By this good law, the Rhodians endeavoured to obviate the abuses, which the avarice and dishonesty of men had, by reason of the deficiency of former statutes, found means to introduce into trade. And as here a sufficient remedy is appointed against the unjust denials and pretences, which in such cases were ordinarily made use of, so by the subsequent article, for avoiding all occasions of confusion and loss by the mariners, &c. persons carrying money aboard of ships are enjoined to deposit the same in the hands of the masters, who in that case are to be responsible for it, and not otherwise.

ARTICLE XIII.

Of money, &c. stolen at sea.

If a passenger embarking in a ship carry money, or any other thing along with him, let him deposit it in the hands of the master. And if (that not being done) he alleges, that he has lost either gold or silver, no notice shall be taken of what he says, further than this, that the master, mariners, and other passengers in the ship, shall be interrogated upon oath about it.

ILLUSTRATION.

This is much the same with the 13th article of the preceding section, only with this difference, that whereas in the former, no injunction is laid to put the master or mariners, &c. of any ship upon their oath in cases of this nature, that deficiency is here supplied, and all persons navigating in a ship, where any money or other valuable effects are missing, are obliged to declare upon oath, whether they know any thing concerning them.

ARTICLE XIV.

Of depositaries denying the receipt of what was left in their hands, and their punishment.

If a depositary denying upon oath, or by writing, the receipt of what was entrusted to him, be afterwards convicted by witnesses, or if the thing deposited be found in his custody, he shall restore twofold, and, besides that, shall be punished as one guilty of wilful perjury.

This needs no explication.

ARTICLE XV.

If merchants or passengers having other men's servants aboard a ship under their charge, or if the master, being entrusted with captives, touch at any city, port, or coast, and there, any person or persons going ashore, the ship happening whilst they are at land, to be pursued by robbers or pirates, and making the ordinary signal puts to sea, so that both the ship and the merchants and passengers goods are preserved, all the goods and effects of those that were left ashore shall be restored to them. And if any of them afterwards commence a suit against the master, for having left them ashore in a place infested with robbers, they shall recover nothing, because the master and mariners were obliged to fly from the pirates. But if a merchant or master leave another man's servant, who was under his charge in any place, he shall make restitution to his master.

ILLUSTRATION.

For the better understanding of the sense of this article, it seems necessary to observe, that as in most other things, so in war, the customs of the Ancients did very much differ from these of the present age; and that especially with regard to prisoners taken in war, who for the most part were made slaves; that is to say, remained in perpetual captivity. And though amongst the more civilized nations, some regard was had to their quality and station, those of the common sort were sold and disposed of, as are now the negroes, which we purchase in Guinea, and carry to the plantations in America. And in this sense is to be understood the captives and servants here spoken of, and supposed to be committed to the care of masters, merchants, or passengers, who by this law lie under an obligation of looking narrowly after them, that if by any accident they should happen to be left ashore, the persons under whose conduct they were left, should be answerable for them, and liable to make restitution either of the persons or value to the owners.

ARTICLE XVI.

Of money lent for naval interest, &c.

If masters or merchants borrow money for their voyages, the goods, freight, ships, and money being free, they shall not make use of suretyship, except there be some apparent danger, either of the sea, or of pirates. And for money so lent, the borrowers shall pay NAVAL INTEREST.

ILLUSTRATION.

By this law, merchants and mariners borrowing money to be laid out in their traffic by sea, seem to be enjoined to pay naval interest for it, which (as already observed) was much more considerable than that which was paid for money borrowed upon security at land, because the hazard was much greater: for, amongst the Rhodians, when money was lent upon naval interest, the risk was to the lender, who, in consideration of that, had a very considerable share of the profits arising from it: so that, upon the main, it was the lenders that traded with their own money, by the intermission of such seafaring persons as thought fit to follow that way of living, and who undoubtedly made a great profit for themselves with the money so borrowed, besides the share they were obliged to give the lenders for the use of their money, and for the dangers to which it was exposed.

ARTICLE XVII.

Of money lent in partnership.

If money is lent to a seafaring person by one in partnership with him, for the use of the partnership, and articles be drawn, either for one voyage, or for any longer time that the partnership is to last, if the person receiving the money doth not return it in the time agreed upon to the owner, and it afterwards happens to be lost, either by fire, robbery, or shipwreck, the lender shall bear no share in the loss, but shall receive his own in safety. But if before the expiration of the time appointed for the partnership, there happens any loss or damage at sea, the loss (as well as the gain) shall be divided between them both, according to the agreement made. This needs no illustration.

ARTICLE XVIII.

Of persons borrowing money upon security, and afterwards going abroad.

If any person borrowing money for a certain term, does afterwards go into a foreign country, the time agreed upon being expired, the loan shall be paid according to the law of suretyships. But if there be no way of getting satisfaction, and the money still remains in the hands of the borrower, he shall pay NAVAL INTEREST for all the time that he was absent.

ILLUSTRATION.

Some account has already been given of the difference that there was amongst the Rhodians, between the interest paid for money borrowed at land, and to be employed there, and that which was borrowed by sea-faring people, to be laid out in goods, and transported to foreign countries in the way of trade. We have likewise taken notice that, in the latter case, the lenders were allowed to receive much greater profits than in the former, because their risk was greater. Now the intent of this article is, only to command the like interest to be paid for money borrowed by a person, who afterwards retires to a foreign country, during the time that he remains there; because the legislators thought it just to give the lenders some extraordinary allowance for the disappointment they met with, and the risk they might run upon such occasions.

ARTICLE XIX.

Of freighting of ships, and giving earnest.

If any person hiring a ship, and giving earnest, says afterwards that he has no occasion for her, he shall lose his earnest;

neft; but if the mafter recede from the agreement, he fhall give the merchant double the earneft.
This article needs no explication.

ARTICLE XX.

Of charter-parties.

In hiring of fhips, the charter-parties [see CHARTER-PARTY] fhall not be valid, except they be fealed; and the penalties may be inferted, with the confent of the parties. But if there be no charter-party, and either the mafter or freighter go from their word, as fuppofe the merchant fhould not give the money agreed to, he muft pay half the freight to the mafter; or, if the latter break his word, he fhall pay to the merchant the half of the freight; but if the mafter pretend intirely to recede from the bargain, he fhall pay to the mafter the whole freight; which penalty fhall be exacted as a punifhment for breach of promife.

This does not want any illuftration.

ARTICLE XXI.

Of mafters or owners of fhips in partnership together.

If two mafters of fhips verbally enter into partnership, acknowledging that they have done fo in former times, and have mutually obferved the conditions thereof, and always paid the duty of each lading; in cafe any accident happens to either of the two fhips, whether being in ballaft or laden, that which is fave fhall fuftain one fourth-part of the damage, though their partnership be commenced without any written inftrument. But where there are articles in writing, they fhall be firm and valid, and the things which are faved fhall be liable to a contribution with thofe that are loft.

ARTICLE XXII.

Of merchants freighting a whole fhip.

If a merchant freighting a fhip agrees to lade it intirely himfelf, the mafter fhall carry nothing in it but water, provifions, ropes, &c. and other the fhip's neceffary tackle; however, if the mafter will put in other goods in the fhip, he may, if he can carry them. But if the merchant, in prefence of three witneffes, proteft againft it, and thereupon there happens at fea to be an ejection, the mafter fhall fuffer the damage; but, if the merchant do not forbid it, they fhall contribute towards the aforefaid damage.

ARTICLE XXIII.

Of the validity of charter-parties.

If there is a charter party in being between the merchant and the mafter, it fhall be valid; and, though the merchant does not compleatly lade the fhip, he fhall pay the freight, according to the contents of that inftrument.

This wants no illuftration.

ARTICLE XXIV.

Of lets and impediments in voyages.

If the mafter having received half of the freight, and fetting fail, the merchant will return, notwithstanding the charter-party, he forfeits the fum he has paid for that impediment. But if the mafter breaks the articles, he fhall forfeit the value of the whole freight to the ufe of the merchant.

ILLUSTRATION.

That the reader may not confound this article with the 20th of this fragment, which likewife treats of the penalties impofed upon fuch as having freighted fhips, do afterward recede from their contracts, which are different from thofe mentioned in this article; we fhall put him in mind, that there the breach of verbal bargains and agreements about freighting of fhips, is fpooken of; whereas the penalties here mentioned are for the breach of charter-parties, which are written inftruments, folemnly figned and fealed; and, befides that, it is more properly the impediments that may happen during the voyage that are here treated of. [See the article CHARTER-PARTY.]

ARTICLE XXV.

Of demurrage, &c.

If a fhip be detained by the merchant ten days longer than the time appointed by the charter-party to remain in any port, he fhall find the company in victuals and drink; and, if ten days more pafs, the merchant fhall pay the freight, and quit the fhip, except he be willing to add a reasonable fum to that before agreed to; upon payment of which he may fail, as he fees convenient.

ARTICLE XXVI.

Of mafters or mariners lying afhore, or being negligent.

If the mafter or any of the mariners lying afhore, the fhip happens, during their abfence, to perifh, whether by night or by day, the mafter or mariners fo lying afhore fhall

fuftain the damage, and thofe who remain in the fhip fhall be free; and whatever damage befalls a fhip by any one's negligence, fhall be refunded to the owner by the perfons by whole fault it happened.

This needs no illuftration.

ARTICLE XXVII.

Of fhipwrecks happening by the fault of the mafter or mariners.

If a fhip puts to fea with merchants or partners goods, and there happens to be difabled, or to perifh by the fault of the mafter or mariners, the goods that are faved fhall be fecured in a certain place, free from any danger. But if it is proved by witneffes that the fhipwreck was occafioned by the tempeft, as well what remains of the fhip, as of the goods, fhall be brought to a contribution; and the mafter fhall retain half the value of the freight. And if any perfon denying, in fuch a cafe, his partnership in a voyage, be convicted thereof by three witneffes, he fhall pay his proportion of the lofs, and likewife undergo the punifhment of that denial.

ILLUSTRATION.

By this law we fee, that further provifion is made for determining fuch differences as might probably arife between the parties concerned, in cafe of fhip-wreck: it being pofitively ordained, that, in cafe fuch a difafter fhould in any manner happen by the fault of the mariners, then the lading (if faved) fhould be preferved for the merchant, free from all contribution towards the damage of the fhip; leaving the other matters, concerning that which the goods may have fufained, to be decided according to the other preceding ftatutes relating to fuch affairs. This article concludes with a very juft and equitable regulation, concerning perfons who having only verbally taken an intereft in any fhip, or in its lading, in cafe of fuch a difafter, fhould pretend to deny themfelves to be concerned therein, in order to avoid the paying of a fhare of the lofs proportionable to what they would have claimed in the profit; of which being duly convicted, they were to pay a double fhare of the lofs, and be further punifhed for their fraudulent denial, as the law required.

ARTICLES XXVIII, and XXIX.

Of the faying of fhips in ports, and fhipwreck; or other damage happening thereupon.

ARTICLE XXVIII.

If a fhip be detained by a merchant or partner, fo that the cannot fail from her port upon the day appointed, and that fhip happens afterwards to be taken by pirates, or to perifh by fire or fhipwreck, he that was the caufe of her being detained fhall pay the damage.

ARTICLE XXIX.

If a merchant in the port where the charter-party is made, does not, at the day appointed, lade the fhip, and the afterwards fuffers any damage by pirates, fire, or fhipwreck, the merchant fhall pay all the damage; but if before the day appointed any fuch accident happens, they fhall both contribute.

Thefe two articles need no illuftration.

ARTICLES XXX, and XXXI.

Of fhips that are loft, and the merchant's money faved.

ARTICLE XXX.

If a merchant lade a fhip, and, carrying money with him, any accident happens to the fhip, fo that the being broken to pieces, the goods are loft, what can be faved of the fhip or goods fhall be liable to a contribution; but the merchant paying the tenths, fhall keep his money: and, if he efaped alone, without laying hold of any implement of the fhip, he fhall only pay half freight, according to the chartry-party; but if he made ufe of any tool belonging to the fhip, in faving of himfelf, he fhall pay a fifth of the money preferved.

ARTICLE XXXI.

If a merchant lades a fhip, and any accident happens, whatever is preferved on either fide fhall be liable to a contribution. If there be money faved, it fhall pay a fifth; and the mafter and mariners fhall ufe their utmoft endeavours to fave it.

This needs no illuftration.

ARTICLE XXXII.

Of a fhip going to fea for a freight, or in partnership, and there fuffering fhipwreck.

If a fhip, being laden by a merchant, puts to fea, either for a freight, or in partnership, and fome misfortunes befall her, the merchant fhall not difpute the paying of half freight; and what is faved of the goods fhall, together with the fhip, be

be liable to a contribution. But if the merchant, or partner, has advanced any money beforehand, all things shall pass according to the form of the written agreement made between them.

This article needs no explication.

ARTICLE XXXIII.

Of accidents befalling a ship after she is unladed.

If a master unlade the goods at the appointed port, and afterwards any accident befalls the ship, the merchant shall pay him the whole freight; and the goods unladed, together with the ship, shall be secure from the passengers. But if any thing remains in the ship, it shall be liable to a contribution with the ship.

ILLUSTRATION.

What is here meant by the unladed goods and ship's being safe from the passengers, seems a little obscure: perhaps, in such cases, the passengers were not allowed any reparation of the damage they might sustain in the clothes and personal necessities they might have on ship-board; because they being only there accidentally, and having no interest in the voyage, it was not, probably, thought just, that the goods of a merchant who hired the ship, and paid the freight, should bear any proportion of the loss sustained by a passenger, by whom he was to expect no profit. Without this interpretation, we do not see how the last sentence of this article can be made consistent with the words immediately preceding.

ARTICLE XXXIV.

Of goods spoiled in the hold, by leakage or water, &c.

If a ship has linen or cloths aboard, the master shall provide good canvas, lest the goods should be damaged by the flowing in of the water in the time of a storm. If the pump or sink too much fills the ship, the master shall forthwith acquaint such as have goods on board, that they may be viewed; and if the seamen not informing the master thereof, the goods be spoiled, the master, together with the mariners, shall refund the damage: but if it appear that the master and mariners declared that the sink was too full, and that the goods should be laid abroad, and those that laded them neglect it, the master and mariners shall be no ways liable to the damage.

ILLUSTRATION.

This article contains a very commendable regulation for obliging the masters and mariners of ships to be careful of the lading, and to have continually an eye upon the hold, to see that it be clear of water, and that every thing remain in a secure situation. Nor is there any thing more just, than that the damage occasioned by the negligence and carelessness of masters and mariners, should be repaired by them, since otherwise some of them would be so indifferent in regard to merchants goods, that they would scarce be at the pains to flow them in places of the hold convenient for them: and, on the other hand, it is no less reasonable that, if the masters and mariners acquit themselves of their duty, in acquainting the owners of the goods of the danger that they are in, and they notwithstanding refuse to let them be removed, the owners themselves should fit down with the loss, which they would not prevent. However these are cases which very seldom happen among us.

ARTICLE XXXV.

Of a ship lightening her burthen in distress.

If a ship either having lost her mast by accident, or, it being cut, throws over any of her lading in that distress, all the mariners, merchants, and goods, and what is preserved of the ship, shall be liable to a contribution.

This needs no illustration.

ARTICLE XXXVI.

Of ships running aboard of one another.

If any ship under sail, in the day-time, run aboard of another lying at anchor in an harbour, or that has slackened her sails, all the loss and damage shall fall upon the master and passengers, and goods of the ship under sail, which shall be liable to a contribution. If it be in the night-time, the ship that slackens her sails shall put out a light, or, wanting that, shall endeavour to avoid the danger, by shouting and crying; both which being neglected, and the ship perish, it is her own fault; and that being duly proved, no reparation shall be made by the other. But if those that have the management of the sails be negligent, and the commander of the watch be asleep, the ship which has its sails spread shall be deemed to be the author of that misfortune, and shall refund the damage done to the ship she runs aboard of.

ILLUSTRATION.

That some particulars of this article seem to be a little severe, must indeed be acknowledged: for though it be highly reason-

able, that if a ship under sail runs aboard of another, which not being in that disposition, cannot avoid the danger with which she is threatened, it is very hard that the goods of the merchant should pay for the fault of the seamen, in which he can have no hand; and yet more unaccountable, that an innocent passenger (who perhaps is an utter stranger to all those matters) should suffer for the malice, ignorance, or neglect of an obstinate crew. However it seems that hereby the Rhodian legislators intended to stir up all persons whatsoever, by the powerful motives of their own private interest, to do their utmost endeavour to prevent all sorts of unhappy accidents; and, indeed, it should be the principal care of all seafaring persons to avoid such dangerous encounters: but, as it is not possible for a ship that is either lying at anchor, or has her sails in such a posture that she cannot of a sudden change her course, to prevent such meetings, the ship that has her sails in a good disposition, and may flee another way, is obnoxious to the law for all the damage that may befall another of whom she runs aboard, than which, nothing is more reasonable. If the damage is occasioned by the omission of those that receive it, they must even take it for their pains; for if, in a dark night, a ship lying at anchor in any road, puts out no light and keeps no watch, another sailing that way may very innocently run aboard of her, without being aware of the danger; and therefore due care should be taken to keep a regular watch there, as well as at sea, and likewise to put out lights, by which it may be discovered from afar, and thereby freed from such unhappy accidents.

ARTICLE XXXVII.

Of a ship being lost, and the lading saved.

If any accident befall a ship, by which the perishing, the goods of the merchants and passengers are notwithstanding preserved, the goods preserved shall pay their fifteenths, but the merchants and passengers shall not pay the master for the ship.

ARTICLE XXXVIII.

Of ships laden with corn, and surprized with a storm.

If a ship laden with corn be surprized with a tempest, the master shall take care to give good canvas, and the seamen to keep the pump clear; which if they neglect, and the corn is thereby wet, the mariners alone shall bear the damage: but if the corn be damaged by the storm, without any fault on their part, the damage shall be borne by the master and mariners, together with the merchant; and the masters and mariners shall have a hundredth part of what is preserved. And when the ship is to be lightened at sea, the merchant shall first throw something overboard, and then the mariners must follow his example: but, if any of them afterwards steal any thing, they shall restore it double, and lose all manner of benefit.

ARTICLE XXXIX.

Of laded ships being carried out of their course and lost.

If a ship setting sail, laden with corn, wine, or oil, be carried by the master (without the merchant's consent) to any shore or place out of her course, and there happens to be shipwrecked, the goods and lading being saved, the merchant shall suffer nothing by the ship's misfortune, because he was not for touching at that place. But if (the ship being under sail) the merchant tells the master that he must of necessity touch at any place that is not mentioned in the charter party, and there the ship happens to perish, the lading being saved, the merchant shall make good that ship to the owner: but, if the thing was undertaken by their mutual consent, they shall contribute for the damage.

These articles need no illustration.

ARTICLE XL.

Of the shipwreck of ships, out of which precious goods are saved.

If any ship suffers shipwreck, and, nevertheless, a part both of the ship and goods be saved, if the passengers have gold, silver, velvet, pearls, or precious stones about them, the gold that is saved shall pay the tenths, and the silver the fifths: and, if the velvets be not damaged, they shall pay the tenths, as gold; but if they be, the damage shall be deducted, and the remainder shall contribute; and the pearls, as they shall be rated, equalling the weight of gold, shall compensate the value of the ship.

ILLUSTRATION.

What the reason may be that silver, which certainly is more burthenome in a ship than gold, should pay one half less towards the damage in case of shipwreck, cannot easily be conceived, no more than what should make velvets, which are yet more burthenome and bulky than silver, be taxed twice as much as silver. It is certain, that that commodity was much esteemed among the Ancients, when it was not so commonly wore as it is now; but we can hardly believe that it was more precious than silver. As to the pearls, of which

which mention is here made, the term in the Greek is *μαρμαίρεα*, which, in the Latin translation, is rendered uno, from unus, ONE, because (several being found in one shell) not one of them is like another; but that term not being usual in England, we thought it convenient to render it by the common name of pearl.

ARTICLE XLI.

Of ships being lost, and the goods of passengers saved.

If any ship be disabled or lost, and there being passengers on board, their goods and baggage be saved, they shall contribute towards the loss of the ship: and if two or three of the passengers lose their money, all the others (according to their ability) together with the ship, shall contribute towards the loss of their money.

ARTICLE XLII.

Of a ship's being laden with goods, and turning leaky.

If a merchant-ship turn leaky, the lading being taking out, it shall be in the master's choice to put it aboard another ship, or aboard the same, if once repaired; and that not being repaired, if the master offers to carry them in another to the port agreed upon, the merchant shall pay the whole freight.

ARTICLE XLIII.

Of ejection and damage in a tempest.

If a ship be surprized with a storm, and an ejection be made, or if the yard-arms, masts, rudder, anchors, or ship-boats be broken, all that is preserved of the ship and goods shall contribute towards the damage.

ARTICLE XLIV.

Of other damage happening in tempests.

If a ship has goods on board, and in a tempest lose her masts, rudder, boats, &c. and, by the violence of the storm, the goods happen to be wet, there shall be a contribution; but, if the lading be more damaged by the sink than by the tempest, the master shall, notwithstanding, receive his whole freight, but shall deliver the goods by the same measure, and in the same condition that he received them.

ILLUSTRATION.

This article contains a special proviso for preventing of damage to merchants goods, by the negligence of the mariners, in not taking due care of the hold and the pump, which sometimes occasions considerable loss to the owners of the lading; for which, the master of a ship is very justly, by this law, obliged to restore the goods (the danger of the sea only excepted) by the same measure, and in the same condition, in which he received them; and, on the other hand, the merchant is enjoined to pay his full freight. Now, as to this law obliging the master to return the same measure of goods, in the same condition he received them, that is, in some cases, impossible; for there being goods which, if once wet, can never be restored to their primitive goodness and lustre, they cannot, consequently, be returned in the same condition; by which it is plain, that as no law commands impossibilities, here must only be meant, that if, by the neglect of the master and mariners, the goods be damaged in the ship, he must sustain the damage.

ARTICLE XLV.

Of saving any part of a shipwreck.

If a ship be surprized at sea with whirlwinds, or be shipwrecked, any person saving any thing of the wreck, shall have one fifth of what he saves.

ARTICLE XLVI.

Of seamen perishing in a storm, and of the ship's boat.

If the ropes break, and the boat goes adrift from the ship, with mariners in it, and they perish at sea, the master shall pay their heirs one full year's wages; and if any person finds the boat, and preserves it safe, he shall restore every thing as he found it, and receive one fifth part as a reward.

ARTICLE XLVII.

Of shipwrecked goods fished up in the sea.

If gold or silver, or any other thing, be taken up out of the sea eight cubits deep, he that so takes the same up shall have one third; and, if 15 cubits, he shall have one half, because of the depth: and if any thing is cast on shore by the tide, and taken up only one cubit deep, the finder shall have a tenth part.

ILLUSTRATION.

The three precedent articles determine the rewards due to persons that find and save shipwrecked goods, as three of the

four subsequent do the punishments of such as steal or embezzle any part of a wreck, or do in any manner aggrieve, or cause any detriment to persons under that misfortune: and as the circumstances of place, &c. are different, the rewards are always to be proportionable to the danger from which the person delivers the goods; it being very reasonable that a person fishing up goods in the main sea have a more considerable reward allowed him, than one that finds them cast ashore upon the sea-sands.

ARTICLE XLVIII.

Of persons taking shipwrecked goods by violence.

Whoever takes any thing from a wreck by violence, shall restore four-fold.

The above article is taken out of the second title of the eleventh book, and is of itself so express and rational, that it needs no illustration.

ARTICLE XLIX.

Of such as force masters of ships to fail.

Whoever imposes a private burthen upon the public, and forces a master of a ship to fail, shall not only bear the loss and damage of the shipwreck, but be severely punished.

ILLUSTRATION.

This article is taken out of the fifth title of the aforesaid book, and does not seem so very plain but that it may admit of a short explication.

We should, indeed, have been at a loss to guess at the meaning of it, if the summary prefixed to it had not been plainer than the article itself, in which these words [to fail] are only understood, but are expressed in the summary preceding the article; so that, comparing both together, we find the meaning of it to be this: that if any merchant, or other person, should, upon any occasion, force a master of a ship to fail against his own will and inclination, and there should afterwards happen any misfortune or disaster to the ship, the person that forced the master to fail should be answerable for all the damages: which, indeed, is highly reasonable.

We own that it is very oddly expressed in the article, which verbatim runs thus: Whoever imposes a private burthen upon the public, and forces a master to it, shall not only, &c. But considering that the word impose, which we here render impose, may likewise signify to lade, and that onus, which we render burthen, may likewise very properly signify the burthen or lading of a ship, and considering also the following words of the article which concern shipwreck, or damage happening in such a case, it is plain enough, that the natural sense of that law can be no other than what we have interpreted it.

As to the words private and public, they seem to be properly enough made use of on this occasion, because, when a man pretends to force another person, against his will, to take an interest in his private and particular concerns, it is certainly an imposition on the public; for though injuries done to particular persons regard immediately only them to whom they are done, yet they immediately affect the commonwealth in general, which is undoubtedly attacked in every assault that is made upon the person or privileges of any of its members; which plainly appears from the universal practice and consent of all the kingdoms, states, and civil societies in the world, who agree that the public has a right to punish crimes, though committed against private persons, and that without the consent of the persons to whom the injuries were done, it not being necessary that that should intervene in order to the criminal's punishment: and so we may observe, that in such cases, besides the counsel appearing for the plaintiff at the prosecution of the criminal, the solicitor, or attorney-general, ordinarily appears for the king, as they likewise do in other countries.

ARTICLES L, and LI.

Of persons violently robbing and preying upon shipwrecks.

ARTICLE L.

Whoever violently takes away any of the miserable remainders of shipwrecks, or takes any advantage of that grievous misfortune, shall restore fourfold to the owners.

ARTICLE LI.

If any man more grievously oppresses shipwrecked persons, and forcibly carries off any shipwrecked goods, after restitution made, if he is a freeman, he shall be condemned to three years banishment; if a man of low degree, he shall be employed in the public works during that time; and if a slave, he shall be put to the most severe and hardest labour.

ILLUSTRATION.

These two last articles are extracted out of the 5th title, of the LXIId book of the Digests, and determine the punishments to be inflicted upon persons robbing, or in any manner oppressing such as have had the misfortune to suffer shipwreck; which punishments are proportioned to the circumstances, by which those crimes may either be aggravated or extenuated. Most happy would our mariners think themselves, if such wholesome constitutions could take place throughout all his Britannic Majesty's dominions, in some parts whereof they are extremely wanted, and particularly upon the coast of Cornwall and Wales, where, if an unfortunate ship does happen to run ashore upon the sands or rocks, the inhuman, brutish, and uncivilized inhabitants, far from tendering any friendly succour or assistance to the persons in distress, most barbarously deprive them of the miserable remains of their shipwrecked fortunes, stripping them even of their wearing cloaths, and sometimes cruelly murdering those unhappy people, who would have met with a milder fate amidst the waves of the ocean, than in the unmerciful hands of those barbarous coasters. See the article SHIPWRECKS.

REMARKS.

The laws of the Rhodians were so much esteemed amongst the ancient Romans, that they were unanimously received as the rule of all maritime affairs, except in cases where they were directly opposite to the native laws of their country. And as the fraud and dishonesty of men had found means to elude the true design and intent of the first Rhodian legislators, the Romans took care to reform such abuses, by some explanatory additions to the aforesaid laws, which, as long as that monarchy lasted, they always held in great veneration.

The ancient Romans were not ashamed to take all the helps and assistances they could have from other nations, to render their own body of laws the more perfect and complete. It was with this view that they sent persons into Greece, there to collect the best and most useful laws which they could pick up among the commonwealths of that country, which were afterwards digested into twelve tables, and were made the ground-work of the body of the Civil Law. It was likewise for the same purpose that they borrowed of the Rhodians their laws relating to maritime affairs, as being the best collection of laws of that kind that were then extant, and inserted them in the body of their own laws. And at this day the Rhodian laws, the laws of Oleron [see OLERON'S LAWS], and other maritime laws of other nations [see WISBURY LAWS], are received as the general law for deciding all causes civil and maritime, in aid of the municipal laws of each country, and without any apprehension that the said foreign laws will be an infringement of their own municipal laws, because they are received by virtue of their own authority, and only to supply the defects and omissions of their own laws, for deciding cases for which their own laws have made no provision.

These laws, as well as the other maritime laws which are interperfed throughout this work, having a close affinity with, and indeed being incorporated with the civil law, a due knowledge of the latter should seem to be indispensably requisite to enable us to make a right judgment in the decision of maritime controversies. I shall not presume to take upon me to ascertain the limits, power, and jurisdiction of the courts of common law, when compared with that of the high court of admiralty: I shall only observe, that they have for some ages been jealous of the power and authority of each, and the courts of common law seem to have gained the ascendancy, and to have drawn all the business they could from the civil law courts. Whether this has proved more for the ease, benefit, and advantage of the subjects of this kingdom, I cannot presume to judge. I hope, however, that I may be permitted to say, without offence, that, in whatever court maritime and commercial disputes and litigations are brought for adjudication, those who are to plead, or to adjudge in such courts, cannot be too well acquainted with the maritime laws of weight and authority that have been promulgated in all wise and civilized nations. Now as it is certain, that it is in the body of the civil law we have the most complete, if not the only collection, of the rules of natural reason and equity, which are to govern the actions of mankind; and therefore it is, that it has been called *RATIO SCRIPTA*, written reason, as containing the most perfect rules of reason for deciding all differences that may arise among men in their intercourse with one another: and as all maritime and commercial laws ought to be founded on, and consistent with the principles of the civil law, which is the same in all countries, it follows that the study of the civil law should by no means be neglected in a trading empire.

In all other countries where the study of the civil law is cultivated, they have peculiar laws and customs of their own, of which they are as tenacious as we can possibly be of ours. Yet they are so far from banishing or discouraging the study of the civil law, under an apprehension of its encroaching upon their own municipal laws, that, on the contrary, they give the professors thereof all encouragement; they study it

as a qualification for the better understanding of their own laws, and make it subservient to them, by applying the general rules of natural reason and equity, which are contained therein, to clear up any difficulties and obscurities, and to supply any defects or omissions that may occur in their own municipal laws.

In former times, when the civil law was more universally known and studied here in England than it is at present, the judges and professors of the common law had frequent recourse to it, in cases where the common law was either totally silent, or defective. So that the sages of the law of those days were sensible of the good use that might be made of the reason of the civil law, in aid and subserviency to the common law of the land, as other nations make use of it at this day.

And besides this general advantage that is to be reaped from the study of the civil law, we are not to look upon it altogether as a foreign commodity in this island, some of the particular laws thereof having been enacted for deciding controversies which arose here in England, and bearing date from this from the Romans. The greatest part of this island was governed wholly by the civil law for the space of about 360 years, viz. from the reign of the emperor *CLAUDIUS* to that of *HONORIUS*; during which time, some of the most eminent among the Roman lawyers, as *PAPINIAN*, *PAULUS*, and *ULPIAN*, whose opinions and decisions are collected in the body of the civil law, sat in the seat of judgment here in England, and distributed justice to the inhabitants. But after the declension of the Roman empire, the Saxon, Danish, and Norman customs took place in the island, according as the said nations became masters of us, every one being fond of introducing their own customs.

The law of nations is likewise founded on the principles of the civil law; and the law of nations is absolutely necessary to be well understood, as well with relation to treaties of commerce, and of peace and friendship, and of all kind of alliance between nation and nation, as with regard to all maritime concerns between one state and another. And the necessity of the law of nations, and consequently the civil law thereupon grounded, being well understood by the ablest lawyers in this kingdom, appeared manifestly, and beyond contradiction, upon a very recent and very important occasion: I mean the affair that happened a few years ago, between his late Majesty and the king of Prussia, with respect to a memorial, and other papers, delivered by *Monf. Michell*, the king of Prussia's secretary of the embassy, to his grace the duke of Newcastle, concerning the Silesia loan. For in the duke of Newcastle's letter, by his Majesty's order, to *Monf. Michell*, in answer to the said memorial, &c. there is the most profound knowledge in the law of nations and the civil law displayed by those able civilians and lawyers, who were ordered by his Majesty to draw up the said answer *. See the article *SILESIA*.

* These gentlemen were, the learned *Sir George Lee*, judge of the Prerogative Court; *Dr. Paul*, his Majesty's advocate-general in the courts of civil law; *Sir Dudley Rider*, then his Majesty's attorney-general, afterwards the right honourable lord chief justice of the court of King's Bench; and the honourable *William Murray, Esq.* then his Majesty's solicitor-general, afterwards his Majesty's attorney general. The only gentleman now living of the abovementioned, is the latter, who is now the lord chief justice of the King's Bench.

There are some particular matters in which the civil law hath always been, and still is allowed to be, the only law in England, whereby they are to be decided; and the courts of justice which have cognizance of the said matters, do proceed therein according to the rules and forms of the civil law. Thus, in the high court of admiralty, causes civil and maritime are here to be decided according to the civil law and the maritime customs. Thus, in the court of honour, the judges thereof are to proceed according to the civil law. Thus also, in the universities, and all the ecclesiastical courts of this kingdom, they proceed according to the civil law, and the canon law, which is, in a great measure, founded upon the civil law.—But these matters are beside my purpose.

Having mentioned the courts where the civil law is allowed to be not only of use, but of force and authority here in England, we beg leave to consider how far the reason and equity thereof may be of service in other courts, where it has not the force and authority of law. And we cannot but think, that in all courts of equity, where the rigour of the common law is to be mitigated by the rules of equity, the knowledge of the civil law must be of great service, and more especially in concerns of a commercial nature: for it is there, and no where else, that we have the fullest and most perfect collection of the general rules of natural reason and equity, applied to the various transactions and intercourses of business between man and man. If, therefore, one were to judge what is just and equitable in a cause depending between parties, would it not be a great help towards forming a right judgment therein, to enquire into the general rules of equity touching the said matter, which have been laid down and established by the most eminent lawyers that ever lived in any age, and to see how they have applied them in similar cases? Can it be imagined,

gined, that the reasonings of those great men upon cases of the like nature, will not give great light, and contribute very much towards forming an equitable decision in matters which are to be determined upon the principles of equity, and not according to the rigour of the law? And will not a knowledge of the ancient and modern maritime laws of other wise nations, which are esteemed of authority, as being grounded on the principles of the civil law, greatly contribute to enable lawyers to conduct their pleadings and adjudications, more consistent with the principles of right reason and equity, than can be done if they are unacquainted with these laws? How far, therefore, these rules of equity, which may be collected from the body of the civil and maritime laws, may be useful in the high court of Chancery, and the court of Exchequer, whose proceedings are according to equity, is most humbly submitted to the great wisdom and experience of the learned judges, and others who are best acquainted with the practice of those courts.

And if this knowledge of the rules of reason and equity can be of service in the inferior courts of equity, it cannot be less useful and necessary in the supreme court of equity of the kingdom, which is that of the lords assembled in parliament. It is to that high tribunal that the subjects have recourse, in order to obtain an equitable redress of the grievances which they pretend to have had done them by the inferior courts. And the lords who compose that august assembly, and who are the supreme judges of the property of the subject, cannot be supposed, by reason of their high rank and quality, and their frequent avocations upon account of the weightier matters of government, to apply themselves to that minute study of the laws which is expected from other judges: and, therefore, seeing they have frequent occasions to act in a judicial capacity, it is the more necessary that they should be acquainted at least with the general rules of reason and equity, which may help to guide them in the judgments which they give in matters of private property that come before them.

And if we consider the said body in their legislative capacity, as having under their direction the arduous matters of state, and especially such as regard the intercourse between us and other nations, the knowledge of the law of nations, which is built upon the civil law, is absolutely necessary in deliberations of this kind, that no resolutions may be taken in such matters, but what are agreeable to the principles of the law of all nations. And it was upon this account that, according to the ancient custom and usage of parliament, the masters of Chancery, who formerly were civilians, were summoned, with the judges of the realm, to give their assistance and attendance in the upper house of parliament: for as the judges of the realm were to give their counsel and advice, when required, in matters which depended on the laws of the land; so the masters of Chancery, who were skilled in the civil law, and the law of nations, were often consulted in matters which depended on those laws.

There is likewise another court, where we humbly conceive that the knowledge of the civil law may be of service, for determining matters that come before it; and that is, the king's privy-council, which is a court of justice in some respects, as it is in others a council with which his Majesty is graciously pleased to advise, and consult in matters relating to the public. It is a court of justice, wherein his Majesty is pleased finally to determine some matters of private property, as particularly all matters of prizes taken from an enemy in time of war, in which the appeal lies from the high court of admiralty to the king in council: and those causes are to be judged by no other law but the civil and maritime law.

The privy-council is likewise a court of justice, for the final determination of all appeals that come from the English plantations in America, from the isles of Jersey and Guernsey, and other places: in all which causes the rules of equity collected in the body of the civil law, must be of service to judge of the equity of the sentences which are complained of, but more especially in the causes which come from the isles of Jersey and Guernsey, where the proceedings in their courts of judicature have a great conformity with the civil law; and the customs of Normandy, which are the law by which those islands are governed, are not only illustrated and explained by the civil law, but many times the aid of the law is there invoked, as a rule for deciding cases which are not expressly regulated by their own customs, as appears from the commentaries of Rouille, Terrier, and others, on the said customs.

Having seen in what cases the civil law may be useful, if not necessary, for determining some matters that come before the privy-council as a court of justice, we must beg leave to consider how far it may be useful in the other matters that come under the deliberation of that august assembly, as a council to his Majesty for the affairs of state. It is by their council and advice that his Majesty steers the helm of government: it is there that all TREATIES OF PEACE AND COMMERCE with foreign states and potentates are examined and considered. See TREATIES.

As to what regards the internal policy of the state, for maintaining peace and quiet in the society, for procuring plenty

of all things necessary to human life, for encouraging manufactures within ourselves, and promoting a beneficial trade with our neighbours: although all these things depend, in a great measure, on the frame and constitution of our own government, on the soil and climate of the country, on its situation for trade, and on the natural temper and disposition of the inhabitants: yet, in order to improve these to the best advantage, we cannot but think that it may be of service to know what laws the Romans, the greatest and most flourishing commonwealth that ever was, thought fit to enact for promoting trade and manufactures within themselves, and for the government of their colonies in foreign parts, to preserve them in a due subjection, and to make them useful and subservient to the seat of the empire from which they derived their origin, and to which they owed their protection: all which laws are collected in the body of the civil law, and may be usefully applied by us on many occasions.

But as to what concerns the outward policy of the state, that is, the intercourse which it must have with other states and princes, we humbly conceive that the knowledge of the civil law must be of singular use in all transactions of that kind: for the civil law being in so great esteem and veneration among all other nations, that they make it the rule and standard of equity in all cases which are not expressly provided for by their own particular laws and customs, what more effectual arguments can be used to obtain justice from them in an amicable way, than those which are founded on the principles and maxims of the civil law? It is arguing with them upon their own principles, from maxims of their own law, and the law of all nations, which is the most effectual way to convince them by reason. And it was in consideration of this that our ancestors, in their great wisdom, thought proper to employ generally, in all negotiations with foreign courts, and in treaties of peace and commerce, persons who were well skilled in the civil law, and law of nations: and although it was necessary on some occasions, and more particularly at solemn congresses for treating of peace, for the greater lustre and splendor of the embassy, to employ persons of the first rank and quality; yet, to ease them of the great weight of affairs, they were always accompanied by some person of an inferior rank, who being versed in the study of the civil law, and law of nations, might be aiding and assisting in the conferences which were to be held for settling and adjusting the respective interests of the several princes and states concerned. And this we see is the constant practice of all other nations at this day, who, in their embassies for treaties of peace, employ always at least one person who has been bred to the law; although this is the less necessary in foreign countries, where all the nobility, in their studies at the university, go through a regular course of the study of the civil law, and law of nations: by which means they lay such a foundation, as to be able afterwards, from the principles thereof, to assert and defend the interests of their country, whenever their prince is pleased to employ them in affairs of that kind.

In matters of intercourse between one nation and another, we have no other law to go by but the law of nations; and this law of nations is chiefly grounded on the rules and maxims of equity which are laid down in the civil law, and which have been received by most nations, as the rules of justice between one nation and another. So that, to understand the law of nations thoroughly, and to be able to comprehend the reasoning of the authors who treat thereof, it is absolutely necessary to have some knowledge of the civil law, as one may easily perceive by looking into Grotius, Puffendorf, and other authors who have wrote on that subject.

And I must observe here, in relation to the English colonies upon the continent of America, that there is a very great affinity between them and the colonies of the Spaniards, and other nations, who have made settlements among the Indians in those parts: for the grants made by our kings, of tracts of land in that country, for the planting of colonies, and making settlements therein, appear to have been made in imitation of the grants made by the kings of Spain to the proprietors of lands in the Spanish colonies, upon the very same conditions, and in consideration of the same services to be performed by the grantees. So that the government of the Spanish colonies, and the rights of the proprietors of lands therein, depending chiefly on the rules of the civil and feudal law, as may be seen by the learned treatise of Solorganus, *De Indiarum Jure*, the knowledge of the said laws must be of service likewise for determining any controversies that may arise touching the duties or forfeitures of the proprietors of lands in our English colonies.

We have made these few remarks only to shew in what particulars the civil law is, and may be, of use here in England, and how we may reap the same advantages from it which other nations do, without any danger to our own municipal laws. Our ancestors were so sensible of the great importance thereof, both in private and public affairs, that, besides the public professors established in the universities for teaching this science, and who have salaries allotted them by the beneficence of our princes, many of the private founders of colleges have,

in their endowments, set apart particular fellowships, as an encouragement to persons to study it. And from the principles of the civil law, and the laws of nations bottomed thereupon, we apprehend that not only the commercial and maritime laws of all trading nations may be the better understood, but such other laws may be formed and ordained in this kingdom for the universal propagation of its trading interests.

RHUBARB, is a thick root, of an oblong figure, large at the head, and tapering pretty suddenly as it extends in length. It is sometimes single, but more usually divided into two or three parts at the lower end. We frequently meet with it in pieces of four, five, or six inches long, and three or four in diameter at the top; it is of a tolerably smooth and even surface, and externally of a faint yellow colour, with a large admixture of brown; it is moderately heavy, but not hard; it cuts through very freely and easily with a knife, especially if the blade of it has been rendered a little unctuous, first by drawing it over an almond, or any other fatty substance. When fresh cut, it is found to be of a marbled or variegated appearance; its colours are a pale but bright yellow, and a faint reddish; the yellow is the ground colour, and the red is disposed in short irregular veins, much in the manner of the darker colour in the common nutmeg. It is of a somewhat lax and spongy texture; it has an agreeable and somewhat aromatic smell, and a bitterish, astringent, and subacid taste, upon the whole not disagreeable: it tinges the spittle to a fine bright yellow, on being held some time in the mouth.

Rhubarb is to be chosen fresh, tolerably hard, and moderately heavy, and such as does not dust the fingers in handling; such as, infused a few minutes in water, gives it a fine yellow, and, when bruised in a mortar, has a reddish colour with the yellow. Rhubarb is not so often adulterated as damaged; care is to be taken that it be not wet or rotten; much of it is subject, after keeping too long, to be worm-eaten and full of holes on the surface. There are certain traders in this drug who have a way of filling up these holes with powder of some of the worst and most decayed pieces, but this is easily discovered, and such rhubarb always to be rejected.

The Ancients were not acquainted with rhubarb; it is an error to suppose they mean our rhubarb by their *rah* and *rheum*; Dioscorides and Galen evidently describe, under that name, the *rhapontic*, a root of a different plant, and very different in its virtues from our rhubarb.

Rhubarb is brought to us from Russia and the East-Indies. It is produced in great plenty on the confines of China and Tartary, and in many parts of Tartary itself; the mountains of Tibet abound with it, and a very considerable part of what is sent into Europe grows there.

We are not certain that it grows in any part of Russia, though we receive considerable quantities of it from thence; it is possible it may be first brought thither from China and Tartary, and then sent to us. The Chinese are very careful in their manner of drying it: they take up the root only in winter, or early in spring, before the leaves begin to appear; they cut it into such pieces as they think proper, and lay it on a table in a shady place, turning it once or twice a day, for two or three days; after this they string the pieces on a cord, at a distance from one another, and then hang them up in a shady place, where they may dry leisurely. It is by this management that the rhubarb is rendered so firm and solid as we find it; for if it were hung up to dry at once in a warm airy place, it would become light and spongy: they say, also, that if the root be taken up in the summer, it is not only light and of little virtue, but that it has nothing of the reddish marbling, that is one of the great characters of its goodness with us.

The plant which produces the true rhubarb is of the number of the *ennandria-trigynia* of Linnæus. It was long before it was known in Europe; but of late it has been sent from Russia to the gardens at Paris and Chelsea, in both which it thrives extremely well, and stands the severest colds unharmed.

The root of this plant shews it to be the genuine rhubarb, and it agrees perfectly with a specimen of the plant which some years since Dr Amman of Petersburg had gathered himself on the mountains of Tibet.

We have proof sufficient now that we have the true rhubarb plant among us; and it will be easy to propagate a quantity of it, in order to try whether its virtues, when produced with us, will be the same with those it possesses as brought from its native climate.

The root of the rhubarb plant is long, thick, and perennial; its bark, while growing, is of a brownish red colour, but under this the substance of the root is of the true colour of the dried rhubarb, only deeper, of the right nutmeg grain, marbled with red and yellow, and has the true smell and taste of rhubarb, especially about the upper part of the root. It has a viscosity indeed in the mouth, that rhubarb, as we meet with it in the shops, has not; but this may only be the difference of the same root fresh and dried. A number of large leaves are produced first from this root; they are of a fine green, elegantly undulated at the edges, of an oblong figure, broadest at the base, and somewhat auriculated; they stand

on very thick and fleshy pedicles, moderately long, convex in their under part, and flat on the upper; these divide each into five large and prominent ribs, running with many divisions through the whole leaf: in the middle of these leaves rises a stalk, of an angular compressed figure, striated, and rising to about three feet high, which, from the middle to the top, is furnished with clusters of little flowers, surrounding it at certain distances; they are very small and white, and are succeeded each by a single seed, of a triangular figure: it flowers in June, and ripens the seed in July and August.

Rhubarb, on a chemical analysis, is found to be composed of a large quantity of sulphur and fixed salt, a small portion of acid salt, and a large share of earth. On these principles, the whole root must be of the gummy kind, and its earthy and gummy parts are very easily separated, and that in large quantity: from an ounce of rhubarb there may be prepared, by means of common water alone, somewhat more than an ounce of the gummy extract. There is but a very small quantity of resinous matter in rhubarb, and what there is is blended with a large share of alkaline salt: two ounces of rhubarb, ever so carefully managed, will not yield more than about three drachms of a resinous, and that a saline extract; the salt in this is in so large a portion, that it will readily dissolve in common water: and this shews us the reason why tincture of rhubarb, made even in rectified spirit of wine, does not become milky on being mixed with water, as many of the other tinctures of this kind do.

Rhubarb possesses the double virtue of a cathartic and astringent; it readily evacuates particularly the bilious humours, and afterwards gently astringes and strengthens the stomach and intestines. It is given with great success in all obstructions of the liver, in the jaundice, in diarrhoeas, and in the fluxus albus and gonorrhoeas: it is also an excellent remedy against worms. It is sometimes given as a purgative, sometimes as only an alterant; and which ever way it is taken, it is an excellent medicine, agreeing with almost all ages and constitutions. The only cases in which its use is to be avoided, are those in which the blood and viscera are too hot. Fallopius says it is never to be given to people who have disorders of the kidneys or bladder, as it is apt to occasion an extraordinary heat in those parts; and Simon Pauli tells us of vertiges brought on by a too free and continued use of it.

Rhubarb is given in powder in infusion, and in its own crude solid state, the chewing it being, perhaps, the best way of giving it of all others, when it is intended to strengthen the stomach and assist digestion; the quantity of 25 grains, or thereabout, should be chewed daily on these occasions, an hour before eating; this is also by much the best way of taking it against the obstructions of the viscera. Its dose in powder is from half a scruple to two scruples; in infusion, about a drachm of it will purge gently, but the dose may be increased up to two drachms: it is observable, that neither the infusion nor the decoction, nor even the extract of rhubarb, purge nearly so briskly as the root itself in powder.

The preparations of rhubarb in use in the shops are, 1. The tincture in spirit. 2. The tincture in wine. And, 3. The extract; though the last is but little used.

Tincture of rhubarb in wine.

Take fine rhubarb two ounces; of the seeds of the lesser cardamum, cleared from their husks, half an ounce; of saffron two drachms; bruise the rhubarb to a gross powder, with the cardamums among it; then cut the saffron small with a pair of scissars, and put the whole into a matras with a quart of white wine; let them stand three days together without heat, often shaking them; then strain off the tincture, and filter it for use.

Tincture of rhubarb in spirit.

Take of fine rhubarb two ounces, of the lesser cardamum-seeds, freed from their husks, half an ounce, of saffron two drachms, proof-spirit a quart; make the tincture without heat, in the same manner as the former.

Both these tinctures are purgative, and strengthen the stomach and intestines afterwards: they are given in most of the cases in which the root itself is proper. Their dose is from one ounce to two ounces and a half; the latter purges somewhat more strongly than the former.

Extract of rhubarb.

Take of fine rhubarb a pound, cut it into thin slices, and afterwards bruise these to a gross powder in a mortar; put it into a matras, and pour on it two quarts of water; let the matras in a sand-heat, so as to keep the liquor moderately warm, for 10 or 12 hours; then strain off the infusion, return the remaining mass into the matras, and pour on it rectified spirit of wine a quart; set it again in the sand-heat for 24 hours, then strain off the tincture: mix this liquor with the former, and gently evaporate the whole to the consistence of an extract. This is gently purgative; its dose is from 10 grains to a drachm: but, in truth, the plain powder of the root seems to be a much better medicine for all the purposes in which this could be given.

The

The tai-haam, or the rhubarb, grows in several parts of China: the best is that of Tsetchanen; but that which grows in the province of Xenfi, and the kingdom of Thibet, is far inferior to it: what grows elsewhere in this part of the world is of so little value, that it is not used. The stalk of the rhubarb is like the small bamboos, or Chinese canes: it is hollow, and very brittle, three or four feet high, and of a dark violet colour. In the second moon, that is, in the month of March, it sends forth long and thick leaves, which grow four and four on the same tail, looking towards each other, and forming a chalice. The flowers are of a yellow, and sometimes of a violet colour. In the fifth moon it produces a small black seed, as large as millet; in the eighth moon they pull it up, and find the root large and long; that which is heaviest and most marbled in the heart is the best and most esteemed. This root is of such a nature as renders it very difficult to be dried.

The Chinese, after having pulled up and cleaned the roots, cut them in pieces about two inches large, and dry them on plates of stone, under which they kindle fires: they turn these pieces 'till they are thoroughly dry. If they had ovens like those in Europe, they would not make use of these plates. As this operation is not sufficient to draw out all the humidity, they make a hole in each piece, and suspend them in the greatest heat of the sun, 'till they are in a condition to be kept without being corrupted.

As to the use of rhubarb, the Chinese are nearly of the same opinion with the Europeans: however, they rarely use rhubarb crude and in substance, for they say it tears the bowels, and produces gripes; and as the Chinese generally love better not to be cured, than to be relieved by great pain, they more cheerfully take rhubarb by way of decoction, with a great many other simples, which they combine according to the rules of their art: but if it is necessary to take it in substance, they prepare it in the following manner:

They take as many pieces of rhubarb as they have occasion for, and steep them 24 hours in rice wine (that of grapes would be better if they had any) 'till they are very soft, and can be cut into thin slices. Then they put upon a furnace a kind of kettle, whose mouth is two feet in diameter, and which diminishes gradually to the bottom in form of a cap. They fill this kettle with water, and cover it with an inverted sieve, made of small slips of bark. Upon the bottom of the sieve they lay the pieces of rhubarb, covering the whole with a piece of wood, over which they throw a felt, that the steam of the water may not come out; then they heat the furnace, and make the water boil, so that the steam raised through the sieve penetrates the slices of rhubarb, and destroys their acrimony. At last this steam resolving, as in an alembic, falls down into the boiling kettle, and renders the water yellow, which the Chinese keep for cutaneous disorders. These slices must remain at least eight hours in this circulation of the steam, after which they take them out, and dry them in the sun. They repeat this operation twice, and then the rhubarb is prepared, and is of a blackish colour. It may be pounded and formed into purgative pills. Five or six drachms at least make a dose, which purges gently and without gripes. The urine is that day more copious and red than usual, which, according to the Chinese, denotes that an unnatural heat is dissipated in that way. They who have an aversion to so many pills, take the same quantity of the dried slices, and in an earthen or silver vessel boil them in nine ounces of water to three, which they drink warm, but sometimes they mix simples with it.

This manner of preparing rhubarb produces the most salutary effects. An obstinate constipation had reduced a mandarin to the greatest extremity, and no remedies could procure him a stool; he vomited them up as soon as they were swallowed, as he also did rhubarb, whether taken in pills or decoction: a Chinese physician made him take a decoction of a double dose of this prepared rhubarb, with which he had mixed some virgin honey, by which means the patient had no nausea, and was freed from this disorder without any pains or gripes.

Some European physicians say, that a drachm of that part of the rhubarb where they string it, given in the morning fasting, in a glass of rose or plantain-water, is an infallible remedy for fluxes. The Chinese physicians think quite otherwise, and say, that the rhubarb always begins to corrupt at that hole; that the powder found there is of no use; that it ought to be thrown away; and that only the internal part of the root, which is weighty and well marbled, ought to be used. It may happen, that in China they undervalue this part of the rhubarb, because it is there worth no more than four-pence a pound, or because, being much dearer in Europe, the natives are unwilling to lose any of it.

RICE, according to Pomet, is the product of a plant which grows very common in many places of Europe: it commonly grows in the water, and, as some observe, though the water increases during the time of its growth, it still keeps its ear above the surface of it. That which is commonly sold in Paris, is brought from Spain and Piedmont. This is a seed of so great use and profit, that it may be called the manna of the poor, and throughout several entire countries, they have scarce any thing else to subsist on.

Choose the newest rice, well cleansed, large, that is to say, plump or well fed, white, not dusty, nor smelling rancid: those who take notice of the rice of Piedmont, esteem it much more than that of Spain, which is commonly reddish, and of a saltish taste. The use of rice, chiefly at Paris, is for the Lent season, when they boil it in water, then in milk, and sometimes reduce it to powder, that is to say flour, which they use instead of wheat flour to thicken their milk with.

To reduce rice into powder, pour boiling water upon it, and then wash it with cold water, so often 'till the water remains clear; after this put it into a mortar to pound, and when it is powdered set it to dry, and then to searce it fine, for it will often appear very fine when it is wet, and yet as it dries shews that it is coarse and requires sifting.

It is restorative, nourishing, and sweetening; it conglutinates the humours, and is useful in fluxes of the belly; it purifies the mass of blood, and stops hæmorrhages. It is used either in ptisans or food.

Besides this, pearl or French barley is used, which ought to be chosen new, dry, plump, and well fed, white, but not blanch-ed: it is prepared at Charenton, near Paris; but the best is that of Vitry. We likewise have rice that is brought from several parts of the country, but chiefly to make a sort of coffee of, which it tastes very like when burnt. The poor buy what we call in England groats, which is made from oats, and when ground at the mill is called oatmeal.

There is a millet also shelled and picked, which they prepare in the forest of Orleans: besides other pulse, as the green and yellow pease, which come from Normandy, and the beans of Picardy and other places; there are other things also sold in the shops, which are made of wheat flour, as vermicelli, both the white and yellow sort, and starch.

The vermicelli, which the Italians invented, and call vermicelli, is a paste made out of the finest part of the wheat flour and water, which is afterwards drove through small pipes like syringes, to what length or thickness they please; so that from the resemblance of its figure to small worms, it is called vermicelli. Some of this kind of paste they make in the shape of ribbands, of two fingers breadth, and this they call kagne; other parcels of it are formed like a quill, and those they call macaron; and some in small grains like mustard-seeds, which they call femoule, the name by which they call the finer flour they compose it of: and finally, some in the shape of beads, which they call patrer. They colour this paste as they fancy, with saffron or other things, and sometimes make it up with the yolk of an egg, sugar, and cheese. Of late years this is made at Paris, and used in soups and broth, as in Italy, Provence, and Languedoc. The white vermicelli ought to be new made and as white as possible, and the yellow of a fine golden colour, the driest and the newest made which can be got.

Starch is made of the *fecula* of wheat flour, which the starch-makers form into cakes and dry in an oven, or by the heat of the sun. This used to be brought into France from Flanders and other countries, but at present that (if we can believe the French) which is made at Paris surpasses that of all other places, and they transport from thence great quantities into other parts of France, and several neighbouring countries.

We ought to choose starch for being white, soft, and moist subject to crumble, likewise such as has been dried in the sun, and not in an oven, which makes it of a greyish white: its use is so generally known that it needs no description.

Mons. Lemery says, this plant bears its stalk about three or four feet high, much thicker and stronger than that of wheat or other corn: the leaves are long, like the reed, and fleshy; the flowers blow on the top like barley, but the seed which follows is disposed in clusters, each of which is enclosed in a yellow husk, ending in a spiral thread. This seed is oblong, or rather oval, and white: the plant is cultivated in moist or low grounds in Italy, and the seed brought dry from Piedmont, Spain, and several other places: its chief use is for food, but is sometimes made use of in physic: it nourishes well and stops fluxes, therefore is good in armies, camps, and sieges, because it is of light carriage and excellent sustenance, and easily prepared; it increases blood, and restores in consumptions: it is made into frumenty by boiling in milk, or, for want thereof, in water; or into cakes with water or milk, and so baked dry; and is excellent good in broth, with any kind of flesh.

Beside the other uses of rice, there is an excellent spirituous liquor made from it, which the people of Peru call *acua*, and we, from a wrong pronunciation of the word, *arrac*.

REMARKS.

The first origin, says a late French writer, of rice plantations in Carolina, was purely fortuitous; a ship on its return from the East-Indies happened to be cast away on the coast of this colony, some bags of rice being taken out of the ship, a trial was made of sowing them, which succeeded beyond expectation; and this cultivation has been so improved, that for some time past, one year with another, fifty thousand barrels of rice are sent from thence to Europe, each weighing about four

four hundred pounds, and at least worth from 50 to 60 s. per barrel, and often more; consequently, at only 50 s. the barrel, here is a sum of 125,000 l. sterling, and the greatest part of this rice is re-exported to foreigners, which is an additional advantage to the English; besides that, like tobacco, it employs a great number of ships.

For the first encouragement of this commerce, the government of England laid a heavy duty on foreign rice, exempting that of its own colonies; but the cultivation of rice coming to be thoroughly established, it was made subject to a duty. See the *BUSINESS of the CUSTOMS*, at the end, of P. [PLANTATIONS.] And this duty includes only the rice for home consumption, the transportation of it from the colonies all over the Mediterranean, and Spain and Portugal, being permitted, on condition that the ships shall directly return to England.

Thus the English traders are enabled to sell their rice cheaper than that brought from the Levant, formerly a great market for it; but now, by the wisdom of the English, this trade is at a very low ebb.

If these laws stood in need of any addition, it is a dispensing clause in the return of ships to England, when the owners intended to sell them, the sale of ships in England being such a considerable branch of commerce, that it is highly the interest of that nation to facilitate the means of selling them, for the greater encouragement of building more.

From north to south the English are in possession of a chain of colonies, reaching to Spanish Florida, and very advantageously situated for trade and navigation. Our possessions, indeed, are of larger extent, stretching themselves without bounds*, up the country, where they inclose all the English settlements, and the Spanish in Florida; our colonies may be said to form a kind of a bow, of which those of the other two nations are the string.

* Observe the Frenchman! Their colonies in North America are boundless, so many of their map-makers say; and if their ministers should be of the same opinion, what will it avail England to treat about limits, if none shall be acknowledged? See the article *MAP*, and our article *BRITISH AMERICA*. See also the articles *CANADA*, *COLONIES*, *LOUISIANA*, *MISSISSIPPI*, *NORTH CAROLINA*, and *PLANTATIONS*.

The English colonies, continues this writer, in these parts, are Nova Scotia, New England, New York, Pennsylvania, the two Jerseys, Maryland, Virginia, Carolina, and Georgia: these different colonies have their respective government both civil and military; they are independent and separated one from the other, but the subjection of the military government, in regard of the civil, will be an eternal bar to any COALITION of their forces for acting harmoniously under one chief*.

* Under the several heads before referred to, we have endeavoured to shew the absolute necessity of a coalition of forces, and a union of power among our British colonies in North America, before the last war, as an effectual barrier against the shameful incroachments which the French had been many years making in that part of the world; ALL WHICH CAME TO PASS: and I had the unpeakable satisfaction to observe, that such union of forces and power which I had done myself the honour to point out and zealously recommend, was adopted by his late Majesty's councils.

Every country being governed by its own inhabitants there, mind only themselves, with little or no concern about their neighbours; it is not the authority of the governors, or even of the king himself, which, without the consent of the assembly of a colony, can march its troops and militia to the assistance of any other which may be attacked; particularly the New England people have carried matters so far, as to make their governor dependent on them for his revenue; and on some differences between them and the king's council concerning their governor, they had the confidence to say, it was little considered that this colony afforded an hundred thousand men capable of carrying arms*.

* Certainly this French scribbler could have such intelligence only from some of his Popish emissaries, who are restless in sowing the seeds of confusion, as well in British America as in the mother country.

The military power of a country, where there is such a slender subordination, is little to be feared; yet is it the only one which might be formidable from the great number of the inhabitants, did not their inclination tend rather to be pirates* than soldiers; besides, in every point of the military government, it is certain, that we are vastly SUPERIOR TO THE ENGLISH†.

* What an impudent and groundless reflection does this Frenchman make upon our North Americans!

† If this be true, as we have now reason to believe, we doubt not, but from the wisdom of his Majesty's councils at present, that the scene will soon be changed, and that our brave

brave NORTH AMERICANS will be as successful against the French on the main, as they were at Cape Breton, and that the consequences of their success may prove more satisfactory to them in the present, than in the former case. The reader is desired to observe here as well as elsewhere, that the author wrote this before the last war, and the last TREATY OF PEACE, and judges it more satisfactory to remain as it does; it giving an insight into the history of the times, and shews better the nature of the last peace.

In an act of parliament passed anno regni Geo. II. tricesimo tertio, intitled, An act for granting liberty to carry RICE from his Majesty's province of Carolina in America, directly to any part of Europe southward of Cape Finisterre, in ships built in, and belonging to, Great Britain, and navigated according to law; which was to be in force for five years from the 29th day of September 1730, and from thence to the end of the then next session of parliament; and also an act made in the eighth year of the said reign, to continue the said act from the expiration thereof, till the 29th of September 1742, and from thence to the end of the then next session, and so extend that liberty to the province of Georgia in America; which said acts, by several subsequent acts made in the 15th and 16th, the 20th and 27th years of the said reign, were further continued from the expiration thereof, till the 29th of September 1760, and from thence to the end of the then next session, shall be and the same is hereby further continued from the expiration thereof to the said 29th of September 1767, and from thence to the end of the then session of parliament.

R I V E R S. Navigable rivers are of such important use in a trading nation, that it is quite needless to say any thing in general upon that head: we shall, however, take notice of something particular in regard to this matter, that seems to merit the public attention.

The ingenious Dr Congreve, late of Wolverhampton in the county of Stafford, after many years observation on the country between the Severn and the Trent, formed a design of uniting those rivers, and was at the labour and expence of measuring and calculating every part of the levels in that distance; and hath published this proof of his ingenuity, without fearing the reproachful name of projector, usually bestowed by the ignorant, on all those who attempt any thing new for the service of mankind. He hath shewn, by comparing it with other works of the same kind effected in other countries, that this design may be executed without any very great difficulty or expence; and the mill and forges on the canal, and the navigable rivers and sluices will be mutually useful to each other, according to the modern way of conducting improvements of this nature.

The expence will appear less considerable than may be generally supposed, by comparing it with works of this kind already executed; and might be less so, by employing the army on this undertaking, giving them a reasonable addition of pay.

By the account kept of the expence of cutting the new canal at Chester, in the year 1735, it appears that a canal dug 100 feet wide at top, 6 feet deep, and 60 wide at bottom, cost 28 s. every ten feet, which amounts to 739 l. 4 s. per mile; that the expence of that canal 20 miles, did not exceed 17,000 l. But here a canal of half these dimensions will answer all purposes, and will not be half the expence.

A barge 120 feet long, 15 feet broad, containing 1800 superficial feet, and drawing 2 feet water, is equal in weight to 3600 cubic feet; each foot cubic weighing 70 pounds, amounts to 252,000 pound weight; this barge, if drawn with six horses, will carry 126 tons, with two feet water, or very little more. If this scheme be completed, it will make a passage by water from York to Bristol, across the middle of the kingdom, where most of the heavy goods are made or produced. Timber, coals, lead, iron, millstones, lime, alabaster, marble, Birmingham, and all other wares made in the kingdom, would be carried to all parts at a cheap rate. What advantage this will be to the land-owners, as well as to trade, I need not mention. But so beneficial a scheme, so clearly stated, merits the regard of the public.

The distance and fall of the water from Aldersley to Burton upon Trent, is as follows:

	Miles.	Fur.	Perch.	Feet.	Inch.
From Aldersley to Newmill is	2	1	25	Fall	20 0
Thence to Penkridge -	8	3	36		68 9
From Penkridge to Burton	33	2	0		100 9
Total	43	7	21		189 6

In which space are 17 mills and forges.

	Miles.	Fur.	Perch.	Feet.	Inch.
From Aldersley to Newbridge	0	4	0	Fall	6 0
Thence to Prestwood -	12	5	0		175 0
From Prestwood to Severn	13	0	8		104 6
Total	26	1	8		285 6

In which space are 25 mills and forges.

Length of the whole, 70 miles, 29 perches; fall both ways, 475 feet.

There are upon the whole length of the said water 42 mills and forges, which, by late improvements, will be a great help to make the rivers navigable, without any damage to the mills.

The fall of the water in the canal betwixt Petersburg and the Wolga, in Russia, both ways (that is, east and west) is 555 feet, which is more than the fall of the water of this canal by 80 feet. Vid. Capt. Perry's Account of Russia.

In 475 feet (the fall of the Penk and Smethfall) are 158 yards, 1 foot, which will require 32 locks, wears, and turnpikes, each lock, &c. being 5 yards high; which is not equal in number to the locks upon the river betwixt Letchlade and London, which, in 138 miles, hath 36 locks, wears, and turnpikes.

A canal from Severn to Trent, may be made, viz.

Sixteen thousand acres are in a square whose side is five measured miles: such a square seems to be betwixt Eflington wind-mill, the head of Chillington mill-pool, and the tops of Wrotteslye-park, Tettenhall-wood, Wolverhampton, and Bifbury-hills.

Seven brooks arise from the springs and rain-waters that fall on these 16,000 acres, and may all be drawn into a magazine in the moors betwixt Tunfall and Penford.

Five or six hundred acres will be in this magazine, if a dam of 24 feet high be made betwixt the new mills at Penford and the hill, in which the stone-quarry, and another at the new bridge of Tettenhall, 10 feet high.

Twelve miles or less will be the length of the canal from Tettenhall to Prestwood, where the Smethfall meets the water from Stourbridge, and so goes to Severn.

Eight miles or less will be the length of the canal from Penford to Penkridge, from whence the river will easily be made navigable to Burton: the land-floods of these 16,000 acres, that now are hurtful to mills and forges, by this magazine will be made serviceable.

Seventy-one market-towns and cities may trade by this canal. More may be added.

Two brooks run into the pool at Gofebrook-mill, from whence the water will run both into Severn and Trent, whenever the miller pleases.

Five brooks only feed the magazine of St. Feriol in Languedoc, which hath 595 acres in it, and supplies a canal 64 French leagues long. See Philof. Transact. No. 56.

Two millions and fifty thousand acres in the three counties of Stafford, Derby, and Leicester.

Twenty-four miles inland navigation only to these three counties.

One market-town only out of forty hath navigation in the three counties.

Two hundred and fifty thousand pounds per ann. got by water-carriage in the same quantity of land in the seven Dutch provinces.

Two thousand six hundred and twenty-five miles is the length of the fifteen Roman roads in England and Wales, many parts of which are spoiled for want of inland navigation.

One thousand pounds per week lost out of the iron trade within six miles of Dudley-castle.

One thousand tons of coals might, perhaps, be sold every week more than now are in the three counties, and as many of lead, lime, iron, stone, timber, marble, fullers-earth, wool, &c. if a canal were made betwixt Severn and Trent by Penk and Stour; then clothiers might trade from Burton to Kinfare, and so to Bridgwater, &c.

One tenth of the waste land of the three counties inclosed, will be worth 10,000 l. per ann. at 4 s. per acre, which will make a canal, and keep poor vicars; this canal will make an easy and cheap carriage betwixt the western and northern clothiers, and bring fish living, in well-boats, to supply these three inland counties.

300,000 l. per ann. is, says Sir William Petty, the charge of the land-carriage in England, one third of which might probably be saved, if this canal were made betwixt Severn and Trent, and another betwixt Severn and Thames by the Bath river, and market-towns have corn, cheese, &c. carried cheaper than by horses, and 2000 l. per week might be added to the wages of the labourers in husbandry and manufactory, the money saved by water-carriage.

Nine parts in ten of the product of all tilled lands are owing to the labour of men and horses, says Mr. Locke, so that to take off many men and horses from husbandry, to land-carriage, must be a vast damage to husbandry, and no small damage to the roads.

Two miles and a half or more is the length of the magazine in the moors betwixt Newbridge and Penford on the west side of it, three miles the length of it on the east side: it may contain 456 acres.

Fifty acres more might be added to it, by placing one sluice on the Dam-mill brook out of the boggy lands betwixt Barnhurst and Cronkwall, and one other sluice on the Mosely brook, out of the boggy lands betwixt Penford wood and

Manfell-Newhouse, upon the road betwixt Wolverhampton and Stafford.

More magazines may be made on the brooks that come out of the forest of Cannock, &c. which would fall into the canal, though not into this magazine.

Seven mills upon the brooks that would come into these moors, to join the Barnhurst brook, viz. Chillington mill, Dam-mill, New-mill, Seawall-mill, Gofebrook-mill, Tunfall-mill, and Fordhouse-mill, all which depend upon springs, and have but small pools, except one.

If the rains on these 16,000 acres that come into these moors betwixt Newbridge and Penford are 36 inches, which is less by six inches than the rains of Lancashire and Cheshire, which join to part of Staffordshire, they are more than the rains of Lisle by one third, for the rains are but 24 inches, which help their canal and that of Mardyke; and almost double to the rains of Paris, which are 19 inches, and perhaps to those of Briare, which help to fill the canal betwixt the two rivers of Paris and Orleans.

The rains on these 16,000 acres will probably fill this magazine 12 times per ann. 2 yards deep.

The depth of rain-water, if it were to stagnate on the earth, would amount, one year with another, at Townley in Lancashire, to 42 inches and a half, at Upminster in Essex 19 inches and a quarter, at Zurich in Switzerland 32 inches and a half, at Pisa in Italy 43 inches and a quarter, at Paris in France 19 inches, and at Lisle in Flanders 24 inches.

Forty acres allowed to each canal and its locks, so that the magazine of 500 acres will fill both the canals, and their locks, being 80 acres, five or six times before it is empty once.

N. B. That the rains on the west side of England are double to those on the east side, and that this magazine will not be 40 miles from West-Chester.

If this canal were made, and two or three more, it is very probable that the same number of working horses and their drivers now employed in England, working the same number of hours every day, may improve the product of the lands of England to be worth 1,000,000 l. of money per ann. more than they are now. For the horses that might be spared from carriage on the roads, as also those that carry corn, &c. to markets, might carry marble, lime, &c. which now lie useless in the earth, for improvement of land, to make them produce much more corn and grass, than they now do.

OBSERVATIONS concerning the RIVERS betwixt Oxford and Bath.

Sir James Long's objections were made new in 1683-4, which are said to be answered in 1664 by Mr. Aylyffe, Mr. Smith, &c. who were for an inland navigation betwixt Avon and Isis, by a cut to be made from Malmesbury to Summerford upon Isis near Cricklade.

Sixty thousand pounds computed by Matthews and Bakerville to be the charge of the canal from Bristol to Oxford, though there may be rocks to be cut through.

Three pounds per ton the price of carriage by land, and twenty shillings per ton by water, from Oxford to London.

Mr. Hill and Mr. Rowland Vaughan were said to design this in queen Elizabeth's time.

Judge Vaughan proposes projectors to be hanged that did not finish any navigation undertaken by subscription, if they misapplied the money.

From Cricklade to Purtonstake one mile and a half, thence to the foot of Purtonhill one mile and an half, thence to Brinkworth betwixt Summerford and Malmesbury to fall into the Avon seven miles. Here may a canal be cut.

A boat might pass from London to Bristol in ten days.

The bill said to pass the commons, but stopt when twice read, with the lords.

Cromwell said to offer 20,000 l. at the Navy-Office to join the city of London in this designed cut.

Matthews dedicates a book about it to king Charles II. ann. 1670.

Vid. Mr. Fridour's book, 1672, of the Languedoc canal; and Philof. Trans. No. 56. where is a map of it.

Mr. Collins says, that from canals to water grounds sprinkled with salt is vast profit.

Capt. Matthews had a private seal for the cut granted to him, as he says, by king Charles II.

Thirty-six locks, wears, and turnpikes, are upon the river Thames betwixt London and Letchlade, by which navigation London receives the provisions of seven counties, and send its merchants goods to them.

It is humbly supposed, that the same number of locks, or fewer, may make good this navigation betwixt Severn and Trent, and carry the provisions and manufactures of seven counties, or more, to above 70 market-towns and cities.

Ninety-three miles English is the length of the canal begun betwixt the Don and the Wolga, to make a communication betwixt the Caspian and the Euxine Seas.

The Ladoga canal designed for the use of Petersburg 460 English miles long, the fall of the rivers that fall into the Wolga 110 feet, of those that fall into the Neva (upon which another dock is to be made) 445 feet fall. Total 555. Vid.

Vid. Capt. Perry's Account of Russia. Four hundred seventy-one thousand one hundred and fifty-four men were employed to cut a canal to draw down the lake of Mexico. Vid. Collection of Travels, Vol. IV. page 531.

R E M A R K S.

Under our article FRANCE, we have shewn what advantages the trade of that nation derives from the great plenty of river-navigation that runs through most parts of their provinces. The convenience of communication, the facility of carriage for the natural productions and manufactures to the sea, are two objects of great importance for a kingdom of so vast an extent as that of France. Its principal rivers, the Seine, the Loire, the Garonne, the Rhone, with the others, that run into them, are an advantage it owes to nature. Its industry has added to it NAVIGABLE CANALS, admirable for the immensity of the work, and for the profits the commerce draws from them. Such is the canal of Languedoc, by means of which Riquet established a commodious communication between Bourdeaux and Marseilles, that is to say, between the ocean and the Mediterranean: such the canals of Orleans and Briare, between the countries watered by the Seine and Loire; not to mention other canals, and projects for rendering rivers navigable, the carrying of which into execution will have respectively their use and advantage.

The Dutch too have an infinite number of rivers and canals, running through the whole seventeen provinces [see the article UNITED PROVINCES], some in every part; and as all these rivers and canals are navigable, so this river-navigation is so considerable, particularly in those provinces, that it is said, above 50,000 men are constantly employed upon them in the dominions of the States-General; who being all used to the water, make good seamen on occasion. By mean of this river-navigation, the Dutch carry on a great and beneficial commerce with Germany and France, and even as high as Switzerland.

In this they may be said to have no rival: the trade up the Maese and the Rhine is, as it were, their own, and through them they trade into all the navigable rivers, which flow into them; by the means of which, the Dutch enjoy a full commerce on both those great streams, and possess the trade of all the countries through which they flow; and by the Danube, which begins to be navigable near the Neckar, they have likewise a trade down that river into Bavaria, and even to Vienna itself.

The Spaniards are endeavouring to improve their river navigation.—The great importance of making the river Ebro navigable, has been recommended to the court of Madrid by an able minister. It is intended, it seems, to make that river more navigable from Navarre, or even higher up, down to the very alkafues of Tortosa, where it runs into the Mediterranean. By this means, the superfluous commodities and fruits of the several countries which this river traverses, may be conveyed at an easier charge, and their traffic on that account facilitated; and many other benefits procured, without any real expence, as the principal difficulties are at present surmounted, inasmuch that flat-bottomed vessels frequently pass from the neighbourhood of Tudela to Tortosa, and even to the sea, laden with gunpowder, bombs, grenades, artillery, and other military stores, manufactured in Navarre, as also any other commodities, that want carriage thither; though the navigation has its difficulties, especially at the water-fall of Flix, where they are at the charge and trouble of landing the goods, and putting them aboard again. But this, and the other inconveniencies, they say, may be easily removed, as we have seen, in Flanders, France, and Holland, much greater surmounted by means of flood-gates, sluices, and other contrivances. If the navigation of this river should be made more easy, the Spaniards may go up and down the river with common vessels, which will not only promote the mutual commerce of the several provinces of Spain, and that which might be carried on abroad, but also serve for the transport of all the materials necessary for the navy; and the above stores of war, together with wheat, barley, and other supplies for the army, and his Majesty's garrisons, to the saving of millions of dollars, which have been expended in that kingdom, by carrying them, as they have done on several occasions, either upon horses or in waggons. And,

By erecting of new ship-yards in the alkafues, they propose to themselves other advantages. For as they will be situated at the mouth of the river Ebro, they happen to lie in the very passage of the masts, planking, and other timber, which being cut down in several parts of the Pyrenees, and conveyed by different roads, and small rivers into the Ebro, they may be brought down to the ports of the Mediterranean and the ocean. And if such quantities of naval stores in general be detained in the alkafues, as shall be worked up in the proposed new ship-yards, there will be saved the expence and risk of transporting them to Calabria, and the four towns, as has been done, making a coasting voyage of above 500 leagues; so that the way will be so much shorter than when they carry them to these parts, subject to the expence and hazard above-

mentioned. By this measure the Spaniards propose to procure many able hands from the neighbouring provinces for their new ship-yards, and thereby have such kinds of works established in several places: they will, by this means, also be enabled to improve and secure the building and fitting out of men of war and merchant-men, while at the same time it will be easier to man the ships upon these coasts, that as soon as they are finished, they might sail to the ports of Andalusia, or other parts, that should be thought proper; since, even for the few that have been lately built in the yards of Calabria and the four towns, it is well known, that after great delays and expence, the Spaniards could procure but a scanty number of hands in those provinces to man them for so short a trip as to Cadiz.—This is a specimen of what the Spaniards are about, in regard to the increase of their river-navigation.—And we might mention more instances of several powers in Europe, who, for the benefit of their trade, are pursuing the like measures. No one need be informed of the unspeakable benefit arising to trade from the river-navigation on the continent of America. The Louisiana, as the French have christened Florida, a vast country watered by the river Mississippi, and by a multitude of other rivers, yield the French at present more than bare promises, as we are likely soon to experience to our cost, unless they shall be effectually checked in their career: nor is the same of less utility and importance in Asia. It cannot be supposed, but that in a country of such an exceeding extent as China, and so very populous, there must be a communication of the product of one province with another, and that this must occasion a very great trade among them; and, indeed, it is so to a wonderful degree, as well by land-carriage as by river-navigation; and especially by their canals, of which the royal canal in China from Canton to Peking is the wonder of the world.

Their river-navigation is exceeding great; the two rivers of Kiang and Hoang are known to be navigable, the first above 1200 miles, the latter 700 miles. The great lake Phujang is said to be 300 miles in circumference, and has great ships sailing in it. Some exaggerating authors raise these things up to impossibilities, and tell us they have 300,000 ships and barks, and that it is ordinary to see 30,000 vessels on the river at Nanquin at once, besides such as are continually going and coming upon business.

Certain it is, there is a vast inland commerce among them, the product of the respective provinces requiring it: for as the several productions are extremely different, so the distant provinces call for those things in trade which they have not of their own, and which are the product of the provinces most remote. Thus the carrying and recarrying those productions, whether for subsistence or for merchandize, necessarily requires all possible assistance of boats, horses, and men; and this occasions the extraordinary circulation of their trade. For example.

The best and finest silk is found in the province of Chekiam, or Chekaing, lying south of Nanquin, the country being spread over with forests of mulberry-trees. The chief city of this province is Hamcheu, a place full of the people employed in drawing or spinning the silk from the worms, and doubling it again, so as to make it fit for the throwster's mill: also they tell us there are 10,000 throwsters, or twisters of silk, here. To this city there is a navigation by 17 canals or rivers, some reaching to one river, some to another: so that the silk is, or may be, transported by water-carriage to all the great cities and sea-ports in China; some of which otherwise would not be able to carry on the manufacture of silk, without fetching the materials, at great charge, a long way by land.

It is from this city the raw silk is brought above 100 miles, to the sea port of Limpo, from whence the English factory receive it, and bring away great quantities of it to Europe. From this city it is likewise carried north to Peking, and south to Canton, places distant and remote, one above 700 miles one way, the other 600 miles another way; in both which cities, as well as in Nanquin (the greatest of them all) the manufactures work it up into the most curious broad silks, and other manufactures, of which this country is so full. Kiamfi is an inland province, full 300 miles from the sea, at the nearest distance, and almost 500 at the remotest, yet it has the royal canal running through the center of it, in its passage from Canton to Peking: so that, by this canal, there is a navigation quite through the province, and a communication of inland trade from sea to sea, as it may be called: that is, from Lamton Bay, or Langehang, as the Chinese call it, to the bay of Nanquin, and the sea of Cang below Peking, which is above 1000 miles.

In the north part of this province also is the great inland sea, or lake, of Phangu, or Fujang, which has 1000 very large ships, or jonks, employed on it, and all the rivers in the province fall into it: they say it is 300 miles in circumference, and empties all its waters into the great river Kouang, or the Blue River.

In this province, lies the great manufacture of china-ware; that is to say, the finest and best is made here. From hence, after great multitudes of people are employed in the labouring part, the goods are conveyed by water to all parts of the empire, and to all the several ports of Tonquin, Canton,

Canton, Amoy, Nanquin, Pekin, Chufan, Limpo, and from those ports to all the rest of the world.

This trade must of necessity employ not only a great many hands, but a great many vessels, boats, and barks, upon those canals, lakes, rivers, and seas: and it will not be wondered, were we to go over all the provinces in this manner, and view the inland commerce, by which 59 millions of people are said to be fed, clothed, and employed (for so many they tell us the country contains): it will not, I say, be wondered at, that the numbers of ships, barks, and boats, are so many, which are seen upon those rivers and canals.

The next province west of this, and yet farther from the sea, is Huquam. The great river Koiang runs through the heart of this province; and the channel being very broad, and withal exceeding deep, the stream is mild and gentle, and is therefore not only navigable for great ships, but the navigation is very safe and easy.

Here is also another lake, or inland sea, larger than the former, being, as some write, 400 miles in circuit, and in some places 50 to 100 fathoms deep, on which there are very large ships employed. All this is taken notice of, to shew that the inland trade of this country is exceeding great, by the means of river-navigation: for as this river is made use of to supply the two populous cities of Chiccheu and Nanquin, in which are so many millions of people, as well with provisions as with manufactures and merchandizes of several kinds, so the trade must be very great, and the number of vessels employed also very great; and it is certainly so, for they tell us there are above a million of people taken up in the navigation of this one river only, and in the canals made from it to the neighbouring provinces, for the convenience of trade, including the two great lakes.

The product of this province is chiefly corn and rice, cotton and fish; the latter is found in the great lake mentioned above in most incredible quantities, which are carried down the great river to Chiccheu and Nanquin in boats, with wells to keep them alive.

The great quantity of corn and rice carried down to Nanquin, &c. is enough to keep a very great number of vessels constantly employed, and no question it does employ some thousands.

But the navigation does not end here, the Koiang being navigable still further west: for this river, which takes its rise in the mountains of Thibet, in the Great Mogul's country, runs above 500 miles, and is a very large river before it enters the dominions of China: so that it is navigable to the farthest western bounds of the Chinese empire.

It is also very remarkable, how the navigation of this river reaching thus far, is particularly useful, and indeed necessary to trade, because in these western provinces of China, the heavy and bulky goods are chiefly produced, which could not be carried so far as to the sea-side or sea-ports, but by water. For example,

The province of Suchuen, or Suchen, lies west, extended to the eastern boundary of the kingdom of Thibet; and this great river runs through the heart of the province, and is distant there from the sea near 700 miles.

In this province are found mines of several metals and minerals, which being heavy goods require water-carriage, or else could not be removed, except at an immense charge, to so great a distance as Canton or Nanquin, or any of the sea-port towns which lie so far due east from them.

We have run over these provinces to shew the inland navigation of the country, and the prodigious course of trade carried on by that navigation, which is the great occasion their produce and manufactures come so cheap to the European markets. Which ought to be a prevailing argument with Great-Britain, to cultivate river-navigation to what extent they are able, in order to answer the same wise and salutary purposes. See the article ROADS.

R O A D S. The repairs, amendment, and preservation of the roads of this kingdom, is certainly a public good work, well worth the constant attention of the legislature; and, by virtue of acts of parliament, the public hath found great advantage from the improvements of the roads, and by the application of tolls collected at the turnpikes.

The first is, that travelling might be rendered safer, easier, and pleasanter to gentlemen and others, upon their ordinary occasions; that this end is greatly answered, every one's experience will tell him, who can remember the condition of the roads about 30 or 40 years ago.

The second is, the benefit accruing to our trade and commerce, by rendering the carriage less expensive upon all sorts of goods and merchandize: whether they are provisions of any kind, the immediate growth and produce of our lands, or whether any other sorts of wares, which must have conveyance by land.

That this good end hath also been greatly answered, will clearly appear, by comparing the former rates of carriage with what is now paid. Of this we shall produce some few instances to the city of London only, that being the great mart, not only for provisions, but also for the various manufactures carried on in the several parts of the kingdom. Hither they are chiefly brought, and from hence the same car-

rier loads back with such goods, as the several counties have a demand for, whether they be foreign or otherwise. Those who have made it their business to be rightly informed of this matter, have, upon enquiry, found that carriage in general is now 30 per cent. cheaper than before the roads were amended by turnpikes: of which it may be proper to produce some proofs.

1st, From Birmingham to London it is said there are not less than 25 or 30 waggons sent weekly; 7 s. per hundred was formerly paid, the price now paid is from 3 to 4 s. per hundred.

2dly, From Portsmouth to London the common price was 7 s. per hundred, the government paid for in queen Anne's war; and now only 4 to 5 s. per hundred is paid: and, in the late war, arms and warlike stores for his Majesty's service were carried at the rate of 4 or 5 s. per hundred.

3dly, From Exeter to London, and from other towns in the west of like distance, the carriage of wool and other goods is very great, especially in times of war.—12 s. per hundred was formerly paid, now only 8 s. per hundred: the same may be affirmed with respect to Bristol, Gloucester, and the adjacent counties; the land-carriage particularly, in time of war, is very large, and the price of it is proportionably reduced.

4thly, Let us proceed now to another part of the kingdom, of less distance from the metropolis, and see what is the difference between the present rates of carriage, and those which were used to be given: from the woollen manufacturing towns in Essex to London, 2 s. 6 d. was formerly paid for a double bay, but now only 1 s. 6 d.; a single bay paid formerly 1 s. 6 d. is now reduced to 6 d. and 8 d. a pack of wool, weight 200, paid formerly 6 s. now only 4 s.

5thly, Butter from Cambridge to London, the produce of the Isle of Ely and county of Norfolk, from whence about 90,000 firkins are brought yearly, was formerly from 18 d. to 2 s. per firkin, and is now but 14 d. More instances might be produced, but these may be sufficient; and from these it may be inferred, that the reduction in the price of carriage is general from all places. To set this matter in a still more striking light, it may not be improper to descend to an exact scrutiny into this matter. Wherefore to begin in the order wherein we first set out.

From Birmingham to London, viz.

15 Tons of goods formerly sold at 7 s. per hundred cost	l. 105
15 Tons now at 4 s. per hundred cost only	60
Saved 3 l. per ton	45

From Exeter to London.

8 Tons of goods at 12 s. per hundred cost	l. 96
8 Tons now at 8 s. per hundred cost	64
Saved in the carriage of 8 tons	32

From Essex formerly.

800 Double bays at 2 s. 6 d. per bay, cost	l. 100
800 Ditto, now at 1 s. 6 d. per hundred, cost only	60
Saved 40 per cent.	40
300 Packs of wool, formerly at 6 s. each, cost	l. 90
300 Ditto now at 4 s. cost	60
Saved	30

And now let us enquire from whence the saving in land-carriage, so great a benefit to trade, ariseth; no other cause, we conceive, can be reasonably assigned, than that, since the amendment of the roads by turnpikes, our carriers are enabled to draw greater weights, with the same number of horses in one carriage, than they formerly could do. To demonstrate this, we shall bring an example or two: the roads in general were formerly so deep and bad, so full of holes and sloughs, that a team of six horses could scarce draw from any place of 60 miles distance, or upwards, above 30 hundred weight of goods; whereas the same team can now draw with more ease 50 or 60 hundred.

Suppose from Birmingham, or any other place of equal distance,

Formerly 30 hundred at 7 s. per hundred cost	l. 10 10
Now 50 hundred at 4 s. per hundred costs only	10 0

Or, to shew the savings, you may be pleased to compute thus:

50 Hundred formerly at 7 s. per hundred cost	l. 17 10
50 Hundred now at 4 s. per hundred cost	10 0
Saved	7 10

Again, suppose from Exeter, &c.

That formerly six horses could draw 40 hundred of woollen goods, at 12 s. per hundred, is	l. 24
Now 6 horses can draw 60 hundred at 8 s. per hundred	24
From	

From these instances it is extremely evident, that a team with six horses can now draw 20 hundred more than they could do formerly; that the price of carriage is, for this reason, proportionably reduced, and the public, or trade and commerce, have the immediate benefit of it.—In provisions, as wheat, meal, malt, butter, and cheese, &c. the farmer and landed interest generally have the benefit of these savings. In all our manufactured goods, the public have the benefit of them, whether they are used at home or exported. The cheaper the maker can get his wares to market, the cheaper he must and doth sell them: of this every merchant and trader is fully sensible.—It is a known maxim in commerce, that the less it is burthened, or the easier the conveyance both at home and abroad, the more extensive and beneficial it will certainly prove. I have shewn above, the general benefit that the nation reapeth from the improvement of our roads by turnpikes. I shall not proceed to point out whence it is, that the farmers and traders apprehend so great a burthen upon trade, from the late act of limitation; whereby no waggon, &c. shall be drawn with more than five horses, unless up steep hills, after the 1st of July 1752: and the trustees or commissioners of the turnpike roads, in their respective districts, are required, on or before the 25th of March 1752, to erect weighing engines at the toll-gates, or elsewhere, upon their respective roads; and that no waggon, &c. be suffered to pass through with above 60 hundred, the weight of the waggon, &c. included.

We shall not enter into the merits of this act; there has been scarce time to shew with what consequences it may be attended, and therefore we must leave it to experience. If the article of carriage receives as great additional benefit by the last principal acts, as it has done by the establishment of tolls and turnpike roads in general, the public will have no reason to complain.

However, be this as it may, the public will be no way relieved from the great expence attending the constant amendment on the highways; and what traders may save, in respect to the point of carriage, the public pays very amply for, I am afraid, for the repairs of the highways: and that expence falling upon the public in general, instead of traders in particular, is only a seeming alleviation of the burthen; it remains still a prodigious expence to the nation, from which, in as great a measure as is possible, they ought to be disincumbered, and that saving, if it can be effectuated, will answer other public exigencies. All contentions about expedients to save and preserve the roads by changing the manner of carriage, and laying peculiar restraints thereon, do not appear to be striking at the root of the evil; for supposing that the roads by such expedients do wear out or decay one twelfth less than they did before such expedients are carried into execution, yet, if the price of carriage is raised one twelfth more from inconveniences that the carriers may experience, we do not see any great gain that will thereby accrue to the public in general.

The essential point, we humbly apprehend, to be considered, is, whether there is any probability so to repair and amend the highways in general, that the weight of any carriages that have heretofore contributed to, or may hereafter contribute to, lessen the price of land-carriage in general, will do little injury to the roads in general, and consequently, after such work is gradually completed, will put the nation to very little expence in their constant reparation, in comparison to what now is expended by the public for that purpose. This, we conceive, is the principal matter that deserves to be weighed and considered: and although we do not presume to offer any thing to the public consideration, that will effectually answer these desirable purposes; yet we shall give a summary of what has occurred to us upon this occasion, with a view to spirit up and excite others more capable, to put a matter of this general concern in such a light, as may appear more rational, eligible, and practicable than any thing that we can presume to suggest.

Whether any thing of the nature of that which we shall take the liberty to offer, may ever be practicable, might be tried by a fair experiment of five miles, or even of one single mile only, at the public expence; and if it should be found to answer in one mile, then it might be seriously thought of to be made general, or laid aside. Nay, one hundred yards only, experienced in one of the most public roads, through which the heaviest carriages pass, would, perhaps, be sufficient to give this matter a fair trial. But this is not an experiment that has never been tried, it was long experienced by the ancient Romans; and as we seldom err in the imitation of their wise example, in many important particulars, the imitating them, perhaps, in regard to the management of their highways, so far as it may be experienced to be practicable in this nation, may not be attended with less emolument and glory than in many other things, wherein we are fond, and even value ourselves upon following their great and glorious example.

Nor do I pretend to have any merit in the proposal; it was, I understand, many years since drawn up by a public-spirited gentleman. I shall endeavour only to put the matter in something of a different light, as being more accommodated to

the present times, by adding what may seem requisite, and curtailing what may be superfluous.

The Romans, while they governed this island, made it one of their principal cares to make and repair the highways of the kingdom, and the chief roads we now use, are of their marking out; the consequence of maintaining them was such, or at least so esteemed, that they thought it not below them to employ their legionary troops* in this work; and it was sometimes the business of whole armies, either when in winter-quarters, or in the intervals of truce or peace with the natives.

* We know by experience in Scotland, what the soldiery can do in this respect.

If we lay aside the barbarity and custom of the Romans as heathens, and take them as a civil government, we must allow they were the pattern of the whole world for improvement and increase of arts and learning, civilizing and methodizing nations and countries conquered by their valour; and if this was one of their great cares, that consideration ought to move something with us. But to the great example of that generous people, we will add three arguments.

(1) It is useful. And that as it is convenient for carriages, which in a trading country is a great help to negociate, and promotes universal correspondence, without which our inland trade could not be managed.

(2) It is easy. We question not to make it appear it is easy, to put all the high roads, especially in England, in a noble figure, large, dry, and clean; well drained and free from floods, unpassable sloughs, deep cart-ruts, high ridges, and all the inconveniences to which they are liable; if not constantly kept in repair in the common way, at a prodigious expence to the public; and when this is once done, much easier still to be maintained so, at a very moderate and trifling public expence, in comparison to the present annual one, raised by toll, and other rates.

(3.) It may be cheaper; and the whole assessment for the repairs of highways for ever be dropped, or applied to other uses for the public benefit.

The proposal is as follows:

First, That an act of parliament be made, with liberty for the undertakers, where it is wanted, to dig and trench, to cut down hedges and trees, or whatever is needful for ditching, draining, and carrying off water, cleaning, enlarging, and levelling the roads, with power to lay open or inclose lands; to incroach into lands, dig, raise, and level fences, plant and pull up hedges or trees, for the enlarging, widening, and draining the highways, with power to turn either the roads or water-courses, rivers and brooks, as by the directors of the works shall be found needful, always allowing satisfaction to be first made to the owners of such lands, either by assigning to them equivalent lands, or payments in money, the value to be adjusted by judicious and indifferent persons, to be named by the lord chancellor, or lord keeper, &c. for the time being; and no water-course to be turned from any water-mill, without satisfaction first made both to the landlord and tenant.

But before we proceed, it may be necessary to say a word or two upon this article.

The chief, and almost the only cause of the deepness and foulness of the roads, is occasioned by the standing water, which for want of due care to draw it off by scouring and opening ditches and drains, and other water-courses, and clearing of passages, soaks into the earth, and softens it to such a degree, that it cannot bear the weight of horses and carriages; to prevent which, the power to dig, trench, and cut down, &c. mentioned above, will be of absolute necessity: but because the liberty seems very large, and some may think it is too great a power to be granted to any body of men over their neighbours, it is answered,

(1.) It is absolutely necessary, or the work cannot be effectually done, and the doing of the work is of much greater benefit than the damage can amount to. But,

(2.) Satisfaction is proposed to be made to the owner, and that first too, before the damage be done, as an unquestionable equivalent; and both together, I think, are a full answer to any objection in that case.

Besides this act of parliament, a commission must be granted to fifteen, at least, in the name of the undertakers, to whom every county shall have power to join ten, who are to sit with the said fifteen, so often and so long as the said fifteen do sit for affairs relating to that county; which fifteen, or any seven of them, shall be directors of the works, to be advised by the said ten, or any five of them, in matters of right and claim; and the said ten to adjust differences in the counties, and to have right by process to appeal in the name either of lords of manors, or privileges of towns or corporations, who shall be either damaged or encroached upon by the said work: all appeals to be heard and determined immediately by the said lord chancellor, or commission from him, that the work may receive no interruption.

This commission shall give power to the said fifteen to press waggons, carts, and horses, oxen, and men, and detain them to work a certain limited time, and within a certain

limited space of miles from their own habitations, and at a certain rate of payment: no men, horses, or carts, to be pressed against their consent, during the times of hay-time, or harvest; or upon market-days, if the person aggrieved will make affidavit he is obliged to be with his horses or carts at the said markets.

It is well known to all who have any knowledge of the condition the highways in England in general would be in, without the constant great expence we are at to repair them, that in most places there is a convenient **DISTANCE OF LAND** * left open for travelling, either for driving of cattle, or marching of troops of horse, with perhaps as few lanes or defiles, as in any counties: the cross roads, which are generally narrow, are yet broad enough in most places for two carriages to pass; but, on the other hand, we have on most of the high roads a great deal of waste land thrown in as it were for an overplus to the highway; which, though it be used of course by cattle and travellers on occasion, is indeed no benefit at all either to the traveller as a road, or to the poor as a common, or to the lord of the manor as a waste; upon it grows neither timber nor grass, in any quantity answerable to the land; but, though to no purpose, is trodden down, poached, and over-run by drifts of cattle in the winter, or spoiled with the dust eternally flying from the roads in the summer. And this may be observed in many parts of England to be as good land as any of the neighbouring inclosures, as capable of improvement, and to as good purpose.

* A great quantity of this land has been unwarrantably incroached on, and inclosed within these 30 or 40 years; and if enquiry was made into the titles, I doubt not but they will be found very deficient.

These lands only being inclosed and manured, leaving the roads to dimensions with measure sufficient, are the fund upon which the proposer would build the stock of money that must carry this design into execution, without any expence to the public whatever.

These lands, which we shall afterwards make an essay to value, being inclosed, will be either saleable to raise money, or fit to exchange with those gentlemen, who must part with some land where the ways are narrow: always reserving a quantity of the lands to be let out to tenants, the rent to be paid into the public stock or bank of the undertakers, and to be reserved for keeping the ways in the same repair; and the said bank to forfeit the lands, if they are not so maintained.

Another branch of the stock must be hands, for a stock of men is a stock of money; to which purpose every county, city, town, and parish, shall be rated at a set price, equivalent to eight years payment for the repair of highways; which each county, &c. shall raise, not by assessment in money, but by pressing of men, horses, and carriages, for the work; the men, horses, &c. to be employed by the directors: in which case all corporal punishments inflicted for misdemeanors, as of whippings, stocks, pillories, houses of corrections, &c. might be easily transmitted to a certain number of days work on the highways; and in consideration of this provision of men, the county should for EVER AFTER be acquitted of any contribution, either in money or work, for repair of the highways, building of bridges excepted.

There will, perhaps, lie some popular objection against this undertaking; the first is, the great controverted point in England of the **INCLOSURE OF THE COMMON** †, which tends to depopulation, and injures the poor. 2. Who shall be judges or surveyors of the work, to oblige the undertakers to perform to a certain limited degree.

† If as much of common land had been inclosed, and the profits thereof applied to the repairs of the highways, as has been unjustifiably stolen therefrom, the amount would have greatly, if not effectually, contributed to this good work.

For the first, the inclosure of the common: a clause that runs as far as to an incroachment upon Magna Charta, and a most considerable branch of the property of the poor: I answer it thus:

(1.) The lands proposed to be inclosed, are not such as from which the poor do indeed reap any benefit, or at least any that is considerable.

(2.) The bank and public stock, which are to manage this great undertaking, will have so many little labours to perform, and offices to bestow, that are fit only for labouring poor persons to do, as will put them in a condition to provide for the poor who are so injured, that can work; and to those who cannot, may allow pensions for overseeing, supervising, and the like, which will be more than equivalent.

(3.) For depopulations, the contrary should be secured, by obliging the undertakers, at such and such certain distances, to erect cottages, two at least in a place, which would be useful to the work and safety of the traveller, to which should be an allotment of land, always sufficient to invite the poor inhabitant, in which the poor should be tenant for life gratis, doing duty upon the highway as should be appointed; by which, and many other methods, the poor should be great gainers by the proposal, instead of being injured.

(4.) By this erecting of cottages at proper distances, a man might travel all over England as through a street, which

might contribute, in some measure, to prevent robberies, and prove directors to travellers in their way.

(5.) This undertaking once duly settled, might in a few years be so ordered, that there should be no poor for the common; and if so, what need of a common, for the poor? Of which in its proper place.

As to the second objection, Who should oblige the undertakers to the performance?

(1.) It is answered, Their commission and charter should become void, and all their stock forfeited; and the lands inclosed and unfold, remain as a pledge; which would be security sufficient.

(2.) The ten persons chosen out of every county, should have power to inspect and complain, and the lord chancellor upon such complaint to make a survey; and to determine by a jury, in which case, on default, they shall be obliged to proceed.

(3.) The lands settled on the bank shall be liable to be extended for the uses mentioned, if the same at any time be not maintained in the condition at first provided, and the bank to be amerced upon complaint of the county.

These and other conditions, which on a legal settlement to be made by the wisdom of the legislature, might be thought on, that I do believe would form a constitution so firm, so fair, and so equally advantageous to the country, to the poor, and to the public, as has not been put in practice in these latter ages of the world.

By means of a grant of waste, and almost useless lands lying open to the highway, we may presume to say, those lands to be improved, as they might easily be, together with the eight years assessment to be provided in workmen, a noble magnificent **CAUSEWAY** might be erected, with ditches on either side deep enough to receive the water, and drains sufficient to carry it off; which **CAUSEWAY** should be four feet high at least; and from thirty to forty feet broad, paved in the middle, to keep it well cemented and cooped in, and so supplied with gravel, and other proper binding materials, as should secure it from decay, with small occasional reparation.

We hope no man would be so weak now, as to imagine that by lands lying open to the road, to be assigned to the undertakers, we should mean that all Finchley-common, &c. should be inclosed and sold for this work: but lest somebody should start such preposterous objections, we think it is not improper to mention, That wherever a highway is to be carried over a large common, forest, or waste, without a hedge on either hand for certain distance, there the several parishes shall allot the directors a certain quantity of the common to lie parallel with the road, at a proportioned number of feet to the length and breadth of the said road; consideration also to be had to the nature of the ground, or the giving them only room for the road directly, shall suffer them to inclose in any one spot so much of the said common, as shall be equivalent to the like quantity of land contiguous to the road: thus, where the land is good, and the materials for erecting a causeway near, the less land may serve, and on the contrary the more; but in general, allowing them the quantity of land proportioned to the length of the causeway, and forty rod in breadth; though where the land is poor, as on downs and plains, the proportion must be considered to be adjusted by the country.

Another point, in relation to the dimensions of roads, should be adjusted, and the breadth of them, I think, cannot be less than thus:

From London every way 10 miles, the high post-road, to be built full 40 feet in breadth, and four feet high, the ditches eight feet broad, and six feet deep, and from thence onward 30 feet, and so in proportion.

Cross-roads to be 20 feet broad, and ditches proportioned; no lanes and passes less than nine feet without ditches.

The middle of the **HIGH CAUSEWAYS** to be paved with stone, chalk, or gravel, and the best-cemented matter that can be procured the nearest thereunto, and kept always two feet higher than the sides, that the water might have a free course into the ditches, and persons kept in constant employ to fill up holes, let out water, open drains, and the like, as there should be occasion. A proper work for highwaymen, and such malefactors as might, on those services, be exempted from the gallows.

It may here be objected, That eight years assessment to be demanded down, is too much in reason to expect any of the poorer sort can pay; as for instance, if a farmer who keeps a team of horses be, at the common assessment, to work a week, it must not be put so hard upon any man as to work eight weeks together. It is easy to answer this objection. So many as are wanted must be had; if a farmer's team cannot be spared, without prejudice to him, so long together, he may spare it at sundry times, or agree to be assessed, and pay the assessment at sundry payments; and the bank may make it as easy to them as they please.

Another method, however, might be found to fix this work at once. Suppose a bank be settled for the highways of the county of Middlesex, which as they are, without doubt, the most used of any in the kingdom, so also they require the more charge, and, in some parts, lie in the worst condition

of any in the kingdom, 'till the present great expence for their repair took place.

If the parliament fix the charge of the survey of the highways upon a bank to be appointed for that purpose, for a certain term of years, the bank undertaking to do the work, or to forfeit the said settlement. As thus:

Suppose the tax on land and tencements for the whole county of Middlesex does, or should be so ordered, as it might amount to 20,000 l. per annum, more or less, which it now does, and much more, including the work of the farmers teams, which must be accounted as money, and is equivalent to it, with some allowance to be rated for the city of London, &c. who do enjoy the benefit, and make the most use of the said roads, both for carrying of goods and bringing provisions to the city, and therefore in reason ought to contribute towards the highways; for it is a most unequal thing, if a design of this kind should ever take place, that the road from Highgate to Smithfield-market, by which the whole city, is, in a manner, supplied with live cattle, and the road by those cattle horribly spoiled, should lie all upon that one parish of Islington to repair: wherefore we will suppose a rate for the highways to be gathered through the city of London, of 10,000 l. per annum more, which may be appointed to be paid by carriers, drovers, and all such as keep teams, horses, or coaches, and the like, or many ways, as is most equal and reasonable; the waste lands in the said county, which, by the consent of the parishes, lords of the manors, and proprietors, shall be allowed to the undertakers, when enclosed and let out, may (the land in Middlesex generally letting high) amount to 5000 l. per annum more. If then an act of parliament be procured to settle the tax of 30,000 l. per annum, for eight years, most of which will be levied in workmen, and not in money, and the waste lands for ever: we may presume to affirm, that the highways for the whole county of Middlesex should be put into the following form, and the 5000 l. per annum land be bound to remain as a security to maintain them so, and the county be never after burthened with any further tax for the repair of the highways.

And that we may not propose a matter in random generals, like begging the question, without demonstration, we shall enter into the particulars how it may be executed, and that under these following heads of articles:

- (1.) What is proposed to be done to the highways.
- (2.) What the charge will be.
- (3.) How to be raised.
- (4.) What security for the performance.
- (5.) What profit to the undertakers.

(1.) In regard to what is proposed to be done to the highways. We answer first, to repair them, and yet, secondly, not alter them, that is, not alter the course they at present run. But perfectly build them as a fabric; and, to defend to the particulars, it is first necessary to note which are the roads we mean, and their dimensions.

First, The high post-roads; and they are, for the county of Middlesex, as follows:

	Miles.
From London to	
Stains, which is	15
Colnbrook is from Hounslow	5
Uxbridge	15
Buſſay, the Old-Street way	10
Barnet, or near it	9
Waltham-Crofs, in Ware road	10
Bow	2
	66

Besides these, there are cross-roads, by-roads, and lanes, which must also be looked after; and that some of them may be put into condition, others may be wholly slighted and shut up, or made drift-ways, bridle-ways, or foot-ways, as may be judged convenient by the countries.

The cross-roads of most repute are as follow:

	Miles.
From London	
Hackney	
Ditto	
Tottenham	
Enfield-Walth	
London	
Edgware	
London	
Ditto	
Brentford	
Kingston	
Ditto	
Hackney, Old Ford, and Bow	5
Dalston and Islington	2
Hornsey, Moulſewell-Hill, to Whetstone	8
The Chace, Southgate, &c. called Green lanes	6
Enfield town, Whetstone, Tottenham to Edgware	10
Hampstead, Hendon, and Edgware	8
Stanmore, to Pinner, to Uxbridge	8
Harrow and Pinner-Green	11

Overplus miles	50
	140

And because there may be many parts of the cross-roads which cannot be accounted in the number above mentioned, or may escape our knowledge or remembrance, we allow an overplus of 50 miles, to be added to the 90 miles above, which together make the cross-roads of Middlesex to be 140 miles.

For the by-lanes, such as may be slighted need nothing but to be ditched up; such as are for private use of lands for carrying corn and driving cattle, are to be looked after by private hands.

But of the last sort, not to be accounted by particulars, in the small county of Middlesex, we cannot allow less in cross by-lanes, from village to village, and from dwelling-houses which stand out of the way to the roads, than 1000 miles. So in the whole county we reckon up,

	Miles.
Of the high post-roads	67
Of cross-roads less public	140
Of by-lanes and passes	1000
	1207

These are the roads we mean, and thus divided under their several denominations.

To the question, What we would do to them? it is answered,

(1.) For the 67 miles of high post-road, it is proposed to throw up a FIRM STRONG CAUSEWAY, well bottomed, well cemented, and well built, six feet high in the middle, and four feet on the sides, faced with brick or stone, and crowned with gravel, chalk, or stone, as the several countries they are made through will afford, being 44 feet in breadth, with ditches on either side eight feet broad, and four feet deep; so that the whole breadth will be 60 feet, if the ground will permit.

At the end of every two miles, or such like convenient distance, shall be a cottage erected, with half an acre of ground allowed, which shall be given gratis, with 1s. per week wages to such poor man of the parish as shall be approved, who shall once, at least, every day, view his walk, to open passages for the water to run into the ditches, to fill up holes or soft places.

Two riders shall be allowed to be always moving the rounds, to view every thing out of repair, and make report to the directors, and to see that the said cottagers do their duty.

(2.) For the 140 miles of cross-road, a like CAUSEWAY to be made, but of different dimensions, the breadth 20 feet, the ditches four feet broad, three feet deep, the height in the middle three feet, and on the sides one foot or two, where it may be needful, to be also crowned with gravel, and well cemented and built, as before; and 1s. per week to be allowed to the poor of every parish; the constables to be bound to find a man to walk on the highway in every division, for the same purpose as the cottagers do on the greater roads.

Posts to be set up at every turning, to note whither it goes, for the direction of strangers, and how many miles distant.

(3.) For 1000 miles by-lanes, only good and sufficient care to keep them in repair as they are, and to carry the water off, by clearing and cutting the ditches, and laying materials where it is wanted.

This is what is proposed to be done to the roads; and what, if once performed, we suppose all people would own to be an undertaking both useful and honourable to the kingdom.

(2.) The second question proposed to be answered is, What the charge of all this will be?

Which is reckoned thus:

The work of the GREAT CAUSEWAY is proposed not to cost less than 10s. per foot, supposing materials to be bought, carriage and mens labour to be all hired; which, for 67 miles in length, is no less than the sum of 176,880 l. as thus:

Every mile, accounted at 1,760 yards, and three feet to the yard, is 5,280 feet, which, at 10s. per foot, is 2640 l. per mile, and that again multiplied by 67, makes the sum of 176,880 l. wherein is included the charge of water-courses, mills to throw off water where needful, drains, &c.

To this charge must be added ditching to inclose land for 30 cottages, and building 30 cottages, at 40 l. each, which is 1,200 l.

The work of the smaller causeway is proposed to be finished at the rate of 12 d. per foot, which being for 140 miles in length, at 5,280 feet per mile, amounts to 36,960 l.

Ditching, draining, and repairing 1000 miles, supposed at 3s. per rod, for 320,000 rods, is 48,000 l. which added to the two former accounts, stand thus:

	l.
The high post roads, or great causeway	178,080
The small causeway	36,960
By-lanes, &c.	48,000
	263,040

If I were to propose some measures, continues the proposer, for the easing this charge, I could, perhaps, lay down a scheme how it may be performed for less than one half of this charge.

As first, By a grant of the court at the Old Bailey, whereby all such criminals as are condemned to die for smaller crimes, may, instead of transportation, be ordered a year's work on the highways; others, instead of whipping, a proportioned

time, and the like; which would, by a moderate computation, provide us generally a supply of 200 workmen, and those coming in as fast as they go off; and the overseers should make them work.

Secondly, By an agreement with the African company, to furnish 200 negroes, who are generally persons that do a great deal of work; and all these are sublet very reasonably out of a public storehouse.

Thirdly, Large carts and horses to be bought, not hired, with a few able carters; and to the other a few workmen that have judgment to direct the rest: and thus, perhaps, the great causeway might be done for 4s. or 5s. per foot charge; but of this by the by.

Fourthly, A liberty to ask charities and benevolence for the execution of this work.

(3.) To the question, How this money shall be raised? I think if the parliament settle the tax on the county for eight years, at 30,000 l. per annum, no man need ask how it shall be raised; it will be easy enough to raise the money; and no parish can grudge to pay a little larger rate for such a term, on condition never to be taxed for the highways any more. Eight years assessment, at 30,000 l. per annum, is enough to afford to borrow the money by way of anticipation, if need be, the fund being secured by parliament, and appropriated to that use and no other.

As to what security for performances.

The lands which are inclosed may be appropriated, by the same act of parliament, to the bank and undertakers, upon condition of performance, and to be forfeited to the use of the several parishes to which they belong, in case, upon presentation by the grand juries, and reasonable time given, any part of the roads in such and such parishes be not kept and maintained in that posture they are proposed to be. Now the lands thus settled are an eternal security to the country, for the keeping the roads in repair, because they will always be of so much value over the needful charge, as will make it worth while to the undertakers to preserve their title to them; and the tenure of them being so precarious as to be liable to forfeiture on default, they will always be careful to uphold the causeways.

Lastly, What profit to the undertakers? for we must allow them to gain, and that considerably, or none would undertake such a work.

To this it is proposed, first,

During the execution of this work, let them be allowed out of the stock 3000 l. per annum, for management.

Also, after the work is finished, so much of the 5000 l. per annum as can be saved, and the roads kept in good repair, let be their own; and if the lands secured be not of the value of 5000 l. a year, let so much of the eight years tax be set apart as may purchase land to make them up; if they came to more, let the benefit be to the adventurers.

It may be objected here, That a tax of 30,000 l. for eight years will come in as fast as it well can be laid out, and so no anticipations will be requisite; for the whole work proposed cannot probably be finished in less time; and if so,

	l.
The charge of the county amounts to	240,000
The lands saved eight years revenue	40,000
	<hr/> L. 280,000

Which is 13,000 l. more than the charge; and if the work be done so much cheaper, as is mentioned, the profit to the undertakers will be unreasonable.

To this I say, I would have the undertakers bound to accept the salary of 3000 l. per annum for management; and, if a whole year's tax can be spared, either leave it unraised upon the county, or put it in bank, to be improved against any occasion of building, perhaps, a bridge; or some very wet season, or frost, may so damnify the works, as to make them require more than ordinary repair. But the undertakers should make no private advantage of such an overplus; there might be ways enough found for it.

Another objection lies against the possibility of enclosing the lands upon the waste, which generally belongs to some manor, whose different tenures may be so cross, and so otherwise encumbered, that even the lords of those manors, though they were willing, could not convey them.

This may be answered, in general, That an act of parliament is omnipotent with respect to titles and tenures of land, and can empower lords and tenants to consent to what else they could not. As to particulars, they cannot be answered, 'till they are proposed; but there is no doubt but an act of parliament may adjust it all in one head.

What a kingdom would England be, if this design were effectually executed in all the counties of it! And yet I believe it is possible, even in the worst. I have narrowly observed, says the proposer, all the considerable ways in that impassable county of Suffolk, which, especially in some parts of the Wild, as they very properly call it, of the county, hardly admits the country people to travel to markets in winter, and makes corn dear at market, because it cannot be brought, and cheap at the farmer's house, because he cannot sometimes carry it to

market; yet even in that county would I undertake, says he, to carry on this design, and that to great advantage, if backed with the authority of an act of parliament.

I have seen, in that horrible country, the road 60 to 100 yards broad, lie from side to side all poached with cattle, the land of no manner of benefit, and yet no going with a horse, but at every step up to the shoulders, full of sloughs and holes, and covered with standing water. It costs them incredible sums of money to repair them, and the very places that are mended would fright a young traveller to go over them. The Romans mastered this work, and, by a firm causeway, made a highway quite through this deep country, through Dorking in Surrey, to Stansted, and thence to Okeley, and so on to Arundel; its name tells us what it was made of, for it was called Stone-Street, and many visible parts of it remain to this day.

Now should any lord of a manor refuse to allow 40 yards in breadth out of that road I mentioned, to have the other 20 made into a fair, firm, and pleasant causeway over that wilderness of a country?

Or would not any man acknowledge, that putting this country into a condition for carriages and travellers to pass would be a great work? The gentlemen would find the benefit of it in the rent of their land, and price of their timber; the country people would find the difference in the sale of their goods, which now they cannot carry beyond the first market town, and hardly thither, and the whole country would reap an advantage an hundred to one greater than the charge of it. And since the want we feel of any convenience is generally the first motive to contrivance for a remedy, I wonder no man ever thought of some expedient for so considerable a defect.—Thus far Mr Projector.

REMARKS.

Ancient Rome* was the center of a great number of magnificent highways, which run through all Italy: several of them crossed the Alps, the country of the Gauls, the Pyrenees, and the whole kingdom of Spain. One of them reached from Rome to Lyons, from Lyons to Rheims, and from Rheims to the Channel; it was carried on again in Great-Britain, and continued as far as Scotland. That which extended as far as Byzantium [Constantinople] was continued on the other side of the Hellespont, from Chalcedonia through Asia Minor, Syria, and Palestine, then winding through the Isthmus of Suez, which joins Asia and Africa, passed through Egypt, as far as Syene, and thence into Ethiopia. There were others that ran along the coasts of Africa, from one end of it to the other; and hence possibly the Romans borrowed the model of their paved ways.

* See the History of the Highways of the Roman Empire, by Nicholas Bergier, counsellor at the court of Rheims; a very curious and learned work, and too little read.

If we compare the remains of the Roman roads with the best of our modern ones at present, we shall find many of the former that have stood firm and intire for above 1000 years, without any repairs, while ours want reparation two or three times, and oftener, a year.

If the Roman highways, through any neglect to mend them in time, are decayed and broken down in some places, at this time of day, yet there are several countries where they still remain whole and intire. The Appian Way, which was first carried from Rome to Capua, and afterwards continued from Capua to Brundisium, is still in good condition, though it has been a high road above 1900 years; and we have some ways in several parts of France, which have subsisted upwards of 15 or 1600 years. Now it is to their particular structure that we are to ascribe their long duration; which structure was as follows: They first of all laid open with a plough two parallel furrows; then the soldiers (for they were generally employed in the works of this kind in time of peace) carried away the light loose earth that they found betwixt the furrows, and dug 'till they came to a hard firm bottom: they then filled up the fosse, or bed which they had hollowed, with a more dense and weighty matter; as for instance, with a sort of hard sand, or gravel, taken out of the rivers, or dug out of the quarries: this done, they rammed the whole hard down, and smoothed it with heavy rollers; nor did they always end their work here, but oftentimes (to facilitate the draining off the water, and to prevent any mud or dirt from soaking in, which would infallibly undermine and loosen the whole) raised a terras, or causeway, several feet above the level of the plain, consisting of four layers, or stories, of strong masonry.

On the foundation of earth, which, as said before, was firmly compacted and levelled, they spread a covering of cement, made of lime and sand, or bassock, about an inch thick. The first layer, which they placed upon the cement, was of large flat stones, laid one upon another, ten inches high, and cemented together with well-tempered mortar: the largest stones of all were ranged along the sides of the causeway: this layer was called statumen.

The second layer consisted of stones of a cubical, round, or oval figure, and of many rough irregular stones, sometimes mixed

mixed with potsherds and pieces of broken tiles and bricks; all these were spread with a shovel over the first coat of stones, and rammed down into the mortar, which cemented them together: this second layer was about eight inches thick: this layer was called *rudas*.

The third layer consisted of a foot of mortar, not made of beaten tile, for that would have been too expensive, but of chalk, sand, or haddock, mixed with lime, as any of these materials were near at hand. This layer, which was sometimes called the pudding, or pap, though more commonly the nucleus, or kernel, filled up all the cavities or interstices in the inferior layers, and settled into a hard level coat. The great difficulty we find in breaking it now, sufficiently proves how firm a support this was to the upper covering, especially when we consider the extreme hardness of the inferior strata, with which it is so firmly incorporated, as to form one compact impenetrable body, capable of sustaining the greatest weight imaginable: this layer was called nucleus.

The fourth and last layer, which they called the crust, sometimes consisted of great hard stones, cemented together, as we find in the Apian Way; sometimes of gravel, or small flints mixed with gravel, as we find in most of the Roman military ways*.

* *Misson's Travels into Italy.*

The hardest stones of all the free-stone, and the largest sort of flints, they reserved for their towns. This layer was called *summa crusta*.

The small stones, flints, and gravel, were often brought hither from other parts, the country people being ordered to gather them in their vineyards, their heaths, and plowed lands, on the banks of rivers, and the sea-shores, and to bring and lay them by the highway-side, where the soldiers had occasion to use them in their work. Of these materials the Romans made a covering six inches thick, upon the third layer, and secured it on the sides with two borders of earth, which they consolidated with heavy stones, which they laid sloping, for the water to run off the causeway on the plain beneath, to prevent its soaking into, and thereby loosening the gravel. By means of this precaution, the traveller and carrier, in all seasons, enjoyed the benefit of a dry hard road. It sometimes happened that the flint pavement was loosened, by the falling down of the banks and borders which should support the road on the sides; but the internal layers being so closely bound and cemented, they did not suffer much by it, and the damage was easily repaired.

§ There would be no great hardship upon the country people who come for ten miles round to the London markets, and to all other markets throughout the kingdom, and go home with their carts empty, if they were obliged, by act of parliament, to carry a load of proper road materials gratis, to contribute to put the roads into this desirable condition.

† Our own soldiers, in times of peace, might also greatly contribute towards forwarding this good work, provided, during the time of their working at the roads, they had an addition of six-pence or eight-pence a day made to their pay, out of the stock appropriated to carry this design into execution. We have experienced the benefit of their labour in this shape, in the Highlands of Scotland; besides, by labour of this kind, they will be preserved more healthy, stout, and vigorous, kept from the vices and debaucheries which the idle profession of a soldier, in times of peace, is too apt to lead them into, and be better fitted to act in their military capacity, when public affairs required them; they will also be less odious, and esteemed less burthensome to the people in times of peace, when they experience they receive so great a benefit from their labour at so small an expence. And what barges are obliged to return empty from London, or any other considerable market-towns to which, by water-carriage, they may bring any commodity, should also be compelled, by the said act of parliament, to carry back gratis a load, or such a quantity as shall make up their load, of the best road materials that are to be met with the nearest to their river navigation; but they shall not be obliged to land them any where beyond, or out of the course of their necessary navigation; nor shall they land them but at the most convenient place nearest to the river-side where the road corporation shall order them: but neither the bargemen nor the land-market people shall be obliged to load or unload the said road materials, without some reasonable gratuity made them by the corporation. Likewise all coasting vessels, which now return empty into the country, shall be obliged to take a certain quantity of such road materials, when and where it may prove of benefit to the corporation, and no injury whatever to the employment of such vessels: nor shall the vessels be ever at any trouble in the loading or unloading such materials, without a reasonable gratuity from the said corporation. But lest any thing of this kind, though only of a temporary nature, should look too much with the aspect of arbitrary power, and be taken for a hardship, the road corporation might allow them the half price of their ordinary freight; and something of the like kind might be done in regard to the land carriage; which they may chuse to accept, rather than go empty.

Every one will readily apprehend the lasting strength and support that the roads must receive from the side walls and abut-

ments, raised to a due height, with proper drains to carry off the water, towards the sloping extremity of such side walls and abutments; for if they are made competently strong, they will so cement the road materials, as to render them as hard as a rock, and quite impenetrable; at least so durable and permanent, that, after the roads are effectually completed, they will require very little constant annual expence to keep them in repairs; and which expence, after the first, must be borne intirely by the road corporation, and the public, if I understand the projector rightly, to be for ever after free from all future tax or incumbrance whatsoever, all turnpikes be laid aside, and no toll or highway tax be ever more heard of in this kingdom.

ROMAGNA, or **ROMANIA**, a province in Italy, in the Pope's dominions, bounded on the east by the *Marcha d'Ancona*, along the river *Foglia*; on the south by the *Apennine Hills*, which part it from *Tuscany*; on the west by *Lombardy*, along the *Panero*; and on the north by the fens of *Verona* and the *Po*, and by part of the *Venetian gulph*.

This whole country is naturally very rich and delightful, and the plains and vallies productive of corn, wine, oil, fruits, and pastures for cattle. There are some large woods, which abound with all kind of game; and those parts which are contiguous to the *Adriatic Sea* furnish the country with a sufficiency of salt, both for itself and all the neighbouring inland territories. The sea, as well as their many rivers, supply it with plenty and variety of fish; and some of these being navigable, help to carry on an advantageous commerce. The people here are strong and laborious, and equally fit for arms, traffic, or learning; and the mountains yield mines of several metals, and the country hath various hot mineral springs, of excellent virtue for the preservation of health.

RAVENNA city hath the *Adriatic* on the east; the air is very healthy, and the vines in its neighbourhood furnish it with plenty of delicious wines; but as they have no fresh water but that of rain, the town often labours under a great scarcity of it.

CERVIA, situate in an unhealthy air, near the coast of the *Adriatic gulph*, 12 miles south-east from *Ravenna*, and 15 from *Rimini*. The air is so bad, and the place so thinly inhabited, that it doth not contain above 400 inhabitants: it has some salt-works, which bring in a considerable profit.

Rimini is pleasantly situated, on a spacious plain on the coast of the *Adriatic gulph*, at the mouth of the river *Marecchia*; it being seated between a fertile plain on one side, and hilly grounds on the other, covered with gardens, vines, olives, and fruit-trees.

FORLÌ, a city, situate 15 miles south-west of *Ravenna*; its territory is extremely rich and fertile, and produces not only plenty of corn, wine, oil, fruits, beans, and other pulse, but likewise great quantities of cummin, annise, and cardamum seeds; of fennugreek and saffron, both wild and cultivated; besides salt and mineral waters, marble, mill-stones, sulphur, &c. It is 46 miles round, and has four considerable dependencies on it. Here is an academy of wits, which has produced many learned men and works, in various arts and sciences.

FAENZA, an ancient city, famed, in regard to its trade, for a fine earthen ware, called by its name, and not inferior to the *Dutch Delft*, and for its fine linen manufacture.

ROMANIA, **RUMELIA**, or **RUMELI**, in Turkey, formerly a part of *Thrace*, a province of European Turkey, is bounded by *Mount Argemum*, or *Rhodope*, anciently called *Hæmus*, which separates it from *Bulgaria*, on the north; by the *Euxine Sea* and *Bosphorus*, or strait of *Constantinople*, on the east; by the *Propontis*, or sea of *Marmora*, and the *Archipelago*, on the south; and by another branch of *Mount Rhodope*, which separates it from *Macedon*, on the west; being near 300 miles long, and 130 broad. It is a fruitful country, abounding in good arable and pasture ground, but produces scarce any wine; and the mountains which divide it from *Bulgaria* and *Macedon* are exceeding cold and barren; but then they are of such difficult access, that no country is better defended naturally than this, being encompassed by the sea on the south-east, as it is by these mountains on the north-west: so that should the Turks be driven out of *Servia* and *Bulgaria* by the Christians, it would be difficult to penetrate further into the Turkish-empire.

In the mountains beforementioned are mines of silver, lead, and allum; but, through the laziness of the Turks, the riches that might be gathered from thence are lost. Its chief river is the *Mariza*, which rises at the foot of *Mount Rhodope*, and falls into the *Archipelago* at *Eno*, against the isle of *Samandracchi*. In this river it is said that gold sand is sometimes found, supposed to be washed down from the mountains.

The chief cities and towns are these, viz.

CONSTANTINOPLE, the capital of the whole Turkish empire, is seated at the most eastern point of *Romania*, on a neck of land, which projects towards *Natolia*, from which it is separated by a canal, or strait, about a mile broad; the sea of *Marmora* washes its walls on the south side, and a gulph of the canal of *Constantinople* waters it on the north.

This city with its suburbs, according to *Tournefort*, is the largest in Europe. Its situation, by general consent, is the

most agreeable, and the most advantageous of any in the whole world. It seems as if the canal of the Dardanelles, and that of the Black Sea, were designed on purpose to bring it the riches of the four quarters of the world: those of the Mogul, the Indies, the remotest north, China, and Japan, come by the way of the Black Sea; and by the canal of the White Sea, or sea of Marmora, come the merchandizes of Arabia, Egypt, Ethiopia, the coast of Africa, the West-Indies, and whatever Europe produces. These two canals are as the door of Constantinople; the north and south, which are the ordinary winds there, are, as it were, the two folds of the door: when the north wind blows, the door is shut, that is, nothing can come in from the southern coast; this door opens when the south wind prevails.

The port of Constantinople is commodious and magnificent; it is a basin seven or eight miles in circuit towards the city, and as much on the suburbs side. Its entrance, which is about 600 paces broad, begins at the point of the Seraglio, or Cape of St Demetrius situated in the south; this point opens to the east, and faces Scutari; Galata and Gallum-Pacha are to the north; lastly, it terminates to the north-north-west, where the river Lycus empties itself. This river is made up of two streams; the biggest, on which there is a paper-mill, comes from the west, and the other flows from the north-west. The Lycus is not every where navigable, and, therefore, there are stakes to point out the surest places. The stream that comes from the north-west is not practicable for boats farther than the village of Hali-bei-cui; the other is deep enough for about four miles. These streams are of wonderful use to cleanse the haven; for, descending from the north-west, they wash all the coast of Passim-Pacha and Galata, while part of the waters of the canal of the Black Sea, which descend from the north like a torrent, dash violently against the Cape of Bosphorus, and recoil to the right towards the west: by which motion they sweep away the mud that might gather about Constantinople, and, by a piece of natural mechanism, drive it on by degrees as far as the fresh waters. These fresh waters help to preserve the shipping; for experience shews, that they are less subject to be worm-eaten in such ports where there is fresh water, than where there is salt: some fish too take greater delight in such water, and are better tasted.

The port of Constantinople abounds with tunny-fish; dolphins also sometimes appear in this port, in such numbers that it swarms with them: their teeth are made like a saw. Procopius, in commendation of the port of Constantinople, says it is a thorough port, that is, you may anchor in any part of it; and it is justly observed by him, that the ships there have their prow on land, while the poop is in the water. In shallower places you go over a plank into the biggest ships; so that there is no occasion for a boat to load or unload them. If the Turks would bend their thoughts to navigation, they might make themselves formidable that way, for they have the best harbours of any in the Mediterranean; they would be masters of all the trade to the East, by favour of their ports in the Red Sea, which would open them a door in the East-Indies, China, Japan, places which the Christians cannot reach without doubling the Cape of Good Hope; but the Turks hug themselves at home, pleased to see all the nations in the world come to them. Nothing but the east wind can disturb the port of Constantinople, it being intirely exposed to it; whenever it blows hard from that quarter, especially if it be in the night, it occasions a frightful hurley-burley, for the seamen make such a bawling, and dogs such a barking, that one would think the town was going to be swallowed up, if one were not apprized of the cause of it.

The bazars, or bezzins, are places like our changes, for selling fine wares of all sorts. The old and new bazars stand pretty near each other; there are large square buildings, covered with domes, supported by arches and pilasters. In the old one there is but little fine merchandize! it was built in 1461. Here they sell all sorts of weapons, especially sabres, and likewise horse-barnesses, some of which are enriched with gold, silver, and precious stones. The new bazar is replenished with all manner of merchandizes; and though there be none but goldsmiths-shops, yet they sell furs, vests, carpets, stuffs of gold and silver, silk, goats-hair, &c. nor is it without jewels and China wares. They were repairing it when Mr Tournefort was at Constantinople, in the year 1700; and he tells us that it would be much more lightsome than it was before, and there would be apartments for officers to have the guard of it, and go their rounds night and day. The goods are well secured in these places, the gates being shut betimes. The Turks retire to their own homes in the city, but the Christian and Jewish merchants cross the water, and return the next morning. See the article BAZAR.

The market for slaves of both sexes is not far off. Here the poor wretches sit in a melancholy posture: before the buyers cheapen them, they turn them about from this side to that, survey them from top to bottom, put them to exercise whatever they have learned, and this several times a day, before ever they come to an agreement. Such of them, both men and women, to whom nature has been niggardly of her charms, are set apart for the vilest services; but such girls as have youth and beauty pass their time well enough, only they are

often forced to turn Mahometans. The retailers of this human ware are the Jews, who take great care of the slaves education, that they may sell the better. Their choicest they keep at home, and thither you must go if you would have better than ordinary; for it is here as it is with markets for horses, the handfomest do not always appear, but are kept within doors. These Jews teach their beautiful slaves to dance, sing, play on instruments, and every thing else that may inspire love. Sometimes they marry very advantageously, and feel nothing of slavery; they have the same liberty in their houses as the Turkish women themselves. One sees incessantly coming from Hungary, Greece, Candia, Russia, Men-grilia, and Georgia, swarms of young wenches, designed for the service of the Turks. The sultans, the bassas, and the greatest lords, often chuse their wives among them. The women whom fortune allots to the seraglio, are not always the best disposed of: it is true, a poor shepherd's daughter may come to be a sultana; but then, what numbers of them are neglected by the sultan! After the Grand Signior's death, they are shut up for the rest of their days in the Old Seraglio, where they pine themselves away, unless some bassa courts them. This Old Seraglio was built by Mahomet II. Here are confined these poor wretches, to bewail at leisure the death of a prince, or that of their children, whom the new sultan often causes to be strangled. It would be a crime to shed a tear in the seraglio where the emperor resides: on the contrary, every body strives to express their joy for his accession to the throne. This Old Seraglio, called by the Turks Eski Serai, is inclosed with a wall 24 spans high, for two miles in compass, within which are lodgings and gardens for those ladies diversions. There is no going into it, the gate being guarded by janizaries and capigis.

Instead of inns at Constantinople, and indeed all over Turkey, they have public buildings, called caravanferas, or kans, erected in convenient parts of the city, for the markets, and traffic of different commodities. These are for all men, of what quality, condition, country, or religion soever they be. See the article CARAVANSERA.

ADRIANOPLE is about 110 miles from Constantinople, towards the north-west; 85 from the confines of Bulgaria, to the south; and 175 from the straits of the Dardanelles, to the north. It is inhabited by Greeks, Jews, Armenians, Turks, and Walachians, and other nations. There is in this city a beautiful exchange, half a mile long, called Ali-Bassa, taking its name from its founder. It is a vast arched building, with six gates, and contains 365 noble shops, including those that are under the arch of the great gate; they are furnished with all sorts of rich goods, and kept by Turks, Greeks, Armenians, and Jews, who pay five piastres, or crowns, a month for each of them, to the founder's heir, or to such as have purchased them, and half a piastre to the mosque of Vicereli, granted by the Grand Signior, to whom it belonged. Near this exchange is a street called Seraci, full of good shops; with all sorts of commodities, which affords a delightful fight for a mile in length.

NICOPOLI, situate on the left bank of the river Nessio, near the confines of Macedonia, is a place of pretty good trade.

GALLIOLI, in Turkish JEBBOLE, is a place of great trade, by reason of its convenient situation, being in the way to Constantinople and Adrianople; inasmuch that the bassa who governs it makes about 1000 crowns a year of it, besides the profits of the cadi, aga, and other officers.

The famous canal which separates the two fairest quarters of the earth, Europe and Asia, is called the Hellespont, the Strait of Gallipoli, the canal of the Dardanelles, the Arm of St George, or the Mouth of Constantinople. This canal is in a fine country, bounded on each side with fruitful hills, on which you see sometimes vineyards, sometimes olive-plantations, and a deal of arable land. As you go in, you have Thrace and Cape Greek on the left-hand; Phrygia and Cape Janizary on the right; the Propontis, or sea of Marmora, presents itself on the north, and the Archipelago remains behind on the south. The mouth of the canal is four miles and a half over, and is defended by the new castles built in 1659, to secure the Turkish fleets against the insults of the Venetians, who used to attack them in the sight of the old castles. The waters that pass through this canal, out of the Propontis, are as rapid as if they flowed beneath a bridge, and, when the north wind blows, no ship can enter; but, when it is south, you hardly perceive any current at all; you must only beware of the castles, and yet the passage might be forced without much danger, the castles being above four miles asunder: the Turkish artillery, however monstrous it appears, would not much annoy the ships, if they had a good wind, and went in a file. Such merchants ships as come from Constantinople, stop three days at the castle on the Asiatic shore, to search whether they have any of the Turks slaves on board; and yet there passes not a day but some or other of these poor creatures make a shift to escape. No ship of war, of whatever nation, is exempted from being thus visited, without an express order from the Porte: it is true, it is rather a ceremony than a search. See LEVANT TRADE, ORIENTAL TRADE, and TURKEY TRADE.

ROYAL EXCHANGE, a commodious and elegant building in the city of London, for the convenient public meeting, at stated hours, of the merchants, eminent tradesmen, brokers, agents, and all who have commercial business to transact, by either buying or selling commodities, making contracts, or drawing or remitting monies, either within the three kingdoms, or on or to foreign countries, by the means of bills of exchange.

An idea of the ROYAL EXCHANGE OF LONDON, as given by Mr Addison, afterwards secretary of state to his Majesty George I.

‘ There is no place in the town, says he, which I so much love to frequent as the Royal Exchange. It gives me a secret satisfaction, and in some measure gratifies my vanity, as I am an Englishman, to see so rich an assembly of my countrymen and foreigners consulting together, upon the private business of mankind, and making this metropolis a kind of emporium for the whole earth. I must confess, I look upon high change to be a great council, in which all considerable nations have their representative. Factors in the trading world are what ambassadors are in the politic world: they negotiate affairs, conclude treaties, and maintain a good correspondence between those wealthy societies of men that are divided from one another by seas and oceans, or live on the different extremities of a continent. I have often been pleased to hear disputes adjusted between an inhabitant of Japan and an alderman of London, or to see a subject of the Great Mogul entering into a league with one of the Czar of Muscovy. I am infinitely delighted in mixing with these several ministers of commerce, as they are distinguished by their different walks and different leagues. Sometimes I am jostled among a body of Armenians; sometimes I am lost in a crowd of Jews; and sometimes make one in a group of Dutchmen: I am a Dane, Swede, or Frenchman, at different times; or rather fancy myself like the old philosopher, who, upon being asked what countryman he was, replied, That he was a citizen of the world.

Though I very frequently visit this busy multitude of people, I am known to nobody there but my friend Sir Andrew, who often smiles upon me as he sees me bustling in the crowd, but, at the same time, connives at my presence, without taking any further notice of me. There is, indeed, a merchant of Egypt who just knows me by sight, having formerly remitted me some money to grand Cairo; but as I am not versed in the modern Coptic, our conferences go no further than a bow and a grimace.

This grand scene of business gives me an infinite variety of solid and substantial entertainment. As I am a great lover of mankind, my heart naturally overflows with pleasure, at the sight of a prosperous and happy multitude; inasmuch that, at many public solemnities, I cannot forbear expressing my joy with tears, that have stolen down my cheeks. For this reason, I am wonderfully delighted to see such a body of men thriving in their own private fortunes, and, at the same time, promoting the public stock; or, in other words, raising estates for their own families, by bringing into their country whatever is wanting, and carrying out of it whatever is superfluous.

Nature seems to have taken a particular care to disseminate her blessings among the different regions of the world, with an eye to this mutual intercourse and traffic among mankind, that the natives of the several parts of the globe might have a kind of dependance upon one another, and be united together by their common interest. Almost every degree produces something peculiar to it. The food often grows in one country and the fauce in another. The fruits of Portugal are corrected by the product of Barbadoes; the infusion of a China plant sweetened with the pith of an Indian cane; the Philippic Islands give a flavour to our European bowls. The single dress of a woman of quality is often the product of an hundred climates: the muff and the fan come together from the different ends of the earth; the scarf is sent from the torrid zone, and the tippet from beneath the pole; the brocade petticoat rises out of the mines of Peru, and the diamond necklace out of the bowels of Indostan.

If we consider our own country in its natural prospect, without any of the benefits and advantages of commerce, what a barren uncomfortable spot of earth falls to our share? Natural historians tell us, that no fruit grows originally among us besides hips and haws, acorns and pignuts, with other delicacies of the like nature; that our climate of itself, and without the assistance of art, can make no farther advances towards a plum than to a stone, and carries an apple to no greater perfection than a crab; that our melons, our peaches, our figs, our apricots and cherries, are strangers among us, imported in different ages, and naturalized in our English gardens; and that they would all degenerate and fall away into the trash of our own country, if they were wholly neglected by the planter, and left to the mercy of the sun and soil. Nor has traffic more enriched our vegetable world, than it has improved the whole face of nature among us. Our ships are laden with the harvest of every climate; our tables are stored with spices,

and oils and wines; our rooms are filled with pyramids of China, and adorned with the workmanship of Japan: our morning's draught comes to us from the remotest corners of the earth; we repair our bodies by the drugs of America, and repose ourselves under Indian canopies. My friend Sir Andrew calls the vineyards of France our gardens, the Spice Islands our hot-beds, the Persians our silk-weavers, and the Chinese our potters. Nature, indeed, furnishes us with the bare necessities of life, but traffic gives us a great variety of what is useful, and, at the same time, supplies us with every thing that is convenient and ornamental. Nor is it the least part of this our happiness, that, whilst we enjoy the remotest products of the north and south, we are free from those extremities of weather which give them birth; that our eyes are refreshed with the green fields of Britain, at the same time that our palates are feasted with fruits that rise between the tropics.

For these reasons, there are not more useful members in the commonwealth than merchants. They knit mankind together in a mutual intercourse of good offices, distribute the gifts of nature, find work for the poor, add wealth to the rich, and magnificence to the great. Our English merchant converts the tin of his own country into gold, and exchanges his wool for rubies. The Mahometans are clothed in our British manufacture, and the inhabitants of the frozen zone warmed with the fleeces of our sheep.

When I have been upon the change, I have often fancied one of our old kings standing in person, where he is represented in effigy, and looking down upon the wealthy concourse of people with which that place is every day filled. In this case, how would he be surprized, to hear all the languages of Europe spoken on this little spot of his former dominions, and to see so many private men, who in his time would have been the vassals of some powerful baron, negotiating, like princes, for greater sums of money than were formerly to be met with in the royal treasury? Trade, without enlarging the British territories, has given us a kind of additional empire. It has multiplied the number of the rich, made our landed estates infinitely more valuable than they were formerly, and added to them an accession of other estates, as valuable as the lands themselves.

R E M A R K S

ON THE ROYAL EXCHANGE, with regard to private Traders.

From this just, beautiful, and elegant description of this assembly of traders, an idea may be formed, not only of their usefulness to the state, but what their general conduct ought to be upon this public stage of action; for here the eyes of traders are like those of Argus upon each other, and the least faux pas in the management and negotiation of their private concerns, may bring instantaneous ruin upon individuals, although they may really be men of large fortunes, and even of an extensive and a boundless credit.

As a memento, therefore, to the younger and less experienced class, we shall presume, from a desire of being as useful as we can to the rising generation, to point out some of those shoals and rocks, on which numbers have split in their adventures, from their misconduct on the Royal Exchange; to the end that this commercial chart of ours, wherewith we present them, may guard them against those evils.

To which purpose, we shall consider the principal relations wherein traders are under a necessity of acting upon the exchange towards each other, and towards those, who may act in any capacity subservient to their interests.

And (1.) With regard to brokers, who are concerned as middle agents between trader and trader, in relation to drawing and remitting monies by bills of exchange.

We shall first consider the drawer, who has occasion to dispose of his credit in paper. And herein there is no little delicacy requisite on his side; for as these exchange agents [the brokers in bills of exchange] are presumed to know, in the course of their alterations, the quantity of exchange-bills that are to be disposed of on a post-day, as well as the quantity wanted to any peculiar foreign part, they can often, in an hour's time, discover how this matter stands, and thereby become masters of the plenty or scarcity of bills to be sold, as well as the quantity required to be purchased.

When this is known (bills of exchange being considered like another commodity to be bought and sold) the broker, by his private consultation between the buyer and seller, or the drawer and remitter, has it in his power to discern, and in a great measure to fix the price of exchange for such bills. But as it is his interest to execute as much business in a post-day as he can for the sake of his commission, he will not be remiss in bringing those contracts to as speedy a conclusion as he can, for the sake of gaining brokerage for his agency.

The seller and buyer also are heedful to their interest, the one to get as advantageous terms for his bills as he can, the other to get them as cheap as the plenty or scarcity will admit of. It is, however, the interest of the broker to oblige both parties, and as there are a certain number of these brokers, who are upon the wing to rival each other, it is the interest of every individual to catch at all the business he can

left, during change time, he should be supplanted by any of his brethren, and thereby lose his commission. Thus several of these brokers applying both to drawers and remitters, they feel out the market price by these altercations; and the remitters may judge from the brokers' intercourse, who seem eager to fall their bills below the market price, and a drawer may also judge from the price bid, who seem to be under the necessity to remit.

In the course of these money-negotiations between the principal parties concerned, there arises a crisis of great delicacy, in relation to the personal credit of both, and the broker will easily discern it. For if the seller offers his bills at under rate, or the buyer bids more than men of the best credit upon the exchange, here naturally arises a suspicion both on the side of the drawer and remitter; the latter may from hence distrust the goodness of the bill, and the former may doubt whether his money may be punctually paid, when he has parted with his bill, although the time of payment is short. In these transactions, therefore, both parties will be upon their guard, lest in the conduct of these concerns, their personal credit should suffer upon the change; for the principals should not only consider, that their credits are in the power of each other on such occasions, but likewise in the power of the brokers, whom they employ, and who may possibly afterwards give out such secret innuendoes, that may in one post ruin a trader's reputation, though he may be a man of substance.

Nor is any thing attended with more unhappy consequences to a trader, than the appearance of drawing and redrawing upon the exchange; for this is construed as an indication of a man's over-trading, or of his declension in credit and fortune. Necessities of this kind generally proceed from over-trading, and it is to be feared that there are more traders undone by undertaking too much, than for want of trade. Over-trading is like over-lifting among strong men; vain of their strength, and pride prompting them to put it to the utmost stretch, they at last attempt something too heavy, and become cripples ever after.

Though the discounting of bills of exchange by the bank of England and bankers, is a common practice among traders, even of no indifferent repute, yet when too frequently practised, is a sign of want of competent capital wherewith to carry on the circle of their commerce; for who would allow 4 per cent. discount out of the profits of his trade, if he could do without it? This is another sign of over-trading, and is construed so by the exchange, notwithstanding many are weak enough to think that no one remarks it.

Too many frequently desiring the favour to over-draw on their banker with whom they may keep cash, is construed upon change as another token of declension, or over-trading; and although traders may flatter themselves that these things remain secrets and unknown, yet if often practised, even by pledges in bankers hands, I could tell them how they are generally blown; but this is not my business. If some should not be generous enough in their own breast to thank me for the hint, that shall not prevent my good offices to others, whose gratitude I have experienced.

Traders that use the exchange giving out promissory notes, is no symptom in favour of a trader, though it may not always be imprudent. A few years since, practice of this kind gave an alarm in the city of London, when it was discovered, that several traders had entered into a combination to support each others credit, which proved to be rotten at bottom, by the mutual loan of promissory notes. If a man really possesses a tolerable fortune, and he plunges in trade so far out of his depth, as to need the practice of such artifices, it will in the end ruin the little credit and fortune he may have: but such I am afraid, as well as others, are too apt to flatter them, as great sinners do, that their mal-practices are concealed from all but themselves; when, from the nature of such things being carried on in the heart of the metropolis, and, as it were, within the scent of the Royal Exchange, they will soon be smelt out from the general intercourse of transactions among men of business.

There are two principal causes that may be properly called over-trading in a young beginner, and by both which traders are overthrown. (1.) Trading beyond their stock. (2.) Giving too large credit.

A trader ought to measure well the extent of his own strength; his stock of money and credit is properly his beginning, for credit is a stock as well as money: he that takes too much credit, is not in less danger than he that gives too much: and the danger lies particularly in this, if the tradesman over-buys himself, that is, buys faster than he can sell; by his buying on credit, payments, perhaps, become due too soon for his compliance therewith: though the goods are not sold, he must answer the bills, upon the strength of his proper stock, that is, he must pay for them out of his own cash: if that should not hold out, he is obliged to put off his bills after they are due, or suffer the impertinence of being dunned by the creditor, and perhaps by servants or apprentices, and that with the usual indecencies of such kind of people.

This greatly impairs a trader's credit, and if he has any further dealings with his former creditors, he is treated like an

indifferent paymaster: if he bargains for six months, they know he will take eight or nine in the payment, and this they consider in the price, and use him accordingly, and this impairs his gain: so that loss of credit is indeed loss of money, and this weakens him both ways.

The trader that buys warily, generally pays surely, and every young beginner ought to buy cautiously. Some tradesmen pride themselves on seeing their shops well stocked, and their warehouses full of goods; this is a snare to them, and induces to the purchase of more goods than they can vend suitably to the credit they take, or the capital they possess; it is a foolish as well as a fatal error, whether it lies in their judgment or their vanity; except in some retail trades, where a great choice of goods is absolutely necessary, or a trader will want trade on that account; otherwise an experienced trader had rather see his warehouse rather sparingly filled, than overstocked: if it be too empty, he can supply its deficiency when he pleases, if his credit be good, and his cash strong; but a thronged warehouse is a sign of the want of customers, and of a bad market; whereas an empty warehouse is a sign of a quick demand. This conduct will support a man's credit on change and elsewhere, in foreign countries as well as in his own.

He then that keeps his credit unshaken has a double stock; we mean, it is an addition to his real stock, and often far superior to it. I have known several traders in the city of London, who have traded to a considerable degree very successfully, and yet have had a very trifling capital, and some not a shilling of their own; but by the strength of their reputation, being prudent and assiduous, and having preserved the character of honest men, and the credit of their business by cautious dealing and punctual payments, they have gone on 'till the gain of their trade has effectually established them, and they have raised good estates out of nothing.

He that takes credit in trade may give credit, but he must be exceeding vigilant, for it is the most dangerous state of life that a trader can live in. If the people he trusts fail, or fail but in punctual compliance with him, he can never support his own credit, unless he inviolably observes the preservative maxim not to give so much credit as he takes: that is, he must either sell for shorter time than he takes himself, or in less quantity; the latter is the safest, that he should not trust so much as he is trusted with. If indeed he has a large real capital; besides the credit he takes, that alters the case; a man that can pay his own debts, whether other people pay him or no, that man is out of the question: but if such a person trusts beyond the extent of his stock and credit, even he may be overthrown too.

Could the trader buy all upon credit, and sell all for ready money, he might turn usurer, and put his own stock out to interest, or purchase land with it; but as that is not the case, he should to restrain his liberty of buying and selling, as never to give so much credit as he takes, by one third part at least.

By giving credit, we mean that even all the goods which a trader buys at home or imports from abroad upon credit, may not be sold upon credit: perhaps there are goods which are usually sold so, and no otherwise: but the alternative lies before him thus, either he must not give so much credit in quantity of goods, or not so long credit in relation to time: to explain ourselves.

Suppose a trader buys 10,000 l. value of goods on credit, and this 10,000 l. are sold for 11,000 l. likewise on credit, if the time given be the same, the man is in a state of apparent destruction. Perhaps he owes the 10,000 l. to twenty creditors, perhaps the 11,000 l. is owing to him by 200 debtors: it is scarce possible that these 200 petty customers (if that be his way of dealing) should all so punctually comply with their payments as to enable him to comply with his; and if 2 or 3000 l. fall short, the tradesman must be inevitably undone, unless he has a fund to supply the deficiency. But, if a trader had bought 10,000 l. in goods at 6 or 8 months credit, and had sold them all again to his 200 customers, at three or four months credit, then it might be supposed that all, or the greatest part of them, would have paid time enough to enable him to make the payments on his side good; if not, all would be lost still.

On the other hand, suppose he had sold but 3000 l. worth of the 10,000 l. for ready money, and the remainder at six months credit, it might be supposed that the 3000 l. in cash, and what else the 200 debtors might pay in time, would satisfy such trader's creditors, 'till the difference might be made good: so easy a thing is it for a man to lose his credit in trade, and so hard is it upon such a blow to retrieve it again: should not therefore the trader most effectually guard as well against running too far into debt himself, as to suffer others to run too deeply in his debt? For if his debtors do not pay him, he cannot pay his creditors, and the next thing is a commission of bankruptcy: thus a trader may be undone, although he has 11,000 l. wherewith to discharge 10,000 l. Though it is not possible to carry on the extent of trade we do in this kingdom, without a reciprocal credit both taken and given; yet this is so nice and tender a point, that perhaps, as many traders fail by giving, as by taking too much credit.

There

There are divers other ways of over-trading, besides this of taking and giving too much credit; one of these is the running into projects and large undertakings, either out of the trader's ordinary road, wherein he is already engaged, or grafting at too many undertakings at once: in both which cases the trader is often wounded, and sometimes too deeply to recover. For such adventurers generally stock-starve the trader's ordinary business, which is his principal constant support; and as schemes out of the way of a trader rarely add to his credit, so if they lessen his stock, they weaken him in both his grand supports, and it is no wonder that he at length sinks.

The prudent and safe trader is he, that avoiding all such remote excursions, keeps close and steady within the verge of his own concerns, and exerts his whole attention and abilities in his shop, his warehouse, or his counting-house, to what he well understands, and confining himself to what belongs to him there, goes on in the road of his business without launching into unknown oceans; and content with the gain of his own trade, is neither, by too much ambition or avarice, tempted to be greater or richer by such uncertain and hazardous attempts. See the article PROJECTOR. See also the article CREDIT [PRIVATE CREDIT], wherein I have endeavoured to shew, both in a personal and a national light, the necessity of all traders carrying on their affairs in general less by credit, and more by ready money.

Credit on a public exchange, and among the commercial world, within the compass of a man's concerns, is so much a trader's blessing, that it is the choicest ware in which he deals; he cannot be too tender of so estimable a jewel, or purchase it too dear when he stands in need of it: it is a stock to his warehouse, it is current cash in his chest, it accepts all his bills, for it is on the fund of his credit that he has any to accept: demands otherwise would all be made upon the spot, and he must pay for his goods before he had them: in a word, it is the life and soul of his trade, and it requires the utmost attention and vigilance to maintain and preserve it.

If then a trader's own credit should be of so much value to him, and he should be so delicate in his concern about it, ought he not, in some degree, to have the same care of his neighbours? As a good name is to a man better than life, as the wife man says, so is credit to a trader; it is the life of his traffic; and he that wounds such a man's credit without cause, is as much a murderer in trade, as he that kills a man in the dark is a murderer in matters of blood. There is a peculiar nicety in regard to the credit of a trader, which does not reach in other cases: any other person who is stigmatized in his character or reputation, it is injurious to him: if it comes in the way of marriage, or a preferment in any shape, it may greatly disappoint and prejudice him only for a time: but if this happens to a trader, he is instantly and inevitably blasted and undone. A trader's credit and a maid's virtue, ought to be faced against the tongues of defamation; and yet how many traders have been thus undone, and how many more have been put to the full trial of their strength in trade, and have stood their ground by the mere force of their good circumstances! Whereas had they been unfurnished with cash to have answered their whole debts, they must have fallen with the rest. There have been instances, not only on the London exchange, but that of other places of the like kind, where groundless rumour, invidious calumny, and even mean and artful innuendoes, have greatly hurt, and sometimes ruined, the characters of worthy and substantial traders. Have we not lately had a most notorious instance, as appeared in our courts of law, of a vile and infamous attempt to ruin the credit of two very worthy and honourable merchants of the city of London? When I mention the names of a F—t—d and C—k—t, every one acquainted with the true characters of these gentlemen, and of the circumstances of this late affair, I am persuaded, will think that I have herein done nothing more than justice to the characters of these eminent traders.

A trader's reputation is of no less nicety than a blight upon a fine flower; if it is but touched, the beauty, or flavour of it, or the seed of it is lost, though the noxious breath which touched it, might not reach to blast the leaf, or hurt the root; the credit of a trader, especially in his beginning, is too much at the mercy of every enemy he has, 'till it has taken root, and is established on a solid foundation of good conduct and prosperity. Every idle tongue can blast the character of a young trader: though we would not discourage, yet we would alarm young beginners, and apprise them of the storm and scandal which they may expect upon the least slip they make. If they but stumble, fame will throw them down; if they recover, she will, indeed, as fast set them up; but calumny generally runs before, and bears all down with it; and there are ten, perhaps, who fall under its weight, to one that is raised again by the hurry of report.

Nor have only young traders been often the sacrifice of obloquy; I could point out many instances like those of the honourable, though imprudent Woodwards, late bankers in Exchange-alley. There was a time too, when Lombard-street was the only bank, and the goldsmiths there were all called bankers; the credit of their business was such, that the like in private hands has not since been seen in England.

Y O L. II.

Some of those bankers had above a million and an half of paper-credit upon them at a time.

On a sudden, like a clap of thunder, king Charles the 1st shut up the Exchequer, which was then the common center of the overplus cash, which these bankers had in their hands: and what was the consequence? Not only the bankers who had the bulk of their cash there, but all Lombard-street stood still with astonishment; the very report of having money in the Exchequer, brought a run upon the bankers that had no money there, as well as upon those that had; and not only Sir Robert Viner, Alderman Backwell, Farrington, Forth, and others, broke and failed, but several were ruined, who had not one penny of money in the Exchequer, and only sunk by the rumour of it, which gave a check to the whole credit of Lombard-street.

But these are such days, that we have never seen since the happy Revolution; no princes that ever reigned in this kingdom, have been so tender of the public credit, as those of the royal house of Hanover; and would our British traders in general, be as solicitous to preserve their own personal credit, and that of their fellow traders, unfulfilled, as our present most gracious sovereign is to maintain them in their legal rights and liberties, the traders of Great-Britain would be a match in point of skill and address, in their commercial affairs, for those of any, or indeed for those of all nations in the world. And while every individual is vigilantly upon his guard, honourably and judiciously to uphold and maintain his own credit, and do no injury to that of other traders, the whole body will become, as it were, a united corps, and may, by dint of their ingenuity and their large capitals, (which in the general are superior to those of most nations) rival the traders of every other state or empire.

As the preservation of the personal credit of our British traders in general, is not only of the greatest importance to themselves and families, but likewise of unspeakable benefit to the state, I hope I shall be excused if I urge a word more upon a topic so interesting and national, more especially to the rising generation of our traders.

Among the various steps of misconduct that have a tendency to injure and ruin the trader, that of borrowing money (imprudently) upon interest is not the least. He that borrows upon interest, should inviolably apply the loan to stop the breach, which made it first necessary to him to borrow; otherwise, such loan will sink him deeper into the calamity than it found him; he ought to consider, whether he may not be as hard distressed to pay back the loan, as the debts which it was intended to discharge, and whether he may not want money as much then as before.

There is a vulgar error in trade, concerning the borrowing money upon interest: some think that no man should borrow on interest, but he whose necessity obliges him to do it, for the immediate support of his credit, and prevention of his ruin, and that as soon as he is able he should refund it, to free himself from the payment of interest: this is carrying the matter to a more rigid extreme than it ought, and there may be some exceptions to this, as there are to most general rules.

Some ready-money dealers are yet obliged to keep such vast stocks of goods by them unfold, that they are sometimes undone by that means; but he that buys for credit, and sells for ready money, or less credit than he bought for, is always safe, and he may safely borrow money upon interest, for any considerable sum: the reason is obvious; his trade must increase in proportion to the loan which he takes up; if not, he has no use for the money he borrows, and will return it of course. But if he fees that he can employ more money than he has, and that he can certainly gain more than the interest he pays will balance, and that he can make his returns in due time, he then knows, how much money he may borrow, that he gains so much by it above the interest, besides the difference of the credit given and taken for exchange.

A. finds he has bought the value of 3000 l. in saltpetre, or pepper, at an India sale; but if he could buy 6000 l. value at the same rate, he has a customer for it, a very good paymaster, who will give him after the rate of 8 per cent. profit; whereas if he does not buy that quantity, such a man will. Upon this A. borrows 3000 l. at 5 per cent. interest of a scrivener, and he buys the goods, sells them again for 3 per cent. profit more than the interest he pays comes to, and has his money in cash again, time enough to repay the scrivener. At this way of calculating, A. is sure to gain 3 per cent. whereby he gains good profit, without any hazard, as it were: and if he has a return sooner, as may be the case, then he gains so much more, as the difference of the money comes to, at 5 per cent. per ann. for the difference of time.

On the other hand, he that gives longer credit than he takes, though he gains 10 per cent. and pays but 5 per cent. may gain nothing. Example: Suppose he is trusted but 6 months, and he trusts his customers 12 months; if he pays 5 per cent. interest for the money, and yet should sell the goods for 10 per cent. profit, it is plain he gains nothing, and acts with disadvantage into the account; because he runs the risk of the person he trusts, and makes no profit, either for his trouble or hazard.

By the trusting of customers twelve months, we would not suggest that any trader in his wits should sell his merchandise by contract for a year's credit, and for that time to tie up his hands, that he cannot demand his money before. What we mean is, according to the ordinary usage of trade: Example: A wholesale man deals with another, a shopkeeper, and trades with him upon the general credit of his dealing; the shopkeeper goes on buying and paying; he does not examine when the payment for every particular parcel of goods is due, but he buys as his occasions require goods, and he pays as he can spare money; and as he is a current man, and purchases large quantities, he is esteemed a good customer; yet if we look into his accounts, his parcels and his payments answer one another, perhaps, after the rate of 9 to 10 and 12 months credit, nor does he think himself a bad paymaster; and yet, if the wholesale dealer with whom he trades, paid interest of 5 per cent. for his money, unless he got more than 10 per cent. by this customer, he would lose money by all the goods which he sold him.—This is a reflection that every tradesman ought to make, and well to consider, who may incline to take up money at 5 per cent. interest.

Besides, if all the while any part of the money-borrower's goods remain in the warehouses unfold, and all that while he pays interest for the money that bought them, this article of interest-money, if exactly deducted from the profits, eats through the whole bargain; and if such trader would keep an accurate account of profit and loss, he would experience that such conduct would destroy the whole profits of his trade. In a word, interest of money is a canker-worm in trade, eats through and through the trader, and insensibly consumes him; and few traders, we fear, state to themselves this matter in a true light; for whatever loss the trader meets with, the money-lender must be duly paid his interest: and with whomsoever the trader compounds, the money-lender makes no composition, unless he is forced, by the ruin of the trader, to compound for principal as well as interest, when, perhaps, by the mere interest, he has received doubly his principal.

If it be thus fatal to the trader to pay but the legal interest of 5 per cent. for his money, how deplorable must his case be, when he is oppressed either by the lender, the procurer, the scrivener, or banker, under the sly and ruinous article called procurator, continuation, premio, and the like? And this extortion is made when the debtor is apparently in need of the loan, or that it appears he is not in a condition to refund the money: and although, perhaps, the creditor has good security for his money, yet those people never want pretences and artifices, somehow to hook in new and frequent considerations, by way of addition to the ordinary interest-money.

There is another unhappy practice among the more necessitous traders, and which in the end is infallibly destructive and ruinous, at least as far as it is followed: this is passing and repassing promissory notes, or bills indorsed by one another reciprocally, and drawn upon themselves; for so it may properly enough be termed, for the present supply of cash, in which they are, in the long-run, even extortioners upon themselves.

This mischievous practice began principally among merchants trading in foreign parts, when at an extraordinary pinch for money: suppose it be, that the merchant has a ship come into the river, laden with wines, and he wants a sum of money immediately wherewith to pay the custom-house duties; which being done, will presently come to market, and reimburse his money.

The importer wanting cash for the purpose, and being in full credit on the exchange, and having a friend at Amsterdam, that he knows will honour his bills, he draws upon him for 2000 l. sterling, payable at two usances: upon this draught he immediately receives the money upon the exchange, for the exchange is the merchant's bank on such occasions as these: having thus taken up the money on the credit of his bills, he lands his wines, or whatever other goods they are; sells a large quantity of them on the keys, and getting in a competent sum to answer it, he immediately takes care of his credit, and of his friend at Amsterdam: and having paid but one month, and his bills being payable at two months in Amsterdam, he punctually remits 2000 l. to his friend there in good bills, to answer his first draught upon him, and remits the like sum at usance; so that his friend, experiencing in this case, how careful he is of his honour, is ready to accept any bills for him another time: thus far this transaction is carried on with reputation; and though a merchant drawing, may have some small loss, by remitting at a shorter time than his draught was made for, yet that is not considerable, the service done him upon such an exigence requiring it, and merchants of the best figure are sometimes obliged to serve themselves with ready money in such a manner.

But supposing the merchant finds, that though his wines are landed, and perhaps sold, yet he has other pressing occasions which call for his money, and he cannot remit to Amsterdam to answer his draught: hereupon he contrives another shift to keep the money two months longer; which is by ordering his friend at Amsterdam to redraw upon him at London at two usances; which he at Amsterdam does accordingly, and

his bills being accepted here, the merchant at Amsterdam is fully satisfied, and the drawer's credit remains good at London. But, in this case, the merchant at London becomes an extortioner upon himself; for, besides the loss by the exchange, which is generally against him, because he cannot, like a man that draws or remits for the advantage of the exchange, wait, and take it this way or that way, as the course of exchange may be most to his benefit; so his necessity at first, and his credit at last, pressing him to draw when he had occasion, and be drawn upon just as bills become due, his necessities also oblige him to run the risk, and take his chance for the course of the exchange; and this is frequently to his disadvantage. Besides this, his friend at Amsterdam must have his commission, both for the payment of his bills, and again for drawing, with the charge of brokerage both upon the exchange of London and Amsterdam, with postage of letters, and other incidents: nor does the matter end here.

When the two usances are towards expiring, and that, on such an approaching day, his bills from Amsterdam will become due, and must be paid or his credit ruined, and perhaps his friend at Amsterdam too; and being not yet in cash to answer those bills, he has recourse to another expedient, and having still unspotted credit abroad, he draws for 10,000 crowns upon two merchants, the one at Genoa, the other at Leghorn, his correspondents, at 30 days after sight, having effects sufficient in their hands to answer the payment. In order to back this credit, he buys 2000 l. worth of goods of the warehousemen in London, in druggets, or duroys, &c. for which he can currently have six months credit, and takes care to have those goods shipped, and the bills of lading sent to his correspondents, before his advice of drawing the bills.

