me to repeat the experiment upon hemp alone: I therefore put in water to rot some very fine hemp, well cleaned from the parenchymatous part, or pith that falls from the instrument in dressing it: the paper which it produced was very strong, and convinced me that it was very easy to make it of that part of the hemp which is thrown away in rope-works, or other workhouses where it is dressed or employed.

The conviction I reaped from this experiment touching the hemp, necessarily influenced my notions concerning cotton, that down much softer and more flexible than hemp, must easily undergo the necessary preparation for making paper. I ought indeed, to regard the experiment I made upon cotton as superfluous, after that which I had tried upon hemp; yet as authors, those at least whom I have read, do not say that cotton paper was made immediately of cotton, before it had passed through the state of cloth, and Pere du Halde reports that the Chinese make theirs with cotton rags, I thought proper to remove that doubt entirely, because it seemed to me essential that no scruple should remain with regard to that fact, and the success seemed to influence all those parts of plants to which we commonly give the name of down. Of this kind there are several, namely the linagotris, the cat's-tail of the willow, dog's-bane, and trumpet-wood; which, though not so easily spun as cotton, seem to me susceptible of that consistence which is necessary to the paste or pulp of which paper is made: the cotton being therefore, beaten to a sufficient degree, produced a smooth white paper, of a strong texture, which promised to have all the advantages of our own.

I will not, however, pretend to propose it as an advantage to make paper of cotton: the hemp-rag is a material in our possession, which would be altogether useless if we did not know how to employ it for this purpose; but by knowing, from this and other experiments, that it is possible to make paper with these different materials, even though they have not passed through an intermediate state, we afford a succedaneum to those who are in want of ordinary rags, which are not so common as people may imagine, in countries remote from great cities.

In some places of our American colonies, cotton is more common than hemp-rag, which may be the means of making that trade more lucrative, and of greater consequence; but perhaps this is giving views of utility which many other reasons may render useless: besides, to know whether or not it would be used to advantage, would require more delicate experiments, and a more minute enquiry touching the price which that paper would bring, and the profit which is acquired in the ordinary cotton-trade. I have neither made the calculations nor the experiments that are requisite; all that I am in search of, is the possibility of the thing, and not its advantages or disadvantages.

I proceeded then to try the other downs, though I have been able only to examine that of the dog's-bane, called wad, and of the two kinds that are obtained from thistles, that only with seeds of divers kinds, which are crowned, but not the rind which the antients obtained from the leaves that have been mentioned above. This experiment did not succeed so well as that which I made with cotton. The paste formed of the down of these plants was not of such a good consistence or coherence as that of the pulp made with cotton; yet with much care and precaution, it was formed into sheets of paper strong enough to be hung upon cords to dry, but very easily torn; the parts did not adhere, they not being sufficiently interwoven and bound together; and without this quality no paper can be good.

So great a difference between these kinds of down, may appear singular, but this difficulty will be explained by the following observation. That which is upon wad and thistle, is not, properly speaking, a down, but formed of a sort of hair, sustained upon the seeds of these plants: these hairs are commonly called, by botanists, tufts and plumes, because they form upon the seeds a kind of tuft, and many of them push out branches on the sides, by which they resemble real plumes, or feathers.

Cotton, on the contrary, is a down that surrounds the grain, without order or regularity, sticking closely to it, without any constant figure. When this is pulled off, and the seed wiped clean, we can easily perceive that it issues from small points, like so many holes. If this operation is performed while the fruit is young, the thread or hairs are found softer, and less dry, than when it is farther advanced; and it is difficult to refute the notion, particular as it is, that cotton is no other than a matter which transpires from the seed. When we know what forms the down of certain thistles which we before have mentioned, the singularity of this notion vanishes.

The leaves and stalks of thistles are roughened with a quantity of hairs, which are so many pipes giving issue to a clear limpid liquor, a little viscous and glutinous, which dries in the air, and assumes a consistence like that of cotton: nay it really is so to such a degree, that when this down is collected, it is easy to form a thread of it between the fingers: such an observation may, perhaps, appear very delicate to make, and thence doubtful and hazardous; yet it does not require so much attention as people may imagine; all that is necessary is, to procure a microscope with a focus of some inches, to observe the threads, and the kind of wheel in which they are formed: and both these being distinguished, you may perceive, by the naked eye, all that passes in this operation of nature.

That this may be seen the plainer, you may chuse the *carduus benedictus* of the Parisians, or that which has the round head, covered with down: these are, in my opinion, more proper than many others of the same class, for proving this observation: the interior part of the scales that form their head, is provided with an infinite number of glands, that filtrate a liquor like that which I have mentioned; and this liquor changes in the air to threads, which form the down that surrounds the heads of those thistles. This will not admit of a moment's doubt, seeing this thread may be perceived forming under the very eye: if we will gradually and cautiously separate the scales from one another, we then have the pleasure to see this matter lengthen and extend like gum, rosin or wax, and in a moment change into white threads, resembling those of paper.

Now we perceive the similitude there is between cotton and the wool of thistles, and the difference between both and the pretended down of those last and of wad. The cotton issues from the seeds, which it surrounds like the wool of thistle-heads, and both sweat from certain parts, which may be considered as a kind of glands. On the contrary, what is supposed to be down in the thistle, consists of parts that are stiff and dry, consequently brittle, easily grouped into little smooth masses, which are not composed of a quantity of small fibres, that partly detaching themselves from one another, form in the cotton and thistle-wool that softness and flexibility, which makes what in these substances is commonly called the cottonaceous part, a quality which renders them easy to mix together, when they are beaten or pounded, in order to form a paste for paper. Must we, therefore, intirely reject these downs? No, surely; perhaps in the twinkling of an eye they may be rendered useful. I know it may be difficult to catch that point of view, than which nothing requires so much address in improving the arts; but we shall endeavour, at the conclusion of this article, to give some hints on the subject; for it would be very advantageous to find the means of employing a kind of down which is in such abundance, and costs nothing but the trouble of gathering it.

We shall now proceed to another experiment, which, though unsuccessful, ought to be related: it was tried upon the *alga marina*, which Seba exhorts us to examine. Under this name is comprehended not only that which is useful in packing glassware, and wrapping round the bottles of liquor which come from Montpellier, and from thence called the glass-makers weed; we say, not only this is regarded as an alga, but likewise the *fucus*, or *varus*, which has a better title to that name, since the glass-makers weed is not properly of that species, but of the class of dog's-grass: however, we have always mentioned it as an alga, because it is better known by that than the name of *cyperus*.

This plant having been treated like the others beforementioned, did not form the paste that would cohere in any shape, for its leaves has but few fibres: they are, in some sort, composed of parenchymatous parts, which may be considered as a bundle of small vesicles, the sphericity of which is an obstacle to that union that must obtain among the parts of paper. Two spheres can only touch one another in one point; this is a truth demonstrated in geometry, as well as this other, that plain surfaces may be in contact through their whole surfaces; a property which facilitates the intertexture of the parts of cotton-hemp in the composition of paper, and to which the other is an obstacle. To this I likewise attributed the little success I had an experiment which I made with coralloides a kind of plant of the glass of alga, which abounds in all our woods, and in some places almost intirely covers the trees and rocks. These plants are in some measure dissolved by the trituration; and when they were spread in water, according to the practice of making sheets of paper, they could not be re-united upon the form. The same thing happened to the *conserva* of Pliny, which is also of the same tribe.

It may be considered as a loss to the paper-manufacture, that we cannot give a body to these plants when they are triturated: the whiteness they acquire when drying, and their prodigious quantity, make us regret this circumstance, especially if they cannot be employed with success in some other manufacture; and we can easily conceive what impressions the report of the commissioners of the academy must have made, upon the minds of those who consulted it about the advantage that might be reaped from a cottonous matter they had gathered in the pond of Petz, at the distance of a league

and a half from Metz, and was found to be no other than dried conserva, which did not deserve the attention that had been bestowed upon it; for they had already founded great hopes on the discovery, relating to the trade of the country.

A substance that might, perhaps, turn out to more advantage, is the cods of common caterpillars, which, in some years, are in such plenty as almost to cover the trees. These cods, though not proper for spinning, may, nevertheless, enter into the composition of paper. The essay which was made gives room to hope for the success. In effect, these cods, cleared of the leaves that stuck to them, being beaten, were easily reduced to a kind of pulp, which being spread in the water, was without difficulty collected on the form, and made into sheets of paper that might be brought to a degree of perfection, which it must be owned they had not: nevertheless, though this paper ought rather to be ranked with the coarse brown than with the white fine sort, it gives room to believe, that it may in time acquire a certain degree of whiteness; some of the sheets were whiter than others: nay, the same sheets were sometimes whiter in one part than another: and the business will be, to find a remedy for this inconvenience. One of the best (which, by the bye, I could not employ) is, without contradiction, to pound the cods in the ordinary mortars of the mills, or bray them under the cylinder: the quantity of cods gathered by my direction was not enough to fill the mill-mortar, so that the workman made use of an ordinary mortar, which was attended with two defects; the substance was not beaten uniformly, and the foreign bodies were not discharged: these evils are prevented in the mill: the pebbles are always moved equally, or at least more equally than with the hand of a workman who uses an ordinary mortar: so that the substance must be more effectually triturated in the mill. Besides, the mortars of the machine are open on one side, near the bottom: this hole is covered with a hair-cloth, the interstices of which are large enough to transmit what has undergone a sufficient degree of trituration. Thus the paste becomes whiter, an advantage we cannot obtain from any ordinary mortar, and which the silk paper I made could not have: for some of the sheets were sprinkled with several little black points, occasioned by the excrement of the caterpillars, which were interwoven with the silk of the cods; and the water which passes into the mortar of the mill would have carried off these excrements; nay, perhaps the silk loses a part that serves no purpose but to render the paper of a greyer colour, when it continues mixed in the pulp. This part is more easily dissolved and disengaged from the paste by the water that continually runs through the mortars. The small fragments of leaves that may be left after the picking, will also be beaten with more difficulty in a common mortar, and the paper will be spoiled by them, as it happened to some sheets of that which we made.

This inconvenience would be avoided by putting the cods in the mill mortars, where, at least, the leaves would be more easily beaten, and this they might be, in the state wherein they appear in the cods: for the caterpillars have divested them of their parenchymatous parts, on which they feed, and nought remains but the fibres, which by the net-work they form, supported the parenchyma that filled up the interstices. Though these fibres be like those of a tree, they are, at the same time, more slender and fine, and have already by the work of the caterpillars, acquired an elaboration that wants only a little of our assistance. The beginning of rottenness might suffice. The preparation given to the rags before they are put under the pestle, is one of the methods that may be the most useful on this occasion. The rags being picked, are cut into small pieces, and laid in heaps where they grow warm, and acquire a kind of fermentation, that gives them a degree of rottenness, which renders them the more fit for trituration. In the opinion of the workmen, this preparation is so indispensibly necessary, that, when the rags are clean, and destitute of the grease which is then requisite, they think themselves obliged to supply this defect. The same method may be taken with cods mixed with leaves. These leaves, assisted with a little moisture, will heat and rot to a certain degree, which it is our business to distinguish, that then they may be beaten as easily as the silk.

It were to be wished that these leaves were not mixed with the silk, whereas the greatest part of the cods are composed of them; yet there are some which consist of pure silk, and are usually found in the angle formed by the union of two branches. These are no other than threads of silk stretched from one bough to another, in different ways. The others, consisting partly of leaves, are placed in the middle of leaves, which, after the caterpillars have partly consumed, they bind and unite them together, thus forming larger or smaller bundles of pods, of the ends of little branches. There is no room to doubt that the silk of other caterpillars might likewise be employed: the cods of pure silk, and even those that are partly formed of the hair which covers the caterpillars, are equally proper materials for paper: nor should the cods belonging to the caterpillars of the pine-tree be rejected.

We ought, however, to be sure that it is possible to make paper of silk; but is it made of that substance in China? Though it may appear unnecessary to resolve that question, I will ex-

amine the reasons that are advanced to prove that it is not made of silk. It is usually said, That if the Chinese paper, which is pretended to be made of silk, was actually composed of that substance, it would in burning twist itself different ways, and be shrivelled up like parchment, which is made of prepared sheep-skin; whereas that paper burns as equally as that made of the rags of hemp-cloth and linen. These facts cannot be contradicted; but yet the silk paper which I made burned like ordinary paper, though the cods, which were the chief materials, shrunk up in burning, in the same manner as parchment. What, therefore, is the cause of this difference? I believe we must seek for the explanation in the tissue or texture, which is very different in the paper from what it was in the cod; there the threads are long, disposed in different manners, so as that one single thread often forms several folds.

The fibres of paper are very short, and, though differently arranged and bound together, the connection is not so strong: it is no longer one or several threads of a considerable length. It happens then, that when the cods are burned, their threads are drawn different ways; those of one surface draw those of another, and, therefore, they must twist and turn sometimes to one side, and sometimes to another; whereas the fibres of paper being so short, and connected together only by juxtaposition, they must act very little, if any thing at all, upon one another, consequently will burn equally. What proves the justness of this application is, that, in paper, there is sometimes one place where the silk has not been well beaten, and is still too much interwoven, and that place always is shrivelled up in burning. This explanation is, perhaps, sufficient to clear up the question relating to silk paper; and howsoever the Chinese paper may be made, I think we ought to be persuaded that it is possible to make it of silk: neither ought we to entertain any doubt about the use to which we might put the stalks of hemp and flax; and I think we have reason to hope, that one day an advantageous use may be found for the different kinds of down, not only of the cotton, of which, it is, perhaps, very singular to have entertained any suspicion, but also of the thistle, the trumpet-wood, and the wad, which more than any other would merit an happy success, it's paper having a gloss and silver brilliancy which might be of some use in many cases.

All that remains, therefore, in order to fulfil our hope of this down, as well as of the others, is to find out some method, perhaps very easy and simple, and, for that very reason the more difficult to invent. If, for example, when the materials are ready to be beaten, instead of simple water, we should substitute a gummy or mucilaginous water, like that in which have been boiled the parings of leather, roots of marsh-mallows, the great comfrey, or such substances, the paste by these means would be endued with a kind of glue, which might be an expedient by means whereof the parts would cohere more strongly; perhaps it would be sufficient to prepare in this matter the water of the tub in which the paste is diluted when it comes from under the pestle.

If, notwithstanding this preparation, the paste should not have body enough, perhaps by substituting compression in the room of immersion, which is the ordinary method of forming the sheets of paper, we should be able to render the parts of the paste more coherent; and I imagine this is the method which must be taken with that cottonaceous substance that owes it's origin to the conserva of Pliny. The heaps formed by the reunion of the different feet of this plant, are already of a certain thickness, and not easily torn; so that, in extending the paste made of this plant, we might give what thickness we would to every sheet, and the compression would afterwards do the rest. It might be found impracticable to make sheets as thin as those of ordinary paper; but even if we could do no more than make pasteboard, it would be an advantage which we ought not to neglect, but, on the contrary, prosecute with care. An enquiry into the materials which may be used for making of paper, by Mr. Guettard, of the Royal Academy of Sciences, and physician to his serene highness the duke of Orleans.

R E M A R K S.

The reader will please to observe, from this account of divers materials whereof paper may reasonably be presumed to be made, the great utility that a knowledge in natural history has to advance the manufactural arts; and, therefore, how beneficial it may prove to our artists and the nation, to have those things duly propagated in a trading empire. Every artisan and manufacturer will hence discern how importantly useful to their respective employments those gentlemen are, who have studied the productions of nature, and have suggested rational experiments thereon, in order to promote the trafficable arts. Princes, statesmen, and landed gentlemen in general, must be convinced, from instances of this kind, how necessary it is to encourage and honour those who apply themselves to studies that have so happy a tendency to inspire a general industry and ingenuity, and to advance the arts. Those who are wholly busied in the active life, have rarely leisure for researches of this nature, or a proper turn to make experiments

experiments suitably adapted to the advancement of their several branches of business: but it well becomes those who are engaged in the hurry of life, to devote some portion of their time to the perusal of books wrote upon Natural History, and for the improvement of the manufactural and mechanic arts. By this means our paper, as well as other manufactures, may arrive at their ultimate perfection, and be made from such materials as are little suspected. See the articles *MUSEUM* [REMARKS thereon], and *ROYAL SOCIETY OF LONDON*.

INCUMBUSTIBLE PAPER is made of the *Asbestos* [see *ASBESTOS*] which will bear burning without injury; and if an ink could be made of the same permanent nature, it might be a great preservative of writings of consequence from that consuming element, in cases of accident.

Mr Lloyd, in the *Philosophical Transactions*, No. 166, describes the manner of making this paper. He pounded a quantity of the asbestos in a stone mortar, 'till it became a downy substance, then sifted it through a fine sieve, and by this means purged it pretty well from its earthy parts; so that what earthy or stony matter he could not separate before, or in the pounding, being reduced to a powder, came through the sieve. This done he brought it to the paper-mill, and putting it in water in a vessel just big enough to make a sheet with such a quantity, he stirred it pretty much, and desired the workmen to proceed with it in the usual method, with their writing-paper mould, only to stir it about always before they put it in their moulds, considering it as a far more ponderous substance than what they used, and that, if not immediately taken up after it was agitated, it would subside.

The paper made thereof proved but coarse, and too apt to tear; but there is reason to believe it might be much improved, in case it was pounded in one of their mortars for the space of 24 hours.