To support his credit with them also, he writes, at the same time, that, if his effects in their hands should not supply in time to answer his bills, they should draw upon such another merchant at Paris on his account, to whom he had given directions to accept his bills; all which being politically managed, the bills at Leghorn and Genoa are accepted and paid, without the drawing upon Paris: and now the merchant of London has transferred his debt from his friends abroad, to two or three warehousemen, or Blackwell-Hall factors at home, and has now got six months time for the payment of this 2000 l. more than the four months at first; so that in all he has enjoyed this credit ten months.—When these six months are expired, it would be greatly to his interest that he might be able, out of his ordinary cash, to pay the tradesmen off; but his other demands do not admit of it, and, that he may not be dunned and dishonoured, he becomes under the necessity to take the same course again, and his friends at Leghorn and Genoa having accepted his bills, on the credit of the effects already in their hands, and shipped to them as above; he now tries his good friend Monf. —, banker at Paris, and draws 2000 l. sterling upon him; and taking up this money upon change, as before, he pays off his warehousemen and factors, and perhaps buys again, in order to lay in still a good bank at Leghorn and Genoa.

All this while the London merchant keeps up his credit, his bills are all honourably accepted and paid; but still the drawing falls all upon himself at last, till by thus frequently running the same round, if he will make an exact calculation, he shall find that he has paid at last from ten to fifteen per cent. for the use of this money; and, which is still worse, is indebted the principal sums, one where or other; and this gradually eats him up, and devours his fortune, till at length some considerable disaster happening abroad, in the course of his affairs, he receives a blast upon his reputation, so that his bills will not be taken as formerly upon the exchange, and then he is undone.

This drawing and remitting, as it is a fatal thing to a merchant, so, unless it be very warily managed, it soon comes to be smelt into by the staunch-credited remitters of money upon the exchange, and they are always jealous where they find a man thus concerned; so that it rarely can be carried on for any long time without observation, unless it be done with a vast variety of changing hands, and sometimes names, and a very punctual answering every demand to a title; and yet at length it proves fatal to most that embark in it.

Another thing that often proves ruinous to a trader, more especially to the merchant, is the want of requisite accomplishments to acquit himself with credit and honour in his profession; but as I have spoken very amply to this matter under the article MERCANTILE COLLEGE [BRITISH MERCANTILE COLLEGE] I refer the reader to that head.

REMARKS in a national light.

Though the constant interest of our trade and commerce does, in a great measure, depend upon the industry, prudence, skill, and ingenuity of our merchants and traders in general, yet these things alone will not answer that great end; if the government of Great-Britain does not steadily, wisely, and zealously co-operate with our traders to promote and advance the same cause, all that our traders can do will be ineffectual. But as too many catch at every occasion to misrepresent the conduct of the royal house of Hanover, in relation to the

care that has been taken of the trade of this kingdom since the happy accession of that august family to the throne; I think it my duty to refresh the memories of some, with a short state of what has been done by his late and present Majesty, with regard to this important point. And as an impartial man, I think this more incumbent upon me, because I have taken the liberty, where I have thought truth and the public interests have required it, to give my free and undigested sentiments on some points wherein it appears to me that our ministers have not so warmly espoused this cause as could be wished.—We shall briefly trace this matter from the beginning of his late Majesty's reign.—To which end we shall take notice of the treaty, concluded at Madrid, on the 14th of December, 1715, and, by comparing it with that concluded at Utrecht on the 19th of December, 1713, shew several particulars in which the treaty made with his late Majesty is more advantageous to Great-Britain than that which was made in Queen Anne's reign: and indeed it must be equally surprizing how so had a treaty came to be made at the end of a glorious and successful war, and how so good a one was obtained by king George I, in the beginning of a reign disturbed by such intestine commotions. But we may learn from hence, that the wisdom of a sovereign, and the integrity of his ministers, are more necessary for bringing about works of such consequence for the public good, than any juncture of time, or any other the most favourable circumstance.

We must here premise, that by the treaty concluded at Madrid in 1667, the duties of importation payable upon the manufactures and products of Great-Britain, amounted, upon the established valuation in the Spanish book of rates (after the deduction of the *gratias*) in Andalusia to 11½ per cent. in Valencia to 5 per cent. and in Catalonia to about 7 per cent. or less, and consequently, upon the whole aforesaid trade, those duties could not exceed 10 per cent. on a medium.

After this short account of our trade with Spain before the treaty of Utrecht, made by the late queen, we must observe, that, by the explanatory articles of this last-mentioned treaty, the duties of importation upon the products and manufactures of Great-Britain were augmented in Andalusia to 27½ per cent. at a medium.

But by the treaty made by king George I. at Madrid, the said duties were again reduced, according to the aforesaid treaty of 1667, and the deduction of the *gratias* * is established as an inviolable law; whereas before, the *gratias* of the farmers of the royal revenue of Spain, were particularly altogether precarious, and depended intirely upon courtesy.

* For the nature of those *gratias* in Spain, see our article *GRATIAS*, where this matter is fully explained.

That the common reader, however, may here understand something of the nature of these *gratias*, he must know, that when the king of Spain had laid higher duties upon our English goods than what the British merchants were able or willing to comply with, he used to abate a certain part: which indulgence or abatement went under the name of *gratia*, or matter of favour, and not matter of right by treaty. But when he had farmed out these his customs to several of his subjects, the farmers, in order to draw more merchandize to their respective ports, and thereby to increase their own particular profits, used to make new abatements, or *gratias*, to the British merchants, endeavouring sometimes to outvie one another in such indulgences, and by that means to get a greater proportion of custom into their own hands.

But to proceed. The duties on exportation may be computed to be raised by the Utrecht treaty, near as much as the aforesaid duties of importation: whereas, by the treaty made by his late Majesty, they are reduced to their ancient standard. Complaint having been made that the Spaniards, after the suspension of arms in queen Anne's reign, had taken several New England, and other British ships, gathering salt at the island of Tortuga, a very full and just report concerning that affair was laid before her late Majesty, of which we shall give the reader the following extract.

‘Your Majesty's subjects have, from the first settlement of the continent of America, had free access to this island, and have without interruptions, unless in time of war, used to take what salt they pleased there; and we have proof of that usage for above 50 years, as appears by certificates of persons who have been employed in that trade. It doth not appear, upon the strictest enquiry, that the Spaniards ever inhabited or settled on the said island; nor is it probable they ever did, it being all either barren rock, or dry sand, and having no fresh water or provisions in it. We take leave to lay before your Majesty, the consequence of your Majesty's subjects being prohibited to fetch salt at Tortuga; which will in part appear from the number of ships using that trade, being, as we are informed, one year with another, about 100 sail. The salt carried from thence to New England is used chiefly for curing of fish, which is either cod, skate-fish, or mackerel; the former of which is the principal branch of the returns made from the continent to Great-Britain, by way of Spain, Portugal, and the Streights, for the woollen and other goods sent from this kingdom thither. Besides which,

‘the skate fish and mackerel are of such consequence, that the sugar islands cannot subsist without them, their negroes being chiefly supported by this fish: so that, if they were not supplied therewith from New England (which they cannot be if your Majesty's subjects are prohibited from getting salt at Tortuga) they would not be able to carry on their sugar works. This hath been confirmed to us by several considerable planters concerned in those parts. Upon the whole, your Majesty's subjects having enjoyed an uninterrupted usage of gathering salt at Tortuga, ever since the first settlement of the continent as aforesaid, we humbly submit to your Majesty the consequence of preserving that usage and right, upon which the trade of your Majesty's plantations so much depends.’

Notwithstanding it appears, from what is above-written, that our SUGAR ISLANDS were like to suffer considerably, for want of FISH from NEW ENGLAND, no care was taken to have this matter remedied by the explanatory articles to the Utrecht treaty, which were posterior to the above mentioned report.

However, in the third article of the treaty made by king George I, this business is fully settled to our advantage. The British merchants having had several hardships put upon them at Bilbao in Spain, which occasioned the decay of our trade at that place, the said merchants did make and execute, in the year 1700, A TREATY OF PRIVILEGES with the magistrates and inhabitants of St. Ander, very much to the advantage of this kingdom, in order to their removing and settling there: the effect of which was prevented by the death of king Charles II. of Spain, and the war which soon after ensued. This matter, it seems, was slighted or neglected by the managers of the Utrecht treaty: for by the XIVth article of that treaty, there is only A LIBERTY GIVEN TO THE BRITISH SUBJECTS TO SETTLE AND DWELL AT ST. ANDER, UPON THE TERMS OF THE IXth AND XXXth ARTICLES OF THE TREATY OF 1667, which are general: but no regard was had to the forementioned treaty of privileges in 1700; whereas by the second article of the forementioned treaty made by king George I, the forementioned TREATY OF PRIVILEGES with St. Ander, is confirmed and ratified.

Another considerable advantage obtained is, that the French, by the treaty made with his late Majesty, are to pay the same DUTIES at the DRY-PORTS, through which they pass by land-carriage, as we pay upon importation or exportation by sea, which was not provided for by the Utrecht treaty.

By the schedules annexed to the treaty of 1667, the valuable privileges of having JUDGE-CONSERVATORS in Spain (appointed to make a more speedy and less expensive determination of all controversies arising in trade between the British merchants and the Spaniards) was fully established. But by the XVth article of the Utrecht treaty, that privilege was in effect given up: for it is therein only stipulated, THAT IN CASE ANY OTHER NATION HAVE THAT PRIVILEGE, WE SHALL IN LIKE MANNER ENJOY IT. But by the Vth article of the treaty made by his late Majesty king George, it is stipulated, that WE SHALL ENJOY ALL THE RIGHTS, PRIVILEGES, FRANCHISES, EXEMPTIONS, AND IMMUNITIES WHATSOEVER, WHICH WE ENJOYED BY VIRTUE OF THE ROYAL SCHEDULES, OR ORDINANCES, BY THE TREATY OF 1667: so that hereby the great privilege of JUDGE-CONSERVATORS is again confirmed to us. These are some of the advantages which the royal house of Hanover hath obtained for us in our SPANISH TRADE.

We shall now give a short account of those procured for us from the AUSTRIAN LOW COUNTRIES, by virtue of the XXVIth article of the BARRIER TREATY.

This branch of our trade was regulated by a tariff, or declaration of the DUTIES OF IMPORT and EXPORT, in the year 1670, which was superseded by another made in 1680, and continued 'till the last tariff, settled in 1715 with king George I. As for the two former, those who will be at the pains of perusing them, will find the tariff of 1670 laid HIGHER DUTIES on several considerable branches of our trade than that of 1680, but in many particulars was more favourable to us than the latter. Now by the tariff made by king George in 1715, these DUTIES were fixed and regulated for the future by those which were most favourable in either of the former tariffs, and all our British products and manufactures (one only excepted, which shall be named presently) settled upon an easier foot than ever.

Our woollen cloths, being the most profitable branch of our trade into these countries, by this means gained a very considerable advantage: for the tariff of 1680 having laid HIGHER DUTIES upon the finer sorts, and LOWER DUTIES on ordinary cloth, than what were settled in the tariff of 1670, his late Majesty, by the forementioned BARRIER TREATY, reduced the DUTIES on the finer sorts to the tariff of 1670, and confirmed the DUTIES on ordinary cloth according to the tariff of 1680. Inasmuch that the tariff of 1715, considered with relation to this valuable part of our trade, reduced the DUTIES at least one sixth part, supposing the exportation of all sorts to be equal; but, as there is always a much greater exportation of the ordinary cloth than of the

finer

finer forts, the reduction of these duties became still much more considerable.

We must further observe, that there had been several innovations made to the detriment of the English merchant, since the tariff of 1680; all which innovations were intirely set aside by the said treaty of 1715, upon every species of goods except butter, which is mentioned because we cannot be too minute and circumstantial in accounts of this nature: this article, however, is moderated, and is rated in proportion to what has been paid by the Dutch.

As our commerce with the Netherlands [see the article NETHERLANDS] was thus settled to the advantage of our British merchants, so it was much to their satisfaction.

I cannot conclude this topic without observing, that as nothing but the great reputation of his late Majesty king George in foreign countries, and of his fixed purposes to pursue the real good and happiness of his kingdoms, could bring about treaties so beneficial to our commerce, in so few years as he did; so it is impossible to reflect with patience on the folly and ingratitude of those men, who wickedly laboured to disturb him in the midst of these his royal cares, and to misrepresent, as they did at that time, his glorious endeavours for the good of his people. And if this great prince did so much for us, even within the first two or three years of his reign, and still greater things during every year of his reign afterwards, as I shall shew in its proper place: if this wise monarch did so much for these kingdoms, altho' his whole reign was disturbed with the storms of rebellion and invasion, and domestic ferments of another kind too, what would he not have done for commerce, if his reign had been a scene of desirable quiet and tranquillity? Instead of undervaluing the important things he did in this respect, we ought rather to admire that he was able to do so much, when we could not reasonably expect he should have been able to have done any thing.

And it may be further said with great truth, that, as well during the reign of his present Majesty, as of that of his royal predecessor, they have never made the least attempt to invade the rights of trade or possessions of any state or empire whatsoever; they never discovered any glimmerings of low artifice, chicanery, or perfidy, in their treaties and negotiations with foreign powers, nor the shadow of an intention to injure any in relation to their territorial or commercial interest. On the contrary, the royal house of Hanover have supported the interest and glory of this nation by measures the most just, the most equitable, and the most honourable towards all countries; and I wish I could say the like of some neighbouring nations; but their present, as well as their past conduct, would give the lie to it; for at this time, without the least cause or provocation on the side of his Britannic Majesty, his dominions are most ignominiously attacked in the face of the whole world: and what adds to the aggravation of the baseness and treachery is, that these very designs have been chiefly, and most effectually meditating, ever since the last treaty of peace and friendship, and under the disguise of the sincerest amity, and most honourable intentions to preserve the tranquillity of Europe. See our article PLANTATIONS, and divers others, to which we from thence refer. Ought not such conduct as this to rouse all true friends to the trade and interest of Great-Britain, to unite their zealous endeavours, to make the remainder of his Majesty's reign as great and as glorious as it has hitherto been, and not suffer it to be sullied with the loss of any part of his dominions, especially those which are so inestimable to the kingdom, and which are, therefore, so shamefully invaded at present? If the wife and good have any thing of moment to offer at this critical time; either within doors or without, for the true interest and honour of the nation, let it be offered with moderation and strength of argument, not with rancour, heat, and animosity, for this destroys the power and splendor of truth and right reason. Let gentlemen communicate their sentiments like gentlemen: let Britons not widen our breaches, when it is their duty to heal them: let us not debate, but act, when the enemy is at the door: let us demonstrate to the whole world that we are an united people, that we have all imaginable reason to love and revere our most gracious monarch, and to be warmly attached to the support of his royal house, and to the trade and glory of the kingdom; that we are determined to be unanimous to enable his Majesty effectually to resent the indignity which is now offered to the nation, and to chastise and humble those who are the common disturbers of the peace and tranquillity of the whole world. And as the chief expense, during the reign of his late as well as his present Majesty, has been (as I hope to make appear at a proper time) laid out upon the royal navy of this kingdom, and our magazines are at present plentifully filled with naval and military stores: as the naval power of this nation is much greater now than it ever was before in any period of time, even compared with that of any other, or many nations: and as we are in a capacity, as I could easily prove, to increase our naval power to such a degree as will soon make our enemies tremble: as this is the real situation of our public affairs; we need not be intimidated by the bullies of the world. Every true friend to the Protestant cause, will cheerfully lend his

helping hand to scourge those whose insolence and treachery deserve it; and certain I am that those who shall do otherwise, and endeavour to distract his Majesty's councils at this crisis, or to perplex the great representative of the nation, or the public in general, with ill-timed disputes and controversies, can be as little friends to the Protestant interest, as to the trade and the liberties of these kingdoms: and such who shall attempt, in any shape, to embroil our public affairs, at so important a conjuncture, deserve ever to be stigmatized, as unworthy to live under so mild, so gracious, and so free a government; they ought to be branded on the forehead with an hot iron, that they may be for ever after shunned and avoided, as pestilential to society, and fitter to live under a Popish tyranny than under a government like this, of all desirable liberty and freedom. No man has a greater contempt for men in power, who abuse the great trust reposed in them, than myself, nor would any one sooner lend a hand to pull them down; and few have spoke their mind with more freedom upon very interesting occasions than I have done: but as I have done it with that decency and moderation that becomes every man that means good and not mischief, I do not find that I have given any offence. But whoever impartially considers the history of his late and present Majesty's reigns in these kingdoms, will find that their hands have been tied from doing the nation that good they have ever aimed at; their reigns have been disturbed with rebellions at home, and attempts of invasion from abroad; and our domestic squabbles, under the pretence of popular patriotism, have not, perhaps, done the nation less injury than the attempts of our foreign foes. It is true, great sums of money have been raised; but what with domestic strife, unnatural rebellions, and the perfidy of foreign courts upon those accounts; these sums, I am persuaded, have not had the effect that half the money would have had, if those, who have pretended to have been friends to their country, had approved themselves really such. See the articles REVENUE and TRADE; see also our article PARLIAMENT [MEMBER OF PARLIAMENT].

The Royal Exchange of London is the first place in the kingdom that will feel the effects of the injury meditated to be done at this juncture by foreign rivals and enemies to our trade and navigation; and I am well persuaded that great and honourable body will be the first who will supply his Majesty with the sinews of war, to defeat those wicked intentions. However our enemies may flatter themselves with the weight of our debts and taxes, and that we cannot act with that spirit and vigour requisite to frustrate their unwarrantable designs, they will find themselves as shamefully mistaken as they have heretofore been. It is true, our debts are large, but their incumbrance, let them remember, is, by the reduction of interest, rendered much lighter than otherwise it would have been: and there are easy ways and means to render our debts much lighter still than they are; nor will his Majesty want either ample resources or wise measures, to reduce a certain nation to as low an ebb as ever the great Marlborough did, if they once more rouse the British lion against them.

ROYAL SOCIETY.

Of the first constitution of the ROYAL SOCIETY of London, established in the reign of king Charles II.

Charles the IId, by the grace of God, of England, Scotland, France, and Ireland, king, defender of the faith, &c. To all unto whom these presents shall come, greeting. Having long resolved within ourself to promote the welfare of arts and sciences, as well as that of our territories and dominions, out of our princely affection to all kind of learning, and more particular favour to philosophical studies; especially those which endeavour, by solid experiments, either to reform or improve philosophy. To the intent therefore that these kinds of study, which are no where yet sufficiently cultivated, may flourish in our dominions; and that the learned world may acknowledge us to be, not only the defender of the faith, but the patron and encourager of all sorts of useful knowledge, KNOW YE, that we, out of our special grace, certain knowledge, and mere motion, having given and granted, and do by these presents give and grant, for us, our heirs, and successors, that there shall be for ever a society, consisting of a president, council, and fellows, which shall be called by the name of the president, council, and fellows of the Royal Society of London, for cultivating and improving of natural knowledge, of which society we do by these presents declare ourselves to be founder and patron. And we do hereby make and constitute the said society by the name, &c. to be a body corporate, to be continued under the same name in a perpetual succession; and that they and their successors (whose studies are to be employed for the promoting of the knowledge of natural things, and useful arts by experiments, to the glory of God and the good of mankind) shall, by the aforesaid name of president, council, &c. be enabled and made capable in law, to levy, hold, possess, and enjoy, lands, tenements, &c. liberties, franchises, jurisdictions, for perpetuity, or terms of lives, or years, or any other way; as also goods, chattels, and all other things of what nature or kind soever. And also by the name aforesaid to give, grant, demise, or assign the said lands, goods, &c. and

and to do all things necessary thereabout. And the said persons by the name aforesaid, are enabled to implead, be impleaded, sue, defend, &c. in any courts, and before any judges, officers, &c. whatsoever, of the king, his heirs and successors, in all and singular actions, real and personal: pleas, causes, &c. of what kind soever, as any of his subjects within his kingdom of England, or corporations, are by law capable and enabled to do.

And the said president, council, and fellows, are impowered to have a common seal for their use in their affairs; and from time to time to break, change, and make anew the same, as shall seem expedient unto them.

And his Majesty, in testimony of his royal favour towards the said president, council, and fellows, and of his especial esteem of them, doth grant a coat of arms to them and their successors, viz. on a field argent a canton of the three lions of England: for a crest, an eagle proper on a ducal coronet, supporting a shield charged with the lions aforesaid; and for supporters, two talbots with coronets on their necks. The said arms to be borne, &c. by the said society upon all occasions.

And that his Majesty's royal intention may take the better effect for the good government of the said society from time to time, it is established, that the council aforesaid shall consist of 21 persons (whereof the president for the time being always to be one). And that all persons, which, within two months next ensuing the date of the said charter, shall be chosen by the said president and council; and in all times after the said two months, by the president, council, and fellows [and noted in a register to be kept for that purpose] shall be fellows of the said society, and so accounted and called during life, except by the statutes of the said society to be made, any of them shall happen to be amerced; and by how much any persons are more excelling in all kinds of learning, by how much the more ardently they desire to promote the honour, business, and emolument of the said society, by how much the more eminent they are for integrity, honesty, piety, loyalty, and good affection toward his Majesty, his crown and dignity, by so much the more fit and worthy such persons are to be judged for reception into the society.

And for the better execution of his royal grant, his Majesty hath nominated, &c. his trusty and well-beloved, William, viscount Brouncker, chancellor to his dearest confort queen Catherine, to be the first and modern president, to continue in the said office from the date of the patent to the feast of St Andrew next ensuing, and until another person of the said council be duly chosen into the said office. The said lord Brouncker being sworn in all things belonging thereto, well and faithfully to execute the said office, before his right well-beloved and right trusty cousin and counsellor, Edward Earl of Clarendon, lord high chancellor of England, in the words following:

I William viscount Brouncker, do promise to deal faithfully and honestly in all things belonging to that trust committed to me, as president of the Royal Society of London, for improving natural knowledge. So help me God.

And his majesty hath nominated, &c. the persons following, his trusty and well-beloved Sir Robert Murray, Knt. one of his privy council in his kingdom of Scotland, Robert Boyle, Esq; William Brereton, Esq; eldest son to the lord Brereton, Sir Kenelm Digby, Knt. chancellor to his dearest mother queen Mary, Sir Gilbert Talbot, Knt. master of his jewel-house, Sir Paul Neile, Knt. one of the ushers of his privy chamber, Henry Slingby, Esq; one of the gentlemen of his said privy chamber, Sir William Petty, Knt. Timothy Clark, doctor of physick, and one of his physicians, John Wilkins, doctor of divinity, George Ent, doctor of physick, William Erskyne, Esq; one of his cupbearers, Jonathan Goddard, doctor of physick, William Ball, Esq; Matthew Wren, Esq; John Evelyn, Esq; Thomas Henshaw, Esq; Dudley Palmer, of Gray's Inn, Esq; Abraham Hill, of London, Esq; and Henry Oldenburg, Esq; together with the president aforesaid, to be the first and modern 21 of the council and fellows of the Royal Society aforesaid, to be continued in the offices of the council aforesaid, from the date of the patent to the feast of St Andrew next following, and from thence 'till other fit persons be chosen into the said offices. The said persons to be sworn before the president of the society for the time being, well and truly to execute the said offices, according to the form and effect of the aforesaid oath to be administered to the president, by the lord Chancellor as aforesaid. For the administering which oath to the said persons, and all others hereafter from time to time to be chosen into the said council, full power and authority is granted to the president for the time being: and the said persons duly sworn, and all other from time to time duly chosen into the said council and sworn, are to aid, advise, and assist in all affairs, businesses, and things, concerning the better regulation, government, and direction of the Royal Society, and every member thereof.

Furthermore, liberty is granted to the said society, lawfully to make and hold meetings of themselves, for the searching out and discovery of natural things, and transaſion of other businesses relating to the said society, when and as often as shall be requisite, in any college, hall, or other convenient place in London, or within ten miles thereof.

VOL. II.

And power is granted to the said society, from time to time to nominate and chuse yearly, on St Andrew's day, one of the council aforesaid, for the time being, to be president of the society, until St Andrew's day next ensuing (if he shall so long live, or not be removed for some just and reasonable cause) and from thence until another be chosen and put into the said office, the said president to be elected, before admission to that office, to be sworn before the council, according to the form before expressed, who are impowered to administer the said oath from time to time, as often as there shall be cause to chuse a president.

And in case that the said president, during his office, shall die, recede, or be removed, then, and so often, it shall be lawful for the council of the Royal Society to meet together to chuse one of their number for president of the said society: and the person so chosen and duly sworn, shall have and exercise the office of president for the remainder of the year, and until another be duly chosen into the said office.

And in case that any one or more of the council aforesaid shall die, recede, or be removed, (which persons or any of them, for misdemeanor, or other reasonable cause, are declared to be amerceable by the president and the rest of the council) then and so often it shall be lawful for the president, council, and fellows, to chuse one or more of the fellows of the Royal Society in the room of him or them so deceasing, receding, or removed, to complete the aforesaid number of 21 of the council; which person, or persons so chosen, are to continue in office until St Andrew's day then next ensuing, and until others be duly chosen, the said persons being sworn faithfully to execute their office, according to the true intention of the patent.

And his Majesty doth will and grant unto the said president, council, and fellows, full power and authority on St Andrew's day yearly, to elect, nominate, and change, ten of the fellows of the Royal Society, to supply the places and offices of ten of the aforesaid number of 21 of the council, declaring it to be his royal will and pleasure, that ten and no more of the council aforesaid, be annually changed and removed by the president, council, and fellows aforesaid.

And it is granted on the behalf of the said society, that if it shall happen that the president be sick, infirm, detained in his Majesty's service, or otherwise occupied, so as he cannot attend the necessary affairs of the society, then and so often it shall be lawful for him to appoint one of the council for his deputy, who shall supply his place from time to time, as often as he shall happen to be absent, during the whole time of the said president's continuance in his office, unless he shall in the mean time constitute some other of the council for his deputy: and the deputy so constituted, is impowered to do all and singular things which belong to the office of the president of the Royal Society, and in as ample manner and form as the said president may do by virtue of his Majesty's letters patent, he the said deputy being duly sworn before the council in form before specified, who are impowered to administer the oath as often as the case shall require.

It is farther granted to the society, to have one treasurer, two secretaries, two or more curators of experiments, one or more clerk, or clerks, and also two sergeants at mace, who may from time to time attend on the president; all the said officers to be chosen by the president, council, and fellows, and to be sworn in form and effect before specified, well and faithfully to execute their offices, which oath the council are impowered to administer: and his Majesty nominates and appoints his well-beloved subjects, the aforesaid Will. Ball, Esq; to be the first and modern treasurer; and the aforesaid John Wilkins and Henry Oldenburg, to be the first and modern secretaries of the Royal Society, to be continued in the said offices to the feast of St Andrew next following the date of the patent. And that from time to time and ever hereafter on the said feast of St Andrew (if it be not Lord's day, and if it be Lord's day on the next day after) the president, council, and fellows aforesaid, are impowered to nominate and chuse honest and discreet men for treasurer and secretaries, which are to be of the number of the council of the Royal Society; which persons elected and sworn, in form before specified, are to exercise and enjoy the said offices until the feast of St Andrew next then following.

And if it shall happen, that the aforesaid election of the president, council, treasurer, and secretaries, or any of them, cannot be made or perfected on the feast of St Andrew aforesaid; it is granted to the aforesaid president, council, and fellows, that they may lawfully nominate and assign another day, as near to the said feast of St Andrew as conveniently may be, for making or perfecting the said elections, and so from day to day 'till the said elections be perfected.

And in case that any of the aforesaid officers of the Royal Society shall die, recede, or be removed, from their respective offices, then and so often shall it be lawful for the said president, council, and fellows, to chuse one or more into the office or offices, vacant, to hold the same during the residue of that year, and until others be duly chosen and sworn in their places.

Moreover, on the behalf of the society, it is granted unto the president and council, that they may assemble and meet together in any college, hall, or other convenient place in

London, or within ten miles thereof (due and lawful summons of all the members of the council to extraordinary meetings being always premised) and that they being so met together, have full power and authority, from time to time, to make, constitute, and establish such laws, statutes, orders, and constitutions, which shall appear to them to be good, useful, honest, and necessary, according to their judgments and discretions, for the government, regulation, and direction of the Royal Society, and every member thereof; and to do all things concerning the government, estate, goods, lands, revenues, as also the businesses and affairs of the said society: all which laws, statutes, orders, &c. so made, his Majesty wills and commands, that they be from time to time inviolably observed, according to the tenor and effect of them: provided that they be reasonable, and not repugnant or contrary to the laws, customs, &c. of his kingdom of England.

And furthermore, full power and authority is given and granted unto the said society, from time to time, to chuse one or more printers and gravers; and by writing, sealed with the common seal of the society, and signed by the president for the time being, to grant them power to print such things, matters, and businesses concerning the said society, as shall be committed to them by the council from time to time, the said printers and gravers being sworn before the president and council, in form before specified: which president and council are empowered to give the said oath.

And for the greater advantage and success of the society in their philosophical studies and endeavours, full power and authority is granted unto them to require, take, and receive, from time to time, dead bodies of persons executed, and the same to anatomize, to all intents and purposes, and in as ample manner and form, as the College of Physicians and Company of Surgeons of London (by what names soever they said two corporations are or may be called) have had and made use of, or may have and use the said bodies.

And for the improvement of such experiments, arts, and sciences, as the society may be employed in, full power and authority is granted unto them, from time to time, by letters under the hand of the president, in the presence of the council, to hold correspondence and intelligence with any strangers, whether private persons or collegiate societies, or corporations, without any interruption or molestation whatsoever: provided, that this indulgence or grant be extended to no farther use than the particular benefit and interest of the society, in matters philosophical, mathematical, and mechanical.

Full power and authority is also granted, on the behalf of the society, to the council, to erect and build one or more colleges within London, or ten miles thereof, of what form or quality soever for habitation, assembling, or meeting of the president, council, and fellows, about any affairs and businesses of the society.

And if any abuses or differences shall ever hereafter arise and happen, about the government or affairs of the society, whence the constitution, progress, and improvement, or businesses thereof may suffer, or be hindered: in such cases, his Majesty assigns and authorizes his right trusty and right well-beloved cousin and counsellor, Edward earl of Clarendon, lord high chancellor of England, by himself during his life, and after his decease, the lord archbishop of Canterbury, the lord chancellor, or lord-keeper of the great seal of England, the lord high treasurer of England, the lord-keeper of the privy seal, the lord bishop of London, and the two principal secretaries of state for the time being, or any four or more of them, to compose and redress any such differences or abuses. And lastly, his Majesty strictly charges and commands all justices, mayors, aldermen, sheriffs, bailiffs, constables, and all other officers, ministers and subjects whatsoever, from time to time to be aiding and assisting unto the said president, council and fellows of the Royal Society, in and about all things according to the true intention of his letters patent.

This is the legal ratification, which the Royal Society received at its first establishment. According to the intention of these letters patent, their council, I believe, has ever since been annually renewed; their president, their treasurer, their secretaries chosen: the chief employments have been to preserve their privileges, to disperse correspondents, and to form the body of their statutes, which I will here insert.

An abstract of the statutes of the ROYAL SOCIETY.

Whatever statute shall be made or repealed, the making or repealing of it shall be voted twice, and at two several meetings of the council.

This obligation shall be subscribed by every fellow, or his election shall be void.

We, who have hereto subscribed, do promise each for himself, that we will endeavour to promote the good of the Royal Society of London, for the improvement of natural knowledge, and to pursue the ends, for which the same was founded; that we will be present at the meetings of the society, as often as conveniently we can; especially at the anniversary elections, and upon extraordinary occasions; and

that we will observe the statutes and orders of the said society: provided that whenever any of us shall signify to the president under his hand, that he desires to withdraw from the society, he shall be free from this obligation for the future. Every fellow shall pay his admission-money, and afterwards contribution towards the defraying of the charges of observations and experiments, &c.

The ordinary meetings of the Royal Society shall be held once a week, where none shall be present, besides the fellows, without the leave of the society, under the degree of a baron in one of his Majesty's three kingdoms, or of his Majesty's privy council; or unless he be an eminent foreigner, and these only without the leave of the president.

The business of their weekly meetings shall be, to order, take account, consider, and discourse of philosophical experiments and observations; to read, hear, and discourse, upon letters, reports, and other papers, containing philosophical matters; as also to view, and discourse upon the productions and rarities of nature and art; and to consider what to reduce from them, or how they may be improved for use or discovery.

The experiments shall be made at the charge of the society; two curators at least shall be appointed for the inspection of those which cannot be performed before the society; by them the bare report of matter of fact shall be stated and returned. The election of fellows shall be made by way of ballot, and their admission by a solemn declaration made by the president of their election.

The election of the council and officers shall be made once a year: eleven of the present council shall be continued by lot, for the next year, and ten new ones chosen in like manner. Out of this new council shall be elected a president, a treasurer, and two secretaries in the same way.

The president shall preside in all meetings, regulate all debates of the society and council, state and put questions, call for reports and accounts from committees, curators, and others; summon all extraordinary meetings upon urgent occasions, and see to the execution of the statutes. The vice-president shall have the same power in the absence of the president.

The treasurer, or his deputy, shall receive and keep accounts of all money due to the society, and discharge all money payable by the society. He shall pay small sums by order of the president under his hand, but those that exceed five pounds by order of the council. All bills of charges for experiments shall first be signed by the curators. The accounts of the treasurer shall be audited four times a year, by a committee of the council, and once a year, by a committee of the society.

The secretaries are to take notes of the orders, and material passages of the meetings; to take care of the books, papers, and writings of the society; to order and direct the clerks in making entries of all matters in the registers and journal-books of the society or council; to draw up such letters as shall be written in their name, which shall be approved at one of their meetings; to give notice of the candidates propounded, in order to election.

The curators by office shall have a sufficient allowance for their encouragement, which shall increase proportionably with the revenue of the society, provided that it exceed not 200 l. a year. They shall be well skilled in philosophical and mathematical learning, well versed in observations, enquiries, and experiments of nature and art. They shall take care of the managing of all experiments and observations appointed by the society or council, and report the same, and perform such other tasks, as the society or council shall appoint; such as the examining of sciences, arts, and inventions, now in use, and the bringing in histories of natural and artificial things, &c. They shall be propounded at least a month before they are chosen: they shall be examined by the council before the election: to their election every member of the society shall be summoned: they shall at first be only elected for a year of probation, except they be of known merits: at the end of the year, they shall be either elected for perpetuity, or for a longer time of probation, or wholly rejected. The causes of ejecting a curator shall be the same with ejecting a fellow, or for fraudulent dealing or negligence in the affairs of the society, provided that he shall first receive three respective admonitions. If any curator shall be disabled by age, infirmity, or any casualty, in the service of the society, some provision shall be made for him during life, if his condition requires, according as the council shall think fit.

The clerk shall constantly attend at all meetings; he shall follow the directions of the secretaries, in registering and entering all matters that shall be appointed: he shall not communicate any thing contained in their books, to any that is not a fellow. He shall have a certain rate for what he copies, and a yearly stipend for his attendance.

The printer shall take care for the printing of such books, as shall be committed to him by order of the society or council; and therein he shall observe their directions, as to the correction of the edition, the number of copies, the form, or volume, &c.

The operators of the society, when they have any of their work under their hands, shall not undertake the work of any other

other persons, which may hinder the business of the society. They shall have salaries for their attendance.

The common seal of the society shall be kept in a chest with three locks and three different keys, by the president, treasurer, and one of the secretaries. The deeds of the society shall be passed in council, and sealed by them and the president.

The books that concern the affairs of the society, shall be the charter-book, statute-book, journal-book, letter-books, and register-books, for the entering of philosophical observations, histories, discourses, experiments, inventions.

The names of benefactors shall be honourably mentioned, in a book provided for that purpose.

In case of death, or recess of any fellow, the secretaries are to note it in the margin of the register, over-against their names.

The causes of ejection shall be contemptuous disobedience to the statutes and orders of the society, defaming or maliciously damnifying the fame. This shall be declared by the president at one of the meetings, and the ejection recorded.

REMARKS on the important general utility of the **ROYAL SOCIETY**, and the consequences of the decay thereof.

Having observed an affectation in some to treat the Royal Society and its members with very unbecoming contempt and indignity, by insinuating even that any blockhead, if he is but acquainted with a leading member, may be matriculated into this body, and have his name dignified with F. R. S.; I have pitied the understanding of such censurers; for though fools will dare to mingle with the wise, who but a fool will defame a whole body of men, because he may not be acquainted with any of the wise with whom it abounds? But,

Praising is harder much than finding fault. **Rosc.**

As I have always looked upon this society as one of the most useful, most important, and most honourable in the three kingdoms, and more especially so in relation to its trade and commerce, I judge it no way incompatible with this work, to give some faint idea of this institution, in order to disabuse those who may have been deceived by such who have detracted from its merits. For that certainly can be ascribed only to the want of due information, with respect to the nature and utility of this establishment.

That our uninformed readers may make a right judgment of this great and noble design, we shall attempt, in few words, a display of its high importance to the nation. Now the great purpose of this society is, to make faithful records of all the works of nature and art, which can come within their reach; that the present age and posterity may distinguish error strengthened by prescription, restore truths neglected, apply those known to more various uses, and make the way more easy to what remains unrevealed in all useful, and more particularly in all commercial science; which is the life and soul of these kingdoms. This is the compass of their design; and these great ends they have so far answered, as to have proved of unspeakable emolument to mankind in general, as well as Great-Britain in particular: and those nations of Europe that have followed their laudable example, have likewise been of great service to society, as well as to their native states and empires.

As for what belongs to the members themselves that constitute this society, they are of different religions, countries, and professions. For they did not propose to lay the foundation of an English, Scotch, Irish, Popish, or Protestant philosophy, but a philosophy of mankind. A most glorious and most benevolent attempt, and attended with the most glorious and benevolent consequences!

By their naturalizing, as it were, men of all countries they have settled a constant intelligence throughout all civilized nations, and made the Royal Society of England the general bank and free-port of the whole world, for sound knowledge and philosophy grounded on **EXPERIMENTS**, not on visionary hypothesis and conjecture, as it was before their happy institution. And by the admission of men of all professions, these two benefits have arose. (1.) Every art, and every way of life has been secured from receiving detriment by their joint councils. (2.) By the equal balance of all professions, no one in particular has by this society overweighed the other, or made the oracle speak their private sense only. All ranks of men have some one darling, upon which their care is fixed. If mechanics alone were to make a philosophy, they would bring it all into their shops, and force it to consist wholly of springs, wheels, and weights; if physicians, scarce any thing would be considered, besides the cure of diseases. So much is to be found in men of all conditions, of that which is called pedantry in scholars; which is an obstinate addiction to the forms of some private life, and too regardless of general things. But,

Though the society entertains men of particular professions, yet the far greater number are gentlemen, free and unconfin'd. This has prevented, in a great measure, two corruptions of learning complained of: the one, that knowledge still degenerates to consult present profit too soon; the other, that philosophers have been always masters and scholars; some

imposing, and all the other submitting, and not as equal observers without dependance. The first of these were, before the establishment of this corporation, the cause of much inconvenience. It weakened the strength of useful arts; it made an unhappy disproportion in their increase; while not the best, but the most gainful of them flourished. But above all, it diminished that very profit for which men strive: and so they were served like some foolish guards, who, while earnest in picking up small money dropt out of the prisoner's pocket, let the prisoner escape, for whom they might have got a great ransom. A second error that has been avoided by this society, is, that the seats of knowledge have since their time been **LABORATORIES**, as they ought to be; not only **SCHOOLS**, where some have taught, and all the rest **SUBSCRIBED**.

We shall next consider what course of enquiry they have taken, to make their labours unite for the service of mankind.

1. In regard to their expence. Of the stock, upon which their expence has been defrayed, that has arose only from among themselves, by small admission-money and contributions. Such a revenue as this can make no great fund, nor amount to any vast sum; they have been no incumbrance to the public, though the public have enjoyed all the benefit of their studies and their labours.

2. The perfection to which all manual arts have, by their means, been brought, deserves our attention. Men now generally understand, to employ those very tools which the Ancients left us, to infinite more works than formerly; they have likewise devised a great multitude of all sorts, which were before unknown. The ordinary shops of mechanics are now as full of rarities, as the cabinets of the former noblest mathematicians.

Till the sixteenth century, the art of mechanics was contained in a very narrow compass, there being nothing more known about it, than the fix ordinary powers. At this time several of the most eminent mathematicians began to consider mechanics, and by the study and industry of the learned members of our Royal Society therein, and by their great example inciting other nations, mankind have received such extraordinary advantages, that none can be sensible of, but those who have diligently attended to their labours and transactions. To the art of mechanics is owing all sorts of instruments to work with, all engines of war, ships, bridges, mills, curious roofs and arches, columns, pendent galleries, and all other grand works in building of every kind. Also all clocks, watches, jacks, chariots, carts and carriages; all elegant and useful machines of every sort, are owing to the manual application of these principles: in a word, architecture, navigation, husbandry, and military affairs, owe their invention and use to this art; and, indeed, whatever hath artificial motion by air, water, wind, or cords; as all manner of musical instruments, water-works, &c. This is a science of such importance, that, without it, we could hardly eat bread, or lie dry in our beds.—Without mechanics, a general cannot go to war, nor besiege a town, or fortify a place; or could even invent a stocking-frame, the weaving-loom, and any thing else for the improvement of the manufactural arts.

The Royal Society have been happily instrumental to the advancement of all these arts, and to lay open the secrets of all trades, and the several machines used therein; whereby one trade has derived great aid and assistance from others, to the mutual benefit and advantage of all. See our articles **ARTIFICERS**, **MECHANICS**, **MANUFACTURERS**, and **PHILOSOPHY EXPERIMENTAL**.

The method which they have taken to pry deeply into natural knowledge, has been the most judicious, and this may be reduced to these following heads: the queries and directions they have given abroad; the proposals and recommendations they have made; the relations they have received; the experiments they have tried; the observations they have taken; the instruments they have invented; the theories that have been proposed; the discourses they have written or published: the repository and library; and the histories of nature and arts, and the works they have collected.

The manner of their gathering queries, and dispersing questions, is this. First, they have required some of their particular fellows to examine all treatises and descriptions, the natural and artificial productions of those countries, in which they would be informed; at the same time they have employed others to discourse with seamen, travellers, tradesmen, and merchants, who are likely to give them the best light. Out of this united intelligence from men and books, they have composed a body of questions, concerning the observable things of these places. These papers being produced in their assemblies, have been augmented or contracted, as they have in their joint judgment seen occasion. And then the fellows themselves are wont to undertake their distribution into all quarters, according as they have had the convenience or correspondence.

They have composed queries and directions, what things are necessary to be observed, in order to their making of a natural history in general; what are to be taken notice of towards a perfect history of the air, and atmosphere, and weather; what is to be observed in the production, growth, advancing,

vancing, or transforming of vegetables; what particulars are requisite, for collecting a complete history of the agriculture which is used in several parts of this nation, and others.—Whereby they have been the instruments of improving husbandry in general, and transplanting exotics into their own country for the benefit of its commerce.

They have prescribed exact enquiries, and given punctual directions, for the trials of experiments of rarefaction and condensation; concerning the cause and manner of the petrification of wood; of the load-stone; of the parts of anatomy; of currents; of the ebbing and flowing of the sea; of the wonders and curiosities observable in mines: in all which they have made improvements, that have tended greatly to the advantage of these kingdoms, as I could easily shew in a surprising variety of particulars, would the limits to which I am circumscribed admit of it.

To their queries, in general, they have received good returns and satisfaction. Besides these there have been several great and profitable attempts, relating to the good of mankind, and that of the British nation, propounded to them by many public bodies and private persons, which they have again recommended to be examined apart by divers of their own number, and by other men of ability and integrity, who have accepted of their recommendations of this kind. In consequence of this conduct, they propounded the composing a catalogue of all trades, works, and manufactures, wherein men are employed, in order to the collecting each of their histories; by taking notice of all the physical receipts or secrets, the instruments, tools, and engines, the manual operations or flights, the cheats and ill practices, the goodness, badness, and different value of materials, and whatever else belongs to the operations of all trades.

The effects of these measures are too manifest throughout all their labours to need proof.

Their improvements in astronomy and navigation are not less than in those of other cardinal points of general use. They suggested the making a perfect survey and map of all the fixed stars in the zodiac, both visible to the naked eye, and discoverable by telescopes; towards the observing the apparent places of the planets with telescopes, both by sea and land: and, in order to perfect this great work, several of their fellows had their portions of the heavens allotted to them, wherein they have made an extraordinary proficiency, and their members, or those who have built upon their discoveries, have made very considerable improvements in astronomy and navigation.

They first recommended the advancing of the manufacture of tapettry; the improving of silk-making; the propagating of saffron; the melting of lead ore with pit-coal; the making iron with sea-coal; the using the dust of black-lead, instead of oil, in clocks; the making trials on the qualities of English earthen of various kinds, in order, if they could not discover so fine a substance as china, for the perfecting of the potters art: in most of which the desired improvements have been made, by the generous communication of their successful experiments, and the spirit which they first raised for those things in the nation.

They first started the propagation of potatoes; the planting of verjuice grapes in England; the chemical examination of French and English wines; the gradual observation of the growth of plants, from the first spot of life; the increasing of timber, and the planting of fruit-trees; which they have done, by spreading the plants into many parts of the nation, and by publishing free and unreserved accounts of the best ways of their cultivation.—The great effects that we have experienced in relation to these particulars, were first owing to this noble and generous body.

Nor is there any branch of the mathematical literature but what has received more extraordinary helps and advancement from this learned corporation, than from any other whatever; and how far that hath contributed to the promotion of our commercial arts and trade, see our article MATHEMATICS. But it would be endless to recount all the useful and important discoveries and improvements that this learned body have made for the benefit of the trade of these kingdoms: nothing less can do justice to them than an ample history of all their transactions; wherein we shall find that there is scarce any branch of trade, or any art or science practised in Great-Britain, but hath received some advantage from this institution. This was a part of the assistance and information which they at first gave to others, to provoke them to enquire, and to order and regulate their inquiries. To these may be added the relations of those effects of nature and art which have been communicated to them. These have been infinite in number: all which have furnished judicious readers and artists, from time to time, with admirable hints to direct their observations. Among the vast heap of relations which abound in their entry-books, it is no wonder that some should prove misrepresentations, and sometimes deceptions of the relations. But this has never long occasioned the propagation of mistakes: nay, sometimes the very erroneous accounts of others have been attended with some benefit; for as the minds of men are liable to mistake falsehoods for truths, though they are ever so circumspect, so they are often drawn by uncertain,

and sometimes erroneous reports, to stumble on truths and realities.

But if this way of general receiving all credible accounts of natural and artificial productions, shall seem to have been exposed to over-much hazard and uncertainty, that danger has been removed, by the Royal Society's reducing such matters of information into real and impartial trials, performed by their own hands. To which end it has been their usual course, when they themselves have appointed the trial, to propose one week some particular experiments, to be prosecuted the next, and to debate beforehand concerning all things that might conduce to the better carrying them on. In regard to which, it has been the custom for any of the society to urge freely what came into their thoughts or memories, either from the observations of others, or from books, or from their own experience. This is a most necessary preparation to any that resolve to make a deep search into nature, or any advancement in the useful arts.

It is impossible but they, who will only transcribe their own thoughts, and disdain to measure or strengthen them by the assistance of others, should be, in most of their apprehensions, too narrow and obscure, by setting down things for general, which are only peculiar to themselves: it cannot be avoided but they will commit many gross mistakes, and bestow much useless pains, by making themselves wilfully ignorant of what is already known, and what is concealed.

It was tried among the Ancients, to find out the pure and primitive language of the world, by breeding up a child so, that he might never hear any man speak. But what was the event of that trial? Instead of obtaining that end, the child was made absolutely dumb thereby. And the like success will that philosopher find, who shall expect that, by the keeping his mind free from the tincture of all others opinions, it will give him the original and uninfected truths of things. All knowledge is to be got the same way that a language is, by industry, use, and observation; it must be received, before it can be drawn forth. It is true, the mind of man is a glass, which is able to represent to it self all the works of nature; but it can only shew those figures which have been brought before it. I know it may be here suggested, that they who busy themselves much abroad about learning the judgments of others, cannot be unprejudiced in what they think; but it is not the knowing, but the peremptory addiction to others tenets, that fours and perverts the understanding: nay, to go farther, that man who is thoroughly acquainted with all sorts of opinions, is much more unlikely to adhere obstinately to any one particular, than he whose head is only filled with thoughts that are all of one colour.

Nor can discoveries of this nature be better conducted than by the joint labours of the whole society. It were an intolerable burthen, if it were wholly cast on the experimenters themselves: for it is not only true, that those who have the best faculty of experimenting are commonly most averse to the reading books, and so it is fit that this defect should be supplied by others pains: but also it would too much tire and waste, or at least divert their spirits, before they came to the main work; whereas the task being shared amongst so great a number, becomes not much more than a business of delight. Well then, by this first comment and discourse upon the experiment, he that is to try it being present, and having so good an opportunity of comparing so many other men's conceptions with his own, and with the thing itself, must needs have his thoughts more enlarged, his judgment confirmed, his eyes opened to discern what most commendous helps may be provided, what part of it is more or less useful, and upon what side it may be best attempted: the truths which he learns this way will be his pattern, the errors will be his sea-marks, to teach him to avoid the same dangers; the very falsehoods themselves will serve to enlarge, though they do not inform his understanding.

Those to whom the conduct of the experiment is committed, being dismissed with these advantages, do, as it were, carry the eyes and imaginations of the whole company into the laboratory with them; and, after they have performed the trial, they bring all the history of its process back again to the rest. Then comes in the second great work of the assembly, which is to judge and resolve upon the matter of fact. In this part of their employment, they used to take an exact view of the repetition of the whole course of the experiment; here they observed all the chances, and the regularities of the proceeding; what nature does willingly, what constrained; what with its own power, what by the succours of art; what in a constant road, and what with some kind of sport and extravagance; industriously marking all the various shapes into which it turns itself when it is pursued, and by how many secret passages it at last obtains its end; never giving it over 'till the whole company has been fully satisfied of the certainty or impossibility of the effect.

This critical and reiterated scrutiny of those things which are the plain objects of their eyes, must needs put out of all reasonable dispute the reality of those operations which the society shall positively determine to have succeeded. If any shall still think it a just philosophical liberty to be jealous of resting on their credit, they are in the right, and their dissentings are always

always most thankfully received, if they be established on solid works, and not only on prejudices or suspicions. To the Royal Society it is as acceptable to be confuted as to discover, seeing, by this means, they will accomplish their main design: others are inflamed, many more labour, and so the truth is obtained between them; which may be as much promoted by the contentions of hands and eyes, as it is commonly injured by those of tongues.

The history of the experiments performed being thus secured by the society, the next matter is their conjecturing upon CAUSES, which is a matter of no less delicacy than of general importance in experimental researches; and herein such exquisite discernment is required, that they have been cautious to shun the overbearing dogmatizing on causes on the one hand, and not to fall into a speculative scepticism on the other; and whatever causes they have, with such deliberation, found to hold good, they have still made them increase, to the advance of science, by further experimenting upon them: wherein though they have been, in many respects, very successful, yet this has been owing to their great caution; because they have not been over hasty and precipitate in concluding upon the causes, before the effects have been sufficiently searched into: for although the experiment has been the task of few, yet the conjecturing and debating on its consequences has been the employment of their full and solemn assemblies. Experience in all ages has evinced that there never can be found, in the breast of any particular philosopher, as much weariness and coldness of thinking, and rigorous examination, as is needful to a solid assent, and to a lasting conclusion in regard to matters of experimental science: the wisest men are apt to deceive themselves into a certain confidence of the certainty of their knowledge.

On the other side, this doubtfulness of thoughts, this doubtfulness of concluding, which is so useful in this case, is so natural to a multitude of counsellors, that it is frequently urged against them as their inseparable imperfection. It is not in these cases that the most speedy determinations will answer the end aimed at: here many delays are required; here he that can make a solid objection, or ask a reasonable question, will do more service than he who shall rashly fix on an hundred ill-grounded resolutions.

Nor has the society been only fore-armed against this great inconvenience, they foresaw it, and, therefore, have not regarded the credit of names, but things, preserving to itself the liberty of refusing or liking, and so advancing its stock, by a sure and double increase, by adding new discoveries, and retaining ancient truths.

Another mischief, against which this body have guarded in the great matter of CAUSES, is an eternal instability and aversion from assigning of any. Though at their first establishment they were not daring in settling general conclusions, yet they laid no injunctions upon their successors not to do so, when they had obtained a sufficient store of well-grounded experiments, whereon they might safely depend. Nothing sound is to be expected from those who will fix blindly on whatever they can lay hold on; and nothing great from them who will always wander, who will never leave disputing; the one can produce nothing but unwholesome and rotten fruits, and the other, for fear of that, will endeavour to have no harvest nor autumn at all. It has been the conduct of the society, that the way to arrive at advancement in true science, a solid speculation should every day be more and more pursued; which is to be done by a long forbearing of speculation at first, 'till all materials be ripe for it. They have never affirmed anything of the cause, 'till the trial was past; whereas to do it before, ever proved a venomous thing in the advancement of sciences; for whoever has fixed on his cause before he has experimented, can hardly avoid fitting his experiments and his observations to his prepossessioned cause, rather than the cause to the truth of the experiment itself. But this society have made little other benefit of the causes to which they have consented, than that thereby they might have a firm footing, whereon new operations might proceed; and for a continuation and variation of the enquiry, the tracing of a false cause hath often conducted to the knowledge of the true. Thus it frequently happens to philosophers as it did to Columbus, who first believed the clouds that hovered about the continent to be the firm land; but this mistake was happy, for, by sailing towards them, he was led to his great discovery: so, by sometimes prosecuting mistaken causes, with resolution of not giving over the pursuit, this learned society have been guided to the truth itself.

There is nothing of all the works of nature so inconsiderable, or so fully known, but, by being made to reflect on other things, it will contribute to enlighten them, and shew itself the more conspicuously. Such is the dependance amongst all the orders of creatures, the inanimate, the sensitive, the rational, the natural, the artificial, that the right apprehension of one of them is a good step towards the understanding of the rest: and this is the highest pitch of human reason, to follow all the links of this chain, 'till all their secrets are open to our minds, and their works advanced or imitated by our hands! Thus has this learned corporation judged, conjectured upon, and improved experiments, for the benefit of the useful arts.

VOL. II.

But in those that have come under their care, there is one thing more about which the society has been solicitous; which is, the manner of discourse and communication among the fellows, of which, had they not been watchful, the whole spirit and vigour of their design had been destroyed, by impertinent verbosity. The effects of a superfluity of prating overwhelms most arts and professions; this society, therefore, have been rigorous in putting in execution the only remedy for this extravagance: they reject all amplifications, digressions, and swellings of style, to return to the primitive purity, when men delivered so many things in an almost equal number of words.

By these wise measures the society avoided the talkative jargon, and thereby have arrived at a wonderful scene of useful knowledge. They have likewise reduced its principal observations into one common stock, and laid them up in public registers to be nakedly communicated to posterity, or suppressed, as by repeated scrutiny and trial they shall deserve. By this, they have ever made a firm confederacy between their own labours, and the industry and ingenuity of future ages. If their predecessors, like these worthies, had continued to add, by little and little, to the store of experimental knowledge; if they had endeavoured to have been benefactors to, and not tyrants over our reasons; if our learned disputants and wranglers had communicated more of their WORKS, and less of their WIT and PEDANTRY, they would have advanced, rather than eclipsed, the human knowledge, and solid science would have been, ages before, propagated among mankind, to the proportionate increase of their felicity.

And as their purpose has always been to accumulate a mixed mass of experiments, without digesting them into any perfect model, so, to this end, they have confined them to no peculiar order of subjects; whatever they have recorded, they have not done it as complete schemes of science or opinion, but as substantial materials, wherewith the great structure of solid arts and true knowledge might be gradually, and not precipitately erected: for it is certain, that a too sudden striving, as their predecessors did, to reduce the sciences, in their beginnings, into method, beauty, and system, very much retarded their increase: for it happens to the invention of arts as to children in their younger years, in whose bodies the same applications that serve to make them straight and comely, are often found very mischievous to their ease, their strength, and their growth.

By their fair and equal way of registering the knowledge that has come before them, they have left room for their successors to augment, to approve, to contradict them at their discretion. How unpeepably beneficial to true science this conduct hath proved, may be judged, by comparing the state of science before their time with its present. What wonders would not such societies have by this time produced, if they had been begun in the times of the Greeks and Romans, or even of the schoolmen? If our ancestors, a thousand or two thousand years ago, had begun, in this manner, to have added gradually to the storehouse of true knowledge, what depth of nature could by this time have been hid from our view?

If in the first learned times of the Ancients, and all those that followed after them, down to this day, their philosophers had chiefly bestowed their pains in making plain histories of nature, and not in building up sciences, without substantial materials for the purpose, how unspeakably their successors would have been indebted to them, is much easier conceived than can possibly be described. Perhaps, indeed, the names of some particular men who compiled those systems and epitomes which they gave us, and which ever cramped true and general science, would have been less glorious than they were; though that may be doubted, for we have reason to believe that these ages would have honoured a Plato, Aristotle, Zeno, and Epicurus, as much, if not more, than now they do, if they had only set things in a way of propagating EXPERIENCES down to us as the only TRUTHS.

But this matter of reputation was only the private concernment of five or six: as for the interest of those times in general, we may venture to say, that, in all effects of true knowledge, they might have been as happy without those bodies of arts as they were with them, logic and the mathematics excepted. To instance in their physics; they were utterly useless in respect of the good of mankind; they almost confessed as much, by reserving their natural philosophy for the retirements of their wise men. What help did it ever bring to the bulk of the people? What visible benefit to any city or community in the world? Their mechanics and artificers, and husbandmen (for whom the true natural philosophy should be principally intended) were so far from being assisted by those abstruse doctrines, that scarce any one of those professions has understood Aristotle's principles of bodies, from his own time down to ours. If, therefore, those ages, instead of raising so many mere speculative, and, in many respects, very idle and whimsical opinions, had only minded the laying of a SOLID GROUND-WORK, as our Royal Society has done, for a vast pile of experiments, to have been continually augmenting

through all ages, we should have infinite more reason to revere and bless their memories than we have at present. If such a course had been at first set on foot, philosophy would have been kept closer to MATERIAL THINGS, and would not have undergone so many eclipses as it did. If we reckon from its first setting forth in the East, we shall find, that, in so long a track of time, there have not been above 400 or 500 years, at intervals, wherein it has been in any request in the world. And if we look back on all the alterations of states for these 3000 years, we may still behold that the SCIENCES OF MEN'S BRAINS have been always subject to be far more injured by such vicissitudes, than the ARTS OF THEIR HANDS. What cause can be assigned for this? Why was learning the first thing that was constantly swept away, in all destructions of empires and foreign inundations? Why could not that have weathered out the storm, as well as most sorts of PRACTICAL ARTS AND MANUFACTURES, which, though they began as soon, or before the other, yet they have remained, through all such changes, unaltered, except for the better? The reason of this is evident: it is because philosophy was made too subtle for the conceptions of men of business, who are the great support of all communities. The philosophers themselves did, as it were, banish it out of the world, by confining it only within the shades of their walks. By this means, it was first looked upon as most USELESS, and so fit soonest to be NEGLECTED: wherefore if philosophy at first had been made more to converse with the senses, and to assist familiarly in all the occasions of human life, it would, no doubt, have been thought needful to have been preserved in turbulent, as well as ignorant times: it would have escaped the fury of the most barbarous people, as well as the arts of ploughing, gardening, cookery, making iron and steel, fishing, sailing, and many more such handicrafts have done. But it is too late to lament this error of the Ancients, seeing it is not now to be repaired: it is enough that we gather from hence, that, by bringing philosophy down to men's sight and practice, and applying it to the numberless commercial arts of life, the Royal Society has put it into a condition of holding out against the invasions of TIME, or even BARBARISM itself; that by establishing it on a firmer foundation than the AIRY and ENTHUSIASTICAL NOTIONS of men alone, upon all the WORKS OF NATURE, by turning it into one of the great and universal ARTS OF LIFE, of which men feel there is daily need; this society have provided, that it cannot hereafter be extinguished, at the loss of a library, at the overthrowing of a language, or at the death of some few philosophers: but that men must lose their EYES and HANDS, and must leave off desiring to make their LIVES convenient or pleasant, before they can be willing to destroy such philosophy, or cease to revere and honour those who are the zealous promoters of it.

After this learned body had received the royal confirmation of their institution, the whole civil world entertained the highest esteem and veneration towards their enterprise. In imitation of this SEARCHING SPIRIT, this affection to SENSIBLE KNOWLEDGE, in England, other nations fell into the like kind of applications; and the most considerable effects of their endeavours throughout Europe have been generally recommended to the Royal Society of London by their authors, to be examined, approved, or corrected. This has brought great glory to our nation.

As France lies the nearest to England in its situation, so that country has also been the nearest to it in its zeal for the promotion of EXPERIMENTS. In that kingdom, the Royal Society has maintained a perpetual intercourse with the most eminent men of art of all conditions, and they have mutually and generously communicated their knowledge, for the benefit of each other; and if the politicians of the two empires could have always as happily accorded, and have acted with as much unanimity for the real happiness and welfare of both nations, as this kind of philosophers have really done, the world would never have been as it has, and is likely always to be, distracted with eternal wars and bloodshed. If the statesmen of both kingdoms were actuated as much by the principles of benevolence towards mankind, as their respective experimental philosophers have been: if these two nations had set the world as glorious an example of the love of peace, and the felicity of human nature, it is very likely that Christendom in general might have enjoyed an uninterrupted cessation of halcyon days; for had these two states acted in concert, upon such noble and generous principles towards each other, they would have so awed the rest of Europe, as ever to have prevented those eternal broils that are daily springing up among the various potentates. Such conduct among the men in power in both nations, would have proved a far more effectual preservative for securing the everlasting peace of Europe, than even the project recommended for that intent by a learned French abbot, in the year 1712*.

* See a tract, intitled, A Project for settling an Everlasting Peace in Europe; first proposed by HENRY IV. of France, and approved of by QUEEN ELIZABETH, and most of the then PRINCES of EUROPE, and now discussed at large, and made practicable.—By the ABBOT ST PIERRE, of the French

Academy. This is a very curious and elaborate performance; and it would be very happy for mankind, if to great and glorious a design could ever be accomplished.

From the physicians, chirurgeons, and anatomists of France, our society has received many faithful relations of extraordinary cases; from their most judicious travellers, the fruits of their voyages; from their famous mathematicians, many advances in that branch of learning; from their chemists, the effects of their operations; and from others of their best observers, many rarities, and discourses of their fruits, silk, wine, bread, plants, salt, and such natural productions of their soil. And to instance once for all, our society was affectionately invited by the French academy of Paris to a mutual correspondence: in which invitation, there is one expression, that ought not to be passed over in silence, That they have acknowledged the ENGLISH NATION to have many advantages for the propagating of REAL PHILOSOPHY, which are wanting to all others. This confession is true: yet these advantages, unless they had been improved by the Royal Society, had been only as those that we have had for FISHING, objections and arguments of our sloth and supineness, 'till lately.—In return for these communications of the French, our British philosophers have been no ways behind them, they have made ample retaliation; and the French and all the world, are not only highly indebted to great numbers of this learned body, as might easily be shown; but they have gratitude enough to acknowledge, that they owe more to one president of this society, than to all the philosophers that ever lived taken together: I mean the immortal Sir Isaac Newton, the glory of the English nation, the eternal honour of the Royal Society of London.

From ITALY also, the Royal Society were at first earnestly invited to a mutual intelligence, by many of their most noble wits, but chiefly by the prince Leopoldo, brother to the then Great Duke of Tuscany, who was the patron, at that time, of all the inquisitive philosophers of Florence.

In GERMANY, and its neighbouring kingdoms, the Royal Society met with great veneration, and have had with them a constant intercourse of philosophical communication. For which kind of enterprises, the temper of the German nation is admirably fitted, both in respect of their peculiar dexterity in all sorts of manual arts, their profound knowledge in mineralogy and metallurgy, as well as in chemistry in general; and also in regard of the plain and unaffected sincerity of their manners, wherein they so much resemble the English, that we seem to have derived from them the compositions of our minds, as well as to have descended from their race.

In the LOW-COUNTRIES, their interest and reputation have also been established, by the lasting friendship of their chief learned men, and at first principally of Huygens. This gentleman bestowed his pains on many parts of the speculative and practical mathematics, with wonderful assiduity, and particularly his applying the motion of pendulum clocks and watches, was an excellent invention. In the prosecution of such discoveries, he often required the aid of our Royal Society; and he received the lights of their TRIALS, and freely admitted their alterations or amendments. And this learned correspondence with him, and many others in these countries, has been continued down to this day. Even during the breach between Charles II. and the States-General, the traffic of sciences was uninterrupted, when all other commerce was stagnated.

In short, most civilized nations, and especially those that enjoy any tolerable share of trade, have now philosophical societies of this kind established in their respective countries, for the advancement of these arts in particular, which have any connexion with their commercial interests and useful sciences: and all those learned bodies at Berlin, Muscovy, Denmark, and Sweden, &c. preserve a constant correspondence with our Royal Society at London, pay the highest regard to their judgments in all philosophical and mathematical disquisitions, and always express great veneration for those peculiar members of that body, who have eminently distinguished themselves in knowledge of this nature.

But not to wander farther in particulars; it may with great truth be said, that no society ever received greater honours than our Royal Society from all foreigners, who have had a taste for any branch of solid science.—All foreigners, men of letters, the nobility, ambassadors, and foreign princes that have travelled here, have all visited the Royal Society, as one of the most illustrious institutions belonging to the whole kingdom. From hence they have returned home, with a free engagement of their assistance; the men of learning assuring it of a contribution of their labours, and the statesmen and princes of their authority and endeavours, in satisfying all philosophical queries, with which they have been plentifully furnished.

It would be an useless pomp to reckon up a catalogue of their names, especially seeing they are recorded in the registers of the society. It will not be amiss, however, to mention the visit of one prince to them, because it may afford us a profitable observation. When the duke of Brunswick and Lunenburg was introduced into their weekly assembly, and

had subscribed his name to their statutes, there was, according to custom, one of the fellows appointed to interpret to him, what experiments were produced and examined at that meeting. But his highness told them, that it was not necessary they should put themselves to that trouble, for he well understood our language, having been induced to the study of it, out of a desire of reading our philosophical books. From whence, says bishop Spratt, there may this conclusion be made, that if ever our *NATIVE TONGUE* shall get any ground in Europe, it must be by augmenting its *EXPERIMENTAL TREASURE*. Nor is it impossible, but as the *FEMININE ARTS OF PLEASURE* and *GALLANTRY* have spread some of our neighbouring languages to such a vast extent, so the *ENGLISH TONGUE* may also in time be more enlarged, by being the instrument of conveying to the world the *MASCULINE ARTS OF KNOWLEDGE*.

We shall now relate what encouragement this institution has received at home in its native soil. As the original of this society met with a general approbation within ourselves, the most judicious of all professions and interests, their reverence to the first trials and intention; for our most wealthy merchants and citizens in particular, have assisted it with their presence; and thereby have added the industrious and active genius of men of traffic, to the reserved and sedentary temper of men of learning. They have contributed their labours, helped their correspondence, employed their factors abroad to obtain answers to their enquiries in foreign parts; they have laid out in all countries for observations, they have bestowed heretofore many gifts on their treasury and repository. There is one bounty chiefly that deserves applause and imitation. It is the establishment made by Sir John Cutler, for the reading on mechanics, in the place where the Royal Society shall meet. This was the first lecture that was founded of this kind, amidst the vast munificence of so many benefactors to learning in our country; and yet in a trading country, this was the most necessary of all others. For this chiefly caused the slow progress of manual arts; that the *TRADES* themselves have never served apprenticeships, as well as the *TRADESMEN*; that they have never had any *MASTERS* set over them, to direct and guide their works, or to vary and enlarge their operations.

Of our physicians, many of the most judicious have contributed their purses, their hands, their judgments, their writings. This they have most generously done, though they have also in London a college peculiar to their profession; which ever since its foundation, for the space of about 250 years, has given the world a succession of the most eminent physicians of Europe. In that they confine themselves to the advancement of medicine; in this they have also with great zeal and ability promoted an universal inspection into all *NATURAL KNOWLEDGE*.

Of our nobility and gentry, the most noble and illustrious have condescended to labour with their hands, to impart their discoveries, to propose their doubts, to assist and defray the charge of their trials. This they have done with such an universal agreement, that it is almost the only one thing, wherein the nobility of the three kingdoms have been united. This laid a good foundation for removing their prejudices towards each other.

Of our ministers of state at home, and our ambassadors abroad, most of them have been fellows of the Royal Society, and these latter especially have been wont to bestow pains in foreign courts, to collect relations and secrets of nature as well as of state.

Our great captains and commanders have enrolled their names amongst this illustrious number, and regarded these studies, which are not, as other parts of learning, to be called the studies of the gown; they as well becoming the soldier, as any other way of life. Nor have our most renowned *GENERALS* neglected the opportunities of philosophical enquiries, even in the midst of their greatest enterprizes, on which the fate of kingdoms has depended. They have been furnished with instruments and directions by the Royal Society, and amidst the tumults of war and government of fleets, they have found leisure to make some trials of experiments: which *WORKS* as much excel that of *DECLAIMING*, which some of the *ROMAN GENERALS* used in their camps, as it is better to do than to *TALK* well.

Of our churchmen the most distinguished, by the constant patronage and assistance they have afforded the Royal Society, have confuted the false opinions of those men, who believe that philosophers must needs be irreligious: on the contrary, the wisest and most learned among that reverend body have declared their opinions, that the greatness of the Divine Majesty is best to be worshipped, by the honouring and observing of nature, which is the universal minister of his almighty power. The searching into the works of nature, while it delights and enlarges the human understanding, and strikes us with the strongest assurance of the wisdom and power of the divine architect, in framing for us so beautiful and well-regulated a world, does at the same time convince us of his constant benevolence and goodness towards us.

Before the art of philosophical experimenting took place, scarce any thing prevailed but vain imaginations, whimsical

conjectures, presumptuous hypotheses, and wretched reveries of every sort; and these were ushered into the world, and gilded over with the respectable name of philosophy. Not such is the philosophy of the Royal Society, but as different therefrom as light from darkness, as reason from absurdity, or truth from error.

From the more obvious powers of nature, we are led by this philosophy, aided by the mathematical disquisitions, to penetrate into the powers of nature, and so to apply her divine principles to the acquisition of every branch of useful knowledge. By the principles of attraction and repulsion, we view the smallest particles of matter, endowed with a mighty power of action; whence ensues that variety of properties and phenomena, depending on the figure, size, motion, and action, of the constituent parts of bodies. Thus we discern, that by the particles of matter attracting each other, they cohere with various degrees of firmness, according to their tangibility, by a greater or lesser quantity of surface; which all variety of bodies does, with different degrees of consistence, from the hardest to the softest, from the most fixed to the most fluid bodies.—By these principles also we are shewn, that on the separation of the particles of matter beyond the sphere of attraction, there commences a repulsive power, by which they mutually repel each other, and acquire their elasticity. Hence the force of elastic fluids is accounted for on the principle of a centrifugal force, actuating the separated parts of matter.—On this part of philosophy, depends the solution of the phenomena attending the various processes of chemistry; why solid bodies dissolve in fluid menstruums, and fluid ones become hard; why heavy bodies are suspended in lighter fluids, and the opaque, by solution, rendered transparent. Hereby are pointed out the methods of analysing natural bodies, and discovering their component parts. Whence infinite discoveries in art and nature, are brought to light for the use of arts and trade.

This philosophy also leads to the interior recesses of the earth; suggests to us the manner how minerals and metallic ores are generated [see the articles *MINERALS* and *METALS*]; how sulphureous, saline, and mercurial principles, produce the variety of mineral waters; why some are hot or others cold, [See the articles *PYRMONT* and *SPA WATERS*] Why the phenomena of earthquakes, and the eruptions of volcanoes.

By the nature and laws of fluids, we see what is necessary to constitute matter a fluid substance, and how such act upon solids, and what relates to their specific gravities, the quantity and force of pressure, why things sink or swim, the nature and use of the hydrometer, the hydrostatic balance, and the whole science of hydrostatics.

Before this philosophy became to be studied, with what uncertainty did we grope after the origin of springs and fountains? We knew nothing of the theory of aqueducts, or the reason why water rose in a pump; the suspension of mercury in the barometer was a mystery; nor could we account for the action of that simple instrument the syphon, or common crane: much less could we estimate the force of spouting fluids, or say what the action of the air must be to move the sails of a mill. And as to the theory of the tides, that was indeed vulgarly adjudged to be the effect of the moon, but, according to what steady laws it is effected, was a matter too incomprehensible for any to investigate, but a president of our Royal Society, a *NEWTON*; the *ELDEST SON* of wisdom, as the ingenious Mr Martin elegantly styles him.

Then as to the doctrine of winds, this philosophy accounts for their phenomena upon the plainest principles; and shews why some are constant, why others are periodical and alternate; and why in great latitudes, the winds are uncertain, both as to their immediate cause, as well as to the point of the compass from whence they blow.

The nature and theory of sounds, and in consequence the science of harmony, was a mystery 'till true philosophy brought it to light; and this was not 'till our Newton's days. From him we learn the true cause of sounds, and trace them from the tremulous body, through all the elastic aerial undulations, to the curious mechanism of the ear. From him we are taught why some are loud, others low; some obtuse, others acute; and some more agreeable than others. Hence all the grounds of melody and music are derived, the rationale of musical proportion, the harmonical division of lines, the structure of organs, harpichords, and other musical instruments, are all the result of this philosophy.

If we look into the vegetable world, what amazing scenes does philosophy present to our view! The generation of plants was quite mysterious and incomprehensible, 'till philosophy shewed us each in its embryo pre-existent state, and convinced us that plants of every kind were completely included in the seed of each proceeding plant; and to the whole tribe were all contained and included in infinite miniature, in one original seed: this is a most wonderful discovery, and incredible to vulgar minds.

Philosophy next apprizes us of the curious and exquisite apparatus of parts, for the production of embryo-plants. The scene here lies in the flower, whose delicate attire is destined not only for beauty and fragrance, but principally for the purposes of generation. To this end serve the stamens, with their

their apices and included farina, the stylus and matrix, with its included feed; which latter part makes all that agreeable variety of fruit, so desirable and delightful to the taste.

By our philosophical researches, we have been enabled to make great improvements in the knowledge of the make and structure of the bodies of plants and trees: we see the wondrous system of the attracting capillary vessels, which imbibe and draw up the sap, or nutritious juices of the earth, by means of the roots, and which is constantly perspired off by the leaves. Besides these, we find other vessels destined to supply the plant with air; and astonishing it is to consider, how each annual system of air and sap-vessels (which makes the annulus or ringlet of wood, by which the tree does each year increase its bulk) unravel and expand itself from the bark, in which all the bulk or lignous part of the tree, is originally contained. These and many other curious and engaging speculations in botany, we owe entirely to the invention of optical glasses, and consequently to our favourite science philosophy.

But in nothing is the excellence of philosophy so conspicuous, as in its sublime discoveries relating to the nature and structure of animal bodies, and the use of the several parts. By this science we are taught the divine laws of animal mechanism; not in the low nonsensical notion of the Cartesians, who consider animals as mere machines, devoid of life or sensation: on the contrary, true philosophy represents an animal fabric as one of the noblest works of God, in which dead matter is made to live, inert matter is rendered capable of action and motion; matter absolutely devoid of any sensitive faculty, endowed with various powers of sensibility, in different modes, and almost infinite degrees. But above all, to consider how this inanimate, inert, insentient substance, should be constructed with faculties rendering it capable of mind and thought, is the most mysterious and amazing speculation! This fixes the bounds to philosophical enquiries; hitherto can we go, but no further. Bold presuming man may as well pretend to make an animal, as to account for its powers and functions. These are all the works of infinite wisdom, whose judgments are unsearchable, and ways past finding out.

But however inscrutable the origin of an animal may be, the laws by which the several animal functions are governed, and the vital actions performed, are the proper subjects of philosophy; and though the cause, the manner, and intimate texture of most parts of animal bodies, are latent and incomprehensible, yet it is great satisfaction to think we are admitted to the knowledge of the offices, uses, and ends of the several parts, and the general œconomy of animal nature, which is one of the most agreeable and sublimer lessons of philosophy.

Thus we are shown the nature, make, and disposition of the bones, and how they give firmness and stability to the body. We are next taught the structure and use of the muscles, for giving motion and strength to the parts; though the *modus agendi* (or muscular motion) be among the number of nature's arcana. We have lately been instructed in the true use and design of that noble organ the heart, the primum mobile of animal nature; from hence we learn the origin and use of that wonderful system or compages of vessels we call arteries and veins for circulating the blood and animal fluids through every part of the body, for the grand and final purpose of nutrition.

Besides these, we find another wonderful apparatus of vessels or parts we call nerves, which have their origin from the brain and marrow, and are appointed by nature the instrumental cause of sensation to animals. Thus the optic branch is destined for vision, the auditory nerves for hearing, the olfactory pan for smelling, the nerves spread over the tongue and palate for tasting, and all the other nerves, minutely ramified through all the body, for the general sense of feeling. But the immediate cause of this nervous sensation, whether by means of a fine subtle fluid, called animal spirits, passing through the hollow fibrillæ of the nerves, or whether by means of a subtle æthereal spirit acting upon the solid capillamenta, or whether this great work of nature be any otherways effected, is as yet a matter concealed from human intelligence.

But whatever be the cause thereof, it is, without all doubt, derived from the noble viscus the brain: for the brain is manifestly of the glandulous kind, and the use of the glands is to secrete the various juices destined to serve the various purposes of animal life. Thus the liver secretes the bile, the pancreas, the pancreatic juice, the kidneys strain off the urine, the breasts collect the milk, the testes secrete and prepare the semen, and other glands the lymphatic liquor. By such wondrous contrivances are the operations of life carried on, and the animal functions perfected through the determined period of duration for each respective species.

In ASTRONOMY we owe every great improvement to philosophy; we hereby know the nature of circular and elliptic motion, and the laws which govern bodies moving in these or any other orbits; we hence learn all the anomalies of motion in a system of bodies, and can settle the theories for calculation. Hence the places, position, aspects, transits, occultations, eclipses, and other affections of the heavenly

bodies, become known for any given time, past, present, or to come.

In CHRONOLOGY, we are guided by the unerring hand of philosophy. We thence get a true idea of time, and the only just methods of measuring it, and dividing it in a natural and proper manner. By this means our periods and cycles, our years and days, become constant and certain; which would otherwise be vague and unsettled, and induce a general confusion in our accounts, and thereby embarrass the occurrences of life.

In NAVIGATION and GEOGRAPHY [see those articles NAVIGATION and GEOGRAPHY], great and manifold are the uses of philosophy. From thence we learn the size, dimensions, and figure of the earth; and by the discovered properties of the wonderful stone, are enabled to navigate the spacious seas, with much certainty and safety. Hence a communication and commerce with other nations and people, is opened unto us; we are hereby made, as it were, proprietors as well as inhabitants of the earth: and most of the wealth and commodities of life, are owing to this philosophical improvement of the natural properties of wind and water.

Yea, GEOMETRY itself is but the philosophy of the magnitude and dimensions of natural bodies, and their various proportions and relations to each other on that account: and no one who understands any thing of the modern Newtonian mathesis, can deny, that its very first principle (viz, the doctrine of fluxions) consists in the doctrine of motions, and velocity of the generating powers of bodies: and therefore, every mathematical science is, in its general nature, purely philosophical: and it would be very easy to shew, that some of the most perplexed propositions of geometry are demonstrated with the greatest ease by philosophy; and that some problems, impracticable by the geometrician, are solvable with the greatest facility and exactness by the philosopher.

In OPTICS, what variety of the most curious inventions and structures of instruments has of late flowed in upon us! Scarce a year or month can pass, not pregnant with optic discoveries and contrivances; and yet none of these inventions, none of these machines, owe their origin to any other source than philosophy. It is this science alone that discovers, not only why a microscope can assist the eye to discern small objects, or a telescope distant ones, but it enables the artist to give the best form to his glasses, and to dispose them in the best manner, in the structure of these and other instruments, to answer the ends proposed. And who can say to what limits this growing science may yet extend, under the conduct and direction of our philosophical society?

We need not say, that PERSPECTIVE, DIALLING, or the art of shadows in general is purely philosophical. These arts consist only in the various representations and optical views of nature: and to represent things under the same appearance and respective relation which they have to each other, requires no small art or skill in philosophy. How little do we esteem a mere mechanic diallist, who knows nothing of the reason or philosophy of his art; who sets the style of a dial pointing to the pole, for no other reason, but because he cannot make it shew the hour in any other position?

PAINTING, as it consists in an exact imitation of nature, by a judicious mixture of colours, and a proper disposition of various tints, lights, shades, &c. must be pronounced a philosophical art, whose theory depends on the most refined principles of this science. A person by a thorough skill in this doctrine of light and colours, might almost make a picture a priori: how natural, genuine, and excellent must that portrait be, which is executed by a hand, whose every motion is directed by the dictates of presiding science!

GUNNERY, or the doctrine of projectiles, is, perhaps, the only art whose principles are purely philosophical throughout; and that yet has not received all the advantage it is capable of from this all-perfecting science. 'Till Sir Isaac Newton's time, all that was wrote on this subject was errant jargon: since him, we have had many pieces on the parabolic hypothesis, whose theories are founded in vacuo, and vacuous theories they are indeed: their authors not understanding true philosophy, could not instruct mankind in the principles of gunnery; and this is but too well known an instance of the fatal consequences that attend either the ignorance or neglect of philosophy, in the momentous affairs of life. However, something considerable has already been done, and more may be expected, to give the engineer all the advantages he can possibly have from the present mathesis and philosophy. See the article MATHEMATICS.

In PHYSIC and SURGERY, the whole field of philosophy, in its utmost extent, is concerned [see the article QUACK]: for, on the one hand, if we consider the human body as a system of solids and fluids in motion, this will require, at once a thorough knowledge in all the laws of motion, of action and re-action, of attraction and repulsion, of every mechanical principle and power, the hydrostatic and hydraulic laws of fluids, and every other principle of nature's agency in one, who has the care of such a noble machine to keep it in order, and to rectify it when out.

And what shall we more say? For the time would fail us to speak of anatomy, and of botany, and of agriculture, and of gardening.

gardening, and of every mechanical and manual art and trade also, even down to brewing and baking [see the articles BREWING and BAKING], whose professors and artists by the various improvements and precepts of philosophy, have been enabled to explain to us the animal œconomy, the nature of vegetation, the culture of plants, the improvement of land [see the article MANURE], the manufacture of goods [see the article MANUFACTURER], and meliorating the methods of procuring and preserving our bread and our meat, our beer and our wine [see the article WINE]. And it may be shewn, that a man in every vocation, in every employment of life, has occasion enough for the assistance of this science; and that in every occupation no artist can execute and succeed so well as he that keeps close to nature, and best understands her operations, which is all we have to understand by philosophy.

If then all that has been said be true, (and who will say it is not?) if philosophy be of that importance to mankind, as has been shewn it is; we need not wonder to see the wise and knowing part of our species, in every age, have so great an opinion of such a science, and so desirous of being initiated into its mysteries. How ardent were the pursuits of Plato, Pythagoras, Socrates, Aristotle, Seneca, and other sages of antiquity, after philosophy, even in its infant state? But to see and enjoy it in its present glory and perfection, to which it has arose since the time of the ROYAL SOCIETY, what studies would have been too arduous, what voyages too dangerous, what climates too distant, for those champions of wisdom not to have undertaken, with the greatest alacrity and pleasure?

It is very remarkable, that whereas other arts and sciences give only a polish to mankind, and make them expert and ingenious, this of philosophy, in a peculiar manner, confers not only the highest delight, and the most transporting pleasure to the mind, but even happiness itself. The attribute of philosophy is felicity by general consent: thus the inspired penman—Happy is the man that findeth wisdom.—Thus Virgil too,

Fœlix qui potuit rerum cognoscere causas.

An idea of such societies, peculiarly adapted to the general improvements of all the COMMERCIAL ARTS.

It would be endless to urge all that might be said upon a topic of such infinite extent, and of such infinite utility to mankind in general. If we have said enough to give Britons some idea, though a very glimmering and imperfect one, how highly they are obliged and indebted to all gentlemen, who have made any advancement in these the most excellent and the most useful of all sciences, and more particularly to that most learned and honourable society, that has produced a succession of the ablest philosophers that ever lived: if, from what has been said, we have removed the prejudice of some towards this noble institution, and strengthened the good opinion of others, this will be no small satisfaction; but that is not all that I would humbly intend: the principal motive with me, is not only to give a faint display of the merit of all who have successfully applied themselves to these studies, but to convince the public, that not only the constant preservation, but the constant increase and advancement of THE WHOLE COMMERCE OF THE THREE KINGDOMS, DEPEND UPON DULY ENCOURAGING AND HONOURING THOSE WHO EXCEL IN ANY BRANCH OF THESE SCIENCES THAT TENDS TO THE BENEFIT OF TRADE AND NAVIGATION, AND TO THE GLORY OF THE BRITISH EMPIRE: for if once these studies become neglected and unfashionable among us; if the students therein are disregarded, and meet with no honour or emolument suitable to the important nature of their applications, these ineffable sciences will be left only to the men of figure and fortune; and how few the number of these have been, when compared with those of another condition, is well enough known; and how few of these have met with any recompence suitable to their merit is equally notorious.

Indeed in the time of Sir Isaac Newton, and a few years after, the mathematical and philosophical studies were in highest esteem; and, because it was the mode of the times to have some knowledge therein, they were pretty generally pursued: but the gentleman and man of business, in the general, have not so ardent a taste, or indeed leisure sufficient, so to apply themselves as to make any great proficiency in what has been well known for above this century past; and therefore such, in the general, cannot be expected to have greatly contributed to the advancement of philosophy; to do which, certainly requires uncommon talents, and greater severity of application than one gentleman among thousands will bestow; and although among the learned professions, more especially among the most learned clergy and physicians, there have arose many excellent mathematicians and philosophers, who have contributed to the improvement of found philosophy; yet, even among these, there have been but very few that have excelled in comparison to the number who constitute these learned bodies; and those who have made any extraordinary proficiency, lived in the times when these studies were more in vogue, and in higher veneration than they seem to be at present. In short, had it not

VOL. II.

been for the Royal Society of London, (among whom there has always been, and I hope there always will be, a most laudable emulation to advance philosophy) it is greatly to be feared we should have few philosophers capable of making considerable improvements therein, except in our universities; and in those noble seminaries too, philosophy is not so generally and so zealously pursued as it was 50 years ago. And here few derive any great advantage from these studies, except the capital professors, and the ordinary tutors to young people of distinction, who sometimes, by virtue of their office, and friendships contracted with their pupils, obtain handsome preferment in the church; but philosophy now-a-days seems to be as little the road to extraordinary preferment in the church, as in the state, though it is the great support of both.

It is well enough known, and I hope it has been well remembered by those whose duty it is not to forget it, that, in the late war, we had no extraordinary choice of able engineers, while our enemies had numberless: we had very few then; and a gentleman that would have approved himself, perhaps, one of the ablest in all Europe, was long neglected; and although he was deservedly recommended to his late royal highness the prince of Orange, in order to save Bergen-op-Zoom, yet he came too late, and was, on his return, still disregarded, 'till the East-India company had occasion for his service: but his heart being almost broke before he was provided for suitably to his distinguished merit, it is no wonder that he did not long survive the generous preferment he at length met with. It would be no difficulty to give many more instances of gentlemen of real merit in philosophical studies, who have reason to complain of the difficulties and discouragements which they have met with: many a cobbler, I am afraid, lives more comfortably than some able mathematicians and philosophers, who, if duly contented by the great, might be made happily instrumental to improve and advance the commercial arts of this kingdom.

For my own part, I frequently lament the low condition of many of those gentlemen; nor can I but think there may be ways and means easily found out to provide for them, in a manner suitable to their talents, and that in such a manner, as to enable them to promote our commercial arts in particular, by the course of their studies being duly planned out and regulated by a committee of the ROYAL SOCIETY, appointed for that purpose: for I would humbly propose to make this illustrious corporation still more and more serviceable, if possible, to the state, than it has been; and this, we conceive, may be done with no less glory to themselves, than honour and emolument to the kingdom.

Nor would I only presume to suggest the manner how, under the direction, management, and controul of the Royal Society, such students in particular may become more useful to the nation than they are at present, but how this celebrated body may, in other respects also, become instrumental to a still further advancement of all arts that are subservient to the interest of our trade and navigation. And this is submitted to be done, by enabling the Royal Society to confer suitable rewards and honours on all working mechanics, artificers, and manufacturers, who shall make any capital improvements in their several branches, and the like on those who shall make any important advancement in the arts of agriculture, or any thing connected therewith, as farming, grazing, nurserying, mineralogy, metallurgy, &c.

That something of this nature is really wanting in England at present, and that to be under the conduct of so learned and so experienced a body, seems to be obvious from hence; that in Ireland we find they have long since instituted what they call the Dublin Society, which consists of a number of private gentlemen, and traders of eminence and fortune, who have by themselves, and their influence among their friends and persons of distinction, raised a fund by voluntary subscription, for the promotion of industry and labour among the poor, and for the advancement of manual arts, whereon commerce depends; and the remarkable success with which the endeavours of these gentlemen have been crowned, should have some weight, methinks, with us in England, to think of the establishment of a well-constituted society for this, as well as the other laudable purposes of philosophical improvements, for the benefit also of the trading part of the kingdom; for whatever useful improvements are made in the latter, the former will be certain to reap all the benefit and advantage by them: every artificer and mechanic, every manufacturer and farmer, every tradesman and merchant, as well as every landed gentleman and nobleman, will thereby become gainers, and the nation in general the more and more prosperous and powerful: and the more especially so, if all proper measures be taken by the governing society, to propagate among the people all those discoveries that shall be made, either by new inventions, or by the improvement of the old, in the plainest and most intelligible manner, that these discoveries may not remain only in the hands of a few, but be diffused through the nation, for the common benefit of all. That England should seem to be ripe for the reception of, and the people well disposed to promote and encourage, a proper institution of this nature, may be reasonably enough in-

ferred, from the spontaneous conduct of several bodies of people among us at this time: I mean that laudable and numerous society who have distinguished themselves by the title of ANTIGALLICANS, and who have voluntarily and liberally raised a fund among themselves, in order to distribute as premiums, to those who shall excel in any of the mechanical or manufacturing arts, for the benefit of our commerce.

In imitation of this public-spirited body of gentlemen and tradesmen, we find likewise, by repeated advertisements in our public news-papers, addressed 'TO THE PUBLIC, That some of the nobility, clergy, gentlemen, and merchants, having at heart the good of their country, as their advertisement expresses, have lately met together, in order to form a society for the encouragement of arts, manufactures, and commerce in Great-Britain, by bestowing rewards, from time to time, for such productions, inventions, or improvements, as shall tend to the employing of the poor, to the increase of trade, and to the riches and honour of this kingdom, by promoting industry and emulation, &c.' The advertisement further informs, that 'Though at present their plan is not completed, it has nevertheless been resolved to make a beginning, in manner following: that is to say, cobalt having been already discovered in some parts of this kingdom—for producing specimens, not less than ten pounds in weight, for the best in quality, to be produced on or before the 15th day of January next, with satisfactory certificates of the place where found, and reasonable assurances that it may be obtained in quantity, 30l. — To be determined that day fortnight. For raising and curing the most and best madder for dying, in this kingdom, not less than twenty pounds in weight, of which samples to be shewn, with satisfactory certificates, on or before the 15th day of January, in the year 1756, 30l. — To be determined that day fortnight. For the best drawings by boys and girls, under the age of fourteen years, and proof of their abilities, on or before the 15th day of January, 1755, 15l. Likewise for the best drawings by boys and girls, between the age of fourteen and seventeen, with like proof of their abilities, on or before the same day, 15l.

By order of the subscribers,

WILLIAM SHIPLEY.

- Cobalt is a mineral found in mines of copper, lead, silver, tin, and iron, in Sweden, Germany, and other countries: it has likewise been found in Cornwall, and may probably be discovered in other places in this kingdom. It is a heavy substance, sometimes of a blackish, but more commonly of a bluish-grey, some of its parts inclining to a silvery colour, and that with much variety, according to its mixture with metals, stoney, or other matters: it has also sometimes on its surface a red efflorescence, which is called the flowers of cobalt.
- The test of cobalt is, the staining glass blue in fusion, and producing arsenic and zaffer, from which smalt is made.
- Those who may find what answers the above description, and are ignorant of making an assay, are advised to apply to some skilful person, as uncautious trials with this mineral are dangerous.

Further REMARKS on the greater utility of the ROYAL SOCIETY, to arts, manufactures, and trade, than it ever has been.

It seems to be the temper of the public, at present, to cherish and encourage such a design, which makes it needful, at this juncture, to think of it in earnest. The above advertisement acquaints us, that the plan of those patriots is not yet completed; and that of the Antigallicans is but in its infancy; and therefore the public should not be wanting to avail itself of these happy dispositions in the people; and instead of dividing themselves into various independent and disjointed bodies, it would be more eligible, perhaps, to unite their subscriptions and donations, and put the same under the government of one body, duly qualified and experienced to point out what is necessary to be done for the constant advancement of the commercial arts of every kind, to distribute the premiums according to merit, and receive all intelligence and information from practical artists and traders, of the difficulties their respective arts and trades may labour under; to the end that this grand body may deliberate and determine, with their united knowledge and judgment, what measures shall be needful for them to take, from time to time, in order to aid and assist all artists to bring still to greater and greater perfection their respective arts and trades. Now, while the Royal Society of London subsists in its present splendor and dignity, with its present constitution, and under the royal sanction and authority; such an illustrious corporation, abounding with persons of the first-rate knowledge and experience in all philosophical researches, should seem to be the only fit body to undertake the chief controul and management of all those smaller bodies that appear disposed to advance the commercial arts, by the aid of their voluntary subscriptions and donations: for, without any disparagement to other worthy and judicious bodies, this society may be presumed to have all the knowledge requisite to point out the best

methods of improving the mechanical and manufacturing, and all other arts whereon trade depends; and, therefore, they should seem the properest to be invested with the distribution of rewards for the encouragement of persons to excel therein.

If any private societies should unite, in order to raise sums of money among themselves, for the promotion of the like good ends, those societies may depute some of their more intelligent members to confer with the Royal Society, from time to time; by which means these benefactors will, in effect, have the distribution of their own donations as much in their own power as they would otherwise, with this difference, indeed, they would have the advantage of the advice of that learned body to aid and assist them in carrying their good intentions the more effectually into execution. Nor is it improbable, if the public were to request the Royal Society to take this trouble upon them, but the members thereof might not a little contribute with their purses, as well as with their studies and their experiments, to forward so laudable a spirit.

Another advantage that would attend this matter being invested in the Royal Society is, that the public could have no reason to be under any apprehension that any pseudo-artist, any pick-pocket pretenders to knowledge, should impose upon them; because nothing could come before them but some of their members would be thorough judges of, and they being wise experimenters themselves, and habituated to judge of these things with due circumspection and accuracy, it would be very difficult, if not next to impossible, to deceive them: a man may as well have the confidence to pass upon them lead for gold, or French coin for pure sterling money, as a false experiment for a true one; whereas among other private bodies of gentlemen, however public-spirited their intentions may be, yet, if they have not been conversant and familiar with philosophy, both in the theoretical as well as experimental part, they can neither give proper directions for trials to be made, in order to answer any capital purpose, nor can they be proper judges of many when laid before them.

Was it not needful to say more, I might further urge, that this renowned society consists of a numerous body of persons of the first distinction in the kingdom; many of whom, though it should be suggested, they may not themselves be competent judges of some things that may come before them, yet they will always be good judges how the public money is bestowed, and prevent its embezzlement or misapplication. Nor can there be the least fear of any thing of this kind, while a noble lord presides over this society, who is not less conspicuous for his profound knowledge in philosophical disquisitions, than for his distinguished honour in every relationship.

I have dwelt the longer upon this article, thinking the advancement of the commercial arts a matter of the last consequence to a commercial state. And although some might imagine, that a sum to be annually raised by voluntary subscription for this purpose, would amount to but a trifle, and not worthy the attention of the Royal Society; yet I am inclined to believe that a mighty easy way might be suggested, and no way disagreeable to the public, to raise, for a certainty, 20 or 30,000l. a year for so good a design, besides what might arise by voluntary subscriptions.—But if ever any thing of this nature should be thought of in earnest, the many wise in this kingdom will stand in no need of any intimation from me how to obtain a proper fund for so popular an occasion. The great Colbert of France, who was prime minister under Lewis XIV, used to declare, That he thought he spent his time well in reading over a hundred proposals for the advancing the wealth and commerce of France, though but one of them deserved to be encouraged. And while other nations are studiously cultivating the arts of commerce, we shall hardly think them undeserving our regard, while our whole dependence is upon them.

A BRIEF ACCOUNT OF THE PROGRESS OF THE ABOVE SOCIETY for the encouragement of ARTS, MANUFACTURES and COMMERCE, instituted at London, anno MDCCLIV.

In the ANCIENT and USEFUL ARTS of AGRICULTURE and HUSBANDRY.

The Society have constantly offered honorary premiums of gold and silver medals, for planting of acorns, chestnuts, elms, firs, and Weymouth pines, in different quantities, and for fencing and preserving the same effectually, in order to raise timber, so essential for the service of the navy, and wood for domestic uses in building, &c.

The great utility of the cultivation of these trees is so obvious, and indeed has been so well conceived by our nobility and gentry, that it will be sufficient to remark, that the premiums have been claimed, from time to time, by persons of the highest distinction.

The cultivation of madder, which is a root of great use in dying, has been encouraged by the Society's premiums from the first year of their institution: it was formerly planted in England in great quantities, but of late years had been wholly discontinued, the Dutch having constantly supplied us with this valuable article; and it is computed that the imports of madder from Holland have amounted for some

some time past to 200,000 pounds *per annum*; but under the sanction of the Society the growth of this plant is revived, and very large quantities are now cultivated by sundry persons in different parts of this kingdom; one person in particular has planted 29 acres, and the premiums offered by the Society are regularly claimed; so that in a very short time we shall have no occasion to send to Holland for a vegetable, which will thrive as well in our own country.

The other articles in husbandry which have been encouraged by the Society are, the raising apinaries; for which both honorary and pecuniary premiums are offered: the quantity required for the first premium, being eighty pounds, is no less than four hundred stocks in hives or boxes, and before the Society threw out these premiums, no persons ever thought of possessing such a stock of bees—Several sorts of fodder, particularly lucerne, have been cultivated with great success; and lastly, hemp, the growth and preparation of which in this kingdom, for the making of sail-cloth and cordage, is of very considerable importance, has been greatly encouraged, and the premiums claimed in several counties.

P O L I T E A R T S .

The Society set out with giving premiums for drawings by boys and girls: these have since been extended to various ages, and to different kinds of drawing, too numerous to specify in this place; and honorary premiums of gold and silver medals have been established, and claimed, for drawings by young ladies, the daughters of peers and peeresses. Through the encouragement given by the Society to this art, drawing is become a branch of education; and as a great many of our manufactures, which depend on correctness and elegance of design, are annually exported to foreign countries, the improvement of these, which will be the result of encouraging our youth to learn this art, must in time prove a national advantage.

In the year 1757, premiums were offered for modelling, which are still continued; and this art has been greatly improved amongst us, several excellent specimens in clay, and in wax, having been presented to the Society, in consequence of their premiums. The great benefits arising from the improvement of this art, to the statuary, sculptors, &c. is too well known to require a detail.

Etching and engraving, and casting in bronze, all of which have their various well-known uses, have been considerably improved under the sanction of this Society; and premiums for these articles are still offered.

In 1758, premiums were published for the encouragement of the medallic art, and the subjects proposed and executed have been, some of the most glorious events of the late war: as these medals are struck from steel dies, an extensive benefit is derived from improvements in this branch, which is not known in general; a variety of articles in hard ware, as eweers, seals, &c. of which vast quantities are exported, are likewise struck from steel dies, and therefore all improvements of them must prove beneficial to these manufactures by increasing the variety of designs or patterns.

History and landscape painting have likewise been encouraged, and also statues and basso relievos in marble; by which many young artists and some masters have been induced to produce such performances in each branch, as have done honour to the Society under whose sanction they have been produced.

Engraving on gems has been encouraged with success; and several other articles of inferior note, but which are all useful in their kind.

C H E M I S T R Y , M I N E R A L O G Y and D Y I N G .

Premiums have been offered for sundry preparations and improvements in these very useful arts, and are still continued: those which have been particularly improved or established, and for which premiums have been paid, are, verdigris used by the dyers, the making of which from British materials has been so far established to the satisfaction of the Society, that the premium is discontinued. White enamel, in imitation of the Venetian, has been produced, and a manufactory established in England, in consequence of the premiums thrown out for this article.

Premiums have likewise been claimed for improvements in dyeing cloth and silk in grain, and for dyeing cotton scarlet, or crimson in grain, and to answer the purposes of the Turkey or India red. Specimens of improvements of varnish, to answer the ends of Martin's at Paris, have been brought in for the premium offered for this article, and are now under examination; and also a composition to prevent steel from taking rust: the making salt petre of pig and bar iron, sal ammoniac, a substitute for borax, &c. are subjects for which premiums are offered under this head; and it is not to be doubted but that considerable improvements will be made in every branch of these commercial arts.

M E C H A N I C S .

The first articles in this class which the Society encouraged by premiums were improvements in wind and water mills,

models of which have been produced to the Society, and are kept in their repository.

Premiums were likewise offered for improvements in spinning-wheels, and this year a complete spinning-wheel has been produced, with which one person may spin six threads at a time, and it will prove very serviceable to several of our manufactures by saving a number of hands; but an article of much greater consequence lately brought to perfection is, the erecting of a saw-mill for sawing of planks, the model of which has lately been purchased by the Society for one hundred pounds, and is now lodged in their repository: this machine is worked by water, and carries sixteen saws: from this model various mills may be constructed for the same purpose.

Bounties have also been granted for several useful inventions and improvements in mechanics, which have from time to time been laid before the Society, particularly improvements in reels for winding silk, a new invention of a machine for planing cast-iron, esteemed very curious and useful; and several other things of less consequence. To this cursory review of the Society's success in the pursuit of the first part of their plan, the encouragement of arts, I have only to add, that they have a repository consisting of a variety of models, machines, &c. some of which have been presented to the Society; others have been deposited in consequence of their premiums and bounties; and several have been purchased of the inventors or improvers for the benefit of the public; and as this repository is continually increasing, either by donations from gentlemen, or in consequence of premiums and bounties, they may in time form a collection equally useful and extensive. The second branch proposed to be encouraged by this Society is,

M A N U F A C T U R E S .

Several valuable manufactures have been improved, and some actually established, through the patronage of this Society. In the year 1755, premiums were offered for making buff leather for the use of the army; in consequence of which, bullocks hides were dressed in oil, and were found to be as good as the hides of buffaloes imported from abroad: Lord Romney introduced the use of this leather among the Kentish militia, and it has since been approved by several regiments.

In 1756, the Society offered a premium for making carpets in England in imitation of those made in Turkey and Persia, which have been brought to very great perfection by Mr. Moore, in Chiswel-street, Moor-fields, who produced to the Society a carpet in many respects equal, and in some superior, to those imported from Persia and Turkey.

A manufactory of crucibles made of English materials, has been established by Mr. Leiberick in Westminster, in consequence of a premium published by the Society for that purpose.

Marble paper, which has hitherto been imported from Holland, chiefly for the use of bookellers and stationers, has been brought to such perfection this present year, as in every respect to equal the Dutch; and the first premium offered for this article has been claimed by, and granted to, the manufacturer, who resides at Exeter.

Paper for rolling-press printing has likewise been considerably improved by means of the encouragement given by this Society: the French excel in this article, and their impressions from copper plates are more perfect than ours; but we have lately manufactured a quantity of this paper nearly equal in quality to the French.

Quilting in the loom, in imitation of Marseilles or India quilting, has been established in this country, and brought to great perfection, under the patronage of the Society, and the premium has been claimed and adjudged.

The making of flowers of point lace, after the manner of Brussels lace, having been encouraged, great improvements have been made therein, and the premiums have been claimed and granted.

Premiums have been published for making chip hats, which have thereby been considerably improved, and the premiums have been granted accordingly.

Also great encouragement has been given to the manufacturers of druggets, specimens of which were produced, so excellent in their kind, that the premium is discontinued.

These are the principal manufactures that have flourished under the sanction of the Society, and have rendered this part of their plan of equal utility with the encouragement of arts.

The encouraging of improvements in arts and manufactures, has so direct a tendency to the support of commerce, that little remains to be said on this head, which completes the plan of our laudable Society: however, several articles in

C O M M E R C E

Have been greatly improved by means of their premiums, especially in our colonies.

The planting of white mulberry trees, whose leaves are the proper food for silk worms, has been promoted by premiums;

ums; and great quantities of cocoons, being little balls or bags on which the inclosed silk worms have spun the silk, have been produced to the Society's correspondents in the colonies, who have paid the premiums that have been claimed for this article.

The importation of raw silk from the colonies has likewise been promoted by premiums, which are still continued.

A premium is also offered for producing wines in our American colonies, and some samples have been sent over of both red and white, which were greatly approved of in the Society; but as the time for granting this premium does not expire till 1765, we may expect further improvements, and that such wines will be produced as shall deserve the reward of one hundred pounds.

The cultivation of hemp, of the olive and cinnamon trees, of aloes, safflower, &c. in the colonies, is encouraged by suitable premiums, and various other articles to be imported from thence; amongst which the importation of pearl-ash has been effected this present year, though not in such large quantities as to merit the premium; but the proprietor has been honoured with the Society's gold medal, in consideration of what he has already done towards promoting their intentions with respect to this commodity.

And so large a field is opened in the colonies, for carrying on the laudable designs of this Society, that it is impossible to set bounds to the advantages that may one day arise, from affording this encouragement to our fellow subjects in America, especially if it be considered that our possessions in North America are so extensive, that they include almost all the different climates of the world; and there is the greatest reason to imagine that most of the spice trees, plants, and other valuable articles, which at present are peculiar to the east, may be cultivated in the west.

Having now given an account of the principal public advantages arising from the premiums and bounties granted by the Society for the encouragement of ARTS, MANUFACTURES and COMMERCE,

I have only to add, that this respectable body at present consists of between two and three thousand members, and that their proceedings are carried on with the utmost candour, propriety, and decorum, by means of a well-digested set of rules and orders, which are printed for the use of the members, the substance of which I shall endeavour to comprize in as few words as possible.

THE OFFICERS of this Society are, the president, the vice-presidents, of whom there are ten, the secretary, assistant secretary, register and collector: these are chosen annually by ballot. The election of a new member is likewise by ballot: he may be proposed by a member, at any meeting of the Society, and be balloted for at the next meeting, when, if two thirds of the members then present ballot in his favour, he is deemed a perpetual member on payment of twenty guineas, or a subscribing member on payment of any sum not less than two guineas, so long as such payment is annually continued.

Their meetings are held in their great room opposite Beaufort buildings in the Strand; and they meet every Wednesday at six in the evening precisely, from the second Wednesday in November to the last Wednesday in May; and in the intermediate time, on the first and third Wednesday in every month: these are called ordinary meetings, besides which, there are eight general meetings every year, and some occasional extraordinary meetings.

When the Society is sitting, the president or presiding member conducts the business of the evening agreeable to the book of rules and orders which lies on the table before him: the business begins with reading the minutes of the preceding meeting, which being once read, are on a second reading to be discussed if necessary, article by article, before any other subject is considered: all the minutes which are not objected to on the second reading, stand confirmed: after this the reports from committees are read, and agreed to or disapproved; unless a motion is made and seconded to postpone the reports, in order to introduce any new proposition, which cannot be received after ten o'clock: if such motion is seconded is carried by a majority of hands held up in support of it, then the new proposition is immediately considered, being first delivered at the chair in writing; and in this, and all other cases, the greatest freedom of debate is allowed, and carried on with the utmost decency and candor, every member being patiently and attentively heard without interruption, unless he departs from any order of the Society, or speaks more than once to the same question, which is not permitted, unless a gentleman has been misunderstood, and desires to explain himself: when any member speaks, he stands up and addresses himself to the gentleman in the chair, and the rest remain silent: no limitation of time is prescribed to the speaker, but few exceed ten minutes, except on very extraordinary occasions; and most gentlemen, for the satisfaction of so large an auditory, speak as audibly as possible.

There are nine standing committees, and two chairmen to each committee, besides which there are occasional committees for miscellaneous subjects: to these committees are referred

the several subjects properly falling under their consideration, as letters, to the committee of correspondence, polite arts, to the committee of polite arts, &c. and every member is of every committee, though particular gentlemen are nominated to each committee.

These are the principal regulations that have not been already noticed in the course of this narrative, which I cannot more aptly conclude than with a sincere and fervent prayer, "that this most free and independent Society, instituted for THE PUBLIC GOOD, may long continue to do honour to its patrons, and that its present most excellent plan with all possible improvements may be handed down to posterity, and by them be sacredly revered, and firmly upheld with the rest of those inestimable privileges, which have rendered us superior to all the nations of the earth."

RUM, a spirituous liquor, often used in punch: it is made in the West-Indies, of sugar-canes, and is, in the general, of a stronger body than brandy, i. e. it contains a larger quantity of oil, and less phlegm and salt: its oil is less attenuated and subtilized, whereby its volatile salts are more embarrassed and theached up. Neither is its oil reduced to such minute and subtle particles, either because the canes were less fermented with the water, or because the oil and salt of this cane are more viscid and gross, than those of the molasses drawn from the sugar, which has undergone the sundry necessary operations, and has been thoroughly fermented afterwards. For although all thoroughly fermented liquors afford much more spirit, in proportion to their body and kind, than the less fermented; yet it is certain, that the sundry operations sugar undergoes in the making, may, and does break, attenuate, separate, and divide the principles in the molasses (though the grossest of the sugar) more than these same principles existing in the crude cane, where the firm union of the gross oil and salt makes the unprepared sugar of almost a loathsome luscious taste. And also all liquors, thoroughly fermented, have, during the fermentation, a free access and communication with the external air; whereby the intestine motion is promoted, and the smallest and most separable parts are too much attenuated and reduced to a subtle aura, which exhales to the depauperating of the liquor of much of its finest parts; hence it yields less (though a subtle) spirit.

That rum which is of a brownish, transparent colour, of a smooth, oily, grateful taste, of a strong body and confidence, of a good age, and well kept, is the best. That of a clear, limpid colour, and hot pungent taste, is either too new, or dashed with spirits.

To such palates and stomachs as can bear it, rum is certainly preferable to brandy, either for a dram or punch, in many cases. Brandy (e. gr.) is diuretic, because it stimulates the vessels, and rarefies the blood, whereby only its finer and more ferous parts are strained off by the kidneys; but rum not only stimulates by its salts, but lubricates by its more and grosser oil, and thereby expands and dilates the renal lateral vessels; whereby not only the thinner, but also the grosser and more excrementitious parts of the blood, are allowed a ready passage through the renal strainers, and get off by the ureters.

Again, when the vessels are sluggish, and the blood sily, brandy promotes perspiration in a gouty habit, and forces off part of the salts by urine, as it at the same time carries much essential vegetable salt into the blood; but rum softens and dilates the vessels more; hence a freer perspiration both of salts and ferocities, as well as a discharge by urine; and at the same time it conveys less salt into the blood, and its more and grossly oil sheaths the remaining acrimony of the blood; which answers two valuable intentions. 1. It thereby dilates the corrugated capillary vessels, wherein the gouty matter was stopped and lodged, and the relaxation of the vessels gives nature an opportunity to pour in thinner fluids upon these gritty lodgments and sharp matter, whereby they are diluted, dissolved, thrust forward, and expelled by the excretory ducts of the skin. 2. It blunts the edges of the pointed pricking salts, and obtunds the reigning acrimony, makes it less uneasy to the patient, 'till the elastic vessels can attenuate, separate, and dissolve it, so as to be either perspired or thrown back into the blood, 'till it arrive at and be strained off by the kidneys.

In nephritic pains and gravelly cases, where the vessels are always much contracted, and sometimes inflamed, the use of rum is preferable to that of brandy, because it relaxes the contraction more, increases the stream of urine, and makes way for the obstructed matter to pass off, or be forced and washed out of the channels. Bilious constitutions can bear the use of rum, diluted with water, better than brandy, because their solids being elastic and contracted, and their vessels narrow, and fluids acrimonious; for whatever blunts the acrimony of their juices, and softens and dilates their fibres and vessels more, must be beneficial. On the contrary, whatever adds to the stimulation and contraction of their solids, and the sharpness and saltiness of their fluids, must unavoidably be hurtful. All such as have elastic fibres, contracted vessels, sharp and thin juices, lean and slender bodies, if they will be meddling with drams (which, if they prefer health and long life

life to taste and luxury, they should use but as medicines, i. e. from necessity, not choice or pleasure) should prefer rum. Hard drinkers, who have broken their constitutions by frequent debauches, will have a moderate dram, that will not only raise, but preserve the tone of the stomach, maintain and strengthen good digestion, and keep them from being too much damped: here rum should take place of brandy; not only because it fills and invigorates the nervous tubes with less volatile and more durable spirits, but, at the same time, its oil blunts the points of the salts, which other liquors have left too plentiful in the blood.

In chronic asthma, coughs, and stuffing of the lungs, if any moderate dram may be allowed, rum is the best, because its spirits are less volatile, its oil more and grosser, to smooth the stiff and contracted vessels, expand their sides, make way for spitting, and, by its solid particles, clearing the tubes of some parts of their load.

In choleric disorders, from acrimony, prickings, paining and tearing the nervous threads, rum offers fairer for relief than brandy, because it is more oily, smooth, and softening. It is also more suitable to old age, because, at the same time it stimulates, it also lubricates and dilates the vessels, whereby they keep longer open and passable, the straitening, shutting up, and coalescence of which, is the only cause of old age and natural death.

In recent great colds, without a fever, rum is more serviceable than brandy, provokes both perspiration and urine more powerfully, as it sheathes the salts, makes their stimulus less sensible, and contracts the vessels less; nay, its sulphur smooths and dilates them more.

When the person is very hot and thirsty, a dram of rum is much better to drink than brandy, before water, small beer, or milk; for this keeps the vessels more pliable, dilated, and lax, maintains a freer course for the fluids to pass without let or stoppage: for the mischief done by water, or such small liquors, in this case, is, being drank cold, they suddenly contract the vessels, so as the liquids cannot pass; their finest and thinnest parts are discharged through the interstices, or forced along the tubes, whilst the more gross are obstructed, fixed, and wedged in; hence obstructions, flag-nations, inflammations, ulcerations, or mortifications, or schirrhous's, and carcinomatous tumours of some viscera of the lower belly.

But for these reasons, phlegmatic and corpulent people must still allow brandy the preference, because it stimulates more, and raises a greater contraction; for it abounds more with salts, and its oil is more subtle, exists in smaller particles in the liquor; and their vessels and fibres are so soaked in insipid humidities, and relaxed with oil, that they want no lubrication, nor the salts in their blood any absorbent. Cachectic, hydropic, lethargic, and paralytic persons, must also chuse brandy on the same account; and so must those who have furred-up vessels and foul glands (which raise scrophulous knots, œdematous swellings, whether fixed or shifting) for the spirits of brandy being more fine and subtle, they rarefy the blood, and stimulate the vessels more. In excessive hot weather, when the fibres are much relaxed, and perspiration, or sweat, profuse, brandy must have the precedency, because it stimulates and contracts more, and rarefies the thick and stazy matter better, raises a brisker motion in all the juices; though it must be owned, that these its good effects are but of short standing.

In a moist, foggy, or marshy air, where the moisture hangs upon the skin, and straitens or stops the mouths of its excretory ducts, and diminishes perspiration, or where the spring of the air is weakened or broke, so that it neither expands itself sufficiently in our lungs, food, nor blood, but renders the juices both ways fizy, a dram of brandy is better than rum. But in an infected air rum is before brandy, because it leaves more oil in the mouth and throat, which entangles and imbibes the infectious effluvia, or miasmata, floating about and hanging in the atmosphere, and sucked in together with the air; and in this case, the greatest preservative is to spit out all our spittle whilst we are in that infected air.

Rum being a spirit procured from the fermented scummings, waste, and refuse matters of a primary sugar-house, that immediately works the sugar from the cane, differs from a sugar spirit, as containing more of the natural flavour, or essential oil of the sugar-cane, a deal of the raw juice, and parts of the cane itself, being often fermented in the liquor, or solution, whereof the rum is prepared.

The unctuous flavour of rum is often supposed to proceed from the large quantity of fat used in boiling the sugar; which fat indeed, if coarse, will commonly give a disagreeable, stinking, or oily flavour to a spirit, as I have found by experience; but rum has its specific and natural flavour from the cane.

When a sufficient stock of these refuse materials is procured, they are fermented in the common method, though always slowly at the beginning of the season of making rum in the islands, for want of yeast, or other fermenting matter, to set the liquor at work; but, by degrees, they procure a sufficient quantity of the ferment, which spontaneously rises as a head in the operation: and thus they come, in a little time, to ferment and produce their rum with great expedition.

VOL. II.

When the wash is fully fermented, or to a due degree of acidity, the distillation is carried on in the common way, and the spirit made up proof, though sometimes advanced nearest to alcohol, or the state of double proof; in which case they call it double-distilled rum.

It may be otherwise rectified to advantage, as it is commonly first drawn with a full dose of high-flavoured oil in it, which requires to lie, or digest for a long time in the spirit, before the whole becomes soft and fit for use; whereas, were it to be well rectified, it would grow mellow much sooner, and have a much less potent flavour, which sometimes renders it disagreeable.

The best state to keep it in, both for exportation and otherwise, is, doubtless, that of alcohol, unless when the gross oil is required in it, for the sake of mixing and covering; and, by duly throwing out its oil, it may be brought nearly to the flavour of a fine sugar-spirit, or arrac, as a very small proportion of it, used in its natural state, to a fine tasteless spirit, will give it a flavour bordering very near upon that admired in arrac.

This spirit is usually very much adulterated in England, with one or other of the cheaper sorts; even a rectified malt-spirit, if used in moderation, much less a molasses, or sugar-spirit, being not easily distinguishable therein.

The ways of trying its goodness are the same with those mentioned under brandy [see BRANDY and DISTILLATION.] In this, and most other respects, it ought to be considered as a brandy of a particular species; so that what is delivered in regard to brandy will be also applicable to rums: for though the sugar-cane differs from the vine, yet the sweet saccharine substance whereto both the juice of grapes and the juice of the sugar-cane are, by the same art, reducible, fits them to afford wines and brandies that shall not be readily found to differ; which is a pregnant hint, that may prove of unspeakable advantage to the British sugar colonies. See the articles SUGAR, SUGAR COLONIES. See also the BUSINESS of the CUSTOM-HOUSE at the end of this letter R.

RUSSIA, or MUSCOVY, is bounded on the north by the Northern Ocean; on the east by Great and Chinese Tartary, and part of the Japonic Sea; on the south by the Calmuc and Cuban Tartary, Persia, Georgia, and the Caspian and Euxine Sea; and on the west by Poland and Sweden. Its extent from east to west, that is, from the confines of Sweden to those of China, is computed, by some geographers, to be 1500 leagues; and from north to south, that is, from the Frozen Sea to the Euxine, 600; though others differ in their accounts: the whole country, however, lies between the 46th and 70th degree of north latitude, and in some parts eastward reaches even beyond it, and between the 30th and 160th of east longitude.

Russia may be divided into Western and Eastern, Tartarian and Laponic, and the late conquests in Asia.

I. In the WESTERN MUSCOVY are the following provinces:

1. PLESKOW, or PSKOW. 2. GREAT NOVOGOROD. 3. TWERA. 4. RZEVA, or RESCHOW. 5. BIELA, or BIELSKI. 6. SOMOLENSKO. 7. SEVERIA. 8. CZERNICHOW. 9. VORSTIN. 10. REZAN. 11. BIELGOROD. 12. MORDOA, &c. 13. NISINOVGOROD, or LOWER or LESSER NOVOGOROD. 14. VOLODIMER. 15. SULDAL. 16. MOSCOW. 17. ROSTOW. 18. YERO. SLAWLA. 19. BILIJESORA, or BELOZERO. 20. VOLOGDA. 21. CARGAPOL, OWEGA, &c. 22. DWINA.

II. In the EASTERN are the provinces of,

1. MEZON. 2. JUGORA, or INGORSKI. 3. CANDORA and TEESCA. 4. PETZORO, or BORANDAI. 5. The country of the VOGLISI. 6. PERMIA. 7. OUSTIONG. 8. ZIRANIA; and, 9. VIATKA, or VIADSKAI.

III. In the MUSCOVIAN TARTARY are those of,

1. CASAN, or CÄZAN. 2. BULGARA. 3. BASKIRIA. 4. ASTRACAN. 5. SIBERIA; and, 6. SAMOIEDA.

IV. In the RUSSIAN LAPLAND.

1. MURĖSMANROI, or MARITIME LEPORIA. 2. TERSKOL LEPORIA. 3. MORESKI LEPORIA; and, 4. NOVA ZEMBLA.

We shall not, in so large a territory, enter into a minute description of these distinct provinces, many of which afford little trade, but give the best general state of this trade that we can.

As the Czarina is now mistress of a vast extended dominion, there must necessarily be a great variety in the trade of so many countries; and yet, as they are all under the management of one sovereign, so they are, by an extraordinary conduct, brought at last to run, as it were, in one general channel; which was the effect of the exquisite conduct of the late Czar Peter, emperor of Russia.

The Muscovite dominions are something wonderful in their situation, and which qualifies them for commerce with almost all the world, in a manner which no empire but this can boast of.

They have a communication with four parts of the world, by seas so remote from one another, that nothing can be shewn like it in the whole globe; and, in the observing this, we shall be able with the greater ease to describe the prodigious commerce they now carry on.

1. They have the port of Archangel, in the White Sea, as it is called by some, the Frozen Sea by others; and by this they have a navigation to the northern ocean, can fit out ships to Spitzbergen (Groenland) and, by the north cape, into the German and Caledonian Oceans, and may send ships to any part of America, passing by the north of Scotland and Ireland, with as great ease as the Dutch, who go north about, do to the same countries. It is true, the Muscovites have not yet meddled with those remote branches of trade, but it may not be long ere they do.

2. They have the port of Peterburgh, in the gulph of Finland; by which they have opened a door into the Baltic Sea, and, by that sea, into the British Channel, and so with all the rest of the world. They have also the intire possession of Wiborg, Narva, Revel, and Riga, four of the best ports for trade in that part of the Baltic Sea.

3. They have the port of Astracan, in the Caspian Sea, by which they have a navigation to the coast of Georgia and Persia, and where they are likely one day to open effectually the most important trade in that part of the world, notwithstanding they met with some obstruction, in relation to the Persian raw-silk trade from Geylan, on the side of Georgia: and to that purpose the late Czar fortified Terki, on the utmost western bound of Circassia; and the late Czarina built a fort and royal city there, which they boast will, in time, be equal to that of Peterburgh in the gulph of Finland.

4. They have three small forts on the side of the Black Sea, which, when they took Afoph from the Turks, they slighted, as having resolved to make Afoph the seat of a naval power, equal to that of the Turks, and so have obliged the Grand Seignior to allow them a free passage out of the Palus Meotis, and the Black Sea, by Constantinople, into the Mediterranean, which would have been a door of trade worth a kingdom itself; but that great design miscarried afterwards, by the loss of Afoph*, which they were obliged to restore to the Grand Seignior, by that fatal treaty made on the banks of the river Pruth, in Moldavia; and, since that, they are glad to make use of these smaller ports in the Black Sea; but they have not yet appeared to be of much service, either in matters of trade or war, having no harbours so seaward capable of receiving any ships of burthen, nor any navigable river by which to carry on their commerce by land, the country next adjoining being mostly desert, and incapable of trade: yet it is said the late Czar, had he lived, would have settled a communication that way by caravans, and so have had a trade to Terki on the Caspian Sea.

* This town standing on the frontiers of Russia, against Turkey, has been several times taken and retaken of late years; but on the last peace, concluded in the year 1739, between those powers, it was agreed that the fortifications should be demolished, and the town remain subject to Russia.

These are the four seas into which the great extent of their dominions gives them an entrance; which yet are so exceedingly distant and remote in their situation, as to have no practicable communication by sea with one another: but the situation of Muscovy is such, that, by the great river Wolga, which runs from north to south through the heart of their dominions, they may one day form a communication for trade between all these parts, being able, with the help of two small canals, which his Czarist Majesty had begun before his death, to join the waters of the lake Onega with the stream of the Wolga, and so in effect cause the waters of the Caspian, the Baltic, and the White Sea, to meet one with another. In the like manner, by a canal at Varonitz, he had brought the navigation of the rivers Wolga and the Don, or Tanais, together, and so joined the waters of the Caspian with those of the Euxine Sea; though by the dismantling of Afoph, as above, that communication is not rendered near so useful to this country as it otherwise might have been.

Having these advantages for extending their commerce by such a strange kind of river-navigation, we will proceed to enquire into the funds of trade which are to be found in this vast dominion. And here we may observe, that though the industry of the people of Muscovy is really scandalous (at least it was so before their prince fired their minds with expectations of getting great things from trade) and that their manufactures were very few, yet now no single country (take it complexly) has so many, and such valuable things for exportation, as the Muscovite dominions, and those both of land produce and manufacture, and which, consequently, bring a prodigious return to the country in money; but 'till the late Czar settled his court at Peterburgh, opening a trade to the Baltic Sea, and bringing his subjects to cloath and dress after the German and French manner, they had no great consumption of British or French manufactures among them, and, consequently, no great commerce this way; but now their exports and imports are exceedingly increased, and are daily increasing; and certain it is, that the balance of trade is greatly to the advantage of the Russians, with most countries with which they have dealings.

The produce of the European part of this country is as follows.

	Tar in a prodigious quantity.
	Honey and bees-wax.
	Russia-leather, deer, bear, and elk-skins.
	Pot-ashes, timber and plank, iron, and some copper, the last from Kexholm, or South Finland.
	Hemp and flax.
	Linen and linen-yarn.
	Furrs, such as sable, black fox, ermin, rain-deer, martens.
	Raw silk, by the Wolga.
	Persian, Indian, and China goods, the last by land-carriage.
From Russia and north parts of Muscovy,	Tar,
	Deals,
	Fir-timber,
	Masts,
	Iron, and also copper.
From Livonia, Easthonia, and Narva, new conquests, and from Lower Russia,	Hemp, flax, linseed the best in Europe.
	Corn, sturgeon, and caviar.
	Pitch and tar.
	Linen-yarn.
	Linen cloth of several sorts.
	Russia linen, properly so called.
	Diaper, a late manufacture.
	Sail-cloth, the like,
	Canvas and duck, } both improving.
	Pot-ashes.
From Siberia,	Rich furrs, as sables, ermins, black fox, white bear.
	Beaver, &c. as above.

From Circassia, — Tobacco, which is very much increased.

All these are extraordinary exportations, and the more, because exported in an extraordinary quantity: but their manufactures are but small in proportion to these; except their linen, linen-yarn, and Russia leather; and these, it must be acknowledged, are articles of very great extent, and have been much increasing for many years past. Of these merchandizes, the tar is, as before observed, a prodigious article. The late Czar was, as the Czarina now is, the sole merchant, and it is principally exported at Archangel and Wiborg.

The Czarina is likewise said to be the only merchant in the tobacco of Circassia. Tobacco, it seems, was once prohibited to the Muscovites, that is to say, to smoke; the reason was, that it affected their heads, and made them drunk: and they say of a Russian, that if he is drunk, he becomes mad, is a mere Russian; and the quarrels and murders which frequently happened among them were such, occasioned chiefly by this tobacco, that it obliged the late Czar to prohibit the use of it: but, as the people were gradually brought under a new discipline, they became more civilized, and under government; and upon this the Czar allowed them the use of tobacco again; which, as it grows in exceeding plenty, and very good, in their own dominions, they are supplied from thence wholly, and the government makes a very great revenue from it. The country of Circassia they say yields above 60 or 70,000 hogheads of tobacco yearly, and they vend no inconsiderable quantity of it in the Baltic, and in Sweden and Poland, to the great detriment of the English and Dutch merchants, who had all that trade before.

Between the port of Astracan and the coast of Persia, there is a very large commerce carried on.

From Siberia, the Czarina's share only of the sables and rich furrs taken there, is said to amount to above 150,000*l.* sterling a year, and the duty paid upon the rest to as much more; by which some guess may be made of the value of these fine furrs, the whole trade of that kind being in her dominions.

The trade in their new conquests was very great before, and is not lessened since their falling into the hands of the Russians. The hemp, flax, and other naval stores shipped off every year at Riga, Revel, Narva, Wiborg, and Peterburgh, are so exceeding great, that the Dutch only are said to load 300 ships a year at Petersburg, and near as many at Wiborg.

The tar being a monopoly in the Czarina's own hands, brings in about 250,000*l.* sterling profit to her exchequer, occasioned chiefly for the following reasons:

1. Because of the excessive tyranny of the nobility and boyars, the labour of the people is of no great value; and their masters being obliged to yield the Czarina so many barrels of tar, according to the lands and estates they hold, they again oblige their vassals to produce it to them; so that it really costs next to nothing either to the Czarina or to the nobility, but the expence and consumption of an infinite quantity of timber in the country; which, on the other hand also, is of no value, the woods being of such a boundless extent, that, if we give credit to some travellers, there is one wood, or forest, equal to the whole isle of Great-Britain.

2. Because of the great quantity produced; for though it is extremely cheap, yet the quantity supplied is so great, that it makes the revenue from it amount prodigiously: and some think it rises to as much more as we have mentioned.

The late Czar erected two or three foreign trades out of the way of all Europe besides, and in which none could disturb him, nor does any one yet pretend to it: the one is, a trade by caravans from China. This trade he long strove to accomplish; and because the distance is prodigious great, and the way most of it desolate and dangerous, he erected stages, at proper distances, on the way, so that travellers might subsist at a reasonable expence, and likewise be secure from the insults of the Tartars, who are naturally thieves, and who rove about, and surround passengers, and sometimes plunder them of all they have, and murder them also. Nay, in some places he built cities, as Janifea, on the river Janifea; Albassin, or Albaza, on the Yamour; Schelinga, on the river Schelinga; Argun, on the river Argun; and the like.

If due notice is here given of dangers to travellers on these roads, the governors of the several stages, or cities, are always ready to send convoys to escort the merchants from one stage to another; and when they hear of any caravans of merchants coming, and having notice of any hoards of Tartars on the road to attack them, they send detachments of their soldiers to meet their caravans, and conduct them safe: and this they are obliged to do, without taking or demanding any gratuities or rewards, much less obliging the merchants to pay any tolls or duties on their goods.

These caravans, or companies of merchants, sometimes consist of several hundred horses and camels, and bring a very large quantity of rich goods; and would the Chinese emperor have done his part towards opening a trade with Europe that way, as the Czar would have done, it might have been made easier to them both, and infinitely more considerable. For example:

There are several rivers capable of being made navigable, whose course running from west to east, have their beginnings in the Muscovite dominions; and, were due methods taken to clear these rivers of the obstructions which prevent their navigation, and which are rather accidental than natural, half the journey might be turned into a voyage, and be performed by water.

There are likewise other rivers, more southward, which rise on the frontiers of China; some take their course directly into China, and passing by or through some of the greatest trading cities and provinces in that country, empty themselves into the Chinese ocean.

Other rivers rising on the same frontiers, and not very remote from the first, take a quite contrary course, and empty themselves into the Caspian sea. So that were these mighty monarchs agreed to promote reciprocally the good of each other's subjects, a small expence to settle caravans, or land-carriages, between the said rivers, for the distance, perhaps, of 12 or 20 days journey, would facilitate the commerce of those nations that way, and goods might come even from Pekin in China to Peterburgh itself, almost all the way by water.

We shall but just mention with what ease these two powerful monarchs, if they concurred in their endeavours, might bring the world to a certainty about the continuity of the northernmost land of Asia with that of America, and the possibility or impossibility of a passage by the north-east seas to China and Japan; whether Nova Zembla be an island or a continent; whether there be any such thing as passing from the mouth of the river Oby, and the river Janifea, into the ocean, or whether those rivers empty themselves into the straits called Waygat's, and whether that strait is a bay or a vare, and opens eastward into the ocean; whether the river Tartarus opens into the said Indian Ocean, or whether its stream is continually diving under a surface of ice; whether the north-east part of Grand Tartary, and the mountains of which our geographers say they know not how far they extend, run out beyond the pole, or whether they are broken off by the ocean, and leave room to ships to steer to the south-east, and to the land of Jesso and Japan.

We do but just mention these things, however instructing they might be, because the emperor of China, not addicted to improve his people by commerce or correspondence with Europe in this shape, is no way inclined to make discoveries, or, perhaps, apprized of the advantages it might be to his country if he did.

But we must not omit, that the late Czar of Muscovy, a very enterprising and politic prince, had encouraged several of his own people to travel by land, and trace the northern coast, in order to discover what they could of these things; but either for want of constancy to endure the extremity of the weather, or for want of judgment, they have, 'till very lately, done nothing worthy of the design, nor afforded any accounts that have been satisfactory: not that the thing was impracticable, for as they never came to any country but what was inhabited, it is hard to conceive that it should be impossible for some people to travel through a country where others could dwell; or, which is still more, that they could not pass through a country in the summer, where others could subsist the whole winter. We make no doubt, but if the late Czar had lived, and accomplished his other great enterprises for the advancement of the commerce of his people, he would have found some methods to make a commerce with

China more practicable by sea or by land, by caravan, or by river-navigation, than it is at present.

Whether the journey to China may be shortened by the convenience of water-carriage, it may be considered, that the way which travellers from Moscow to China now take, is this: they go north to Jerslaw upon the Wolga, 200 miles; then to Wolagda, on the Russian Dwina, 188 miles farther, the same river, which runs to Archangel; then north to the latitude of the arctic circle (to avoid a great desert of 800 miles, which lies in the way) then south-east to Tabolski, on the river Irtsich, which some make in 54, but Sanfon places it in 66, degrees of north latitude; and this is 3000 miles from Moscow, if we may believe the journal of the Holstein ambassador, Ibrand of Gluckstadt, who travelled as minister of the Czar of Muscovy, from Moscow to Pekin.

From hence they cross the river Oby, and travel east to the river Janifea, which by the account of Ibrand held them 67 days.

All this might be traversed another way, thus: from Moscow to Casan, all the way down the Occa and Wolga, about 300 miles; at Casan they enter the river Kama, by the stream of which, large enough for vessels of 80 tons, they can go up to Perma Mielki, within three days journey of Irtsich: so that by travelling only three days by land, all the journey of 2200 miles to Jobolski may be performed by water.

Let it be supposed, that from Jobolski they go by water 'till they enter the Oby, which has been done, and is practicable every day: from the banks of the Oby to the Janifea, and from the Janifea to the great lake of Baikala, is the 12 or 20 days journey we speak of. Out of this lake issues the great river Angara, or Argun, by some called Yamour, according to Sanfon, or Jamor, or Amour, according to others; which running with a vast channel, empties itself, after a course of 2720 miles, into the great Tartarian ocean, or sea of China.

This is the river which the Chinese ought to take care of, and which, perhaps, may be as easily opened for navigation as the Wolga, whose course is as long, and channel as large: and, as it lies in a latitude not to be incumbered with ice, it may probably be an easy passage into the Chinese sea, and answer as well, perhaps, to the Russians, as a north-east passage by sea would to the rest of the world.

Some of the modern map-makers, though their authority is much to be questioned, bring the head of the river Irtsich farther south, and make its course much longer than the Ancients; they lay the stream parallel with the Oby, and that with Janifea, and their spring-heads not far asunder; so that according to those maps, from Casan on the Wolga, it cannot be above six days journey to the Irtsich, without going north up the Cama at all, and then they may pass down the stream of Irtsich, which lies north-east by east, 'till they come into the Oby, and then to the land by the river or the lake Janifea; and from thence in 20 days journey, as above, they reach the lake Baikala, whence they go by the Angara. But those differences can only be adjusted by the Russian geographers, and these routes settled to China, so as to make it easy for the carriage of merchandizes. But, as the Chinese have not concurred herein, there lie difficulties, which, perhaps, may never be removed except by force.

But the late Czar, who had this trade to China much at heart, had his eye another way; and though even this, according to one method, wanted the concurrence of the Chinese government, yet if that failed, there was another method which would not want it at all, which was thus:

The navigation from Moscow to the Caspian Sea is known, and is all within themselves; the Wolga enters the Caspian Sea about the latitude of 46 degrees on the north side of the said sea. On the east, almost in the same latitude, is a great river called Khun or Sihun; others call it Oxus or Oxus, which enters itself into the same sea, and is navigable many hundred miles, or may be so: it rises out of the same mountains, and not far from the head of the great river Ganges. From the head of this river, or so far as it may be supposed to be made navigable, they travel now in 26 days to the frontiers of China, where they meet with the river Coccei, or the Yellow river, by which the Chinese do already correspond with some of the Tartars of Karakathay, and of the kingdom of Tibet, which some call the Independent Tartary.

This river Coccei is, therefore, navigable already, even on this side of the Chinese dominions; and when it enters China, it passes through the heart of the country, between Pekin and Nanquin, and receives into it the river that runs through Pekin, or the Royal Canal, which the emperor began to make for that navigation, and then falls into the sea of China in the latitude of 33.

There is yet another way to be proposed for this passage to China, and that is passing out of the Caspian Sea up the said river Gyun, to Bokara. This is a city of great trade already, and to which great quantities of spices are brought from Surat up to Lahor upon the river Indus, of which we shall speak separately.

From Bokara they keep still the stream of the river Gyun, about 300 miles; then overland to Cachemire, within three days

days of the great river Indus, which they cross over; and keeping under the mountains, and in the Great Mogul's country, they come to Syrmagar on the river Ganges, all which is a journey of about 18 days. Here they embark, and sail down the stream to Minapour, where they go up another river for about ten days more; then landing, they travel by land to Barantola, the capital city of Lallebontan. Here, or within a very little of this place, they meet with the great river Kiam or Kaïm, which runs directly into China, and upon which they pass above 460 miles to Nanquin in the heart of China.

So that in all this passage there is not above 28 days journey by land, all the rest being upon very considerable rivers, well known to those who have been in these countries.

By any of these methods it is evident, that a much easier way of trading to China might be settled, than is now carried on by caravans, which are four or five months upon the roads; and if they perform it, it is with great fatigue as well as great hazard: whereas the methods of carriage being settled as above described, the trade should seem easy to be carried on, by giving commission to captains for buying and consigning to other factors for sale, as is the practice of other countries nearer home.

But there is yet an easier way for this commerce with China, than what has been mentioned, and which we are told the late Czar had in his eye, and resolved to attempt or not, as his expedition to Georgia might succeed: and, indeed, if there was a friendly disposition in the Persians, or in the Great Mogul, it would appear most easy to establish a commerce with India that way almost all by sea; and then the commerce from India to China by sea likewise will be a thing so easy, that it would by no means be worth while to make any attempt by land. For example:

From the mouth of the Wolga in the Caspian Sea, to the mouth of the Sihun, or to the mouth of the Oxus, is an easy voyage; the former of these rivers is navigable up to Bokara, a city already full of merchants, and which has a great trade for all the kinds of goods which we now bring from the coast of Malabar, from Bombay or Surat.

These goods are brought up the river Indus to Cachemire; also the trade of the bay of Bengal, is brought up the river Ganges to the lake of Tibber; and both being in the Great Mogul's country, they are brought within eight days journey the last, and within five days the first, to the city of Termed on the Gyun, from whence they come by water to Bokara, and after into the Caspian Sea.

So that to bring it to a short conclusion, the whole trade of the Indies from the mouth of the gulph of Persia, which is very near to Surat, and the mouth of the river Indus to Achim on the island of Sumatra, may be brought by water (eight days caravan only excepted) to Bokara on the Sihun, thence over the Caspian Sea to Astracan on the Wolga, and thence to Petersburg, the late Czar's new canal to Petersburg being supposed to be completely finished, as he originally intended.

From China then to Bengal, every one knows is no long voyage; and the goods of China are every year brought by the Chinese junks through the straits of Singapore to Achin in the island of Sumatra, and thence to Hugeli on the Ganges, and that with much less charge and time, than they can come one twentieth part of the way over the deserts from Pekin to Moscow. So that the Russians seem to have no more to do, than to induce the Great Mogul, by a proper treaty of commerce, to open the trade of the Ganges and the Indus, and settle a safe correspondence between his subjects and the Muscovites, and the trade to China would be effectually secured.

This prospect was so glorious, and the advantage of such a commerce would have been so considerable, that it accounts for all the great enterprizes and motions of the late Czar that way: his embarking an army, and building a fleet to make himself master of the Caspian Sea*: all which, at one time, the world seemed to look upon as chimerical, and of no weight, not substantial enough to answer the expence; but we are likely one day to see a trade so effectually opened, either through Persia into the Mogul's country, or by the river Oxus and the Sihun to the said country, as may render the Russian dominions immensely rich and potent, by making them the mart of all Europe for the East-India and Chinese commodities, especially the finest, and such as are not too bulky for carriage.

* Although the trade of the Caspian Sea hath not hitherto proved so successful, either to the Russian or British empire, as was expected, yet the matter is said, at present, to be upon the tapis; some proposals having been lately made to the Russian court about it, by means of an annual fleet, to be built at the expence of the crown; the ships to be commanded by Russian officers, or at least officers in the Russian service; but merchants and their goods to be transported at a reasonable rate, with a sufficient force to escort and protect them. In case this design can be brought to bear, it is intended to make Astracan the mart where all Persian commodities are to be vended. But 'till the troubles of Persia are some way or other at an end, it is not easy to conceive how a scheme of this sort can be carried into execution with success.

As for the advantages of the north-east passage to China and India, which so many adventures have been made for, and so many lives lost, it is in the power of the Muscovites to search that to the bottom, and to bring the world to a certainty about it: but we must add also, that if it was found practicable, it would not be any great advantage to the trade of the people of Muscovy in particular, more than to the rest of the world: nay, it might, perhaps, prove the contrary, and, therefore, it may not be amiss to observe, That

In former times both the English and the Dutch made several attempts to discover the northernmost coasts of Europe, and to find out a passage that way to China and the East-Indies. The English in queen Elizabeth's time, under Sir Hugh Willoughby, made a fatal attempt; that unhappy gentleman, with his ship, beat it long at sea in vain, and being driven into a creek on the shore of the Russian Lapland, endeavoured to winter there; but they were all frozen to death, by the violence and extremity of the weather, not having discovered so much as the White Sea.

The Dutch, in the year 1596, under the famous Heemskirk and Barents, discovered the straits of the Waygats, as they are now called, and went, as it was thought, into a strait or passage between Nova Zembla and the main, but were not able to proceed far enough for the ice; no, not so much as to know, whether there was a passage through, or only a deep bay, and so were obliged to return again. After which Heemskirk sailed round the north part of the land or island of Nova Zembla, passing into the latitude of 80 degrees, and then coming back into the latitude of 76, and being driven on shore by the ice, he lost his ship, and he and his whole crew were obliged to stay all the winter in great extremity of cold: and the next year building themselves two shallops of the wreck of their ship, with great difficulty, they got to the shore near the mouth of the river Cola in Laponia Rusienne, but came home no wiser than they went out, as to knowing whether there was any passage or no.

We mention these things only, to intimate how industrious both the English and Dutch have been, even so long as about 160 years since, to find out a passage to the Indies that way: and no doubt it would be very advantageous to both these nations in their trade, (1.) As the voyage to China in particular, would be at least 8000 miles shorter than it is now, by the Cape of Good Hope, and the straits of Sunda or Singapore. (2.) That the danger as to health would not be so much this way, being beyond all comparison healthier, because it is not needful to pass the line at all, or go into any violent hot climates; whereas our navigators pass the line four times in every voyage to China, as they now go; and extreme cold is found to be much healthier than extreme heat, and easier to be borne.

But to bring this to a point; suppose this passage could be found out, the question, in regard to the trade of Russia, What advantage would such a trade be to the Muscovites? The answer is, nothing, in comparison, perhaps, to what it may otherwise prove: for if the Muscovites can, upon any tolerable terms, bring the manufactures and growth of China and the Indies home to their own country, they would thereby make themselves the merchants, and their country the general mart of this part of the world for those goods, and raise an immense profit from the trade; seeing all the northern parts of Europe must necessarily come to their markets to purchase these commodities.

But if the English and Dutch could go about by the north-east to China, and bring all those goods by sea, Russia could have no benefit thereby, except what might happen on any ship's putting in by stress of weather into their ports; which would prove of little consideration to what we have put in competition therewith. Besides, they would have the mortification of seeing the trade all carried away by their doors, without paying them any toll or profit whatsoever.

It is true, that could a passage be found beyond the land of Nova Zembla, from the mouth of any of the rivers in the Muscovite dominions, as from the river Oby, or the Janifea, which is still farther, and so the trade should first come into the Czarina's dominions, it would do very well on their side, and her country would be the great emporium for all the riches of the east: for our navigators have hitherto been no more able to find a passage through the Waygats, than they have been able to pass quite round by the north of Nova Zembla.

But the grand difficulty does not seem to lie about passing the straits of Waygats, or sailing round Nova Zembla; it should seem that there is an ocean beyond it, because the great rivers Oby, Janifea, and others, whose names our geographers do not agree about, and which rising in the southern parts of Grand Tartary, and taking their course due north, must empty themselves somewhere into the ocean, on the north side of the country.

It is pleasant to observe, that although none have ever yet been able to pass through the Waygats, or to discover to general satisfaction whether Nova Zembla be an island or a continent, or whether the northernmost parts of Asia be contiguous with America; yet our map-makers shew us at the north-

north-east part of Asia a great promontory of land, and a long ridge of mountains, and say it is not yet discovered where they end; at the same time putting these words over the sea-coast, between those two undiscovered lands,—[Here they may fish for whales, but the navigation is very difficult.] Upon the whole, though such passages have not hitherto been discovered, yet we cannot answer for what futurity may bring to light; but if such passages should be found, if they are not practicable in the ordinary way of commerce and navigation, the discovery will as little avail Russia as any other state or empire.

For though there should be such a passage discovered, yet if it be found so hazardous that ships should often be obliged to return back without being able to beat through, and others stranded and run on shore, and then inclosed among the ice and lost, this would, as to trade, be no passage at all, seeing in trade that may be said not to be practicable, which is not so to the advantage of the merchant.

What discovers itself to us in the late attempts of the Muscovites to find out a passage to China by sea, that they do not intend it from the White Sea at Archangel, and so through the Waygats, by which all Europe would soon be as able to go as themselves, and so the discoverers be nothing the better for it; but their design seems to be to discover, whether a passage being found out by the north-east point of Tartary, it may not be navigated from some other part of the Muscovite coast, either by the river Oby or the Janisea, or some other rivers, by which means, though they would have the chief benefit of it to themselves, yet even this way, such a discovery might be of some advantage to the rest of this northern world too.

Now, if the Muscovites can first make out the main discovery, viz. That there is a passage, and that they may sail about by the north-east point of Asia, and then could still keep the straits of the Waygats undiscovered, and as it were shut up, they would by such a discovery have the whole trade of China and the Indies to themselves, being able to bring their ships into some particular port or place, not so liable to be frozen up as the Waygats, and then bring the goods, by the rivers Oby or Irtysh, into the very heart of their country.

But we have not yet done with the trade of Russia, in which we are to take notice, that on the eastern side of this great empire, and on or near the bank of the great Kama, they have great quantities of rock-salt, which they dig out of the earth, then dissolve it in its own brine, as it may be called, that is, in salt-water which rises out of the mines of salt, and then boil it up again to be very fine white and strong salt.

They drive a considerable trade in this salt, inasmuch that it is ordinary to see 20,000 people employed in making it, all at a time.

They bring this salt down the river Kama, thence carry it up by the Wolga and the Occa to Moscow, and down the Wolga to other cities, even as far as the city of Astracan.

They cure also vast quantities of fish in the great lakes at the head of the Oby, the Janisea, and other lakes in the frontiers of Kathay; which fish is brought down those rivers to Casan, and so into the Wolga, and up to Moscow.

As we have mentioned the produce of the Russian dominions for their trade on this side, and by the exportation of which so much wealth daily flows into their country, it seems necessary to add something of the increase of their trade this way, and of the city of Petersburg, as it respects the trade of the Baltic Sea.

PETERSBURGH is a great city, and the Czar, besides the houses of the inhabitants, founded many magnificent structures there; among the rest, the fortifications are said to be invincibly strong, taking in its advantageous situation by water. Also the works which he made at Cronstot are very considerable; and the shore is so lined with artillery in all places, that no power in that part of the world will, perhaps, ever make any attempt on that side. But notwithstanding that, it may not be absolutely impracticable by other nations: nor are the fortifications at Cronstot, or on any other part of the entrance of the Neva, so formidable as to secure the city from all apprehension of an attempt, when it should come to be made by any nation able and experienced in such undertakings; and this appeared by the panic, which seized them in the year 1726, when a Squadron of British men of war appeared before the harbour of Revel, threatening, as they thought, an attack upon this place.

The Czar also built a cathedral, several churches, and a palace for himself, with a great many fine apartments, and so many lines drawn for increasing them, that had he lived, it was believed he would have equalled, if not exceeded, the palace at Versailles, a model of which he had caused to be taken. Here are very fine docks and yards for building large ships of war, from 70 to 90 guns; and, as it is said, the emperor resolved to keep in constant pay a full complement of seamen to man them fit for service. Nor is it impossible, perhaps, that this empire should one day obtain a competency of constant navigation, as a nursery for the maintenance of a much larger royal navy than they have at present.

*Till within these twenty years, a Muscovite fleet was a thing

that was never heard of; it seemed at first to appear in the Baltic, like a comet in the waste or starry spaces; or like the new star in Cassiopeia's chair, for all the world to wonder at. Yet so it is, that the Russians are able now to figure it in the Baltic, with a naval power no way contemptible. But what is it, that is not absolutely impossible to accomplish, which a prince of the late Czar's great natural abilities and indefatigable application, was not able to do?

Though Petersburg is the capital city of Russia, yet it stands very low, and is exposed to inundations; and therefore some have thought that the Czar was ill advised, and took a very injudicious step, when he pitched upon the spot of ground on which he built this new city; for that the great quantity of waters, which sometimes come down from the Ladoga, and from the innumerable lakes of Finland and Carelia, are such, that the Neva cannot give vent to them fast enough, to prevent the city of Petersburg being subject to inundation: nor can any human art, some say, be able to prevent this, there being no way possible to be contrived on that side, whereby to carry the water off, except a canal, exceeding deep and broad, were opened from that great branch of waters, which passes near Kexhold to Wiborg. This, it is imagined, might turn the water another way, and the Czar, it is also said, had ordered such a canal to be opened.—But, however, Petersburg is so situated, as to be the center of a vastly-extended commerce; and may one day, perhaps, show the world, that to trade to that city, will be to trade to Turkey, to Persia, to India, and even to China itself all at once.

We have already spoken of the grandeur and magnificence of this metropolis, the establishing the navy there, and the building ships, as well men of war as merchantmen; of all which it must be observed, that this cannot fail to bring a vast concourse of business and of people; and trade must follow the court, as naturally as the court follows the fashions.

We are told there are in Petersburg above three quarters of a million of people; and that their numbers daily increase, by the prodigious increase of the court since the time of Czar Peter; as also in a particular manner by the increase of the naval power of Russia, of which this port is the center, in so prodigious a manner, within a few years, as to have at once from 60 to 80 sail of capital men of war, besides lesser men of war, prohmss, frigates, sloops, and galleys, amounting to above 300 more. All the seamen, workmen, artificers, tradesmen, &c. depending on such a navy, must necessarily increase the inhabitants of this imperial city; and this number of inhabitants must consequently bring a new face of trade into this part of the empire, of which it is proper to take some notice.

The supply of provisions to so great a body of people, has occasioned numerous trades to be set up, which greatly tend to the increase both of shipping and of people, and particularly of that useful sort of people called seamen, who are a set of men more imminently wanted now in this part of the Russian empire.

The bringing corn to serve this city, employs now a prodigious number of vessels and boats, great and small, upon the river Neva, and upon the great lakes of Ladoga and Onega, to and from all the towns on every side of these lakes: all which part of the country is now exceedingly enriched and aggrandized, to what it was before this capital was built; the lands are improved almost beyond all imagination, by the great quantity of corn raised in the country, adjoining to these rivers and lakes; to which before the inhabitants never applied, not having a convenient port for its exportation, much less a capital city for its consumption.

Nor is the country on the shores of all those rivers and lakes, sufficient for supplying the said capital city with corn, but a great number of ships are employed, more than ever before, in fetching corn from the coast of Livonia and Esthonia, and even from Dantzic itself, for the supply of the markets at Petersburg.

As the corn-trade thus employs a number of vessels, so does the fishing as well in the Baltic, viz. in the gulph of Finland, as also on the great lakes of Ladoga and Onega, which are covered with fishing-boats, always employed in catching fish at the proper season, and carrying them to Petersburg, as well fresh fish for the daily markets, as cured and dried for keeping, and storing ships and houses for winter consumption, when the said lakes are frozen up.

Abundance of small craft are also employed on the Wolga, and men and carriages between the Wolga and Petersburg, for conveying goods and merchandizes to Petersburg; such as tobacco, honey, wax, leather, and all sorts of goods, the growth and produce of the southern parts of Muscovy; and for the return of the merchandizes imported at Petersburg, such as grocery, wine, oil, fruits, woollen manufactures, silk, and all other goods, occasioned principally by the building so great a city in that place.

And though all the importations to this city from the exterior provinces cannot be minutely enumerated, yet it may be concluded, that the trade from Petersburg to Moscow itself, the great and most ancient capital of the whole empire, is exceedingly great, that city having all its supply of manufactures, and of other goods besides, through the said river

Volga, or by land-carriage, by fled from the city of Petersburg.

This increase of commerce is manifest by the great number of shopkeepers, manufacturers, artificers, and other tradesmen, with whom the metropolis at present swarms.

It is not probable (we might say hardly possible) but that the erecting a new capital and imperial city, in a place where there was no town of note before, and bringing together such a body of people where there were very few inhabitants before, must, as is observed of the trade by water, consequently improve the lands, employ the country, and draw together people for business of all kinds, from the inland provinces, as well to the adjacent towns, as to the banks of the rivers, the sea-coasts, lakes, &c.

Of this the famous city of Novogorod was a remarkable example: this was a city once prodigiously great, populous, and rich, so that it was called the Golden City; by which the whole correspondence between the Russian empire and the rest of Europe was carried on, and it was the mart of the whole trade.

While this city flourished, all the country round it did so too: the wealth and numbers of people collected there, enriched and employed all the adjacent provinces, the lands were cultivated to furnish provisions for their subsistence, all the richest grounds were employed to feed cattle for them, and to raise fruits and plants to supply the markets.

Thus it is now at Petersburg, which, if we may believe fame, is much greater, much richer, and far more populous, than Novogorod ever was, and consequently must in proportion increase and enrich all the adjacent country, and fill their towns with people and money, because it will fill them with business and trade.

But with this exception, the city of Petersburg is enriched by the fleets, the marine part of trade, and by the court, and by the magnificence of the equipages of their nobility, great officers, &c. and has an infinite advantage by all meeting together as in a common center.

It is true, the Czar found he had another weighty clog upon his new empire as to trade: nature had seemed to exclude the Muscovite dominions from a communication of trade with the rest of the world, till by a wonderful chain of victories, unexpected even to himself, that emperor opened a door for his subjects into the Baltic, by his conquest of Ingria and the mouth of the Neva, which he could no way come at before. Many of his ancestors had in vain attempted this communication by the way of Narva; but, though they had several times conquered that city, they could never keep it: but the Czar not only secured the Neva, and since that conquered Narva, and all the coast of Livonia, but also reduced Wiborg, on the other side; so that the whole gulph of Finland was entirely his own: and, which is still more, he also secured the possession of these conquests by a peace, as well with Sweden as with all his other neighbours.

But his Czarish majesty, besides this, had another great obstruction to his mighty enterprizes, which was, that the king of Denmark kept the passage of the Sound, the great key through the navigation of the Baltic, and no ships could pass in or out without paying such an unlimited toll as he should think fit.

This rendered the Muscovite commerce into Europe tributary to the Danes; and this was now the only impediment to the Czar for the trade of his people; which, but for that occasion, he would have soon extended to France and Spain, Italy and Venice; for which too, he had laid a good foundation by treaties.

This difficulty, under which his dominions laboured, gave first birth to the design of cutting a canal from Hufum to Skiswic, or some other port in Holstein (for there are several places where there was no great difficulty in the execution) and thereby to have joined the two seas, and opened a back-door into and out of the Baltic, and which the king of Denmark would have had no power or right to interrupt; nor would the rest of the trading world have been displeased therewith.

These are some of the obstacles that this great prince met with in his glorious undertakings, which if he could have surmounted, he would have bid fair to have been as powerful at sea as most of his neighbours; and this would have rendered the alliance of Russia by sea not less considerable than it now appears by land.

But he had his disappointments, as well as other princes, and particularly one of no little mortification to so enterprising a monarch. He had been compelled to restore Afoph, at the mouth of the river Don, of which once he not only had the possession, but had, at an immense expence, made it one of the most impregnable fortresses in the world; nor could the whole Turkish empire have recovered it, unless the Czar had been first beaten from it by land; and, had he kept it, he would have built such a fleet of ships of war, from 70 to 100 guns, at Voronitz upon the Don, or Tanais, which would soon have enabled him to have brought the Grand Seigneur to have granted his ships a free passage and commerce through the Thracian Bosphorus and the Hellespont, into the Levant Seas, or have driven the Turks out of the Euxine Sea, and have starved Constantinople itself.

But, in this respect also, this illustrious prince was disappointed, being, by surprise, brought into such a labyrinth in Moldavia by the Turks, that he and his whole army had been swallowed up, if he had not purchased his peace and deliverance, among other things, with the yielding back Afoph to the Turks. The late Czar resolving to reform and civilize his people, who, before his time, were little better in the general than savages, he determined to make a general change in apparel, and brought the Russians, especially those about his court, to cloath themselves after the German fashion: this change put his subjects incessantly upon a new expence, viz. buying cloaths in an unusual manner, for which purpose the manufactures of England and Scotland, &c. were introduced, as well at Petersburg as at Moscow, in prodigious and unusual quantities.

But the Czar, after the example of the Swedes, the Prussians, and the Saxons, attempted to act herein greatly for the prosperity of his subjects in this particular of new cloathing them, resolving to introduce the making and manufacturing all those cloths and stuffs which his subjects were then beginning to wear, and to have them all made in his dominions, that his poor might be usefully employed.

Nor was it so unlikely an undertaking as at first it seems to be, in that he had an easy supply of wool out of Poland and Saxony, especially of the first, sufficient for those works.

His Czarish majesty had also resolved to bring manufacturers from France, to settle in Petersburg, to manage and carry on the silk trade, furnishing them with silk from Persia, by the navigation of the Caspian; by which means the silk itself is so cheap, and the labour of the people more particularly so, he resolved to have all sorts of the richest brocade silks, as also ribbons, &c. wrought in his own country, as well for their own use as for the exportation to foreign parts; but this is one of the great improvements that is not likely soon to be brought to perfection.

The Russians have had also, some years, a royal foundery: for having a sufficient quantity of iron ore in the country about Kexholm, which they bring to Petersburg by water, the late Czar resolved to supply foreign countries with cannon, bombs, shells, shot, and all sorts of military stores which are furnished from the iron; as also small arms, muskets, pistols, swords, halberds, &c. This foundery is kept continually at work, and the Czarina, his successor, gave directions for enlarging and encouraging the works, having got some very skilful workmen out of the king of Prussia's dominions. This foundery, as well as their iron manufactures in general, have proved a very great advantage to this empire, and are daily advancing.

In short, there seems to be nothing wanting to make the city of Petersburg a center of commerce to the whole Baltic, but the raising some settled employment for the poor in general, by which they may gain a comfortable subsistence to themselves and families: and this subsistence after the Russian manner being so exceeding cheap, and labour, by consequence, moderately low, it is manifest, if they have but two things provided for them, viz. proper materials to work upon, and skilful workmen to instruct them how to manage those materials, they would work as cheap as the Indians and Chinese, and in a few years, perhaps, fill Europe with their manufactures, in such a manner as none in these parts would wish to see. And the establishing manufactures seems to be an essential part of the system that they have at present adopted, which we must more and more sensibly feel and experience as they advance therein, unless we shall take less of their productions and commodities, in proportion as they shall import less of ours.

Of the MONIES, WEIGHTS, and MEASURES OF RUSSIA.

In Petersburg and Archangel most merchants keep their accounts in rubbles and copecks; and some keep them in copecks, grieveners, and rubbles.

The Russian coins go under divers denominations, viz. copecks, altines, grieveners, polpoltins, poltins, and rubbles. They have likewise a small gold coin, called a Russian ducat, worth between eight and nine shillings sterling.

The said monies are reckoned as follows: 3 copecks is an altin, 10 copecks one grievener, 25 copecks is a polpoltin, 50 copecks is a poltin, 100 copecks is a rubble, and 2 rubbles is a ducat.

They count their small money in altines, adding one copeck to make the rubble.

The rubble is worth between four and five shillings sterling. An English crown-piece goes among them according to weight, at between 120 and 130 copecks.

Their weights are zollotnicks, pounds, poods, and barquits; 96 zollotnicks make their pound, which is counted equal to 13 oz. 3 dwts. 6 grs. Troy weight; 40 pounds is one pood; 10 pound is a barquit: a pood of 40 lb. Russian weight will render in England 35 $\frac{1}{2}$ or 36 lb. avoirdupois weight.

Their long-measure for linen and woollen is the arsheen, which is divided into 16 veshcoves, and is 28 inches London measure; and 7 English yards make 9 of their arsheens, or 100 arsheens make 56 English ells.

Their measures for corn are the chetwert and the chetwericks; 8 chet-

8 chetwericks is one chetwert, which holds about $5\frac{3}{8}$ bushels Winchester measure.

They pay the customs in no other money than foreign rix-dollars, English crowns, ducats, and such-like good whole pieces, which they also take by weight.

They give to Hamburgh in exchange an uncertain number of copecks for the rixdollar of Hamburgh.

To Amsterdam, the rubble, for an uncertain number of stivers current money of Amsterdam. The exchange generally rises in November and December.

R E M A R K S.

In negociating money by bills of exchange between England and Russia, it is commonly done by the way of Amsterdam. The computation of which is thus: (1.) The Russian rubbles are converted into florins current money of Amsterdam; this current money is reduced into bank money, according to theagio, which is generally from 3 to 5 per cent. i. e. 103 to 105 florins, or gilders, current money, are equal to 100 florins, or gilders, bank money of Amsterdam; and this bank money of Amsterdam is reduced into sterling money, according as the course of the exchange shall be between England and Amsterdam. See the article HOLLAND.

☞ All merchandizing coming from Russia pay a duty to the king of Denmark in passing through the Sound. See the article DENMARK.

The DUTIES which the following Russia goods pay in passing through the Sound.

		rixd.	stiv.
Linen	Fine, 1000 arsheens, pay	1	12
	Middling, ditto	0	40
	Coarse, ditto	0	30
1	Shipon of fine flax	0	12
1	Ditto of coarse	0	8
1	Ditto of hemp	0	8
1	Piece of canvas	0	3 $\frac{1}{2}$
6	Shipon, or 1 last of iron	0	24

Note, 1000 is 1 shipon, and 6 shipon is 1 last.

N. B. 48 stivers make 1 rixdollar.

☞ When the captains of ships run the goods through the Sound without paying the duty to the king of Denmark, the merchant allows the captain $\frac{1}{3}$ of the duties saved, for his trouble.

RUSSIA COMPANY. The Russia company was first projected towards the end of the reign of king Edward VI, executed in the first and second years of Philip and Mary, but had not its perfection 'till its charter was confirmed by act of parliament under queen Elizabeth, in 1566. It had its first rise from certain adventurers, who were sent in three vessels on the discovery of new countries, and to find out a north-east passage to China: these falling into the White-Sea, and making up to the port of Archangel, were exceedingly well received by the Muscovites, and at their return, solicited letters patent to secure to themselves the commerce of Russia, for which they had formed an association.

The charter was promised them by Edward VI. but he dying, was first dispatched by queen Mary, in 1555. By this charter, the association was declared by a body politic, under the name of the Company of Merchant-Adventurers of England, for the Discovery of Lands, Territories, Islands, &c. unknown, or unfrequented. Their privileges were, to have a governor, four consuls, and twenty-four assistants for their commerce; for their policy, to make laws, inflict penalties, send out ships to make discoveries, take possession of them in the king's name, set up the banner royal of England, plant them, and, lastly, to enjoy the exclusive privilege of trading to Archangel, and other ports of Muscovy, not yet frequented by the English.

This charter, not being sufficiently guarded, was confirmed by parliament, in the eighth year of queen Elizabeth; where-in it was enacted, That, in regard the former name was too long, they should now be called the Company of English Merchants for discovering New Trades; under which name they should be capable of acquiring and holding all kinds of lands, manors, rents, &c. not exceeding 100 marks per ann. and not held of her Majesty. That no part of the continent, island, harbour, &c. not known or frequented before the first enterprize of the merchants of their company, situate to the north or north-east of London; nor any part of the continent, islands, &c. under the obedience of the emperor of Russia, or in the countries of Armenia, Media, Hircania, Persia, or the Caspian Sea, shall be visited by any subjects of England, to exercise any commerce, without the consent of the said company, on pain of confiscation.—The said company shall use no ships in her new commerce but those of the nation, nor transport any cloths, serges, or other woollen stuffs, 'till they have been dyed and pressed.—That in case the company discontinue of itself to unload commodities in the road of the Abbey of St Nicholas in Russia, or some other port in the north coasts of Russia, for the space of three years, the other subjects of England shall be allowed to traffic to Narva, while the said company discontinues its commerce into Russia, only using English vessels.

This company subsisted with reputation almost a whole century, 'till the time of the civil wars. It is said, the Czar then reigning, hearing of the murder of king Charles I, ordered all the English in his states to be expelled; which the Dutch taking the advantage of, settled in their room.—After the Restoration, the remains of the company re-established part of their commerce at Archangel, but never with the same success as before, the Russians being now well accustomed to the Dutch merchants and merchandize.

This company subsists still, nearly on the foot of that of Hamburgh, and the Northern and Turkey companies, i. e. each member thereof traffics for himself, and on his own bottom, only paying an acknowledgement for admission-money, besides some other dues imposed from time to time, for the occasions of the company, and the commerce in general.

Of the **BRITISH CASPIAN TRADE**, as it was attempted to be carried on through **RUSSIA** to **PERSIA**.

'Till the sixteenth century we had no Caspian commerce, and then only small trials. His present Majesty king George II, renewed a treaty of commerce with Russia in 1734, by which a liberty of this trade is granted. In 1741 the parliament of Great-Britain passed an act, granting a liberty to such persons as are free of the Russia company, to import the RAW SILK of Persia into Great-Britain, in return for British manufactures sold in Persia; in consequence whereof, were sent 170,000 l. value into Persia.—In 1743, John Elton, one of the factors in Persia, engaged himself as a ship-builder in the service of NADIR SHAH, which offended the Russians, and at length occasioned a decree of the Russian court, published in 1746, prohibiting this trade.—The cruelties of NADIR SHAH involved his people in such misery, that no sales of goods could be made by the BRITISH factors in the north of Persia, from 1744 to 1747.—In June 1747 NADIR suffered a violent death.—His nephew Ali succeeded to the throne, and trade revived.—In January following, AMUR ASLAN KHAN, a cousin of NADIR, revolting from ALI, sent a body of forces, who pillaged the BRITISH factors in RESHD, to the amount of 80,000 l.—Yet the British CASPIAN traders did not give over all hopes of the recovery of their loss.—The rebel AMUR ASLAN KHAN, the author of the plunder of the British factory, was soon seized by IBRAHIM, and put to death.—After that, SHAHROKH was chosen king, and supported by a powerful party.—This carried IBRAHIM back, but his fortune was reversed, by the desertion of his army, and his total defeat.—The British CASPIAN traders applied to SHAHROKH for redress, about the month of Jan. 1750.—Afterwards the ENGLISH factors in St Petersburg united in sending a person of reputation to act in concert with Mr Wilder in Persia, intending to reconcile certain difficulties which had arisen among the adventurers, and apprehending that a coalition of interest would be the best means of preserving that unanimity, without which, a solicitation for the recovery of their loss would prove fruitless.—With regard to their respective losses, they had now but one common interest: but here we experienced the great want of proper regulation, and what perplexities commercial affairs in ASIA are subject to, if left free and open, or with the appearance of a BODY CORPORATE, without the substance of it*. See our articles LEVANT TRADE, ORIENTAL TRADE, and TURKEY TRADE.

* In EUROPE every man has a right of claiming according to the laws of the country he is in, regard being had, at the same time, to private agreements, or the authority of the consul of his own nation, as has been found productive of the general good of the whole factory or community: but in ASIA there must be some regulations independent of the national government, or animosity and confusion inevitably ensue; so at least we found it in the CASPIAN trade. Hanway's Travels.

The success the merchants had at ASTRABAD, the remembrance of the promises of ADIL SHAH, the assurance that Persia abounded in money, likewise that SHAHROKH was established in the government, inclined the factors and merchants to attempt a recovery, at the risk of some expence; the ancient laws of Persia also favoured this design: however Mr CHAMBERLAIN, who was charged with the king's letter, found it unnecessary to proceed any farther than RUSSIA, PERSIA being still torn with intestine commotions; but nothing has been yet done, and it may be presumed that a great part of the Indian treasure is dissipated so as to leave no hope of accomplishing any recovery.

These distractions having continued for six years, the cultivation of raw silk in PERSIA has also been much neglected*. Many other reasons concurred to raise the price of silk to this nation. Under these circumstances, the BRITISH parliament was induced to try if our own plantations could produce this valuable commodity, and accordingly an act was passed, entitled, An act for encouraging the culture of raw silk in his Majesty's colonies or plantations in America. See the articles SILK, and BRITISH AMERICA, particularly GEORGIA.

* The ARMENIANS and RUSSIANS, have for some years past imported hardly $\frac{1}{10}$ part of the usual quantity.

Notwith-

Notwithstanding the encouragement given by the legislature to the culture of raw silk in our American colonies, an ample supply of this commodity, we fear, can be brought only from Asia, unless we shall be able to make some very extraordinary improvements. Europe, during the last war, did not produce the usual quantity, nor has the price of some particular kinds declined since that time: for the consumption of this article rather increases than diminishes. The EAST-INDIA company, therefore, we may presume, applied to parliament for an alteration of the duty of CHINA silk, the obtaining of which affords an encouragement to the importation of it*, and no doubt we shall have a sufficient quantity. The act in favour hereof is entitled, An act for repealing the DUTIES payable upon CHINA raw silk, and for granting other DUTIES in lieu thereof. See SILK.

* In 1752, we find accordingly a large supply of CHINA raw silk arrived.

The Russia company finding themselves thus excluded a branch of trade, from which they had expected many private as well as national benefits, applied their thoughts how best to repair this injury: the most natural expedient was to obtain a liberty to purchase the same commodity in RUSSIA, which they could no longer provide in the north of PERSIA, at least not to transport it through RUSSIA: they might, indeed, purchase silk in RUSSIA to transport to other countries, but an act of parliament was necessary for the importation of it into England. Accordingly the following petition was presented to the parliament.

The petition of the merchants of London trading through Russia into Persia,

Sheweth,

‘ That your petitioners did, in the year 1741, obtain an act of parliament to enable them to import Persian raw silk by the way of Russia from Persia, if purchased there with the produce of British woollens, and other manufactures. Your petitioners having, in consequence of the said act, sent into Persia about 200,000*l.* value in British manufactures, and received part of their returns in Persian raw silk, are now prevented by the many revolutions and fatalities which have happened in Persia since the commencement of this trade. Other accidents also have intervened to obstruct the design as at first proposed, his Majesty not having any minister at the court of Persia, to protect our factors, his Majesty’s subjects, and our effects in that country, which gives the Russians and Armenians very great advantage over us, your petitioners.

And as the Russians and Armenians do bring large quantities of Persia raw silk yearly into Russia, which cannot be purchased by your petitioners to be sent into Great-Britain, the present act restraining all imports of Persian commodities, but such as are in return of goods actually sold in Persia; the raw silk in question is therefore carried to Holland by the Armenians, and woollen goods taken of the United Provinces in return.

Your petitioners therefore humbly pray, that in order not to lose so valuable a branch of trade, as that of importing raw silk, a commodity at this time so much wanted, that a clause may be annexed to the bill now depending, relating to the importation of China raw silk, to permit your petitioners to import Persian raw silk, from Russia, subject to the same restrictions as they have done from Persia by the way of Russia.

And your petitioners, &c.’

In consequence of this application, the following separate act* was obtained, from which some happy effects may be felt, as soon as the Persians are in any capacity to send a supply of silk into Russia: and this will probably be the case, whenever Persia shall be restored to a state of tranquillity.

* In 1750, 23d year of his Majesty’s reign.

An act for permitting raw silk of the growth of Persia, purchased in Russia, to be imported into this kingdom from any port or place belonging to Russia.

‘ Whereas by an act made in the fourteenth year of his present Majesty’s reign (entitled, An act for opening a trade to and from Persia through Russia) it is (amongst other things) enacted, that from and after the 24th day of June 1741, it shall and may be lawful to and for any person or persons, free, or to be free, of the fellowship of English merchants for discovery of new trades, commonly called the Russia company, exclusive of all others, to bring and import into this kingdom, in British-built shipping, navigated according to law, from any port or place of or belonging to the Czar or Emperor of Russia, raw silk; or any other goods or commodities of the growth, produce, or manufacture of Persia (provided such manufacture be made of the growth or produce of Persia) being purchased by barter with woollen, or other manufactures, goods, or commodities, exported from Great-

Britain to Russia, and from thence carried into Persia (gold and silver in coin or bullion excepted) or with the produce arising from the sales of such manufactures, goods or commodities, so exported to Russia, and carried into Persia as aforesaid, and not otherwise: and it is by the said act also further enacted, that no silk, or other produce, commodities, or manufactures of Persia, shall be imported into Great-Britain through Russia, by virtue of the said act, unless the importer or importers thereof do take an oath, or (being of the people called Quakers) a solemn affirmation, before the collector, customer, or comptroller of his Majesty’s customs (who are by the said act empowered to administer the same) at the port or place of importation, that, to the best of his or their knowledge and belief, the silk, and other the produce, commodities, or manufactures of Persia, contained in his or their entry or entries, was or were really and truly purchased by barter with woollen, or other manufactures, goods, or commodities, exported from Great-Britain to Russia, and from thence carried into Persia (not being gold or silver in coin or bullion) or with the produce arising from the sales of such woollen, or other manufactures, goods, or commodities, so exported as aforesaid, and not otherwise; and that in default of taking such oath or affirmation, all such silk, or other the produce, commodities, or manufactures of Persia, so imported from Russia, shall be liable to be seized and forfeited, in like manner, as if the same had been imported contrary to the act made in the twelfth year of the reign of king Charles II. entitled, An act for encouraging and increasing of shipping and navigation: and whereas, soon after the commencement of the said act made in the fourteenth year of his present Majesty’s reign, a very beneficial trade between Great-Britain and Persia, through Russia, was opened, by means whereof great quantities of raw silk, and other the goods and commodities, of the growth, produce, or manufacture of Persia, were imported into this kingdom, in return for the woollen and other manufactures, goods, and commodities of Great-Britain, upon much easier and more advantageous terms, than such silk, and other goods and commodities of the growth, produce, or manufacture of Persia could have been otherwise procured: but whereas the said trade between Great-Britain and Persia, through Russia, hath been for some time past interrupted, the subjects of Great-Britain not having been of late permitted to transport British manufactures, goods, and commodities into Persia, through the dominions or territories of or belonging to the empire of Russia, in consequence whereof the importation of raw silk, and other commodities of the growth, produce, or manufacture of Persia from Russia, hath been discontinued: and whereas it would be of great advantage to the trade of this kingdom in general, as well as contribute to the increase and improvement of the silk manufactures in particular, if raw silk of the growth or produce of Persia, purchased in Russia, were permitted to be imported from any of the countries, dominions, or territories of the empire of Russia, in return for woollen and other manufactures exported from Great-Britain to Russia, although the same be not carried from thence into Persia; may it therefore please your Majesty that it may be enacted, and be it enacted by the king’s most excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and by the commons, in this present parliament assembled, and by the authority of the same, that from and after the 24th day of December 1750, it shall and may be lawful to and for any person or persons, free or to be made free, of the said fellowship of English merchants for discovery of new trades, commonly called the Russia company, exclusive of all others, to bring and import into this kingdom, in British-built shipping, navigated according to law, from any port or place within the countries, territories or dominions, of or belonging to the empire of Russia, raw silk of the growth or produce of Persia which shall be purchased by barter with woollen or other manufactures, goods, or commodities, exported from Great-Britain to Russia, although the same be not carried from thence into Persia (gold and silver in coin or bullion excepted) or with the produce arising from the sale of such manufactures, goods, or commodities, exported from Great-Britain to Russia as aforesaid, and not otherwise, upon paying, or securing to be paid, the customs and other duties now payable for the same, by any law now in force, according to such rules, methods, and directions, and in the same manner and form, and with such allowances, abatements, discounts, and drawbacks, and under such penalties, forfeitures, and disabilities, as are by law prescribed and practised, on the importation of raw silk of the growth or produce of Persia, imported into this kingdom from any port or place in the Levant Seas, by any person or persons free of the Levant or Turkey company; any thing in the said act made in the fourteenth year of his present Majesty’s reign, or in the said act made in the twelfth year of the reign of king Charles II. entitled, an Act for encouraging and increasing of shipping and navigation, to the contrary notwithstanding. Provided always, and be it further enacted, that no silk of the growth or produce of Persia, shall be imported into Great-Britain,

Britain, from any of the countries, dominions, or territories, of or belonging to the empire of Russia, by virtue of this act, unless the importer or importers thereof do make oath, before the collector, customs, or comptroller of his Majesty's customs (who are hereby empowered and required to administer such oath) at the port or place of importation, that, to the best of his or their knowledge and belief, the silk, contained in his or their entry or entries, was really and truly purchased by barter with woollen or other manufactures, goods, or commodities, exported from Great-Britain to Russia (not being gold or silver in coin or bullion) or with the produce arising from the sale of such woollen, or other manufactures, goods, or commodities, so exported as aforesaid, and not otherwise; and in default of making such oath, all such silk so imported from any of the countries, dominions, or territories, of or belonging to the empire of Russia, shall be liable to be seized and forfeited, in like manner as if the same had been imported contrary to the said act, made in the twelfth year of the reign of king Charles II, entitled, An act for encouraging and increasing of shipping and navigation. Provided also, that nothing herein contained shall extend, or be construed to extend, to deprive the corporation of the united company of the merchants of England trading to the East-Indies, of any of the powers, privileges, franchises, and benefits, which do or shall belong to them, or which they could or might have had and enjoyed in any manner whatsoever, if this act had not been made, any thing herein contained to the contrary notwithstanding.

And be it further enacted, That this act shall be deemed a public act, and shall be judicially taken notice of as such, by all judges, justices, and other persons whatsoever, without specially pleading the same.

* I presume, says the judicious Mr Hanway, in his Travels, it is meant by this act to restrain all purchases of silk in Russia to the produce of Persia only, for the words of the act allow no more: but silk of the growth of Greece is sometimes brought through Walachia into the Ukrain, and from thence transported to St Peterburgh, but the quality does not answer. It may be necessary to observe, that this act has been explained to mean silk purchased with the produce of British manufactures at large; for in barter, or with the identical money received for such goods, it is hardly possible. This act will very much favour the Armenians, for besides the encouragement they had to bring silk from Persia into Russia, either to transport into Holland for their own account, or to sell it in Russia, they may now dispose of it also in England, and by being naturalized may also import such silk into this kingdom, for their own account, as one of them has already done. The advantages this bill is calculated to produce are many, for whoever receives the profit of the first sale, the more there is brought to market, the cheaper it must be to us.

The benefits of the silk manufactory must ever appear considerable, even upon the most superficial view, when it is considered, that a pound of 16 ounces of the plainest manufactured silk is commonly worth 35 or 40s. and that rich silks increase in proportion to the greater labour which is bestowed on them. The great pound of 24 ounces, costing 21s. the small pound is 14s.: let us now see what profit arises from it, and how much it increases in value, as it passes through the hands of the several workmen; and here the charge only of throwing the small pound is 5s. dyeing, grain colours included, on a medium, is 2s. and winding, weaving, &c. is 10s. so that allowing 1s. for the dyeing materials, the nation gains 16s. at least on every pound of silk manufactured here and exported abroad, and in some articles much more. To instance only in one particular, a pair of silk gait stockings weighs about 2½ ounces of silk, which computed as above is 2s. 2d. and 20 per cent. brokerage, and other contingencies on the silk, is less than 3s. and yet the stockings sell for 9, 10, or 12s. Thus this beneficial branch of commerce gives a subsistence to the industrious artificer, and enriches the nation.

An abstract of Mr Hanway's view of the British trade and factory at St Peterburgh.

The productions of the earth, says this gentleman, and foreign trade, are the great sources from whence the riches of every nation proceed: Russia has made great strides in the improvement of her commerce for several years past, enjoying some advantages beyond any other nation: the number and greatness of her rivers open a communication almost to every part of the globe, but particularly within her own extended dominions. As to timber, hemp, iron, which are the instrumental causes of trade, no country in the world produces a greater quantity, which is a natural consequence of the cheapness of land and labour: the former of these GREAT-BRITAIN enjoys in her AMERICAN dominions, though not the latter; but if we have occasion for the commodities of Russia, that empire has the greatest source of her revenues in the trade which this island carries on with her subjects.

V O L. II.

Hemp, which twenty years since was hardly worth 5 rubles the berquevitz *, of late years has been about twice that value; the increase of silver makes money every year less valuable: as they can afford this article in St Peterburgh at 6 or 7 rubles, they will certainly bring enough of it to market so long as they can obtain 8 or 9.

* Or 61. per ton first cost in St Peterburgh.

Iron is also a very improveable article: they have both wood, hands, and ore in Siberia, sufficient to make a quantity, which would depreciate the value of the Swedish iron, raise their rivalry and competition with the Swedes† in this important article of the revenues of that nation, and at the same time greatly augment those of the Russian empire. But by a certain fatality which prevails in every country in some instance or other, the Russian government, for a course of years, has preferred a profit of about 15,000 l. or 5000 tons, to near twice that advantage which they might have had to all appearance, though the price should have been reduced, had the quantity been more than doubly augmented. The great difficulty was, in whose hands to lodge an increase of power in that distant country Siberia. It is not 40 years since the Russians began to open iron mines, and yet in the year 1750, they exported 20,000 tons: the ordinary annual export may now be called 12 or 15,000 tons, which is so much more in favour of the Russians, as the SWEDISH forges, for these few years past, have not produced so much by one third as formerly.

† The question is, Whether, with regard to the balance of power in the North, the SWEDES are not poor enough in all conscience?

The ordinary computation of the Russian general export from St Peterburgh is three millions‡, of which the British subjects in Russia take off two, consisting chiefly in hemp, flax, iron, hogs-bristles, hare-skins, hempen and flaxen manufactures, Russia leather, and other articles.

‡ In 1750, the exports were four millions of rubles, or 880,000 l. value.

The ordinary imports of the Russians were two millions, consisting in indigo, cochineal, lead, pewter, tin, wrought silks, gold and silver lace, toys, cotton and linen manufactures, woollens and wines. The Russians receive the balance in their favour in silver and gold, of which part is a sum of about 500,000 silver rixdollars, of the coin of the United Provinces; these do not, however, pass current in Russia, but the duties on goods must be paid in them at a certain rate, according to weight. The consumption of the Russians is so far increased with their acquisitions by commerce, that they import now more than usual, but the English have still above a million balance against them. It seems to be a maxim established in all countries where commerce has made any progress, that the value of exports must exceed that of the imports, for otherwise the balance must necessarily be paid in money: against this the Russians have taken the precaution of making it death to export their coin, nor is any plate or bullion exportable without express permission. I have already observed, that in countries possessed of silver and gold mines, money may be considered as a commodity; but even in these countries we do not find such great wealth, as where the only resource is in the industry of numbers of WORKING PEOPLE, and in those productions of the earth, which being essential to the support of mankind, are really intrinsically worth more than silver, gold, or precious stones.

When a people are desirous of foreign productions, and especially articles of luxury, if they do not exert themselves to pay for such commodities by their labour, and the produce of their own lands, they must be impoverished, and in danger of ruin. The augmentation of the revenues of Russia ought to be imputed, in a great measure, to the increase of her trade for some years past, and the increase of her national wealth, to the great annual balance in her favour, of one million of rubles\$.

\$ 220,000 l.

The interior trade of Russia is certainly very much augmented, and the commerce they carry on with the Tartars and other frontier nations, is a considerable object, as Russia sometimes receives a large quantity of foreign silver and gold from those nations, in exchange either for her own or foreign productions. I will not undertake, from an impulse of my good wishes, to determine what articles Russia should be cautious of importing; but those of the produce of Great-Britain are either essentially necessary to her, or such as she can never suffer by: I speak not of the major part of them, for I think not one article, even our ale, but tends to the good of the Russians; not to mention the great advantages to Russia of the Riga and Narva trade with Great-Britain and Ireland. As our Russian trade is well conducted, I shall

pays it over, observing only, that in whatever light it is considered, it ought to be a means of establishing a PERPETUAL FRIENDSHIP between this nation and the Russian empire.

OBSERVATIONS ON the RUSSIAN COIN.

It is remarkable, that when the Russian trade began to flourish, and for some time after, their rubble, which was intrinsically worth no more than 39 current stivers of Holland, was estimated an exchange at 70 current stivers, and this price of their commodities regulated accordingly in the merchants calculation of them; at length it was reduced to 50, and from 45 to 50 it has stood for many years. The Russian rubble has too considerable an alloy to encourage the exportation, but it is not so base as to induce any piratical traders to bring false coin into the country: I speak of the silver money. But by an error in politics in a late reign, the want of money induced the government to make a copper coin of 5 copecks value, which was not intrinsically worth 2; the consequence of which was, that some millions of this coin were run in upon them, particularly by the Jews of Poland; so that at length, in the years 1744, 45, and 46, the government wisely reduced the value each year a copeck, and it now stands at 2 copecks. They keep accounts, as before observed, in rubbles and copecks, 100 copecks to a rubble; and their old way of reckoning, yet in the greatest use, as it is in some parts of Germany, is with beads on wires, which they work without pen and ink.

Before I take my leave, says Mr Hanway, of Russia, I ought, perhaps, to mention a circumstance of some moment to my friends in that country, if not to this nation. The English factory in Russia, as I have already had occasion to mention, was first established in Archangel, in virtue of a charter granted by king Philip and queen Mary, at the same time that the Czar Ivan Waffilowitz (wayed the Russian scepter.

This charter is of too extensive a nature, either in regard to the crown, the Russia company, or the British subjects at large, to be fully complied with, and is consequently become in certain respects obsolete: it reserves, however, in full force, such necessary authority as excludes all foreigners, except Russians, from a participation of the Russia trade to Great-Britain; and in virtue of the bye-laws to which the traders acquiesce, the good government of the company is supported; a small tax is levied for extraordinary occasions, and for the charitable purpose of relieving poor seamen and the widows of deceased mariners.

The factors employed abroad in the name of the Russia company, removed from Archangel to St Petersburg, soon after Peter the Great founded that city, which he made the seat of the Russian commerce. Among other particulars it is remarkable, that this factory has been for some time blended with foreigners; who, in consequence of their naturalization, have enjoyed a participation of the privileges and immunities of the company. The British factors saw this with impatience, and at length sent their remonstrances to their principals in London, in consequence of which an opposition was made to a bill * then depending before the parliament in behalf of a foreigner. This is a circumstance in every respect interesting, and about which there are a great variety of opinions: some particulars relating to the case of the merchants of Great-Britain residing at home, or in the British factories in foreign countries, with respect to persons obtaining acts of naturalization, without any purpose of continuing in these kingdoms, were printed, and of which I have preferred such extracts, as serve as an introduction to the subject, viz.

* 1752.

‘ The granting to strangers all the privileges and immunities which the constitution derives to those born under its protection, and who have a mutual tie of duty and affection, has been ever regarded, in all civilized nations, as a point of the highest importance to the public; as it plainly is in Great-Britain, where such a participation, in the birthright of its subject, cannot be bestowed but by the legislature; that is, in effect, by the consent of the whole kingdom. Whenever, therefore, this high and great favour is conferred, it must be presumed to flow from just and weighty reasons; such as eminent services actually performed by those who seek it, or which may be rationally expected from them; and in this light, acts of naturalization are highly reasonable, as they are apparently calculated for the public benefit; and arguments of this kind may be usually suggested, when favours of this sort have been rendered more general, with a view to invite into this country foreign protestants of easy fortunes, skilful in commerce, capable of introducing or improving manufactures, or, in a word, fit to become useful members of the community; into which they are received in the most solemn manner, and become entitled to all that is dear and valuable to Englishmen.

These motives, arising from reciprocal advantages, have been esteemed so wise and equitable, that acts of naturaliza-

tion, so founded, have been ever considered as tending highly to the advantage of this nation, and more especially to the mercantile interest, which certainly reaped very signal and indisputable advantages from them; as is particularly manifest from numbers of opulent families now subsisting in these kingdoms, that were originally invited, fixed, or established here, in virtue of such wise and salutary laws.

But this being the case, it is not easy to see how the same benefits, or any other adequate to them, can arise from particular or general acts of naturalization, where the privileges granted to strangers are not in some measure restrained to their residence within the BRITISH DOMINIONS; and this, from the last bill for such a general naturalization, seemed to have been the sense of the legislature, from a clause evidently founded upon this reasoning.

The naturalizing foreigners, and thereby giving them a title to all the privileges of British subjects, without requiring from them the plain and natural equivalent of RESIDING HERE, puts it in their power to settle in foreign countries, with all the advantages due to the subjects of Great-Britain; and thereby affords them an opportunity of serving their own countrymen, and, indeed, foreigners of all nations, at the expence of Great-Britain, without any the least advantage accruing to this nation.

With respect to foreigners thus naturalized, and established as factors abroad, we are not led, either from reason or experience, to conceive, that they can have any particular attachment to the interests, or any real zeal or rooted affection for the welfare of Great-Britain; but must be chiefly governed by that principle of self-interest, which originally led them to seek such privileges, of which they might avail themselves, in consequence of those treaties and alliances concluded with the kingdom of Great-Britain, and by which many valuable immunities and indulgencies are secured to her subjects, equivalents for which are, and will be always expected from the British nation. These may frequently occasion a public expence, and that expence must be raised by taxes on the natives of this island; but these naturalized foreigners residing abroad, do not in the least contribute to them. Foreigners, under these circumstances, are then more favoured than the natives.

The arguments in favour of unrestrained acts of naturalization to factors abroad, ought to be extremely clear and convincing; for in Russia, and, perhaps, in other countries, it is difficult, if not impracticable, to make the natives understand, how the people of any other country can become Englishmen, or British subjects, and by that means entitled to the privileges that by TREATIES are stipulated to us. Thus such treaties may be rendered very precarious, the dignity of the nation weakened, and the conduct of such foreigners subject us to disputes and inconveniences, which otherwise might never have arisen.

The act of navigation, that wise and salutary law, which has been the bulwark of the British commerce, breathes a spirit that would incline us to think the same regard ought to be had to British subjects, as to British bottoms; and that all imaginable precaution should be taken to secure the advantages arising by a commission on the sale of the commodities and manufactures of this island, to their natural proprietors and native subjects; more especially at a juncture, when there is nothing more evident, than that all the nations in Europe have opened their eyes to the advantages of commerce.

The question then is, If upon this principle we ought to be very circumspect in bestowing the privileges of subjects on those who were yesterday our rivals, without any security that they will not become the same to-morrow? To this we may also add, that as there was a time when the whole of our traffic was engrossed by Lombards, merchants of the Steel-yard, members of the Hanse-Towns, and other foreigners, if we ought in common prudence to avoid every thing that may bring us into the like state again?

The connexion which the nation hath with foreigners, and the advantages confessedly derived from them, has made a deep impression on the minds of some of the greatest men in this kingdom; but general views of things do not always give the mind that light and satisfaction as a particular object, which it can more easily grasp, and from thence, with the greatest facility, enlarge itself, and take in others of a similar nature. Let us then examine the particular case which gave occasion to these remarks. ‘ The amount of the reasons against any restrictive clause in the acts of naturalization of foreigners, as factors in Russia *, was this, that the treaty of commerce between the crowns of Great-Britain and Russia is really a matter of no great moment, and that the figure which the English make in Russia is owing to their association with foreigners in that country.’ A further argument was, ‘ That foreigners situated in Russia are under peculiar disadvantages to all other foreigners, or even what they themselves would be if situated in any other country; not by any particular law of the legislature, but from a partial regulation of the Russia company, by which each

* A paper published in 1752.

member is restrained, by virtue of the oath taken upon his admission to his freedom, from giving any commissions to any person not free of that company; and that freedom is never granted but to British-born and naturalized subjects: from whence it is deduced, that the trade is a monopoly. Thus because the Russia company do not give up to foreigners the benefits of the Russian trade with Great-Britain, therefore their charter is hurtful to Great-Britain. Now it is evident, that there cannot be a greater trade where a greater liberty is open to the natives of a country than this in question. The Russian markets are always well supplied, each trader pursuing his own inclination to import, and his own opinion concerning the rise and fall of markets, and the opportunities of sale. I have known British houses in St Petersburg, that, for several successive years, have had from 40 to 100 bales of cloth remaining over the annual demand. The credit given the Russians is never less than twelve months, unless in small articles, and it is often extended to fifteen and eighteen months; and the prices of goods are as low as possible, for the merchant to receive a living profit. There are no monopolies or exclusive privileges assumed by the Russia company, nor any rule of conduct established, which has the least appearance of being injurious to this nation; for any natural-born Protestant subject may, for 5 l. take his freedom of the company, go into Russia, and establish a house of business, under the protection of the British crown. The English merchant may also consign goods to any person who is a native of Russia, or a subject of Great-Britain, remembering that the advantage in favour of the British subjects in Russia, according to the 27th article of the treaty of commerce, is about one-third part in the customs of soldiers' cloths *, Yorkshires †, and flannels. Nor is there any restraint with regard to the markets of these kingdoms, for any Russian, as well as freeman of the company, may send Russian goods into England; he is only to pay the aliens duty, as established by law ‡. The law of nations, the right of reciprocal protection, and the last articles of the treaty do, I apprehend, make the Russians intirely free to trade to this country. Some Russian merchants have actually been here, but finding they could not dispose of their goods in a satisfactory manner, nor live near so cheap as at home, they returned to their own country.

* Coarse cloths so called.

† A thick coarse cloth.

‡ This duty amounts to 3 s. 4 d. on a ton of hemp, or about 2 per cent. on the present value of hemp, at 23 l. per ton, which, in general terms, is provided for in the treaty of commerce.

Besides this favour in the customs, the British factors in St Petersburg esteem it a valuable privilege, that, in all cases where they are defendants, particularly bankruptcy, their affairs are cognizable by the college of trade, and their books sacred to the inspection of reputable merchants, appointed by that college. In many cases, also, where they are plaintiffs, they apply to the college of trade; but their common suits and demands for money of the Russian merchants, have been for some years transferred to the magistracy *.

* This was a most ignorant and corrupt tribunal, and a shame to the Russian nation in my time; but if it should continue the same, it is in the power of factors to represent this grievance.

With regard to the quartering of soldiers in Russia, the British subjects are indulged in a peculiar manner, and no doubt it ought to be deemed a favour, under a military government, to be exempt from it. This privilege, however, was more sacred and more considerable formerly than of late years: I have myself opposed attempts made by the officers of the police to oblige me, as a tenant, to find quarters. I do not know that these attempts have yet succeeded against tenant or landlord; but if the landlord is compelled to find quarters, and the rent is raised on this account, the tenant ought to complain: for we consider it not only as the spirit of the treaty, that British subjects shall enjoy an intire exemption from quarters, that is, the landlord not being chargeable with it, the tenant shall have his rent so much the cheaper. This must be the sense of the 16th article, or it means nothing; for who can imagine it should be deemed a favour to a British government, that common soldiers may not fit in the counting-house of a British merchant in Russia?

How cautious the Russians are of being lavish of any essential part of the treaty, appears by this, that, in order to ascertain the legality of property, when a British subject first appears in the custom-house of St Petersburg, the officers demand a certificate of his Majesty's consul, that the person is really what he pretends to be, and without it they will not clear his goods.

In what manner this treaty of commerce is considered by the Russians, may be deduced from the embassy of Monsieur de Dieu at the Russian court, in 1745. It is generally reported, and I believe it is true, that his chief business was to negotiate a treaty of commerce on the behalf of his masters, the States of the United Provinces, on the plan of that of Great-Britain; but certain it is, that he did not accomplish any such

treaty: and if so able and so favoured a minister could not procure this privilege for his countrymen, the Russians certainly meant not that the advantages they grant to BRITISH SUBJECTS should become general; so that naturalizations granted to foreigners in Russia tend to enervate the treaty of commerce, and may at length render it contemptible.

The Russians know very well, that the English were the first that discovered Archangel; that they had an exclusive privilege of trade to Russia in the reign of queen Elizabeth; that Peter the Great, whose maxims of government are justly near to them, always shewed a distinguished regard to the English merchants, and even at the time that the politics of the two nations did not intirely coincide *, he gave them his royal word, that, at all events, they might consider themselves as under his peculiar care and protection: this I have been assured by one who was familiar with his imperial Majesty. The Russians are also sensible of the political, as well as of the commercial interest of the two nations, and consider this country, and I hope will always consider it, as their hereditary friend †. As our extensive commerce has reached every corner of the earth, the greater our support is at home, the greater must our reputation be abroad. Reputation is certainly no imaginary thing, but must be in some degree productive of good to our commercial interest, with relation to the spirit of commerce in our factories abroad.

* Some difference with his late Majesty as elector of Hanover.

† I remember the compliment made to this nation by the governor of Astracan, a very ingenious man, whom I have mentioned in the course of these papers, speaking to his friends in my presence: 'You are to consider, says he, the English merchants in a different light from those of any other nation trading to this country; they are skilful, generous, humane, upright; they extend their commerce over the whole earth, and every country where they come is enriched by them. The commodities they deal in are necessary, substantial, of the greatest use to the community, and they take off more of the Russian commodities than all the other nations united.'

The British houses in St Petersburg have not only a trade to Great-Britain and Ireland, but to Holland, Prussia, Sweden, Holstein, and several parts of Germany; also to Portugal, Spain, and Italy; this has arisen from the connections of their extensive commerce, intirely independent of naturalized subjects in Russia. On the other hand, this is not the case with naturalized subjects *. There long has been, and I hope ever will be, an honourable distinction abroad between us and other foreigners, both as BRITONS and as MERCHANTS, not in the esteem of the Russians only, but of all other nations. Whether it is worthy of national observation or not, can be determined only from the nature of the subject; but it is apparent, that the naturalization of foreigners to reside in Russia creates ill blood in the breasts of his Majesty's natural-born subjects who are in that country: it would have created much more, but that there are but few of the naturalized factors who have not failed; had they conducted their trade with moderation and prudence, it is probable the British commerce might have been intirely in their hands, and this nation nothing the better for the commission on the sale of British commodities, or on the purchase of those of Russia. Besides, is it not highly reasonable to think that such naturalized subjects would be less tender than the British factors, in regard to the prices this nation might pay for NAVAL STORES?

* I have heard the Russian merchants occasionally treat us with ridicule, by using a droll expression, which signifies, 'Are you a white-washed Englishman?' And a naturalized factor being in some distress, pleaded his being an English subject, to Valenofsky, a minister of the empress Anne: 'You an English subject! says the minister, why you was born in Casan, in the dominion of the empress.'

I passed some years of my life at Lisbon, where I observed that the French Protestants in that place live in mutual harmony with the native subjects of this island; and from the experience we have that their riches always center here, they are considered upon the same footing with other British subjects.

The trading world is often suspected of acting upon narrow principles; yet our factors abroad are not only for the most part loyal, but, upon the comparison of the several governments under which they live with the excellent constitution of these kingdoms, they contract a patriot and disinterested spirit: but when, from the strongest evidence, they apprehend the intention of the legislature is defeated, and their own interest hurt at the same time, they are alarmed, and think it their duty to appeal to their country. The British factors in Portugal are jealous of those foreigners, who having obtained of the British crown a participation of the British birthrights, carry all their wealth to any country except this island, where, indeed, their paternal connections do not center *. Many of the Portugal traders signed the petition already mentioned, the meaning of which is intelligible beyond dispute,

* Mr Raleigh, a great Portugal trader, who has given estates to many Hamburgers in Lisbon, can tell if any of them ever brought a shilling of it into this country.

and

and seems to speak the general sense of the merchants of this metropolis, though some may be inclined, upon DIFFERENT PRINCIPLES, TO DIFFERENT SENTIMENTS. The BRITISH FACTORS in HAMBURGH have not one naturalized subject among them. The convention of the British Hamburg company with the regency of that city, will not admit any naturalized subject to a participation of the valuable immunities of that company, and which, for a series of years, they have enjoyed with a most unblemished reputation: and what could this nation gain by an admission of naturalized subjects into that factory?

It would be easy to prove, that whatever we play into their hands is a losing game to this country; for I do not comprehend what they could give us in exchange. My reason for thinking it is a losing game is this; with regard to the Russian factors, I know at this time eight or ten British subjects, I suppose there are more, who laid the foundation of their fortunes as factors in that country, and some of them are yet interested in houses there; there is not one of those persons but has brought riches, more or less, and some of them, I believe, to a considerable amount, to the national stock of this country, and are, I have great reason to think, good members of the community.

On the other hand, I have seen a list of 24 foreigners, many of whom I know personally, who, within these 25 years, have been naturalized, and of all this number, in all this time, only one ever came into this kingdom, and he had particular connections with a British subject. It must be observed, that it was only 25 years since any naturalization reached Russia; the trade then was not so considerable as it is now, nor had our people established themselves there under the sanction of such a treaty as the present.

We are jealous of weakening ourselves by the want of foreign aids; but to think ourselves dependent in cases where our interest in one light is apparently wounded, is it not to weaken ourselves, for fear of being weakened? Not to confound things of a different nature under one name, it must be observed, that the circumstances of naturalized subjects at home, under this government, and intitled to enjoy all the good, and subject to share in all the evils, which befall the state, are very different from those persons who participate of the advantages which this nation enjoys abroad.

The intention of naturalization, no doubt, is the benefit of this island; and if there are cases in which naturalizations are not attended with any benefit, but, on the contrary, prostitute the honour of the nation, enervate its influence, and counteract its native subjects, it is to be presumed that such cases have not been set in a proper light.

The French Protestants have, indeed, strong connections with this island; their parentage, their interest, or the protection they receive, induce them to consider this as their proper home, and, consequently, they are intitled to all the regard which we can shew them.

If experience is the best guide of life, it is that which must teach us whom to receive into our breasts as friends, and whom to reject, in the commercial light we now consider the subject, as no friends to this country. By what rule can we judge better, than by observing those people who return our kindness with gratitude, and those who forget the benefits they receive?

If our first concern ought to be for our own children, it ought then to be considered how many sons of tradesmen, merchants, gentlemen, and even noblemen, are lost to their parents, their country, and their God, for want of employment? Merchants are no where more honourably esteemed than in this country; but they often lay the foundation of that knowledge for which they are esteemed in distant climes; and shall we encourage foreigners to take their place?

There cannot be more trade carried on than a country will bear; it will usually employ so much money, so many hands, and no more. Do we want money in this nation to carry on our trade? By no means. It is true, the national interest is already very low, perhaps it will be lower still; and what will be the consequence, but we must throw more money into trade, and extend our settlements and commercial interest over the earth as much as possible? Why should we encourage FOREIGNERS to do any thing for us ABROAD, which we can do better OURSELVES? What circumstances should we be in, if all our FACTORS ABROAD were foreigners? What tie, or what security should we have of their integrity, in the SALE of our COMMODITIES, much less in the promotion of our NATIONAL MANUFACTURES, in opposition to those of other countries, or zeal in the purchase of the commodities of the countries where they reside, if they left us no pledge of their fidelity, nor spent any part of their lives in this island?

On the other hand, what riches do not our FACTORS bring home! How many considerable men have not we in this metropolis from LISBON! Who can be ignorant of the wealth that has been brought here by EAST-INDIA FACTORS? Are not these great national objects? Italy, Spain, and other countries, are ever sending us new recruits to our commercial strength, arising from FACTORAGE. But there is yet a further reason which occurs: let the warmest advocates for

general naturalizations, without any distinctions of persons, professions, or residences, consider how destructive such naturalizations are to our GENERAL SYSTEM OF NATURALIZATION AND NATIONAL PROFIT. If we give to foreign Protestants abroad that which should invite them hither, we may even prevent their coming to us. By being lavish of our beneficence, we seem to be sufficiently paid by their acceptance of it, without any regard to the return which they are to make us. For what foreigner, seeing us so prodigal of our bounty in a case of this nature, which he knows to be injurious to the natural-born subjects of this island, can, in proportion as it is beneficial to himself, entertain any other opinion than that we do not pretend to pursue our own interest?

The original intention of naturalization being confessedly the benefit of this nation, where there is the least ground of suspicion that the party going abroad means not to add any thing to the national advantage, ought he not, in such a case, to declare on what principles he pretends to the favour in question; and if it should appear that he deceived the legislature, would not such a repentment be due as at least to refuse a compliance?

If a reciprocal regard to the interest of this nation is the sole motive of the invitation given to foreigners who reside here, and if by their residence they do in fact give us the earnest of a grateful return, is there no security to be asked of those who do not so much as pretend to live amongst us, nor give us any kind of equivalent? The very expectation of advantage from them is distant, remote, confused, and, perhaps, utterly unintelligible.

The injury is obvious to demonstration, and is actually complained of by those who feel it, whose interest is common with that of the whole nation.

The reader to whom the subject is new, must now be informed, that the merchants and Russian factors, at length obtained the thing they asked, by fixing the time of absence to the naturalized foreigners already mentioned, to three years, and then to reside three years alternately in this country, or to become an alien: but this was a temporizing accommodation of the matter, and does not seem to answer the full intent of the legislature. Upon the principle that this restrictive clause will produce the end proposed, it might become a rule of conduct to the nation in similar cases of naturalized factors. As a trading nation, we might be yet more indulging to those whose connections are nearly equal with the common ties of the natural-born subjects. But let us consider dispassionately, how dangerous it is in politics to enter very deep into refinements of this sort, either immediately to advance the interest of a nation, or to prevent an injury which may be more remote.

The object most dear to an honest man is the real happiness of his country. This principle being laid down, let us consider what means are most effectual to obtain this end in a direct view. We see one of the wisest princes in Europe using his utmost endeavours to bring people into his country, as we desire to engage foreigners who can bring riches, arts, or industry, to come to this island. He gives them lands and great immunities; he has brought 20,000 into his capital in a few years; but he is far from extending those privileges to persons out of his dominions. With regard to ourselves, the same reasons that induce us to give encouragement to people to come to this island, may be a sufficient motive not to give it out of these dominions, and under foreign jurisdiction. If we carry our views so far as to give foreigners abroad a power of taking share in what our own people possess, without any security of the least return from such foreigners, nay, where all appearances make against any return, do we not counteract our own principle?

If it is urged, That a nation cannot be said to confer a favour which by restrictions is rendered less valuable; I do not apprehend, without being Quixotes in politics, what it is we mean by these words: for suppose interest is the object in pursuit: as to weakening the influence of naturalization, by which commerce is intended to be promoted, this also seems to prove nothing more, than that we should run all hazards, rather than lose any possibility of getting a subject who is a foreigner, though at the expence of a subject who is a native. It is said that naturalization without limitation has, after an indefinite absence, brought foreigners into this country, who might not otherwise have come. It would be well worth examining if this is true, and who such persons are, and what were their inducements to settle here, before this argument can be answered; for, when they do in fact come, we receive them with open arms; and we ought to countenance and encourage those who may settle here, if we do not pay too much for it. But I do not comprehend that here are any settlements of such weight as to establish a rule of conduct in opposition to our commercial interest, as it appears in a direct view. The case before us is foreign to the countenancing of strangers, who set out upon a principle of designing to settle in this island. I say FOREIGN TO SUCH PRINCIPLES; for though many French Protestants have come here, after being as long abroad, under the protection of the crown of Great Britain as they pleaded, yet still the matter will rest on

on this issue: are we so fond of naturalization, as to give a power to foreigners, without distinction, to supplant our own people, when experience teaches us we have no just grounds to expect any suitable returns?

It cannot be too often repeated, that we ought to be cautious of curbing in any degree the inclinations of the natural-born subjects in regard to commerce, or of damping that spirit and application to trade, on which is founded the opulence of this nation, and its strength and influence as a maritime power. And whilst interest is the great incentive to human actions, and particularly actions of this kind, I think it is apparent, that the more we interpose to countenance foreigners in commercial designs, in cases not demonstrably beneficial to this country, the more we depress the spirits of our own merchants, who confessedly do advance the interest of the nation: and this discouragement may extend not only in regard to their being deprived of those profits which immediately accrue from the share such naturalized foreigners have in their trade, but also to a jealousy of being intirely supplanted, in the course of time.

May it not be questioned what prejudices would this nation receive, if no naturalized subject, 'till he has resided here seven years, nor the children born abroad of persons already naturalized, their parents not having lived in his Majesty's dominions for the same number of years, were received abroad as factors or merchants, in common with native-born subjects? If it can be demonstrated that such prejudice will be greater than any that can be proved on the other side the question, there is no room for a debate; but if it can be made appear that it is only equal, the scale, we may expect, will turn in favour of the native subject, much more if the prejudice is against the latter, for this plain reason, that the national and mercantile interest are but two words for the same thing. The impartial reader will consider the argument, not the writer, if I am suspected of interest, where I have no other view than national benefit; yet the real truth can receive no diminution: I hope that will be done which is most for the interest of my country, be it what it will."

RUSSIA considered with relation to other principal states and empires.

The northern parts of the empire of Russia, from the frontiers of the Swedish dominions to those of China and Japan, are guarded in such a manner, as to be secure not only from danger, but from apprehensions, having on that side a sea hitherto impenetrable, and through which, if any passage could be found, it must turn to the benefit, but can never prove of any disadvantage, to the subjects of Russia; which is a point of great consequence, and a blessing scarce known to any other country than this. The frontiers of the empire towards China are also inaccessible, as consisting of deserts impenetrable by armies, but which yield a tolerable passage for caravans; so that the Russians may always reckon on the friendship of the Chinese, and, whenever they apply themselves seriously thereto, may make this friendship turn to their advantage.

The Tartars inhabiting the countries between Russia and Persia, are no longer formidable to the first-mentioned empire; on the contrary, they all respect it, and many of them have willingly submitted, and become vassals to it.

The Caspian Sea, and the dominions which the Russians have on that side, give them a fair opening into Persia, which they have already improved so, as to gain to themselves a very advantageous trade; and this by degrees may be extended, perhaps, as far as the East-Indies.

It will always be the interest of Russia to cultivate a good understanding with the Shah; but, in case of a rupture, she would not have much to fear, since the frontiers of Persia being open, the might soon make an end of the war, by letting loose upon them the Tartars who are her tributaries. The Turks, and their associates the Crim Tartars, are more dangerous enemies; but, at present, the circumstances of the Porte are such as scarce will allow her to break with the Russians, if she had concluded a peace with Persia; and we shall hereafter see, that Russia can never want the power of defending herself on this side, or even of making the Turks sensible of the folly of breaking with her without just provocation. The two great Christian principalities depending upon that empire, will always have a bias in favour of the Russians, and, therefore, the Turks run a greater hazard by making war with this, than with any other nation.

The interests of Russia in Europe are not hard to assign. As to Sweden, it is of great consequence to live upon good terms with that crown; and, on the other hand, the superiority of Russia, when forced into a war, has of late been rendered so apparent, that there are good grounds to expect the Swedes will continue quiet on that side for a long time to come, even supposing that no stress should be laid on the natural connections between the two branches of the house of Holstein, when they come to govern these nations. As it is requisite for the court of Peterburgh to be well with the Swedes on one side, so it imports them no less to be upon good terms with the Poles on the other; for which reason, we see the late Czari-

VOL. II.

na omitted nothing to set the present king Augustus upon the throne of Poland, well knowing that his interests were of such a nature as must, without treaties, bind him effectually to her's.

There seems to be no great cause of intercourse between Russia and Denmark, farther than what results from attention to the balance of power in the North, which will always incline a wise administration in this empire to keep the scales as even as may be, between this crown and that of Sweden and Denmark.

The interests of Russia, with respect to the house of Austria, are its most material concern; for while these houses are united, not only by general alliances, but by a due and hearty regard for each other's prosperity, neither has much to fear from the Turks; but if they are divided, and the Ottomans should recover their ancient power, they may be formidable to both.

As to Prussia, of late years great regard has been due, and, in succeeding times, it is like to claim a greater; but certainly, if these two powers pursue their true interests, and are not misled by ambitious views, they are not like to fall out. The maritime powers are the natural allies, and hitherto have been, and are like to be fast friends to Russia.

As to the other potentates of Europe, their dominions lie at too great a distance for Russia to have very great intercourse with them of any sort; and with respect to the house of Bourbon, as the court of Peterburgh has never had any cause to like, so, in spite of all its power, there is no probability of its ever seeing much reason to fear it.

And now the imperial prince has issue, there does not appear any sign, at present, that this empire will soon be disturbed by any intestine commotions in regard to the succession; nor could any thing distress the Russians on this occasion, unless we suppose that Sweden, Denmark, Poland, and Prussia, should unite, and continue united in this league, to promote a revolution, which seems now far from probable.

It is very certain, that the great power of the Russian empire and her close connexion with the house of Austria, has excited a spirit of suspicion and jealousy in the North, to which also the particular views of several powers have not a little contributed; but notwithstanding this, what has been said remains not at all the less certain.

But if, on any future occasion, a war should actually break out between the houses of Austria and Bourbon, &c. the turn of that war must remain very uncertain, since the force of the Russian empire is really much greater than is commonly imagined, and would be found so in such a case.

We may from hence form a judgment of the abilities of those ministers who direct at present the councils of this empire, and who by shewing an unshaken steadiness in pursuing that system which they have adopted, have at least raised the credit of their government to a very high degree, and, for some time, made this empire not only the arbiter of all differences in the north, but have likewise extended its influence to the most distant parts of Europe, since it is universally confessed, that the march of the Russian auxiliaries, during the late war, was the measure that contributed most to the conclusion of the definitive treaty at Aix la Chapelle.

It deserves the reader's notice, likewise, that, in the present state of things, the true interests of this empire will certainly be the rules of the reigning Czarina's government; for remaining single, and having no particular desires or designs to gratify, the peace and prosperity of her government can depend on nothing else.

In consequence of this, a constant and firm adherence to that system, best calculated to promote the good of her subjects, and the glory of the empire, will be the standing maxims in the Czarina's councils. As such a conduct cannot fail of having a strong tendency to promote peace and satisfaction at home, and to secure the attachment of the allies of Russia, by maintaining the credit of the administration abroad, there are no grounds to apprehend, at least in our times, any great inconveniences of extraordinary alterations should ensue.

We may likewise add, that things remaining, as they are like to remain, in their present posture for a few years, the advantages of these measures will become more and more perceptible, and a proper sense of loyalty and gratitude diffuse itself through the inhabitants, even of the remotest provinces of that extended empire, which is certainly in a very thriving condition, and will by degrees, in consequence of the improvements that are daily making, come to extend its power and influence much farther than those who are unacquainted with, or unattentive to, political principles, can easily conceive.

REMARKS on our article Russia, since the last war, and treaty of peace of 1763.

As the last treaty of peace has annexed such extensive territories to the crown of Great-Britain in North-America, it is now hoped, that we shall no longer stand in need of NAVAL STORES of any kind from Russia, or elsewhere; we being able to produce them there, in what quantities we please, provided rational and vigorous means shall be taken by the government of England for that purpose. See our articles NAVAL STORES, NAVAL AFFAIRS, WAR.

That the court of England seems to be in earnest about this important matter, it is said that an ADDITIONAL DUTY will soon be laid on the foreign importation of HEMP, HEMPSEED and FLAX, particularly from RUSSIA and the Baltick; great quantities, the growth of our own American colonies, being expected over in the spring.

RUTLANDSHIRE, the smallest county in England, almost of a circular form, encompassed on the east and south with Lincolnshire and Northamptonshire, with Leicestershire on the south and west, and with part of Leicestershire and Lincolnshire on the north. It is about 15 miles in length, 10 in breadth, and is computed at 136 square miles.

The air is sweet and healthful, it being quite free from fogs and mists. The Gwash-Wash is the chief river which runs through the shire, which is from east to west, in the middle of the county. There are several brooks that run into this river, by which the inhabitants are supplied with water, and with plenty of fish; almost all the south and east parts, in

particular, have good supplies from the river Welland, which separates it from Northamptonshire and Lincolnshire.

The soil is very fruitful in corn and pasture, which breeds great numbers of cattle, especially sheep, whose wool is observed to be more drier than in other countries, from a red quality peculiar to the soil. The vale of Catmos in particular, where Oakham stands, is not inferior in fertility to the vales of White Horse and Belvoir. It also produces abundance of wood for fuel.

OKEHAM is the capital of the county, and shire-town for the assizes, and for transacting all other public affairs.

UPPINGHAM, a modern town, the second in the county, and the only one that has a market. It is a neat, compact, well-built town, with a well-frequented market for cattle, corn, &c.

This, though a small county, is remarkable for many fine seats, and some of the first rank, particularly the earl of Gainsborough's at Enton, and the earl of Winchelsea's, at Burley on the Hill, both near Okeham.

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE, continued from the end of letter Q.

With regard to RUM.

RUM imported in casks not containing 20 gallons at the least, (except for the seamen's use) forfeited, or the value; but, if it appears, to the satisfaction of the principal officer of the customs, to be imported without fraud or concealment, may be admitted to entry. 5 Geo. I. c. 11. §. 2. and 27 Geo. II. c. 18. §. 4.

— or spirits, of the British sugar-plantations, imported directly into Great-Britain, may, on entry, and before payment of the duty of excise, be landed and put into warehouses, provided by the proprietor or importer, and approved of by the commissioners of excise, under the joint locks of the proprietor and warehouse-keeper; security being first given to pay the said duty, (according to the gauge at landing) as soon as such rum or spirits shall be sold, or at the end of six months, if they shall not be then sold. 15 and 16 Geo. II. c. 25. §. 1, 7. and 23 Geo. II. c. 26. §. 2.

— If the duty is not paid at the expiration of the said six months, the commissioners may cause such rum or spirits to be sold by auction, and out of the produce discharge the duty and all expences, and pay the surplus, if any, to the proprietor. 15 and 16 Geo. II. c. 25. §. 9. and 23 Geo. II. c. 26. §. 2.

— Landed without being entered at the custom-house, and without the collector of excise, or without a warrant from the proper officers, or without the presence of an excise-officer, forfeited; one moiety to his majesty, the other to such person as shall seize, inform, or sue for the same. 15 and 16 Geo. II. c. 25. §. 3. and 23 Geo. II. c. 26. §. 2.

— May from time to time be delivered out of such warehouses, (but not in less quantities than one cask, containing at least 20 gallons, unless it was for the use of the seamen in the voyage) on paying the duty, and producing to the warehouse-keeper, and officer appointed to attend, a warrant or certificate from the collector, certifying such payment. 15 and 16 Geo. II. c. 25. §. 5, 6. and 23 Geo. II. c. 26. §. 2.

— Warehouse-keepers, and officers appointed to attend warehouses, are to enter, in proper books, accounts of all rum, &c. which shall be brought into and carried out of their respective warehouses; and at the end of every six months transmit an account thereof, upon oath, to the commissioners of excise, together with what is remaining; and if it shall appear to the said commissioners, that any of the said rum, &c. has been delivered out before payment of the duty, then such warehouse-keepers and officers respectively offending, shall be disabled to hold any publick office, and also forfeit 100l. 15 and 16 Geo. II. c. 25. §. 4. and 23 Geo. II. c. 26. §. 2.

— No rum nor spirits of America, (except of the growth or manufacture of his majesty's sugar-colonies there) may be imported into Ireland, unless shipped in Great-Britain in ships legally navigated, upon forfeiture thereof, or the value, together with the ship and her furniture. 6 Geo. II. c. 13. §. 4.

And since, there has been an act of parliament, made in the 33d year of his late majesty, for encouraging the exportation of RUM and SPIRITS of the growth, produce and manufacture, of the British sugar-plantations, from this kingdom, and of British spirits made from molasses.

The duties of custom payable upon the importation of rum and spirits from the British sugar-plantations, to be repaid upon the exportation thereof—And the duties of

excise to be remitted upon all such as shall be exported before payment is made of the said duties—The exporter to give bond for the due exportation thereof—Upon producing a certificate of such bond having been given, the rum, or spirits mentioned therein, are to be delivered out of the warehouses—And a certificate of the quantity, and size and marks of the casks, &c. to be given therewith—And produced to the officer attending the shipping—Due entry to be made of such delivery—Bonds to be given for the duties are to be delivered up, upon oath made of the intended exportation—And certificates produced, &c. of the quantity shipped, and that the same are proof spirits; and also of the delivery thereof from the warehouses, &c.—If part only of the rum or spirits, mentioned in the bond, are certified to be delivered and shipped, the quantity is to be indorsed on the bond—And the bond is to be delivered up, when the remaining part shall be certified to be delivered and shipped; provided the same be before the time stipulated for payment of the duties—All rum and spirits intitled to the said drawback, &c. are to be exported in casks containing not less than 100 gallons, and in vessels not less than 100 tons burthen—The quantity delivered out is to be computed according to the gauge taken upon the importation thereof—If after delivery they shall be concealed, or not shipped within 12 hours, or the casks opened, or the same be reduced or altered in quantity or quality; such rum or spirits are FORFEITED, and the bond is to be put in suit; unless the commissioners see cause to forbear the same—Bonds given for exportation are not to be discharged till certificates be produced of the due exportation and landing, and proof made thereof on oath, in manner required by the act, for preventing the excessive use of spirituous liquors, &c.—The condition of all bonds taken shall be to produce such certificates, within such times respectively as are limited by the act, for producing the certificates therein required to be delivered—In case no such certificates shall be produced within the time limited, the bonds may be put in suit—If such rum or spirits shall not be exported, or shall be fraudulently reloaded, the same, together with the vessels, cattle and carriages employed therein, are FORFEITED; and the persons concerned forfeit double the amount of the duties—And the master or commander of the vessel, if he assists or connives thereat, is to suffer also six months imprisonment; or if the package be altered before arrival at the place of discharge, he forfeits 100l.—The rum or spirits to be exported, are to be PROOF; and the exporter is to give five days previous notice of the shipping thereof, and allow the officers to mark the casks, and take samples, paying for the same, if demanded, upon PENALTY of forfeiting 100l.—If any rum or spirits shall be altered or reduced, in quantity or quality, after being shipped, the same is FORFEITED, and the persons concerned therein forfeit 100l.—And no drawback is to be allowed for the same—PENALTY for granting a false certificate, or of counterfeiting, altering, &c. any oath or certificate, 500l.; one moiety to the crown, and the other to the prosecutor.—An additional DRAWBACK of 3 l. 3 s. per tun, allowed on all British-made spirits drawn from molasses, exported; oath being made of the truth thereof, and the duties being duly paid; and certificate produced of the quantity shipped, and that the same were PROOF SPIRITS, &c.

The powers, regulations, forfeitures, and clauses, &c. in the recited act, relating to the DRAWBACKS hereby granted on the exportation of spirits, and to the preventing or punishing FRAUDS, &c. are extended to this act—And all FINES, PENALTIES,

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

PENALTIES, and FORFEITURES, imposed by this act, shall be sued for, levied, recovered, or mitigated, by such ways, means, and methods, as may be recovered or mitigated by any law or laws of excise (not otherwise directed by this act) or by action of **DEBT, BILL, PLAINT, or INFORMATION,** in any of his Majesty's courts of record at Westminster, or in the court of Exchequer of SCOTLAND; and that one moiety of every such **FINE, &c.** shall be to his Majesty, &c. and the other to him or them, who shall discover, inform, or sue for the same. — That any person sued, &c. in pursuance of this act, may plead the general issue, and give this act, &c. in evidence in their defence, &c. and if a verdict shall pass for defendant, such defendant shall have **TREBLE COSTS.**

With regard to the **RUSSIA COMPANY.**

RUSSIA COMPANY. — Any British subject may be free of it, upon payment of 5 l. for admission. 10 and 11 Will. III. cap. 6. §. 1, 2. — Any person free of this company may import, in British-built ships legally navigated from Russia, any goods of the growth, produce, or manufacture of Persia (provided such manufactures are made of the growth or

produce of Persia) purchased by barter with, or the produce of, woollen or other goods exported from Great-Britain to Russia (except gold or silver in coin or bullion) and from thence carried into Persia, to the truth whereof the importer is to make oath; paying the same customs as such goods are liable to if imported from the Levant seas by any person belonging to the Turkey company. 14 Geo. II. cap. 36. §. 1, 2. — But by 23 Geo. II. cap. 34. raw silk of the growth or produce of Persia may be imported under the same regulations, although the goods with which they are purchased are not carried from Russia into Persia.

— If any doubt shall arise, whether any of the goods so imported be of the growth, &c. of Persia, or not, or were imported contrary to this act, and for that reason shall be seized as forfeited, the proof thereof shall be incumbent on the importer or claimer. 14 Geo. II. cap. 36. §. 4.

— Wrought silks, and other manufactures of Persia, mentioned in act 11 and 12 Will. III. cap. 10. are not to be worn in this kingdom, but are to be under the regulations in the said act. 14 Geo. II. cap. 36. §. 3.

— Nothing in this act is to deprive the East-India company from enjoying their full powers, privileges, &c. — 14 Geo. II. cap. 36. §. 6.

S.

S A B

SABLE. Several authors have, here and there, given descriptions of these species of precious animals. I shall therefore only add thus much, viz. (1.) That it is the nature of these creatures, at a certain time of the winter, to sleep for a while; but first they hide themselves so securely, that it is a very hard matter to find any of them. And if at any time they are discovered, they lie wrapped up, as it were, like a ball, and you may roll and throw them about, without waking them. (2.) That they live upon mice, cedar-kernels, red-berries, fish, &c. (3.) That those years, when cedar-kernels and red-berries are most plenty, these animals are the most difficult to be found, and their furr is the worse; because feeding plentifully, they rest most; on the contrary, if there be a scarcity of cedar-kernels and berries, they are easier caught; for they then run more about, and exercise makes the furr much more beautiful. (4.) That the most beautiful sable skins have generally the worst tails, and the worst skins, on the contrary, the finest tails. (5.) That there are sables as white as snow, but they are met with very rarely. (6.) Upon the islands in the north-eastern sea, beyond Khamtichatki in Russia, the sables are very indifferent, but then they have tails a quarter of a Russian ell long, streaked red and black. Near Crafnoyahr, Abakan, Kuanetfko, and some other places, you may buy a hundred of the best sable tails for about six or eight rubbles; whereas they are worth from 25 to 30 rubbles at Tobolsky, and will sell for 100 rubbles at Moscow. The skins bear the same proportion of price. A timber of sables consists of 40 skins, or 20 couple.

Note, a rubble is about 4s. 6d. sterling. See the article **RUSSIA**.

SADLER. Under this title is carried on a very considerable trade, but in very different degrees.

Their business is not only saddle-making, which is a curious as well as very ancient employ, but to complete some, and sell all other necessaries for the saddle-nag and horseman.

Some only work privately, making up goods for town and country trade.

Some keep but small shops, and for the most part sell and repair the middling sorts of saddlery-wares, but seldom make up. Others have large shops, and make up and sell all sorts of the finest horse-furniture.

Others again keep large stocks of goods for exportation, and merchandize a great deal on their own accounts.

They were a company before the year 1190, but not incorporated 'till 1272. In the reign of king Edward I. Livery-fine 10 l. whereof his royal highness the late prince of Wales was a member.

Their hall is near Foster-lane in Cheap-side, and their court-day on the first Tuesday in the month.

Before their hall-gate they have a stand, in which they sit to attend the lord mayor on the day of his installation.

SAFE-CONDUCTS, PROTECTIONS, PASS-PORTS.

A safe-conduct is a security given by the king, under the great-seal, to a stranger, for his safe coming into and passing out of the realm, touching which are several statutes. A passport is a licence granted by any in authority, for the safe passage of man or ship, &c. from one place or country to another.

Protections are of two sorts; public, where a prince takes on him the defence of another prince or state; or private, of persons or ships, in effect only a passport.

By the law of protection, the protected person owes all respect to his protector, who, on his part, should defend and succour the protected; or he may withdraw himself from the protection, and seek another. The Genoese revolting from the protection of the French king, he changed their conditions into privileges, that he might deprive them of them when he should think fit. Molloy 84.

In protections of ships and persons, generally great faith is kept by the granters; for at this day, if a ship hath a Barbary protection, the pirates of that nation will restore any such ship they have taken; and if no protection, yet if taken

S A F

within sight of their castles, the prize is not absolute, unless resistance be made.

The statute of Magna Charta, 9 Hen. III. cap. 30. ordains, That all merchant-strangers shall have safe conduct into, out of, and whilst in, England, to buy, sell, &c. if not openly prohibited; except in time of war, and in an enemy's country. And by 27 Edw. III. cap. 2. Safe-conduct is granted to merchant-strangers, to dwell and traffic in this kingdom, and return at pleasure.

By 15 Hen. VI. cap. 3. it is recited, That whereas the king had granted safe-conduct to certain persons coming in and out of England, France, and Ireland, with certain laden ships; and faith should be given both to the copy called Vidimus, and the original of those letters: and that one John de Guntier granted such copy to as many as he pleased, sealed with the seal of him that called himself king of France; by which a great navy of enemies was assembled, and took many ships, &c. to the great damage of England.

The king, at the grievous complaint of the commons in parliament, ordains, that the clause Vidimus shall not be put in any future safe-conduct granted, without great cause. And also that in all safe-conducts, the name of the ships, masters, number of mariners, and ship's burthen, shall be expressed.

By 18 Hen. VI. cap. 8. Merchants aliens may charge vessels of Spain, and other parts, enemies of the king, if the masters, owners, &c. have safe-conduct. And if any such ships be taken by the king's subjects, not having authentic safe-conducts, the possessors may enjoy the same. And proclamation is to be made of this statute on the sea-coasts, that merchants aliens may have knowledge of it.

By 20 Hen. VI. cap. 1. All letters of safe-conduct granted to the king's enemies, or others, shall be enrolled in chancery before delivery, or else be void: and if at any time hereafter, goods are taken by English subjects on the sea in enemy's ships, not having legal safe-conduct, they shall enjoy them without restitution.

And the king's subjects, taking such ships, and forcibly bringing them into any port of the realm, shall not receive damage, if ready to make restitution within reasonable time after they shall have knowledge of letters of safe-conduct, enrolled in chancery before taking them.

By 31 Hen. VI. cap. 4. Any subject offending upon the sea, or in any port of the kingdom, to the injury of any strangers in amity with us, or having safe-conduct, the chancellor of England may issue process to bring the offenders to answer to the parties grieved, and make such restitution as shall seem to the chancellor expedient.

And on this process, the chancellor shall further proceed, to make full delivery and restitution, of persons, ships, &c. with all costs and losses, disbursed and suffered by them.

A late act 4 Geo. II. cap. 18. recites, That treaties are subsisting between the king and subjects of Barbary, by which it is stipulated, that all ships belonging to his Majesty or his subjects, may pass the seas, and enter the harbours of the said governments, without seizure or molestation, on producing passes under seal of the admiralty-office, called Mediterranean passes. It is therefore enacted, That if any shall forge or counterfeit any such pass, or make any alteration or erazement, &c. such persons, on conviction in any of his Majesty's dominions, shall be guilty of felony.

And the said offences, wheresoever committed, may be tried and adjudged in any county of England, or before any justice in Scotland.

By the laws of France, no vessel shall put to sea from any port, without passport from the admiral, recorded at the admiralty-office of the place whence the master sails; who, in 24 hours after his arrival in any port, shall present his passport, and declare all the considerable circumstances of his voyage, &c.

And by a treaty marine, made by king Charles II. with the king of France in the year 1677, a form of passport is appointed to be given by the lord admiral of England, or by the mayor or other chief magistrate, or the principal officers of the customs, in the several ports and places of the king's dominions,

dominions, to ships and vessels. See MARQUE [LETTERS OF MARQUE], REPRISALS, MARINE TREATIES.

SAFFRON.

Of its growth and cultivation in England.

As saffron grows at present most plentifully in Cambridgeshire, and has grown formerly in several other counties of England, the method of culture does not, I believe, vary much in any of them, and therefore I have judged it sufficient to take notice of the observations which several capable persons have made, in different seasons, in the years 1723, 24, 25, and 28, up and down all that large track of ground that lies between Saffron Walden and Cambridge, in a circle of about ten miles diameter. In that country, saffron has been longest cultivated, and therefore it may reasonably be expected, that the inhabitants thereof are more thoroughly acquainted with it than they are any where else.

I shall begin with the choice and preparation of the ground. The greatest part of the track already mentioned, is an open level country with few inclosures; and the custom there is, as in most other places, to crop two years, and let the land lie fallow the third. Saffron is always planted upon fallow ground, and all other things being alike, they prefer that which has borne barley the year before.

The saffron-grounds are seldom above three acres, or less than one, and in chusing them, the principal thing they have regard to is, that they be well exposed, the soil not poor, nor a very stiff clay, but a temperate dry mould, such as commonly lies upon chalk, and is of a hazel colour; though if every thing else answers, the colour of the mould is pretty much neglected.

The ground being made choice of, about Lady-day, or the beginning of April, it must be carefully plowed, the furrows being drawn much closer together and deeper, if the soil will allow it, than is done for any kind of corn, and accordingly the charge is greater.

About five weeks after, or during any time in the month of May, they lay between twenty and thirty loads of dung upon each acre, and having spread it with great care, they plow it in as before. The shortest rotten dung is the best, and the farmers who have the conveniences of making it, spare no pains to make it good, being sure of a proportionable price for it. About Midsummer they plow a third time, and between every sixteen feet and an half, or pole in breadth, they leave a broad furrow or trench, which serves both for a boundary to the several parcels (when there are several proprietors to one enclosure) and to throw the weeds in at the proper season.

To this head likewise belongs the fencing of the grounds, because most commonly, though not always, that is done before they plant. The fences consist of what they call dead hedges, or hurdles to keep out not only cattle of all sorts, but especially hares, which would otherwise feed on the saffron-leaves during the winter.

About the weather we need only observe, that the hottest summers are certainly the best, and if therewith there be gentle showers from time to time, they can hardly miss of a plentiful rich crop, if the extreme cold, snow, or rain of the foregoing winter, have not prejudiced the heads.

The next general part of the culture of saffron, is planting or setting the roots; the only instrument used for which, is a narrow spade, commonly termed a spit-shovel.

The time of planting is commonly in the month of July, a little sooner or later, according as the weather answers. The method is this: one man with his spit-shovel raises between three and four inches of earth, and throws it before him about six, or more inches; two persons, generally women, following him with saffron heads, place them in the farthest edge of the trench he makes at three inches distance from one another, or thereabouts. As soon as the digger or spitter has gone once the breadth of the ridge, he begins again at the other side, and digging as before, covers the roots last set, and makes the same room for the setters to place a new row, at the same distance from the first, that they are from one another. Thus they go on 'till a whole ridge, containing commonly one rod, is planted, and the only nicety in digging is to leave some part of the first stratum of earth untouched to lie under the roots; and in setting, to place the roots directly upon their bottoms. What sort of roots are to be preferred, shall be shewn under the fourth head; but it must be observed in this place, that formerly when roots were very dear, they did not plant them so thick as they now do; and that they have always some regard to the size of the roots, placing the largest at a greater distance than the small ones.

The quantity of roots planted in an acre is generally about sixteen quarters, or 128 bushels, which according to the distances left between them, as before assigned, and supposing them all to be an inch in diameter one with another, ought to amount to 392,040 in number.

From the time that the roots are planted, 'till about the beginning of September, or sometimes later, there is no more labour about them; but as they begin to spire, and are ready to shew themselves above ground, which is known by digging

V O L. II.

a few out of the earth, the ground must be carefully pared with a sharp hough, and the weeds, &c. raked into the furrows, because otherwise they would hinder the growth of the plants.

In some time after appear the saffron-flowers, and this leads us to the third branch of our present method. The flowers are gathered as well before, as after they are full blown, and the most proper time for this is early in the morning. The owners of the saffron get together a sufficient number of hands, who place themselves in different parts of the field, pull off the whole flowers, and throw them handful by handful into a basket; and so continue 'till all the flowers are gathered, which happens commonly about ten or eleven o'clock. Having then carried home all they have got, they immediately spread them upon a large table, and placing themselves round it, they fall to picking out the filamenta, styli, or chives, and together with them, a pretty long portion of the stylus itself, or string to which they are joined. The rest of the flower they throw away as useless. The next morning they return into the field again, whether it be wet or dry weather, and so on daily, even on Sundays, 'till the whole crop be gathered.

The chives being all picked out of the flowers, the next labour about them is to dry them on the kiln. The kiln is built upon a thick plank (that it may be moveable from place to place) supported by four short legs. The outside consists of eight pieces of wood, about three inches thick, joined in form of a quadrangular frame, about twelve inches square at bottom on the inside, and twenty-two inches at the top, which is likewise equal to the perpendicular height of it. On the fore-side is left a hole about eight inches square, and four inches above the plank, through which the fire is put in. Over all the rest, laths are laid pretty close to one another, and nailed to the frame already mentioned, and then are plastered over on both sides, as is also the plank at bottom very thick, to serve for a hearth. Over the mouth, or widest part, goes a hair-cloth fixed to two sides of the kiln, and likewise to two rollers, or moveable pieces of wood, which are turned by wedges or screws, in order to stretch the cloth. Instead of the hair-cloth many people now use a net-work of iron wire, with which it is observed, that the saffron dries sooner, and with a less quantity of fuel; but the difficulty of preserving the saffron from burning, makes the hair-cloth be preferred by the nicest judges in drying.

The kiln is placed in a light part of the house, and they begin by laying five or six sheets of white paper on the hair-cloth, upon which they spread wet saffron, between two and three inches thick. This they cover with other sheets of paper, and over these lay a coarse blanket five or six times doubled, or, instead thereof, a canvas pillow filled with straw, and after the fire has been lighted for some time, the whole is covered with a board, having a large weight upon it.

At first they give it pretty strong heat, to make the chives sweat, as their expression is; and in this, if they do not use a great deal of care, they are in danger of scorching, and so of spoiling all that is on the kiln.

When it has been thus dried for about an hour, they take off the board, blanket, and upper papers, and take the saffron off from that which lies next it, raising at the same time the edges of the cake with a knife. Then laying on the papers again, they slide in another board between the hair-cloth and under papers, and turn both papers and saffron upside down, afterwards covering them as above.

The same heat is continued for an hour longer; then they look to the cake again, free it from the papers and turn it; then they cover it, and lay on the weight as before. If nothing happens amiss, during these first two hours, they reckon the danger to be over; for they have nothing more to do, but to keep a gentle fire, and turn their cake every half hour, 'till it be thoroughly dry; for doing which as it ought, there are required full twenty-four hours.

In drying the large plump chives they use nothing; but towards the latter end of the crop, when these come to be smaller, they sprinkle the cake with a little small beer to make it sweat as it ought; and they begin now to think, that using two linen cloths next the cake, instead of the two innermost papers, may be of some advantage in drying; but this practice is followed, as yet, but by few.

Their fire may be made of any kind of fuel; but that which smoaks the least is best, and charcoal, for that reason, is preferred to any other.

What quantity of saffron a first crop will produce is very uncertain. Sometimes five or six pounds of wet chives are got from one rod; sometimes not above one or two, and sometimes not enough to make it worth while to gather and dry it. But this is always to be observed, that about five pounds of wet saffron go to make one pound of dry, for the first three weeks of the crop, and six pounds during the last week; and now the heads are planted very thick, two pounds of dried saffron may, at a medium, be allowed to an acre for a first crop, and four and twenty pounds for the two remaining, the third being considerably larger than the second.

In order to obtain these, there is only a repetition to be made every year of the labour of houghing, gathering, picking, and drying, in the same manner as before set down, without the addition of any thing new; except that they let cattle into the fields, after the leaves are decayed, to feed upon the weeds, or perhaps mow them for the same use.

About the Midsummer after the third crop is gathered, the roots must all be taken up and transplanted: the management requisite for which is the fourth thing to be treated of. To take up the saffron-heads, or break up the ground, as their term is, they sometimes plow it, sometimes use a forked kind of hough called a pattock, and then the ground is harrowed once or twice over; during all which time of plowing, or digging and harrowing, fifteen or more people will find work enough to follow and gather the heads, as they are turned up. They are next to be carried to the house in sacks, and there to be cleaned or raised. This labour conflicts in clearing the roots thoroughly from earth, and from the remains of old roots, old involucre, and excrescences; and thus they become fit to be planted in new ground immediately, or to be kept for some time without danger of spoiling.

The quantity of roots taken up, in proportion to those that were planted, is uncertain; but at a medium it may be said, that allowing for all the accidents that happen to them in the ground, and in breaking up, from each acre may be had 24 quarters of clean roots, all fit to be replanted. The owners are sure to chufe for their own use the largest, plumpest, and fattest roots, but above all, they reject the longish-pointed ones, which they call spickets or spickards, for very small round or flat roots are sometimes observed to flower.

This is the whole culture of saffron in the country above mentioned; and we have only now to consider the charges and profits which may be supposed, one year with another, to attend this branch of agriculture; and of these we have drawn up the following computation for one acre of ground, according to the price of labour in this county.

	l.	s.	d.
Rent for three years	3	00	0
Plowing three times	0	18	0
Punging	3	12	0
Hedging	1	16	0
Spitting and setting the heads	1	12	0
Weeding or paring the ground	1	4	0
Gathering and picking the flowers	6	10	0
Drying the flowers	1	6	0
Instruments of labour for three years with the kiln, about	0	10	0
Plowing the ground once, and harrowing twice	0	12	0
Gathering the saffron-heads	1	00	0
Raising the heads	1	12	0

Total charge 23 12 0

This calculation is made upon the supposition, that an acre of ground yields 26 pounds of neat saffron in three years, which is stated only as a mean quantity between the greatest and the least; and therefore the price of saffron must be adjusted accordingly, which I think cannot be done better than by fixing it at 30 s. per pound; since in very plentiful years it is sold for 20 s. and is sometimes worth between 3 and 4 l. At this rate, 26 pounds of saffron are worth 39 l. and the neat profits of an acre of ground producing saffron, will in three years amount to 15 l. 13 s. or to about 5 l. 4 s. yearly. This, I say, may be reckoned the neat profit of an acre of saffron, supposing that all the labour were to be hired for ready money; but as the planter and his family do a considerable part of the work themselves, some of this expence is saved: that is, by planting saffron, he not only may reasonably expect to clear about 5 l. yearly per acre, but also to maintain himself and family for some part of each year; and it is upon this supposition only, that the result of other computations which have been made of the profits of saffron, can be said to have any tolerable degree of exactness; but the calculations themselves are undoubtedly very inaccurate.

We have said nothing here concerning the charge in buying, or profits in selling the saffron heads, because in any large track of ground, these must at length always ballance one another, while the quantity of ground planted yearly continues the same.

An essential extract of saffron.

Take two ounces of the choicest fresh English saffron dried, and either cut small or remaining whole; put it into a clean bolt-head with a long and slender neck; pour upon it so much of the purest alcohol, containing no foreign thing, as may float four or six inches about it: then stop the glass slightly with a wreath of paper, put it into a wooden little furnace supplied with a live coal buried under sifted ashes, that the heat may be only a hundred degrees. Leave it thus in digestion for three days, the vessel being often shook; let it afterwards rest for 24 hours, in a cold quiet place; then carefully strain off all the tinged liquor through a piece of clean linen, placed in a funnel set in a clean glass, and keep it closely stopped. It will be of a bright red colour.

The saffron remaining at the bottom of the glass, will be found paler than before. To this pour the like quantity of fresh alcohol, and proceed as before, and mix the tincture thus acquired with the former; the saffron will now remain paler. If more alcohol be added to it, and the process be repeated, a still poorer tincture will be obtained, which ought to be kept separate: the saffron will now become pale, but otherwise will have the same appearance and bulk, as before. To this if water be added, digested therewith, and poured off, it will be of a yellow colour; put on fresh, and continue thus, 'till no more tincture can be extracted; and now the chives will appear quite white, and if gently dried, will retain their former figure, though they appeared much shrunk, perfectly inodorous, and insipid, so as scarce to be distinguished from bits of clean thread; whence it is wonderful, where the feat of that surprizing matter extracted from it should be, which is found to give so rich a tincture to so large a proportion of alcohol. Let the tincture procured by the two first digestions, be distilled in a glass body, fitted with its head, and perfectly well closed, with a fire of a hundred degrees, 'till about an ounce remains behind, which, when cold, is to be poured into a glass vessel, to be kept carefully stopped. It will prove of an exceeding red colour, a highly fragrant odour, and a bitter, aromatic, penetrating taste, and have the consistence of thin oil. Let it be kept under the title of the essential extract of saffron. The spirit that comes over in the distillation will be limpid and colourless, but retain the grateful and aromatic smell and taste of saffron. This is to be reserved for the same use, and thus every time becomes the richer.

The U S E.

This surprizing experiment shews us a new species of matter, which we can neither call oil, spirit, gum, rosin, resinous gum, wax, or balsam; but it is something perfectly singular, and of a spirituous oily nature. This extract mixes with water, spirit, and oil, and has such exhilarating virtues, that being used too freely, it occasions an almost perpetual and indecent laughing; but used moderately, it becomes proper: it tinges the urine red, and is particularly said to destroy the petrifying power thereof in the kidneys, and therefore to be an extraordinary remedy against the stone.

R E M A R K S.

Thus we find that nature has prepared, in particular parts of certain vegetables, a determined kind of body, so different from all others as scarce to be referred to any other known kind; and has, at the same time, endowed it with virtues, otherwise inimitable. We have seen an example of this in the chives of saffron, which the principal chemists have so highly esteemed, as to call it the philosophers spice. It is incredible how rich this saffron is in colour, taste, odour, and virtue; how small the bulk is that possesses all these rich faculties, and how tender and easily corruptible the thing itself is, and therefore requires the above peculiar method of operation.

Saffron is in many places in great esteem in sauces, and on many occasions in foods, but its great use is in medicine. It is a high cordial, a powerful aperient, detergent and resolvent. It gives great relief in faintings and palpitations of the heart; it also strengthens the stomach, and assists digestion. It is certainly a noble medicine, under the direction of a skilful physician, but given by a quack may prove as hurtful as otherwise it might be salutary.

The English saffron is allowed by all, except the French writers on these subjects, to be greatly superior to any other. It is to be chosen fresh, tough, and flexible, difficultly broken, of a strong smell and very bitter taste, and such as stains the hands in touching it. Our druggists are apt to keep it in damp places, to increase its weight, whereby it becomes mouldy, and such is to be rejected.

S A I L-C L O T H.

The chief LAWS relating to this manufacture.

Makers of sail-cloth shall fix stamps, with their names, &c. to every piece, under the penalty of 5 l. Persons cutting off stamps, or using any false names, incur certain penalties. A bounty is allowed on exportation of British-made sail-cloth. All foreign sail-cloth imported, for which duties are granted, shall be stamped with a stamp expressing from whence imported, &c. on forfeiture of 10 l. upon conviction before one or more justices. New ships on first setting out to sea, shall have a complete set of sails, bona fide, belonging to her, manufactured here, on pain of 50 l. Flax yarn used in British sail-cloth, shall not be whitened with lime, on forfeiture of 6 d. per yard.

Every master of a ship, belonging to a subject (East India ships excepted) having any foreign sails on board, shall, at the time of making entry of his ship, also make entry, on oath, of all foreign sails used on board, for which the same duties shall be paid as by stat. 12 Ann. cap. 16. Foreign sail-cloth, unstamped, shall not be made into sails, under penalty of

of 50*l*. and forfeiture of the sails. Sails made of foreign fail-cloth unstamped, shall not be mended, under penalty of 20*l*. Every sail-maker shall impress on every new sail, a mark of eight inches diameter, containing his name and place of abode, and under the penalty of 10*l*. See the articles CANVAS, and HEMP; and see the BUSINESS of the CUSTOMS at the end of LETTER S. for the LAWS relative to SAIL-MAKING.

SAIL-MAKER. The sail-maker cuts out and sews the pieces together, which form the sails of a ship. It is a profitable trade.

SAILOR, see the article SEAMEN.

SALT. This being a commodity of general utility in commerce, as well with regard to our fisheries as our royal navies, and ships concerned in the merchants service, and there being several delicacies in the operation to produce a salt suitable to all the occasions of life, we shall give an abstract of the learned Dr Brownrigg's late improvements upon the making of salt, to a greater perfection than has been heretofore practised in this kingdom.

Mines of salt, says the doctor, have been long discovered and wrought in England, Spain, Italy, Germany, Hungary, Poland, and other countries in Europe. Moreover, the sea affords such vast plenty thereof, that all mankind might thence be supplied with quantities sufficient for their occasions. There are also innumerable springs, ponds, lakes, and rivers, impregnated with common salt, from which the inhabitants of many countries are plentifully supplied herewith.

In some countries which are remote from the sea, and have little commerce, and which are not blessed with mines of salt, or salt waters, the necessities of the inhabitants have forced them to invent a method of extracting their common salt from the ashes of vegetables.

In short, this salt is dispersed all over nature; it is treasured up in the bowels of the earth; it impregnates the ocean; it descends in * rain; it fertilizes the soil; it arises in vegetables; and from them is conveyed into animals; so that it may well be esteemed the universal condiment of nature.

* See Boyle on the falseness of the sea.

Naturalists, observing the great variety of forms under which this salt appears, have thought fit to rank the several kinds of it under certain general classes, distinguishing it most usually into rock or fossil-salt, sea-salt, and brine or fountain-salt: to which may be added others of those muriatic salts, which are found in vegetable or animal substances. These several kinds of common salt often differ from each other in their outward form and appearance, or in such accidental properties as they derive from the heterogeneous substances with which they are mixed; but, when perfectly pure, they have all the same qualities; so that chemists, by the exactest inquiries, have not been able to discover any essential difference between them.

By rock-salt †, or native salt, is understood all salt dug out of the earth, which hath not undergone any artificial preparation.

† By rock-salt, *sal rupium*, the ancient chemists mean salt adhering to the rocks above the high-water mark, being there lodged by the spray of the sea, evaporated by the heat of the sun; which is the purest salt of all for chemical uses, and is to be had off the rocks of Sicily, and several islands in the West-Indies.

Under the title of bay-salt may be ranked all kinds of common salt extracted from the water, wherein it is dissolved by means of the sun's heat and the operation of the air; whether the water from which it is extracted be sea-water, or natural brine drawn from wells and springs, or salt water stagnating in ponds and lakes.

Under the title of white salt, or boiled salt, may be included all kinds of common salt extracted by coction from the water wherein it was dissolved; whether this water be sea-water, or the salt water of wells, fountains, lakes, or rivers; or water of any fort impregnated with rock-salt, or other kind of common salt.

The first of these kinds is in several countries found so pure, that it serves for most domestic uses, without any previous preparation, triture excepted. But the English fossil-salt is unfit for the uses of the kitchen, until by solution and coction it is freed from several impurities, and reduced to white salt.

The British white-salt also is not so proper as several kinds of bay-salt for curing fish, and such flesh-meats as are intended for sea-provisions, or for exportation into hot countries. So that for these purposes, we are obliged, either wholly or in part, to use bay-salt, which we purchase in France, Spain, and other foreign countries. To remedy these inconveniences, what follows may be useful, in order to shew how the subjects of Great-Britain may be supplied with salt of their own manufacture, fit and sufficient for all their occasions.

In order that the methods here proposed might be better understood, and that the reasonableness of them might more fully appear, it is necessary to premise a brief account of several ways of preparing bay-salt, as well as white-salt. From this history may be formed a judgment, how far the methods now in use are proper, in what deficient, where

erroneous, and how they may be improved for the benefit of our trade.

BAY-SALT in general may be divided into two kinds. First, bay-salt, drawn from sea-water, as is practised in France, Spain, Portugal, and many other countries. Secondly, bay-salt extracted from salt springs, ponds, and lakes; as at Cape de Verde islands, Tortuga, and other places. Of these the first is imported in large quantities into Great-Britain and Ireland: our American colonies, in times of peace, are chiefly supplied with the latter; but in time of war they have large quantities of bay-salt from Lisbon, and other parts of Portugal.

Bay-salt is prepared in a manner the most simple and easy, when the water of ponds and lakes impregnated with salt, is totally exhaled by the force of the sun and air, and the salt is left concreted into a hard crust at the bottom of the lake or pond. Of salt thus prepared we have instances in many parts of the world, as in the Podolian desert near the river Borysthenes, on the Russian frontiers towards Crim Tartary, in the kingdom of Algiers, and in other parts of the world.

Bay-salt is also drawn from the brine of ponds and lakes, and it is prepared in this manner in the Cape de Verde islands. This account was collected chiefly from the relations of several persons of credit, who themselves assisted in making salt in these islands. Every kind of bay-salt is prepared without artificial heat, and by only exposing the brine under a large surface to the action of the sun and air, by which, in proportion to the strength of the brine, and to the different temperature of climate and season, the salt crystallizes into what we call bay-salt, and comes under different appearances to us from different places, which arise principally from the cleanliness and care of the artist.

WHITE-SALT, although in general, is made in warm climates, with the greatest ease, and at least expence, by the heat of the sun, after the methods already described; yet in several countries, where bay-salt might be conveniently made, they prepare all their salt by culinary fires. Thus in Austria, Bavaria, and many other parts of Germany, and also in Hungary, and even in some parts of Italy, they constantly boil the water of their salt-springs into white-salt. But in other parts of Europe, as in Britain, and in the northern parts of France and Germany, an erroneous opinion long prevailed, that the heat of the sun was not there sufficiently intense, even in the summer season, to reduce sea-water or brine into bay-salt. And all arguments would probably have been insufficient to remove this mistake in the English, had not the contrary been fully proved by experiments, which were first accidentally made in Hampshire. However, the method of making salt by coction, will probably still continue to be practised in Britain, as the salt so prepared is for several uses preferable to bay-salt; and when prepared after a particular manner, is preferable to common bay-salt, even for curing provisions, as the practice of the Hollanders sufficiently testifies: so that the due and right preparation of white-salt seems very deserving of the notice and regard of the public.

White-salt, as it is prepared from various saline liquors, may therefore be distinguished into the following kinds:

1. **MARINE BOILED SALT**, which is extracted from sea-water by coction. 2. Brine or fountain-salt, prepared by coction from natural brine, whether of ponds or fountains. 3. That prepared from sea-water, or any other kind of salt-water, first heightened into a strong brine by the heat of the sun, and the operation of the air. 4. That prepared from a strong brine or lixivium drawn from earths, sands, or stones impregnated with common salt. 5. Refined rock-salt, which is boiled from a solution of fossil-salt in sea-water, or any other kind of salt-water, or pure water. 6. Lastly, Salt upon salt, which is bay-salt dissolved in sea-water, or any other salt-water, and with it boiled into white salt; and under these heads may be ranked the several kinds of boiled salt now in use. The learned author before mentioned has given us an exact history of the manner of preparing these different kinds of salt, as practised in different places, with miscellaneous observations and cautions relating to their respective processes, for which in general we must refer to the work itself: but the making salt upon salt deserves more particular attention, as the author, being under no tie of secrecy, has revealed to us the method of making in Holland and Zealand that strong and pure kind of salt, with which they cure herrings, and all other provisions for long-keeping, which gives the Dutch a great advantage over all other nations in the herring-fishery; since fish preserved with this salt look much cleaner and fairer than those that are cured with bay-salt, and keep much better than those preserved with any other kind of white-salt.

From the process whereby white-salt is made from sea-water by coction, it appears that sea-water, besides common salt, contains several other ingredients, some of which are separated before the common salt falls, and others remain in the bittern, after all the salt is extracted. Our author has given a full and circumstantial account of these in an express chapter under the appellation of *Memoirs for an Analysis of Sea-water*.

The salt-boilers, and particularly those who prepare brine-salt, have long been accustomed to make use of various substances, which they call additions, or seasonings, and mix them with the brine while it is boiling, either when they first observe the salt begin to form, or else afterwards, during the time of granulation. These additions they use for various purposes. First, to make the salt grain better, or more quickly form into crystals; secondly, to make it of a small fine grain; thirdly, to make it of a large, firm, and hard grain, and less apt to imbibe the moisture of the air; fourthly, to render it more pure; and, lastly, to make it stronger, and fitter for preserving provisions.

These additions most commonly used to answer the above-mentioned purposes, are wheat-flour, refin, butter, tallow, new ale, stale beer, bottoms or lees of ale or beer, wine-lees, and allum. Wheat-flour and refin are used for the property they possess of making the salt a small grain; butter, tallow, and other unctuous bodies, are commonly applied, as they are said to make the brine crystallize more readily; for which end, some salt-boilers more particularly prefer the fat of dogs; but others have little to plead for their using these substances, but immemorial custom. How far they have the effects ascribed to them, can only be determined by experiments, as several boilers, who formerly used them, now find they can make as good salt without them. Wine-lees, new ale, stale ale; the lees of the ale and beer, are now generally rejected by the marine salt-boilers, except in the west of England, where the briners, who use them, affirm that they raise a large grain, and make their salt more hard and firm, and some say that they make it crystallize more readily. Hoffman prefers the strongest ale; and Platt assures us, that it makes the salt of a larger or smaller grain, according to the degree of its staleness. The only good effects that fermented liquors can have as an addition, are probably owing to their acid spirit, which may correct the alkaline salts of the brine, and so render the common salt more dry and hard, and less apt to dissolve in moist air: if, therefore, it should be thought necessary to use any of these additions, in order to correct the alkaline quality of the brine, stale ale, or Rhenish wine*, ought to be chosen, as new ale contains but little acid.

* Why not malt vinegar?

Allum is an addition long known and used in Cheshire, together with butter, to make the salt precipitate from some forts of brine, as we are assured by Dr Leigh, in his Natural History of Lancashire, Cheshire, &c. who first taught the Cheshire salt-boilers the art of refining rock-salt. As the bad properties of their salt proceeded from hard boiling, they found every method ineffectual, until they had recourse to a more mild and gentle heat. And as allum hath been long diffused amongst them, it is not likely that they found any extraordinary benefit from it, otherwise they would scarce have neglected it, and continued the use of butter. However, the late Mr Lowndes hath lately endeavoured to revive its use, asserting, that brine-salt hath evermore two main defects, flakiness and softness; and, to remedy these imperfections, he tried allum, which fully answered every thing he proposed, for it restored the salt to its natural cubical shoot, and gave it a proper hardness, nor had it any bad effect whatever. But our author is of opinion, that whoever considers the nature of allum, will scarce expect such extraordinary effects from it. Neither does it here seem wanted; for the grains of common salt will always be sufficiently hard, and of their natural figure, large size, and no ways disposed to run by the moisture of the air, if formed by a gentle heat, and perfectly free from heterogeneous mixtures: so that the goodness of Mr Lowndes's salt does not seem owing to the allum with which it is mixed, but chiefly to the gentle heat used in its preparation.

The Dutch, who have long shewn the greatest skill and dexterity in the art of boiling salt, make use of another addition, which they esteem the greatest secret of their art: this is whey, kept so long 'till it is extremely acid, now first revealed by our author to the British salt-boilers, but long held in great esteem by the Dutch, for the good effects it hath upon their salt, which it renders stronger, more durable, and fitter to preserve herrings, and other provisions.

Bay-salt, as well as white salt, is of different kinds, and possessed of different qualities: with the different kinds of these, provisions must be cured, according to the uses for which they are designed. The Dutch, indeed, use no salt for curing provisions, besides their own refined salt: with it they can preserve flesh and fish of all kinds, as well as with the strongest bay-salt, and chuse to be at the expence of refining bay-salt, rather than to defile their provisions with the dirt and other impurities with which it commonly abounds.

Salt esteemed the best for curing provisions, and for preserving them the longest time, is that which is the strongest and the purest. This may be known by the following characteristics, viz. it is usually concreted into large grains or crystals, which are firm and hard, and, in respect to those of other kinds of common salt, the most solid and ponderous; it is not disposed to grow moist in moderately dry air, to which it has been

exposed a considerable time; its colour is white and somewhat diaphanous; it hath no smell; its taste is truly muriatic, and more sharp and pungent than that of other kinds of common salt: it has, besides these, several other distinguished properties, mentioned by our author. The salts which approach nearest to this degree of perfection, are the best kinds of bay-salt, and the strong Dutch refined salt; but most of the salt now made for sale is very far from answering to these characteristics.

Having related the various methods of preparing that are now in use, as far as they are come to our author's knowledge, it appears, that this art is not brought to such perfection in the British dominions as in several other countries, the salt here prepared being unfit for preserving many kinds of provisions. It remains now to shew, that this want of a strong salt of British manufacture, proceeds not from any defect in nature, but of art, and that, if proper skill and industry be used in the British dominions, and due encouragement there given by the legislature, such improvements may be made in this art, that not only Great-Britain, but Ireland also, and the British colonies in America, may be supplied with salt of their own manufacture, proper for curing all kinds of provisions, in quantity sufficient for all their occasions, in quality equal, if not superior, to any foreign salt now made at a moderate price.

These are truths, which appear evident from the facts and reasonings contained under the following positions:

Lemma I. The quantity of water which annually falls in rain, snow, and hail, is very different in different parts of Great-Britain, there commonly falling almost double the quantity on the western coasts, that falls on the eastern coasts of that island.

Lemma II. The quantity of rain which falls in Lancashire, during the four hottest months of the year, viz. May, June, July, and August, doth not, at a medium, amount to more than a third part of the quantity of water which falls in rain, snows, and hail, during the whole year.

Lemma III. The water which ascends in vapours from the sea, very greatly exceeds that which defends thereon in rain and other aqueous meteors; but the quantity of water which usually exhales from a given part of the ocean, in a given time, cannot with any exactness be determined.

Lemma IV. The quantity of water which commonly exhales in Great-Britain from shallow ponds, during the four hottest months of the year, greatly exceeds the quantity of rain which commonly falls on the surface of those ponds during the said months.

From these lemmata, which the author has supported by the observations not only of himself, but of other learned men, are deduced the following propositions:

Proposition I. In several parts of England large quantities of bay-salt may be extracted from sea-water, during the hottest months of the year, by receiving the salt water into ponds, and suffering its aqueous parts thence to exhale by the heat of the sun, and the operation of the air and winds.

Proposition II. In several parts of England large quantities of bay-salt may very commodiously be extracted from sea-water, after the same manner that is practised in France, and in other parts of Europe.

Proposition III. Bay-salt may be extracted in England from sea-water, in larger quantities, and with more certainty, than by the foregoing method, if care be taken to preserve the brine contained in the salt-pits from being diluted with rains, and to promote the evaporation of the water by several artificial means, which may easily be put in practice.

Proposition IV. In several parts of England large quantities of excellent bay-salt may, with great ease, be made from the natural brine of salt springs, and also from the rock-salt dissolved in weak brine, or sea-water.

Proposition V. Bay-salt may be prepared in England by the foregoing methods, at a very moderate expence, equal in goodness to the best foreign bay-salt, and in quantity sufficient for the consumption of all the British dominions.

Proposition VI. In several of the British colonies in America, bay-salt might, with little expence and trouble, be prepared from sea-water, in quantities sufficient to supply the American fisheries, and all other occasions of those colonies, so as to become a considerable branch of their trade.

The author has supported all these propositions with great ingenuity; but we cannot pass over in silence the artificial means to promote the evaporation of sea-water mentioned in Proposition III, as well as to preserve the brine contained in salt-pits from being diluted with rains; we therefore shall lay before the reader a short account of these.

It will be proper, says our author, to make all the salt-pits of the marsh in one long row, extended from east to west, and for each pit to make covers of thin boards, or rather of coarse canvas, or sail-cloth, stretched on frames of wood, and painted white. These covers must all be fixed with hinges, to strong posts and beams, on the north side of the pits, so that they may be let down and drawn up with cords and pulleys, or by some other contrivance, somewhat like draw-bridges. These covers, thus fixed, may be let down over

over the pits like a shed, or penthouse, in rainy weather, and in dry weather may be erected almost to a perpendicular, but inclining a little towards the south, so as to form a wall with a south aspect. Thus these may serve a double purpose, as coverings for the pits in wet weather, and as reflectors of the sun's heat upon them in dry weather, and thus greatly promote the evaporation of aqueous parts of the brine. The hinges on which the reflectors turn may be fixed about eight or ten inches from the ground, by which means, when the reflectors stand upright, there will be an opening left beneath them, through which the air will continually flow in a brisk current, and greatly increase the evaporation of the water.

After having gone through that part of Dr Brownrigg's work which relates to bay-salt, we proceed to the methods that gentleman proposes for preparing and improving white salt, which, if brought into use, may probably be of advantage, not only to private undertakers, but also to the public: for it appears, that two very different kinds of white salt are required, the one for the use of the table, and the other as a condiment for provisions. Its whiteness, dryness, and the smallness of its grain, are the properties which chiefly recommend the first kind; and its great strength and purity, the latter. It is this strong and pure kind of white salt which is wanted in the British dominions; and it is, therefore, our author's principal design here to consider how this defect may be supplied, although, at the same time, instructions are given how to prepare table-salt, not only better in quality, but also at less expence, than it is now prepared by the common methods.

Lemma I. In the common processes for making white salt, the salt is deprived of a considerable part of its acid spirit, by the violent boiling used in its preparation.

Lemma II. Most kinds of white salt are rendered impure by the mixture of various heterogeneous substances.

Lemma III. White salt, by the violent coction commonly used in its preparation, is rendered less fit for preserving fish, flesh, and other provisions, than it would be if prepared with a more gentle heat.

Lemma IV. The heterogeneous substances which are commonly mixed with white salt, render it less proper for preserving provisions than it would be if separated from them.

After having fully considered the foregoing lemmata, our author gives a method of preparing a kind of white salt proper for curing fish, flesh, and other provisions; likewise a method of refining salt; but for these we must refer you to the work itself, as well as for the tables, wherein the several expences attending these operations are minutely considered. Most of the facts referred to in these disquisitions are such, as the constant practice of those who make salt sufficiently warrants us to rely upon for true and certain; or else they are the observations of judicious salt-officers, daily conversant in these matters, or of curious and inquisitive navigators, merchants, travellers, and naturalists; or, lastly, the experiments of many learned physicians, chemists, and philosophers: the truth of which several facts, though many of them have been some time published, hath never been called in question. So that these observations and experiments may probably be more relied on by the public, than if they had only been made by our author, since they have the testimony of many skilful and unprejudiced persons, who could have no notion of the uses to which they have been here applied. If, therefore, the arguments founded upon those facts should be esteemed any ways reasonable and satisfactory, the author presumes to remark, that it might not be unworthy the wisdom of the British legislature to direct a more full enquiry to be made into a matter of this importance, and to order proper works to be erected for making bay-salt, and for making and refining white salt, and to put those works under the management of able and judicious persons, to make exact and accurate trials, in order to discover the best and cheapest methods of doing them; and the methods which should be most approved of might, for the general good, be made public, and established, by law, a common standard, to which all those who make salt in the British dominions should be obliged to conform.

The making and refining salt must certainly be considered as one of those mechanic arts, the history of which, as we are taught by the noble * lord Verulam, is a necessary part of that knowledge, that true science of nature, which is not taken up in vain and fruitless speculations, but effectually labours to relieve the necessities of human life. See THE BUSINESS OF THE CUSTOMS AT THE END OF LETTER S, FOR THE LAWS RELATIVE TO SALT.

* Verulam de Aug. Scient. lib. ii. cap. z.

SALTERS, or, as they are often termed, **DRY-SALTERS**, who deal in divers foreign goods of a dryish kind, as log-wood, cochineal, put-shes, &c. and much like merchants, mostly in a wholesale way.

They were incorporated into a company by queen Elizabeth, and are one of the twelve of the city of London.

SALT-PETRE. It is a salt, though extracted out of the earth, yet abundantly impregnated with the spirit of the air; it also cleaves to stone walls, rocks, clefts, and caverns under

VOL. II.

ground. That which is extracted out of fat earth, is made in most countries in Europe; but our greatest quantities come from the East-Indies. It is composed of near an equal quantity of fixed and volatile nitrous aerial salts, bitterish in taste: it is the product of the elements, deposited in the bosom of the earth, for the generation and nourishment of vegetables, and may not be improperly called the universal and unspecified mercury.

Purification of salt-petre.

Take what quantity you please of nitre, dissolve it in * warm water, filtre, evaporate, and crystallize, as you do other salts. Some esteem the crystalline nitre best, others the lumpy; but I could never observe any difference in them, the one being the top, and the lump the bottom of the pan in which the nitrous liquor was put to shoot.

* Somewhat more than six times its weight of boiling water is sufficient.

Of the gathering of salt-petre in quantities.

Although it be certain that the air and the water are all impregnated with a kind of nitre, which is frequently to be seen coagulated into fine white salt, like flour of wheat (but by the very taste may be easily known to be petre) sticking to the sides of plastered walls, and, in brick walls, to the mortar between the bricks (in dry weather, or where the wall is defended from the rain) for lime doth strongly attract it; and although dew and rain do convey much of it to the earth, and the clouds seem to be spread out before the face of the sun, either to imbibe some part of his influence, or to have a salt generated in them, for to advance the fertility of the earth, and certainly they return not without a blessing; for salt-petre may be easily extracted out of rain and dew, but from the latter more plentifully, accompanied, indeed, with a greasy purple oil, in great plenty: though likewise most standing waters, and even deep wells, have some small quantity of salt-petre in them: though the face of the earth, if it were not impregnated with this salt, could not produce vegetables, for salt (as the lord Bacon says) is the first rudiment of life, and nitre is, as it were, the life of vegetables; yet, to be more sure of it, experiment shews likewise, that some is to be found in fallows, and the earth which moles cast up in the spring: though the air and water want it not, yet it is not there to be had in any proportion answerable to the charge in getting it: and though the earth must necessarily have great quantities thereof generated or infused into it, yet, in these temperate countries of Europe, it is no sooner dilated by rain, or other waters, but it is immediately applied to the production or nutriment of some plant, insect, stone, or mineral; so that the artist will find as little of it here to serve his turn, as in the other two elements.

The chief places, therefore, where salt-petre is to be found in any quantities in these northern countries, are in stables, pigeon-houses, cellars, barns, warehouses, or, indeed, any place which is covered from the rain, which would dissolve it, and make it vegetate, as also from the sun, which doth rarify it, and cause it to be exhaled into the air. (For the same reason, husbandmen also might make double or treble the profit they usually do of their muck, if they will lay it up under a hovel, or some covered place, until they carry it out upon their land.) And I have been told by an experienced workman, that no manure yields petre so plentifully as the earth in churches, were it not an impiety to disturb the ashes of our ancestors, in that sacred depositary. See the article MANURE.

For this purpose the earth should be of good mould; and the better the mould is, the more petre is produced, for in clay or sandy earth, little or none is to be found: the freer ingress the air hath into a place, it is still of more advantage, so that the sun be excluded; and let the earth be never so good, if it be laid on a brick or boarded floor, it will not be so rich in petre as if it had free communication with the exhalations of the lower parts of the earth.

In any place thus qualified, you cannot miss of good quantities of petre, if it have not been drawn out in some years before, which a workman will quickly find, after he hath digged the first spadeful of earth, by laying a little of it on the end of his tongue; and if it tastes bitter, he is sure of good store of salt-petre; if the ground be good, it continues rich to six or eight feet deep, and sometimes, but not often, to ten.

After the salt-petre is extracted, if the earth be laid wet in the same place again, it will be twenty years ere any considerable quantity grows there of it; but if the earth be well dried, it will come in twelve or fourteen: and if they mingle with the dried earth store of pigeons-dung and mellow horse-dung, and then temper it with urine (as was usual before we were supplied with petre from India) it will be fit to dig again in five or six years. He that shall cast water upon a ground fit to dig for petre, will only sink the mineral deeper into the earth; but he that throws soap-suds on it, will quite destroy the petre (as the workmen have a tradition) and it very well deserves a further enquiry.

That salt-petre, and the way of drawing it out of the earth

now in use, was a modern invention, is generally concluded by all authors; but whether we owe it to chance, or the sagacity of some great wit, is as unknown as the time when it was first discovered.

It seems to have many years preceded the invention of gun-powder, which by the Germans is ascribed to Constantine Autlitzer, or Berthold Schwertz, a monk of Friburgh, and was in all probability not long discovered when the inventor (Polydore Virgil tells us) taught the use of guns to the Venetians, at the battle of Fossa Claudia, where they obtained that notable victory over the Genoese, anno 1380: for there is mention made both of salt-petre and aqua fortis, in the writings of Geber, a Spanish Moor, and an alchemist; but at what time he lived is not satisfactorily known, though it be certain some hundreds of years before Raymund Lully, who, about the year 1333, published some of his books, wherein he treats of salt-petre and aqua fortis. It is no ill conjecture of Maierus, that the aforesaid monk being a skilful alchemist, had a design to draw a higher spirit from petre than the common aqua fortis, and, that he might the better open the body of petre, he ground it with sulphur and charcoal, by which compofure he soon became the inventor of gun-powder. See GUN-POWDER.

The manner of collecting salt-petre in quantities.

In the first place you must be provided with eight or ten tubs, so large that they may be able to contain about ten barrows full of earth each of them: these tubs must be all open at the top, but in the bottom of every one of them you must make a hole, near to that side you intend to place outermost, which hole you must fit very well with a tap and a spiggot, on the outside downward.

On the inside of the tub, near the tap-hole, you must carefully place a large wad of straw, and upon that a short piece of board, which is all to keep the earth from stopping up the tap-hole. When you have placed your tubs on their stands, at such a distance one from the other that you may come with ease between them, then fill them up with such petre earth as you have chosen for your work, leaving only void about a span's breadth between the earth and the edge of the tub; then lay on the top of the earth in each tub, as near as you can to the middle, a bundle of wicker, like the bottom of a basket, and about a foot in diameter, and by it stick into the earth a good strong cudgel, which must be thrust pretty near the bottom; the wicker is to keep the water, when it is poured on, from hollowing and disordering the earth, and the cudgel is to be stirred about, to give the water ingress to the earth upon occasion: then pour on your earth common cold water, 'till it stands a hand's breadth over the earth; when it hath stood eight or ten hours, loosen the spiggot, and let the water rather dribble, than run, into half-tubs, which must be set under the taps. This lixivium the workmen call their raw liquor; and note, that if it come not clear at the first drawing, you must pour it on again, and, after some little time draw it off, 'till it come clear, and of the colour of urine.

If you are curious to know how rich your liquor is before boiling, you may take a glass phial, containing a quart, fill it with the common water you use, then weigh it exactly; next fill the same glass with your liquor, and find the difference of weight, which, compared with the quantity of all your liquors, will give you a very near guess how much salt-petre you are like to make by that boiling.

Then pour again, on the same earth, more common water, that it may bring away what is remaining in the earth of the former liquor. This second liquor is of no other use but to be poured on new earth, instead of common water, because it contains some quantity of salt-petre in it.

When this is done, turn the useless insipid earth out of the tubs, which you must fill with new earth, and continue this operation, 'till you have in the same manner lixiviated all the earth: then fill your copper with your liquor, which copper, for one of the profession, must be about two hundred weight, and set strongly in a furnace of brick-work; besides, on one side of your furnace you are to place a tub full of your liquor, which, at a tap below, may dribble as fast into the copper as the force of the fire doth waste your liquor; which invention is only to save charges in fuel.

When you have boiled it up to that height, that a little of it, flirtd off the finger on a live charcoal, will flash like gun-powder (which for the most part falls out to be about two days and a night's boiling) at that time, upon trial, a hundred weight of the liquor contains about 35 lb. weight of petre; but the workmen seldom make use of any further indication, than by finding the liquor hang like oil on the sides of the brazen scummer, when it is dipped into it, which is a sign it is fit to be passed through the ashes, which is done in this manner.

You must prepare two tubs, fitted after the manner of the first, wherein you put your earth, saving that at the bottom of these tubs you must lay reeds or straw, a foot high; over them place loose boards, pretty near one another, over them again a little more straw (which is to keep the ashes from the

top, and give the liquor room to drain the better from them): then fill up your tubs with any sort of wood-ashes, to half a foot of the top; pour on the foresaid liquor, as it comes scalding hot out of the copper, on the ashes contained in the first tub; after a while draw it off at the top: and so continue putting on and drawing off, first at one tub of ashes, then at the other, 'till your liquor grows clear, and loses the thick turbid colour it had when it went on.

When all the liquor hath in this manner passed through the ashes of both tubs, that by this means all its greasy oil is left behind in the ashes, you must keep it for the second boiling in a vessel by itself: in the mean time, pour upon your ashes a sufficient quantity of common water, very hot, once or twice, to bring away what is remaining of the liquor in the ashes.

When you begin the second boiling, put first into the copper the water that went last through your ashes, and as that wafteth, let your strong liquor drop into the copper, out of the tub above described, standing on the side of the furnace, 'till the liquor in the copper be ready to shoot or crystallize.

Note, That toward the end of your boiling, there will arise great store of scum and froth, which must be carefully taken off with a great brass scummer, made like a ladle, full of little holes; and usually about that time it lets fall some common salt to the bottom, which you must take up with the said scummer, and lay it aside for another use.

To know when the liquor is ready to shoot into petre, you need but drop a little of it on a knife, or any other cold thing that hath a smooth superficies, and if it coagulate, like a drop of tallow, and do not fall off the knife when it is turned downwards, which also may be judged by its hanging like oil to the sides of the scummer; when the liquor is brought to this pass, every hundred weight of it contains about three score and ten pounds weight of petre.

When you find your liquor thus ready to shoot, you must with great iron ladles take it out of the copper, into a high narrow tub for that purpose, which the workmen call their settling tub; and when the liquor is grown so cold, that you can endure your finger in it, you shall find the common, or cubic salt, begin to granulate, and stick to the sides of the tub; then at the tap, placed about half a foot from the bottom, draw off your liquor into deep wooden trays, or brass pans, and the cooler the place is where you let them stand to shoot in, the better and more plentifully will the salt-petre be produced; but it will be of no good colour 'till it be refined, but will be part white, part yellow, and some part of it blackish.

The salt which sticketh to the sides and bottom of the settling-tub is of the nature of common salt, and there is scarce any petre to be found but is accompanied with it, though no doubt some of this is drawn out of the ashes by the second liquors: if it be foul, they refine it by itself, and about London sell it at good rates, to those that salt neats-tongues, bacon, and collar-beef; for, besides a savory taste, it gives a pleasing red colour to most flesh that is salted with it.

When the liquor hath stood two days and two nights in the pans, that part of the liquor which is not coagulated, but swims upon the petre, must be carefully poured off, and being mingled with new liquors, must again pass the ashes, before it be boiled, else it will grow so greasy that it will never generate any salt. To refine salt-petre, see above.

Before we take our leave of this article, it may not be amiss to observe, first, that though petre will dissipate in gun-powder, yet if you fulminate it in a crucible, and burn off the volatile part with a powder of coal, brimstone, antimony, or meal, there will remain a salt, and yet so fixed (very unlike common salt) that it will endure the force of almost the strongest fire you can give it; which being dissolved into water, and spirit of nitre dropped into it, 'till it give over hissing (which is the fame with the volatile part that was separated from it in the fulmination) it will be again reduced to crystals of petre, as it was at first; which noble experiment the world hath already been taught, by an honourable member of the Royal Society of London, with a train of such important observations as never were before raised from one experiment.

That which I aim at then is, that, if the spirit of volatile salt of foot, or of the urine, blood, horns, hoofs, hair, excrements, or, indeed, any part of animals (for all abound with such a volatile salt fixed, and oil, as petre doth) could by the same way, or any like it, be reduced to petre, or some nitrous salt not much differing from it; it would excellently make out a theory that I am much delighted with, 'till I am convinced in it, which is, that the salt which is found on vegetables and animals, is but the nitre which is so universally diffused through all the elements (and must, therefore, make a chief ingredient in their nutriment, and, by consequence, of their generation) a little altered from its first complexion: and that the reason why animals that feed on vegetables are obliged by nature to longer meals than those that feed on other animals, is, because animals are fuller of that salt than vegetables: and, indeed, such animals are but

caterers of it for man, and others whom nature's bounty gratifies with a more strong and delicious diet.
SALVAGE, an allowance made for the preserving goods from shipwreck.

The principal laws relating thereto.

By the naval laws of Oleron, if a ship departing with her lading to any place abroad, happens, in the course of her voyage, to be rendered unfit to proceed therein, and the seamen save as much of the lading as possibly they can; if the merchants require the goods of their master, he may deliver them if he pleases, they paying the freight in proportion to the part of the voyage that is performed, and the costs of the salvage: but if the master can readily refit his vessel, he may do it; and although he has promised the people who helped him to save the ship, the third or the half part of the goods saved, for the danger they ran therein; yet, if such a cause come before any judicature, it shall be considered the pains and trouble they have been at, and the reward be accordingly, without any regard to the promises made them by the parties concerned, in the time of their distress. See **OLERON'S LAWS**.

If a ship puts to sea with merchants goods, and there she is disabled or perishes, by the fault of the master or his men, the goods that are saved shall be secured in a certain place, free from danger; but if it be proved by witnesses that the misfortune was occasioned by tempest, what remains of the ship and goods shall be brought to a contribution, and the master shall retain half the value of the freight, by the laws of Rhodes. And the same laws have ordained, that if a ship be surprized at sea with whirlwinds, or wrecked at sea, any person saving any part of the wreck, shall have one fifth of what he saves. See **RHODIAN LAWS**.

And for the charges of salvage, very great allowances have been made; as to the divers and salvors, the half, the third, or the tenth of the things saved, according to the depth of the water out of which they were fished, whether fifteen, eight, or one fathom: also a tenth part for salvage on the coast, and the fifth to him that, saving himself, carries something with him. If the ship only perish, and the goods be saved, then the goods shall pay the tenth or the fifth, as the difficulty of the saving thereof shall require; and gold, silver, silk, and the like, being of easy transportation, shall pay less than goods of greater weight, and more burthenome for carriage, which are in greater danger. *Lex Mercat. Malines, 119.*

Where things are cast up by shipwreck, or left through casting in storms, the laws of Rhodes allow to the finder a fifth part for the saving; and in France they allow one third part for salvage; but by the common custom of countries, every person of quality, or lord of a manor, &c. claims all as his own, if it cometh upon his land; contrary to some sea laws, which give it to the finder: though, by the opinion of lawyers, the finders thereof should do therewith as with other goods found upon land; they ought to proclaim the things to be forth-coming to the true owner or loser, and, if no man claim the same, then the finder to keep them to himself. *Lex Mercat. Malines, 119.*

By statute 12. Ann. cap. 18. All persons required by constables, &c. who shall act in the saving and preserving any ship in distress on our sea-coasts, or the cargoes thereof, shall within 30 days after be paid a reasonable reward for the same, by the master of the ship or merchant; in default whereof, the ship or goods so saved shall remain in the custody of the officers of the customs, 'till payment be made: and if any difference arise about the salvage, three justices of peace shall adjust the quantum to be paid to the persons acting therein, which shall be binding to all parties, and recoverable in an action at law.

And if goods thus saved are not claimed in twelve months, they shall be sold, the justices taking an account thereof in writing, signed by the officer of the customs, into whose hands they are safely to be put; and, if they be perishable goods, they are to be forthwith sold, and, after charges deducted, the money arising by such sale shall be transmitted into the Exchequer, with a fair account of the whole, for the benefit of the owner, who giving proof of his property before one of the barons of the Exchequer, shall, upon his order, receive the same.

If any persons shall molest any one in saving the ship or goods, or, when saved, shall deface the marks of any goods, before the same be entered in a book for that purpose, such persons shall, in 20 days, make double satisfaction to the party grieved, at the discretion of the two next justices, or, in default thereof, shall be sent to the house of correction for 12 months. See the remainder of this statute under the article **WRECKES**.

SAMOGITIA lies on the north of Prussia, between Courland and Semigallia, on the north; Lithuania on the east, and south-east; and Ducal Prussia on the south-west, with a small part of it extending west, quite down to the Baltic. It is a marshy soil, and has abundance of rivers and lakes, that at some seasons overflow the land, which yields corn and

pasture. The country has inaccessible mountains, and is over-run with woods, wherein the inhabitants find great quantities of honey, every tree, almost, having a swarm of bees; and their wax is purer and whiter than that either of Lithuania or Livonia. Here is a breed of horses which are small, but sprightly, swift, and hardy.

The Samogitians, as well as Poles, plow, sow, and harrow, all at the same time; and the ground having been but once improved by burning, will bear crops seven or eight years together, without dunging. When they burn the woods on the lands, if they meet with high trees, they do not cut them down, but only prune off their side branches, to let in the rays of the sun upon the ground; which they perform with such dexterity, that one peasant will prune above a thousand trees together, without once coming down: for which end, he provides himself with a seat of rope, much like a stirrup, which he fastens to a long cord, and having cast it over an arm of a tree, a boy, who is on the ground, draws him up and down; and, when this is done, by the help of another tree he easily shifts himself, with his hook, to the next. They have also as odd a way of sowing; which is, by mixing two parts of barley with one of wheat, and putting them into the ground together, in the spring; whereby it happens, that the barley may be mowed in one harvest, and the wheat reaped the next. This wheat being trod down by those that mow the barley, the next harvest commonly comes up very thick and high. In time of war they bury their corn under ground, in a place made up with posts and bark of trees, for that purpose; and they dry their corn with smoke, before they lay it up in their granaries, by which means it keeps good for several years together.

SARDINIA, an island in the Mediterranean, situate between 8 and 10 degrees of east longitude, and between 39 and 41 degrees of north latitude; bounded by the strait which divides it from Corsica on the north; by the Tuscan Sea, which flows between this island and Italy, on the east; and by other parts of the Mediterranean Sea on the south and west; and is about 140 miles long, and 60 broad; a warm country, but not esteemed very healthful.

This island, which is the most considerable in the Mediterranean, next to Sicily, for bigness and fertility, is said to be about 700 miles in circuit, comprehending the turnings and windings of the coast, namely, the capes and the gulphs; which way of calculating is no less uncertain than laborious; hence some have it only 500 miles in compass. The soil is fruitful in all sorts of corn, and no less productive of various fruits, in great quantity and perfection. It also breeds vast herds of large and small cattle, so that it furnishes Italy with wool, hides, and a fine sort of cheese, besides its home consumption. The traffic it drives moreover from the fishery of coral, linen, silk, &c. is no less considerable. The most rocky and mountainous parts of the island are no less rich within than barren without, they yielding great quantities of metals and minerals, as gold, silver, lead, iron, sulphur, allum, &c.

REMARKS.

This island was under the dominion of Spain 'till the year 1708, when Sir John Leak, the English admiral, reduced it to the obedience of the late emperor Charles VI. It was afterwards allotted to the duke of Savoy, anno 1719, with the title of king of Sardinia, under whose dominion it still remains: but the duke was obliged to make a cession to the house of Austria of the island Sicily [See **SICILY**] to which throne he had been advanced by the parties to the Utrecht treaty, anno 1713.

The commerce of the dominions of his Sardinian Majesty was heretofore so very inconsiderable, as to be scarce worthy of notice; but by degrees, and under the two last reigns, more especially, things have been much changed. The staple commodity of Piedmont is a kind of silk indispensably necessary in many manufactures, and his Sardinian Majesty has put this under such regulations as to make it rise to the highest amount possible; the navigation of the Po enables the inhabitants of Turin, and the adjacent country, to carry on a considerable trade to Venice.

There is a little (and but a little) traffic stirring at Alexandria and Villafranca. Besides all these, his Sardinian Majesty has gradually and silently possessed himself of all the passages, by which the inland trade is carried on between France and Italy, and having it by this means in his power to lay what duties he thinks proper, derives from thence an additional revenue, which is not only of great consequence in itself, but the more so by keeping the neighbouring states in a kind of dependance, through fear of the injuries he might otherwise do the commerce of their subjects.

This sufficiently demonstrates the power of his Sardinian Majesty, and that it is both natural and expedient the ballance of Italy should be held by him. This his interests seem to direct, the situation of his country demands, and even without the least suspicion of flattery, we may add, the conduct of the present king deserves it. Whatever addition of territory he receives from any quarter, is not more an acquisition to him, than to the common cause; and we have reason

reason to wish his power may increase, because we see the whole of his power has been exerted for the noblest purposes, in preserving the freedom and independency of Italy; which, without question, will be always at his heart, and in his eye.

The doubts and suspicions which weak and narrow minds have been, at certain seasons, too apt to suggest, with reference to this great prince's conduct, are in reality as idle and improbable, as they are false and groundless; because it is impossible, that the house of Bourbon should ever give him any security for the performance of the promises they may be induced to make him. A little consideration will set this in the strongest point of light. The offers they made him have been almost without limits, which, at the same time that it shews his importance, must convince him, that unless they had mighty views for their own advantage, they would never make them. But what are these views? The establishing a superior power in the house of Bourbon in Italy. If we put this into other words, it means neither more nor less, than proposing to give him a master; which is such a proposition, as no offers whatever can tempt a wise and brave prince to listen to with the least attention.

It was to avoid this, that in the earliest part of his reign he entered into an alliance with those very powers, which gave him an opportunity of knowing their maxims so well, while they professed themselves his friends, that it is the greatest absurdity to suppose he can ever be brought to trust them, after having had them so long, and to such a degree, his enemies. It was to prevent his having a master, that he engaged in the late war, and run so many risks in the course of it. This was manifestly the basis of the treaty of Worms, the whole scope of which was to render him independent, and to give him the power of supporting that independency.

To depart, therefore, from this plan, for the sake of any thing that could be offered by the Spaniards and French, would be such a manifest sacrifice of the substance to the shadow, that, considering the knowledge we have of his Sardinian Majesty's character, ought never to be suspected. The smallest distrust granted him by the queen of Hungary, under the guarantee of his other allies, is of more real consequence to him, than half the duchy of Milan given him by the house of Bourbon, admitting they should have it in their power to give it; because they can never have this power, without having at the same time the power of taking it again; which would not only render the possession of that, but of all his other dominions, precarious.

It is very apparent, that even as things stand now, the territories of this monarch are very far from being extensive; but it must be allowed that they are very populous, and the people of Savoy, and of the vallies, are naturally martial; so that under these two last reigns, a very considerable army of regular troops has been constantly kept up, and the king can never be at a loss to bring 40 or 50,000 men into the field, when occasion requires it.

This force is, indeed, nothing in comparison to that of France and Spain; but it will appear very considerable, when compared with the strength of other Italian princes. Besides this, the fortresses of Piedmont are in so good order, that his Sardinian Majesty can always make a stand, 'till he is supported by the Austrians, which he must be so long as they desire to preserve their dominions in Italy.

Upon these principles, therefore, we may safely lay it down, that though his revenue is not so large as that of the Great Duke, yet he is one of the greatest powers in Italy, and is justly esteemed so by his neighbours, his allies, and his enemies. His claim upon the city of Geneva, and the attempts made by some of his predecessors to become masters of it, will be hardly ever forgot by that republic; which, however, is sufficiently covered from either his ambition, or his resentment, by its strict league with the Swiss Cantons, as well as by the protection it may always expect from the French crown.

The pretensions he inherits from his ancestors to several places possessed by the republic of Genoa, will probably hinder him, at least for some years, from living in any strict degree of harmony with that commonwealth, which is naturally jealous of him, and will probably continue so; though, if they knew their own interest, they would certainly compromise their differences with this prince, which would be a thing of great consequence to both.

His taking the title of king of Cyprus, and some circumstances, has created a coldness between this monarch and the republic of Venice, though it is certainly for their mutual good to forget old injuries, and to assist each other.

There have been formerly high disputes between his Majesty's predecessors and the Pope, which have been renewed in the last, and even in the present reign; but they seem now buried in oblivion, as they ought to be, considering that the pontiff must be long ago convinced by experience, that the thunder of the Vatican has lost its efficacy; and excommunications will do very little, either with this prince or his subjects; and as to the temporal power of the Pope, it is not to be compared with that of the Sardinian monarch.

The territories of the king of the Two Sicilies, if we consider him only in the light of an Italian potentate, lie at too great a distance to create any difference between them; but considered as a prince of the house of Bourbon, the king of Sardinia cannot but be jealous of any augmentation of his power. But to say the truth, the great point which this monarch must always keep in view, is the balancing the power of that house and the house of Austria; to the latter of which, notwithstanding his near relation in blood to the former, it is more natural for him to adhere.

As things stand at present, it is far from being probable that the court of Vienna will incline to measures that may justly provoke a prince, to whom she has so many obligations, for whose assistance she must have so often occasion, and who, in that case, would easily find resources sufficient to defend himself against all attempts.

On the other hand, while, from a due regard to their respective interests, a good correspondence is kept up between them, the light of experience plainly shews, that their enemies will find it very hard to make any impression upon either; and in process of time it is highly probable that such alterations may happen in Spain, as will render their capacity of defending themselves still greater than they are at present.

But with respect to the house of Bourbon, though it will be always decent and proper for his Sardinian Majesty to preserve for it a just measure of respect and complaisance; yet as his safety must perpetually depend upon the greatness of his own strength, and the limitation of their power, so it can never become either requisite or agreeable to him, to enter into any close alliance with that family, the aggrandizing of which must be always, if not at his expence, at the risk of his security. There are also good reasons to believe, that France will not easily be drawn to quarrel with a prince, who keeps, as it were, the gates of her dominions, and who may be justly styled a terror to her, while she is so to all the rest of her neighbours; for, without doubt, if the king of Sardinia were thoroughly provoked, and the house of Austria at full liberty to support him, he might carry his arms either into Dauphiny or Provence, or, perhaps, into both at the same time, more efficaciously than in the last, or the preceding war; in both which, however, interruptions on this side have brought the French monarchy into circumstances of very great distress. As for the maritime powers, they are, though at a distance, the natural and constant allies of the monarch of whom we are speaking, because their interests and his are the same: and if a good port could be made in the county of Nice, capable of admitting men of war, he would be quickly able not only to maintain his own freedom, but also to protect the liberty and independency of Italy against all invaders; though he would not be even then in a capacity of giving law to others.

If once the affairs of this part of the world were put into such a situation, the benefits resulting to the people there, as well as to all the rest of Europe, would be so great and so evident, that his Sardinian Majesty would have no room to apprehend any new confederacy formed against him, since his neighbours would be then as willing to defend that system, as for want of considering it properly, they formerly seemed averse to receive it.

We have dwelt the longer upon this article, because, with respect to the British nation, there is no power in Italy, with the strength and state of which it imports us so much to be well acquainted, as the crown of Sardinia.

But there is one thing very requisite to be observed before we conclude, which is this, that nothing can be of greater importance to the trade of this nation, than the preserving the balance in Italy; which, if lost, must necessarily throw all that valuable branch of commerce, in which we have at present so large a share, and from which we derive annually a considerable profit, into other hands, and, which is worst of all, into the hands of the French; a thing against which we have as much reason to guard, as a trading nation, as the king of Sardinia himself has cause to oppose, as far as possible, the growth of the French power, out of regard to his own safety. This sufficiently shews, that our interests are really mutual, and that there is nothing of political art in what we have been told, of the expediency of supporting this monarch against all his enemies, though at a large expence to ourselves. See the article MEDITERRANEAN, especially our reasons for the constant care and possession of GIBRALTAR, the key of all our ITALIAN and LEVANT COMMERCE, and the grand preservative of the balance of power in ITALY.

SAVOY duchy is situated between France and Italy, on the west side of the Alps, bounded by the lake and territories of Geneva on the north, by Switzerland and Piedmont on the east, by another part of Piedmont and Dauphiné on the south, and by Franche Comté and Dauphiné on the west. It is a barren country, generally being encumbered with the high cold mountains of the Alps; however, there are some pleasant fruitful vallies, producing corn, wine and fruit; and they have large herds of cattle, and abundance of game, venison, and wild fowl, in their mountains, and plenty of fish

fish in their lakes and rivers. Their greatest misfortune is, that they lie open to the incursions of the French; and whenever their prince is at war with that kingdom, Saxony is first made sensible of the ravages of the French troops, and used as a conquered country, though upon every treaty of peace it has hitherto been restored to the duke of Savoy, at present king of Sardinia. See the articles **SARDINIA** and **PIEMONTE**.

SAXON GREEN COLOUR.

Method of dyeing white cloth green, called Saxon green.

The ordinary greens, stained blue in a woad-vat, and afterwards yellow, in a bath of dyers woad, are seldom uniform, almost always dull, and require several days labour to finish them entirely. The green, dyed according to the new process, of which the Saxons are believed to be the inventors, is, without comparison, more fresh and lively; and, in four and twenty hours, one may dye several pieces of cloth, first blue, and then green, in the same copper.

Although this green is not so solid, when tried instantaneously, as the common green, nevertheless it resists, as much as these, both the action of the air, and the rays of the sun; and its lustre hath obtained it the preference over them in England, Germany, and the northern countries.

The first Saxon greens imported into the kingdom of France were purchased immediately, and the public, astonished at their liveliness, was desirous that they should be imitated in France. Their desire was complied with, as soon as it was possible to learn the basis of the process; and those who were charged with the execution, have succeeded so much to their wish, that the last cloths which they dyed are, at least, as pretty as the finest greens brought from Saxony.

The foundation of this green is a blue, extracted from indigo by the acid of vitriol: it is covered with a yellow, extracted from real yellow woad, from dyers weed, or from any other ingredient, which gives a yellow of a good tint; but the success of the process depends upon the choice of the acid, known in trade by the appellation of oil of vitriol; and also upon the equal distribution of the same acid, when it is incorporated with the blue of indigo in the copper, where the cloth is to be dyed first a lively shining blue, and afterwards a yellow, which is to be changed into a green.

If the oil of vitriol is weakened by a too great quantity of aqueous particles, it doth not attack the best indigo, or, at least, extracts from it an ugly grey. If the indigo blue, extracted by a concentrated, or very acid oil of vitriol, is not equally distributed in the bath of the copper, as this liquor is much heavier than water, it is precipitated to the bottom by its own gravity: in this case, the cloth dipped in the bath imbibes the blue very unequally, and appears variously shaded. It takes, indeed, the green colour in the bath of yellow; but that green is also differently shaded.

In publishing the process of a Saxon green, we thought proper to begin with informing dyers with the method of preventing these defects. The common oil of vitriol which is bought of druggists, or brought from Hamburgh or Holland, must be concentrated by distillation. But this operation is difficult for a dyer, who may not be always supposed capable of conducting distillation by a retort. Now it is required to have the oil of vitriol with the fewest aqueous particles possible; these may be expelled by a sand-fire, strong enough to make them evaporate into smoke or vapour. When the oil of vitriol ceases to smoke with the same degree of heat, it is a sure sign that it is concentrated, or acid enough to extract the blue colour from indigo, and consequently to make what is called, in the process, the composition. This evaporation is performed in a glass pot without a funnel, better than in any other vessel: where that is wanting, a well-burnt stone pot may be used, provided it is not porous; or finally, an earthen pot well varnished, which, however, is not so proper for that operation, as either those of stone or glass.

This vessel, of glass, of stone, or of varnished earth, is to be placed upon an iron pan, half, or two-thirds, full of fine sand, which ought to be well dried before. This iron pan must be put upon a stove, with a grate, and an ash-pan under it, and the bed of sand must be gradually heated with a charcoal fire, that the glass, stone, or earthen pot, may likewise be heated by degrees, and not be in danger of cracking, which would certainly be the case, if it was warmed too precipitately.

As soon as the oil of vitriol emits no more aqueous vapours, the acid begins to evaporate: it is easily judged if the vapour is acid, by holding a piece of blue paper stretched over it: if the paper becomes red almost instantaneously, the liquor is sufficiently evaporated: allow it then to cool 'till it be lukewarm, by taking the pot off the hot sand, and placing it upon straw at a small distance from the stove, that the contiguous air may be dry: for, was it placed in a moist air, the oil of vitriol would re imbibe the aqueous humidity, which is lost by evaporation. This liquor, being thus cooled, so as to be hardly lukewarm, must be poured upon the quantity of indigo which shall be afterward prescribed. The indigo, however, must be beforehand reduced to a powder, and put

VOL. II.

into a glass or stone vessel, which should be well stopp'd with a cork; with wax round it, lest the oil of vitriol, after dissolving the indigo, which is then called the composition of blue, should re-attract the moisture of the air.

In fine, if you would be absolutely certain that the oil of vitriol is concentrated enough not to fail in forming this composition, you have only to pour two ounces of it upon forty or fifty grains of pulverised indigo, put into a phial, and to mix them well by shaking the phial; in an hour's time, the liquor which floats above the sediment, should be of a fine dark blue: if it is only grey, the oil of vitriol is not enough concentrated.

Process for dyeing a piece of cloth twenty ells long, into a Saxon green.

Dissolve in a sufficient quantity of river water, which breaks soap perfectly well, three pounds and a half of Roman alum, and two pounds of the powder of white tartar; boil the cloth in it half an hour, or five and thirty minutes at most; take it out and expose it to the air to cool, but do not wash it.

Refresh the bath of this boiler with twenty or five and twenty buckets full of water, and throw in, at two different times, the composition of blue designed for the cloth. If the oil of vitriol has concentrated, or has stood the proof as described above, it is sufficient to take a pound and a half, and pour it lukewarm upon two ounces and an half of fine powder of indigo. You must wait till the dissolution is made, and the liquor becomes a fine dark blue; but if this composition of blue has been made some days before, so much the better; for then you may take one pound ten ounces, or a little more, and pour the half of it into a large stone pot, or into a bucket, proper for the use, into which there must be put before, ten or twelve pints of the refreshed bath from the boiler. The whole must be well jumbled, in order to diffuse the composition of blue. You must likewise have a straining-bag of cloth, steep it well in the bath of the boiler, open it, and pour into it that half of the composition which is already mixed. By this means you will preserve the straining-bag, which, without this precaution, would have been burnt by the oil of vitriol, if it had been poured in as much concentrated as at first.

Put the straining-bag over the whole extent of the bath, that it may imbibe the blue equally: palliate likewise the bath, that the distribution of the colouring particles may be more equal; when the cloth is cooled, let it down into the cauldron, and keep it there five or six minutes without boiling, turning it rapidly, and agitating the bath with a pole of white woad. Then take out the cloth, raising it only upon the turn. Put the straining-bag again into the same bath, and throw in the other half of the composition of blue, after it has been dissolved, as the former half, in ten or twelve pints of water taken from the boiler. Pass the straining-bag over the bath, as formerly, palliate it strongly, let down the cloth, and turn it three or four times very quickly, in continuing to agitate the bath with the stick: in fine, in order to make the colour even, boil the bath of blue very gently, and turn the cloth in it slowly for seven or eight minutes. Take it out stained blue, and let it cool.

Empty this boiler of three-fourths of its contents, and as many buckets full as you take out of the blue bath, pour in the like number of the yellow bath, described below.

In order to make the yellow bath, you must heat gradually another boiler, into which must be put a sufficient quantity of pure river water, with a bag of new-coarse cloth, containing from ten to twelve pounds of real yellow woad (not fustic) cut into chips.—When this bath has been heated by degrees 'till it boil, you must let it boil two full hours. Yellow woad, cut into chips, succeeds better than when it is ground; in this case, eight pounds are sufficient for a piece of cloth of twenty ells; but there is a great risk of using it adulterated.

After you have poured into the first boiler when the blue was made, the quantity of the yellow bath, prescribed above, or even a greater number of buckets full, according to the shade of green required; the blue cloth, which ought to be sufficiently cooled, must be let down into this new bath, when very hot, and stirred about 'till you have the shade of green you want: then take out the cloth, cool it by exposing it to the air, wash it, lay the nap, dry it on the tenter-hooks, brush it, as scarlet is brushed, and afterwards press it, but in this operation let it be as cool as possible. If you have several pieces of blue cloth to be dyed green successively, you must take from the bath, which dyed the preceding piece blue, as many buckets full as are to be added from the yellow bath to dye the blue cloth into a green; which will amount to twenty buckets full, or thereabouts, to be taken out, and twenty to be supplied; by these means, the shades of green are rendered more equal and uniform.

The Saxon green of that cloth, which hath been first dyed blue in a bath composed of alum and white tartar, is much more solid than that which is stained blue in a new bath of plain water, without these salts, but it has not so good a lustre.

lustre. However, as it resists the rays of the sun for twelve days, it may be reputed a very good tint. Being made by means of an acid, it must not be proved by soap, which is prescribed for the ordinary greens made in the blue vats. In order to prove it, you should boil it for five minutes in a quart of water, with two drachms of Roman allum, as scarlet is tried, which is also dyed with an acid: if it preserves its colour, it may be reckoned a very good tint, although, by this operation, it loses much more than in the rays of the sun.

SAXONY, the electorate and dominions of Saxony in Germany.

These dominions, as they are included in the circle of Upper Saxony, are bounded by the duchies of Magdeburgh and Brunswic on the north, Silesia and part of Bohemia on the east, Bohemia and Franconia on the south, and the Landgraviate of Hesse on the west.

The particular divisions, as they lie from south-east to north-west, where the Upper leads to Lower Saxony, are as follow, viz.

The first, which lies betwixt the Elb and Oder, is the marquisate of **LUSATIA**.

It is for the most part sandy and boggy, that they have little corn; but here is such plenty of wood, venison, and fish, as might enrich them if they had any trade.

GORLITZ is the largest town in the marquisate, and by some called its capital. Their chief trade is in beer, and in dressing and dyeing woollen and linen cloth.

LAUBAN upon the river Queis is a little town, but has a great linen manufacture.

ZITTAW is a fine city, has a good trade in beer, and a great manufacture of cloth.

CAMITZ is a populous little city, and has a manufacture both of woollen and linen cloth.

GUBEN is a large and populous town, and has a woollen manufacture.

SOMMERFIELD has also a woollen manufacture, and **CALOW** has a great market for wool.

The marquisate of **MISNIA** is the second division of the electorate of Saxony. It has Lusatia on the east, Thuringia on the west, Merburgh, Bohemia, and Franconia on the south, and the duchy of Saxony, with Anhalt on the north. Their plains abound with all sorts of corn, and their hills with rich minerals.

DRESDEN is a large city situate on the Elbe, the capital of the electorate of Saxony, 65 miles north-west of Prague, and 85 south of Berlin.

The trade of this place is very inconsiderable. The most important commodity here is silver, of which the mines near Fridburg produce every fifteen days about the value of 20,000 dollars *, which is brought into the city in ingots in a regular carriage appointed for that purpose, and immediately coined and delivered to the proprietors. The mines are under the care of directors, whose business it is to support the value of the stock; but they usually go in a beaten track, without making any efforts to increase the quantity; on the contrary, it often comes short of the ordinary computation. This silver is immediately coined into florins of 16 grosch, which, with respect to the current money of bats, driers, &c. is worth 7 per cent. advance, and is consequently so speedily conveyed into the neighbouring territories to be again melted down, that it is next to impossible to obtain in change, in this true silver, money for one single louis d'or in the ordinary commerce of the people: in which instance the Saxons seem very regardless of their own interest; for though this silver may be considered as a commodity, the currency of such a coin as their bats and drivers, must be detrimental in proportion as they are worse than their genuine coin.

* 3500l.

The exchange here is regulated as in Leipzig. The par is reckoned 125 Saxon dollars for 100 rixdollars current in Amsterdam, but the exchange is generally 135 for their small monies: there is an agio of 3 per cent. when payment is made for bills in louis d'ors, and for ducats 4 per cent. is allowed.

MEISSEN has a manufacture of porcelain, which is more beautifully painted and enamelled than that of Japan, and much dearer; and the vent of it brings no inconsiderable sum annually into this country. See our article **PORCELAIN**.

COLDITZ is a little town of good trade, at the conflux of the Muldaw and Multa.

FREYBERG is a large, well-built, and populous town, but owes both its increase and rise to the neighbouring mines of all sorts of metal, but especially silver, copper, pewter, and lead, besides brimstone, vitriol, &c.

THURINGIA is bounded on the north by the duchy of Brunswic and the principality of Anhalt, on the east with Misnia, on the south by Franconia, and on the west by Hesse.

GOTHA, the capital of the duchy of **SAXE GOTHA**, is a large walled city on the river Leina. Its chief trade is in dyers woad.

EYSENACH is a pretty little city on the river Nesa. It has a considerable trade in iron, of which here are mines not far from it.

ERFURT is reckoned the capital city of Thuringia: it lies in a pleasant fruitful plain on the river Gere, in a country abounding with all sorts of corn and good wines, by their trade in which, and in woad, the inhabitants get much money at their two great fairs.

WEYMAR is a neat, well-built city, on the river Ilma. It has a good trade in wine, yet the adjacent country abounds with corn-fields and hop-grounds, instead of vines.

MULHAUSEN on the river Unstrut, lies in a fruitful soil, and reaps so much benefit by its river, in point of commerce, that it was admitted amongst the Hanse-Towns, and is called a large populous city.

WIPIREN, on a river of the same name, is a town of good trade.

One of the chief places of trade in the circle of Upper Saxony, is

LEIPSIK, in the principality of Misnea or Meissen situate on the river Pleiss, 42 miles north-west of Dresden.

Leipsc, by its advantageous situation in the centre of Germany, is become one of the most commercial cities of Europe; none in Germany are equal to it, being but little inferior to Hamburg itself; though small, it is very populous, and as well built.

In order to a just idea of the trade of this city, it must be considered in two points of view, during the time of the fairs and out of the fairs. [See the article **FAIRS**.] Leipsc abounds in merchants, with a few or no manufactures; yet considerable fortunes are raised there. Three years ago only a retale dealer left an only son three millions of livres, and M. Stoman, who set out with little or nothing, even outstripped the former. Estates of 2 or 300 thousand rixdollars are no extraordinary matter; several of four or five may be produced.

The merchants of Leipsc may be divided into three classes, the wholesale dealers making 150, the retailers to the number of 250, and the woollen drapers, who make no small number. To these may be added the booksellers, a considerable body, Leipsc having the greatest book-trade of any city in Germany, but differently managed from any part of Europe. The German and northern booksellers furnish themselves at Leipsc; and this is done either by barter, or ready money, but the far greatest part by barter.

One of the most lucrative branches of the commerce of this city consists in exchange of monies, which is so considerable, as to be computed at four millions of livres each of the principal fairs.

The second branch of trade lies in home and foreign goods; by the home are meant the products of the soil and manufactures of the inhabitants of the country. As to the foreign, Leipsc is a staple for all French, English, and Dutch commodities, for which there is a demand in the North, and of such northern goods as turn to good account among the more southern nations. The former are Lyons stuffs, Nismes and Paris stockings, French jewellers work, and hard-ware, Dutch and English cloths, silk and woollen stuffs, and hard-ware.

This trade is carried on personally or by commission; many limit themselves to the latter and find the sweets of it. In and out of fair-time, commissions pour in upon them from merchants of all quarters to buy or sell goods, draw bills of exchange, receive or pay money, and to forward goods.

The fairs are unquestionably the main springs of its opulence, few, if any in Europe, equalling them in the amount of the sales and bargains transacted there; and they may be said chiefly to owe the incredible resort thither to the convenience of their appointed times, and the privileges of the city. The most considerable fair is that of Easter, beginning on Jubilate-day, three weeks after Easter; this is succeeded by that of Michaelmas, opening on the 1st of October; the last is New Year's fair, beginning the 2d of January, and scarce worth the name of a fair in comparison of the others.

The city privileges are also very favourable to commerce; its citizens are its garrison; no soldier of the king of Poland is so much as to lie a night in the place. During the fair, it is in the fullest sense a free port for the home goods, and the foreign pay only one duty, which is a very small excise; the Steel-yard fee is also very moderate. The magistracy omit nothing for the safety and ease of strangers. As to the total of the business done at the fairs, it cannot be well ascertained, by reason of the difference of them; that of the Jubilate is estimated at ten millions of livres, and the produce of the Steel-yard at four hundred thousand.

In Leipsc are about thirty French refugee merchants and some Italians; but the natives only are allowed to deal by retale or purchase land; however the trade for French cloths and laces is chiefly in the hands of the said refugees, several of whom go themselves every year to Lyons to buy up their fortunes.

The quantities of home goods at Leipsc astonish a stranger. Among the various manufactures of Saxony, that of linen at Lusat is not the least considerable. The prodigious quantities of Chemnitz dimities and handkerchiefs, are carried off by the English and Dutch, to send to both the Indies. The Saxon woollen stuffs, anniseed, tin-work, the celebrated porcelain, justly preferred to China, smalt, called the Prussian

sian blue, are all articles which deserve to come into account. Likewise gold and silver lace, velvet, camblets, damasks, and other silk stuffs, are made at Leipzig; but they are not the best in the world: what goes off much better is, thin waxen linen bedaubed with flowers and antic figures; these being sold extremely cheap, are all taken off their hands by the northern traders, who dispose of them for tapestry.

The Leipzig fairs were confirmed by the emperor Maximilian I. with a prohibition of the like within 15 German (75 English) miles. By its *jus stapula*, or staple privilege, the refusal of all goods coming on the king's roads from within 15 miles, is to be offered to the merchants of Leipzig.

SA Y, or **ASSAY**, a term used in the art of refining. See the article **ASSAY**.

SAY, or **SAYE**, in commerce, a kind of serge, or light crossed stuff, made of wool; greatly used abroad for linings of cloaths, and by the religious in Popish countries for shirts. Those made in England are chiefly exported to Portugal and Spain, and some to Leghorn.

SCILLY, west longitude 7, latitude 50, a cluster of islands and rocks, situated in the Atlantic Ocean, 30 miles west of Cornwall, the most westerly county of England, dangerous to be approached by strangers on account of the hidden rocks, and have been very fatal to many ships of our own nation on their return home; particularly admiral Shovel, with three other men of war, were cast away here on the 22d of October 1707, in the night-time, in their return from the Mediterranean and the siege of Toulon, there being near 1000 people on board the admiral, several of them gentlemen of quality, both of Spain and England. There is, however, a safe passage to these islands, where ships are furnished with pilots from the place, and there are some secure harbours in them, large enough to receive the royal navy.

In the towns of St. Mary's, the people trade in several sorts of commodities, usually sold in shops, many of which they are furnished with from England; and ships coming in, or passing by the island, supply the rest of their occasions. With these strangers they sometimes exchange dried fish, cattle, or provision of the island, for such commodities as they want. A fleet of coasters, forced in by an easterly wind, is of advantage to the islanders, as well in their pilotage of them into the harbours, as in the traffic and expences of the people ashore. Commanders and passengers of ships from the West-Indies, or other foreign parts, putting in, never fail of shewing their liberality, and of leaving some of their commodities and riches behind them. By this means the islanders are supplied with a stock of rum, brandy, wine, and other foreign liquors; some for consumption upon the islands, and some (by leave of the custom-house) for consumption elsewhere. For the sake of this trade, which is their principal dependance at present, the people of Scilly run very great hazards in going off with their small boats to supply themselves from shipping passing by, shewing undaunted courage and resolution, in venturing when the seas run mountains high. There being no owners of houses and lands in Scilly, the peoples hindrances in the improvements of land and trade, are the short leases, and scarcity of houses to be met with; it requiring an interest to procure a house, and another for a lease of one. On which account, it was usual here to engage houses at the decease of the present dwellers. If any houses are built by leave, at the expence of an islander, they become the property of the proprietor after a short term: so that no islander possesses house or land, but upon pleasure or lease.

The agent is the proper person to apply to for a house, or land, or a lease of either, or both; who has the direction and management of all the houses, buildings, repairs, rents, &c. upon the islands; who also has it in his power to distribute favour, or shew vengeance, in unequal measure. But the present agent is a gentleman, esteemed for his generosity, good sense, and humanity.

The inhabitants are very civilized, and are improved in trade and commerce. The lands are naturally very fruitful, and could easily be improved; but as these islands are held of the crown by proprietors, the persons in trust for the proprietors have usually made their advantage of them, injurious to the islanders, and the good intent of the reposers of that trust. But if, instead of the custom of letting short leases (of about twenty-one years) long leases were lett, as in Cornwall, and other parts, it would much encourage the improvement of lands in Scilly, and foreigners to settle there. And no doubt but those islands are as well stored with tin, as many parts of Cornwall.

SLAVONIA, including Ratzia, is bounded by the rivers Drave and Danube, which separate it from Hungary, on the north-east, by the river Save, which divides it from the Turkish provinces of Servia and Bosnia on the south-west, and by Croatia and the country of Cilley on the west, being 200 miles long and 60 broad, a fine level fruitful country where it is cultivated; but having been for many years a frontier province against Turkey, and subject to the ravages of the Christian as well as Turkish armies, it has produced but little corn or wine: the chief town is Pofeza, which, with the whole country, is subject to the house of Austria: the people

are a mixture of Greek and Latin Christians. The Ratzians inhabit the eastern division of this country.

SCOTLAND. All that part of the continent, which is joined with England and Wales, and lies beyond the counties of Cumberland and Northumberland, belongs to Scotland, together with great numbers of islands on all the other sides, which are bounded by the ocean. It is in length about 250 miles, and 150 in breadth; in the most southerly part it is 54 degrees 54 minutes in latitude, and 15 degrees 40 minutes in longitude; but the most northerly it is 58 degrees, 32 or 30 minutes in latitude, and 17 degrees 50 minutes in longitude.

The soil in general is not near so fruitful as that of England, being much more fit for pasture than corn: yet in some of the inland counties they have great store of grain, wherewith they trade to Spain, Holland, and Norway. The skirts of the country abound with timber, which is of a vast bigness, especially their fir-trees.

We having already, in the alphabetical order, given a pretty minute state of the trade and fisheries carried on in the several principal shires and stewartries in Scotland, we shall here only give a summary view of the trade in general of this part of the united kingdom, and what else may contribute to give a just idea of its circumstances for traffic.

MEMOIR concerning the **BANKS** established by authority in **SCOTLAND**.

The bank of Scotland, commonly called the Old Bank, was erected by act of the Scots parliament, of date the 7th of July, 1695.

By which act the incorporation is allowed to have a capital of 1,200,000 l. Scots, or 100,000 l. sterling, and each share thereof to be 1000 l. Scots, or 83 l. 6 s. 8 d. sterling; and each subscriber to the said capital paid one tenth of a share in specie, being 100 l. Scots, or 8 l. 6 s. 8 d. sterling, making 120,000 l. Scots, or 10,000 l. sterling; on which sum then paid, this incorporation commenced their banking.

After this, they made a call of another tenth, and continued to deal on these two tenths 'till the year 1720, when, upon an emergency, they called for a third tenth.

They made for many years large dividends, proportionable to these calls, which at length they thought fit to reduce to 5 per cent. annually, payable in the month of April, and chose to retain the surplus profits to increase their dealings.

Some years ago they were willing and capable, out of their surplus profits, to make an extraordinary dividend to their proprietors of one tenth of their respective shares: but, in place thereof, the proprietors were willing they should retain the money, and hold it as or in place of a fourth call, or tenth, and take annually 5 per cent. for it.

At two other different times they were ready also to make extraordinary dividends, each of one tenth, and the proprietors in like manner chose to have them retained, and deemed to be other two calls, to be attended with 5 per cent. yearly dividend: whereby there are now six tenths of their capital paid, being 50,000 l. sterling, upon which they issue a dividend yearly of 5 per cent. and beyond which they probably have surplus profits, to be the subject of future extraordinary dividends.

Though thus the calls made on the stock are six tenths, being 600 l. Scots, or 50 l. sterling per share, upon which the ordinary annual dividend is only 30 l. Scots, or 2 l. 10 s. sterling, yet the current price of one share is 70 l. sterling, whereby the purchaser has only $3\frac{1}{2}$ per cent.—The stock is very seldom in the market.

The Royal Bank was erected by charter, of date the 13th of May 1727, a copy of which I have obtained, and shall give an abridgment of at the end of this Memoir, which must be considered with the act of parliament and charter of the Equivalent company therein recited.

In consequence of the charter of the Royal Bank, the proprietors of the equivalent subscribed only to the amount of 111,347 l. 19 s. 10 d. $\frac{1}{2}$, which is now the capital stock of this bank.

The bank, immediately after their erection, made a call of 10 per cent. on the subscribing proprietors of the said capital; and soon after made a second call, of another 10 per cent, which two calls being about 22,000 l. sterling, was their first fund of banking, together with 4 per cent. which they receive yearly for their capital out of the Equivalent Fund.

About three years after their commencement, they were obliged to accept of a loan of 40,000 l. sterling, from the Society of Trustees for improvement of manufactures and Fisheries in Scotland, at 5 per cent. interest; which loan they continue to hold, whereby their fund is 62,000 l. sterling, beside their said annual dividend from the Equivalent.

This bank obtained another charter, confirming all their powers and privileges by the former, and empowering them to enlarge their said capital, and add 40,000 l. to it by subscription, on such conditions as they think equitable: but this power they have not exercised.

This bank, a few years after their commencement, raised the yearly dividend to their proprietors to 6 per cent. of their capital.

capital, payable one half at Christmas, and the other half at Midsummer; which dividend is nearly 5 per cent. of both capital and calls paid; and this dividend they continue uniformly to make, retaining any surplus profits for extraordinary dividends.

About twelve years ago, they made an extraordinary dividend of 5 per cent. on the capital, being one fourth of the calls, and are about to make another dividend of 15 per cent. which will repay to the proprietors the whole calls; or they may retain the money for a fund of banking, giving each proprietor credit for his share of it in their books, and to add one half per cent. to the dividend annually, making in all $6\frac{1}{2}$ per cent.

The Equivalent company have, by the aforesaid act of parliament, 600l. sterling yearly for expence of administration, of which they have annual savings, which sometimes they divide among their partners. Some few years ago the Equivalent company divided their savings, whereof the bank's share afforded 2 per cent. of the capital to each of their proprietors, which was issued to them.

The current price of the stock of this bank is 160 l. for every 100 l. capital; and yet the purchaser at that price will have nearly 4 l. per cent. when the aforesaid $\frac{1}{2}$ per cent. is added to the annual dividend.

Both the banks lend money upon security in lands, upon personal bonds and bills.

They do not chuse to lend upon lands; and, when they do lend upon that security, they have frequently indulged the debtors to repay 10 per cent. yearly of the capital, besides the interest.

When they lend on bills, they take them payable at 60 days date, and add the legal interest for that time to the sum lent. Neither of these banks discount bills, or lend upon deposits or pledges of any sort.

The exchange between London and Edinburgh was very variable, and sometimes the private dealers in Edinburgh would have taken 2 per cent. for bills on London, which was hurtful to trade.—The Royal bank, to remedy this grievance, have, for several years, dealt in that branch of exchange, and correspond only with the Bank of England, and never take more than one per cent. for draughts on the Bank of England payable at sight, which keeps the private dealers from extortion.

Both banks allow cash accounts with them to merchants, capital manufacturers, manufacturing companies, and other men of business, and give them credit to draw on them beyond their monies lodged, to various extents, from 100 l. to 5000 l. sterling, suitable to their respective circumstances, trade, or business; the benefit of which is, that those who have such cash accounts chuse always to be somewhat indebted to the bank, and may pay in at any time not less than 10 l. and upwards, which reduces the debt, and by which means the merchants never have any sum above 10 l. lying dead, the bank charging interest only for what balance is due to them upon every payment. This is not the case with the bank and bankers in London.—In such accounts, the two banks give credit for above 300,000 l. sterling, which create constant operations in paying in and taking out by these compt-holders, and is a very great encouragement to traders and great manufacturers.

For some time after the Royal Bank was erected, there was a jealousy, emulation, and bickering, between them and the Old Bank, through the peevishness of some in their directions: but, of late years, these are removed, and there is sufficient business for them both, and they at present harmonize; each of them receive the notes of the other bank in payments, which once in the week they exchange, and take surplus notes of the other.

About six years ago, four merchants in Aberdeen commenced a banking company, struck notes, and endeavoured to have all the same operations as the two established banks in Edinburgh.

Some time after, two different societies of merchants and gentlemen in and about Glasgow, commenced each of them in like manner a banking company in Glasgow.

The company in Aberdeen gave up their trade in December last, called in their notes, and publicly advertised that their partnership was dissolved. Those in Glasgow yet continue; but it is probable they may be judged illegal.

The substance of the WARRANT of the CHARTER erecting the ROYAL BANK OF SCOTLAND.

Our sovereign lord considering, That, by an act of parliament made and passed in the 5th year of his Majesty's reign, intituled, An act for settling certain early funds, payable out of the revenues of Scotland, to satisfy public debts in Scotland, and other uses mentioned in the Treaty of Union; and to discharge the Equivalent claimed on behalf of Scotland, in the terms of the same treaty; and for obviating all future disputes, charges, and expences, concerning these equivalents: it is enacted, amongst other things, That every year, from the feast of the Nativity of St John the Baptist, one thousand seven hundred and nineteen, the sum of 10,000 l. of lawful money of Great-Britain, shall be a yearly fund for the particular purposes in that act expressed, concerning the same, and shall continue

and be payable for ever, subject nevertheless to redemption by parliament, according to a proviso in the said act contained in that behalf; and that the said annuity of 10,000 l. during the continuance thereof, shall be chargeable upon, and be payable out of, the monies arising from time to time from the customs, duties, excises, or revenues, that are or shall be under the management of the commissioners of the customs, and commissioners of excise, in Scotland, or of any commissioners, farmers, or managers of those revenues, or either of them, for the time being, with such preference as in the said act is mentioned; which said annuity is thereby enacted to be payable quarterly in manner in the said act mentioned, and to be free from all taxes and impositions whatever.—His Majesty is authorized, by such names as he shall think fit, to incorporate the proprietors of the debts, stated to amount to l. 248,550: 0: 9 $\frac{1}{2}$, due to the creditors* of the public in Scotland.—And the said l. 248,550: 0: 9 $\frac{1}{2}$, should be the capital, or joint-stock of the corporation, and be deemed personal or moveable estates, not liable to arrestments or attachment.—600 l. per annum to be paid to the corporation for charges of management.—His Majesty, by his letters patent, did give, grant, and ordain, that all persons, natives and foreigners, bodies politic and corporate, who then were proprietors of the debts and sums of money so stated to amount to l. 248,550: 0: 9 $\frac{1}{2}$, or who by any lawful title, derived to the said proprietors at any time thereafter, should be intitled to any part, share, or interest therein, should be called one body politic and corporate of themselves, in deed and name, by the name of the Equivalent Company: and that such corporation, and their successors, should have perpetual succession, subject to such redemption as is therein mentioned, and use a common seal, and should by that name be capable to sue and be sued; and that the sum of l. 248,550: 0: 9 $\frac{1}{2}$, be the capital, or joint-stock of the EQUIVALENT COMPANY.—And the annuity of 10,000 l. payable to the company, or their cashier, to be divided among the proprietors, according to their shares in the stock.—The stock of the company to be transferable.—The 600 l. is payable to the EQUIVALENT COMPANY, or any person to be appointed by them, under their seal to receive the same.—Distinct books of subscription to be left at London and Edinburgh, wherein the proprietors are to declare at which of these places they are to have credit for their stock.—Distinct books of transfer to be kept at these places likewise.—Two of the directors to be for ever chosen, residing at Edinburgh, to have the custody of these books.—Stock in the books at London may be discharged therefrom, and new credit got in the books at Edinburgh, and reciprocally for stock at Edinburgh.—His Majesty covenants to give the EQUIVALENT COMPANY further powers and privileges, upon their humble suit and request.—And the company requested, that his Majesty would be pleased, by letters patent under the great seal of Scotland, to enable such of the proprietors of the said corporation as should subscribe their stock for that purpose, to have the power of BANKING in SCOTLAND only, with liberty to borrow and lend upon security there; and that the corporation may, for that purpose, be empowered to take subscriptions at Edinburgh, for such share of the stock as they shall incline to subject to such TRADE or BANKING, under such regulations as they by by-laws shall appoint, and that such subscribed stock only shall be affected by the transactions relating to BANKING, and shall (after so subscribed) become transferable from the other stock of the company, and that at Edinburgh only, and thereafter to be transferable from the other stock of the EQUIVALENT COMPANY, at EDINBURGH only.—Accordingly a charter was ordained to pass the seals of Scotland, authorizing the directors of the EQUIVALENT COMPANY, or any three of them, in such way as the majority of them shall direct, to receive at EDINBURGH all such voluntary subscriptions as should be made on or before the 29th of September, 1727, by the proprietors of the said company, who shall, at subscribing, have credit for stock in the company's books at EDINBURGH; which subscriptions are to be entered in books to be kept for that purpose.—The stock so subscribed to be under the management of the company hereby established.—The subscribers to be called by the name of the ROYAL BANK OF SCOTLAND, and by that name to have perpetual succession, and a common seal, &c. be capable in law to sue, and be sued, &c. in any of the courts within Scotland.—To purchase lands, &c. in Scotland, and to sell the same.—The Royal Bank to have a power of banking within Scotland.—To lend any sums at any interest not exceeding lawful interest, upon personal and real security, and pledges of any kind.—The Royal Bank may keep the cash of other persons, and borrow, owe and take up money on their bills or notes, payable on demand.—A prohibition to trade with the money or stock of the company, in buying or selling wares of any sort.—Allowance nevertheless to deal in bills of exchange, in buying bullion, &c. and selling wares bona fide pledged, and lands, &c. purchased, and the produce thereof.—That there shall be, from time to time, a governor, deputy-governor, nine ordinary, and nine extraordinary directors, for managing the affairs of the corporation; the governor and nine ordinary directors, or any five of them, to be

be called a court of directors.—The members of the corporation may, from time to time, meet at Edinburgh, for choosing their governor, deputy-governor, and directors, and for making by-laws, &c.—Public notice thereof to be given 30 days, at least, before the time appointed for such meeting.—The members so assembled to be called a general court of the corporation.—That there be four general courts in the year.—The governor, deputy-governor, and directors, after the 24th of December, 1728, to be chosen annually, on the first Tuesday of March.—Their qualifications of stocks, viz. the governor 2000l. deputy-governor 1500l. an ordinary director 1000l. an extraordinary director 500l.—One vote allowed for 300l. two votes for 600l. three votes for 1200l. and four votes for 2000l.—No person intitled to more than four votes.—Proxies qualified with stock, allowed to vote in elections.—Form of the oath that may be put to persons claiming to vote, as follows, viz. I, A. B. do swear, that the sum of of the capital stock of the body politic, called the Royal Bank of Scotland, doth at this time belong to me in my own right, and not in trust for any person or persons whatsoever.—The oath to be administered by the governor or deputy-governor, or, in their absence, by any two directors.—No person refusing to take such oath, shall be capable to vote.—The same oath to be taken by such as appoint proxies, before a justice of peace, or chief magistrate of a burgh.—The proxy to produce his powers for voting, with such affidavit, to the general court.—Each succeeding governor, deputy-governor, and directors so chosen, to continue for one year, and 'till others are chosen and sworn into their places.—In case of the death, &c. of any of them, those remaining in their offices may call a general court, to chuse others in their room.—None to be chosen into these offices but such as are subjects of Great-Britain, or naturalized, and qualified with stock as aforesaid.—And not to continue in those offices longer than the continuance of stock in their own names and rights.—Nor shall they be capable to act 'till they have taken the oath of office, as before represented.—To be administered by any of the barons of the court of Exchequer, or any two directors, who shall have taken the said oaths before any of the barons of that court.—An oath de fidei to be administered to the cashier, and other officers.—No governor, deputy-governor, or director, nor any officer or servant under them, shall be capable to act, until such have produced certificates from the proper officers of their having taken the oaths to the government.—Any neglecting to take the said oaths, or to take upon them their office for 40 days, if in Scotland, or 40 days after their coming into Scotland, their places shall become vacant, and others may be chose in their places, by a general court.—The court of directors, or major part of them, may call a general court, upon 30 days notice, and shall upon demand of any nine or more of the members, having each 1000l. stock, call a general court.—And in their default of calling such court, the said nine or more members, having each 1000l. stock, may summon and hold a general court, upon notice as aforesaid.—Which general court, for any mildemeanor or abuse, may remove or displace the governor, deputy-governor, or any of the directors, and elect and chuse others in their room.—The governor, deputy-governor, and directors, or any five of them, may meet at any place in Edinburgh, for the management of the affairs of the corporation, and hold courts, and summon general courts, as they see cause, and act according to the by-laws to be made and given unto them by the general court; and, where such by-laws are wanting, they, or the major part of them, may direct and manage all the affairs of the corporation, and may appoint a cashier and secretary and all other officers, and may allow them salaries, and displace them, as they see cause.—No governor, deputy-governor, nor director, capable to be named, or chosen, into the office of cashier, or any other the officers of the corporation.—Five extraordinary, and four ordinary directors at least, to meet to state and audit the account, and sign and approve the same, as often as directed by the by-laws.—The extraordinary directors to have no powers but such as shall be given to them, and allowed of by the general courts.—The general courts to make and constitute by-laws, &c.—And to impose mulcts and amerciaments upon offenders, which, if not duly paid, may be retained out of their dividends.—The general court may make calls upon the proprietors, which are not in the whole to exceed 50l. upon the 100l. capital, and no call to be above 10l. per cent. at a time.—Any person neglecting or refusing to pay such calls, shall not be allowed to transfer, or part with any part of their stock.—Such calls chargeable with interest, from the time they ought to be paid, and their dividends may be detained, and applied for payment thereof.—Books for transfers to be kept for Edinburgh.—Form of transfers, when made by the party himself: I A. B. this day of in the year of our Lord do assign and transfer being all my interest, or share, or (as the case may be) part of my interest, or share, in the capital stock, or fund, of the Royal Bank of Scotland, and all benefit arising thereby, unto C. D. his executors, administrators, and assigns. Witness my hand, A. B. Or, in case the party assigning be not personally present, then, by an entry in the book or books, signed by some person thereunto

lawfully authorized by letter of attorney or factory, under hand and seal, attested by two or more witnesses, in the words, or to the effect following, viz. I A. B. this day of in the year of our Lord by virtue of a letter of attorney, or authority, under the hand and seal of dated the day of in the said year do, in the name and on the behalf of the said assign and transfer being all the interest, or share, or (as the case may be) part of the interest, or share, of the said in the capital stock, or fund, of the Royal Bank of Scotland, and all benefits arising thereby, unto his executors, administrators, or assigns. Witness my hand.—Former acceptance is as follows.—And no other method of transfer shall be valid.—Letters of attorney to contain the names and designations of the writer and witnesses, and to be attested by a notary, justice of peace, or minister of the parish where the granter resides.—Any share of the stock may be disposed of by last will and testament.—An extract of the testament is to be delivered to the company, and a memorandum thereof entered in a book to be kept for that purpose.—All the shares or interests in the stock to be deemed personal estates, and not to be liable to any arrestment of attachment.—A court of directors to consist of the governor, deputy-governor, and ordinary directors, or any five of them at least, wherein the governor is to preside, and, in his absence, the deputy-governor; in the absence of both, any director present may be chosen to preside in that court of directors, or in any general court of the corporation; and, in default thereof, the general court may chuse a president; the president to have no vote, but in cases of equality.—The court of directors may name committees to manage their affairs.—The cashier of the corporation, or any other person authorized by them, to receive their proportion of the 10,000l. annuity.—Which is to be paid without any fee or reward whatsoever.—The general court twice every year is to declare a dividend, at such two of the quarterly courts as they think fit.—No dividend to be made, but out of their share of the 10,000l. annuity, and the profits of banking.—Calls upon the stock may be repaid.—A general court may assume such of the proprietors of the equivalent stock, as shall not have subscribed before the 20th of September 1727, within two years from the date of the charter.—Upon such terms and conditions, and at such times as the majority of the first subscribers shall appoint in a general court.—Such further subscriptions to be under the management of this corporation, from the time of subscribing.—And to enjoy the same privileges, &c. with the first subscribers.—The charter to be construed in the most favourable sense for the advantage of the corporation.—His Majesty covenants to give such further privileges as he may lawfully grant.—Which shall be devised by their own council, and approved of by the lord advocate, or solicitor-general for Scotland for the time.