Paper is of various kinds.---With regard to colours, they are divided into white, brown, blue, &c. and to quality, into fine, second, bastard, superfine, &c.---With respect also to use, into writing, printing, pressing, cap, cartridge, copy, post, &c.---With regard to dimensions, into demy, crown, fool's-cap, pot, royal, super-royal, imperial, elephant, atlas, &c. There is also printed, raised, and imbossed paper, wherewith to hang rooms, and wherein there is a large consumption, and in which our artists have arrived to a great perfection.

MARbled PAPER is a sort variously stained with divers colours, made after the following manner:

Take clear white gum-tragant, put it into an earthen pan, pour fresh water to it, 'till it is two hands high over the gum; cover it, let it soak 24 hours, then stir it well together, add more water to it, keep it often stirring for a whole day, or longer, and it will swell according as you find your gum is fresh or stale, for the fresh will dissolve sooner than that which has lain by a long time. When you find it well dissolved, pour it through a cullender into another pan, add to it more water, and, after it has stood a little and been stirred about, strain it through a clean cloth into another clean pan; keep it well covered, to hinder the dust, or any other thing from coming to it; this water, when you go to make use of it in marbling your paper or books, must be neither too thick nor too thin; you may try it with your comb, by drawing the same from one end of the trough to the other; if it swells the water before it, it is a sign that it is too thick, and you must add in proportion a little more water.

Your trough must be of the bigness of your paper, or rather something wider, and about four inches deep.

After you have filled your trough with the aforementioned water, and fitted every thing for the work, then (before you lay on your colours) take a clean sheet, and draw the surface, which will be a thin sort of film, off of it; then have your three colours, namely indico mixed with white lead, yellow oker, and rose-pink, ready prepared at hand, and for each colour have two galley-pots, in order to temper them, as you would have them in different shades.

All your colours must be ground very fine with brandy.

The blue is easily made deeper or lighter, by adding more or less white-lead.

The yellow used for that purpose is either yellow orpiment or Dutch pink.

For blue, grind indigo and white lead, each by itself, in order to mix that colour either lighter or darker.

For green, take the aforesaid blue and white, and some yellow to it, and temper it darker or lighter, as you would have it.

For red, take either lake or rose-pink.

Every one of these colours are, as we said before, first ground very fine with brandy, and, when you are ready to go to work, add a little ox or fish-gall to them; but this must be done with discretion, and you may try them by sprinkling a few drops upon your gum-water; if you find the colour fly and spread too much about, it is a sign of too much gall, which, to remedy, add more of the same colour that has none, but when you see the colour spread, and retract itself gently, it is right.

When thus you have your colours, and all things in good order, then take a pencil, or the end of a feather, and sprinkle or put first your red colour, then the blue, yellow, green, &c.

VOL. II.

begin your red from No. 1, and go along your trough to No. 2; also the blue from No. 3, all along to No. 4; the yellow and green put here and there in the vacant places; then with a bodkin, or a small skewer, draw a sort of a serpentine figure through the colours, beginning from No. 1 to No. 2: when this is done, then take your comb and draw the same straight along from No. 1. to No. 2. If you would have some turnings or snail-work on your paper, then with a bodkin give the colours what turns you please.

Thus far you are ready in order to lay on your paper, which must be moistened the day before, in the same manner as book-printers do their paper for printing; take a sheet at a time, lay it gently upon your colours in the trough, press it slightly with your finger down in such places where you find the paper lies hollow; this done, take hold at one end of the paper, and draw it up at the other end of the trough, hang it up to dry on a cord, when dry, glaze it, and it is done. You may also embellish your paper with streaks of gold, by applying musc gold or silver, tempered with gum-water, among the rest of the colours.

To gild paper.

Take yellow oker, grind it with rain water, and lay a ground with it upon the paper all over; when dry, take the white of eggs, beat it clear with white sugar-candy, and strike it all over; then lay on the leaf gold, and when dry, polish it with a tooth.

Some take saffron, boil it in water, and dissolve a little gum with it; then they strike it over the paper, lay on the gold, and, when dry, they polish it.

To silver paper, after the Chinese manner, without silver.

Take two scruples of clear glue, made of neats leather, one scruple of white allom, half a pint of clean water, simmer the whole over a slow fire, 'till the water is consumed, or the steam ceases; then your sheets of paper being laid on a smooth table, you dip a pretty large pencil into that glue, daub it over as even as you can, repeat this two or three times, then sift the powder of talc through a fine sieve, made of horse-hair or gauze, over it, and then hang it up to dry, and, when dry, rub off the superfluous talc, which serves again for the same purpose. The talc you prepare in the following manner:

Take fine white transparent talc, that which comes from Muscovy, boil it in clear water for four hours, then take it off the fire, and let it stand so for two days: then take it out, wash it well, and put it into a linen rag, and beat it to pieces with a mallet: to 10 pounds of talc add three pounds of white allom, and grind them together in a little hand-mill, sift it through a gauze sieve, and being thus reduced to a powder, put it into water, and just boil it up: then let it sink to the bottom, pour off the water from it, place the powder in the sun to dry, and it will become a hard consistence. This beat in a mortar to an impalpable powder, and keep it for the use abovementioned, free from dust.

To make fine red paper.

Take a pan full of water, put some quick-lime into it, to make it into a lee, and let it stand over-night; then put Brazil chips into a clean pot, about half full, fill it with the lees, and boil it to half, and, when it is just hot, add to it a little allum; when you would use it, mix it with a little gum or size, and then with a pretty large pencil lay your colour on the paper with an even hand.

Of JAPAN PAPER.

The paper is made in Japan of the bark of the *morus papyrifera* fativa, or true paper-tree, after the following manner: every year, when the leaves are fallen, or in the tenth Japanese month, which commonly answers to our December, the young shoots, which are very fat, are cut off into three feet long, or shorter sticks, and put together in bundles, to be afterwards boiled with water and ashes.

If they should grow dry before they can be boiled, they must be first soaked in common water for about 24 hours, and then boiled. These bundles or faggots, are tied close together, and put upright into a large and spacious kettle, which must be well covered, and then they are boiled 'till the bark shrinks so far, as to let about half an inch of the wood appear naked at the top. When the sticks have been all sufficiently boiled, they are taken out of the water, and exposed to the air 'till they grow cold; then they are slit open length ways, for the bark to be taken off, which being done, the wood is thrown away as useless, but the bark dried, and carefully preserved, as being the substance out of which they are in time to make their paper, by letting it undergo a farther preparation, consisting in cleansing it anew, and afterwards picking out the better from the worse.

In order to this, it is soaked in water for three or four hours, and being grown soft, the blackish skin which covers it, is scraped off, together with the green surface of what remains, which is done with a knife, that they call *Kaadfi Kiufaggi*,

that is, a Kaadi Razor. At the same time also, the stronger bark, which is of full a year's growth, is separated from the thinner, which covered the younger branches, the former yielding the best and whitest paper, the latter only a dark and indifferent sort. If there is any bark, of more than a year's growth, mixed with the rest, it is likewise picked out and laid aside, as yielding a coarse and worse sort of paper. All gross knotty particles, and whatever also looks in the least faulty and discoloured, is picked out at the same time, to be kept with the least coarse matters.

After the bark has been sufficiently cleaned and prepared, and sorted according to it's differing degrees of goodness, it must be boiled in clear lye. As soon as it comes to boil, and all the while they keep it on the fire, they are perpetually stirring it with a strong reed, pouring from time to time so much fresh lye in, as is necessary to quench the evaporation, and to supply what hath been already lost by it. This boiling must be continued 'till the matter is grown so thin, that being but slightly touched with the finger, it will dissolve and separate into flocks and fibres.

Their lye is made of any sort of ashes in the following manner: two pieces of wood are laid a-cross over a tub, and covered with straw, on which they lay wet ashes, and then pour boiling hot water upon it, which as it runs through the straw into the tub underneath, is imbued with the same saline particles of the ashes, and makes what they call lye.

After the boiling of the bark, as above described, follows the washing thereof. This is a business of no small consequence in paper-making, and must be managed with great judgment and attention.

If it hath not been washed long enough, the paper will be strong indeed, and of a good body, but coarse, and of little value. If, on the contrary, the washing hath been continued too long, it will afford, it is true, a whiter paper, but too greasy, blotting, and unfit for writing. This part of paper-making, therefore, must be managed with great care and judgment, so as to keep to a middle degree, and to avoid either extreme. They wash it in a river, putting the bark into a sort of pan or sieve, which will let the water run through, and stirring it continually with the hands and arms, 'till it comes to be diluted into a delicate soft wool or down. For the finer sort of paper the washing must be repeated, but the bark put in a piece of linen instead of a sieve, because the longer the washing is continued, the more the bark is divided, and would come at last to be so thin and minute, that it would run out through the holes of the sieve, and be lost. At the same time also, what hard knots or flocks, and other heterogeneous useless particles remain, must be carefully picked out, and put up with a coarser sort of bark for worse paper.

The bark having been sufficiently and thoroughly washed, is put upon a thick smooth wooden table, in order to it's being beat with sticks of the hard Kusunoki wood, which is commonly done by two or three people, until it is wrought fine enough, and becomes withal so thin, as to resemble a pulp of soaked paper, which being put into water, will dissolve and disperse like meal.

The bark being thus prepared, is put into a narrow tub, with the fat slimy infusion of rice, and the infusion of the oreni-root, which is likewise very slimy and mucous. These three things being put together, must be stirred with a thin clean reed, 'till they are thoroughly mixed in an uniform liquid substance of a good consistence.

This succeeds better in a narrow tub. But afterwards the mixture is put into a larger one, called in their language fine, which is not unlike those made use of in our paper-mills. Out of this tub the leaves are taken off, one by one, and proper patterns, made of bulrushes instead of brass wire, and called mis. Nothing remains now but a proper management in drying them. In order to this, they are laid up in heaps upon a table, covered with a double mat, and a small piece of reed (which they call kamacura, that is, a cushion) is put between every leaf, which standing out a little way, serves in time to lift them up conveniently, and take them off singly. Every heap is covered with a small plank or board, of the same shape and size with the paper, on which are laid weights, first indeed small ones, lest the leaves, being then as yet very wet and tender, should be pressed together into one lump, but by degrees more and heavier, to press and squeeze out all the water. The next day the weights are taken off, the leaves lifted up one by one, by the help of the small stick abovementioned, and with the palm of the hand clapped to long rough planks made for this purpose, which they will easily stick to, because of the little humidity still remaining. After this manner they are exposed to the sun, and when full dry, taken off, laid up in heaps, pared round, and so kept for use or sale.

I took notice, says Kœmpfer, that the infusion of rice, with a gentle friction, is necessary for this operation; because of it's white colour, and a certain clammy fatness, which at once gives the paper a good consistence, and pleasing whiteness. The simple infusion of rice-flour would not do it, because it wants that clamminess, which is a very necessary quality. The infusion, I speak of, is made in an unglazed

earthen pot, wherein the rice grains are soaked in water, and the pot afterwards shaken, gently at first, but stronger by degrees. At last fresh cold water is poured upon it, and the whole percolated through a piece of linen. The remainder must undergo the same operation again, fresh water being put to it, and this is repeated so long as there is any clamminess remaining in the rice. The Japanese rice is by much the best for this purpose, as being the whitest and fattest sort growing in Asia.

The infusion of the oreni-root is made after the following manner. The root pounded or cut small, is put into fresh water, which, in one night's time, turns mucilaginous, and becomes fit for use, after it hath been strained through a piece of linen. The different seasons of the year require a different quantity of this infusion to be mixed with the rest. They say, the whole art depends almost entirely upon this. In the summer, when the heat of the air dissolves the jelly, and makes it more fluid, a greater quantity is required, and less in proportion in the winter, and in cold weather.

Too much of this infusion mixed with the other ingredients, will make the paper thinner in proportion, too little, on the contrary, will make it thick and parched. Therefore a middle quantity is required to make a good paper, and of an equal thickness. However, upon taking out a few leaves, they can easily see, whether they have put too much or too little of it. Instead of the oreni-root, which sometimes, chiefly at the beginning of the summer, grows very scarce, the paper-makers make use of a creeping shrub called *sane kadfura*, the leaves whereof yield a mucilage in great plenty, though not altogether so good for this purpose, as the mucilage of the abovementioned oreni-root.

The *juncus fativus* is cultivated in Japan with great care and industry. It grows tall, thin, and strong. The Japanese make sails of it, and very fine mats to cover their floors.

It hath been observed, that the leaves when they are fresh taken off from their patterns, are laid up in heaps, on a table covered with two mats. These two mats must be of a different fabric; one, which lies lowermost, is coarser, but the other, which lies uppermost, thinner, made of slender bulrushes, which must not be twisted too close one to another, to let the water run through with ease, and very thin; and not to leave any impressions upon the paper.

A coarser sort of paper, proper to wrap up goods, and for several other uses, is made of the bark of the *kadfura* shrub, after the method above described. The Japanese paper is very tight and strong, and will bear being twisted into ropes. A thick strong sort of paper is sold at Syriga (one of the greatest towns in Japan, and the capital of the province of that name) which is very neatly painted, and folded up, so much in a piece as there is wanting for a suit. It looks so like silken or woollen stuffs, that it might be easily mistook for them.

A thin neat sort of paper, which hath a yellowish cast, is made in China and Tonquin, of cotton and bamboo. The Siamites make their paper of the bark of the *pliockkloika*. They have two sorts of it, one black, and another white, both very coarse, rude and simple, as they themselves are. They fold it up into books, much after the same manner as fans are folded, and white on both sides, not indeed with a pencil, in imitation of those more polite nations who live farthest east, but with a rude stylus made of clay. Thus far the description of the way of making paper in the east, which the late learned Beermannus was so desirous to know, and so earnestly intreated travellers to enquire into, mistaken however in that thought, and seemed to be persuaded, that it was of cotton; whereas it evidently appears, by this account, that all the nations beyond the Ganges make it of barks of trees and shrubs. The other Asiatic nations on this side the Ganges (the black inhabitants of the more southern parts excepted) make their paper of old rags, of cotton stuff, and their method differs in nothing from ours in Europe, but that it is not altogether so intricate, and that the instruments they make use of are grosser.

To compleat the account proposed to be given of the paper-manufactures in Japan, we have here added the description of the plants and trees whereof it is made.

THE PAPER TREE.

From a strong, branched, lignous root, rises a straight, thick, equal trunk, very much branched out, covered with a fat, firm, clammy, chefnut-coloured bark, rough without, and smooth on the inside, where it adheres to the wood, which is loose and brittle, with a large moist pith. The branches and twigs are very fat, covered with a small down or wool, green, inclining to a dark purple. They are channelled 'till the pith grows, and quickly decay when broke off. The twigs are irregularly beset with leaves, at two or three inches distance, or more, standing on slender, hairy, two inch long foot-stalks, of a dark purple cast, and the bigness of a straw. The leaves differ much in shape and size, being sometimes divided into three, sometimes into five serrated, narrow, unequally deep, and unequally divided lobes, resembling in substance, shape and size, the leaves of the *urtica mortua*, being flat and

and thin, a little rough, dark green on one side, and of a lighter green, inclining to white, on the other.

They dry quickly, when broke off, as do all other parts of this tree. Strong single fat nerves (leaving a remarkable hollow on the opposite side) run from the bottom of the leaves towards the top, and send out many transverse ribs, almost parallel to one another, which send out others still smaller, turned in towards the edges. In June and July come forth the fruits, upon the extremities of the twigs, standing on short footstalks, round, somewhat larger than a pea, surrounded with long purple hairs, composed of acini, first of a greenish colour, which turns to a black purple when ripe: the fruit is full of a sweetish juice. I did not observe, whether or no there are any juli that come before the fruit. The tree is cultivated for the use and improvement of the paper-manufactures, on hills and mountains. The young, or two foot long twigs, are cut off and planted in the ground at moderate distances, about the tenth month, which soon take root, and the upper part, which stood out of the ground, quickly drying, they send forth many fine young shoots, which are fittest to be cut for use towards the latter end of the year, when they are come to be about a fathom and a half long, and about the thickness of an arm of a middle sized man. There is also a wild sort of kaadsi, or paper tree, growing on desert and uncultivated mountains; but it is scarce, and otherwise not very proper for paper-making, and therefore never used.

1. Those who would excel in the art of paper-making, should be acquainted not only with the common methods of making the different kinds of paper, but enquire into every sort of material wherewith the same may be made in the cheapest and the best manner.

2. This business should be considered with a chemical view, in order to shorten and improve the process.

3. The methods of making the whiteft paper, and giving any kind of colour thereto, should be well known.

4. Attempts should be made to render paper more durable, and less apt to be gnawed or torn by domestic animals.

5. The state of this art should be well known, as practised in China, France, Holland, and England, in order to advance the manufacture for every use.

6. The ways of embossing and printing of paper for hangings, should be advanced, the consumption therein being great.

7. The application of this art to the Asbestos [see ASBESTOS], so as to make incombustible paper, should be studied.

8. A method of discharging the printers ink out of paper should be enquired into.

9. The best way of making filtering paper, for chemical uses, should be invented.

✶ In the journals of the house of commons of the kingdom of Ireland, that I have by me, from the 11th year of king James I. to the 25th year of the reign of his present majesty king George II. inclusive; printed at Dublin, upon a good paper, and with a good letter, I was well pleased to find at the conclusion of them, the following, viz.

These JOURNALS are printed on an Irish paper, manufactured by Mr Thomas Slator, at Temple-Onge; and the types cast in Dublin, by Messieurs Daniel Malone and Robert Perry, letter-founders.