Under our article ABERDEENSHIRE, we have taken notice of the board of trustees established by charter for the improvement of the manufactories and fisheries of Scotland, in consequence of an act of parliament anno 1727, granting some encouragements to them from funds arising in Scotland. These, though small, yet by oeconomy have had a surprizing good effect; which will best appear from the following genuine abstract, which has been transmitted to me from Scotland.

ACCOUNT of LINEN CLOTH for sale, stamped in SCOTLAND from November 1, 1727, to November 1, 1753, distinguishing the quantities and value annually.

Years.	Yards of Linen.	Value in money.		
		l.	s.	d.
1728	2,183,978	103,312	9	3
1729	3,225,155	114,383	19	8
1730	3,755,622	131,292	15	11

R E M A R K S.

This is a very extraordinary increase in the linen manufacture of Scotland, in the space of 26 years, it being above quadruple the number of yards and value to what it was at the beginning, and amounts now to almost half a million of money per annum. But besides the quantity of linen before shewn, there has been likewise no inconsiderable quantity manufactured by private people, for bedding and table-linen, for shirting also, and for home use of every sort, and great quantities of tape and incle, and thread exported, which are not taken any account of by the officers of the trustees: the country too, in the general, is remarkably well stocked with linen cloth; even the lower sort of people are now plentifully provided with body, bed, and table-linen. Upon the north side of the city of Edinburgh, in the road to Leith, is built a neat row of houses, with a large and commodious garden, called PICARDY, for the reception of some French families brought from France, for the improvement of the cambric manufacture; which has been of great use, and is daily growing more and more profitable.

Anno 1733, the said board of trustees, amongst other premiums, appropriated 1500*l.* sterling per annum, after the rate of 15*s.* per acre, for 2000 acres of ground to be sowed with LINT-SEED and HEMP-SEED, according to the rules laid down in a peculiar plan for that purpose. This had a very agreeable and extraordinary good effect, the growth of lint increasing greatly every year. Premiums also were given for erecting lint-mills, and bleach-fields; but of late years the said premiums for sowing of lint and hemp-seed are withdrawn, on account of the funds for these good purposes not answering to the extent of what they were formerly; whereby we have the mortification to see the growth of lint much decreased; but it is greatly to be desired that ways and means will be found to supply this deficiency.

In regard to the propagation of lint, it may be worth observing, what method has been found by experience to be the best for cultivating of mosses at a small charge in Scotland, of which there are a great many, to be fit either for tillage or pasturage, which is creating so much more valuable ground in the country. This has proceeded from several years study and experiments of an ingenious gentleman, Mr Græme, of Argomercy in Stirlingshire, the truth of which is attested by several gentlemen in the commission of the peace, and by them recommended to the said board of trustees. — They say in every piece of moss he intends to labour, he makes only a few small ditches, three feet deep, for drains; he pares his field, covers it with earth, which he brings by an easy carriage from the adjacent lands; or, if these lands are too distant, he gets earth enough by digging in the moss itself: he then mixes this earth with ashes, which he obtains easily, by burning the moss, that being a soft rotten earth: then he uses a breast-plough, which a single man pushes easily before him: his harrows, his rollers, and all his instruments, are suited to the nature of his soil and labour, and are purchasable at a very easy rate. He performs all his work with men, without horses or oxen; nor is he at any expence either for dung or lime; his manure costs nothing but a very cheap and easy labour, and he makes his soil as rich as he pleases. Constant tillage impoverishes other, but greatly meliorates a mossy soil. The highest estimation of all this charge is 40*s.* per acre, viz. 20*s.* for digging and laying on the earth, 10*s.* for paring, 5*s.* for burning, and 5*s.* for extra-charges. — The whole may be reduced to 25*s.* per acre. Neither does moss cultivated in this manner immediately run out, but being refreshed with earth and ashes every third year, it will improve every year by the tillage.

From this judicious gentleman's experience, and that unquestionably attested by persons of honour and credit, moss prepared in this manner answers admirably well for the growing of lint, either coarse or fine. If he wants strong rank lint, he plows the ground very deep, lays a greater quantity of earth upon it, and a great quantity of ashes; harrows them well, then plows his fields half as deep as before: after which he sows Riga lint-seed thin. If he wants shorter, small stalked, or fine lint, he does not plow so deep, gives less ashes, and sows Dutch lint-seed thick. He has raised of both kinds, especially the coarse, which is most wanted, and is, perhaps, most profitable for this country. The gentleman has likewise had good crops of potatoes, rape, pease, beans, wheat, barley, and oats, clover, and natural grass; and after two or three years culture, they bear good turneps. — A man with his paring plough can easily pare an acre in ten or twelve days, which he then burns, and spreads the ashes and earth, plows it with his new breast plow, without cattle; and where cattle can go, two little Highland horses may do it. An acre thus dressed and sown with lint, is a living for a family the whole year; and, when the flax is manufactured, at a moderate computation may be reckoned worth 100*l.* sterling.

Some years ago, his present grace the duke of Argyle, ever ready to promote the public good, and other lords and gentle-

men, finding some difficulties to attend the spinners of flax into yarn, as well as the weavers of the said yarn into different sorts of linen, by reason of the want of a ready sale for their goods; and they being unable to keep them on hand for a market, were often obliged to sell them at an under value, to the great prejudice of the manufacture: on these considerations they were incorporated by a charter from his present Majesty, under the name of the British Linen Company, with a capital of 100,000*l.* sterling, for trading in all branches of this manufacture. They import flax from abroad, the best lint-feed, pot and weed-ashes for bleaching, and sell them on credit to proper hands, then buy the yarn and linen, all at reasonable prices; which linen, particularly the sort corresponding to Osnaburghs, &c. fit for America and the West-Indies, they keep in large ware-houses, both here and at London, where they are sold for exportation: by which means this manufacture has been greatly improved and increased; but I am heartily sorry to tell you, says my correspondent, and you with very good reason will grieve, that it has now received such a blow (as cannot easily be recovered) by taking off the BOUNTY upon EXPORTATION, whereby above 8000 weavers in this country are turned out of their bread. I am informed that, upon the act's taking place, and merchants ceasing to buy their goods, these weavers went about desiring to enlist, not only in the British, but also in the Dutch service; from whence they frequently desert to France, and thereby become a double loss to the kingdom, by assisting our rivals, &c. In the county of Angus, where many of these weavers live, also my lord Panmure, a most amiable gentleman, who being in the army and having occasion to recruit there, found most of them to be weavers.

Anno 1749, being then in London, I gave my best assistance in forwarding the act for a bounty on the whale-fishery; and, on my return hither, did associate with others to establish that trade from this place [Scotland] which has succeeded so well, though unfortunate the two first years, that last year we sent six large ships out to Greenland, and the example was followed by several other places in this country; our fleet last year were in all 17 large ships from Scotland; but again I am much concerned to tell you, that we meet with a great discouragement; and some companies at Glasgow have already given up this most national and valuable branch of trade, by reason that the BOUNTIES ARE NOT REGULARLY PAID IN THIS COUNTRY; for though the act of parliament enacts, that the said bounties should be paid out of the CUSTOMS IN GENERAL, yet, by opinion of the late attorney-general sent to our commissioners of the customs here, he restrains those CUSTOMS to five articles, viz. OLD SUBSIDY, PETTY CUSTOMS, ADDITIONAL DUTY, ONE PER CENT. INWARDS, and COMPOSITIONS ON PETTY SEIZURES; out of which customs, it seems, that the commissioners salaries and all other charges, are first paid, and there does not remain a sufficiency for the payment of BOUNTIES.

The ensuing winter I again repaired to London, having had the honour to be appointed commissioner from our CONVENTION OF ROYAL BOROUGHS, to solicit the act for encouraging the BRITISH-HERRING-FISHERY; by virtue of which act, on my return here, we constituted a FISHING CHAMBER for HERRINGS, with a capital of above 13,000*l.* sterling; upon which we began our operations with buffes; and some other towns followed our example, by establishing fishing chambers, with stocks of 10,000*l.* sterling each, besides some private traders upon the general bounty of 30*s.* per ton.

Though we did not succeed very well at first, as all things are attended with casualties and extra-charges at their commencement, yet we continued 'till this year, when we broke up, and sold our buffes, &c. by reason of the premium, or bounty, not being regularly paid, as above mentioned. As you, Sir, have been already so full upon this subject of FISHERIES, I need say the less; you having, upon this occasion, mentioned the old proclamations and treaties in former times, that no foreigners should come and fish within light or within 14 miles of our shores: if these should be revived, it would do our business at once, and save the charges of all BOUNTIES. I am, and ever was, so much inclined to forward fisheries of every kind in this kingdom, that I have been at Dronten, and last year at Bergen, in Norway, on this occasion, where I got such information as, I humbly conceive, may tend to the improvement of our herring-fishing, which shall be communicated in the sequel, when I come to mention some things farther about the Highlands and their adjacent islands. See our article FISHERIES.

Upon both sides of the Firth of Forth is plenty of great and small coal, which are exported abroad, and coast-ways: the great coal is esteemed the best firing for house use: many ships are loaded at Alloa, where the price is from 5*s.* to 6*s.* 8*d.* per 24 hundred the ton. The coal is brought to Leith by water, and to this city by carts, weighing about 12 hundred, and sells for 5*s.* per cart; and at the same rate we have them from other collieries round the town. The refuse of the great coal is used for boiling of sea-water to make salt, of which we have great quantities in this firth, and sells for 7½*d.*

7½ d. per bushel, or 25 s. per ton: the English Iceland fishers are generally served in that article here, and a large quantity is exported to Bremen, Embden, and to the Baltic. — We have some foreign trade to most parts in Europe, also to America and the West-Indies; but these two last are chiefly carried on from GLASGOW and DUMFRIES, which trade is of the utmost consequence to our manufactures: we have, in return for them, sugar, rum, and tobacco, &c. large quantities of the latter are re-exported, which bring in a balance of money, or answer for other commodities that we have occasion to import.

This brings me to GLASGOW, which is a large, handsome, regular, and well-built city, upon the river Clyde. They have a good university, a town-house, fine churches, the houses mostly built of free-stone; many of their opulent merchants have villas on both sides of the river: the tide and small ships come up to the town.

Upon the Union of the two kingdoms, this town commenced their trade to America, which became very considerable, and has imported from 20 to 23,000 hogheads of tobacco in a year, besides sugars, and other West-India commodities, together with their large concern in the herring-fishing in the Firth of Clyde and Highlands, which are exported to the Baltic. They also send some ships to Greenland and Davis's Straights, for the whale-fishing; all which has increased their shipping very much, and encouraged every kind of manufactures, particularly linens, fine and coarse, cheques, tapes, mcle, thread stockings, handkerchiefs, and plaids, or tartans. They have several sugar-houses, an iron slitting-mill, all sorts of iron manufacture, a glass-house, rope-walks, and soaperies, a Delft-work, also a very considerable tannery, having their raw hides from Ireland, &c.

Six miles from Glasgow is the town of Paisly, remarkable for the industry of its inhabitants, and the effects thereof, by increase of people, buildings, churches, and an hospital. About 60 years ago, they had not above 60 weavers, including journeymen and apprentices; now there are about 1400 weavers, and 93 thread-mills. They make cambrics, lawns, minionets, linens, handkerchiefs, thread and tapes, &c.

About 14 miles down the Clyde from Glasgow, is NEW PORT and GREENOC; the former has a good harbour, fine ware-houses, and is the port of Glasgow; the latter is a town of good trade.

IRVINE and AIN are also towns of pretty good trade; the former has above 60 sail of ships in the coal-trade to Dublin, and other places; the latter has five or six ships in the tobacco-trade from America.

CAMPBELLTON, a royal burgh in CANTIRE, is a pleasant-situated town, has a fine basin and good harbour. The inhabitants of this place and country are very industrious in agriculture, linen manufactures, and fisheries. They had a Greenland company for the whale-fishing, but some differences arising amongst those concerned, it broke up; however, they carry on a considerable trade with herrings, also cod and ling-fishing, with wherries at BARRA, LEWIS, and at ZETLAND, as well as in their own neighbourhood, which they carry for most part to Ireland.

DUMFRIES is a neat well-built town, much increased of late years, has imported about 3000 hogheads of tobacco from America in a year; but in the neighbourhood of it, upon that coast, they have too much trade with the ISLE of MAN, from whence they bring great quantities of French brandy, and other liquors, to the great injury of Britain, and her revenues. See MAN, [ISLE of MAN,] and SMUGGLING.

ANNANDALE, NITHSDALE, and CLYDESDALE, are great sheep countries; some store-masters have above 30,000 sheep, and rent 1000 l. a year; but being scarce of firing, they are thinly inhabited, and manufacture but little of their own wool, which is sent to other places.

At DUNCE in BERWICKSHIRE, JEDBURGH and HAWIC in ROXBURGHSHIRE, they manufacture plaids, capes, and lerges, &c. TIVIODALE, and shire of MARS, are good corn countries; wheat, barley, and oats, are exported from BERWICK and EYMOUTH.

The shires of the three LOTHIANS are remarkable for fertility in fine corns, particularly wheat, barley, and oats. FIFE, PERTH, and ANGUS SHIRES, have the greatest share of the linen manufacture, yarn and thread, particularly in and about the towns of COUPER, PERTH, DUNDEE, ARBROATH, and MONTROSE. Ships are loaded from the four last-mentioned places to London, with quantities of goods of great value; and they have otherwise a very good trade.

ABERDEEN town and shire; the town is populous, large, and well built, has a town-house, traders and merchants hospitals, and one for old women; also Gordon's hospital, endowed with 10,000 l. the interest whereof is at 5 per cent. per annum, for education of boys; they have six churches, and a very good university. The harbour is safe and capacious, and might be made to hold a great number of ships; the entry is guarded by a fort, and though there is a bar, it may be removed, and made deep water, by carrying the pier a little farther out. From this port is sometimes exported

3 or 4000 tons of oat-meal in one season. The manufactures here are chiefly fine and coarse stockings, plaidings, and ferges, to a great amount; I have heard of ships loadings of these goods to Holland, from 10 to 15,000 l. in one cargo; but these trades are now somewhat fallen off, as the country people have of late run more into the linen manufactures. They have a very extraordinary salmon-fishing, both on the rivers DEE and DON; they have likewise a company for the Greenland whale-fishing, and within these ten years have had a tobacco-trade from America, with 10 to 12 sail of ships.

The exports from Aberdeen, before the Union, were salt, salmon to France, dried cod and ling, both to France and up the Mediterranean; narrow and broad fringims and ferges, to Holland, and some stockings to Hamburg and Holland. Our imports from thence were wine and brandy from France, bay-salt, soap, starch, and barrel-staves, from Dantzic, and some flax from the last place and Holland.

Soon after the Union, a company here opened a trade to Virginia; but unfortunately two ships being lost at that time, put an end to the attempt.

The most material branch, and of longest standing here, is the manufactory of knit stockings, which was only begun for the Holland market, about the Revolution; they have here risen to such an extent, that, for some years within these twelve preceding, there have been shipped for Holland and London from 60 to 80,000 l. sterling value.

The wool, little of which is the product of this country, is brought raw from Newcastle and London; this was for many years retailed by the importers to the country people, who bought it in small parcels, as they could afford to buy: it was combed, spun, and knit into stockings by the women and children, and, when washed out, sold either in town, or in the country markets, to merchants exporters: then insufficiency, and cheating of every degree, was frequent, and they were truly not worth the money they gave here to the last wearer: this, as in the like cases, brought a damp on their sale at every market, and they have not as yet recovered credit at London, where the stockings of the like kind, from Guernsey and Jersey, outdo ours.

Some merchants about ten or twelve years ago, successively undertook a reform of that abuse; since which they have introduced the trade of wool-combing, so that now, I believe, we have more wool-combers than in all the rest of Scotland: the merchant imports the wool, combs it in his own ware-house, and gives it out to the people, who spin the yarn and knit the stockings, into any form or size they are directed. I have known sundry times stockings shipped for Campveer in one bottom, to the value of 2000 l. sterling.

About ten or twelve years ago some merchants here introduced a trade to Virginia, and they have kept stores both there and in Maryland; we have four companies trading in the importation of tobacco from different parts in North America, which trade was pretty brisk until the late act of parliament has brought even the fair trader under sundry discouragements; and at present the imports are considerably lessened, though I still hope the trade will not be wholly lost here.

Since the peace of Aix la Chapelle, our merchants have much turned their thoughts on the linen manufacture; this was occasioned by the consumption they had for both coarse and better sorts of linen in North America. We had some years ago set up a manufactory of coarse bleached linen, known by the name of Osnaburghs, which cloth was greatly encouraged by the bounty given on exportation; and we were assured from all parts, that ours were the best made in Scotland. When the parliament last year took off the bounty, that manufacture was converted into one of fail-cloth, which remains entitled to the bounty, but they continue still to make some Osnaburgh cloths. Besides the above, there are three other manufactures of bleached linen, each of which has from thirty to forty looms, constantly employed in the manufacture of cloth, of the value of 1 s. 6 d. to 7 s. per yard; and about two years ago, an island upon the river Don, about half a mile above the bridge, was made into a bleach-field of about five acres. The island is pleasantly situated, well watered and sheltered, and for the two last summers has produced as fine and as beautifully bleached cloth as any in Europe. But our undertakers in the linen way say the market is dead at present, and large stocks on hand unsold. One of those linen companies have got about eight or ten stocking-frames, for the weaving of cotton and linen stockings, caps, &c. and have already erected an incl-frame, which at once yields 40 pice.

There is besides another company, who have erected about twelve or twenty frames for weaving cotton stockings, caps, &c. besides, all our linen companies make cheques, napkins of cotton and linen, and tartans. Last year two merchants only here have introduced, and very successfully carried on, the manufacture of white and coloured threads for sewing, to some considerable value.

The two rivers of Dee and Don, which abound in salmon, may afford annually at an average one hundred laits of salt-fish, which are those caught after the 15th of May, and are mostly

mostly fold for the French, and some for the Flanders market, where they have the reputation to be the best fish, and best cured of any in the world. From the beginning of the fishery-season, which is the middle or end of January, to the 15th of May, the salmon caught are either sent raw or pickled for the London market, and this may be yearly to the value of about 3000*l.* sterling.

We have here pork which is salted and cured both for London and sometimes for Holland; it is esteemed for the fat and the lean being better mixed and sweeter than the pork of England; and there is exported, and shipped coast-ways about fifteen or twenty lasts yearly.

The chief product of this part of Scotland is oats and oatmeal, the staple articles that bring here the freest return of money, in the time of good crops. The two counties of Aberdeen and Banff have, besides a competent provision for home service, often afforded from 50 to 70,000 bolls of oatmeal, which are fold in the Firth of Forth, and Tay on the east-coast of the Firth of Clyde, and in the Highlands on the west, and very often in Ireland, to which last place we have about five or six weeks ago begun to export.

For some years past there has been a demand from London, which I am told is afterwards carried down and used at Manchester, for linen yarn; it is a very coarse kind, bought here at from 18*d.* to 2*s.* per spindle; but as it is made of flax bought by the country people, they often cheat both in the tale and in the length of reel, and it has for twelve months past been on the decline. I am told, that few years ago from 12 to 20,000*l.* sterling value has been sent to London; but unless some method be taken like that lately with the stockings, this branch will be lost. It would be to the benefit of the country, if it could be got wove here, and a reasonable profit on the linen.

There are 35 ships belonging to this port, including our two whale-ships; and they consist of about 4500 tons, and are chiefly employed in the North American trade, and in that to London, Holland, and two annual ships to Dantzic, as many to Riga, some to Norway, and one annual ship to Antigua, and to France with salmon.

The greatest part of our fuel is coals imported from Newcastle to the Firth of Forth. They are chiefly brought us by small ships of about 200 tons, belonging to the sea-ports in Fife; we take also about 30 or 40 cargoes of lime, and above 20 cargoes of Scots-made salt; so that about 30 or 40 Firth barks have their whole bread in those employs, which serve to take off our ready money, though in small parcels.

The country people live chiefly on oatmeal, greens, and milk. The knitters of stockings and spinners of linen yarn, are only the women and children: they are not able to gain above 2*d.* $\frac{1}{2}$ per diem at the first, nor exceed 3*d.* $\frac{1}{2}$ sterling per diem at last, when linen yarn bears any tolerable price at London.

They have here, perhaps, the most plentiful and best-served fish-market in the world; there are above 60 fishing-boats within 16 miles of this town on both sides. The whole of the fish caught by 30 boats come duly to our market; at least, the half of the fish caught by the other 30 are sold here, so that after a storm, when fish are scarce, our other provisions become sensibly dearer.

BAMFF, MURRAY, ROSS, and CAITHNESS SHIRES, are very good corn countries, and generally export barley, bigg, oats and oatmeal; all sorts of vivers in these northern counties are extraordinary cheap, and wages very low.

Although the woollen manufacture is not the staple of this country, yet it is far from being inconsiderable. There is an opulent company established at HADDINGTON, where they make all sorts of superfine and coarse broad and narrow cloths, also bays, shalloons, long ells, carpets, and worsted plushes. Before the union of the two kingdoms, there was a very considerable undertaking of this sort at New Mills near Haddington, which had large privileges by act of parliament, but upon the Union that company dissolved; yet the working people, who had been employed therein, continued to make cloths and other woollen manufactures. At this place is a weekly market, where large quantities of raw cloths are purchased from the country people, which are milled, dyed, and pressed by the cloth-dressers here.

At DALKEITH in MID LoTHIAN, is a considerable manufacture of bed-coverlets, which supplies most of the country with that commodity. At MUSSELBURGH are also made some broad cloths, but the principal manufacture here is a sort of narrow stuffs of various colours, which are allowed to be the cheapest manufacture in Europe, being fold by the weaver at 2*d.* per yard. Of these, large quantities are exported to Holland; they also make a sort of white stuffs yard wide, that is much used in the country for bed-curtains, &c.

At EDINBURGH, shalloons and tartans, or plaids, are reckoned the best in Britain; but the largest quantities are made at and in the countries about STIRLING, where many hundred looms are employed in the manufacture of

ferges, shalloons, and tartans; the two former are exported to Holland, and the latter to England, America, and the West-Indies.

At ALLOA, four miles from Stirling, down the Firth, are made camblets, blankets, and long ells. At KILMARNOCK, and in the adjacent country, they make cloth ferges, which are exported to Holland and Hamburg; from thence they are sent into Germany, and there milled and dyed for soldiery clothing: also in this place are made carpets, coarse floor cloths, and cloths made in imitation of those at KENDAL.

This country abounds greatly in mines and minerals, though hitherto but little regarded. Some old and late works are those of LEADHILLS, alias HOPE TOWN, belonging to the right honourable the earl of Hopetoun, lying in the shire of CLYDESDALE; these are most remarkable for all kinds of lead ore; the green, yellow, grey, and black, are found here, as well as the blue and white; the two latter are got in great quantities, and in all their variety; the soft broad grained ore is got most frequently, and in greater quantities than the hard short ground steel ore. Of this broad ground blue ore, pieces are got from the mine like a mirror, as if polished by art. Of late, the white ore has been got in great plenty. There are some pieces almost transparent, shot out in the form of crystals of all figures, from every part of the cavity, adhering to the sides of it, as branches to a root; of which some are short and solid, joined by pairs to one surface, crossing one another like two perpendicular plains, and at right angles; others are long, sometimes joining both sides of the cavity, closely united one to another, and hollow like tubes. The fine soft blue ore is often crufted with these crystals, as if designed by nature to beautify the mass, which in its native state is very brilliant in the mine, attracting with admiration the eyes of the curious.

There has been and is still found, gold in these parts, of which formerly, broad pieces, Jacobuses and Caroluses, have been coined. It is sometimes found upon the surface amongst a particular kind of earth like red and yellow paint, by the gatherers called oker and brimstone; which earth does not extend to a great breadth, but it has its course in length, regular as the lead veins. They gather it generally in the hollow places near the sides of the rivulets, to which places it is washed down by the rains from its proper bed. Within these few years a piece was found on the side of Glenconner water about nine drop weight, which was brought to the earl of Hopetoun.

It was searching for gold, when they first discovered the lead mines, which were in the high grounds there about 380 years ago; but in the lower grounds only about the year 1534. Sir James Hopetoun, the present earl's great grandfather, got possession of these grounds by his lady Anne Foulis, of the family of Collingtown, in the year 1641. Since which time they have produced great quantities of lead; some years 1500 tons of lead, and 600 tons of potters ore*.

* This is a bright flakey ore, in large lumps, used for glazing earthen ware. Great quantities are sent to Delft in Holland.

At WANLOCKHEAD, belonging to the duke of Queensberry, about a mile from lord Hopetoun's works are very good workings in lead-mines, which were discovered at the time of those at Lead-hills, but their ore is generally of the blue hard steely kind, and contains about 14 ounces of silver in a ton of lead, which is refined and extracted out of it; they have also of the soft flakey blue ore, and the works have been so rich this last year, as to produce about 30,000 bars of lead, each bar containing $\frac{1}{2}$ Ct. which makes 1875 tons.

Anno 1600, at TARTIVEN, 12 miles west of this city, was a fine silver-mine wrought, the bottoms of which were cleared out anno 1730. The York-Buildings company expected the work to continue, but were disappointed.

Anno 1715, Sir John Erskine, of Alva near Stirling, found a nest of silver at Alva, which he wrought out that same year to the amount of 15,000*l.* since which no more has been discovered; but in the same range of hills, called the Echals, there have been several old and late workings in copper-mines, which contain a quantity of silver, particularly at Aithry, Blair, Logy, and Tillycultrie; the appearances are very good and encouraging in several places.

At STRONTIAN, in Argyleshire, are very considerable lead-mines, discovered by Sir Alexander Murry, anno 1727, wrought for account of the duke of Norfolk, and sundry other partners; these were afterwards lett to the York-Buildings company, and since to others; I have known 1500 hands employed in these works at one time.

At TYNDRUM, upon the earl of Broadalbin's estate, anno 1740, lead-mines were discovered and wrought by Sir Robert Clifton, now leased to the Mine Adventurers company, and produce large quantities of ore. There are several other lead-works in different parts of the country, and appearances with-

out number; but in this country, few are willing or able to venture upon such precarious business; and indeed, it is most proper for societies.

There is lately a mine of wadd or black-lead discovered upon M'Donald of Glengary's estate in Invernessshire, leased and wrought by Capt. Thynne; also in the same shire, about 20 years ago, a fine copper-mine was discovered and wrought by Mr Champion of Bristol, upon the estate of M'Donald of Applecross, opposite to the island of Sky, but being troubled with water, it was necessary to bring up a level, which was too expensive for him to undertake.

There are several other good copper-mines in that neighbourhood and in the islands, which ought to be tried.

This country is happily intersected with many firths and lochs, or long inlets of the sea, which is a great convenience to trade; the Firth of Forth from St Abb's-head to Stirling about 60 miles, and from the Forth of Glasgow on the West Sea, is only 18 miles over land; from thence to Fairland-point in Wigtonshire, being the Firth of Clyde, is 90 miles; the Murry Firth from Kinnaird's-head to Inverness, is about 70 miles. This town has a good trade with the Highlands, and a chamber for the herring-fishery from Inverness to FORT WILLIAM, which from East to West Sea, is 48 miles, all a valley, fine-made roads, great lochs or lakes in the middle, and bounded with mountains on each side; from Inverness to the east-end of Lochness, is four miles. The loch is 20 miles long, at the upper end is FORT AUGUSTUS. They have a vessel to carry stores and provisions; the river of Ness is well stored with salmon; from FORT AUGUSTUS to LOCH OICH is 2 miles and a half, the loch 5 miles, one mile to LOCH LOCHY, which is ten miles long, from thence to Fort William five miles and a half; from Fort William is an inlet of the sea to Castle Deuart in the Island of Mull, 36 miles.

Upon the MURRAY FIRTH, opposite to the town of Fortrose, about six miles from Inverness, is a large new fort now building at AIRDESSER, well fortified; the barracks will be sufficient to hold 1500 men, and there is free access to the sea. This comes in place of FORT GEORGE at INVERNESS, now demolished, as is also an old fort on the other side of the town, built by Oliver Cromwell. FORT AUGUSTUS and FORT WILLIAM, make a chain from the East to the West Sea as above mentioned, and divide the Highlands, which might not only prevent a junction upon any insurrection or invasion, but may also be a means to assist the civilizing and introducing manufactures and industry amongst the Highlanders, which will certainly prove the best and most effectual way of maintaining peace and improving the country. To all these forts there are fine spacious roads made, fit for any wheel-carriages from the south and low countries. The wisdom of the legislature cannot be sufficiently admired for annexing the Highland forfeited estates to the crown, particularly lord Cromarty's in Ross-shire, lord Lovat's in Invernessshire, Cameron of Lochiel's in Argyleshire, and the duke of Perth's in Perthshire, and in appropriating the revenues thereof, for the improvement of the country in the manufactures, &c. and farther for the same purpose, by an act of the last parliament, 3000 l. per ann. payable out of the customs, is granted and put under the management of the commissioners and trustees for improving fisheries and manufactures in Scotland; and they have already made a beginning, and published a plan for distributing the said sum for the first year, viz. for introducing the linen manufactures at four different stations and settlements, in certain parts of the Highlands, in the shires of INVERNESS and ROSS (where it hath not hitherto been introduced) and applied a sum not exceeding 630 l. each station, conformably to the plan; which is for building proper houses, purchasing lint-feed, giving premiums to the raisers and dressers of flax, and for wheels, reels, heckles, and all sorts of utensils, for masters and mistresses to breed up others, 2520 l.—For supporting and encouraging the manufacture in those places where it hath been already introduced, but hath not yet arrived to any considerable degree of perfection, 300 l.—For salaries to one or more inspectors, not to exceed 100 l. and for defraying incidental expences attending the execution of this plan, 80 l.—It is hoped that these wise and useful measures will have the desired effect.

The most considerable fir-woods in this country are in STRATH or the valley SPEE, chiefly belonging to Sir Lodovick Grant, Mr Grant of Rothiemurchas, and the duke of Gordon. Sir James Grant, Sir Lodovick's father, sold sixty thousand well-grown trees to the York-Buildings company, the boughs and tops of which they burnt into charcoal, having erected a furnace and forges for making of iron, and having bog and rock-ore in the country. Also they got pig-iron from Mr Rawlinson's furnaces at M'Donald's of Glengary, lying between Fort William and Fort Augustus; to which place fine ores were brought from Lancashire, mixed with Scotch ores, and there melted.

The trees were partly cut into deals, and partly carried whole down the river Spey to London, for masts, yards, and bowsprits for ships. But the company's affairs at London going wrong, made them give up these undertakings, however promising they were. Formerly there were also iron-furnaces

and forges at Achnacarry on Loch-Lochy, ten miles from Fort William, and in other places of the Highlands.

At present there are new iron works erecting at Bonawe in Argyleshire, to which place great quantities of timber are brought down from Glenorchy to Loch Awe, and then by the water or river Awe, in which are plenty of salmon. Also from Lough Etive to Bonawe.

Upon Lochiel's estate are fine woods, which may easily be brought to FORT WILLIAM—Also upon Loch Ness, particularly on lord Lovat's estate, which might be brought to Inverness. Upon Chisholm's estate are likewise very fine woods on the river Beaul, but so difficult to be brought to the river, which has several falls, that it makes the wood of little value. In like manner lord Braces has very fine woods about the head of the river Dee, forty miles from Aberdeen; but somewhat the same difficulties attend them as do the last mentioned. It is much to be regretted, that such fine timber, fit for ships masts, should be cut down into boards, or left rotting on the ground; I can't think, but by some contrivance they might be brought to water-carriage.

All round about the western islands, and opposite upon the main, are plenty enough of herrings, cod, ling, and salmon, &c. to enrich a nation. We have sometimes a hundred fail of ships there in a season, and all of them get their loadings; and many more ships might be loaded, if the fishery was upon a right establishment; but at present it is attended with so much charge, and is so precarious, that many adventurers suffer greatly by it, and it is in a great measure given up; for the chief herring-season is in the winter time. Ships come thither from the east and west country loaded with salt and barrels, and provisions for three or four months voyage, besides stores of tobacco, spirits, oatmeal, and bread for the Highland fishermen; for they carry no nets of their own, but engage the Highland boats to fish for them, giving these Highlanders provisions fish or no fish, and then giving so much more for the barrel of fresh herrings, according to their success and demands.

The proprietor of the estates where such fishings are, exacts one night's fishing, the best in the week, for himself; also a tax for the liberty of packing them upon the shore. If a vessel gets a cargo, when many of them are together, it will come pretty dear, by the quantity of provisions given to the fishermen, and the high price for the fresh herring, every one striving to have his cargo first, by reason of the bad weather at that time of year. It should not be forgot also, that it is somewhat precarious, for though the herrings come annually pretty regular, yet it is uncertain into what loch they will come, and how long they will remain.

Suppose a number of ships goes to Loch Boque on the west side of the Lewis, and after staying some time, they hear that herrings are plenty in Loch Broom upon the main; if the wind is westerly, which is often the case, they may not get about the island for a long time, and when they arrive at Loch Broom, the herrings may have shifted to Loch Seafort or Stornway, on the east side of the Lewis, and thereby the fishers be altogether disappointed. Then it comes to be a heavy loss upon the adventurers; the dead freight of the ship which from this Firth is generally 40 s. per last, being sunk, stores exhausted, salt wasted, barrels spoiled, &c.

Wherefore, in my humble judgment, storehouses should be erected in sundry places, salt, barrels, and other necessities lodged there, and ships not to come till their loadings are ready.

I shall communicate some farther thoughts about improving of this article, amongst other remarks subjoined to this letter, and beg reference thereto.—But I must here previously observe, that the consequence of such settlements would be the making of so many towns, cultivating more ground, growing of corn, and planting of potatoes, &c. Also the fishermen would always be at hand, and prompted to follow after the succeeding fisheries of cod and ling. In many of these western islands, they have great quantities of fern, which is found to contain the best and most salts of any vegetable; they burn the fern to ashes, and either use them in place of soap, or make a pot-ash and soap of them. These shores likewise abound with sea-weeds, which are burnt into kelp, fit for bottle glass-houses, and great quantities thereof are brought to Newcastle.

Some of these islands are very fruitful in corn, barley, or bigg, and oats, particularly the island of Tyric, which is level; it belongs to the duke of Argyle, and the fourth end of the south-west belonging to M'Donald of Clandronald, abounds mostly with limestone and marble; also they here use the sea-weed for manure.

They often delve their ground with garden-spades, and sow their corn by drilling, by which means it produces sixty fold. These islands and the Highlands in general, abound with black cattle, which are drove down to fairs and markets in the low countries, particularly to Crieff and Falkirk; at the former of which places, I have seen twenty thousand head of cattle, and sold from 30 to 40 s. per head; most of them are drove from thence to England, where they are fattened and brought to London, which is also a great trade from the shire of GALLOWAY.

ORKNEY

ORKNEY and SHETLAND islands are the most northerly parts of his Majesty's dominions in Scotland; the former of these helps to feed the latter, Orkney being plentiful in corn and all sorts of vivers; they are very populous, most of the inhabitants are fishermen, or at least they understand to handle the oar; oatmeal is from 7 to 8 s. per boll, or 1 s. 4 d. English; bigg 5 to 6 s. per boll, or six Winchester bushels; beef and mutton $\frac{3}{4}$ to 1 d. per pound; geese 4 d. to 6 d. fowls 2 d. to 3 d. eggs 1 d. per dozen, or 14; eating butter 2d. $\frac{1}{2}$ per pound, grease butter 30 to 40 s. per barrel. Wages for women servants, 5 s. 6 s. 8 d. to 8 s. 4 d. per ann. men servants, 12 to 15 s. per ann. wages for head servants about 4 d. per diem, and maintenance. Their fishing here is not considerable, on account of the rapidity of the tides; in Pentland Firth, the tide running nine miles an hour, yet they have plenty of fish for their own consumption, and some for exportation; however, they are so expert at the business, that they go generally to the island of Bara, the southernmost of the long western islands, to the cod and ling-fishing, and are annually employed by all the British cod-fishers to Iceland. The Hudson's-Bay ships call there every year, and carry some of them to remain at their settlements in Hudson's-Bay for several years, and afterwards bring them home and exchange them for others. This year about 300 of them are employed on board the herring-busses belonging to the London society; I think they may also be made very subservient and useful to our Greenland whale-fishing.—They have some linen and woollen manufactures, particularly those of coarse stockings.—Capt. McKensie has made a very exact survey of the Orkney and Lewis islands, with descriptions of them, also of the soundings and tides, published in folio; he is now employed by the lords of the admiralty to go on with the survey of all the western islands and coasts, which, when published, will be of very great use.

ZETLAND, or SHETLAND, grows but little corn; yet the country is populous, and is supplied with oatmeal from the Orkneys and other parts; they are much employed in fishing for herrings, cod, ling, and tusk. This last-mentioned is a thick, fat, and delicious fish, somewhat like a small cod, not found any where else in Britain; they have a considerable trade to Hamburg with their fish and coarse stockings, from whence they bring many necessaries as well as superfluities of life.

BRASSA SOUND, famous for the rendezvous of the Dutch herring-busses; formerly eighteen hundred sail have been here from Holland in one season. The Dutch buy of them coarse stockings and mittens.—Whales come frequently ashore on some of these islands, which proves a good perquisite to the admiral. Also there are too often shipwrecks of Dutch, Danish, and Swedish Indiamen, and large Norwegian ships bound for the Irish channel.—They have fine beef and mutton in this country, and live very comfortably, but their fisheries might be much improved.

R E M A R K S.

The last parliament, continues my correspondent, were inferior to few in regard to the wise measures taken by them for the encouragement of trade and manufactures, as well as for several useful laws, tending particularly to the improvement of this part of the united kingdom. Many of the same persons being still in the administration, and the new parliament having an addition of many true patriots, gives us the pleasing hope and prospect of a continuation of such a system of policy, as will effectually preserve and promote the commerce, and the public credit of these kingdoms.

Amongst these, the fisheries are not the least. We have seen the happy effects of the bounty for the whale-fishing; though it was granted only for seven years, yet the trade has increased so much, that we have had this year eighty-nine large stout British ships in Greenland, which have been, in the general, pretty successful; the nett produce of which fishery is near all gain to the nation, besides the multiplying our fishers and sailors. But as extraordinary charges attend every new trade at its commencement, and in this case in particular, from the necessity of erecting of boiling-houses and warehouses, and bringing from the island of Foern on the coast of Jutland, commanders, speculators, and harpooners, &c. both to execute our business and instruct our people: these things are very expensive to the first undertakers. We are obliged to give those chief officers high wages and premiums, and are at the charge also of sending them home again annually.

On these considerations, it is judged absolutely necessary to have a prolongation of the BOUNTY for seven years farther, which was last winter approved of by a late able minister, but put off 'till this winter on account of a new parliament. As this and all bounties are given amongst ourselves, they can be of no loss to the nation; and therefore it is to be hoped, a measure so expedient will meet with no obstruction. Besides, in this case, the revenue is first increased by all the duties on the articles used by this trade, viz. on iron, hemp, flax, oak plank, pitch and tar, &c. for building of ships; also the duties and excises on spirits, liquors, and salt, &c. consumed in these voyages, make us fit out and navigate, at a greater charge than our neighbours and rivals. Wherefore

the bounty is but returning only a part of those duties, and putting us on a footing with our neighbours. And after the cessation of this bounty, it is reasonable enough to believe, that this trade may be able to stand upon its own legs, and consequently will greatly tend to increase the revenue, as well as greatly benefit the whole kingdom. It is to be hoped likewise, that by the time of expiration, we shall have no occasion for these Jutlanders, who make good advantage in serving us at present, as well as the Hollanders, Hamburgers, Bremeners, with the chief officers in the whale-fishery. But as every saving is necessary to be made upon an infant trade, wherein we are rivalled too, it is humbly proposed, That As the islands of Orcades lying in the latitude 58 and 59, and directly in the way to Iceland and Greenland, are a very plentiful country for all sorts of provisions, and well peopled, more especially with fishermen; so the fleet of 25 to 30 sail of vessels from BROAD STAIRS, RAMSGATE, or MARGATE, for the annual Iceland cod-fishing, should proceed from those parts to the Orkneys, with no more hands than are necessary to navigate the vessels thither; where they should take on board all the additional hands wanted for the fishing, and set them down again in about a month or six weeks upon their return from the fishing; by which means there will be a considerable saving in the articles of wages and provisions.—In like manner our Greenland-ships might sail from all the different ports in Britain, at first with their officers and as many hands only as are necessary to navigate the ships to the Orkneys, and there take in the additional hands for boat-steerers, &c. wanted for that fishery; these hands may be made boat-steerers the first year, and learn in a few voyages to become dexterous harpooners and speculators, &c.: these additional hands likewise may be set down again upon their return from the fishing. This would not only prove a great saving in wages and provisions in those fisheries, but also be a certain resource for these officers and hands, that are so necessary for the business; whereas, at present, we are at an extraordinary charge for our dependance upon the Jutlanders before mentioned; and though many of our people are taught to be chief officers, as harpooners, &c. yet it frequently happens, that the necessary Jutlanders are otherwise engaged in voyages abroad, or out of the way when wanted; so that the Orkneys may, in this respect, supply the place of Jutland: for which purpose, some new regulations in the law for obtaining licences, in order to give title to the bounty, would be necessary.

We before observed, that there are in Scotland 16 large ships employed in the Greenland trade, which, in proportion to the number of merchants and their stock, is more than in England: but as the articles of our customs, out of which, as we have said, these bounties are payable, viz. out of the OLD SUBSIDY, PETTY CUSTOMS, ADDITIONAL DUTY, ONE PER CENT. INWARDS, and COMPOSITION IN PETTY SEIZURES, have proved insufficient to answer the intention of parliament; there are already considerable arrears due to the Greenland ships and herring-busses, contrary to the design of the legislature. Upon this account, the herring-fishing chamber of Edinburgh has already given up; and I am afraid, unless some remedy is found, the other chambers and whale-fishing adventurers in Scotland, will be obliged to follow their example; for it is not enough that the government owes them so much money, these trades cannot be carried on in Scotland without punctual payment of the bounties; and what a pity would it be, that such a national and beneficial trade should be so short lived! But we have all reason to hope, that the parliament, when applied to, will give speedy and effectual relief; and that they will not starve, but nurse and cherish, these infant undertakings. Having mentioned the herring-bus-fishing, which in Holland is called the great fishery, it requires and deserves some consideration. I am glad that so many gentlemen of worth and consideration are concerned in the fishing society at London, who may overcome any difficulties that may occur in such a delicate branch of trade, wherein we have many rivals.

In order to answer this great end the more speedily and substantially, we are humbly of opinion, that the act of parliament needs several amendments. The chief intention of the legislature, was certainly to make this branch of trade general, and to spread itself throughout the kingdom: but the 3 per cent. bounty upon the amount of money employed that way, being restrained to the society at London, and the chambers at the out-ports, prevents this trade becoming general, because no private adventurers in busses are entitled to it. Moreover, the out-port chambers complain of trouble and expences in being obliged first to remit their money to London, which is designed to be employed in this trade, paying it into the bank and drawing it out again, without any manner of use. Another great inconvenience is, that they are obliged to send all their vouchers to the society at London, in order to receive the said 3 per cent. through their hands. Now it is humbly submitted, that if the parliament should think fit, in lieu of the said 3 per cent. which corresponds to about 10 s. per ton, and in lieu of 30 s. per ton already stipulated to be paid, to grant 40 s. per ton for the whole bounty to every bus, that shall be fitted out with nets, and

all necessaries for the herring-fishing, the buffes being surveyed and certified by the officers of the customs, in the same manner as the whale-ships are surveyed, &c. it would answer much better; and, indeed, when the great charge of nets is considered, the herring deserves rather a larger bounty than the whale-fishing.

It may be worth observing, that it has been found by experience the herrings are often seen about the Lewis and western islands, in the months of May and June, as well as in the autumn and winter months: wherefore, it might be permitted for buffes to fish in these places in all seasons; they will always go where they expect the best success: it may be sufficient for them to be properly fitted out, and to be employed in the fishing, at least four months in the year, to entitle them to the bounty. This article of early herring and buff-fishing comes to be very dear, on account of the great charge of nets, and the fish are chiefly consumed in the Netherlands and Germany: the Dutch themselves for that reason are much fallen off from this early fishery. The Baltic consumption is chiefly supplied from Norway, where they have large quantities of herrings cured and packed, at about 6 or 7 s. per barrel: they are afforded so cheap, by reason of their being caught within lands and inlets of the sea, by a number of small boats and nets at an easy charge, and the people being always at home. They have of late years a contrivance, which may deserve the attention of our people, by which they catch great quantities in a short time. The method is this: when the herrings come into some of their deep bays, they draw a parcel of large nets joined together like a fleet of bufs-nets, across the mouth of the said bays, which is called an inclosing net, by which means the herrings are inclosed and hemmed in; then the small boats with their nets fall to work, and do great execution.

We have before observed, what advantages may be derived to Scotland from the many lochs or inlets of the sea, in the western islands and the Highlands, which run up from 10 to 30 miles within land, and often not above one mile broad; particularly the Firth of Cromarty, Lochs Rogue, Seafort, and Stornaway in the Lewis, and Lochs Allyn, Broom, and Torndon, opposite on the main, and sundry others; into several of which lochs, herrings do annually come in great plenty. Since this is the case, we might enclose and hem them in, by a fleet of bufs-nets drawn across the loch, as is done in the Baltic; and notice being given to all the boats round about, they would come with their small nets, and fish what quantities they pleased.

If this should be found practicable, it would be requisite to have proper places, the most central for this fishing, store-houses with salt and barrels, and all sorts of necessaries, where coopers, twine-spinners, and net-breaders, &c. may have employment the whole year; and when the herring seasons are over, the fishers may be employed in the cod and ling-fishery, of which there are great plenty and very good in these parts; there are likewise many rivers stored with fine salmon much neglected; these fisheries, when improved to the extent they are capable of, would greatly contribute to increase the wealth of the united kingdom, and prove an additional nursery for seamen: but these things are more proper for some society, public or private, the adventure and trouble being too much for private people.

When herrings are caught in these parts and properly cured for exportation, either to the West-Indies or other places, the best opportunities of shipping are from London, Bristol, Liverpool, &c. yet there are difficulties in bringing them coastwise, by reason of the debenture upon exportation: this ought to be regulated, as a further inducement for private persons or societies to engage herein. See the article *DEBENTURE*. They are much embarrassed also in Scotland in relation to the article of foreign salt, imported for the cure of fish [see our article *SALT*], which requires some amendment in the law. Though a quantity of salt should, at present, lie a number of years, in which time it will waste considerably, yet no allowance is made to the trader for such waste. For when weighed out again, the custom house claims a penalty of 10 s. per bushel duty for every deficient bushel. If at importation it is entered for the cure of fish, and there is no opportunity for using it that way, which has been the case in this Firth for several years, as salt is generally brought hither by our retour ships from the Straights; yet that salt is not allowed to be exported, but must lie as a dead stock, and waste away, besides being liable to the above-mentioned penalty; which is a difficulty on this trade, that seems necessary to be removed.

Also when any parcel of such salt is carried from Edinburgh to the Highlands and western islands for the cure of fish, there are some hardships that attend traders herein; for they give bond at 10 s. per bushel, and the merchants or purchasers grant also new bonds to the custom-house in these parts where it is lodged and to be used; yet the first importer is still held bound to cancel these bonds, though it should be many years after, until the said salt shall be consumed: some remedy would be necessary for this article likewise.

We come now to the consideration of the linen manufacture, which certainly is an object no way unworthy the most serious public regard and attention.

This staple manufacture was first cherished and raised in Scotland by the means of bounties; but by some unhappy mistake, thinking it could stand upon its own legs, the bounty was this year withdrawn, which has given a sudden check to its growth; nor will it be able to rise again without some powerful aid. For I am informed by good authority, that above eight thousand weavers are quite turned adrift, many of whom are sent to our plantations, many become soldiers both in the British and Dutch service, and some are gone into other employments of various kinds at home.

If this, upon due inquiry, should be found to be *FACT*, is not this undoing all that has been hitherto done? If this capital manufacture should ever be revived again, it must be some considerable time first; a number of hands cannot be collected and bred to this manual art of a sudden. See our articles *ARTIFICERS* and *MANUFACTURERS*.

Ireland, though more concerned in the linen manufacture than Scotland, does not suffer so much, because of their high bounties at home. It is true, the government has granted 3000 l. per ann. in aid to civilize the Highlands, by promoting the growth of lint and establishing the manufacture there, which most certainly in time will be of great use, but cannot be a present relief to this valuable and important article, and preserve it from ruin.

It is suggested by some, as a redress for this grievance, to take off the drawback on the exportation of foreign linen; but we are afraid, this measure will not effectually answer the purpose, and may be attended with consequences no less disadvantageous than those it is intended to prevent; for, if the drawback is taken off, only upon what linen is re-exported to our plantations, it is likely to prove a means of encouraging fraud and smuggling, by entering the same out for other places, and smuggling it into America. If the drawback is wholly taken off, these linens from other places may still be smuggled to America.

Moreover, a measure of this kind may discourage our trade to Germany, by not taking some of their goods in exchange for ours. And may not our commerce to Spain, &c. be greatly prejudiced, for want of an acceptable assortment of cargoes? As other nations may obtain the proper assortments from France and Holland, if this should prove the case; so the remedy least injurious, should seem to be the revival of the bounty upon British linen exported. And although the giving such bounty should be thought a present incumbrance, yet as it wholly centers and circulates among ourselves, the nation cannot be the poorer, but must necessarily so prosper in its linen manufactures and the employment of the poor, as to make ample and permanent compensation for this temporary national burthen.

Another article of great importance, which seems to be in a declining way at present, as well in Scotland as in England, is our tobacco trade, which hitherto has occasioned a great demand and consumption of our manufactures, and given employment to many ships; and the re-export thereof has brought money into the kingdom, and enabled us to pay the balance due for other articles imported. But we are informed, that the late act of parliament, though well intended, to prevent many abuses and frauds committed in this trade, is attended with so many real difficulties and discouragements to traders, that both officers and merchants are often at a loss what to do; wherefore, several American merchants in Scotland have given up this trade, and others, it seems, are likely to follow their example. This has an evil aspect. To remedy which, it would be happy if some method could be found, that would prevent fraud, without cramping or destroying the trade. Till something better can be suggested, we would submit to consideration the example of lowering the duties on teas. This has had too happy a tendency, as to produce a far larger revenue to the crown than it did before, [see the article *SMUGGLING*], and to prevent smuggling in the like proportion. Let it be supposed that the duty on tobacco was, in like manner, reduced even to 2 d. per pound, is it not highly reasonable to believe, that the same desirable effect would follow therefrom, as hath done in regard to the duty on teas? and that the revenue would be thereby considerably increased, and smuggling proportionably cease, which is now encouraged as well by the high duties at home, as the great drawback on exportation? Nor is encouragement to smuggling the only disadvantageous consequence of these high duties; it also gives foreigners the benefit of manufacturing our tobacco cheaper, than we can do; and that tobacco which does not cost them above 2 d. per pound, is sent us again worth from 2 s. 6 d. to 5 s. per pound, such as Straburgh rappee, &c. whereas if the manufacturing of tobaccos in all its shapes at home was encouraged, as well as the exportation of the same so manufactured, and either no drawback at all, or only half of the duty, allowed for the export of unmanufactured tobacco, we should then not only have a great additional benefit from the trade, but the revenue augmented in proportion to the increase of the vent and consumption.

This manufacture of tobacco in France alone, has enabled the farmers to pay for that branch, and salt, 40 millions of livres; which, in the time of Lewis the XIVth, was farmed

for no more than 8 or 10 millions; for which reason, perhaps, they will not be very ready to promote the growth of it, either in America or at home. I have been told another reason for our tobacco being brought so low is, that we plant too great a quantity, and that it would be better to burn a part of it, as the Dutch do their spices: wherefore, would it not prove more nationally beneficial to raise a smaller quantity of tobacco, and employ our spare ground and hands in raising hemp and flax, &c.?

The article of mines in Scotland seems to be greatly neglected, though several works have turned to no inconsiderable account; which may serve as a specimen of what may reasonably be further expected. This part of the united kingdom is mountainous, and has many promising appearances of veins of copper, lead, and, in some places, tin; and some of these contain such a proportion of silver, as is worth the extraction. Yet hitherto strangers have not ventured much into the Highlands, the reason of which, we may presume, has been, that property was formerly not so secure there as could be wished. The case at present is much altered for the better, since the plan formed by the last parliament for appropriating the forfeited estates in the Highlands to the public benefit, appears to be of such national importance; and, since his Majesty, in his late most gracious speech, recommended it to the present parliament to make such further provisions as may be expedient for perpetuating the due execution of the laws in that part of the united kingdom*, we may expect that not only improvements in the Highlands will be made in the mineral kingdom, but in many other manufactures, and in the fisheries. This will certainly give a new face, not only to the Highlands, but to every part of the kingdom of Scotland; it will convert, we hope, the spirit of rebellion into that of honest industry, and useful commerce, which will render the people prosperous and happy, instead of poor and turbulent, under his Majesty's benign government.

* See his Majesty's Speech, November 14, 1754.

As an inducement to cultivate the arts of mineralogy and metallurgy in Scotland in particular, where nature seems to have given so generous an invitation, we need only consider what a beggarly country Sweden would be without their mines; nor has Russia, of late years, less profited by them. Upon the whole, Scotland, it is certain, has by nature many advantages for trade; a large territory; of easy defence; plenty of people, if employed at home; a wholesome air; mines; a proper situation for the eastern and western trades; a safe coast; rivers of easy entry; the seas and rivers stocked with fish. This country is as capable of extended trade as any in all Europe; yet, 'till within these few years, it was reduced to a very low state: trade was ruined; the national stock wasted; the people forsook the country; the rents of lands were unpaid; houses in towns, and farms in the country, were thrown upon the owners hands; the creditors could not have the interest of their money to live on; and the debtors persons and estates were exposed to law.—But since the Union, the aspect of things is certainly greatly changed for the better; and, if this country had not unhappily been the dupes and bubbles of a rebellious crew, this nation would have certainly been in a far more prosperous condition. And it is to be hoped, that no wise measures will be wanting effectually to eradicate this cursed spirit of rebellion among the more ignorant Scots, for that is not likely ever to prove of other consequence to them than to promote, the spirit of anarchy, and, consequently, of woe and poverty.

Before I conclude this article of Scotland, I think it proper to acknowledge, that the chief matter of which it is composed was communicated to me by Francis Grant, Esq; brother to Sir Archibald Grant, Bart. and also to the right honourable the late lord high advocate of Scotland, and now lord Preston-Grange, one of the lords of session.

Of the WEIGHTS and MEASURES of SCOTLAND.

The weight in Scotland upon which not only their other weights, but likewise their liquid and dry measures are founded, is the French Troy ounce, being about one and four fifths per cent. lighter than ours; but their pound consists of 16 ounces, whereas that of our's is only of 12. There is no doubt but this ounce was originally the same with our's, and that it is only time and neglect hath made this difference.

The Scottish pint, upon which all their wet and dry measures are founded, ought to weigh, of the running water of Leith, 55 of those ounces, and to contain about 99 square inches: consequently, their three pints being as 297 is to 282, is 5 per cent. better than our beer gallon, near 103 of such pints going to our beer-barrel.

Their ordinary peck consists of $21\frac{1}{4}$ of such pints; but the peck used for oats, barley, and malt, contains near 31 of such pints; and thus their boll consists of four such pecks; their

ordinary peck is about one-fifteenth part less than our bushel, but the extraordinary about a fourth part more.

In this kingdom they did use to keep their accounts three different ways, viz. in Scotch pounds, shillings, and pence; in Scotch marks; and in English pounds, shillings, and pence: counting 20 Scotch shillings to a pound, and 12 Scotch pence to a Scotch shilling, and 13 Scotch shillings and four Scotch pence to a mark; a Scotch shilling being then only valued at the price of an English penny, and their mark was valued at no more than $13\frac{1}{3}$ d. English money.

But since the union of the two kingdoms, the same species of gold and silver as are coined in the king's mint in the Tower of London, pass current in this kingdom.

SEA DOMINION in general. The constant prosperity of our trade and navigation depending principally on the figure the nation is capable of making at sea, and preserving those rights and privileges upon that liquid element, to which we are not only intitled by nature, but by the laws of nations, and by treaties; it becomes necessary, in a work of this kind, to take proper notice of a topic of such high concernment.

By the word sea, according to the genuine signification, is understood the ocean and main sea, as well as gulphs and inland seas, such as the Mediterranean, Adriatic, Egean, British, and Baltic Seas, which are more immediately subject to dominion: for as to the sovereignty of the vast ocean, no man can pretend to it, unless he was lord of the universe; and the dominion of every prince and state can extend no farther on the main seas than where it is reasonable that his neighbours should begin, or where the particular dominion is lost in the boundless deep.

By dominion is meant a propriety, or right of using, enjoying, disposing of, and freely alienating the thing so enjoyed and possessed. This dominion is of two sorts; that which is common to all men, as possessors without distinction; and that which is particular to some, appointed and set apart by peculiar persons or states, so that all other persons are excluded from a liberty of use and enjoyment, without the previous consent and permission of the proprietor or enjoyer.

That the land is subject to such a dominion is not doubted; but several have objected against the dominion of the sea. They say the nature of the element will not admit of any such property, that being fluid, and, consequently, subject to a continual alteration, by the accession of new waves, which continually shift from one place to another; whereby the state of it is so absolutely uncertain, that it is hard to suppose any part of it retainable in a particular possession, which naturally consists in the distinction of limits, and they cannot conceive this possible in the sea.

To which it is answered, That as God has ordained the land should be ruled, protected, and governed by public power, so the same is appointed for the sea, which cannot be alleged to be near so fluid as rivers, the property of which has been seldom, if ever disputed. If it is said, Rivers being bounded on either side by land, can admit of particular dominion more easily than the sea, this makes for our purpose, to prove the king of Great-Britain's title to the sovereignty of the British Seas, they being in a great part bounded by land.

But to answer the above-mentioned objection more generally; no reasonable man will deny, that tho' the water is frequently shifted, the channel, or space of ground over which it flows, continually remains the same; and when a man is said to rule over a sea or river, it is understood not of the element, but of the site where they are placed. The waters of the British and Adriatic seas continually run out, yet the sea is the same; as the Tyber, Po, Rhine, Thames, or Severn, are the same rivers as they were a thousand years ago; and this is what is subject to princes by way of protection and government.

Would it not seem ridiculous if any man should allege, that the sea ought to be left without protection, so far that any one might do what he pleased there, well or ill, rob or spoil? Which alone argues, that the sea ought to be governed by those to whom it most properly appertains by divine disposition. The air is a much more fluid element than the water, and yet that space which is above any piece of land that any particular person possesses, is so absolutely the property of the owner, that he may lawfully hinder any man from extending a scone, or any thing from any contiguous building, that may reach over his ground, even though the foundation of any such building be entirely upon the ground of him who owns it. And if the possession of the ground gives the proprietor an unquestionable title to the dominion of the air, the possession of the channel of the sea must sufficiently intitle the possessors to the dominion of the waters. As to their not being capable of limits and bounds, on account of their fluidity, that is a frivolous argument: for, unless the sea is supposed to be infinite, it must necessarily be bounded; and it is certain the sea and land do so mutually embrace one another with crooked windings and turnings, this by peninsulas and promontories, and that by creeks and gulphs, that they both promiscuously set bounds to one another; and, besides, it has been bounded.

Others

Others object against the particular dominion of the sea, that freedom of passage, commerce, and traffic, is a right so inherent to mankind, that it can no where be abrogated or abolished, by any law or custom whatsoever, and that the sea is like the highway, common to all. To this we reply, It is so, as much as other highways by land, or great rivers are, which, though common and free, are not to be usurped by private persons to their own intire use, but remain to the use of every one; not that their freedom is such that they should be without the protection and government of some prince or state.

As the sea is capable of protection and government, so is the same, no less than the land, subject to be divided among men, and appropriated to cities and potentates; which long since seems to have been ordained as a thing most natural.

As to the community of the sea by freedom of passage, no body pretends an inoffensive passage ought, or can in reason be denied to travellers and strangers at sea, in as much as it has relation only to the offices of humanity, and where there is no cause of fear or jealousy; which freedom of passage does not in the least derogate from the dominion of the place where such persons are permitted to pass: because the passengers being allowed that liberty, not as having a regal right and title to it, but by permission; and the permitting of another to participate of any thing, does not in the least divest the owner of his propriety, or any ways diminish his power over his own, especially when he himself loses nothing by it. All passages through foreign countries are (as they ever have been) subject to such limitations and restrictions, as the several princes and sovereigns of the countries, through which passage is desired, think fit for the welfare and security of their own people, as well as of their allies.

The right of the flag, which is in the crown of Great-Britain, demands a mark of respect from all ships passing in the British Sea, and is the limitation and restriction on which such passage is permitted. As to that part of the objection which relates to the liberty of trade, it appears, at first view, so trivial, that it needs no other confutation but a flat denial, as the objectors give no other reason but their bare assertion: but, to silence them, let us suppose that, in time of peace, France would exchange her wines with England's wool, and the English, not finding it consistent with the interest of the nation to let the wool be exported (as certainly it is not) nor being willing to give the French money for their wines, since they can be abundantly supplied with that commodity from Spain and Portugal, in exchange for English manufactures, should refuse any such commerce with France; the question is, Whether France has any right to compel England to compliance with her demand? Who is there that will not answer in the negative? it being certain that every nation in the world may consent to or refuse all traffic with any other, as they think fit, except there has preceded some treaty or compact to the contrary. Some who oppose the dominion of the sea, instead of arguments, pretend to produce authorities against it, which we shall observe, as far as they seem to have any weight with them.

They tell us Antoninus Pius, according to Marcianus the lawyer, and Justinian in his Institutions, declared, That, by the law of nature, the air, as well as the rivers, the sea, and its shores, ought to be common to all. Accordingly he allowed the fishermen of Formia and Capena (and all others in general) to fish upon the shore, with this provision only, that they should not meddle with towns, monuments, and buildings, which were not by any law common to all. They also cite Ulpian against the dominion of the sea, as saying, That the sea, being by nature free for all, cannot be subjected by any peculiar law or private dominion; and in another place, That the sea and shores are common to all, as the air, and that it is often declared by the emperors, That none should be deprived of the liberty of fishing. We are told also, that Antoninus Pius said, That he himself was lord of the world, but the law of the sea. If the opinion of some particular persons was of sufficient authority to build the suppositions of the absolute community of the sea upon, these objections might be of some force: but, by inquiring diligently into the laws and customs of most ages and nations, we shall find the matter to be quite otherwise; and to evidence it, in the course of our argument, we shall instance several nations that were successively in possession of the sovereignty of the Eastern Seas. As to the testimony of Ulpian, let us make use of him himself against it: for he reckons the revenues of fisheries (which are generally looked upon to be part of the regalia, or royalties of the prince) among the public customs, and places fishponds among the other possessions that are deemed liable to pay assessments. Justinian's laws, as excellent as they are, have suffered considerable infractions and alterations, and particularly in one relating to the marine: for by his laws, ships driven by tempest upon a shore, should either belong to the former owners, or as things relinquished and unpossessed become theirs who first should find them; which good law is confirmed in the German empire, but intirely altered by several other nations, and, among others, by the English. In a word, it is not to be supposed that Justinian meant, by any decree or institution of his, to forbid a particular domi-

nion of the sea, since he appropriated the Hellespont to himself, in such a manner that the liberty of that sea, and the ports there, cost the merchants and mariners that frequented them very dearly, according to Procopius, who was his contemporary, and wrote his history. The most considerable authority the objectors quote, is the answer of the emperor Antoninus Pius, That he himself was lord of the land, but the law of the sea. This matter being put in a wrong light, the reader should be informed of the fact, which is this:

Endemon Asiaticus, a native of Nicomedia, a city in Bithynia, having suffered shipwreck in the Egean Sea, and his goods having been seized by the customers of the Cyclades Islands (in the Archipelago) he represented to the emperor Antoninus how unjustly and cruelly these custom-house officers had dealt by him, and petitioned him for relief (according to Volusius Marcianus, who was one of that emperor's privy-counsellors) in these words, Oh emperor Antoninus, our lord, we having been shipwrecked, were robbed of all by the receivers of the customs that inhabit the Cyclades Islands! To which the emperor made him the following answer, I indeed am sovereign of the world, but the law of the sea: let it be determined by the Rhodian laws [see RHODIAN LAWS] which are prescribed for the regulation of sea affairs, so far as they are not opposed by any of our laws: for the emperor Augustus was also of that opinion. The only controversy that ever was about the reading of this answer, is in relation to the pointing of it, and particularly to the full point, or period, which is found after these words, But the law of the sea: there being a full point after the words beforementioned, the objectors allege, that the BUT implies the emperor indeed acknowledged himself to be lord of the land, but not of the sea, and that the law only, and no man, was lord of the latter. Whereas the true sense of this answer seems to be, That sea affairs ought properly to be determined by the Rhodian law, which was appointed to be the rule in such cases: for since the emperor ascribed to himself the sovereignty of the whole world, he undoubtedly intended in that to comprehend the sea; which, as well as the land, was subjected to his authority, though in a different manner, controversies in relation to land affairs being always determined by the Roman laws only, but those relating to marine affairs were decided according to the sea laws of the Rhodians; with this restriction, indeed, that the Rhodian laws should only take place when they did not oppose any Roman law: besides the disputes about the reading of this answer, Joannes Ignæus, and others, affirm, That the emperor Antoninus, far from declining to ascribe to himself a dominion over the sea, rather seems to intimate, by this answer, that he was lord of it; alleging, that, by these often-recited words, I indeed am sovereign of the land, but the law of the sea, he means to say, I indeed am the lord of the world; and I also am the law of the sea. With this agrees the opinion of the learned Samuel Petit, a Frenchman, who says, Antoninus does not here deny himself to be lord of the sea, so as to decline to give law, and do justice to those who frequent it; for, on the contrary, he orders the controversy between Endemon and the customers to be determined according to the Rhodian law; by which law, however, he does not think himself so tied up, as to be deprived of other means of relieving Endemon, even against it, in case he should sustain any injury by the Rhodian law, which he plainly and positively makes subject to his own laws. Monsieur Petit adds, he believes the Greek word in the petition (which was both made and answered in that language) that signifies law, has been by a mistake inferred for another; that has some affinity to it in the sound and letters, and signifies wind: so he makes the emperor say, I indeed am lord of the land, but the wind of the sea. Whether the fault is in the pointing, or in the construction, it is very unlikely that Antoninus should assert a thing contrary to the known laws and customs of all ages, and his own imperial prerogative.

The opinion of the sovereignty of the sea has been opposed by two very learned men, whom we may suppose to be set to work by their several masters, and wrote to serve a particular turn: the one is Fernando Vázquez, counsellor to Philip III. of Spain, the other the famous Hugo Grotius. Vázquez, in his Discourse of the Law of Nature and Nations, writes to this purpose: Their opinion is not much to be esteemed, who imagine the Genoese or Venetians may forbid others a passage through their respective gulphs, as if they could lay claim to those seas by prescription; which is equally contrary to the imperial laws, and to the primitive law of nature and nations, which cannot be subject to any alteration. That it is against this law is evident, because by it not only the seas, but all other immoveable things whatever, were in common; and though afterwards that law came to be partly abolished, so far as it relates to the dominion and propriety of lands, which being first enjoyed in common, according to the law of nature, were afterwards divided and separated from common use; yet it is otherwise as to the dominion of the sea, which has been from the beginning of the world, and is to this present day, common, without the least alienation, as is universally known.

And many of the Portuguese are of opinion, their king has acquired, by prescription, such an ancient right to the vast ocean of the West-Indies, that he may lawfully refuse other nations passage through it; and the vulgar sort of Spaniards seem likewise to be of opinion, that no people but themselves have a right to sail through that vast and spacious sea that leads to the Indies, which the kings of Spain have conquered, as if they also obtained a right by prescription to them; yet we look upon these mens imaginations as no less vain and foolish than the opinion of those who have dreamed the same things of the Genoeve and Venetians. The law of prescription can be of no force in deciding controversies which happen between princes and people that acknowledge no superior, because the peculiar civil laws of any country are of no more weight, in relation to foreign nations, than if such laws had never had a being: so that for deciding controversies of that nature, recourse must necessarily be had to the general law of nations, originally or secondarily, which certainly can never admit of such an usurpation of a title to the dominion of the sea by prescription.

The reader, by the weakness of these arguments, will have a taste of the rest, and desire no more of them. Notwithstanding Vaquez has the character of a great man in the learned world, he begins with a plain contradiction; for although he says he holds the law of nature to be absolutely unchangeable, and cannot be subject to any alteration, yet he owns afterwards, that law came to be partly abolished, &c. He acknowledges, that, by the law of nature, the land was common at first, and being evident that it is not now so, what should hinder a private dominion of the sea, which, according to himself, was not more common in the beginning than the land? For if he alleges that such a property over the land is usurped, as he says of that of the sea, he overthrows all property, and abolishes all laws, both divine and human; and if, on the contrary, he acknowledges such a dominion over the land to be just (as certainly it is) why then should he deny a propriety of the sea?

The other parts of his discourse are of the same strength; for whereas he says the sea has been from the beginning of the world, and is to this day common, as is universally known, it is so plain a falsehood, that one would wonder a man who, in other things, is extolled for his wisdom and sufficiency, should assert a thing so contrary to the laws and customs of most ages and nations, as we shall see presently: but Don Vaquez was to please the court of Spain, who then were on no good terms with the republic of Venice, whose greatness at sea hindered the Spaniards from being masters of the Mediterranean. The senate asserted their dominion in the Adriatic about the same time, as may be seen in Julius Pancerius's tract of the Dominion of the Sea, where we find enough to confute what Vaquez says of the Venetians: it is in the second book, chap. 6. In the year 1630, Mary, sister to the king of Spain, being married to the emperor's son Ferdinand, king of Hungary, and the Spaniards designing to convey her from Naples with a squadron of their own, the Venetians suspected they intended some infringement of their privileges by this specious precedent, which they might, perhaps, afterwards pretend to make use of to their prejudice, and thought they took this occasion, when the republic was involved in a war abroad, and infected with the pestilence at home, to endeavour to undermine the sovereignty of the Adriatic Sea; which had been uninterruptedly enjoyed by the signiory of Venice by immemorial prescription.

The Spanish ambassador having acquainted the state that his master's fleet was to transport his sister, the queen of Hungary, from Naples to Trieste, the doge answered, That her Majesty should not pass but in the gallees of the republic. To which the ambassador replying, That they were infected with the plague; the senate met to consult about it, and came to the following resolution: That his Catholic majesty's sister should not be transported to Trieste in any other fleet but that of the republic, according to the usual custom of the gulph, with which her Majesty should be attended, with all the marks of respect and deference that were due to her quality; adding, that if her Majesty proceeded any other way, the republic would by force assert her rights, and attack the Spanish gallees in an hostile manner, as if they were enemies. Upon which the Spanish ambassador was obliged to desire the favour of the senate to transport that princess with their gallees to Trieste, which was accordingly performed by the Venetian general, Antonio Pisani; and both the emperor and king of Spain returned the Venetians thanks; which is a plain indication that they did not then call in question the Venetians title to the dominion of the Adriatic Sea.

The most considerable adversary we have to deal with in this controversy, is Hugo Grotius, author of the celebrated piece, intitled *Mare Liberum*, which the learned Selden fully answered in his *Mare Clausum*. After the treaty between the Spaniards and Hollanders, held at the Hague in the year 1609, concerning the freedom of trade and navigation to the East-Indies, the above-mentioned author published his book, with an intention to prove that the Hollanders had liberty to trade to the East-Indies; which he endeavoured to do by the law of

nations, allowing such a liberty of navigation to all mankind, in which none can be molested without injury.

He asserted further, That the right of navigation through the Atlantic and Southern Sea to the Indies, cannot be the propriety of the Portuguese, or of any other nation in particular; because the law of nature not only permits, but requires, that should be common. The learned author of this tract had certainly good reason to assert the Hollanders and other nations right to the liberty of the Atlantic Ocean, and to trade in the Eastern Seas as well as the Portuguese: for who can say in the midst of the vast deep, such a channel or such a space is mine? and who has a right to exclude any one a passage through the main? So that the dispute is brought within a narrower compass; and by the dominion of the sea, is only meant the sovereignty of such a part of it, as, bounding any country, may be said to belong to it, and to extend as far as certain imaginary lines or visible marks. And herein Grotius agrees in some measure with us, when he says, that such small parts of the sea as can in a manner be inclosed, if they may be at all possessed, ought to fall to them who first acquire a title to them by occupation. Now the difference between a greater and less part, cannot well take place in the determining of a private dominion; since it is not the space nor the extent of the thing possessed, but the nature and validity of the title, by which the matter should be decided. And the author in another place in express terms excepts a bay or creek; and says elsewhere, he does not speak of an inland sea, which being straitened on either side, exceeds not the breadth even of a river, but the ocean; which the Ancients called immense and infinite, the parent and original of things confining the air, &c. He adds a little after, The controversy is not about a freight or creek in the ocean, nor of so much as in the view of the shore. And in other places, he says things much to the same purpose; so that in the dispute about the sovereignty of the British Sea, we should have little to do with him; for he grants enough to warrant the crown of Great-Britain's asserting its dominion over it. He advances every thing modestly, and the main of his argument tending to set free the Atlantic and Southern Seas from the sovereignty the Portuguese claimed, he is in the main in the right; for it is impossible to possess the whole ocean, or to have a title to the dominion of it, unless a prince or people were sovereigns of the whole world. Alexander's conquests gave him but a small sea-dominion, about half the Mediterranean, and part of the Indian Sea. The Romans, indeed, had a title to the dominion of almost all the known part of the Great Ocean, as lords of the shore: but there never was, nor ever will be, a power so infinite as to subject the whole world, and to be sovereign of both sea and land, exclusive of all others. The sea bounding the land under the subjection of any prince, will be under his dominion. Grotius, in his excellent treatise de Jure Belli & Pacis, says*, The land and rivers, and any part of the sea that may fall under the private dominion of any nation, ought to be open to such as have occasion to pass upon just and necessary grounds; and even a creek, or narrow sea, may be possessed by any that possess the land on both sides, provided the space of sea be not so great as, being compared with the land, it cannot seem to be any part of it. In a word, he acknowledges the right of primary occupation of creeks and streights of the sea, at least, that it was not by virtue of any natural right that the sea was not appropriated and entered upon by occupation, attributing the community of it only to custom, and confessing that custom being changed, the reason of the community ceases. That it has been changed, is too well known to need any further proofs of it against Vaquez, and as much of Grotius as is against the dominion of the sea.

* Book ii. chap. 2. § 13.

We might bring many authorities of the same weight, but shall only take notice of two or three, as Reginus Sixtinus, in his book de Regalibus, where he says, The thing in question concerning the sea and its shore is, whether they ought, as navigable rivers, &c. to be reckoned among the regalia, or royalties, of the prince, every thing that is reputed such being as much the private and peculiar right of the prince, as the subjects estates are theirs. And so Catheranus Decis. 155. no. 81. and Ferrarius Montanus de Feud. book v. chap. 7. reckons the sovereignty and dominion of the sea among the royalties of the prince, without making any distinction between that and a public river. And Myningerus, Aul. 1. no. 162. decad 11. says, The property of the sea is a part of the royalties of the prince. But not to detain the reader longer on this head, we shall prove by law and history, sacred and profane, ancient and modern, that the sea is capable of a private dominion and propriety.

Holy writ, in more than one place, justifies this; for there we find it said, Replenish the earth and subdue it, and have dominion over the fish of the sea, &c. And again, The fear of you, and the dread of you (which are terms implying dominion) shall be upon every beast of the field, and every fowl of the air, upon all that moveth upon the earth, and upon all the fishes of the sea, &c. Which words, though it must be

be acknowledged they are not meant of private dominion (since, in the persons of our first parents, and of Noah and his three sons, this blessing was given to them and their posterity in general;) yet it is by no means to be forgotten, that the sea and land did so pass together at first into the common enjoyment of mankind, that from hence we may very reasonably conclude, that being both in one globe, there could be no such diversity in their nature, as might hinder the one more than the other to pass at the pleasure of men, in the future distribution of things, into private dominion and possession. Nor is there, by that donation, any community ordained; mankind are left to their own choice, to use and enjoy both sea and land, as they think fit. To these passages of Scripture, the objectors oppose other, as, The heavens, even the heavens are the Lord's, but the earth hath been given to the children of men. From which they pretend to infer, that there being no mention of the sea, the Almighty reserves that peculiarly to himself; which explication is formally contradicted in several places of the Scriptures, and particularly in that above cited. They may as well say God is not the creator of the sea, because in the same Psalm it is said, You are blessed of the Lord, that made heaven and earth. Who will deny but that the Psalmist, by the word עָרֶץ, means the world in general, which comprehends both sea and land? And both are equally possessed by the children of men. Several other passages of Scripture are quoted on both sides in this controversy; but the objectors find them as little to their purpose as that before recited out of the Psalms. We shall now give instances of the private dominion of the sea possessed by several nations: and first by the

TYRIANS.

Tyre was a town great in strength and riches, by her commerce; according to Isaiah, The harvest of the river is her revenue; than which nothing can be more expressive, nor more elegant. And again, speaking still of Tyre, The sea has spoken, even the strength of the sea. Nothing can be more apparent, and no authority so full and unexceptionable. It is said by the Psalmist, I will set his hand also in the sea, and his right-hand in the rivers; by which, according to Eben Ezra, the dominion of the waters is assigned to king David, that he might rule over such as failed therein. There is also a clear and convincing passage in Holy Writ to our purpose: And the king Ahazuerus laid a tribute upon the land, and upon the isles of the sea; by which it appears very plainly, that prince was lord of the sea and islands, upon which he imposed a tribute. There are some apocryphal texts, which confirm what we assert; as that, O ye men, do not excel in strength, that bear rule over the sea and land, and things in them: but yet the king is more mighty, for he is lord of all these things, and hath dominion over them. And that, The sea is set in a wide place, that it might be deep and great; but in case the entrance were narrow, like that of a river, who then could enter the sea, to look upon it, and have dominion over it, without passing through the strait? Whoever will give themselves the trouble to look over the comments of the Jewish rabbins in the xxxivth chapter of Numbers, where the bounds of Canaan are set out, will find they are positively of opinion that the sea is included. The rabbi Jehuda, a celebrated interpreter of the law, from the express words of the holy law concludes, that the whole sea, lying before the western coast of the Holy Land, being limited by strait lines drawn on each side, from the north-east and south borders, through that great sea into the west, having been, together with the main land, given to that people by God, those precepts should no less be observed in that immense ocean, than in the Holy Land itself, according as the author's opinion is delivered to us in the most ancient digests of the Jewish law, de Libellis Divortii & Manumissionis, cap. i. fol. 8. All that lies directly opposite to the land of Israel, is of the same account with that law, according as it is written, As for your west border; you shall even have the great sea for a border; this shall be your west border, the border of the sea, or of the west. Also the islands situated on either side, in the same direct line, fell under the same account with the sides themselves; so that a line being drawn through the isles, from Cephalonia to the main ocean, and also from the river of Egypt to the ocean, whatever is contained within that line is under the dominion of Israel, and what lies without that line is out of its dominion; which this author, rabbi Eben Ezra, and others, made to reach through even the Spanish Sea, notwithstanding its vast distance from the continent of the land of Israel; alleging by that passage, where it is said, The great sea shall be thy border, it was meant, the great sea, which of itself was their border, should also be their possession. This is, perhaps, to stretch the sovereignty of the Jews too far; and other rabbins, by moderating their explication of the law, come nearer to the true meaning. They would have a straight line drawn from the promontory of Mount Hor, to the entrance of Pelusium, or from the north-east to the south, by which they would bound the western dominion of the Holy Land, reckoning whatever space of sea or island

should fall within the compass of the said line towards the East, should belong to the territories of Israel. After this manner, the said line would include very considerable spaces of the sea, lying before the shore inhabited by the tribes of Ashur, Ephraim, Dan, Zabulon, and Simeon; which sea was looked upon to be the property of that people, as well as the land, according to the digests of the Jewish laws.

Of these two opinions of the rabbins, this latter (by which only the adjacent parts of the sea are conceived to be, by God's appointment, assigned with the Promised Land to the children of Israel) is the most universally received, as is evident, not only by both volumes of the Talmud, but also by the testimony of the most learned rabbins, Moses Maimonides and Moses Cotzenis; and this latter opinion serves directly our purpose, as well as the first; for we assert, That the sea is capable of dominion, and it is not the extent, but the nature of the thing, that is here called in question.

By the law civil and domestic, as well as by the common law, whether intervenient or imperative, and by the most known practice and custom of the most renowned nations and kingdoms that are known to us, such a sovereignty and dominion of the sea has been universally admitted. It must be allowed, either that all these mighty nations, who either by virtue of some domestic law of their own, or of some other law common to themselves and their neighbours, have admitted of such dominion, are, or have been, competent judges of the natural permissive law; or else it must be supposed, that the most famous nations of the world have erred for many years against nature, the law of which, according to Justinian, is, That which being established by natural reason amongst all men, is observed by all alike, and called the law of nations, because it is supposed to be a law which all nations use; see his Institutions de Juré Naturali: with which passage that of Caius, in his book de Acquirendis Rerum Dominio, very well agrees, where he says, The law of nations is by natural reason observed in the same manner amongst all men. And that the dominion of the sea has been the law and practice of nations, we are now to prove from profane history first, and then that it has been continued down to our own times.

The inhabitants of the island of Crète, now called Candia, had a very large dominion in the neighbouring seas, as appears in the writings of Diodorus Siculus, and others, particularly Thucydides, who tells us, when they acquired this dominion, Minos, the son of Lycastus, son of Jupiter, king of Crète, possessed all the Cretan, and a great part of the Egean Sea, as sovereign lord of it. And according to Eutropius, the empire of the Cretans over that part of the sea, did not expire till Cæcilius Metellus made an intire conquest of that island. We may see, by Plato's works, that the sea laws of the Cretans were attributed to Minos. This dominion of the Cretans is supposed to be in the time of the Judges, and to have lasted till that of the Lydians, which began 175 years afterwards. These

LYDIANS,

According to Eusebius, held this dominion 92 years; but Isaac Casaubon was of opinion, that XCII was by a mistake inserted in the Greek for CXX. Marius Scotus, and Florence the monk, both make mention of the dominion of the Lydians, which is generally reckoned to have begun about the time of Æneas. Their successors in it were the

PELAGES,

Of whom Eusebius says, They in the second place possessed the dominion of the sea, which is meant exclusively of the Cretans, who were not in his catalogue; and though this author makes their dominion to last 85 years, it is conjectured it did not last above 55. The time of it is placed in the days of Solomon. And after them the

THRACIANS

Held the dominion of the sea, which began in Jeroboam's reign; but authors do not agree how long it lasted. We now come to the

RHODIANS,

Who, though they are omitted by Marius and Florentius, according to Eusebius, held the dominion of the sea 23 years, beginning about the reign of Josaphat. Strabo in his fourth book says, That Rhodes was sovereign mistress of the sea a considerable time. They indeed have rendered their name and sovereignty immortal, by their sea laws; which, as Constantius Harmenopolus affirms, in his Porchir. Juris, lib. xii. tit. 11. are the most ancient now in being, and were in force among the Romans from the time of Tiberius, as you may see in Jus Græco-Romanum, tom. ii. p. 265. The passage before-mentioned, in the emperor Antoninus's answer to Enderion's petition, confirms this; and it is certain, the emperor Justinian put those laws into the Digests. Next to them the

SEA

PHRYGIANS

Acquired the dominion of the sea, as it is supposed, in the time of Lycurgus. Eusebius writes they maintained it 25 years, others say 26; and then the

CYPRIONS

Possessed it. Some authors say they maintained it 23 years, and others 31 years: the time is said to be the reign of Joaz. The

PHOENICIANS

Held this dominion in the days of Uzziah, king of Judah: from them all the bottom of the Mediterranean was called the Phœnician Sea; and Pliny tells us, That people were very skilful in the art of navigation, insomuch that Atergatis, queen of Syria and Phœnicia, published an edict, importing, That it should not be lawful for any one to eat fish without her licence and permission: it afterwards became customary to consecrate to Atergatis fishes of gold and silver, when she was placed among the goddesses. After the Phœnicians the

EGYPTIANS,

As we find in Eusebius, Marianus, and Florence the monk, were sovereigns of the sea, under their kings Phamnitis and Bocchoris, who flourished a little before the beginning of the Olympiads. Next to them the

MILESIANS

Held this dominion; and though Eusebius takes no notice of the time they enjoyed it, Marianus and Florence agree their dominion lasted 18 years. Stephanus also observes, That Naucratis, a city of Egypt, was built by the Milesians, who then possessed the sea: Eusebius adds, their sovereignty was about the time of Romulus. They also built Sinope, on the Euxine Sea, which, according to Strabo, in his xiith book, commanded the sea flowing within the Cyanean Islands. The

CARIANS,

As Eusebius, numb. 1281, and Diodorus Siculus, biblioth. 5, enjoyed a dominion in the sea, about the time of the good king Hezekiah; as did afterwards the

LESIANS.

See Eusebius, numb. 1341: their dominion, according to some authors, lasted 69 years; but Marianus makes it last but 58 years. The

PHOCIANS

Succeeded them in the dominion of the sea; about the time of the Jews captivity at Babylon; and Eusebius writes, that they maintained it 44 years. The

CORINTHIANS

Were also sovereigns of the sea, though they are omitted in the catalogues of the historians; however, Thucydides, lib. i. reports, that being very potent in shipping, and mightily suppressing piracies, they acquired a very great reputation and command by sea, as well as by land. He takes notice also of their diligence and success in restoring the affairs of navigation to their former perfection: it must nevertheless be confessed, that authors have been too silent with respect to them and the

IONIANS,

Whose dominion of the sea is taken notice of by the same historian, in words to this effect: the power and strength of navigation were in the hands of the Ionians in the time of Cyrus the first king of the Persians, and his son Cambyfes. The

NAXIANS

Enjoyed this maritime sovereignty after them, during the space of 10 years, in the reign of Cambyfes and Darius; they inhabited the island of Naxos, one of the Cyclades, in the Archipelago. After them the

ERETRIANS

Possessed the dominion of the sea for about seven years. They were so called from Eretria, a rich and famous city in the island Eubœa. The next masters of the sea were the

ÆGINETÆ:

They were the inhabitants of the island Egina; and not long before the Peloponnesian war broke out, were so strong at sea,

SEA

that they insulted the Athenians, and it was to curb them that the state of Athens increased their naval strength, by which they afterwards acquired the sovereignty of the Eastern Sea. Not only Eusebius, but Strabo and Elian, take notice of the dominion of this people: some make it last 10, some 20 years, and some more. But the Athenians were too great a nation, to suffer so inconsiderable a people as the Æginetæ were, to enjoy this power long. After them the

ATHENIANS and LACEDÆMONIANS

Enjoyed the sovereignty, though they are not inserted in the catalogue of the lords of the sea. Demosthenes, in his 11th Phil. says, The Lacedæmonians had a dominion over the sea and over the land, and who does not know that Eurymachus the Spartan, commanded the Grecian fleet in the war between the Grecians and Xerxes? It is true, the Lacedæmonians were not so strong by their own naval strength, as by that of their allies the Peloponnesians; but their dominion at land was the occasion of their being preferred to the dominion at sea; and they always had the chief command, 'till the famous Timotheus an Athenian general, having subdued Corcyra, brought the people of Epirus, the Athamanians, Chaonians, and other nations, to enter into an alliance with them. Upon which the Lacedæmonians found themselves under an indispensable necessity to resign the sovereignty of the sea to the Athenians, in a treaty of peace then concluded between the two nations.

The Lacedæmonians were not allowed to put to sea so much as one ship of force, but ships of burthen only; and the Athenians obliged Artaxerxes Longimanus king of Persia, to agree, That the king's ships should not come within the length of a horse-race of the Grecian Sea, and that it should not be lawful for him to send any ships of force within the Cyanean and Chelidonian Islands, which formerly had been infested by his navies, as may be seen in Plutarch's life of Cimon the Athenian. Indeed, the Greek history is full of instances of the power and dominion of the Athenians at sea. Isocrates speaking of it tells us, It was not lawful to sail in long ships or gallees beyond Phælis, a town situated in a direct line with the Chelidonian Islands.

This dominion was entirely lost in the end of the Peloponnesian war, when Lyfander destroyed their fleet and took Athens. And they never recovered it so far as to be said to be masters of the sea afterwards, though they grew powerful again. If any should be curious to know how these catalogues of the maritime sovereigns have been preserved, we can only inform them, that it is very probable, that Castor Rhodius, who lived about the time of Augustus Cæsar, and wrote a history of those that had ruled at Sea, as Suidas witnesses, furnished Julius Africanus and Eusebius with these lists of the nations who held dominion at sea, though Castor's history is itself lost.

To continue as far as we can trace this dominion of the sea after the Athenians lost it, there were not above 70 years between the Peloponnesian war and the reign of Alexander the Great. When the Tyrians, according to Quintus Curtius, had not only a sovereign dominion over the neighbouring sea, but was mistress over all the seas through which their ships did sail. Before this we find by the Greek histories, that the Lacedæmonians were again masters at sea, and the Boeotians aspired to it, if they did not obtain it after their successes at land. But the Tyrians were such absolute masters, that Tyria Maria, or Tyrian Sea, became a proverbial expression for all seas possessed, so as the passage through them could not be obtained without the permission of the lord.

We find a query in Aristotle's works, Whether it be for or against the interest of any well-governed nation, to maintain a sovereignty of the sea, so as to exclude all others from the benefit of navigation through the part so possessed, either upon account of passage, traffic, or fishing, &c.? But he had been too well instructed of the lawfulness of such a dominion, by the continual practice of all the neighbouring nations, to declare against it. Though the many instances that have been given of the sovereignty of the sea from ancient history, are sufficient to convince any reasonable man, that it is capable of dominion; yet we shall add some further arguments, which seem to corroborate what has been urged.

It is very well known by all who are acquainted with the histories of ancient times, that according to the custom of the East, the symbols of dominion and empire, which the kings of Persia demanded of the Greeks and other nations, were earth and water; by which was undoubtedly meant the empire of the sea as well as the land. Darius demanded earth and water of the Athenians and Lacedæmonians, who threw his ambassadors into a well. He also demanded it of Indatyrus king of Scythia, as we find in Herodotus, and in the Greek copies of the history of Judith; that Nebuchadnezzar required earth and water of the neighbouring nations, with which he threatened to make war.

Several parts of the sea belonging to the Eastern Empire were reckoned among its provinces and governments. Witness Constantinus Prophragennetus, lib. 1. Them. 17. where he says, That the Hellespont was very expressly assigned to

the commander in chief of the Egean Sea. And again, That the Egean Sea was reckoned among the provinces of the empire, and that the Cyclades Islands, and the most remarkable of the Sporades, Myteline, and Chios, belonged to the government of the Egean Sea. The emperor Leo by a decree declared, that every man should possess the sea lying before his lands, by such a peculiar and unquestionable right, that he should have power to deprive any other person of using or enjoying the same in any manner, so as to reap any gain or benefit, without the special consent of the owner. By which the opinion of the universal community of the sea is utterly destroyed, and a private and separate propriety and dominion introduced. This decree took immediate effect about the year of our Lord 900, without any opposition, over all the Egean Sea, as well as over the Bosphorus, Hellespont, and all the other seas subjected to the Constantinopolitan empire. We have hitherto confined ourselves to the Levant or eastern part of the Mediterranean: let us now see how the dominion of the sea was maintained in the western; where first we find the

SPINETANS,

So called from the ancient city Spina, situated near the mouth of the river Po, in possession of the sovereignty of the Adriatic Sea; where, as we read in Strabo, lib. 5. and Dionysius Halicarnassæus, de Orig. Rom. lib. 1. they raised such considerable revenues, that they used to send very liberal tenths to the temple of Apollo at Delphos. The same author adds, that the

TUSCANS

Were absolute sovereigns of that part of the Mediterranean that washes the southern coast of Italy. And Diodorus Siculus, lib. 20. says, The Tyrrheni or Tuscans were so powerful upon the sea, which they possessed as lords of it, that at last it took their name. But the

CARTHAGINIANS

Grew so mighty at sea, that all other naval dominion ceased, and none could pretend to dispute with them the maritime empire, 'till the reign of Agathocles, king of Sicily, who shared for some time with them the sovereignty of the sea. His subjects in Africa revolting from him about the 118th Olympiad, the dominion of the Mediterranean devolved almost entirely upon the Carthaginians, who held it near 40 years, and gave laws to all navigators, 'till the beginning of the first Punic war, when the Romans refused any longer subjection to them at sea. Before this, the people of Rome, notwithstanding they had extended their conquests very far at land, gave up the sovereignty of the sea to the Carthaginians, as we may see by the first league concluded between these two mighty states, about the 68th Olympiad. By which Polybius tells us it was stipulated, That neither the Romans nor their confederates, should sail beyond the Fair Promontory, unless they should be driven thither by tempests or enemies. And Polybius further gives an account, That in the second treaty of peace concluded between the two nations, it was provided, That no Roman should so much as touch either upon Africa or Sardinia, except it were either to take in provisions or repair their ships. But after the second Punic war, when Carthage was forced to submit to what laws the Romans, their conquerors, pleased to give them; when the Roman fleet was also victorious at sea as well as Scipio by land, the dominion the Carthaginians held at sea, was of course transferred to the people of Rome; and, indeed, they became masters of the Mediterranean, before they were masters of Carthage; so industrious had they been to increase their naval strength, without which they say, they could never subdue their rivals, the Carthaginians: for Hannibal in his speech to Scipio, in the 30th book of Livy, seems to acknowledge the Romans to be lords of all the Mediterranean, and its islands. And accordingly after the conclusion of the peace at the end of the second Punic war, the Carthaginians themselves burnt 500 galleys, that they might not be obliged to pay homage to their conquerors, of whom they had formerly exacted the same marks of submission. The

ROMANS

Having thus acquired the dominion of the sea, were very careful to maintain it, and had always a powerful fleet ready, either to suppress pirates, or assert their sovereignty.

The fleet that was given to Pompey to scour the Mediterranean Seas, is mentioned by all the Roman historians; and Pliny tells us, that by freeing the sea from pirates, he restored the dominion to the people of Rome. He also made them masters of that part of the sea, to the sovereignty of which the Cilicians pretended, as appears by an ancient league between them and Antiochus king of Syria. That the latter should surrender his warlike ships and their furniture, except ten galleys, none of which should be rowed with above thirty

VOL. II.

oars; and Polybius says, it was not allowable for him to have so much as one with that number of oars; and that none of his ships should pass the promontory of Sarpedon, unless it were to carry money or hostages.

As to the nature of the sea dominion of the Romans, and the extent of it, Appianus Alexandrinus makes them sovereigns of all the Mediterranean, and Dionysius Halicarnassæus, lib. 1. de Orig. Rom. writes, their dominion extended over the whole ocean as far as it is navigable. However extravagant this boundless empire may appear at first, it will not at a second view seem improbable, that the Romans were sovereigns of most part of the known seas, as they were of the land. For the sovereignty of the British Seas was in their possession as long as they were masters of any considerable part of Britain; but they looked on the Mediterranean to be entirely their property, as appears by several passages of Florus, Sallust, and other authors, who being Romans, gave ordinarily to that sea the general name of our sea.

Their naval dominion may be proved by so many examples, that we should tire the reader to repeat them, and the eastern emperors pretended to the same maritime sovereignty as the people or Cæsars of Rome enjoyed. Themistius, in his 5th Oration, speaking of the emperor Theodosius the Elder, ascribes to him the dominion of almost the whole earth and sea, of which he calls him ruler. Dion Chrysostom tells us, the emperor Trajan, long before this, granted the citizens of Tharsus a dominion and jurisdiction over the river Cydnus, and the adjacent sea.

Thus much is sufficient to shew, that the Antients believed and practised the dominion of the sea. When the Barbarians over-ran the empire, the Roman power was broken as well by sea as land; and as their territories fell under the dominion of several princes, so their naval force was divided, navigation neglected, barbarism prevailed, and with that, ignorance; and commerce growing dangerous, fleets grew less, and the sovereignty of the sea was not talked of again, 'till there arose a power able to maintain, as well as assert it. The first of this kind was that of the

VENETIANS,

Who claimed the sovereignty of the Adriatic Sea, formerly so called, from the ancient city of Adria. At the bottom of this sea, bay, or gulph, stands the famous city of Venice, governed by a republic, that, from the beginning, have made it one of their chief political maxims to encourage trade, and improve their strength at sea. This bay is 600 miles long, and the land on both sides possessed by several princes, inasmuch, that a sixth part of it does not belong to the Venetians; yet by their promoting commerce they grew formidable at sea, asserted their dominion over the gulph, as belonging to their city, the capital of those parts, and for some time there was no nation that durst dispute the sovereignty with them.

Flavius Blondus, Decade 2. lib. 8. tells us, That in the year 1265, when Lorenzo Tepolo was doge of Venice, the republic imposed a tax upon all that traded in the Adriatic Sea, making a law (which to this day remains in force) that all who sailed between the gulph of Quivera and the Cap di Pola, or promontory of Solo and coast of Revenna, should (if thereto required) come into Venice and pay custom, and (if the officers thought fit) unlade their goods and let them be surveyed.

Several barks were ordered to cruize day and night about the harbours to enforce the execution of this law. The inhabitants of Ancona complaining to the Pope of this exaction, the case came to be considered, and Gregory X. confirmed to them the right of levying their customs in the Adriatic for the maintenance of mariners employed by them against the Saracens and pirates. The ceremony of the doge's wedding the Adriatic Sea, is much older, and shews their sovereignty is as old as Alexander III. by whom it was instituted according to Anton. Peregrino in his 8th book de Jure Fisci 185. This ceremony is performed on Ascension-day, when the doge goes in his bucentoro, a magnificent galley of state accompanied by the chief noblemen in a most pompous manner, and as a sign of the perpetuity of the republic's dominion over it, throws a ring into the water in token of wedding it, saying these words as translated from the Italian, WE ESPOUSE THEE, O SEA, AS A SIGN OF A REAL AND PERPETUAL DOMINION.

But the proofs of the republic's asserting this sovereignty are so many, that they would be almost endless, should we come to instances: we therefore refer the curious to a treatise written by way of epistle from Franciscus de Ingenius to Siberius Vincentius, in vindication of it against Joannis Baptista Valenzolo, a Spaniard, and Laurentius Motorus, a Roman, who being the duke of Ossuna's creatures, wrote against it to please that duke, then viceroy of Naples, and a great enemy to the republic.

In this epistle, the author reckons no less than thirty eminent lawyers of his opinion, in favour of the Venetian's dominion in the Adriatic. In the year 1399, when the king of Naples had married his sister to the archduke of Austria, he did not

pretend to transport her by way of the gulph, without first asking the republic's leave. There are two letters extant from the emperor Frederic III. to Giovanni Mocenigo, then doge of Venice, desiring liberty of the state to transport corn through the Adriatic from Apulia; and others from the kings of Hungary to the same purpose are produced by Francis de Ingenius above mentioned. All the commanders of their ships treat as open enemies those of any prince or state, though in peace with them, that attempt the least infringement of this their dominion; of which a very signal instance happened in the year 1638, when the Turkish fleet having entered the gulph without the senate's permission, the Venetian general attacked them in an hostile manner, sunk several of their ships, and drove the rest into Valona, a port upon the Adriatic Sea, belonging to the Grand Signior. The Venetian, not satisfied with this, landed his men, and put a great number of mariners to the sword who had escaped him at sea. The Sultan not long after concluded a treaty with the senate, and thereby it was agreed, That it should be lawful for the Venetians in time to come to seize by force, if they did not otherwise submit, all Turkish vessels, which should enter the gulph without their licence, and that even within the ports and havens under the obedience of the Grand Signior, situated on the Venetian Gulph. We have instanced before, their refusing to let the queen of Hungary pass, and the emperor and king of Spain's owning their dominion by complying with them. It is true, the emperors had from time to time endeavoured to share this dominion with them, but the republic would never admit of it; and in the year 1535, commissioners on both sides met at Friuli, to decide this important question; where two advocates, Rapicio for the emperor, and Chizzola for the state of Venice, learnedly disputed this matter. After a full hearing, and several weighty arguments too long to be inserted here, the imperial commissioners acknowledged, that by the native force and evidence of the learned Chizzola's discourse, they were persuaded in their consciences that the commonwealth of Venice was the undoubted mistress and protectress of the Adriatic Gulph, and might there impose what custom she thought convenient. Than which declaration nothing could be more glorious for the republic of Venice, as being an acknowledgment paid her by the agents of the greatest power in Europe: nor can any thing be a better proof of the dominion of the sea in them. Which makes good the argument of his Britannic Majesty's sovereignty: for there is not one reason urged by Chizzola in behalf of the Venetians sovereignty of the Adriatic, but will serve to vindicate the right of the crown of Great-Britain to the dominion of the British Seas, of which see the article SEA BRITISH. The Venetians are not the only nation who have pretended to dominion at sea. The

TUSCANS AND GENOESE

Have done the same. The Great Duke of Tuscany is generally acknowledged to be the lawful lord and sovereign of the Tuscan Sea. To maintain which sovereignty, he has built several forts and castles there, to which such foreign ships as arrive before them, are obliged to pay those marks of respect, that by the laws of the country are established. The Genoese were formerly very considerable at sea, especially in the time of crusades, when, though rather by policy than power, they were superior in the East to the Venetians. And before the English and Dutch fell into the Persian and Turkish trade, Venice and Genoa were the only marts and staple ports of Christendom, for all the precious commodities of those countries. The histories of Italy shew us how likely the Genoese were once to reduce the commonwealth of Venice. Their fleet besieged the city of Venice, and their admiral Doria triumphed in the Adriatic about the year 1300; but the Venetians afterwards recovered their naval power, and followed the Genoese so closely, that they broke theirs. However, the city of Genoa is still much frequented by foreign merchants; and according to Benedictus Bonius, lib. de Censibus, artic. 16. §. 40. Genoa is the lawful sovereign of the Ligustic Sea, and this state always keeps a certain number of armed gallees, and other ships for the defence of their right and title to that dominion. The

PISANS

Were also very considerable in the Mediterranean Sea, about 400 years ago, and once a match for the Genoese; but they soon lost their reputation, and since the city has been annexed to the Great Duke of Tuscany's dominions, its trade is sunk, and Leghorn is now the only flourishing port in Tuscany. The

POPE

Pretends also to the sovereignty of the sea, which bears the name of the Church's Sea, as is proved by the very words

of the bull Cœnæ Domini; which, among other delinquents, excommunicates and anathematizes all rovers, pirates, and robbers, haunting and infesting our sea, and especially that part of it which lies between the mountain Argentaro and Sarracius. The

SPANIARDS

Have sometimes thought fit to speak favourably of the community of the sea; yet when it was for their present purpose, they have as severely maintained the particular dominion of it as any other nation; and notwithstanding, that by the common law of Castile, the use of the sea is free, yet many of their most esteemed lawyers have declared in express terms, not only that, according to their opinion, the sea is capable of dominion, but that such a dominion was acquired by their king: and so the prince may grant any man a permission to fish in any certain part of the sea, says Gregorius Lopez ad Alphonsinas, Partid. 3 tit. 28. l. 11. Nor must we forget that several German authors in the titles of Charles V. emperor and king of Spain (and particularly in the preface to the constitution concerning public judicatures in the empire) stile him KING OF THE CANARY ISLANDS, AND OF THE ISLANDS AND CONTINENT OF THE INDIES, AND OF THE OCEAN, &c. By which, though he was not really so, it sufficiently appears they did not question the lawfulness of a dominion in the sea. As to the

PORTUGUEZE,

They are, above all others, obstinate maintainers of this doctrine of the lawfulness of a dominion and propriety in the sea, as will sufficiently appear by the usual title of their kings. And particularly king Emanuel, in his preface to the laws of Portugal, stiles himself, DOM MANUEL, PER GRACE DE DEOS, REY, &c. SENHOR DE GUINEE, ET DA CONQUISTA, &c. NAVIGACAM ET COMMERCIO D'ETHIOPIA, ARABIA, PERSIA, ET DA INDIE, &c. Where he pretends to be sole lord of the navigation and trade of Ethiopia, Persia, &c. But all this is nothing in comparison to what is found in the body of the laws of Portugal, concerning the pretensions of that nation to the sole dominion, even of the vast Atlantic ocean itself: for among the said laws, O quinto libro des Ordonacões, tit. 112. there is a most positive and absolute prohibition to any person whatsoever, whether native or stranger, in any ship or vessel, to pass to the countries, lands, and seas of Guinea and the Indies, either upon occasion of war or commerce, or for any other reason whatsoever, without the king of Portugal's special licence and authority, under pain of death and confiscation of all effects, to be inflicted upon all such persons as should presume to go thither in contempt of the prohibition.

Pursuant to this law, several persons who fell into the hands of the Portuguese, were put to death; and it extended to foreigners as well as the king's own subjects, though the former never acknowledged his pretended title to the dominion of the Atlantic and Southern Sea, which gave occasion to a very warm dispute between our queen Elizabeth and Don Sebastian king of Portugal. But the matter then in question was not, whether king Sebastian was capable of becoming lawful sovereign of those seas; but whether he had acquired such a dominion by right of occupation, or otherwise, which it was plain he had not. If we look into the histories of the northern nations, we shall also find that several of them have demanded dominion at sea; as the

DANES, NORWEGIANS, SWEDES, and POLANDERS.

Before Denmark and Norway became united under one monarch, the Norwegians had a separate sovereignty in the sea, as well as the Danes. Saxo Grammaticus, in the 7th book of his History of Denmark, writes, That in the time of Harald Hildeland, king of Denmark, none durst presume to usurp any privilege or dominion in the Danish Seas, because the empire of the land and sea was the same in Denmark. He adds, that Olo, who succeeded his father in both dominions, vanquished all such as pretended in any manner to infringe his sovereignty therein. In the year 1582, Frederic II. king of Denmark and Norway, permitted and lett out the passage and use of the Norwegian Sea to the English Muscovy company, in the same manner as if he had rented out a piece of land. The SWEDES are of the same opinion, with regard to the dominion of the sea, as very plainly appears by the treaty concluded between Christiern IV. king of Denmark, and Gustavus Adolphus king of Sweden; in which the latter entirely renounced the sovereignty formerly claimed by him over the seas of Norway, Norland, and the jurisdiction of Warbhuyfen.

All merchants concerned in the Baltic trade, know very well what

what great revenues the king of Denmark raises out of the royalties of that and the Norwegian Sea. As to the Poles, we find by Januszowski Syntagma of the statutes of that republic, lib. 3. tit. 10. fol. 109. that when Henry duke of Anjou was king of Poland, the French ambassadors agreed that the said most illustrious prince then chosen, as soon as he should assume the government of his kingdom, should, at his own charge, maintain a navy sufficient for the defence of the ports, and of the sovereignty of the sea belonging to the kingdom and dominions of Poland.

The FRENCH.

Though the French have sometimes, in opposition to the ENGLISH, declared for the community of the sea, yet it is very certain they have pretended to the dominion of it, and even of part of the British Seas. Charondas Caronæus, in Not. ad Cod. Henrici III. lib. 20. tit. 7. Confit. 1 and 28. says, The king is sovereign of the seas which flow about his kingdom, because the universal right of all things common by the laws of nature and nations, is transferred into his dominion. With which assertion agree several passages of Stephanus, Paschasius, Ludovicus, Servinus, Popellenerius, and others.

They pretend to derive a title to the sea that flows about the coast of Britany, from the possession of that continent, which they allege had once a sovereignty in the sea; for the proof of which they instance one Rotlandus, mentioned by Eginhart in his life of Charlemagne. He is there spoken of as governor of that shore, where they affirm it was usual to exact a certain custom of ships that navigated there; whereas that custom was only a sort of pilotage or conduct-money, which was principally paid by the inhabitants, or at most by such only as traded upon the coast, for pilots to conduct them safe from the shore of Bretagne, which is very dangerous.

That this was the nature of that exaction is plain, by the account Bertrandus Argenterus gives of its origin, in his book ad Confect. Brit. art. 46. where he says, the ancient kings of Britany, considering the frequent shipwrecks that happened upon that rocky shore, which then was almost destitute of havens, made a law, that none should go to sea without taking guides and passes, for which they paid a certain sum, called in Bretagne, to this day, droit de salvage.

The French kings have been so far from disowning the sea is not capable of dominion, that they have usurped a sovereignty which does not belong to them, by pretending to that part of the British Seas: for Henry II. and Henry III. published two edicts, requiring all foreign ships navigating in the neighbouring seas, and meeting with any of their ships, to strike their top-masts, in acknowledgement of their pretended sovereignty; which edicts they endeavoured to get the convention of States to confirm, but never could effect it: on the contrary, the latter of them was declared void, and of no effect in law, in a notable case, in which some Hamburg merchants were plaintiffs, against Mich. Butardus and other defendants, before an assembly of the States of that kingdom, held at Tours by Henry IV.

We shall not in this place answer the vain arguments brought by the French authors, to prove their king's title to the sovereignty of the sea flowing about their coasts: for by asserting and proving that there can be no legal dominion of any part of the British Sea, but what is vested in the crown of Great Britain, all the French pretend to the contrary will be at once destroyed, and appear to be groundless. See our article SEA BRITISH. Having taken notice of the dominion of the sea claimed by the nations of Christendom, we must now observe what naval sovereignty the

TURKS

Pretend to in the Levant. The Grand Signior, succeeding by right of conquest to the sea dominion of the emperors of Constantinople, changed the name of the Egean and Euxine, into those of the White and Black Seas, of which he in a very solemn manner styles himself lord. This is particularly remarkable in the league concluded at Paris, the 20th of March, 1604, between Henry IV. of France, and Achmet the Ottoman emperor; by which, Achmet granted the French liberty to fish and search for coral, in certain freights and bays upon the coast of Africa, subject to the Sultan. Besides this, Coriolanus Cippicus, in his history of Pietro Mocenigo, says, The Turks had built two very strong castles, opposite to one another, on both sides the Hellespont, at its narrowest passage, which being well provided with ordnance and ammunition, the governors had orders to sink all ships that should attempt to pass without the permission of the Grand Signior. See the article ROMANIA in Turkey.

As to the opinion of the DUTCH in relation to the sovereignty of the sea, they, as well as the Hanseatic towns,

have declared for a community of the sea; but that is because they once being the greatest traders in the world, got more by that community than any other people, and have very little to pretend to by a sea dominion. Whatever their real sentiments are, they seem to be against any such sovereignty. But what is their opposition to right, reason, and the practice of almost all countries and ages?

The HANSEATIC TOWNS, in a dispute about the Venetians asserting the sovereignty of the Adriatic Sea, urged by their advocates, that Inter res communes, uti ipse imperator numerat mare, & ideo nemo in mari piscari aut navigare prohibetur, & adversus inhibentem competit Actio Injuriarum, l. 10. si quis in mare, l. Injuriarum, sect. ult. de Injuriis. Sin littora quoque communia sunt, l. 2. re divers. Quia accessorium sunt mercis, & accessorium sequitur naturam principalis, l. 2. de Peculio Legat. c. Accessorium de Reg. Juris 6. Ad littus maris igitur accedere quisvis potest, non piscandi tantum gratia, sed etiam edificandi & occupandi causa. l. quod in Litt. de Acquir. rer. Dom. l. in Litt. ne quid in loc. pub. Jo. Angelius J. C. de Repub. Hanfiat. par. 6. fol. 85. edit. Francof. An. Dom. 1641. But these arguments were easily answered by the Venetian lawyers, Quemadmodum communi littorum refringitur ad populū æquo occupata sunt, lib. 3. sect. Littora D. de quid in loc. pub. Ita etiam communia maris, adeo ut per mare a nemine occupatum, navigatio sit omnino libera; per mare autem occupatum ab aliquo principe liberam habeant navigationem, qui sunt illi principi subjecti: alii vero eatenus, quatenus idem principes permittit. Julius Tacitus de Dom. Maris Adriatici.

The infringements the Hollanders have made on the dominion of the British Sea, have cost them dear; but now the two nations are so nearly allied by interest, it is to be hoped they will rather help us in maintaining that just dominion, than ever think of abridging any part of it; since it will appear, under our article SEA BRITISH, that the sovereignty and dominion of the British Seas are the sole and undoubted prerogative of the king of Great-Britain.

R E M A R K S.

Our reason for introducing this article, which asserts and proves a right to the dominion of the SEA, is, in order not only to vindicate and maintain, in its proper place, this nation's right of sovereignty in the British Seas, on which the preservation of our fisheries, &c. depends; but to confront a late certain French writer, who has endeavoured to subvert those principles, with a view to pave the way some time or other, we may presume, to some intended encroachments and usurpations of his Grand Monarque on the British rights of navigation. The author to whom I allude is Monsieur Deslandes, in his Essay on Maritime Power, published during the late war. This gentleman was encouraged to write this essay, by the count de Maurepas, who had the care of the French marine. The design in writing it is pretty evident; that minister has been long endeavouring to inspire the councils of that country with an ardent passion of retrieving the naval power of France, and setting it again on the foot upon which it stood in the reign of Lewis XIV. In order to bring this gradually to bear, the count de Maurepas, from time to time, caused several treaties to be written and published on navigation and commerce, in such a method as was most likely to stimulate the pride, and excite the jealousy, of the French nation; and in justice to the learned and judicious author, I think it in many respects a very ingenious and masterly performance of its kind, notwithstanding I am about to censure the following passage, which is as follows, viz. 'I think it proper to observe, says this excellent writer*, that most of the States of Europe have been for appropriating to themselves the sovereignty of such seas as wash their coasts, and excluding others the use of them. As for France, incapable of giving into so vain a notion, she has always supported her right of navigating ships in ALL SEAS; and the king of Denmark having dared, in 1637, to disturb some vessels that were employed in the whale-fishing on the coast of Greenland, Lewis XIII. caused him to be informed, by count d'AVAUX, his ambassador, that ALL SEAS were open to his subjects, and that he was able to maintain them in the possession, of which he would suffer no body to doubt. And it is, indeed, one of the first principles † in

* To confirm what he urges upon this head, he has the following note: 'To be persuaded, says this gentleman, beyond all possibility of doubt, that there is nothing more frivolous, or worse founded, than these sort of pretensions, one need only read two excellent works composed upon this subject, the one by the learned HUGO GROTIUS, under the title of MARE LIBERUM; the other by THEODORE GRASWINCKEL, advocate fiscal of the dominions of the States of Holland, under the title of MARE LIBERUM VINDICATUM.'

† This learned author discovers here no small prejudice in favour of his country; he ought certainly, in justice, to have mentioned

mentioned the book written in answer to Grotius, by our learned SELDEN, under the title of *MARE CLAUSUM, SEU DE DOMINIO MARIS, LIBRI DUO*, LONDINI, 1636, 8vo; and his answer to the other book cited by our author: in which two works he has fully proved, that a RIGHT may be acquired over the SEA, that such a RIGHT has been acquired over OUR SEAS by our ancestors, and that it has always been submitted to by our neighbours, nay, that our kings have granted commissions to hear complaints, even against the FRENCH king for injuries done at SEA. We say, our learned SELDEN has proved all this as fully as any thing can be proved by reason, authority, or evidence; and to his satisfaction, therefore, we refer the English reader, for full satisfaction on this head.

‘ the law of nature, as established by our old lawyers, *MARE COMMUNE OMNIUM EST*, say they, & *LITORA, SICUT AER, & EST SÆPISSIME RESCRIPTUM, NON POSSE QUEM PISCARI PROHIBERI*: i. e. The sea is common to all, and so are its coasts; and it is often set down as law, that no body has a right to prohibit fishing in them. LEWIS XIV. pushed his authority still farther, and employed it not only in favour of his subjects, but also of his allies: for the king of England, Charles the Second, inclining to disturb the Hollanders, and even French, in fishing in the channel, or along the coast of Flanders, LEWIS XIV. in 1661, charged the count D’ESTRADES, his ambassador, to tell him, That he was in the wrong to extend his prohibition of fishing, to the prejudice of common right, which gave that liberty to all the world; that besides the interest he had in this, in respect to his own subjects, he could not help assisting, in this case, the Dutch, his allies, or refuse them his interposition, having a maritime force, sufficient to render him not afraid of being opposed in this respect by any prince in the world.*—Such were the terms, continues Monsieur Deslandes, in which this prince expressed himself, who having had the assistance of good councils, knew how to render himself powerful in shipping, and formidable at sea.’—However, as a more satisfactory answer to what this learned Frenchman has suggested in regard to this matter, we shall refer to the article following.

* This is another very indifferent proof of the French independency at SEA. They engaged in war with us, in conjunction with the DUTCH, with no other view than they afterwards engaged in a war on our side, against the DUTCH, to make the maritime powers weaken each other, and to gain strength and experience at our cost. If there was any weight in count D’ESTRADES’s declaration, in favour of the DUTCH right to fishing on our coast without our permission, it was certainly taken away, by the FRENCH king’s joining with us in a war against HOLLAND; among the causes of which, this was one, that they had FISHED in our SEAS without leave: so that if the FRENCH king’s authority could avail any thing in this case, here it is on both sides.

SEA BRITISH. The sovereignty of the British Seas, maintained and asserted to have always been, and still continues to be, the undoubted right of the kings and queens of Great-Britain.

We shall first settle the bounds of the British Sea. The eastern and southern coasts of Britain are washed by the German Ocean, and that which Ptolemy calls particularly the British Sea, and which according to Mela, in his treatise de Situ Orbis, lib. ii. cap. 3. reaches as far as the northern coast of Spain. And the Arabian geographer, (Clim. 4. part 1.) says, Towards the North Andalusia, by which name the Arabians comprehend all Spain, is washed with the English Sea; adding, there are nine stages from Toledo to St James’s, which place he says (Clim. 5. part. 1.) is situated on a promontory of the English Sea. St James’s is a town in the province of Galicia. On the west side of Britain lies the Vergivian Sea, which, where it washes the coast of Scotland, takes from thence the name of Deucaledonian Sea: of this Vergivian Sea, the Irish, or St George’s Channel, is a part. Upon the north of Britain flows the Caledonian Sea, in which are situated the Orcades. Thus the British Sea, or the channel lying between England and France, the Vergivian, the Deucaledonian, and the Caledonian Seas, are properly called the British Seas, and, as such, are subject to the British empire.

Hugo Grotius, in the second book of his treatise of Peace and War, chap. 3. §. 11. speaking of the sea, has these words: ‘ The bare possession of the shore is not sufficient to intitle any people to a right to the adjoining sea: nor is it enough for a prince to imagine, or write himself lord of the sea, without proclaiming himself by some OVERT-ACT to be so.’—By which he certainly means, that it is not from a bare occupation or possession of the neighbouring land, but from an actual and peculiar use and enjoyment of the sea itself, and exerting all the functions of a sovereign upon it, such as prescribing rules of navigation to those that frequent it, punishing delinquents, protecting others, and receiving from all that homage and advantage due to every lawful sovereign, that sufficient arguments can be derived for proving a lawful title to the dominion of it. Now, if we make it

appear, that the possession of the British Sea was at first acquired, and ever since asserted, in the very manner specified by that author, though he wrote against it, we hope there will be no room for objection, by which the argument can be invalidated.

Before we proceed further, it may be proper to observe, that the extent of the British dominions in the Eastern and Southern Seas was settled by a treaty concluded in the year 1674, between king Charles II. and the States-General; by which it was to reach from the middle point of the land Vanlaten in Norway to Cape Finisterre. The dominion of the sea intitles the lawful possessors to the six following prerogatives.

- (1.) The royalty of granting the liberty of fishing for pearl, coral, amber, and all other such precious commodities.
- (2.) To grant licences to fish for whale, sturgeon, pilchard, salmon, herring, and all other sorts of fish whatsoever, as is usual in Spain, Portugal, and several other places.
- (3.) To impose tribute and custom on all merchants ships, and fishermen fishing and trading within the limits of the sea that is subjected to any particular dominion.
- (4.) The regular execution of justice for protecting the innocent, and punishing the guilty for all crimes committed within the extent of such sea dominion.
- (5.) To grant free passage through any such sea to any number of ships of war belonging to any other prince or republic, or to deny the same, according to circumstances and occasion of such passage, in the same manner as any prince or state may grant or deny free passage to the foreign troops through their territories by land, even though the prince or state to whom such ships or land forces belong be not only in peace, but in alliance, with the prince or republic of whom passage is desired.
- (6.) To demand of all foreign ships whatsoever within those seas, to strike the flag, and lower the topmast, to any ships of war, or others, bearing the colours of the sovereign of such seas.

All which prerogatives do unquestionably belong to the kings and queens of Great-Britain. And although the duty of the flag is but an indifferent honorary ceremony, yet it is a significant acknowledgement that the absolute sovereignty of the seas in which the colours are required to be struck, is vested in the prince to whom that duty is paid. And such is the high regard that the British nation puts upon the execution of this ceremonious homage, that a contempt thereof, according to the marine laws, is punishable as open rebellion or high treason.

That this acknowledgement was always taken for a confession of the absolute sovereignty of the English Seas, appears by a memorable record among the marine laws, about the end of the reign of king John, viz. * ‘ That if a lieutenant in any voyage be ordained by common council of the kingdom, do encounter upon the sea any ships or vessels, laden or unladen, that will not STRIKE AND VEIL THEIR BANNERS, at the commandment of the lieutenant of the king, but will fight against them of the fleet, that, if they can be taken, they be reputed as enemies, and their vessels, ships and goods taken and forfeited as the goods of enemies, though the masters or possessors of the same would come afterwards, and allege that they are the ships, vessels, and goods of those that are friends to our lord the king; and that the common people in the same be chastized by the imprisonment of their bodies for their rebellion, at discretion.’

* Inter Leg. Marina, sub fine anni regni Henrici Secundi le Ordinance called Hastings.

The claim of this British sovereignty at sea has the sanction of no less than 17 or 18 centuries to countenance and uphold the like uninterrupted practice; and even so long ago as Cæsar’s time the Britons asserted and maintained the like dominion, as may be seen in his commentaries, liv. iv. where he says*, ‘ That before his descent in Britain, having summoned the merchants and other seafaring Gauls together, and made a diligent enquiry concerning the situation of the British shore and ports, he found that none dared to cross the seas to go into Britain, without permission, but merchants, and that they too were so ignorant of those shores (as being deprived of a free use of the sea) that he was obliged to send Volusenus, in a long ship, to sound the British coasts.’ Whence it may be rationally inferred, that since the ancient Britons excluded the Gauls and others, at their pleasure, from the free enjoyment of the sea, they must certainly have been the lords of it. And that this was not a bare prohibition of coming into the island of Britain, but even of navigating within the extent of their maritime dominion, is plain from hence: that the merchants themselves, who were allowed to go thither, seem to have only had the liberty of coming to an anchor, and disposing of their goods upon the coasts, without being admitted into the ports but

* — quæ omnia ferè Gallis erant incognita. Neque enim temere præter mercatores, illò adit quicumque; neque his ipsi quidquam, præter oram maritimam, atque eas regiones quæ sunt contra Galliam, notum est, &c.

very seldom; since those that Cæsar had summoned to conduct his navy into Britain, could not undertake to do it, as being entirely ignorant of the situation of their ports. If they were permitted to come to any place, it is conceived to be Gaul's Town, near Yarmouth. They had a naval force to defend this naval dominion, which when Cæsar saw, he preferred their ships to the Romans: these ships coming to the assistance of the Gauls were the occasion of his expedition to Britain, to revenge himself for the succours the inhabitants had sent their neighbours, his enemies.

Julius Cæsar subdued only an inconsiderable part of the coast; nor did the dominion of the British sea fall into the hands of the Romans 'till the reigns of the emperors Claudius and Domitian, who having conquered the southern parts of the island, the empire of the sea, at least in proportion to that part which was conquered on the shore, did necessarily devolve upon the possessor of the land, and was actually reckoned a part of his dominion, as well by his subjects as by himself.

Though Claudius was the first of the Roman Emperors who had subjected the British Sea to his dominion, yet the Romans were not then so fully in possession of the British Seas, as they were afterwards in the days of the emperor Domitian; who sending Agricola to be his lieutenant in the province of Britain, this general extended the Roman conquests much farther toward the North, than any had done before him: he also sailed round the land, discovered the Orkades or Orkney Islands, situate on the North of Scotland, and 'till then unknown; and having conquered them, the empire of the Northern British Seas was possessed by the Romans, as well as that of the Southern.

Seneca also witnesses, That Agricola designing to make war upon the Caledonians, provided a powerful fleet to favour, by a mighty diversion by sea, the enterprises of his army by land. The Romans having acquired the sovereignty of the British Seas, committed the management of naval affairs here to a great sea-officer called Archiguburnus, who had a numerous fleet under his command, with which he was ordered to assert and maintain the Roman dominion in the British Seas; but the Romans abandoning afterwards their conquests in the North, retired into the southern parts of Britain; and we may suppose, as they lost the dominion of the land in the North, so they were obliged to give up the sovereignty of the sea there, which naturally returned to the Britons.

We find little mention made of the affairs of the Romans in Britain, especially those relating to the sea, 'till the reign of Dioclesian, who sent C. Carausius to scour the British Seas, which were infested with Gaulish and Saxon pirates. This Carausius afterwards usurped here, and maintained the sovereignty by sea and land seven years. Caius Allectus, who killed him, coined a medal, having on one side his name and image (for he also usurped) and on the reverse a three-oared galley, with this inscription, *Virtus Augusta*; by which representation, he meant to express the force and greatness of the empire of the British Seas. Constantius Chlorus, who reduced him, is complimented upon it by several authors; who, among other things, highly extolled him for the restitution of the sea dominion to the Romans, and of freedom of traffic and commerce to all nations, by scouring the sea from pirates; not only upon the coasts of Gaul, but even of Spain and Africa.

About the time of Constantine the Great, an officer was established in Britain, by the name of count of the Saxon shore; who, besides his command at land, had under his government the seas flowing between France, Holland, Germany, Denmark, and this island; and that not as a bound, but as a distinct part of the British empire, as there was a prefect of the Euphrates, a count of the Danube, a count of the Rhine, &c. By the Saxon shore it is very plain, that the shores of all the above-mentioned countries are meant, because the Saxons, being then the most potent people in Germany, enlarged their conquests all along the coasts of Germany, Holland, and France; which appears by the Breviary of the imperial dignities, where speaking of that tract of land extending from the mouth of the Loire to that of the Seine, it is said, under the command of the duke of that province, there was a tribune of the first band of soldiers of Armorica and Grammona, on the Saxon shore. And again, speaking of that shore which extends from the Seine to the Maese, including Normandy, Picardy, and Flanders, it is said, there were Dalmatian horsemen lodged upon those borders on the Saxon shore: and in effect, all the shores extending from the western parts of Denmark to the western parts of France, are in the Breviary most expressly comprehended under the general term of the Saxon shore; the count of which resided in Britain, as the seat of the sovereignty of all those seas.

It is very certain the Saxons never seated themselves in Britain, 'till after the Romans had abandoned the island. Some descents they might probably have made as pirates, but never possessed themselves of any part of the country, 'till after king Vortigern called them in against the Picts; whereas they had settled on the coasts of Gaul and Belgia; and the

VOL. II.

Saxon shore cannot, without committing a great absurdity, be supposed to mean that of Britain, where the Saxons had not seated themselves, but that of Belgia and Gaul, where they had; which coast by the Breviary is plainly proved to be the Saxon shore, under the count above named, who resided, as has been said, in Britain. And for a confirmation that Britain and the Saxon shore were two different jurisdictions, we shall here insert a list of other governors and officers, that were under the command of the *magister militum* * *presentalis*, according to the very words of the Breviary.

* In the edition of Alciatus and Pancirolus, the word *militum* is by a mistake inserted for *limitum*.

Sub dispositione viri illustris *magistri peditum presentalis comites limitum infra scriptorum.*

Italix, Africae, Tingitanæ, tractus Argentoratensis, Britanniarum, littoris Saxonici per Britannias.

About the year 450, the Romans having entirely abandoned Britain, the Britons resumed the sovereignty of the sea as soon as they found themselves in possession of that of the land. But having been weakened by the frequent levies that the Romans made of soldiers here, to serve them in other parts of their empire, the Scots and Picts, to revenge themselves for old quarrels, fell upon them, and forced them to call in the Saxons to their assistance, declaring they were not capable of assisting them. The Saxons by treachery got possession of several parts of the island, turned their arms against those they came to assist, and new adventurers coming from Germany to Britain to make their fortunes here, the leaders of each colony founded a kingdom, and from the number of these monarchies, the famous name of Heptarchy was given to the sovereignty of this island; to which the dominion of the British Seas was always a certain appendant, where the Britons, Saxons, or Danes, were masters of the island. It is said, Arthur failed with his victorious fleet and army as far as Ireland, forcing those northern people to pay obedience to his standard, and acknowledge him for supreme lord, even from the British to the Russian shore. Though this, perhaps, is in the fable, yet it is plain it was the received opinion, that the Britons pretended even then to the sovereignty of the sea.

Having spoken of the maritime sovereignty of the Britons and Romans, that of the Saxons and Danes comes next to be treated of. The Saxons, even at the time of their first arrival in Britain, were very powerful at sea, and very expert in the art of navigation, as it was practised in those days, which is proved by the character given them by Bede and other authors of credit; the Saxons, say they, were so familiarly and particularly acquainted with maritime affairs, that by an almost incredible nicety in their observations they counted months and years only by the continual revolution of the tide, or ebbing and flowing of the sea; calling the former in their language *ledones*, or *lidunas*, and the latter *malinas*; and Ethelberd, an ancient writer, seems to insinuate in his first book, that the Britons being then informed the Saxons were a people very expert in navigation, and well provided with all things necessary for war, they were the more desirous of their alliance: to whom they sent ambassadors with considerable presents, and offers of a free trade and commerce; that they came, conquered, and were themselves conquered by the Danes, is related in our English histories.

All that can be expected from us is, to report as much out of them as proves, that both Saxons and Danes, while they were masters here, were in possession of the dominion of the British Seas.

Gildas relates, that Osta and Ebissa, two leaders of the Saxons, extended their dominions on the northern coast of this island, and Allor, with his sons Cissa and Cimenus, on the southern; and that they became soon masters of the seas to the southward of Scotland. The former with forty armed vessels sailing about that kingdom, invading and spoiling the Orkades, but minding their sovereignty at land more than at sea, their naval strength fell to decay; which the Danes and Normans observing, it was a temptation to them to infest this island, and commit frequent robberies in the British Seas, in a sort of long-boats or galleys of their own invention, with which they used to be too hard for the English Saxons, 'till Alfred caused a great number of other ships to be built longer, deeper, and nimbler than the Danes; by which means he drove those invaders out of the English Seas, and recovered the absolute dominion of them; which was transmitted to the succeeding kings, of whom EDGAR became powerful at sea.

Edgar began his reign in 957, according to the Saxon Chronicle; and as to his fleet, it consisted of near 1000 sail; and he did not coast round his kingdom once a year in one of the three squadrons, as some say, but each squadron carried him to the extent of its cruise, and then he embarked on board the other squadron; and in the year 973, he caused himself to be rowed over the River DEE by eight kings, while himself steered the helm; and in his titles, he constantly used this, of LORD OF THE BRITISH SEAS. This is a fact of much greater certainty than can be produced for any naval

power within this period of time; and therefore it deserves our attention.

We may see, by an extract of an old record, how far king Edgar pretended to the sovereignty of the sea. Albitonantis Dei largiflua qui, est rex regum, ego Edgarus Anglorum Basileus, omniumque rerum insularum oceani quæ Britanniam circumjacent, cunctarumque nationum quæ infra eam includuntur, imperator & dominus *: and Randolph of Chester, though he does not swell the number to above 400 ships, makes mention of his sailing round the island, Idem quoque Edgarus 400 naves congregavit, ex quibus omni anno post festum paschæ 100 naves, ad quamlibet Angliæ partem statuit; sic æstate insulam circumnavigavit: but the Danes afterwards, as they had been before, were very successful in their attempts against the Saxons here both by sea and land.

* Ex. Chart. Fundam. Ecclæ. Wigorn.

Insomuch, that the English or Saxon-Britons, were forced to buy them off: and a tax call Danegelt, was levied here, to be paid them that they might not assault the inhabitants of this island, either by land or sea. The Saxons, or English, maintained the Danish fleet, which was to be employed for the defence and guard of the English Seas, as well as of the kingdom. Edward the Confessor abolished this tribute, as far at least as it was to be paid to the Danes: some authors say, that this tax was levied after the English threw off their subjection to the Danes, for the maintenance of the English navy, which was afterwards strong enough to defend the sovereignty of the British Seas, 'till the Norman invasion.

Hence it appears, that the dominion of the sea went with that of the land; and that in Edgar's time, the English Saxons enjoyed it without competitors, as they did also under Canutus the Dane; of whom it is written, that designing to check the vanity of flatterers, by shewing them, that even the greatest kings were, at their highest pitch of grandeur, only men, fat down on a seat on Southampton shore, to make a trial before them of the obedience of the sea, to whom he thus addressed himself.

Thou, O sea! art under my dominion, as the ground upon which I sit is mine, and none did ever disobey me and was unpunished. I command thee not to come up upon my land, nor to presume to wet the feet or garments of thy lord. Matth. of Westminster, anno 1035.

But the tide flowing in the ordinary manner, and wetting not only his Majesty's feet, but his legs, the king leaping up resigned his crown of gold to a crucifix, declaring none was worthy of the name of a king, but him alone, who can command both sea and land, and they obey.

It can hardly be expected, that the sovereignty of the British Seas should be maintained without any intervals of invasion by foreign powers, especially in such confused times as the Heptarchy, and the contention between the English and Danes; but it will be seen, that whenever the dominion of this island was settled, that of the sea was always an appendant to it: and since the Norman invasion, the kings of England have defended their sovereignty against all foreign powers, and their dominion at sea has been asserted and acknowledged, without any remarkable interruption, from the year 1066, to the present times: we shall now, therefore, prove, that the civil and natural possession of the sovereignty of the English Seas has been invested in the kings or queens of this nation, from the Norman invasion to our times.

By a civil possession (according to the explication of Hugo Grotius, in his treatise de Jure Civili, lib. 5.) we mean, That which is requisite by law to found a right and title upon, and by a natural possession we mean an actual possession, which, according to the same author, is also necessary for proving the validity of any prince's title to the sovereignty of the sea: both of which we undertake to assert and maintain. As,

I. That the kings of England have, by many solemn overt-acts and declarations, ascribed to themselves the dominion of the adjacent seas; and that dominion has been both allowed and confirmed, not only by the laws and customs of the nation (as appears by the records of parliament, &c.) but also by the common and universal assent of all the neighbouring and other foreign nations concerned.

II. That the kings and queens of England have always exercised the dominion of the English Seas, as well as of the islands situate in them, as of a province belonging to them, in which they have levied tribute and customs of foreigners, and have also prescribed laws of navigation to such foreigners, as in time of peace have enjoyed their protection there, and that (in case of the violation of such laws) foreign princes and states, by making application to them, have thereby openly acquiesced and acknowledged them to be the sovereign lords of the sea.

III. That passage through the English Seas having been humbly desired, has been sometimes granted, and sometimes refused, by the kings and queens of England, to the foreigners that petitioned for it; and also that all ships navigating in their seas, on certain occasions, have been stopped and arrest-

ed for the service, and by the command, of the kings of England.

IV. That the liberty of fishing in the British Seas has been frequently obtained by licence of the kings and queens of Britain; and that protection has been given by them to the fishers, upon whose humble request such licence had been granted, and a tribute exacted for that protection.

To this shall be added several other corroborating evidences; but as for what happened from the Norman invasion, to the union of the two crowns under James I. we shall not be so particular, as in what has fallen out since that time; because that being of later date, will consequently be of greater weight.

The order which we propose to observe, will naturally lead us to treat of the dominion of the Western or Irish Sea, in discoursing of the estate of the maritime affairs of England, at the time that the sovereignty of that sea was added to that of the English, by the accession of Ireland to the crown of England, under king Henry II. and king John, who conquered that island.

As to the dominion of the Northern or Caledonian and Deu-caledonian Seas, we shall endeavour to evince, that it is the sole and undoubted prerogative of his Britannic Majesty, as a necessary appendant of the sovereignty of the kingdom of Scotland, both which he has derived by an unquestionable right from his royal predecessors, the kings and queens of that country.

To begin with William the Norman, it appears by several passages in Doomsday-book, that he maintained the maritime affairs of England in a very flourishing state. And other histories speak largely of his powerful navies, which, by the addition of the Norman fleet, must have been sufficient to secure the dominion of the sea; and though the Danes appeared in the northern parts, and committed some piracies in the western, yet they dared not engage the royal navy of England; but what they performed was by stealth and surprise. The Normans immediate successors, William Rufus and Henry I. were as careful in maintaining their empire at sea, as their father the first William had been. Florence of Worcester and Hoveden relate, That being about to declare war against Robert duke of Normandy, who was then preparing for an expedition to England, he commanded his butecarl, a sort of sea-officers then known by that name, to guard the seas, and take care that no person should pass over from Normandy towards the English coasts. Besides, this being a sufficient proof of his strength at sea, the very office of these butecarl proves, that he looked upon himself as lawful sovereign of it; they being no other than Custodes ipsius maris, or guardians of the Sea, as will be shewn more fully hereafter.

The confusions that happened in Stephen's reign, hindered the growth of the English strength at sea; and, indeed, his dominion by land was rendered precarious, by the interest of Maud the empress, and her son Henry II. in whose time, Ireland being conquered, the Western Sea was added to the maritime empire of the kings of England; and that these kings have expressly vindicated and asserted their title to the dominion of those seas, appears among other Irish statutes, by an act made in the reign of Edward IV. stat. Hibern. cap. 6. forbidding fishing there without licences, and laying a tax on all boats and vessels coming thither to fish: since which, king James I. did, by a solemn proclamation, positively forbid all fishing upon the Irish coasts to foreigners, without permission.

Many other instances might be given to prove, that the kings of England have, from time to time, asserted their right to the sovereignty of the Irish, as well as of their other seas. Which warrants us, from the reign of king John, when Ireland was annexed to the crown of England, to reckon them a part of the British Seas; the empire of which we are now endeavouring to maintain, to be part of the sovereignty of Britain.

King John, in the passage before cited, challenged the homage of the flag near 500 years ago, by that memorable ordinance at Hastings, whereby this duty was required, not barely as a mark of courtesy, but as a matter of undoubted right, cum debita reverentia, and all that refused it were to be treated as enemies. This homage of the flag is a consecutive acknowledgement, that the right and dominion of the seas are in him, to whose flag they strike and pay that homage; implying, that the prince grants a general licence for ships to pass through his seas, that are his friends, paying him that duty: like those services when lords grant out estates, reserving a pepper-corn, or some such trifle, the value of which is not regarded, but is only a significant mark of the remembrance and acknowledgement of their benefactor's right and dominion. This salutation is to be paid, not only by foreigners, but also by natural-born subjects; and such as refuse to do it, may be brought to the flag to answer the contempt.

King John asserted his title to this homage, by a fleet of no less than 500 ships, in a voyage royal of his, when he failed to Ireland, commanding all vessels, which he met in his way, to pay that duty and acknowledgement; and our succeeding kings

kings have done the same, with more or less vigour and success according to the circumstances of their affairs. His son Henry III. was too much involved in his wars with the barons, to mind his naval dominion: but then Henry's son Edward I. coming to the crown about the year 1272, and entering into a war with Philip the Fair of France, both princes agreed upon a freedom of commerce (then called sufferance of war) and each appointed commissioners to take cognizance of all things relating to this agreement, which they were to decide, according to the laws and customs of merchants, as far as it was allowed by the aforesaid treaty of commerce.

When these two kings concluded a peace, they mutually obliged themselves to be enemies to each others enemies, except some princes expressly mentioned in the treaty of peace and alliance*. But several complaints arising concerning injuries done, and violences offered to merchantmen upon that sea, not only during the sufferance, but after the peace; and the two kings foreseeing the differences between the king of France and the earl of Flanders, might give occasion to other complaints of that nature, they appointed each four commissioners, with full power to decide all controversies of that kind that had happened, or might happen. Upon which a very remarkable remonstrance was exhibited to them, not only in the name of the whole body of the people of England, but there also joined in it the procurators of all the nations in Europe, that were then in any manner considerable for trade and navigation, who all unanimously acknowledged the kings of England to have been time out of mind (quatenus kings of England) the **LAWFUL SOVEREIGNS OF THE ENGLISH SEAS.**

* Selden de Dom. Maris, l. 2. c. 14, 27, 28—Rot. 2 Parl. 174.

This is such an authentic proof, that none can, with any colour of reason, object against it. The original writing is among the archives, kept in the Tower of London, in the old French or Norman tongue, in which it was then usual to draw up such sort of instruments. The reader, perhaps, will not be displeased with a translation of as much of it as relates to the present case.

• To you our lords, auditors, deputed by the kings of England and France, to redress the injuries done to their subjects, by sea and land, in times of truce and peace; we the procurators of the prelates and nobles, and of the admiral of the English Sea, as well as of the cities and towns, and of the merchants, mariners, messengers, and foreign inhabitants, and all others belonging to the realm of England, and other dominions and territories belonging to the king of England; as also of divers other inhabitants of Genoa, Catalonia, Spain, Germany, Zealand, Friesland, Denmark, and Norway, and of sundry other maritime places of the empire, most humbly shew: That whereas the kings of England, by right of the said kingdom, have always been in peaceable possession of the **SOVEREIGN LORDSHIP OF THE ENGLISH SEAS**, and of the **ISLANDS** situate within the same, with power of constituting and appointing of laws and statutes, and of prohibiting the use of arms and passage of ships otherwise equipped than merchant-ships, and of taking security and granting protection, as occasion shall require, and of appointing all other things necessary for the maintaining of peace, justice, and equity, among all manner of people, as well foreigners as their own subjects navigating in those seas, and also of determining all causes and differences, and administering justice to high and low, according to the aforesaid laws, statutes, ordinances, constitutions, and prohibitions, and generally of doing and acting all other things incumbent and belonging to the exercise of their sovereign jurisdiction within the aforesaid seas; and whereas, &c.*

* See Coke Instit. 142.

Though the Flemmings are not mentioned in this instrument, it appears in the records, Rot. Par. 14 Edw. II. part 2. membran. 26. that the ambassadors of the earl of Flanders to that king, fully acknowledged the undeniable right of the crown of England to the sovereignty of the adjacent seas. The passage is this.

MEMORANDUM.

• That whereas for the reformation of certain injuries in an amicable way, done by the subjects of the earl of Flanders to the subjects of the kingdom of England, and by the subjects of the said kingdom to those of Flanders, since the time that our said lord the king undertook the government of his kingdom, &c. And whereas the said ambassadors had been admitted by our said lord the king, to treat anew of this kind of injuries, these ambassadors or other ambassadors of the aforesaid earl, in the aforesaid treaties, did, among other particulars, that they required before all things, make supplication, that the said lord the king, would at his own suit, by virtue of his royal authority, cause enquiry to be made, and do justice, about a certain depredation lately made by the subjects of England (as it

is said) upon the English Seas, of wines and divers other merchandizes belonging to certain men of Flanders, towards the parts of Cranden, within the territory and jurisdiction of our said lord the king, alleging, that the aforesaid wines and merchandizes taken from the said Flemmings, were brought within the jurisdiction and realm of the said lord the king, and that it belonged to the king himself, so to do, for that he is **LORD OF THE SAID SEA.**

To these testimonies of the dominion of the crown of England in the neighbouring seas, we shall now add some other remarkable ones in the reign of Edward III. the originals of which are yet to be seen in the Tower of London: and the first is that king's commission to Geoffrey de Say, admiral of his Western and Southern Seas, in which is this passage: 'We calling to mind that our progenitors, the kings of England, have in former times been **LORDS OF THE ENGLISH SEAS** on every side, and defended the same against all invaders; and considering, that it would extremely grieve us if (which God forbid) our royal honour should, in any manner, be impaired, or should suffer any diminution of this nature in our time, and desiring,' &c. Nor was the commission given at the same time to John de Norwich, admiral of the Northern Seas of England, in any manner different from that to Geoffrey de Say.

There is yet another observation which may be made upon an action of the same Edward III. which is his coining of those ancient pieces of gold called rose nobles, in which he has been imitated by several of our kings of later date. Upon this piece is seen the representation of a ship floating in the sea, there being seated in the ship, as on a throne, a king armed with a shield, having a royal diadem on his head, and a sword in his hand; by which, doubtless, that great prince intended to denote, that the Sovereignty of the English Seas belonged to him, nor was it ever subject to a master that defended it better. For king Edward III. is said to have entertained 1100 ships of war, such as were usual in his time, for preserving the freedom of the **ENGLISH SEAS.**

It is objected, indeed, that upon some pieces of money anciently coined in France, there were much the same figures, and that also some coins of Zealand bear the representation of a lion rising out of the sea, &c. To which it is answered, That as to France, there was never any money coined there with the insignia of the sea, &c. except such as were stamped by the kings of England, while they were in possession of that country: and with respect to Zealand we shall allow, if she pleases, her animal rising unnaturally out of the sea, to denote the situation of that island, but believe the owners will scarce pretend, that piece of money represents any dominion in the sea. But there are innumerable other examples to prove, that the kings of England have always assumed, and ascribed to themselves, the dominion and sovereignty of the adjacent seas; but the instances we have given are so full, that there will be no need of a ding any more to them. And the task would be endless, if we should attempt to cite all the passages out of our lawyers, that have supported this claim of the crown of England to the dominion of the **BRITISH SEAS.** There is one point universally known, and as universally acknowledged by all, viz. that in law these two phrases *intra regnum*, within the kingdom, and *intra quatuor maria*, within the four seas, have one and the same signification; that is, that all the actions done within the limits of the English empire, in those, are deemed to be done in England itself.

In the ancient records concerning the custom of the Admiralty, we read it was usual in the time of Henry I. and of other kings of England, who reigned about the beginning of the 12th century, when any person accused of a capital crime committed at sea, after being five times summoned by the public cryer, did not, within a certain limited time, make his appearance before the court of Admiralty, such person or persons were banished out of England, and out of the **SEAS** belonging to the king of England, for a greater or less number of years, according to the pleasure of the admiral. It was also formerly customary to enter actions in express terms, concerning differences arising in those seas, in the ordinary course of our common law.

However, the sea province of the English empire does properly belong, according to the ancient and received custom of the kingdom, to the lord high admiral of England, or his deputies, not only with relation to its defence and safeguard, but to its government and jurisdiction, which the said officers have always had cognizance of. As for the prerogative of the kings of England in constituting and appointing of naval laws, it is very ancient; for besides what has been said of our Saxon kings, Richard I. some years before his death, which happened in the year 1199, published the **SEA LAWS**, that to this day are famous by the name of the laws of Oleron [see the article **OLERON'S LAWS**], which island he was then possessed of, and it is said by some authors, he was then there. And since the king of England is universally acknowledged to have been the author of these laws, which have taken place ever since that time, it is to be supposed his right to give laws was universally allowed, or the making of them would have been impertinent, or of no use.

Edward

Edward I. prescribed a method to be observed for the more regular execution of those laws, as we find in the records of the Tower, de Superioritate Maris, and in the reign of his grandson Edward III. the judges of England were consulted, to the intent, 'That the form of proceeding, formerly instituted by Edward I. and his council, at the request of his subjects, might be resumed and continued for the better retaining and preserving the antient superiority of the seas of England, and the authority of the English Admiralty, in explaining and correcting the laws and statutes made by his progenitors the kings of England, for the maintenance of peace, and the administration of justice, to all nations and people navigating in the ENGLISH SEAS, and the taking cognizance of all attempts made against the liberties thereof, by punishing the guilty, and awarding satisfaction to the injured, according to the laws and ordinances made by the lord Richard, king of England, upon his return from the Holy Land, and declared and published in the aforesaid island of OLERON.' Which record proves sufficiently by whom, and where, the laws bearing the name of that island, were published.

The officers appointed by the kings of England for the management of maritime affairs, were the buticarli, who were sometimes called guardians of the navy, and sometimes guardians of the sea. In the time of Henry III. authority to guard the Eastern Sea and shore was given to Thonron de Moleton, with the title of captain and guardian of the sea. Rot. Parl. 48 Henry III. numb. 3. & Rot. Claus. 48 Henry III. mem. 3. In the same prince's reign, Hugh de Crequeur is styled warden of the Cinque Ports, and of the sea in those parts.

After him, in the year 1292, Edward I. dividing his fleet into three squadrons, gave the three officers commanding them the name of admirals; and the like command and character was given to three other such officers, in the time of his son and successor, Edward II; which prince being likewise succeeded by his son, Edward III, in his reign a parliament was called, to provide for the peace and security of the realm, by LAND and SEA. In the time of Richard II, Hugh Calveilee was made admiral of the sea, and so others, as appears by the general list of admirals; by which it is plain, provision was no less punctually made by the kings and parliament of England for the defence of the sea, than for the support of the government by land; and of what nature the commissions granted to those admirals were, may be seen by the form thereof, yet extant, of which we have transcribed as much as is necessary to express the extent of their jurisdiction in those days.

'We give and grant to N—— the office of our great admiral of England, Ireland, and Wales, and of the dominions and islands belonging to the same; also of our town of Calais, and our marches thereof, Normandy, Gascoigne, and Aquitaine: and we made, appointed, and ordained, and by these presents we make, appoint, and ordain, him the said N—— our admiral of England, Ireland, and Wales, and our dominions and isles of the same, our town of Calais, and our marches thereof, Normandy, Gascoigne, and Aquitaine: as also general governor over all our fleets and seas of our said kingdoms of England and Ireland, our dominions and islands belonging to the same. And KNOW YE further, that of our special grace, and upon certain knowledge, &c. we give and grant unto the said N——, our great admiral of England, and governor-general over our fleets and seas aforesaid, all manner of jurisdictions, authorities, liberties, offices, fees, profits, duties, emoluments, wrecks of the sea, regards, advantages, commodities, preeminences, and privileges whatsoever, &c.

King Edward VI, in the third year of his reign, granted a commission to John earl of Warwick, his admiral, wherein he calls him 'Our admiral of England, Ireland, Wales, Calais, and Boulogne, and marches of the same, and of Normandy, Gascoigne, and Aquitaine, as also governor-general of all our fleets and seas.'

From these forms of the commissions of our English admirals, for several ages past, we shall only infer, that the coasts of the transmarine provinces mentioned in the said commissions, are only inserted to denote the extent and limits of the sea that is thereby committed to their charge and protection; for either the names of the provinces of France inserted in these commissions must signify something or nothing: it is ridiculous to suppose they signify nothing; and if they denote any thing, it must be the bounds of our admiral's jurisdiction, for the following reasons.

I. It cannot be imagined the names of these provinces are there inserted in consequence of our king's pretensions to the crown of France, for then they would have given their admirals the title of admirals of England, France, &c. besides, the English were driven out of France, except Calais, and the English pale in Picardy, before the names of any of these provinces, Aquitaine only excepted, were mentioned in the commissions of the admirals of England. By which it appears, II. That the kings of England only added the names of those provinces in their admirals commissions, for the

better distinction of their boundaries: for while they possessed the maritime provinces of France, there was no necessity of mentioning them in their commissions, because the dominion of those seas belonged to them as kings of England, and not as dukes of Normandy, Aquitaine, &c. but having been dispossessed of these, by adding them afterwards as bounds of the jurisdiction of their admirals, they intended to prevent all differences about the extent of their ancient dominion, as kings of England over the sea.

It appears by the instrument before mentioned, presented to the commissioners appointed by Edward I. and Philip the Fair of France, to determine certain maritime differences, that, by the consent of all the trading nations in Europe, the kings of England had then been in peaceable possession of the dominion of the sea by immemorial prescription; that the sovereignty of the sea belongs to them, not because they were Domini utriusque ripae, when they had both England and Normandy, and were lords of both shores: for Edward I, at that time, had not Normandy, but that it is inseparably appendant to the kingdom of England. Our kings being superior lords of the said seas, by reason, as the very record mentions, of the said kingdom; and since the sovereignty of the sea did always belong to the king of England, not in any other right than that of the kingdom, no prince or state ought, or can doubt, the title by which our present claim is deduced. It is objected, That admirals were established many centuries ago in France, as well as in England. But this does not prove that they had the same power as the English admirals had; on the contrary, it is very evident that those officers were at first only occasional commanders of naval forces, on certain expeditions; and so far were they from pretending to any real jurisdiction in the sea itself, as belonging to the crown of France, that they were, in ancient times, for the most part foreigners and mercenaries, hired for some present service, for which we shall give a very unsuspected testimony, viz. that of Joannes Tillius, a clerk of the parliament of Paris, who in his second book de Rebus Gallicis says, 'The kingdom of France having been lessened by intestine divisions, and its kings reduced to narrow dominions by their potent vassals, (such as the kings of England, who possessed Normandy, Aquitaine, and other countries, the dukes of Bretagne, the earls of Flanders, Provence, and Languedoc) and having for a long time no command in the sea, had consequently no occasion for admirals, till they undertook the expedition for the Holy Land, in which they made use of mercenaries, whom they hired of the Genoese, Spaniards, and other maritime nations expert in the art of navigation, with whom they agreed for the transportation of their forces,' &c. — Which appears to be very true, by the list of French admirals, where Engerenæus Concaus is the first that is said to have enjoyed that dignity, which was conferred upon him, according to Joannes Feronius, by Philip the Bold, king of France, about the year 1280. And Joannes Tillius makes the institution of that office of a later date; for, according to him, 'Amaurius, viscount of Narbonne, was first made admiral of France, about the year 1300: nor do the edicts and decrees of Charles V. and VI, Lewis XII, Francis I, Henry II. and III, and other French kings, concerning marine affairs, and the admiralty, seem to relate to any thing but to the goods and persons of the subjects of the crown of France, and of the enemies taken in time of war by them: for though the admirals of France be therein styled our lieutenant-general, throughout the sea, and the shores thereof, yet that lieutenant-general, as they call him, never had any command over any part of the sea flowing between Britain and France, as a province, or dominion, belonging to his master the king of France, but only over the ships and naval forces of the said king passing through the British Seas, much in the same manner that any sovereign prince commands and governs the persons belonging to his own retinue, though in a foreign country, but without pretending to have any jurisdiction out of his own family, in that territory.'

As to the French kings having at the beginning, been in possession of Normandy, Picardy, and Flanders; (though it must be observed, that their kingdom was for a long time dispossessed of them), the possession of the shore, as we have already remarked out of Grotius, gives no title to the dominion of the sea flowing before it. And Julius Pacius de Domin. Maris Adriatici, writes, That the right to the sea arises not from the possession of the shores, for the sea and land make distinct territories. It is no more necessary that every sea-town should command 100 miles at sea, than that each city should command 100 miles by land.

By the laws of England, the land is called the REALM, but the sea the DOMINION; and as the loss of one province does not infer that the prince must resign up the rest; so the loss of the land territory does not, by concomitancy, argue the loss of the adjacent seas.

It appears further, that the office of admiral was at first occasional in France; for that, though all the great officers of the crown, as the constable, master of the horse, great master of the household, and others, have each their particular

particular station in the parliament of Paris; yet it was positively denied, in the time of Henry II, to Gaspar de Coligni, admiral of France; and Henry of Montmerancy seemed to be convinced of the French admirals narrow jurisdiction, when, in the year 1612, causing a statue to be erected at Chantilly, in honour of his father the duke of Montmerancy, he styles himself only, in the inscription, *Navalis militiæ magister*, or general of the militia by sea, he being admiral of France. The possession of the islands of Guernsey, Jersey, and some other isles on the coasts of Normandy by the kings of England, is made use of as an argument to prove the extent of their dominion over the Channel, and that those islands do not belong to them as an appendant or remainder of the duchy of Normandy; but it appears, by several treaties between the kings of England and other princes, that those isles are spoken of as belonging to the crown of England: and in the grant made of them by Henry V. to his brother John duke of Bedford, that prince was to enjoy the sovereignty of them, without any recognition to be made to that king, or his heirs, notwithstanding any prerogative of the crown for any other tenure held of him out of the said islands, which may in any manner belong to the said islands, castle, or dominions. And besides it is certain, that Henry duke of Warwick was, by Henry VI, made king of those islands, and of the Isle of Wight. Now it is not probable that prince would have erected them into a kingdom, if he had not possessed them by a title superior to that of an appendant of the duchy of Normandy. Our kings have frequently forbidden hostilities between foreigners at war with one another, within such distances from the ports and harbours of those islands as to them seemed convenient: and we shall see, by a patent granted by Edward VI. to the inhabitants of Jersey, that he gave them the privileges contained in it, from no other principle than as he was master of the *BRITISH SEAS*. This patent was confirmed by queen Elizabeth and king James I. By which 'all merchants, natives or strangers, and enemies as well as friends, are allowed, in time of war, freely, lawfully, and securely, to sail into and about, and frequent the said island and the coasts thereof, with their ships and goods, as well for shelter against foul weather, as upon any other lawful occasions, and there to use free traffic and commerce, and to abide with all security and safety, and to come thence and return thither at pleasure,' &c.

This dominion of the isles on the coast of Normandy, and all the islands within the extent of the British Sea, is no inconsiderable proof of the sovereignty of the kings of England over them.

That they had always a right of imposing tributes for the protection given by them to foreigners within their seas, might be further evinced, from variety of other remarkable instances: we shall only insert the following abstract of the records of parliament, as it may be seen in the original Norman, Rot. Parl. 2 Rich. II. article 38. in schedule, of which the following articles are a translation.

The merchants of London having been consulted by the earl of Northumberland and the mayor of London, about the proper methods for the guard and defence of the *NORTH-EAST ENGLISH SEAS*, it was resolved by the commons in parliament, That that sea should be guarded by two men of war, two barks, and two bilanders, armed for war, and exact of all ships as follows:

- (1.) Of all ships and barks, of what burthen soever (except ships bringing goods from Flanders to London, or carrying wool or skins from London to Calais, which were also to pay for their convoy, if they required any) passing through the said sea, for the voyage going and returning, 6 d. per ton.
- (2.) Of all fisher boats fishing in that sea for herring, 6 d. a week per ton.
- (3.) Of all ships or boats fishing there for other sorts of fish, 6 d. per ton every three weeks.
- (4.) Of all Newcastle colliers, 6 d. per ton every three months.
- (5.) Of all other ships and vessels trading with Prussia, Norway, or any other of those parts beyond sea, for the voyage going and returning, 6 d. per ton.

Nor have the kings of England been contented with exacting tribute, as an acknowledgement of their dominion in the British Seas; they always obliged all foreigners passing through their seas to pay them such other homages and tokens of submission, as are sufficient to prove they acquiesced in the lawfulness of their title to that dominion. It was ever accounted even treason for any ship, of any nation whatsoever, to refuse to acknowledge the sovereignty of the kings of England, by striking their colours, lowering their top-masts, &c. or performing such other ceremonies as have been required by the admirals, or captains, of any of the king's navies, or ships meeting with foreigners at sea; and such as refused so to do, forfeited ipso facto, by that refusal, all the privileges and rights to which they might otherwise be intitled as allies, and were punishable by the king of England, or his admirals, in the same manner as if they had committed a crime within the jurisdiction of his territories by land.

These ceremonies, as we have shewn in the preceding pages, have been for many ages exacted by the English kings, with all imaginable rigour. By an article of the *OFFENSIVE*

VOL. II.

and *DEFENSIVE LEAGUE*, concluded between the French and Dutch, anno 1635, it was agreed, 'That if at any time the Dutch fleet (which, according to the league, was to scour the French coast in the Mediterranean from pirates) should meet with the French fleet, the Dutch admiral should, at his first approach to the French, strike his colours and lower his top-mast, and afterwards salute the French admiral with guns; which salutation the French admiral was to return with guns only *.'—But even the duty of the flag there claimed by the *FRENCH* in the Mediterranean, is vastly inferior to that due to the *ENGLISH* in their seas, the first being only a bare token of respect, the refusal of which could, at most, amount to no more than a breach of the league; whereas the homage paid to the *ENGLISH* being a real and fundamental prerogative of the crown, the contempt of it is, as has been said, deemed to be open rebellion, and the contemners may lawfully be invaded in an hostile manner, according to the orders and instructions that are given to the admirals and commanders of the *ENGLISH NAVIES AND SHIPS*.

* Leo ab Aitzmet Hist. Traët, Pacis Belg. pag. 177. edit. Lugd. Batav. 4. 1034.

Another point, in relation to the sovereignty of the kings of England to the dominion of their seas, is the practice very much used of old by them, to extend their embargoes all over the *BRITISH SEAS*, and seize foreign ships passing there, as well as if they had been within their own harbours, and employing them in their own service, as will appear by the following mandate, issued out by king John to this purpose.

'The king to all *STUREMANNI* (sea captains and officers) and *MARINELLI* (mariners or sea soldiers) and merchants of England using the sea, greeting: *KNOW YE*, that we have sent Alanus Juvo of Sorham, Walter Stalun, Vincent of Hastings, and Wilmund of Winchelsea, with others of our barons of the Cinque Ports, &c. four faithful *STUREMANNI* and *MARINELLI* of our galleys, to arrest and safely bring into England all ships that they can find, with all that shall be found in them: and therefore we command you to be aiding to them in this business, so that ye be in England with your ships and goods at such ports as they shall appoint: and if any shall attempt to resist them, contrary to our command, *YE* our liege men are required to assist them with all your power, as you tender yourselves and your chattels, and your quiet and residence, and that of all your kindred within our dominions.'

Much the same order was given by Edward III, to Thomas de Wenlock, vice-admiral of his western fleet, to seize and arrest all ships for his immediate service. However, a competent hire was always allowed for ships so impressed, according to their burthen, and the number of their hands.

That it was customary for the kings of England to grant passports, or safe-conducts, to such foreigners as desired liberty to pass through their seas, may also be sufficiently proved, out of the records of parliament, where will be found the conditional clause of such passports, 'That the persons who had obtained them should not convey, or cause any thing to be conveyed, nor in any manner relieve nor impart any thing to the king's enemies in France.' And in Edward the First's time it was always a peculiar injunction laid upon his sea commanders, That they should take special care to vindicate and maintain the sovereignty which his predecessors, the kings of England, were wont to have in the *SEA*, concerning the explication and amendment of the laws, which had been by them instituted for the government of all nations and people navigating in the English Seas; than which nothing can more explicitly demonstrate that they possessed the dominion of them.

In a passport granted by Henry IV. of England, to Farrando Urtis de Sarachione, a Spaniard, that king permits him to sail freely from the port of London through his kingdoms, dominions, and jurisdictions, to the town of Rochelle. And what can be meant by *DOMINIONS AND JURISDICTIONS* here, but those of the seas flowing between London and Rochelle? And the ambassadors of Charles VI. of France, and Robert III. of Scotland, in the passports they obtained of the same king Henry, are therein allowed free passage through all the places, territories, and dominions, under his power, by sea as well as by land: whereas the passports granted by several kings of France to the ambassadors of the kings of England, only run thus:

'P——, by the grace of God, king of France, to all our governors and subjects, greetings,' &c.

The reason of which must certainly be this, that the king of England being himself lord of the sea, there was no necessity that the kings of France should secure them within the bounds of their own jurisdiction; which John king of Sweden seems very well to understand, when in his letter to queen Elizabeth, in the year 1587, he desires leave for

Olaus Wormæus, one of his subjects, to pass through her Majesty's SEA DOMINIONS, to carry some merchandize into Spain.

The * Hamburgers and the Hanse-Towns petitioned for licence to transport corn thither about the same time, and were positively forbidden, being told plainly, That such as should presume to go beyond a former licence, 'should for that bold presumption suffer the loss of all their goods and effects, in case they fell into the hands of any of her Majesty's ships of war, or others.'

* June 30, anno 1598.

Wetefeldius and Bernscovius, ambassadors from Christian IV, king of Denmark, desiring the same liberty of transporting corn to Spain, by order from their master, were answered, 'That her Majesty could by no means consent to the king of Denmark's demands; neither would she grant such a liberty to her own subjects, or any else, 'till the war between her and the Spaniards was at an end.' If queen Elizabeth was not sovereign of the ENGLISH SEAS, why did so many flates humbly request her for privileges which she had no right to grant or refuse? The frequent applications that have been made by foreign potentates for obtaining liberty to fish in the ENGLISH SEAS, and the conditions upon which that privilege has been granted, are other proofs of the lawfulness of the English dominion in their seas.

Mention has already been made of the tribute imposed upon fishermen in the ENGLISH SEAS, in the time of Richard II, and in the Irish Seas in the reign of Edward IV, to which we shall now add some notable instances of the same nature.

We find in the Rolls of Parliament, in the reign of king Edward I, a protection was granted by that prince for the men of Holland, &c. to this purpose:

'The king to his trusty and well-beloved John de Buteturtu, warden of the port of Jernemouth, greeting: being informed that men of Holland, Zealand, and Friezland, who are now in amity with us, design to come and fish in our sea, near Jernemouth, we require you to cause public proclamation to be made once or twice a week, forbidding all manner of persons whatsoever employed in our service, to presume to do, or cause to be done, to these men, any injury or damage, &c.'

The records are full of such protections in the reigns of that king's successors, Edward II, Edward III, Richard II, Henry IV, Henry V, and Henry VI; the last of whom, as appears by Rot. Franciæ, 38 Henry VI. mem. 9 and 14. frequently gave licences, especially to the French, to fish in HIS SEAS, prescribing a certain time, as well as the size of the boats, they or others were to fish in. So jealous have our princes always been of this prerogative, that Edward VI. appointed custodes, conductores, and walfores, guardians, conductors, and wasters, with a special power to protect the FISHERMEN upon the coast of Suffolk; for which protection a tribute was levied on the fishers, according to their burthen. The words of their commission will shew us what their office was: they had power to 'raise and collect all costs, charges, and expences, to arrest and apprehend all persons who should pretend to protect, conduct, or waste the fishermen, and to commit them to the next gaol, there to be kept securely, 'till the king should be pleased to give order for their delivery.' And in the patents of that nature granted by Richard III. and Henry VII, these officers were empowered to exact this tribute, 'even though any one or more of the said fishermen may have obtained letters of safe-conduct [see the article of SAFE-CONDUCT] from any other king, prince, potentate, or governor whatsoever.'

Queen Mary I. being married to Philip II. of Spain, granted, for a fine and a yearly revenue of 1000 l. to be paid into the treasury of Ireland, a general licence for the NETHERLANDERS to FISH ON THE NORTHERN PARTS OF THAT KINGDOM. Mr Camden in his Britannia, speaking of the Northern Sea, which washes the coast of Yorkshire, says, 'The Hollanders and Zealanders first obtaining leave according to the ancient custom, of the governor of Scarborough castle, made a very plentiful and advantageous HERING-FISHING: the English reserving only the honour and privilege to themselves, have, by a very condemnable negligence, always resigned the PROFIT TO STRANGERS.' This liberty of FISHING in the ENGLISH SEAS has been always requested by STRANGERS, and particularly by the FRENCH, though they would gladly usurp a share of the MARINE SOVEREIGNTY, if they had power to maintain it. HENRY IV. of FRANCE, his admirals usually asked of our QUEEN ELIZABETH licences for the FRENCH FISHERMEN to FISH IN THE NEIGHBOURING SEAS FOR SOLES FOR THAT PRINCE'S OWN TABLE.

The English do not pretend that their kings were sovereigns of the Caledonian and Deuceadonian Seas, 'till the kingdom of Scotland was united to that of England, under James I. Though the ancient Scots enjoyed, without any competitors, the sovereignty of the greatest part of the seas with which their shores are washed; yet they had, for many ages to-

gether, a continual controversy with their neighbours, the Danes and Norwegians, about the more northerly parts of the Caledonian Sea, to the possession of which they all pretended; and, in the main, the government of those seas did for the most part accompany the sovereignty of the Orcades, and other islands situate near them; which, after many revolutions and changes of masters, did at length devolve upon the kings and queens of Scotland, who peaceably possessed them a long time: for about the year 1468, Christiern, king of Denmark, surrendered the Orcades and Scotland to James III, king of Scotland, who had married his daughter Margaret, and resigned the right to those isles to him and his heirs for ever. By which surrender and resignation, the Scots kings became possessed of the sovereignty of the Northern Seas, in which they are situate, as well as of the isles. Nor have the Scots neglected, on several occasions, to assert their dominion of the adjacent seas. Mr Welwood, an eminent lawyer of that nation, in a treatise he wrote of the dominion of the adjacent seas, takes notice of a quarrel that had happened between the DUTCH and the SCOTS, about the propriety of the sea, which, at last, was composed on the following conditions, 'That the DUTCH FISHER-BOATS should not come within 80 miles of the shore, and that, in case they should be driven in thither by stress of weather, they should pay a certain tribute at the port of ABERDEEN, where a castle was built and fortified chiefly on that occasion; and the DUTCH, for some time, did really and effectually pay that tribute,' &c.

In a parliament held in the sixth year of the reign of Mary queen of Scotland, that dominion was again asserted, and all foreigners were expressly forbidden to FISH within the extent of the SCOTTISH SEAS, without licence. King James VI. of Scotland, and I. of England, had that act confirmed and enlarged: 'And all fishers, or other persons whatsoever, occupying the SCOTTISH SEA, and FISHING for herrings or white fish, were enjoined to bring the same to be sold at FREE PORTS within the kingdom of Scotland, that his Majesty and his subjects might not be deprived of the advantages and emoluments which God had appointed for them.'

Since the union of the crowns of England and Scotland, the sovereignty of the SCOTTISH SEA, and the other seas with it, which we have taken notice of in speaking of the extent of the BRITISH SEAS, devolved upon the kings and queens of Great-Britain; and we shall, in the sequel, observe how they have been careful to assert and maintain it.

But we must first take notice, that the English had great privileges and immunities in the Northern Seas granted them by the kings of Denmark and Norway, who had at first excluded them from all commerce and traffic in some parts of them. At last it was agreed, by a treaty made in the year 1485, between Henry VII. and John II, kings of England and Norway, that the English should for ever enjoy the liberty of fishing, trading, and sailing safely and securely to IRELAND, called in the treaty the island of Tyle, and of buying, selling, and merchandizing in those seas, upon payment of the ordinary duties of the ports, provided that by petitioning for such liberty once in seven years, they acknowledged the sovereignty of the kings of Norway in those seas. Thus we find the dominion of the sea is not only capable of being possessed, but that other princes, besides the kings of England, have claimed and enjoyed it. 'Frederic II, king of Denmark and Norway, in a letter to queen Elizabeth, in the year 1585, says, That if the English abstained from doing any injury, they should enjoy their former liberties and privileges, without petitioning any more for licences.'

This privilege depended on the good will of the sovereign of those seas at first, but having been long enjoyed, the English pleaded a right of it by prescription. It is certain, however, that they have a better title to the dominion of the Northern Sea towards the coasts of Greenland: for their Muscovy company first acquired a right to that sea by actual occupation, their MARINERS being the discoverers of it, and their FISHERS improved the whale-fishing.

An actual and primary possession is much more sufficient than an intentional one, to vest the discoverers with a title to the propriety of the thing so discovered: of which king James I. seemed very sensible, when in his letters of credence given to Sir Henry Wotton, his ambassador to the States-General of the United Provinces, he says, 'That the FISHERS in the Northern Seas, towards the coasts of GREENLAND, were acquired by right for him, and his only.' Notwithstanding which, it is certain that the Hollanders have been too unfriendly, by encroaching upon the BRITISH FISHERIES, not only on the NORTHERN OCEAN, but even on the coasts of GREAT-BRITAIN.

We shall now observe how the kings and queens of Great-Britain have asserted the dominion of the British Seas, since the union of the two crowns of England and Scotland.

When king James I. succeeded to the kingdom of England, the nations of Europe were almost all in profound peace, except the Dutch and Spaniards; and the quiet of the English Seas was in some measure disturbed by the frequent hostilities

ties that happened between the Spaniards and Dutch; upon which he published a proclamation, forbidding (as lord of those seas) any sort of injury or violence to be offered by either party, within certain limits which he appointed, as may be seen by the proclamation itself.

Our pleasure is, that within our ports, havens, roads, creeks, or other places of our dominion, or so near to any of our said ports and havens as may be reasonably construed to be within that title, limit, or precinct, there shall be no force, violence, or offence, suffered to be done, either from men of war to men of war, or men of war to merchantmen, or merchantmen to merchantmen, of either party, &c.

And though that proclamation did only prohibit the committing of hostilities within or near certain creeks, bays, ports, and harbours, (which were called the king's chambers, some of which took in 30 leagues of the sea) no inference can be brought thence to destroy that prince's title to the sovereignty of the more distant parts of the ENGLISH SEA; for he allows the two nations at war between themselves (but both at peace with him) to invade, attack, and make prize of one another in the open sea: nor did the SPANIARDS make any scruple to claim the king of England's protection against their enemies the DUTCH, and all others whatsoever, not only within the seas abovementioned, but all over the ENGLISH SEAS, which they looked upon to be as much a part of his dominion as the land, as appears by the discourse of their advocate here, who pleads it in express terms; adding, 'That towards the north and west the kings of Great-Britain's SEA DOMINIONS were of a vast extent; for that the northern coast of Britain having no opposite shore, their sea jurisdiction that way had no limits; and the south of Ireland lying opposite to Spain, and the west to the Indian countries belonging to that crown, were consequently bounded by them.' So far did this Spanish lawyer make the dominion of our kings extend. Whether he has extended it too far or not, we shall not undertake to determine, but make no difficulty to affirm, that the Hollanders have, of all nations, been too free with the English on this occasion, and encroached too much on our MARINE SOVEREIGNTY. This is said without any design to revive old misunderstandings, or to put any Briton out of humour with our ancient and natural allies, who have appeared so resolutely in the cause of liberty, and are now, we hope, in a strict alliance with Great-Britain*.

* However incompatible the interests of Great-Britain and the United Provinces may appear in the eyes of some, in relation to their commercial concerns, we cannot but think it possible to promote and cement a union in this great and essential point, which, if it could be happily effected, would tend more substantially to the reciprocal lasting interest of both powers, than treaties and alliances founded on any other principles only: for this commercial concert and good understanding would enable us, by means of our joint maritime strength, both mercantile and otherwise, not only to preserve that share of trade and naval power we both at present possess, but to increase them at the expence of our common enemies, and to keep them in subjection, that they may never have it in their power to injure either state. Let it be supposed, for instance, that such a strict and interesting connection subsisted at present between these two powers, would not that effectually prevent those measures that the French seem to be now taking to injure our trade in the East-Indies, and elsewhere? And if the French carry the point at which they aim in Asia, against Great-Britain, and settle the French empire there, according to the system that it is said Dupleix has formed, may not the Dutch likewise soon feel the effects of the French power in that part of the world? If the English should be extirpated from the trade of the East-Indies, and the French power and commerce is raised there, in the like proportion as that of England shall decline, what hinders but that France may soon totally destroy the Dutch power there also? For when the power that England and France now have in the East-Indies, is united in the hands of France alone, it would be scarce possible for the Dutch to support themselves in their possessions and commerce in that part of the world. On the other hand, if the English and the Dutch should heartily unite in preserving and increasing that empire and commerce which they now have in these Indies, it would be impossible for France there to withstand their united force; and would not this enable Great Britain and Holland to give law to all other European powers who should attempt any trade in this part of the world? The like consequence would follow in regard to the commerce of these two potentates in Europe, provided their interests in commerce and navigation could become one, and happily coincide, for the mutual preservation and glory of both states. Would some of the wisest and ablest men of both these Protestant maritime empires, think seriously of a matter of this high consequence to them, we should soon experience the weight and influence of so happy a commercial concert; it would prove, in its consequences, a far more effectual preservative of the ballance of power than any other expedient, not only in Christendom, but throughout the whole globe, because Great-Britain and Holland, in concert with other of their Protestant allies, would then be able to give law, whenever occasion should require. And this desirable union between these maritime powers, in regard to their trading interest, may not appear impracticable, if ever it

should be thought of in earnest by the joint wisdom of both nations. See the articles UNITED PROVINCES, HOLLAND, FLANDERS, and NETHERLANDS.

Notwithstanding king James exercised great forbearance towards the Dutch and others, yet there was no point of which he was more jealous than of the sovereignty of the sea, which may be seen by the following proclamation, which he issued in the year 1609.

Whereas we have been contented, since our coming to the crown, to tolerate an indifferent and promiscuous kind of liberty to all our friends whatsoever, to fish within our streams, and upon any of our coasts of Great-Britain, Ireland, and other adjacent islands, so far forth as the permission or use thereof might not redound to the impeachment of our prerogative royal, nor to the hurt and damage of our loving subjects, &c. finding our continuance herein hath not only given occasion of over-great encroachments upon our regalities, or rather questioning of our right, but hath been a means of daily wrongs to our own people that exercise the trade of fishing, &c. which is a matter of great consequence to our estate, considering how much the strength thereof consisteth in the power of shipping, and use of navigation; We have thought it now both just and necessary (in respect that we are now, by God's favour, lineally and lawfully possessed, as well of the isles adjacent) to bethink ourselves of good and lawful means to prevent those inconveniences, and many others depending upon the same: in consideration whereof, &c. we have resolved first to give notice to all the world, that our express pleasure is, that, from the beginning of the month of August next coming, no person, of what nation or quality soever, being not our natural-born subject, be permitted to fish upon any of our coasts and seas of Great Britain, Ireland, and the rest of the isles adjacent, &c. until they have orderly demanded and obtained licences from us, &c. upon pain of such chastisement as shall be thought fit to be inflicted upon wilful offenders.

The Dutch got too much by their fishings on our coast, to be frightened with a proclamation: and this pacific king had no great inclination to any harsher methods than what words would effect. The Hollanders knowing his temper, presumed upon it so far, as to plead immemorial possession. Upon which king James commanded his ambassador at the Hague to give the States-General to understand, that he expected other satisfaction with reference to the fishings. And indeed the Dutch dealt with him so unfairly in that matter, that a prince of more martial temper would have been provoked to a rupture; but negotiations were king James's beloved way of concluding affairs, and a long one commenced about this, in which we shall see what was urged by the English on this subject.

We shall begin, therefore, with an abstract of a letter written by the secretary of state in England, to the English ambassador at the Hague, dated December 21, 1618, viz.

As to their [the Dutch] claiming an immemorial possession, founded by the law of nations, his Majesty will have them told, That the kings of Spain have sought leave to fish there (in the British Seas) by treaty from this crown, and that the king of France (a nearer neighbour to our coast than they) to this day requests leave for a few vessels to fish for provision for his own household, and that it appears so much the more strange to his Majesty, that they, being a state of so late date, should be the first that would presume to question his Majesty's ancient right, so many hundred years inviolably possessed by his progenitors, and acknowledged by all other ancient states and princes. That themselves, in their public letters of the last of June, seemed then to confirm their immemorial possession (as they term it) with divers treaties, as by that of the year 1550; and another between his Majesty's predecessor and Charles V, as prince of those provinces, and not by the law of nations. To which their last plea, his Majesty would have them told, That he being an islander prince, is not ignorant of the laws and rights of his own kingdom, nor doth expect to be taught the laws of nations by them nor their Grotius: for his Majesty taking this for a high point of his sovereignty, will not have it slighted in any fashion whatsoever, &c. Let them advise to seek leave from his Majesty, and to acknowledge him his right, as other princes have done, and do; or it may well come to pass that they that will needs bear all the world before them with their Mare Liberum, may soon come to have neither Terram and Solum, nor Rempublicam Liberam. To which letter the ambassador returning an answer, among other things says, 'I told the prince of Orange, That howsoever his Majesty, both in honour of his crown and person, and interest of his kingdom, neither could nor would any longer desist from having his right acknowledged by this state, as well as by all other princes and commonwealths; especially finding the same openly oppugned both by their States men of war, and the writings of Grotius, and the taking of John Brown the last year, may testify; yet this acknowledgement of a right and due was no exclusion of grace and favour, and that the people of this country

paying

paying that small tribute upon every one of their buffes (which is not so much as disputed by any other nation whatsoever) such was his Majesty's well-wishing to this state, that I presumed of his permission to suffer them to continue their course of fishing, which they might use thereby with more freedom, and less apprehension of molestation and lett than before, and thereby spare the cost of some of their men of war, which they yearly send out, to maintain that by force which they might have of courtely. The prince answered, He would do his best endeavour to procure his Majesty contentment, but he doubted the Hollanders would apprehend the same effect in their payment for fishing, as they found in the passage of the Sound, where at first an easy matter was demanded by the king of Denmark, but now more exacted than they can possibly bear. And touching their men of war he said, They must still be at the same charge with them, because of the pirates. He asked me whether this freedom of fishing might not be redeemed with a sum of money. To which I answered, It was a matter of royalty, more than of utility, though princes were not to neglect their profit. The same ambassador wrote home afterwards, That the States had acknowledged their commissioners in England had gone beyond their instructions in using of the term of immemorial possession. But this dispute dropped, and nothing came of it in king James's reign, except a verbal acknowledgement of his dominion in the British Seas, with which this king satisfied himself; and his easiness encouraged our neighbours to contemn the authority of his son Charles I. in the beginning of whose reign they committed innumerable abuses, which provoked his Majesty to equip a fleet, and publish a proclamation, declaring the reason of his making that armament, A. D. 1636. Wherein having shewn what outrage had been done to his father's and his own prerogative, by several people fishing in their seas without licence, he says:

'We being very sensible of the premises, and well knowing how far we are obliged in honour to maintain the rights of our crown, especially of so great consequence, have thought it necessary, by the advice of our privy-council, to renew the aforesaid restraint of fishing upon our aforesaid coasts and seas, without licence first obtained from us; and by these presents to make public declaration, that our resolution is (at times convenient) to keep such a competent strength of shipping upon our seas, as may (by God's blessing) be sufficient both to hinder such further encroachments upon our regalities, and assist and protect those our good friends and allies who shall henceforth, by virtue of our licence (to be first obtained) endeavour to take the benefit of fishing upon our coasts and seas in the places accustomed.'

The Dutch expressing their apprehensions of these naval preparations to Sir William Boswell, then resident at the Hague, he acquainted the ministers in England with it, and Sir John Cook, then secretary of state, sent a letter, wherein, after he had set forth the several encroachments made by the Hollanders on the fishings in the British Seas, and other marine offences, he writes thus: 'Considering that peace and war must be maintained by the arm of power, which only keeps down war by keeping up dominion, his Majesty thus provoked, finds it necessary, even for his own defence and safety, to reassume and keep his ancient and undoubted right in the dominion of these seas, and to suffer no other prince or state to encroach upon him, thereby assuming to themselves, or their admirals, any sovereign command, but to force them to perform due homage to his admirals and ships, and to pay them acknowledgements as in former time they did. He will also set open and protect the free trade of his subjects and allies, and give them such safe-conduct and convoy as they shall reasonably require: he will suffer no other fleet, or men of war, to keep any guard upon these seas, &c.' In the same letter the secretary says, 'We hold it a principle not to be denied, that the king of Great-Britain is a monarch at land and sea, and that it concerns him as much to maintain his sovereignty in all the British Seas, as within his three kingdoms, because without that these cannot be kept safe, nor he preserve his honour and due respect with other nations.'

This fleet, however, did not finish the work it was designed for; and king Charles being afterwards involved in a war with his parliament, it was not likely he should then much mind his dominion at sea. But when the Rump had the government, they, out of jealousy of the neighbouring commonwealth, fitted out a fleet, to maintain the right of sovereignty of the new pretended sovereignties to the British Seas. This fleet was scarce arrived in the Downs, when the Dutch, thinking to surprize it, fell upon it, and hoped to destroy the naval strength of the English at once; but Blake, who commanded the English fleet, making his party good with them, though they had two ships to his one; and Oliver, after they had been well beaten in several naval fights, obliging them to beg a peace of him, the duty of the flag was heartily agreed to, and the sovereignty of the English Seas very plainly acknowledged by the Dutch, in the 15th and 16th articles of the treaty concluded between the two nations, November 15,

1653. The substance of which two articles is as follows.

ARTICLE XV.

'That the ships and vessels of the said United Provinces, as well men of war as others, be they in single ships or in fleets, meeting at sea with any of the ships of the state of England, or in their service, and wearing the flag, shall strike the flag, and lower their top-sail, until they be passed by, and shall likewise submit themselves to be visited, if thereto required, and perform all other respects due to the commonwealth of England, to whom the dominion and sovereignty of the British Seas belong.'

Leo ab Aitzma, fol. 847, says, The States would have this addition inserted, after passed by, 'In such manner as the same has been formerly observed in any times whatsoever.' This article was from hence transcribed into the tenth article at Whitehall *, and afterwards into the 19th article at Breda; from thence into the 6th article made at Westminster after †; and that clause of searching each other's ships made reciprocal; by the 5th article of the marine treaty at London. By the British Seas in this article are meant the four seas, and not the Channel.

* September 14, 1662.

† December 18, 1674.

ARTICLE XVI.

'All Dutch ships are allowed to pass and repass in the British Seas, either men of war or others, without any wrong or injury, not exceeding such a number as shall be agreed upon, &c. but, in case the said States-General shall have occasion to pass through the said seas with a greater number of men of war, they shall give three months notice of their intention to the commonwealth, and obtain their consent for the passing of such a fleet.'

Whatever infringements were made of these articles, we question whether king Charles II. would ever have broken the peace on that account. There is nothing more certain, than that the first Dutch war in this reign was owing to French councils: however, the effects answer our design, and prove that the Dutch, who have most openly oppugned the title of the English to the sovereignty of their seas, have most solemnly acknowledged it, as may be seen by the 19th article of the treaty of peace concluded between that king and the States-General, July 29, 1667, to this purpose: 'That the ships and vessels of the said United Provinces, as well men of war as others, meeting any of the said king of Great-Britain's men of war in the BRITISH SEAS, shall strike the flag, and lower the top-sail, in such manner as the same hath been formerly observed in any times whatsoever.'

When the Dutch applied to queen Elizabeth for succours, one argument for her assenting them, made use of by their agent, was, that the situation of their provinces would be a great security for the preservation of her empire in the ocean; as may be seen in Stowe. And how that wise state came to forget themselves so far afterwards, as to put the realm of England to the charge of two or three wars to bring them to reason, we cannot comprehend: for the homage the English require at sea is a trifle, in comparison of the advantages they reap by their alliance, and the security of their protection. It is probable the imperious methods used by the English in demanding the flag of the Dutch, might exasperate that state, and that the court of England were excited by the French, who under Richlieu began first to apply themselves vigorously to the increasing their traffic and strength at sea: but Richlieu left that undertaking to the famous Colbert, who had the glory to finish it, and to see the French fleets in a condition to contend with the most powerful maritime states. He formed companies for trading to Africa, the East and West-Indies, and founded a polity for the government of the marine. But knowing all the French naval strength would signify little, while the English and Dutch continued theirs, he may reasonably be supposed to advise his master to set them one against the other, in order to destroy them both; and how far he proceeded in that fatal design, the histories of the reign of king Charles II. will make appear.

England then connived at the growing greatness of France at sea, than which nothing could more endanger her maritime sovereignty. She not only suffered, but assisted the French to build a fleet; and had not the parliament, though almost too late, put a timely end to the misunderstanding which the French did very industriously foment between Great-Britain and Holland, with a design to ruin the naval power of both, Lewis XIV. would not have found it so difficult a task to acquire the dominion of all the European seas, as he did to defend his own coasts and harbours against the victorious fleets of the queen of Great-Britain, and the States-General of the United Provinces.

The great efforts the French court made to encourage and improve navigation, were seconded by the labours of ingenious persons, appointed by the ministry * to write tracts, in

* Monsieur Savary's French Dictionary of Commerce was undertaken in France from this motive; and we find that there

these engaged in that work, written many years since, not only two brothers of distinguished abilities, who spent a considerable part of their lives therein, but that merchants of the first class, the public offices of the kingdom, the council of commerce itself, personages of various ranks, eminent for their knowledge in trade, and even the first ministers of state, unanimously concurred to encourage the composition and publication of that performance, for the benefit of their country: and doubtless they judged wisely, that nothing could more effectually raise an emulous spirit both amongst themselves, and in opposition to foreigners, than the whole nation experiencing the greatest men in it devoted to the general improvement of trade, and earnestly labouring, by their example, to render the knowledge and practice thereof universal in the kingdom: and the event has verified their penetration and foresight.—The present author of this English Dictionary of Commerce never was so happy as to meet with any assistance in this, or any other of his labours in the public service; never met with any patronage from any man whatsoever, nor any sort of public or private encouragement; but on the contrary, he has met with a series of mal-treatment and discouragement, for his zealous and public-spirited endeavours to serve his country.

order to raise the spirit of commerce in the kingdom, and to excite people of all qualities to be more or less concerned in the trading companies that were then forming; wherein the king, and most of the princes of the blood, and the lords of the court, had very considerable shares, that, by their examples, others might be induced to venture in the same bottoms. And to one of these authors we are obliged for an acknowledgement of the English dominion in the seas lying between us and France, which we suppose fell from him accidentally. This passage is to be found in a treatise intitled *Le Parfait Negociant*, written by the *Sieur Savary*, and first published at Paris in the year 1675, with the order and approbation of *MONSIEUR COLBERT*, prime minister for the marine, to whom it was dedicated.

This author, pages 118 and 119, speaking of the discovery of the Canary Islands, says, 'That the duke of Burgundy, joining with the king of England, an enemy of France, made a descent into Normandy, with 1000 ships, so that the war being broke out, and the English possessing the sea and our ports, the admiral could not get,' &c. Now if the English possessed the sea in such a manner, that the admiral of France himself durst not equip a few transport-ships, to send men and provisions to the Canaries, to the discovery and right of which the French pretend, none can imagine the French at that time presumed to cope with us at sea; and if such a possession as that attributed by the French themselves, was not an authentic proof of dominion, we cannot tell what is.

It is true, the French may answer to this, When we lost their ports, we lost the dominion of the sea; but it has been shewn, that the British naval sovereignty was not founded upon so precarious a possession, but is as old as history, and as undeniable as any thing can be, which is proved by the acknowledgement of all nations and ages. We have looked into the histories of most of our kings, from the Norman invasion, to king Charles the 11th's reign, and have found they all asserted and maintained their dominion of the sea.

King James II. was buſied about other things, and what navy he had was intended rather to secure his arbitrary government by land, than to defend his sovereignty at sea. King William, his successor, gloriously asserted and maintained it, in conjunction with the Dutch, by giving laws to all nations, in all the seas in the world, where a royal fleet ever appeared. And queen Anne did with the same vigour and success uphold that dominion at sea which king William left her, the French managing their sea affairs like pirates, and pretending to no dominion but what they got by surprize, as corsairs do over ships they can master.

In the late queen Anne's reign we have an instance of her asserting her sovereignty at sea; for admiral Whetstone, in July 1706, meeting with a fleet of Swedish-merchantmen, under convoy of a Swedish man of war, her Majesty's ship the *Worcester* fired a gun, as a signal to command the Swedes to strike; but the Swedish captain sent his lieutenant aboard, to acquaint the English commander that he had positive orders not to strike to any flag whatsoever, even in the Channel itself. The captain of the *Worcester* receiving that message, instead of the ordinary marks of homage to be expected from all foreigners in the English Seas, fired a ball, which being answered with a broad-side by the Swede, the *Worcester*, and another English man of war, engaged the Swedish man of war, killed and wounded about 150 of her men, with some loss on their side, and brought her and all the merchant ships into the river; nor were they discharged 'till satisfaction was given the queen for the affront put upon her admiral in her own seas. Some instances of the same nature, though not so solemn, happened in king William's reign, and will, we hope, be sufficient to induce other nations not to invade the right which the kings and queens of Great-Bri-

VOL. II.

tain are as lawfully possessed of, to the sovereignty of the British-Seas, as to the dominion of the British empire at land.

REMARKS.

It is an observation worthy the serious attention of every Englishman, That empire has always followed trade, travelling (as it were) from one part of the world to another, as commerce has shifted its station; and, in all countries, still growing or declining in power, in proportion as traffic has been encouraged or disregarded. And the commerce of this nation depends on our dominion at sea.

Cicero ad Attic. says, *Qui mare teneat, eum necesse rerum potiri*: which shews this to have been the opinion of a very great man, who had been at the head of affairs in a powerful state, above seventeen hundred years ago: and the practice of all princes who have lived since that time, and have ever designed either to extend their dominion, or to render themselves considerable to their neighbours, fully proves the observation to be true.

The Romans (who aspired to nothing less than universal empire) while their conquests were confined within the narrow bounds of Italy, were so much prejudiced with the notion of a landed interest, that, as Livy relates, they thought it scandalous for a man of fashion to exercise any merchandize; and, in consequence of that prepossession, they were not in a capacity to make any figure by sea, an element little practised on by them, and less understood. But this notion lasted only 'till they had an opportunity to look more abroad into the world: then experience taught them, as they came to quarrel with the Carthaginians (who at that time were the great trading people) that commerce was necessary to establish their empire, and that not only their conquests were at an end, but the possession of the territories they had conquered was precarious, unless they could acquire and secure to themselves the dominion of the sea.

We have seen that it is not an empty title, which the kings of England have always taken to themselves, of being supreme lords and governors of the ocean surrounding the British shore, but a right which they have constantly maintained, at the expence of numerous fleets. In that famous accord, made between our great king Edward I. and Philip the Fair of France, it appears, that the French king was by him called to an account for piracies, committed by his subjects within the British Seas: and by that memorable ordinance made at Hastings, in the reign of king John of England, the honour of the flag (ever claimed by the English) is decreed to take place universally, not barely as a civility, but as a right to be paid (cum debita reverentia) with due deference.

This due maintenance of the sovereignty of the British Seas has animated the English nation to endeavour likewise to maintain, in concert with other allies, a superiority of maritime power in general; whereby, from time to time, the balance of power amongst the European States has been hitherto preserved, and since the Revolution, the Protestant interest, and the liberties of millions of people, may be truly said to owe their existence to the MARITIME PROWESS of these kingdoms in particular; for if this power had not been occasionally exerted, the united maritime power of all other states and empires together, could not have prevented that universal empire of slavery, that has been so steadily pursued by a neighbouring power. See our article FRANCE.

The nations recorded in history to have been at any time possessed of the empire of the sea, have always esteemed a neighbouring prince's offering to set up a naval power, by building more ships of war than were requisite to secure the trade of his subjects from piracies, &c. to be as just a foundation of political jealousy, as the raising of new forts upon his frontiers, or the levying of a formidable army in a time of profound peace: and, therefore, they have always taken measures either to prevent such attempts, or to destroy them in their birth. This was the practice of the Romans, and this has been the practice of his Majesty's royal predecessors the kings of England.

The Romans, as soon as they had acquired the sovereignty of the sea (which they thought not dearly purchased with the loss of above 700 ships) immediately entered upon measures to preserve so valuable an acquisition. They grew watchful over this new dominion, and were soon alarmed by the smallest umbrage from any power that did but seem to interfere with them in NAVAL AFFAIRS. It was from these political considerations that they would not permit the Carthaginians to fit out any fleets, and that they forbade ANTIOCHUS (at that time the greatest king in the East) to BUILD MORE THAN TWELVE SHIPS OF WAR.

Upon the like principles his late Majesty king George acted, when the Spanish fleet was destroyed by Sir George Byng in the Mediterranean. This single action rendered the king of Great-Britain, at that time, as much master of the Mediterranean, as he has been always acknowledged to be sovereign over the British Seas. This many years prevented the growth of the naval power of Spain: and did not England and Holland act in concert, from the like motive, when they insisted

on the dissolution of the late Ostend East-India company, in the Austrian Netherlands? [see AUSTRIAN NETHERLANDS, and OSTEND EAST-INDIA COMPANY]: for the chief reason given by the maritime powers was, lest A NEW NAVAL POWER should arise in Europe, in consequence of this commercial establishment.

There is no occasion for troubling my readers with a detail of examples to the present purpose, since nothing is more known in our English history, than that our kings have ever been jealous of their neighbours making use of any pretext to increase their naval strength, and have accordingly judged it of the greatest importance to frustrate such designs, though at the risk of war: for what less did our immortal queen Elizabeth risk, when she sent to the French king, to prohibit his building any more ships of war than what he then had, without her leave first obtained? This was an instance of wisdom and resolution worthy a prince who claimed the sovereignty of the sea.

Our maritime force is undoubtedly our chief bulwark against foreign invasions, and what hath given us so great a weight and influence over our neighbours. It is this only which raised us from a little, despised, inhospitable people, to a great, polite, and formidable state. To this we are obliged for our trade, our riches, the improvement of our land, the consumption of our manufactures, and the possession of all our valuable colonies and plantations abroad, as well as the dominion and sovereignty of those seas which surround us at home.

It therefore behoves us, in the strongest manner, not to suffer the royal navy of England to be insulted, trifled with, or brought under contempt, by friend or foe, under any pretence, or upon any occasion whatsoever. National honour, once lost or impaired, is, like the honour of a private person, very hard to be retrieved. Those nations which have, for several ages, stood in awe of us, will begin to act the part of bullies, if ever we give them the least reason to suspect we are afraid of them. Most people are too apt, through vanity and self-love, to construe the effects of lenity, forbearance, and a pacific disposition, as the result of pusillanimity, and a sudden dread of offending them; which may produce another bad consequence, by depressing the spirits of our sailors, and erasing that laudable partiality for the native valour of their country, which inclines them to believe that no opposition, nor inequality of numbers, is able to withstand it. I think it proper, in the first place, to lay before the reader the instructions, which (as I am informed) are given to all the captains and lieutenants of our men of war, to this effect.

Instructions to the captain.

—Upon your meeting with any ship or ships within his Majesty's seas (which, for your better guidance herein, you are to take notice extend to Cape Finisterre) belonging to any foreign prince or state, you are to expect that in their passage by you, they strike their top-sail, and take in their flag, in acknowledgement of his Majesty's sovereignty in those seas; and if any shall refuse to do it, or offer to resist, you are to use your utmost endeavours to compel them thereto, and in no wise to suffer any dishonour to be done to his Majesty.

Instructions to the lieutenant.

You are to take upon yourself the intire charge and conduct of his Majesty's said ship, and stand accountable for the well executing the whole duty of commander thereof, during the absence, or in case of the death of your said commander, with respect as well to the printed general instructions given to commanders (a copy whereof is hereunto annexed) as any other particular orders of his Majesty, &c.

I shall now give an instance or two of the strictness with which these orders have been executed in former reigns, and begin no higher than that of king James the First, who, though perhaps the most inactive monarch that ever sat upon the British throne, protected one of the officers of his navy (who had obliged a French ship to strike to him under very particular circumstances) against the strongest representations of that court, and even refused to make them any satisfaction himself, as appears from cardinal Richieu's Testament Politique, in that chapter treating of the necessity which France is under to be powerful at sea. The cardinal addresses himself to Lewis the XIIIth in the following terms, viz.

—England being situated as it is, if France was not strong in its fleets, might undertake whatever she thought proper to the prejudice of France, without apprehending any return to her disadvantage. She might destroy our fisheries, disturb our commerce, and, by blocking up our greatest rivers, oblige our merchants to pay her what tribute she should think fit to impose upon them. — She might unmoored make descents on our islands, and even on our continent. — In a word, the situation of the native country of that proud nation is such, [proud only, I say, of preserv-

ing her own; as well as the liberties of those whom France would enslave*] that they have no reason to fear the greatest powers of the earth; and the ancient hatred† they bear this kingdom, might probably make them undertake any thing against us, should there ever come a time that we should be so weak as not to have it in our power to act offensively against them.

* See the article FRANCE.

† If England bears any hatred to France, see the reasons why, under our article PLANTATIONS; where we have set forth the perfidy of the statesmen of that nation, for above a century past.

The insolence which the English were guilty of towards the duke de Sully, in the reign of the king your father, ought to oblige us to put ourselves in such a posture, as not to suffer such an affront another time.

That duke being appointed by Henry the Great, ambassador extraordinary to the court of England, and having embarked at Calais, on board a French ship, carrying the flag of France upon her main topmast-head, was no sooner got into the Channel, but being met by an English yacht, that was sent to receive him, the captain of the yacht commanded the French ship to strike.

The duke, thinking his quality of ambassador sufficient to protect him from such an affront, manfully refused to strike; but this refusal being answered by three cannon-shot from the English yacht, which pierced his ship, and, at the same time, pierced the hearts of all good Frenchmen, force obliged him to do that which reason ought to have defended him against; and to all the complaints he made, he could receive no other satisfaction nor answer from the English captain but this, That as his duty obliged him to honour him as an ambassador, it obliged him also to see the honour done to his master's flag, that was due to the sovereign of the seas. — And though king James expressed himself upon this affair in civil terms, his words had no other effect than to oblige the duke to find his only satisfaction in his own prudence, by feigning himself to be cured, at the same that he felt the greatest smart, and that his wound was not to be healed.

The king your father was obliged to dissemble upon this occasion; but with a resolution, upon some other opportunity, to support the honour of his crown, by the naval force which time should make him master of.

I represent to myself this great prince, upon that occasion, laying the scheme which your majesty ought now to put in execution.

The war between the parliament of England and the states of Holland, in the year 1652 (the sharpest sea-war that was ever known between any two nations) was occasioned by this punctilio of the honour of the flag, which the Dutch admiral, Van Tromp, refused to pay to our admiral, the immortal Blake.

In the reign of king Charles the Second, another bloody sea war was commenced between England and Holland, on the same account, with this very particular circumstance, that the captain of a single yacht, sent over to Holland to bring home Sir William Temple's lady, was ordered to demand this acknowledgement from the whole Dutch fleet. I confess the English ministry, at that time, did this in order to pick a quarrel with Holland; but I mention it only to shew the obligation which officers of the navy are under to perform their duty; for whatever the intention of these orders might be, the captain was undoubtedly obliged to execute them, under pain of being dismissed the service with infamy at least.

The late king William, of immortal memory, had the same regard for this right of the honour of the flag, and made it one of his reasons for declaring war against the late French king, as appears from the following article of the declaration itself: 'The right of the flag, inherent in the crown of England, hath been disputed by his, the king of France's orders, in violation of our sovereignty of the Narrow Seas, which in all ages hath been asserted by our predecessors; and we are resolved to maintain the honour of our crown, and of the English nation.'

We shall conclude these instances with a passage out of Sir John Borough's treatise upon this subject.

'The sovereignty of our seas (says he) being the most precious jewel of his Majesty's crown, and next under God the principal means of our wealth and safety, all true English hearts and hands are bound, by all possible means and diligence, to preserve and maintain the same, even with the uttermost hazard of their lives, their goods, and fortunes.'

SEAMEN. Their importance to this kingdom is too well known to need animadversion; the essential point to be considered is, how they may be rendered more useful to the kingdom than they are, and be kept from going into foreign service, by preferring that of their own country. It is observable, that whenever this kingdom is engaged in a war with any of its neighbours, two great inconveniences constantly follow, one to the king, and one to trade.

I. That

I. That to the king is, That he is forced to press seamen for the manning of his navy, and force them involuntarily into the service: which way of violent dragging men into the fleet, is attended with sundry ill circumstances; as,

(1.) Our naval preparations are retarded, and our fleets always late, for want of men; which has exposed them not a little, and been the ruin of many a good and well-laid expedition.

(2.) Several irregularities follow, as the officers taking money to dismiss able seamen, and filling up their complement with raw and improper persons*.

* This has been the case ever since the days of the great Sir Walter Raleigh, and it is certainly high time to redress a grievance so injurious to the public.

As concerning the musters and presses, says Sir Walter, for sufficient mariners to serve in his Majesty's ships, either the care therein is very little, or the bribery very great; so that of all other shipping, his Majesty's are, ever the worst manned: and at such times as the commissions come out for the pressing of mariners, the officers do set out the most needy and unable men, and (for considerations to themselves best known) do discharge the better sort, a matter so commonly used, that it is grown into a proverb amongst the sailors, That the muster-masters do carry the best and ablest men in their pockets; a custom very evil and dangerous, where the poverty and use of men should come in trial. For many of these poor fishermen and idlers, that are commonly presented to his Majesty's ships, are so ignorant in sea-service, as that they know not the name of a rope, and, therefore, insufficient for such labour. That which might easily be redressed, if the vice-admiral of the shire where men are mustered, and two justices, had directions given to join with the muster-masters, for the pressing of the best men, whom they well know, and would not suffer the service of their prince and country to be bought and sold, as a private muster-master would do. Besides, the captains themselves of the ships, if they be bare and needy (though pity it were that men of such condition should have such charge committed unto them) will oftentimes, for commodity, chop and change away their good men; and therefore it were fitly provided to bridle such odd captains, that neither they themselves, nor any of their men, should receive his Majesty's pay but by the pole, and according as they were set down in the officers' books when they were delivered, without changing of any names, except to supply such men as are wanting by death or sickness, upon good testimony, under the hands of the master, the boatwain, the master-gunner, the purser, and other officers of the ship: for it nearly concerns them to look well thereunto, having daily use of them (a).

(a) See Raleigh's Works, by Dr Birch.

(3.) Oppressions, quarrelings, and oftentimes murders, by the rashness of press-masters, and the obstinacy of some unwilling to go.

(4.) A secret aversion to the service, from a natural principle, common to the English nation, to hate compulsion.

(5.) Kidnapping people out of the kingdom, robbing houses, and picking pockets, frequently practised, under pretence of pressing for seamen.

With various abuses of the like nature, some towards the king, others towards the subject.

II. To trade; by the extravagant price set on wages for seamen, which they impose on the merchant with a sort of authority, and he is obliged to give, by reason of the scarcity of men; and that not from a real want of men, for in the height of a press, if a merchantman wanted men, and could get a protection for them, he might have any number immediately, and none without it; so they are they of public service.

The first of these things has cost the nation more millions of money, during the three last wars, than I care to say, in these three particulars.

(1.) Charge of pressing on sea and on shore, and in small craft employed for that purpose.

(2.) Ships lying in harbour for want of men, at a vast charge of pay and victuals for those they had.

(3.) Keeping the whole navy in constant pay and provisions all the winter, for fear of losing the men against summer, was done for several years, besides bounty-money, and other expences, to court and oblige the seamen.

III. The second of these, viz. the great wages paid by the merchant, has cost trade also above 20 millions sterling. The coal-trade gave, in king William's time, a specimen of this, for the first three years of the war, 91. a voyage was given to common seamen, who before sailed for 36s. which, computing the number of ships and men used in the coal-trade, and of voyages made, at eight hands to a vessel, does, modestly accounting, make 896,000l. difference in one year, in wages to seamen in the coal-trade only, at that time. In the succeeding wars, the like has taken place, though not quite to so great a degree.

For other voyages, the difference of sailors' wages has been 50s. per month, and 55s. per month, and upwards, to foremast-men, who before went for 26s. per month, besides subjecting the merchant to the insolence of the seamen,

who are not to be pleased with any provisions, will admit no half-pay, and command the captains even what they please; nay, the king himself can hardly please them.

For the cure of these inconveniences, various proposals have been submitted to the public attention; the substance whereof we shall lay before the reader with all brevity.

The first proposal is as follows, viz.

That by an act of parliament, an office, or court, be erected, within the jurisdiction of the court of admiralty, and subject to the lord high admiral, or otherwise independent, and subject only to a parliamentary authority, as the commission for taking and stating the public accounts.

In this court or office, or the several branches of it (which to that end shall be subdivided, and placed in every seaport in the kingdom) shall be lifted and entered into immediate pay, all the seamen in the kingdom, who shall be divided into colleges, or chambers, of sundry degrees, suitable to their several capacities, with pay in proportion to their qualities, as boys, youths, servants, men able and raw, midshipmen, officers, pilots, old men, and pensioners.

The circumstances of this office.

(1.) No captain, or master of any ship or vessel, should dare to hire, or carry to sea with him, any seamen but such as he shall receive from the office aforesaid.

(2.) No man whatsoever, seaman or other, but applying himself to the said office to be employed as a sailor, should immediately enter into pay, and receive for every able seaman 24s. per month, and juniors in proportion, to receive half pay while unemployed, and liberty to work for themselves, only to be at the call of the office, and leave an account where to be found.

(3.) No sailor could desert, because no employment would be to be had elsewhere in the kingdom.

(4.) All ships, at their clearing at the custom-house, should receive a ticket to the office for men, where would be always choice, rather than scarcity, who should be delivered over by the office to the captain or master, without any trouble or delay; all liberty of choice to be allowed both to master and men, only so as to give up all disputes to the officers appointed to decide.

(5.) By this would be avoided the great charge captains and owners are at, to keep men on board before they are ready to go; whereas now the care of getting men will be over, and all come on board in one day; for the captain carrying the ticket to the office, he may go and chuse his men, if he will, otherwise they will be sent on board him, by tickets sent to their dwellings, to repair on board such a ship.

(6.) For all those men that the captain or master of the ship takes, he shall pay the office, not the seamen, 28s. per month (which 4s. per month overplus of wages, will be employed to pay the half-pay to the men out of employ) and so in proportion of wages for juniors.

(7.) All disputes concerning the mutinying of mariners, or other matters of debate between the captains and men, to be tried by way of appeal, in a court for that purpose to be erected, as aforesaid.

(8.) All discounting of wages and time, all damages of goods, averages, stopping of pay, and the like, to be adjusted by stated and public rules, and laws in print, established by the same act of parliament; by which means all litigious suits of this nature in the court of admiralty (which are infinite) would be prevented.

(9.) No ship that is permitted to enter at the custom-house, and take in goods, should ever be refused men, or delayed in the delivering them above five days after demand made, and a ticket from the custom-house delivered, general cases, as arrests and embargoes, excepted.

The consequences of this method.

(1.) By this means the public would have no want of seamen, and all the charges, and other inconveniences of pressing men, would be prevented.

(2.) The intolerable oppression upon trade, from the exorbitance of wages, and insolence of mariners, would be taken off.

(3.) The following sums of money should be paid to the office to lie in bank, as a public fund for the service of the nation, to be disposed of by order of parliament, and not otherwise; a committee being always substituted, in the intervals of the session, to audit the accounts, and a treasury for the money, to be composed of members of the house, and to be changed every session of parliament.

(1.) Four shillings per month wages advanced by the merchants to the office for the men, more than the office pays them.

(2.) In consideration of the reducing mens wages, and, consequently, freights, the owners of ships, or merchants, shall pay, at the importation of all goods, 40s. per ton freight, to be stated upon all goods and ports in proportion, reckoning it on wine-tonnage from the Canaries as the standard, and on special freights in proportion to the freight formerly paid; and half the said price in times of peace.

Note, This may well be done, and no burthen; for, if freights are reduced, as they will be if wages are so too, then the merchant may well pay it.

The payment of the above said sums being a large bank, for a fund, and it being supposed to be in fair hands, and currently managed, the merchants shall further pay upon all goods shipped out, and shipped on board from abroad, for and from any port of this kingdom, 4 l. per cent. on the real value, bona fide, to be sworn to, if demanded: in consideration whereof, the said office shall be obliged to pay and make good all losses, damages, averages, and casualties whatsoever; as fully as by the custom of assurances now is done, without any discounts, rebates, or delays whatsoever; the said 4 l. per cent. to be stated on the voyages to Barbadoes, and enlarged or taken off, in proportion to the voyage, by rules and laws, to be printed and publickly known.

Reserving only, that then, as reason good, the said office shall have power to direct ships of all sorts, how, and in what manner, and how long they shall sail with, or wait for, convoys; and shall have power (with limitations) to lay embargoes on ships, in order to compose fleets for the benefit of convoys.

These rules, formerly noted, to extend to all trading by sea, the coaling and home-fishing trade excepted; and for them it may be ordered,

First, for coals: the colliers being provided with men at 28 s. per month, and convoys in sufficient number, and proper stations from Tinnmouth bar to the river, so as they need not go in fleets, but as wind and weather present, run all the way under the protection of the men of war, who should be continually cruising from station to station; they would be able to perform their voyage in as short a time as formerly, and at as low pay, and consequently could afford to sell their coals 20 s. per chaldron, as well as formerly at 15 s.

Wherefore, there should be paid into the treasury appointed at Newcastle, by bond to be paid where they deliver, 10 s. per chaldron, Newcastle measure; and the stated price at London to be 27 s. per chaldron in the pool, which is 30 s. at the buyer's house, and is far from being dear, in a time of war especially, as it is cheaper than ever was known in a war; and the officers should by proclamations confine the seller to that price.

In consideration also of the charge of convoys, the ships bringing coals shall all pay 1 l. per cent. on the value of the ship, to be agreed on at the office; and all convey-money exacted by commanders of ships, shall be relinquished, and the office make good all losses of ships, not goods, that shall be lost by enemies only.

These heads, indeed, are such as would need some explication, if the experiment were to be made, and, with submission, would reduce the seamen to better circumstances; at least it should seem to bid fair to have them in readiness for any public service, much easier than by all the methods of encouragement that have hitherto been tried.

For, by this method, all the seamen in the kingdom would become the king's hired servants, and receive their wages from him, whoever employed them; and no man could hire, or employ them, but from him: the merchant should hire them of the king, and pay the king for them; nor would there be a seaman in England out of employ, which would prevent their seeking service abroad: if they were not actually at sea, they would receive half-pay, and might be employed in works about the ship-yards, stores, and naval concerns, in order to keep all things in repair.

By this means, if a fleet or squadron was to be fitted out on any sudden emergency, they would be manned in a week's time, for all the seamen in England would be ready: nor would they be shy of the royal service, for it is not an aversion to the king's service, nor is it that the duty is harder in the men of war than the merchant-men; neither is it fear of danger which makes our seamen lurk and hide themselves in a time of war; but it is the article of wages is the matter: 24 s. per month in the king's service, and from 40 to 50 s. and upwards per month from the merchant; which is the true cause; and the seaman is in the right of it, for who would serve his king and country, and fight, and run the risk of being knocked on the head, at 24 s. per month, that can have 50 s. without the like degree of hazard? and till this be remedied, in vain are all the encouragements which can be given to seamen; for they tend but to make them insolent, and encourage their extravagance.

Nor would this proceeding be any damage to the seamen in general, for 24 s. per month wages, and to be kept in constant service, or half-pay when idle, is really better to the seamen than 45 or 50 s. per month or upwards, as they now take it, considering how long they often lie idle on shore, out of pay: for the exorbitant rate of seamen's wages, though it has been an intolerable burthen to trade, has not visibly enriched the sailors, and they may as well be content with 24 s. per month now as formerly.

On the other hand, trade would be sensibly revived by it, the intolerable price of freights would be reduced, and the public would reap an immense benefit by the payments mentioned in the proposal: for,

(1.) Four shillings per month upon the wages of all the seamen employed by the merchant, which if we allow 200,000 seamen always in employ, as there cannot be less in all the ships belonging to England, is 40,000 l. per month.

(2.) Forty shillings per ton freight upon all goods imported.

(3.) Four per cent. on the value of all goods exported or imported.

(4.) Ten shillings per chaldron upon all the coals shipped at Newcastle, and 1 per cent. on the ships which carry them.

What these four articles would pay to the Exchequer yearly, it would be very difficult to calculate: but, perhaps, few single taxes ever given in time of war, have exceeded it.

It is true, out of this the public would be to pay half-pay to the seamen, who shall be out of employ, and all the losses and damages on goods and ships; which, though it might be considerable, would be small, compared to the payment aforesaid; for as the premium of 4 per cent. is but small, so the safety lies upon all men, being bound to insure: for I believe any one will grant, that it is not the smallness of a premium ruins the insurer, but it is the smallness of the quantity he insures; and, perhaps, if a premium of 4 per cent. be paid into one man's hand for all goods imported and exported, and any man might be the general insurer of the kingdom, and yet that premium could never prejudice the merchant adventurer.

So that the large revenue which this should raise, would be felt no where; neither poor nor rich would pay the more for coals; foreign goods would be brought home cheaper, and our own goods carried to market cheaper; owners would get more by ships, merchants by goods, and losses by sea would be no loss at all to any body, because repaid out of the public stock.

Another unseen advantage would arise by it; we should be able to out-work all our neighbours, even the French and the Dutch themselves, by selling as cheap, and carrying goods as cheap in time of war as in peace; an advantage, which has more in it than is easily thought of, and would have a noble influence upon all our foreign traffic. For what could the Dutch or the French do in trade, if we could carry our goods to Cadiz at 50 s. per ton freight, and they give 8 or 10 l. and the like in other places? Whereby we could be able to sell cheaper, or get more than our neighbours.

There are several considerable clauses might be added to this proposal, some of great advantage to the general trade of the kingdom, some to particular trades, and more to the public; but I avoid being too particular in things which are but the product of a private opinion.

If the government should ever proceed to the experiment, no question but much more than has been hinted at would appear; nor do we see any great difficulty in the attempt, or who would be aggrieved at it; and there I leave it, rather wishing than expecting to see any thing like this undertaken.

Another PROPOSAL suggested by the judicious Mr Carey, late of Bristol, merchant, in his Discourse on Trade.

That gentleman observes, 'That navigation is the medium between our inland and foreign traffic: the latter is carried on by ships and sailors; the former are the sea-waggons, whereby we transport and carry commodities from one market to another; and the latter are the waggons, who drive and manage them: these are a sort of jolly fellows, who are generally bold in their undertakings, and go through any kind of labour in their own way, with a great deal of cheerfulness; are undaunted by storms and tempests, the sea being as it were their element, and are allowed by all to be the best navigators in the world; they are our wealth in peace, and our defence in war, and ought to be more encouraged than they are in both, but especially in the latter; which might be done, if better methods were used to engage them in the service, and better treatment when they are there: now I should think, if so man was forced into the king's ships till he had been three years at sea, nor to say there above that x time without his free consent, and then to be permitted to take a third part employment so much longer, and so totos schools; it would encourage them to come willingly into the service, which they look upon now to be a slavery, whereto they are bound for their lives: this, and the manner of pressing them, suffers very much the making of sailors, landmen not faring so, but their hands to the bar, left the next day they should be hauled away to the fleet, though they understand nothing of the war: by this means our men of war would be manned with able seamen, and not with such who only stand in the way, and are useless, when they are most wanted; nor do I take embargoes to be any help towards it; for many sailors do then lie hid, who would appear to serve in merchants ships, and might be easily met with at the return of their voyages: by these means, in a short time, there

there would be a double set of mariners, enough both for the service of the fleet and of trade, the last of which would every year breed more.

This would also prevent great mischiefs, which arise from pressing sailors out of merchant-ships whilst on their voyages, many of them being thereby lost at sea, and others have been detained in the West-Indies, to the discouragement of trade; and it would also prevent another mischief, too much practised abroad, where captains of men of war press sailors from one merchant-ship, only to make advantage by selling them to another.—Thus far Mr Carey.

There has lately appeared a treatise, drawn up with no less judgment than zeal towards the public interests, entitled, *An Essay towards a method of speedily MANNING a FLEET, upon any SUDDEN EMERGENCY.*—After this ingenious gentleman has shewn the necessity of the nation being always in a condition to man and equip a respectable fleet at short warning, he then modestly submits his own proposal for a voluntary REGISTER for SEAMEN to public consideration, the substance of which is as follows, viz.

I. When a king's ship returns from a voyage or cruise, &c. and is to be paid off, the captain or commanding officer should have power to declare to the ship's company, that any able-bodied man, desirous to enter his name, &c. in the register for seamen, is at liberty to do it, under the conditions therein mentioned and prescribed; which are to be then publicly and audibly read to the men, that no person may afterwards plead ignorance.

II. The men should be called over by their names, according to the ship's book; and each man asked separately, whether he chuses to enter his name in the REGISTER or not. If he does not, he should be at full liberty to refuse it, but having once refused it, should not afterwards be admitted, so long as a sufficient number of others offer themselves to complete the REGISTER.

III. A list being thus taken of the names of such as are willing to enter, and are fit for the service, proper columns are to be made for entering, at the same time, each man's age, complexion, stature, marks, if any trade, county or country, and the city, town, hundred or hamlet, he declares his intentions to go to for the present.

IV. A copy of this list, signed by all the 'commission and warrant officers on board, is to be forthwith sent to the admiralty or navy-board, from whence præcipes or orders will be issued to the several magistrates of the cities, towns, &c. to which these men go (according to the list) to enter the name of every man that comes into his district, with all his descriptions, and the name of the place he last came from.

V. A return is to be made to the admiralty, &c. every month, more or less, by the mayor, bailiff, or nearest justice of the peace, of the name and description of every registered man that has come into, or left his district during that month, taking particular care to mention the place he declared an intention to go to; whilst the other magistrate, or near the place he goes to, makes in the same manner his return, specifying the place from whence any new man last came.

Let it be taken for granted, says this gentleman, that a REGISTER for SEAMEN would be a successful and proper method to engage their service: the next point to be considered, is what number of men would answer that purpose.

I shall leave that entirely to the wisdom of my superiors.—But permit me to suppose at present, that the number was to be 10 or 12,000 men; and that each man was to receive after the rate of 5*l.* per ann. or 2*s.* a week, which amounts to 5*l.* 4*s.* a year. The sum necessary to pay 10,000 men, would then be 50,000*l.* or 52,000*l.* a year, and so in proportion for any greater or smaller number.

After the rate of 500 men to a ship, this number would equip 20 or 24 line of battle ships; and if these be not sufficient, this method does by no means preclude the pressing of vagrants, idle, loose, and disorderly men, without any visible means of maintaining themselves in an honest industrious calling. On the contrary, let the magistrates exert themselves, and be every where encouraged to seize, imprison, and convey to the several sea-ports, all persons under that description; and by dividing these dissolute fellows amongst the several ships, more hands would be added, more ships equipped, and the country cleared of these noxious irreclaimable villains. This would be pressing in a legal manner, and perhaps the only method for putting a stop to the outrages daily committed in all parts of the town and country.

Fifty thousand pounds a year may, perhaps, at first view, be esteemed a very large additional expence to the nation: but when the advantages arising from it shall be considered, I flatter myself, that every well-wisher to his country would think that sum, or even a much larger, well employed. Some few of these advantages are as follow:

First, This may be a means of saving a large expence to the nation, by deterring our neighbours from any sudden and rash attempts upon the rights and privileges of the

crown and subject. For when they know us in a condition to do ourselves justice, as well as disposed to resent an injury, they may not be so forward in disturbing our tranquillity and peaceable disposition.

Secondly, A great many lives may hereby be spared. For if this scheme should prevent insults and incroachments, which are generally the first seeds of war; the consequence is, that many officers and seamen who would be engaged, and lose their lives in that war, are hereby saved to the public.

Thirdly, These men, who have been employed in the service of their country in time of war, would, in time of peace, have some gratification for their former fatigues and dangers, instead of being turned adrift to starve, rob, and murder, as they actually do; or being driven, by necessity, into foreign service.

Fourthly, Large annual sums are now raised and paid, as rewards, for apprehending highwaymen, footpads, &c. who are brought to the gallows and gibbet; a great part of which might probably be saved, as well as the lives of these miserable wretches, were this scheme to take place.

Men who have been forcibly taken from their trade and family, and have been kept four or five years abroad, who have lost almost all the skill they had in their several callings, and, perhaps, been deprived of their friends by death, removals, &c. can scarce settle immediately to any useful and industrious way of life, when turned ashore. But this scheme would, in a great measure, prevent them from taking any desperate courses; it would give them an assurance of not wanting some provision for the future, the want of which generally drives such men to extremities. And as the lords of the admiralty would have a power to discharge any man who behaved ill, this would oblige the men to a more sober and regular behaviour. The very register would be a great check to such irregularities: for, as the place of each man's residence, and his description would hereby be well known, he would certainly, sooner or later, be discovered: he would be just in the same condition as a deserter from the army, few or none of which escape punishment.

But, moreover, an encouragement of this sort might probably draw many of our men out of foreign service, to that of their country again. An advantage of inestimable value, as it not only weakens their hands, but strengthens ours.

It is true, they receive, when paid off, the wages due to them: but this only leads them into lewdness, debauchery, and bad company; which so far corrupt their morals, whilst the money lasts, that, when it is gone, they associate into bands of the most abandoned sort, and perpetrate all manner of wickedness, to enable them to continue in and support the way of life they have fallen into.

As a farther encouragement to be given to such seamen as shall voluntarily enter themselves, it is proposed,

First, No man should be allowed to ply a boat on any river, in any port or harbour, unless he be registered, if a registered man offers himself for that purpose.

Secondly, A worn-out registered man, not admitted into Greenwich-Hospital, should be allowed to ply a boat, as above, in preference to any other registered man, and consequently to any man not registered.

Thirdly, Preference should be given to a man registered before a war, to remain upon the list in time of peace (if able and fit for service) before any man registered during the war, and before the peace.

Fourthly, All warrant-officers doing duty on board any ship in ordinary, by a deputy, should be obliged to take a deputy from amongst the registered men (if any such offers, that is fit for the business) rather than any other man, under a penalty.

Fifthly, A registered man to be received into Greenwich-Hospital, in preference to a man not registered; and when struck off the list, as no longer fit to serve, to be constantly received there.

These regulations necessarily require the keeping an exact account of the date of each man's registry.

As this scheme proposes the keeping up the number of 10 or 12,000 men, exclusive of those employed on ordinary occasions in time of peace, it becomes necessary, that as soon as any registered man is taken into the king's service (except in time of war) another man be admitted to register in his stead. I have here inserted an exception, which, in my humble opinion, had better have been omitted. For if a fund were once raised, and appropriated to that sole use, I do not perceive the least inconvenience that could arise from continuing that method in time of war likewise; that is, when any register for service, the same should be completed as soon as possible: otherwise our enemies, knowing that our stock of seamen is drained, would no longer stand in awe of any further armaments. But, in the height of a war, it can scarce be supposed we should have men enough completely to man our fleet, and to fill the register at the same time. If so many men should be found, then we

have always 10 or 12,000 men ready upon any occasion. If, as is most likely, men should be wanting, then the fund would thereby be so long increasing, and enabled, at the conclusion of the war, to provide for so many more men as should be judged proper.

The only inconvenience I can foresee that may attend this measure is, that, at the end of the war, the register may possibly be full, and, consequently, no room left for such as have served during the war. But that is not at all likely; and if not, then the increase of the fund will admit of so many additional men, for a time at least: and we presume to hope, that a scheme of this nature will be so generally approved, as in time to meet with all the encouragements at this day bestowed upon other generous and charitable institutions, no one of which can be put in any competition with this, for the importance of, and advantages arising from, it, to the nation in general, and every individual.

Perhaps it will be said, That every body is convinced of the necessity of encouraging our seamen, and having always a certain number ready to be called together at short warning: but the difficulty is, how to find a proper fund for that purpose.

How difficult soever that may be, if it is necessary, if the mercantile interest, and our general safety, suffer by that neglect, the difficulty should be no objection. Large sums are annually expended in buildings, and other, perhaps, necessary works; but surely no one of them can be compared to this for expediency, and general advantage.

When our real interest is in question, it is not to be doubted but a British house of commons will find the proper resources. See An Essay towards a Method of speedily MANNING A FLEET upon any SUDDEN EMERGENCY. Printed for Sandby in Fleet-Street.

R E M A R K S.

In the year 1740, the house of commons gave leave to bring in a bill for registering all seamen, watermen, fishermen, keelmen, bargemen, and seafaring men, capable of service at sea, throughout his Majesty's dominions; but it being judged by the house to be overloaded, and too arbitrarily to affect the liberties of the subject, it was dropped; upon which the house resolved itself into a committee of the whole house, to consider of heads of a bill for the further and better encouragement of seamen to enter voluntarily into his Majesty's service; in which committee several resolutions were agreed to, but nothing further done.—It may be useful, however, here to give the several resolutions of the house of commons upon this occasion, which are as follow, viz.

1. That a voluntary register of seamen will be of great utility to this kingdom.
2. That it shall extend to all the dominions of the crown of Great-Britain.
3. That the fraternity of Trinity-house of Deptford Strand be intrusted with the management of the said register, with power of appointing inferior officers and servants necessary for the execution of the said trust.
4. That a certain sum of money be paid to every man who is willing to register.
5. That every registered man should be obliged to give an account of the place of his abode to the register office.
6. That the registered men shall be divided into classes.
7. That a yearly pension be allowed to every registered man who shall be disabled in fight, over and above such allowances as are now given, and a yearly pension to every widow of a registered man slain in fight, over and above the present allowances made to such widow; and if the party leaves any children, that each of them have a yearly pension, until they arrive at the age of fourteen.
8. That every registered man be exempted from paying the king's or parish taxes, or serving any parish offices, or serving in, or contributing towards, the militia.
9. That none be preferred to be petty officers in any of his Majesty's ships but registered men.
10. That all petty officers in merchants ships, as boatswains, gunners, &c. be chosen out of the registered men.
11. That all men who shall register themselves do remain on the register no longer than to a certain age.
12. That all men who shall have continued on the register a certain age, do enjoy all the advantages of registered men during life.
13. That all registered men shall have the preference of being admitted into Greenwich Hospital.
14. That all captains and commanders of his Majesty's ships of war, who shall be applied to in foreign parts, shall take on board any registered men, and the men so taken on board shall, from that time, be deemed part of the ship's company, and receive wages accordingly.
15. That registered men be allowed to go into the merchants service, when the service of his Majesty shall not require them, and that the proper officers do give them certificates for the same.
16. That registered men be intitled to receive their wages in certain proportions.

17. That all seamen now absconding in foreign parts, or at home, on account of running goods, who shall enter on board any of his Majesty's ships, and claim the benefit of this register, shall be intitled to their pardon, except persons who have been concerned in actual murder.

18. That all registered men who shall be summoned to appear on board any of his Majesty's ships, and shall neglect or refuse to do the same, shall be subject to be punished as deserters.

19. That all foreign seamen who shall claim the benefit of this register, shall be intitled to all the rights and privileges of natural-born subjects.

20. That the trustees of charity schools for the education of boys, shall be obliged to put forth apprentices to the sea-service, such as shall find masters willing to take them.

21. That the registered men shall wear some honourary mark of distinction.

22. That the register-office be obliged to give an account to the lord high admiral, or the commissioners for executing the office of lord high admiral, for the time being, of all the men that shall be registered.

23. That the register-office shall, on the receipt of an order from the lord high admiral, or the commissioners for executing the office of lord high admiral for the time being, for any number of men contained on the register, issue out their order for the said number of men to appear, according to the order directed to them as aforesaid.

FURTHER REMARKS.

Were an act of parliament to be passed for establishing 10,000 able seamen certain for ever, for the king's service, we may presume to affirm, that it may be plainly demonstrated, that the advantages which would accrue therefrom to every part of the nation in general, would render the extraordinary expence of such establishment, if any at all, very inconsiderable. Should any one be startled at the very sound of such a large number of men, without giving himself either time to consult the merits of another proposal we are about to offer, which may be drawn from what has been said, ask, in objection to it, what occasion the government would have, during the time of peace, which may sometimes hold, very probably, for ten or twenty years, to encumber itself with such numbers of a set of people, who, in their opinion, must be very unnecessary? we shall request of him a candid perusal of what follows, and doubt not but to find him much better reconciled.

By the advance money that should be given, and the certainty of not being dismissed, after any short expedition, from his Majesty's service, to make what provision they can for themselves, in that of others, the number of volunteers that would immediately offer themselves, would very quickly make up the list proposed; nor would the manner in which they should be employed, even at those times when the fleet may have a call but for a very few of them, be a less temptation for them to enter.

As his Majesty's docks and yards do continually maintain a very large number of workmen, in the several articles relating to the navy, one part of the said seamen might, with little prejudice to the hands already employed, be made use of in time of peace, in the work there: at first, in such parts only of it, as may be most easily attained in a very little time, till by degrees they may arrive to such a tolerable knowledge in the others, as will not only enable them, by the money they shall earn, to maintain themselves and families very comfortably, but render them, when required to their original province of sailing, more useful and expert in the intire management of every particular belonging to the ship; whilst the other part of them, or as many as there may be a call for, provided it does not exceed one half of the number, unemployed in his Majesty's fleet, shall have a permit for a year, to sail in such vessels as are coasters, or make short voyages, such as to France, Ireland, Norway, &c. by which means they will acquire such perfect knowledge of the many rocks and sands that almost intirely surround us, that they may prove, when summoned again into his Majesty's navy, of very important use, even in the quality of pilots. And to prevent any difficulty, or dispute, that may arise between the masters of such vessels and the king's sailors, that want to ship themselves on board them, the merchants or masters, bound for any such ports as abovementioned, shall be obliged to receive into their vessels one half of their complement of the KING'S MEN, at the common wages, who shall likewise have a written power, or authority, granted them, to ship themselves on board any coasters or vessels trading as before-mentioned, in any port of Great-Britain where they are, provided they do not exceed the number of other hands shipped on board of the said vessels.

A REGISTER may also be kept at every port, of the number of hands each vessel ships, that the government may be assured of the punctual and ready compliance of the merchants, or captains, in receiving one half of their complement of king's men, without any manner of evasion or objection, if such offer themselves. And if it should so chance, that many of these sailors should seek employment all at the same

same port, where there were vessels lying in expectation of hands; there may be such regulations, that no one vessel should take in more than an equal proportion of the said sailors. As for instance, if three vessels lay in the same port, supposing each vessel carry ten hands, and five of his Majesty's men should offer themselves only to one of these three ships, they shall not be allowed to go all together in that one vessel, but shall distribute themselves amongst the three, and that vessel, whose lot it was to have but one, shall receive the next king's man that comes to enter himself at that port, as his fair dividend.

No owners, or masters of the vessels beforementioned, shall prefer, in their first choice of the hands they propose to ship, any other sailors to those belonging to his Majesty; but if no application is made from any of them, the captains may be at their own discretion to receive others for the whole voyage. And for the future ease of the said established number of seamen, and to make them in every degree more useful to the government, after the expiration of the year, for which the permit was granted to one half of them to go into the merchants service, there may be an exchange of stations for the same length of time, between them and the other half that were left and employed at home. By these measures the grandeur and security of the nation will stand upon an immovable and unperishable basis; and the inconveniencies which it may otherwise sustain, from having most of the hands in their vessels, during the time of war, impressed, perhaps, just as they are clearing out for their voyage, and laden with commodities which may be in danger of being greatly damaged by such a retardment to their sailing, will immediately vanish, and the approach or declaration of a war carry with it none of the ill effects on the apprehensions of the trading people, which it may at present.

The number of sailors which the government, upon this scheme, may have occasion to distribute amongst them, ought, very far from being judged an act of compulsion, to be received as the strongest instance of its lenity, tenderness, and regard for their interest. The king's men, it is to be presumed, will be as good, if not better, than what they may otherwise be obliged to take up with; nor, if any exigency of affairs should constrain the government to call off these men into the royal service, can they possibly think the losing a part of their complement an hardship, as their voyages will be so very short, that they may have time enough, from the first summons of his Majesty for his sailors to return, 'till the time limited for such return (which may be three weeks, or a month) to provide themselves with a supply, and even without being necessitated to pay any such exorbitant wages as the scarcity and timidity of the seamen, during the time of a press, exacts from them. If, as I am informed by some persons who pretend to have made a pretty exact computation of the number of seamen employed in the home and neighbouring trades, there may really be 30,000; then, were the whole established number of his Majesty's seamen distributed equally among the merchants, in the room of some of the others, such seamen would be but one third of each ship's complement; so that the merchants can neither scruple to receive so few, to the prejudice of the other sailors, nor think it any grievance to part with them, when his Majesty's occasions demand them.

As it is an inherent principle in every Englishman, to submit with reluctance to any thing that seems to carry a check upon his liberty and free choice; so I would not, in this engagement to his Majesty's service, have men constrained to bind themselves up either for life, or for a long term of years, but chuse to leave it to their own discretion to quit the service when they have an inclination, on this easy and reasonable condition only, that they shall be obliged to give a year's notice of their intention, on the failure of which, proper penalties may be thought of to be inflicted. Such an argument as this will be no more than what is entered into almost every day between man and man, in every branch or kind of business; but for their encouragement not only to enter, but to continue in the service voluntarily, I could wish an easy fund might be found out, whereby the government might be enabled to cloath them from head to foot, once in two years, with a badge of the flag of England, as a peculiar and honourable distinction from all other sailors: those cloaths to be worn by such as work in the yards, only at such times as they shall be absent from their work.

So many brave and skilful men, all appearing in a national livery, cannot but affect the minds of every thinking British spectator with the most sensible satisfaction, when he beholds the true protectors of the kingdom's grandeur and happiness so deservedly cherished; and every foreigner will have the strongest sentiments as well of our gratitude and policy, as of our undoubted security. The men themselves, when the necessity of affairs may have recourse to a strong navy, will think themselves under the greatest obligations to repay, with extraordinary cheerfulness and bravery, such extraordinary marks of the nation's bounty and regard for them. For the first three years, any able seamen may be admitted upon this establishment, not exceeding forty years of age, but, after the said three years, none shall exceed the age of thirty. And as a

further reward and inducement for their long continuance in the service, it is proposed, that those who have served for such a term of years, or done such services as the discretion of the board of admiralty, or the commissioners, shall judge worthy of it, shall receive a small pension for life, though they are not any way disabled in the service; and in case any of them leaves a widow, she shall enjoy for her life one moiety of what was before his allowance; but if any of them quit the service, and afterwards re-enter, they should have but half the benefit of the time they served before. And if any of them, whilst in the merchants service, should, by any accident that might happen to the vessel, in using their endeavours for its safety or otherwise, sustain any damage in their limbs, so as to render them incapable of earning their bread as sailors for the future, they should be considered, notwithstanding, as the king's men, and receive the same benefit of a pension, or the hospital, as if they had sustained such wounds or damage in the king's own ships. And at last, to all these considerable and inducing advantages, I would join that great and most necessary encouragement of all, the certainty of having their pay, whatever capacity they serve in, whether in merchant-ships, or the governor's own, on the most easy regulations both to themselves, their creditors, friends, or relations, who may be their executors, or possessed of their powers of attorney, without any unnecessary delays upon account of unjust and vexatious claims, and free from exorbitant and unwarrantable deductions, which has been but a too frequent and enormous practice.

During our wars with the French in our late reigns, complaints of this kind were so loud, so miserable, and so numerous, that they pierced the hearts of every Englishman, excepting such as were the principal authors of their oppression, and made a very guilty gain from their miseries.

In that melancholy time their hardships, I have been assured, were as great, as if some of the persons to whom a part of the inspection and management of the naval affairs was entrusted, had been in an actual league with the French to destroy them.

That they were impressed from their callings at home, or on their return, perhaps, from a tedious East-India voyage, when they were big with the hopes of refreshing themselves on shore for a few weeks, and regaining, in their own native air, their health and vigour, which might be impaired by a long continuance in a foreign climate.

This was a grievance that might easily allow of a mitigation, and be rendered in some part justifiable, from the necessities of the state at that time, provided they had not been forced into a service, where, from the corrupt management of some avaricious persons, there was not only an uncertainty of receiving the pay they should be intitled to in such service, on any reasonable terms, but danger of being defrauded of the greatest part of it, together with a probability, from too severe a confinement on board the fleet (which was sometimes for two or three years together) of forfeiting, by their deaths, the benefit of what was due to them from the merchants, from whose service they were so abruptly taken, or leaving it, at least, a disputable legacy to their widows, or other relations.

From this inability of the sailors to make such convenient returns of their pay as would have been a comfortable subsistence to their distressed families, the parishes were loaded with insupportable taxes for their relief, whilst the purvers were suspected and accused, by the miserable sufferers, of burdening the sailors with large demands for the little conveniences they were obliged to take up of them; that some, when they had the favour of having their accounts in some manner stated, had not, perhaps, one farthing to receive. To this manifest discouragement of the sailors, when on board, was owing the absolute necessity of impressing them during all those wars, in such a violent manner, that he who could hide himself from the diligent pursuit of a press-gang, thought it as great happiness, even though he was almost starving all the while, as if he had escaped falling into the hands of an Algerine rover; and the merchants have been obliged to advance their wages from 24s. to 50s. and 31. and upwards, a month per man, after the inconvenience of waiting a long time, before even that would be a sufficient temptation for any of them to venture. Nor were the colliers forced to give less extravagant hire in proportion, for the bringing their vessels up the river.

I mention these inconveniencies, which in the times before named affected not only the merchants and the seamen, but the whole nation, not so much as a handle for a general outcry against the custom of impressing men into his Majesty's fleet, as from a melancholy reflection, that the said economy at that time used in distributing their due encouragement to each sailor, should force the government to such rough measures as it then did, to obtain an able one: whereas, had it been otherwise, and each man knew how to come at what he had earned in a less dilatory and disadvantageous manner, I sincerely believe that above half the money that was allowed for impressing men had been saved, and that abundance of seamen would have thought the glory of serving in the navy preferable to some advanced wages they might gain from the merchants.

Should

Should any of the methods we have suggested for executing what is proposed, appear to the judgment of others, not so entirely practicable, as we have the zeal to imagine they may be, we are confident, the numerous advantages prefigured therefrom, for the good of our king and country, will render any errors of that zeal pardonable. To be so well fortified in that most valuable branch of Great-Britain's security (its maritime force) as not only to be in a constant readiness to engage in a war, but from the reputation of such an armament, in a capacity to prevent the approaches of one, appeared to me such a desirable blessing, that no difficulties ought to discourage any true and honest lover of his country, from using his utmost abilities to obtain it.

To give a cheerful and suitable encouragement to the sailors, is no more than an act of justice and gratitude due to them as our protectors, and of prudence to ourselves, as being protected and aggrandized by them. And we have engaged the more strenuously in favour of this one point, as it is but too manifest, that from a deficiency of such encouragement, and the want of means to make some certain provision for them, after they are discharged from on board the fleet, many out of the numbers that are unemployed at the same time, are obliged to go into foreign service, that only great and dangerous possibility of rendering our present imagined superiority over all other nations precarious for the future; every foreign realm, whose interest it is to turn its genius to maritime affairs, searching diligently after, and receiving greedily, ENGLISH SEAMEN, preferably to those of their own, or any other nation; whilst others of them, too frequently from a dearth of employment, are tempted to supply their necessities, by plundering, robbing in the streets, breaking open houses, &c. too notorious an evidence of which is, that at almost every sessions at the Old-Bailey, there has been, at such times, generally one or more seamen among the people convicted of capital crimes. A prevention, therefore, of these grievances, is to be wished, as much for the security of the government, as for the ease of the people. That the merchants should suffer as little as possible, either from the damage done to their goods, or the losing some part of the benefit of the foreign markets, from being detained too long in their home ports, by the seizure of their men, or by being obliged to give extravagant wages for seamen, who, perhaps, may be only foreigners, old men, or boys, as few others will venture themselves during the time of a press, should be the speediest caution of a government, whose REVENUE is so much interested in the flourishing or oppressed condition of the trading part of the nation. That the parishes should not be overburthened by an extraordinary charge of poor, which must be the case, when persons, who are, perhaps, settled in a tolerable way of business, able to support themselves and families, are involuntarily hurried on board the fleet; and, in short, that no sudden preparations for war, should be of so ill consequence to the meaner sort of people, as to diminish the benefit of what they earn by hard labour, by creating any advanced prices on the most common necessities, demands the consideration of their superiors, not less from humanity than policy.

Thus, from such regards as these being shewn for the strength of the kingdom, and the felicity of all the members of it, every thing must flourish in the most delightful manner, the sovereign fortified against all attempts of his enemies, and the people ready to make him the most grateful returns for their prosperity.

REMARKS upon the whole of the article SEAMEN.

The reader has now before him, under this article SEAMEN, the substance of what has been proposed since the Revolution, in regard to the measures requisite to be taken, in order to the speedy manning of the royal navy upon any emergency. Which of these proposals may deserve the preference, or whether any of them may be eligible, I shall not take upon me to declare; the judicious, perhaps, may find something in every one that may deserve their attention, and may, from the whole, form one better than either. It is observable, that the sense of the parliament has been to promote a voluntary register; and the scheme proposed in the essay before cited seems to be built upon the same principles; and, indeed, all compulsory methods upon this occasion ought to be avoided, because they are likely to have no better effect than the violent means of impressing men by force have hitherto had, and, therefore, can by no means answer the salutary end proposed. Moreover, whatever hath a tendency to strike at the liberties of the whole seafaring body of the people, should be studiously guarded against in a land of liberty. Nor will the violent and arbitrary example of France, or that practised in any other nation, have any weight with Great Britain, to induce her to follow it; and, therefore, every thing that can be urged from topics of this kind, will lose its weight with a British parliament. That something effectual is indispensably necessary to be done, to answer an end so much for the safety and glory of the kingdom, is agreed on all hands.

The methods which the French and Spaniards have lately taken, have rendered them, in case of a war, much more

powerful enemies than they were some years ago. Our trade can never be said to be safe, unless our ships of war are, at least, equal, if not superior, to theirs in number. That we exceed them as yet in number, as well as in goodness of ships, is a point not to be disputed: may this superiority long continue! I think it must, and will, if we are not wanting to ourselves; but it behoves us to have a watchful eye upon their motions. These neighbours of ours are daily increasing their fleets, and sending large armaments (in time of peace) to different parts of the globe, in order to make new settlements, enlarge their commerce, and protect their subjects. It is notorious that the Spaniards, with a high hand, encourage their guarda costas in the West-Indies, even to insolence, as well as injustice. And it is allowed that the French, by secret methods, and by open and hostile attempts, are endeavouring to disturb and endanger our settlements in the East-Indies, as well as those in America. The present state of their maritime power must, undoubtedly, be the true cause and foundation of all these outrages. Such attempts would be useless and impolitic, if they apprehend any probability of our calling for an immediate reparation of damages; but they are perfectly acquainted with our situation, and bid defiance to our number of ships in harbour. They know it would be exceedingly difficult for us to equip even a small fleet, upon any sudden emergency; wherefore they presume upon our not doing it, till we are driven to it by some great and absolute necessity. They are apprized of the impediments arising from our constitution, and the time it takes to man a fleet, let the circumstances be ever so pressing, and perceive that their ships may be at sea, and possibly have struck their stroke, before a small squadron of our large ships can be manned and equipped.

At the conclusion of the last war, when the first ship was paid off, there were, if I mistake not, 65,000 seamen on board his Majesty's fleet; and yet, when a few ships were, a little while ago, to be fitted out for the East-Indies, we were obliged to have recourse to severe methods, in collecting a sufficient number of hands to man them, so as to sail in due time. Nay, further, when only four ships were ordered, the last spring, to take on board the troops for Gibraltar and Minorca, they were, if I am rightly informed, detained a considerable time, only for want of hands to man the ships for so short a service. Our seamen, as well as artificers, are said to be engaged in foreign service, where they meet with proper encouragement: whereas we take little or no care of them, any longer than whilst we want their assistance. Thus when press-warrants are issued, the poor fellows abscond, and run any hazards, rather than be forced into the service; the few that voluntarily enter, or are taken in their lurking-holes, are no better than slaves; for as new ones are no where to be found, so those no sooner return from a long and hazardous voyage, than they are turned over to other ships, and are sent upon some distant expedition.

Of our LAWS relating to SEAMEN.

Every seaman in the service of the crown, or any subject, except of hoys, smacks, &c. belonging to London, employed in bringing corn, fish, or provisions, to pay 6d. per month to Greenwich-Hospital. Masters of ships to detain the 6d. per month out of seamen's wages.

The 6d. a month paid by seamen, shall extend to ships belonging to Great-Britain and Ireland, and the islands in America, &c. and collectors to be appointed, who may examine all masters of vessels; and they to pay the duty before ships are cleared, under the penalty of 20l.

Only the seamen in the king's service were entitled to a place in Greenwich-Hospital; whereupon the following act was made, setting forth, that

As there is no provision made for such seamen in the merchants service, as are disabled by accidental misfortunes, or for those worn out by age, or for the widows or children of such as shall be killed or drowned in the said service; and as the seamen in the said service are willing to allow 6d. per month out of their wages, to be applied for the relief of such as shall be disabled or worn out by age, and of the widows and children of those killed in the said service;

It is provided that Alexander Hume, John Briffow, John Bance, Henry Gough, &c. shall be one body corporate and politic, by the name of the president and governors for the relief and support of sick, maimed, and disabled seamen, of the widows and children of such as shall be killed, slain, or drowned in the merchants service; and that by the same name of the president and governors, they shall have perpetual succession; and that they may receive and enjoy in trust, for the purposes of this act, all such sums of money as are granted, and shall be raised by virtue of this act, or shall be contributed or bequeathed by well-disposed persons; and that they may at any time hereafter, without licence in mortmain, purchase or receive any lands, tenements, or hereditaments, or any estate or interest therein, so that the same be only for the use of, or to be converted into, an hospital, with offices and appurtenances necessary for the said purposes.

The

The president and governors shall provide in the said hospital for the reception of seamen rendered incapable of service, or shall allow them certain pensions, or otherwise, as they shall think most for the advantage of the said charity; and shall also relieve the widows and children of such seamen as shall be killed or drowned in the said service, provided such children are not of the age of 14, or if, of that age or upwards, they are incapable of getting a livelihood, by reason of lameness, blindness, or other infirmities, and are proper objects of charity: and shall make reasonable allowances to those who shall lose an eye or limb, or be otherwise hurt in fighting, defending, or working the ships in which they serve, or in loading or unloading the cargoes, or otherwise howsoever in doing their duty, in proportion to the damage they shall receive, so far as the revenues will extend for the said purposes, according to such rules, orders, and regulations, as shall be established in pursuance of this act.

No seaman shall be provided for by a pension or otherwise, as decrepit or worn out, unless he shall have served five years in the merchants service, and paid 6d. per month out of his wages for that time for the purposes of this act. If any person shall at one or more payments contribute 50l. for the purposes of this act, he shall be declared a governor of the said corporation.

Every seaman, or person employed in any vessel belonging to a subject of England, and every master or owner navigating the same (other than such apprentices, under the age of eighteen, as are exempted from payment of 6d. per month to the hospital at Greenwich, by an act of 2 Anne, and persons employed on the coasts of England, in taking of fish brought fresh on shore; and persons employed in boats or vessels that trade only from place to place within any river in England, or in open boats upon the coasts thereof), and pilots employed on board vessels, shall, after the 29th of September 1747, pay 6d. per month, and proportionally for a lesser time during their employment, for the purposes aforesaid.

The master, owner, or commander, of every vessel, is to deduct out of the wages, &c. of every such seaman, &c. (except as before excepted) the said duty of 6d. per month, and shall pay the same to such receivers as the president and governors, or the trustees of the out-ports, shall appoint, if such seamen, &c. shall have or be intitled to any wages, shares, or profits.

Those seamen who shall have been longest in the said service, and contributed most towards the said duty, shall be first provided for as worn out or decrepit.

If any seaman, or other person employed on board any vessel, shall, in the discharge of his duty, either on shore or on board, break any limb, or be otherwise hurt, so that immediate care is necessary to be taken of him, the president and governors of the port of London, and the respective trustees for the out-ports, shall provide proper relief for such person, until he be so well recovered of such hurt, as to be removed and sent with safety to the port to which such vessel belongs; and the expence thereof, not exceeding 2d. per mile, shall be paid by the president and governors at the port of London, or by the trustees for the out-port to which such person shall be sent.

If any seaman or other person shall serve five years or more in the merchants service, and shall have paid the 6d. per month for that time, and shall be adjudged by the president and assistants, or the respective trustees, a proper object of relief, he shall be provided for at the port where he shall have paid the greatest part of the said duty for the last five years of his service.

If it shall happen that seamen employed in the merchants service, within the limits of this act, shall be shipwrecked, or taken by the enemy, and on their return from their imprisonment may be travelling with passes to the place of their abode, the president and governors, and the respective trustees, may relieve them in such manner as they shall think proper.

Whereas the united company of merchants of England trading to the East-Indies, have at their own expence provided for such seamen employed by them as have been rendered incapable of service, and have established a fund for that purpose, and are therefore desirous that the persons employed in the said service, may be exempted from the payment of the said 6d. per month; it is therefore enacted, that no officer, seaman, &c. of any vessel, employed in the service of the said company, shall, during the time of such service, be liable to the payment of the said duty.

No officer or seaman, &c. during his employment in the service of the said company, nor the widows or children of such as shall be killed or drowned, shall be entitled to any benefit by this act, during the time they shall be employed in the said service.

The act for making perpetual an act for the better regulation and government of seamen in the merchants service, and for extending the provisions thereof to his majesty's colonies in America, was made in the 1st year of George III.

From and after the 1st of May, 1764, all the provisions, penalties, matters and things, in the act of 2d of Geo. II.

VOL. II.

are extended to his majesty's colonies in America; and the forfeitures applicable to Greenwich Hospital are to be paid there, to the officer constituted by the admiralty; and masters of ships deducting any of the said forfeitures out of the seamen's wages, and not duly paying over the same, forfeit treble the value to the use of the said hospital.

SHIP-BUILDING; see ARCHITECTURE MARINE.

SHIPPING.

The dimensions, tonnage, and number of guns of some men of war built in Spain, the Indies, France, England, and Genoa; and the rules of the Spaniards, French, English, and Dutch, in regard to their failors and mariners, according to Don Gerónimo Uztariz, the celebrated Spaniard.

In the collection of the laws of the Indies, and some other books published in Spain, there are instructions and directions for building ships; and there were plans drawn up by lieutenant-general Don Antonio Gafaneta, and approved by his Majesty, in the years 1713 and 1720. Though both these schemes met with opposition from the variety of opinions usual upon such occasions, and the disagreement between kingdoms in this article, which not only differ from one another in their rules, but even from themselves in practice, we ought to prefer the plan laid down by this general for his Majesty's ships of war, both from his great experience in navigation, and his skill in naval architecture, acquired both by theory and practice; and pursue it at least, till his Majesty shall think proper to prescribe another.

In each of these plans are expressed the particular dimensions and other circumstances, that ought to be observed in building men of war and merchant ships; however, I shall give the dimensions, number of guns, and men of a ship, built after the rules practised in Cantabria, and also of some others built in France, England, Genoa, and Campeachy, within the last five and twenty years; and at the same time say something of our old method of building; that as we observed the great disagreement already mentioned, by comparing our own rules with those of foreigners, we may be most likely to discover the best and safest plan. This account is taken with great care from the papers drawn up at Cadiz in the year 1718, by some officers of his Majesty, of great experience in the sea service, who made a very particular survey of these and the rest of the ships and frigates of his Majesty's fleet that year. The extracts which I have taken from this memorial, are as follow:

The *St Lewis*, built in Cantabria in the year 1715, a third rate.

	Span.	cub.	In.
Length by the head of the keel	-	60	$\frac{1}{2}$ 0
Length on the gun-deck	-	70	$\frac{1}{2}$ 0
Breadth on the beam	-	18	$\frac{1}{2}$ 0
Depth	-	9	$\frac{1}{2}$ 0
Main-tack	-	19	2
Quarter-deck	-	17	$\frac{1}{2}$ 0

	Pound.	Guns.
The lower tier	18	26
The second tier	12	26
The third tier	6	8

Total of guns 60

It is to be observed, that in manning ships of war at Cadiz, they neither observe the old customs of Spain, nor yet that of the French, English, or Dutch, and therefore I shall give each of them distinctly.

The number of hands on board the ships of the Spanish fleet in general, was after the rate of 26 failors and 26 marines to a hundred tons. But in the capitana and admiral's ship, after the rate of 28 of each sort to a hundred tons, and upon account of the signals a hundred hands more, viz. 50 failors and 50 marines, were added to the complement of each ship, agreeable to several royal ordinances, made between the years 1677 and 1682.

To a ship of 60 guns were allowed as many } 75 gunners.
gunners, and a fourth more, making in all }
There was added a fourth of this number } 18 sea-officers
75, viz. 18 sea-officers, which makes - }
There were failors equal in number to both } 111 failors.
these sums, and a fifth more, or }
Boys equal to a third part of the failors, or } 37 boys.

Total 241
To these 241 mariners were added the same } 241 marines.
number of marines }

Both sums, in which their officers are included, make } 482 hands.

S H I

The complement of a French man of war is three men, a gunner, a marine, and a sailor, to every four pounder.

To a	—	—	—	—	6 pounder,	5	
To an	—	—	—	—	8	7	
To a	—	—	—	—	12	9	
To an	—	—	—	—	18	11	men.
To a	—	—	—	—	24	13	
To a	—	—	—	—	36	15	
So that a ship of sixty guns, viz. the St Lewis, which mounted 26 eighteen pounders, 26 twelve pounders, and 8 six pounders, according to this rate, has for her complement							560 hands
The English and Dutch say, they have a man less than the French to every gun, so that their complement of sixty gun ships must be after this rate							500 hands
A Spanish ship's complement for sixty guns							482
French							560
English and Dutch							500

A distinct list of the officers, sailors, marines, &c. making up the 500 hands, which, according to the custom of Spain, were allowed to a sixty-gun ship, including fifteen swabbers, that were not reckoned in the 482; because the full complement was shipped according to the rate of the men of war, independent of these, there having been a reform made in respect to the number of marines, which before made up half the ship's crew, that they might be reinforced with troops in case of their making any invasion ashore; but as engagements at sea are now decided by great guns, sailors are fittest for this service.

Total of the ship's crew							500

To these 500 men are appropriated 509 ratios, or allowances per day, in consideration that 6 ratios are assigned to the captain of every large ship, and to the cadets or guards marine, during any expedition, half a ratio extraordinary. So that these multiplied by 30, the number of days in a month make 15,270 ratios. The following articles make up a thousand ratios.

Biscuit	—	11 Quintals, 25 pounds.
Wine	—	46 Arrobs, 7 azumbres.
Bacon	—	1 Quintal, 9 $\frac{1}{2}$ pounds.
Beef	—	1 Quintal, 46 pounds.
Bacallao	—	86 Pounds.
Cheese	—	54 Pounds.
Butter	—	1 Quintal, 25 pounds.
Oil	—	1 Arrobo, 2 pounds.
Vinegar	—	1 Arrobo, 4 azumbres.
Wood	—	15 Quintals.
Water	—	125 Arrobs.
Salt	—	1 Celemin.

S H I

In the 30 ratios, or day-allowances, are included the following articles for every thousand.

White biscuit	—	22 $\frac{1}{2}$ Pounds.
Mutton	—	10 Pounds.
Fowls	—	2 $\frac{1}{2}$ Fowls.
Eggs	—	30 Eggs.
Raisins	—	3 Pounds 10 ounces.
Almonds	—	2 $\frac{3}{4}$ Pounds.
Sugar	—	14 $\frac{1}{2}$ Ounces.
Charcoal	—	15 Pounds.

The ship Nuestra Senora de Begona, built at Genoa, in the year 1703.

Of the ROYAL SHIPPING, or MARINE of FRANCE, and other STATES, being an abstract from M. DESLANDES, drawn up by the order of, and addressed to, the Count DE MAUREPAS, secretary of state and of the marine in France.

Every body knows the several establishments of the marine in France; every one knows, at least in the gross, what pains, what labour, what vast sums of money they have cost; how many experienced arts and artificers have been drawn together, all of them, in point of curiosity, as well as utility, worthy the particular attention even of such as are used to, and well versed in, these sort of things. These establishments are likewise remarkable, by a great number of officers of all ranks, placed in such a relation to each other, as that their subordination assists, and never prejudices, their duty; and as, in the marine, there are three principal objects, that, by turns, command and employ all their care, so these officers are divided into three classes, who have, indeed, different parts assigned them, but who, by the discharge of their several duties, contribute all to one great end.

The first object of the marine in France is, as it were, a prologue to the rest; and consists in assembling the materials that are proper, in fortifying and in disposing them, so as to render them applicable, with the greatest ease, to all the uses of navigation. These preliminaries relate to the viewing, purchasing large falls of timber, and appropriating them to their proper uses, on the knowledge of buying and selling an infinite number of all kinds of commodities, on the manner of employing them, and drawing the greatest utility from them, in the construction, careening, and equipment of vessels. It is discernable at first sight, that to be master in this art, there is required a judicious mixture of theory and practice, joined to a very extensive genius, perfected by a constant experience.

Hence it is that France have never had, in the marine, but two intendants of consummate abilities, viz. Desclouffeaux and Vauvre, both chosen by M. de Seignelai, both of them men of elevated genius, who had high conceptions, and who never considered difficulties in any other light, than as steps conducing to the glory of surmounting them.

The second object comprehends the management of the dif-

ferent branches of duty on ship-board, and the conduct of ships at sea, or navigation, strictly and properly taken: and this supposes two parts, viz. the art of piloting and of working: the first respects the use of the compass, maritime charts, instruments for taking the height of celestial bodies, or for measuring the ship's run, with the rules and conjectures necessary to make a good estimate [see the article NAVIGATION]. The other regards the management of the sails and of the helm, as well with regard to her course, as to the advantages that may be obtained from the winds, and from currents, and with respect to the ship's driving or altering her course through their force*. How many opportunities are there here for exercising all the faculties of the human understanding!

* Mr Pitot, one of the members of the Royal Academy of Sciences, has given us an excellent work on that subject, which far exceeds any hitherto published. The book mentioned by our author, is entitled, *The Theory of working Ships applied to Practice*, containing the Principles and Rules for sailing with the greatest Advantage possible.

The last object of the marine seems only to comprehend what is accessory; and yet this, by little and little, comes to be considered as the principal part. The accessory consists in certain forms and methods, which are settled in every port, in order to bring all expences to a just account, fixing the estimate, muster-rolls, and other things of a like nature, and, in short, what is called keeping the ship's books. It is true, that, generally speaking, these things are necessary and useful, especially in providing against frauds and abuses; and yet it may be that even these frauds and abuses had better be borne with, than the tedious and troublesome parade of formalities invented to get rid of them.

To these three classes answer three sorts of officers, who keep themselves each to his province, and never pretend to carry their views farther. This is all that is expected at this time of day: so that every profession is bounded, and any one of them is thought sufficient for the exercise of one man's capacity.

This is, in gross, what concerns the royal marine. As to the marine in the hands of private persons, it is distributed through, and flourishes in, all the maritime provinces of the kingdom, where it is more or less distinguished, first, according to the degree of fortune, ability, and industry of those concerned in it; secondly, in proportion to the quantity of gold or silver that circulates; thirdly, according to the critical circumstances, which increase and diminish, quicken or retard, this circulation. Hence it is, that the same places are not always equally powerful, or possessed of an equal share of trade. Repose and inaction frequently succeed the greatest hurry; sometimes, also, that luxury, which follows riches at the heels, as they again are produced by trade; that luxury creates such a dissipation of wealth, that, before it is well seen, it vanishes away.

Upon this subject I will just mention one of those happy observations that every body makes, and no body minds. Most of our traders burn with vehement desire of growing rich: to do this, they spare neither pains nor labour, but run all hazards, and endure all toil, to attain this end; but when they are once become excessively rich, by all their assiduity and fatigues, they think of nothing but procuring pompous titles, and noble alliances, of which they find just cause to repent, every vein of their hearts: they are despised and slighted, while they foolishly consume what with such infinite labour they acquired.

There cannot be then any thing more useful for exciting and recompensing judicious and able traders, than to teach them that sensible maxim of the author of *Oeconomies Royal* and *Politique*, viz. To banish intirely luxury and superfluity, whence their ruin is drawn on, and thereby a wide gap opened in society.

Commerce by sea is carried on in three different ways: the least considerable is that from one port or creek to another, and which is called coasting: it serves principally for maintaining a constant correspondence between all the maritime provinces of the kingdom, by supplying from one what is wanting in another. This commerce is so much the more advantageous in France, because it encourages industry, and may be carried on with equal ease and safety in almost all seasons of the year; whereas, in the northern countries in England, and even in Holland, they are blocked up the best part of the winter by the ice, which hems in their vessels, and exposes them to greater inconveniences, by unexpected shocks when at sea: France is, besides, much less exposed to sudden inundations of the sea, and there happen fewer shipwrecks on its coasts than on those of other countries, though even its coasts are not every where free from danger.

The second kind of maritime commerce is, that which is carried on throughout Europe, and comprehends those real and effectual succours which one country lends another, and by which all its several kingdoms become reciprocally useful. These succours consist either in the products of their soil, in the works of manufacturers, or in curiosities; and it is easy

to discern, that the better any kingdom is stocked with these, the more strangers will resort thereto, and the more trade will flourish. The two branches of which it is composed in all countries are, as I have said, the product of a fruitful soil, and the labours of an industrious people.

France, in her hemp and flax from Bretagne; in the salts of Brouage, of Marennes, and of Croisic; in the red wines of Bourdeaux; in the white wines of Anjou; in the brandies of Nantes, of Cognac, and the Isle of Rhé; in the papers of Auvergne and Angoulême; in the parchments of Normandy, and the gold and silver brocades fabricated at Lyons; in all sorts of grain, wheat, barley, oats, rye, has sufficient resources for commerce, which never can fail her. I must confess, that since the revocation of the edict of Nantes, over which we ought to draw a veil, as the most unlucky event in the reign of Lewis XIV. I must confess, I say, that many of our manufacturers are naturalized in foreign countries; but there are still enough left in the kingdom, if they were well managed, both to employ its inhabitants, and to enrich them. All that we ought to fear is remissness, bad working, and, if I may dare to speak out, a spirit of fraud and deceit; for we ought not to flatter ourselves, that through the wise rules, and from the authority of many royal ordinances, which direct the observations of those rules, our manufactures are no longer subject to these three sorts of revolutions.

From the time that Edward the Third drew over a vast number of artisans, who escaped from the excessive cruelty committed by the Spaniards in Ghent, Louvaine, and other cities of Brabant, and made use of them for establishing in England woollen manufactures, these manufacturers have never degenerated, have never lost their credit or reputation*; they are still on the same foot, and furnish fine cloths of all colours, with which the English carry on a large trade, as well in Germany, by means of the staple they have established at Dort, as in the Levant, by the way of Smyrna. Heretofore, neither they nor the Dutch could approach the coasts of the Grand Seigneur's dominions, but under the banner of France [see the article *LEVANT TRADE*], but at this day they trade there in their own name, and in their own right; and one may very safely say, that, in proportion as their trade has increased, our's has suffered by many losses, bankruptcies, and other causes of declension, that many very much question whether it will ever be able to recover its ancient lustre. The voyages of which I have been hitherto speaking, even such as carry us to the very extremities of Europe, merit only a cursory attention: the true commerce by sea is that which embraces the other three parts of the globe, that which requires the whole force and skill of the nautic art. As the dangers therein are greater, and the risks run more than ordinary, so its profits are also very considerable; and it is thence that we derive so many shining fortunes, acquired by lawful means, and which ought never to be confounded with those hastily raised and odious estates drawn out of the miseries of the people, and tinctured, if I may so say, with their blood.

* We wish what Monsieur Deslandes says upon this occasion was true; but some recent instances prove the contrary, to the great scandal, as well as detriment, of the English woollen manufacture: but it is to be hoped that the legislature will take due notice of a practice so pernicious in its consequences. See the articles *ARTIFICERS, MANUFACTURES, MECHANICS, and ROYAL SOCIETY OF LONDON*.

Almost all the nations of Europe carry on, at this day, some commerce either with Asia, Africa, or America; but we are not to conceive from thence, that this renders them all equal. Though the Portuguese are very justly considered as the restorers of the marine, and of navigation, as having heretofore great territories in Asia, inasmuch, that several Arab kings were in their pay, and many pagan princes thought themselves honoured by the commands of these new masters, their authority, however, is now but the shadow, and their power but the skeleton, of what it was. [See the article *PORTUGUEZE EAST-INDIA TRADE*.] They support themselves on the remains of their old reputation, which time has almost worn out; and Goa itself is no longer known but for its terrible inquisition, that horrible tribunal*, where no forms of justice are observed, and where natural equity never finds a place in their decrees. The Hollanders, at present, are the great masters of the commerce in the East-Indies, which they manage with infinite address, mingling com-

* The history of this inquisition was written by a physician, who had proved not its salutary, but its unjust rigours. Happy France, to have looked always with horror on a tribunal which has so much discredited, and rendered so odious the Christian name! More happy still, if the priests do not, some how or other, find means to introduce it under another name!

The physician mentioned above, was one Mr Dellon, and a very good book his is; but the best that I have ever seen on the subject, and that which deserves to be read by every curious person, is the *Memoires Historiques pour servir à l'Histoire des Inquisition*. A Cologne 1716, 2 vols. 12mo.

plaisance with a spirit of dominion, and having equally recourse to artifice and force. An ancient writer wished, that arms were always subject to the gown; at Batavia, and in the rest of the Dutch colonies, they are both subject to trade.

All the world knows that the best part of America belongs to the Spaniards: I must confess I am a little in the dark as to their title; nor can I positively say, whether the ill usage they have given the natives, and the many thousands of their throats they have cut, has created them a good one: but this is certain, that their power is too extensive in itself, too ruinous, by the conduct of their bishops and governors, who purchase all their dignities and employments, and too much hurt by that fraudulent spirit of private gain, which possesses all who reside there, to subsist long. Besides this, their government grows daily worse and worse, there being little union between the principal who manage there, and a kind of insensible usurpation growing up, which the Spaniards themselves do not perceive, or, which is worse, affect not to perceive.

The principal fault in the government of these vast kingdoms appertaining to the Spanish monarchy is, that their orders never arrive in time, and, when they do arrive, it is next to an impossibility to get them executed; two things which usually cause the miscarriages of all great affairs.

Within about half a century past, the English have found the true method of managing affairs in America, and without which they will hardly ever succeed: all their steps in that country are directed with the utmost prudence; they search for, and embrace, every new branch of commerce that industry can discover, or that chance presents; they protect and perfect all their old colonies, and, at the same time, do not neglect planting new; in short, they act as if fortune had reserved for them, some time or other, the entire dominion of that mighty country*.

* The English reader should be here put in mind, not to be led away with the praises bestowed upon their nation by this writer, and of their wisdom in conducting their colonies. These are not to be considered as genuine and candid representations, flowing from the real sentiments of the author, but as artificial colourings, necessary to raise the jealousy of those to whom he writes; and making his countrymen thereby the more keen for the destruction of this kingdom.

As to the advantages, continues this writer, which regard the marine, and which France, in her situation, may find in her own proper bosom, they may be reduced to four; of which the first, without contradiction, is her situation, the most commodious, and the most advantageous that can be in the world, as well for attacking as defending, and for disturbing the commerce of others, as for cultivating her own; sending to all places, and receiving trading vessels from all parts of the earth: hence it was said to the late Czar, Peter I, whose head was always full of great projects, and to the king of Sweden, Charles XII, so unfortunately assassinated before Frederickshal, That, if any kingdom could aspire to be the mistress of all her neighbours, it must be FRANCE. In effect, she is placed in the middle of Europe: nothing can impede, nothing can prove an obstacle to her; she commands, on the one side, over the ocean, and it seems, by the extent of her coasts, by their turnings and windings, that the seas of Spain, Germany, and Flanders, struggle to pay her HOMAGE; on the other, she is bounded by the Mediterranean, looking full upon Barbary, having on her right-hand Spain, at her left Nice, Genoa, the dominions of the Grand Duke, and all the rest of Italy. What a situation is this, if we knew but how to make use of it, and if, opening our eyes to our interest, we no longer languish in soft effeminate idleness!

The English and the Dutch are forced to strike out far for whatever is necessary to them, and are constrained to put out to sea, in order to reconnoitre and attack their enemies; whereas FRANCE is able to attack them, as it were, hand to hand, to combat with advantage, and to retire with ease; which are advantages of no small consequence at sea: but, what is still more, foreign vessels that return from long voyages, worn and beaten by the wind, and by the tempests, foul in themselves, and weakly manned, pass, as it were, under our eyes, in the view and at the mercy of FRANCE, as cardinal d'Ossat observes, and, in spite of themselves, must approach our coast. One may easily judge what a facility this gives of carrying them off, or, at least, disturbing their navigation, which must turn, says the same cardinal, to the profit and commodity, to the safety, grandeur, and reputation, of the crown of FRANCE.

As to the rest, all that I have been saying here is not to cry up, or to make an eulogium on war, in order to turn mens minds thereto, who have, perhaps, but too great an inclination for it already. I know, on the contrary, all the merit of a gentle and moderate government, of a government where justice and good faith prelide, where all endeavours are used to drive out the seeds of hatred and jealousy, and where no pains are spared in the cultivation of tranquillity

tranquillity and peace; but to avoid being deceived, says cardinal Richieu, we must sleep like the lion, WITHOUT SHUTTING OUR EYES, which ought to be continually open, in order to foresee the smallest inconveniences that may happen. For hence it is that we often see in states, that such evils as were imperceptible in their origin, and which were least thought of, are the most dangerous, and those which prove of the greatest consequences in the end.

In effect, a wise prince, and one who has regard to his interest, ought to watch attentively over every thing that may contribute to the service, or to the prejudice, of his crown. He ought, with the same vigilance, to weigh duly the present situation of his own kingdom, and of the other kingdoms that surround him. While the balance continues even, an easy and pleasant union will certainly reign; but, as soon as this fails, quarrels, animosities, and dissensions, will arise, and will encrease: FRANCE is too clear-sighted ever to be ignorant of the EXTENT OF HER POWER, and nothing can outrage her more sensibly, than to suspect her being ignorant of it. Always ready to DECLARE WAR, she ought, however, never to attempt it unjustly; ever in a condition to defend herself, she should never be in a disposition to bear injuries: *Veniendum tunc ad arma*, said Theodoric, king of Italy, *cum locum apud adversarios justitia non potest reperire*; i. e. We are then to have recourse to arms, when justice no longer finds place amongst our adversaries.

It is reported, that Henry III. imagined one night that he was in the midst of a troop of lions, tigers, and leopards, ready to devour him; and the next morning, quite out of his wits, and terrified about the consequences of a dream, which he ought to have despised, flew to the castle of Madrid, where he kept a great many foreign wild beasts, and ordered them to be all killed in his presence. This tragedy settled his mind, as idle and ridiculous as it was. Any one might have whispered in his ear, The animals that threatened you, were not those in your menagerie, but, on the contrary, your neighbours, always disposed to hurt you, and above all, your MARITIME neighbours.

The second advantage in which we ought to think ourselves happy is the security of our coasts, which in a manner defend themselves, and which have hitherto defeated all the descents that ever were attempted on them. Witness those that admiral Tromp would have made in 1674, not only at the mouths of the Loire and of the Groyne, but along the coasts of Bretagne, Poitou, Saintongue, and Guienne. He found that all was so well guarded, and that every where so good orders were given, that he durst attempt nothing considerable. Witness again the descent attempted by the lord Berkley in 1694, at Camaret, in which the English lost upwards of 1200 men, with general Talmash, who commanded the troops that were debarked. The French, however, opposed him with no more than two independent companies of marines and the militia appointed for the defence of the coast. Piqued at this unfortunate expedition, lord Berkley attempted several other descents on Normandy and Flanders, none of which, however, were attended with any better success.

To this natural security of our coasts, which enables us to save a mighty expence, may be added the fertility of our MARITIME PROVINCES, as well as those that are washed by the ocean; a fertility which renders them extremely agreeable, opulent, and populous, by drawing to them a vast concourse of strangers. All the other kingdoms of Europe, on the contrary, complain of the unlucky situation of their coasts. Here they are absolutely barren and full of mountains of sand; there grows nothing that is useful, nothing that comes to maturity farther off; both country and people seem alike neglected by nature.

These kingdoms, however, have an advantage that is peculiar to them, and which I could almost envy them; it is this, that the sea washes their principal cities where the court makes their residence, and where we see united all the politeness attending a royal presence, with all the force that depends on a maritime strength. We admire there the art and intelligence that is necessary to make the several parts of so vast a machine move in regular order, and in such a manner as to assist each other; they take by the hand, if I may be allowed so to say, riches and conveniences from all quarters; every body interests himself in the prosperity of trade*, and none are so blind as not to see, none so obstinate not to acknowledge, that upon this depends the happiness of the state.

* It is to be wished, that what this French author says, was really the case in Great-Britain.

This is what happens every day in Portugal, Muscovy, Denmark, Sweden, Great-Britain, and Holland, of which all the capital cities stand upon, or very near the sea; Paris, on the contrary, knows nothing of it, but by strained relations, and, if I may so speak, stories at second hand. We behold there a voluntary indolence throughout, which concerns itself about nothing that does not conduce either to amusement or

VOL. II.

to pleasure; and I am very positive, that as to half the things that are consumed, and half the rarities that are admired there, they know not by what country, or by whose industry they are so obliged.

This ignorance, which is almost general, of what is produced in our own country, and what comes from abroad of the necessities of life, or that serve to nourish laziness and increase luxury, affords room for that slight regard, or rather absolute contempt, that is had for navigation and commerce*. But this unjust contempt would be quickly extinguished, if instead of a sedentary education, always within the shadow of the house in which they were born, we took care to make such young people travel, as seem destined, either by their birth or fortune, to the first places in the government. If we explain to them exactly all that relates to our colonies, all that is indispensably necessary to supply the wants of this kingdom, which daily grows more and more: if we instructed them in the principal manufactures that employ and enrich our several provinces, and pointed out to them such as are beginning to decay, and such as, though they are absolutely decayed, might yet be restored, and brought to be of infinite benefit to the kingdom, by preventing going out of great sums into foreign parts: if, in fine, they were made perfectly to comprehend the three branches that constitute the riches of the kingdom, viz. estates in land, trade, and manufactures: if we shewed them the connection of these three branches, and how they ought mutually to prop and support each other, how the real effects of any country augment in value in proportion as commerce and manufactures are themselves augmented, and thereby the circulation of gold and silver, which is become the standard, the common measure of the confidence of the public, and the authority of the sovereign: if all this should be laid down in a clear and familiar method, and in just and evident calculations, in order to avoid loading the memory too much; would not such an education be infinitely more valuable, than those of which we are at present so fond? Would there not arise from thence both greater respect for, and greater profit to, the common-weal†?

* This is apparently calculated to animate the French nation to the studious regard of its trade and navigation.

† We are willing to flatter ourselves that the work wherein we are engaged, will not a little contribute to the cultivation of such kind of knowledge among the nobility, gentry, and merchants of this kingdom. See our article MERCANTILE COLLEGE.

The third advantage which France enjoys is, that the most considerable armaments may be there made with the greatest readiness and facility. She not only draws out of her own stores almost all the materials requisite to a maritime force, but she nourishes also, within the compass of her dominions, an infinite number of able artificers, capable of employing these materials in the best manner.

There are likewise amongst these workmen, some ingenious discoveries, very little known abroad, and which having been made at different times, have passed as a kind of legacies from parents to their children. These discoveries do not consist in perplexed reasonings, but in EXPERIMENTS and FACTS, which suffice for the current service of the MARINE, where, generally speaking, it is of far greater consequence to execute quickly, than to think how a thing may be done nicely, and where whatever is performed by mens labour, is preferable to what is done by machines. The conclusion of all this matter is, that we cannot be too careful in preserving this race of workmen, [see our articles ARTIFICERS, MANUFACTURERS, MECHANICS], whose industry is perpetual, and increases as it continues; a race of mean people it is true, but who surpass, in my humble opinion, the lazy nobility, who make the pursuit of pleasure their sole occupation; a nobility, as M. deSully says, among whom we find more mongrel gentlemen, who are fit to make buffoons, gamesters, or porters, than to apply themselves in a generous way, in carrying arms for the service of their king, or the defence of their country.

What I have been saying recalls to my mind an excellent remark inserted by M. Colbert, with his own hand, in the instruction which he caused to be drawn up in 1681, for the dyeing of wool of all colours, and for improving drugs, and other materials employed therein: 'One cannot look, says he, on the fertility of France, or see so great a number of lazy fellows, who sit useless, and with their arms folded, while they might be so advantageously employed, either in the cultivation of the earth, or in many other ways, which nature has pointed out for their benefit, in order to live at the expence of the blood and substance of others, without blaming the form of government, and negligence of our ancestors, and their attachment to useless employments; which served only to fill their heads with wind and smoke, and thereby very often produce such storms and tempests, as went very near destroying the state by the fury of civil wars.' Before the time of M. Colbert, we were obliged to bring from Holland almost every kind of sea-stores, down to the iron-work for our anchors, match, cordage, cables

cables ready made, saltpetre, and even cannon powder, as if there had not been in this kingdom forges, hemp, iron, saltpetre, sulphur, or men capable of going through hard labour. M. Colbert was determined to banish foreign manufactures, and to establish things of this sort at home, upon so much better footing, as that they should quickly excel those which we formerly employed. He farther resolved, that we should extract from the natural riches of the kingdom, whatever it was possible it should produce. He created in France, ARTS, TASTE, GENIUS, of which, 'till then, France was utterly ignorant, and which she has since carried to so great a perfection; and with regard to particular manufactures, he brought from countries where such manufactures were in the highest perfection, persons who thoroughly understood them, settled them in this kingdom, and whose posterity, enriched by his favours, do, even at this day, honour to his choice. How much does such an example deserve to be followed! and how many illustrious strangers would an obliging reception bring amongst us!

I must confess, that there are some sorts of commodities and merchandize necessary to the marine, which only the northern countries produce. But it will be always easy for us to provide ourselves with these, by adhering constantly to the two following precautions; the first, maintaining a close alliance with one of the three great powers in the Baltic: the second, carrying on all this trade on our own bottoms, without ever receiving them at the second or third hand, without paying commissions, which are always heavy and ruinous.

I shall here take notice of a very sensible regulation that is observed in England, that ought to be regarded as the basis of all her commerce: the English themselves are alone permitted to export the commodities of their own country, or to import those of foreign nations. This practice puts that great island in continual motion, and is the reason that money never circulates there at a price considerably above its real value. It likewise hinders a spirit of indolence from communicating itself, and spreading from one to another; that dangerous spirit, more dejecting, through a too quick sense of evils, than thoughtful how to repair them, and which proves thereby, in the end, the ruin of the state. The connection there is between all the different parts of the society is so close, that it is simply impossible that a single person should be hurt, without the rest feeling the blow.

Though the times were then very perilous and difficult, yet we were not altogether ignorant of the value of such a custom, even in the days of Charles IX. In effect, that prince, supported by an ordinance of Henry II, his father, prohibited, about the middle of the year 1567, all his subjects to freight any foreign ships, and all foreigners exporting French commodities in any other than French bottoms, under pain of confiscation: salt only was excepted on account of the prodigious sale, which is much sunk since the Hollanders, and other people of the North, have thought fit to purchase it in Portugal, and to be content with the sort that country yields. Will it be believed, that the cutting off so ancient and so valuable a branch of commerce, which cardinal Richlieu esteemed more than the Spanish Indies, is owing to nothing but certain *ILL-CALCULATED DUTIES*, to which we have endeavoured to subject it? What happiness! could this kingdom be brought once to understand, that every operation in FAVOUR of the REVENUE which hurts commerce is mischievous in itself, and that, with regard to commodities that are indispensably necessary to life, the consumption is always proportionable to the duties imposed upon them.

The only remark as can be made, in support of this, regards the wants we begin to feel in FRANCE, of all sorts of wood fit to be employed in building. Neither ought this observation to be confined only to that sort of wood, but to all others, that serve either for carpenters, makers of carriages, or even which is destined for the fire: these last are particularly grown, almost every where, excessively scarce, and prodigiously dear: forges, glass-houses, the luxury of great cities, the too great curiosity exercised about dressing good cheer, have consumed prodigious quantities, and we have taken no care to replace them: we feel every where the want of wood, and still we let it every where decay.

There are certainly considerations important enough to stir up the zeal of such as are intrusted with the management of our WATERS and FORESTS, considerations which ought to induce them to say, with one of the ablest men of the Roman empire, That we ought never to felicitate ourselves on having done any thing, while there is yet any thing that remains to be done; and how many remain to be done which we know not! How many things are they ignorant of, who are intrusted with these offices, and of which they will always remain ignorant, while they retain so great a concern for their own bare interest! *

* That the royal shipping of the kingdom of Great-Britain has been subject to much greater expences than has been necessary, is a matter which, in the opinion of some of the wisest, greatest, and honestest men in the kingdom, requires severest scrutiny into. This was the sentiment of a late able minister, who, I am persuaded, would have probed this matter to the bottom, had he lived.

No body can possibly doubt that wood, properly stiled forest-wood, was heretofore much more common than it is at present: most towns, most boroughs, a great part of the abbies, that are at such a distance from them at this day, were not only near, but even in the midst of, these woods. I have travelled across a long chain of mountains, which extend from west to east, and, in a manner, thwart the whole country of Bretagne: the ancient tradition of the place reports, that all these mountains, which in a manner touch one another, were formerly a continued forest; and, in effect, having caused an infinite number of places to be bored, to the depth of 35 or 40 feet, and have there found, amongst prodigious spoils of the vegetable and animal kingdoms, trees in a manner quite intire, and as sound as if they had been but that moment cut down. This could have proceeded from nothing else but the quality of the soil in which they were planted, a soil dry and stony, mingled with a red sand, and particles of iron, easily taken up by a knife touched with a load-stone.

But the greatest mischief that has been done to the marine is, that of not having preserved the forests situated near the sea-coast, or on the banks of navigable rivers. These forests, condemned one after another, have been cut down out of caprice, or under several frivolous pretences. How much cost and expence, what an infinite labour, might have been spared, if they had still subsisted! It seems they made, here tofore, some such reflections, and that the governors of MARITIME PROVINCES were particularly charged with the care of Woods, and with the inspection of the sea and rivers; whence it came to pass, that those governors, officers removable at the pleasure of our princes, while as yet sons never succeeded their fathers in their offices, on a supposition of their inheriting their virtues, took the title of foresters. This title was principally in vogue under the second race of our kings; and we are assured, that Charlemagne was the first that bestowed that title, and that he conferred on a Saxon lord, who settled himself in Flanders, the coasts of which were then altogether naked, and exposed to the incursions of the Danes.

It is very probable that these great foresters performed the functions of a sort of officers, who began to be known, in the reign of the emperor Constantine, under the titles of *comites litoris Saxonici per Britanniam*, of *comites Cimbrici & Batavici litoris*, of *duces tractus Aremoricani*, &c. These officers were very powerful, and acknowledged none for their superiors but the *praefectus praetorio of Gauls*; they were equally charged to look to the safety of the coasts, and to the preservation of the forests, castles, and other edifices which stood in or near the coasts.

The celebrated John de Tillet, first secretary to the parliament of Paris, observes, that the word Forest is derived from an old Low-Dutch term, which signifies rivers, as well as woods. He cites, in support of this, several authentic charters, which are still preserved in the archives of the palace: amongst the rest, one by which Childebert, founding the abbey of St Germain des Prez, yields to it all his rights on the river Seine, as he then held them, adding, as the same Tillet observes, and as they were his forests. The true signification of which term is certainly to be learned from hence, that anciently all the banks and shores, indeed all the places adjacent to the sea, and to rivers, were filled with trees, and as they were first inhabited, grubbed up, and cultivated, they bestowed the name of forest equally on all places where wood and water were joined. The neighbourhood retained its denomination after it became more peopled; but by degrees, as inhabitants began to increase, and barbarism gave way to softer manners, to more polished conversation, and to pleasures, towns were formed, arts were introduced, and the conveniences of life were refined and improved every day. It was necessary to sacrifice to these uses a great quantity of wood, in order to give people, if we may so speak, room to breathe: hence it came to pass, that, preserving a few trees for ornament, they cut down all the rest, without reflecting, that a very transitory satisfaction would induce frequent and grievous fits of repentance: in effect, the common complaint throughout almost every part of the kingdom is, that there is no wood left, or, at least, that the people are ruined by the expence of its carriage.

The late marquis Seignelai, whose views extended to futurity, had formed a design of causing all the sea-shore to be planted with timber fit for SHIP-BUILDING. I don't know what obstacle hindered that design, which was undoubtedly worthy the most clear-sighted ministry: it may be that, after mature deliberation, M. de Seignelai began to distrust the French genius, always ready to seize, with ardour, new schemes, and to abandon them afterwards out of pure distaste. He was afraid that a project which required an age, or an age and a half, to bring it to perfection, would appear a chimerical project: for the bulk of our nation, through a rapidity and intemperance of taste, would have us purpose and execute at the same time, and would have invention and perfection appear almost together: works that require great application, says cardinal Richlieu, are little agreeable to our humour or natural disposition.

The last advantage respects the order of government, and, in one word, the whole system of our marine. The different usages, regulations, and employments, and all sorts of labours, are disposed in such a manner, that they enter into, and corroborate each other, so as to afford mutual assistance. We have nothing to fear from what gave so much uneasiness to the famous duke de Sully, when he became superintendent of the finances: as he found himself stopped at every turn by a heap of useless formalities, disputes, and very ill-founded remonstrances, he could not help saying in a brisk tone, which exceedingly became him, 'Great kingdoms are not governed by slips of paper, skins of parchment, strokes of a pen-knife, scratches of a pen, vain words, or, in short, by imaginations, fancies, thrugs, and grimaces.' The aim of this ministry was to quicken, and to render more simple the operations of the treasury; and he was justly afraid, that a long train of formalities, and round-about methods, should render the most essential and decisive parts of all affairs less attended to.

In regard to the marine, it is divided into two corps, who are so perfectly well acquainted with their respective privileges and prerogatives, as to observe one another with some degree of jealousy, and to put each other reciprocally in mind of their duty; and, while one of these corps devotes itself to the fatigues of war, and distinguishes itself by its firmness and bravery, on the most shining and perilous occasions, the other, more tranquil in appearance, saves it a thousand cares, and a thousand inquietudes, which would consume that body to no purpose. Courage begins to grow cold, when deprived of its liberty of acting in its full extent, or when depressed by many important cares; it wants only favourable occasions to appear and distinguish itself: at least, this is what the great M. Turenne believed, especially in the latter part of his life, and which he generously expressed, with a frankness and confidence worthy of so great a man. I have, said he, only one thing to do, which is to conquer. Choisi has put all the frontier places into a state of defence, Du Metz takes care of the artillery, and Jacquier makes it his business to prevent my ever suffering for want of provisions.

And since I have been speaking of M. Turenne, give me leave to report a fine saying of his in 1665, to Lewis XIV. who asked him, in confidence, 'What would be proper to be done, in case Philip IV. of Spain, who was very ill, should happen to die?' M. de Turenne answered, upon the spot, 'In that case, Sire, the augmentation of your ships of war and galleys, would be of as great utility as the increase of your land troops, as well in respect to what the king of Spain has in the Indies, in Italy, and in Sicily, as with regard to Spain itself, the entrance of which lies fair and open, by the way of Portugal.' An answer like this appears to me decisive; and if we had reasoned in this manner when the crown of Spain devolved on a branch of the house of Bourbon, all had ended well, and we had brought ENGLAND and HOLLAND, joined together, to the last EXTREMITY, by weakening their TRADE. I will add further, that, though in virtue of his rank as marshal-general of the camps and armies of the king, M. de Turenne ought to have given his advice only in that sort of war which was properly his province; yet, such was the extent of his genius, and so quick his apprehension of truth, as enabled him to discern, that there were certain occasions in which a MARITIME POWER ALONE ought to be employed, and where one victory at SEA is of equal value to a long series of victories obtained by land: the very perfection of policy is to know how to enter into the differences, which are sure to escape superficial minds.

I return to the established order in the MARINE OF FRANCE: and I must confess, that what distinguishes it in a particular manner is, that MILITARY CORPS of which it is composed, and which has an air of dignity, which diffuses itself over all its parts. Considered in this light, there is not one in EUROPE which ought not to yield to it with reverence. The character of the maritime power of the DUTCH is economy, and that of the maritime force of the ENGLISH is activity: the first, according to the republican genius, place all honour in saving, and direct all their views this way; whatever should contribute to the strength or security of their ships, they pare off to save charges, as far as possible, and by repeated endeavours this way, they expose their vessels to frequent shipwrecks. I lay it down as a thing pretty certain, that, for want of those necessary precautions, the DUTCH lose a third of the ships they equip every year. As for the ENGLISH, who are more judiciously covetous, they more than recover, by quickness and diligence, what they lay out in extraordinary expences.

One of their ships makes as many trips in four months, as a Dutchman can in five, or even in six; and there is certainly no kind of profit more real, or more certain, than that which arises from the shortness of campaigns, or of voyages at sea. The French hold a middle character, as it were, between these two; without having the economy of the Dutch, or the activity of the English, they surpass them, without difficulty, in the arrangement and exactness of their service;

they have gained by this I know not what title, the SUPERIORITY AND EMPIRE.

But there happens from hence sometimes two inconveniences. The first is, that we think ourselves checked, as the marquis de Montlue says, if we don't march with all the attendance of a prince, and yet this sometimes leads us into great inconveniences. It is better to move like a private gentleman, and not to play the prince, than, by straining things to a great height, to run the hazard of bringing upon one self some mischief. The second, that, through too great attention to the procuring every thing necessary, we sometimes go too far, and provide also for superfluities; so that by an excess of prudence, we fall short in expedition. However, it is frequently necessary to dispatch, for success depends on a certain degree of boldness, and not seldom on a single stroke. In great affairs, says cardinal d'Orléans, in a letter to M. Villeroi, in order to avoid a great evil, or to gain a great good, one must venture, and put something to the risk, and resolve at once, and, without delay, to get out of a bad situation in the briefest and quickest manner possible.

It is easy to judge, from what I have been saying, that French vessels ought, in general, to be better armed, and better equipped, than those of all other nations. In them there is nothing wanting, as to what is requisite for the campaign, or for the preservation of the seamen and soldiers embarked. For in our marine, we know perfectly well the value of men's lives, and esteem it the highest point of prudence to take all the care that is possible for preserving them.

There is still more than all this; we have in France, as it were, an entire nation, who, exempt from all other charges and impositions, apply themselves entirely to, and think of nothing else but, SEA AFFAIRS. Their course of life is undoubtedly very thorny and laborious. But as they are bred to it from their infancy, and as they are pleased, by a continual variety of objects, they accustom themselves to it by little and little, and pass from one campaign to another, almost without perceiving it: these people, with all this, are infinitely brave; of IRON, in point of LABOUR, of STEEL, in point of COURAGE, as Cæsar says of the ancient GAULS. They attempt besides things astonishing, and, in respect to which, nothing but an apprenticeship* could have diminished, in their eyes, the peril and the risque. It is true that our seamen have one disadvantageous quality, which is, that, on the slightest discontent, they withdraw, and go into foreign service: but this fault, however, is not singular in them, it is, indeed, the fault of the whole nation; curious after novelties, and full of vain caprice, they often quit the kingdom. Hence it is, that one every-where sees Frenchmen, and that we find them fighting under every banner, Nullum bellum sine milite Gallo.

* The classes of the marine, is one of the finest establishments in the kingdom of France, and, at the same time, one of the most useful and advantageous. Mr. Arnoux and Bonrepos, intendant of the marine, established them, though, as it but too often happens, the prime minister ran away with the credit.

These classes, that our author talks of, are no other than the enrolled seamen in France, and this was the first fixed, by an ordinance, dated 22 Sept. 1688: the seamen were then divided into three classes, of which one was obliged to serve annually on board the king's ships, and the other two were at liberty to serve the merchants. They have been since distributed into five classes. In the year 1681, there were 60,000 men enrolled.

Behold the principal advantages of which France has a right to boast, and which she cannot neglect, but to her shame, and to her prejudice. Her situation is such, that, I repeat it again, all the nations of Europe cannot help looking upon her with an eye of JEALOUSY. It may be, that I shall have an objection started to me here, of little solidity indeed, but which, notwithstanding, has dazzled and misled many persons of merit. 'A maritime power, say they with disdain, however useful, however beneficial it may be supposed at bottom, draws after it too great an expence, and has too ruinous a train at its heels; consequently it ought rather to be abandoned, on account of the immense sums it must cost, than preserved for the sake of the profits that from it ensue.'

To this objection, which they endeavour to render so much the stronger, by many affected computations, I shall offer three things in answer, which are not only very weighty, but altogether decisive; and I hope they will strike the reader in so forcible a manner, as to leave him no inclination to demand any farther, or more ample explication.

In the first place, it is true, that the marine demands expence, and even expences that are pretty large. But what part of government, what branch of the state does not demand them? Can one sustain a war, can one adjust the management of the revenue, can one give a proper air of magnificence to the king's household, can one secure the good-will, or entertain correspondences with foreign nations, without having in one's hands considerable sums of money, and disposing of them in a proper manner, and as necessity requires? In great affairs, says the cardinal de Retz, one ought never

to regard money. A sovereign is too rich, while discovering a noble courage, a greatness of soul, quick parts, and strong penetration, even in his most trivial actions, he favours the COMMERCE and MANUFACTURES of his subjects. Before him, the cardinal de Richlieu had remarked, 'That he ought to be careful in laying up money to supply the necessities of the state, and religiously exact in preserving them, when no occasions offered for laying them out; but that he ought to be equally liberal in employing them whenever the good of the public required it, and to do it in time, and in proper measure; otherwise any retardment on such occasions, costs the state very often extremely dear, by making it lose opportunities that never are to be covered.'

Besides, if for maintaining the marine, it is requisite to be continually advancing money, and providing things long beforehand, I dare aver, that the marine will indemnify with usury, and not be at all slow in paying. Is it not that which protects and enlivens trade, both at home and abroad? Is it not that which secures all our traders, all our merchants, who are dispersed through all the different parts of the world; that preserves them, in the midst of the Grand Signior's dominions, from pillages and insults, to which they would be otherwise subject; that procures them capitulations, and valuable privileges on the coast of Barbary, and in the seas of the Levant, and enables them to sail in safety, wherever the French flag hath appeared? Is it not that which, in a time of war, keeps off the enemies from our coasts, which would be otherwise ravaged, and preserves a free passage for the navigation between one maritime province to another? In a word, is it not that which so amply fills the coffers of our kings, and that which gives their subjects so favourable an opening for discharging their superfluities, by sending into foreign countries the fruits of their harvest, or of their industry? The abbé de St. Pierre has observed, in one of his Political Memoirs, That the balance of our commerce with foreigners, amounts to, at least, one hundred and fifty millions a year (that is, about 7,000,000*l.* sterling) which makes, one month with another, twelve millions and a half. Is it not the maritime power that preserves this balance, and by preserving it, sustains our credit, always on the point of falling, through the jealousy of our neighbours?

Secondly, If cardinal de Richlieu thoroughly understood the thing, and has not carried it too far in his Political Testament, we ought to agree, that the principal riches of a state is its reputation, so important to a great prince, that it is impossible to purpose to him any advantage, that can in any degree compensate the loss of it. But how is that reputation to be acquired and preserved, that reputation, I say, which Machiavel looked upon to be so necessary to all sovereigns, that he called it, The apple of their eyes? How can a prince ever reckon on his fame? Or suppose it should force strangers, delicate as to point of honour, to acknowledge his superiority, the same cardinal de Richlieu has pointed out two methods equally noble and sure; the first is, to entertain in all courts ambassadors, whose birth, conduct, train, and expence, may do honour to the master who employs them; the other, to seize, with the utmost briskness, whatever has the least tendency to increase the domaine of the marine; to cause considerable squadrons to be yearly fitted out, and to let them rendezvous regularly every year at certain places, such as Cadiz, Genoa, before Algiers, at Copenhagen, and in the passage of the Sound. It is there, so to speak, where all the nations of Europe assemble, and where it is proper to strike their eyes, by the appearance of strong squadrons. It is there that a prince, who has a good reputation, does more by the bare interposition of his name, than others can do, who are less esteemed, with all their menaces and intrigues. I do not speak of still more numerous squadrons, that it may be convenient to equip from time to time, and to send to America, and into the East-Indies; it suffices me to repeat here what that great minister, whom I before cited, has said, that nothing is more indispensable to a state, than its reputation; the diminution of which, however slight it be, may prove a step to create an unlucky disposition towards its absolute declension.

In the third place, if there be any excess in the marine, if things relating thereto are sometimes pushed too far, it is not that which ought to be accused, but the present system of affairs in this kingdom, in which, to say the truth, we scarce distinguish any thing that looks like frugality, œconomy, or disinterestedness. All things are now executed at a prodigious expence, and all we do is swallowed up in pomp and decoration; private interest, in most mens minds, overbalances the love of public good*, and that regard which is due to their country. Happy the hand, who shall establish things in their natural situation! Happy the age, in which there shall be seen a nobility, accustomed from their very infancy

to a masculine and generous virtue, above little interests, despising frivolous occupations, and even life itself, when opposed to the grandeur of their sentiment. I would shew, says the M. de Montlue, to those whom I leave behind me, that I am this day the oldest captain in France, that I never sought repose, but endeavoured to acquire honour by doing service to the kings, my masters, which was the sole end and aim of my life, flying all those pleasures and delights, which turn out of the road of virtue and true greatness young men, whom God hath endowed with commendable parts, and who are on the point of advancement.

In regard to frugality, it is more necessary to soldiers, than to any other sort of men. Is it not then shameful, while their life is thick strown with risks and hazards, to be thinking how they may invent new delights, and pique themselves on refining luxury and pleasure? An emperor was, heretofore, treated as loose and effeminate, because, after his death, a looking-glass was found in his tent. What an example this of Roman austerly! Charles V. being once on the point to take the field, the townsmen of Antwerp and Bruges went to make him a present of Flemish pictures, of infinite value, in which were represented Bacchanalian sports, marriages, and country feasts. The emperor, who scarce deigned to look upon them, putting on a serious air, said, Carry back your presents, they don't by any means suit me, I see nothing in them but cramming*.

* Our kings have often endeavoured, though to very little purpose, to repress, during a war, the expence and sumptuousness of tables, of which Tacitus speaks well, when he calls them *luxoriosos apparatus conviviorum, &c. irritamenta libidinum.*

I ought not to forget here, a question that hath been often handled among the English. They enquire whether the gentry are fitter for maritime service than soldiers of fortune, who have nothing to subsist on, but their merit and their experience? and with them it seems to be decided in favour of the latter. It is true, according to cardinal de Richlieu, that all men being equal by nature, must suffer, with regret, that difference, which protection and riches put between them. It is also true, that many, who are obliged to give way, blame, with reason, those who command them to shew, that though they are inferior to them in power, yet, in merit, they surpass them.

But without weighing critically what, perhaps, belongs in a peculiar manner to England, I shall only say, that in France the marine has gained considerably since it has been composed of select youths, and of officers chosen out of the best families. It is not that I would exclude certain men, who may be said to be privileged, and who indemnify themselves from an obscure birth, by a display of talents superior to any birth. I willingly compare them to that plebeian, so famous in the Roman History, and to whose speech I will give a place here, in order to humble those who want every thing but birth.

'I cannot, said he, expose to the eyes of the public, the portraits, the triumphs, or the consulates, of my ancestors: But if you incline to see them, I can produce abundance of pikes, standards, horse-harness, and other military rewards, besides many wounds. These are my charters, these are my nobility, which it is true I have not received from my fathers, but have purchased, by my own proper toils, and at the expence of my blood. There is nothing of deceit in my words; that is a kind of art with which I am absolutely unacquainted. Virtue is best seen and distinguished by her own light. Let those who have been wanting to their honour, and have committed base and scandalous actions, seek to varnish them over by the pomp of their discourses; for my part, I never learned the sciences of the Greeks, which I don't see have rendered either wiser or more virtuous many of those, who boast of being well versed in them. But I have learned what the republic ought to advise and to approve; to attack the enemy, to succour speedily such as are under my orders, to fear nothing but infamy; to brave, by turns, the scorching heat of summer, and the winter's pinching cold; to lie upon the ground; and, in fine, to suffer all that is most tedious or tiresome in war.'

Nobility, without doubt, owes its splendor to fair and generous actions; but as it degenerates every day, ought we to complain that such actions are revived, and appear in other men? The nobility brigade and intrigue, in order to acquire charges and employments, without ever thinking how to merit, or to execute them. What madness in these vain men! Their ancestors have left them, it is true, all that depend on them, riches, great names, and shining titles; but they have not left them personal merit; that lay beyond the extent of their power; that alone they could not communicate, that alone is the thing not hereditary. They say that I am a brutish fellow, and without the least tincture of good manners, because I am ashamed to own a player for my companion, disdain either shewy or effeminate pleasures, and give less wages to my cook than to any other of my

* *Patriæ rem unusquisque, non suam, augere debet. Melius est enim pauper in divite, quam dives in paupere imperio versari.* Val. Max. lib. 4. i. e. A man ought to study to augment the public stock, not his own. For it is much better to be poor under a rich government, than to be rich under a poor one.

my domestics. What mighty crimes! and yet they are all mine. I thought this eulogium due to several officers of great merit, who have rendered the marine illustrious, by so many heavy campaigns; and who, in spite of the obstacles they met with at every turn, in spite of their rivals, who seem to block up their way to preferment, have acquired it notwithstanding, and that too with the highest applause; such, even in late times, was M. de Gué Trouin, as much distinguished by his undaunted bravery, as by his superior capacity, who exposed himself rapidly and boldly to all sorts of dangers, even to those which he had not foreseen, and which his intrepidity seemed to ward off, by not suffering them to confound him.

REMARKS, regarding the lasting security and glory of the BRITISH EMPIRE.

Thus far Mons. Deslandes, who has zealously endeavoured to raise a spirit in France for a boundless advancement of the maritime power of that kingdom; and who does not discern this to be the grand system, which now prevails at that court?

The Romans, though their city was situated very conveniently for maritime affairs, not being above fifteen miles distant from the Tyrrhenian Sea, and having the river Tyber running through it, capable of receiving the smaller vessels, yet seem wholly to have neglected all naval concerns for many years after the building of Rome; and some eminent writers have been willing to assign this as one of the principal causes which preserved that state so long in its primitive innocence and integrity, free from all those corruptions, which an intercourse with foreigners might probably have brought into fashion.

But, as an instance of what may be done by a vigilant people, we find, that, about the year of the city 492, the Romans observing, that the coasts of Italy lay exposed to the depredations of the Carthaginian fleet, which frequently made descents upon them, and considering that the war with that republic was likely to continue, they determined to render themselves masters of a naval army: which they accomplished, with such wonderful bravery and resolution, as soon to be capable of trying their naval strength against their more formidable enemy, and afterwards to give many signal defeats to the Carthaginians, who, 'till that time, held the dominion of the sea uncontested, derived down to them from their ancestors.

Whoever considers this fluctuation of power, from the Carthaginians to the Romans, must perceive a dangerous parity in that accession of naval strength which has accrued to the crown of France, from the beginning of the reign of Henry IV. to the end of the reign of Lewis XIV. Who could have imagined that France, in so short a time, could have been able to equip a fleet capable of disputing the dominion of the deep against the united navies of England and Holland? But after the diminution of her maritime power during the war with queen Anne, who could have suspected that France should have so speedily recruited and augmented her navy, so as frequently to deride the British power, before the French had the insolence to conduct Navarro out of Toulon, and commence that inglorious engagement, wherein a brave British admiral was not only shamefully assisted by his colleague, but afterwards disgraced for nobly defending the honour of his country? And who could have thought, that the French after the reduction of their fleets in its two interceptions by the admirals Anson and Hawke, and after the loss of 2185 ships taken from them by us, during the course of the late war, should be able so expeditiously to restore their debilitated navy, and retrieve their commerce to a stronger, and in a better condition than it ever enjoyed before? — But all this has been, and now is, unhappily for us, the case! which should rouse Britain from that apathy, she has too long and too tamely suffered, while her enemies have been audaciously insulting her in too many parts of the universe.

It is the invariable policy of France to amuse her neighbours with delusive negotiations, while she is secretly preparing to afflict them with the rapacity of her arms. See our REMARKS on the article PLANTATIONS. Was not this the unkingly conduct of Lewis XIV. that grand ravager, in his barbarous destruction of the Palatinate, and his perfidious invasion of the United Provinces? Was not this the behaviour of Lewis XV. to her Hungarian Majesty, when he as unkingly renounced the Pragmatic Sanction, and, instead of preserving the indivisibility of the Austrian inheritance, was the first to lop the branches of so fair a tree, by his invasion of Bohemia? And what can Great-Britain expect will be the consequence of the treaty of Aix la Chapelle, for establishing a christian, universal, and perpetual peace, as well by sea as land; and for preserving a sincere and inviolable friendship between the several high powers at war, both as principals and auxiliaries, their heirs, successors, kingdoms, states, provinces, countries, subjects, and vassals, of what rank or condition soever they may be, without any excep-

VOL. II.

tion either of places or persons? Why, from the French nation we can expect nothing but French policy; that is, whenever France is able to unsheath the sword, she will think it no dishonour to cancel the most sacred engagements she has made with the pen. This is certainly the policy of France; and this we have been told by some of our ministers themselves, who, as they are so well acquainted with the practice of our most inveterate enemy, ought to be perpetually on the guard for our own security.

The French navy is now grown to an enormous list, and our brave admiral Vernon, more than a year ago, shewed an account which he had procured of the French navy then in the ports of Brest and Toulon; whereby it appeared that, exclusive of what were in the harbour of Rochefort, the ships of force amounted to near one hundred sail. What a wonderful augmentation since the close of the year 1747, when, according to the most accurate accounts of many, the whole royal navy of France amounted to no more than 31 ships of the line, from 80 to 90 guns, besides seven frigates; of which 7 were old and unserviceable, and the remainder too few to attempt any thing in opposition to the navy of England! But let us also remember, that the British nation at the same time, notwithstanding the detriment she had sustained by the interception of commerce, and the loss in the royal navy, was still capable of continuing the maritime war, and of prosecuting it with redoubled vigour; her royal navy in 1747, consisting of 126 ships of the line, besides 75 frigates, 43 sloops, 16 bombs, and 11 fire-ships, in all 279, of which 225 were in commission, being 96 more than those in employment at the commencement of the Spanish war; but, at the conclusion of the war, in the beginning of 1749, on the reduction of the British navy, the ships continued in commission were only 71 of the line, with 29 frigates, besides sloops and tenders for which 10,000 sailors have been since continued in the service of the royal navy.

Therefore, we ought not to be intimidated at the views of France, but rather vigilant in our own.

Every court in Europe knows, that such has been the steady conduct of Great-Britain for many years past, to act perfectly consistent with her treaties and alliances, and chiefly upon the DEFENSIVE, to preserve not only the rights and liberties of her own people, but to protect her allies from being oppressed and over-run by the power of France, whereby all Christendom must have been involved in the calamitous event. England cannot be charged in any respect, during the reign of the present family especially, with having violated her engagements with any state or empire, or with having attempted to act OFFENSIVELY against any power without very great provocation; and the exertion of their maritime strength on these occasions has been with the greatest moderation, and in order only to preserve that balance of power, which has hitherto preserved the liberties of all Europe. But this will not long continue in the power of Great-Britain, if other nations increase and strengthen their maritime power, for the sake of protecting and extending their trade, and the English, at the same time, do not use all possible means to keep up theirs: if we are regardless of our well-being in this respect, our rivals in trade must sooner or later become our superiors, and this must produce very injurious and fatal effects to this kingdom. For as trade is the chief source of our affluence, and consequently, the great instrument of power, so, if we suffer our trade to decline for want of due protection by a maritime force, our influence, as a maritime state, and all our present affluence and security, must necessarily dwindle in a just proportion to it. That we may be the better apprized of the schemes and measures of France for many years past to augment her marine, in order one day to assert and maintain an ascendancy over the English and Dutch in maritime prowess, we refer the reader further to the article NAVAL AFFAIRS. To make still a further judgment upon concerns of this nature, see also the articles MARITIME, or MARINE AFFAIRS, NAVAL STORES, BRITISH AMERICA, COLONIES, PLANTATIONS.

As we would not omit any thing essential under such interesting heads, as those we have just referred to, we shall take notice of a particular or two more, which seem to require the serious attention of the public at this time: the first is, that Spain, as well as France, seems at present to be engaged in such measures, that can scarce fail to raise not only her royal navy, but her mercantile shipping, to a height superior to what it ever was. See the articles CASTILE, CATALONIA, FACTORS, FLORIDA, MEDITERRANEAN, MANUFACTURES, MARITIME, or MARINE AFFAIRS, NAVAL AFFAIRS. In regard to some of our laws relative to shipping, see the article MASTERS OF SHIPS. See also MEXICO.

There are likewise many other of the lesser states, that are either raising a new maritime power, or augmenting what they have; and as the machinations of certain potentates may hereafter be productive of such alliances, as may one day occasion a union of maritime power that may prove formidable to Great-Britain, it behoves her to guard sometimes against those possible evils; and more especially so,

feeling that the marine, as well as the finances of our naturally, the States General, are, by certain intrigues and distractions fomented amongst them, in worse plight and condition than they have been for half this century: nor is this the only melancholy situation of Holland, that may prove disadvantageous to these kingdoms on urgent occasions; there is another circumstance, that relates to the affairs of that state, which is no less detrimental to the joint interest of England and the United Provinces: I mean the present unfettered state of the barrier, which has been postponed too long, and may be attended with consequences equally injurious to the common cause with what else has been intimated. See the articles HOLLAND, FLANDERS, NETHERLANDS. — These considerations taken with their united force, should, methinks, have their due weight with Great-Britain to preserve and augment the power of her royal navy to such a degree, that she may be able to assert and maintain that superiority of maritime strength for which she has been so long renowned, and which has hitherto proved the salvation of the liberties of the whole Protestant interests. See the articles SEA DOMINION and SEA BRITISH.

Nor does it appear to me, that the augmentation of our royal navy to the height requisite at this or any other conjuncture, need be so great a burthen to the state, as some are wont to apprehend; especially if those marine concerns were managed with that economy and sagacity, which many judge necessary: and if, besides this, due measures were taken to provide ourselves wholly with naval stores of every kind, and not to be under the necessity of taking any from other states, or, at least, such a proportion only as may be politic, in order to uphold and cement such a mutual degree of commercial interest as good policy may suggest; for we cannot expect to be sellers to all nations, and buyers of none. If, however, we are wise enough to supply ourselves with such a proportion of our naval stores in general, as will keep the bulk of the treasure thereon expended within ourselves, an expence of this kind may, perhaps, add riches to the nation, instead of being an incumbrance to it. See what I have urged in this light in particular, under the article NAVAL AFFAIRS. See also the article NAVAL STORES.

SHROPSHIRE is bounded on the east by Staffordshire, on the north by Cheshire, on the south by Worcestershire, Herefordshire, and Radnorshire, and on the west by Montgomery and Denbighshire in Wales, and is computed to be 134 miles in compass. The air of this county is very healthy, as it generally is in such as are mountainous or hilly. The soil is various, the hilly parts not being altogether so fruitful as the low grounds. Here are mines of coal, copper, lead, iron-stone, and lime-stone.

SHREWSBURY, the county town, is delightfully situated on the Severn. Here is a market every Thursday for Welch cottons and flannels, of which there are sold as much as comes to 1000l. a week one with another.

BRIDGNORTH, on the same river, is a place of great trade, carried on both by land and water: its markets are well stocked with all necessities, and its fairs are resorted to from most parts of the kingdom for horses, black cattle, sheep, butter, cheese, bacon, linen cloth, hops, and most other goods and merchandize. The town is well furnished with artificers, who deal in making and selling clothes, leather, iron-tools, and the common manufactures of the kingdom, and is as famous as any other for making of stockings.

OSWESTRY has a great traffic on its market-day for the Welch flannels and freizes, of which it is the staple.

SIAM, a kingdom of Asia, beyond the Ganges, in the farther East-Indies, bounded on the north by the kingdoms of Pegu and Ava; on the east by Cambaya, Lao, Jancoma, and Tanga; on the south by a bay of its own name; and on the west by the bay of Bengal; making a semicircle of about 450 leagues, though others make it larger, and bounded by Pegu and Lao on the north, the China and Indian Ocean to the east and west, with the kingdom of Malacca to the south.

SIAM PROPER, or the **UPPER SIAM**. The air is very temperate, and the soil in general very fat and fruitful. The country abounds with rice, cotton-trees, and others, from whence they extract oils for divers uses. They have abundance of trees that yield a gum, which is the chief ingredient of the Japan and Chinese varnish. The best fort of Benjamin comes from hence, it being pure, clear, and white, with little streaks of an amber colour. — They till their lands after the rains, and gather their harvest of rice after the waters are retired, though sometimes they do it before, in boats; for, according to some historians, it grows so fast, that the ear is always above water, though it rises a foot in 24 hours. — The rice which grows where the rivers do not overflow, and which is nourished by great cisterns, or trenches of rain-water, is more substantial, durable, and better relished than the other. They raise several sorts of herbs, pulse, and roots. — They have also lemons, citrons, pomegranates, and oranges, which they call crystal ones, because of their value, arising from their use to sick people. — In fine, the country abounds with all the fruits of the Indies; the most

estimable is the arrac-tree. — Their fruits are large figs, like faulages in form, jakes, shaped like large melons, and of a delicate taste, and smell, sugar-canes, pepper-trees, cocoa's, anana's, and that remarkable plant called ginseng, which they drink like tea, in a morning fasting.

They have mines of gold and silver, lead, tin, iron, load-stone, marble, agats, sapphires, crystals, antimony, emeralds, and tambank, which is a mixture of copper, with a little gold and silver. They have steel, of which the inhabitants make fabres, poignards, and knives, but they are in general bad smiths. A diamond-mine was discovered here once, but neglected for want of encouragement, because the mines are entailed on the crown, which has the sole benefit of them. — Here are various kinds of beasts, as elephants, rhinoceroses, leopards, tigers, with all the other tame and wild beasts of the Indies; but they eat little flesh, and only catch deer, whereof they breed great numbers, for their skins, which they send yearly to Japan.

They are ignorant of the arts, except the ordinary sorts of mechanics, but are dexterous at gilding, and beating of gold into plates. They make a coarse sort of cotton cloth, and are good at embroidering. The common people employ themselves in fishing, and the better sort in merchandizing. The women are the chief merchants, some of whom trade considerably, though none of them get estates by foreign trade, that being appropriated to the king.

The chief places are,

CHANTEBON, or as some call it, **LIAM**, stands at the mouth of a river of the same name, near the gulph of Siam, and in the extreme south-east part of this country. The river is navigable for large ships, and there is a tolerable trade carried on here.

BANKASOY, on a river which lies four or five leagues to the east of the bar of Siam, where are two islands called the Dutch islands, at which ships are obliged to stay in the south-west monsoons, when they cannot get water over the bar that bears off it south-east and by south, about nine leagues distant. It is a place not much frequented by strangers, though it produces much aquila and Japan-wood, and elephants-teeth, which are all sent to the king, who traffics with them. This place is of chief note for ballichang, or a sauce made of dried shrimps, cod, pepper, salt, and sea-weed, or grafs, all mixed, and beaten up to the consistency of thick mustard. Many hundred tons hereof are expended in Siam, and the adjacent countries.

BANCOCK, or **BENCOCK**, in an island formed by the river Menan. Most ships bound to India put in here, to give an account from whence they came, as well as of their lading, and complement of men, &c. and to pay custom, the acquittance for which they shew at another place up the river, called Canon-Bantenau, within a league of the town of Siam, and then they have liberty to trade any where through the kingdom without paying any thing, but for their cocket, which they are obliged to do on penalty of forfeiting the ship.

The capital of the country, and the seat of the king, is **SIAM**, a large city, formed by three streams of the river Menan, or Memnan, which is generally full of ships, prows, &c. 30 leagues from Bontempia.

The Dutch have a factory here, about a mile below the town, on the same side of the river, and their chief makes a good figure here, though the Siam market takes off but little of European goods; and their greatest traffic is in tin, Japan-wood, and deer-skins, which they buy up for the Japan market. The Portuguese had a great trade here formerly, 'till they obstructed the commerce of the natives with the Dutch, and attacked the latter in the river Menan; which so incensed the king, that he became an enemy to the Portuguese ever after, and encouraged the Dutch, whose trade here is very advantageous with respect to the isles of Java and Sumatra.

The English had a factory here for many years, 'till about 1686, the East-India company had a quarrel with the Siamese, and withdrew it. The suburbs, which are inhabited chiefly by strangers, lie on both sides of the river.

TENNASERIM is a city of great trade, near a river of its own name, which falls into the bay of Bengal with three mouths, and is above 200 miles north-west of Siam, and 20 leagues within the bay, amongst several small islands.

CUI, or **COUIR**, is a place on the coast hereabouts, which produces great quantities of tin and elephants-teeth; but all are sent to Siam, for the king's use.

MARGUI, **MERJEE**, stands in an island near Tennaferim, 140 miles south-west from Siam, and is esteemed, by some, the best port in the Indies. It is a safe harbour; and the country produces rice, timber, tin, elephants teeth, and aquila-wood. A large number of English merchants settled here formerly, and carried on a considerable traffic, but were obliged to quit it in 1687, by the Old East-India company; who having a mind that the English here should reside at Fort St George, threatened the king of Siam with a war, if he did not deliver them up, or force them out of his country: and the officer whom they sent with the message behaving insolently to the government, and putting some of the Siamese to death

death without cause, the enraged populace massacred 76 of the English, by way of revenge. This place, and Tennafirim, is the road where ships from Guzaratte arrive, in June and July, and merchants transport their goods from hence over land to Siam.

LIGOR, the capital of a country of the same name, which was formerly a kingdom of itself, till by civil dissensions it became a prey to the king of Siam; it stands above 380 miles south of Siam. The Dutch have a factory here, which trades in tin and pepper, the country producing abundance of the former, which they engross all to themselves.

SANGOR stands on the side of a large river, about 12 leagues south of Ligor; it produces tin, elephants-teeth, aquilawood, and some gold; but the inhabitants meet with such discouragement in digging for tin, that there is little to be got, and what is manufactured is bought up by the Dutch factory at Ligor.

JONSALAM, or **JUNCALAN**, or **JONKUYLOAN**, on the western coast, is an island within a mile of the continent, but the south end is about three leagues from it. Between this and the continent there is a good harbour for shipping, in the south-west monsoons, and on the west side of the island; Puton Bay is a safe one in the north-east winds; between this island and Merjee there are several other good harbours; but the sea-coast is very thinly peopled, because of great numbers of freebooters, called Salleiters, who inhabit islands along the coast, and both rob and take people for slaves, whom they transport to Achim, in Sumatra, and there sell them: this town often suffers by their depredations. Those islands afford for traffic ambergrease, the horns of the rhinoceros, good masts, and abundance of tin; but few people dig for it, by reason of the abovementioned out-laws; besides, their governors being generally Chinese, buy their places at the court of Siam, and hence the people to reimburse themselves: yet the villages on the continent drive a small trade with ships that come from Coromandel coast and Bengal, but both the buyer and the seller deal by retale; so that a ship's cargo is a long time in selling, and the product of the country as long in purchasing: the island is about 80 leagues north-east of Achim, and was formerly called a kingdom.

MARTABAN, or **MARTAVAN**, once a kingdom independent on the bay of Bengal, which Moll places in the empire of Ava, and the Sansons say it formerly belonged to Pegu, but it is now a province subject to Siam. It abounds with corn, medicinal herbs, oil of Jessamy, roses, oranges, lemons, figs, pears, chestnuts, &c. mines of gold, silver, iron, steel, lead, copper; it has also rubico, lacque, benzoin, and they make a sort of porcelain vessels, varnished black, much esteemed for keeping liquors. It is said to extend 300 miles from the south to the north, and 115 where broadest, from east to west. Father Piemento says, it formerly yielded three harvests a year; but about 1597, much of it was laid waste by the Siamese. Boufingault says it has so good an air, that the inhabitants never have the head-ach. It has Pegu on the north, Siam on the south and east, and the Indian Ocean, and bay of Bengal, on the west. The capital, of the same name, is a well-built populous town, and has one of the best havens in the country, with a free entrance at all seasons, to which ships trade from Malacca with pepper, china ware, camphire, &c. and make their returns in rice, which they likewise export to Cochim. Moll places it 223 miles north west of Siam, on the east side of the gulph of Pegu, from which city it stands about 92 miles to the south, and it was reckoned its principal haven.

The GOLD and SILVER WEIGHTS of SIAM

Are by tual, which weighs nearest 9 dwts. 10 grs. and is $9\frac{1}{2}$ dwts. better than standard silver.

GREAT WEIGHTS

Are from their coins likewise, as

	lb.	oz.	dr.	
80 Tuals is 1 cattay, or	-	-	2 9 4 $\frac{1}{2}$	Avoir.
50 Cattys is 1 pecul, or	-	129	0 13	Ditto

But 50 cattys of Siam should make 1 pecul China, of 132 lb. for they weigh all their goods by the China dotchin; but it is never found that the king's dotchin at Siam gives more than 129 lb. which should be 132 lb.

COINS.

Their coins are tuals, miams, tuangs, and samporfs.

2 Samporfs is	-	-	1 Tuang
2 Tuangs	-	-	1 Miam
4 Miams	-	-	1 Tual

Their accounts are kept in cattys, tales, tuals, miams, tuangs, and cowries.

800 Cowries is	-	-	-	-	1 Tuang
2 Tuangs	-	-	-	-	1 Miam
4 Miams	-	-	-	-	1 Tual
4 Tuals	-	-	-	-	1 Tale
20 Tales	-	-	-	-	1 Cattay

10 miams pass for a tale China, and 85 tales Siam are always reckoned at 8 tales China.

CUSTOMS.

The Chinese, Moors, and Banians, pay 8 per cent. customs. The English, at present, pay no customs, but pay meafurage for their ships; a ship of 200 tons burthen pays from 1150 to 1200 rupees meafurage, and so for other vessels, in proportion to their burthen.

REMARKS.

In order to make a right judgment of the nature of the East-India trade in general, and consequences of the same trade to these kingdoms in particular, the reader is desired to consult the following articles throughout this work, viz BENGAL, CAMBODIA, CARAVANS, CHINA, COMPANIES, COROMANDEL, DUTCH EAST-INDIA COMPANY, EAST-INDIA COMPANY OF ENGLAND, EUROPE, FRANCE, in regard to its East-India trade in particular; GOLD, with respect to the gold brought from the East-Indies into Europe; JAPAN, INDOSTAN, MONOPOLIES, ORIENTAL TRADE, OSTEND EAST-INDIA COMPANY, PEGU, PORTUGUESE EAST-INDIA COMPANY.

Under these heads, and what we shall further lay before the reader in the sequel, he will find such FACTS, and such argumentative matter stated, naturally deducible therefrom, as will enable him to determine within his own breast, that great point, whether it is for the interest of the nation that the East-India company should be continued under its present constitution, or whether it should be annihilated, and the trade laid open to all his Majesty's subjects.

And as the substance of what has been urged against the company will be found faithfully represented under the preceding articles, so will also the answers thereunto; but there having lately appeared an answer to some of the principal objections which have been started against the company, and that in a light something different from what has been given throughout the preceding parts of this work; I should be charged with partiality, if I was to omit this additional argument in favour of the company, since I have suppressed nothing of weight that has been urged in opposition to that corporation. Another inducement to this is, that I shall scarce have another opportunity of saying any thing more in relation to the East-India trade before this work is completed; and, therefore, all evidence in regard to a subject of this importance, will be expected to be fairly laid before the public, for their information. — The substance of this argument in vindication of the company is as follows, viz.

'The remotest traffic is always most beneficial to the kingdom's stock; for example—Suppose pepper to be always worth two shillings the pound, and a merchant should fetch it from Holland, and pay there twenty-pence the pound, he will gain well by the adventure; but if he fetch this pepper from the East-Indies, he cannot give above five-pence the pound to obtain the like gain, clear of all charges; which sufficiently proves the great advantage we have by purchasing commodities in remote countries, not only for our own consumption, but for exportation: so that it is plain we make a much greater stock by gain upon many commodities, than those nations do where they grow; and surely there is not less honour and judgment by getting riches in this manner, than by an increase of our own means, especially when this latter is advanced for the benefit of the former, as hath been found in the East-Indies by sale of our native commodities.

But for the better understanding thereof, we must distinguish between the gain of the kingdom and the profit of the merchant; for although the kingdom pays no more for this pepper than is before supposed, nor for any other commodity purchased in foreign countries, more than the stranger receiveth from us for the same; yet the merchant payeth not only that price, but also the FREIGHT, INSURANCE, INTEREST, CUSTOMS, and many other CHARGES, which are exceeding great in long voyages; but all these, in the kingdom's account, are but commutations among ourselves, and no privation of the public stock; they remain still in the kingdom.

It is of great importance to the nation, that the price of lands should be improved [see our article LANDED INTEREST], which never hath, nor can be done, but by a successful foreign trade, the balance whereof is the only means and rule of our treasure; that is to say, when, either by issuing out of the realm yearly, a greater value in wares than we consume of foreign commodities, we grow rich; or, by spending more of strangers goods than we sell them of our own, we are impoverished: for the first of these courses brings in the money which we have; the last will carry it away again when we have got it. See our article BALANCE OF TRADE.

It is a true saying, That plenty or scarcity of money makes all things dear or cheap in a commonwealth [see our articles MONEY, CASH, CIRCULATION]; but it is necessary to distinguish the seeming plenty of money from that which only is substantial, and able to perform the work; for there are many

many ways and means to procure money into a kingdom (for a short time) which therefore do not enrich, but rather impoverish the same, by the several inconveniencies which ever accompany such alterations; for instance, if we should melt down our plate into coin [see our article COIN], it would cause plenty for a time, yet should we be nothing the richer, but rather this treasure being thus altered, is made the more apt to be carried out of the kingdom, it we exceed our means by excess in foreign wares, or maintain a war by sea or land, where we do not feed and cloath the soldier, and supply the armies, with our own native provisions; by which disorders our treasure will be exhausted, for it is not the merchants exchange by bills that can prevent the last of the abovementioned evils. [See the article EXCHANGE.]

But whether it be the stranger or the English merchant brings money into this country, it must ever be done upon a valuable consideration, either for wares carried out already, or after to be exported, which helps us nothing, except the evil occasions of excess or war aforementioned be removed, which will exhaust our treasure; for otherwise, the money that one man bringeth in for gain, another man shall be forced to carry out for necessity, because there shall ever be a necessity to ballance our accounts with strangers, although it should be done with great loss upon the rate of money, which is exported at great risk and danger of confiscations, for necessity or gain will ever find some means to violate the laws.

So that the treasure which is brought into the realm by the ballance of our foreign trade, is that money which only doth abide with us, and by which we are enriched; and by this plenty of money thus gotten (and no otherwise) do our lands improve; for when the merchant disposes of his cloth well abroad, he presently buys a greater quantity, which raiseth the price of wool, and other commodities, which improves the landlord's rents, as the leases expire daily; and also by this means money being gained, and brought more abundantly into this kingdom, it doth enable many men to buy lands, which must make them the dearer; but if our foreign trade come to a stop or declination, by neglect at home, or injuries abroad, whereby the merchants are impoverished, and so the commodities of the growth and product of the nation less issued, then do all the benefits abovementioned cease, and our land fall daily in price; wherefore the flourishing estate of our general trade is the only means to make our lands improve: so the particular trade to the East Indies is a PRINCIPAL INSTRUMENT therein, because it hath much increased the general traffic of this kingdom.

In the course of a foreign trade there are three degrees of gain; the first is that of the commonwealth, which may be done when the merchant (who is the principal agent therein) shall lose. The second is the gain of the merchant, which he sometimes doth justly and worthily effect, although the commonwealth be a loser. The third is the gain of the king, whereof he is ever certain, even when the commonwealth and the merchant shall be both losers.