REMARKS ON PAPER, in another Light.

Before the Revolution, there was hardly any other paper made in England than brown; but the war ensuing, and duties being laid, from time to time, on foreign paper, it gave such encouragement to our paper makers, that most of them began to make white paper, fit for writing and printing; and they have brought it, by degrees, to so great perfection, both for quantity and goodness, that they make now above seven eighths of what is consumed in Great-Britain; and several of them make it as white and as well bearing as any that comes from abroad.

The necessity of having writing and printing paper is well known to every body; but it will not perhaps be amiss to make it appear, how profitable and beneficial that manufacture is to Great-Britain.

Rags are the main ingredient paper is made of in these kingdoms, which were formerly cast away and thrown to the dunghill, but are now gathered with great care by poor people, who get honestly their livelihood by it, and would otherwise beg their bread: this employs abundance of hands. When these rags are gathered, they are brought to the mill, and this still employs more hands. After they are in the mill, they let them lie a while, 'till they are sufficiently mellow or rotten, and then put them into the tubs under the hammers, to be beaten into a kind of jelly or white substance, looking like milk; and being thence carried into the vat, the chief workman, upon a pair of molds for that purpose, takes up the sheets or water-leaves (of which he makes 4 or 5000 a day, more or less, according to the size of the paper).

These water-leaves, after being well pressed between two felts, and the water well drained out, are carried up into the

drying rooms, and there hung upon a multitude of ropes to dry: and from thence being brought down again into the fizing room, a liquor is there prepared for fizing or gumming every sheet; the paper which is for printing being but moderately sized, but that which is for writing more nicely gummed, that it may bear ink.

This paper, after fizing, is a second time pressed, and carried up into the garrets, and hung upon the ropes to dry once more; and then, with a great deal of care and hard labour, pressed a third, a fourth, and a fifth time, to make it smooth and of a good grain; and then put up into quires and reams. Now, considering how many hands every individual sheet of paper passes through, before it is brought to perfection, it is plainly perceived that a great number of people is employed in each mill, then those who gather the rags up and down in all the counties of England, and bring them to the mills: those who make the felts, which takes up a good quantity of wool, being very thick, and for every sheet of paper, a piece of felt of the same size, or a little larger; the rope-makers, the mold-makers, the carpenters, wheelwrights, timber-merchants, smiths, (for this work consumes a great deal of iron, by the hammers beating perpetually upon the iron plates) and several other trades, who depend upon the building and keeping the mills in repair; those who sell allum, copperas, cuttings and parings of gloves, parchment and leather; all which are used in fizing or gumming of paper: these things considered, it cannot be denied, but a vast many people get their livelihood, or receive a benefit, by this useful and ingenious manufacture.

There is still one farther use we would make of this information, and this is, to compute by it, the value of paper which was heretofore annually imported from the French nation.

Upon the interruption of our French commerce, in the late queen's wars, we increased our importation of paper from other countries, and the manufacture of this commodity in Great-Britain. Indeed the manufacture of white paper commenced in this kingdom, not long before that æra. At this time there were about one hundred and twenty fairs within 60 miles of London for white paper; which, at 8 reams per day, must produce near 300,000 reams per annum: and if those of Yorkshire and Scotland, together with the increase of our importations from Italy and Holland, were then allowed to produce above 100,000 reams more for the consumption of this kingdom, (as they certainly did, if the whole paper-manufacture of Britain was then, as computed, but two thirds of our consumption) the whole quantity made in this kingdom, or imported from other countries instead of French paper, amounted to 400,000 reams per annum; then such therefore must have been our annual importation from France, and the value of this, at 5 s. per ream must have amounted to 100,000 l. per annum.

The paper-manufacture hath, for many years, been established in most countries; though France, Holland, and Genoa, are the places where it has best succeeded. The quality certainly depends upon the materials whereof it is made; and where it is done from linen rags, it depends much on the quality of the linen worn in the country where it is made: where that is fine or coarse, or brown, the rags, and consequently the paper made thereof, must be so too. Though the English manufacture of paper is not yet arrived to the perfection of some other nations; yet it is daily improving, and we doubt not but our artists will equal those of any other nation, when they are wise enough to make small trials upon all sorts of materials which bid fair to make a more beautiful manufacture than what they have. The vegetable kingdom, we have seen, admits of an infinite variety of subjects, whereon to make experiments, at a very trifling expence: and whether many cheap fossils, of a beautiful white, may not, by proper managements, be brought to a due cohesive confidence for the purpose, may deserve notice.

As this is a manufacture of such general use, both for writing, printing, engraving, packing, &c. it cannot be made too good nor too cheap for the great variety of purposes where-in we find it subservient to other arts.

Extract of two edicts of the French king, concerning the paper manufacture.

Arrêt of the king's council, prohibiting the exportation of old linen, old cloaths, rags, &c. 1697.

The king having been informed, That the exporting old linen, old cloaths, rags, &c. is a very considerable prejudice to the manufactures of paper and cards of this kingdom, had ordained, by a former arrêt of the 28th of January, 1697, That the said goods should pay 12 livres per hundred weight upon their exportation, instead of 6 livres per hundred weight, payable by the tariff of 1664; but his said majesty having since that been informed, That notwithstanding double duty, divers particular merchants continue to export such great quantities out of the kingdom, as would cause a scarcity thereof to the manufacturers in the provinces aforesaid; for remedy whereof, his majesty ordains, and hereby makes an express prohibition to all persons, of what rank or condition soever, to export out of the kingdom, without his permission, any

any old linen, old cloaths, or rags, from the day of the publication hereof, upon pain of confiscation, and three thousand livres fine, of which the third part to the informer.

Done at Versailles, Signed, DU JARDIN.
May 29, 1697.

Arrêt of the king's council, taking off the duties of exportation upon all cloth of gold and silver, and silks, and upon paper, paste-board, and cards; and moderating the duties upon stuffs of wool, and thread linen-cloth, and other merchandizes, December 24, 1701.

Likewise his majesty ordains, That for paper of all sorts, white, brown, blue, and all other colours; books, printed, bound, and not bound; cards, paste-boards, and cards to play with, going out of this kingdom into foreign parts, there shall not be paid any duties at all.

Done at Versailles, Signed, PHILIPPEAUX.
Dec. 24, 1701.

By these two abstracts of the French king's arrêts, it may be perceived, how careful he is of his manufactures in general, and of that of paper in particular.

There are seven provinces in France where the manufacture of paper is settled, viz. Champagne, Normandy, Brittany, Angoumois, Perigord, Limousin, and Auvergne; the three last provinces are full of large forests of chefnut-trees, and abound so much in that kind of fruit, that the common people have no other food all the year round, and no other drink but water; so that they can afford their work very cheap, and do it for next to nothing, except some of the upper workmen, who earn a small salary by the week. This is so true, that considerable parcels of paper were imported, some years since, from thence, although the duties paid here exceed one hundred per cent. on the first cost; notwithstanding which, the French merchants were long able to under-sell us greatly.

Now if chefnuts, and such-like spontaneous productions of the earth, for which we are chiefly beholden to nature, very little to the labour of man, are the greatest part of the subsistence of the people employed in the paper-manufacture of France, there can be little doubt of their living on less wages than our English labouring people: no one will assert, that a belly-full of chefnuts, which grow without the labour of man, shall cost as much as a belly-full of bread, which pays so much to the ploughman, the seedman, the reaper, the thresher, the miller, the baker, and innumerable other labourers, who have bestowed some work upon every loaf that was ever eaten. Our people therefore are subsisted at a great charge, and the French manufacturers in this article, for almost nothing, in comparison to what ours are.

Ought not every requisite measure, therefore, to be taken by this kingdom, so to reduce the price of the common necessities of life, that our manufacturers may be able to afford their labour so cheap, that our competitors may not in time run away with the whole trade? But how can this be ever effectuated, while the kingdom is incumbered with taxes necessary to pay interest-money for so enormous a national debt wherewith we are now loaded?

PAPER CREDIT. Under the articles **BANKS** and **BANKING**, **CASH**, **CIRCULATION**, **CURRENCY**, [**PAPER CURRENCY**], **MONEY**, the reader will find our sentiments in relation to these points; which having an affinity with what we shall say, upon the present occasion, may be necessary to be consulted.

PAPER-CREDIT signifies, in the general, whatever property is circulated in a state, or transferred from one person to another, by the means of any written paper-obligation, instead of hard money, or merchandizes, or lands; such as exchequer bills, bank notes, bills of exchange, promissory notes, bonds, mortgages; and some include herein all transfers made by stocks, &c. The term considered in this acceptance, including the conveyance of property of any kind whatever, from person to person, and from nation to nation, by the means of paper-authority only, comprehends a wonderful circulation of property over the whole trafficable world; without which, the concerns of commerce could not possibly be carried on with that extent and facility they are at present.

In order to render what we shall observe of use chiefly to our own country, we shall restrain our consideration to the circulation of property of this sort within ourselves.

Eraſmus Philipps, Esq. computes in the year 1725, * the whole money-transactions of this nation at 126,199,328 l. which he does in the following manner, viz.

* See The State of the Nation, in respect to her commerce, Debts, and Money, p. 42, & seq.

It is a stupendious thought, says this gentleman, to consider the money-transaction of this kingdom; perhaps it may not be unacceptable to give some account of it. I believe I shall be allowed to compute the rents of this kingdom at

1.
20,000,000

And upon the supposition that the lands of England are not taxed at half the value, this account may be near the truth.

The duties on the customs produce per ann. } about 1,600,000

Which, upon an average of 30 l. per cent. ad valorem, shews our imports to be for about } 5,300,000

Besides our re-export, which may be about 1,500,000
The rest of the duties and funds - 2,199,328

If it is allowed me, that there are eight millions of people in this nation, I believe I shall not exceed, if I reckon the manufactures consumed at home to amount to per annum } 16,000,000

I shall not mention the interest arising from mortgaged land, that being computed before in the rental; but I must take notice of the mortgages themselves, because they are often transferred, and may be reckoned money in circulation; and these have been computed at a fifteenth part of the land, which will come to about } 26,000,000 princ. money.

The next thing I shall mention is the great national debt; And this is about 53,000,000

The malt produces more, about 600,000

So that the whole money-transaction of this nation seems to be for about } 126,199,328

And all this is carried on with no more than 15,000,000 of specie.

And perhaps I may be particular in saying, the reason of this prodigious circulation is the debt itself; for the large and regular interest that has been paid on these state-actions, have exhausted all private hoards, and made these securities become like a new species of money, current in every body's hands.

REMARKS before the last War.

Since Mr Phillips wrote, not only the national debts, but the public revenue has greatly augmented, and consequently our paper-circulation has increased in the like proportion; and yet it is to be feared that the quantity of specie, at present, is much below 15,000,000 at which, when that gentleman wrote, he computed it. And to what degree the price of labour and our native commodities are affected by the weight of our national debts and taxes, or in consequence of this paper-credit so greatly exceeding the quantity of real specie, may be seen under the article **DUTIES**, **LABOUR**, to which we refer the reader. To corroborate what is there urged, see likewise the article **BONDING**, in regard to the **DUTIES** OF **CUSTOMS**.

And how detrimental to the kingdom, in other respects, this great increase of paper-credit is likely one day to prove, may be inferred from what follows, according to the ingenious Mr Hume*.

* See Hume's political Discourses.

First, It is certain, says that gentleman, that our national debts cause a mighty confluence of people and riches to the capital, by the great sums which are levied in the counties to pay the interest of those debts; and perhaps too, by the advantages in trade, which they give the merchants in the capital above the rest of the kingdom.

Secondly, Public stocks, being a species of paper credit, have all the disadvantages attending that species of money. They banish gold and silver, from the most considerable commerce of the state, reduce them to common circulation, and by that means render all provisions and labour dearer, than otherwise they would be.

Thirdly, The taxes which are levied to pay the interest of these debts, are a check upon industry, heighten the price of labour, and are an oppression on the poorer sort.

Fourthly, As foreigners possess a share of our national funds, they render the public, in a manner tributary to them, and may, in time, occasion the transport of our people and our industry.

Fifthly, The greatest part of public stock being always in the hands of idle people, who live on their revenue, our funds give great encouragement to an useless and inactive life.

But though the injury that arises to commerce and industry from our public funds, will appear, upon ballancing the whole, very considerable, it is trivial in comparison of the prejudice that results to the state, considered as a body politic; which must support itself in the society of nations, and have various transactions with other states, in wars and negotiations.

The ill there is pure and unmixed, without any favourable circumstance to atone for it: and it is an ill too, of a nature the highest and most important.

We have, indeed, been told, that the public is no weaker upon account of its debts, since they are mostly due amongst ourselves, and bring as much property to one, as they take from another. It is like transferring money from the right-hand

hand to the left, which leaves the person neither richer nor poorer than before. Such loose reasonings and specious comparisons will always pass, where we judge not upon principles. We ask, is it possible, in the nature of things, to overburthen a nation with taxes, even where the sovereign resides among them? The very doubt seems extravagant; since it is requisite in every commonwealth, that there be a certain proportion observed betwixt the laborious and the idle part of it. But if all our present taxes be mortgaged, must we not invent new ones? And may not this matter be carried to a length, that is ruinous and destructive?

In every nation, there are always some methods of levying money more easy than others, suitable to the way of living of the people, and the commodities they make use of. In Britain, the excises upon malt and beer afford a very large revenue, because the operations of malting and brewing are tedious and impossible to be concealed; and at the same time, these commodities are not so absolutely necessary to life, as that their price would very much affect the poorer sort.

Duties upon consumptions are more equal and easy, than those upon possessions. What a loss is it to the public, that the former are all exhausted, and that we must have recourse to the most grievous method of levying taxes!

Were all the proprietors of land only stewards to the public, must not necessity force them to practise all the arts of oppression used by stewards, where the absence and negligence of the proprietor render them secure against enquiry?

It will scarce be asserted, that no bounds ought ever to be set to national debts, and that the public would be no weaker, were 12 or 15s. in the pound land-tax mortgaged, along with all the present customs and excises. There is something therefore in the case, besides the mere transferring of property from one hand to another. In 500 years, the posterity of those now in the coaches, and of those upon the boxes, will probably have changed places, without affecting the public by these revolutions.

It must be confessed, that there is a strange supineness, from long customs, crept into all ranks of men, with regard to public debts, not unlike what divines so vehemently complain of with regard to their religious doctrines. We all own, that the most sanguine imagination cannot hope, either that this or any future ministry, will be possessed of such rigid and steady frugality, as to make any considerable progress in the payment of our debts; or that the situation of foreign affairs will, for any long time, allow them leisure and tranquillity, sufficient for such an undertaking*. What then is to become of us? The events here will depend little upon the contingencies of battles, negotiations, intrigues, and factions. There seems to be a natural progress of things, which may guide our reasoning.

* In times of peace and security, when alone it is possible to pay debts, the monied interest are averse to receive partial payments, which they know not how to dispose of to advantage, and the landed interest are averse to continue the taxes requisite for that purpose. Why therefore should a minister persevere in a measure so disagreeable to all parties? For the sake, I suppose, of a posterity, which he will never see, or of a few reasonable reflecting people, whose united interest, perhaps, will not be able to secure him the smallest borough in England. It is not likely we shall ever find any minister so bad a politician. With regard to these narrow destructive maxims of politics, all ministers are expert enough,

As it would have required but a moderate share of prudence, when we first began this practice of mortgaging, to have foretold, from the nature of men and of ministers, that things would necessarily be carried to the length we see; so now that they have at last so happily reached it, it may not be difficult to guess at the consequence. It must, indeed, be one of these two events; either the nation must destroy public credit, or public credit will destroy the nation. It is impossible they can both subsist, after the manner they have been hitherto managed, in this as well as in some other states. See the article **MORTGAGED INTEREST**.

There was, indeed, a scheme for the payment of our debts, which was proposed by an excellent citizen, Mr Hutchinson, above 30 years ago, and which was much approved of by some men of sense, but never likely to take effect: he asserted, that there was a fallacy in imagining, that the public owed this debt; for that really every individual owed a proportional share of it, and paid, in his taxes, a proportional share of the interest, besides the expenses of levying these taxes. Had we not better, says he, make a proportional distribution of the debt among us, and each of us contribute a sum suitable to his property, and by that means, discharge at once all our funds and public mortgages? He seems not to have considered, that the laborious poor pay a considerable part of the taxes by their annual consumptions, though they could not advance at once, a proportional part of the sum required. Not to mention, that property in money, and stock in trade, might easily be concealed or disguised; and that visible property in lands and houses would really at last answer for the whole; an inequality and oppression, which would never be submitted

to. But though this project is never likely to take place, it is not altogether improbable, that when the nation becomes heartily sick of the debts, and cruelly oppressed by them, some daring projector may arise, with visionary schemes for their discharge. And, as public credit will begin, by that time, to be a little frail, the least touch will destroy it, as happened in France, and in this manner it will die of the doctor*. See the article **MISSISSIPPI**.

* Some neighbouring states practise an easy expedient, by which they lighten their public debts. The French have a custom (as the Romans formerly had) of augmenting their money; and this the nation has been so much familiarized to, that it hurts not public credit, though it be really cutting off at once, by an edict, so much of their debts. The Dutch diminish the interest without the consent of their creditors; or, which is the same thing, they arbitrarily tax the funds as well as other property. Could we practise either of these methods, we need never be oppressed by the national debt; and it is not impossible but one of these, or some other method, may, at all adventures, be tried on the augmentation of our incumbrances and difficulties. But people in this country are so good reasoners upon whatever regards their interests, that such a practice will deceive no body; and public credit will probably tumble at once, by so dangerous a trial.