It hath been already observed, that the commonwealth may be enriched in the course of trade, by the ballance of the same, when excesses are avoided; but it may be affirmed, that such happiness may be in the commonwealth, when the merchant, for his particular, shall have no occasion to rejoice. As for example: suppose the East-India company should send out one hundred thousand pounds in goods, or money, into the East-Indies, and receive home for the same the full value of three hundred thousand pounds; hereby it is evident, that this part of the public stock is trebled; and yet it may be proved, that the company shall be losers by the adventure, if the returns be made in bulky commodities; for the freight, the charges abroad and at home, his Majesty's duties and customs, and other charges, will be above two hundred thousand pounds; which being added to the principal, produceth loss. And thus we see, that not only the kingdom, but also the king, may get very much, when the merchant shall lose; which gives good occasion to consider how much more the nation is enriched by this trade, when all things pass so happily, that the merchant is a gainer also, together with the king and kingdom.

But for the better explaining of that which hath been affirmed as above, we must understand, that if the said one hundred thousand pounds should be trebled by the return of so much silks, and other fine commodities, out of the Indies, then the merchant likewise should gain by such an adventure, because those commodities would require but five hundred tons of shipping to bring home the same, which is but a very small charge, in respect of four thousand five hundred tons of shipping, which would be required to lade home the like value in bulky commodities.

The second sort of gain in the course of trade is, when the merchant, by his laudable endeavours, may both bring in and carry out wares and commodities to his advantage, by buying them, and selling them to good profit, which is the end of his labours; yet nevertheless the commonwealth shall decline, and grow poor, by a disorder in the people, when through pride, and other excesses, they consume more foreign wares in value than the wealth of the kingdom can satisfy and pay,

by the exportation of our own commodities; which is the very quality of an unthrif, who spends beyond his means. See our articles EXPORTATION and IMPORTATION.

The third sort of gain is the king's, who is ever sure to get by trade, when the commonwealth and the merchant shall lose severally, as aforesaid, or jointly, as it may and sometimes doth happen when the merchant is unsuccessful, and when our commodities are overbalanced by foreign wares consumed: but if such disorders be not prevented, his Majesty in the end shall be the greatest loser, when his subjects be impoverished.

The safety of this kingdom consists not only in its own strength and wealth, but also in the laudable and lawful performances of those things, which will weaken and impoverish such powerful princes, as either may or are become our enemies in remote countries.

All nations (who have no mines of their own) are enriched with gold and silver by one and the same means, which is already shewed to be the BALLANCE of their foreign trades; and this is not strictly to be done in those countries where the fountain of treasure is, but rather with such order and observations in their trade, and against excess, as are before-mentioned: for suppose England, by commerce with Spain, may get and bring home five hundred thousand ryals of eight yearly, yet if we lose as much by our trade in Turkey, and therefore carry our money thither, it is not then the English, but the Turks, who have got this treasure, although they have no trade with Spain, from whence it was first brought. But if England having thus lost with Turkey, does notwithstanding gain twice as much by France, Italy, and other members of her general trade, then there will remain five hundred thousand ryals of eight clear gain by the ballance of the same; and this comparison holds between all other nations, both for the manner of getting, and the proportion that is yearly gotten. But if yet a question was made, whether all nations get treasure, and Spain only lose it, I answer no; for some countries by war, or by excess, do lose that which they had gotten, as well as Spain, by war, and want of wares, doth lose that which was its own.

The industrious Hollanders wanting means in their own hands, do find rich mines in his Majesty's seas; golden mines they may be termed, for the States so call them in their public proclamations [see our article FISHERIES], which they have set forth on all occasions for the better preservation of their fishing: a treasure it is (indeed) inestimable, and an employment most profitable: from hence originally proceed the increase and maintenance of their people, their arts, their private wealth, their public treasure, the multitude of their ships which fetch materials to build ships, the swarms of their small vessels which catch fish, to lade their great ships which trade with fish; the produce whereof doth furnish them with all their wants of foreign commodities, and make them also rich in treasure, with which treasure they do also enlarge their trade into all the quarters of the world, whereby they become the magazines for England, France, Spain, and other places. In which course of trade, they are not less injurious to supplant others (especially the English) than they are careful to strengthen themselves, with more than ordinary diligence; for they know well, that trade hath raised their fortunes, and doth feed their hopes.

We have no other means to get treasure but by foreign trade; for mines we have none: and how this money is gotten in the management of our trade is already shown; that it is done by making our commodities, which are exported, to overbalance in value the foreign wares which we consume: so that it remains only to shew, how our money may be added to our commodities, and being jointly exported, may so much the more increase our treasure.

And here let it be supposed, that our yearly consumption of foreign commodities is to the value of twenty hundred thousand pounds, and our exportations to exceed that two hundred thousand pounds, which sum it may be affirmed is brought to us in treasure to ballance the account: but if we add three hundred thousand pounds more in ready money, into our former exportation in wares, what profit can we have (will some men say) although by this means we should bring in so much ready money, seeing that we have carried out the like value?

To this the answer is; that when we have prepared our exportation of wares, and sent out as much of every thing as we can spare or vend abroad, it is not therefore said, that then we should add our money thereunto to fetch in more money immediately, but rather first to enlarge our trade therewith, by enabling us to bring in more foreign commodities; which being sent out again into the places of their consumption, they will in due time much increase our treasure: for though in this manner we do yearly multiply our importations to the maintenance of more shipping and mariners, improvements of his Majesty's customs, and other benefits, yet our consumption of those foreign commodities is no more than it was before; so that all the said increase of commodities brought in, by the means of our ready money sent out, as aforesaid, doth in the end become an exportation

tion unto us of a much greater value than our said monies were, which is proved by the three several examples following.

First, suppose that one hundred thousand pounds sterling, being sent in our shipping into the east countries, and that it will buy there one hundred thousand quarters of wheat, clear of all charges on board the ships, which being after brought into England and housed, to export the same at the best time for vent thereof in Spain or Italy, and that it there sells for two hundred thousand pounds to make the merchant but a saver, yet by this reckoning we see the kingdom hath doubled that treasure.

But the profit will be far greater when we trade thus with our money in remote countries; as for example, if we send one hundred thousand pounds into the East-Indies to buy pepper there, and bring it hither, and from hence send it to Italy or Turkey, and that it yields there five hundred thousand pounds, at those places, in regard to the excessive charges which must be disbursed in those long voyages in shipping, wages, victual, interest, customs, and the like, all which charges the king and the kingdom gain; and it may be here observed, that as the public profit by foreign trade is the only means whereby we gain our treasure, so the trade to the East-Indies (in its proportion) doth far excel all others.

The third example is, where the voyages are short, and the commodities rich, which therefore will not employ much shipping, the profit to the kingdom will be far less; as when another hundred thousand pounds shall be employed in Turkey in raw silks, and brought hither to be exported from hence, the merchant shall have good gain, though he sells for one hundred and fifty thousand pounds; and thus, take all the voyages together in their medium, the ready monies exported will be returned to us near treble. But if any man will yet object, that these returns come to us in wares, and not really in monies as they were issued out,

The answer is; that if our consumption of foreign wares be no more yearly than is before supposed, and that our exportations be so mightily increased by this manner of trading with ready money, it is not then possible (in the course of trade) but that all the overbalance or difference should return in either money, or such commodities as we must export again; which, as is before plainly shewed, will be still a greater means to increase our treasure; for it is in the stock of a kingdom as in the estates of private men, who, having store of wares and merchandize, do not therefore say, that they will not venture out or trade with their money (for this would be ridiculous) but do also turn that into wares; whereby they multiply their money, and so by a continual and orderly change of one into the other grow rich, and when they please turn all their estates into treasure, for they that have wares cannot want money; for what originally begot the monies sent out, but our wares?

Neither is it said that MONEY is the life of trade, as if it could not subsist or pass current without the same; for we know that there has been great trading by way of commutation or barter, when there was but little money stirring in the world. There are some nations which have such remedies against this want, that it can neither decay nor hinder their trade; for they transfer bills of debt, and have other ways whereby they assign their credit from one to another daily for very great sums, with ease and satisfaction by writing only; whilst, in the mean time, the mass of treasure, which gave foundation to these credits, is employed in foreign trade as a merchandize which doth much increase their traffic. It is not, therefore, THE KEEPING THE MONEY IN THE KINGDOM, WHICH MAKES A QUICK AND AMPLE TRADE, BUT THE USE OF OUR WARES IN FOREIGN COUNTRIES, AND OUR WANT OF THEIR COMMODITIES, WHICH CAUSES THE VENT AND CONSUMPTION ON ALL SIDES.

And here it may be observed, that Leghorn is one of the most famous places for trade in Europe, and yet the merchant hath but little means to make their returns from thence, but only in ready money; which they may, and do carry away freely at all times, and without custom, to the great advantage of the duke of Tuscany and his subjects, who have been much enriched by the continual great concourse of merchants, from all the states of princes their neighbours, bringing them money daily to supply their want of the said wares; and thus we see that the current of merchandize, which carries away their treasure, becomes a flowing stream to fill them again in a greater measure with money.

Therefore, let no man doubt but that MONEY must ever attend on MERCHANDIZE, for they go together: and it is worthy the noting, that there are princes who are content to part with their treasure, only to enjoy the trade of the wares which are brought them, for which (to encourage the merchant) they take no custom; whereas we, by sending out our MONEY, do gain the employment of our SHIPPING, the trade of our WARES, and the profit of the CUSTOMS, which is a TREBLE benefit.

Some men have thought, that those countries which permit money to be carried out, do it because they have few or no wares to trade withal; but we have great stores of commodi-

VOL. II.

ties, and therefore their action ought not to be our example. To this it may be answered, that if we have such a quantity of wares, as doth fully provide us of all things needful from beyond the seas, why should we then doubt that our monies sent out in trade must not necessarily come back again in treasure, together with the great gains which it may procure in such manner as is before-mentioned? and on the other side, if those nations which send out their money, do it because they have few wares of their own, how come they to have so much treasure as we ever see in those places, which suffer it freely to be exported at all times, and by whomsoever? The answer is, Even by TRADING with their MONIES; for by what other means can they get it, having no mines of GOLD or SILVER?

It may now be expected, that I should give my thoughts with respect to the great complaints which have been this year published, against the India company's exportation of gold and silver bullion; but I chuse rather to observe,

That the foreign bullion exported by the East-India company, their officers and servants, for five years, commencing at Michaelmas 1711, and ending at Michaelmas 1716, amounted to 1,163,625. Besides, more than one tenth part of the whole export, was yearly sent to the East-Indies in goods of English produce.

In five years, from Christmas 1712 to Christmas 1717, the East-India goods exported from England to foreign parts, amounted on their nett value to

3,335,928

Exclusive of the drawbacks and prompt payment allowed the merchants.

By which it is apparent, that over and above the value of the bullion exported to India, there was a balance accruing from foreign parts to the amount of

1,699,671

Which have been answered to Great-Britain by goods, exchange, or bullion. Besides this sum, The company have paid for customs in five years to Christmas 1717

1,848,070

The drawbacks on exportation of goods in the same time

898,179

So that the remaining surplus towards clearing the debt of the nation, amounted to

949,873

To which is to be added, as a further gain to the nation, all the salpêtre, drugs, tea, coffee, pepper, cotton, yarn, raw silk, muslins, and calicoes, expended in Great-Britain in the said five years, which otherwise must have been purchased at much dearer rates of our neighbours.

Note, The East-India company did licence foreign bullion for purchase of diamonds, from Michaelmas 1711 to Michaelmas 1716, 1,123,537.

But, because much the greatest part of the said diamonds are again exported, this sum, is not added to the above bullion.

I shall now only observe, that I think the trade to the East-Indies will entirely be lost to this nation, if it should be laid open; but as I may probably publish too much on this subject for our natural enemies, or our professed friends and allies to hear at this time, so I will defer giving my thoughts thereupon 'till a more proper opportunity offers. Some Thoughts relating to Trade in general, and to the East-India Trade in particular, printed for Baldwin.

That the reader may have a summary view of what has been urged for and against the East-India trade and company, the following short queries may not be unnecessary.

I. In favour of the TRADE and COMPANY.

1. Quere. Whether the East-India trade in general be beneficial or otherwise, upon the whole, to the European potentates interested therein?

If it has been, and still continues to be, detrimental to the Europeans upon the whole, can it be supposed that they would be so infatuated as to carry on a losing trade for many years? And,

If it is a commerce detrimental to the respective states that are engaged, how comes it to pass that other nations are endeavouring to establish this trade?

If the trade to the East-Indies could be most advantageously carried on, by the several powers therein concerned, in a manner free and open to all the subjects of these powers, how happens it that every one of them should rather prefer large joint-stock exclusive companies?

If all the European states, engaged in this trade, carry on the same by the means of rich and powerful joint-stock corporations, with privileges and immunities exclusive of the subjects of such states, and Great-Britain alone was to attempt to carry on this trade different from them all by a regulated company, and to leave the same free and open to all his Majesty's subjects—Quere, Could Great-Britain be presumed to carry the trade on with the like degree of profit and safety that other nations do?

Whether the importation of gold from the East-Indies, and the re-exportation of East-India commodities to Europe America, and Africa, together with the building, employment of the shipping concerned therein, breeding of seamen, the

the benefits arising from freight, assurance, customs, and all other charges, are not of far greater advantage to the kingdom, than the exportation of silver is a detriment? And whether, if the trade was laid absolutely open to all his Majesty's subjects, the exportation of silver would not rather be augmented than diminished?

Whether gold and silver, or bullion, ought not to be esteemed by the legislature as a commodity, or merchandize, and suffered, like other wares, to be freely exported? [See our article *BULLION*, Vol. I.] And if so, whether all objections raised against the company, by reason of their exportation of silver, are not inconclusive, and of no more weight against the company than against the trade itself, if laid open, because it cannot be carried on without such exportation?

Whether, if all the silver that has been produced in America was now circulating, as money*, in Europe, Europe would be the richer for it? And whether silver, if that was the case, would not have been as cheap as tin, or, perhaps, copper?

R E M A R K S.

* It may be here necessary to observe, that it must be beneficial to trade, that our princes, nobility, and gentry, should wear the richest gold and silver cloathing, and use such utensils, and adorn their palaces and houses with those precious metals, as much as the revenues of the crown, or income of the estates of the nobility and gentry will admit; only with this difference, that crowned heads may lay out this way, whatever the extent of their revenues will allow; but the nobility and gentry must act in this, with such regard to their families, that they may all be properly provided for, whilst the heir only should fill up such splendid appearances.

The reason of which is this, that as the gold and silver (i. e. money) increases in greater proportion than the people increase, so will the prices of every thing advance, and that in much greater proportion than the rents will or can rise; wherefore it cannot but be beneficial even for trade, that as much of these metals be used in splendor, as is consistent with the above-mentioned circumstances; because, by thus keeping so much of those metals out of trade, the more just distinction will it keep up amongst the several ranks and stations of men, whilst at the same time it will give so much greater employment, and that in the most nice and curious arts, to mechanics, &c. and to prevent our markets from rising so high, as to hinder the exportation of our commodities, or give too great encouragement to the importation of foreign goods.

I am induced to make this remark, from the practice of the East-Indians, who, as I have often heard, carry this matter so far, as to bury the money they get by trade; as E. Philips, Esq. p. 7. also says, that they have, since the year 1602, buried above 150 millions of silver, which hath been brought into Europe (a).

(a) Money is the tradesman's working tools, without which he cannot proceed in trade at all; therefore, since the increase of money amongst the people will increase the price of things in greater proportion than the rents can be raised; the more money circulates in trade, the more must the traders have in their hands to carry it on; and this will necessarily raise tradesmen so much nearer the rank of gentry, as the quantity of cash they circulate is greater in proportion to the rents, than it would be if the prices of things were kept lower, the way above suggested.

Whether this trade extends to exhaust our wealth, or whether, on the contrary, our re-exportations of East-India goods do not, in the *BALANCE OF TRADE* with other countries, compensate us for the money paid for them; and whether we could carry on these *TRADES* so extensively, and to that advantage, without East-India goods to make up our fortments, as these goods are now, by the present channel and course of trade, become necessary for our foreign markets? But,

Whether, if the trade is laid open, private traders, who are disunited in their interests, can have such large capitals lodged in the Indies, and such a degree of weight and influence there, as are necessary to carry on trade with the natives; and whether numbers of separate traders going to India will not raise the price of the Indian commodities, and lessen the price of our own?

II. IN OPPOSITION TO THE COMPANY.

Query—If the East-India trade is so essentially connected with many other branches of our trade, whether it would not, if laid open, very much enlarge our trade in *GENERAL*, increase our *NAVIGATION*, and add to the wealth and riches of this kingdom?

Whether this trade is not carried on by the company with greater prejudice to the nation than it would be if made free and open, as they export less of its manufactures, and set their own price upon what they import, at the expence of the people of Great-Britain?

Whether, if the trade was laid open, a much greater number of ships would not be employed in this trade than at present, and those the strongest and most warlike, which, by this means, would be more extensive and enlarged in places

already traded to, and to others hitherto unfrequented; and, consequently, whether more of our fellow-subjects would not find employment both abroad and at home, more of our woollen, and other manufactures, be exported, and we have those goods much cheaper from thence for our own consumption, which we cannot well be without, and not interfere with our own; and whether those which we re-export, whereby our traffic with them in foreign markets would be very much enlarged, and the consumers of those goods take them from us, which they now do from *OTHER* nations?

Would not laying open this trade prove the means to carry on a great coast-trade in the Indies, and our coarse and fine cloths, and other manufactures, in all probability, be sold in greater quantities than hitherto, and a very great profit arise to the kingdom, by the additional freight which our ships will be able to make, in carrying of goods and passengers from one country to another?

Whether those who may be against this trade being laid open, as thinking the nation would be the more exhausted, ought not to examine what commodities are brought from those parts of the East-Indies, that take from us the greatest quantity of our product and manufactures, and in return, give us commodities that we cannot well be without; that are partly re-exported, and that do not interfere with, or hinder the consumption of, our own; and what from those parts, to which we chiefly export gold and silver? And whether upon these enquiries it will not be found, that those people who take from us most of our product and manufacture, give us in return saltpetre, pepper, cowries, &c. indico, and other dyeing goods, as well as drugs of most kinds, and very often gold and silver, particularly the former, which is afterwards exchanged for goods at Madras; and whether those places to which we chiefly send gold and silver, do not give us, in return, goods MANUFACTURED, INTERFERING WITH, AND HINDERING THE CONSUMPTION OF, OUR OWN, or such as serve us only for *LUXURY*, and whereof a very small value is re-exported to foreign countries independent of Great-Britain?

Whether, therefore, if this trade is now carried on to the disadvantage of the nation, it would not be the contrary, when laid open; especially if we are as careful as our interest obliges us to be, to encourage the different *TRADES* to some of those places, and with some of those people, and to discourage it to and with others? And whether, if this trade was laid open, under proper regulations and restrictions by the *LEGISLATURE* (whose business it is to discourage the trading to all disadvantageous ports of India, by *DUTIES* on commodities serving only for luxury, or interfering with, or hindering the consumption of, our own manufactures) the nation would be so far from being thereby the more exhausted, that a more extensive and beneficial trade would not be carried on, and greater employment given to our navigation and seamen? For when a trade is confined to a *FEW*, who are in no apprehension to be outdone by any rival, they are not like to take any extraordinary pains to improve it; whereas, when *MANY* carry on a *TRADE*, their industry and ingenuity are always at work to outvie one another; and to this it is we owe the increase of our trade in the course of 100 years past, and the extensiveness of our commerce at present. Whether the government, or a number of gentlemen that a *REGULATED COMPANY* shall be composed of, cannot apply money to the maintenance of forts and castles with good garrisons, as well as a number of gentlemen of whom an exclusive company is composed; and whether the servants of the government, or the factors of a *REGULATED COMPANY*, cannot do all in *INDIA* that the servants or factors of an exclusive company can do, touching *TRADE*, *PRESENTS*, and *ALLIANCES*? &c.

SIBERIA, or *ASIATIC RUSSIA*, formerly denominated *GREAT TARTARY*, is situated between 60 and 120 degrees of east longitude, and between 47 and 72 degrees of north latitude, being bounded by the Frozen Ocean on the north, by the Pacific Ocean, China, and Chinese Tartary on the east, by the Mogul's and Ubec Tartars on the south, and by the rivers Obi and Irtis, which separate Asiatic from European Russia on the west, being upwards of 2000 miles in length from east to west, and 1500 miles in breadth from north to south; the north of it a cold, barren, uninhabited country, covered with snow eight or nine months in the year; the southern provinces, a more fruitful soil, but most of the natives live a vagrant life like the ancient Scythians and Tartars, depending chiefly on what they take by hunting and fishing, or the produce of their flocks and herds: there are very few towns, and very little of the land cultivated, except near Tobolski the capital, to which part of it the Swedish prisoners were banished some years ago, and to which the Russians send most of their prisoners and some large colonies; but still there want hands to manure the ground, and great part of Siberia remains a desert. They have scarce any trade or manufactures; the principal traffic of the Muscovites of Siberia, is by sledges over the lake and frozen country to China in the winter, and they have been endeavouring to find a way into the sea of Japan and China, by their rivers

which fall into the Frozen Ocean, but have not succeeded yet, as I can learn; but they relate they have met with some rich mines of silver and copper in the mountains of Siberia, which they have begun to work. We include the Calmuc Tartars within the limits of Siberia, as they acknowledge themselves subject to the empire of Russia.

TOBOLSK, or **TOBOLSKA**, the chief city of Siberia, is situated on the confluence of the rivers Tobol and Irtisk, in latitude 58, longitude 67. 10, east. It is seated on a high hill of a large compass, the lower part of which is inhabited by Mahometan Tartars, who drive a good trade up the river Irtisk, and carry their merchandizes across Great Tartary, quite to China.

This city is, likewise, a famed mart for all the commodities which are brought thither, not only from most parts of Muscovy, but likewise from Tartary, and other countries: and the concourse of those merchants doth daily increase, and is vastly advantageous to the Russians.

Here is plenty of all sorts of provisions, and very cheap. An hundred weight of rice is sold for sixteen pence, and a good ox for two rixdollars, and the rest in proportion, especially fish, which is here in great plenty and variety; inasmuch that a sturgeon of forty pounds weight is sold for five or six pence, and the same may be said of all kinds of game. In this city are held the supreme courts of judicature for all Siberia and Dauria; and here is likewise the residence of a metropolitan, sent hither from Moscow, who has a supreme spiritual jurisdiction over those two provinces.

The river Irtisk, which runs along one side of the town, is reckoned as rapid as the Danube, and flows thither from the south, and empties itself into the Oby. That of Tobol, which runs along the other side, and from which the town takes its name, is supposed to have its spring-head from the same territory with the Irtisk, and falls into it a little below it, and both bring a constant flow of merchandizes into it all the summer.

DEMIANSKI, seated on the river Irtisk, fifty leagues north of Tobolska, is a town of good traffic.

SOMAROSKOI JAM, is another town of some trade on the same river, about 50 leagues below Demianski, and about 20 above its confluence with the Oby.

TINNEN, **TINNEN**, alias **TINNA**, is situated in latitude 56. 50, longitude 65. 10, on a river of its name, called also **TOXA**: it stands about 40 leagues south of Tobolska, and is a great market for all kinds of furs. It is large, populous, and surrounded with stout walls and ramparts; and is chiefly inhabited by Tartars, who are very affable and courteous, and carry on a considerable trade with other nations.

JAPANZIN stands in latitude 58. 10, longitude 63. 25, about 45 leagues north-east of Tinnen, on the river **TOXA**, and was built for a stage for persons who travelled on this road; as was also **Vergaleria**, the first town of Siberia, for those who travelled thence in Persia. It was built anno 1590, and is the residence of a governor, and of a numerous garrison, who yearly distribute out the corn, and other provisions, to other fortresses and garrisons seated in countries not tilled.

TARA, situate in latitude 57. 5, longitude 71. 45, almost in the middle of the province, upon the river Irtisk, is another considerable place for trade, and built by the Muscovites for the security of it down that river.

SURGOUT is seated on the north-east side of the river Oby, and is a poor town, thinly inhabited, and worse built; and in short, in the whole territory of it the people are so poor, that they can scarcely afford cloaths to keep themselves warm. They cultivate but little land, and that very indifferently; and subsist almost wholly on their hunting of fables, ermines, black foxes, beavers, and such-like creatures, with which this territory abounds; some of which they catch in traps, others they hunt with dogs, and traffic for their skins. The ermines are here the finest and largest in all Siberia; and the black foxes are in such esteem, that a skin of that sort is sold for two or three hundred rubles. Hyenas and beavers are, likewise, in great plenty here.

NARIM, in latitude 58. 50, longitude 82. 53, capital of a territory of that name, is, likewise, situate on the Oby, a little below where that river receives the Keta. It is large and populous, and defended by a strong fortress, and a good garrison of Cossacs. The territory about it abounds with foxes, beavers, ermines, fables, &c.

TOMSKAI is a strong frontier town, and the capital of a province of its name. It is seated on the river **TOXA**, which falls into the Oby a little below it. It stands about 30 leagues south of Narim, latitude 56. 50, longitude 84. 37, east.

Other towns along those rivers above-named are, **SIBER**, or **SIBIER**, **BERESAI**, **JURGOET**, which last stands on an island in the Oby; and the fortress of **Comgofcoi** on the river **Telt**, which hath a good garrison.

REMARKS.

The inhabitants of this last Narim, were a little above 30 years ago ordered to get upon their sledges, and make what farther discoveries they could towards the eastern part of this province. They travelled eastward through several waste

and desert countries, which had, however, abundance of rivers, trees, and a good soil; and, at the end of three weeks, found a champaign country, inhabited by a sort of wild people, who lived in huts, and called themselves **Tingoesi**. They were seated along the river **Jenizea**, which is larger than the Oby, and runs in almost a straight course northward, the length of 25 degrees, from the lake **Baykal**; where it rises, to the Northern Ocean, into which it discharges itself. This river is observed to overflow in summer; like the Nile in Egypt, to above 70 leagues of the flat land; during which time, these **Tingoesi** move up, with all their cattle, towards the mountains, till the waters are dried up; and then return, and make the best of that fine pasture land.

The next year a new set of Muscovites were sent with the former, and some **Samoiedes** and **Tingoesi**, who were their guides, and here and there their interpreters; and these still kept towards the east, not daring to decline towards the south. In their way they met with some wild people on this side the river **Perfida**, which is not so wide, but is as rapid as the **Jenizea**; and these were a stout robust people, with little eyes, who made signs as if to tell them, that on the other side of that river, there was heard an omoth, which some understood of thunder, others of the sound of bells. The report they made at their return, excited the curiosity of others; and the waiwode sent thither, the year after, about 700 men, who penetrated again as far as the river **Perfida**, and encamped there along its banks, waiting for the spring, that they might see it thawed and open. Here they perceived, when the wind sat towards them, the confused sound of bells, of men, and horses, on the other side of the river, though they met with no men on this side: they fancied likewise, that they saw some vessels, with their sails of a square form, such as are used in India. In the months of April and May they saw, with pleasure, the whole country covered with variety of flowers, plants, fruits, beasts, birds, &c. and, by slow journeys, returned, and arrived in Siberia in autumn, where they gave an account of what they had seen.

This river of **Perfida** is supposed to be the boundary of the kingdom of Cathai, on that side which lies between India and China, and this gave them great hopes of more considerable discoveries in process of time; but the troubles which happened in Muscovy, put an end to the embassy they had designed to send thither, in a summer or two. However, the governor of Siberia sent thither a fresh caravan by land, and a number of covered vessels down the Oby into the Northern Sea, to discover the coasts of it as far as the mouth of the **Jenizea**; and the first that came, whether by land or water, were to wait for the others a whole year, and then return by the same way. Both performed their parts, and made a faithful report of what they had observed, which was sent, sealed, to the court of Moscow, to be made use of as soon as the war was ended. But by the little notice that has since been taken of it, it is probable, that the account has been either lost, or discouraged; and that the Muscovites have returned, in a great measure, to their pristine aversion to all discoveries of this kind, and all commerce with other nations: otherwise they have very great conveniences, by means of those rivers, most of them navigable, to carry their enquiries a great deal farther after the so much desired **NORTH-EAST PASSAGE INTO CHINA AND JAPAN**. For instance, they have here a large river called the **Taas**, which falls into the Oby, and which seems to come down from a forest not far from the **Jenizea**; whence springs another river not far from the former, which falls into the **Jenizea**; so that from the Oby one might, by means of the **Taas** above mentioned, cross that part of Siberia and **Samoieda**, and, after about two or three leagues march by land, come to another called the **Torgalf**, and sail down it into the **Jenizea**, the **Torgalf** having been lately discovered by the **Tingoesi** and **Samoiedes**, and found to be navigable, quite into the **Jenizea** above mentioned.

The **Jenizea**, so lately mentioned, is another river that would no less contribute to such useful discoveries, and, consequently, may deserve a particular description in this place. It hath its spring-head in some lakes near high mountains on the south side by Siberia, and thence running towards the north-west, crosses the land of the **Curges**, or **Kurgisses**, where it grows considerably larger, by the addition of a great number of brooks and rivers; particularly the **Angara**, which springs out of the lake **Baykal** above named, and waters the city of **Jenizea** in the territory of the **Tonguscan Tartars**, and called, by most travellers, **Jenizefcoi**, the **Padkamena**, and **Tonguska**, both of them also very considerable.

A good way below this it enters into **Samoiedia**, where it receives, among many of a lesser size, those of **Nizia**, **Tonguska**, which runs through the territories of the **Tongusci**, a little below the confluence of which is the monastery of **Troitzcogo**, and somewhat lower still, on the opposite side, the town of **Turnganscoi**, where the **Turngan** falls again into the **Jenizea**. Next to it, it receives those of the **Schoriga**, **Corefiga**, **Gataka**, and **Ubo**; and below these one branch of the **Guskina**; and a few leagues farther the other, by which is formed the island of that name; and, after a great winding

winding along the east side of a vast ridge of mountains, it divides itself, before it falls into the Frozen Sea, and forms a second island over-against Nova Zembla. We shall only observe farther, concerning the course of this river, that it receives a great number of others, for some of which we hardly find any names in maps.

A short account of the many attempts that have been made for the discovery of a NORTH-WEST PASSAGE.

The first person who attempted this discovery was John Cabot, employed by Henry VII. of England, towards the end of the fifteenth century, but was prevented from finishing his discovery by his people mutinying. He was always of opinion there was a passage, and that he should have discovered it if not prevented by his men.

It was almost fourcore years before another attempt was made, and then undertaken in the year 1576 by Sir Martin Forbisher, who was so little discouraged by an unsuccessful voyage, that he made two more, though with the same success. In 1583 Sir Humphry Oilbert went on the same expedition, but went no farther than Canada, in which voyage he settled the cod-fishery at Newfoundland. In 1585, Capt. John Davis made an attempt, but without success, and two more in the two following years, but without succeeding in his great attempt of discovering the north-west passage, though he proceeded to the height of 72 degrees north.

Mr Hudson, in the year 1610, after having in vain made a trial of the north-east passage, attempted the discovery of the north-west, passing through the streights that have since borne his name into an open sea; but was, like John Cabot, prevented from proceeding by a mutiny among his seamen, who refused to proceed any farther. After him Baffin made three voyages in the years 1612, 1615, and 1616.

In the year 1618, Mr Henry Button, afterwards Sir Henry, attempted to improve upon the discoveries made by Mr Hudson, and wintered at port Nelson, where, by the extreme cold, he lost great part of his men. He was the first person who wintered in those countries.

During these attempts of the English, the king of Denmark, thinking to perfect their attempts by the vicinity of his country, in the year 1605 fitted out two ships, and sent them on the same expedition, under the command of Capt. Cunningham, a Scotsman, who succeeded no better than the English; which did not prevent another expedition in the year 1607, when the men mutinied, and obliged the captain to return. This ill success only occasioned the king of Denmark to change the people; and having fitted out two ships, sent them under the command of a Dutchman, named Christian Richardson, manning his ships from Norway and Iceland, but with the same success, the men mutinying before they saw the land of Greenland. In 1619, the Danes sent Capt. Munk, who wintered there, and lost all his men but two, with whom he got home in the pinnace, leaving the ship behind.

In the year 1631, the English resumed the undertaking, and sent two ships, one from London under the command of Capt. Fox, and one from Bristol under the command of Capt. James, who met near port Nelson in the month of August. Fox came home that year, but James wintered in that country, and endured almost incredible hardships, but at last arrived safe in England.

The ill success of these attempts put a stop for many years to any ships being fitted out for this discovery, especially as the Hudson's-Bay company, which was established in Charles the 1st's time, had taken that discovery under their more immediate care, being by their charter obliged to fit out ships to send on that discovery; though we read of only two expeditions, one under the command of Capt. Barlow, who was lost, and another unsuccessful under the care of Mr John Scrogg, in the year 1722.

From this time till Capt. Middleton's expedition in the king's ship *Furnace*, in the years 1741 and 1742, we hear of no attempt. This voyage occasioned a controversy between Arthur Dobbs, Esq; now governor of North Carolina, and the captain, on his return, but with little satisfaction to the public, the principal intent of the voyage, the discovery of the passage, not being completed.

In the year 1744, an act was passed, promising a reward of 20,000 l. to be paid by the lords of the treasury, to any persons who should succeed in discovering the north-west passage. This, with other advantages, which the undertakers proposed to themselves by such an attempt, encouraged a subscription for fitting out two ships from London, called the *Dobbs* and *California*, under the command of the captains Moor and Smith, who sailed the 20th of May, 1746, and after wintering at port Nelson in Hudson's-Bay, to be ready to go on with their expedition early the next year, and making many attempts, which proved to them only the probability of a passage, and not the certainty by success, they arrived safe in Yarmouth-roads on the 14th of October, 1747. The last voyages that we have heard of, are those made by Capt. Swaine from Philadelphia, but with as little success as any of the former.

Of the NORTH-EAST PASSAGE.

The north-east passage has likewise been often attempted by the English, the Dutch, and the Danes, but hitherto unsuccessfully. There have been, however, as I am informed, some discoveries made within these few years, that have not only a tendency to facilitate such a discovery, but are of such a nature, as seem to prove demonstrably the CERTAINTY of such a passage: and these discoveries, if I am rightly informed, are now in the possession of an English gentleman, who has been at no inconsiderable trouble and expence fitly to come at such intelligence, by residing several years in Russia, and there employing proper people to pursue such measures as have been instrumental thereunto. Such a happy discovery, made by a subject of the crown of Great-Britain, must not only give eternal glory to the kingdom, but be attended with unpeakable advantages. As I know something of this gentleman's character, I am confident that he would be the last person who would offer any thing of this kind to the public, if it was not grounded upon very rational principles.

SICILY. See NAPLES.

SILESIA, a duchy in Germany. This country lies between Bohemia, Moravia, and Lusatia, on the south-west, and Poland on the north-east. On the side next Bohemia are many barren mountains; but the rest of the country is good soil, abounding with corn, wine, sweet-cane, or galengal, madder, and flax; and in the mountains which divide it from Moravia are mines of silver, the richest in Germany: there are others of copper, lead, iron, quicksilver, salt, salt-petre, and chalk.

TESCHEN, which stands between the two rivers Oels and Weichsel, has a good trade in wine and fruit from Hungary, with store of venison, wild fowl, and fish, and two sorts of beer, the one of wheat, the other of barley, both much esteemed.

FREYSTADT, on the river Oels, is noted for mines of iron, and is a great thoroughfare from Cracow to Vienna.

STRIGA stands on the river Polnitz, and is noted for excellent beer, and that remarkable mineral called terra figillata.

BRESLAW, which is the metropolis of Silesia, stands at the conflux of the Oder and Olaw, and two other rivers. It is a very populous city, and much frequented by Hungarian, Bohemian, Polish, and other foreign merchants. Here is a square near a mile round, where are, on one side, three grand warehouses, about 500 paces in length, like market-halls, full of shops, where they sell silks, stuffs, fine cloth of all colours, iron wares, &c. and on the other side are the houses of the merchants to whom they belong. But the salt-market, in respect to the magnificent houses round it, is reckoned the finest of all its squares.

CROSSEN stands near the conflux of the Oder and Boben: it is a neat old city, and has a considerable trade, particularly in linen cloth and earthen ware, by its rivers.

REMARKS.

A misunderstanding having some time subsisted between the crowns of Great-Britain and Prussia, in relation to the SILESIA LOAN, it may be of use to posterity to know the answer that was given, by his Britannic Majesty's order, to the king of Prussia's memorial upon that occasion; and especially so, because there is great knowledge therein contained of maritime and commercial affairs, and the whole is drawn up with such extraordinary judgment and accuracy, as will ever do honour to those celebrated lawyers whose names are superscribed thereto.

The duke of NEWCASTLE's LETTER, by his MAJESTY's order, to Monsieur MICHELL, the king of PRUSSIA's secretary of the embassy, in answer to the memorial, and other papers, delivered by Monsieur MICHELL to the duke of NEWCASTLE, on the 23d of November, and 13th of December last. Published by authority. London, printed by Edward Owen, in Warwick-Lane. 1753:

S I R,

Whitehall, Feb. 8, 1753.

I lost no time in laying before the king the memorial which you delivered to me, on the 23d of November last, with the papers that accompanied it.

His Majesty found the contents of it so extraordinary, that he would not return an answer to it, or take any resolution upon it, till he had caused both the memorial, and the Exposition des Motifs, &c. which you put into my hands soon after, by way of justification of what had passed at Berlin, to be maturely considered, and till his Majesty should thereby be enabled to set the proceedings of the courts of admiralty here in their true light; to the end that his Prussian Majesty, and the whole world, might be rightly informed of the regularity of their conduct, in which they appear to have followed the only method which has ever been practised by nations

tions where disputes of this nature could happen, and strictly to have conformed themselves to the law of nations, universally allowed to be the only rule in such cases, when there is nothing stipulated to the contrary, by particular treaties between the parties concerned.

This examination, and the full knowledge of the facts resulting from it, will shew so clearly the irregularity of the proceedings of those persons to whom this affair was referred at Berlin, that it is not doubted, from his Prussian Majesty's justice and discernment, but that he will be convinced thereof, and will revoke the detention of the sums assigned upon Silesia, the payment of which his Prussian Majesty engaged to the empress queen to take upon himself, and of which the reimbursement was an express article in the treaties by which the cession of that duchy was made.

I, therefore, have the King's orders to send you the report made to his Majesty upon the papers abovementioned, by Sir George Lee, judge of the Prerogative Court; Dr Paul, his Majesty's advocate-general in the courts of civil law; Sir Dudley Ryder and Mr Murray, his Majesty's attorney and solicitor-general. This report is founded on the principles of the law of nations, received and acknowledged by authorities of the greatest weight in all countries; so that his Majesty does not doubt but that it will have the effect desired.

The points upon which this whole affair turns, and which are decisive, are,

First, That affairs of this kind are, and can be, cognizable only in the courts belonging to that power where the seizure is made; and consequently, that the erecting foreign courts, or jurisdictions, elsewhere, to take cognizance thereof, is contrary to the known practice of all nations in the like cases, and therefore a proceeding which none can admit.

Secondly, That those courts, which are generally styled courts of admiralty, and which include both the inferior courts, and the courts of appeal, always decide according to the universal law of nations only, except in those cases where there are particular treaties between the powers concerned, which have altered the dispositions of the law of nations, or deviate from them.

Thirdly, That the decisions in the cases complained of appear, by the inclosed report, to have been made singly, upon the rule prescribed by the law of nations; which rule is clearly established, by the constant practice of other nations, and by the authority of the greatest men.

Fourthly, That in the case in question, there cannot even be pretended to be any treaty that has altered this rule, or by virtue of which the parties could claim any privileges which the law of nations does not allow them.

Fifthly, That as, in the present case, no just grievance can be alleged, nor the least reason given, for saying, That justice has been denied, when regularly demanded; and as, in most of the cases complained of, it was the complainants themselves who neglected the only proper means of procuring it, there cannot, consequently, be any just cause, or foundation, for reprisals.

Sixthly, That, even though reprisals might be justified by the known and general rules of the law of nations, it appears by the report, and indeed from considerations which must occur to every body, that sums due to the king's subjects by the empress queen, and assigned by her upon Silesia, of which sums his Prussian Majesty took upon himself the payment, both by the treaty of Breslau, and by that of Dresden, in consideration of the cession of that country, and which, by virtue of that very cession, ought to have been fully and absolutely discharged in the year 1745, that is to say, one year before any of the facts complained of did happen; could not, either in justice or reason, or according to what is the constant practice between all the most respectable powers, be seized, or stopped, by way of reprisals.

The several facts which are particularly mentioned above, are so clearly stated and proved, in the inclosed report, that I shall not repeat the particular reasons and authorities alleged in support of them, and in justification of the conduct and proceedings in question. The King is persuaded, that these reasons will be sufficient, also, to determine the judgment of all impartial people in the present case.

It is material to observe upon this subject, that this debt on Silesia was contracted by the late emperor Charles the Sixth, who engaged not only to fulfil the conditions expressed in the contract, but even to give the creditors such further security as they might afterwards reasonably ask. This condition has been very ill performed by a transfer of the debt, which had put it in the power of a third person to seize and confiscate it. You will not be surprized, Sir, that, in an affair which has so greatly alarmed the whole nation, who are intitled to that protection which his Majesty cannot dispense with himself from granting, the King has taken time to have things examined to the bottom, and that his Majesty finds himself obliged, by the facts, to adhere to the justice and legality of what has been done in his courts, and not to admit the irregular proceedings which have been carried on elsewhere.

The late war furnished many instances, which ought to have convinced all Europe how scrupulously the courts here do justice upon such occasions. They did not even avail them-

VOL. II.

selves of an open war, to seize or detain the effects of the enemy, when it appeared that those effects were taken wrongfully before the war. This circumstance must do honour to their proceedings, and will, at the same time, shew, that it was as little necessary as proper, to have recourse elsewhere to proceedings intirely new and unusual.

The King is fully persuaded, that what has passed at Berlin, has been occasioned singly by the ill-grounded informations which his Prussian Majesty has received of these affairs; and does not at all doubt, but that, when his Prussian Majesty shall see them in their true light, his natural dispositions to justice and equity, will induce him immediately to rectify the steps which have been occasioned by those informations, and to complete the payment of the debt charged on the duchy of Silesia, according to his engagements for that purpose.

I am, with much Consideration,

S I R,

Your most Obedient,

Humble Servant,

HOLLES NEWCASTLE.

To the KING's Most Excellent MAJESTY.

May it please your Majesty,

In obedience to your Majesty's commands, signified to us by his grace the duke of Newcastle, we have taken the memorial, sentence of the Prussian commissioners, and lists marked A and B, which were delivered to his grace by Monsieur Michell, the Prussian secretary here, on the 23d of November last, and also the printed Exposition des Motifs, &c. which was delivered to his grace the 13th of December last, into our serious consideration; and we have directed the proper officer to search the registers of the court of admiralty, and inform us how the matter appeared from the proceedings there, in relation to the cases mentioned in the said lists A and B, which he has accordingly done.

And your Majesty having commanded us to report our opinion, concerning the nature and regularity of the proceedings under the Prussian commission, mentioned in the said memorial, and of the claim, or demand, pretended to be founded thereupon, and how far the same are consistent with, or contrary to, the law of nations, and any treaties subsisting between your Majesty and the king of Prussia, the established rules of admiralty jurisdiction, and the laws of this kingdom:

For the greater perspicuity, we beg leave to submit our thoughts upon the whole matter in the following method:

First, To state the clear established principles of law.

Secondly, To state the fact.

Thirdly, To apply the law to the fact.

Fourthly, To observe upon the questions, rules, and reasonings alleged in the said memorial, sentence of the Prussian commissioners, and Exposition des Motifs, &c. which carry the appearance of objections, to what we shall advance upon the former heads.

First, As to the law.

When two powers are at war, they have a right to make prizes of the ships, goods, and effects, of each other, upon the high seas: whatever is the property of the enemy, may be acquired by capture at sea; but the property of a friend cannot be taken, provided he observes his neutrality.

Hence the law of nations has established,

That the goods of an enemy, on board the ship of a friend, may be taken.

That the lawful goods of a friend, on board the ship of an enemy, ought to be restored.

That contraband goods, going to the enemy, though the property of a friend, may be taken as prize, because supplying the enemy with what enables him better to carry on the war, is a departure from neutrality.

By the maritime law of nations, universally and immemorially received, there is an established method of determination, whether the capture be or be not lawful prize.

Before the ship or goods can be disposed of by the captor, there must be a regular judicial proceeding, wherein both parties may be heard, and condemnation thereupon as prize, in a court of admiralty, judging by the law of nations, and treaties.

The proper and regular court for these condemnations, is the court of that state to whom the captor belongs.

The evidence to acquit or condemn, with or without costs or damages, must, in the first instance, come merely from the ship taken, viz. the papers on board, and the examination, on oath, of the master, and other principal officers; for which purpose there are officers of admiralty in all the considerable sea-ports of every maritime power at war, to examine the captains, and other principal officers of every ship, brought in as prize, upon general and impartial interrogatories: if there do not appear from thence ground to condemn, as enemies property, or contraband goods going to the

enemy, there must be an acquittal, unless, from the aforesaid evidence, the property shall appear so doubtful, that it is reasonable to go into further proof thereof. A claim of ship, or goods, must be supported by the oath of some body, at least as to belief.

The law of nations requires good faith: therefore every ship must be provided with complete and genuine papers, and the master, at least, should be privy to the truth of the transaction.

To enforce these rules, if there be false or colourable papers; if any papers be thrown over-board; if the master and officers examined in *PREPARATORIO* grossly prevaricate; if proper ships-papers are not on board; or if the master and crew cannot say whether ship or cargo be the property of a friend or enemy: the law of nations allows, according to the different degrees of misbehaviour or suspicion, arising from the fault of the ship taken, and other circumstances of the case, costs to be paid, or not to be received, by the claimant, in case of acquittal and restitution. On the other hand, if a seizure is made without probable cause, the captor is adjudged to pay costs and damages: for which purpose, all privateers are obliged to give security for their good behaviour; and this is referred to, and expressly stipulated by, many treaties *. [See our articles *PRIVATEERS*, and *MARITIME*, or *MARINE AFFAIRS*, and *TREATIES OF COMMERCE*.]

* Treaty between England and Holland, 17 Feb. 1668; art. 13.—Treaty 1 Dec. 1674, art. 10.—Treaty between England and France, at St Germain, 24 Feb. 1677, art. 10.—Treaty of commerce at Ryfwick, Sept. 20, 1697, between France and Holland, art. 30.—Treaty of commerce at Utrecht, 31 March, 1713, between Great Britain and France, art. 29.

Though from the ships papers, and the preparatory examinations, the property does not sufficiently appear to be neutral, the claimant is often indulged with time, to send over affidavits to supply that defect: if he will not shew the property, by sufficient affidavits, to be neutral, it is presumed to belong to the enemy. Where the property appears from evidence not on board the ship, the captor is justified in bringing her in, and excused paying costs, because he is not in fault; or, according to the circumstances of the case, may be justly intitled to receive his costs.

If the sentence of the court of admiralty is thought to be erroneous, there is in every maritime country a superior court of review, consisting of the most considerable persons, to which the parties who think themselves aggrieved may appeal; and this superior court judges by the same rule which governs the court of admiralty, viz. the law of nations, and the treaties subsisting with that neutral power whose subject is a party before them.

If no appeal is offered, it is an acknowledgement of the justice of the sentence by the parties themselves, and conclusive. This manner of trial and adjudication is supported, alluded to, and enforced, by many treaties *.

* As appears with respect to courts of admiralty adjudging the prizes taken by those of their own nation, and with respect to the witnesses to be examined in those cases, from the following treaties:—Treaty between England and Holland, 17 Feb. 1668, art. 9 and 14.—Treaty 1 Dec. 1674, art. 11.—Treaty 29 April, 1689, art. 12, 13.—Treaty between England and Spain, 23 May, 1667, art. 23.—Treaty of commerce at Ryfwick, 20 Sept. 1697, between France and Holland, art. 26 and 31.—Treaty between England and France, 3 Nov. 1655, art. 17 and 18.—Treaty of commerce between England and France at St Germain, 29 March, 1632, art. 5 and 6.—Treaty at St Germain, 24 Feb. 1677, art. 7.—Treaty of commerce between Great Britain and France, at Utrecht, 31 March, 1713, art. 26 and 30.—Treaty between England and Denmark, 29 Nov. 1669, art. 23 and 31. Heineccius, who was privy-counsellor to the king of Prussia, and held in the greatest esteem, in his treatise de Navibus ob vecturam vitætarum mercium commissis, cap. 2. § 17 and 18. speaks of this method of trial.

With respect to appeals, or reviews:—From treaty between England and Holland, 1 Dec. 1674, art. 12. as it is explained by art. 2. of the treaty at Westminster, 6 Feb. 1715-16.—Treaty between England and France, at St Germain, 24 Feb. 1677, art. 12.—Treaty of commerce at Ryfwick, 20 Sept. 1697, between France and Holland, art. 33.—Treaty of commerce at Utrecht, 31 March, 1713, between Great Britain and France, art. 31 and 32; and other treaties.

In this method all captures at sea were tried, during the last war, by Great Britain, France, and Spain, and submitted to by the neutral powers. In this method, by courts of admiralty acting according to the law of nations, and particular treaties, all captures at sea have immemorially been judged of, in every country of Europe: any other method of trial would be manifestly unjust, absurd, and impracticable.

Though the law of nations be the general rule, yet it may, by mutual agreement between two powers, be varied or departed from; and where there is an alteration or exception, introduced by particular treaties, that is the law between the parties to the treaty, and the law of nations only governs so far as it is not derogated from by the treaty.

Thus, by the law of nations, where two powers are at war, all ships are liable to be stopped, and examined to whom they belong, and whether they are carrying contraband goods to the enemy: but particular treaties have enjoined a less degree of search, on the faith of producing solemn passports, and formal evidences of property, duly attested. Particular treaties too have inverted the rule of the law of nations, and, by agreement, declared the goods of a friend, on board the ship of an enemy, to be prize; and the goods of an enemy, on board the ship of a friend, to be free, as appears from the treaties already mentioned, and many others *.

* Particularly by the aforesaid treaty between England and Holland, 1 Dec. 1674; and the treaty of Utrecht between Great Britain and France.

So likewise, by particular treaties, some goods reputed contraband by the law of nations, are declared to be free.

If a subject of the king of Prussia is injured by, or has a demand upon, any person here, he ought to apply to your Majesty's courts of justice, which are equally open and indifferent to foreigner or native: so vice versa, if a subject here is wronged by a person living in the dominions of his Prussian Majesty, he ought to apply for redress in the king of Prussia's courts of justice.

If the matter of complaint be a capture at sea during war, and the question relative to prize, he ought to apply to the judicatures established to try these questions.

The law of nations founded upon justice, equity, convenience, and the reason of the thing, and confirmed by long usage, don't allow of reprisals, except in case of violent injuries, directed or supported by the state, and justice absolutely denied, in re minime dubia, by all the tribunals, and afterwards by the prince.

* Grotius de Jure Belli ac Pacis, lib. 3. cap. 2. §. 4. 5.

Treaty between England and Holland, 31 July, 1667, art. 31. Reprisals shall not be granted 'till justice has been demanded according to the ordinary course of law.

Treaty of commerce at Ryfwick, 20 Sept. 1697, between France and Holland, art. 4. Reprisals shall not be granted, but on manifest denial of justice.

Where the judges are left free, and give sentence according to their conscience, though it should be erroneous, that would be no ground for reprisals. Upon doubtful questions, different men think and judge differently; and all a friend can desire is, that justice should be as impartially administered to him, as it is to the subjects of that prince in whose courts the matter is tried.

Secondly, As to the FACT.

We have subjoined here two lists, tallying with those marked A and B, which were delivered to his grace the duke of Newcastle, by Mons. Michell, with the said memorial, the 23d of November last, and are also printed at the end of the said Exposition des Motifs, &c. from whence it will appear, that as to the list A, which contains 18 ships, and their cargoes,

- 4 If ever taken, were restored by the captors themselves, to the satisfaction of the Prussians, who never have complained in any court of justice here.
- 1 Was restored by sentence, with full costs and damages, which were liquidated at 2801 l. 12 s. 1 d. sterling,
- 3 Ships were restored by sentence, with freight, for such of the goods as manifestly belonged to the enemy, and were condemned.
- 4 Ships were restored by sentence, but the cargoes, or part of them, condemned as prize or contraband, and are not now alleged, in the lists A or B, to have been Prussian property.
- 5 Ships and cargoes were restored by sentence, but the claimant subjected to pay costs, because, from the ships-papers, and preparatory examinations, there was ground to have condemned, and the restitution was decreed merely on the faith of affidavits afterwards allowed.
- 1 Ship and cargo was restored by sentence upon an appeal, but, from the circumstances of the capture, without costs on either side.

There need no observations upon this list. As to the eight cases first above-mentioned, there cannot be the colour of complaint.

As to the four next, the goods must be admitted to have been rightly condemned, either as enemy's property or contraband, for they are not now mentioned in the lists A or B.

If contraband, the ship could have neither freight nor costs, and the sentences were favourable in restoring the ships, upon presumption that the owners of the ships were not acquainted with the nature of the cargo, or owners thereof. If enemy's property, the ships could not be entitled to freight, because the bills of lading were false, and purported the property to belong to Prussians.

The ships could not be entitled to costs, because the cargoes, or part of them, being lawful prize, the ships were rightly brought in.

As the six remaining ships and cargoes were restored, the only question must be, upon the paying or not receiving costs, which depends upon the circumstances of the capture, the

fairness

fairness of the ship's documents, and conduct of her crew; and neither the Prussian commissioners, the said memorial, or said Exposition des Motifs, &c. alleges a single reason why, upon the particular circumstances of these cases, the sentences were wrong.

As to the list B.

Every ship on board which the subjects of Prussia claim to have had property, was bound to, or from, a port of the enemy; and many of them appeared clearly to be, in part, laden with the goods of the enemy, either under their own, or fictitious names.

In every instance where it is suggested that any part of the cargo belonged to a Prussian subject, though his property did not appear from the ship's papers, or preparatory examinations, which it ought to have done, sufficient time was indulged to that Prussian subject, to make an affidavit that the property was bona fide in him; and the affidavit of the party himself has been received as proof of the property of the Prussian, so as to intitle him to restitution.

Where the party won't swear at all, or swears evasively, it is plain he only lends his name to cover the enemy's property, as often came out to be the case, beyond the possibility of doubt.

It appears by a letter ^{29 May}_{9 June}, 1747, from Mons. Andrié, to his Prussian Majesty, exhibited in a cause, and certified to be a true extract by Mons. Michell, under his hand; that this colourable manner of screening the goods of the enemy was stated in the following words:

• Your Majesty's subjects ought not to load on board neutral ships any goods really belonging to the enemies of England, but to load them for their own account, whereby they may safely send them to any country they shall think proper, without running any risk: then, if privateers commit any damage to the ships belonging to your Majesty's subjects, you may depend on full justice being done here, as in all the like cases hath been done.'

List B contains thirty-three cases:

- 2 Two of them never came before a court of justice in England, but (if taken) were restored by the captors themselves, to the intire satisfaction of the owners.
- 16 In sixteen of them, the goods claimed by the Prussian subject appear to have been actually restored, by sentence, to the masters of the ships in which they were laden; and, by the customs of the sea, the master is in the place of the lader, and answerable to him.
- 14 In fourteen of the cases, the Prussian property was not verified by the ship's papers, or preparatory examinations, or claimant's own affidavit, which he was allowed time to make.
- 1 And the other cause, with respect to part of the goods, is still depending, neither party having moved for judgment *.
- 33 And so conscious were the claimants that the court of admiralty did right, there is not an appeal, in a single instance, in list B, and but one in list A.

* The Prussian has since applied for judgment, on the 29th of January, and obtained restitution.

Thirdly, To apply the LAW to the FACT.

The sixth question in the said Exposition des Motifs, &c. states the right of reprisals to be, Puisqu'on leur a si long tems dénié toute la justice, qu'ils étoient fondés de demander.

The said memorial founds the justice and propriety of his Prussian Majesty's having recourse to reprisals, because his subjects, N'ont pu obtenir jusqu'à présent aucune justice des tribunaux Anglois qu'ils ont réclamés, ou du gouvernement auquel ils ont porté leurs plaintes. And in another part of the memorial it is put, Apres avoir en vain demandé des réparations de ceux qui seuls pouvoient les faire.

The contrary of all which is manifest, from the above state, and lists hereto annexed.

In six of the cases specified, (if such captures ever were made) the Prussian subjects were so well satisfied with the restitution made by the captors, that they never complained in any court whatsoever in this kingdom.

The rest were judged of by a court of admiralty, the only proper court to decide of captures at sea, both with respect to the restitution and the damages and costs, acting according to the law of nations, the only proper rule to decide by: and justice has been done by the court of admiralty so impartially, that all the ships alleged in list A to have been Prussian, were restored; and all the cargoes mentioned in either list, A or B, were restored, excepting 15, one of which is still undetermined.

And, in all cases in both lists, justice was done, so intirely to the conviction of the private conscience of the Prussian claimants, that they have acquiesced under the sentences, without appealing, except in one single instance, where the part of the sentence complained of was reversed.

Though the Prussian claimants must know, that, by the law of nations, they ought not to complain to their own sovereign, till injustice, in re minime dubia, was finally done them, past redress; and though they must know that rule of the law

of nations held more strongly upon this occasion; because the property of the prize was given to the captors, and ought, therefore, to be litigated with them. The Prussian, who, by his own acquiescence, submits to the captors having the prize; cannot afterwards, with justice, make a demand upon the state. If the sentence was wrong, it is owing to the fault of the Prussian that it was not redressed. But it is not attempted to be shewn even now, that these sentences were unjust in any part of them, according to the evidence and circumstances appearing before the court of admiralty, and that is the criterion.

For as to the Prussian commission to examine these cases, ex parte, upon new suggestions, it never was attempted in any country of the world before: prizes, or not prize, must be determined by courts of admiralty belonging to the power whose subjects make the capture: every foreign prince in amity has a right to demand that justice shall be done his subjects in those courts, according to the law of nations, or particular treaties, where any are subsisting. If in re minime dubia these courts proceed upon foundations directly opposit to the law of nations, or subsisting treaties, the neutral state has a right to complain of such a determination.

But there never was, nor ever can be, any other equitable method of trial. All the maritime nations of Europe have, when at war, from the earliest times, universally proceeded in this way, with the approbation of all the powers at peace. Nay, the persons acting under this extraordinary and unheard-of commission from his Prussian Majesty, don't pretend to say, that, in the four cases of goods condemned here, for which satisfaction is demanded in list A, the property really belonged to Prussian subjects: but they profess to proceed upon this principle, evidently false, that, though these cargoes belonged to the enemy, yet being on board any neutral ship, they were not liable to enquiry, seizure or condemnation. Fourthly, From the questions, rules, reasonings, and matters alleged in the said memorial, sentence of the Prussian commissioners, and Exposition des Motifs, &c. the following propositions may be drawn, as carrying the appearance of objections to what has been above laid down.

First PROPOSITION.

That, by the law of nations, the goods of an enemy cannot be taken on board the ship of a friend: and this the Prussian commissioners lay down as the basis of all they have pretended to do.

Answer. The contrary is too clear to admit of being disputed: it may be proved by the authorities of every writer upon the law of nations; some of different countries are referred to *. It may be proved by the constant practice, ancient and modern; but the general rule cannot be more strongly approved, than by the exception which particular treaties have made to it †.

* Il Consolato del Mare, cap. 273, expressly says, The enemy's goods found on board a friend's ship, shall be confiscated. And this is a book of great authority.

GROTIUS de Jure Belli ac Pacis, lib. iii. cap. 1. § 5. numero 4, in the notes, cites this passage in the Il Consolato, in his notes lib. iii. cap. 6. § 6.

LOCCENIUS de Jure Maritimo, lib. ii. cap. 4. § 12.

VOET de Jure Militari, cap. 5. nu 21.

HEINECCIUS, the learned Prussian before quoted, de Navibus ob Vecturam vitætarum Mercium commissis, cap. 2. §. 9, is clear and explicit upon this point.

BYNKERSHOEK Quæstiones Juris Publici, lib. i. cap. 14. per totum.

ZOUCH (an Englishman) in his book de Judicio inter Gentēs, pars 2 §. 8. numero 6.

Treaty between Great-Britain and Sweden, 23 Oct. 1661, art. 12 and 13.—Treaty between Great-Britain and Denmark, 29 Nov. 1669, art. 2d.—And the passport, or certificate, settled by that treaty, are material as to this point.

† Treaty between France and England, 24 Feb. 1667, art. 8. Treaty of Utrecht between France and England, 1713, art. 17.—Treaty between England and Holland, 17 Feb. 1668, art. 10.—Treaty between England and Holland, 1 Dec. 1674, art. 8.—Treaty between England and Portugal, 10 July, 1654, art. 23.—Treaty between France and the States General at Utrecht, 11 April, 1713, art. 26.

Second PROPOSITION.

It is alleged that lord Carteret, in 1744, by two verbal declarations, gave assurances in your Majesty's name, that nothing on board a Prussian ship should be seized, except contraband; consequently, that all effects not contraband, belonging to the enemy, should be free, and that these assurances were afterwards confirmed in writing, by lord Chesterfield, the 5th of January, 1747.

Answer. The fact makes this question not very material, because there are but four instances, in lists A or B, where any goods on board a Prussian ship have been condemned, and no satisfaction is pretended to be demanded for any of those four cargoes and lists A and B: however, it may be proper to shew how groundless this pretence is.

Taking the words alleged to have been said by lord Carteret, as they are stated, they don't warrant the inferences endeavoured

voured to be drawn from them; they import no new stipulation, different from the law of nations, but expressly profess to treat the Prussians upon the same foot with the subjects of other neutral powers under the like circumstances, i. e. with whom there was no particular treaty: for the reference to other neutral power, cannot be understood to communicate the terms of any particular treaty. It is not so said. The treaties with Holland, Sweden, Russia, Portugal, Denmark, &c. all differ. Who can say which was communicated? There would be no reciprocity; the king of Prussia don't agree to be bound by the clauses to which other powers have, by their respective treaties, agreed. No Prussian goods, on board an enemy's ships, have ever been condemned here; and yet they ought, if the treaties with Holland were to be the rule between Great-Britain and Prussia; nay, if these treaties were to be the rule, all now contended for, on the part of Prussia, is clearly wrong: because, by treaty, the Dutch, in the last resort, are to apply to the court of appeal here.

Treaty of alliance between Great-Britain and Holland, at Westminster, the 6th of February, 1715-16, article 2.

Whereas some disputes have happened, touching the explanation of the 12th article of the treaty marine, in 1674, it is agreed and concluded, for deciding any difficulty upon that matter, to declare, by these presents, that, by the provisions mentioned in the said article, are meant those which are received by custom in Great-Britain and in the United Provinces, and always have been received, and which have been granted, and always are granted, in the like case, to the inhabitants of the said countries, and to every foreign nation.

Lord Carteret is said twice to have refused, in which Monsf. Andrié acquiesces, to give any thing in writing, as not usual in England.

Supposing the conversations to mean no more than a declaration of course, that justice should be done to the Prussians, in like manner as to any other neutral power with whom there was no treaty; there was no occasion for instruments in writing, because in England the crown never interferes with the course of justice. No order, or intimation, is ever given to any judge. Lord Carteret, therefore, knew that it was the duty of the court of admiralty to do equal justice, and that they would, of themselves, do what he said to Monsf. Andrié.

Had it been intended, by agreement, to introduce between Prussia and England a variation, in any particular, from the law of nations, and, consequently, a new rule for the court of admiralty to decide by, it could only be done by a solemn treaty, in writing, properly authorized and authenticated; the memory of it could not otherwise be preserved, the parties interested, and the courts of admiralty could not, otherwise, take notice of it.

But lord Chesterfield's confirmation, in a letter of the 5th of January, 1747, being relied upon, the books of the secretary's office have been searched, and the letter to Monsf. Michell is found, which is verbatim as follows:

« Monsieur, à Whitehall, le 5 Janvr, 1747-8.

« Ayant eu l'honneur de recevoir les ordres du roy sur ce qui a formé le sujet du memoire, que vous m'avez remis, du 8 de ce Mois, N. S. Je n'ai pas voulu tarder à vous informer, que sa Majesté, pour ne rien omettre, par où elle peut temoigner ses attentions envers le Roy votre maitre, ne fait nulle difficulté de declarer, qu'elle n'a jamais eu l'intention ni ne l'aura jamais, de donner le moindre empêchement à la navigation des sujets Prussiens, tant qu'ils auront soin d'exercer leur commerce d'une maniere licite, et conformément à l'ancien usage établi et reconnu parmi les puissances neutres.

« Que sa Majesté Prussienne ne peut pas ignorer, qu'il y a des traités de commerce qui subsistent actuellement, entre la Grande Bretagne, et certains etats neutres, et qu'au moyen des engagements formellement contractés de part et d'autre, par ces mêmes traités, tout ce qui regarde la maniere d'exercer leur commerce reciproquement, a été finalement constaté et reglé.

« Qu'en même tems il ne paroît point, qu'aucun traité de la nature susdite existe à présent, ou a jamais existé, entre sa Majesté et le roy de Prusse; mais, que pourtant, cela n'a jamais empêché que les sujets Prussiens n'aient été favorisés par l'Angleterre, par rapport à leur navigation, autant que les autres nations neutres: et cela étant, sa Majesté ne suppose pas, que l'idée du Roy votre maitre, seroit d'exiger d'elle des distinctions, encore moins de preferences, en faveur des sujets à cet égard.

« Que de plus sa Majesté Prussienne est trop éclairée pour ne pas connoître, qu'il y a des loix fixes et établies dans ce gouvernement, dont on ne peut nullement s'écarter; et que s'il arrivoit que la marine Angloise s'avisât de faire la moindre injustice aux sujets commerçans du Roy votre maitre, il y a un tribunal ici, favoir, la haute cour de l'amitié, à laquelle ils se trouvent en droit de s'adresser et de

« porter leurs plaintes; assurés d'avance, en pareil cas, qu'on leur y rendra bonne justice; les procédés juridiques de la dite cour étant ayant été de tout tems hors d'atteinte, et irréprochables; temoin, nombre d'exemples, où des vaisseaux neutres, pris illicitement, ont été restitués avec frais et dommages aux propriétaires.

« Voici ce que le Roy m'a ordonné de vous répondre sur le contenu de votre dit memoire; et sa Majesté ne sauroit que se flatter, qu'en consequence de ce que je viens d'avancer, il ne restera plus rien à desirer au Roy votre maitre relativement à l'objet dont il est question; et le Roy s'en croit d'autant plus assuré, qu'il est persuadé que sa Majesté Prussienne ne voudroit rien demander, qui ne fut équitable.

« Je suis avec bien de la considération,

« Monsieur,

« Votre très humble, &c

« Très obeissant Serveur,

« CHESTERFIELD.

There need no observations. It is explicit, and, in express terms, puts Prussia upon the foot of other neutral powers with whom there was no treaty, and points out the proper way of applying for redress.

The verbal declarations made by lord Carteret in 1744, which are said to have been confirmed by this letter from lord Chesterfield, cannot have meant more than the letter expresses. And it is manifest, by the above extract from Monsf. Andrié's letter to his Prussian Majesty, that in May 1747, Monsf. Andrié himself understood, that goods of the enemy, taken on board neutral ships, ought to be condemned as prize.

It is evident, from authentic acts, that the subjects of Prussia never understood that any new right was communicated to them.

Before the year 1746, the Prussians don't appear to have openly engaged in covering the enemy's property.

The men of war and privateers could not abstain from captures, in consequence of lord Carteret's verbal assurances in 1744, because they never were nor could be known: and there was no occasion to notify them, supposing them only to promise impartial justice. For all ships of war were bound to act, and courts of admiralty to judge, according to the law of nations and treaties.

Till 1746, the Prussian documents were, a certificate of the admiralty, upon the oath of the builder, that the ship was Prussian built; and a certificate of the admiralty, upon the oath of the owner, that the ship was Prussian property.

From 1746, the Prussians engaged in the gainful practice of covering the enemy's goods, but were at a loss in what shape, and upon what pretences, it might best be done.

On board the ship 3 Soeurs, was found a pass, bearing date at Stettin the 6th of October 1746, under the royal seal of the Prussian regency of Pomerania, &c. alleging the cargo, which was ship-timber, bound for Port l'Orient, to be Prussian property, and, in consequence thereof, claiming freedom of the ship.

Claiming freedom to the ship, from the property of the cargo, being quite new, the proposition was afterwards reversed: and on board a ship called the Jumeaux, was found a pass, bearing date at Stettin the 27th of June 1747, under the royal seal, &c. alleging the ship to be Prussian property, and, in consequence thereof, claiming freedom to the goods. But this pass was not solely relied on, for there was also found on board the same ship, another pass, bearing date at Stettin the 14th of June 1747, under the royal seal, &c. alleging the cargo to be Prussian property.

And it is remarkable, that the oaths, upon which these passes were granted, appeared manifestly to be false: and neither of the cargoes to which they relate, are now so much as alleged to have been Prussian property in said lists A. or B.

It being mentioned, in the said Exposition des Motifs, &c. that Monsf. Michell, in September 1747, made verbal representations to lord Chesterfield, in respect to the cargo taken on board the said ship called the 3 Soeurs, which was claimed as Prussian property; and no mention being made in lists A and B of the said cargo, we directed the proceedings in that cause to be laid before us, where it appears in the fullest and clearest manner, from the ship-papers and depositions, that the cargo was timber, laden on the account, and at the risk of Frenchmen, to whom it was to be delivered at Port l'Orient, they paying freight according to charter-party. That the Prussian claimant was neither freighter, lader, or consignee; and had no other interest or concern in the matter, than to lend his name and conscience: for he swore that the cargo was his property, and laden on or before the 6th of October 1746; and yet the ship was then in ballast, and the whole of the cargo in question was not laden before May 1747.

Several other Prussian claims had, in like manner, come out so clearly to be merely colourable, that Monsf. Andrié, from his said letter, ^{29 May} 9 June, 1747, appears to have been ashamed of them.

Third PROPOSITION.

That lord Carteret, in his said two conversations, specified, in your Majesty's name, what goods should be deemed contraband.

Answer. The fact makes this question totally immaterial, because no goods condemned as contraband, or which were alleged to be so, are so much as now suggested to have been Prussian property in the said lists A and B; and, therefore, whether as enemy's property or contraband, they were either way rightly condemned; and the bills of lading being false, the ships could not be entitled to freight.

But, if the question was material, the verbal declarations of a minister in conversation, might shew what he thought contraband by the law of nations; but never could be understood to be equivalent to a treaty, derogating from that law. All the observations, upon the other part of these verbal declarations, hold equally as to this.

Fourth PROPOSITION.

That the British ministers have said, that these questions were decided according to the laws of England.

Answer. They must have been misunderstood, for the law of England says, that all captures at sea, as prize, in time of war, must be judged of in a court of admiralty, according to the law of nations, and particular treaties, where there are any.

There never existed a case, where a court, judging according to the laws of England only, ever took cognizance of prize.

The property of prizes being given during the last war to the captors, your Majesty could not arbitrarily release the capture, but left all cases to the decision of the proper courts, judging by the law of nations and treaties, where there were any: and it never was imagined, that the property of a foreign subject, taken as prize on the high seas, could be affected by laws peculiar to England.

Fifth PROPOSITION.

That your Majesty could no more erect tribunals for trying these matters than the king of Prussia.

Answer. Each crown has, no doubt, an equal right to erect admiralty-courts, for the trial of prizes taken by virtue of their respective commissions; but neither has a right to try the prizes taken by the other, or to reverse the sentences given by the other's tribunal. The only regular method of rectifying their errors, is by appeal to the superior court.

This is the clear law of nations, and, by this method, prizes have always been determined, in every other maritime country of Europe, as well as England.

Sixth PROPOSITION.

That the sea is free.

Answer. They who maintain that proposition in its utmost extent, don't dispute but that when two powers are at war, they may seize the effects of each other upon the high seas, and on board the ships of friends: therefore, that controversy is not in the least applicable upon the present occasion *.

* This appears from Grotius in the passages above cited, lib. iii. cap. 1. sect. 5. num. 4. in his notes. And lib. iii. cap. 6. sect. 6. in his notes. See our article SEA DOMINION.

Seventh PROPOSITION.

Great-Britain issued reprisals against Spain, on account of captures at sea.

Answer. These captures were not made in time of war with any power.

They were not judged of by courts of admiralty, according to the law of nations and treaties, but by rules, which were themselves complained of; in revenue courts: the damages were afterwards admitted, liquidated at a certain sum, and agreed to be paid by a convention, which was not performed. Therefore reprisals issued, but they were general. No debts due here to Spaniards were stopped, no Spanish effects here were seized. Which leads to one observation more.

The king of Prussia has engaged his royal word to pay the Silesia debt to private men.

It is negotiable, and many parts have been assigned to the subjects of other powers. It will not be easy to find an instance, where a prince has thought fit to make reprisals upon a debt, due from himself to private men. There is a confidence that this will not be done; a private man lends money to a prince, upon the faith of an engagement of honour, because a prince cannot be compelled, like other men, in an adverse way, by a court of justice. So scrupulously did England, France, and Spain adhere to this public faith, that, even during the war, they suffered no enquiry to be made, whether any part of the public debts was due to subjects of the enemy, though it is certain, many English had money in the French funds, and many French had money in ours. This loan to the late emperor of Germany, Charles the VIth,

VOL. II.

in January 1734-5, was not a state transaction, but a mere private contract with the lenders, who advanced their money, upon the emperor's obliging himself, his heirs and posterity, to repay the principal with interest, at the rate, in the manner, and at the times in the contract mentioned, without any delay, demurr, deduction, or abatement whatsoever; and, left the words and instruments made use of should not be strong enough, he promises to secure the performance of his contract, in and by such other instruments, method, manner, form, and words, as should be most effectual and valid, to bind the said emperor, his heirs, successors, and posterity, or as the lenders should reasonably desire.

As a specific real security, he mortgaged his revenues, arising from the duchies of Upper and Lower Silesia, for payment of principal and interest; and the whole debt, principal and interest, was to be discharged in the year 1745. If the money could not be paid out of the revenues of Silesia, the emperor, his heirs and posterity, still remained debtors, and were bound to pay. The eviction or destruction of a thing mortgaged, don't extinguish the debt, or discharge the debtor.

Therefore the empress queen, without the consent of the lenders, made it a condition of her yielding the duchies of Silesia to his Prussian Majesty, that he should stand in the place of the late emperor, in respect of this debt.

The seventh of the preliminary articles, between the queen of Hungary and the king of Prussia, signed at Breslau, the 11th of June, 1742, is in these words; 'Sa Majesté le roi de Prusse se charge du seul payement de la somme hypothéquée sur la Silesie, aux marchands Anglois, selon le contrat signé à Londres, le 7me de Janvier, 1734-5.'

The stipulation is confirmed by the ninth article of the treaty between their said Majesties, signed at Berlin, the 28th of July, 1742.

Also renewed and confirmed by the second article of the treaty between their said Majesties, signed at Dresden, the 25th of December, 1745.

In consideration of the empress queen's cession, his Prussian Majesty has engaged to her, that he will pay this money, selon le contrat, and consequently has bound himself to stand in the place of the late emperor, in respect of this money, to all intents and purposes.

The late emperor could not have seized this money, as reprisals, or even, in case of open war between the two nations, because his faith was engaged to pay it, without any delay, demurr, deduction, or abatement whatsoever. If these words should not extend to all possible cases, he had plighted his honour to bind himself, by any other form of words, more effectually to pay the money; and therefore was liable at any time to be called upon, to declare expressly, that it should not be seized as reprisals, or in case of war; which is very commonly expressed, when sovereign princes or states borrow money from foreigners. Therefore, supposing for a moment, that his Prussian Majesty's complaint was founded in justice, and the law of nations, and that he had a right to make reprisals in general, he could not, consistent with his engagements to the empress queen, seize this money as reprisals. Besides, this whole debt, according to the contract, ought to have been discharged in 1745. It should, in respect of the private creditors, in justice and equity, be considered, as if the contract had been performed; and the Prussian complaints don't begin 'till 1746, after the whole debt ought to have been paid.

Upon this principle of natural justice, French ships and effects, wrongfully taken, after the Spanish war, and before the French war, have, during the heat of the war with France, and since, been restored, by sentence of your Majesty's courts, to the French owners. No such ships or effects ever were attempted to be confiscated, as enemies property here, during the war; because, had it not been for the wrong first done, these effects would not have been in your Majesty's dominions. So, had not the contract been first broke, by non-payment of the whole loan in 1745, this money would not have been in his Prussian Majesty's hands.

Your Majesty's guarantee of these treaties is entire, and must therefore depend upon the same conditions, upon which the cession was made by the empress queen.

But this reasoning is, in some measure, superfluous; because, if the making any reprisals upon this occasion, be unjustifiable, which we apprehend we have shewn, then it is not disputed, but that the non-payment of this money would be a breach of his Prussian Majesty's engagements, and a renunciation, on his part, of those treaties.

All which is most humbly submitted to your Majesty's royal wisdom.

January 18, 1753.

G. PAUL,
D. RYDER,
W. MURRAY.

TRANSLATION of the earl of CHESTERFIELD's letter to
Monf. MICHELL.

S I R,

Whitehall, Jan. 5, 1747-8.

Having had the honour to receive the king's orders upon the subject of the memorial, which you delivered to me on the 8th instant, N. S. I would not delay informing you, That his Majesty, in order to omit nothing, whereby he may shew his attention to the king your master, makes no difficulty in declaring, That his Majesty has never had, or will have, any intention, to give any interruption to the navigation of the Prussian subjects, as long as they shall take care to carry on their commerce in a lawful manner, and conformable to the ancient usage as established and acknowledged amongst neutral powers.

His Prussian Majesty cannot be ignorant, that there are treaties of commerce actually subsisting between Great-Britain and certain neutral states, and that by means of the engagements formerly contracted on each side by those treaties, every thing relating to the manner of reciprocally carrying on their commerce, has been finally settled and regulated.

At the same time, it does not appear that any such treaty exists at present, or ever did exist, between his Majesty and the king of Prussia: nevertheless, that has never hindered the Prussian subjects being favoured by England, with respect to their navigation, as much as other neutral nations: and his Majesty does not suppose, that the king your master means to require distinctions from his Majesty, much less any preferences, in favour of his subjects in this point.

His Prussian Majesty is too well informed not to know, that there are in this government fixed and established laws, which cannot be departed from; and that in case any English ships of war should commit the least injustice to the trading subjects of the king your master, here is a tribunal, viz. the high court of admiralty, where they have a right to apply, and make their complaints; and they may be previously assured, that, in such case, impartial justice will be administered to them; the juridical proceedings of the said court being, and having ever been, unimpeached and irreproachable, as appears by numerous examples of neutral vessels illegally taken, having been restored, with costs and damages, to the proprietors.

This is the answer the king has ordered me to give, upon the contents of your said memorial; and his majesty cannot but flatter himself, that, in consequence hereof, the king your master's desire will be fully answered, with relation to the point in question; and of which his Majesty is the more assured, as he is persuaded that the king of Prussia would not require any thing, but what is equitable.

I am, with much Consideration,

S I R,

Your most obedient,

And most humble Servant,

CHESTERFIELD.

TRANSLATION of Mr PETER TRAPAUD's declaration of
his having made satisfaction to the Prussians for the damage
received by the ship St John, No. 16. in list A.

In the Exposition which his Prussian Majesty has published, of such ships of his subjects as were taken by the English in the last war, I have observed in the list A, No. 16, that the ship St John, John Grosse captain, is therein mentioned, as having received some damages to the prejudice of the Prussian owners. As the fact is known to me, as I was the sole owner of her cargo, I do hereby as such testify the truth, for the satisfaction of all whom it may concern. And I cannot conceive, how the Prussian subjects dare demand an indemnification, which they have already more than received, as I am going to convince them.

In the month of November 1747, I ordered the said ship to be freighted at Bourdeaux, and loaded at Libourne with 158 3/4 tons of white wine. On the 1st of December following, that ship put out to sea; on the 11th of the said month, she got as far as the Downs, where she was met by an English privateer, called the Prince of Orange, who sent six of his men on board the Prussian ship, and had the Prussian pilot brought on board him, with the ship-papers and documents, in order to their being examined. On the 12th of the said month, as she lay at an anchor, a great storm arose from the west south-west, which obliged the Prussian captain, with the consent of his crew, and of the six Englishmen who were then on board his ship, to cut his cable, in order to drive off to sea. The ship got afterwards into Browerhaven inlet in Holland, on the 15th of the said month of December, without any other damage, than the loss of part of her cable and of an anchor, and arrived at Rotterdam the 21st of the said month. All this is proved by the declaration of both the captain and his crew, made on the 4th of January, 1748, before Jacob Bremer, notary public in Rotterdam; and afterwards sworn to on the 6th of the said month, before the commissioners of the chamber of maritime affairs.

After the ship was unloaded, the captain gave in to me his account for gross average, consisting of the following articles:

1. For the loss of his cable and anchor.
2. For the maintaining, during eight days, the six men who had been put on board his ship by the English privateer.
3. For a passport I procured for him, from the Prussian envoy at the Hague, which cost 3 or 4 florins.

I paid him for my share in that gross average 704 florins, Holland currency, over and above 105 florins which I gave Capt. Grosse as a present, and 10 florins 10 stivers I gave as a present to the crew of his ship: besides all this, it cost me 20 florins, or thereabouts, in England, which Messrs Simond (brothers) had disbursed, by my order, for the Prussian pilot, who remained on board the privateer, after the storm had parted them.

Those who understand the navigation and fitting out of ships, must allow, that the Prussian owners will find themselves more than reimbursed for all their pretensions, by means of the 839 florins 10 stivers, Holland currency, which I have paid them; and that they cannot, with any foundation, make any other demands.

All that I have alleged above, can be verified by authentic vouchers (except the presents or gratuities to the captain and his crew, amounting to 115 florins 10 stivers, for which I took no receipt). In witness whereof I have signed this present declaration. Rotterdam, January 30, 1753.

PETER TRAPAUD, jun.

LIST of all the PRUSSIAN ships taken by BRITISH armaments at sea, during the last war, as well those detained for examination only, as those judicially proceeded upon, together with the judgments given in the admiralty-courts of GREAT-BRITAIN thereupon, tallying with his PRUSSIAN Majesty's LIST marked A.

No. of ships.	Ships, which (if taken) were restored by the captors, upon examination, without either party applying to a court of justice.	Ships and goods restored, with all costs and damages attending the capture.	Ships restored with freight, according to the bills of lading, for such goods, which were found to be the property of the enemy, and condemned as prize.	Ships and goods restored, but without costs, from circumstances arising from the case.	Ships and cargoes restored, paying costs. In these cases, it either appeared, that the ship had not the usual evidence of property, according to the custom of the sea; or from the ship-papers, or examination of the crew, there appeared just reason to presume the cargo to belong to the enemy, and the neuter claimant declined proving his property, by strict legal evidence; and obtained restitution, on the faith of his own affidavit; and, in these cases, courts of admiralty have always made the like decrees.	Cargoes, or part of them, condemned as contraband, and not now alleged, in list A or B, to have been Prussian property, and therefore were certainly prize of war.	Appeals from the admiralty decrees.

On the 3d of February, the duke of Newcastle received a letter from Mr Wolters, his Majesty's agent at Rotterdam, inclosing the following declaration:

DANS l'Exposition que sa Majesté Prussienne a donnée au public, des vaisseaux de ses sujets pris par les Anglois dans la dernière guerre; j'ai remarqué dans la liste A. no 16. que le navire le St Jean, Capit. Jean Grosse, y est notté comme ayant reçu quelques dommages, au prejudice des propriétaires Prussiens. Comme le fait m'est connu ayant été seul propriétaire de sa cargaison, je veux en cette qualité rendre témoignage à la vérité, pour servir où il appartiendra. D'ailleurs, je ne puis comprendre, comment les sujets Prussiens osent demander un dédommagement, qu'ils ont déjà plus que reçu, comme je vais les en convaincre.

Dans le mois de Novembre 1747, je fis fretter à Bordeaux, et charger à Libourne le dit navire avec 158½ tonneaux de vin blanc. Le 1^{er} de Dec. suivant, ce navire mit en mer; le 11. du dit mois, il se trouva à la hauteur des Dunes; là il fut rencontré par le corsaire Anglois, nommé le Prince d'Orange, qui envoya à bord du navire Prussien six hommes de son equipage, et fit venir à son bord le pilote Prussien avec les papiers de mer, pour en faire l'examen. Le 12. du dit mois, étant à l'ancre sous les cingles, il s'éleva une furieuse tempête de la part du W. S. W. qui obligea le capitaine Prussien, du contentement de son equipage, et des six Anglois pour lors dans son bord, de couper le cable pour gagner la mer. Ce navire entra ensuite dans le passage de Browerhave en Hollande, le 15^e du dit mois de Decembre, sans avoir eu d'autre dommage que la perte d'une partie de son cable et d'une ancre, et arriva ensuite à Rotterdam le 12^e du fuid^t mois. Tout ceci est constaté par la declaration du capitaine et de son equipage, passée le 4 Janvier 1748, pardevant Jacob Bremer, notaire public dans Rotterdam; ensuite fermentée, le 6^e du dit mois, pardevant les commissaires de la chambre de la marine.

Après que le navire fut dechargé, le capitaine me fit fournir son compte d'avaire grosse, dans lequel il portoit les articles suivants:

1. Pour la perte de son cable, et de son ancre.
2. Pour la nourriture de 8 jours à 6 hommes qui avoient été mis, par le corsaire Anglois, sur son bord.
3. Pour une passeport que je lui fis donner à la Haye par l'envoyé de Prusse, qui couta 3 à 4 florins.

Je lui payai, pour ma portion, dans cette avaire grosse, 704 florins, argent courant d'Hollande, en outre 105 florins dont je fis present au Capit. Grosse, et 10. 10. aussi de present aux matelots, qui composoient son equipage. Outre tout ceci, il m'en a coté 20 florins ou environ, en Angleterre, pour autant que Mess. Simond, freres, avoient déboursé par mon ordre pour le pilote Prussien qui étoit resté à bord du corsaire, lorsque la tempête les sépara.

Ceux qui le connoissent en navigation, et en armement de navire, ne pourront disconvenir, que les propriétaires Prussiens se trouvent, au moyen de 859. 10. courans d'Hollande, que je leur ai payés, plus que remboursés de toutes leurs pretensions; et s'ils peuvent, avec quelque fondement, en demander d'autres.

Tout ce que j'avance ci dessus peut se verifier par des pièces authentiques, (à la reserve des presents, ou gratifications, au capitaine ou à son équipage) montant à 115, 10. dont je n'ai pas retiré de quittance,) en vertu dequoy j'ai signé la presente declaration. Rotterdam, ce 30 Janvier 1753.

PIERRE TRAFAUD, le jeune.

The above declaration was signed in my presence; and the original vouchers quoted in the same, have been produced to me. Witness my hand and seal.—Rotterdam, January the 30th, 1753.

R. WOLTERS. (L. S.)

LIST of all the neutral ships, taken by BRITISH ships during the last war, in whose cargoes the subjects of PRUSSIA claim to have been interested; together with the judgments given by his Britannic Majesty's courts of admiralty thereupon, tallying with his Prussian Majesty's List marked B.

No. of ships.	Ships names.	If taken, released by the captors, or examination, without either party applying to a court of justice.	In what voyage taken.	Judgment as to ship.	Judgment, as to goods.	For what cause.	Appealed.

* On the 20th of January, affidavits were exhibited in the court of Admiralty, and sentence prayed on the part of the Prussian claimant, and the goods were decreed to be restored.

MEMOIR upon the breeding of SILK-WORMS in FRANCE, and all other climates where mulberry-trees can be cultivated. By M. de Goyon de la Plombanie.

* A pretty long stay which I made in the southern provinces of the kingdom where silk-worms are bred, together with what I have read in the best authors, have enabled me to shew the public, that the method commonly followed for this purpose does not answer the end proposed.

In the Indies, and all other places where the climate allows people to breed silk-worms on the trees, like our caterpillars, the silk is very fine, very strong, and in great abundance. Whence we conceive that a pure and temperate air is necessary to those very delicate animals, which must be kept very clean, and breathe with difficulty in a confined and thick air, from which they contract disorders. In those happy eastern climates, nature of herself performs her operations; but with us, she requires the assistance of art; art, therefore, ought to correspond with nature, so as to aid her effectually, without ever doing her the least violence.

When I was in Languedoc, I observed that in the cold mornings the silk-worms were benumbed, and moved but very little, and that, of all the chambers in which they were bred, those which had most light, the freest air, and were exposed to the south, succeeded infinitely better than the rest; that those people who were least careful in keeping them clean, could never turn them to account, and, for want of this precaution, a number of them perished, after they had been raised at a great expence. In this respect they are so delicate, that the least impure or strong smell throws them into convulsions; people of stinking breaths, rank respiration, or they whose sweat is of a disagreeable odour, nay, the smell of women at certain times, is pernicious to these animals, and does them more injury than one would imagine.

A variety of food, gathered from different soils and different trees, contributes to render the silk unequal: the leaves gathered wet, given after they are faded, or mixed together, without separating the tender from the harsh, the worms eating at intervals, or of what they dislike, all these circumstances, which too often occur in the method of breeding them practised in France, greatly contribute to the little success and returns of the manufacture: yet, hitherto, I have not seen one person employ himself as he ought, in finding means to remedy these inconveniences. This consideration has determined me to communicate to the public my own ideas of the subject; and after I shall have given a detail of them, any person can try the experiment in miniature, that he may assure himself of the utility of my method.

Some methods which may be used in making silk in France, so as to render it abundant, and of good quality.

Pains must be taken to have a number of mulberry-trees; they may be planted in all sorts of soils where they will grow, but they must not be shaded by any other sort of trees. Almost all the soils that produce walnut-trees and elms, will agree with the mulberry: and they must be carefully engrafted with that kind whose leaf is the most broad and smooth.

REMARKS upon the different soils and qualities of the trees.

All those trees that rise in light, barren, sandy grounds, that have little moisture, will produce the finest and strongest silks; whilst those which are produced in fertile fat ground, abounding in juice, yield a coarser and weaker silk; young trees, from 6 to 12 years old, will produce silk that is neither so fine nor so good as that from trees of 18 or 20 years growth; so that the oldest are always to be preferred. It is the same case with mulberry-trees for silk, as with vines for fruit, which is different in quality, according to the different ages of the trees, and the difference of soil. Nature always makes one thing at one time for another; the old vines, and those that are planted in a meagre soil, produce the best wine, though in small quantity; those raised in a fat soil, produce a larger quantity, but of an inferior quality: so that both kinds nearly yield the same profit. The same thing will happen in silk, if we do not mix the produce of different soils and different trees. This is an essential remark for the œconomist, though he has not hitherto regarded it. The practice is to mix the leaves, and give them indifferently to the worms; but it has been observed, that a worm, fed with leaves of different qualities, always makes an ill-formed silk, as may be perceived by the microscope: worms thus managed will be like a spinner, who puts indiscriminately flax and hards upon her distaff, and cannot possibly spin thread so good and equal, as if it had been made solely from one of these materials. If the Indian silk is so beautiful, uniform, and strong, it is because the worms eat only of the leaves of one tree, on which they have been bred, and care is taken to pick the cods, so as that the best are kept together. From these remarks it follows, that we ought to furnish those little animals with a lodging that would procure to them, as much as possible, the same advantages they enjoy in those countries where they thrive with-

VO L. II.

out care; that is, to shelter them from the injuries of our climate, to procure for them a pure temperate air, that shall be continually renewed, and give them a great deal of light, which contributes to their health; to clean them gently every time they receive new food, without touching them with the hand, or any sort of instrument: finally, if we cannot secure them from the noise of thunder, at least, to free them from the sight of lightning, which gives them more disturbance, by the quick and violent vibration of their little optic nerves, which incommodes their circulation, and affects them with distempers. If care be taken to prevent all these dangers, by the means which I am going to describe, we may be assured of having worms that will succeed to a miracle.

Of the lodging of SILK-WORMS.

When the design is to raise a great quantity of silk-worms, so as to profit by the income they will produce, it will be necessary to build on purpose a lodging wholly detached, for raising the worms, proportioned to the quantity of the owner's trees. For example: if the scheme is, to make 500 lb. weight of raw silk, the lodging must be 80 feet long, and 20 feet broad, with three stories, comprehending the ground-floor; and every story must be 10 feet high, exclusive of the thickness of the roofs, which should be plastered, if plaster is to be easily got; if not, there must be a ceiling of boards, joined together as well as possible, upon which several folds of brown paper must be glued, to hinder dirt and dust passing from one floor to another, for nothing is more hurtful to the worms.

The house shall extend from north to south, fronting the east and west; the ends opposed to the north and south shall be built up without any opening, so as that there shall be no admission either to the north wind or south sun, which are equally prejudicial to the worms: but the two fronts to the east and west shall have windows opposite to each other, six feet broad, and in height from the ceiling to the floor, with an interval of four feet only between them. Each of these windows must be shut by two sashes of glass, or at least, in lieu of glass, be covered with white oiled paper: these sashes must open sideways, upon little sliders, like the scenes in the opera; each shall be three feet and an inch broad, and slide behind the frame of the window, one against the other, for the sake of convenience; and, in order to keep out the lightning in tempestuous weather, there shall be within side, at the top of the window, an umbrella of wax cloth, to exclude every ray of light. When this is to be used, the glass or paper sashes may be shut, by means of a roller, at one end of the apartment, a cord communicating with all the umbrellas may be drawn, so as to make them act together at once, either for admitting or excluding the light. Every artist will easily comprehend the nature of the contrivance. It will also be necessary to have a second umbrella, of coarse canvas, on the outside of every window, which will occasionally serve to break the too violent action of the wind and sun, and even of the hail, without excluding too much air or light.

Such a building may be executed of wood and mud covered within and without by plaster, or lime; if in a country abounding with stone, it may be executed in stone; the greatest expence will be in the glass-work and umbrellas.

At the two extremities of this house there must be stoves, a foot and a half broad, six feet long, and two feet high, made of plates of cast iron. Round each stove, at the distance of half a foot, a little wall must be built of brick, or tiles, which shall surround it, so as to hinder its heat from being absorbed by the external air. In this interval however, formed on all parts between the stove and the wall, a necessary quantity of air shall be introduced, by a ventilator, or bellows, made for the purpose, to be worked either by the wind, or a little horse. In cold weather the stove must be furnished with fire, to the necessary degree of heat, which may be communicated through the funnels, in the first apartment, or hall, in order to be distributed; but great care must be taken to prevent smoke. The air being heated in the intermediate space of the stoves, will in like manner be distributed through the whole first hall by means of a tin pipe, which must run the whole length of it, and be furnished with small holes, proportioned to the distances; that is, the farther they are removed from the stove, they must be the larger, and more numerous. Thus the air being treated between the furnace and its crust, will warm that of the hall, give it a suitable degree of temperament, and continually renew that which was foul, and this, as the sashes were shut, in going out through the joinings, will resist the external cold air, which would otherwise enter.

It will be sufficient to warm one hall in a house consisting of three, because that will be enough for rearing the little worms, during the cold mornings of the spring; and, when they grow large, they may be distributed into the other halls, in the order which we shall now describe.

We must plant little posts of oak, half a foot broad on one side, and three inches on the other, at the distance of six feet between them. They must be fixed in a line across the hall, and united by ledges of wood, at the distance of twelve inches from one another; so that the posts being 10 feet high, there will be nine ledges: an interval of three feet and a half must

be left from one range of posts to the other, for the convenience of passing between them: the ledges being one inch thick, and three inches broad, shall be placed horizontally, and mortised in each post; then boards of fir, a foot broad, and six feet long, shall be tied to these ledges, with bits of leather, or sheep-skin, in the manner of hinges, one on each side. These hinges will allow the boards to be raised or lowered, like the lid of a coffer; a cord at each end of the boards passing through pulleys at the roof, and fixed to a hook at the lower part of the posts, will actuate all the boards of the same side, like lattices; and if all these boards be kept in a horizontal position, they will serve as so many shelves, upon which the leaves and the worms may be spread. Care must be taken to put nothing upon the board which is next to that where the worms shall reside; but when you would renew the leaves, gently raise up the board on which the new leaves are placed, so that the worms may see and smell them; they will not fail to go thither, and abandon that on which they were: and this migration will afford them an opportunity to clean the first, and prepare it for the reception of new food, when it shall be thought proper to furnish it: and this gentle and continual exercise of the silk-worms passing and repassing alternately from one board to another, will keep up their appetites, and strengthen their bodies. In order to make them yield silk, they must be presented with bits of straw and heath, in the usual way; these small branches must be prepared on the next board, when it is perceived they will no longer eat, but seek to deposit their silk, and make their cods.

I shall not here treat of the different distempers to which the worms are subject during their moulding, abundance of authors having already performed that task; my sole aim is to prevent the dangers to which they are exposed, by describing the attention which ought to be given, and the precautions to be taken in their lodging, in preserving the air pure and temperate, and in managing the light so as to strengthen their bodies, and to excite them to eat.

There must be two places for the store of leaves; in one they must be wiped upon cloth, or a very clean board, when they are wetted by the rain; and in the other they must be preserved cool and fresh, that they may not be too much faded. Besides, it must be observed, that in very hot weather there falls upon the leaves a kind of manna, or honey, which is viscous, and very pernicious to the silk-worms, for it afflicts them with looseness, makes them sick, and languish to death, or, at least, destroys the beauty of the silk. The dust of the roads too, that often sticks to the leaves, incommodes and disgusts the worms. These inconveniencies may be alleviated, by putting the fresh-gathered leaves in other baskets, and rinsing them several times in pure limpid water, which will wash away the dust, honey, or manna. But these leaves must not be given to the worms until after they have been wiped upon sheets; and care must be taken not to let them lie any time in heaps, except in a very cool place, otherwise they will ferment, and become still more pernicious. By the choice of food and regimen the causes of disease are prevented. Over and above these precautions, those who have the charge of breeding silk-worms will be very attentive in chusing the cods, and dividing them into three or four classes, that they may have the finer silk, and that it may not be rendered defective by a mixture of the good with that which is common; afterwards, no pains must be spared in unwinding the silk with all possible art, and if the threads break, as will often be the case, they must be supplied by other cods, in the room of those which have broke, and these must be thrown among the refuse, as being of a defective silk, which would spoil the other. This advice I give with great confidence, being persuaded that those who follow it will find it turn to advantage.

REFLECTIONS upon the above REMARKS.

This memoir will meet with abundance of opposition, especially among people bigoted to old customs; and therefore I propose to write to those only who conduct themselves by the rules of good sense and reason, and are in a condition to profit by the new lights they receive.

What I propose is demonstrated from nature, but, if practised, the expence may seem to exceed the profit. It may therefore be necessary to undeceive those who allow themselves to be prejudiced against this memoir, by furnishing them with means to try the experiment at a small expence; for it will be prudent to try the scheme in miniature, before it is undertaken at large, not only for informing one's self whether or not the author has spoke truth, but likewise to know if there would be any real advantage in following his advice. In order to avoid all mistakes, we must exactly observe the least circumstances, keep account of the time and expence which have been employed, together with the profits which have been drawn, and to compare this with the usual method, in due proportion, that we may see which of the two is preferable: this spirit of curiosity, inquiry, and application, is always useful; by such occupation we acquire instruction, and are insensibly conducted to useful and curious discoveries, which flatter us the more, as they are the fruit of our own study and meditation.

To begin we may use a closet, or any little place, which may

resemble the large building I have described; that is, be equally windowed, enlightened, aired, and glazed, furnished with umbrellas to keep out the lightning, and the joinings may be secured with pasted paper. We must try to supply it with fresh air, to leave nothing that yields a bad scent, and without using a stove, to procure warmth by a proper circulation of warmed air. When this small apartment is put in order, furnished with moving boards such as I have described, so as to fill up the whole capacity of the lodging, as much as may be, without impairing the convenience of passing; it may be tenanted by a quantity of worms, suitable to the extent of the place.

In order to ascertain the number, we must observe that one worm, come to its natural growth, occupies the space of two inches square. As it increases in bulk it requires more air: and when the season is temperate, we run no risque in opening the casements in the day-time, but they must be carefully shut at night. According to this dimension, a board four feet long and one broad may hold about 300 worms; and a closet 12 feet square, and 10 feet high, will contain 18,000; if we can make 10 stories, and three rows of shelves, these 18,000 may produce as many cods; but as some of them always die, I reckon 15,000 may turn to account: 150 cods ought to produce an ounce of silk, when they are good; so that the 15,000 will yield about six pounds of raw silk.

Thus the curious observer will see whether his trouble and expence exceed that of the ordinary method, by comparing the charge and profit on each side, and by including in this account the loss which is occasioned by want of care, he will find, if he is judicious, that his crop will sometimes be augmented one half, or at least one third. If he is satisfied with this experiment, he may afterwards work at large, in proportion to the number of his mulberry-trees, build an house for the purpose, situated on a rising ground, well secured from bad winds, and not in a bottom, which is always subject to mischievous fogs and squalls of wind.

At the same time, he must take care to increase the culture of his mulberry-trees, without, however, planting such a number as will hinder the cultivation of other necessary provisions, and to make woods of them, as people make coppices; in which case the leaves will be finer, and more easily gathered, and the wood will serve for firing. They may also be planted at random, without being subject to any sort of cultivation, for we cannot have too many. This tree, when the soil is naturally good, may be useful by its wood, in a great many shapes: its leaves are a treasure; the poultry and hogs are fed by its fruit, which, indeed, is eaten by all sorts of animals.

REMARKS before the last war.

Under the article BRITISH AMERICA, particularly under the colony of GEORGIA, and also in our REMARKS on that article, I have taken notice of the production of the silk-worm, which was the first motive to the establishment of that plantation, in order to raise silk for the carrying on, in some degree, within ourselves, that estimable manufacture, and to save some proportion of that ready money we are obliged to expend on the importation of foreign raw silk. How it hath come to pass that a design of this kind should miscarry, in a climate confidently declared, time after time, to be proper for it, has never yet been cleared up to the satisfaction of the public; but certainly this is necessary, after the nation has been at so great an expence on the occasion. England is not esteemed a climate so suitable as Georgia, and other of her plantations on the continent of America, for the brood of this delicate animal; and yet there have been instances which seem to bid fair for success in a design of this kind even in England, provided it had been properly and resolutely pursued by some reasonable public encouragement; but perseverance and public spirit seem to be wanting in this kingdom, to bring many important concerns for the benefit of trade to their ultimate perfection, or to give them a fair experimental trial.

How far we have succeeded even in England, in regard to the production of the silk-worms, may deserve notice in the following single instance, and divers others that might be mentioned: and if so, certainly in Georgia, and other contiguous colonies, this matter might be brought to far greater perfection; and this is my chief reason for laying before the reader the following experiments, that were made in Chelsea Park, in the months of May, June, and July, 1719. Philosophical Transactions. April 27, I received a small parcel of silk-worms eggs from Languedoc.

May 6, early in the morning I found them hatched of themselves; the wind shifting in the night from east northerly, to the west southerly, changing the air of a sudden to warm, two days before the change of the moon.

After feeding and managing them according to art, through the whole course of their four sicknesses, they were come to their state of perfection, being then as thick as a man's little finger, and from four to five inches long, of a yellowish colour, and, when held against the light, they might be seen through, as you may an egg, being of the same colour and consistence, filled with the matter that makes the silk. This

is a certain sign that they will begin to spin in 24 hours, or less. They then forsake their food (being very voracious before) and hunt about for a convenient place to fix their holdfasts for supporting the balls, or cones, that they are to make, which they do in a most wonderful mathematical manner, with a mixture of a gummy substance, that ties all together; and when the loose fuzzy substance is taken off, and some of the silk is wound off, the remainder is so smooth and compact, shining like satin, that they are made use of for artificial flowers, and esteemed the best of any thing yet known for that purpose, for which they are generally kept in boarding-schools. I weighed many hundred of these silk-balls, or cones, which I found to weigh from 35 to 40 grains, with their aurelia's, or chrysalis, within them.

June 27, they began to spin, having been hatched seven weeks and three days, and in four or five days finished their laborious and curious work; but their balls were not fit to be removed until eight or ten days.

July 7, Mons^r. Lachivre began to wind off their silk-balls, with a machine that made great dispatch, winding much fine silk in a day. I found that an ounce of silk-balls would make about a drachm of fine silk; but, to be more certain, I weighed out to the winder 12 pounds of silk-balls, at four times, and told the balls in every three pounds as followeth, viz.

The first three pounds contained	-	812	Balls
The second three pounds contained	-	842	
The third three pounds contained	-	797	
The fourth three pounds contained	-	868	

So that the whole 12 lb. weight contained 3319 Balls,

Which, when wound off, was found to yield and make one pound and an ounce, or 17 ounces of fine silk, and about seven ounces of coarse refuse, unwound, in all a pound and half, avoirdupoise weight, or two pounds Troy; which is as great, or greater, making or yielding, as in any part of the world, and the silk as fine. I shewed it to a noted silk broker, who said it was Italian silk (not knowing it was made in England) and worth about 20s. per pound, if I had ever so many bales of it, &c.

Now upon this experiment, finding that 3319 silk-balls would make one pound and one ounce of fine silk, I was desirous to know what quantity of silk might be expected from the worms hatched from one ounce of eggs.

Of which to obtain the knowledge, I made use of the following method: by often weighing and telling, I found that 100 eggs weighed but one grain: so that if one grain contains 100, a scruple must contain 2000, and a drachm 6000, and an ounce, at eight drachms to the ounce, must contain 48,000 eggs. Now if every egg hatch a worm, and every worm makes a silk-ball, there must be, from one ounce, 48,000 silk-balls; and if 3319 balls will make one pound and one ounce of fine silk (which by experience I found they did) then 48,000 silk-balls will make 15 lb. 6 oz. of avoirdupoise weight in fine silk, or 18 lb. 8 oz. of Troy weight, which is very considerable. And in the same proportion, 1 lb. of silk-worms eggs will produce worms sufficient to make above 180 lb. of silk. But allowing for casualties, and supposing but 12 lb. of fine silk made from the worms and their silk-balls, produced from an ounce of silk-worms eggs, it will be found much to exceed most countries, according to Augustino Gallio's computation: for he saith, that in the southern parts of France, viz. Languedoc and Provence, they make but 7 or 8 lb. of silk from silk-worms hatched from an ounce of eggs; and in Brescia in Italy, but 8, 9, or 10 lb. of silk from an ounce of eggs; only in Calabria, where the silk-worms and their eggs are larger, they make 11 or 12 lb. of silk from an ounce of eggs, which still does not exceed, nay hardly comes up to, what we make in England.

I have only this to add, that experience hath taught me how to hatch silk-worms twice in a year, so as to have two crops of silk in one year; and that the mulberry-trees will have leaves in England twice in a year, without prejudice to either tree or fruit, is most certainly true.

REMARKS ON OUR ARTICLE SILK, SINCE THE LAST WAR, AND THE DEFINITIVE TREATY OF PEACE, 1763.

The silk we have from Italy is generally thrown, and serves for warp for our manufactures, and the greater part we import from PIEDMONT, the whole principality not being larger than a small English county; yet it is reckoned that the king of Sardinia receives at least 200,000 l. of us yearly for that commodity, and all in ready money, for he hath loaded all our manufactures with very high duties, which is in effect a prohibition, and admits those of France at a small custom; for which reason they supply his dominions with WOOLLEN MANUFACTURES.

The prices we pay him for THROWN SILK are also extravagant, being in general above TWENTY SHILLINGS for every pound; nevertheless he appears to be very fond of keeping us dependent upon him; for an engine or machine being erected in this kingdom [see DERBYSHIRE] for

throwing RAW SILK into ORGANZINE, to prevent the use thereof, we are told, he hath prohibited the exportation of RAW SILK out of his dominions; and we have now none from thence but what is got by stealth; however, the markets are open in other parts of Italy.

As we have but one water-engine of the quality of that in Derbyshire for throwing silk in this kingdom, if that should be destroyed by fire, or any other accident, it would make the throwing fine silk among us very precarious; and it is very much to be doubted, whether all the men now living in the kingdom could make such another.

As we have commodious rivers for that purpose, whose streams hold all the year, and run through large towns, where scarcely any manufactures are carried on, it would be matter of great consequence to our silk manufacture to have three or four more erected, according to the model of that at Derby, though at the PUBLIC CHARGE, which would give us hopes of preserving that manufacture among us for ever; and we should come in for a part of the fine raw silk of Granada, Valentia, Murcia, and other provinces in Spain, as well as the products of several parts of Italy, in exchange for our woollen manufactures, and not be tied down to the strict rules of paying our ready money, as we are now, to the duke of Savoy; and when once fully employed, the profit in a short time might defray the whole expence. See the article SILK.

It certainly is extremely impolitic for us to depend for silk imported from any foreign country, provided we can be able to furnish ourselves with so valuable a material in our own plantation; a matter that has been long hoped for and expected hitherto in vain. Some have attributed this to the unkindliness of the climate in our continental colonies; [see our article SILK WORMS] but it being asserted many years since, that Georgia did actually produce silk of a good quality, as good, as was then said, as that of the Piedmontese itself; and yet no considerable quantities hitherto having been there produced in so many years, many have doubted the veracity of the production. Whether it has been owing to want of the proper care, and effectual encouragement, we cannot say; but this others have thought to have been the real cause, and not any unfavourableness in the climate. It has been judged by many, who have been well acquainted as residents in our plantations of Carolina, Virginia, Maryland, and Pennsylvania, more northerly climes than Georgia, that those colonies would produce the best silk, and as fit for organzine as any in the world; for these countries afford vast numbers of white and other mulberry-trees, which grow wild, and spring up almost every where in great abundance, which looks as if nature had called us thither to propagate that manufacture, long before now, in those plantations: but if these climes are rather too northerly for the delicate tenderness of the silk-worm; now we are possessed of the FLORIDAS, the most southerly of those continental plantations, we can have no excuse, if we are wanting in our efforts to attempt this capital material, and that in the most effectual and vigorous manner, that the climate will admit of.—It is to be hoped, that no possible care, or even expence, that can be afforded, will be spared to set this design a-foot; for in time it certainly will prove of as great advantage to this nation, as any employment in the plantations; the manufacture of silk being a more profitable undertaking, where the air and land are happily adapted to raising the production needful in competent quantities.

It has been a dispute, whether the manufacture of silk, woollen, or linen, is most considerable in the world. Many travellers say the silk manufacture exceeds either of the other two; and they assign this reason for it, that the people of CHINA, who are computed to be two hundred millions in number, are chiefly clothed with silk garments, which indisputably demonstrates it to abound with the greatest quantity of silk of any country in the world, it being there so very plentiful and cheap, that several of the Jesuits affirm, five suits of silk there do not exceed the price of one suit of woollen in Europe.

Certain it is that Persia, India, and China, had the manufacture of silk long before it came into Europe, the first that was brought being in the time of Augustus.—We manufacture at present very great quantities of thrown and raw silk in this kingdom; it is thought to be six times, at least, as much as it was about three score years ago; for then we were supplied with French and Italian silks, all fully manufactured. The vast riches of China, arising from this manufacture, is sufficient to demonstrate the great advantage thereof; and the extraordinary treasure the duke of Savoy draws into his country by silk, which is made in the little principality of Piedmont, as before observed, is also another instance: we may judge, if he draws above 200,000 l. sterling a year from this kingdom, what his profits are, which he draws from Holland, and other places where the manufacture is carried on to a very great degree.

We are informed the very land for planting of mulberry-trees, in many parts of Italy, is worth from three to five pounds an acre; and gentlemen there, as well as in Sicily, sell their mulberry leaves to the poor for one half the silk they make,

make, and the money is equally divided between them upon sale of the silk; and that the leaves of a tree there have yielded three or four pounds.

Now if the manufacture of silk, and the planting of mulberry-trees has raised the land to be so valuable, and some gentlemen receive such considerable revenues from their crops of leaves, very great things may be expected by our effectually encouraging and promoting the manufacture of silk in our colonies, where as much land may be had for sixpence, as in Italy for five pounds. And if great numbers of mulberry-trees were planted among the Indian nation, when they shall be duly reconciled to our people, bordering on our settlements, and some skilful, good-tempered, persons employed to instruct them in the proper seasons for gathering leaves, and feeding the worms, and rewarding them bountifully for their pains, those people might be brought to be very profitable subjects to this nation. The Spaniards, while FLORIDA was in their hands, notwithstanding their pride, were condescending enough to instruct some of the Indians, under their jurisdiction, to render them very serviceable in carrying on and improving the manufactures of indigo, cochineal, and several others, to the great advantage of New Spain. The French also, while they possessed CANADA, in their settlements about the river St. Lawrence and the great lakes, and on the Mississippi, took a great deal of pains to instruct them in every thing they thought might contribute towards enriching their mother-country. They went with them on their long travels in their hunting seasons; and while they had CAPE BRETON, made these INDIANS inhabiting that part of the continent, very useful to them in their FISHERIES. If the Spaniards and French engaged those people to be so serviceable to them, I do not see it is impossible, if kindness, justice, and good nature was duly exercised towards them, but they may be brought to be highly serviceable to Great-Britain also.

No part of the world should seem to be better adapted to the brood of the silk-worm than our colonies now are; consistent not only with philosophic speculation on the various climes and situations thereof, but from the unquestionable experience of most other parts of the world, where this material is produced of the best qualities, and the greatest emolument. It is generally observed, that all those countries which afford the best silk, border upon the sea, and lie pretty near the same latitude; our plantations, the province of Giron and Nanking, and Chekian in China, all border upon the sea, and are pretty near the same latitude. Those places in Turkey that produce silk, border upon the sea, and Italy and Sicily are, in a manner, environed by the sea; likewise the provinces of Granada, Murcia, and Valentia in Spain; the places that yield the best silk, as well as Languedoc and Provence in France; all lie upon the sea.

Provided we should never be able to induce our neighbouring Indians in North-America to become useful to us in this valuable production, may not the negroes from Africa prove so? As the great advantages that accrue to Portugal and Spain, as well as to ourselves in our sugar and tobacco plantations, is by the cheap labour of negroes, may not the same cheapness of labour be also of prodigious benefit to us, if employed in our COLONIES, in producing and making of silk? And when that season is over, may not the same negroes servants turn their hands to raising and dressing of hemp and flax, the charge being little more than their cloathing from England; for the earth there produces provisions in abundant plenty?

We are told by gentlemen of good intelligence, that the whole charge of making a pound of silk in China does not stand in above five shillings, and almost any person, man, woman, or child, may work at it; and a man or woman, with a child to assist in directing the thread of the silk, may, with a proper machine, reel from the cocoon or silk-bag, one pound in a day.

Where we have, at present, proper land in our plantations for little or nothing, and might have labour performed as above, it is not unreasonable to suppose that silk could stand us in so much as it may do the Chinese. A manufacture of this kind might be brought, in a little time, to so great a degree of perfection, and such quantities raised, that I should conceive the labour of negroes employed in this work would produce above twice as much as those that are employed in planting either sugar or tobacco: and as this nation now greatly inclines to the wearing of silk garments in imitation of the French, to the great discouragement of our woollen manufactures, the manufacture of silk from our plantations would not only enable us to supply ourselves amply therewith, but enable us to export large quantities of silk fully manufactured.

SILK MANUFACTURE of CHINA. It may be said that China is the country of silk, and seems to be an inexhaustible source of that commodity. It not only furnishes silk to a great number of nations in Europe and Asia, but also the emperor, the princes, the mandarins, the literati, the women, and, in a word, all those in easy circumstances, wear habits of silk, and are clothed with satin or damask; very few, except the vulgar or country people, wear cotton painted blue.

The several provinces of China furnish perfectly beautiful silks, yet such as come from Tche-hiang are undoubtedly the best and finest. The Chinese judge of good silk by its whiteness, softness, and fineness; for if, in handling it, it is rough to the touch, it is a bad sign. Sometimes, to make it look well, they prepare it with a certain rice-water, mixed with lime, which burns it, and renders it incapable of being manufactured when transported into Europe.

This is not the case with that which is pure, for nothing can be more easily wove, and a Chinese workman will work upon it in an hour without breaking a single thread.

Their looms are very different from those of Europe, and much more simple. Two or three windles and a wheel are sufficient to do it; and, in a word, it is surprizing to see the simplicity of the instruments with which they make the most beautiful stuffs. At Canton there is a sort of silk, which comes from Tong-hing, but it is not comparable to that brought from the province of Tche-hiang, provided this last is not too moist, which we ought to beware of; for the Chinese, who are generally wont to cheat, sometimes put into the heart of the packet one or two parcels of coarse silk, widely different from that on the surface. See the article CHINA.

Of this silk the most beautiful stuffs are made in the province of Kiang-nan; for to this province most of the good workmen repair, and it furnishes the emperor with all the silks he uses, and those he makes presents of to the grandees and lords of his court. The great trade of Canton, where foreign merchants abound, also draws a vast number of good tradesmen to it.

They could make stuffs as rich as those of Europe, if they were sure of their sale; but they generally employ themselves on the most simple kind, because the Chinese are fonder of what is useful than of what is beautiful.

They, indeed, make gold stuffs, but they do not pass their gold through the drawing-mill, as they do in Europe, in order to twist it with the thread, but are content to gild a long leaf of paper, which they cut into narrow slips, with which they cover the silk, with a great deal of dexterity.

These stuffs are very beautiful at first, but do not last long; neither are they very proper for wearing apparel, because the air and the moisture soon tarnish the splendor of the gold. They are most proper for curious pieces of furniture, and the ornaments of churches; and none but the mandarins and their wives cloath themselves with these stuffs, and that very seldom.

The pieces of silk most used by the Chinese are gauzes, both of the plain and flowered kind, of which they make summer habits; damasks of all sorts and colours; striped satins, and the black satins of Nankin; corded taffeties, which wear well; several other sorts of taffeties, some with flowers, and others striped in a beautiful manner; crapes, brocades, and different sorts of velvets: of this last the crimson is the dearest, but it is easy to be deceived in it; the best method of discovering the fraud, is to take lemon-juice, mixed with lime, and sprinkle some drops of it on different parts, and, if the colour changes, it is a sign that it is bad.

The Chinese also make a prodigious number of other stuffs, two of which are most generally used among them.

First, a sort of satin, stronger, and less glossy than that made in Europe. This is sometimes plain, and sometimes adorned with flowers, trees, birds, and butterflies.

Secondly, a particular taffety, of which they make drawers, and other sorts of wearing apparel. It is thick, and yet so pliant, that we may fold it and press it with our hand, without leaving any mark in it. They also wash it, like other stuffs, without losing a great deal of its lustre.

The Chinese workmen give the lustre to this taffety with the fat of the river-porpoise, which they purify by washing and boiling; then with a fine brush they give the taffety two beds in the same direction, on the side they intend to render glossy. When they work in the night-time, they use this fat melted in their lamps instead of oil, because its smell banishes the flies from the place, which is looked upon as a great advantage, since these insects, by lighting on the work, are very detrimental to it.

The province of Cang-tong furnishes a particular silk, which is found in large quantities on the trees and in the fields. When it is spun, they make a stuff of it called kein-tcheou, and this silk is produced by small insects, which nearly resemble caterpillars. They do not spin it round nor oval, as silk-worms do, but in very long threads, which adhere to the bushes and shrubs, as the wind pushes them to one side or another. They gather these threads, and make of them silk stuffs, coarser than those which are spun in houses. These worms are wild, and eat indifferently the leaves of the mulberry, and those of other trees. Persons unacquainted with this stuff, would take it for a rough stuff, or a coarse druggert. The worms which spin this silk are of two kinds; and the first, which is larger and blacker than our silk-worm, is called tsiou-kien; and the second, which is smaller, is called tiaokien. The cotton of the first is of a reddish grey; but that of the other is blacker; and the stuffs made of them retain these two colours. It is very close, does not cut, lasts long,

washes

washes like stuff, and, when it is good, spots do not spoil it, not even those of oil, but come out of their own accord. This stuff is much esteemed by the Chinese, and is sometimes as dear as the fattins and best-made silks. As the Chinese are very dexterous in counterfeiting, they make false kien-tcheou, with the refuse of the silk of the hang, and it is very easy to be deceived, if we are not very careful. The workmen of Canton also make ribbands, silk stockings, and buttons, to great perfection.

AN ACT OF PARLIAMENT for repealing the DUTIES payable on CHINA RAW SILK, and for granting other DUTIES in lieu thereof, made in the year 1750.

‘Whereas the duties now payable upon raw silk imported from China are a great discouragement to the importation thereof: and whereas a constant and plentiful supply of that valuable commodity to be manufactured in this kingdom, will be a public benefit, and greatly contribute to the increase and improvement of the silk manufactures: therefore we, your Majesty’s most dutiful and loyal subjects, the commons of Great-Britain, being desirous to promote and encourage the manufactures of this kingdom, do most humbly beseech your Majesty, that it may be enacted, and be it enacted by the king’s most excellent majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, That from and after the 24th of June, 1750, the several rates, duties, subsidies, and impositions, now payable upon the importation of raw silk of the growth or produce of China, by virtue of several acts of parliament now in force, shall cease, determine, and be no longer paid.

And be it further enacted, by the authority aforesaid, That from and after the said 24th of June, all raw silk imported from China into this kingdom, by the united company of merchants of England trading to the East-Indies, or by any licence from the said company, shall, in lieu of the said rates, duties, subsidies, and impositions, by this act repealed, as aforesaid, be charged with, and pay the same rates, duties, subsidies, and impositions, as are now charged upon, and payable for, raw silk of the growth or produce of Italy; which said rates, duties, subsidies, and impositions, by this act granted, shall be paid by the said united East-India company, at the same times, and in the same manner, as the several rates, duties, subsidies, and impositions, by this act repealed, as aforesaid, have been paid.

And be it further enacted, by the authority aforesaid, That the several rates, duties, subsidies, and impositions, by this act granted, shall be raised, levied, collected, paid, and applied, in such manner, and for the same purposes, as the said several rates, duties, subsidies, and impositions, by this act repealed, as aforesaid, are now respectively raised, levied, collected, paid, and applied; and all the provisions of or in any act or law now in force for raising, levying, collecting, paying, and applying the rates, duties, subsidies, and impositions, hereby repealed, as aforesaid, shall be in full force, and shall be put in execution for raising, levying, collecting, paying, and applying the rates, duties, subsidies, and impositions, by this act granted, as fully and effectually, to all intents and purposes, as if the said provisions were particularly repeated and re-enacted in the body of this present act.

And it is further enacted and declared, by the authority aforesaid, That all raw silk of the growth or produce of China, imported after the said 24th of June, shall, upon the exportation thereof from this kingdom, be entitled to, and receive the same drawbacks and allowances only, as are now by law directed to be paid upon the exportation of raw silk of the growth or produce of Italy, any law or usage to the contrary notwithstanding.’

AN ACT OF PARLIAMENT for encouraging the CULTURE of RAW SILK in his MAJESTY’S COLONIES, or PLANTATIONS, in AMERICA.

‘Whereas it will greatly tend to the increase and improvement of the silk manufactures of this kingdom, to encourage the growth and culture of silk in his Majesty’s dominions in America, may it therefore please your Majesty that it may be enacted, and be it enacted, by the king’s most excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, That from and after the 24th of June, 1750, it shall and may be lawful to import any raw silks of the growth and culture of any of his Majesty’s colonies, or plantations in America, directly from thence into the port of London, without paying any subsidy, custom, imposition, or other duty whatsoever, for the same, so as a due entry be first made thereof in the custom-house, at the time of importation, and in the same manner and form (expressing the package, marks, and numbers, together with the quantities and qualities of the respective goods) as was used and practised before the making of this act, and so as the same be landed in the presence of, and examined by, the proper officer or officers of the customs appointed for that purpose, and so as the same be imported in ships or vessels that may lawfully trade to his Majesty’s plan-

VOL. II.

tations, manned as by law required: and on failure of the said conditions, or directions, herein last mentioned, such silks shall be liable to the payment of the respective duties, as if this act had never been made.

Provided always, and be it further enacted, by the authority aforesaid, That in order to intitle the importer and importers of raw silk to the exemption intended by this act, every merchant, or other person or persons whatsoever, who shall, after the 24th of June, 1750, load any raw silk on board any ship or vessel, in any of the British colonies or plantations in America, shall, before the clearing out of the said ship or vessel from thence, make proof on oath, before the collector and comptroller of the customs, and naval officer, at the port or place where such raw silk shall be put on board, or any of them, that the raw silk, which he, she, or they, hath, or have, shipped on board the said ship, or vessel (expressing the quantity thereof) is bona fide of the growth and culture of some or one of the British colonies, or plantations, in America, expressing the parish or place in such plantation where the same was cultivated and produced, and by whom, producing such person’s oath thereto, made before the governor of such island or province, or before the next justice of the peace (which oath the said governor, or justice of the peace, collector and comptroller of the customs, and naval officer, or any two of them, are hereby required and empowered to administer without fee or reward) and the master, commander, or other person taking charge of the ship, or vessel, on board which such raw silk shall be loaded, shall also bring with him a certificate, or certificates, from such collector and comptroller of the customs, and naval officer, or any two of them, as aforesaid, under their hands and seals of office (which certificate, or certificates, such collector and comptroller of the customs, and naval officer, are hereby required and directed to grant without fee or reward) expressing the marks, number, tale, and weight of the raw silk in each bale, parcel, or other package whatsoever, so shipped, or loaded on board such ship, or vessel, with the names, place, or places of abode, of the exporter, or exporters thereof, from the said British colonies, or plantations, in America, and the name or names, place or places of abode, of such other person or persons, who shall have sworn the goods therein mentioned to have been of the growth and culture of the said British colonies, or plantations, in America, and the name, or names, of the person, or persons, to whom the same are consigned in the port of London; which certificate, or certificates, the said master, commander, or other person taking charge of such ship, or vessel, shall, on his arrival in the said port of London, deliver to the collector, comptroller, or other chief officer of his Majesty’s customs at the said port, at or before the entry of the said raw silk; and at the same time shall make oath, before any one of them the said collector, comptroller, or chief officer of his Majesty’s customs (who are hereby required and empowered to administer the same without fee or reward) that the said bales and parcels, and goods mentioned in such certificate, are the same bales and parcels, and goods, as were taken on board in the said British colonies, or plantations, in America; and if any raw silk of the growth and culture of the British colonies or plantations, in America, shall, after the said 24th of June, 1750, be imported as herein before mentioned, without such certificate, signed and delivered as herein before required, and oath made as before directed, by the master, commander, or other person taking charge of the ship, or vessel, in which the same is imported, all such raw silks shall be liable to the payment of the respective duties, as if this act had never been made, any thing herein before contained to the contrary notwithstanding.

And be it further enacted, by the authority aforesaid, That if any person or persons shall, from and after the said 24th day of June, 1750, make, or cause to be made, an entry, or entries, of any foreign raw silk, under the name, or description, of raw silk of the growth, or culture, of any of the British colonies, or plantations, in America, or shall mix, or cause to be mixed, any foreign raw silk with raw silk of the growth or culture of the British colonies, or plantations, in America, with intent to evade the payment of the duties payable on foreign raw silk, every person or persons so making, or causing to be made, such entry, or entries, or mixing, or causing such mixture or mixtures to be made, shall forfeit and lose the sum of 50*l.* for every such offence, and all such foreign raw silk; and in case of any mixture, the quantity so mixed, both of foreign and British-plantation culture or growth, or the value thereof, together with the bales, or other packages containing the same, shall be forfeited, and shall and may be seized and prosecuted, or the value thereof be sued for by any officer, or officers, of his Majesty’s customs; one moiety of which penalties and forfeitures shall be to the use of his Majesty, his heirs and successors, and the other moiety to him or them that shall seize, prosecute, or sue for the same, in any of his Majesty’s courts of record at Westminster.

Provided always, that if any doubt or dispute shall arise, whether the said raw silk, or any part thereof, so to be imported as aforesaid, is of the growth or culture of the British

colonies or plantations in America, or of foreign growth or culture, the onus probandi shall lie on the owner or claimer thereof, and not on the informer and prosecutor; any law, custom, or usage to the contrary notwithstanding. And be it further enacted, by the authority aforesaid, That if any action or suit shall be commenced against any person or persons for any thing done in pursuance of this act, the defendant or defendants, in such action or suit, may plead the general issue, and give this act and the special matter in evidence at any trial to be had thereupon, and that the same was done in pursuance and by authority of this act: and if it shall appear so to have been done, then the jury shall find for the defendant or defendants; and if the plaintiff shall be nonsuited, or discontinue his action, after the defendant or defendants shall have appeared, or if judgment shall be given upon any verdict or demurrer against the plaintiff, the defendant or defendants shall and may recover treble costs, and have the like remedy for the same, as defendants have in other cases by law.*

R E M A R K S.

Such has been the encouragement given by the legislature, to the culture of raw silk in our AMERICAN colonies. An ample supply of this commodity, however, can be brought only from ASIA, unless we make some very extraordinary improvements. EUROPE, during the last war, did not produce the usual quantity, nor has the price of some particular kinds declined since that time: for the consumption of this article increases rather than diminishes. The EAST-INDIA company, therefore, having, we presume, previously taken their measures, applied to parliament for an alteration of the duty on CHINA silk (as we see by the preceding act), the obtaining of which affords an encouragement to the importation of it; and, no doubt, by means of the company, we shall have a sufficient quantity*; which will prove highly beneficial to the silk manufacture of this kingdom. And, For the further encouraging this important manufacture, the following act passed in the year 1753.

* In 1752 we find accordingly a large supply of CHINA raw silk arrived.

An act for encouraging the silk manufactures of this kingdom, and for securing the duties payable upon the importation of velvets, wrought silks, and silks mixed with other materials, not manufactured in Great-Britain.

• Whereas the payment of the duties charged and made payable by divers acts of parliament, upon the importation of velvets, wrought silks, and silks mixed with other materials not manufactured in Great-Britain, is frequently evaded by the subtil and fraudulent practices of evil-disposed persons, to the great discouragement of the silk manufactures of this kingdom, and the loss of his Majesty's revenue: therefore, for preventing such frauds and abuses for the future, be it enacted by the king's most excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and commons in this present parliament assembled, and by the authority of the same, That all velvets, wrought silks, and silks mixed with any other materials (such velvets, wrought silks, and silks mixed with any other materials, not being manufactured in Great-Britain, and such wrought silks, or silks mixed as aforesaid, not being prohibited to be worn therein) which shall be imported into this kingdom, after the twenty-ninth day of September, one thousand seven hundred and fifty-three, shall after the same have been entered at the custom-house, and before they are discharged by the officers, and delivered into the custody of the importer or his agent, be marked or sealed at each end of every piece, with such mark or seal, and by such officer or officers, as the respective commissioners of the customs in Great-Britain shall direct and appoint for that purpose.

And be it further enacted, by the authority aforesaid, That from and after the said twenty-ninth day of September, every person intending to export any such velvets, wrought silks, or silks mixed with any other materials, as herein before are mentioned and described, which shall have been imported into this kingdom, after the said twenty-ninth day of September, shall before such goods are shipped in order to be exported, give notice to the proper officer or officers to be appointed for that purpose, by the respective commissioners of the customs in Great-Britain, when and where he will pack up the said goods in order to be exported; and the said commissioners of the customs are hereby empowered and required to cause such officer or officers, to take care that such seals, stamps, or marks, be taken off from every piece so intended to be exported, without fee or reward; and no person shall be intitled to the drawback allowed upon the exportation of such velvets, wrought silks, or silks mixed as aforesaid, unless he shall have given such notice as herein before is directed, and until such seals, stamps, or marks, shall be taken off by the proper officer or officers as aforesaid.

And be it further enacted, by the authority aforesaid, That from and after the twenty-ninth day of September, one thousand seven hundred and fifty-four, in case any velvets,

wrought silks, or silks mixed with any other materials (such velvets, wrought silks, or silks mixed with any other materials, not being manufactured in Great-Britain, and such wrought silks, or silks mixed as aforesaid, not being prohibited to be worn therein) shall be found in any shop, warehouse, or other place whatsoever, upon land within this kingdom, not being marked or sealed as herein before directed, upon both ends of every whole and entire piece, or upon one end of every remnant of such velvet, wrought silk, or silk mixed as aforesaid, the same shall be forfeited, and shall and may be seized by any officer or officers of the customs, and secured in some or one of his Majesty's warehouses; and such officer or officers is and are hereby indemnified for so doing; and all such velvets, wrought silks, or silks mixed as aforesaid, so seized and secured, shall, after condemnation thereof in due course of law, be publicly sold to the best bidder, and one moiety of the produce arising by the sale of such velvets, wrought silks, or silks mixed as aforesaid, shall be to the use of his Majesty, his heirs, and successors, and the other moiety to the officer or officers who shall seize and secure the same as aforesaid; and the person in whose custody or possession the goods so seized and secured shall be found, shall also, for every such offence, forfeit the sum of two hundred pounds, to be recovered and divided in manner herein after directed.

And be it further enacted, by the authority aforesaid, That no velvets, wrought silks, or silks mixed with any other materials as aforesaid, which after the twenty-ninth day of September, one thousand seven hundred and fifty-four, shall be seized and forfeited by virtue of this act, or for any other cause of forfeiture, shall be consumed or used in this kingdom, but shall be exported again, and not sold otherwise than on condition to be exported, and shall not be delivered out of the warehouse wherein the same shall have been secured, until sufficient security be given, that the same and every part thereof shall be exported, and not landed again in any part of Great-Britain.

And be it further enacted, by the authority aforesaid, That if any person or persons shall at any time forge or counterfeit any stamp, mark, or seal, to resemble any stamp, mark, or seal, which shall be provided or used in pursuance of this act, or shall forge or counterfeit the impression of any such stamp, mark, or seal, upon any goods required by this act to be stamped, marked, or sealed, or shall sell, or expose to sale, any of the said goods with a counterfeit stamp, mark, or seal thereon, knowing the same to be counterfeited; all and every such offender and offenders, their aiders, abettors, and assistants, shall, for each and every such offence, forfeit the sum of five hundred pounds, and shall also be adjudged to stand on the pillory in some public place for the space of two hours.

And be it further enacted, by the authority aforesaid, That all pecuniary penalties and forfeitures by this act imposed, shall and may be sued for and recovered in any of his Majesty's courts of record at Westminster, or in the court of Exchequer at Edinburgh respectively, by action, bill, plaint, or information, in the name of his Majesty's attorney-general, or in the name of his Majesty's advocate in Scotland, or in the name or names of some officer or officers of the customs; and that one moiety of every such penalty and forfeiture shall be to his Majesty, his heirs, and successors, and the other moiety thereof to the officer or officers of the customs who shall inform and prosecute for the same.

Provided always, and it is hereby further enacted, That if any officer or officers of the customs shall neglect or refuse, for the space of one month, to prosecute to effect any person or persons for any pecuniary penalty or forfeiture by this act inflicted upon offenders against the same, that then it shall be lawful for any person or persons whomsoever to sue for, prosecute, and recover the respective pecuniary penalties and forfeitures by this act inflicted, in like manner as is herein before directed with regard to the officers of the customs; and one moiety of the said respective forfeitures, when recovered, shall, in such case, go and be applied to the use of his Majesty, his heirs, and successors, and the other moiety to the person or persons who shall sue or prosecute for the same respectively.

And be it further enacted, by the authority aforesaid, That upon every action, bill, plaint, or information, entered and filed as aforesaid, for any pecuniary penalty imposed by this act, a capias in the first process shall and may issue, specifying the sum of the penalty sued for; and the defendant or defendants shall be obliged to give sufficient bail or security by natural-born subjects, persons naturalized or denizens, to the person or persons to whom such capias shall be directed, to appear in the court out of which such capias shall issue, at the day of the return of such writ, to answer such suit or prosecution; and shall likewise, at the time of such appearance, give sufficient bail or security, by such persons as aforesaid, in the said court, to answer and pay all the forfeitures and penalties incurred for such offence or offences, in case he, she, or they shall be convicted thereof, or to yield his, her, or their body or bodies to prison.

And be it further enacted, by the authority aforesaid, That if any action or suit shall be commenced against any person or persons

persons for any thing done in pursuance of this act, the defendant or defendants in such action or suit may plead the general issue, and give this act, and the special matter in evidence, at any trial to be had thereupon; and that the same was done in pursuance, and by authority of this act: and if it shall appear so to have been done, then the jury shall find for the defendant or defendants; and if the plaintiff shall be nonsuited, or discontinue his action, after the defendant or defendants shall have appeared; or if judgment shall be given upon any verdict or demurrer against the plaintiff, the defendant or defendants shall recover treble costs, and have the like remedy for the same as defendants have in other cases by law. And be it further enacted, by the authority aforesaid, That if any velvets, wrought silks, or silks mixed as aforesaid, shall be seized by virtue and in pursuance of this act; and if any doubt or question shall arise, where the said velvets, wrought silks, or silks mixed as aforesaid, were manufactured, the proof shall lie upon the owner or claimer thereof, and not upon the prosecutor; any law, usage, or custom to the contrary notwithstanding.

R E M A R K S.

Silk is a material for a very considerable manufacture; which being brought from abroad raw, we here twist, dye, and weave into different goodnesses, both plain, striped, and flowered, either by itself, or mixed with gold and silver; so richly brocaded, that we are allowed to exceed those from whom we had the art. Of this material also are made great quantities of ribbons, stockings, and other things; not only to serve ourselves, but also to export.

Our importation of raw and thrown silk is from Turkey, Italy, Sicily, and India.

1. Thrown silk comes chiefly from Leghorn, Genoa, Naples, and Messina.

2. Raw silk from Turkey, that is, Persia by the way of Turkey, Bengal in India, and from China.

All this silk is manufactured in Great-Britain, very little excepted, which is sometimes re-exported unwrought, chiefly to Ireland. The growth and increase of the consumption of silk in these kingdoms, has been much owing to the high duties on French wrought silks, particularly their alamoses, lustrings, [see ALAMOS and LUSTRINGS] and rich broad silks of every kind; but more especially to the prohibiting the use and wearing of EAST-INDIA wrought silks, which were formerly worn in England to an extraordinary degree; inasmuch that one ship from India, namely, the Tavistock, brought in one article of wrought silk 9000 pieces of damask (besides a great many of several other sorts) each of which was worth at market, one with another, 9 l. or more: so that the said damask only amounted to 89,000 l. sterling.

At the making of the treaty of Utrecht, the state of the silk trade was then represented as follows *.

* See The British Merchant.

As to our increase of the silk manufacture at home, this will appear in some measure by the vast increase of the importation of raw and thrown silks from foreign countries, from Turkey, Italy, and the East-Indies.

But here I must acknowledge, that the importation of ardaas, or coarse Persia silk, from Turkey, is vastly abated. This has been principally occasioned by the imposition of such duties on it as it could not bear. But then this loss has been in part supplied by a vast importation of program yarns; and besides this, the importation of bellandine, or white Turkey silk, and of sherbassie of Persia, is greater now, than that of these and the cheap ardaas silk, joined together, ever was before the beginning of the first war. All the work, therefore, that was formerly done with ardaas silks, and is now performed by program yarn, together with the whole increase of the number of bales imported from that country more than formerly, must be placed to the account of the increase of the silk manufacture in England.

I will not pretend to determine the value of this increase; all I will say here, shall be only to explain it. Suppose then, that formerly our annual importation of ardaas, and other silks imported from Turkey, amounted to 1500 bales, and that, at this time, the importation of bellandine and sherbassie amounted to 1600 bales of silk; at first sight, this would look as if only a hundred bales of silk more were brought into the English manufacture: but if the program yarn, which is for the most part a new importation, should be allowed to supply 500 bales of ardaas silk, and that, nevertheless, 1600 bales of raw silk from Turkey are imported; then it would be manifest, that not only 100, but 600 bales of our present annual importation, must either be re-exported, or added to our silk manufacture. If it shall be allowed that the Turkey trade, by this means, furnishes 600 bales of silk per annum to our manufacture, more than it did before, I shall be very glad to be informed, whether such a quantity is not sufficient to produce 80 or 90,000 lb. weight of wrought silk? The Turkey merchants, or rather the weavers of Spitalfields, might certainly answer this question; and also, whether, at least, 600 bales of Turkey silk are not brought an-

nually to our looms, more than before the beginning of king William's war.

But we are yet more sure of our importation of Piedmontese and Bergamo silks; this amounts to near a thousand bales in a year, and is wholly new. Of these, and other Italian thrown and raw silks, we use at least 1200 bales annually at our looms more than we did before the beginning of the first war. And whence is this prodigious increase of our silk manufacture, but from the interruption of our commerce with France, and the prohibition of East-India silks?

I have by me an account of the East-India raw silks imported for several years last past; the whole quantity, at a medium, will make 400 bales per annum: so much of this as is not re-exported, is used at the English looms. If, by these several articles, 2000 bales are used at our looms, more than formerly, the weavers will be ready to answer, whether the produce will amount to less than 280,000 lb. weight of wrought silk; and this quantity, at 50 l. per pound, will make the increase of our silk manufacture 700,000 l. per annum. I am very ready to believe that such has been the increase, from what was asserted at the bar of the last House of Commons, by a gentleman well skilled in these matters.

He asserted, that our manufacture of	
lustrings, alamoses, and other black	} 300,000 l. per ann.
silk, for hoods and scarves only, amounted to	
Of silks for linings of clothes, in imitation of perians, to	150,000
Of silk handkerchiefs	200,000
The whole of these articles*	650,000 l. per ann.

All this, besides the recovery of stuffs and cottons mixed with silks, which before were almost lost to this kingdom.

Lustrings and alamoses are now very little used; the silks that are used in their stead, are rasiageans and mantua silks, which are quite a different fabric. But the whole value, it seems, of our black silks is 300,000 l. per annum. This is an entire new manufacture to England, with which, before the first war, we were wholly served by France. This is not such a prodigious sum as people may imagine; it amounts to little more than 1 s. 8 d. per annum, for every one of the female sex; and we may very well conceive, that 300,000 of this sex are in these silks every one at the charge of 20 s. per annum, which makes up the whole sum: but whatever is the quantity, France served us with the whole before.

For brocades, and other rich silks, almost the whole quantity used in England, were the manufacture of that nation, as well as great part of the perians for linings: and if this last sort made in England amounts to 150,000 l. per annum, the whole of these two articles imported, may very well be believed to be the value of 200,000 l. per annum.

The above-mentioned articles, and that of silk handkerchiefs, make it credible, that I am not much mistaken in my computation of 2000 bales of silk manufactured by our own looms, more than were before the interruption of the French commerce, and the prohibition of East-India manufactures: whether such a manufacture, of so much value, deserves our care or our contempt, is the next thing to be considered. In the first place, I must insist upon it, that the whole price of this increase of our silk manufacture, from the worm to the mercer's shop, is paid to the product of our lands, and to the labour of our people.

There can be no question of the silks which are imported raw from Turkey, and manufactured here in England. No bullion is sent to that country. The raw silks are purchased there for our woollen manufactures; and as a part of the price of these is paid to the land-holder for his wool, and the rest to the labour of our people that made it up, it must be affirmed that the whole value of Turkey raw silk, is indirectly paid to our own people, by being paid to them for the goods that are exchanged for it: and as for the whole new value that is superadded to it, for the charge of importing, throwing, weaving, and dyeing of this silk, it is entirely, and directly paid to the labour of our own people. The same thing may be affirmed of the raw and thrown Italian silks; they are both purchased by an over-balance of English manufactures exported to that country*; and if the whole value of these is directly paid to the English lands and labour, and if we could not hope to preserve our Italian markets for them, without taking off their silks, it must be acknowledged, that our land-holders and labourers are indirectly paid the value of these silks, by being paid for the goods that are exchanged for them.

* Although silver is not sent out directly to Piedmont, as it is to India, yet, in fact, it is the same thing; for the balance of some other trade is carried thither, which otherwise would be remitted to us.

The only difficulty is concerning East-India raw silks, which are purchased partly by our silver, and partly by our manufactures.

factures. But of those it must be acknowledged, that the whole price of importing and working them up is paid to the labour of our people. But as East-India raw silks are the least part of our importation*, so it is of these that we make the greatest re-exportations, and the countries to which we do it, reimburse us not only our whole cost of the re-exported raw silk that is imported from the East-Indies. However, the throwing of raw silk employs so many little and otherwise useless hands, that I shall never quarrel with the East-India trade for the silver it exports for those useful materials.

* The case is greatly altered, since the act of parliament to encourage the importation of China silk.

But this can never be said in defence of a trade, which exchanges our silver for foreign silks already manufactured to the very utmost perfection; for what can these be said to pay our lands? what to the labour of our people? It were better for us to send our money to the East-Indies than to France, for these manufactured silks, not only because they are purchased cheaper in the former, but because the cost of a long importation is all paid to our own navigation; besides that, it were less dangerous to enrich a country at so great a distance, than so near a neighbour as the French nation.

But that which I am chiefly aiming at is, that this whole increase of the silk manufacture in England, is so much lost to other nations: for all that pretend that we are not richer nor more populous than we were before the war, will grant, that our consumption of wrought silks cannot be greater than it was before. Whence then is this increase of a manufacture to the value of 700,000*l.* per ann. gained? and to what countries is it lost? It must be wholly lost to France and the East-Indies, and how is this loss to be proportioned?

Our whole quantity of black silks was heretofore brought from France; our own manufacture of this commodity amounts to 300,000*l.* per ann. France therefore has lost in this article the selling us so great a value.

There is no reason to believe, that the whole value of East-India wrought silks annually consumed in England ever amounted to 200,000*l.* per ann. It remains therefore to make up the whole 700,000*l.* per ann. that the value of 200,000*l.* per ann. more in brocades and other rich silks must have been imported from France.

Then let the custom-house accounts make the wrought silks imported from France as much or as little as they please, the increase of the silk manufacture in England will demonstrate, that our importation of this commodity from France was heretofore 500,000*l.* per annum.

By the extraordinary industry and ingenuity of our silk manufacturers, we have the satisfaction to observe, that the wear of French silks in general, is in this kingdom greatly discountenanced, by the wife and glorious example of his Majesty and all the royal family: and, indeed, the fabrics of Spitalfields are now esteemed to be superior to those of France. We have likewise many excellent designers among our weavers, which has not a little contributed to the increase of this manufacture, to that superlative height to which it is arrived. See the article ENGRAVING. And if our manufacturers would follow the example of the French in making a very light and cheap sort of silks, our exportation of these manufactures might reasonably be expected to increase.

The late encouragement given by the legislature to the importation of China raw silk, it is to be hoped, will have a happy tendency to render a great part of our silk manufactures much cheaper than without this silk. For,

The China silk is not only of excellent staple, but comes at little above one third of the price of Italian Piedmont silk. Before the late act, the duty of Bengal raw silk being one third more, and China near three times as much as that of the Italian, hindered our being supplied so fully as we ought, and was a great detriment to the nation; for we pay the duke of Savoy mostly ready money for what we have from him, which as effectually drains us of our bullion, as the India or China trade does; with this aggravation, that according to Mr Gee, almost three pounds of China silk may be purchased for the money that one pound of Piedmont silk costs us.

Although silver, as before observed, is not sent out directly to Piedmont, as it is to India, yet in fact it is the same thing; for the balance of some other trade is carried thither, which otherwise would be remitted to us.

The silk of China will answer, in most respects, the use of Italian silk, provided we could be constantly supplied with the fine raw silk of which they make their damasks, satins, and other fine manufactures, which, by the curiosity of those silks, must come up to the goodness of Italian silk.

The China silk that we commonly receive, is purchased at Canton, the nearest port we trade to in China; but their fine silk is made in the province of Nankin and Chekiam, where their fine manufactures are carried on, and where prodigious quantities of raw silk are made, and the best in all China. We have never till lately imported any of the superfine here, but two or three ships have brought extraordinary good, the

best of which, we are informed, was brought from Amoy; and doubtless, if encouragement was given for the importation of that fine silk, it might be thrown here, and our manufactures carried on at a small expence to the nation: the countries of Chekiam and Nankin that produce it, are much to the northward of the places we now trade to, and near Chufan, about five or six hundred miles to the northward of Canton, an island in which we formerly had a factory, and were admitted to trade.

That country is very cold in winter, and I have been informed, some of our woollen goods have sold very well there, especially our callimancoes and long-ells.

Besides, the countries of Chekiam and Nankin are near the heart of the empire, where the greatest trade is drove; and Nankin being the metropolis of trade in that country, as London is in England, she sends out her manufactures and merchandize to Canton, as we do to Bristol, and other out-ports. But, as Canton is the nearest port, some captains and supercargoes raise objections against going further down the coast, alleging that it is a difficult pilotage, and in danger of losing their passage back that year; that the mandarins, and other officers, impose upon them, which makes it difficult to trade with them. But when private traders had liberty to go to China, they were of another opinion; they went to those places where they could get most money, and the people of Chufan (where the merchants of Nankin as well as of Hamcheu and Nimpo, two other great trading cities, lodge great quantities of merchandize) would be as ready to cultivate a correspondence with our captains and supercargoes, as the people of Canton are; and it is hoped we may find as much encouragement to trade to those parts, as we now do to Canton, their interest being the same among them all. A trade of this nature cannot be immediately settled, good and prudent management and time must do that. Some of our ingenious gentlemen have found, that several of our commodities, as well as our woollens, would do very well towards the heart of China; and to speak freely, every lover of his country ought to have the advantage thereof in view, as well as his own private gains. If this trade could be fixed, and any quantities vended in that vast country, and the fine silk above-mentioned imported, it would exceedingly add to the profits we already receive by the Indian trade, and bring those advantages with it, that may enable us to vie with any kingdoms in Europe in the SILK MANUFACTURES; for as cheapness and goodness always give preference, SILK so imported from China will answer in both respects. And it is to be hoped, improvements of this kind will be readily undertaken by the company, and be an acceptable service to them, as well as to the nation in general. Joshua Gee.—And we find that the company, from the preceding act of parliament, have in earnest engaged in this affair; and we may hope for such success in our silk manufacture, by means of the East-India and Turkey raw silks, that we may not be outdone therein by any other country.

For more matter relating to the silk trade, see the article RUSSIA, in regard to the silk of Persia being imported through Russia. See also the articles LEVANT TRADE, ORIENTAL TRADE, and TURKEY TRADE, for hints tending to some improvements to be made in our silk manufactures.

An ACT for explaining, amending, and rendering more effectual, an act made in the nineteenth year of the reign of king Henry the seventh, intituled SILK-WORKS.

‘Whereas by an act passed in the nineteenth year of the reign of king Henry the seventh, intituled SILK-WORKS, it is, amongst other things, ordained and enacted, that no manner of person shall from thenceforth bring, or cause to be brought, into the realm of England, to be sold, any manner of silk wrought by itself, or with any other stuff, in any place out of the said realm, in ribbands, laces, or girdles, upon pain of forfeiture of all the said ribbands, laces, and girdles, and every of them, in whose hands soever they be found, or the values of the same, the one moiety to the king, and the other moiety unto any of the king's subjects that would sue for the same: and whereas notwithstanding the aforesaid act, and the other laws now in being, great quantities of foreign manufactures, and particularly ribbands, laces, and girdles, are brought into, and sold in this kingdom, to the great diminution of the trade and manufactures of this kingdom, and to the great prejudice, hindrance, and impoverishment, of great numbers of his majesty's subjects; an evil which, if not timely prevented, will affect and greatly lessen the public revenue, and greatly distress the silk trade and manufactures of this kingdom: for remedy whereof, be it enacted by the king's most excellent majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, that if any person or persons shall, after the twenty fourth day of June, 1763, import, bring, or convey, or cause to be imported, brought, or conveyed, into this kingdom, any ribbands, laces, or girdles, not made and manufactured in Great-Britain, whether the same be wrought

wrought of silk alone, or wrought of silk mixed with any other materials; all such ribbands, laces, and girdles, shall be, and the same are hereby declared to be forfeited; and the same shall and may be seized and detained by any person or persons whatsoever, in whatever importers, venders, or retailers hands the same may be found or discovered; and shall be disposed of as herein after is mentioned; and the person or persons bringing, conveying, or importing such ribbands, laces, or girdles, into this kingdom, or causing the same to be so brought, conveyed, or imported, shall also forfeit, for every offence, the sum of one hundred pounds; and all and every person and persons who shall be aiding, abetting, or assisting in the bringing and conveying or importing into this kingdom, any such ribbands, laces, or girdles, as aforesaid, shall severally forfeit and pay the sum of fifty pounds, over and above any interest which he, she, or they, may have, or may have had, in any such ribbands, laces, or girdles. And be it further enacted by the authority aforesaid, That all and every person and persons, being a vender or venders, retailer or retailers, of any kind of ribbands, laces, or girdles respectively, in whose custody or possession any such ribbands, laces, or girdles, or any of them, shall be found, or who shall sell or expose to sale, any such ribbands, laces, or girdles, as aforesaid, or who shall conceal any such ribbands, laces, or girdles, with intent to prevent the forfeiture or seizure of the same, shall, over and above the forfeiture and loss of such ribbands, laces, and girdles, and all interest which he, she, or they, may have therein, for every such offence, forfeit and pay the sum of fifty pounds. And be it further enacted by the authority aforesaid, That all pecuniary forfeitures and penalties incurred under this act, shall be paid, one moiety to our sovereign lord the king, his heirs, and successors, and the other moiety to him or them who will sue or prosecute for the same respectively; such of the said penalties which shall arise in that part of Great Britain called England, to be sued and prosecuted for in any of his majesty's courts of record at Westminster, by action of debt, bill, plaint, or information, in which no essoin, protection, or wager of law, or more than one imparlance, shall be allowed; and such of them as shall arise in that part of Great-Britain called Scotland, to be sued and prosecuted for in the court of Exchequer at Edinburgh, in such manner as any penalties and forfeitures for offences against the laws touching the customs may be sued or prosecuted for there respectively.

Provided always, and be it also further enacted by the authority aforesaid, That whenever such ribbands, laces, and girdles, shall be found and seized in that part of Great-Britain called England, and out of the cities of London and Westminster, and the limits of the weekly bills of mortality, and the same shall not exceed in value the sum of twenty pounds, it shall and may be lawful for two or more of his majesty's justices of the peace for such county, city, borough, or place, where the same shall be so found and seized, upon any information before them, that such ribbands, laces, or girdles, were seized as ribbands, laces, or girdles, unduly brought into, and not manufactured within, this kingdom, to hear and determine the same, and to proceed to condemnation or discharge thereof, as shall seem just; any thing herein before contained to the contrary notwithstanding.

And, for the utter prevention of all and every such ribbands, laces, and girdles, seized and condemned as aforesaid, from ever being made use of to the prejudice of the trade and manufactures of this kingdom, be it further enacted by the authority aforesaid, that all and every such ribbands, laces, and girdles, after condemnation thereof, shall, by order of the court, judge or judges, or justices, where or before whom such condemnation shall be had, be publicly burnt and entirely destroyed; but the execution of such order shall and may be suspended for so long time only as may be thought just and meet, for the better attaining the ends of justice, with regard to any suit or prosecution had, or to be had, for the recovery of any pecuniary penalty or penalties by this act inflicted.

Provided always, and it is hereby further enacted by the authority aforesaid, That forthwith, after the seizure of any such ribbands, laces, or girdles, as aforesaid, the same, until they shall be condemned, burnt, and destroyed, as aforesaid, or discharged as unduly seized, shall be deposited in one of the king's warehouses belonging to the Custom-house, in case such seizure happens to be within the cities of London or Westminster, or the weekly bills of mortality, where the same shall be received and admitted at all times by the proper officer or officers there, who is and are hereby empowered and required to receive and preserve the same until they shall be condemned, burnt, and destroyed, or discharged as aforesaid; and in case such seizure shall be made out of the said cities of London and Westminster, and the weekly bills of mortality, then the same shall be deposited in the hands of the chief magistrate of such city, town, or place, where the same shall be seized, or in the hands of the constable of the next adjacent village, who is and are hereby empowered and required to receive and preserve the same, until they shall be condemned, burnt, and destroyed, or discharged as aforesaid.

VOL. II.

charged as aforesaid; and all and every such ribbands, laces, and girdles, may, from time to time, be viewed and inspected by any person or persons, on behalf of the prosecutor or prosecutors, or of the person or persons interested in, or claiming, the said ribbands, laces, and girdles, with the leave of the court, officers, judges, or justices, where or before whom any prosecution or suit shall be carried on for condemnation thereof, or for recovery of any penalty by this act inflicted, who are and is hereby required to make and give such order, from time to time, for that purpose, as may be just and reasonable.

And, for the better discovering and detecting any offender or offenders against this act, be it enacted by the authority aforesaid, That upon an information in writing made upon oath before any two or more of his majesty's justices of the peace for the respective county or place (which information shall be signed by the party or parties making the same) that there is good ground and reason to suspect that such ribbands, laces, or girdles, as aforesaid, have been imported into this kingdom, and are concealed by, or are in the possession or custody of any retailer or seller of any kind of ribbands, laces, or girdles, contrary to the true intent of this act, it shall and may be lawful for such justices respectively, to issue their warrant or warrants to any constable or constables, or other peace officer or officers, within the said county or place, empowering him or them to search, in the day-time, the house or houses, out-house or out-houses, warehouses, shops, cellars, rooms, and other places, belonging to, or hired, employed, or made use of, by such retailer or seller who shall be suspected to conceal or have in his, her, or their possession or custody, any ribbands, laces, or girdles, not made or manufactured within Great-Britain; and if any such ribbands, laces, or girdles, not being made or manufactured within Great-Britain, shall be found, to seize and carry away the same, for the purpose of carrying this act into execution, and to dispose thereof as is herein before directed.

And be it further enacted by the authority aforesaid, That if any action or suit shall be commenced against any person or persons for any thing done in pursuance of this act, the defendant or defendants in such action or suit, may plead the general issue, and give this act, and the special matter, in evidence, at any trial to be had thereupon, and that the same was done by the authority of this act; and if it shall appear to have been so done, then the jury shall find for the defendant or defendants; and if the plaintiff shall be nonsuited, or discontinue his action, after the defendant or defendants shall have appeared; or if judgement shall be given upon any verdict or demurrer against the plaintiff, the defendant or defendants shall recover treble costs; and have the like remedy for the same, as defendants have in other cases by law.

Provided always nevertheless, and it is hereby enacted, That in every such action, it shall and may be lawful for the defendant or defendants, by leave of the court where such action shall be depending, at any time before issue joined, to pay into court such sum of money as he or they shall see fit, as amends for the matter or cause complained of in such action; whereupon such proceedings, orders, and judgements, shall and may be had, made, and given, in and by such court, as in other actions where the defendant is allowed to pay money into court.

And be it further enacted by the authority aforesaid, That if any ribbands, laces, or girdles, wrought of silk alone, or of silk mixed with any other materials, shall be seized by virtue and in pursuance of this act, and any doubt or question shall afterwards arise, where the said ribbands, laces, or girdles, so wrought as aforesaid, were manufactured, the proof shall lie upon such person or persons, being a vender or venders, retailer or retailers, of any kind of ribbands, laces, or girdles respectively, in whose custody or possession the same were found, and not upon the prosecutor or prosecutors, plaintiff or plaintiffs; and in case no such proof shall be given, that such ribbands, laces, and girdles, were manufactured within Great-Britain, then the same shall, without any further proceeding, be taken and held to have been manufactured out of Great-Britain, and contrary to, and in violation of, this act; any law or custom to the contrary notwithstanding.

Provided always, and it is hereby declared, That if any such person or persons, in whose custody or possession any such ribbands, laces, or girdles, as aforesaid, shall be seized by virtue and in pursuance of this act (such person or persons not importing or concealing the same) shall discover, upon oath, before any one or more justice or justices of the peace, the person or persons who sold such ribbands, laces, or girdles, to such person or persons, in whose custody or possession the same shall be seized, so as that such person or persons so selling the same shall or may be prosecuted and convicted according to the intent of this act, as the seller thereof, in case the same shall be, or be taken and held to be, within the intent and meaning of this act, manufactured out of Great-Britain; such person or persons so discovering as aforesaid, shall be, and is and are hereby freed and discharged of and from all and every penalties and forfeitures by this

act inflicted, upon all and every person and persons, being a vender or venders, a retailer or retailers, having in their custody or possession, any such ribbands, laces, or girdles, as aforesaid, not made or manufactured in Great-Britain, and of and from any proof that such ribbands, laces, or girdles, so seized as aforesaid, are manufactured in Great-Britain.

Provided also, and it is hereby further enacted by the authority aforesaid, That nothing in this act contained, shall extend, or be in any wife construed to extend, to subject any person or persons whatsoever, who shall wear or make use of such ribbands, laces, or girdles, as aforesaid, as part of his, her, or their apparel or dress only, to any forfeiture, or to any pecuniary penalty or penalties inflicted by this act, or to any proof that such ribbands, laces, or girdles, are manufactured within Great Britain.' 3 Geo. III. c. 21.

SILVER, a metal too well known to need a definition. By the art of metallurgy it is found to be the finest, purest, most ductile, and most precious, according to its natural properties, of all metals, except gold. See the articles **METALLURGY** and **METALS**, and the several heads from thence referred to.

There are silver mines, more or less, in all the quarters of the world. See the article **MINES**. Those of Peru and Mexico, and of some other parts of America, are much the richest. See the articles **AMERICA**, **PERU**, **MEXICO**, and **ORES**.

The mineral stones or ores, dug out of the earth, are not all of the same quality, consistence, or colour; some are white and ash-coloured, others spotted with blue or red, and sometimes with both; others are black: these last are the richest, and the easiest wrought.—Others of a yellowish red, and of a greenish colour.

The usual way of separating silver from the ore, in Europe, is the same as that of gold: i. e. by means of mercury [see **MERCURY**] with the difference only of adding salt. See the articles **GOLD** and **REFINING**.—How silver ore is assayed, see the article **ASSAY**.

R E M A R K S.

In the large way of business, silver and gold ores are treated either by amalgamation with mercury [see **AMALGAMATION**], or by smelting and refining them with lead [see **SMELTING**, and **REFINING**]. That by amalgamation is only used where the ore is exceeding rich, particularly at the silver mines of Potosi: for by grinding such rich ores with mercury, the nobler metals will be drank up by it, and may be readily separated from it again by distillation; which carries over the quicksilver, and leaves the nobler metals behind. Lead is used with the poorer ores, in order to imbibe the richer metals they contain; which it does much after the same manner by fusion, as quicksilver does without it, so as to separate the heterogeneous parts, by keeping them floating, and afterwards restoring the nobler metals by cupellation.

The large way of smelting gold and silver ores is analogous to the small one of assaying [see **ASSAY**]; all things being proportionably larger, the fire animated with bellows, and the blast directed upon the surface of the melted metal, so as to blow off the lead in the form of litharge, before it is fully vitrified [see the article **LEAD**]. But here the silver is not perfectly refined at one operation; some proportion of lead still remaining mixed among it, that requires to be burnt out, after the same manner, in a stronger fire: and even

thus it is with great difficulty that silver can be obtained pure, or totally separated, either from lead or copper. This large way of working might, perhaps, be improved in respect of the vessel or test employed, and the management of the fire, so as to work by the means of flame, without the assistance of bellows.

With regard to the test, we are to observe, that bone-ashes, though ever so well washed and sifted, are not, perhaps, the fittest matter to make tests of; the test so made being apt to crack in the fire, unless dried, very gently, for many days, before they are used. But there is a particular kind of talc, or unvitrifiable sperth stone, that being calcined to fine powder, as it readily may, and made up with a small solution of vitriol in water, affords such tests as may be almost immediately used without danger of cracking.

Again; the flame of a wind-furnace may be made to play upon the surface of the melted metal, so as readily to perform this operation, without blowing with bellows, that violently tear away the silver along with the lead, in the form of litharge. And this farther convenience may be obtained, that not only smaller and cheaper wood, but even pit-coal, shall here serve for the fuel, provided the structure of the furnace be contrived for the purpose. And in some places, particularly in Flintshire, they have of late advantageously used common pit-coal for testing in the large way, and the same improvement might also be made in the small way of assaying. The methods of obtaining silver in purity are various, and differ according to the metal wherewith the silver is mixed or alloyed. If copper be mixed therewith, the best and cheapest way to purify the silver is, to calcine it with half its weight of common sulphur, then melt the whole together, and throw into the pot, at several times, a due quantity of clean and new iron filings; which will immediately make the sulphur quit the silver, catch hold of the iron, and form a scoria at top, leaving the silver free from copper, iron, or sulphur, at the bottom. See the article **FLUX**.

One method of separating **GOLD** from **SILVER** is by **QUARTATION**. See the article **QUARTATION**. See also that of **AQUA FORTIS** and **AQUA REGIA**, as applicable to **GOLD** and **SILVER**. See also the article **REFINING**.

Of trafficking in **SILVER BULLION**, see the article **BULLION**.

Of the fixing a **PAR** between **GOLD** and **SILVER**, see the article **COIN**.

Of silver bullion being a commodity, exportable as well as importable like other wares, see the articles **BULLION** and **COIN**.

Of the quantity of specie requisite to circulate the commerce of a nation, see the articles **CASH** and **CIRCULATION**.

Of the augmentation and diminution of coin in denomination, see the article **COIN**.

Sir Isaac Newton's representation laid before the lords of the treasury relating to the scarcity of **SILVER COIN**, and the measures taken to prevent the same. See the article **COIN**.

Of the laws of England relating to its coin, see **COIN**.

Of the exportation of silver by the East-India company in particular, see the articles **PEGU** and **SIAM**, and all other articles relating to the **EAST-INDIA TRADE**.—For further insight into subjects having an affinity with the circulation of silver, see the articles **CREDIT** [**PRIVATE CREDIT**] **PUBLIC CREDIT**, **FUNDS**, **DEBTS** [**NATIONAL DEBTS**], and **MONEY**.

In order to render our native commodities cheap and money plenty, see our articles **LABOUR**, **MANURE**, and **POOR**.

		to the lb. Troy.	
Portugal	-	1. 3 12	13 1. 46 16 0
English guineas	-	1 1	44 $\frac{1}{2}$ 46 14 6
			00 1 6
And the Portugal standard worse $\frac{1}{4}$ grain	-		00 2 6

Total worse lb. Troy by standard and tale 00 4 0

This, with the difference in point of exactness in coining, wherein the Portugal is much more defective than the English coins, may be very good reasons for their being refused in payments in any of the receipts of the public revenue; but answer very well the purpose of those who benefit by the irregularity, in trading with the heavier and passing off the lighter by tale; and which, if they can turn into guineas or heavy silver, make another gain.

How our standard is proportioned to that of other countries, and thence what the true par of exchange is between us, see the article COIN, where you will find Sir Isaac Newton's tables and the explanation thereof, and his representation afterwards to the lords of the treasury upon our coin.