But it is more probable, that the breach of national faith will be the necessary effect of wars, defeats, misfortunes, and public calamities, or even, perhaps, of victories and conquests. It must be confessed, when we see princes and states fighting and quarrelling amidst their funds, debts, and public mortgages, it always brings to my mind, a match of cudgel-playing fought in a China shop. How can it be expected, that sovereigns will spare a species of property, which is pernicious to themselves and to the public, when they have so little compassion on lives and properties, which are useful to both?

Let the time come (and surely it will come if we continue to increase our national debts) when the new funds, created for the exigencies of the year, are not subscribed to, and raise not the money projected. Suppose either that the cash of the nation is exhausted, or that our faith, which hath been hitherto so ample, begins to fail us. Suppose that, in this distress, the nation is threatened with an invasion, a rebellion is suspected or broke out at home, a squadron cannot be equipped for want of pay, victuals, or repairs, or even a foreign subsidy cannot be advanced. What must a prince or minister do in such an emergency? The right of self-preservation is unalienable in every individual, much more in every community. And the folly of our statesmen must then be greater than the folly of those who at first contracted debts, or, what is more, than that of those who trusted, or continue to trust this security, if these statesmen have the means of safety in their hands and do not employ it.

The funds created and mortgaged, will, by that time, bring in a large yearly revenue, sufficient for the defence and security of the nation: money is perhaps lying in the Exchequer, ready for the discharge of the quarterly interest: necessity calls, fear urges, reason exhorts, compassion alone exclaims: the money will immediately be seized for the current service, under the most solemn protestations, perhaps, of being immediately replaced. But no more is requisite. The whole fabric, already tottering, falls to the ground, and buries thousands in its ruin. And this may be called the natural death of public credit. For to this period it tends as naturally, as an animal body to its dissolution and destruction*.

* So great dupes are the generality of mankind, that notwithstanding such a violent shock to public credit, as a voluntary bankruptcy in England would occasion, it would not probably be long, ere credit should again revive in as flourishing a condition as before. The present king of France, during the late war, borrowed money at lower interest than ever his great-grandfather did; and as low as the British parliament, comparing the natural rate of interest in both kingdoms. And though men are commonly more governed by what they have seen than what they foresee, with whatever certainty; yet promises, protestations, fair appearances, with the allurements of present interest, have such powerful influence as few are able to resist. Mankind are, in all ages, caught by the same baits: the same tricks, played over and over again trepan them.

The heights of popularity and patriotism, are still the beaten road to power and tyranny, flattery to treachery, standing armies to arbitrary government, and the glory of God to the temporal interest of the clergy. The fear of an everlasting destruction of credit, allowing it to be an evil, is a needless bugbear. A prudent man, in reality, would rather lend to the public immediately after they had taken a sponge to their debts than at present, as much as an opulent knave, even though you could not force him to pay, is a preferable debtor to an honest bankrupt. For the former, in order to carry on business, may find it his interest to discharge his debts, where they are not exorbitant. The latter has it not in his power. The reasoning of Tacitus, Hist. lib. 3. as it is eternally true, is very applicable to our present case. Sed vulgus ad magnitudinem beneficiorum

adefat: stultissimus quisque pecuniis mercabatur: apud sapientes cassâ habebantur, quæ neque dari neque accipi, salva republica poterant. The public is a debtor, whom no man can oblige to pay. The only check which the creditors have on it, is the interest of preserving credit; an interest which may easily be overbalanced, by a very great debt, and by a difficult and extraordinary emergence, even supposing that credit irrecoverable. Not to mention, that a present necessity often forces states into measures, which are, strictly speaking, against their interest.

These two events, supposed above, are calamitous, but not the most calamitous.

Thousands are thereby sacrificed to the safety of millions. But we are not without danger, that the contrary event may take place, and that millions may be sacrificed for ever, to the temporary safety of thousands*. Our popular government, perhaps, will render it difficult or dangerous for a minister to venture on so desperate an expedient, as that of a voluntary bankruptcy. And though the house of lords be altogether composed of the proprietors of lands, and the house of commons chiefly, and consequently neither of them can be supposed to have great property in the funds; yet the connections of the members may be so great with the proprietors, as to render them more tenacious of public faith, than prudence, policy, or even justice, strictly speaking, requires.

* I have heard it has been computed, that the whole creditors of the public, natives and foreigners, amount only to 17,000. These make a figure at present on their income, but in case of a public bankruptcy, would, in an instant, become the lowest, as well as the most wretched of the people. The dignity and authority of the landed gentry and nobility, are much better rooted, and would render the contention very unequal, if ever we come to that extremity. One would incline to assign to this event a very near period, such as half a century, had not our fathers prophecies of this kind been already found fallacious, by the duration of our public credit; so much beyond all reasonable expectation. When the astrologers in France were every year foretelling the death of Henry IV. these fellows, says he, must be right at last. We shall, therefore, be more cautious, than to assign any precise date, and shall content ourselves with pointing out the event in general.

And, perhaps too, our foreign enemies, or rather enemy, (for we have but one to dread) may, be so politic as to discover, that our safety lies in despair, and may not, therefore, show the danger, open and barefaced, 'till it be inevitable. The balance of power in Europe, our grandfathers, our fathers, and we, have all justly esteemed too unequal to be preserved without our attention and assistance. But our children, weary with the struggle, and fettered with incumbrances, may sit down secure, and see their neighbours so oppressed and conquered; 'till at last, they themselves and their creditors lie both at the mercy of the conqueror. And this may properly enough be denominated, the violent death of our public credit. See the articles MONEY, CREDIT [PUBLIC CREDIT], DEBTS [NATIONAL DEBTS], FUNDS.

These seem to be the events, which are not very remote, and which reason foresees as clearly almost as she can do any thing, that lies in the womb of time.

And though the ancients maintained, that, in order to reach the gift of prophecy, a certain divine fury or madness was requisite, one may safely affirm, that, in order to deliver such prophecies as these, no more is necessary, than merely to be in one's senses, free from the influence of popular madness and delusion.

REMARKS ON PAPER-CREDIT, since the last War, and the Peace of 1764.

Our public debts having near trebled since Mr Phipps wrote, the judicious reader will duly apply the same, in conjunction with what that gentleman has observed: certain it is, that the weight of our additional taxes has enhanced the prices of every thing taxed, in proportion thereto. See our Articles DUTIES and LABOUR, and BONDING AT THE CUSTOM-HOUSE.

This increase of paper circulation, of which is before spoken, in a degree proportionate to the augmentation of our national debts and taxes, 'tis to be feared may occasion such an exorbitant rise in the price of our English manufactures in general, that foreigners will not be in a condition to purchase them of us: and if we cannot sell our wares, how shall we be able to purchase those of foreigners? if once this proves to be our case, what will become of the REVENUE OF CUSTOMS? When we are unable to send our English manufactures, what will also become of the REVENUE OF EXCISE, when the greatest part of our manufacturing people is rendered incapable to purchase EXCISEABLE COMMODITIES? Instead of these revenues producing any degree of a SINKING FUND for the gradual discharge of our PRINCIPAL MONEY PUBLIC DEBT, how shall we raise the interest? Flatter ourselves as much as we will, there must assuredly be a NE PLUS ULTRA

to our FUNDING AND BORROWING, or at length we must become a bankrupt nation, if we continue to increase our paper circulation more and more. Will not this at last enable our competitors in trade to beat us out of all the markets in the world; and then what chance shall we have to beat them with the sword, when the national wealth is exhausted, and we have not but paper to circulate, which we can never realize on the greatest exigency?

P A R, in affairs of commerce, signifies any two things equal in value: and, in the exchange of money with foreign countries, the person to whom the bill is payable is supposed to receive the same value as was paid the drawer by the remitter; but this is not always the case with relation to the intrinsic value of the coins of different countries, which is owing to the fluctuation in the prices of exchange amongst the several European countries and the great trading cities. In order to judge of the intrinsic par of foreign coins for mercantile uses, see the articles COIN and EXCHANGE; for the use that may be made of this knowledge, also in a national light, see the article BALANCE OF TRADE.

Besides the intrinsic par of exchange, there is another par, which, with no less propriety, we may distinguish by the extrinsic par of exchange. For the nature, uses, and private advantages that may be made by this skill in the exchanges, see the articles ARBITRATION OF EXCHANGE, and also the capital trading cities of Europe, under the articles of their respective provinces, &c.

PARAGUAY, a province of South America, is bounded by the country of the Amazons on the north, by Brazil on the east, by Patagonia on the south, and by Peru and Chili on the west, lying between 12 and 37 degrees of south latitude, and between 50 and 75 degrees of west longitude, being 1500 miles in length from north to south, and almost as much in breadth. Some make it's extent far more considerable, but they are thought to exaggerate the matter. Some geographers make it to comprehend the several provinces or districts following, 1. Paraguay, properly so called. 2. Chaco, or Tucuman. 3. Rio de la Plata. 4. Guayra, Parana, Urvaig, and, according to others, the captainric del Rey in Brazil.

If so, the extent is so considerable, that it must be supposed to have a variety of climates, soils, products, and inhabitants, the particulars whereof shall be given under the heads of each province above-mentioned.—To avoid needless repetitions, we shall first give a general account of the whole. The land is, generally speaking, very rich and fruitful, producing plenty of wheat, and other European grain, some vines, but chiefly abounds in sugar-canes; and has whole woods of peaches, almonds, figs, &c. It is at present so well stocked with all sorts of cattle, small and large, that they run in a manner wild. The Portuguese in the Brazils kill them in great numbers only for their hides and suet, and let the flesh rot on the ground. [See PORTUGUESE AMERICA]. The natives eat their flesh, but half raw. In some parts they are obliged to destroy their calves, to prevent their growing too numerous, through the richness of their pasture. They have also great plenty and variety of other beasts, wild and tame horses and mules in such prodigious quantities, that the former run wild every where, and of the latter they supply Peru with 50,000 per ann. according to some, besides what they send elsewhere, and keep for their own use.

Mines of iron and copper have been discovered in many parts of Paraguay, besides some rich ones of gold and silver, and of the finest amethysts.

PARAGUAY PROPER, so called, is the most northern of all, and nearest to Brazil, being bounded by that on the north, on the east by the province of Guayra, on the south by those of Rio de la Plata and Parana, and on the west by that of Chaco or Tucuman. But on the west and north, geographers do not seem to be acquainted with it's boundaries. Paraguay Proper is divided into two equal parts almost, eastern and western, by the river of it's name, which runs through the midst of it from north to south.

This river hath it's spring-head in the southern part of the country of the Amazons, a little above the territories of the Xarayes, which lie from latitude 16 to 20 south, and longitude west, spread themselves from 50 to 55, and beyond, and are said to abound with mines of gold and silver. In it's course from north to south, it forms a large lake, called the Laguna de los Xarayes, from which it enters into the province of Paraguay Proper, where it waters the towns of Porto de la Candelaria, and the city of Assumption, the capital, whence it runs into the territory of Rio de la Plata. The chief rivers it receives are, Rio de los Payaguas, Botetes, Jacarii, Taraiti, Guacuri, Pilai, Tabati, Peribibus, Salado, Araguaig, Cunagba, Tibiquari, Japfur, Piscomay, Parana, and Vermejo; and after having received these two last into it's stream, it then assumes the name of Rio de la Plata, near the town of Corrientes. (De Lisle.) According to the observations made by the jesuits, anno 1702 and 1703, which are the latest and the best that ever were made; this river is found to spring from the mountains of Potosi in Peru, of which we shall speak in it's proper place. Father Techo reckons it one of the greatest rivers in America, and gives it a course

a course of 300 leagues before it falls into the Parana; and adds, that it is navigable about 200 when joined to it. Father Jepp, who was there ann. 1691, says, that silver was then cheaper than iron, and that a common two penny knife would fetch a crown, a two shilling hat, ten or twelve crowns, a gutt of ten or twelve shillings thirty crowns, and so of the rest. As to the healthiness of the climate, though we can say nothing to contradict it, yet most of our accounts tell us, the natives are far from enjoying the benefit of it; which is chiefly owing to their gorging themselves with such prodigious quantities of half raw flesh, as fills them with worms and other crudities, that turn at length into dangerous diseases.

The missionaries in those parts where the natives are converted, take care to sow great tracks of land with wheat, that they may have plenty of white bread, not only for themselves, but to impart to the natives, who living mostly on their Indian corn, are so fond of this, that they will give two or three horses for a white loaf. They likewise take care to cultivate their vines, that they may not want wine to their music and good cheer; and we are told, that they have so many of them, as yield 500 casks of it in a year, if not spoiled by the pismires, which are here very numerous, or by the wasps and bees, or blighted by the north-winds; for in this case it will make that liquor so dear, that a cask will cost twenty or thirty crowns, and after all cannot be preserved from turning sour, without a great mixture of lime. They have plenty of roots and herbs, and the only thing they want is oil to their salads, instead of which they are forced to use honey and fugar. Silver is so plenty among them, that old shoes and hats are much more valued, and an ell of linnen bath fetched four or five crowns: whereas iron is so scarce that a horseshoe and a bit for a bridle has been exchanged for several horses.

The chief towns in Paraguay Proper and Chagua, lie in the following order:

1. Assumption. 2. Villa Rica. 3. Maracaju. 4. Arcacia. 5. Ypane. 6. Sant Ignatio. 7. Nost. Sign. de la Fé. 8. Xeres, Conception Antiqua.

ASSUMPTION town, the metropolis of Paraguay, stands on the eastern banks of the river of it's name, a little above the place where the Picomago falls into it, having Villa Rica on the north, and that of La Plata on the south, and about seven or eight leagues from each. It was built by the Spaniards anno 1538 (De Laet, Rogers) and is famed for its healthy and advantageous situation, as well as for the number of it's inhabitants. The territory about it is exceeding rich and fruitful, produces plenty and variety of fruits, not only of those which are natural to the country, but of those which have been transplanted thither from Spain; and the air is there so temperate, that the trees are clothed with a constant delightful verdure.

There are likewise very noble and rich pastures, in it's neighbourhood around, on which are bred vast herds of cattle; so that there is such an extraordinary plenty of all provisions in the town, as makes the natives, blacks and others, ambitious of living in it.

VILLA RICA, or the RICH TOWN, stands near the same eastern banks of the Paraguay, about eight leagues (some say much farther) north of that of Assumption, on a small river of no great note.

Those called PUERTO DE LA CANDELARIA, and NOPA SENHORA DE FE, are the two most distant towns northward from the metropolis abovementioned, and have nothing worth notice except their fruitful territories.

II. The province of TUCUMAN, is bounded on the north partly by that called De los Chicas, in Peru, and partly by that of Chaco; and on the south partly by that of Cayo, and partly by the territory of the Pampas; on the east by Paraguay Proper, and Rio de la Plata; and on the west by the imperial bishopric of St Jago in Chili, and by the south end of the Chica's; extending itself from Rio Vermejo, which parts it from Chaco on the north, to that called Rio Quarto, which divides it from Cayo on the south, almost 10 degrees, that is, from the 24th to the 34th of south latitude; and from east to west, where broadest, that is, from the river Salado to the ridge De la Cordillera, which parts it from Chili, almost 7 degrees, that is, from 62 to 69 $\frac{1}{2}$ of west longitude: so that it lies for the most part in a very temperate and healthy climate; and though it hath no mines discovered of either gold or silver, yet it's territory is both rich and well cultivated, especially towards the government of Chili; but it hath some desert cantons towards the Magellanic side. The climate is moderately hot, being all within the temperate zone, and their summer begins about the 10th of our September, and ends about the 9th of March.

The soil is of a sandy nature, and almost without stones, which makes it very inconvenient for building; but the land is very well watered not only with some large rivers, but also with plenty of small ones, brooks, and variety of springs and lakes; all which are commonly bordered with gardens, orchards, vines, and groves, which yield a noble prospect, and delightful shade and verdure. The country between those rivers produces plenty of cotton, wax, honey, pastel,

which they use for dyeing, besides variety of fruits, roots, Indian wheat, &c. They likewise breed up vast quantities of cattle, large and small, with great plenty of deer, and other game, fowl wild and tame, especially partridges in great quantities, and a great variety of other fowl.

This country, which is commonly called Traplanda, and, by the inhabitants of the government of Chili, the province De la Sal, is computed to extend about 300 leagues in length, from north to south, and about 150 in breadth, where broadest, but varies as it runs more towards the south, where it ends somewhat in the figure of a cone. It is inhabited chiefly by three savage nations, viz. the Tucumans, from whom the whole district is called, the Jurios, and Diaguites, the last of which employ themselves in feeding of cattle, especially sheep, the wool of which is manufactured and dyed by them, and a great commerce is made of it through this whole province. These sheep are very large and strong, though their wool is fine, and the inhabitants use them likewise for carriage, as we do here our horses. The inhabitants are clothed with their woollen and cotton manufactures, which they dye of several colours with their pastel, and other ingredients.

The chief places in Tucuman are, 1. San Jago del Estero. 2. San Salvador, al Xuxui. 3. San Miguel. 4. Salta, or Lerma. 5. Londres. 6. Cordova. 7. Esteco, al N. S. de Talavera. 8. Rioja. 9. Putupas. 10. Soto la Punta. 11. Capo de San Luis. 12. De los Santos.

SAN JAGO DEL ESTERO, the metropolis of this province, and an episcopal see, is situated on the banks of the Dolce, or Sweet River, which is here pretty large and navigable, being able to carry large vessels, and affords plenty and variety of fish: the town, however, is not very considerable, it consisting but of about 300 houses, some say 500 families, and is without walls, ditch, or any other defence. The inhabitants are mostly of the Masticho and Mulatto kind, of dark yellow complexions, lazy, and sickly, occasioned by the heat of the climate, and more given to pleasure than to any traffic or work. The country about it is rich, and produces plenty of wheat, rice, barley, fruits of all sorts, particularly figs and raisins.

SAN SALVADOR, or XUXUI, stands near the confines of Peru, at the foot of a high mountain, which forms part of the famed ridge called the Andes. It has a considerable river running by it, a little above the place where it falls into the Leon, from which both descend into the Rio Vermejo, or Red River. This town has about 300 houses, and is the most northerly of all this province, and within a degree of the southern tropic, about 83 leagues from Potosi.

SAN MIGUEL, al ST MICHAEL, the first town the Spaniards founded in this country, is pleasantly situated on a fertile plain, and near the banks of a small river, which falls into the Rio Dolce, near San Jago, from which it is distant about 18 leagues to the north-west. Mr Baudrand, who calls it S. Michael de Estero, says it is the capital of Tucuman, and a bishop's see, under the metropolitan of La Plata. The plain on which it stands is fertile, producing plenty of wheat, rye, barley, grass, &c. so that it breeds great quantities of cattle, produces cotton, flax, some wine, and great abundance of wood for all uses. The air is reckoned one of the sweetest and healthiest in all Paraguay, and the country well inhabited, and stored with all conveniences of life.

SALTA stands on a small river, which soon after falls into a neighbouring lake, and is at some small distance south-east from San Salvador, and east from the burning mountain of Capia-po, and about 15 leagues from Estero, and hath a bridge over the river. It is inhabited mostly by Spaniards, to whom both it and the territory about it belongs, and hath about 400 houses, and five or six churches or monasteries. It hath neither walls, ditches, nor any other defence but it's inhabitants, who are about 500 men that bear arms, besides their slaves, negroes, as well as Mulattoes, which may amount to about thrice that number. Salta is a place of great resort, on account of the quantity of corn, meal, wine, cattle, salt meat, and such other commodities, which are sent hence into Peru, and other parts. Martiniere.

LONDRES, situate near a great marsh of it's name, caused by a small river which comes down from the Andes, and falls into it, was built by Tarita, governor of this province, ann. 1555, in order to keep the natives in awe, and called it Londres, in compliment to our queen Mary, then married to king Philip of Spain. (Wood Rogers.) It stands near the frontiers of Chili, in latitude 29. 12 south.

CORDOVA, situate about 100 leagues south of San Jago del Estero, and 160 north-west-ward of Buenos-Ayres, is a considerable town in this province, but situate on a marshy, though a rich and fertile ground, and bigger than Buenos-Ayres. It stands in latitude 31. 30. south longitude, 63. 30. west, in a temperate climate and healthy, with equal winter and summer, and all the territory about it full of cattle, both great and small, and abounding with excellent pasture. It all produces plenty of corn, fruits, and other necessities, and hath several plentiful salt-pits; so that the town drives a considerable trade in those commodities with Peru, it being situate on the road to Buenos Ayres. The inhabitants are Spaniards, and amount to about 300, who are mostly employed in tilling the

the ground, and manufacturing of cotton cloth, which they send to Potosi.

- II. RIO DE LA PLATA, so called from the famed river of that name, along whose banks it extends itself on each side about 200 leagues in length, from north to south, and about 100 leagues, where broadest, from east to west; is bounded on the north by the provinces of Chaco, Paraguay Proper, and Parana; on the east by that of Urvaig; on the south by the territory of Pampas; and on the west by Tucuman. We must, however, remind our readers, that the limits of these provinces are far from certain or agreed on, especially those between this province and Tucuman, there being no boundaries fixed between them, because the whole country is plain and champaign, without mountains or hills, or even so much as a tree, house, or hut, by which they might be terminated.

However, the climate is here moderate and healthy, and pretty far in the temperate zone, the country extending itself from the 32d, to almost the 37th degree of south latitude. Their winter is in May, June, and July, when the nights are indeed very cold, but the days moderately warm; the frost is neither violent or lasting, and the snows very inconsiderable.

The river De La Plata receives several considerable ones in its course, so that it swells at some times to such a degree, as to cover a great deal of land on each side, which, upon the abating of the water, is found to be much the fatter by them. At such seasons, the natives betake themselves to their canoes, wherein they put their families and goods till the inundation abates, and then return to their old habitations. (Rogers.) The stream of it into the sea is so strong and rapid, that it sweetens it for a great way. The water of it is said to be very clear, and excellent for the lungs and wind, inasmuch that the people who live near it are said to have very clear and melodious voices, and to be generally inclined to music. (Covaglie.) Our author adds, that it petrifies the branches of the trees that fall into it, and that vessels are naturally formed of it's sand, which are of various figures, look as if they were polished by art, and keep the water cool. It likewise abounds with such plenty and variety of fish, that the people catch it in great quantities, without any other instrument than their hands, and all along the banks are seen the most beautiful birds of all kinds. (Sepp.) The plains about it are likewise affirmed to be so large and even, without any obstruction to the sight, that the sun seems to rise and set in them. It's course, from the confluence of those two rivers that forms it, to it's mouth, is above 200 leagues: it runs mostly to the south and south-east, and is navigable all the way by the largest vessels, and full of delightful islands. Among the large rivers that fall into it on both sides, those called the Rio Vermejo, or Crimson River, the Rio Dolce, or Salado, the Caracal, and some others, flow into it on the west, and the celebrated one of Urvaica, and some others on the east side: so that, upon the whole, this famed river may, in all probability, be the greatest in the world for breadth and continued depth, though perhaps that of the Amazons, Quebec, and some others, may equal or even excel it in length of course.

As the country on both sides this river is very plain and extensive, so their way of travelling is easy and pleasant, viz. by high carts covered with hoops and ox-hides, and with conveniences for travellers to sleep in; which is so much the more convenient, because they travel mostly in the night, to avoid the excessive heat.

The product of this province is much the same with that of the others, that is, all sorts of European and American fruits, both of wheat, cotton, sugar, honey, &c. but the most wonderful increase in this country is that of the cattle of all kinds. For the plains here extending themselves near, if not more, than 200 leagues, and abounding with such an excellent pasture, the beasts brought hither from Spain have multiplied to such a degree, that they are all in common, no man claiming any property to them, but every man taking what he hath occasion for.

The number of black cattle especially, is here so prodigious, that they kill many thousands of them merely for their hides, every time the ships go for Spain, and leave their carcasses to be devoured by beasts and birds of prey, which are here likewise very numerous: sometimes, when they cannot vend their hides, they will kill them for their tongues, and those that care not to be at the trouble of fetching them from the plains, may buy them for a shilling or two.

Those likewise that make use of their milks, either for food or drink, may go into those pastures, and milk as many cows as they will, or carry off as many of their calves, and kill them for their food, they being all at the mercy of the first comer, and no man claiming more property to them than another. Horses are no less numerous and cheap, and in common like the other cattle; so that they may be had likewise for fetching, in what quantities a man pleases; and of those that are already broke, one may buy some of the best, and of the true Spanish breed, fit for service, for a piece of eight per head; and it is confidently affirmed, if our author's accounts are not greatly exaggerated, that the Spaniards can

bring 30,000 horse into the field, all of Indians, well mounted, disciplined, and accoutred. (Sepp.)

Game fowl is here in no less plenty; and the partridges, which are as large and tame as our hens, are in such vast quantity, that one may kill them with a stick. Their wheat makes the finest and whitest of bread; and, in a word, they seem to want for nothing here, especially the natives, but salt and fuel: the former the Spaniards have brought to them from other parts, and the latter they supply with planting of vast groves of almond, peach, and other trees, which require no other trouble than putting the kernels into the ground, and by the next year, we are told, they begin to bear fruit. The return for European goods is so prodigious, that it almost exceeds belief, inasmuch that an ordinary two-penny knife, or pair of scissors, will fetch a crown, a gun of 10 or 12 shillings value, 20 or 30 crowns, and so of the rest, down to old hats, shoes, needles, &c.

The chief towns in this province are, 1. Buenos-Ayres, 2. Santa Fé, 3. Corrientes, 4. Santa Luisa; and 5. Chanas, besides several others of less note.

The town of BUENOS-AYRES is so called from it's pleasant and healthy situation, it being seated under the 34th degree of south latitude, upon a rising ground, at about 50 leagues from the mouth of the Rio de la Plata, and upon the south side of it, that river being here 7 leagues in breadth, and navigable by any ship 60 leagues above the town, and no farther, by reason of a great cataract.

The territory about it, which is of a vast extent, is very fertile in fruits of all sorts, and pasture grounds covered with vast quantities of cattle; and would be still more so; if duly cultivated, especially in corn, but the people there are lazy, and content themselves with what nature produces, without labour. It bore formerly very excellent vineyards, from which they made some sorts of exquisite wines, besides the vast quantity of grapes they dried for use: but they were destroyed by the pismires, which chanced one year to appear in such swarms, that they eat them all up, root and branch, so that they were forced to pluck them up.

SANTA FE is the next Spanish establishment in this province to that of Buenos Ayres, to which it is distant about 70 leagues to the north-west, in latitude 31. 40. south: it stands on the mouth of a river, which falls into that of La Plata, and on the south-west side of this latter. All the territory not only about it, but quite down to Buenos-Ayres, on each side of that river, is very rich in all productions, and vastly delightful. The town is built of brick, and encompassed with the small river-avementioned, and was built by the Spaniards for the defence of both that of de la Plata, and of the rich gold and silver mines which are in the neighbourhood of this settlement, though the Spaniards do not care to open them, lest that should encourage some of their enemies to come and take them from them. (Coreal, Rogers.)

CORRIENTES, or CORIENTES, is the next in course up the river, and stands about 80 leagues higher, being built by the Spaniards, on the confluence of the Parana and Paraguay, but is small and inconsiderable, and no ways answering the dignity of it's situation between those two famed rivers.

IV. The province of PARANA, so called from the great river of it's name beforementioned, and which is it's boundary on the south and east, where it divides it from those of Rio de la Plata, last described, and Urvaica; on the north it joins to that of Guayra, and the unknown islands of Brazil; and Paraguay Proper on the west. It's extent, as far as it is well known, that is, conquered and converted, is computed about 200 miles, all that is beyond being unknown to us as yet, and the breadth about 115 leagues, more or less according as it's limits wind more in or out.

The Parana hath it's spring-head in some of the unknown tracks of southern Brazil, and holds it's course from north-east to south-west, in which it crosses, and waters the provinces of Guayra and Urvaica, as well as this of Parana. It's longest course, exclusive of it's windings, is computed at 300 leagues, before it joins it's waves with those of the Paraguay, near the town of Corrientes, lately mentioned, on the most northern verge of Rio de la Plata, last described.

The towns belonging to this district did lie on the Parana, in the following order, San Ignacio, on the west side of it, about 30 leagues above the place where it joins with the Paraguay; Itapoa, or the Incarnation, about 16 leagues higher on the same side; Corpus, about 20 leagues higher on the east side; Mondais, on a river of it's name, near its fall into the Parana on the west; Santa Maria d'Ignazu, on it's confluence with it on the east, and now lying in ruins; Acarai, overagainst it, on the west side; Jovara, on the river of it's name, where it falls into this on the west; and Paquiri, on another of it's name, overagainst it. We know very little of these towns, except their situation, and much less of those of Loreto and San Ignacio, on the Cucapa and Yuti, which lie more remote from the river, and of that of St Anne, on the lake of Apupan.

V. The Province of GUAYRA, is bounded on the north by the unknown tracks of Brazil, and the nations of the Tupiques; on the east by the captainric of St Vincent, in the same

fame country, and partly by the Northern Ocean; on the south it hath the province of Urvaica, and part of that of Parana; and on the west the remainder of the same province, from which it is divided by the river of that name: it's extent, from east to west, is computed about 150 leagues, and about 140 from north to south; it's boundaries towards Brazil are uncertain.

The tropic of Capricorn cuts it almost into two equal parts, so that it's climate must of course be very hot, though moist, by reason of the vast dews and rains, so that it is very fruitful in provisions, as well as diseases; inasmuch that some represented it as a fitter habitation for wild beasts than human creatures: and yet we are told that it was pretty well peopled at the first coming of the Spaniards.

It is watered by several rivers, which fall into the Parapaná, which last defends from the southern mountains of Brazil, and is of a considerable bigness before it falls into the Parana. The chief of those that fall into the Parana, are the Tibaxiva, Pirapus, and Itangua, besides some others of less note. Both sides of those rivers are covered with several sorts of trees, the most valuable of which among the natives are the cedars, which are very numerous, and so tall and large, that they make vessels of one single trunk, which will carry 20 oars. Others produce excellent fruits, and some of them yield a good kind of balsam.

VI. The province of URUICA, commonly called URVAIG, and URVAIGA, is bounded by that of Guayra, last described, on the north; on the south by the mouth of Rio de la Plata; on the east by the captainric Del Rey; and on the west by the province of Parana, from which it is parted by the river of that name. It extends itself from 25 to 33. 20. of south latitude; the length of it, from north-east to south-west, being computed somewhat above 210 leagues, and the breadth of it, from east to west, about 130 where broadest, but much narrower in other parts. It is divided into two parts, viz. east and west, by the river of it's name, which rises out of a small spring in the country called Ibiturua, near the mountains of South Brazil, and runs quite through the midst of it, from north to south: some Geographers gave it the name of the river of the Missions, but it is very small and inconsiderable during a course of several score of miles, 'till it comes to receive divers others into it's stream, which swell it so far, that it becomes at length almost equal to that of Paraguay, and falls into the Rio de la Plata, almost overagainst the town of Buenos-Ayres.

In it's course, upon leaving the mountains of Brazil, and through the territory of Ibiturua, it's stream runs mostly south-west, after which it winds more to the south, and runs almost parallel with the Parana. It's stream runs near 200 leagues from it's source, with a prodigious noise, occasioned by huge rocks and stones, which lie in it at certain distances, and make it incapable of carrying ships of burthen; but, in winter, the vast floods and streams that pour down into it, make it look more like a sea, and overflow a great deal of land on each side. After a course of about 200 leagues, it begins to enlarge it's stream, and flows more gently and smoothly about as many more, the whole course of it being computed about 400 leagues.

Captain Woods Rogers, who calls this large river Uruguay, adds, on the authority of Father Sepp, that it hath a prodigious cataract, which he looks upon as an obstacle appointed by divine providence, to preserve the poor natives from the avarice and cruelty of the Spaniards, who are thereby prevented from proceeding farther up, and settling themselves in those rich cantons. He observes, that these Indians are very harmless and ignorant, and not only fall into the vices of the Spaniards, but likewise under their heavy yoke; for it seems they make no difference between converts and idolaters, but use all with the like tyranny, and as if they were no better than brutes. The plains formerly were full of ostriches, lions, several sorts of goats and deer, but at present all that vast extent of land on both sides of the river Urvaig is turned into pasture grounds, covered with an infinite number of cattle, especially cows and horses, which run wild upon them.

CAPITANIA DEL REY, or the ROYAL CAPTAINRIC. This district is by some joined with the captainrics of Brazil, and by others made a province of Paraguay: it extends itself along the eastern coast of the latter, quite from the captainric of St Vincent, from which it is divided by the river of St Francis quite to the mouth of the Rio de la Plata, that is, from 26 to 35 degrees of latitude, extending itself, from north-east to south-west, the length of 10 degrees, and about four in breadth, where broadest. It has no places of any note, nor indeed any river worth describing, except that of the Holy Ghost, and that called Rio de Martin de Souza; the former of these is also called Rio Grande, and it's mouth Barra de Rio Grande de Alagoa, and Puerto de San Pedro; it is formed by the two rivers of Tibiquari and Igat, both which have their course near the mountains of Ibiturua, but by a different course, the one directly southward, of above 100 leagues, and the other south-westward, of above 160; during which, each of them receives several others; they unite their streams at last, in the territory called Terra dos Patos, and thence taking a turn south-westward, and parallel to the

sea-coast, form a slip of land of about five leagues in breadth, and 50 in length, and empty themselves into the Northern Ocean, at the barra abovementioned, and is from the confluence of those two rivers to this place that it hath the name of Santo Spiritu, or St Esprit; the other, called Rio de Martin de Souza, springs from the mountains in the country of Tape, and runs directly southward into the same ocean, about 60 leagues from the bar, or mouth, of the Holy Ghost. The country is poorly inhabited, either by natives or Portuguese, the latter having formerly made such havock of the former, that those that were left were glad to retire farther into Paraguay, to avoid their cruelty.

REMARKS.

The Jesuits of Paraguay having been so daring as to oppose, with an armed force, a new regulation of limits agreed upon in America, between the crowns of Spain and Portugal, as appears by late accounts from Madrid, it may seem surprizing how those reverend fathers should resist the orders of such good friends to them as the Spanish and Portuguese governments are, and much more so, that they should be able to resist them effectually: therefore, we doubt not but the following account, extracted from the best authors, will be acceptable to such as are strangers to the empire which the Jesuits have founded in that country.