S K I E, the biggest but one of all the western Islands of Scotland, is a part of Inverness, from which it is divided by a narrow channel. The soil is generally a black mould, though there is some of a red colour, wherein iron is sometimes found. The arable land is for the most part black, yet affords clay, white, red, and blue; and in some places there is fine white marble, various marcasites, [see MARCASITES] agate, and variegated stones; crystals of several colours, plenty of free-stone and lime-stone. Here are the lapis thecticus, the lapis ceraunius (a sort of cramp-stone) and plenty of good springs, some of which are medicinal.

It is very high land, both on the coast and within the country; and almost to the center of the island, there are seven high mountains that lie near one another. The soil is fruitful enough in the low grounds, and produces plenty of those species of cattle and corn, which are to be found in the other western islands; especially of the latter, for it supplies the neighbouring continent with barley and oats.

Cod and ling are common upon the coast, and herrings in great abundance, for the taking of which here are many convenient harbours and bays, with about thirty rivers that afford salmon and other fish. [See the article SCOTLAND.] The country is populous, the people handsome, and very healthy. Their cattle are horses, cows, sheep, goats, and hogs.

S K I N S. After various dressings of skins, some of which are only simply preserving them, others consist in penetrating, suppling, and strengthening the skin by means of oil on the flesh side only, (for the hair side is carefully covered during the operation) our furriers begin by employing the furs of our common wild beasts, such as foxes, pole-cats, moles, badgers, otters, rabbits, hares, mountain-cats, and some others, and they find means to make them valuable, by the judicious assortments they make of the most beautiful of them.

The mountain-cat is a very wild animal, bigger than the fox, and which, for its sparkling eyes, is looked upon by several naturalists to be the lynx of the Ancients. Its skin is, perhaps, one of the most beautiful in the world. But the creature is found in the forests of France as well as in other countries; and people there, as well as in other countries, had rather pay a high price for some skin of a dismal colour, and frequently counterfeited and dyed, if they can please themselves with the thoughts that it comes from some remote clime. It is true, that the northern parts of Europe and America furnish us with furs of great softness and lustre*. The countries which send us the most valuable, are Siberia on the confines of Tartary and Muscovy, Nova Zembla, Spitzberg, Greenland, Terra de Labrador, or New Britain, and Canada. The Ostiacks and Samoids†, who inhabit the northern parts of Siberia near the sea, venture on the ice into uninhabited countries, in order to hunt rain-deer, elks, and foxes. The tributes which the Tartars owe, some to the emperor of China, others to the courts of Persia, Constantinople, or Peterbourg, are paid in furs only: and those petits-gris, which the French merchants bring from China, probably are not the produce of China, but of Chinese Tartary.

* Wasserfchleb's Memoirs.

† Peyrere's Relation of Groenland.

Siberia is the true magazine of fine furs [see the article SIBERIA.] But our merchants do not go into that country, but purchase these goods either at Archangel or Peterbourg. The Czars have for a long time past claimed the whole property of the most valuable product of Siberia, as the fine skins, and the gold-dust which is found in some of their rivers: and the situation of the country facilitates this subjection.

Siberia is open only on the side of Tartary, of which it makes a part, and where furs are of little or no value. To the north and west it is defended by the ice: towards Russia it is hemmed in by a ledge of mountains, the passages of which are commanded by so many forts and barriers, where all those

who come out of the country are searched with the utmost rigour, even to the breaking up of the carriages, to see if there is nothing valuable concealed in them. The criminals, who are exiled from Muscovy to Siberia, are obliged to go a hunting. They are maintained, but their captures belong to her Czarinian Majesty. The other inhabitants who hunt likewise, are not allowed to sell their goods out of the country: but the best skins which they have to sell, must be carried to the governor of Siberia. He pays them somewhat above the common price, which is a mere trifle; then puts a stamp on them, and sends them to the senate of Russia, which distributes them at Moscow, Peterbourg, Archangel, and other places of trade. They hunt with gins, or long poles, or blunt darts, which either kill or stun the beast without injuring the skin.

The northern furs in most esteem are the sable, the black fox, the ermine, and the petit-gris.

The sable is a sort of weasel, found in Biscay, Prussia, Canada, and many other places; but the most esteemed is the Siberian, which we call xibiline: the blackest is the most valuable. But there are tricks played under the polar circle, as well as in the temperate zone. The Siberians and Russians have found out a way to dye the brown sable to the colour of that which is naturally of the most beautiful black. Lemon-juice is the best thing we know to discharge this artificial colour, and lay the cheat open.

The dearest furs of the Siberian sable are those which are made of the tips of the tails of this creature, and which can only serve for small things.

The black fox, which is as well known as the sable in the coldest countries, and is not common any where else, may undeceive us of a vulgar error. Some of them, indeed, are found perfectly white, which would naturally be of another colour in other countries: and some, which were brown in summer, turn grey or white in winter, and resume their colour in summer: but there are many which never change colour.

Ermine, so much esteemed for its whiteness and lustre, is also a kind of pole-cat, or weasel. Some dictionaries confound it with the squirrel, of which we are going to speak; and to increase the confusion, with the Siberian sable, although they are three different animals. The sable and ermine differ as much as black and white. In order to heighten the charming white of the ermine, the furriers usually prick them here and there with little black fuffs, which are bits of the skin of a lamb from Lombardy, which is of a very shining black.

The fourth furr, which we have from the North, is the petit-gris. It is the skin of the squirrel of cold countries. It differs from ours in this, that from brown, like ours, in summer, it turns grey in winter, and continues grey after death. Two very different sorts of furs are made of this skin. The black makes the petit-gris, and the belly is as white, and more shining, than ermine. It is bordered on each side with a black streak, which is carefully preserved. When the furr is alternately varied with the back and belly of the skin, it is much the richer: and this is what was formerly called the little vair, which frequently occurs in the coats of arms of some ancient families.

From that branch of the skinner's trade which dresses skins intire, we may pass to the other, which generally dresses them without the hair. It is subdivided into several classes, which have some operations in common, and others peculiar to each class.

Although there is a great difference between the dresses of shammoy, allum leather, Hungary leather, Morocco leather, [see LEATHER] the tanner, and parchment-maker; yet the skins which pass thro' the hands of these several workmen, ought to have been, for the most part at least, washed of the blood and impurities in a running water, set to drain, worked with the hands, or pounded with wooden pestles in a tub, or vat; put into the pit (which is made in the ground, and bordered with wood, or stone and mortar) filled with water, in which quick lime is dissolved, in order to loosen the hair, that it may be easily rubbed off, without injuring the skin; drawn out, and set to drain on the edge of the pit; stretched on the leg, or horse, in order to have the hair scraped off with a blunt iron knife, or sometimes with a cylinder of wood; pared off the flesh and membranes on the flesh side, and of the scabs, or roughness, on the grain side, with a sharp knife; rubbed with a whetstone on the same horse, to take off any particles of the lime, or other thing which may occasion hardness; thickened by different sorts of powders, whereby they become greater in bulk, and so much lighter, as gradually to rise to the surface of the water; stretched out green, or half-dried, and piled one over another, or put up separate, after being dried to a crust; hung out to air upon poles, lines, or any other way; which must be done several times in dressing small skins.

This alternate transition from the liquid of the air into that of water, and from water into the air, with the assistance of the lime, salts, and oil, opens the inmost fibres of the skin so effectually, as greatly to facilitate the introduction of substances proper for making them pliant, without rendering them thinner.

Natural philosophy would be much embarrassed to fettle the order and great number of these operations, by the dint of reason alone. But what the most penetrating genius has never been able to invent, frequent handling of the same thing brings a man to practise with success. Common workmen continue to do the same thing scrupulously by habit. One of them more expert than the rest, and whose experience makes up all his philosophy, oversees the whole, judges of the degree of dryness and moisture, of the hardness and softness, determines justly, and either repeats, lengthens, or shortens the processes.

These processes, though really the same in the four or five principal dressings of leather, are so different in regard to the manner of executing them, and the time required in them, that the knowledge of all the minute particulars is requisite for him only who intends to practise the trade. We will content ourselves with what constitutes the true objects of some of these trades; of the skinner, because this is of most general concern.

The allum leather-dresser dresses all sorts of white leather, from the ox-hide to the lamb-skin. He works chiefly for the saddler and glover. For dressing the saddler's leather, he uses bran, sea-salt, and allum. For that which the glover uses, after the common preparatives, he first employs bran, and then with salt, allum, fine flour, and yolks of eggs, mixed in hot water, he makes a sort of pap, with which the skins are daubed and fed, in a trough or tub.

The shamoy-dresser soaks in oil not only the skin of the true shamoy, which is a wild goat, but likewise those of all other goats, though much inferior to the true, and even sheepskins, which he dresses like shamoy.

The tanner uses the bark of young oaks, from 18 to 30 years old, ground in a tanning-mill, in which he soaks skins more or less, according to the different services expected from them, and their chief use is to remain firm, and keep out water.

Whereas the tanner's way of dressing leather, in lime and tan, takes up two or three years; the Hungarian leather-dresser allows but three or four weeks to that which passes through his hands. He supplies the harness-makers, saddlers, belt-makers, and all other trades that use not only white and allum leather, or oiled and tanned leather, but also skins coloured grey with ink, and dressed in tallow, which is the distinctive work of the Hungarian leather-dresser*.

* Our curriers in England dress this sort of leather.

His name (Hongreyun in French) and method came from Hungary, whither a French workman went, by order of Henry IV. to learn the trade by stealth, and thereby to lower the price of harnesses and several other things made of leather, wanting in his armies.

The tanner in certain cases, instead of tan, uses redon, which is a plant cultivated in Gascony, and very common in Polish Russia. It serves chiefly for tanning rams and sheepskins, which the French call bassanes: but it is also used in dressing Russian leather, which the Polish Russians make a great mystery of, though there is a very good manufacture of that sort at St Germain en Laye.

The confit and fumach are in little use but for Morocco leather. The confit, into which goatskins are put after the common preparation, is a large tub of warm water, wherein they are thrown, after having dissolved therein a very cheap substance, taken from the animal kingdom, and that is the sweepings of dog-kennels.

The fumach is taken from the vegetable kingdom: it is a dust which comes on the leaves and small branches of the plant called rhus, or sumach. It is sumach, with galls and allum, that the Morocco leather-dresser chiefly uses, whose intention is to give a grain to goat skins, and thereby to render them susceptible of the most beautiful colours. They call grain those little wrinkles, or furrows, which run all over the surface of Morocco leather, as also that of calves and cows-leather, which they bring to a resemblance of it, by dint of washing, pounding, washing again, wringing, and folding the skins different ways. We shall say nothing either of the water tinged with rust of iron, which serves to give a black colour, nor of the lac, and other substance, which colour the skins red, yellow, &c.

The workmen who give the grain, and the most lively colours, to the skins of shamoy, or other goats, and who dress calves and sheepskins in the same manner to imitate Morocco, make a great secret of certain parts of their art, which they say are the nicest parts of it. The precautions and mis-trusts of tradesmen are sometimes very diverting. In my walks among them, I found a rope-maker who refused to let me take a draught of the mechanism of making a horse-girt, without a compulsive order.

As the grain and beautiful dyes of goatskins are the work of the Morocco leather-dressers, the last preparation and dyes given to certain tanned leather, are the business of the currier: so, likewise, when skins dressed white by the skinner, are destined for writing or drawing, the parchment-maker puts the finishing hand to them.

VOL. II.

REMARKS.

Skins, and the hair of beasts, manufactured, become parchment and vellum, leather, of which are made shoes and boots, saddles, harness and furniture for horses, gloves and garments, coaches and chairs, household stuffs, covers of books, drinking vessels, &c. and furs for cloathing, hats and caps. These branches of trade that are derivable from the skin-trade, render it a very considerable concern, and well deserving preservation as much as we can within ourselves.

The English have greatly increased their quantity of furs and skins of all sorts, from their northern colonies, since they have settled and planted northward to Nova Scotia, Annapolis, and other places towards the river Canada.

These several sorts of skins brought to Europe from these parts, are of the following kinds, viz. deer-skins, bear, beaver, otter, raccoon, fox, elk, cat, wolf, marten, mink, musquash, fisher, &c. all which furnish us with materials within ourselves to carry on divers valuable and extensive branches of our commerce, without being obliged to import them from other nations; and for which raw materials we pay in the manufactures of England, Scotland, and Ireland, and thereby the mother-country, as well as our colonies, become more and more enriched. And this is likely to be the case to a very considerable degree; since CANADA is annexed to the crown of Great-Britain by the Treaty of 1763. See AMERICA, CANADA, MISSISSIPPI, INDIAN AFFAIRS in NORTH-AMERICA.

SLAVE TRADE. See AFRICAN TRADE, and ENGLISH AFRICAN COMPANY. See also DUTCH AFRICAN COMPANY, FRENCH AFRICAN COMPANY, and PORTUGUESE AFRICAN COMPANY.

SLESWIC, or SOUTH JUTLAND. This duchy is an ancient dependence on the king of Denmark. It has North Jutland on the north, from which it is separated by a line drawn from the city of Bypen, on the German Ocean, to Colding on the lesser Belt; on the east it is bounded by the Baltic; on the south by the duchy of Holstein; and on the west by the North Sea or German Ocean. Its greatest length, from the south-east to the north-west, is about 86 miles, and its greatest breadth, from east to west, about 60. It is watered by a great number of rivers, which render it very fruitful; it abounds with meadows and pastures. The eastern part of this duchy lies higher than the western; and in the latter there are large plains, which produce a great plenty of all sorts of corn.

The islands of North Strand, Fora, Sylt, Amron, Rom, and Manoc, belong to this duchy.

It is divided into several bailiwicks.

The whole duchy of Sleswic belongs to Denmark, the king having conquered it, during the minority of the duke of Holstein, in the late war of the North; and the possession has been secured to him by the guaranty of the kings of Great-Britain and France. The nobility of this province is very powerful, and divided into four circles, which are, those of Hadersleben, Tonderen, Flensburgh, and Gottorp. The chief towns in the duchy of Sleswic are as follow:

SLESWIC, or SLEWZWIC, the capital of this duchy, is seated on a small arm of the sea, called the Sley, at the distance of about 22 miles from Keil, toward the north-west, 38 from Gluckstadt, to the north-east, and 28 from Lunden, to the east.

In 1100 it was a place of very great trade, and much frequented by merchants from Great-Britain, France, Spain, Flanders, &c. This city was even so considerable, that Adam Bremensis, who flourished about the year 1100, called it Civitatem opulentissimam ac populosissimam, a most rich and populous city: but its trade is now almost dwindled to nothing. The soil, especially towards the south and east, is not very fruitful, but the town is sufficiently supplied with all necessaries of life from the neighbouring country, and the Sley affords abundance of fish. They brew beer here, which is not very palatable, but they import some from abroad, as well as wine, which is here pretty cheap.

GOTTORP was the ancient seat and patrimony of the dukes of Holstein, the chief branch of which family, after the royal one, took from thence the title or surname of Gottorp. It is about six miles distant from Sleswic, to the south-west, and stands on the Sley, which almost surrounds it, and carries vessels of small burthen to and from the Baltic.

ECRENFORD stands on a little gulph on the Baltic, which makes a very commodious haven, and affords a pretty considerable trade, it being one of the safest ports on that shore; it is about 22 miles distant from Gottorp to the east, and six from Kiel, towards the north.

FREDERICKSTADT, was thus called from its founder Frederick duke of Holstein and Sleswic, who built it in the year 1621, peopled it with Hollanders, and granted them great privileges. He endeavoured, also, to settle a silk trade there, and, for that purpose, sent a famous embassy to Mulcovy and Persia, which gave occasion to Adam Olearius, secretary of it, to publish an account thereof, in an excellent book

of travels. This town stands on the banks of the river Eyder, and is 42 miles distant from Sleswic, towards the west, and 42 from Gluckstadt, to the north.

TONINGEN is also situated on the river Eyder, 10 miles below Frederickstadt, and about 14 from the German Ocean. It is not an ancient town, but it has a pretty good trade, which increases daily, by means of its commodious harbour, formed by the Eyder.

HUSUM, the capital of a bailiwick of the same name, stands on the gulph of Hover, and is about 10 miles distant from Toningen, to the north, and 20 from the German Ocean. It has a harbour capable of small vessels; and as the neighbouring country abounds with pastures, they keep here, every week, a market for cattle; and it has been observed, that, in time of war, they have fold here above 4000 horses in a year. In the gulph on the west of the town, they fish vast quantities of excellent oysters.

FLENSBURG, the capital of a bailiwick of the same name, is so called from the bay, or gulph of Flens, on which it stands, and which is formed by the Baltic. The town is about eight miles distant from Sleswic, to the north, and near 30 from Toningen, to the east. The bay, on the bottom of which it stands, makes here a fine haven, where ships of great burthen may ride safe, and come up to the very warehouses, to load and unload. On the land side it is encompassed with mountains, which shelter it from winds, and supply it with water.

APENRAGE stands on another gulph of the Baltic, and is 16 miles distant from Flensburg, to the north-west, and about 14 from Husum, to the east. It has a port at the bottom of the bay, which is much frequented by the Danish fishermen, and affords it a pretty good trade with the adjacent islands: this is also the chief place of a bailiwick of the same name.

HADERSLEBEN is a good sea-port town, near 20 miles distant from Apenrade, to the north. It is watered on the west by the lake of Hadersledam, and on the east by the canal, or gulph, called Haderslebsoerd, which is so shallow near the town, that vessels of burthen are obliged to anchor at the distance of two miles from it. That gulph into which the lake runs is very narrow, and about nine miles lower falls into the Baltic Sea. The country about this town abounds with fruitful corn-fields, and excellent pastures, which, together with the fish taken out of the lake and gulph, render this a pretty flourishing place.

TUNDER, or **TUNDEREN**, a small but well-built town, stands on the southern bank of the river Wydaw, about 12 miles distant from Hadersleben to the west, 20 from Husum to the south, and near 14 from the German Ocean. It lies in a fruitful soil, and had formerly a considerable trade, which is now lost, its harbour being choked up with sand *.

* This is an instance, amongst numberless others in this work, to shew that when trade declines, poverty ensues.

The most considerable islands adjacent to the duchy of Sleswic are as follow:

NORTHSTRAND, in the German Ocean, lies overagainst the bailiwick and town of Husum, and was, it is said, separated from the continent by a violent storm. When it became an island, it was about 12 miles long, and four broad in some places, and in others less. Its soil is very fruitful, and produced abundance of corn before the great inundation that happened; it had also very fat pastures, where they fed exceeding good cattle: and they used to send daily to Husum, and other places, a prodigious number of sheep, fowls, ducks, and geese, and great quantities of butter.

AMRON, or **AMROEN**, is a small island to the north-west of Northstrand, from which it is about seven miles distant. It is in the form of a crescent, and is not considerable, but for its oyster-fishery.

FORA, **VOOREN**, **FOCTER**, or **FOCBER**, lies towards the north-east of Amron, nearest the coast of Sleswic, between Northstrand and Sylt. It belongs to the prefectorship of Tunder, and is of an oval figure, about six miles in length, and four in breadth. It abounds in cattle and corn, and has about 4200 inhabitants, and several villages.

SYLT lies to the north of Fora, from which it is separated by the Rode Tist, or Red Channel. It is of a triangular form, about 14 miles long. The greatest part of its soil is nothing but sand and heath; but towards the east and west there are some pastures, where they feed cattle. There are no woods here, and the people are obliged to fetch from the continent what they want for firing. Their number amounts to about 1750 souls. A great part of the men and boys set out every year for the whale-fishery on the coast of Iceland, Greenland, and Spitzbergen.

ROM, or **ROEM**, towards the north-east of Sylt, is about seven miles long, and about four broad, and has about 1500 inhabitants, and several villages. The eastern coast of the island has good pastures, and on the west there are harbours capable to receive middle-sized vessels.

There are several other islands on the coast of Sleswic, but they are so small and inconsiderable, that they do not deserve mentioning.

SLIGO, or **SLEGO**, a county in Ireland, lies full upon the sea, to the north and north-west, where it is also bounded by the river Trobis; it has Mayo on the west; part of that county, and Roscommon on the south; and the county of Leitrim on the east. The greatest extent from north to south, is 35 miles, and from east to west, 33; or, as some say, 44, it being very unequal both ways, and runs out in a point to the north, as far as Donnegal-Bay. It is computed to contain 241,550 acres. Great part of the country is mountainous and boggy, but its lower grounds and bottoms have a good soil, both for the ploughman and the grazier.

SLEGO, which lies on a bay of the same name, is a market-town, and the only town of note in the county. It has a very commodious harbour, and ships of 200 tons may come up to the town-key. The town is populous, but not large, nor is the trade here considerable, though much better than in any of the other places beyond it.

S M E L T I N G, among metallists, the melting of the metal in the ore, in a smelting furnace, in order to separate the metallic from the earthy and other parts. Smelting, in propriety, is restrained to the large way of working upon ores from the mines, and reducing them to a pure metal, so as to fit the produce for civil, mechanical, and oeconomic uses. For the methods of smelting the several metals from their respective ores, see the articles **COPPER**, **LEAD**, **TIN**, **IRON**, **GOLD**, **SILVER**, and **MERCURY**. See also the articles **ASSAY**, **FLUX**, **METALLURGY**, **MINERALOGY**, **MINES**, **MINERALS**, **ORES**, **REFINING**.

Preparatory to the smelting of ores, the following operations are requisite.

EXPERIMENT I.

The method of roasting of ores.

We took a pound of the common Cornish mundic, and breaking it into small lumps, exposed it upon the grate of a furnace, whilst the fire was made below, and thus at first gently heated and terrified the mundic; but afterwards by degrees increased the fire, so as to make the lumps glow, or appear red-hot: in which state we kept them for half an hour, or 'till no more sulphureous vapour, or stench, rose from them.

OBSERVATIONS.

This experiment shews the common method of roasting ores, in order to discharge their sulphureous, arsenical, or antimonial parts, that might otherwise hinder their fusion, or else carry off a considerable proportion of the truly metallic matter in melting. For fear this metallic matter should fly off, we made the fire gentle at first, but increased it, by degrees, 'till the lumps became red-hot, otherwise the sulphur would not quit its hold, for sulphur requires a naked fire, and the assistance of the open air, before it will burn, or go intirely off.

The richer and more tractable ores have no occasion to undergo this previous operation of roasting, but are usually committed to fusion soon after being dug up, and separated from their stone, or mine. However, if they contain any considerable quantity of sulphur, or arsenic, it is usual to roast even these a little.

But some copper ores are so refractory, or hold their sulphur so tenaciously, as to require many roastings before they will let it go, being either stamped or melted after every operation; so that all the parts may, at several times, be equally exposed to the fire, and have their sulphur discharged.

In the large way of business, which is smelting, this operation is usually performed in a trench, cut somewhat aloope on the ground, that the air may have the freer access at the bottom; then they place a layer of billet-wood in the trench, and upon this a layer of the ore, in little lumps; and so continue, interposing a layer of wood and a layer of ore, for three or four stories, when the pile being completed, they set fire thereto, and make it continue to burn slowly for several days together, during which time there arises a large quantity of sulphureous vapour, that may be perceived to a considerable distance.

But when the ore, by repeated roasting, stamping, and fusing, is become tolerably pure, they now finish the operation, by throwing it into a particular furnace, having a funnel to increase the draught, so as to make the fire the stronger, and discharge the sulphureous fumes in greater plenty. And this furnace is so contrived, that the open flame of the wood may play directly upon the ore; whence all its volatile part is separated, and the remainder left fit for the last washing and stamping.

When the ores contain a large quantity of sulphur, this usually sweats out, and runs down into cavities made on purpose to receive it, whence it may be laded out, and cast into moulds. But perhaps the most frugal method of roasting ores, so as to save, or collect, all the sulphur, or arsenic, they contain, is not generally known and practised: for, in the common way, a large proportion is lost, which may be collected, by means of a proper hood, in the form of flowers; and also the rising fume might, by a particular structure of the

the furnace, be made to pass into a large vessel of cold water, and there be condensed, as we see in certain chemical distillations and sublimations.

After the poorer and more stubborn sorts of copper ore have been thus successively roasted, and come to be quenched in water, or washed, they often impregnate the water with a vitriolic matter; so that sometimes profit may be made, by evaporating these waters, and suffering the vitriol to shoot: for the acid part of the sulphur, here separated by the fire, is greatly disposed to enter the metallic part of the ore, and dissolve it, so as to form an actual blue vitriol, or vitriol of copper, which sells for a considerable price.

And here it should be remembered, that ores rarely yield the less metal for roasting, unless the fire were made too strong, especially at the first: for when the yield proves small, the general complaint of the smelters is, that the ore, when sent to their furnace, was too little roasted; though indeed the fault is often their own, in neglecting to make the fire sufficiently brisk and strong from the first, which is a very considerable secret for increasing the yield of an ore.

There are, however, some reasons to believe, that many imperfect ores lose considerably of their metal by roasting, especially when they are mixed with arsenical or antimonial matters, which have a known property of volatilizing the impurer metals, and carrying them off in fume: whence, doubtless, it is that some poor ores and mundics are commonly treated with little success.

The remedy, in this case, we apprehend to be the due use and application of some fixing substances, whether of an absorbent, alkaline, or neutral nature; such as quick-lime, kelp, or pot-ash, dry river mud, clay, iron-filings, or the like, mixed, or stratified, along with the ore. And by certain additions of this kind, we doubt not but the yield of some poorer ores might be considerably increased.

The business of roasting of ores may be improved, and reduced to a few easy rules. (1.) We see it is of two kinds, or simple and compound; that is, either with or without addition. No addition is wanted when the ore proves rich, or in itself nearly of a metallic nature, as some ores are found to be; but additions are principally required, when arsenical, antimonial, or sulphureous matters are naturally mixed with the ores.

(2.) The fire is to be so regulated, from the first, that only the lighter, or more volatile, sulphureous, or arsenical fumes, may go off, otherwise the more metallic part also would fly away, and, without some proper contrivance to catch it, be lost. Yet the ore must feel the force of an open flame at last, otherwise all the sulphur, arsenic, antimony, and other immature mineral substances, will not be dislodged.

(3.) The more these immature substances abound in the ore, the gentler the fire should be at first; and when the greater part of them is thus exhaled, the fire is to be quickened by a freer admission of the external air.

(4.) Lastly, where such additions are used as are not metallic, for example, lime, mud, &c. they ought to be separated by stamping and washing, before the infusion, which would otherwise be hindered, or uselessly incumbered.

EXPERIMENT II.

The method of stamping and washing of ores.

We took the mundic roasted in our former experiment, and beat it fine in a metalline mortar; then feared it; and now putting it into a budding-dish, we washed it in several waters, with care to separate the heavier portion from the lighter, and drying this heavier part, which is always the more metallic.

OBSERVATIONS.

These operations of stamping and washing are not necessary in the richer sorts of ores, but sometimes absolutely required in the poorer and more stony kinds. If a large quantity of more stony matter adheres to the ore, it is sometimes knocked off with hammers, so as to leave the more metallic part free from this barren or superfluous substance.

If still the ore proves hard and flinty, it is sometimes softened by lying, for several months, exposed to the open air, which thus renders it fit for the stampers, though it sometimes also requires to be ignited, and quenched in water, to fit it for that purpose. Thus a large heap of hard, and otherwise untractable ore, may be heated red-hot, by interspersing it with billets, and setting them on fire; after which it may readily be quenched, and rendered friable, by throwing cold water upon it, or by driving and passing a small stream of water through it, from some adjacent river. And sometimes this operation is required to be repeated, before the ore will grow soft and tractable.

It is usual to stamp most ores in a state of moisture, or wetness, to prevent the avoilation of their dust, or powder, but especially such as require much washing to separate their barren and lighter earthy parts, which would otherwise uselessly encumber the smelting-furnace. To perform this stamping the more commodiously, a stream of water is made to pass under the stampers, so as to make various windings and turnings, and, in part, run into certain cavities, made on purpose to catch and detain the heavier matter, whilst the lighter is washed away to a greater distance by the current.

But the method of washing the ores of the nobler metals is more exact and curious, particularly in washing of sand for gold, on the banks of the Rhine and Danube, where gold is frequently found, especially in such places where the sands are raised into large heaps, or a kind of mountains, by the rapidity of the stream.

These sands are usually washed by the hand, in a particular long trough, made with a descent, or current, for the purpose, and lined at the bottom with flannel, for thus the sand being artificially agitated with the hand, the lighter and larger stony matter rises uppermost, whilst the heavier descends, and is caught in the pores of the woolly cloth at the bottom: in the mean time, the lighter matters are washed farther off, by a stream running down the declivity: and when the flannel has thus collected a considerable quantity of the richer metallic matter, the whole cloth may be easily taken off, and rinsed in a proper vessel of water, where all the metallic matter, before adhering to it, readily falls off, and sinks to the bottom of the vessel; where, the water being decanted, the metal may be collected alone, and dried. And this is the method of procuring the gold, where the sand is fine, or extremely small.

In the large works, or where the gold is mixed with big sand, gravel, or stones, they make use of wire sieves, whose mesh is always of one certain size; so as readily to transmit the fine sand, or gold dust, and retain the larger gravel and stones behind: for it is extremely rare to meet with any grain of gold, so large as a barley-corn, in the sands of rivers. Whence this method by the sieve is highly serviceable, and conducive to the former operation: for though a large quantity of fine sand, thus presses the sieve, it may be readily separated in the trough; after the method already described.

And this may suffice to shew the general and particular methods of stamping and washing of ores. We see the end of these two previous operations; is to get rid of the matters which are not metalline; that so the furnace may not be uselessly employed upon such substances as will themselves yield no metal in the fire; and only hinder the metallic parts of the ore from coming together, and affording a yield answerable to the expence and trouble of the fusion.

After the heterogeneous parts have thus been thrown off, by roasting and washing, from the proper earth of the ore, the pure metal now remains to be separated from this earth by fusion.

But there are two difficulties, at least one or other of them, always found in this affair. For, (1.) This proper mineral earth, how flexible soever it may prove in gold and silver, yet scarce comes up to the fusibility of the pure metal, but rather flows thick and sluggish, unless the fibre be very intense indeed: but 'tis plain, that if this substance remains viscous, the molecules of the metal cannot sink through it, in order to form a metalline mass at the bottom. (2.) Sometimes only, a very small quantity of pure metal lies concealed in a vast body of such adhering earth, or wrapped up with the matters of other metals; whence one of these two inconveniences must arise, viz. either that the small quantity of metal cannot well, under so great a bulk of slag in fusion, as in the ebullition to be again involved, as it were, in little drops or bubbles, among the pappy mass of the scoria*.

* Scoria is the dross, crust, or slag, found at the top of a melted metal, or metallic matter; being often in the form of a vitreous mass, or glassy matter, and proceeding from the flux employed and united with some stony recrementitious matter contained there. But when a large proportion of a saline flux is used, the scoria will dissolve, or give, by the influence of the air.

These two inconveniences have their two remedies. (1.) The first is to add such substances as promote vitrification, and at the same time cause a thin flux of the vitrified body. Such substances [see the article FLUX] are for the large work, SAND, FLUXILE MUD, ALKALINE SALTS, TARTAR, NITRE, &c. and for the small, GLASS OF LEAD, a little BORAX, or any compound flux salt; the basis whereof is commonly tartar and nitre. (2.) The second is to add metal itself: this is a common way, and seems greatly improveable, if it can be brought to answer the expence. In this case, as a greater mass of metal cannot, by the same fire, be so much agitated and tossed about, as a less; or if it could be agitated as much, yet all its particles would cohere more firmly, in a large mass, than in a small one; hence, by such an additional metal, the little mass that would otherwise be with difficulty collected from the several falling particles of the melted matter, is artificially enlarged, so as to cover the whole bottom of the melting pot; in consequence whereof, all the single metallic particles that fall afterwards, are easily caught and detained below, by the large metalline mass, which there lies ready to receive them.

The metal usually employed to encrease the mass in this manner, is lead: but Becher, with great probability of much better success, recommends the use of silver in its stead, where the

the perfect metals are expected. For silver, in this case, does not only remain unaltered by the fire and flux, but also by a specific efficacy, not to be known but by trial, collects together, and fixes the same potential atoms of the metallic principles that are lodged in an exceeding subtle form, remote from one another, up and down in the ore, and actually deduces them to perfect metal. Upon which property of silver it is, that Becher has built his *minera arenaria*, sand mine, or inexhaustible method of extracting the perfect metals out of sand; where, by using silver instead of lead, he undertakes to produce a ten times greater increase of the nobler metals.

But as this latter method can only, or principally, be used to profit in the separation of gold from its ore, by fusion; so lead remains a very convenient addition for the reception of silver, as performing a double use in the operation, viz. by imbibing the metal pure, and at the same time promoting the vitrification of the earth, mixed along with the silver.

Copper being in itself of difficult fusion, requires such a fire as is able to melt its glassy scoria sufficiently thin, at the same time that it is melted itself; and this it does, unless the flints should prove very obstinate indeed. Hence bare fusion, sometimes without any other assistance, will bring out this metal from its ore, and throw it down into a mass, the scoria here flowing so thin, as readily to suffer the metalline particles to sink through it; but when the ore is more stubborn, its separation may be promoted by metalline, or other additions, as above-mentioned.

In short, the difficulty of thus separating the metal from its proper earth, is principally founded in the ores of silver, gold, and copper; but lead and tin being very fusible bodies, are much easier melted from their adhering mineral matter.

There are, upon the whole, three things to be principally regarded in the smelting of ores, viz. (1.) The fusibility of the metal. (2.) The fusibility of the scoria. And, (3.) The contact or mixture of the metallic matter, with the inflammable part of the coals.

(1.) Different metals run in different manners from their ores. Thus lead, though extremely fusible in the metal, yet runs with difficulty from the ore, so as to require a considerable violence of fire. This stubbornness not belonging to the metal must be attributed to the stony, sulphureous, or other mineral matter, wherewith the ore is mixed; which matter seems to require a degree of heat, capable of vitrifying the lead, before the metal will run: but then, the lead thus vitrified, recovers a metallic form again, by coming in contact with the coals, especially charcoal.

Tin runs from its ore with greater ease than lead, and is therefore smelted in much less furnaces; but copper requires an intense heat, or a blast furnace; and iron, the greatest heat that can be given in a furnace: and both iron and copper absolutely require immediate contact with the fuel employed. Hence it appears, that each metal must have its determinate degree of heat, to run it with advantage from the ore or stone.

In order, likewise, to obtain the metal from the ore, to best advantage, the scoria, or slag, must be necessarily made to run thin and fluid; otherwise it entangles or inviscates the metal, and will not let it separate fully. And hence we frequently observe, in the assaying of copper ores, small grains of metal interperfed here and there among the scoria, that require to be separated by stamping and washing the whole mass; which labour might have been prevented, by using a proper degree of heat, capable of procuring a thin fusion, and a suitable flux, so as to have made all the metal fall to the bottom of the furnace; which it frequently does, when the operation is well performed, by means of a well-adapted flux.

To promote a thin fusion of the slag, in the larger furnace, it is often proper to use the more soft and fusible sands as a flux; and sometimes that loamy sand, which the smiths employ for the welding of iron; this sand readily vitrifying, and adhering to the metal in the fire: and, where it will answer the charge, even litharge, or dross of lead, might be used for this purpose in the larger furnace; for scarce any thing procures so thin a fusion of the slag as lead.

In the large work, sulphur is found to adhere tenaciously to copper; which metal, therefore, seldom comes out pure in the furnace, without repeated fusions. The best method of separating this sulphur, is, to use a violent heat, no additional flux at all, and the greatest draught of air that can any way be procured; so that all things may conspire to burn out, or carry off the sulphur, and introduce in its stead, a thing of a different nature, viz. the inflammable matter of the wood and coals, and the vitrification of their ashes; whereon ductility appears to depend. But where iron is mixed with copper, no better addition is found than sulphur, and the more sulphureous marcasites, or what they, at the smelting-huts, call *marcasite-blocks*: for the sulphur which these contain, causes the copper readily to run away from the iron, and leave it behind in the furnace. And here the power which sulphur has upon the several metals, is very remarkable: it renders silver almost as fusible as lead: it also greatly increases the fusibility of iron, and regulus of antimony; but renders tin much less fusible than it is of itself;

and lead, even refractory in the fire: whence certain rules might be formed, for the use and application of sulphur to metals, for the improvement of metallurgy. And thus the whole art of smelting seems to depend upon knowing the degree of heat required by every ore; so as to make the slag, as well as the metal, run thin, and evaporate or discharge the sulphureous parts; and lastly, introduce the proper metallic, ductile form, by means of some unctuous or inflammable matter.

It seems principally owing to a defect in the knowledge of fusion, that so many recrements, or slags of metals, anciently thrown, as useless, from the furnace, have been wrought to considerable profit, of late, by more skilful workmen; at least, it seems more rational to attribute the success to this course, than to any supposed growth of metals in such slags: so, likewise, it is currently believed, that lead has grown rich in silver, by lying exposed to the open air, or by long covering churches, or other buildings; whilst, perhaps, it is rather owing to the unskilfulness of the former workmen, who were not able to separate all the silver naturally contained in the lead.

And thus it appears certain, that the ancient metallurgists were unacquainted with any way of extracting, to profit, a small quantity of silver out of copper; which is now commonly done by ingenious contrivance: whence the ancient copper, found upon temples, or other buildings, frequently contains silver. So likewise, in the forest of Dean, they at this day work the slag of their old iron works over again to profit.

SMOLENSKO, a duchy and palatinate in Muscovy.

This province is styled the great duchy, or palatinate, and extends about 200 miles from east to west, though not half the breadth from north to south. It hath on the north, the principality of Bela; on the west, Lithuania, unto which it formerly was subject, 'till subdued by the Muscovites; on the south, it hath the duchy of Severia; and, on the east, that of Moscow.

The river Nieper, or Boristhenes, hath its spring-head on the north-east borders of this province, and runs quite across it, directly from east to west. As for the territory, it is not over fertile; but abounds with several kinds of wild beasts, whose skins fetch a good price. It lies from the 55th to the 56th deg. 30 min. of latitude. Its chief cities and towns are,

SMOLENSKO, **ZUERCOVA-LOUKI**, **GRAVISK**, **DRAGABUSA**, and **BOGLOVESTINE**; all of them inconsiderable, except

SMOLENSKO, capital of the duchy, which is pleasantly situated on the Nieper above-mentioned, near the confines of Lithuania, and is a large and well-built populous city. It is almost surrounded with woods, wherein are taken the best furs in all Muscovy.

As it stands on the frontiers, between Muscovy and Poland, it hath often shifted from one to the other, 'till yielded, with the whole province, to the czar, by the treaty of 1686.

SMUGGLER, a cant word for one that illegally evades the payment of the duties, laid by the state, on any kind of merchandize.

An Abstract of the chief LAWS of ENGLAND relating to SMUGGLERS.

By stat. 8. Geo. I. cap. 18. Any persons found passing knowingly with any foreign goods landed without due entry and payment of the duties, from any of the coasts, or within twenty miles thereof, and shall be more than five in company, or shall carry any offensive weapons, or wear any mask or disguise, when passing with such goods, or shall forcibly resist any officer of the customs or excise, in seizing run goods, shall be guilty of felony, and transported for seven years; and if he return before that time, it is felony without benefit of clergy.

And all persons receiving or buying any goods, wares, or merchandizes, clandestinely run or imported, before the same shall have been legally condemned, knowing the same to be so clandestinely run or imported, being convicted on the oath of one or more credible witnesses, or confession, before one justice of peace, shall forfeit 20 l. to be levied by distress and sale, &c. and for want of distress, shall be committed to prison, without bail or mainprize, for three months; the one moiety of the above penalty to the informer, the other to the poor of the parish where the offence was committed.

All seizures of vessels or boats of 15 tons or under, which shall be made after the 25th of March, 1722, by virtue of act, 1 Ann. cap. 7. for granting to her Majesty new duties of excise, &c. and of an act for continuing several impositions, &c. to raise money by loan for the service of the year 1710, or any other act relating to the revenue of customs for carrying uncustomed or prohibited goods from ships inwards, or for relanding certificate or debenture goods from ships outward-bound; and all seizures of horses, or other cattle, or carriages whatsoever, for being used in the removing, carriage or conveyance of such goods, contrary to the said acts, are to be examined into, proceeded upon, heard, adjudged, and determined, by two or more justices of peace,

peace, residing near the place where such seizure shall be made, whose judgment shall be final, and not liable to appeal or certiorari. Stat. 8. Geo. I. cap. 18.

Any two justices for London and Westminster, shall have the like power in determining such seizures as shall be made within those cities, as any two justices of any other county or place have. Ibid.

This act to continue for two years commencing from the 25th of March 1722, and from thence to the end of the next sessions of parliament.

By 6. Geo. II. when any officer of the customs shall neglect to seize and prosecute any vessel, horses, or carriage, which shall be forfeited for running of brandy, such officer being convicted upon the oath of one witness, before one justice of the peace, shall forfeit for every neglect 50 l. one moiety to the king, and the other to the informer, to be levied by distress and sale of the offender's goods, by warrant of such justice; and, for want of such distress, such offenders shall be committed to prison for six months.

By 9. Geo. II. cap. 35. intitled, An Act for indemnifying persons who have been guilty of offences against the laws made for securing the revenues of customs and excise, and for enforcing those laws for the future, it is enacted, That all his Majesty's subjects, their heirs, &c. who before the 27th of April, 1736, have incurred any penalty by clandestine running of goods, &c. making false entries of goods, or abusing officers, &c. shall be indemnified; and may plead the said act for their discharge; paying only 1 s. 4d. for entering the plea, provided that they stop all proceedings brought against officers, or their assistants, for, or concerning any matter, cause, or thing, committed by such officer, or his assistants, on occasion of any offences, &c. intended by the said act to be released and discharged; and in case any person shall claim the benefit of this act, and shall afterwards bring an action against an officer, &c. such officer, &c. shall be discharged, may plead the general issue, &c. and may recover costs against such plaintiff.

All persons taking, or being intitled to, the benefit of the said act, and shall be afterwards guilty of the like offences, shall be liable to be prosecuted for both the former and new offence, and for smuggling bonds, &c. The act is not to discharge any judgment for monies actually levied, nor the informer's part of the penalty; and all persons liable to be transported for any such offences, committing the like after claiming the benefit of the said act, shall suffer death as a felon, without the benefit of clergy; and all persons neglecting to pay composition money (before agreed to be paid) shall be excluded from the benefit of the said act.

Excepted out of the said act, all seizures of goods, vessels, &c. money due on entry of goods or bond debentures, fraudulently obtained, and actions depending; and the treasury may compound, in cases where judgment was given for his Majesty on the 11th of May, 1736, relating to debentures, &c.

That from and after the 24th of June, 1736, upon information, upon oath, before any one or more justices of the peace, that three or more persons, are or have been, after the said 24th of June, 1736, assembled together for any the purposes aforesaid, and are or have been armed with fire-arms, or other offensive weapons, may grant a warrant for apprehending them, and may (if upon due examination he or they find cause) commit them to the next county gaol, there to remain without bail or mainprize, until discharged by due course of law; and upon conviction of their being assembled to assist in the running of goods, they shall be transported for seven years, as other felons, by the acts of 4 and 6 Geo. I. and returning before the expiration of such term, shall suffer death as felons, without the benefit of clergy.

Any person apprehending any other person, guilty of any of the last-mentioned offences, shall have a reward of 50 l. and the like sum of 50 l. shall be paid to any person maimed in the apprehending; and if any one is killed, his executors shall have 50 l. and an offender discovering two or more accomplices, within three months after the offence committed, to the commissioners of the customs, shall himself be discharged, and shall be intitled to the like reward of 50 l.

That from and after the said 24th of June, 1736, if two or more persons are found passing together within five miles of the sea, or a navigable river, with horse, carts, &c. whereon shall be laden six pounds weight of tea, or five gallons of brandy, or other spirits, &c. not having paid the duty, and having offensive arms, or being masked, &c. shall be deemed runners of foreign goods, within the meaning of the act of 8 Geo. I. and the proof of the entry, and payment of the duties, shall lie on the persons found with the goods; such persons, upon conviction, shall be adjudged guilty of felony, and be transported for seven years; and, returning before the expiration of the term, shall suffer death, without the benefit of clergy.

All goods, weapons, cattle, and package of goods, &c. so found, shall be forfeited and lost.

The 50 l. reward to persons wounded in apprehending, and to the executors of persons killed, and to the discoverers of their accomplices, are to be paid to the respective receivers-

VOL. II.

general, by order of the commissioners, on certificate of the judge, of the offender's conviction; and the commissioners shall adjust each person's share in case of difference.

Upon information, on oath, before one or more justices of the peace, that persons are lurking within five miles of the sea, or navigable river, and there is reason to suspect that they wait with intent to be aiding and assisting in the running, landing, or carrying away, any prohibited or uncustomed goods, may grant a warrant for apprehending them; and they not giving a satisfactory account, may be sent to the house of correction, and be whipped, and be kept to hard labour for any time not exceeding one month; and the commissioners shall pay 20 s. to the informer, for every offender so taken as aforesaid; yet persons so apprehended, desiring time to clear themselves of the accusation, shall only be committed to prison till satisfaction or security be given, not to be guilty of the like offences again.

That after the 24th of June, 1736, persons offering tea, brandy, &c. to sale, with or without a permit, may be stopped on suspicion, and the person stopping the same may prosecute in his own name; and, on recovery, shall be intitled to a third part of the produce on sale; and the commissioners shall advance one shilling per pound for tea, and one shilling per gallon of brandy so seized, to the prosecutor, till sale.

That after the said 24th of June, 1736, all watermen, carmen, porters, and other persons whatsoever, found with prohibited or run goods, knowing the same to be prohibited or run, being lawfully convicted, on the oath of one or more credible witnesses, or by confession before one or more justices of the peace, where the offence shall be committed, or the goods found, shall forfeit treble the value; half to the informer, and half to the poor; where, &c. to be levied by distress, and sale of the offender's goods, by warrant from the justice or justices before whom such offender shall be convicted; and, for want of distress, the offender to be committed to the house of correction, there to be whipped, and kept to hard labour, for any time not exceeding three months.

Vessels arriving from foreign parts, with six pounds of tea on board, or brandy, &c. in a cask under sixty gallons, (except for the use of the seamen, not exceeding two gallons a man) hovering within a league of the shore, all such goods, with the package, shall be forfeited.

After 29 Sept. 1736, foreign goods taken in or put out of any vessel, within four leagues of the English coasts, without payment of customs (unless in case of apparent necessity) shall be forfeited, and the master, &c. shall forfeit treble the value; and the vessel, if not above 100 tons, shall be forfeited; and persons offering to bribe an officer to connivance, shall forfeit 50 l. the forfeitures, one half to the king, and the other to the informer, who shall prosecute in any of the courts at Westminster; and actions, &c. for assaults upon officers, may be tried in any county of England.

All goods found concealed, after the master's report at the custom-house, shall be forfeited; and the master shall forfeit treble the value; and persons forcibly obstructing or wounding officers on board, in the execution of their offices, shall, on conviction, be transported, not exceeding seven years; and, upon returning before the expiration of the time, shall suffer death as a felon, without benefit of the clergy.

Officers may go on board coasting vessels, and search for prohibited and uncustomed goods, and may continue on board during the vessel's stay in the port; and persons obstructing such officers, forfeit 100 l. and likewise 100 l. penalty is laid on all houses, men, &c. knowingly harbouring any person against whom process hath issued for obstructing officers, &c. but no forfeiture herein, unless public notice shall have been first given, in two successive gazettes, of such person's absconding, and a writing fixed to the door of the church.

Sheriffs, mayors, &c. on request in writing, of a known solicitor for the customs or excise, to grant special warrants for apprehending offenders; and the persons granting such warrants, shall be saved harmless from all escapes.

But, in trials of seizures, judges are to proceed according to the merits of the cause, without enquiring into the fact or form of making the seizure; and officers and their assistants, may oppose force to force, and when carried before a justice for wounding or killing any person, in such cases shall be admitted to bail.

The said act shall not indemnify any person prosecuted by the East-India company.

Any person sued for any thing done in pursuance of the said act, may plead the general issue, and give the special matter in evidence; and if found for him, shall have treble cost.

Provided, That nothing in the said act shall extend to restrain his Majesty's court of king's-bench, or any of the judges thereof, or the court of judicatory in Scotland, from bailing any person committed for felony, by virtue of the said act, in such manner as they may, by law, do in other cases of felony.

A warrant to bring offenders before a justice, upon the aforesaid (smuggling act of 9 Geo. II.

Whereas I have been informed upon oath, that since the 24th day of June, 1736, A. B. of, &c. C. D. of, &c. and E. F. of

of, &c. have been assembled together, for the purpose of clandestine landing and running of prohibited or uncustomed goods, and were armed with fire-arms and other offensive weapons, contrary to the form of the statute in that case lately made and provided: these are therefore to require you to apprehend and bring the said A. B. C. D. and E. F. before me, or some other justice of the peace for this county, to answer the premises aforesaid. Given under my hand and seal, &c.

By 19 Geo. II. reciting that divers dissolute persons associated themselves to support one another, and appeared in gangs, carrying fire-arms, and have been aiding in running prohibited goods, or liable to duties, or in the illegal landing of goods which have been shipped or exported upon debenture or certificate; or in rescuing the same after seizure, or in obstructing the officers of the revenue in their office, and that several officers had been killed, &c. by the said dissolute persons; it is enacted, That if any, to the number of three or more, armed with fire-arms, or other offensive weapons, shall, after the 24th day of July, 1746, be assembled in order to be aiding in the illegal exportation of wool, or other goods prohibited to be exported, or the carrying of wool or such other goods, or liable to pay duties which have not been paid or secured; or in the illegal relanding of any goods which have been exported upon debenture or certificate; or in rescuing the same after seizure from any officer of his Majesty's revenue, or other person or persons employed by them; or in rescuing any person who shall be apprehended for any of the offences made felony by this, or any other act; or in preventing the apprehending any person who shall be guilty; or in case any persons, to the number of three or more, so armed, shall, after the said 24th day of July, be so aiding; or if any person shall, after the 24th day of July, have his face blacked, or wear any vizard or other disguise, when passing with such goods, or shall forcibly resist any of the officers in the seizing such goods; or if any person, after the said 24th day of July, shall maim, or dangerously wound, any officer of the revenue, in his attempting to go on board any vessel within any port of this kingdom, or shoot or maim, or dangerously wound him when in such vessel, and in his office; every person so offending, and convicted, shall be adjudged guilty of felony, and suffer death without benefit of clergy. And every person who shall at any time be convicted of any of the said offences in Scotland, shall suffer death and confiscation of moveables.

If any person shall be charged of any of the offences aforesaid, before one or more of his Majesty's justices of peace, or of the king's bench, if committed in England; or before the lord justice-general, or one of the lords of the judiciary, or any one or more of his Majesty's justices of the peace in Scotland, if the offence in Scotland, by information of one or more credible persons upon oath subscribed, such justice of the peace, &c. before whom made, shall forthwith certify, under his hand and seal, and return such information to one of the principal secretaries of state to his Majesty, his heirs or successors, who is to lay the same before his Majesty, his heirs, &c. in privy council; whereupon it shall be lawful for his Majesty, his heirs, &c. to make an order, thereby commanding such offenders, &c. to surrender, within 40 days after the first publication in the gazette, to the lord chief justice, or any justice of B. R. or to any one justice of peace, if the offence in England, or to any of the lords of judiciary, or to any justice of peace in Scotland, if the offence there, who is required, upon such surrender, to commit him or them without bail, &c. to the county-gaol or prison of the place where the surrender is, that he may be forth-coming to answer; which order the clerks of the privy council shall cause to be printed in the two successive gazettes, and to be sent to the sheriff of the county where the offence was, who shall, within 14 days after the receipt, cause the same to be proclaimed between ten in the morning and two in the afternoon, in the market-places, upon two market-days, in two market-towns, near to the place where the offence was committed, and shall be fixed in some public place in the said towns; and in case such offender, &c. shall not surrender, he escaping after such surrender, shall, from the day appointed to surrender, be adjudged to be convicted of felony, and shall suffer death, as if attainted by verdict and judgment, without benefit of clergy, if the offence is in England; and shall be adjudged to be convicted of a capital crime, and suffer death and confiscation, as in case of a person found guilty of a capital crime, and under sentence, if the offence be in Scotland; and the court of B. R. or the justices of oyer and terminer for the county or place where such person is, may award execution against such offender, &c. in such manner as if he, &c. had been convicted in B. R. or before justices of oyer and terminer, if the offence be in England; and the judiciary, or the lords of judiciary in their circuits, may award execution against such offender, &c. in such manner as if found guilty and condemned in the same court of judiciary, or in the circuit. Every person who (after the time appointed for surrendering) harbours or succours such person, knowing him to be so charged, and to have been required to surrender, and who has not, being prosecuted for the same within one year after

the offence, and lawfully convicted thereof, shall be guilty of felony, and shall be transported for seven years, according to 4 Geo. I. and 6 Geo. I. and if such offender shall return into Great-Britain or Ireland before the same term, he shall suffer as a felon, without benefit of clergy.

Nothing therein shall prevent any judge or justice, or any magistrate or minister of justice whatever, from securing such offender, against whom information shall be made, and such order in council shall be made, by the ordinary course of law; and in case such offender, &c. shall be taken, in order to be brought to justice, before the time required to surrender, in such case, no proceeding shall be had upon such order, but he shall be brought to trial by due course of law.

Every offence by this or any other act relating to the revenue, shall be determined in any county in England, as if the fact had been committed therein: provided that no attainder for any offence by this act shall make any corruption of blood, loss of dower, or forfeiture of lands, &c. That if any officer, &c. or other person employed in seizing wool or other goods, not having paid or secured the duty, shall be beat, wounded, maimed, or killed, by any offender against this act, or if the said wool, &c. be rescued by persons armed as aforesaid, the inhabitants of every rape or lath, or hundred in England, shall make full amends for such beating, &c. and for such loss of goods, and shall pay 100l. for each person killed to his executors or administrators; and such officers, their executors, &c. are enabled to sue and recover the same, the sum for beating, &c. not to exceed 40l. The sum raised for that purpose to be proportionably assessed on the inhabitants of such rape, &c. for the damages and expences in recovering the same, in such manner as damages and costs are raised in hundreds in case of robberies, and for paying the expences according to 8 Geo. II. If the plaintiff be nonsuited, the charges of the defence, &c. to be levied as the said act directs; and every action shall be prosecuted in the same manner as the said 8 Geo. II. directs.

No person to recover, unless notice be given of the offence four days after the commission of it unto two inhabitants of some town, &c. near the place where the fact was done; and shall within eight days after such fact declare, on oath before some justice of the peace of the county, &c. where the same was committed; which examination every justice shall be obliged to take, whether he or they so examined do know the person, &c. who committed such fact, or any of them; and if it be declared that he or they knew the person, &c. who committed the same, or any of them, then he or they shall be bound by recognizance to prosecute according to law; and no such person or persons shall recover damages by virtue of this act, unless he or they, besides the said notice and recognizance, give such notice, and enter into such recognizance, as persons robbed are by the said 8 Geo. II. directed to give and enter into.

Provided, That where any offender shall be apprehended and convicted of the offence within six months after the offence, no hundred, &c. or inhabitant thereof, shall make any satisfaction for such damages, or pay the said 100l. to the executors, &c. of such killed person.

No action to be brought against the inhabitants of any hundred, &c. unless the same shall be commenced within one year after the offence committed.

All persons who shall apprehend, or discover so as he may be taken, any person in England so advertised, who shall not have surrendered within forty days, and cause him to be brought before the chief justice of B. R. or any one of the justices of the said court, or any justice of the peace for London or Middlesex (who is hereby required to commit such person to Newgate for such felony), shall have for every such person who shall be so apprehended 500l. to be paid in one month after execution shall be awarded against such offender, by the commissioners of the customs or excise respectively, who are required to receive the applications of such who are concerned, and to determine who are entitled to the said reward and shares thereof, and to divide the same as they the said commissioners, or the major part of them, shall think reasonable. And if any offender, against whom no order of council shall have been made, shall himself discover any other offender against whom such order shall have been made, he shall be discharged of his own offence (if no prosecution commenced) and shall have his share of the reward. And if any person lose a limb or an eye, or be otherwise maimed, &c. in apprehending or making pursuit after such offender, every such person shall receive 50l. over and above any other reward he may be intitled to by this act. And if any person, &c. shall be killed in the taking or pursuing, &c. then the executors, &c. of such person, &c. shall have 100l. All which rewards to be paid by the receiver-general of the customs, or cashier of the excise.

If any of the said offender or offenders in England shall, before his Majesty's order in council shall be made, discover two or more accomplices to the commissioners, &c. and apprehend them, or cause them so to be, so as they or two of them at least be brought to justice and convicted, the offender or offenders so discovering shall have 50l. and every person, &c. so discovering, shall be clear of his or their offence, for

for which no prosecution shall have been commenced, to be paid as aforesaid. Provided, that nothing in this act shall restrain B. R. or any of the judges thereof, or the court of justiciary of Scotland, or any of the judges thereof, from bailing any person committed on this act, and not convicted or attainted, in such manner as they may do by law in other cases of felony.

Persons guilty of any of the above offences, against whom no prosecution shall have been commenced, or composition made, before the said 24th of June, shall be acquitted on the following terms, viz. That he do, before 29th Sept. 1746; enter into his Majesty's fleet, and serve as a sailor for one year, and before such time register his name, employment, and place of abode, with the clerk of the peace of, &c. in a book, which the said clerk is to keep among the records of the sessions for the said county, &c. and shall sign such register, signifying that he claims the benefit of this act, and that he has entered himself with a commission-officer, by name, of his Majesty's fleet, to serve as a sailor; which entry must be as follows:

* N. B. Though the time is expired for entering sailors, yet it is now of use to see whether persons have entered pursuant to the statute.

A. B. claims the benefit of an act of the 10th year of the reign of his Majesty king George II. and has entered himself with a commission-officer of his Majesty's fleet, and has registered his name in the book kept by the clerk of the peace of this county, riding, or division, this day of pursuant to the directions of the said act.

For which entry shall be paid to the clerk of the peace 1 s. And the clerk of the peace is immediately after the said Sept. 29, to transmit to the said commissioners, an exact account of the persons who have by such entry entitled themselves to the benefit of this act.

Persons who shall claim the benefit of this act, and shall afterwards commit the like offences, or shall within the said year procure their discharge, shall be subject to be prosecuted not only for the new offence, but also be liable to the pains they would have incurred, in case the above indemnity had not been given.

If any officer of his Majesty's navy by any means suffer such person to avoid the service, such person shall lose the benefit of the act, and the officer forfeit 500 l.

In case any information shall be brought to trial on account of the seizure of any ship as forfeited for illegally carrying goods, or of any wool, goods, wares, or merchandizes as accustomed, or illegally carried or exported, or intended so to be, or as illegally reloaded after having been shipped or exported, upon debenture or certificate, wherein a verdict shall be found for the claimer thereof, and it shall appear a probable cause of seizure, the judge or court shall certify the same on the record, and the defendant shall not be entitled to costs, nor shall the person who seized the same be liable to any action, &c. And in case any shall be commenced wherein a verdict shall be given for the defendant, the court or judge shall certify on the said record, that there was a probable cause for such seizure, then the plaintiff, besides his ship and goods, or the value thereof, shall not have above 2 d. damages, nor any costs of suit, nor shall the defendant be fined above one shilling. The said act to continue seven years. See the Business of the Custom-house at the end of every Letter.

SMUGGLING.

The following are some genuine SMUGGLING ANECDOTES, in relation to the ISLE of MAN.

The Isle of Man is, and has been many years, a common storehouse for all manner of goods and merchandizes that pay high duties in Great-Britain or Ireland, or are prohibited to be imported into these kingdoms.

The merchants in that island have constant supplies of large quantities of tobacco, both in leaf and roll, tea, in chests, with all sorts of East-India and Dutch goods from Holland: one cargo landed there from Rotterdam, though contrary to law, consisted of 345 chests of tea: they are likewise supplied with tobacco and other things from Dunkirk, Ostend, Norway, and even some parts in Great-Britain; with tea and India goods of all sorts from Gottenburgh and Denmark; with vast quantities of brandy and wines from France, and with rum from America: the Scotch and others send vessels to our plantations on purpose for that commodity, and land it there, contrary, as is supposed, to the act of navigation. These goods are all warehoused in that island, and afterwards put into packages of lesser quantities and weights, such as may be most handy and convenient for running into Great-Britain and Ireland.

There are nine or ten large wherries, and above twenty boats in the island, constantly employed in the smuggling trade, and go weekly from thence, if the weather permits, laden with high-duty or prohibited goods; the wherries and boats

from Piel-town supply the east and north parts of Ireland; the Highlands and west of Scotland; those from Douglas and Derbyhaven, Wales, Cheshire, and Lancashire; and those from Ramsey, Cumberland, and all the country on each side of Solway Firth; but their chief trade is up the river at Boulnefs, into the Scotch borders near Annan.

Ten or twelve of these boats are almost every week seen in a fleet passing Whitehaven, all laden, steering for the said river, where they land their cargoes at noon-day, the country being all ready to assist and protect them, in such numbers as no officer dare offer to molest.

These cargoes, which generally consist of brandy, rum, tea, and silks, are afterwards brought out of the Scotch border on horseback in the night, under an armed force of fifteen or twenty men, into England, and guarded by them up into the country, till they have passed all the preventive officers on the English border.

Thus all the northern counties on this side Trent, if not further, are supplied from that island with these commodities at a cheap rate, for the smuggler generally buys his brandy and rum there at two shillings the gallon, or under, and other goods in proportion, and by paying no duties is enabled to under-sell the fair trader.

It was several years ago made appear, that the clandestine trade carried on from this island, was then above 100,000 l. yearly loss to the revenue of Great-Britain and Ireland, and it is computed now to be near twice as much, not to mention its carrying away the coin, the detriment to the honest merchant, landholder, and even ruin to the labouring people; for being constantly supplied with brandy, rum, and Dutch Geneva, at so cheap a price, induces them to drink so much as not only weakens their constitutions, but corrupts their morals.

There is no other method, it is feared, can be thought on to put a stop to this great and growing evil [all the laws hitherto having proved ineffectual], but either by lowering the duties, or purchasing the island of the present proprietor.

From July 16, 1753, to July 11, 1754, a manufacturer of tobacco, with eight working men, manufactured and shipped off to Ireland 166 hogheads, containing 8397 rolls, 175,358 pounds neat tobacco. There is now in the Isle of Man several workhouses, in which are employed 50 men and upwards, all workers of Irish roll tobacco.—Say but 48 men, that in the same proportion with the manufactory in England, will be 996 hogheads, containing 50,382 rolls, 1,052,148 pounds neat tobacco, which must all be run into Great-Britain or Ireland, but chiefly to Ireland.

Irish duties on 1,052,148 lb. tobacco, is 1,24,001 16 7 1/2
Loss per annum will be English 22,155 10 9

N. B. The supply for tobacco to the island is chiefly from Dunkirk.

Tobacco imported into the Isle of Man, makes a considerable article of the lord proprietor's revenue, who receives half a pound duty on the same, which is allowed on all hands, to bring him in 1500 l. per annum.

One factor only, named W. T. for the merchants and dealers in tobacco in Dublin and other parts of Ireland, actually paid near 1000 l. to the proprietor's collector for tobacco only, in the year 1753. And there are three or four more factors in that island for tobacco dealers, who pay less sums annually.

These tobaccos are mostly manufactured in the island into fine pig-tail and coarse roll, and run into Great-Britain and Ireland.—The working manufacturers were first procured from Dublin and Glasgow; there are not now less than fifty of these hands, and a number of boys employed in several workhouses in the island.

Further OBSERVATIONS on the present state of SMUGGLING from the ISLE of MAN.

The lords of the treasury, considering the intolerable growing evils arising from smuggling, ordered (the beginning of this summer) the commissioners of the customs to order the several collectors of his Majesty's revenue in Great-Britain, to transmit to them the most accurate estimate possible of the nature and quantity of the clandestine trade carried on in their respective districts, with their own observations thereon, and their opinions of the most feasible methods of suppressing the same, and whatever else might tend to the improvement and better establishment of his Majesty's revenue in the customs and excise; that the same might be considered by their lordships, and laid before parliament, &c. or to that effect. One of these orders addressed to the collector of the port of ——— by the secretary of the customs, I saw. The said collector, who is an able and intelligent officer; and with whom I have often conferred on these matters, did accordingly acquit himself to his principles. He also informed me, that the like orders had issued from the commissioners of the customs in Ireland to the respective collectors in that kingdom, with some of whom, the most notable, he had kept a close correspondence on this head, as well as with several in the ports of Great-Britain. That upon the whole of their informations and estimates he found, that the smuggling trade from the Isle of Man alone to Ireland, could not amount to less than a loss of 200,000 l. per ann. to his Majesty's revenue in that kingdom.—And from the said island to England, Wales, and

and Scotland, at least 300,000l. per ann.—And to the East India company and the fair trader 200,000l. per ann. more, in the whole 700,000l. per annum, exclusive of the horrid consequences attending the said clandestine trade from the said isle; the chief of which are, the destruction of the health, breed, and morals of the British subjects stretching round the said island.—The death and daggers of their manufactures and agriculture.—The decay and consumption of the fair trader, and the temptation, and almost necessity they are thereby daily brought under, of countenancing and connecting themselves with the said smugglers, in order to keep out of a gaol.—The inevitable forerunners of the decay and destruction of his Majesty's customs and excise, if suffered to continue much longer.—Add only one consideration more, the nourishing and strengthening the trade and commerce of foreign powers, particularly one, our most dangerous neighbour, by destroying our own, and draining us constantly of our cash, &c. &c.

A MEMORIAL or petition of the merchants, owners of ships, &c. in the ports of Cumberland, has been lately presented to the lords of the treasury, setting forth the grievances they labour under from the clandestine trade carried on from the Isle of Man [see the sequel], to which I could add many more facts and considerations in support thereof, very interesting.—For instance, not one merchant along the coast of that county, has for seven years past, imported and paid duty for any French brandy, the county being glutted with the same by the smuggling-boats and night-carriers from the Isle of Man, though for four years past, that island has been chiefly supplied with coarse Spanish brandy from Ceite and Barcelona, which they purchase there at about 10d. English, per gallon, and is sold out again to the smuggling-boats in the Isle of Man, at 18d. English, per gallon, the duty on importation of the same in the Island being but 1d. per gallon to the lord of the Isle, and the freight.—This brandy may be bought afterwards on the south and west coasts of Scotland, for about 2s. 2d. per gallon in great quantities.

Above 4000 gallons of this brandy were last year seized at different times, put up to sale at the custom-house at Whitehaven, but it would not fetch even the king's duty. Is not this a plain demonstration that the country about was supplied with it by the smugglers at a much lower price? Yet by the seizures of brandy brought to that custom-house last year as just mentioned, it is MOST CERTAIN, that not one smuggling-boat load from that island in a hundred, is taken by the cruizers or coast-officers, or any other ways. Almost every soul along the coast of Cumberland, &c. even the beggars and their brats, if they can steal any thing to purchase coarse sugar, drink tea once or twice a day, especially the dammed teas imported from Gottenburgh, &c. into the Isle of Man, much of which is sold by the smugglers from thence for 6d. or 1s. per pound, so that the excise on this article is dwindled to nothing along the coast. By such deplorable means, punch, bumbo, rumbo, and dry drams, have universally prevailed among all degrees of people on the coasts of Great-Britain and Ireland lying round the said island, to the inconceivable detriment of both the customs and excise, and it lessens in proportion the consumption of malt liquor, and the necessary motives of brewing it well.

REMARKS on the annexing the Isle of Man to the crown.

True it is, no less than eight ships arrived in the Isle of Man in the compass of 14 days in July last past from foreign parts, with brandy, rum, geneva, tobacco, arrack, teas, silks, &c. At one town called Douglas, the streets of which were scarce passable for several weeks, on account of the hogheads, all the warehouses in the town not being able to contain their cargoes, 'till room was made by running off the stock then in cellar. The smugglers last summer marched in the night in bodies of twenty men armed, and as many horse-loads of brandy, teas, &c. into and through some of the towns in Cumberland.—There are no troops in the whole country, except a small garrison at Carlisle on the east side thereof.

The above-mentioned observations, together with the following memorial of the merchants, do truly discover the present state of smuggling from the Isle of Man to the British dominions.—It remains now to examine the utility of suppressing the same effectually.—The present ineffectual means used for that end.—And, lastly, what may effectually and speedily do it.

It is now admitted by all the intelligent, that the abovementioned trivial duties to the lord proprietor of the Isle of Man do not amount to less than 5 or 6000l. per annum, at one penny a gallon upon spirits of all denominations imported there, a halfpenny a pound on tobacco ditto, and 2½ per cent. on all dry goods ad valorem: by which, if there were no other lights, a reasonable judgment might be formed of the bulk of the clandestine trade carried on from thence to the British dominions round them, and the shocking loss it must be to his Majesty's customs and excise in particular, exclusive of the fatal consequences to his subjects.

From which it cannot but be admitted, that the government had better give the lord proprietor of that island, and his heirs for ever, a consideration of 5, or even 10,000l. a year, for

his sovereignty, than let it remain 12 months more as it is, it being obvious that the sum the government would save thereby, in a year or two, would more than pay such consideration for ever, at 3 per cent. even exclusive of the annual fair revenue of that island, which would then belong to the crown, and may be reckoned at 2000l.

Thus much in regard to the propriety and necessity of purchasing and annexing it to the crown, and making it a part and parcel of the realm of England, by act of parliament. See the article MAN [ISLE of MAN] and what follows.

It is said (and I believe with reason) that the present annual expence to the crown, in supporting cruizers, and additional coast-officers, all along the coast of the three kingdoms, round the said island, and chiefly on account of the smuggling from thence, amounts to no less than 20,000l. per annum.

How improper! how injudicious these lofty masted and decked sloops and cruizers are for the purpose intended, I submit to the cabin-boy, without repeating any more, than that they do not catch one smuggling boat in a hundred.

I shall be ashamed to repeat, that such lofty cruizers must be discovered by the smuggling, open, four-oared boats, with their two low masts and small sails, above an hour or two, at least, before the cruizer can discover them; the natural consequence of which is, the boats immediately clap to windward, and stand a wide course from the cruizer, by which they are seldom discovered, except in a fog, when it is always calm enough to give the boats an advantage by their oars. Moreover, such cruizers draw too much water to pursue the smuggling-boats in shore, and, before such can reach them with their boats, their cargoes are landed, and numbers of people always ready to convey them away. So much for the insignificance of such cruizers!

I come now to offer effectual means totally to suppress the smuggling from that island.

And first that of purchasing and annexing the same to the crown, which, indeed, is to be preferred on every account. This would infallibly put a final end to smuggling from that island; because all such foreign goods as mentioned above, must then be brought to the island in ships of burthen, and landed in one of their four ports, and this could not be done without the knowledge of a king's governor, collector, and the proper officers, in the face of day, the whole coast of that island being rocky and dangerous, except their four ports, and open boats cannot supply them with such goods from France, Holland, Spain, Denmark, and Sweden.

But if the lord proprietor should decline taking a reasonable consideration for his sovereignty thereof, or ask an unreasonable one for the same, which I would not suppose, except he should estimate the growing revenue thereof in proportion as it has increased since the year 1736, when he came to the inheritance thereof, viz. to have increased from 1000l. in the aforesaid duty, to 5000l. a year: if this should be the case, it may properly fall under consideration, as a most important national concern, whether it be not absolutely necessary to have an act of parliament for commissioners immediately to inquire into, and ascertain, the value of the said island, and to oblige him to receive such valuable consideration in lieu thereof, &c. as in the case of the heritable jurisdictions in North Britain.

But if measures of this kind should be thought improper, I doubt not means may easily be found to induce him to alter his inclinations in a short time,—viz. By dismissing the present set of improper cruizers employed for suppressing the running trade from that island, and employing the annual expence of their establishment in fitting out and supporting half a score light open boats, or cutters, carrying 9 or 10 men each, having two low masts, equal to those of the smuggling-boats, to sail and row six oars at a time, to be stationed on proper cruizes round the said island.—These must see and be seen at the same time; but being light, and better adapted for sailing and rowing, and drawing equal water, would soon come up with the smuggling-boats.

Suppose, also, the captors were intitled to 40s. per head for each smuggler so taken in the fact; and besides one moiety of the clandestine goods then taken, the 40s. per head to be paid them out of the remaining moiety of the goods, or, in case of a deficiency therein, to be instantly paid them by the collector of the port where the prize and smugglers are landed, upon delivering over to the civil power such captive smuggler, or smugglers, who are to be empowered to commit the said delinquents to gaol, 'till they can be conveniently turned over to serve on board the royal navy for the space of seven years at least; such cruizers, nevertheless, to be intitled only to one third of the goods taken, except they deliver over to the civil magistrate one or more of the smuggling delinquents then taken in the fact.

If some people should think this punishment too light for such atrocious enemies to the public, they have my consent and approbation either to transport them to America for life, or even to exchange them for our Christian slaves in Barbary: all which I think much too favourable for such who promote the destruction of their fellow-creatures and country at the same time.

Upon this last method it must be observed, as the reason of its effectualness, that at present the smuggling merchants and factors in the island give, for freight to each of the smuggling boats, five guineas, which is paid to the said crew immediately, upon their producing a certificate of their having delivered their said cargo to their consignment in Scotland, England, Wales, &c. But as the captures would be at least as 20 to 1 under this disposition, so would the danger to the boat-crews be, on account of the penalties annexed, which would quickly discourage all freight at any price: this would soon stagnate all stock on hand in the island, stop farther importation of such goods, and with it the lord's duties. Most of these Mank's boatmen are very hardy able-bodied seamen, mostly married and wedded to their own home, and to whom a servitude and absence of seven years, or more, would, I am confident, be a kind of death. In short, SOMETHING MUST SPEEDILY BE DONE TO PUT AN EFFECTUAL END TO THE ENORMOUS SMUGGLING TRADE CARRIED ON FROM THAT ISLAND, OR ALL THE EVILS ABOVE MENTIONED MUST INFALLIBLY CONTINUE.

N. B. No Leeward Island rum is now imported into the Isle of Man, but coarse, stinking North America rum, drawn from molasses, carried there by their lumber ships from the Leeward Islands, particularly French molasses, from St Eustatia. French and Spanish wines abound in the island, and great quantities of Dutch geneva, very coarse Spanish silks, Barcelona handkerchiefs. The Liverpool Guinea-men also take in stores at the Isle of Man; and their toys and trinkets imported there from Holland, France, &c. Horrible!

The MEMORIAL before mentioned, of the merchants and owners of ships in the port of Whitehaven.—Humbly addressed to the right honourable the lords commissioners of his MAJESTY'S treasury.

' We the merchants and proprietors of ships in the port of Whitehaven, in the county of Cumberland, beg leave to represent to your lordships the great damage which this nation in general, (and more especially the ports of this county) sustains from the clandestine trade carried on from the ISLE of MAN, to the several parts of Great-Britain and Ireland, and humbly submit to your lordships judgment the means we apprehend to be the most conducive to remove the same.

It is well known that this Island is the great storehouse wherein the French, and other nations, deposit prodigious quantities of wine, brandy, coffee, tea, silks, and other India goods, which are there admitted upon very low duties, and afterwards smuggled upon the coast of Great-Britain and Ireland, in small boats and wherries, built for that purpose; besides the frauds committed in the article of TOBACCO, which being first entered in the several ports of Great-Britain, for foreign parts, after receiving the drawback, are frequently landed in this island, and afterwards run back again in this kingdom and Ireland.

For the carrying on of which clandestine trade, the situation of the Isle of Man is extremely commodious, being within seven hours sail of the several coasts of England, Scotland, Ireland, Wales.

The loss, by this illicit trade, to his Majesty's revenues in the kingdoms of Great-Britain and Ireland, hath, by competent judges, been computed at no less than TWO HUNDRED THOUSAND POUNDS annually, besides the damage to the fair traders in general, and to the honourable East-India company in particular, which may reasonably be computed at no LESS SUM. And if the duties alone upon these foreign commodities, thus fraudulently imported, amount to so excessive a sum, we may judge, in part, what an immense treasure in SPECIE is annually drained from these kingdoms, and principally from the circumjacent sea-coasts, for the purchase thereof, which, in the same proportion, tends to the impoverishing his Majesty's dominions, and the enriching a neighbouring state, the formidable rival of our power, as well as our commerce.

But the greatest loss which the public sustains by this detestable trade, proceeds from the alienation of such numbers of his Majesty's subjects from the honest arts of life, from agriculture, from manufactures, or from lawful commerce, to an employment which tends both to the destruction of their lives, and the debauching of their morals, by the excessive importation of spirituous liquors.

These evils, though extending in some degree to all parts of Great-Britain and Ireland, are yet most sensibly felt by the port of Whitehaven, and other neighbouring ports of this county, by reason of their vicinity to the Isle of Man.

We beg leave, therefore, to represent to your lordships the peculiar hardships which the trade of this port labours under, from the clandestine practices above mentioned, which, of late, have been carried on to a most exorbitant height.

A considerable trade hath formerly been carried on from the port of Whitehaven, by the exportation of British manufactures, to Virginia and Maryland, and other of his Majesty's plantations in America, and the importation of tobacco, and other products of those colonies, and also the exportation of coals to Dublin, and other parts of the kingdom of Ireland,

VOL. II.

by means whereof the commerce of these kingdoms hath been enlarged, his Majesty's revenues increased, and great numbers of able-bodied seamen have been raised ready upon any emergency, to be applied to the defence of their king and country. Both these trades are at present in a very declining state, occasioned chiefly by the exorbitant growth of the smuggling trade in the Isle of Man: for whereas formerly a profitable branch of the trade of this port consisted in supplying the Irish markets with tobacco, this hath been greatly diminished by the manufactories of this commodity which have been set up, and greatly increased of late in the said island, by means whereof those markets are chiefly supplied with manufactured tobacco, in a clandestine way, to the great prejudice of the trade of this place, and the fair trader in general.

We beg leave likewise to represent to your lordships the difficulties which the coal-trade labours under, as it is at present carried on from Whitehaven and the neighbouring ports, to Dublin and other parts of the kingdom of Ireland, arising from the same cause. And whereas, by an act made in the 12th year of his late Majesty George the 1st, No goods or commodities whatsoever, other than such that are of the growth, product, or manufacture of the Isle of Man, are allowed to be brought from the said island, into the kingdoms of Great-Britain or Ireland, on any pretence whatsoever, under the penalty of a forfeiture of ship and goods; which makes it necessary that the owners of ships employed in the trade, for the safety of their property, should use the greatest caution and circumspection, in appointing the most faithful masters and sailors to navigate them that are to be met with, yet it frequently happens that small quantities of prohibited goods are taken on board, on the coast of the said island, where boats are continually plying to supply them, by reason whereof, ships of great value are forfeited and sold, to the great prejudice of their innocent proprietors, who are often without redress, inasmuch as the nature of the trade will allow only such low wages to the masters of coal vessels, that few persons who are possessed of any considerable property will accept of that office. By this means, this once-flourishing trade is now reduced to a very declining state, few people being willing to venture their substance upon so precarious a foundation. For the removal of these obstacles to lawful commerce, by which the nation in general (and more especially the port of Whitehaven, and other neighbouring ports) are greatly affected, we humbly beg leave to mention to your lordships the expedient, which, by the wisdom of the legislature, has been judged most conducive to this end, viz. by purchasing the sovereignty of the said Island of the right honourable the proprietor, and annexing it to his Majesty's government; for the carrying of which useful design into execution, your lordships have been vested with a proper authority.

But if this cannot be effected, we humbly desire your lordships would vouchsafe to take under your consideration the state of the smuggling trade from this island, and apply such further remedies as in your wisdom shall seem most expedient, since it is evident from experience, that the laws now in being are not sufficient to restrain the illicit practices complained of, which are grown to so exorbitant a pitch, that the smuggling boats go publicly in large fleets, and at a common risk: so that when any of his Majesty's cruisers fall in with them, it is scarce possible to take more than one at a time, and then the law hath provided no other punishment but the loss of the boat and goods, which loss is abundantly made up by the success of their confederates. But this seldom happens, for the cruisers employed in the channel are but slow sailers, and easily seen at a distance, and easily avoided, so that scarce one in a hundred of the smuggling boats or wherries ever falls into their hands.

It seems necessary, therefore, that a greater number of small boats, well manned, should be employed in apprehending these smuggling vessels, and that some further provision ought to be made by law, for the punishment of those who are employed in navigating them, either by transportation to the British colonies in America, or by sending them, for a limited time, on board his Majesty's navy, or by some other way which may be judged more expedient.

Signed by 40 of the principal merchants and owners of ships.

ANNUAL REVENUE OF THE ISLE OF MAN TO THE LORD PROPRIETOR.

	l.	s.	d.
Lords rents, certain and impropriate tythes	1500	—	—
Fines certain, payable upon deaths of tenants and alienations of estates, and fines levied on the people for breach of penal laws, com. annis	500	—	—
Duties and customs upon imports necessary for the home consumption of the island, com. annis	500	—	—
Duties and customs on goods imported into the island, and afterwards smuggled into Great-Britain and Ireland, com. annis	4000	—	—
Revenue in gross	6500	—	—
9 Y			Revenue

	l.	s.	d.
Revenue in grofs (brought over)	6500	—	—
From which deducting his annual civil list	700	—	—
Then his present income will be	5800	—	—
But were the smuggling trade suppressed, } whereby the lord would annually lose } the duties arising thereon, viz.	4000	—	—
Then the lord's annual income, upon a } fair trade, would amount only to }	1800	—	—

N. B. Brandy, rum, &c. pay only one penny per gallon duty in the Isle of Man.

Teas, India goods, &c. pay ad valorem $2\frac{1}{2}$ per cent.

By which it is evident how great the importation of clandestine goods into the island must be, to raise annually 4000 l. upon such low duties.

But it is now believed these low duties amount annually to 6000 l.

The tobacco alone imported into the island brings in to the lord, at a halpenny per pound, 1500 l. per annum.

FURTHER REMARKS ON SMUGGLING.

Although the smuggling trade carried on by means of the Isle of Man is exceeding great, and attended not only with very great detriment to the revenue, but of unspeakable injury to the fair trader, who pays the legal duties for those commodities that others smuggle; yet it is to be wished that all the smuggling in the kingdom centered in this island only, for then the annexing the same to the crown of Great-Britain might prove an effectual remedy against so great an evil. Certain, however, it is, that this illegal and pernicious practice has spread itself too much over the whole kingdom, and calls aloud for an effectual redress, if there is a possibility. But while men are weak or wicked enough to persuade themselves, that there is nothing criminal in robbing the king of his revenue, or taking a false custom-house OATH, it is to be feared that those evils will never be extirpated from amongst us. See the articles AFFIDAVIT and OATH.

Nor do mankind seem to be sensible of the consequences to the public of thus robbing the royal revenue: for whatever the revenue is illegally plundered of, occasions the raising of new funds, or taxes, to supply that deficiency; and this has been the occasion of the continuance of the national debts and taxes: for if all those sums of money of which the public revenue has been, since the Revolution, deprived, by the infamous practice of smuggling, had been saved, it is to be questioned whether the nation would have been much in debt at this time of day. So that it may be said with truth, that smuggling has been one principal cause of the continuance of our debts and taxes; and, therefore, such who perpetrate acts of this kind, are the greatest bane to these kingdoms, if the perpetuity of our debts and taxes is one of the greatest of evils.

Nor does the mischief thus terminate to the injury and oppression of the community in general; it strikes directly at the immediate ruin and destruction of every individual fair and honourable trader in the kingdom; for he that evades the payment of the legal duties upon the commodities wherein he traffics, will, as he can well afford it, undersell him who justly pays the duties; and thus the honourable trader must either be undone, or turn smuggler to prevent it. Whence it is apparent, that one smuggler breeds many, and is the source of so general a depravity in trade, that smuggling traders are, in a great measure, become the great instruments of the ruin of all the rest.

The severity that has been shewn towards the most outrageous of these miscreants, has, indeed, had such happy effects, as to break the knot of those terrible banditti; yet this has not struck at the root of the mischief, and in the opinion of most, it can never be extirpated while the temptation from high duties remains so great: for where the avoiding them makes the profit great, no risk, no danger, can prevent men attempting it; it is throwing out a bait to a greedy fish; he will snap at it, though ruin ensues. Besides, it being chiefly the articles of luxury that are smuggled, as brandy, tea, French wine, laces, silks, &c. it spreads their consumption among the lower class of people, who are tempted to imitate, at a less expence, the luxuries of their superiors; and the same smugglers that bring us these superfluities, carry off prodigious quantities of raw wool, to the great prejudice of our manufactures, and the nation in general.

High customs prevent the bartering away our manufactures for foreign goods, not only for our own consumption, but also for exportation, which might enlarge the vent of our goods ten times more than it now is; for if a merchant now exports woollen goods, and would barter them for wines, the duties on them would amount to more than the cost of his woollen goods; so that he must have a double capital for such an adventure, or let it quite alone, where the sales of great quantities of woollen goods are lost to the nation.

As high customs enhance the expences of our navigation, the freight must be raised accordingly, whereby the prices of the soap, oyl, and dye stuff used in manufacturing our wool, are

advanced to the maker, and the freights on the cloths, or stuffs, exported, being also raised, are additional clogs upon the sales of our woollen goods.

High duties prevent the carrying on fishing trades, the great nurseries of seamen; whereby our sailors being few, and their expences raised by taxes, they have the highest wages of most people in Europe, which is another additional advance on the freighters, to the prejudice of our woollen trade, as above.

Great duties taking away so great a part of our merchants' stocks, they are thereby deprived of driving that great trade, and purchasing those quantities of woollen goods they would otherwise do; besides our merchants' risks in trade being greater than those in Holland, and their losses heavier by our customs, their bankruptcies must be more frequent: this sensibly affects our manufacturers, who are generally considerable creditors; for broken merchants may be well compared to ninepins, one of which seldom falls without beating down many others.

High duties recommend foreign manufacturers of fine goods, by making them expensive, which vanity, on that account, soon renders fashionable; whilst our own are despised, though superior in goodness, and are a great discouragement to our manufactures.

Large customs are the cause of the smuggling of wool; because the gain being great by running tea, brandy, and French goods, on account of the high duties, hath raised the contraband trade to a great pitch, and the smugglers cannot make their returns in any commodity so quick and certain a vent, or that gives so good a profit as our wool; for the French being less taxed than we, can work cheaper; and their own wool being coarse, English and Irish wools are so much in demand, that they will give great prices for them, for which reason they receive vast quantities, to the ruin of our manufactures.

High customs on ashes, bay salt, cotton, copper, coals, drugs, foreign soap, flax, fruit, furs, hemp, iron, leather, linens, oil, paper, rice, tobacco, tallow, threads, tapes, silk, and sugar, being necessaries of life, or materials of manufacture, most necessarily made all our commodities dear, not only to our own people, but to foreigners likewise, (though our workmen should have no excise to pay) and such discouragements give opportunity to foreigners to send their manufactures cheaper to foreign markets, and smuggle them, in defiance of all laws, into our own country, to the ruin of our manufactures; for all the above customs are as much taxes on our woollen manufacture, as if they were laid on the wool itself, or more; for the workman must raise the money on the woollen goods he makes, to pay the duties of what he uses of the above articles, with the advances, in all the hands they pass through, before they come to him.

'Tis by these high duties that we ourselves drive away our own manufacturers, and prevent our ever getting more; and foreigners could not rival the people of so fruitful a country as Britain, if we did not furnish them with the means, by our high taxes and restraints, that are always prejudicial to trade, though designed to amend it, and never effect the thing intended, though fortified with the most rigorous penal law: of which Mr Locke gives an instance, in his Considerations, &c. p. 116. 'Tis death in Spain to export money; and yet they who furnish all the world with gold and silver, have least of it among themselves: trade fetches it away from that lazy and indigent people, notwithstanding all their artificial and forced contrivances to keep it there; it follows trade against the rigour of their laws; and their want of foreign commodities, makes it openly be carried out at noon-day.

This seems to be a parallel of the state we are coming to, and which some foreigners may by and by make.

'Tis felony in England to export wool, and yet they who furnish all the world with wool, have least of the manufacturing of it among themselves; the smuggling trade fetches it away from that excited and custom-loaded people, notwithstanding all their artificial and forced contrivance to keep it there: it follows the smuggling trade, against the rigour of the laws, and their want of taking off the taxes on their manufactures makes it openly be carried out at noon-day.

By this we see that neither death or banishment can force trade to an unnatural channel; and it may be compared, in one respect, to water, which cannot be compressed within its natural dimensions: the more force is exerted, the sooner is the vessel broke that contained it, and the water let loose never to return.

The great De Wit, in his Memoirs, Ratibon edit. p. 77, asserts, 'That the navigation, the fishery, the trade, and manufactures, which are the four pillars of the state, should not be weakened or encumbered by any taxes; for 'tis they that give subsistence to the most part of the inhabitants, and which draw in all sorts of strangers, unless the necessity was so great, that the country was threatened with an entire destruction, and these fundamentals should be attacked upon the hopes that these taxes would not last long; at least haste should be made, as soon as the storm was over, TO TAKE THEM OFF: again, this distinction should be made, that

* that manufactures should not, or cannot be taxed at all, because they are not fixed to the country, and we must fetch from foreign countries the stuffs and materials to work them up.

Smuggling sends away our specie.

Britain having no mines of gold or silver, has no other means of getting, or preserving its treasure, but by foreign trade. As customs confine our trade to mere importation, for our own necessities or vanities, and at the same time ruin our manufactures; what we want in exports to balance the imports, must be paid in specie, making the balance of trade every year more and more against us; for as we raise the prices of our goods so high, by taxes, that foreigners will not take them, and yet continue to import their superfluities, which we now chiefly, and in time must entirely, pay for with our gold and silver, as appears by the bills of entry in every week we are obliged to do; and our high duties encourage smugglers, who have seldom a fertile habitation, or any stock of our manufactures by them, to carry out vast quantities of SPECIE to purchase their cargoes: such large draughts make our mint lie idle; we see but little new-coined gold, and hardly any silver; we find our money disappear, and grow scarcer every year; our trade declines, and our people starve. In regard to high duties and their effects, see further the articles BONDING at the custom-house, LABOUR, TAXES, FUNDS, DEBTS [NATIONAL DEBTS] CREDIT [PUBLIC CREDIT.]

That the lowering of the duties on some branches should seem to be the most natural and effectual way to suppress smuggling, and, indeed, to augment the national revenue, may be judged from the lowering of the DUTY ON TEA; the duty thereupon being very considerably augmented since that time, and the smuggling of that commodity proportionably diminished: and this was obtained by the indefatigable application of the right honourable Stephen Theodore Janssen, Esq; late lord mayor of the city of London; to whom I am indebted for these anecdotes, relating to the smuggling carried on by means of the Isle of Man, and for many other curious particulars, which I shall endeavour to render as useful to the public as I am able. See LINEN and TEA.

Further REMARKS on SMUGGLING since the last War.

Since the Reports on the infamous practice of smuggling, made by the committee of the house of commons, and lately published by Mr. Alderman Janssen, now Chamberlain of the city of London, the true idea of those practices seems to be revived, and has induced the government, after so long and shameful disregard of the proper measures recommended throughout the said Reports, to put them in execution: and we hear daily of the good effects of the salutary means at length exerted.

It is said likewise that the Isle of Man WILL AT LAST BE ANNEXED to the crown of England; that Island having been reckoned a PETTY FRANCE, within this kingdom, it being a capital rendezvous for French smugglers, and a prodigious magazine for all sorts of French commodities and manufactures. See the ISLE of MAN. The present vigilance of the government, in this respect, is not only manifest all around the British and Irish coasts, but is exerted in our American plantations. For the French, under the pretence of carrying on their fishery in North America, pursuant to treaty, have been taken smuggling in the river St Lawrence, and as well our British furs from Canada as their own wares, among British subjects: but his Majesty's cruisers there, being very active at present, it is to be hoped, will put a stop to these practices of the French in this part of the world.

The goods lately seized by the officers of his majesty's customs, trading to and from the Isle of Man, and the Isles of Guernsey and Jersey, are said not to amount to so little as 300,000 l. The Dutch, no less than the French, also make their fisheries on the coasts of Great Britain and Ireland subservient to their smuggling practices; and therefore there is no less need for the officers of the revenue to be watchful over these our good friends and allies, lest we should be as great sufferers by their smuggling arts, as we are by their fisheries on our coasts.

England is certainly the best market in the world for such smugglers to bring their wares to, they selling here the dearest, and fetching the best prices, because our own commodities and manufactures sell the dearest to our own subjects of any in the whole world. This, we apprehend, to be the great inducement to smuggling in general in these kingdoms; and till the cause is effectually removed, it is to be feared, the effect will never greatly cease; for the high duties heighten the temptation to some, and the low price of our competitors goods, to others. The immensity of our national debts, and the tax-incumbrances under which our whole commerce labours, for the payment of interest only, and a great proportion of that to foreigners also, occasions the smuggling with which we so greatly abound in every part of this kingdom; and while people can purchase two or three smuggled suits of clothes, for the price of one, and perhaps, not so gay, we cannot suppose any great obstruction will be put to smuggling.

An abstract of an act made in the year 1762 for the further improvement of the revenue of customs; and for the encouragement of officers making seizures, and for the prevention of the clandestine running of goods into any parts of his Majesty's dominions.

Vessels or goods seized by the officers of the customs to be publicly sold, after condemnation, to the best bidder, at such places as the commissioners of the customs shall think proper; one moiety of the produce to go to the said officers, and the other to be paid into the exchequer. Officers to be allowed, after all charges deducted, two third parts of the produce upon wrought silks, bengals, stuffs mixed with silk or herbas, of Persian or Indian manufactures, and calicoes, seized and condemned in pursuance of act 11, 12 Will. III. the other third to be paid into the exchequer; and upon wool, and other goods enumerated act 12 Geo. II. the produce after all charges; and upon tobacco and snuffs burnt, &c. pursuant to act 24 Geo. II. 3 d. per lb. and for tobacco stalks 1 d. per lb. and for tea, not exceeding 2 s. 6 d. per lb.

Where the produce of any seizure shall not answer the expences of condemnation and sale, or a verdict be given for the claimant, the charges to be paid out of any branch of the revenue applicable to incidents. The king to direct, by order of council, or proclamation, how the share of such seizures as shall be made by vessels in his service, shall be divided amongst the officers and men.

Where any foreign brandy, arrack, rum, or other spirits, not being for the ship's use, shall be imported, &c. in any vessel of 50 tons, or under, the same, together with the vessel and furniture, shall be forfeited; and in like manner, where any spirits, tea, tobacco, tobacco stalks, or snuff, are liable to forfeiture by act 9 Geo. II. or act 24 Geo. II. the vessel on board which the same shall be found, if under 50 tons, shall be forfeited, with her apparel: and the vessels, &c. seized and condemned, are to be disposed of as vessels of 40 tons, or under, forfeited for importing foreign brandy, &c.—No writ of delivery to be issued out of the exchequer for any such vessel, unless the officer delay proceeding to trial and condemnation three terms; and security be given, in double the value, to return the vessel upon condemnation.

—Clauses in act 8 Annæ, & 15, 16 Geo. II. Claimant, upon entering his claim, to give security in 60 l. to pay costs; and in default thereof, the goods and vessel to be condemned.—Clauses in act 5 Geo. I. The recited clauses, respecting customable or prohibited goods on board vessels of 50 tons or under, found hovering on the coast of this kingdom, extended to all such like vessels found hovering on any of the coasts of Ireland; and the said offences to be tried, and penalties recovered in any of the four courts of Dublin.—Offences in other ports, to be prosecuted in the court of admiralty, or other court of record of the place; and the forfeitures to be divided and applied as these in Great-Britain.

REMARKS since the last Edition.

In the Reports of the committee of the honourable house of commons, appointed to enquire into the causes of the most INFAMOUS PRACTICE of SMUGGLING, and lately published by Mr Chamberlain Janssen, late lord mayor and representative of the city of London, it is observed, that 'upon the rupture with Spain in 1739, it was clearly foreseen, that the insidious practices of France would necessarily involve us in a war likewise with that power; wherefore it became an indispensable consideration, what would be the most effectual methods to stop those channels, through which we were daily pouring in our wealth among the people of that perfidious nation; enriching them with our specie, merely to purchase superfluous commodities; and, at the same time, impoverishing and weakening ourselves, previous to a war which was upon the point of breaking out with them.

The British parliament, impressed with a deep sense of the mighty evils resulting from this imprudent and baneful intercourse, seized the earliest opportunity of putting a stop to it. They were sufficiently apprized, that this nation paid annually to France, a prodigious sum of money for French cambric; and that our East-India company, out of their stock then in hand, with what they could import, would be able to furnish a commodity equally fit for every purpose; and therefore very judiciously passed an act, in 1744, for prohibiting the wear of French cambric; and so general was the sense of both houses, at that juncture, for this prohibition, that several members declared in their speeches, (doubtless in hopes that their example would be universally followed) that they took it for granted, not a single member of either house would appear in French cambric by that time twelve-month. This act, however, not answering effectually the purpose intended, other acts have passed since to enforce the intention of the first; and these several acts have, at last, completed the disuse of this pernicious commodity among us; and that we may hope for ever.

But the parliament did not stop here: for, the next session, finding the smuggling of tea was got to so exorbitant a height, that the large revenue, which ought to have arisen from it, was sinking daily; and in danger of suffering a much greater diminution, unless a speedy remedy were applied; and being

ing at the same time well informed, that one million and a half of pounds weight of the tea so smuggled in upon us, (together with brandy and other goods) came from France, for all which we paid them our ready money; they passed an act, to commence at Midsummer 1745, for taking off one half (being two shillings per pound) of the excise upon that article; by which wise law, the practice of smuggling was found immediately to lessen; and our specie was consequently, in a great degree, preserved from being sent to France. Our India company thereupon increased their importation of tea very considerably, and the revenue increased with a most surprizing rapidity*; as will fully appear in a large and curious sheet at the conclusion of this treatise. It is computed there have been saved to the nation, by these two salutary laws, not less than three hundred thousand pounds annually; which exorbitant sum had been sent in specie from hence to France, before the prohibition of the wear of French cambric; and the check put to the smuggling of French tea.

* For some years before the passing this act, the excise and custom upon tea (together) produced but little above one hundred and seventy thousand pounds sterling, communibus annis. But so immense has been the increase of this branch of the revenue from that period, that upwards of five millions and a half sterling have been paid into the exchequer, more than would have been, if this act had not passed; whilst the East-India company has, on the other hand, increased her importation of tea, near fifty-three millions of pounds weight.

The succeeding session, the parliament found, from custom-house accounts laid before them, that smuggling still continued to a much greater excess than could have been suspected, when the act of the last session passed. They were likewise sensible, that such numerous and desperate gangs of men, so well mounted and so well armed, might greatly add to the disturbance already broke out in the kingdom. They knew that these banditti carried the earliest intelligence to France, into whose ports they were freely admitted, although in the time of open war, and an open rebellion; and they also knew they were hardy sailors and skilful pilots. All these circumstances were so very alarming, that a committee was moved for, and appointed accordingly, to inquire into the causes of the most infamous practice of smuggling, &c. which committee made the two following Reports, that now appear in print for the first time.

† See page 7, to 11, of the first Report.

‡ The beginning of the winter 1745, when the rebels were in England.

The reader will find, in these Reports and the papers annexed, an abundance of particulars, not only new, but useful and curious. He will see in what manner the laws, for levying the taxes and guarding against frauds, have been suffered for a long course of years to be trampled upon, to the manifest detriment of the fair trader, the very affecting diminution of the revenue, and the utter disgrace of government. He will see, with astonishment, those laws violated by avowed and open acts of force. He will see too many instances of the infringement of those laws, through the fraudulent connivance of those very officers, who were appointed to secure the strict observance of them. In a word, he will see the revenue plundered, in so barefaced a manner, and in such a variety of shapes, that he will be struck with amazement, that practices so opposite to all principles of government, and pregnant with evils of such fatal consequence, could have been permitted to reign so long. And, finally, he will discover, in the course of these sheets, very probable methods proposed, (if not very certain ones) for collecting the old taxes, in a due and regular manner; whereby the frequent imposition of new ones, so oppressive to our manufactures, and so destructive to our trade, might have been spared; and the loss of some important branches of our commerce thereby prevented.

Jovis, 6 Die Februarii, 1745.

Ordered nemine contradicente, That a committee be appointed to enquire into the causes of the most infamous practice of smuggling, and consider of the most effectual methods to prevent the said practice, and to report their opinion therein to the house.

And a committee was appointed accordingly; and all that come to the committee, are to have voices; and the committee have power to send for persons, papers and records.

Anno tertio Georgii III. regis. Cap. XXII.

An ACT for the further improvement of his Majesty's revenue of customs; and for the encouragement of officers making seizures; and for the prevention of the clandestine running of goods into any part of his Majesty's dominions.

Whereas, by an act passed in the twelfth year of the reign of his late Majesty King George the First, intituled, An act for the improvement of his Majesty's revenues of customs, excise, and inland duties, the commissioners of those revenues are respectively empowered and directed to cause all tea, coffee, foreign brandy, rum, or other foreign exciseable liquors, which shall be seized by any officer of the customs or excise, after condemnation, to be publicly sold to the best

bidder, at such places as the said commissioners shall think proper; and to allow the officers making such seizures, for their encouragement, one third part of the full sum arising from the public sale of all such tea, coffee, foreign brandy, rum, or other exciseable liquors, free from all charges of condemnation and sale; and to cause the remaining part of the produce of such sales, after paying the reward to the officer, and the charges of condemnation and sale for such seizures, to be paid into the receipt of his Majesty's exchequer, in lieu of his Majesty's moiety thereof; but the provisions in those subsequent laws, not extending to such seizures when made by officers of the customs, they have hitherto been allowed only one third of the produce thereof, pursuant to the directions of the before-recited act of the twelfth of George the First: And whereas the power given by the said recited act to the respective commissioners of the customs and excise, to cause the goods therein enumerated to be publicly sold, has been found very advantageous to the revenue; and if the like power was extended in general to all sorts of goods, it would prevent many frauds and illicit combinations practised by bidders in the court of exchequer, to the great detriment of the public revenue and the fair trader: And whereas it is highly reasonable and just, as well as of public utility, that the officers of the customs and excise should have equal encouragement to be vigilant in the exertion of their duty, to suppress the pernicious practice of smuggling; to which end, may it therefore please your Majesty, that it may be enacted, and be it enacted by the king's most excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, That from and after the first day of May, one thousand seven hundred and sixty-three, it shall and may be lawful to and for the commissioners of his Majesty's customs, to cause all ships, vessels, and boats, and all goods of what kind soever they may be (excepting only such vessels, boats, and goods, as are by law liable to be burnt) which shall be seized by any officers of the customs, for unlawful importation, or for non-payment of duties, or for any other cause of forfeiture, and condemned according to law, to be sold publicly to the best bidder, at such places as the said commissioners shall think proper; and all and every officer who shall seize such goods, shall, for his and their encouragement, be allowed, by the said commissioners, one moiety of the net produce arising by the sale of such seizure, after deducting the charges of condemnation and sale from the whole; and the said commissioners shall cause the other moiety thereof to be paid into the receipt of his Majesty's exchequer, in lieu of his Majesty's share thereof (excepting in those cases which are otherwise provided for by this act) any law, custom, or usage, to the contrary notwithstanding.

Provided always, and it is hereby declared and enacted by the authority aforesaid, That after deducting the charges of condemnation and sale from the gross produce of all wrought silks, bengals, and stuffs, mixed with silk or herba of the manufacture of Persia, China, or East-India, and all callicoes, painted, dyed, printed, or stained there, which shall be seized and condemned in pursuance of an act passed in the eleventh and twelfth years of the reign of the late king William the Third, (intituled, An act for the more effectual employing the poor, by encouraging the manufactures of this kingdom) the said commissioners of the customs shall allow to the officer or officers who shall seize the same, two third parts of such net produce, and cause the remaining third part thereof to be paid into the receipt of his Majesty's exchequer; and that for all wool, and any other of the species of goods enumerated in an act passed in the twelfth year of the reign of his late Majesty king George the Second (intituled, An act for taking off the duties upon woollen and bay-yarn imported from Ireland to England, and for the more effectual preventing the exportation of wool from Great-Britain, and of wool, and wool manufactured, from Ireland to foreign parts) after deducting the charges of condemnation and sale, the remainder of the produce shall be paid to the officer who shall seize the same, in such manner as by the said act is directed; and that for all tobacco, tobacco stalks, and snuff, which shall be burnt or destroyed, in pursuance of an act passed in the twenty-fourth year of the reign of his late Majesty king George the Second (intituled, An act for the more effectual securing the duties upon tobacco) the officer or officers seizing the same, shall be paid, in the manner directed by that act, three pence for every pound weight of such tobacco and snuff, and one penny for every pound weight of tobacco stalks; and that for such tea as shall be burnt, or otherwise destroyed, by order of the respective

respective commissioners of the customs or excise, pursuant to the laws now in being, the officers making the seizures shall be rewarded in such manner as the said commissioners shall think proper, such reward not exceeding two shillings and six-pence for each pound weight of such tea, in lieu of all other allowances; any thing in this or any other act to the contrary notwithstanding.

Provided also, and it is hereby further enacted by the authority aforesaid, That if the produce of any particular seizure, sold in pursuance of this act, shall not be sufficient to answer the expences of condemnation and sale; or if, upon the trial of any seizure, a verdict shall be given for the claimant, and the ship or goods shall not be condemned; in either of those cases, it shall and may be lawful for the commissioners of his Majesty's customs, to order the charges attending the seizing and prosecuting such ship or goods, to be paid out of any branch of the revenue of the customs, which is by law applicable to the payment of incidents; any thing in this, or any other act of parliament to the contrary notwithstanding. And whereas, for the more effectual prevention of the infamous practice of smuggling, it may be necessary to employ several of the ships and vessels of war belonging to his Majesty, his heirs and successors, on the coasts of Great-Britain and Ireland, and of the other dominions and colonies belonging to the crown of Great Britain; therefore, for the better encouragement of all the officers and seamen employed in such service, to do their duty therein, he it enacted by the authority aforesaid, That it shall and may be lawful to and for his Majesty, his heirs and successors, to direct and appoint the moiety herein before mentioned, or any other part of all and every the seizure and seizures that shall be made by such officers or seamen respectively, so employed as aforesaid, to be divided amongst all such officers and seamen of such ship or vessel of war, who shall make any such seizure as aforesaid, in such proportions, and in such manner, as his Majesty, his heirs and successors, shall think fit to order and direct, by any order or orders of council, or by any proclamation or proclamations to be made or issued, from time to time, for that purpose; and such moiety, or other part of the said seizure or seizures, shall be so paid and divided to and amongst all the officers and seamen of such ship or vessel of war accordingly.

And whereas the laws already made to prevent the clandestine importing and landing of foreign brandy, rum, strong waters, or other spirits, tea, tobacco, tobacco stalks, and snuff in small vessels, which hover upon the coasts of this kingdom, have been found insufficient for that purpose; be it further enacted by the authority aforesaid, That from and after the first day of June, one thousand seven hundred and sixty-three, if any foreign brandy, arrack, rum, strong waters, or spirits of any kind whatsoever, shall be imported or brought into Great-Britain, or into any port, harbour, haven, or creek thereof, in any ship, vessel, or boat, of the burthen of fifty tons, or under (except only for the use of the seamen then belonging to and on board such ship, vessel, or boat, not exceeding two gallons for every such seaman) every such ship, vessel, or boat, with all her tackle, furniture, and apparel, and also all such brandy, arrack, rum, strong waters, or spirits, or the value thereof, shall be forfeited and lost; and where any brandy, arrack, rum, strong waters, or other spirits, or any tea, tobacco, tobacco stalks or stems stripped from the leaf, or snuff, is or are liable to forfeiture, by virtue of an act made in the ninth year of the reign of his late Majesty king George the Second, intitled, An act for indemnifying persons who have been guilty of offences against the laws made for securing the revenue of customs and excise, and for enforcing those laws for the future; and by another act made in the twenty-fourth year of the reign of his said late Majesty king George the Second, intitled, An act for the more effectual securing the duties upon tobacco, or either of them, for being found on board any such ship or vessel at anchor, or hovering within the limits of any of the ports of this kingdom, or within two leagues of the shore, as is particularly expressed in those acts: It is hereby further enacted, That in every such case the ship or vessel on board of which such goods shall be so found, with all her tackle, furniture, and apparel, shall also be forfeited and lost, provided such ship or vessel doth not exceed the burthen of fifty tons.

And it is hereby further enacted, by the authority aforesaid, That every ship or vessel forfeited by this act, shall be seized and prosecuted, and after condemnation be burnt, destroyed, or used in his Majesty's service by the officers of the customs or excise, and the tackle, furniture, and apparel disposed of and divided, and the tonnage ascertained in the same manner as is directed by the laws now in force, with respect to vessels of forty tons or under, forfeited for importing foreign brandy or other spirits.

And it is also further enacted by the authority aforesaid, That no writ of delivery shall be granted out of the court of exchequer, for any ship, vessel, or boat, that is liable to be burnt, destroyed, or used in his Majesty's service, by virtue of this act, or any other act relating to the customs or excise, unless the officer seizing the same shall delay proceeding

VO L. II.

to the trial and condemnation thereof for the space of three terms; and in that case, not without good security being given in double the appraised value of such ship, vessel, or boat, to return the same upon condemnation, in order to be burnt, destroyed, or used in his Majesty's service according to law.

And whereas, by an act passed in the eighth year of the reign of her late Majesty queen Anne, for granting to her Majesty new duties of excise, and upon several imported commodities; and by another act passed in the fifteenth and sixteenth years of the reign of his late Majesty king George the Second, for further regulating the plantation trade, and several other purposes; it is amongst other things enacted, That every person, upon entry of any claim in the court where any prohibited or uncustomed goods, or any ship, vessel, or boat, shall be prosecuted, shall be obliged to give security, in the penalty of thirty pounds, to answer and pay the costs occasioned by such claim; and in default of giving such security within the time limited by the course of that court, for entering such claim, such goods, ships, vessels, or boats, shall be recovered: And whereas many persons have, from the smallness of the penalty, been induced to enter groundless claims in fictitious names, with a view to put the officers of the revenue to vexatious trouble and delay, as well as to deter them from prosecuting seizures legally made, by putting them to an extraordinary expence, oftentimes more than the value of the goods seized, which tends very much to the prejudice of the public revenue, and to the discouragement of the officers thereof, in the execution of their duty: To remedy therefore this inconvenience for the future, be it enacted by the authority aforesaid, That from and after the first day of May, one thousand seven hundred and sixty-three, every person, upon entry of any claim in the court where any goods, ships, vessels, or boats, shall be prosecuted, shall be obliged to give security, in the penalty of sixty pounds, to answer and pay the costs occasioned by such claim; and in default of giving such security within the time limited by the course of that court, for entering claims, such goods, ships, vessels, or boats, shall be adjudged to be forfeited, and shall be condemned; any thing in the before-recited acts, or any other act of parliament, to the contrary notwithstanding.

And whereas, by certain clauses in an act made in the fifth year of the reign of his late Majesty king George the First, intitled, An act against clandestine running of uncustomed goods, and for the more effectual preventing of frauds relating to the customs; (which clauses have been continued by several subsequent acts) it was declared and enacted, That where any ship or vessel, of the burthen of fifty tons, or under, laden with customable or prohibited goods, should be found hovering on the coasts of this kingdom, within the limits of any port, and not proceeding on her voyage for foreign parts, or to some other port of this kingdom, wind and weather permitting, it should and might be lawful to and for any officer or officers of his Majesty's customs, to go on board every such ship or vessel, and to take an account of the lading, and to demand and take security from the master, or other person having or taking the charge or command of such ship or vessel in that voyage, by his own bond, by him to be entered into, unto his Majesty, his heirs and successors, in such sum or sums of money as should be treble the value of such foreign goods then on board, with condition that such ship or vessel, as soon as wind and weather, and the state and condition of such ship or vessel permitted, should and would proceed regularly on such voyage, and should land such foreign goods in and at some foreign port or ports; and if such master, or other person, having or taking the charge or command of such ship or vessel, should, upon such demand, refuse to enter into such bond; or, having entered into such bond, should not depart or proceed regularly on such voyage, as soon as wind and weather, and the state and condition of such ship or vessel should permit, unless otherwise suffered to make a longer stay by the collector, or other principal officer in his absence, of such port where such ship or vessel should be, not exceeding twenty days, then, and in either of the said cases, all the foreign goods so on board such ship or vessel, should and might, by any officer or officers of the customs, by direction of the collector, or other principal officer as aforesaid, be taken out of and from such ship or vessel, and forthwith brought on shore and secured; and in case the said goods were customable, the customs and other duties should be paid for the same: and as concerning wool, or any prohibited goods, or other goods liable to forfeiture, which might be found on board such ships or vessels at the time of their unlading as aforesaid, the same were thereby declared to be subject to forfeiture, and the officers of the customs should and might prosecute the same, as also the ship or vessel, in case she should be liable to condemnation, as in the manner therein after mentioned; and that after such goods were so taken out of such ship or vessel, and brought on shore, and secured by such officer or officers, such bonds so to be given as aforesaid, should be void and delivered up, without any fee or reward for taking or delivering up the same; and such bond, not being otherwise discharged, should, on a proper certificate,

certificate, returned under the common seal of the chief magistrate in any place or places beyond the seas, or under the hands and seals of two known British merchants upon the place, that such goods were there landed, or upon proof by credible persons, that such goods were taken by enemies, or perished in the seas (the examination and proof thereof being left to the judgement of the commissioners of the customs) should be vacated and discharged: And whereas the extending of the said clauses to the rest of his Majesty's dominions, may be a means of preventing illicit trade; be it therefore enacted, by the authority aforesaid, That from and after the first day of July, one thousand seven hundred and sixty-three, the said clauses, and every part of them, shall be extended to all ships and vessels of the burthen of fifty tons, or under, which shall be found hovering on the coasts of Ireland, or any other of his Majesty's dominions or territories belonging to the crown of Great-Britain; and shall be of equal force in every respect, in regard to all such ships and vessels found hovering on any of the coasts aforesaid, as such clauses now are, or shall be construed to be, in regard to any ships or vessels hovering on the coasts of this kingdom; and all offences which shall be committed against the said clauses, or any part of them, on the coasts of Ireland, shall be tried, and the penalties and forfeitures thereby incurred, shall be prosecuted for and recovered in any of his Majesty's courts of record in Dublin in the said kingdom; and all offences which shall be committed against the said clauses, or any part of them, on the coasts of any other of his Majesty's dominions or territories (except this kingdom) shall be tried, and the penalties and forfeitures thereby incurred, shall be prosecuted for and recovered, in any court of admiralty, in the dominion or territory on the coast whereof such offence shall be committed (which court of admiralty is hereby authorized, impowered, and required, to proceed to, hear, and determine the same) or in any court of record in such dominion or territory, at the election of the informer or prosecutor, according to the course and method used and practised there in prosecutions for offences against penal laws relating to the customs or excise; and such penalties and forfeitures so recovered there, shall be divided and applied in such and the same manner as penalties and forfeitures recovered in Great-Britain for the like offences are, or in pursuance of this act may be, directed to be divided and applied.

SOAP, a sort of paste, either hard and dry, or soft and liquid; used in cleansing and bleaching of linen, and for other purposes by the dyers, perfumers, fullers, hatters, &c. See **BLEACHING** and **LINEN**. Some peculiar sorts are also used medicinally.

To make soap requires an intimate union of the salt of pot-ashes with oil, or any vegetable or animal fat: this union, in the present method of soap-making, is procured by a tedious operation, or by long boiling a weak lye of pot-ash and quick lime with the fat, adding a stronger and a weaker lye occasionally by degrees, 'till the requisite point to the perfection of the soap is hit.

R E M A R K S.

It might greatly contribute to shorten this operation, and ease the expence thereof, if a mechanical motion or engine were employed instead of fire, to procure this intimate union of the lye and oil. And that something of this kind is practicable, appears from hence; that if, for example, half a pint of the soap-boilers strongest, or capital lye, as they call it, be briskly shook in a phial, with an ounce or more of oil olive, for half a quarter of an hour, and then the phial be suffered to rest, there will, in a short time after, be found a solid cake of tolerable soap at the top of the liquor, and may be easily preserved in that form, by breaking the phial, and rendered harder by being exposed to the air.

The art of soap-making depends upon the following particulars. (1.) The nature and quality of pot-ash. (2.) The nature of oils and fats. And (3.) The several ways of uniting them to advantage.

(1.) A due enquiry into the nature of pot-ash [see the article **POT-ASH, NORWAY**] shews wherein the superiority of the foreign ashes, particularly those of Marseilles, Castile, Venice, and Joppa, consists; why the soaps, at present made in England, fall short of the perfection of some foreign soaps; and will inform us of the ways whereby even Joppa soap might be equalled in England. For such an enquiry will trace out the real physical differences betwixt one sort of pot-ash and another, with the ways of converting any one of them into the rest; so as to fit them for the soap-boiler, glass-maker, &c. respectively: it shews also, how the mildest pot-ash is obtainable, for the more curious soaps; and especially for those intended to be used medicinally, &c. And, by the way, there is room to suspect, that a thorough enquiry into this subject, would shew the matter of all pot-ash to be the matter of nitre; or that all the vegetables which yield pot-ash by calcination, might be brought to afford nitre by putrefaction; or that pot-ash is nearly the same thing, both in nature and substance, with fixed nitre.

(2.) A due inquisition also into the nature of oils and fats,

would shew likewise, how one sort might be converted into another, or hard animal fats into liquid oils, and liquid oils into solid fats, by digesting oils with certain coagulating acids, &c.—How all the foreign solid oil soaps might be imitated in England, and how a great variety of liquid soaps might be prepared for many different purposes; the foundation of the thing entirely depending upon the use of a highly subtilized and thin vegetable oil.

(3.) An enquiry into the best methods of uniting fixed vegetable salts with oils, might naturally suggest several machines for the purpose; whereby many tons of soap should be readily made by means of mills, wrought by the wind or water; and this either with or without fire. It might also inform us of several menstruums, or connecting mediums, which should, either alone or with little assistance, procure an intimate union.

SOIL. See the article **MANURE**, and those others from thence referred to.

SOISSONNOIS. This province, in France, is bounded on the north by Laonnois, on the east by Champagne, on the south by Brie, and on the west by Valois. It abounds in corn, pastures, and wood.

SOISSONS is situated in a very agreeable and fruitful vale, on the banks of the river Aisne. It is seventeen leagues distant from Paris to the north-east, and about eight from Rheims to the west. It is a large city, well built, and drives a great trade in corn.

SOMERSETSHIRE has Devonshire on the west, Dorsetshire on the south, the British channel on the north, and Wilshire on the east, and is about 150 miles in circumference. The air is the mildest, and the soil, for the most part, the richest in the kingdom: it abounds with grain of all kinds, of which it supplies home and foreign markets with vast quantities. Its hills afford mines of coal, lead, and copper; woad thrives well here; and teazles, a sort of thistles used by cloth-dressers, grow scarce any where else; and of lapis calaminaris, without which there is no making brags, more is dug up here than in all the kingdom besides.

All sorts of cloth are manufactured here; as broad and narrow kerseys, druggets, ferges, duroys, and shalloons, together with stockings and buttons; and in the south-east parts are made great quantities of linen. The value of the woollen manufacture alone here, in the first hands, has heretofore been rated at a million a year.

BRISTOL, the second city in Great-Britain, for trade, wealth, and number of inhabitants, stands on the conflux of the rivers From and Avon. As to the trade of it, 'tis well known to be the most considerable, London only excepted, especially to the West-Indies, to which its merchants were the first adventurers, and always greater traders in proportion, than that metropolis. Liverpool is now said to vie with them. It was even computed, above 30 years ago, when it employed no less than 2000 sail of ships, that the trade, in proportion to the bigness of the two cities, was above three times as great as that of London. Indeed the Bristol merchants had a very good trade to the West-Indies, at the time of the civil war, which they have increased much more, not only thither, but to all parts of the world, since the Revolution. Before that, they knew little of the Guinea trade, and hardly any thing of the Dutch, the Hamburg, the Norway, and the east-land commerce; all which have since been very flourishing here.

In time of peace, 50 West-India ships, many of them of considerable burthen, have arrived here in a fleet, or very near one another. The shopkeepers here, who are in general wholesale men, have so great an inland trade, that they maintain carriers, as the London tradesmen do, to all the principal counties and towns, from Southampton to the banks of the Trent.

Moreover, by means of those two great rivers, the Severn and Wye, they have the whole trade of South Wales, as it were, to themselves; and the greatest part of that of North Wales. And how their trade may be greatly increased, see the article **RIVERS**.

The largest ships lie at Hungroad, four miles down the river; two miles below which is Kingroad, another station, in the merchandize brought to the key by lighters.

One of this city's principal branches of trade, and which has been prodigiously increased since the Revolution, is that to Ireland; from whence it imports tallow, linen, and woollen, and bay-yarn. The Straights trade, for all sorts of fruit, oil, &c. is very considerable.

They have also some considerable manufactures of woollen stuffs, particularly cantaloons, which are carried on chiefly by French refugees. Glass ware is as plenty and cheap here, as in any place in the world, here being no less than fifteen glass-houses, (which are served by the Kingwood and Mendip-hills coal-mines) some for glasses, others for bottles.

BRIDGEWATER, on the river Parret, has a pretty good coast trade to Bristol, and all down the Severn to Wales for coals, to Cornwall for slate, &c. Its foreign trade is chiefly to Portugal and Newfoundland. Wool is brought hither in good quantities from Ireland, for a trade to which kingdom, this port lies as convenient as any in the Severn sea. They have, besides, a great retale trade; and for cheese there are few, if any,

any, greater markets in the kingdom, many waggon loads being brought here, on a market day, for Devonshire.

MINEHEAD has a safe harbour in the Bristol channel, much frequented by passengers to and from Ireland; from whence also about 40 vessels come hither yearly with wool, that being its chief trade. Here are several rich merchants, who have some trade also to Virginia, and the West-Indies; and they correspond much with the merchants of Barnstaple and Bristol, in their foreign commerce. They ship off also about 3 or 4000 barrels of herrings yearly, for the Mediterranean, &c.

TAUNTON, on the river Thone, is a populous town, the inhabitants being computed at above 20,000; some thousands of whom are employed in the manufacture of ferges, duroys, sagathees, shalloons, &c. Some of them, indeed, are, of late years, removed to the neighbouring town of Wellington.

WELLINGTON is chiefly of note for its seven weekly fairs, for cattle from the west country; and its manufacture is ferges, druggets, &c.

YEovil, or **IVEL**, is a good large town, on a river of the same name. Its chief manufacture is gloves, though some cloth is made here, and it has a considerable market for corn, cheese, hemp, flax, linen, sail-cloth, &c.

CHIDDER is famed for the finest cheese in the world, except the Parmesan: the parish is about 23 miles in compass, abounding with pasture. 'Tis common here for 3 or 4 dairies to join their milk, to make one great cheese of 100, or 150 lb. weight, value six-pence a pound on the spot. There are, moreover, such great plantations of apples in this parish, that 3000 hogheads of cyder have been made in a season, and 36 horse-loads of apples have been sent in a week, for 26 weeks together, to Shepton-Mallet, &c. for sale; and 200 bags of wool are produced in it every year.

BRUTON, on the river Bru, drives a great trade in ferges and stockings.

SHEPTON-MALLET is a populous town, with many very considerable clothiers.

Some cloth is also made at **CROSCOMB**, but its chief manufacture is stockings.

FROME-SELWOOD is also remarkable for its woollen manufacture. The cloths made here, are for the most part medleys, of about 7 or 8 shillings a yard.

SOUTH SEA COMPANY.

A short HISTORY of the SOUTH SEA COMPANY.

This company was erected by act of parliament, in the ninth year of the late queen Anne, entitled, An act for making good deficiencies, and satisfying the public debts, and for erecting a corporation to carry on a trade to the South Sea, and for the encouragement of the fishery, &c. The preamble recites, That the debt due to the navy, the army, &c. amounted to 9,000,000 l. and upwards, and thereupon it was enacted, that the duties following should be imposed for paying an interest of annuity, after the rate of 6 per cent. per ann. for all the said sum, which interest amounted to the annual sum of 568,279 l. 10 s. The duties constituting the fund for payment of the said interest, were all the impositions and duties upon wines, vinegar, tobacco, East-India goods, wrought silk, whale-fins, &c. granted by an act of the 8th of queen Anne, 'till the year 1720, continued by this act to the crown for ever, together with the duties on candles, and money given with apprentices. And the queen was empowered, by letters patent, to form the said creditors, interested in the navy-bills, &c. into a company, who, on their subscribing their bills, tickets, debentures, &c. were to be admitted into the joint-stock, and become members thereof, in proportion to the sums due to them. And the said corporation were, by the said act, to be vested in the sole trade to and from all kingdoms and lands on the east side of America from the river Oroonoko, to the southernmost part of Terra del Fuego; and on the west side thereof, from the southernmost part of the said Terra del Fuego, through the South Sea, to the northernmost part of America, not exceeding 300 miles from the continent on the said west side (excepting Brazil, and other places in the possession of the king of Portugal), and the country of Surinam in possession of the States-General) the company to be sole proprietors of all islands, forts, &c. which they should discover within these limits, to be held under the annual rent of one ounce of gold. The crown also was empowered, by letters patent, to direct a stock to consist of 20 s. in every 100 l. of the capital stock of the company, to be raised by the members thereof, and employed in improving, enlarging, and carrying on the fishery of this kingdom, for the use of the company.

In pursuance of this act, the proprietors of the navy-bills, tickets, and any debentures aforesaid, were incorporated, by the name of The Company of Merchants of Great-Britain trading to the South Seas, and other parts of America, and for encouraging the Fishery. And on the peace that followed, anno 1713, the late queen transferred to the said company, the benefit of the *ASSIENTO CONTRACT* with Spain, which was the furnishing the Spaniards with slaves for their mines and plantations in America, by which they were also entitled to send a large ship annually with European goods, consisting chiefly of our woollen manufactures, to the

Spanish West-Indies. [See the article *ASSIENTO CONTRACT*.] By an act of 1 Geo. I. cap. 21. the sum of 822,032 l. 4 s. 8 d. was added to the capital stock of the South Sea company, to make it up just the sum of 10,000,000 l. With this large capital, we don't find that the company ever applied themselves to foreign trade, (which seemed to be the principal design of incorporating them) unless in sending the ship above mentioned with European goods to the Spanish West-Indies, and furnishing the Spaniards with negroes; nor did they make any attempt to promote the fishery (another grand design in establishing this corporation) 'till of late years, and then only by sending a small number of ships annually to fish for whales; but what they chiefly make a merit of is, their being instrumental to the lessening of the national debt, and rendering some of those debts redeemable, which could not have been redeemed otherwise, without a breach of the public faith. They boasted—That they had not only added above 50 per cent. to the estates of all the old proprietors of the stock, but had been continually promoting the public good, by savings and reductions of interest.—That it appeared by a statute of 3 Geo. I. cap. 9. that the capital of the company then amounted to 10,000,000 l. for which a yearly fund of 600,000 l. was payable to them, after the rate of 6 per cent. and that they submitted to accept, after Midsummer 1718, of an annuity of 500,000 l. being after the rate of 5 per cent. per ann. for their ten millions.—That the company agreed also to advance the government the further sum of two millions, for the discharge of lottery-tickets that carried 6 per cent. and accepted another fund to pay them an interest of 5 per cent. for the said two millions.

That afterwards the South Sea company procured as many annuities, redeemable, and irredeemable, and other public debts, to be subscribed into their stocks, as with their original capital amounted to 33 millions and upwards, taking an interest of the government of 5 l. per cent. for the present, and stipulated to take 4 l. per cent. for the whole after Midsummer 1727; by which reduction of interest, the nation was provided of a fund usually called the *SINKING FUND*; whereby the public would have been enabled to have discharged the whole debt within the compass of forty years, or very little more, without laying any new burthens on the subjects.

And whereas it was objected to them, that the change that was made in the long annuities, by the company's redeeming them at twenty years purchase, had brought the nation in debt three millions more than it was before, the annuitants not having paid so much money for them by three millions; the company answered, that the nation was in debt on account of the annuities, according to the payment she was to make to the annuitants, and according to the time she was obliged to continue those payments; and if their bargain makes no alteration in that matter, if it neither adds to or lessens those payments, or the time of continuing them, then it leaves the debt of the nation just as it found it, neither increased nor diminished by it: but if it either lessens the annual payments, or shortens the time of making such payment, it must be so far said to lessen the national debt to the annuitants.

In the year 1716, there was published a calculation of the state of the national debt, in which the long annuities granted at several times were stated and valued, according to the sums paid into the Exchequer for them, which was about eleven years and a half purchase for those in king William's, and under sixteen years purchase for those in queen Anne's, time. This calculation, therefore, states the debt of the nation on the account of the annuities according to the sums they were first granted at.

Because this could neither be reckoned the debt of the nation with regard to the annuitants, nor the value of the annuities. It could not be reckoned the debt of the nation with regard to the annuitants, because the nation had contracted with them not to pay them off at pleasure, by returning them the money they at first paid into the Exchequer, but in an absolute engagement for the payment of such annuities for a certain term of years: neither could it be reckoned the value of the annuities, for their value must be stated (as the value of every thing else must be) not according to what was given for them at first, or what they were worth at that time, but according to what they are worth at the time they are proposed to be purchased: for as they then were only of such a value, because money bore such an interest, so if the state of interest is altered since that time, the value of such annuities must be in the same degree altered; for their value must rise in the same degree that the interest of money decreases, which was the reason that they were worth above 20 years purchase in the year 1720, and therefore could not be purchased at a lower rate, unless a power had been taken in parliament of fixing the price, which was supposed to be a step inconsistent with the safety of the public credit. The stating, therefore, the national debt to the annuitant according to the sums first given for them, was a great mistake.

But yet upon this foundation, that the degree of the debt is to be thus stated, an argument is formed, that the buying the annuities by the South Sea company at 20 years purchase, makes

makes an addition to the national debt, because here is 3,000,000*l.* &c. more paid for them than they were at first granted at. This supposes that the nation owed the annuitants no more than their first purchase money, and could oblige them to take it when they pleased; and if this had been the case, then it must have been granted that the 3,000,000*l.* &c. given by this bargain, had been so far an increase to the national debt.

But if this supposition be contrary to the true state of the case, if the faith of the nation was given absolutely for the payments of such annuities, and for such a term of years, then the debt of the nation to the annuitants must be stated according to that grant. And then the question will be, whether the nation is upon better terms with the annuitants by this new bargain, than she was without it: and the only way to see this clearly, is to see whether the nation is to be sooner quit of her payments to the annuitants, and therefore to pay less to them by virtue of this purchase, than she must have paid to them, had they continued unpurchased in their first state? At the time this purchase was made, the nation was to continue the payment of the annuities for about 83 years.

If, therefore, this term of payment is by this new bargain reduced to a term of years of about half the time, and this be done not by any further money advanced by the nation, but only by a change made in the manner of her payments, and a change of the state of the annuities, then it must be very obvious how much the nation is relieved in her debts to the annuitants. The change made in the manner of the payment is this; the South Sea company buy 100*l.* annuity with 2000*l.* stock, so that the nation is to pay interest for 2000*l.* stock instead of paying an annuity of 100*l.* Was the nation to continue this same payment to the stock, and for the same term of years that she was to have continued her payments to the annuities, then it must have been granted, that she had neither lessened nor increased her debt by this bargain.

But if by virtue of this new bargain, and by this change in the manner of the payments, that is, by paying interest for 2000*l.* stock, instead of an annuity of 100*l.* the nation has not only a redeemable debt to deal with, but is also provided with a fund sufficient for the redeeming or discharging of 2000*l.* stock in about half the time she was to have paid the annuitants, then it must be equally granted, that she has her debt in this great degree lessened and relieved by this bargain. Now what is here only supposed as the effect of this bargain, is the true and real nature of it, and such as it was sufficiently fitted to produce, which may be thus made plainly to appear. The nation pays interest for 2000*l.* stock, instead of paying an annuity of 100*l.* but it is provided for in this contract, that in the year 1727, there should be a reduction of interest at one per cent. So that instead of the 100*l.* annuity, there will be only 80*l.* per ann. paid to the 2000*l.* stock; and this abatement of interest, or deduction of 20*l.* per ann. from the 100*l.* annuity, will raise a fund sufficient for the discharge of the 2000*l.* stock in about half the time that the payment of the annuities was to have been continued. So that by this mere change of the state of the debt, and the manner of the payments, the nation is enabled to discharge the whole debt in about 34 years sooner than it could have been discharged had the annuities not been thus purchased.— That notwithstanding all these advantages accruing to the nation by the scheme laid by the late South Sea directors, they had been evicted out of their estates, however long enjoyed, and by whatever means acquired.

As to the calamities of the year 1720, which altered the estates of so many private persons, they ought not to be imputed altogether to the directors, or to the South Sea scheme itself, but to a more general cause; for there was not any order of men in the nation, that had not some share in helping forward that general insatiation, and to whom therefore the common calamity ought to be attributed; so that it might have been justly expected, that every order of men in the kingdom should have been inclined, either to have pardoned or gently punished such a state of things, as they had not been mere spectators of.— That had the directors been allowed the benefit of a fair and candid trial, they might very justly have pleaded, that they had done nothing privately, or of their own heads; that they were driven into all the steps they took, by the irresistible temper of men of all orders; that they had acted openly in the sight of the legislature, and had the orders and authority of general courts for all they did, and their thanks after it was done.

Another cause the late directors assign for the sudden rise of their stocks, which occasioned the calamities in the year 1720, was the Bank bidding against them. The proposition made to the parliament at first, say they, was only for a voluntary subscription of the proprietors of the irredeemable and redeemable debts into the South Sea stock, at the best terms the company could agree with them (which was no more than selling their stock by subscription), a method the Bank has often pursued; and as the ministry knew the company had gained a sum for their proprietors, by taking in part of the lottery 1710, the year before, besides what they paid

the government for so doing, they insisted the company should pay a sum of money to the government for the liberty of having the said debts subscribed into their stock.

Before this proposition, the Bank had been applied to for undertaking this matter, but they refused it, treating it with contempt. But on the proposition being made to the house of commons, they became bidders of above five millions and a half to the government, by which the scheme first proposed was entirely altered, the same being then put up to the highest bidders; which influenced the minds of all sorts of people, and was the occasion of the extravagant rise of stocks, whereby all the mischievous consequences to private persons ensued; for it is plain the nation has received a great advantage by it, and therefore the ill consequence can only be the increasing some persons estates, and decreasing the estates of others. The second reason of the ill consequences of the scheme was owing to the bargain which the Bank solemnly made to the South Sea company, and never performed, whereby so many persons were misled, and thereby very greatly injured.

The company desire also it may be observed further, that the directors and managers of that scheme were never charged with any frauds or embezzlements of the company's effects.

The late directors also in their defence, and in order to show how instrumental they have been in reducing the interest of money, and putting the national debt in a way of being paid off in a few years, published a treatise, styled, A true State of the South Sea Scheme, &c. wherein they inform us, that the method they first proposed for executing their scheme was as follows:

The total of their capital was about	1. 11,746,000
Total of the annuities and debts to be taken in were about	30,981,000
Which would make the total of their capital	42,727,000

The whole sum to be taken in by the company being so large, and consisting of annuities and debts of various kinds, it was judged impracticable to take in the whole at one time, and that by taking them in at different times, prices, and proportions, the proprietors thereof (through apprehension of being either entirely left out, or of coming in afterwards at a higher price) would be quickened to make their subscriptions, whereby the execution of the scheme would be rendered more easy and certain. Though when the scheme was first formed, the price of the stock did not exceed 116*l.* to 118 per cent. yet it was supposed, if the proposal was accepted by the parliament, that the acceptance would so much increase the credit of the stock, as the company might be able to take in the said annuities and debts, at the rates, and in the proportions herein after mentioned: and if the Bank and East-India company, or either of them, would come in, they were proposed to be admitted into the first subscription at 130 per cent. or even lower, which would nevertheless have increased the profit to the South Sea company. But as their coming in was uncertain, the calculation was made only upon the other annuities and debts, viz.

6,500,000	Annuities and debts, subscribed at 130 per cent. for the stock, would produce stock to the subscribers	1. 5,000,000
7,000,000	Ditto, subscribed at 140 per cent. would be stock to the subscribers	5,000,000
7,500,000	Ditto, subscribed at 150 per cent. would be stock to the subscribers	5,000,000
9,981,000	Ditto, subscribed at 160 per cent. would be stock to the subscribers	6,238,125
30,981,000	Total stock to the subscribers	21,238,125
	Stock gained to the company	9,742,875
	Total stock to the company for the annuities and other debts to be taken in	30,981,000
	Then the capital would stand thus:	
	Proprietors old capital	11,246,000
	Proprietors new capital by subscription	21,238,125
	Total proprietors stock	32,984,125
	Stock belonging to their company in their corporate capacity, gained by their subscription	9,742,875
	Total capital as above	42,727,000
9,742,875	Stock to be sold by the company, at 160 per cent. amounts to in money	15,588,600
	Out of which deduct to be paid to the public	3,500,000
	Rest nett profit to the company	12,088,600
	The company's funds or income, for about 38,600,000 <i>l.</i> at 5 per cent. per ann.	1,930,000
	For 4,127,000 <i>l.</i> at 4 per cent. per ann.	165,080

Total

Total of the company's income, besides the allowance to them for charges of management	1. 2,085,080
81. per cent. for a dividend upon 32,984,125 l.	2,638,730
proprietors' stock comes to	2,095,080
Towards which the company's income would be	

Wanting to make an annual dividend of 8 per cent. 543,650

Which, by the gradual selling the stock, and what the company gained on the subscription, would have supplied the same for above 12 years: before the expiration of which time it was supposed, the benefit of their trade to Africa, and the grants of Nova Scotia, and of the French part of St. Christopher's, would have been sufficient to have perpetuated the dividend, if not to have enlarged it. But the commons objecting against giving the South Sea company the African trade, Nova Scotia, and that which was the French part of St. Christopher's, the South Sea company were prevailed with to leave those advantages out of their proposals, which were the substantial things to have supported their credit; but still with assurance from those in the ADMINISTRATION, of using their utmost endeavours to obtain them for the company: But the price of South Sea stock, from the time of accepting their proposals to the passing the act, rising very considerably, and the Bank and their friends always opposing whatever appeared to be for the benefit of the South Sea company, they could never obtain those advantageous grants, which they had much depended on (as solid supports to the stock) though they frequently importuned and pressed the ministry for the same.

The extraordinary rise of the South Sea stock before the passing the act, together with the opposition of the Bank, having defeated the company of those grants and settlements which they had depended upon as the solid supports of the stock, as has been already hinted, nothing was left them but the opinion of mankind to enable them to execute the act, which put them under a more than ordinary necessity of complying with the general disposition of the people; and, therefore, though their original designs and intentions were to have no subscriptions but of the several annuities and debts that were to be taken in, yet there being, immediately after passing of the act, a prevailing notion among many of the proprietors and others without doors (for it did not proceed from the directors) of taking in money subscriptions; and this opinion growing universal, the directors found themselves under a necessity to depart from the method they had first intended to proceed in, and to begin the execution of the act with a money subscription; to which they were the more easily induced, finding the method prescribed by the act would require a great many months to effect the taking in but a part of those public debts; and that unforeseen accidents might so reduce the price of stocks, as wholly to defeat the execution of the act, and yet the company would remain under the obligation of paying to the public 4,667,000 l. though no part of the act should be executed.

A further inducement to admit of a money subscription was, that they might be thereby enabled to pay off such of the redeemable debts, and to offer money to such of the annuitants, as shall not be inclined to take stock for the same, they not being then certain, there would be such an universal disposition in those proprietors to accept stock for their debts and annuities, as afterwards appeared; but when that disposition did appear, the directors had no occasion to apply the money to that use. By these and the like considerations, the directors were prevailed on to open a money subscription at 300 per cent. with distant times of payment, and without limiting the sum to be taken in, stocks being then 285 per cent.

The method they proceeded in was, that every director took the names of those persons who applied to them, and the sums for which they desired to be admitted into that subscription; which, when brought together, amounted to so large a sum, and the names were of so considerable persons, that though their first intention was to have had that subscription for no more than one million, or at most one million and an half; and though they permitted no person to have more than 4000 l. and the sums desired were generally reduced, yet the directors found they could not bring the subscription to a less sum than 2,250,000 l. without giving such disgust, as might prove prejudicial to the company.

The first money subscription being thus fixed, and the sum it amounted to being 6,750,000 l. of which 60 per cent. being 1,350,000 l. paid down, the directors thought this subscription a sufficient fund to enable them to execute the rest of the act, and accordingly came to an unanimous resolution of taking no more money subscriptions.

But this subscription soon falling out at a considerable profit, it cannot be forgot how impatient persons of all ranks and degrees were for another money subscription, and by their importunity did prevail on the directors to agree the 28th of April to open one, which was done on the 30th of the same month at 400 per cent. of which 40 per cent. was paid down; and the same day resolved it as their opinion, nemine contra-

VOL. II.

dicente, not to take any further SUBSCRIPTION in MONEY. This subscription was intended also not to exceed a million, but the application to get into it was such, that when the directors came to examine the names and sums demanded, they found they could not reduce it under a million and half, without giving the greatest offence.

But the directors thoughts being intent upon executing the act according to their first design, by taking in the annuities and redeemables, especially the former, on which the parliament had laid so great stress; they (the same day it was agreed to open the second money subscription) previously resolved on a subscription for the annuities; which met with such success, that in a few days above two-thirds of them were brought in, and on the 19th of May (the price of stock being then 375 per cent.) the directors fixed the price for the subscribed annuities at 32 years purchase, to be paid as follows, viz.

	For 100 l. per ann.	
Stock 700 l. at 375 per cent. which amounts to	1. 2625	
In money and the company's bonds	- -	575

Total for 100 l. per ann. - 3200

This gave great satisfaction to all parties concerned, and the stock and subscription advanced so fast, that when the parliament rose, the stock was at near 800 per cent. and the second subscription sold for 500 per cent. profit.

At this time the price of stock being about 800 per cent. and the second subscription selling for about 500 per cent. advance, and great numbers of those who desired to be admitted into the third subscription, having requested it at 1000 per cent. the directors thought they could not set it at a less price; but they allowed such times of payment, as with the Midsummer dividend reduced it to about 800 per cent. This met with no blame from any person at that time, but, on the contrary, universal approbation; as appears by the price this third subscription bore, it soon selling at 300 per cent. profit.

When this subscription was completed, the directors came again to a resolution of taking no more money subscriptions, and applied themselves to take in the remainder of the annuities and redeemables. To which end, on the 8th of July they agreed to open their books on the 12th of that month, to take in part of them; which was accordingly done, and in a few days, most of the irredeemables and annuities standing out were subscribed: but some of the proprietors of those debts and annuities, by reason of their absence, or other impediments, not having an opportunity to subscribe before the books were shut, made great application to the directors to be admitted; who, being unwilling to complete the execution of the act with as much expedition as they could, did, on the 27th of July, resolve to open books on the 4th of August following, for taking in the remainder of these debts and annuities, and most of those which were standing out were then brought in.

On the 12th of August the price of stock, inclusive of the Midsummer dividend, was upwards of 900 per cent. which made the stock, exclusive of that dividend, about 820 per cent. The directors agreed to fix the price of the subscribed long annuities at 36 years purchase, and the redeemables at 105 per cent. and the price of stock to be given for the same at 800 per cent. so that the redeemables, considering they were taken in at 105 per cent. had the stock at about 60 per cent. under the current price, which gave general satisfaction at that time.

It farther appeared, that the terms allowed for the annuities and redeemables which were subscribed, were very satisfactory, because they were sold at a much higher price than the unsubscribed; and some time after this price was declared in the Gazette, many considerable proprietors of the unsubscribed annuities and debts pressed and asked it as a favour to be, and were accordingly admitted to subscribe, and particularly several foreigners and merchants, intrusted here by them, for their use. Although the directors had come to several resolutions against any further money-subscriptions, those resolutions were not sufficient to stem the repeated application for the same, from multitudes of all ranks; and the proprietors of the stock began to clamour at their not being admitted to a share of their proportions in the former subscription, and some of them threatened to demand a general court, to order that the proprietors might be admitted to a subscription in proportion to their stock; which obliged the directors to take that matter into consideration: and the same day on which they fixed the price of stock for the two last subscriptions of the annuities and redeemables, they agreed to take a subscription of 20 per cent. on stock, for the proprietors only, the stock in such subscriptions to be valued at 1000 l. per cent. which, at that time, gave great pleasure and satisfaction to the proprietors, and 40 per cent. was offered for the privilege of that subscription.

But this did not take off the applications for another money-subscription to all persons indifferently, to which the directors shewed a great unwillingness; but, by the continued solicitations of multitudes of all degrees; and from all parts, they at length consented to open a fourth money-subscription, on

the 24th of August, at 1000l. per cent. exclusive of the Midsummer dividend (the third subscription then selling at about 300l. per cent. advance) but, to prevent this subscription running to an excessive sum, they agreed that one fifth part, being 200l. per cent. should be paid down, and none be admitted but those who brought their money that very day. The eagerness for this subscription was so great, that notwithstanding this precaution, and the directors full intention that this subscription should not exceed a million, yet, in a few hours, there was 1,200,000l. subscribed, although many were excluded, who pressed very earnestly to come in. Had not the directors taken that precaution in relation to this fourth subscription, it would probably have swelled to a larger sum than the third, as is manifest not only by the eager filling so great a sum (as is mentioned) in so short a space, and the numberless letters the directors received from persons who desired to be admitted into it, but also by a memorable reply that a great minister of state, since dead, made to them, upon their informing him of the method they intended to proceed in, who thereupon told them, That he himself had a list for above a million for that subscription, and that therefore, if they would proceed in the method they had proposed, without taking in lists, as they had done in the third subscription, he desired that they would publish an advertisement in the Daily Courant, That it was not in his power to serve his friends; that thereby he might clear himself of the clamour and charge that would arise against him for having neglected them.

As to the subscriptions for 20 per cent. to be limited to the proprietors only, the same was afterwards (for several reasons) thought fit, by the general court, to be omitted. The spring of the money-subscriptions arose from without doors, and not from the directors themselves, as already mentioned; and one may venture to say, those subscriptions were countenanced by the parliament; for that, after the first money subscription was taken in, there having arisen some doubts concerning the validity thereof, the parliament were pleased to pass a clause in the act, for establishing the two insurance companies, confirming not only the subscription taken, but also all such subscriptions as should after be taken, and to make the receipts that should be given out for the same assignable in law, which they would not have been without authority of parliament. They observe further, that by the original scheme, the highest calculation of the stock was 160l. per cent. and that advance supported by such beneficial grants to the company, which, if pursued and ripened into actual execution, would have kept the stock at least to that price, without being detrimental to any. But several public advantages would necessarily have arisen therefrom; as, first, the bringing the annuities into a state of redemption, which had been always thought an insurmountable obstacle to getting the nation out of debt. Secondly, The reducing the interest of the public debts from 5 to 4 per cent. and thereby increasing the sinking fund above 540,000l. per ann. by which the whole debt of the nation might have been paid off in about 24 years. Thirdly, The lowering the common rate of interest, which would soon have followed as a necessary consequence thereof. Fourthly, The trade and revenues of the kingdom would have been increased, by the peopling and cultivating Nova Scotia, and the French part of St Christopher's; and especially by enlarging and opening the trade to Africa into the INLAND PARTS of the CONTINENT, which has never yet been done, whereby they could scarce have failed of discovering the many rich gold mines which unquestionably are there, and from thence an immense treasure might have been brought into this kingdom.

The South Sea directors, in the year 1720, insisted further, that the scheme was originally formed with a design of great advantage to the public, as well as to the original proprietors, and, notwithstanding it received many alterations between its first formation and passing into an act, and that the execution of that act has been attended with many misfortunes; nevertheless there still flow therefrom many and great benefits, as well to the public, as to the original proprietors: and yet the directors of the South Sea company are punished in a manner beyond any precedent known in England, whilst the projectors and managers of the innumerable BUBBLES set up, even without any legal foundation, and with no other intention than that of fraud and cheat, have not been so much as called in question. [See the articles ACTIONS and BUBBLES.]

A SCHEDULE of the late DIRECTORS respective ESTATES, with their respective ALLOWANCES for their subsistence, and the SUMS taken from them.

	The nett value of the estates of the directors, by the report of the secret committee.			The fines, or sums taken from each director.

Mr Grigby	31,687	6	—	2,000	29,687	6 —

This act for the confiscation of their estates was founded upon the following resolutions of the lords and commons, viz. 2 February, 1720, resolved by the House of Peers, That the South-Sea directors declaring 30 per cent. dividend for the half year ending at Christmas, and 50 per cent. per ann. for 12 years after, was a villainous artifice, to defraud and delude his Majesty's good subjects.

16 February, 1720,

The secret committee of the House of Commons made their report, from whence it appeared that the following portions of South-Sea stock were taken in for the several persons following, viz.

	1.
For the earl of Sunderland, first lord of the treasury, at the request of James Craggs, sen. Esq.	50,000
For the duchess of Kendall	10,000
For the counts of P.	10,000
For the two nieces of the duchess of Kendall	10,000
For Mr Craggs senior	30,000
For Charles Stanhope, Esq.	10,000
For the Swordblade company	20,000

It appeared also, that Mr Aislabe, chancellor of the Exchequer, had great quantities of the South-Sea stock given him, and that a great deal more had been taken in by the members of both Houses of Parliament.

18 February, 1720,

Resolved, That the setting the stock to sale by subscriptions, at high prices, above the intrinsic value, by the directors, was a gross and notorious fraud, and one great cause of the sinking the public credit, and bringing upon the nation the distress it at present labours under.

Resolved, That the advising the late directors to set the stock to sale by subscriptions, at high and extravagant dividends above said, by any persons in the administration, was a notorious breach of the trust reposed in them, to the prejudice of his Majesty's government, and the interest of the kingdom.

20 February,

Resolved, That the taking in, or holding of stock, by the South-Sea company, for the benefit of a member of parliament, or person in the administration, while the company's proposals, or bill, was depending, without a valuable consideration, or security, for the acceptance, or payment, for such stock; and the company's paying, or allowing, such persons the difference arising by the advanced price of the stocks, were corrupt, infamous, and dangerous practices, highly reflecting on the honour and justice of parliament, and destructive of the interest of his Majesty's government.

The

The Commons taking into their consideration that part of the report of the secret committee which related to John Aillabie, Esq; a member of that House, Mr Aillabie was heard in his defence; and it being plainly proved that he had caused a book of accounts between him and Mr Hawes to be burned, and given him a discharge for the balance, amounting to 840,000 l. it was resolved nemine contradicente (among other things) That the said John Aillabie had encouraged and promoted the dangerous and destructive execution of the late South-Sea scheme, with a view to his own exorbitant profit, and had combined with the late directors of the South-Sea company in their pernicious practices, to the detriment of great numbers of his Majesty's subjects, and the ruin of the public credit, and the trade of this kingdom. They resolved, also, That he should be expelled the House, and committed to the Tower, and a bill brought in for restraining him from going out of the kingdom, and from alienating his estate, as was done in case of the directors.

R E M A R K S.

The opposers of the South-Sea scheme suggested, That the confiscation of the directors estates by the legislature was far from being unjust; nay, it is affirmed, that such indulgence never was shewn before to people in their circumstances; for though it should be admitted that they were the proprietors of the sinking fund, that they put the debt of the nation in a way of being paid, and rendered those annuities redeemable which before were irredeemable, yet it was done by such methods as ought never to be countenanced or encouraged. Had they not given out that they were able to make such high dividends, the annuitants had never been drawn in to subscribe their annuities, and others to purchase stocks at those advanced rates. There is no doubt but the company had great advantages by the public debts being subscribed, and by the high price at which their stocks were purchased; but what was the company's gain, was the loss of thousands and ten thousands; nor does the competition of the bank at all excuse the rashness of the South-Sea company, in bidding so vast a sum for the scheme as they were conscious could never be paid, by any gains the company could fairly make. They had, it is true, improved their original stock, by taking in the debts; the bank saw it, and would have been glad to have engrossed those debts, for the very same reason the company was so fond of them: but one would think both the one and the other insatuated, as well as the people, to bid so many millions as they did for the execution of the scheme. There is no doubt but the seeing these great bodies bidding against each other, did contribute to the advancing the price of stock; and if it should be admitted that the bank had their share in abusing the people, and inducing them to part with their fortunes, to purchase what had no existence in nature, it is not to be conceived how this step of the bank can excuse the South-Sea company, who led the way to all these extravagancies: and can it be supposed that the proprietors of the long annuities could ever have been prevailed on to subscribe them, or other people to have given 3 or 400 l. for 100 l. stock, if they had not been assured by the directors it was worth so much, and that they could make dividends in proportion to these prices?

The merit, therefore, of procuring the annuities to be subscribed, which before were irredeemable, by giving out that their stock was worth more than it really was (say the adversaries of the scheme) was no more than the merit of a sharper; for, had not the annuitants been deceived in the value, they never would have subscribed, and, though the bringing them in might lessen the national debt, and be a very great advantage to the company, yet, as it was accomplished by deceitful arts, has very little merit in it, the government may be very little gainers by the scheme, as well as the proprietors of the original stock: but if this gain has arisen from the losses innocent people have sustained, who confided in the veracity and probity of the directors, and who depended upon it that the stock was of the value they set upon it, what excuse they can make for their conduct, it is not easy to say. That there has been only a revolution of mens private estates and fortunes, and that what one has lost another has gained, may be true; but the question is, by what means the losers were induced to part with their fortunes, and beggar their families? Whether the annuitants were not deceived in the value of stock when they subscribed, by the directors setting a high price upon it, and assuring them they could divide 20, 30, nay 50 per cent? What satisfaction is it to a man, that he was tricked into a disadvantageous contract, and not forced into it? How is public credit supported better the one way than the other?

As to the trade to the Spanish West-Indies, by the South-Sea company, though it appeared at first view very beneficial, inasmuch as they exported the manufactures of Great-Britain, and received treasure (chiefly) in return; yet this (it is said) was done with as great advantage formerly, by the way of Cadiz and the flota; and that the fraudulent practices of the company's agents in America have been one principal occasion of the ill usage we have met with on that side for many years past.

The establishing a fishery, which was another grand motive for erecting the South-Sea company, has been no less neglected than traffic: they employed 24 ships, indeed, for some years, but their agents and officers managed so ill, that they brought the company greatly in debt upon that article; whereupon they laid it down, though it be one of the most beneficial fisheries the Dutch are engaged in. Those who have their fortunes in South-Sea stock, content themselves, at present, with the revenues arising from the funds settled upon them; and some of the most wealthy of the proprietors, find means to increase their fortunes by stock-jobbing. They seem to have perfectly forgot the original design of their institution; namely, their sending colonies to South-America, and putting in for a share in the rich traffic of the South-Seas, which has been hitherto monopolized by the Spaniards, which might have been prevented, if this company had exerted themselves in commerce, instead of being made the tools of men in power, who made a sacrifice of the directors to save themselves. For this really appears to be the case, upon an impartial review of this extraordinary affair; and which might be made very apparent from some anecdotes now before me, which may one day see the light in another shape, since I have not room for them here.

True it is, that many of the most judicious and experienced in commercial affairs, looked upon the South-Sea company, considered as an institution for carrying on a trade to the SPANISH INDIES, as a romantic and chimerical project, and ruinous, rather than beneficial, to the national traffic, though the projector of it was cried up by his flatterers, as a person of uncommon genius; as a person remarkable for his learning, experience, and great sagacity in public business.---This seems to be apparent, from the preamble of the act for erecting this company, which is as follows.

“Whereas it is of the greatest consequence to the honour and welfare of this kingdom, and for the increase of the strength and riches thereof, and for the vending the product and manufactures, goods and merchandizes of, or brought into, this kingdom, and employment of the poor, that a trade should be carried on to the SOUTH-SEAS, and other parts in AMERICA, within the limits herein after mentioned; which cannot be so securely carried on, as by a corporation with a joint stock, EXCLUSIVE OF ALL OTHERS: now, for the better encouragement of all and every the person or persons, who shall be or become members of the said company or corporation, to be erected as aforesaid; and to the end and intent that a trade to the South-Seas, and other parts of America, within the limits* herein after mentioned, may be carried on and promoted for the advantage and honour of this kingdom; be it enacted, &c.”

* What the nation was to expect from the stupendous trade that was pretended to be carried on by this company, may be seen in a treatise published in the year 1711, intitled, A View of the Coasts, Countries, and Islands, within the Limits of the South Sea Company, &c.

It is plain here, that the company by its first institution was to have an exclusive trade, and that our people of Jamaica, by this very act, are deprived of the trade to the South-Sea, which was to the great advantage of themselves and the whole nation: so that this act for erecting this exclusive company of traders, deprived the nation of a very beneficial commerce. And, therefore, whatever might be the gain of the company, it could not be all profit to the nation; only so much could be esteemed the gain of the nation, as the gain of the company exceeded that of the Jamaica merchants.

But what the company's gain has been, and what the loss of the Jamaica merchants has really been, is notorious enough not to need animadversion. Nor does it appear, that the company could hope for any profit by this exclusive trade. They were to build FORTS and CASTLES in the SOUTH-SEA, for their security in countries already settled by our enemies, at such a charge, and at such a distance from this kingdom. They might, perhaps, as well have thought of building castles in the air: for this reason, therefore, we might well be allowed to esteem this project as romantic and chimerical. It was giving up the certain profit of the JAMAICA trade, to that imaginary one of a company, which was so far from having any prospect of advantage by it, that they were in a fair way of losing stock and block.

It is true, the Jamaica traders were not excluded, but only from Buenos Ayres, southwards, and from the South-Sea; they had still left the places in the Atlantic Ocean for themselves. But the profit they annually introduced from the South-Sea was considerable, and the company's act gave it up for nothing.

This was the case of the South-Sea project, 'till the peace was made, and 'till the Asiento contract made an alteration.

By this the Jamaica traders were entirely excluded from the Spanish Indies, and the company's castles in the air were turned into an obligation to sell the Spaniards 4,800 negroes per annum, and a permission to send 500 tons of goods to Porto-Bello; but this, instead of turning to any account to the company, was so managed, as not only to be detrimental to them,

them, but highly injurious to the nation, by giving such umbrage to the court of Spain, as contributed to occasion a misunderstanding between Great-Britain and Spain for many years past; and which were not terminated in regard to the company, 'till the treaty concluded and signed at Madrid, the 5th of October, N. S. 1750, as we shall presently see.

But this Assiento contract, however beneficial it might have been rendered, both to the nation and the company, was, by mismanagement, somehow, in carrying into execution, rendered quite otherwise; it was, for many years, like the dog in the manger, it neither traded itself, nor would suffer those that would have done so in the like branch.

The act for erecting the South-Sea company deprived Jamaica of trading to the South-Sea; but the Assiento contract shut them out of the Spanish Indies; yet their returns of gold and silver from the Spanish Indies, in exchange for negroes and other merchandizes, were only 2 or 300,000*l.* per annum. Let the Spaniards have deprived us of this trade; but was it fit for ourselves to give it up?

Thus there was no prospect of the company's trading under this contract, as the stipulations of it were contrived, or getting any thing by it if they did. Could their goods, that were often kept three years in the king of Spain's warehouses, and under his own lock and key, and in so hot a climate, be brought, in the general, to a good market? Or did not one-half of them often perish? Could the Assientists hope for profit from their negroes, that were to pay a heavy load of duties to the king? A treaty could scarce have been contrived of so little benefit to the nation; and yet of this kind one might have been so devised, as to have proved greatly beneficial to the kingdom, as well as to the company, if it had been wisely and honourably executed.

One would have thought, that after these pompous declarations, which we have seen in the preamble to the South-Sea act, some attempt should have been made to accomplish so great a design: but so far from it, that soon after, and without the least TRIAL, they gave up their pretensions of trading to the South-Seas, or in any other manner, than was stipulated by the Assiento contract. Thus, by accepting of the Assiento, they excluded themselves from trading to the South-Seas; and, by the act for incorporating the South-Sea company, all the rest of the subjects of Great-Britain were forbid trading within their limits.—This is the more remarkable, since neither the Dutch nor French, nor any other nation, refrained their subjects from trading to those parts; nor did they neglect to carry on a trade thither, with great profit to themselves; whilst those of Great-Britain, by means of the South-Sea company, were denied that*.

- * Quere, Whether Great-Britain has not the same liberty of trading to the South-Seas, as they had before the South-Sea company was established as a trading corporation, although that company no longer exists as such?

Had the South-Sea company put their original plan in execution, with vigour and honour, it would, indeed, have been a benefit to the kingdom, if not to the proprietors of the stock, by the increase of our exports and navigators; but the sending an annual ship, under such limitations as was done, though a new method of trade, was so far from being a benefit in point of trade, that it certainly lessened our exports, and consequently the trade of the kingdom, on a general balance with the Spanish nation. Cadiz, Seville, Port St Mary's, &c. were, before this trading company was established, the places where the merchants, trading to the Indies, informed themselves what species and quantities of goods were shipped off from time to time; but, on the sending of the annual ships, they were under such uncertainties, that they really declined dealing in our manufactures by these channels; which gradually and insensibly gave our rivals in this trade an open opportunity to establish houses of trade at these ports, and by exercising the trade to the Spanish Indies, in a way the most agreeable to the court of Spain, have greatly supplanted us in this once most inestimable branch of our commerce: and this may, in a great measure, be ascribed to the South-Sea company's method of exercising their contract; for although we apprehend, that an Assiento under different stipulations, and fairly and honourably carried into execution, might have proved beneficial, both to the nation and the company; yet, as that we had was conditioned and exercised, it had quite contrary effects.

Thus we find, that the manner of the South-Sea company's exercising their trade*, was so far from being a benefit to the nation, by an increase of our exports and navigation, that it has been manifestly instrumental to lessen them, and has only turned trade out of its former channel, which was before beneficial to great numbers of merchants and tradesmen, as well as to the nation.

- * What is here chiefly meant by the South-Sea company's exercising of their trade, is that illicit trade with which they were charged some years since by the court of Spain.

If the annual ship, all things considered, was of no advantage to Great-Britain, the company's trade, in general, must cer-

tainly have been of damage to it, and a considerable loss to the proprietors; for the Assiento, for negroes only, was allowed, even by the Spaniards, to be a losing contract; and it was on that express consideration, that the king of Spain granted the South-Sea company the liberty of sending an annual ship, of 500 tons, to the West Indies. If then the one was a certain loss, and the other of no advantage, at least not an equivalent, or preferable to the national trade which we had before, they were nothing more than amusements, and ought to be thrown up, as tending to the prejudice of the proprietors, and the nation in general.

If the commerce of Great-Britain to Spanish America has been interrupted, and turned out of its course for some years, by means of this company, it is no little trouble to ascertain the real loss the nation has thereby sustained; besides the disadvantages which the nation has many years laboured under, through the misunderstandings and heartburnings between this kingdom and Spain. And, as the judicious Mr. Locke observes, 'When trade is once lost, it will be too late, by a mis-timed care, easily to retrieve it again; for the currents of trade, like those of waters, make themselves CHANNELS, out of which they are afterwards as hard to be diverted, as rivers that have worn themselves deep within their banks.'—This is what has been urged in general against the South-Sea company, as a trading corporation.—Wherefore, the court of England, we may presume, experiencing for a series of years, that the court of Spain was greatly irritated with the South-Sea company's conduct, and the court of England having no less reason, perhaps, to be displeased with the South-Sea company for their non-compliance with the terms of the late convention between Great-Britain and Spain, which might have prevented the late war: upon these considerations, we apprehend, it seems probable, that the two courts were determined, by the following treaty, to put an end to the trade of this company.

A Treaty concluded and signed at Madrid, on the 5th of October, N. S. 1750.

'Whereas by the 16th article of the treaty of Aix-la-Chapelle, it has been agreed between their Britannic and Catholic Majesties, that the treaty of the ASSIENTO for the commerce of negroes, [see the article ASSIENTO] and the article of the ANNUAL SHIP, for the four years of non-enjoyment, should be confirmed to Great-Britain upon the same foot, and upon the same conditions, as they ought to have been executed before the late war: and the respective ambassadors of their said Majesties having agreed, by a declaration signed between them, on the 1st June 1748, to regulate, at a proper time and place, by a negotiation between ministers named on each side for that purpose, the equivalent which Spain should give in consideration of the non-enjoyment of the years of the said Assiento of negroes, and of the annual ship granted to Great-Britain, by the 10th article of the preliminaries signed at Aix-la-Chapelle, on the 1st April 1748.

Their Britannic and Catholic Majesties, in order to fulfil the said engagements of their respective ministers, and to strengthen and perfect, more and more, a solid and lasting harmony between the two crowns, have agreed to make the present particular treaty between themselves, without the intervention or participation of any third power; so that each of the contracting parties acquires, by virtue of the cessions which that party makes, a right of compensation from the other reciprocally: and they have named their ministers plenipotentiaries for that purpose, viz. his Britannic Majesty, Benjamin Keene, Esq; his minister plenipotentiary to his Catholic Majesty; and his Catholic Majesty, Don Joseph de Carvajal and Lancaster, minister of state, and Dean of his council of state, who, after having examined the points in question, have agreed on the following articles.

ARTICLE I.

His Britannic Majesty yields to his Catholic Majesty, his right to the enjoyment of the Assiento of negroes, and the annual ship, during the four years stipulated by the 16th article of the treaty of Aix-la-Chapelle.

ARTICLE II.

His Britannic Majesty, in consideration of a compensation of one hundred thousand pounds sterling, which his Catholic Majesty promises and engages to cause to be paid, either at Madrid or London, to the royal Assiento company, within the term of three months at latest, to be reckoned from the day of the signing of this treaty, yields to his Catholic Majesty all that may be due to the company for balance of accounts, or rising in any manner whatsoever from the said Assiento; so that the said compensation shall be esteemed and looked upon as a FULL and ENTIRE SATISFACTION on the part of his Catholic Majesty, and shall extinguish from this present time, for the future, and for ever, all right, pretension, or demand, which might be formed in consequence of the said Assiento, or annual ship, directly or indirectly, on

on the part of his Britannic Majesty, or on that of the said company.

ARTICLE III.

The Catholic king yields to his Britannic majesty, all his pretensions or demands in consequence of the said Affiento and annual ship, as well with regard to the articles already liquidated, as to those which may be easy or difficult to liquidate; so that no mention can ever be made of them hereafter on either side.

ARTICLE IV.

His Catholic Majesty consents, that the British subjects shall not be bound to pay higher, or other duties, or upon other evaluations for goods which they shall carry into, or out of the different ports of his Catholic Majesty, than those paid on the same goods in the time of Charles II. king of Spain, settled by the CEDULAS and ORDONNANCES of that king, or those of his predecessors. And although the favour or allowance called Pie del Fardo be not founded upon any royal ordonnance, nevertheless his Catholic Majesty declares, wills, and ordains, that it shall be observed now, and for the future, as an inviolable law; and all the abovementioned duties shall be exacted and levied, now and for the future, with the same advantages and favours to the said subjects.