The settlement made by the Jesuits upon the river Paraguay in America, is extremely remarkable. These good fathers, every where indefatigable in improving their apostolical talents, and turning the souls of men into ecclesiastical traffic and power, began there by drawing together, into one fixed habitation, about 50 families of wandering Indians, whom they had persuaded to take their word implicitly for whatever they told them: for this is what they call conversion, and is, indeed, the true art of making Papists, who have no other ground for their faith but the assertions of their priests.

From this beginning, and such encouragement, these holy fathers ranging the country, and dazzling the stupid savages with their shining beads, charming them with their pious tales and grimaces, and their tuneful devotions, made such a harvest of converts, as to form a commonwealth, or rather an empire of souls: for every convert is a subject most blindly obedient.

The holy fathers, not 50 in number, are thus sovereigns of a noble country, larger than some kingdoms, and better peopled. It is divided into several large districts, each of them governed by a single Jesuit, who is, as it were, a provincial prince, but more powerful and revered, and better obeyed, than any European, or even any eastern monarch.

His word is not only a law, but even an oracle; his nod infers supreme command: he is absolute lord of life, and death, and property, may inflict capital punishment for the lightest offence, and is more dreaded, and therefore more obeyed, than the Deity. His ministers and officers, civil and military, are doomed by him to the meanest punishments, and whipped, not only like common slaves, but like common felons: nor is this all their punishment, at least all their abasement, which, to a man of spirit, is the worst punishment: while they are yet marked and mangled with the lash, they run (colonels and captains run) and kneel before their holy sovereign, condemn themselves for having incurred his pious displeasure, and, humbly kissing his reverend sleeve, thank him for the fatherly honour he has done them, in correcting them like dogs.

So much tameness and vassalage is part, and an important article, of their conversion: they pretend to be even pleased with their state of bondage, and care not what they do and suffer here, for the mighty treasures of joy and liberty which are infused to them hereafter by the good father, who gives them all that he has to give in the next world, and, by way of barter and commands, takes all that they have in the present.

The poor Indians cultivate the ground, dig and plow, and reap and sow; they make stuffs, and other manufactures; they rear fowls, they breed cattle, they carry burthens, and slavishly labour above-ground, as well as under it, where, in sweat and darkness, and in peril of perishing, they drudge in the mines: yet, with all this industry, they earn nothing for themselves: all their earnings, all the profit and advantages appertain not to them, but solely to their Popish priests, their spiritual sovereigns, who rewards them to the full with what cost them nothing, blessings and masses, and distant prospects, whicy they leave to God, while they tyrannize over them like devils upon earth. Their grain and manufactures are all carried into their priests' warehouses, their cattle and fowls into their yards, their gold and silver into their treasury: they dare not wear a rag of their own spinning, nor taste a grain of their own sowing, nor a bit of meat of their own feeding, nor touch the metal of their own producing; no not so much as an egg from the hens they rear: they themselves are fed and subsisted from day to day, by a limited allowance, furnished them by the appointment, and at the mercy of their great lord, a worthless and imperious priest.

Yet, under all these discouragements, they are diligent and laborious to the last degree, and vie with one another for the high price and distinction bestowed by the father upon such

as excel most in their work and industry, even the bewitching honour of kissing his sleeve. The second commandment in their table of duties is, To fear the Jesuit, and to obey him; as the two next are much akin to it, and of the like tendency, even to study humility, and to condemn all worldly goods, in order to enrich the priest. The precept of fearing God seems to be prefixed for form, and in policy only, since it is impossible there should be any knowledge of God where the exercise of reason is not known nor permitted; nor can God be said to be regarded by those who use the images of God like beasts.

All these stores and warehouses, so much grain, so much gold and silver, so many commodities, from so fine, so large and so plentiful a country, abounding in mines, in rivers, and meadows full of horses and sheep and black cattle, of timber and fruit-trees, of flax and indigo, hemp and cotton, sugar, drugs, and medicinal herbs, as we have seen, must enable these good fathers, who have renounced all wealth, and the world itself, to carry on an infinite and most lucrative trade, in which, though they have vowed poverty, they are extremely active, and consequently must make that Jesuitical government a most powerful one.

It hath advantages which no other government ever had, an absolute independency upon its people and their purses, the whole wealth of the country in their present possession, the people absolutely submissive, and resigned to their good pleasure, and all its calls; no factions; not a malecontent; an army of 60,000 men, all tame and tractable, devoted to blind obedience, commanded in chief by Jesuits, and obstinately averse to be commanded by any other generals; a vast revenue of many millions; no trouble in taxing, nor any time lost in collecting taxes, the people being moulded by their priests to throw all their property at their feet. Behold, Britons, and tremble at the shocking effects of Popery!

Such a government, whilst it proceeds upon the same principle, is unchangeable. No wonder these Jesuits are extremely jealous and tender, not only in keeping the poor natives slaves to ignorance and bigotry, in order to keep them vassals to themselves; but in concealing so much empire and wealth from all the world, especially from Spain, from whence they were sent, at the expence of that crown, to convert the Indians, and make them subject to the Spanish monarchy.

The good fathers are so far from meaning any such thing, that they not only carefully avoid teaching them the Spanish tongue, but press it upon them, as a point of conscience, not to converse with the Spaniards. If any Spaniard happens to come amongst them (a thing which the Jesuits are so far from encouraging, that they care not to see it) he is indeed civilly used, but carefully confined within the walls of their holy citadel, the presbytery: or if, by earnest intreaty, he obtains leave to walk through the town, he is closely guarded by a Jesuit at his side, and sees not a native in the streets; for they are ordered to shut themselves up, and fasten their doors, upon any such occasion.

Besides, these vigilant fathers keep five or six thousand men, employed in several detachments (apostolic troops) to watch and scour the frontiers, in order to cut off all intercourse with the neighbouring countries, not yet subjected to these pious fathers of the church. Towards one of their frontiers particularly, lest the rich mines in it might invite a settlement from abroad, they have destroyed all the houses, in order to discourage any such settlement. For these self-denying friars, who are sworn to poverty, have an ardent zeal to secure all these wealthy mines to themselves for religious purposes, as they impiously pretend.

These poor-rich humble sovereign missionaries, as they are masters of such immense wealth, all consecrated to their own use, that is, to the use of religion, make a proper display of it. The churches are spacious, magnificent in their structure, and set off with all pomp and decorations, grand porticoes and colonnades, rich altars, adorned with basso relievo, pictures in frames of massy gold, and saints of solid silver, the foot and sides covered with cloth of gold, and the pedestals with plates of gold; the tabernacle made of gold; the pyx, or box for the sacrament, of gold, set round with emeralds and other costly jewels; the vessels and candlesticks made of gold; the whole, when illuminated, making a shew almost beyond belief. A proper bait for the eyes of the poor deluded natives, who, by such fine sights, and the pious mountebank attending them, are retained in due awe and wonder.

The princely persons of the poor Jesuits are suitably lodged in a spacious palace, containing grand apartments, furnished with many pictures and images, with proper lodgings for their train of officers and domestics; the quadrangles and gardens all in proportion; the whole court making a square of some miles. And the numerous opulent warehouses, belonging to these holy disinterested men, are their property, arising out of the industry and labour of the poor people.

Such is the situation, such the state and inimitable authority of every Jesuit in Paraguay. There are but forty odd of these monks in all that great track of country, and in it they have above a million of souls, not only to obey them, but to worship them; nor do these, their sightless and abject slaves,

know any other god: for where the true God is ever so little known, no man will worship friars, who always paint him as like themselves, as they themselves are, in reality, unlike him.

REMARKS in another Light, before the last War, on our article PARAGUAY.

The climate and soil of Buenos-Ayres has been thought so inviting, that some have suggested extraordinary advantages would arise to Great-Britain by a settlement to be made here in time of war; and, indeed, as we have been so many years very roughly treated by the Spaniards, in our West-India commerce, we should cast about in times of peace for every place, the taking of which in time of war, might prove beneficial to us, and injurious to the Spaniards, in order to bring them to reason by force, if we cannot do so by other measures.

Would it not be the highest act of benevolence, would it not be acting according to the pure and uncorrupt spirit of Christianity, to relieve such a country from the oppression and tyranny of Popish priestcraft?

There runs a noble highway from Buenos-Ayres to the province of Los Charcos, in which and Potosi, the most considerable mines are found; and as this province is the southernmost of the whole kingdom of Peru, so consequently all South America may be supplied with goods or merchandize of all kinds they want this way, infinitely cheaper than any other.

The reason why the Spaniards do not make use of it for this purpose, shall be given hereafter. But we think it not amiss, to give our reader here an account how all South America has been supplied with European commodities.

In the first place, the goods that come from England are shipped at Cadiz aboard the galleons, which carry them to Porto Bello, where they are unloaded, and sent over-land on mules backs to Panama, and there re-shipped on board ships in the South-Sea, and carried to Callao, and from thence dispersed over-land again to the several provinces of that vast continent; from whence, it is plain, the charges of exportation exceed the prime cost of the goods four or five times.

Whereas, by Buenos-Ayres the charges would be inconsiderable, in comparison with the usual way: for the journey from hence to Peru, is made with much ease in sixty days; and for horses or mules for the carriages, no country in the world is so plentifully stocked with them as this, for all Peru is supplied with these animals from hence: and throughout the whole journey they pass not in the least danger of any hostile Indians, for the province of Tucuman, through which they pass, hath enjoyed a perfect tranquillity from the first planting of it by the Spaniards, excepting about Salta, which borders upon the valley of Calchaqui, from whence they used to be plagued by the Chileans; and for which reason the requas or caravan of mules, which use this trade, never come near it.

They meet likewise upon this road at every forty or fifty leagues with good towns, as Cordova, St. Jago de Lestro, St. Michael de Tucuman, Esfeco, Xuxio, Omagoaca, Sochoa, and others, and single plantations dispersed up and down the country, which make the way both pleasant and commodious.

The intelligent reader will consider the vast differences betwixt the way now in use, and that to supply this part of Spanish America by the way of Buenos-Ayres, by casting his eyes upon the maps to help him to form a true judgment upon the matter: he ought, at the same time, to remember the inconveniences, as well as charge in entering all the goods at Cadiz in Spanish names, to prevent confiscation, before they can be put on board the galleons, and the many hazards they are exposed to in embarking and re-embarking so often; besides the land-carriage very often of several hundred leagues before they come to their intended market, which makes them so excessive dear, that what costs one hundred pounds at Cadiz, must of necessity be sold for near a thousand, to recompence the merchant, in any tolerable degree, for the charges and risque he hath run, as well as the long time he must be out of his money.

Whereas, by this way of Buenos-Ayres, when the goods can be carried thither in English bottoms, if what cost one hundred pounds in England, be only sold at market for 250 l. the merchant will gain considerably more by it, and be able to have three returns in the time he made one the other way. And it is certain, upon so considerable a fall of those goods they stand in so much need of, the consumption of them will be much augmented; for our stuffs and cloths are so unreasonably dear, for the reasons already mentioned, that the poorer sort, and even the trading people, make use of Quito cloth for their wearing apparel, and only the better sort use English cloths and stuffs. But if we could ever be able to settle our trade effectually this way, we should utterly ruin the manufacture at Quito in a few years.

Though much more might be said on this head, yet for the sake of brevity we omit it: we have said enough to those who are competent judges. This is an article of great importance to England. If we were once settled here securely (which

(which if we can ever be persuaded to undertake heartily, I do not in the least doubt may be easily effected in time of war, and our possessions securely maintained) we should be able, in despite both of French and Spaniards, to enjoy a more lucrative trade than ever with South America. For, Buenos-Ayres, and the country depending on it, afford several commodities that Peru cannot be without: in the first place, all the mules and horses that are used in the presidency of Los Charcos, where they have so great occasion for them in carrying first the ore, and afterwards the silver, from place to place, come from hence; and they would have much to do to subsist at Potosi, was it not for the great quantity of dried cow's flesh that is brought from Buenos-Ayres hither, which the ordinary people subsist upon.

It is not to be imagined how dear provisions of all kinds are at the mines; and it is worth taking notice of, that all countries in the world that afford gold or silver in any plenty, are destitute of all other conveniences, and very unhealthy, Chili only excepted.

But what is yet of more importance than all the before-mentioned commodities, is the herb of Paraguay, that is only to be found in the country adjacent, and depending upon the government of Buenos-Ayres; a thing of that mighty consequence to Peru and Chili, that without it they would find it impossible to dig any silver ore out of the mines: for those poor wretches, negroes and Indians, that are employed in working in them, are almost every hour suffocated with mineral vapours, which they meet with in those vast subterranean caverns; and then nothing will recover them but a liquor, made by infusing this herb in warm water, sweetened with sugar, and drank plentifully, which restores them to their former vigour.

Sometimes, when the case is very bad, and the slaves almost dead before they can be brought into the fresh air, they use it for an emetic, which is done by making the infusion stronger, and leaving out the sugar, which clears the stomach of the offensive matter, and saves their lives, where every thing else is found ineffectual.

The inhabitants that live on the surface are likewise extremely plagued by these mineral exhalations, and their bodies dried, or rather parched up to that degree, that if it was not for this same remedy, or liquor, which they are all day sipping, there would be no living near the mines. And with all the care they can take, without doubt their lives are shortened extremely; but what is not avarice capable of doing? In a word, without this herb the mines would be of little or no use, and the province of Los Charcos very thinly inhabited. This herb is gathered in the country of Paraguay, near the city of Assumption, which is situated upon the river of Plate, about one hundred leagues above Buenos-Ayres, and there made into packs, and sent down the river to Santa Fé, a small village about eighty leagues above Buenos-Ayres, and depending upon that government; where the merchants from Chili and Peru come to buy it, and load it upon mules, and convey it to their respective cities.

This village of Santa Fé, is the only pass by which it can go to Peru; for people must not imagine that one can pick and chuse which way they will go in those countries, as they can in Europe; it is very providential they have that one good road through so large a country, so sparingly inhabited. But suppose they could do this, it would be to little purpose; for if ever we become possessed of Buenos-Ayres, we must likewise fortify Santa Fé, which at present contains not many houses, without any great fortification, and take Assumption, and settle it with a colony of our own.

This city is said to contain about 1000 families, but is no better defended than the other.

It was settled by people that had, by their laziness and ill management, out-run their fortunes in Peru; and, to this day, serves for a retreat to all such people as can live no where else in the Indies.

The country round it affords every thing necessary for life, even in too great abundance, for which reason the inhabitants are exceeding lazy, and utterly neglect commerce, spending their time in feasting and playing on the guitar.

They have very little money stirring amongst them, bartering one thing for another like the Indians. This herb serves to procure them cloathing from Buenos-Ayres, as well as all other European goods they want: in short, the country is much too good for its worthless inhabitants, and it's much more worthless priests. We desire our readers to observe, that all the places we have described, as Buenos-Ayres, Santa Fé, and Assumption, are situated upon the same river; and though the distance between them at first seems to be very considerable, yet their having a direct and easy communication by water, makes the passage more convenient than fifty miles by land would be.

It is very obvious, therefore, to every common eye, that if we can ever settle ourselves at Buenos-Ayres, the Spaniards will be under an absolute necessity to open a trade with us; nay, it is in our power to impose what terms we please upon them; but if we had no other way to obtain it, than the affording our goods as cheap again as they can furnish themselves with the other way, even that, with a little patience,

would infallibly produce it. But without trusting to that, we should have them in a manner at our mercy, by having the herb of Paraguay in our hands.

But we have still another lure for the Spaniards, as powerful and as proper to produce the desired effect, as any yet mentioned; which is, the supplying them with negroes in sufficient number, and cheaper than formerly.

This is the great inconveniency, which the Spaniards have laboured under this last age; for having in a manner utterly destroyed the natural inhabitants, they are obliged now to perform the work by negroes, of which they could never get the number they wanted; and it is certain, if they were fully supplied, they would get yearly above twice the quantity of silver they now do.

It must be confessed they used all means imaginable to obtain them. The Genoese undertook to supply them at a concerted price betwixt them, for which end they formed a company called the Asiento, who had their factors at Jamaica, Curacao, and Brazil; and let it be considered what a prodigious tour they made before they got to the mines; first from Guinea to Jamaica, from thence to Porto Bello, and then to Panama, where they were re-shipped on board the fleet when returning to Callao; which is a voyage of four months at least, for they have the wind in their teeth every league of this voyage. After staying some little time at this last mentioned port, they were put on ship-board again, and sent to Africa, which is a voyage of a month, or thereabouts; and when landed, they can't have less than 150 miles to the mines: from whence it is obvious, that not above one negro in three arrived at Potosi, or the adjacent mines, of those that were originally bought by their factors for that end. Whereas, the negroes that might be sent from Buenos-Ayres (as was done by the late Asiento contract, vested in the South-Sea company) would be liable to none of the inconveniences that the other poor wretches suffered, as passing through so many different unhealthy climates, and so many tedious voyages by sea, enough to wear out bodies of steel, especially considering how the miserable creatures are accommodated all the time both with lodging and diet: but this way, they would have but one short voyage by sea; for, from the coast of Guinea to Buenos-Ayres, they would sail four parts in five of the voyage before the wind; and when landed, pass through one of the most plentiful and healthiest countries in the world, even in a manner to the mine's mouth: so that one may venture to affirm, that with careful management, they would not lose one in ten. This article alone is of prodigious consequence, and capable to render our African trade infinitely more flourishing than it is at present; for a cargo, rightly sorted for Guinea, consists of fourscore different commodities at least, of which seventy are of the manufactures and produce of this country; and they return us gold, slaves, ivory, and wood for dyeing.

There is another capital article of commerce in Buenos-Ayres, which should not be omitted; which is that of hides: though this article sounds meanly, after so many great ones already mentioned; yet, when better examined, will be found of no small consequence. Monsieur Acarete du Biscay, the Spanish historian, says, when he first arrived there, he found riding in the port twenty-two Dutch ships, who had on board, one with another, 14000 hides each; and he computes the hides to be worth, in Europe, no more than twenty-five shillings a-piece (which is far from the case at present): and he further says, that if there had been fifty ships, they might have had the like loading; this therefore is no despicable article. This happened when Oliver had declared war against Spain, which had put such a stop to the trade betwixt Cadiz and America, that the inhabitants were obliged to trade with the Dutch, or want all sorts of European goods; for, by the law of Spain, this was capital, and the governor, notwithstanding the necessity, was some small time after sent, for this very thing, a prisoner to Spain, and all he had was seized for the king's use.

The court of Spain suffers but two ships to go yearly from Cadiz to this colony; and there is not a little striving, who shall be the people concerned in them; for they gain above double what the merchants do that send their goods in the galleons, and have their returns in much less time.

The Spanish ministers of state have been very often strongly solicited to bring home all the treasures of Peru and Chili this way, and utterly forsake that of Porto Bello, as apparently more exposed to all enemies, especially since they have lost Jamaica. The court was very much inclined to this advice, as being sensible of the truth of the allegations, by many sorrowful experiences in the wars they have had both with the Dutch and us; but upon scanning this proposal more deliberately, they rejected it, because they plainly perceived, if they should abandon the usual way, a great many cities, and tracks of land, that were then in a flourishing condition, would, in a short time, become desolate, because they absolutely depend upon the passage of the silver, and other merchandizes of Peru and Chili, either through or near them; by which means the other nations of Europe, that have not such choice of countries to settle, would seize upon them, and become

become nearer neighbours to the Spaniards than their true interest will allow of.

It must be confessed, that the Spaniards, upon this occasion, made a true judgment upon the matter in debate. But if any nation in war with them, should seize upon Porto Bello, and think that way to distress them by hindering them from bringing home the silver of Peru, they would find themselves extremely deceived, and laughed at by the Spaniards, who would very readily change the course of it this way; and when the war was over, re-settle it again if they saw occasion. I cannot help taking notice here, of a great many people, who, at the beginning of the late war, were full to the brim with the notion of taking Porto Bello and Panama, as if they thought to imprison the silver in the mines; for, by their politics, the Spaniards were neither to have negroes to work them, or a passage to bring it to Europe. I have lost too much time in mentioning such a weak ineffectual project, if it was not in every body's mouth almost that pretends to speak of this matter. Nor is this mentioned to depreciate the merit of the worthy, upright, and public-spirited admiral, who has always laboured to do his country all services in his power.

If my countrymen have this at heart, as one would think there should be little reason to doubt of, let them turn their thoughts upon Buenos-Ayres or Chili; but the first is by much to be preferred, for many reasons: for a voyage to Chili and back again, cannot take up less time than twenty months, and a ship must pass through as stormy and tempestuous a sea as any in the world; whereas to the river of Plate will not take up half the time, and in all probability will meet with little or no bad weather in the whole voyage. Secondly, the viceroy of Peru will not be able to disturb you at Buenos Ayres, before you probably will have received a second supply or reinforcement, but not so with Chili. Thirdly, we are more certain of procuring a trade with Peru from hence than from Chili, because of the several commodities that Buenos-Ayres, and the country adjacent afford, which Peru stands in absolute need of, and can no way dispense without them: there are yet many more reasons, and, in my opinion, very cogent ones, which, for brevity's sake, I omit.

When this acquisition is once made, you need never fear procuring inhabitants, for there will be more occasion for the bride than the spur; the certain prospect of being enriched, the plenty and healthiness of the country, will be such incitement to people impoverished by want of trade and Popish slavery, that the country would infallibly abound with inhabitants on a sudden.

But there ought to be better order observed in settling this country, than that we have hitherto practised in our other colonies in America; for it is the greatest wonder in the world they ever arrived to any perfection: and, indeed, it was in a great measure owing to our civil wars, which made many wealthy people fly thither with their substance. This was the occasion of the hasty growth of those of Barbadoes and Virginia; indeed New England and Pennsylvania, owe their rise to the sectaries.

It hath both angered and grieved me, to observe in our contiguous colonies upon the continent, this want of foresight; for I am very sure if one was attacked by an enemy, the governor of the next, though ever so well disposed, would find it the hardest matter imaginable to get 500 men together to march to the relief of his neighbour, though they were sure their own turn would be the next. This is but a small instance to what I can give, if I thought it proper. But it is to be hoped, this will soon be effectually remedied by the authority of a British parliament; for we see at this time, what insult the colony of Virginia has lately suffered by the French. See the articles BRITISH AMERICA and NORTH CAROLINA.

In the peopling Buenos-Ayres, if ever it should become the British possession, I advise my country to follow the Turkish policy, and make the people hold their land by the same tenure as their Timariote; only it should descend to their heirs, upon keeping or observing the original contract: which is, to be ready to come completely armed to the appointed rendezvous, and serve wherever, and as long as the government requires. The number of acres that might be then allowed for every soldier, must be settled after some years observation. Another thing that must be remembered, is, never to grant too great a tract of land to one man; for this is the greatest hindrance to the peopling a colony that can be, and is the very disease that some of our plantations are sick of, as Carolina, New York, and the Jerseys; neither is Virginia or Maryland free from this distemper, which is occasioned by rascals taking up the land, because the free rent is little or nothing, and hardly ever paid, in hopes to sell it dear to new comers; though in the mean time they neither stock the ground, or any other way make it useful to the public. This very thing hath done several of our plantations incredible damages, by forcing people away who came to settle in them. See the article BRITISH AMERICA, PLANTATIONS.

Buenos-Ayres will allow of these, and yet more restrictions, if it is found necessary; for here they enter upon the Spanish

improvements without any of their labour, and will have so many other advantageous ways of growing rich, by the situation and proper commodities of the country, that it may justly be reckoned a favour to be permitted to settle here, and to have reasonable tracks of land granted them upon equitable conditions.

This country will, in a very few years, have funds of its own, without any ways oppressing the inhabitants, more than sufficient to defray the charges of the government; as a small duty upon negroes brought hither for the Spaniards, the like upon exported hides, and a very considerable one upon the herb of Paraguay, which will render it one of the least chargeable, and yet one of the most important, colonies the crown of Great-Britain ever had.

That this place might have been as easily taken at the commencement of the late war, [in 1740] as Porto Bello, is little to be doubted; and it's consequence to Great-Britain, had we possessed it no longer than during the continuance of the war, would have been of so great importance to our trade, as to have in a great measure re-imburshed the nation the expence of the war; for by this channel, we might have thrown immense quantities of the British manufactures into Peru: and if the circumstances of affairs had obliged us to part with this place for the sake of peace, should we not have been able to have made far better terms with the Spaniards, than we did by giving up only the paltry island of Ratan? Before we had parted with Buenos-Ayres, might we not have compelled the court of Spain to have ratified and confirmed to us by treaty, our RIGHT TO THE LOGWOOD TRADE, AND TO A FREE AND UNINTERRUPTED NAVIGATION TO OUR OWN PLANTATIONS? If for the sake of the Dutch and our East-India trade, the court of Great-Britain should have judged it eligible to have given up CAPE BRETON, there would have been no reason to have parted with Buenos-Ayres, or any other important place we might have taken from Spain, till we had made our own terms with that court, and obtained at least those rights which engaged us in the war. See the articles WEST-INDIES and LOGWOOD.

REMARKS ON OUR ARTICLE PARAGUAY SINCE THE LAST WAR, AND THE DEFINITIVE TREATY OF 1763.

By the treatment, it is not only rumoured, but really credited at the time of writing this, our British logwood cutters have met with in violation of the late treaty of peace, it looks as if the Spaniards had no sincere intention to adhere to the terms and conditions of peace. Should this prove the case, and we should be obliged to come to a fresh rupture with Spain, the fulness of time seems then to be come to compel us to put an end to the Spanish power in America: And as we are now very happily situated, by virtue of the last treaty, to deprive them of their MEXICAN TREASURES, [see MEXICO] why not also of their PERUVIAN? And Buenos-Ayres, down the river La Plate, being the receptacle of a part of the treasures from PERU, why should this be unthought of longer? Why should not at length a partition of the richest parts of SPANISH AMERICA take effect, either to prefer BRITISH ALLIES, and in that manner satisfy them for contributing after a successful war, in conjunction with England, to humble Spain once for all?

Jesuitism having met with a great blow lately in Europe, their great place of refuge will certainly be amongst their fraternity in Paraguay. What they lose in Europe, therefore, they may gain in Spanish America; and while their dominion shall encrease so near to a fountain of Spanish Peruvian riches, the more difficult it will be to extirpate them. But on a future Spanish war, 'tis to be hoped, England and her Protestant allies will be induced to get a footing as near to PERU, as Great-Britain is at present to MEXICO, and then we may laugh at the Spaniards for ever after, for any injury they will ever after be able to do to this kingdom or her allies. See our articles AMERICA, BRITISH AMERICA, FRENCH AMERICA, FLORIDA, MEXICO, PERU.

PARAYBA. The captainric of Parayba in Brazil, belonging to the king of Portugal, is so called from the river of it's name, lies between that of Rio Grande and that of Tamerac or Itamarika on the south, having the ocean on the east, and the Figueares on the west. It's extent from north to south, that is, from Rio de San Juan de Stau to Capo Blanco, is about 35 leagues; that is, from 5 deg. 50 min. of latitude to 7 deg. 40 min. but as to it's depth into the inland parts we can affirm nothing.

The country is watered by two considerable rivers, viz. the Parayba abovementioned, and San Domingo al Monogoapa; the former of which lies under 6 deg. 24 min. south latitude, four leagues from Capo Blanco, and discharges itself by two mouths into the ocean, being separated by a large sand-bank. This river, though very shallow in summer, doth swell so high in winter, that it overflows all the adjacent low lands, and often carries off numbers of men and cattle. The other which lies farther north, is said to be larger towards it's source than at the mouth; between those two lies the bay called Ponto

Ponto de Lucena, between which and Cabo Ledo is a bay, which affords a safe station to the largest ships.

This country did formerly belong to the French, who were dispossessed of it by the Portuguese anno 1584, who built in it a large city of its name, together with some other towns and villages, and made some considerable plantations of sugar-canes, and erected a number of sugar-mills on the rivers above-named.

The whole territory is fertile, not only in that commodity, but likewise abounds with the Brazil wood, cattle, hides, tobacco, cotton, the roots maniok, ayri, roucou, &c. and much used by the natives, who are called Pettigoues, and are at perpetual war with their next neighbours the Figureas.

The city of PARAYBA, is situate at the mouth of the river of that name, and on the south bank of it about three leagues from the main ocean. The river is navigable up to it, and a ship may carry without any danger, 6 or 700 barrels of sugar. The country along the river is pretty low, plain, and rich, but at some distance from it, it begins to raise itself gradually into fertile hills and dales, which yield a delightful verdure and product; but the flat country being much the richer, is divided into various cantons under their several names, all which being fertilized by the overflowing of the river above-mentioned, produce plenty of barley, sugar, Indian wheat, potatoes, ananas, cocoa-nuts, melons, citrons, oranges, bananas, pakanas, and other necessaries of life. The hills are no less fertile in good pasture, and the cattle that feed upon them, are in great numbers, inasmuch that their very hides amount to a considerable income.

PARCHMENT, in matters of traffic, is made of sheep or goats-skin, prepared after a peculiar manner, which renders it proper for several uses, particularly for writing on and covering of books, &c.

Parchment is begun by the skinner, and ended by the parchment-maker. It constitutes a very considerable article in commerce.

MANUFACTURE OF PARCHMENT.

The skin having been stripped of its wool, and passed the lime-pit after the manner of leather [see LEATHER], the skinner stretches it on a kind of frame, consisting of four pieces of wood, mortified into each other at the four angles, and perforated lengthways from distance to distance, which holes are furnished with wooden-pins that may be turned at pleasure, like those of a violin.

To stretch the skin on this frame, they make little holes all around it, and through every two holes draw a little skewer; to this skewer they tie a piece of small packthread, and tie that over the pins; so that, coming to turn the pins equally, the skin is strained tight every way, like that of a drum.

The skin being thus sufficiently stretched on the frame, the flesh is pared off with a sharp instrument for that purpose; this done, it is moistened with a rag, and a kind of white stone or chalk reduced to a fine dust, strewn over it; then with a large pumice stone, flat at bottom, much after the manner of a muller for grinding colours, they rub over the skin, as if about to grind the chalk, and thus scour off the remains of the flesh. Then they go over it again with the iron instrument; again moisten it as before, and again rub it with the pumice-stone, without any chalk underneath; this smoothenes and softens the flesh-side very considerably. They drain it again, by passing it over the iron instrument as before. The flesh-side thus drained, they pass the iron on the wool or hair-side, then stretch it tight on the frame by means of the pins, and go over the flesh-side again with the iron: this finishes it's draining; and the more the skin is drained, the whiter it ever becomes.

They now throw on more chalk, sweeping it over with a piece of lamb-skin that has the wool on; this smoothenes it still further, and gives it a white down or nap. It is now left to dry, and when dried, taken off the frame, by cutting it all round.

The skin, thus far prepared by the skinner, is taken out of his hands by the parchment-maker; who first scrapes or pares it dry on the summer, with an iron instrument like that above-mentioned, only finer and sharper; with this, worked with the arm from top to bottom of the skin, he takes away about one half of it's thickness. The skin thus equally pared on both sides, they pass the pumice-stone over them, to smoothen it. This last preparation is performed on a kind of form or bench covered with a sack stuffed with flocks, and leaves the parchment in a condition for writing on.

The paring the skin dry on the summer, is the most difficult preparation in the process; for which reason the skinner seldom dare meddle with it, but usually leave it to those more experienced in it: the summer whereon it is performed, is a calf-skin well stretched on a frame, serving as a support to the skin, which is fastened a-top of it with a wooden instrument that has a notch cut in it. Lastly, that the iron-knife may pass the easier between the summer and the skin to be pared, they put another skin, which they call the counter-summer. The parings thus taken off the leather, are used in making glue, fize, &c. What is called vellum, is only parchment made of the skins of abortive calves, or at least of sucking calves; it is finer, whiter, and smoother, than the common

parchment, but it is prepared in the same manner as that, abating that it is not passed through the lime-pit.

PARLIAMENT, a grand assembly of the three estates of the kingdom, viz. lords spiritual, lords temporal, and commons, summoned to meet the king, to consult of matters relating to the common-weal, and to enact and repeal laws.

'Till the Conquest, the great council, consisting only of the great men of the kingdom, was called magnatum conventus, and prælatorum procerumque concilium. The Saxons called it Wittinagemote, or an assembly of wise men.

After the Conquest, about the beginning of the reign of king Edward I. some say in the time of Henry I. it was first called parlementum, from the French parler, to speak; though it still only consisted of the barons, or great men of the nation, 'till in the reign of Henry III. according to some, the commons were also called to sit in parliament, the first writs sent out to summon them, bearing date 49 Henry III. anno 1217, though Sir Walter Raleigh thinks, the commons were first called in the 17th of Henry I. and Dr Heylin fixes the time of their first admission to the reign of Henry II.

Sir Edward Coke, Dodderide, Prynne, and others, have shewn, that the commons of England had ever a share in the legislature, and a place in the great assemblies; though not on the present footing, as making a distinct house, and as composed of knights, citizens, and burghesses.

Parliaments are to be summoned, prorogued, and dissolved by the king alone; nor can a parliament begin without the king's presence, or his commissioners. At first new parliaments were called every year, by degrees their term grew longer. In the time of king Charles II. they were held a long time, with great interruptions between. Both which methods were found of so ill consequences, that in the beginning of the reign of king William, an act was passed, whereby the term of all parliaments was restrained to three sessions, or three years, hence called the triennial act. Since that, from other views, the period of parliaments is again, 3 Geo. I. lengthened to seven years.

A parliament is called by the king's writ or letter, directed to each lord, commanding them to appear; and by other writs directed to the sheriffs of each county, to summon the people to elect two knights for each county, and one or two burghesses for each borough, &c.

Anciently all the people had votes at the elections; 'till it was enacted by Henry VI. that none but freeholders residing in the county, and who had a yearly revenue of 40 s. should be admitted to vote; nor were any to be elected that were under 21 years of age.

That the members might attend in parliament with more freedom, they and all their menial servants, were privileged from all arrests, attachments, imprisonments, &c. for debts, trespasses, &c. but not from arrests for treason, felony, and breach of peace.

The place where the parliament meets, is wherever the king pleases; of late it has been in the palace of Westminster; the lords and commons each in a distinct apartment. In the lords house, the princes of the blood are placed in distinct seats; the great officers of state, dukes, &c. and bishops on benches; and the viscounts and barons on others across the house, all according to their order of creation, place, &c.

The commons sit promiscuously, only the speaker has a chair at the upper end, and the clerk and his assistants at a table near him. Before any matters be done, all the members of the house of commons take the oaths, and subscribe their opinions against transubstantiation, &c. which test, the lords too, though they do not take the oaths, are obliged to take.

The house of lords is the sovereign court of justice of the realm, and the dernier resort; the house of commons is the grand inquest, but no court of justice like the lords.

Any member may move to have a bill brought in for any thing; which, upon a question put, being agreed to by the majority, that person, with others, are ordered to prepare and bring in the same. When ready, a time is appointed for reading: after reading it by the clerk, the speaker reads the abstract thereof, and puts the question; Whether or no it shall have a second reading? After a second reading, the question is, Whether or no it shall be committed? Which is either to a committee of the whole house, if it be of importance, or to a private committee?

The committee appointed, and a chairman chosen, the chairman reads the bill, paragraph by paragraph, puts every clause to the question, fills up blanks, and makes amendments, according to the opinion of the majority. The bill thus gone through, the chairman makes his report at the side-bar of the house, reads all the additions and amendments, &c. and moves for leave to bring up the report to the table; which granted, he delivers it to the clerk, who reads the amendments, &c.

The speaker then puts the question, Whether they shall be read a second time? and, if agreed to, reads them himself. To so many as the house acquiesces in, the question is now put, Whether the bill thus amended, shall be engrossed, the speaker holds it in his hand, and asks if it shall pass? If the majority be for it, the clerk writes on it, soit baillie aux seigneurs,

feigneurs. Or in the house of lords, soit baillie aux communes.—If a bill be rejected, it cannot be any more proposed during that session.

Forty members constitute a house of commons, and eight a committee. A member of the commons, to speak, stands up, uncovered, and directs his speech to the speaker of the house of commons only. In the lords house they vote, beginning at the puisne or lowest baron, and so up orderly to the highest, every one answering apart, content or not content. In the house of commons they vote by yea's and nay's; and, if it be dubious which is the greater number, the house divides. If the question be about bringing any thing into the house, the ay's go out; if it be about any thing the house already has, the no's go out. In all divisions the speaker appoints four tellers, two of each opinion. In a committee of the whole house they divide by changing sides, the ay's taking the right, the no's the left of the chair, and then there are but two tellers. If a bill pass one house, and the other demur to it, a conference is demanded in the Painted Chamber, where certain members are deputed from each house; and here the lords sitting covered, the commons standing bare, the case is debated. If they disagree, the affair is null; if they agree, this, with the other bills that have passed both houses, is brought down to the kings, in the house of lords, who comes thither clothed in the royal robes, and with the crown on; before whom the clerk of the parliament reads the title of each bill, and as he reads, the clerk of the crown pronounces the royal assent or dissent.

The names of counties, cities, corporations, borough-towns, and stewarts, in Great-Britain, with the number of knights, commissioners of shires, citizens, and burgesses, chosen in each to serve in parliament.

unskilful pedagogue. The care of Cato, in the education of his son, is never to be enough commended. He would by no means suffer his own wife to wash and bathe him, or to swathe and dress him, unless himself was present, to oversee and assist her. He had in his family one Chylo, a grammarian, a man well enough versed in learning, as a domestic tutor to his son in that branch; yet he thought it an indignity to have a servant reproach and domineer over him, or give him correction when faulty.—When he was fit to be instructed in literature, and in the laws and customs of his country, the father himself would have the sole care of him. None but he must teach him, even to sling the javelin, to go through the whole exercise at arms, to understand horsemanship, with the manner of fighting in close combat, the art of swimming, and all other achievements, by which youth are inured to the bearing the extremes of heat and cold.

It is also said, that Cato wrote a history for the use of his son, to bring him acquainted with the exploits of his ancestors, and with the art of presiding with glory in the affairs of the state. Whenever his son was present, the father would never suffer any obscene conversation, or let slip any expression, that favoured of rashness and anger, or of vice or folly; being as cautious, as if a vestal virgin was present. Such was the behaviour of the great Cato, and such in the general the good conduct of all the Romans, in the education of their children! Among the several nations and republics of Greece, there was the same care used in the training up their youth. These were the great masters and teachers of that useful knowledge, which shews us the way how to live happily in a private station, and in what manner communities of men are to be best governed. It is the general wish, that the governors of our literary institutions would be more careful to instruct youth in the art of living well, than the art of controversy, and infill into them only the grand branches of knowledge truly serviceable to the state, instead of the jargon of wrangling, and the little friskish arts of sporting with words. Were this the case, we should see their scholars become more useful representatives of the people, and promoters of the welfare of the kingdom.

The old academies of Greece were the seminaries of their republics; out of which, as out of the Trojan horse, came their best kings, and most renowned generals and governors. Alexander and Scipio, two of the greatest commanders that ever lived, with others too numerous to be recounted, had their first rise in glory from the Grecian institutions for literature: and in the same way should all those be trained, who may be expected from their birth and fortune to be placed in any distinguished station, and more especially the senatorial one. Hence it comes to be a national concern; and it is certainly the duty of every government to have public schools and colleges, so well ordered, that they may be as nurseries, out of which the state may be furnished with persons endowed with all the virtues and good accomplishments, that can adorn human nature.

In the progress towards the complete education of a person of this character, he should from his youth be well instructed in the art of speaking, both properly and gracefully; for without this talent, though he may think and judge ever so justly, yet if he is incapable of expressing himself with a becoming and masterly elocution, that the assembly may thoroughly understand his sentiments, the assembly cannot receive the benefit of his judgment, nor can such a one have the satisfaction to observe that regard paid to his understanding which he merits. At his first setting out in his enquiry after truth, there are three arts requisite to be acquired, grammar, logic, and rhetoric. For these are the portals to the palace, wherein true wisdom resides. From these are to be learned the rules of debating and conversing, which must be confirmed and improved by use and exercise, and by reading and imitating the works of the most intelligible and purest writers. When the student has made a proficiency thus far, let him not content himself with these trite and ordinary attainments; but let him grasp at higher improvements; let him enter into philosophy, and take a view of the system of the universe; and then let him look into the life, actions, and ways of men, to see how families are ordered, and in what manner cities and Commonwealths are established and governed. In the former of these enquiries, Natural Philosophy, Metaphysics, and Mathematics are our chief guides: in the latter, Moral Philosophy, Policy, and Economy. Both these sorts of philosophy have but one and the same end in view, by enabling us the better to exercise our intellectual faculties to the best purposes: they differ in this particular indeed; the one of them is consistent with a life of ease and leisure, whilst the other is conversant with business, and always in a state of activity. Hence it is that happiness is either private or public. They who repose their happiness in an active life, in the exercise of all the virtues, are always to be esteemed the most beneficial members of the Commonwealth; for every good thing, by being communicated to many, gains so much greater addition to its intrinsic worth; the felicity, which diffuses itself to multitudes, is certainly preferable to that mere contracted happiness, which centers within the individual. Yet a life of speculation is first in order, and more honourable, that pre-

ceding practice, and giving life and dignity to the noblest actions.

But since the good senator's happiness, and all his knowledge and wisdom, are conversant with a life of activity and public business; and he ought to be one who knows how to measure his actions by the rule of integrity and right reason, who is qualified to manage affairs both private and public, and who understands how to govern a city by wise counsel, how to secure a constitution by wholesome laws, and reform it by a due execution of justice; it follows, that he ought to make himself acquainted with that part of philosophy which prescribes the precepts of virtue, which are the limits of human actions, and contain the whole science of behaving well in a national administration. How shall he be able to set a senate right, in the fundamental duties of justice, prudence, and fortitude? Or, how shall he appease a multitude, or quell a sedition, disperse, or expound laws, who is ignorant of the principles of justice and prudence? Can such a one be able, wisely to give his advice about a war or a peace, a league or a treaty, who knows not when a war is just or otherwise, a peace honourable or the contrary, and a league dangerous or well made, and fit to be kept sacred and inviolable? The substance of this knowledge is not to be obtained, but by studying the most approved authors in moral philosophy, policy, and economy. For out of these treasures we may make a collection of all the virtues, and of all the arts of government.

There is another sort of learning likewise, not less necessary to the accomplishment of this character, by which we are brought acquainted with the most remarkable sayings and exploits of the great and wise, who have lived before our times. These are to be met with in the monuments of faithful annalists and historians. These, according to Tully, are the witnesses and evidences of past times, the torch-bearers and guides of truth, human nature's remembrancers, the leaders and conductors of our actions, and the messengers and envoys sent to us by our forefathers.

To this stock of knowledge, many additions are to be made, before the British senator can be thoroughly qualified. He must be well acquainted with the customs of his own country, the manners of his countrymen, their way of living, their disposition, and their sentiments concerning the present posture of affairs, and all the remarkable occurrences of public life. Besides this, he must be sure to make himself master of that truly useful and necessary knowledge, which completes the character of a wise statesman. He must be well acquainted with the true nature of war and peace, what quarrels his people are engaged in, what leagues and treaties subsist between them and their neighbours, as also between other potentates; what taxes, duties, and customs are already imposed, or may be necessary in future, and whether they are as wisely regulated, as they ought to be, consistent with the interest of commerce and the liberties of a free people: what the rights of the subject are, and what the proceedings of the ministry: in what manner the laws are executed; what are the discontents or differences among the people, and how they are to be allayed and pacified; what is the present state of morality: how the youth of his country are educated and employed: what principles, customs, and rules of conformity are necessary to be introduced, in order to reform and moralize a people; and what is the present state of religion.

Nor should the good senator be ignorant of what passes among the allies and confederates of his own country; what are their rights and demands: he must, in a word, be acquainted with all the reasons and ends of government, understand the customs and usages of his people, the proceedings of all courts of judicature, and all public assemblies. Nor should he be a stranger to the examples and characters of all about him, and to the desires and expectations of his fellow subjects. A good counsellor, says Anthony, is such a one, who well understands, and always adheres to, whatever may contribute to the establishment and welfare of a state, or increase its happiness. Such counsellors and senators were the Lentuli, the Gracchi, the Metelli, the Scipios and the Lælii of Old Rome. But in these our times, such examples are uncommon enough: we often see men crowding for honours and offices, and becoming candidates for the senatorial dignity, without the necessary qualifications of knowledge, wisdom, and experience.

If, here and there, a candidate of an exalted character appears in public, yet, perhaps, his only recommendation is a single campaign, or the services of one year, or a little smattering of the law, or the greatness of his wealth, or the popular clamour of his dependants, and partizans; whilst he has a very slender acquaintance with what have been intimated. The knowledge of men and things, is the rise and foundation of all true wisdom, which can never be attained, but by a knowledge of these arts, and that sound policy which is the grand support of the state: without these, it is impossible for him to think, and speak, and act well or wisely.

For the perfecting of this character of wisdom and prudence, it may be necessary to become acquainted with the laws and customs of foreign countries. This sort of knowledge is attained by travel. The benefit to be made by which, arises from observing the manner and civilities of those abroad, and

and such of their rights and customs as are worthy our imitation; and from remarking their predominant follies and vices, which we must avoid. The laws of foreign nations, their jurisdiction, liberties, way and manner of living, their civil and military discipline, with the management of their domestic affairs, the situation of their country, their climate and soil, their public buildings, their ornaments and fortifications, deserve our notice. It may also be of use to know the real character of every prince, whose dominions we visit; to enquire what opinion the people have of him, and how they are affected towards his government. If there is a senate or great council, how are they chosen, and what are the people's sentiments of their conduct? In what manner is justice administered? What is the national genius of the country? What men they have eminent for their wisdom and learning, and what great generals? These are proper enquiries to be made by a judicious traveller: besides these, he should endeavour to make some useful and advantageous discoveries, in the commercial arts and sound polity, and bring them home, for the service of his own country upon emergencies. But great caution ought to be used not to introduce any strange custom into our country, lest we infect the people with the itch of novelty, and corrupt their minds with effeminacy; whereby they will be brought to forget the rigid virtues and plain honesty, with the good manners, wise laws and customs of their ancestors. For the populace are changeable enough, and nothing is more fatal to a government, than extraordinary innovations. If one who would qualify himself for this great office, has no opportunity of travelling, let him supply this defect by reading the most approved cosmographers, geographers, and historians: and let him be careful to store up such a stock of knowledge, as may preserve him from that childish behaviour, which is the effect of ignorance. In that part of philosophy, which treats of the more abstruse secrets of nature, he should not be entirely unskilful: but he may be very sparing of this sort of studies; to run too far into them is not compatible with a character of this kind. Wisdom has a boundless field to range in. The sciences must be cantoned out, since no single person can become master of them all. The compass of our knowledge may be comprehended under what is honest, pleasant and profitable. What is honest and pleasant, serves rather to make life agreeable, than to qualify us for the governor, court, the rostrum, or the tribunal; it serves us to retire to, and gives new strength and vigour to the understanding, by seasonably indulging in lawful ease and delicacy. This sort of philosophy may possibly do the public service, if its followers delight more in a life of public business, than to immerse themselves in cells and solitude.

There is, however, a retired sort of philosophy, which is of great use to the public. For we are not to look upon them as the only philosophers, who are qualified to direct the affairs of a state; since, besides those, there are others, to whose written labours, and immortal works, we are indebted for the remains and monuments of true wisdom and learning. And there is also a third sort, whose business it is to instruct those under their care in the rules of virtue, and in the art of government. These men certainly deserve well at our hands; because, by their leisure and retirement, we are instructed in business, and taught to come abroad with reputation and advantage. The Antients had many philosophers of this order: such were Theophrastus, Heraclides of Pontus, Dicaearchus, Socrates, and Pythagoras: it is remarkable, that the book which Dicaearchus wrote upon government, was, by a decree of the Spartan commonwealth, ordered to be read publicly once a year, and that all the youth should be assembled together to attend the lecture.

The great end of true philosophy, is to cultivate the mind, to plant in it the seeds of virtue, and not to grate or tickle the ears with wrangle and contention. All contumelious and passionate language, all noisy combats about words, seem unworthy of the name of true philosophy. All arts and sciences are not, properly speaking, virtues; they are only the instruments and ornaments, by which virtue is attained and perfected. There are various sects in philosophy, but these differences ought not to distract the mind of the wise and good senator.

When he hath made himself master of what has been spoke of, the attainment he is possessed of, will become conspicuous by eloquence, which is the ornament of wisdom. Where this is wanting, all his other accomplishments, let them be never so extensive, will insensibly dwindle into obscurity. The art of speaking nervously and elegantly, will enable a gentleman in this capacity, not only to maintain his own dignity, but to defend the rights and liberties of private persons, and the interest of the community. By this the minds of men, when raised to an undue ferment, are easily pacified: by this, where they are lulled and becalmed, they are easily put in agitation; and this has done more sure and fatal execution, than the sword or the spear. When the senator rises to speak, let him speak with all the force of reason and wisdom, and with all the graces and ornament of a chaste and manly eloquence, neither too verbose and diffusive, nor too laconic. Let his speech be well weighed, and yet seem to be

V o l. II.

extempore; let the dignity of pathetic action and gesture always accompany whatever he has to communicate.

Next to eloquence, let him endeavour to make himself a master of the civil law, the design of which, is to preserve an exact equality in the distribution of all things. For, who is so well qualified to decide the controversies of his countrymen, to suppress sedition, well and wisely to defend the laws of his own nation, or the rights of the people, as the man who is really a master of law and equity?

The house of a good and upright lawyer is the national oracle. But the lawyer who should be excluded from the senate, is the notorious brawler and tongue-pad. For this sort of creatures are of a low vulgar order, fervile and mercenary, capable of being the ministers of falshood and injustice: wretches, who bring their tongues and their minds well armed and instructed, into a court of justice, and employ them in the defence of wrong and oppression. It is hardly possible for that man to be a sincere lover of truth and equity, who will prostitute his eloquence, and let out his tongue to hire. On the other hand, it is part of the office and duty of the good senator, to preserve the proceedings of judicature from all corruptions of fraud and deceit; to become a voluntary accuser, and strenuous adversary of all wicked and traitorous subjects, and a no less zealous defender of the good and virtuous; being actuated by a just sense of his own high dignity, a love of justice, and affection for his fellow-subjects; such was the behaviour, and such the principles, of the wise and most noble Romans, that ever sat in their senate.

In the course and progress of all consultations, particular care must be taken, that every subject brought into debate, may be well weighed and thoroughly examined, in as nice, accurate, and judicious a manner, as human prudence, or human wit, can prescribe or devise. We may enumerate five different sorts of things, which are the proper subjects of public debate and consultation, viz. the raising of money by subsidies and taxations; the proclaiming of war, and the making of peace; the defence and safeguard of the realm; the balance of the imports and exports of trade and commerce, and the enacting of good and salutary laws.

If a consultation is to be held upon ways and means to raise money, a thorough enquiry must be made into the state of the duties and customs, and every branch of taxation, of which the public revenue consists; that if they are too small, they may be augmented; and if too great, diminished: for no new taxes ought to be imposed but upon urgent occasions; because all extraordinary impositions are grievous to the subject, and occasion civil disorders. When the emperor Tiberius was persuaded to lay a new tax upon the people, he readily answered, That a good shepherd had a right to the fleeces of his flock, but had none to slay and devour them. A complete knowledge in the finances of this kingdom is no easy acquisition; we do not mean a knowledge only of what money has been raised, and how it has been applied: all this is entering little into the heart of the matter; the specific funds, which have produced the revenue, should be enquired into as minutely as a gentleman of oeconomy would enquire into every branch of his estate; and not only the nett produce of the whole should be stated before the national financier, but the gross produce, that he may be able to judge accurately of the public expence in the collection of such revenue, what proportion that bears to the nett proceeds, and what incumbrance to the state, officers, and tax-gatherers, and all concerned in the revenue, really are to the kingdom. By which means, the wise senator will be enabled to judge, whether such annual revenue cannot be raised at a far less expence to the people, with less incumbrance to commerce and navigation, with greater advantage to the public credit, and with more glory and safeguard to the king and the nation.