ARTICLE V.

His Catholic Majesty allows the said subjects to take and gather salt in the island of Tortudos, without any hindrance whatsoever, as they did in the time of the said king Charles II.

ARTICLE VI.

His Catholic Majesty consents, that the said subjects shall not pay any where, higher or other duties than those which his Catholic Majesty's subjects pay in the same place.

ARTICLE VII.

His Catholic Majesty grants, that the said subjects shall enjoy all the rights, privileges, franchises, exemptions, and immunities whatsoever, which they enjoyed before the last war, by virtue of cédulas or royal ordinances, and by the articles of the treaty of peace and commerce, made at Madrid in 1667; [see the article SPAIN] and the said subjects shall be treated in Spain, in the same manner as the most favoured nation, and consequently, no nation shall pay less duties upon wool, and other merchandizes, which they shall bring into, or carry out of Spain by land, than the said subjects shall pay upon the same merchandizes, which they shall bring in, or carry out by sea. And all the rights, privileges, franchises, exemptions, and immunities, which shall be granted or permitted to any nation whatever, shall also be granted and permitted to the said subjects; and his Britannic Majesty consents, that the same be granted and permitted to the subjects of Spain in his Britannic Majesty's kingdoms.

ARTICLE VIII.

His Catholic Majesty promises to use all possible endeavours, on his part, to abolish all innovations which may have been introduced into commerce, and to have them forborne for the future; his Britannic Majesty likewise promises to use all possible endeavours to abolish all innovations, and to forbear them for the future.

ARTICLE IX.

Their Britannic and Catholic Majesties confirm, by the present treaty, the treaty of Aix-la-Chapelle, and all the other treaties, therein confirmed, in all their articles and clauses, excepting those which have been derogated from by the present treaty: as likewise the treaty of commerce concluded at Utrecht in 1713, those articles excepted, which are contrary to the present treaty, which shall be abolished and of no force, and namely, the three articles of the said treaty of Utrecht, commonly called explanatory.

ARTICLE X.

All the reciprocal differences rights, demands, and pretensions, which may have subsisted between the two crowns of Great-Britain and Spain, in which no other nation whatever has any part, interest, or right of intervention, being thus accommodated and extinguished by this particular treaty; the two said most serene kings, engage themselves mutually to the punctual execution of this treaty of reciprocal compensation, which shall be approved and ratified by their said Majesties, and the ratifications exchanged, in the term of six weeks, to be reckoned from the day of its signing, or sooner if it can be done.

In witness whereof, we the above-mentioned ministers plenipotentiaries, that is to say, Benjamin Keene, Esq; in the name of his Britannic Majesty; and Don Joseph de Carvajal and Lancaster, in the name of his Catholic Majesty, by virtue of our full powers, which we have mutually communi-

VOL. II.

cated to each other, have signed these presents, and have caused the seals of our arms to be put thereto. Done at Madrid; the 5th of October 1750, N. S.

(L. S.) JOSEPH DE CARVAJAL
y LANCASTER.

(L. S.) B. KEENE.

His BRITANNIC MAJESTY'S ratification.

George the second, by the grace of God, king of Great-Britain, France, and Ireland, defender of the faith, duke of Brunswic and Lunenburg, arch-treasurer of the holy Roman empire, and prince elector, &c. To all and singular to whom these presents shall come, greeting: Whereas a certain treaty between us and our good brother Ferdinand VI. Catholic king of Spain and the Indies, was concluded and signed at Madrid, the 5th day of October last past, N. S. by ministers plenipotentiaries, sufficiently empowered with orders and authority on each side, in the form and words following.

[Fiat infertio.]

We having considered the above written treaty, have approved, ratified, and confirmed the same, in all and singular its clauses, as by these presents we do approve, ratify, and confirm the same, for us, our heirs and successors, engaging and promising, on our royal word, sacredly and inviolably to perform and observe all and singular its contents; and never to suffer, as far as in us lies, any person to violate the same, or in any manner to act contrary thereto. In witness whereof, we have caused our great seal of Great-Britain to be affixed to these presents, signed with our royal hand. Given at our palace at St James's, the 5th day of November, in the year of our Lord 1750, and of our reign the twenty-fourth.

GEORGE R.

His CATHOLIC MAJESTY'S ratification.

Don Ferdinand, by the grace of God, king of Castille, of Leon, of Arragon, of the Two Sicilies, of Jerusalem, of Navarre, of Granada, of Toledo, of Valentia, of Galicia, of Majorca, of Seville, of Sardinia, of Cordova, of Corfica, of Murcia, of Jaen, of the Algarves, of Algeira, of Gibraltar, of the Canary Islands, of the East and West-Indies, islands and Terra Firma, of the Ocean Sea, archduke of Austria, duke of Burgundy, of Brabant, and of Milan, count of Ahsburg, of Flanders, of Tyrol, and of Barcelona, lord of Biscay, and of Molina, &c. Whereas there having been agreed on and signed at Madrid, on the fifth day of October of this instant year, by Don Joseph de Carvajal and Lancaster, knight of the most illustrious order of the Golden Fleece, my gentleman of the bed-chamber in ordinary, my minister of state, and dean of this council, governor of the supreme council of the Indies, president of the committee of commerce and money, and superintendant-general of the posts and mails within Spain, as well those that go out of Spain or come from abroad; and Benjamin Keene, Esq; minister plenipotentiary from the most potent king of Great-Britain to my royal person, by virtue of the full powers that have been given to them by me, and by the said most serene king, a treaty upon the equivalent that Spain is to give in consideration of the four years of the Affiento contract for negroes, and of the grant of the annual ship that Great-Britain has not enjoyed on account of the last war, and about all the differences that did subsist between our two crowns. The said treaty is actually as follows:

[Fiat infertio.]

Therefore, after having seen and examined the said treaty, I have thought proper to approve of and ratify the same; as by virtue of the present I do approve of and ratify the same, in the best and most ample manner I can; promising, in faith of my royal word, to fulfil it entirely in the manner as it is therein contained and expressed: to this end I have ordered the present to be dispatched, which is signed with my hand, sealed with my privy-seal, and countersigned by my under-written counsellor of state and secretary of the universal dispatch of war, of Indies, marine, and of the revenues. Given at Buen Retiro on the 5th day of December, one thousand seven hundred and fifty.

(L. S.) I THE KING.

CENON DE SOMODEVILLA.

SPAIN is situate on the most western part of all the continent of Europe, and is encompassed on every side by the sea, except on the side of France, from which it is separated by a continued ridge of mountains called the Pyrennees. On the east and south it is bounded by the Mediterranean, the Straights of Gibraltar, and part of the Atlantic Ocean; on the west by the same ocean; and on the north by the sea called the Bay of Biscay and the Pyrennees. Its site is in the temperate zone, between the 36th and 44th degrees of north latitude, and consequently under the sixth, seventh, and eighth

eight climates; and in length it extends itself from the 10th degree of west to the third degree of east longitude, that is, 13 degrees from east to west, and nine degrees from north to south.

This kingdom is divided into fourteen provinces, viz.

- | | | |
|--------------|------------------|------------------|
| 1. Galicia, | 6. Catalonia, | 11. Estramadura, |
| 2. Asturias, | 7. Valencia, | 12. Andalusia, |
| 3. Biscay, | 8. New Castille, | 13. Granada, |
| 4. Navarre, | 9. Old Castille, | 14. Murcia. |
| 5. Arragon, | 10. Leon, | |

The soil of Spain has been misrepresented as dry and barren by several writers, who appear to have had no knowledge of it. We may even affirm, that its most mountainous and barren parts do produce something for use. Some are covered with stately trees of several sorts, either for timber or fuel. The rocky parts abound with wild thyme, marjoram, and other aromatic herbs, which serve to feed a vast number of sheep, goats, &c. and give their milks and flesh a more exquisite relish than any that is fed on the richest pastures; and if these happen to be scorched with too much heat in summer, the cattle are driven down to the sides of the hills, where they find plenty of those herbs, and meadow grounds well watered by the great number of rivers with which the country abounds; so that at the worst they never want a sufficient quantity of herbage to supply their numerous flocks. Other mountainous and rocky lands produce quantities of a famed plant called by them *esparto*, of which they make all kinds of ropes and other cordage.

The Spanish wheat is inferior to none, if not the very best in Europe, and the common product of it more than the natives can consume. Barley is here very good, and in such plenty, that it is the common grain for their horses and mules, instead of oats, which are here very scarce; and the straw of it serves them likewise instead of hay, of which they make hardly any through the kingdom.

Wine they likewise have in such abundance, that the poorest people drink it; and as to its goodness and the great variety of it, we need say the less, as most men are sufficiently acquainted with the various sorts of it; such as the Malaga, Sherry, Galicia, Alicante, Barcelona, and much greater number of others, which seldom, if ever, come among us, though nothing inferior to those above named.

As for fruits, they not only have the different sorts in much higher perfection, which either naturally grow, or which we cultivate with so much pains here in England, but likewise many others, which, with all our art, cannot be brought by us to any tolerable ripeness, and with which we are more easily supplied from them; such as citrons, lemons, oranges, almonds, raisins, prunes, olives, dates, figs, chestnuts, pomegranates, capers, and a multitude of others too tedious to enumerate. The same may be said of their herbs, flowers, and medicinal plants, which, though excellent in their kinds, yet grow most of them wild here, when in other places they could not be produced without great art and industry.

Their oil, wax, and honey, are allowed to be as good as any in the world. Few countries exceed this for plenty, goodness and variety of fowl, both wild and tame. Of four-footed game, as deer, both red and fallow, hares, rabbits, and particularly wild boars. As for their tame swine, all that have had experience of it, allow that the Spanish bacon exceeds even that of Westphalia. Their sheep are most exquisite in taste, but they are still more valuable for their incomparable wool, which all their neighbours, and nobody more than our clothworkers, can testify to exceed any in Europe. Above all, we must not forget their horses, greatly famed for their exceeding celerity, those especially that are bred in large quantities in Estramadura, and parts adjacent, are reckoned the finest and swiftest. Other provinces breed, indeed, great quantities of them, and equally serviceable, but neither so beautiful nor of so great value. The Spaniards were, from the earliest ages, very curious in their breeding of good horses, and very dextrous in the use and management of them, especially in the field. As for the other services of that useful creature, such as carrying, drawing, plowing, &c. they have here their mules in great quantities, which seem much more fitted by nature for such drudgery, as well as for going over the most craggy and mountainous parts of the country; being both larger, stronger, and surer footed, than the horses, though nothing so swift. Many of them are 16, and some even 17 hands high, and carry very heavy burthens over such rocky parts, and with such ease and steadiness, as is quite astonishing to those who are not accustomed to them.

The silken manufacture is here so encouraged, that we are told, above a million of people are employed in feeding, gathering, and curing silk-worms, and in spinning, weaving, and making all kinds of silks, such as satin, damask, tabby, velvets, flags, and many other sorts. The same may be said of their cotton, hemp, and flax, which likewise grow here in large quantities, and employ a proportionable number of hands; not to mention their scarlet dye, saffron, sugar, pitch, rosin, and other commodities, that grow above ground. If we dive into the bowels of the earth, we shall find gold, silver, quicksilver, which latter they send in large quantities,

into the West-Indies, their lead, copper, and excellent iron, the best of which is dug from the mountains of Biscay, and is sent all over Europe, as exceeding any other in goodness; they have great plenty of sulphur, allum, calamine, and other minerals; as likewise of jett, agate, cornelian, granates, crystal, marble, alabaster, jasper, and other stones. With relation to their gold mines, it must be owned that they have quite neglected them ever since they have been able to draw such immense quantities of that metal from America. But anciently they had it in as great plenty, or much greater plenty, out of their own.

The healthfulness of this country may be gathered, not only from its excellent situation and serene sky, but likewise from the stoutness and longevity of its ancient inhabitants, whilst they gave themselves up to a habit of exercise and temperance; in which last they always did, and do still excel all the other nations in Europe.

Having thus far run through all that need be said in general concerning this country, we shall now take a view of it, with respect to each of its particular kingdoms and provinces, in the same order as we have before ranged them.

The kingdom of GALICIA is washed on the west by the Ocean, on the north by the Cantabrian Sea or Bay of Biscay, on the east it borders upon Asturias and Leon, and on the south upon Portugal, from which it is parted next the sea by the river Minho.

This small kingdom produces wheat, millet, all kinds of herbs, plenty of cattle, especially hogs, whose bacon far exceeds that of Westphalia, strong mules, good horses, though not large; but it is most famed for its noble wines, particularly that of Ribadavia. They have plenty of firing and of timber for building houses and ships. They have likewise quarries of fine marble, and some flax is here produced, with which they make a pretty good sort of linen.

CORUNNA, a famed ancient sea-port town on the Cantabrian Sea, or Bay of Biscay, called by our seamen the Groin. It is by its situation well fenced against the winds, and against the enemy by two strong castles. It stands between the two famed promontories of Finisferre and Ortegal, and is wealthy, being a place of considerable trade.

The principality of ASTURIAS. This principality lies on the north side, along the Bay of Biscay, borders on the west on Galicia; on the south it is divided from Castille and Leon by a ridge of mountains, called the Asturian Mountains, since they are the boundaries between that and those two provinces. On the coasts it reaches to the port Llanes, now Santillana, where it joins a narrow slip of land belonging to Old Castille, which runs into the sea between Asturias and Biscay. The whole length of Asturias is about 135 miles, and 60 in breadth. It is generally divided into two parts or districts, the one called Asturias de Oviedo, and the other of Santillana. But it is farther subdivided into seven merindades, or liberties, besides a little province called Liebana.

This little province of LIEBANA is about 27 miles long, and 12 broad. It is one of the most craggy and mountainous parts of Spain, excessive high, and almost inaccessible. These mountains are called Europeæ, and are in full front of the sea, and produce plenty of corn, wine, fruit, cattle, and game.

The lordship of BISCAY. Biscay, as generally taken, is divided into three provinces, viz. Biscay properly so called, Guipuscoa, and Alaba or Alava. The whole is bounded on the west by that slip of Old Castille which reaches to the sea, and, as was hinted under the last article, parts Asturias from Biscay on the south. The ridge of mountains formerly mentioned as branching from the Pyrennees, parts it from Old Castille on the south-east, as the same mountains part it again from Navarre, and the river Cidaro from France on the east, and all the north side is washed by the Cantabrian Sea, called commonly the Bay of Biscay.

The country is mountainous and barren, producing neither wheat, barley, wine, nor oil, but abundance of millet-feed and fruit, which make cyder in plenty. Some flax is likewise produced in their vallies, and abundance of timber for shipping on the hills. But their greatest treasure lies in their inexhaustible mines of iron, which is reckoned the best in the world, and is transported thence into all parts. Here are whole towns of smiths, that carry on the smithery manufactory, and make all sorts of iron-work, especially swords and fire-arms, very elegant and in great quantities. There is likewise a great deal of wool shipped off from their sea-ports into foreign parts, but most of it is brought hither from Old Castille. Some, however, they have here, but as it is neither so fine, nor in any quantity, they manufacture it wholly for their own use.

BISCAY, properly so called, borders on the west upon that slip of Old Castille which extends itself to the sea, on the south upon Castille, and part of Alava eastward upon Guipuscoa, and has the Bay of Biscay on the north.

BILBOA, though no city, is now the capital of Biscay, it being a place of great trade, by reason it has a good port, small vessels coming up to the mole, and others of greater bulk lying farther out. The greatest export here is of their fine wool and exquisite iron, most of the latter in bars; though great quantities of that wrought metal also are shipped off, such as swords,

swords, fire-arms, horse-shoes, and other such-like military necessities. The town stands six miles distant from the sea on the river Ibaichaval.

GUIPUSCOA follows next, as it runs along the same coasts of the northern Sea or Bay. It borders westward upon Biscay Proper and part of Alava, southward on Alava and Navarre, and eastward on Navarre and France.

ST SEBASTIAN, a noted port on the Bay of Biscay, nine miles from Fuentarabia, and almost inclosed with rivers, which fall into the sea in the neighbourhood of it, particularly that which they call the Branco. The mole will receive two hundred ships.

ALAVA borders westward on Biscay and Old Castille, southward on Castille hill, eastward on Navarre, and northward on Guipuscoa and Biscay.

The kingdom of **NAVARRÉ**. This country is divided from France on the north by the Pyrennees, which also cut it into two parts, distinguished into Upper and Lower; the former, much the larger, and on the Spanish side, is the kingdom we are now to speak of; the other beyond these mountains is by much the smaller, and belongs to France. This we are now upon, borders upon Biscay and Old Castille on the west, on Castille and Arragon on the south, and eastward upon Arragon. Its length is about ninety miles from north to south, and about eighty in breadth from east to west.

Navarre is divided into five districts, viz. **PAMPELONA**, **TUDELA**, **ESTELA**, **OLITE**, and **SANGUessa**, which are parted by prodigious high mountains; yet yielding good corn, and other grain, wine, oil, honey, fruits and herbs, and affording plenty of food and pasture for their cattle, besides an infinite number of fowl, both wild and tame. These mountains produce metals and minerals, and had formerly several rich mines of gold and silver, though now either exhausted or neglected. Here are likewise abundance of fine springs, hot baths, and other medicinal waters.

The kingdom of **ARRAGON**. This kingdom is bounded on the north by the Pyrennees, which divide it from France; on the west it has Navarre and New and Old Castille; on the south the kingdom of Valencia; and on the east, part of Valencia and the principality of Catalonia. The whole length from north to south is 210 miles, and its breadth between 100 and 120. The country is mountainous, but full of delightful vales, and extraordinary fertile, which produce great plenty of wheat, wine, oil, saffron, and fruits of the most delicious kind. They breed also great quantities of cattle, and abound with all sorts of fowl, both wild and tame. The mountains are said to have mines of gold, silver, and other metals, but little is made of any of them, except iron. Here are likewise very considerable rivers, and plenty of good fish: the most remarkable of the rivers is the Turio, which fertilizes a great part of the country, not by an overflow like that of the Nile, but by its slow and gentle course, which gives opportunity to the husbandmen and gardeners to cut channels from it to water their lands, inasmuch that we are told their trees will bear fruits three, and often four, times a year; and not only in great plenty, but in such variety, that they reckon no less than 400 sorts produced in this kingdom. Their orchards, gardens, and pasture-grounds, are likewise much admired for their continual verdure and fertility. In a word, Arragon is on all these accounts, as well as for the extraordinary serenity of its air, compared to Egypt. The Mediterranean helps very much to enrich the country, both by foreign traffic, and the great quantity of fish which is caught on those coasts.

SARAGOSSA, the metropolis of this kingdom, is an ancient and opulent city, seated almost in the heart of it on the bank of the Ebro, and in a fertile and delightful plain, watered with three other rivers, viz. the Xalon, Gallego, and Guerva. It lies in the 41st degree of latitude, and in $1\frac{1}{2}$ degree of west longitude. The city is of an oblong form. It is rich and populous, and carries on a great commerce, and a considerable number of trades and manufactures both within and without the walls. The country round about it is very fertile and beautiful, and produces every thing that is necessary, comfortable, and delightful; corn, wine, oil, fruits in great plenty and variety, fish and fowl of all sorts, and all chiefly owing to its excellent situation.

CATALONIA is bounded on the north by the Pyrennees, by which it is parted from the province of Roussillon in France, on the west by Arragon, and a small part of Valencia; from the first of these it is separated by the rivers Noguera and Mataruna, and a ridge of hills, and from the latter by the river Genia. On the south and east it is washed by the Mediterranean, and has many convenient sea-ports along those shores. The inland is a mixture of plains and mountains; that part next to France is the most mountainous, but farther in, it abounds with delightful and spacious plains. The climate, which reaches from 41 to 43 degrees of north latitude, and from one degree to 30 20 east longitude, is therefore neither so hot as Andalusia, nor so cold as Asturia, and the north part of Spain, being moreover sheltered on the north by the Pyrennees, and on the east by the sea. This temperature, joined to the many streams and rivers with which the country abounds, makes it exceeding

fertile and delightful. Its product, which is here in great plenty, is excellent wheat; rich wine, sweet oil, exquisite honey, delicious fruits of all sorts, abundance of cattle, swarms of fowl, wild and tame, vast quantities of deer, hares, rabbits, and all other game: good hemp, fine flax, saffron, variety of corn, and other grain, herbs, &c. a considerable quantity of silk, fine wool, fish of all sorts, and in the greatest plenty, quarries of marble, alabaster, and jasper-stone, coral taken out of the sea, salt, and many other commodities.

BARCELONA is the capital of this province, and is inferior to few in Europe that are not the courts of princes. It is pleasantly seated on the Mediterranean coasts, a little below the gulph of Lyons, and opens to the sea in a beautiful semicircle, which, together with its eminence and castle, and the beauty of its churches and other sumptuous edifices, affords a most delightful prospect to the ships that sail by or to it, especially as it stands between two considerable rivers, the Lobregat and Bezès, which pay their tribute to that sea on each side of it. The coast it stands upon is a good safe road, and the port, though rather too small, hath yet rendered it a place of great trade, especially when Indian commodities were brought from Turkey and Egypt through the Mediterranean. Its situation is on a spacious plain, at the foot of the mountain Monjuque. Its territory round is stored with all necessities for sustenance and delight, as wheat and other grain, oil, rich wines, fruits of all sorts, cattle, fowl, honey, wood, and game of all kinds.

TARTAGONA, now the second city in this province, stands commodiously situate, near the coast of the Mediterranean, on the brink of a pleasant hill, at the foot of which is a safe and convenient harbour, for small ships, between the rivers Gaya and Francoli.

The climate here is so temperate, and the soil so rich and warm, that the trees bear fruit, and blossom, in the coldest months. The territory is adorned with delightful gardens, orchards, and country-seats; the fields abound with corn, wine, oil, flax, hemp, and fruit of all sorts, in the highest perfection, with all kind of fowl and game, and of fish from the sea.

TORTOSA is situate on the bank of the Ebro, not far from the sea, and has a good bay, formed by that river, that comes up almost to the walls of it. Without the city is a most beautiful plain, 18 miles long, and 6 in breadth, watered by the Ebro, and producing corn, wine, oil, fruit, timber for shipping, great quantity of palm-trees, with cattle, fowl, game, and other necessities, besides silk in abundance, which is here made in farinets. Here are likewise a great many curious springs, which fertilize the plain, and supply the city with water, besides quarries of marble and jasper, one within two miles of the city, and some salt-pits.

VICQUE is pleasantly situate, in a kind of peninsula, made by the rivers Ter and Noguera, which almost encompass it. It stands 36 miles north from Barcelona, at the foot of a hill, near a fertile and delightful plain. On the mountain Mosen, about six miles from the city, are found excellent white and purple amethysts, and topazes; they are dug out of a fat, reddish, or yellowish earth, and the best sort of these last are those of the deepest violet. In the neighbouring mountains are likewise found some gold, emeralds, and other precious stones, but in so small a quantity as not to answer the searching for them.

CARDONA stands about 60 miles distant from Barcelona: near this city is a mountain of salt, which yields an annual revenue of 30,000 pieces of eight: the salt is transparent, and, when powdered, is exceeding white.

The kingdom of **VALENTIA**. This kingdom lies, on the east, along the Mediterranean coasts, facing the islands of Majorca and Ivica, except only a small part towards Catalonia, which is parted from it by the river Cenia; on the north it has the kingdom of Arragon; on the west New Castille and Murcia; and the small track of it which runs toward the south, borders upon the last-named kingdom of Murcia. The greatest length of Valentia is about 210 miles, and its greatest breadth about 48.

This whole kingdom is so delightful, as to be compared to an earthly paradise. The air here is every where so temperate, that this part enjoys a perpetual spring: the trees are always covered with verdure and blossoms, the air very serene, and the weather so moderate and pleasant, as never to be either excessively hot or cold, nor disturbed by immoderate rains; upon all which accounts it is universally allowed to be the most delightful part of Spain, and, by many, even of all the world. The surprising excellence of its soil and climate, is the cause that the whole country is filled with noblemens and gentlemen's seats, and covered with exquisite gardens, pleasant orchards, delightful groves, fertile fields, and pasture grounds; and where the land is not employed for delight, it produces immense plenty of corn, wine, oil, honey, flax, and all kind of herbage; also flowers and fruit in great variety. To all which we may add, that the sugar, rice, and silk it produces, one year with another, is reckoned to amount to three millions of pieces of eight. Here are likewise mines of gold, silver, and other metals, besides great quantity and variety

variety of precious stones, which formerly amounted to an immense value; but they are now wholly neglected. Here is also abundance of allum, the best and finest white lime, and plenty of cochineal.

The earth about Valencia, and other parts of this kingdom, is so well cultivated, that, by Mr Willoughby's confession, they generally have five crops a year, especially of mulberry-leaves for silk-worms, of wheat, and other grain, grapes, olives, maize, or Indian wheat, and sugar-canes.

VALENTIA, the noble and ancient capital of this kingdom, is seated on the shady banks of the river Turio, over which it has five stately bridges, and stands about two miles from the sea. It lies in 39 degrees 20 minutes of north latitude, and about 15 minutes east longitude. Its distance from Madrid, the now metropolis of Spain, is about 180 miles, south-east; from Barcelona, south-west, about the same number; and south from Saragossa about 135. Its sea-port, named Grao, which stands on the Mediterranean, about a mile and a half from the city, furnishes it with every thing either for convenience or delight, the sea supplying it with an extraordinary variety of fish, the neighbouring lake of Albufera, or little sea, with great abundance of water-fowl and fresh-water fish; and the fertile country about with the greatest plenty of corn, wine, oil, fruits, herbs, and other provisions. It is enriched by the number of quality and gentry which live in it, by its great commerce, and the variety of manufactures that are carried on here, especially the woollen, so that the cloth that is made here is reckoned the finest in all Spain.

ALICANT is a famous city and sea-port on the Mediterranean, distant from Murcia, towards the north-east, 42 miles, 60 south from Valencia, and about 210 from Madrid. It is a place of great trade, by reason of its commodious harbour, and well known to the English, for the delicate wines and delicious fruits, which they bring from thence.

The kingdom of **NEW CASTILE**. This country is bounded on the north by Old Castile, from which it is every way divided by mountains, which are only known by the names of the countries they run through; on the east it is parted from Estramadura, by another chain of them, called Guadalupe, and La Sarena; on the south from Andalusia, by those called Sierra Morena, and by an imaginary line from Murcia; and on the east by the river Segura, and mountains of Almanza and Requena from Valencia; and from Arragon by those of Maya, Daroka, and Molina. The length of this kingdom, from south to north, is about 180 miles, and pretty near the same in breadth, where it is widest, but its figure is irregular in the latter.

The country being all inland, and surrounded with such high mountains, which contract the sun's rays as it were into a focus, and, at the same time, suppress the free passage of the cooling sea breezes, its climate is consequently hotter in summer, and colder in winter, than those which lie along the sea-coasts, under the same latitude. It is nevertheless very healthy, and its soil generally fertile, producing abundance of wheat, and other grain, plenty of wine, oil, fruit, and herbs, feeds a great quantity of cattle, all sorts of fowl, wild and tame, and is very well supplied with variety of fish and green pasture, by the many rivers that run through it.

TOLEDO is built on a high, steep, and craggy rock, almost inaccessible on all sides, and made much more so by the course of the river Tagus, which encompasses it almost round, and over which it has two noble bridges. Here are a great number of merchants, tradesmen, and artificers, especially in the silk and woollen manufactures, which two branches alone are said to have employed near 10,000 hands. Toledo is about 36 miles distant from Madrid.

TALAVERA DE LA REYNA is delightfully seated on the river Tagus, 36 miles west from Toledo, and is much famed for its woollen manufacture of stuffs, and particularly for an extraordinary kind of fine earthen ware that is made at it.

The kingdom of **OLD CASTILE**. Old Castile was formerly part of the Roman Tarracconensis, and borders all the way on the south to New Castile, from which it is divided by a ridge of mountains, which change their names according to the places of note they pass through, as Motina, Sigüenza, Segovia, &c. by that chain of them which is called Sierra de Tablada, and by those of Pica and Banos, from Estramadura, on the west; and by those of Avila and Perina, with the little rivers of Carrion, Pisuerga, and Heban, from Leon on the north-west. It is parted again on the north from Asturias and Biscay by another ridge of hills, branching out from the Pyrennees; only in the center, between these two provinces, it hath a narrow slip of land, which reaches quite to the bay of Biscay; lastly, on the east, the Ebro and mountains of Doña, for a considerable length, part it from Navarre and Arragon. The greatest extent of this province, from north to south, reaches from 40. 10. to 43. 15. degrees of latitude and from 1. 30. to 4. 10. degrees of west longitude; that is, about 180 miles, and near about the same number from east to west; that is, both ways taken where largest, for its figure is very irregular, and not near answerable in other parts.

The climate here differs somewhat from that of New Castile, on account of the country being more mountainous, which makes the several parts vary, according to their situation, the

vallies being excessive hot, the upper ground proportionably cold and bleak, and others, according to the proximity of the hills, send down refreshing gales, or cause a greater reflection of the sun. But, upon the whole, the soil is generally good, in some sense or other, the plains yielding plenty of all sorts of grain, fruit, wine, and other provisions, the sides of the hills good pasture for their numerous cattle, and the tops timber for building and fuel. Some of these summits are so high, that they are covered with snow all the summer, which is carried and sold to the towns, as is usual through all Spain, to cool their wine.

WALLADOLID stands on the bank of the river Pisuerga, on a pleasant rising ground, and a noble prospect all round it, as itself yields a delightful one to the beholders, from its fine situation and grand edifices.

This city is populous and opulent: through not only the great number of rich and noble families who make their chief residence in it, but much more so by the large commerce, manufactures, and other inferior trades which are carried on here. The woollen manufacture is here the best and most considerable in all Spain, for here is a vast quantity of the finest wool produced, from innumerable flocks that are raised in the neighbouring plains; and the cloth that is made here is reckoned the best in all the world, and in high esteem both at home and abroad. Here are also sundry other manufactures and trades carried on, with great industry and success.

The kingdom of **LEON**. This kingdom, properly so called, is now bounded by the Asturian mountains; on the east it has Old Castile, from which it is divided by the mountains of Pernia, and the rivers Carrio and Pisuerga, as far as the Ebro, then by those of Heban and Reganno, 'till you come to the mountains Bonilla de la Sierra; on the south, the mountains of Bannos, and another ridge, divide it from Estramadura; and, on the west, the rivers of Agueda, Duero, and a chain of mountains, part it from Portugal, as does the same ridge of hills continued, from Galicia. The whole extent of Leon, from north to south, is about 120 miles, that is, from 42 to about 40, and from east to west about 90; that is, from 4. 20. to 5. 40. east longitude. The river Duero runs almost across the middle of it, leaving one half on the north, and the other on the south.

As this kingdom lies in the same climate and latitude with that of Old Castile, to which it is contiguous, and is, like it, intermingled with ridges of high hill, capacious vallies, and campaign plains, which occasion pretty near the same degrees of heat and cold, dry and moist; its soil and temperature differ very little from that, and its ground brings forth near the same productions, such as excellent wheat, and other grain, pasture and cattle, fine wines, oil, honey, fruit, game fowl, and the like. The natives are here likewise robust, hardy, laborious, brave, temperate, and lovers of learning. The mountains have also some minerals, but chiefly quarries of excellent marble, and veined alabaster, jasper-stones, and sometimes others of greater value, as turquoises, garnets, amethysts, &c.

The province of **ESTRAMADURA**. This province is divided from Portugal, or from the Portuguese Estramadura, on the west, by the rivers Elya, Caya, and some others of less note; on the north it joins on the kingdom of Leon, without any noted mountains or rivers to part them; on the east, the mountains of Banos, Pico, and Guadalupe, divide it from Old and New Castile; and on the south it is parted from Andalusia by the chain of hills called Sierra-Morena. The rivers Tajo and Guadiana running through it from east to west, divide it into three parts; the most northern is that which is beyond the Tajo, the next is between that and the Guadiana, and the last is that which is south of the Guadiana. The length of the whole province, from north to south, is 150 miles, that is, from 38. to 40. 30. latitude; and in breadth, from east to west, about 120, that is, from 4. 40. to 6. 20. west longitude.

The climate, indeed, is exceeding hot, and somewhat sultry, being mostly inland, and wanting those cooling gales which the hills and the sea communicate to the adjacent provinces; but in all other respects it may justly be reckoned the pleasantest and most fertile not only in all Spain, but perhaps in the world. For an evidence of which, we need but instance in the most celebrated plains called La Vera de Plasencia, of which it might suffice to say, that several of the Ancients placed the elysian fields in it, as knowing of no place more delicious and beautiful. This noble plain is about 36 miles in length, and 10 in breadth, and so sweetly delightful, that it invites great numbers of the nobility and gentry to spend the summer in it. It hath 13 small towns, or villages, and about 5000 houses, all beautifully situated, and neat, and all the rest is either covered with the greatest variety of fruit-trees which Europe affords, or beautifully variegated and disposed into olive groves, vineyards, gardens, orchards, meadows, and fields, producing plenty of corn, flax, &c. and watered with many pleasant springs and streams, yielding besides abundance of excellent fish, especially trout. Such is, in fine, the product of this valley, that of the territory of only four inconsiderable villages, out of the 13 that are in it, the product

duct is said to have amounted, in one year, to 150 tons of oil, 550 of wine, 60,000 bushels of chefnuts, an incredible quantity of wheat, and other grain; whilst other parts of it yielded not only the like, or even larger quantities, in proportion, of the same produce, besides fruits, flax, &c. but likewise abundance of silk, wax, honey, saffron, and such like, besides pasture, and great quantities of cattle.

ANDALUSIA province is divided, on the north, from Estramadura and New Castille, by the Sierra Morena mountains; on the east from Portugal, by the river Chanca, and from Algarve by the Guadiana; on the south it has the ocean, the mouth of the Streights, and part of the Mediterranean; and along the south-east it has the kingdom of Granada.

No province in Spain exceeds this in fertility and commerce; the latter is owing to its maritime situation, and convenient harbour. The great quantity of wine and oil is so extraordinary, as to be almost beyond credit. Their cattle, also, are numberless. Fine oranges, citrons, raisins, almonds, pomegranates, and figs, are the natural growth of this province. They have great plenty of fine salt and sugar, and a celebrated breed of horses.

SEVILLE, its capital, situate on the river Guadalquivir, and in one of the most beautiful plains of Europe.—Here is an India-house, for the regulation of their West-India trade, a fine exchange, and mint.—The silk and silver stuffs are the most considerable manufactures carried on here, with those of soap and pottery-ware.—Without the city are salt-pits, and quarries of marble.—Along the river are many commodious keys, where ships of good burthen may safely lie.

CORDOVA stands on a delightful plain: besides the extraordinary fertility of its soil round about, which supplies it with plenty of fine wheat, oil, fruits, &c. it carries on a great variety of trades and manufactures; and, among the latter, the woollen and silken, of the finest kind, and that of a curious gilt leather. It is famed also for a breed of fine horses.

CADIZ is next in rank to the royal cities; it is very advantageously situated for commerce; the spaciousness of the harbour, seated upon the ocean, so near the Mediterranean, draws thither a concourse of ships and merchants, to purchase the produce of Spain, and, of late years, of the West-Indies, which are now first brought hither.

XERES DE LA FRONTERA is well situate on the small river Guadaleta, about six miles from the sea. Its territory is so rich and fertile, that, besides great quantities of wheat, fruit, cattle, and other provisions, it yields 60,000 pipes of sherry yearly. It has also a good brood of horses.

EZIZA seated on the Xenil, and on a delightful plain, producing immense quantities of corn, wine, oil, silk, and cotton.

GIBRALTAR, a well-known sea-port, on the mouth of the Streights. See our article **MEDITERRANEAN**, for its consequence to Great-Britain, as being now in her possession.

BAEZA, situate about three miles from the Guadalquivir; it is remarkable for the dyeing of very fine scarlet cloth, and making of rich taffeties.

SAN LUCAR DE BARAMEDA, about 45 miles below Seville, and serves as a port to that famed city; it was much more considerable than at present, before the Spanish West-India fleets were allowed to set out from, and return to, Cadiz.

PORT ST. MARY is seated on a plain, at the mouth of the Guadaleta river, and is much frequented, on account of its commodiousness.

CARMENA stands in the center of Andalusia, and has very fertile and spacious plains, which produce great plenty of all things.

LUCENA is as delightfully situated as most cities in Europe, few spots of ground producing greater plenty of delicious wine, oil, and choice provisions, than this territory does.

MOGUER, seated on the banks of the river Azige, or Tinto. Its river is remarkable for its colour, or dye, it being impregnated with some mineral, which not only gives a yellow tinge, but petrifies all the sand it runs over.—It has no other good quality, except that of curing worms in cattle.

There are in this province several towns of some note, though under the degree of cities; but as they are not remarkable for any considerable traffic, we shall pass them over in silence.

The kingdom of **GRANADA**. This kingdom is divided, on the north, from the province of Andalusia, by the mountains of Cazorla, Sierra Morena, Segura, and some others; on the east, another chain of mountains divides it from Murcia; on the south it is contiguous again to Andalusia, without any noted boundaries; and on the west it is bounded and washed by the Mediterranean. The whole length of it, from east to west, is about 210 miles; the greatest breadth exceeds not 72; and the whole circumference somewhat above 500.

This country, besides those immense quantities of corn, wine, oil, fruit, cattle, game, fish, &c. which it hath in common with the finest provinces in Spain, we have already taken notice of; here the most craggy mountains are every where covered with vines, fruit-trees in the highest perfection, and what would to some of our readers appear incredible, if not attested by so many undoubted eye-witnesses, here are bunches of grapes, that, like those of the promised land, are obliged

VOL. II.

to be carried on a pole; between two men; and some of them, we are assured from persons of veracity, have weighed 40 pounds. Sugar is here likewise cultivated in great plenty, and that which grows here exceeds any in Spain for fineness. Silk is likewise manufactured in such quantities, and great variety, as to be sufficient to serve the whole kingdom, besides what is exported.

Those fields, hills, and other places which are reckoned the most barren, are covered with thyme, marjoram, lavender, and other aromatic herbs, which their cattle feed upon, and give their flesh a delicious and exquisite taste; laurel, myrtle, sweet basil, and other odoriferous shrubs, grow likewise here, to such height and abundance, that they make their hedges of them: so that if we consider it either with respect to its surprising fertility and plenty of all things for food and delight, or to the admirable prospect of its hills and dales, or the fragrancy of its fruits and herbs, no country seems to approach nearer to the idea we may have of an earthly paradise than this. If we add to all these, its excellent maritime situation, number of commodious harbours and ports, and its vast exports and imports, the number and opulence of its cities, we shall easily own, that this little kingdom must have been one of the noblest and finest in all Spain.

MALAGA is an ancient city, and commodious sea-port. There is nothing but conjecture can be offered about its name; yet, considering the commodiousness of its port, its situation, both for inland and foreign commerce, we need not doubt but it was built in some of the earliest times, and, in all likelihood, passed through the hands of those trading nations which occupied successively the Mediterranean coasts, in one of the pleasantest and most convenient parts of which it stands. As the situation of this place is in a fine fertile plain, surrounded with hills, mountains, and grounds, all of them covered with vines, and the greatest variety of fruits, it may be allowed to yield one of the most beautiful prospects, both from land and sea, of any place on these coasts: and how fine their wines, raisins, almonds, figs, lemons, oranges, and other fruits are, is well known, from the great quantities of them brought hither from thence, besides the vast quantities that are exported into other parts of Europe. Its distance from Madrid is about 260 miles south, and a little to the west; 75 south-east from Seville; and about the same distance south-west from Granada.

ANTEQUERA is pleasantly seated on the banks of the Rio de la Villa, part of the town standing on a hill, and the rest on the plain.

Near this city is a famed salt-pit, three miles in length, near two in breadth, which supplies the whole territory with salt. About eight or nine miles from it is a spring, that dissolves the stone, and brings it away by urine.

This city stands about 220 leagues south from Madrid, 75 south-east from Seville, 72 south-west from Granada, and about 15 south from the sea.

The kingdom of **MURCIA** borders on the north upon New Castille; on the west it is parted from Granada and Andalusia, by the mountains of Segura, and some others, which stretch themselves into the sea, and partly by the kingdom of Valencia. Its greatest length, from north-west to south-east, is about 100 miles, and its greatest breadth, from north-east to south-west, about 70. Its latitude is from 37 degrees 30 minutes, to 38 degrees 50 minutes; and longitude 1 degree 40 minutes west.

The climate here is somewhat of the hottest; but the soil, though mountainous, is exceedingly fertile, never failing but through extreme drought, and generally yielding great plenty of wheat, barley, wine, oil, fruits, pasture, and honey, in great abundance: but what makes the chief wealth of it is, the great quantity of silk which is here made and exported, and employs the greatest number of hands.

MURCIA, the metropolis of this kingdom, is situate in a spacious and delightful plain, so very fertile, that it often yields an hundred-fold in corn, besides all other grain, wines, oil, mentioned in the general account of the product of the country. Round about this plain are planted an infinite number of mulberry-trees, with whose leaves they feed as many worms as generally make, every year, 210,000 lb. weight of silk.

Murcia is computed to be distant about 200 miles south-east from Madrid, 20 north from Carthagena, and about 90 south-west from Valencia.

CARTHAGENA is seated on the side of a hill, on the Mediterranean coast, on the mouth of the river Guadalatin, and is a commodious, as well as one of the most noted sea-ports in Spain. The harbour is likewise well sheltered from storms, by a small island called Elcombrada; it has good plenty of fresh water on the shore, and exports great quantity of wool for Italy. The air is so temperate in summer, and so mild in winter, that the trees are every where covered with leaves, blossoms, and fruit. Besides these productions of the earth on the surface, its bowels yield likewise amethysts, garnets, agates, and other such precious stones.

Its distance from Madrid is about 220 miles south-east, 27 south from Murcia, and 86 east from Granada.

ARTICLES of PEACE, COMMERCE, and ALLIANCE, between the CROWNS of GREAT-BRITAIN and SPAIN, concluded in a TREATY at MADRID, the $\frac{13}{17}$ day of May, in the year of our Lord God 1667.

I.

First, It is agreed and concluded, That from this day forward there shall be between the two crowns of Great-Britain and Spain, a general, good, sincere, true, firm, and perfect amity, confederation, and peace, which shall endure for ever, and be observed inviolably, as well by land as by sea and fresh waters; and also between the lands, countries, kingdoms, dominions, and territories, belonging unto, or under the obedience of either of them: and that their subjects, people, and inhabitants respectively, of what condition, degree, or quality soever, from henceforth reciprocally shall help, assist, and shew to one another all manner of love, good offices, and friendship.

II.

That neither of the said kings, nor their respective people, subjects, or inhabitants within their dominions, upon any pretence, may, in public or secret, do, or procure to be done, any thing against the other, in any place, by sea or by land, nor in the ports or rivers of the one or the other, but shall treat one another with all love and friendship; and may, by water and by land, freely and securely pass into the confines, countries, lands, kingdoms, islands, dominions, cities, towns, villages, walled, or without wall, fortified, or unfortified, their havens and ports (where hitherto trade and commerce hath been accustomed) and there trade, buy and sell, as well of and to the inhabitants of the respective places, as those of their own nation, or any other nation that shall be or come there.

III.

That the said kings of Great-Britain and Spain shall take care that their respective people and subjects, from henceforward, do abstain from all force, violence, or wrong; and if any injury shall be done by either of the said kings, or by the people or subjects of either of them, to the people or subjects of the other, against the articles of this alliance, or against common right, there shall not therefore be given letters of reprisal, marque, or counter-marque, by any of the confederates, until such time as justice is sought and followed in the ordinary course of law: but if justice be denied or delayed, then the king, whose people or inhabitants have received harm, shall ask it of the other, by whom (as is said) the justice shall have been denied or delayed, or of the commissioners that shall be, by the one king or the other, appointed to receive and hear such demands, to the end that all such differences may be compounded in friendship, or according to law. But if there should yet be a delay, or justice should not be done, nor satisfaction given within six months after having the same so demanded, then may be given letters of reprisal, marque, or counter-marque.

IV.

That between the king of Great-Britain and the king of Spain, and their respective people, subjects, and inhabitants, as well upon sea, as upon land and fresh water, in all and every their kingdoms, lands, countries, dominions, confines, territories, provinces, islands, plantations, cities, villages, towns, ports, rivers, creeks, bays, freights and currents, where hitherto trade and commerce hath been accustomed, there shall be free trade and commerce, in such way and manner, that, without safe-conduct, and without general or particular licence, the people and subjects of each other may freely, as well by land, as by sea and fresh water, navigate and go into their said countries, kingdoms, dominions, and all the cities, ports, currents, bays, districts, and other places thereof, and may enter into any port with their ships, laden or empty, carriage, or carriages, wherein to bring their merchandize, and there buy and sell what and how much they please, and also at just and reasonable rates provide themselves with provisions, and other necessary things for their subsistence and voyage; and also may repair their ships and carriages, and from thence again freely depart with their ships, carriages, goods, merchandize, and estate, and return to their own countries, or to such other place as they shall think fit, without any molestation or impediment, so that they pay the duties and customs which shall be due, and saving to either side the laws and ordinances of their country.

V.

Item, It is likewise agreed, That for the merchandizes which the subjects of the king of Great-Britain shall buy in Spain, or other the kingdoms or dominions of the king of Spain, and shall carry in their own ships, or in ships hired or lent unto them, no new customs, toll, tenths, subsidies, or other rights or duties whatsoever, shall be taken or increased, other than those which, in the like case, the natives themselves, and all other strangers, are obliged to pay; and the subjects aforesaid buying, selling, and contracting for their merchandizes, as well in respect of the prices, as of all the duties to be paid, shall enjoy the same privileges which are allowed to the natural subjects

of Spain, and may buy, and lade their ships with such goods, and merchandizes; which said ships being laden, and customs paid for the goods, shall not be detained in port, upon any pretence whatsoever; nor shall the laders, merchants, or factors, who bought and loaded the goods aforesaid, be questioned, after the departure of the said ships, for any matter or thing whatsoever concerning the same.

VI.

And to the end that the officers and ministers of all cities, towns, and villages belonging to either, may neither demand, nor take from the respective merchants and people, greater taxes, duties, stipends, recompences, gifts, or any other charges, than what ought to be taken by virtue of this treaty; and that the said merchants and people may know and understand with certainty what is ordained in all things touching this, it is agreed and concluded, That tables and lists shall be put up at the doors of the custom-houses and register of all the cities, villages, and towns of, or appertaining to, one or the other king, where such rights, and excises or customs, are usually paid; in which, how much, and of what quality, such rights, customs, subsidies, and payments either to the king's, or any of the aforesaid officers, are allowed, shall be put down in writing, declaring as well the species of what is imported, as what is carried out. And if any officer, or any other in his name, upon any pretence whatsoever, in public or secret, directly or indirectly, shall ask or receive of any merchant, or other person respectively, any sum of money, or other thing, by the name of right, due, stipend, allowance, or recompence (though it be by the way of voluntary donative) more or otherwise than aforesaid, the said officer or his deputy being in such manner guilty and convicted before a competent judge in the country where the crime is committed, shall be put in prison for three months, and shall pay thrice the value of the thing so received; of which the half shall be for the king of the country where the crime is committed, and the other half for the denunciator, for the which he may sue his right before any competent judge of the country where it shall happen.

VII.

That it shall be lawful for the subjects of the king of Great-Britain, to bring out, and carry into Spain, and all or any lands and dominions of the king of Spain (where heretofore they have used trade and commerce) and trade there with all kind of merchandize, clothes, manufactures, and things of the kingdom of Great-Britain, and the manufactures, goods, fruits, and kinds of the islands, towns, and plantations to him appertaining, and what shall have been bought by English factors on this side, or farther on the other side of the cape of Buena Esperança, without being enforced to declare to whom, or for what price they sell their said merchandize and provisions, or being molested for the errors of the masters of ships, or others, in the entry of the goods; and at their pleasure to return again out of the dominions of the king of Spain, with all or any goods, estates, and merchandize, to any of the territories, islands, dominions, and countries of the king of England, or to any other place, paying the rights and tributes mentioned in the antecedent chapters; and the rest of all their lading which is not brought to land they may detain, keep, and carry away in their said ship or ships, vessel or vessels, again, without paying any right or imposition whatsoever for it, as if therewith they had never been within any bay or port of the Catholic king. And all the goods, estates, merchandize, ships, or other vessels, with any things introduced into the dominions or places of the crown of Great-Britain as prizes, and judged for such in the said dominions and places, shall be taken for goods and merchandize of Great-Britain, comprehended so by the intention of this article.

VIII.

That the subjects and vassals of the most serene king of Great-Britain, may bring and carry to all and singular the dominions of the king of Spain, any fruits and commodities of the East-Indies, it appearing by testimony of the deputies of the East-India company in London, that they are of, or have come from, the English conquests, plantations, or factories, with like privilege, and according to what is allowed to the subjects of the United Provinces by the royal cedula of Contravando, bearing date the 27th of June, and the 3d of July 1663, and published on the 30th of June, and 4th of July the same year. And for what may concern both the Indies, and any other parts whatsoever, the crown of Spain doth grant to the king of Great-Britain and his subjects, all that is granted to the United States of the Low Countries and their subjects, in their treaty of Munster 1648, point for point, in as full and ample manner as if the same were herein particularly inserted, the same rules being to be observed, whereunto the subjects of the said United States are obliged, and mutual offices of friendship to be performed from one side to the other.

IX.

That the subjects of the king of Great Britain, trading, buying, and selling, in any of the kingdoms, governments, islands, ports, or territories of the said king of Spain, shall have, use, and enjoy, all the privileges and immunities, which

the said king hath granted and confirmed to the English merchants that reside in Andalusia, by his royal cedulas or orders, dated the 19th day of March, the 26th day of June, and the 9th day of November 1645, his Catholic Majesty by these presents re-confirming the same, as a part of this treaty between the two crowns. And to the end that it may be manifest to all, it is contented, That the said cedulas (as to the whole substance thereof) be passed and transferred to the body of the present articles; in the name and favour of all and singular the subjects of the king of Great-Britain, residing and trading in any places whatsoever within his Catholic Majesty's dominions.

X.

That the ships, or any other vessels that shall belong to the king of Great-Britain or his subjects, navigating into the king of Spain's dominions or any of his ports, shall not be visited by the judges of contraband, or by any other officer or person, by his own, or by any other authority; nor shall any soldiers, armed men, or other officers or persons, be put on board any of the said ships or vessels; nor shall the officers of the custom-house of the one or the other party, search in any vessels or ships belonging to the people of the one or the other, which shall enter into their regions, dominions, or respective ports, until their said ships or vessels are unladen, or until they have carried on shore all the lading and merchandize which they declare they resolve to disembark in the said port; nor shall the captain, master, or any other of the company of the said ships be imprisoned, or they or their boats detained on shore; but in the interim, officers of the custom-house may be put on board the said vessels or ships, so they exceed not the number of three for each ship, to see that no goods or merchandize be landed out of the said ships or vessels, without paying such duties as by these articles either party is obliged to pay; which said officers are to be without any charge to the ship or ships, vessel or vessels, their commanders, mariners, company, merchants, factors, or proprietors. And when it happens that the master or owner of any ship shall declare, that the whole lading of his said ship is to be discharged in any port, the entry of the said lading shall be made in the custom-house after the usual manner; and if, after the entry made, any other goods be found in the said ship or ships, more than what are contained in the said entry, eight working days shall be allowed them on which they may work (which shall be reckoned from the day they began to unlade) to the end, that the concealed goods may be entered, and the confiscation of them prevented. And in case that in the time limited, the entry or manifest of them shall not have been made, then such particular goods only, which shall be found as aforesaid, though the unlading be not finished, shall be confiscated, and not any other; nor shall other trouble be given, or punishment inflicted on the merchant or owner of the ship; and when the ships or vessels are re-laden, they may have freedom to go out again.

XI.

That the ship or ships appertaining to the one or the other king, or to their respective people and subjects, that shall enter into any ports, lands or dominions, of the one or the other, and shall discharge any part of their goods and merchandizes in any port or haven, being consigned with the rest to other places, within or without the said dominions, shall not be obliged to register or pay the rights of any other goods or merchandize, than of that which they shall unlade in the said port or haven, nor be constrained to give bond for the goods they shall carry to other places, nor any other security, if it be not in case of felony, debt, treason, or other capital crime.

XII.

Whereas the one moiety of the custom of all foreign goods and merchandize imported into England, is allowed and returned back to the importer, if the said goods be exported out of the said kingdom within twelve months after their first landing, upon oath made that they are the same goods which paid custom inwards, and that if they be not re-shipped within the said twelve months, yet they may at all times be exported without paying any custom or duty outwards: it is therefore agreed, That if any of the subjects of the king of Great-Britain shall hereafter land any goods or merchandize, of what growth or nature soever they be, in any of the ports of his Catholic Majesty, and having entered them, and paid the custom by which this treaty ought to be paid, and shall afterwards desire to transport them, or any part of them, to any other place whatsoever, for a better market, it shall and may be lawful for him or them so to do freely, without paying or being demanded any other custom or duty at all for the same, he or they making oath, if required thereunto, that they are the same goods for which custom was paid at their landing; and in case that the subjects, people, and inhabitants of the dominions of either part shall unlade, or have in any city, town, or village respectively, any goods, merchandizes, fruits or estates, and have paid the customs due, according to what hath been declared, and after that, not being able to put them off, shall resolve to remit them to some other city, town or village of the said dominions, they may not only do it without difficulty or impediment, and

Without paying other rights than what were due at their entry, but likewise the custom or rights shall not be paid again in any other part of the said dominions, bringing certificates from the officers of the custom-house, that they were paid before in the due form. And the chief farmers and commissioners of the king of Spain's rents in all places, or some other officer or officers to be appointed for that purpose, shall at all times permit and suffer the transportation of all such goods and merchandizes from place to place, and give sufficient certificate to the owners thereof, or their assignees, of their having paid their custom at their first landing; whereby they may be carried to, and landed at, any other port or place of the said jurisdiction, free from all duties or impediments whatsoever, as aforesaid, saving always the right of any third person.

XIII.

That it shall be lawful for the ships belonging to the subjects of the one or other king, to anchor in the roads or bays of either, without being constrained to enter into port; and in case they be necessitated to enter thereinto, either by distress of weather, fear of enemies, pirates, or any other accident, in case the said ships be not bound to an enemy's port, and carrying thither contraband goods (whereof without some clear proof they shall not be questioned) it shall be lawful for the said subjects to return to sea freely when they please; with their ships and goods, so that they do not break bulk, or expose any thing to sale; and that when they cast anchor, or enter the ports aforesaid, they be not molested or visited; and it shall suffice, that in case they shew their passports or sea-papers, which being seen by the respective officers of either king, the said ships shall return freely to sea without any molestation.

XIV.

And if any ship or ships belonging to the subjects and merchants of the one or the other, entering into bays, or in the open sea, shall be encountered by the ships of the said kings, or of privateers their subjects: the said ships, to prevent all disorders, shall not come within cannon-shot; but shall send their long-boat or pinnace to the merchant-ship, and only two or three men on board, to whom the master or owner shall shew his passports and sea-letters, whereby not only the ship's lading, but the place to which she belongs, and as well the master and owner's name, as the name of the ship may appear; by which means the quality of the ship, and her master or owner will be sufficiently known, as also the commodities she carries, whether they be contraband or not; to the which passports and sea-letters, entire faith and credit shall be given, so much the rather, for that as well on the part of the king of England, as of the king of Spain, some counter-signs shall be given (if it shall be found necessary) whereby their authenticity may be better appear, and that they may not be in any wise falsified.

XV.

If any prohibited merchandize or goods shall be exported from the kingdoms, dominions, and territories of either of the said kings, by the respective people or subjects of the one or the other, in such case the prohibited goods shall be only confiscated, and not the other goods; neither shall the delinquent incur any other punishment, except the said delinquent shall carry out from the respective kingdoms or dominions of the king of Great-Britain, the proper coin, wool, or fuller's earth of the said kingdom, or shall carry out of the respective kingdoms or dominions of the said king of Spain, any gold or silver, wrought or unwrought; in either of which cases the laws of the respective countries are to take place.

XVI.

That it shall be lawful for the people and subjects of both kings, to have access to the respective ports of the one and the other, and there remain, and depart again with the same freedom, not only with their ships and other vessels for trade and commerce, but also with their other ships fitted for war, armed, and disposed to resist and engage the enemy; and arriving by stress of weather to repair their ships, or furnish themselves with provisions; so that entering willingly, they be not so numerous, that they give just occasion of suspicion, to which end they are not to exceed the number of eight, nor continue in their havens, nor about their ports, longer time than they shall have just cause, for the repair of their ships, to take in provisions or other necessary things, much less be the occasion of interrupting the free commerce, and coming in of other ships, of nations in amity with either king; and when an unusual number of men of war, by accident shall come unto any port, it shall not be lawful for them to come into the said ports or havens, not having first obtained permission of the king unto whom the said ports do belong, or the governors of the said ports, if they be not forced thereinto by stress of weather or other necessity, to avoid the danger of the sea, and in such case they shall presently acquaint the governor or chief magistrate of the place with the cause of their coming; nor shall they remain there any longer time than the said governor or magistrate shall think convenient, or do any act of hostility in such ports, that may prove of prejudice to the one or the other of the said kings.

XVII.

XVII.

That neither the said king of Great-Britain, nor the king of Spain, by any mandate, general nor particular, nor for any cause whatsoever, shall embark or detain, hinder or take for his respective service, any merchant, master of a ship, pilot or mariner, their ships, merchandize, clothes or other goods belonging unto the one or the other, in their ports or waters, if it be not that either of the said kings, or the persons to whom the ships belong, be first advertised thereof, and do agree thereunto; provided that this shall not be construed to hinder or interrupt the ordinary course of justice and law in either country.

XVIII.

That the merchants and subjects of the one and the other king, their factors and servants, as also their ships, masters and mariners, may as well going as coming, upon sea and other waters, as in the havens and ports of the one and the other respectively, carry and use all kind of arms, defensive and offensive, without being obliged to register them, as also upon land to carry and use them for their defence, according to the custom of the place.

XIX.

That the captains, officers, and mariners, of the ships belonging to the people and subjects of either party, may not commence an action, nor hinder or bring trouble upon their own ships, their captains, officers, or mariners, in the respective kingdoms, dominions, lands, countries, or places of the other, for their wages or salaries, or under any other pretence. Nor may they put themselves, or be received, by what pretext or colour soever, into the service or protection of the king of England, or king of Spain, or their arms; but if any controversy happen between merchants and masters of ships, or between masters and mariners, the composing thereof shall be left to the consul of the nation, but after such manner, as he who shall not submit to the arbitrament, may appeal to the ordinary justice of the place where he is subject.

XX.

And to the end that all impediments be taken away, and that the merchants and adventurers of the kingdoms of Great-Britain be permitted to return to Brabant, Flanders, and other the provinces of the Low Countries, under the jurisdiction of the king of Spain: forasmuch as it hath been thought convenient, that all, and any the laws, edicts and acts, by which the importation of cloth, or any other woollen manufacture, of what kind soever, dyed or undyed, milled or unmilled, into Flanders, or the other provinces, hath been prohibited, be revoked and disannulled; and that if any right, tribute, imposition, charge, or money, hath been, with permission, or otherwise, put upon clothes, or any of the foresaid woollen manufactures so imported (except the ancient tribute upon every piece of cloth, and proportionably upon every other woollen manufacture, agreeable to the ancient treaties and agreements between the then kings of England, and the dukes of Burgundy, and governors of the Low Countries) the same should be altogether void, and no such tribute or imposition from henceforth imposed, or put upon the said clothes or manufactures, for no cause or pretext whatsoever: and that all the English merchants, trading in any of the said provinces, their factors, servants, or commissioners, should enjoy from henceforward, all the privileges, exemptions, immunities, and benefits, which formerly have been agreed and given by the foresaid ancient treaties and agreements, between the then kings of England, and the dukes of Burgundy, and governors of the Low Countries: it is therefore agreed, That deputies shall be named by the king of Great-Britain, who meeting with the marquis of Castelfordrigo, or the governor of those provinces for the time being, or any other ministers of the king of Spain, sufficiently authorized in this behalf, shall friendly treat and conclude hereupon; and also such further privileges, immunities, and necessary exemptions, suitable to the present state of affairs, shall be granted for the encouragement of the said merchants and adventurers, and for the security of their trade and commerce, as shall be agreed upon in a special treaty, that shall be made between both the kings, touching this particular.

XXI.

The subjects and inhabitants of the kingdoms and dominions of the most serene kings of Great-Britain and Spain respectively, shall, with all security and liberty, sail to and traffic, in all the kingdoms, estates, or countries, which are or shall be in peace, amity, or neutrality, with the one or the other.

XXII.

And they shall not be disturbed or disquieted in that liberty, by the ships or subjects of the said kings respectively, by reason of the hostilities which are or may be hereafter between either of the said kings, and the foresaid kingdoms, countries, and states, or any of them, which shall be in friendship or neutrality with the other.

XXIII.

And in case, that within the said ships respectively, be found, by the above said means, any merchandize hereunder mentioned, being of contraband and prohibited, they shall be taken out and confiscated, before the admiralty, or other com-

petent judges; but for this reason the ship, and the other free and allowed commodities which shall be found therein, shall in no wise be either seized or confiscated.

XXIV.

Moreover, for better prevention of the differences which might arise touching the meaning of forbidden merchandize, and of contraband, it is declared and agreed, That under this name shall be comprehended all fire-arms, as ordnance, muskets, mortar-pieces, petards, bombs, granadoes, fire-crucels, fire-balls, musket-rests, bandeliers, gunpowder, match, saltpetre, and bullets; likewise, under the name of forbidden merchandize, are understood all other arms, as pikes, swords, pots, helmets, backs, and breast, halberds, javelins, and such armour; under this name is likewise forbidden the transportation of soldiers, horses, their harnesses, cases of pistols, holsters, belts, and other furniture, formed and composed for the use of war.

XXV.

Likewise to prevent all manner of dispute and contention, it is agreed, That under that name of forbidden merchandize, and of contraband, shall not be comprehended wheat, rye, barley, or other grains or pulse, salt, wine, oil, and generally whatsoever belongs to the sustaining and nourishing of life; but they shall remain free, and likewise all other merchandizes not comprehended in the preceding article; and the transportation of them shall be free and permitted, although it be to the towns and places of enemies, unless such towns and places be besieged, blocked up, or surrounded.

XXVI.

It is also agreed, That whatsoever shall be found ~~laid~~ by the subjects or inhabitants of the kingdoms and dominions of either of the said kings of England and Spain, ~~aboard~~ the ships of the enemies of the other, though it be not forbidden merchandize, shall be confiscated, with all things else which shall be found within the said ships, without exception or reserve.

XXVII.

That the consul which hereafter shall reside in any of the dominions of the king of Spain, for the help and protection of the subjects of the king of Great-Britain, shall be named by the king of Great-Britain, and he so named, shall have and exercise the same power and authority in the execution of his charge, as any other consul hath formerly had in the dominions of the said king of Spain; and in like manner the Spanish consul residing in England, shall enjoy as much authority as the consuls of any other nation have hitherto enjoyed in that kingdom.

XXVIII.

And that the laws of commerce that are obtained by peace may not remain unfruitful, as would fall out if the subjects of Great-Britain, when they go to, come from, or remain in the dominions or lordships of the king of Spain, by reason of their commerce or other business, should be molested for cause of conscience; therefore, that the commerce be secure and without danger, as well upon land as at sea, the said king of Spain shall provide, that the subjects of the said king of Great-Britain shall not be aggrieved contrary to the laws of commerce, and that none of them shall be molested or disturbed for their conscience, so long as they give no public scandal or offence; and the said king of Great-Britain shall likewise provide, for the same reasons, that the subjects of the king of Spain shall not be molested or disturbed for their conscience, against the laws of commerce, so long as they give no public scandal or offence.

XXIX.

That the people and subjects respectively of one kingdom, in the dominions, territories, regions, or colonies of the other, shall not be compelled to sell their merchandize for brass-metal coin, or exchange them for other coin or things, against their will; or having sold them, to receive the payment in other species than what they bargained for, notwithstanding any law or other custom contrary to this article.

XXX.

That the merchants of both nations, and their factors, servants, and families, commissioners, or others by them employed; as also masters of ships, pilots and mariners, may remain freely and securely in the said dominions, kingdoms, and territories of either of the said kings, and also in their ports and rivers; and the people and subjects of the one king, may have, and with all freedom and security enjoy, in all the lands and dominions whatsoever of the other, their proper houses to live in, their warehouses and magazines for their goods and merchandize, which they shall possess during the time for which they shall have taken, hired, and agreed for them, without any impediment.

XXXI.

The inhabitants and subjects of the said confederate kings, in all the lands and places under the obedience of the one or the other, shall use and employ those advocates, proctors, scriveners, agents, and solicitors, whom they think fit, the which shall be left to their choice, and consented to by the ordinary judges, as often as there shall be occasion; and they shall not be constrained to show their books and papers of account

account to any person, if it be not to give evidence for the avoiding law-suits and controversies; neither shall they be embarked, detained, or taken out of their hands, upon any pretence whatsoever. And it shall be permitted to the people and subjects of either king, in the respective places where they shall reside, to keep their books of account, traffic, and correspondence, in what language they please, in English, Spanish, Dutch, or any other, the which shall not be molested, or subject to any inquisition. And whatsoever else hath been granted by either party concerning this particular, to any other nation, shall be understood likewise to be granted here.

XXXII.

That in case the estate of any person or persons shall be sequestered or seized on by any court of justice or tribunal whatsoever, within the kingdoms and dominions of either party, and any estate or debt happen to lie in the hands of the delinquents belonging bona fide to the people and subjects of the other, the said estate or debts shall not be confiscated by any of the said tribunals, but shall be restored to the true owners in specie, if they yet remain, and if not, the value of them (according to the contract and agreement which was made between the parties) shall be restored within three months after the said sequestration.

XXXIII.

That the goods and estates of the people and subjects of the one king, that shall die in the countries, lands, and dominions of the other, shall be preserved for the lawful heirs and successors of the deceased, the right of any third person always reserved.

XXXIV.

That the goods and estates of the subjects of the king of Great-Britain, that shall die without making a will in the dominions of the king of Spain, shall be put into inventory, with their papers, writings, and books of account, by the consul or other public minister of the king of Great-Britain, and deposited in the hands of two or three merchants that shall be named by the said consul, or public minister, to be kept for the proprietors and creditors; and neither the cruzada, nor any other judicatory whatsoever, shall intermeddle therein; which also in the like case shall be observed in England, towards the subjects of the king of Spain.

XXXV.

That a decent and convenient burial-place shall be granted and appointed to bury the bodies of the subjects of the king of Great-Britain, who shall die within the dominions of the king of Spain.

XXXVI.

If it shall happen hereafter that any difference fall out (which God forbid) between the king of Great-Britain and the king of Spain, whereby the mutual commerce and good correspondence may be endangered, the respective subjects and people of each party shall have notice thereof given them in time, that is to say, the space of six months, to transport their merchandize and effects, without giving them in that time any molestation or trouble, or retaining or embarking their goods or persons.

XXXVII.

All goods and rights concealed or embarked, moveables, immoveables, rents, deeds, debts, credits, and the like, which have not with a formal notice of the cause, and by a legal condemnation, according to the ordinary justice, been brought into the royal exchequer at the time of concluding this treaty, shall remain at the full and free disposal of the proprietors, their heirs, or of those who shall have their right, with all the fruits, rents, and emoluments thereof; and neither those who have concealed the said goods, nor their heirs, shall be molested for this cause by the exchequers respectively; but the proprietors, their heirs, or those who shall have their right, shall have for the said goods and rights their action at law, as for their own proper goods and estate.

XXXVIII.

It is agreed and concluded, that the people and subjects of the king of Great-Britain, and of the king of Spain, shall have and enjoy in the respective lands, seas, ports, havens, roads, and territories of the one or the other, and in all places whatsoever, the same privileges, securities, liberties, and immunities, whether they concern their persons or trade, with all the beneficial clauses and circumstances which have been granted, or shall be hereafter granted by either of the said kings, to the most Christian king, the States General of the United Provinces, the Hanse-Towns, or any other kingdom or state whatsoever, in as full, ample, and beneficial manner, as if the same were particularly mentioned and inserted in this treaty.

XXXIX.

In case any difference or dispute shall happen on either side concerning these articles of trade and commerce, by either the officers of the admiralty or other person whatsoever, in the one or the other kingdom; the complaint being presented by the party concerned to their majesties, or to any of their council, their said Majesties shall cause the damages forthwith to be repaired, and all things, as they are above agreed, to be duly executed; and in case, that in progress of time any frauds or inconveniences be discovered in the navigation and

VOL. II.

commerce between both kingdoms, against which sufficient prevention hath not been made in these articles, other provisions may be hereafter mutually agreed on, as shall be judged convenient, the present treaty remaining still in full force and vigour.

XL.

It is likewise accorded and concluded, that the most serene and renowned kings of Great-Britain and Spain, shall sincerely and faithfully observe and keep, and procure to be observed and kept, by their subjects and inhabitants respectively, all and singular the capitulations in this present treaty agreed and concluded: neither shall they directly or indirectly infringe the same, or consent that the same shall be infringed by any of their subjects or inhabitants. And they shall ratify and confirm all and singular the conventions before accorded by letters patent reciprocally, in sufficient, full, and effectual form, and the same so formed and made, shall interchangeably deliver, or cause to be delivered faithfully and really, within four months after the date of these presents; and they shall then, as soon as conveniently may be, cause this present treaty of peace and amity to be published in all places, and in the manner accustomed.

Dated at Madrid, the $\frac{17}{22}$ day of May, in the year of our Lord, 1667.

The form of letters which ought to be given by the towns and sea-ports, to the ships and vessels setting sail from thence.

To all to whom these presents shall come, We the governor, consuls, or chief magistrate or commissioners of the customs, of the city, town, or province of N. do testify and make known, That N. N. master of the ship N. hath before us, under solemn oath declared, That the ship N. of tun (more or less) of which he is at present master, doth belong to the inhabitants of N. in the dominions of the most serene king of Great-Britain. And we, desiring that the said master may be assisted in his voyage and business, do intreat all persons in general and particular, who shall meet him, and those of all places where the said master shall come with the said ship and her merchandize, that they would admit him favourably, treat him kindly, and receive the said ship into their ports, bays, havens, rivers, and dominions, permitting her quietly to sail, pass, frequent, and negotiate there, or in any other places, as shall seem good to the said master, paying still the toll and customs which of right shall be due, which we will acknowledge gratefully upon the like occasions. In witness whereof, we have signed these presents, and sealed them with the seal of our town.

DON PEDRO FERNANDEZ,
del campo y Angulo.

WILL. GODOLPHIN.

REMARKS.

The foregoing treaty of 1667, was signed May 23, and the next day Sir W. Godolphin, who was secretary to our embassy, and who was the chief contriver of that treaty, wrote thus to lord Arlington: 'The treaty of commerce, I dare promise your lordship, comprehends not only all the privileges and advantages which this crown hath ever granted to any other state or people, but likewise some conveniencies which it hath never yet permitted to any other; for the better security and perfection whereof, I have diligently perused all the treaties these people have made with others, and all the royal cedulas they have granted in favour of any particular factories: and have not received from our factories any grievance or proposition of advantage in their commerce to be either remedied or procured for them, which we think is not sufficiently provided for in this treaty.'

And in another letter to his brother, May 25, he says, 'I will only say to you in general of the treaty of commerce, That besides all the freedoms and advantages of trade, which this crown hath granted to any other state, we have thereby several concessions and conveniences, whereof we find no example in their articles with any other. And I think they have not made any other these hundred years, which I have not learned as my lesson, in order to the treating and perfection of this.'

Sir William Godolphin might say this, and the world will believe him, since after that treaty we paid no more than the moderate duties above mentioned; and since the privilege of a judge-conservator, without which we cannot trade with any security in that country, and which was only granted before by royal cedulas to our merchants, and might have been revoked by the king, was confirmed to us by that treaty.

This treaty, and that of 1670, [see SPANISH AMERICA] being the principal foundation of all subsequent treaties that have been made between Great-Britain and Spain, we have judged it eligible to take due notice thereof.

In order to judge the more circumstantially of the commerce of Spain, and of the political regulations of that kingdom for exercising the same, and the benefits and advantages to which Great-Britain is entitled, and also the present turn, views, and spirit of the Spanish court, in regard to the advancement of their commerce and navigation: see the articles ALMOXARISFARGO, ANDALUSIA, BISCAY, CAS-

Of the FOREIGN EXCHANGES of SPAIN, particularly between MADRID and other principal trading cities of EUROPE.

Many errors have been committed by authors, in relation to the monies of Spain. La Banque rendue facile, upon this subject, says, in treating of the monies of Spain, that there is 25 per cent. difference between the PLATE MONEY there and the VELLON: but if his commerce had led him to a correspondence either at Madrid or Cadiz, he would have been acquainted with the two augmentations that Philip V. made there, and that a rial vellon is worth there $8\frac{1}{2}$ quarts copper money, so that the rial of old plate of exchange money, is worth 16 vellon, and the effective rial of new plate 17; which makes a difference between these two species of rials, as 32 is to 17; that is to say, $53\frac{1}{2}$ per cent. for 100 rials vellon, are worth only $53\frac{1}{8}$ rials of old plate: as this is the true state of the case, it follows, that La Banque rendue facile is mistaken.

By the word plate is meant silver money, whereby must be understood the money in which some merchants keep their accounts; and it is to that is given the name of old plate, which only is used for the negotiation of the exchanges with foreign places: it is imaginary, as the exchange crown of France, or the livres, sols, and deniers Tournois, or as the pound sterling of England; but as it is requisite in trade to understand the reduction of one sort of money into the other, we shall give the instruction proper for that purpose.

Ufance is reckoned at Madrid, for bills of exchange, of France, Amsterdam, and all Holland, London, Hamburgh, Leghorn, Genoa, Venice, and almost of all the trading cities of Europe, 60 days, exclusive of the date; after the expiration of which time there are allowed 14 days grace: Cadiz allows but 6 to bills drawn out of the kingdom of Spain; but to inland bills, there are 14 days grace allowed; after which bills are protested for non-payment.

The foreign bankers or remitters at Madrid, Cadiz, Seville, &c. keep their commercial accounts in rials and marvedees old plate.

The shopkeepers of Madrid, the customhouses, and the tenants of the kingdom, keep their accounts in rials and marvedees vellon, which are called in France billon.

The merchants of Valentia in Spain, keep theirs in piaftres, sols, and deniers, which are divided into 20 and 12, as our pound sterling is into shillings and pence.

The pistole, or doubloon of exchange, is 4 piaftres, or 32 rials exchange.

The piaftre, or pefo of exchange, is 8 rials exchange, or old plate.

The rial is 34 marvedees, or 16 quarts.

The ducat, or ducado current, is 11 rials, old plate, or 374 marvedees.

The ducat of exchange is 20 sols d'or, or, for facility of computation, 375 marvedees, or 11 rials 1 marvedee old plate.

The fol d'or is 12 deniers d'or.

The said piaftre of exchange, is also reckoned at 15 rials vellon and 2 marvedees, or 128 quarts. And,

The rial vellon 34 marvedees vellon, or $8\frac{1}{2}$ quarts, effective copper money, in which a bill of exchange is paid at Madrid, if the foreign drawer, or any other does not take care to stipulate the payment to be made either in gold or silver, whereby there will ensue a loss to the bearer of the bill of about $1\frac{1}{2}$ per cent.

The pistole of gold, worth 40 rials of 16 quarts, is in France of the standard of 22 carrats, and weighs there 126 grains.

The piaftre with two globes, worth 170 quarts, is in France of the standard of 10 deniers 19 $\frac{1}{2}$ grains, and weighs there 507 grains.

THE METHOD

Of reducing rials vellon, into rials of exchange, or old plate; those into piaftres of exchange, and those again into rials vellon; piaftres effective, into rials of exchange, and those into rials vellon; and for understanding of the reciprocal values of the said monies between each other.

By 5005 Rials 16 marvedees vellon, to be multiplied $8\frac{1}{2}$ quarts, the value of each of those rials.

40040
2502 $\frac{1}{2}$ for the $\frac{1}{2}$.
4 for the 16 marv. 4 marv. vell. making the quart.

42546 $\frac{1}{2}$ Quarts, to be divided by 16 quarts, the value of the rial, or which is more facile take $\frac{1}{4}$ of $\frac{1}{4}$ = $\frac{1}{16}$, it will give

2659 Rials 5 marved. plate, or exchange: take the $\frac{1}{8}$ thereof, and it will give

332 Piaftres 3 rials, 5 marv. of plate; multiply these
By 15 Rials 2 marv. vellon, another value of the piaftre [of exchange.

1660

332

4980

4980 [Brought over.]

19 : 18 for the 2 marvedees, i. e. for 664 marvedees.
3 : 26 for 2 rials, the $\frac{1}{4}$ of the multiplicator.
1 : 30 for 1 rial, the $\frac{1}{5}$ of that.
0 : 10 for 5 marvedees of plate.

Rials 5005 : 16 marvedees vellon, the same as above.

At 250 Piaftres effective, 2 rials 12 $\frac{1}{2}$ quarts, also effective
10 Rials 10 quarts or $\frac{1}{2}$, val. of the said piaft. [or real.

2500

125 for 8 quarts, or $\frac{4}{8}$ the $\frac{1}{2}$ of 250.

31 $\frac{1}{2}$ for ditto, or $\frac{1}{2}$ the $\frac{1}{2}$ of that.

2 $\frac{1}{2}$ for 2 rials

$\frac{2}{3}$ for 12 $\frac{1}{2}$ quarts } real or effective.

By 2659 $\frac{1}{8}$ Rials old plate, the same as above, to be multip.
16 Quarts, value of the said rial.

15954

2659

2 for $\frac{4}{3}$,
 $\frac{1}{2}$ for $\frac{1}{3}$ the $\frac{1}{4}$ of the 4.

42546 $\frac{1}{2}$ Quarts, as above, to be divided by $8\frac{1}{2}$ quarts, the value of the rial of vellon, it gives the 5005 rees, 16 marvedees vellon, as above.

OF THE COURSES OF EXCHANGE.

MADRID

Upon	Gives	To receive
Lyons	1 piaftre exchange, for	75 sols Tournois
Milan	1 ditto	for 100 sols cur. mon.
Messina	3 $\frac{1}{4}$ dit. more or less, for	1 oz. of 30 tarins } more or less.
Vienna	190 mar. more or less, for	1 florin of 60 kreutzers.
Venice	350 ditto, idem, for	1 ducat of 124 foldiban.
Geneva	360 ditto, idem, for	1 crown current money.

Suppose that I am to pay to my correspondents of the following cities, what I am indebted to them, by remitting to each, according to the course of exchange, a bill of exchange, in money of their respective countries, I would know what those several remittances ought to be, according to the following sums due to my correspondents, viz.

Course of Exchange.

	Rials	Mar	
Of Paris, - 83 pistoles	3		at 15 liv. 1 fol the pistole of 32 rials.
Amsterdam, 703 rials	3		at 97 $\frac{1}{2}$ d. gros per 1 duc. of 375 mar.
Hamburgh, 7646	28		at 93 $\frac{1}{2}$ gros per idem.
London, - 1387 piaft.	5		at 4 $\frac{1}{2}$ d. sterl. per piaftre of 8 rees.
Genoa, - 542	5	17	at 113 piaft. of 8 rees per 100 of 5 livres.
Leghorn, - 425	6		at 129 ditto per 100 of 20 fol d'or.
Rome - 8200 rials			at 550 marv. per crown d'estampe.
Naples, 6540			at 300 ditto per ducat of 10 carlins.
Lisbon, - 6647		18	at 830 rees per ducat of 375 marv.

OF THE EXCHANGE OF SPAIN UPON FRANCE.

To reduce 83 pistoles, 3 rials, 5 marvedees of Spain, into livres, sols, and deniers Tournois, of France, exchange at 15 livres 1 fol per pistole of 32 rials of old plate.

OPERATION.

83 pistoles, 3 rials, 5 marvedees, to be multiplied
By 15 livres 1 fol of exchange,

415

83

4 liv. 3 fol. 0 den. for 1 fol, the $\frac{1}{10}$ of 83 pistoles,
0 18 9 for 2 rials, the $\frac{1}{10}$ of the exchange,
0 — 4 for 1 rial, the $\frac{1}{10}$ of that,
0 1 4 for 5 mar. the $\frac{1}{10}$ of the rial,

1250 liv. 12 fol. 5 den. for which the draught must be made upon Paris.

INSTRUCTION.

Multiply the 83 pistoles, 3 rials, and 5 marvedees, by the price of exchange, and the product 1250 livres, 12 sols, 5 deniers, will be the sum to receive at Paris. — For the proof of which, reduce the 1250 livres, 1 fol, by 80 liards, or $\frac{1}{4}$ of sols, the value of the livre, and divide the two products, 100,051, and 1204, the one by the other, and you will have a quotient of 83 pistoles, and 119 remaining, to be multiplied by 32 rials, the value of the pistole; and dividing the same by the common divisor above, it will give 3 rials, and 196 for a remainder, to be multiplied by 34 marvedees, the value of a rial; and dividing again, you will have the 5 marvedees old plate to receive at Spain.

If I had due at Lyons 83 pistoles, 3 rials, and 5 marvedees, and would reduce them into piaftres, multiply them by 4 piaftres, the value of the pistole, and you will have, as below, 332 piaftres, 3 rials, 5 marvedees, to be multiplied by 75 $\frac{1}{4}$ fols Tournois, and the product will be 25,012 fols, 5 deniers, and dividing the same by 20, it will produce 1250 livres, 12 fols, 5 deniers.

E X A M P L E.

Of the EXCHANGES of SPAIN upon HOLLAND.

To reduce 7035 rials, 3 marvedees, old plate, i. e. of 16 quarts each, into florins, fols, and pennings, bank money of Amsterdam, exchange at 97 $\frac{1}{4}$ deniers gros per ducat of 375 marvedees, also of old plate.

O P E R A T I O N.

By 7035 rials, 3 marv. to be multiplied
34 marv.

28140
211053

239193 marv. to be divided by 375, gives
637 ducats, 17 fols, 2 deniers,
97 $\frac{1}{4}$ deniers gros, exchange,

4459
5733
159 $\frac{2}{3}$ for $\frac{1}{4}$ of 637 ducats,
48 $\frac{1}{8}$ for 10 fols, the $\frac{1}{2}$
24 $\frac{1}{2}$ for 5 fols, the $\frac{1}{4}$
9 $\frac{1}{8}$ for 2 fols, the $\frac{1}{16}$ } of the exchange.

$\frac{1}{4}$)62031(

1550 : 15 fols, 8 penings, banco, for which sum the draught must be made on Amsterdam.

I N S T R U C T I O N.

Reduce the 7035 rials, 3 marvedees, into marvedees, by multiplying them by 34 marvedees, the value of a rial, adding thereto the 3 marvedees, and divide the product by 375 marvedees, the value of the ducat, which gives a quotient of 637 ducats, and a remainder of 318, which being multiplied by 20, and divided as before, gives 17 fols, with a further remainder of 85, which multiplied by 12, and divided also as before, gives 2 deniers.

Multiply these 637 ducats, 17 fols, 2 deniers, by the price of exchange, of 97 $\frac{1}{4}$ deniers gros, and divide by 40, the deniers in a florin, and the remainder will be 31 deniers, the $\frac{1}{2}$ of which is 15 fols, or stivers, to be received in bank money of Amsterdam; for the proof of which see the article HOLLAND, for the exchange on SPAIN.

Of the EXCHANGE of SPAIN upon HAMBURGH.

To reduce 7646 rials, 28 marvedees old plate of Spain, into marks, fol, and pennings lubs, bank money of Hamburg, exchange at 93 $\frac{1}{2}$ gros, per ducat of 375 marvedees of Spain.

O P E R A T I O N.

750	
1125	

12000 gros, divisor 24309252(gives 2025 marks, 12 fols, 4 penings, bank money, for which the draught must be made.

I N S T R U C T I O N.

Reduce the 7646 rials, 28 marvedees, into marvedees, by multiplying them by 34 marvedees, the value of a rial, and multiply the product, 259992 marvedees, by the price of exchange, 93 $\frac{1}{2}$ gros, it will produce 24309252 gros for a dividend. Multiply also the 375 marvedees, the value of a ducat, by 32 gros, the value of a mark lubs, and it will give 12000 gros for a divisor, and a quotient of 2025 marks lubs, with a remainder of 9252, to be multiplied by 16 fols, the value of the mark, and dividing by the same, it gives 12 fols lubs, and a further remainder of 4032, to be multiplied by 12 penings, the value of a fol, and still dividing by the same, it gives 4 penings bank money, to receive at Hamburg; for the proof of which operations, see the article HAMBURGH.

Of the EXCHANGES of SPAIN upon ENGLAND.

To reduce 1387 piaftres (of 128 quarts) 3 rials, 3 marvedees, of Spain, into pounds, shillings, and pence sterling of England, exchange at 41 $\frac{1}{2}$ pence sterling per piaftre.

O P E R A T I O N.

By 1387 piaftres, 3 rials, 3 marvedees, to be multiplied
41 $\frac{1}{2}$ pence sterling, the exchange price.

1387
5548
693 $\frac{1}{2}$ for the $\frac{1}{2}$
173 $\frac{1}{2}$ for the $\frac{1}{4}$ } of 1387.
10 $\frac{1}{8}$ for 2 rials the $\frac{1}{2}$
5 $\frac{1}{8}$ for 1 rial the $\frac{1}{4}$ } of the exchange
 $\frac{1}{4}$ for 3 marv.

57750 deniers, to be div. by 12 and 20, give 2401. 12s. 6d. sterling money, for which the draught must be made upon London.

This is so easy that it needs no instruction.

Of the EXCHANGE of SPAIN upon GENOA.

To reduce 542 piaftres (of 128 quarts each) 5 $\frac{1}{2}$ rials of old plate of Spain, into piaftres of 5 lires, bank money of Genoa, exchange at 133 of the said piaftres of Spain per 100 of the said piaftres of Genoa.

O P E R A T I O N.

If 133 piaft. of Sp. = 100 of Gen. what are 542 piaft. 5 $\frac{1}{2}$ rials?

8	100
1064 divisor.	54200
	50 for 4 ri. $\frac{1}{2}$
	12.4 for 1 ri. $\frac{1}{8}$
	6.2 for $\frac{1}{2}$ ri. $\frac{1}{8}$
	54268.6
	8

434150, to be divid.
by 1064, gives 408 piaftres, 8 $\frac{1}{2}$ deniers d'or in bank, for which the draught must be made on Genoa.—And 408 : 8 $\frac{1}{2}$

5
3 $\frac{1}{2}$ fols of bank.—For proof hereof see the article GENOA.

Of the EXCHANGE of SPAIN upon LEGHORN.

To reduce 425 piaftres, 6 rials, old plate of Spain, into piaftres of 20 fols d'or of Leghorn, exchange at 129 piaftres of Spain per 100 of the said piaftres of Leghorn.

O P E R A T I O N.

If 129 piaft. of Spain give 100 of Leghorn, what will 425 $\frac{1}{2}$?

	100
	42500
	50
	25
	42575
to be divided by 129, gives 330 piaftres, 9 deniers d'or, for which the draught must be made on Leghorn.	

Of the EXCHANGE of SPAIN upon ROME.

To reduce 8200 rials, of old plate of Spain, into Roman crowns, of 10 Julio's, exchange at 550 marvedees of Spain per crown d'estampe of 15 Julio's of Rome.

O P E R A T I O N.

O P E R A T I O N .

Exch. 550 marv. to be mul. by 10	8200 rials of plate 34 marv.
	32800
5500 Julio's	24600
	278800 mar.
	15 Julio's
	1394000
	278800

4182000 Julio's, to be divided by 5500, gives 760 Roman crowns, 3 Julio's, 6 bayocks, for which the draught must be made upon Rome.

I N S T R U C T I O N .

Reduce the 8200 rials into marvedees, by multiplying them by 34, the value of a rial; multiply also the product, 278800 marvedees, by 15 Julio's, the value of a crown d'estampe, and you will have 4182000, for a dividend.—Multiply, separately, the price of exchange, 550 marvedees, by 10 Julio's, the value of the Roman crown, and you will have 5500 for a divisor; and the one being divided by the other, will give a quotient of 760 Roman crowns, and 20 for a remainder, which multiplied by 10 Julio's, the value of the said crown, and divided as before, it will give 3 Julio's, with a further remainder of 35; which again multiplied by 10 bayocks, the value of the Julio, and divided as before, it produces 6 bayocks, to receive at Rome.

Of the EXCHANGE of SPAIN upon NAPLES.

To reduce 6540 rials, old plate, or of 16 quarts of Spain, into ducats, carlins, and grains, of the kingdom of Naples, exchange at 300 marvedees of plate per said ducat of 10 carlins.

O P E R A T I O N .

6540 rials, to be multiplied By 34
26160
19620

222360, to be divided by 300, gives 741 ducats, 2 carlins, for which the draught must be made on Naples.

Of the EXCHANGE of SPAIN upon PORTUGAL.

To reduce 6647 rials, 18 marvedees, old plate, into crusadoes and rees of Portugal, exchange at 830 rees per ducat of 375 marvedees of Spain.

187593280, to be divided by 150000, gives 1250 crusadoes, 248 rees, for which the draught must be made on Lisbon.

In regard to the weights and measures of Spain, and their conformity with those of the principal trading cities of Europe, see the article ENGLAND, Vol. I.

SPANISH AMERICA. It was in the time of the emperor Charles V, the first king of Spain of that name, that, as the histories of that prince observe, the greatest news arrived to him that ever any one monarch received in a day, since the creation of the world; namely, the discovery and conquest not of a kingdom only, or an empire, but of a new world, which abounded with such immense treasure, that all the Christian world before was not equal to. In confirmation of this surprizing news, Ferdinando Cortez, his general, (whom the emperor, as king of Spain, had ordered upon this expedition) sent him two ships loaded with silver, gold, pearl, emeralds, &c. to such a prodigious sum, that the emperor himself could hardly give credit to his ears in the report, or to his eyes when he saw the mass of treasure. Succeeding ships returning one after another, brought incredible quantities of treasure, as Cortez, the general, being supplied with more forces, extended his conquests, till the kingdom or empire of Peru was added to that of Mexico, with the inexhaustible mines of Potosi; after that the kingdom of Chili, rich in gold, as the other in silver. This success so

increased both the wealth and dominion of the Spanish monarchy, that they have ever since been lords of America, and of the chiefest empire and kingdoms in that great part of the world. The Spaniards having subdued the country, and rooted out the inhabitants, began soon to plant colonies, establish governments, and settle nations in all that part of the world: and though the English and French have followed their example more north, and both possess some few islands besides, yet their possessions in America, compared with those of Spain, bear no great proportion to them. As our acquisitions there were in the northern parts, where the air was cold and inclement, the soil over-run with woods, the seas frozen, and the people fierce, the Spaniards thought that part of America not worth taking, having to great a possession before in the more temperate, warm, and fruitful parts. Upon the settlement of the Spaniards in these new conquests, and experiencing still the increasing wealth out go even their highest expectations, it soon put them upon establishing laws of commerce, as well as government, in order to preserve not the possession of the country only, for that they did by sending over a competent military force, but to secure the commerce to themselves at home, and to prevent any other nation from breaking in upon it, and enriching themselves by it, at their expence.

To this end, the first regulation as a law of property (and which all other nations trading to America have since imitated them in) was, that they would suffer no ships from any other nation to trade to their new colonies, or to enter into their ports, nor any ships from thence to return to any other country but Old Spain, from whence they came: in a word, that they would have the whole trade to and from their colonies in New Spain center in Old Spain, which it does to this day, except such part as is carried on illicitly by other nations. In pursuance of these measures, the king of Spain erected, in the year 1513, a council of commerce for the Indies at Seville, for regulating this trade; and the king his successor, in the year 1556, erected a royal court of justice, for determining all controversies relating to this traffic.

By virtue of these regulations, and their strict observance, the state of this trade is punctually kept up to the first intention of the emperor's council to this day, and is, perhaps, the best-established commerce in the world. Some, among many others, of those prudent and politic regulations, are as follow:

I. No ships are allowed to go to any of the king of Spain's dominions in America, without special licence from him, which licences are issued out at his court, or chamber of commerce at Seville, as above.

II. No foreigner, or stranger, is allowed to go to the said New Spanish dominions in America, in any of the said licensed ships, upon any terms whatsoever, whether to settle in the said West-Indies, or only to trade there, Irishmen only excepted, and those to be all Roman Catholics.

III. No person whatever, though he were a Spaniard born, and the king of Spain's subject, can go to the Spanish West-India dominions without special licence, to be obtained at the said Contractation-Office, that is to say, without licence from the king.

These fundamentals being previously established, there are then certain limitations to the numbers of ships, and the quantity of goods, that is to say, the tonnage, or burthen, they shall carry, which is always in the breast of the members of the Casa de Contractation, because the quantity of goods sent should not exceed the demand, and, consequently, glut the markets, and also abate the price, and the profits of the trade; likewise it is regulated there, at what times the several fleets of ships shall go out, and to what several places, and when they shall be obliged to come away, in order to their return. It is also regulated, That all the silver, or gold, or jewels, which shall be brought over, for whose particular private interest forever it be, shall be registered and entered in the ship's books of every ship, and likewise in a general register, in the port from whence the ship comes; where also it is to be seen, and duplicates of which are transmitted to the said council at Seville.

As no person is allowed to go to New Spain without licence, so no religious, no ecclesiastics of any kind, are permitted to come back in any of those ships, without licence from the superior of the order to whom they belong.

Some particular goods are not permitted to be laden in Old Spain in any of the ships, though those ships are licensed to go, those goods being reserved to the king to export thither in his own name, or to give licence to others to do it; without which licence the said goods are not only prohibited, but forfeited, if taken.

The manner of the fleets going.

The first fleet is called the galleons, or galloons: these are generally seven ships, but may be increased as the king or the Casa de Contractation, that is, the Council of Commerce, see fit; and they go from Old Spain to and from Carthagena and Porto-Bello, and no where else; neither are they allowed to go any where else, if they could do it. How often

or seldom soever the galleons go out, the next fleet of galleons never go out 'till the last are returned.

The next fleet is called the flota: these go to La Vera Cruz, or Cruz; they have no set time of going out, but the merchants send them as the Chamber of Commerce directs, and they give their directions as they see the trade calls for it, and as the merchants by their petition, representing the occasion, can obtain leave.

The ships to Buenos Ayres are not to be called a fleet, being seldom above two ships, and never above four; and do not usually go out above once in two or three years; and they are generally out two, three, or four years, every voyage.

The Azoga ships, vulgarly called the quicksilver ships, are so called because they carry quicksilver, or mercury, by which the silver is wrought and refined in the mines; but not, as some think, that they should be laden with quicksilver. They are not, strictly speaking, to carry any goods but in particular for the king's account; but they are generally full laden, notwithstanding the first regulation, and the merchants get special licences of the king to load, and they generally pay large sums for those licences.

Note, these carry quicksilver and fruit, or spice, for the king's account, and sometimes military stores and arms for the forces there; as also iron, which is called the king's merchandize: there are also petaches, sent at uncertain times. These are generally but two, and are called advice-boats, because they are sent either to give advice to the West-Indies of their ships being arrived at Old Spain, or of the departure of the fleets, when they have a set time determined. These petaches were generally small vessels and barks, which were dispatched merely for sailing; but now the merchants striving to get leave to ship goods upon them, they are generally about 350 tons burthen each.

N. B. When the ships to Buenos Ayres arrive there, they are to give notice to the governor of the time they intend to depart for Europe; and being obliged to bring back any goods for the king gratis, the notice they are to give to the governor is for him to get ready the king's goods, and is to be given two months before they are to come away: if he neglects it, they may come without it.

When the ships go out for New Spain, they go directly, the galleons to Cartagena, and the other ships to La Vera Cruz: but, when they come back, they go to the Havannah, and stay 'till they get all together, and then beating through the gulph of Florida 'till they come to the height of St Augustine, or perhaps to South Carolina, they steer away together for Old Spain.

All this commerce, under these regulations, and managed as has been said, usually centered at Seville, now at Cadiz; and it is no wonder that Seville, with the weight of so great an affair transacted in it, was become rich and populous; no wonder they have such magnificent buildings, and that the exchange for the merchants, as some tell us, cost king Philip II. 950,000 crowns in ready money.

Some have attempted to make calculations of the magnitude and value of this great trade to the Spaniards; but it is not easy to be done with accuracy. If the account taken out of the registers of the said council of trade may be depended on, it is a prodigy in itself, nor can I venture to vouch the truth of it; but they tell us, that, according to the books of that court, from the year 1519, to the year 1619, inclusive, being the first hundred years of the trade, the value entered, or registered, beside all private trade, was 5000 millions, in gold, silver, pearl, jewels, and other merchandize, though, for the first twenty years, very little was brought; so that it was called eighty years, not an hundred.

There is now passed above another century, and, if the former account was true, I am persuaded the amount must be extremely increased since.

A TREATY between GREAT-BRITAIN and SPAIN, about accommodating differences, preventing depredations, and settling a peace in AMERICA: concluded at MADRID, July 13, 1670.

Forasmuch as the good understanding and correspondence between the English and Spanish nations have been interrupted in America, the most serene and most potent prince, Charles the Second, king of Great-Britain, &c. in order to re-establish and regulate the same for the future, hath dispatched Sir William Godolphin his envoy extraordinary into Spain, with full power and authority to conclude such a treaty as shall be proper and suitable to these ends: and that, in like manner, the most serene and most potent prince, the king of Spain, &c. and the queen-regent, Mary Anne, &c. in order to promote so good a work, and so advantageous to the public, have, on their part, appointed the count de Pegnaranda, counsellor of state, and president of the Indies, to confer

VOL. II.

about, treat, and conclude that affair: they have at last mutually settled and agreed upon these following articles by virtue of their commissions.

I. In the first place, the said plenipotentiaries, Sir William Godolphin, and the count de Pegnaranda, have in the names of the most serene kings their masters agreed, That the articles of peace and alliance made between the crowns of Great-Britain and Spain, at Madrid, the 13 of May, 1667, nor any clause therein, shall any ways be revoked or be understood to be void, or annulled by this treaty, but that the same shall always continue in their former force, virtue, and power; provided it may be not contrary and repugnant to this convention and articles, or any thing that is contained in them.

II. That there shall be an universal peace, and a true and sincere friendship in America, as well as in other parts of the world, between the most serene kings of Great-Britain and Spain, their heirs and successors, and between their kingdoms, plantations, estates, colonies, forts, towns, islands, and territories, without any distinction of places belonging to the one or to the other, and between the people and inhabitants in their respective dominions, which shall for ever endure, and commence from this day, and be inviolably observed, as well by land as sea, and on fresh waters, so as that they are to promote the good and prosperity of one another, and to favour and assist each other with mutual returns of friendship, that so the offices of good-neighbourhood and amity may be discharged and augmented amongst them in all places, as well in those remote countries, as in those nearer home.

III. That also, for the future, all enmities, hostilities and dissensions between the said kings, their subjects and inhabitants may cease, and be quite laid asleep, and that both parties do hinder and abstain from all manner of pillaging, depredations, injuries, and annoyances, as well by land as sea, and on fresh waters, be they where they will.

IV. The said most serene kings are to take care that their subjects do also forbear all acts of violence and hostility, and to call in all commissions, letters of marque and reprisal; and that they do not otherwise give leave to take any prizes, of what nature or kind soever they be, to the prejudice of either of the said two kings, or their subjects, whether they have been given or granted by them, to their own subjects or inhabitants, or to strangers; but are to declare them to be null and of no effect, as they are so declared by this treaty. And whoever shall act any thing to the contrary, shall not only be punished as a criminal, according to the nature of his offence; but shall also be obliged to make restitution and reparation for the losses the injured parties have sustained and require of them.

V. Moreover, the said kings renounce, and they have by these presents both of them renounced, and do renounce, all leagues, confederacies, capitulations, and intelligence, had in any manner whatsoever, to the prejudice of one another, that is or may be repugnant to this peace and treaty, and every thing that is contained therein; all and every such clauses, so far as they may reach to the said effect, being annulled and made void, and declared to have no force or virtue in them.

VI. The prisoners, of what state or condition soever they be, which are detained by reason of any acts of hostility hitherto committed in America, shall forthwith be set at liberty, without any ransom, or any manner of consideration for their enlargement.

VII. All offences, damages, losses, and injuries, which the nations and people of Great-Britain and Spain may at any time whatsoever, 'till now, have suffered on either side in America, be the cause or pretence what it will, shall be utterly effaced and buried in oblivion, in such manner as if the same had never happened.

Moreover it is agreed, that the most serene king of Great-Britain, his heirs and successors, shall have, hold, keep, and always possess, in full right of sovereignty, signiory, possession, and propriety, all the lands, countries, islands, colonies, and other places, be they what they will, lying and situate in the West-Indies, or in any part of America, which the said king of Great Britain and his subjects now hold and possess; inasmuch that they neither can nor ought hereafter to be contested or called in question for them, upon any account, or under any pretence whatsoever.

VIII. The subjects, inhabitants, merchants, captains, masters of ships, and the mariners of the kingdoms, provinces, and territories of each ally respectively, shall forbear and abstain from sailing to, and trafficking in, the ports and havens that have fortifications or magazines, and in all other places possessed by the other party in the West-Indies: that is, the subjects of the king of Great-Britain are not to navigate, nor to traffic in the havens and places that are in the possession of the Catholic king in the said Indies; neither are the subjects of the king of Spain to navigate, or traffic in the places possessed therein by the king of Great-Britain. But if, at any time, either of the kings shall think it proper to grant the other's subjects any general or particular leave or privileges, to sail to, and traffic in, any of the places under his obedience, the said traffic and navigation shall be exercised and main-

to E

tained,

tained, according to the form, tenor, and effect of the said permissions or privileges, given and granted to them; for the security, guaranty, and authority whereof, this present treaty and the ratification of it shall serve.

X. It is also agreed, that in case the subjects and inhabitants belonging to either of the two allies, and their ships, whether they be men of war or merchants ships, and such as belong to private persons, should at any time be forced by storm, pursuit of pirates and enemies, or by any other accident whatsoever, to retire and enter into any of the rivers, creeks, bays, havens, roads, and ports, belonging to the other in America, in order to have protection and refuge, they shall be received and treated there with all manner of humanity and civility; have all the protection and assistance of friends, and they shall be allowed to refresh themselves, and be at liberty, at a reasonable and the common price, to buy provisions and other necessities, whether it be for the support of their persons, or for repairing their ships, and the convenience of their voyages: and they shall no manner of way be retarded or hindered to go out of the said ports or roads; but they may do it whenever they have a mind to it, without any let or molestation.

XI. In like manner, if any of the ships belonging to either one or the other of the allies, their people and subjects, shall run upon sand-banks, or be ship-wreck'd (which God forbid) within the bounds of the coasts or dominions of the other, or suffer any damage there; the persons that shall be shipwrecked, or thrown a-shore, shall by no means be detained prisoners: but, on the contrary, all manner of assistance and succour shall be given them upon such accidents, and they shall have passports granted for their return, and free and peaceable passage of all of them to their own country.

XII. But when it shall so happen, that the ships, either of the one or the other party, as aforesaid, shall be forced into the ports and havens of the other, through the perils of the sea, or some other urgent necessity; in case they are three or four together, and may give just grounds of suspicion, they are, as soon as they arrive there, to let the governor, or the chief magistrate of the place, know the cause of their coming, and to tarry no longer there, than the said governor or chief magistrate will give them leave, and that it shall be necessary to supply themselves with provisions, and refit their ships; and they are ever to abstain from putting any wares or bales of goods a-shore, to expose them to sale; neither are they to receive any merchandise on board, or do any thing that is contrary to this treaty.

XIII. Both parties are sincerely and inviolably to observe this present treaty, and all and every the clauses contained therein; and they are to be observed and punctually fulfilled by the subjects and inhabitants of both nations.

XIV. Particular offences shall no way be a prejudice to this treaty, and cause no enmities or dissensions between the two nations; but every one shall answer for what he has done, and be prosecuted for contravening it: neither shall the one have recourse to letters of reprisal, or any other methods of the like nature, to obtain reparation for the offence of the other, unless justice be actually denied, or unreasonable delays used in administering the same. In which case it shall be lawful for the king, whose subject hath sustained the damage and loss, to have recourse to the rules and ordinary course of the law of nations, 'till reparation be made to the person that has been injured.

XV. This present treaty shall no way derogate from any pre-eminence, right, or signiory, which either the one or the other of the allies have in the seas, freights, or fresh waters of America; and they shall have and retain the same, in as full and ample a manner, as of right they ought to belong to them; and it is always to be understood, that the freedom of navigation ought by no manner of means to be interrupted, when there is nothing committed contrary to the true sense and meaning of these articles.

XVI. That the solemn ratification of this treaty and convention shall in good and due form be delivered by either party, and reciprocally exchanged in the space of four months, to reckon from this day; and they shall in the space of eight months, reckoning from the day of the exchange of the instruments (or sooner if it can be done) be published in all the proper places within the kingdoms, estates, islands, and signiories, of both the allies, as well in the West-Indies as elsewhere.

In witness of all and every one of the articles contained in these presents, we, the above-named plenipotentiaries, have signed this treaty, and set our seals to it, at Madrid $\frac{1}{8}$ day of July, in the year of our Lord 1670.

The COUNT DE PEGNARANDA,
(L. S.)

WILLIAM GODOLPHIN,
(L. S.)

See TREATIES.

General REMARKS, by way of query, on the articles of SPAIN and SPANISH AMERICA, as they relate to Great-Britain in particular, BEFORE THE LAST WAR.

1. Whether it is not notorious to the whole world, that Spain for many years, prior to the late war, so behaved towards

Great-Britain, that the latter was forced into a war with that crown?

2. Is it not equally true, that to prevent the last war Great-Britain bore too long with the conduct of Spain, and did her more good offices, in regard to family-establishments in Italy, than Spain has deserved, seeing that she made no other recompence for the same, after her own turn was served, than that of insult and deprecation upon the British subjects?

3. Whether the first giving up the trade of the South-Seas to the South-Sea Company, did not prove a great injury to the trade of Jamaica, and thereby to Great-Britain in general; and whether the Spaniards putting us off with the Assiento for Negroes, and an annual ship, was an equivalent to such loss of trade at Jamaica? See the articles SOUTH-SEA COMPANY, ASSIENTO CONTRACT.

4. Whether our absolutely giving up the Assiento to Spain, by treaty, in 1750, for so trifling a sum as 100,000*l.* in order to give that court no umbrage in relation to an illicit trade, laid to the charge of the South-Sea company, in their exercise of the Assiento, doth not indicate the most cordial disposition in the court of England to live in strict friendship and harmony with that of Madrid?

5. Whether, when the Assiento was so given up, the LOGWOOD TRADE in the bays of Campeachy and Honduras, to which the subjects of Great-Britain have a right, ought not to have been so regulated as to have prevented future broils on that head, between the two crowns; since 100,000*l.* was no equivalent for the ASSIENTO? And whether the latter might not have been done, upon conditions perfectly consistent with the honour and interest of both nations? See the article LOGWOOD.

6. Whether Spain is not more obliged to Great-Britain for taking off her products of fruit and wines, than she is to any other nation for so doing; and whether Spain doth not every day lessen her imports of the product and manufactures of Great-Britain, and encourage those of our rival nation, in proportion as she discourages ours?

7. Whether Spain hath used Great-Britain well, by deferring, since the last peace of Aix la-Chapelle, to regulate the trade of Campeachy and Honduras upon a proper footing; and whether the dispossession of the British logwood-cutters in the bay of Honduras (if this should prove true) while the two crowns were in treaty upon that very occasion, is acting consistent with the honour of nations, and that equity and friendship which we have a right to expect from a nation for whom we have done so much, and borne so much for peace sake?

8. Whether there is not too much reason to apprehend, from the present conduct of France towards Great-Britain, that the former is certain of the FRIENDSHIP AND ALLIANCE OF SPAIN to act in concert with her against our interests; and whether, notwithstanding the pretended friendship of Spain to England, since the last peace, France hath not obtained such an ascendancy over the court of Madrid, as to retard, and at length absolutely defeat the ratification of any treaty for regulating of the trade of CAMPEACHY AND HONDURAS between the two nations; and whether such regulation hath not been postponed from time to time, 'till France and Spain had both raised their marine to such a pitch, as to be able to surprize Great-Britain, by striking some notable blow, greatly detrimental to her interests?

9. Whether the Spaniards winking as they do at the illicit commerce carried on by the French at present, from the MISSISSIPPI TO MEXICO, and the EXTIRPATION OF THE BRITISH LOGWOOD CUTTERS FROM THE BAY OF HONDURAS, and frequently taking our vessels engaged in that trade, doth not sufficiently indicate a strict friendship between Spain and France, and a great lukewarmness between the former and Great-Britain?

10. Whether the strength that the French are daily gaining upon the MISSISSIPPI, and especially upon those parts bordering on the gulph of Florida; as also the absolute destruction of the Indian nation, called the Nautches, and other Indian allies of the British colonies of Georgia and Carolina, may not forbode an union between SPAIN AND FRANCE on that side, hurtful to our most southern colonies on the Continent, while France, at the same time, may attack Nova Scotia, which was formerly called the DUNKIRK of our NORTH AMERICAN settlements, while in the hands of France? And will not this be more so, if the French ever once again possess themselves of the whole, or of a part of this important colony, as they are possessed of Cape Breton? See the articles BRITISH AMERICA, CANADA, FLORIDA, LOUISIANA.

11. If there be any just foundation still to suspect the sincerity and friendship of Spain, does it not seem necessary to have a strict eye towards the preservation of our SUGAR COLONIES and the NEUTRAL ISLANDS, as well as towards NOVA SCOTIA?

12. Whether, if we find once more that there is no faith to be kept with France, nor with Spain, it is not full time to think of acting upon the offensive, instead of the defensive only, and that by striking the BOLDEST STROKE which we may have in our power?

13. Whether the present state of the marine of Holland, and, indeed, the indifference and coldness of that republic to this nation, together with the unsettled state of their barrier; whether these considerations, and the good plight and condition of the French and Spanish marine, the death of the Grand Seigneur, &c. have not excited France to their present conduct? See the articles HOLLAND, FLANDERS, and NETHERLANDS.

How Great-Britain may be able to cope with the enemy, see the articles NAVAL AFFAIRS, SEA DOMINION, SEA BRITISH, and SEAMEN. See also the article MEDITERRANEAN.

REMARKS on the Article SPAIN, since the last War, and the DEFINITIVE TREATY OF PEACE of 1763.

For the Definitive Treaty of 1763, the reader is referred to AMERICA, where appears the state of affairs between Great-Britain, as the same is settled since the last war. As we had conquered and possessed ourselves of the Havanna, Spain, for the restitution thereof, has ceded, by article XX, to the crown of England, the Colony of FLORIDA, with Fort St AUGUSTINE, and the BAY of PENSACOLA, as well as all that SPAIN possessed on the continent of NORTH AMERICA, to the east, or to the south-east of the RIVER MISSISSIPPI; and, in general, every thing that depends on the said countries and lands, with the sovereignty, property, possession, and all rights acquired by treaties or otherwise, which the Catholic king, and the crown of Spain have had, till now, over the said countries, lands, places, and their inhabitants; so that the Catholic king cedes and makes over the whole to the said king, and to the crown of Great-Britain, and that in the most ample manner and form.

By the VIIth article of the said DEFINITIVE TREATY, that for the future, the CONFINES between the dominions of his Britannic Majesty, and those of his Most Christian Majesty, in that part of the world, shall be fixed irrevocably, by a line drawn along the middle of the RIVER MISSISSIPPI, from its SOURCE to the RIVER IBERVILLE, and from thence by a line drawn along the middle of this river, and the LAKES MAUREPAS and PONTCHARTRAIN, to the sea; and for this purpose, the Most Christian king cedes, in full right, and guaranties to his Britannic Majesty, the RIVER and PORT of MOBILE, and every thing which he possesses, or ought to possess, on the left side the RIVER MISSISSIPPI; except the town of the NEW ORLEANS, and the ISLAND in which it is situated, which shall remain to France; provided that the RIVER MISSISSIPPI shall be equally free, as well to the subjects of Great-Britain, as to those of France, in its whole breadth and length from its source to the sea, and expressly that part which is between the said ISLAND of NEW ORLEANS, and the RIGHT BANK of that RIVER, as well as the PASSAGE both IN and OUT of its MOUTH.—It is further stipulated, that the VESSELS belonging to the subjects of either nation shall not be stopped, visited, or subject to the payment of ANY DUTY whatsoever.

By the said treaty it appears, that Great-Britain has obtained for her NORTH AMERICAN COLONIES, the BARRIER OF THE GULPH of MEXICO, as far as the same extends to the RIVER MISSISSIPPI from east to west; and also the BARRIER of the GULPH of FLORIDA on the east of her colonies, together with the PORTS and HARBOURS of MOBILE, PENSACOLA, and St AUGUSTINE, and the FREEDOM OF THE NAVIGATION OF THE RIVER MISSISSIPPI. All which seem to promise a good SECURITY to all our SOUTHERN COLONIES on the CONTINENT; provided we can also gain the uninterrupted friendship and alliance of the INDIANS neighbouring thereupon; or if that cannot be effectually done, to keep them under due subjection to the British power and dominion.

To accomplish which now, there does not seem any great difficulty, in a little time. For we now, as it were, are in a situation to surround them by our navigation on the east, west, and south, by the Gulph of FLORIDA, the GULPH of MEXICO, and the MISSISSIPPI, on the southern part of the continent.—Which promises fair in conjunction to constitute a pretty FORMIDABLE BARRIER to our plantations of this side. And

By the IVth article of the said Treaty, his Most Christian Majesty renounces all pretensions which he has heretofore formed, or might form, to NOVA SCOTIA, or ACADIA, in all its parts, and guaranties the whole of it, and with all its DEPENDENCIES, to the king of Great-Britain.—Moreover, his Most Christian Majesty cedes and guaranties to his said Britannic Majesty, in full right, CANADA, with all its DEPENDENCIES, as well as the ISLAND of CAPE BRETON, and all the OTHER ISLANDS and coasts in the GULPH and RIVER of St LAWRENCE, and in general, every thing that depends on the said COUNTRIES, LANDS, ISLANDS, and COASTS, with the SOVEREIGNTY, PROPERTY, POSSESSION, and ALL RIGHTS ACQUIRED BY TREATY OR OTHERWISE; which the Most Christian king and the crown of France have had, till now, over the said countries, islands, lands,

places, coasts, and their inhabitants; so that the Most Christian king cedes, and makes over the whole to the said king, and to the crown of Great-Britain; and that in the most ample manner and form, without restriction, and without any liberty to depart from the said cession and guaranty under any pretence, or to disturb Great Britain, in the possessions above mentioned.

As we have seen the security the said treaty promises to our colonies on the southern parts of the continent; so here likewise we see the security it promises to our colonies on the northern parts of the continent; which considered together afford us the prospect of our MARITIME SECURITY and PROTECTION, by the means of the three great gulphs in America, that of St Lawrence in the north, MEXICO on the south, Florida on the east, and the navigation of the two great rivers, the MISSISSIPPI, and that of St LAWRENCE, both from the NORTH and from the SOUTH; besides the additional security and protection we may derive from the navigation of all the other numerous fine rivers, dispersed throughout this whole AMERICAN CONTINENT, both large and small, in every part thereof, and all fitted by nature for a perpetual commercial navigation.

The whole country, that is now annexed to the crown of Great-Britain, abounds with very large rivers, which it were endless to enter into a detail of, and for which we refer to the maps of the country for their names, courses, mouths, &c. and content ourselves with describing a few of the most considerable, as that of St Lawrence and the Mississippi.

The river St Lawrence is the largest in all North America, and inferior to few in the world, it being computed about 25 or 30 leagues wide at the mouth, and 200 fathoms in depth, and 160 leagues in length; and yet by the help of a good south wind, and the currents, which are pretty strong, may be sailed, according to Charlevoix, in 24 hours. As to its source, though the European missionaries have failed up it above 700, or near 800 leagues, that is, as far as the LAKE of ALEMPIGON, yet it is still unknown, unless it really springs from it, which no one hath yet been able to decide.—That LAKE discharges itself into that called the UPPER or SUPERIOR, lately mentioned, and this into that of HURON, and this into that of ERIE, or CONTI, and this last into that of FRONTENAC, or ONTARIO; all this by means of the SAME RIVER, from which it issues out with a smooth course during the first 20 leagues; after which it becomes more rapid during another 30 leagues, that is, till it comes to MONTREAL. From this it resumes its smooth flow quite to that of Quebec, growing still wider as it runs, till it empties itself into the sea above 100 leagues below it: but, according to the report of the wild natives, this famed river arises out of another LAKE, farther up, and larger than any of those we have mentioned, and which they call the LAKE of ASSINIPOLIS, or ASSIBOUELS; and this last is said by them to lie about 50 or 60 leagues above that of ALEMPIGON, and is supposed to have a communication with the NORTHERN SEA; and it is not improbable but a northern passage into it may be found by means of this LAKE. There are falls or cataracts, such as that at NIAGARA. The river is, however, deep almost all the way, and hath a number of pleasant islands in it, the most remarkable of which are COUDRES, ORLEANS, MONTREAL, St JOHN, MISCOU, RICHLIEU, and several others. The highland is well wooded, and some lowlands well inhabited and manured, inasmuch that they yield vast crops of corn and other grain, besides fruits, pulse, &c. The settlements, which are mostly round the shores, are also well situated and built, and yield a noble prospect as one sails by them; the same may be said of the rest.

The river St Lawrence receives several considerable rivers in its course, the chief of which are called DESPRAIRES, or OF THE MEADOWS; the MONS, the TREBLE RIVER, and the large one of SANGUENAY, and St MARGARET, near the mouth of it. All these, and other less remarkable, fall into it on the north side; there are others also on the south. The River MISSISSIPPI runs through the whole province, which the French called LOUISIANA, from north to south, and overflows, at certain seasons, a vast quantity of land; it is called by the Spaniards LA PALLISADA, from the prodigious quantities of TIMBER which is sent down upon it in FLOATS to the sea. It is navigable above 450 leagues up from its mouth. The spring-head is still unknown, tho' the natives say, that it flows from a large stream that comes down from a hill in the country of the ISATI, about the 50th degree of latitude. We have an extraordinary account of the different nations met with on each side of the river, and they are represented as an hospitable, civil people, and willing to commerce with Europeans; their names and situation may be seen in the maps. The French made two settlements, the one near the LAKE ASSINIPOLIS, which is computed about 30 leagues round; the other among the Choagaskades, or stout people, who live in their neighbourhood.

The MISSISSIPPI receives a great many large rivers into its waves; and the country on both sides is fertile enough, and

and inhabited by a great variety of nations; for which we refer to Mr Sale's account thereof, who sailed down it in the year 1638, made some settlements on each side of it, and hath marked the distances between all those rivers that fall into it, and of the several nations that live between them on each side of this; the whole amount of which, from the River of the ILLINOIS, towards which he first set out, down to the mouth of it, he computes to be 653 leagues. The river discharges itself into the gulph of MEXICO, by two branches, which form an island of considerable length.

CANADA PROPER has Gaspé, St. John's Isle, Misou Isle, Richlieu, the Treble River, Montreal, Isle Frontenac, Conti, St. Francois des Anges, St. Alexis, St. Michael, and St. Joseph; all which we shall just intimate, and not enter into a copious description.

Gaspé is chiefly worth notice, for being the capital of a large territory, called from it Gaspesia, extending along the eastern coast of this province from Cape des Rosseis, at the mouth of the river St. Lawrence, to another which lies over-against CAPE BRETON, which is about 110 leagues, and stretches itself much farther inland.

St. John's Isle lies on the Gaspesian coasts, and hath a bay of its name, north of the river St. Lawrence, on the way to the Hollow Island; about 60 miles long, and in some places 30 in breadth.

Misou Island lies on the bay of St. Lawrence, east of the southern cape, called Des Chaleurs, on the Gaspesian coast, and is famed chiefly for its fertility.

RICHLIEU ISLANDS lie on the lake of St. Peter, about 12 leagues from the town of Three Rivers, where the government of Montreal begins. There are above 100 of them, forming a small kind of Archipelago at the mouth of the river St. Lawrence.

THE THREE RIVERS, so called from three rivers which join their currents about a quarter of a mile below it, and fall into the great one of St. Lawrence. It was the capital of the French here, and much resorted to by several Indian nations, which come down those rivers to it, and trade with it in various kinds of furs. The country about it is pleasant and fertile in corn, fruits, &c. and hath a good number of lordships and handsome seats, and fine fisheries contiguous. — The town is about 30 leagues distant from Quebec, and the sailing up and down from one to the other, exceeding agreeable, and several leagues above it.

MONTREAL is situated on an island of the same name, in the river St. Lawrence, about 14 leagues long, and 4 wide, where broadest, and very fruitful in corn, vegetables, &c. The town has a vast trade with the natives. The concourse of Indians of various tribes is very great, some of them coming from places distant some hundred miles; the fair is kept along the banks of the river, which lasts near three months. The natives bring thither all sorts of furs, which they exchange for guns, powder, ball, great coats, and other European garments; iron and brass work, and trinkets of every sort.

FRONTENAC is a fort on the same river, about 100 leagues above Quebec. The soil hereabout is so well cultivated as to yield all sorts of European and Indian corn and other fruits, according to Hennipin. Near is a good haven for all sorts of vessels to ride in with safety.

FORT St. FRANCIS stands in the island of that name, on a bay on the south end of St. Peter's Lake.

There are several more of those islands under that name, very fertile, abounding with wood, wild fowl, pasture and cattle. A RIVER that comes down into the LAKE from NEW-YORK, and splits itself into a great number of branches, makes the country on that side very pleasant and fruitful; and so we may say of all the other parts of this country.

THE PROVINCE of SANGUENAY is another part of Eastern CANADA. On the north-east it has the Indian nation Kilestinoas, on the north-west that of the Esquimaux; on the south-east it is bounded by the river St. Lawrence, and on the south-west by that of Sanguenay; at the mouth of which is the town of THREE RIVERS before noticed. The river Sanguenay springs from the LAKE St. JOHN, and falls into that of St. Lawrence at the town of Jadouffac, which, Charlevoix tells us, is navigable by the largest vessels above 25 leagues up. The haven will contain 25 men of war, and has good anchorage and shelter from storms. This province is much the same, as to its soil, climate, and inhabitants, with that of CANADA PROPER, before described. It yields the greatest plenty of marble of several kinds, inasmuch that not only the principal towns, forts, churches, and palaces, but even the houses of private men are built of it.

QUEBEC, the capital of CANADA, is situate on the confluence of the rivers St. Lawrence, and St. Charles; on the north of the former, and about 140 leagues from the sea. The haven is spacious, and able to contain at least 100 vessels of the line. A little above this is the city, situate on the narrowest part of the river; but between that, and the Isle of Orleans, is a spacious basin, a full league every way, into which the river St. Charles empties itself, which flows

down from the north-west, so that it stands between the mouth of that river, and the Cape Diamant, on that of St. Lawrence. The haven faces the town, and is safe and commodious, and about 25 fathom deep.

The ILLINOIS INDIANS live near the LAKE and RIVER of that name, which last springs from LAKE DAUPHIN, and after a course of above 200 leagues, exclusive of its windings, falls at length into the great river Mississippi. The people live in distant villages, on the plains on both sides of the river, beyond which are large woods and sloping hills, covered with delightful verdure at least nine months in the year, whilst the current, which is mostly south-west, is so smooth and agreeable, that vessels of a considerable size may sail up and down it with ease and safety, during a course of at least 120 leagues, before it falls into the river Mississippi. The lands on each side this river Illinois afford such plenty of pasture, that we see them covered with herds of large and small cattle, as well as goats, deer, and other beasts. The river also swarms with water-fowl of divers sorts, such as swans, geese, cranes, ducks, &c. in prodigious plenty. Great-Britain being now possessed of all the territory on the eastward of the Mississippi, we shall take notice of some other large rivers that fall into it, from FLORIDA. Mr Coxé says, that about twelve miles above the mouth of it a branch runs out of it on the east side, which, after a course of 160 miles, falls into the north-east end of the great bay of SPIRITO SANCTO. That at first 'tis very narrow and shallow, but, by the accession of several rivers, becomes a most lovely river, is navigable by the greatest boats and floops, and forms pleasant lakes, particularly that of PONTCHARTRAIN, by which was discovered a more safe and expeditious communication with the river Mississippi, to avoid the danger and difficulty of sailing up that river by its principal mouth; the navigation of which Great-Britain is now intitled to. From this lake they enter into that of MAUREPAS; from which they go on, by means of the canal or river IBERVILLE, into the river Mississippi. When that cannot be easily done, they carry goods by land from the bay into the lake PONTCHARTRAIN, which discharges itself quite to the country of the Oumas, who are seated on the banks of the Mississippi, a little above New Orleans, and thence pursue that voyage up that river (La Martiniere.)

About 60 leagues higher up, on the east-side, is the river Yafsoona; which comes into the Mississippi, 2 or 300 miles out of the country, and is inhabited by several Indian nations. Sixty leagues higher is the river and nation of Chongue, with some others on the east of them. — Thirty leagues higher the Mississippi receives a river that proceeds from a lake about 10 miles distant, which is about 20 miles long, and receives four large rivers: 1. The Cusates, the most southern of them, being the river of the Cherokees, a mighty nation, among whom it has its chief fountains. It comes from the south-east, and its heads are among the mountains, which separate the Cherokees from Carolina, and is the great road of the traders from thence to the Mississippi, and the intermediate places. — Forty leagues above is the Chicasas; this river forms four delicate islands, which have each a nation inhabiting them. 2. The river Ouerspere, which, about 30 leagues to the north-east of the lake, divides into two branches, whereof the most southern is called the Black River. — The heads of this river are in that vast ridge of mountains that runs on the back of Carolina, Virginia, and Maryland, through which mountains there is a short passage to the sources of the great river Potomack, on the east side of them, by which the Indians, who are well acquainted with them, might, BEFORE THE PEACE, in conjunction with the French from the Mississippi, have harassed and annoyed our colonies. 3. The river Ohio, Oyo, or Hohio, which is a vast river, and comes from the back of NEW-YORK, Maryland, and Virginia. It runs through the most beautiful and fruitful countries in the world, and receives 10 or 12 rivers, besides innumerable rivulets: it is navigable 600 miles. Formerly several Indian nations dwelt on this river, who have been totally extirpated by the Iroquois, who made this river their usual road, when they entered into a war with the nations either to the south or west. 4. The most northerly river that runs into the said lake, and which comes, like the rest, from the north-east, is Jeremy's river. — Twenty-five leagues above the OHIO is the great island of TAMAROA, with a nation over-against it, that goes by its name; and another by that of Cohokia, who dwell on the banks of the Chepullo River. — Thirty leagues higher is the river Chicagou, on the river Illinois; which nation lived upon and about this river, in about 60 towns, and consisted of 20,000 fighting men, before they were destroyed by the IROQUOIS, and driven to the west of the Mississippi. This is a large pleasant river, and, about 250 miles above its entrance into the Mississippi, is divided into two branches: the lesser comes from north and by east, and its head is within 4 or 5 miles of the west side of the great lake of MICHIGEN: the biggest comes directly from the east, and proceeds from a morass within 2 miles of the river Miamiha, which runs into the same lake. On the south-east there is a communication be-

tween these two rivers by a land-carriage of about two leagues, 50 miles to the south-east of the lake — The course of this river Chegogon is above 400 miles, navigable above half way by ships, and most of the rest by floops and barges. It receives many small rivers, and forms 2 or 3 lakes, one especially, called Pimeteovi, 20 miles long and 3 broad, which affords great quantities of good fish, as the adjacent country does game, both of fowls and beasts. Several Indian nations inhabit round about. There is a fort erected here called Crevecoeur, which is about half way betwixt the gulph of Mexico and Canada, and was formerly the usual road of the French to and from both, till they discovered a shorter and easier passage by the rivers OUABACKÉ, and the HOHIO, which rise at a small distance from lake ERIE, or some rivers which enter it.

Eighty leagues higher, the river Mississippi receives the MISCONSIAG, a river resembling that of the ILLINOIS, in breadth, depth, and course; and the country adjacent to its branches is alike pleasant and fruitful. — Sixty miles before it falls into the Mississippi, it is joined by the river Kikapouz, which is also navigable, and comes a great way from the north-east. — Eighty miles farther, almost directly east, there is a communication by a land-carriage of two leagues with the river Miscongüi, which runs to the north-east, and after a passage of 150 miles from the land carriage, falls into the great bay of Ponkeontamis or the Puans, which joins on the north-west side to the great river of the ILLINOIS. — Higher up the Mississippi is the river Chabadeba, above which the Mississippi makes a fine lake 20 miles long, and 8 or 10 broad. — Ten miles above that lake is the river of Tortoises, a large fair river, which runs into the country a good way to the north-east, and is navigable 40 miles by the greatest boats.

The rivers which do not communicate with the Mississippi, are only two large ones betwixt it and the peninsula of Florida; viz. the Coza and the Potache.

The Coza or COUSSA river, which the French have called MOBILE, rises from the Apalachean mountains, with several heads, of which the most northern is at the town and province of Guaxula, at the foot of the mountains. Many rivulets uniting after a course of 80 miles, form a river, with several delightful isles, in a country wonderfully pleasant and delightful. — The first considerable town, or province, is Chihah, with a river of its own name, which helps to enlarge the Coza, and which is famous for its pearl-fishing. From thence the river grows larger and deeper, being reinforced by others from the mountains and the valleys, till it enters the province of Coza, which is reckoned one of the most fruitful and pleasant parts of the country, and very populous. It consists of hills and valleys, rivulets, arable land, and lovely meadows. — Prunes grow naturally in the fields better than can be produced in Spain by culture; and though there are some vines that creep upon the ground, there are other which mount, in almost all places near the rivers, to the tops of the trees. The Coza river enters the Gulph of Mexico 100 miles south of Manihela, or MOBILE, as the French have called it. — One of the rivers that enters the Coza is the Chatta, where inhabit Indians of the same name. — To the east of the Cozas are the Becues, or Abecaes, who have 13 towns, and dwell on divers rivers, which run into the Coza. It is a very pleasant country, consisting of hills and valleys, and its soil is generally more marly or fatter than that of many other provinces. — A little more to the south west, between the Abecaes and Chattas, the Ewemalas dwell on a fair river of the same name, which coming from the north-east, mingles with the Coza. Mr Coxé says, this great river Coza falls into the Gulph of Mexico, 15 leagues east of the great bay of Nassau or Spirito Santo, or north-east of the cape of Myrtle island. — The Ullibalys or Alibamou, Chicazas, and Chattas, who are the most considerable nations upon and between the rivers Coza and Mississippi, kindly entertained the English who resided among them several years, and CARRIED ON A SAFE AND PEACEABLE TRADE WITH THEM, 'TILL ABOUT THE YEAR 1715, WHEN, BY THE INTRIGUES OF THE FRENCH, THEY WERE EITHER MURDERED, OR OBLIGED TO MAKE ROOM FOR THOSE NEW INVADERS, WHO HAVE SINCE UNJUSTLY POSSESSED AND FORTIFIED THE SAME STATIONS, IN ORDER TO CURB THE NATIVES, AND TO CUT OFF THEIR COMMUNICATION WITH THE ENGLISH TRADERS; WHEREBY THEY ENGROSSED A PROFITABLE TRADE FOR ABOVE 500 MILES; OF WHICH THE BRITISH SUBJECTS WERE A FEW YEARS AGO THE SOLE MASTERS.

The town and fort in the ISLE of DAUPHINE lies about 9 leagues south of Fort Lewis, and 10 leagues west of PENSACOLA. The distance between the river Coza, and that of Palache or Spirito Santo, to the east, is about 100 miles, and the coast between them is deep and bold. — The chief harbour betwixt these two rivers, and indeed THE BEST upon all this coast of the GULPH of Mexico, is PENSACOLA, belonging by the last treaty of peace to the crown of Great Britain; it being a large port, safe from

VOL. II.

all winds, which has four fathom at the entrance, and deepens gradually to seven, or eight — It lies 11 leagues east of PORT LEWIS AND MOBILE, 90 west from the upper part of the peninsula of Florida, and 158 from the TORTUGAS ISLANDS. — The land here produces pine trees, fit for ship-masts, of which many were cut down by the Spaniards, and carried to VERA-CRUZ, by a ship belonging to the FLOTA, that brought provisions, and returned with timber. There is a communication from hence by land with Apalachy.

APALACHYCOLA is a good harbour, 30 leagues east of the former, and as much from what the Spaniards called the river SPIRITO SANTO. This river enters the Gulph of Mexico about 100 miles from the cod of the bay of Potache, at the north-west of the peninsula of Florida, in about north lat. 30. It is not easy to find this place, by reason of the isles and lakes before and about it, and though a stately river, whose mouth makes a large harbour, FROM WHENCE A TRADE WAS CARRIED ON TO THE HAVANNA, by small vessels, yet it has not above two fathom water and a half, or three fathom at most, on the bar; but when that is passed, it is very deep and large, and the tide flows higher into it than into any other river upon all the coast. On both sides of it, towards the sea coast, live the nations of the Cufheas, Talliboues, and Adgebaches. This river proceeds chiefly from others, which have their origin on the south or south-west side of the great ridge of hills that divides this country from Carolina, and is supposed to have a course of about 400 miles. — All the channel from hence to the Tortugas islands, is called the Bay of Certos. — Here is a communication from hence by land with the PORT of St. AUGUSTINE in the GULPH of FLORIDA.

In the bay of NASSAU, or SPIRITO SANTO, there are four islands, which lie from south to north-east for 50 miles, with openings between them a mile or two over. The most northerly is that betwixt which and the continent is the entrance of the bay. It is called Myrtle Island, about 24 miles in length, but in some places very narrow. Some think it is the same that the French call L'Île des Vaisseaux, or the Ships Island; which, considering its distance from Dauphine island, and the convenient shelter it affords ships from the wind, is not improbable. — The bay is 15 miles broad from Myrtle Island to a row of islands which run parallel with the main and another bay between them, and stretch 50 or 60 miles to the south; as far as one of the smaller mouths of the Mississippi.

BILOBOBY BAY, with another fair harbour, is about 15 leagues to the north-east of the most eastern branch of the Mississippi, and a small river near it, called Passagoula.

We now shall touch on the Peninsula of Florida, which lies betwixt the Gulph of Mexico on the west, the Atlantic ocean on the east, and the Straits of Bahama on the south. It is about 100 leagues in length, but not above 30 where broadest. The ports and towns of strength and convenience, are St. AUGUSTINE and St. MATTHEW.

St. AUGUSTINE, on the eastern coast of the peninsula, is about 70 leagues from the mouth of the Gulph of Florida, or channel of Bahama, 30 south of the river Alatomaha, and 47 from the town and river of Savannah. — The city runs along the shore at the bottom of a pleasant hill shaded with trees in the form of an oblong square, being divided into four regular streets, which cut each other at right angles. The town is built thickest on the north side towards the castle, about a mile off, called St John's Fort. — There were 50 pieces of cannon mounted on the castle, 16 brads, and some 24 pounders. It has a covered way, and the town is intrenched with 10 salient angles, each defended with cannon, and the castle is secured on the west by a morass. The port is formed by an island and a long point of land, divided from the continent by a river, which falls into the sea two miles above the fort. The island is called Eustacia, or Metanzas.

Though this place is of pretty good strength, every circumstance considered; yet Sir Francis Drake took it, 1586, and it was plundered by Captain Davis in 1665. In 1702, it was attacked by the English and Indians of Carolina, under Colonel Moore, who ruined the villages and farms in the open country, and besieged this town three months; but at the approach of some Spanish vessels to its relief, he raised the siege, and marched back to Charles town, 300 miles by land, leaving the ship and stores he brought with him to the enemy. — It was besieged again by General Oglethorpe in 1740, but to little purpose.

This port, now belonging to Great-Britain, may be attended with extraordinary advantages to the English, our southern settlements on the continent being hereby secured against any future attempts of the Spaniards by land; especially, when the utility of the other ports in the Gulph of Mexico is conjunctively considered. — Besides the great service this place may be to our trade, in not only depriving the Spaniards of a port from whence they might annoy us on that side, but also by enabling us to annoy them upon occasion, by cruising on their home-ward-bound ships coming from the Gulph of Florida, and the Straights of Bahama.

Another place in the Gulph of Florida, next to St AUGUSTINE, that may be of service to this kingdom on an emergency, is St MATTHEW, about 15 leagues to the north. It is the frontier town of Florida next to Georgia. — The English besieged it in 1715, but were obliged to desist with considerable loss.

The sea upon this coast, and off, as far as the Bahama islands, which lie opposite to it, is termed the Gulph of Florida, which, according to our best navigators, is reckoned about 16 or 18 leagues over. And here the mighty current, which upon all the south part of the Gulph of Mexico sets constantly in with a strong stream to the west, driving so all the way to the very coast of La Vera Cruz, turns away again to the east, between the isle of Cuba, and the south coast of North-America, and finding no vent 'till it passes by Cape Florida, it then turns from south to north, and runs through this gulph into the great Atlantic ocean. For this reason it is that all ships from Jamaica bound for England come through this gulph to have the benefit of this current, which has sometimes proved dangerous both to the English as well as Spaniards. To avoid which the navigators make an allowance of about five points in the COMPASS for the current, and keep as near as possible to the Bahama side. — But as hazardous as this passage has sometimes proved for ships bound to Europe, there remains no other course for them to take, except that of the WINDWARD PASSAGE; and in a course of above 160 leagues from Cape Morant, the east point of Jamaica, to the north side of Crooked Island, which is what is called the Windward Passage, the English traders, in time of war, are in continual danger of being taken by the Spanish guarda costas, besides the perils of the sea.

Here it is necessary to observe, from the judicious navigator Mr Atkins, who in his voyage to the West-Indies says, "that ships and vessels may, and often have failed through this channel from the NORTH SIDE OF CUBA to the BAY OF MEXICO, notwithstanding the common opinion on account of the current that is against it; that they keep the BAHAMA shore aboard; and that they meet the wind in summer for the most part of the channel easterly, which, with a counter-current on shore, pushes them easily through it."

He adds two observations of the pilots, in relation to this gulph: "1. This stream goes constantly out to northward in the middle channel, its force having some respect (like tides in other countries) to the moon and the winds; with a counter-current, or at least a stillness of the water, on shore, that will enable a ship to turn through, be the middle stream ever so strong; the same as in the Strait of Gibraltar, where, though the current runs continually into the Mediterranean, ships may work through, keeping the shore aboard. 2. The current which goes out here sets for most part into the Gulph of Mexico, between the two capes of Corientes and Catoche, with counter-currents on shore, though not always so, the pilots having observed them strong to the east at the new and full moons."

From the preceding succinct survey of our present North American settlements, we conceive the following obvious inferences deducible.

1. That it is not the extent and magnitude of our new possessions in America, which would have proved of any manner of advantage to Great-Britain, if they were inaccessible by our ROYAL NAVY and our MERCANTILE SHIPPING; or if the whole had not abounded with numerous very large and extensive inland navigable rivers, whereby we could have an easy and safe communication with every part belonging to the crown of these kingdoms. They would not have been worth our acceptance; and it would have been the most infatuated bad policy to have given up our conquests, surrounded by the sea, for such new continental acquisitions.

2. But as our new territories are restrained in extent to the confines of the MISSISSIPPI, and the freedom of the navigation of that river secured to us from the source to the mouth, to the westward of our ancient colonies: as in consequence hereof, and the possession of all FLORIDA, we are also intitled to the navigation in the BAY of MEXICO to the SOUTHWARD of our ancient colonies, and are become possessed there of the ports and harbours of the bay of PALACHE, PENSACOLA, and MOBILE: as we have also secured to ourselves the additional ports and harbours of St MATTHEW and St AUGUSTINE on the south-east side of our ancient colonies, and those too in the GULPH of FLORIDA, through which the treasure of NEW SPAIN passes: as we have obtained likewise to ourselves the navigation of the GULPH and RIVER St LAWRENCE to the northward of our ancient colonies, and the freedom of navigation in these parts is secured to us by the acquisition of CAPE BRETON; which by good management may render our navigation here no less secure than Gibraltar has done that of the Mediterranean: as we have obtained the right of possession of CANADA, and all its DEPENDENCIES, still further to strengthen us on the northern side of our

ancient colonies: as we may be said, at present, to enjoy a MARITIME BARRIER to all our ancient continental colonies on the NORTH, EAST, WEST and SOUTH, and a navigable intercourse, by many very spacious and fine rivers among them; whereby we shall be able to protect them in their inland, as well as their extensive maritime parts, and cultivate an internal as well as a maritime commerce with the whole within the British boundaries; all our colonies will receive greater security than ever they had before; and therefore we may reasonably enough presume they will grow more and more prosperous, and thereby administer greater reciprocal aid, succour and support to each other, as well as to their mother country. For,

3. It is hardly to be doubted but Great-Britain will exert every measure that will tend to produce or compel such a union among all our colonies, as will add proportional strength to the whole continent; such a united degree of strength and power, as will, in future, render them a full match for France and Spain, and those their INDIAN ALLIES who may be perfidiously instigated to annoy them. — We shall soon be in a capacity, now the boundaries of Great-Britain and France are ascertained, on the American continent, to manage the INDIANS, seeing both nations are limited to their respective sides of the great river Mississippi. If we cannot, by every fair, upright and equitable method, which we hope will be first tried, bring the Indians on our side the great river to live in perfect friendship and harmony with us, we must, for our own safety and prosperity, be compelled to carry fire and sword amongst them, and drive them on the western side of the river: yet we must further hope, that we shall not be irritated too suddenly to this extremity, lest this should strengthen the hands of our enemies there, and enable them to have those Indians the more under their command, and subject to their eternal intrigues and machinations to distress us. — If we should experience, that the French are not determined to keep the peace, but will stir up the Indians to be our perpetual enemies, and will secretly supply them with arms and ammunition to commit ravages and depredations upon our colonists, we must be obliged to deprive France of their settlement at NEW ORLEANS, and of their navigation on the MISSISSIPPI: this, perhaps, may be much easier practicable, than preventing the French from exciting the savages to continue in eternal war with us: and 'till the French shall be totally extirpated from the whole continent, there is reason to fear, they will never desist from influencing the savages to our constant detriment.

4. It does not, therefore, seem at all improbable, that at length what has been suggested may soon come to pass, and that we shall have the whole continent to ourselves, be unmolested either by France or Spain, and bring the Indians under an amicable dominion. For if Spain should interfere to regain Florida, or practise any arts to strengthen the Indian nations against us, for the safety of all our colonies, we must be again forced into a rupture with them also: and if this should be the case, on any occasion whatsoever, we are certainly now in a better situation to carry on a war against both Spain and France than ever we were before we obtained our new conquests. — With regard to Spain, in this part of America, should we be compelled soon to draw the sword against them, our present situation in the GULPH of Mexico gives us just pretensions to have as many ships stationed there, when we see reason for it, as the Spaniards may have at the Havanna; and what then is likely to become of the HAVANNA and the treasure from Mexico? If, upon any contravention of the treaty of peace, on the part of Spain, the court of England should resolve upon reprisals, will not our present situation enable us to become masters of the Spanish treasure from LA VERA CRUZ? See our articles MEXICO, OLD MEXICO, and NEW MEXICO. Must not this prove a perpetual alarm to the Spaniards, lest their FLOTA should fall into British hands upon any provocation? Are we not also better situated than before the last peace, to intercept their Gallies from PERU, which are obliged to sail to the Havanna, as well as the FLOTA, and from thence pass through the GULPH of FLORIDA? And are not our shipping stationed in the GULPH of MEXICO, and that also of FLORIDA, more likely to intercept their treasures, both from MEXICO and PERU, before they arrive at the Havanna, and also after sailing from thence to Old Spain, than they ever were before? Our stations at the BASTIMENTOS, and JAMAICA, for those purposes, we have experienced to have been very precarious. — Next to the HAVANNA itself, we cannot be better situated than we now are, for such important occasions.

In case of a fresh rupture between England and Spain, of which we are speaking, are not the English, situated in the gulph of Mexico and Florida, more likely to reconquer the Havanna than they ever were before? With our ships stationed at Jamaica on one side, and in the gulph of Mexico and Florida on the other, with a force suitable to the occasion, and a resolution in the court of England to take it, we have little reason to fear success, while, as was said by a brave English admiral on another occasion, IT WAS OPEN AT TOP, let the Spaniards fortify and fortify again. As

our northern colonies gave all possible assistance, at the taking of CAPE BRETON, for their future security; so have we not reason to believe the like British spirit will manifest itself in the southern colonies, when we shall again besiege the Havana? On such an occasion, may we not expect great aid from Florida, Georgia, and the Carolinas?

The spirit of conquest is not abated in Britons; and if we have occasion to exert it again, we may possibly carry it farther than the Havana. Being once again masters of that, who will hinder us from carrying our conquests a step further into the bottom of the gulph of Mexico, and becoming victors of the Mexican treasure at LA VERA CRUZ? And will not our domestic circumstances of PUBLIC DEBTS and TAXES, especially upon a fresh war with Spain, oblige us to make our enemies contribute as much towards the immediate expence thereof as possible, and even to enable us to discharge those NATIONAL DEBTS, which they have occasioned? If this resolution is not taken in the next war, I should be glad to be informed, how many more such wars as we have already been engaged in, we can afford to undertake? Or, to ask this question in another manner, what degree of further public debts and taxes can this kingdom bear, before she arrives at her NE PLUS ULTRA of national incumbrances? Or, will people be so wild and infatuated as to imagine that we can never be so loaded with PUBLIC DEBTS and TAXES, as to be unable to raise more money to carry on wars? No man in his senses will assert this. — We have seen what may naturally enough prove the consequence of another Spanish war soon happening with Great-Britain. — Let us now please ourselves with the view of the consequences also of a French war falling out at the same time; for the one will bring on the other, especially since the FAMILY COMPACT has taken place.

It has been observed already, that England will find no great difficulty to dispossess the French of New Orleans, and deprive them of the navigation of the Mississippi, owing to our present situation for the purpose. As this seems to point out the fate of France in these southern parts of the American continent; so what may we reasonably expect will be their doom in the northern parts, where they have as little to defend themselves from British powers as they have in the southern? We are already in possession of all the territory, and of every place of importance to our security there. We have CAPE BRETON, which we may render more invincible than the Spaniards can do their Havana, as being environed by the united force and aid of all our colonies in this part. Is it possible that the small isles of St Pierre and Miquelon should enable France to make head against the united strength of all our colonists? If France, therefore, quarrels with us again, we should, I am persuaded, meet with little obstruction in turning them out of the whole Newfoundland fishery: and when they oblige us to do that again, do they not put it once more in our power to deprive them for ever of this their chief fishery, which is their nursery for seamen? Can they flatter themselves, that this nation will evermore be their dupes to restore them to this privilege again? They cannot; because our circumstances will no longer admit of it. The weight of our public debts and taxes, in consequence of another war, will become so unwieldy, that our future safety and preservation will oblige us to keep what we conquer, or to dispose thereof, that the same must never revert into French hands. See our article WAR. For we are no longer in a capacity to continue the old system, to fight to negotiate, and negotiate to fight again. See CREDIT [PUBLIC CREDIT].

STAFFORDSHIRE is bounded on the east by Warwickshire and Derbyshire, on the south by Worcestershire, on the west by Shropshire and Cheshire; which last joining Derbyshire, makes the north border. In compass it is 141 miles.

Its air is generally good, as is the soil also, even the Moorlands, which are mountainous, and therefore reckoned the most barren, producing a short, but sweet grass, by which they breed as fine large cattle as those of Lancashire.

As to subterraneous productions, both the Moorlands and Woodlands yield lead, copper, iron, marble, alabaster, millstones, coals, salt, &c. beside various sorts of useful earths and clays.

LICHFIELD is a pretty large neat city, within three miles of the Trent.

STAFFORD, the shire-town, on the river Sow, is well built, and much increased of late, both in wealth and inhabitants, by its manufacture in cloth.

NEWCASTLE UNDER LINE is an antient corporation. The chief manufacture is hats. The cloathing trade also flourishes here, and the town is surrounded with coal-pits.

WOLVERHAMPTON is a populous, well-built town. The chief manufacturers here are locksmiths, who are reckoned the most expert of that trade in England.

WALSAL, pleasantly seated on the top of a hill, has a good market, and in and near it are several mines of iron, where-with the townsmen make spurs, bridle-bits, stirrups, buckles, &c. in which they carry on a considerable trade.

PENKRIDGE is noted for its great horse-fair, reckoned one of the greatest in the universe, especially hunters and road-horses, which are brought hither from Yorkshire, and all the horse-breeding counties in England. 'Tis held the 29th of September.

BURTON is of most note for its fine ale, and a manufacture of cloth, which was carried on formerly to greater advantage than at present.

STOCK-JOBGING.

Of the Art or Mystery of trafficking in the PUBLIC FUNDS.

The chief Laws and Statutes concerning Exchange-Brokers, and Stock-jobbing.

Brokers are those persons that contrive, make, and conclude, bargains and contracts between merchants and tradesmen, in matters of money and merchandize, for which they have a fee or reward; and they are called Exchange-brokers in some of our statutes.

By the statute 8 & 9 W. III. cap. 32. for restraining the ill practice of brokers and stock-jobbers; no person shall use or exercise the office or employment of a broker, in London or Westminster, &c. in making or concluding bargains between merchant and merchant, or others, concerning any wares and merchandizes, or monies to be taken up by exchange, or tallies or orders, bills, notes, stock of any company of trade, &c. until such person shall be admitted and licensed by the lord mayor and court of aldermen of London. And, upon admittance of any such broker, he shall take an oath, that he will truly and faithfully execute the office between party and party, without any fraud or collusion, according to the purport of the act, &c. Likewise, he shall give bond to the lord mayor, &c. in the penalty of 500l. for the faithful execution of his office, without any fraud or corrupt practice. The number of such brokers shall not, at one time, exceed one hundred; and the lord mayor and court of aldermen shall cause their names and places of habitation to be publicly affixed on the Royal Exchange, and other public places: and every sworn broker, after his admittance, as aforesaid, shall carry about him a silver medal, having the king's arms on one side, and the arms of the city of London, with his own name, on the other side; which he shall produce at the concluding of every bargain to the parties concerned, upon pain to forfeit 40s. for every omission.

If any person shall act as a broker, not being admitted according to this act, he shall forfeit 500l. besides such other forfeitures as he may any ways incur thereby; and in case any one shall knowingly employ any person to deal for him as a broker, or stock-jobber, who is not admitted and sworn as aforesaid, such person shall forfeit the sum of 50l. And if any person, not being a sworn broker, according to this statute, shall act and deal in discounting tallies or bills, or in stock-jobbing, in selling stock, or any security upon any funds granted by parliament, he shall be liable to the forfeiture of 500l. and to stand on the pillory in some public place in London, three several days, for the space of one hour.

Every sworn broker is to keep a book or register, and therein enter all contracts and bargains that he shall make between any persons, within three days after any contract made, and for omitting so to do, he forfeits 50l. And if any such broker shall, directly or indirectly, take above 10 per cent. for brokerage, he shall, for every offence, forfeit 10l. Also, if any sworn broker deal for himself, in the exchange or remittance of monies; or buy any tallies, orders, bills, or shares in any joint-stock, for his own use; or shall buy goods or merchandizes to sell again, or make any profit in buying or selling any goods, more than the brokerage allowed, he shall forfeit the sum of 200l. and be for ever incapable to act as a broker.

All policies, contracts, or agreements, upon which any premium is, or shall be given or paid, for liberty to deliver, receive, accept, or refuse any share in any joint-stock, tallies, orders, Exchequer-bills, &c. other than such policies and contracts as are to be performed within three days from the time of making the same, shall be null and void, and every such premium shall be paid back: and if any premium be given, contrary to the intent and meaning of this act, with the privacy of a sworn broker; or if any person shall trade therein as a broker, without being lawfully admitted, and the same shall come to the knowledge of any sworn broker, in every such case, such sworn broker shall forthwith discover the same; and, in default thereof, he shall be disabled to exercise the trade and office.

And all penalties and forfeitures given by this act, shall be recovered by action of debt, &c. in any of the king's courts of record at Westminster, one moiety whereof to go to the king, the other to him that shall sue for the same.

By the 6 Geo. I. cap. 18. it is declared, that all undertakings, tending to the common grievance and prejudice of his Majesty's subjects, or great numbers of them, in their trade, commerce,

commerce, &c. and particularly the acting as a corporate-body, by raising stocks, and the transferring or assigning any share in such stock, without authority by act of parliament or charter to warrant the same; and all acting under any charter formerly granted, for particular purposes, by persons who shall endeavour to use the same charters for raising a capital stock, or making transfers or assignments thereof, not intended by such charter to be raised or transferred; and acting under any obsolete charter, &c. shall for ever be deemed to be illegal and void.

All such undertakings and attempts, and things whatsoever, for furthering, countenancing, or proceeding therein, and relating thereto, shall be deemed public nuisances; and the offenders be liable to fines and punishments accordingly, and also incur any farther pains, &c. as are provided by the statute of præmunire.

And if any merchant or trader shall suffer any particular damage in this trade, &c. by occasion of any undertaking by this act declared unlawful, he may have his remedy for the same by action, to be grounded on the statute, against the person, societies, or partnerships engaged in such undertaking, &c. and in every such action the plaintiff shall recover treble damages with full costs.

If any broker, or person acting as a broker, for himself, or in behalf of others, shall bargain, sell, or buy, or contract for the bargaining, selling, or buying, any share or interest in any of the undertakings hereby adjudged to be unlawful, or in any stock of such undertakers, he shall not only be disabled to act as a broker for the future, but shall forfeit 500*l.* one moiety to the use of the crown, and the other to the informer.

By 7 Geo. II. cap. 8. all contracts which shall be entered into, upon which any premium shall be given for liberty to deliver or receive, accept or refuse any public stock or securities, and all wagers, puts, and refusals, relating to the present or future price of stock or securities, shall be void; and all premiums upon such contracts or wagers shall be restored to the person who shall pay them; who, within six months from the making of such contract, &c. may sue for the same with double costs: and it shall be sufficient for the plaintiff to allege, that the defendant is indebted to him, or has received to his use, the money or premium so paid, whereby the action accrued, according to the form of the statute, without setting forth the special matter; and a bill in equity may be preferred for discovering any contract or wager, and the premium given, which the defendant shall be obliged to answer upon oath, &c.

Every person who shall make any contract, upon which any premium shall be given for liberty to put upon, deliver, accept, or refuse any stocks or securities, or any contract in the nature of puts and refusals, or shall lay any wagers, &c. as aforesaid, (except such persons who bona fide sue, and with effect prosecute for recovery of the premium paid by them; and that shall voluntarily, before any suit commenced, repay, or tender such premium which they shall have received; and except those persons as shall discover such transactions in any court of equity) shall forfeit 500*l.* And all persons negotiating or writing such contract, incur the like penalty and forfeiture; which penalties may be recovered by action of debt, or information, in any of his Majesty's courts of record at Westminster.

No money or other consideration shall be voluntarily given or received, for compounding any difference for the not delivering or receiving any public stock or securities; but all such contracts shall be specifically executed; and all persons who shall compound any difference, shall forfeit 100*l.* And no person who shall sell stock, to be delivered and paid for a certain day, if it be refused or neglected to be paid for, shall be obliged to transfer the same; but it shall be lawful for such person to sell such stock to any other, and to receive or recover, from the person who contracted for the same, the damage which shall be sustained: and any person that shall buy stock, to be accepted and paid for on a future day, and which shall be refused or neglected to be transferred, may buy the same quantity of such stock of any other person, at the current market-price, and recover and receive, from the first seller, the damage sustained.

All contracts made for the buying or transferring of stock, whereof the persons, on whose behalf the contract shall be made to transfer the same, shall not at the time of making any such contract be actually possessed in their own right, or in the name of trustees, shall be void; and every person in whose behalf, and with whose consent, any contract shall be so made to sell stock, of which such person is not actually possessed, &c. shall forfeit the sum of 500*l.* one moiety to the crown, and the other moiety to them that shall sue for the same: and any broker or agent, who shall negotiate such contract, and shall know that the person on whose behalf the contract shall be made, is not possessed of the stock, shall forfeit 100*l.* to be divided between the king and the prosecutor.

Every broker, or person who shall act as a broker, receiving brokerage in the buying or disposing of stocks, shall keep a broker's book, in which he shall enter all contracts that he shall make, on the day of the making such contracts, with

the names of the principal parties, as well buyers as sellers; and such brokers, who shall not keep such book, or shall wilfully omit to enter any contract, shall, for every such offence, forfeit 50*l.* one moiety to his Majesty, and the other moiety to the person suing for the same.

But nothing in this act shall extend to any contracts for the purchase or sale of stock, to be made in pursuance of any decree or order of the court of chancery, with the privy of the accountant-general of that court: nor shall any thing in the act hinder any person from lending money on stock, or contracts for re-delivering or transferring thereon, so as no premium be paid for the loan, more than legal interest.

REMARKS.

Plain reasons why STOCK-JOBGING has been, and still continues to be, detrimental to the commerce of this nation.

I. In relation to **TRADING COMPANIES**, whose stocks have been jobbed in, without due regard to the advancement of the commerce of the nation, by the means of those trading companies, as was the great plea for their primary institution.

1. Because, when the African trade was first established by a company, it had such reputation, that shares therein rose from 100*l.* to 480*l.* whereby the artful managers got great estates in selling shares; but after they had made their market, by practising on the passions of those unexperienced in this kind of mysterious traffic, the shares fell from 480*l.* to FORTY SHILLINGS; which proved not only unspeakably prejudicial to that valuable branch of commerce, but injurious to many good families, and destructive to numbers of widows and orphans. This was formerly also the fate of the HUDSON'S BAY TRADE, the WHALE FISHERY, and SPICE TRADE, &c.

2. Because stock-jobbing has been the parent of numberless trading bubbles. See our article BUBBLES and ACTIONS.

3. Because jobbing in the South-Sea scheme of the year 1720, not only ruined thousands of families; but did great injury to the public credit of the nation. See our article SOUTH-SEA COMPANY.

4. Because stock-jobbing schemes have had as fatal effects in France as in England. See the article MISSISSIPPI.

5. Because, in times of danger and difficulty, the stocks of trading companies, which must be always negotiable, are liable, upon every idle rumour, to be raised and lowered by the jobbers therein, to answer their lucrative purposes, and thereby to hurt the PUBLIC CREDIT of those companies, as well as the PUBLIC CREDIT of the nation in general.

6. Because companies may act so imprudently, or unjustly towards other nations, in the exercise of their commerce, as may involve the nation in WARS and PUBLIC DEBTS, as well as ruin numbers of the stock-proprietors. See SOUTH-SEA COMPANY, and SPANISH AMERICA.

7. Because the domestic traffic in the stocks of companies, engrosses the thoughts of the proprietors, that the national commerce often suffers, for want of that money being employed in a free trade; which might prove much more to the advantage of the kingdom, as well as to that of the stockholders themselves, if they employed the same property in the general trade. — These considerations may, perhaps, furnish the weightiest objections that can be urged against all JOINT-STOCK COMPANIES.

8. Because PRIVATE CREDIT is greatly injured hereby; for the monies of the opulent being locked up in these channels of domestic bubbling, and the stock-holders heads wholly engaged in this kind of negotiations, industrious and skilful traders are deprived of those loans of money, which they were wont to have on their PERSONAL SECURITY, at the legal interest, wherewith to carry on the solid national commerce. — Whence private credit has received unspeakable detriment, for want of a competency of cash to circulate the general trade; whereby dealings for READY MONEY, or very short credit, which was greatly the case before STOCK-TRADING took place, are quite laid aside, and long credits enhance the price of our commodities, and bankruptcies have since proved more numerous than ever. See our article CREDIT [PRIVATE CREDIT].

II. THE INJURIOUS EFFECTS OF STOCK-JOBGING, WITH REGARD TO THE PUBLIC REVENUE FUNDS.

1. Because the PUBLIC FUNDS, together with companies stocks, engross that ready money that should otherwise be employed in trade, either by the proprietors or others; which would prevent that long credit which is so fatally customary in our trade, that tends to ruin it in all nations where we have any commerce; for, as foreigners know that our manufacturers are obliged to give and take credit at home, so they have insisted upon long credits abroad. — This prevents all ready money returns, which ruins the merchant as well as the manufacturer. — Whereas, was that money employed in trade, that circulates in the public funds, this practice of long credits would cease both at home and abroad, our commodities go far cheaper to foreign markets than otherwise they can do, quick returns be made, our traders saved from bankruptcy, and our rivals prevented from supplanting us at foreign markets, as they now do.

2. Because

2. Because, while people have opportunity to deal in the funds, they will endeavour, from a spirit of indolence, to subsist on their income that way, and turn their backs on all fair national trade.—This sinks the trade of the nation, for want of that circulation of money requisite to carry it on to proper advantage; whereby, instead of increasing in skilful traders, we swarm in stock-holders and stock-jobbers, brokers and usurers: and thus there appears to be plenty of money for funding and jobbing, while the trade of the nation, which alone can enable us to pay the interest and principal, is starved for want of money to circulate it the most to the public interest.

3. Because funding and stock-jobbing can never increase, but must daily lessen the commerce of the nation, which must daily lessen its real and substantial wealth, and augment only that which is imaginary.

4. Because this kind of traffic gives foreigners, who are proprietors in our funds, an opportunity at critical conjunctures, to use many artifices, in concert with our domestic jobbers, to raise and fall stocks as they please, draw the real money out of the kingdom, and prejudice or ruin the public credit, to answer some infamous temporary purposes.—Wherefore, to damp the spirit of STOCK-JOBGING, we must encourage that of COMMERCE; and to uphold the PUBLIC CREDIT, we must either lessen our PUBLIC DEBTS, or use a SPONGE, with which the public creditors have been threatened by some of late. See the article MONEY.

SUBSIDY, an aid, tax, or tribute, granted by the parliament to the king upon urgent occasions, and imposed upon the subjects, according to a certain rate on lands or goods.

SUBSIDY is also a duty paid at the custom-house upon foreign goods imported into this kingdom. There are various **SUBSIDIES** granted by acts of parliament, according to the exigencies of public affairs. The **SUBSIDY INWARDS**, or **OLD SUBSIDY**. This duty is composed of a **TONNAGE** and **POUNDRAGE DUTY**; which names arise from the different regulations, whereby it is imposed and levied. By the act of 12 Car. II. cap. 4. it is called a **TONNAGE DUTY** on wines imported, being thereon regulated by a sum certain on every ton; and it is called a **POUNDRAGE DUTY** on other goods and merchandize imported, being thereon regulated by a CERTAIN PORTION OF A POUND (OR TWENTY SHILLINGS IN MONEY) of a certain RATE or VALUATION fixed in the BOOK OF RATES, which see.

TONNAGE is payable (in ready money by 12 Car. II. cap. 4. §. 1. 4. before landing) on all wines imported. 12 Car. II. cap. 4. §. 16. except privilege wines. See **PRISAGE**. And by the 13 and 14 of Car. II. cap. 2. vinegar, perry, rape of grape, syder and syder eager, which by the 12 Car. II. cap. 4. were under the common regulation of **POUNDRAGE**, are made subject to **TONNAGE** for this Subsidy: on all which it is to be respectively levied and collected according to the several acts pointed out in the BOOK OF RATES. Another subsidy is called the **NEW SUBSIDY**. It is to be raised, levied, and collected, by the same rules, orders, and methods, and under the same penalties and forfeitures, as signified in the several acts contained in the Book of Rates.

There is a subsidy named the **ONE-THIRD SUBSIDY**, which is the amount of **ONE-THIRD** of the preceding subsidy. This branch, as well as the former subsidies, is composed of a tonnage and poundage duty, and is payable in all cases where that is due: it is to be raised, secured, and paid, by the same ways and means, and methods, under such penalties and forfeitures, and subject to such rules and directions, as for the **NEW SUBSIDY**. Therefore it is to be computed by taking one-third part of the net **New Subsidy** of Tonnage and Poundage.

Another subsidy is termed the **TWO-THIRDS SUBSIDY**; which branch of the customs, as well as the former subsidies, is composed of a tonnage and poundage duty, and is raised, secured, and paid, by the same ways and methods, under such penalties and forfeitures, and subject to such rules and directions, as before directed for the **New Subsidy** and the **One-third Subsidy**. It is an additional subsidy of two third parts of the **New Subsidy** upon all goods liable to the said **New Subsidy**, except in certain cases excepted, as per acts of parliament, and contained in the Book of Rates.

There is also the **SUBSIDY** of 1747. This branch is over and above all subsidies, additional duties, impositions, &c. a poundage duty of twelve-pence in the pound, to be paid in ready money, on all goods and merchandize imported, except for tobacco, whereon it may be secured by bond, according to the several particular rates or values thereof, as rated and valued in the Book of Rates referred to by 12 Car. II. and 11 Geo. I. or by any other act of parliament, &c.

This duty is to be levied and collected by the same ways and means, and under the same penalties, &c. as are directed for the **Old Subsidy**. See the conclusion of Letter A, in regard to the **BUSINESS OF THE CUSTOM-HOUSE**, containing an **ENQUIRY** whether the merchant-importers of this kingdom are not intitled to certain **DISCOUNTS**, which they have never yet received.

SUBSIDIES ON SPIRITS. By 9 Geo. II. cap. 23. §. 17. VOL. II.

all the duties arising by spirits from September 29, 1736, are united to, and made part of the aggregate fund; and from that time the several duties then payable on spirits imported are accounted for in one sum, under the title of **SUBSIDIES ON SPIRITS**. See **SAXBY**. **SUBSIDY**, and **ONE PER CENT. OUTWARDS**, with the duties on leather, white woollen cloths, foreign goods used in dyeing, exported.

THE SUBSIDY OUTWARDS.

By 12 Car. II. cap. 4. §. 2. was granted, as part of the subsidy of poundage, and continued therewith to August 1, 1710.—9 Ann. cap. 6. §. 1. revived from March 1710, for 32 years.—3 Geo. I. cap. 7. §. 1. continued for ever; and is made part of the general fund by that act established.—This subsidy, as well as the Subsidy Inwards, is composed of a **TONNAGE** and a **POUNDRAGE**, and is to be paid in ready money before shipping off, in order for exportation.

ONE PER CENT. OUTWARDS.

This duty is payable in ready money, without discount, upon all goods and merchandizes liable to **SUBSIDY** *, exported from any part of Great-Britain, capable of a ship or vessel of 200 tons upon an ordinary full sea, to any part or place in the Mediterranean sea, beyond the port of Malaga, in any ship or vessel that hath not two decks, and doth carry less than 16 pieces of ordnance mounted, together with two men for each gun, and other ammunition proportionable.

* It is understood practically, that **FOREIGN GOODS USED IN DYEING**, enumerated in the portable Book of Rates, are not liable to this duty of one per cent.

The **SUBSIDY** granted in the year 1758-9, of poundage upon certain goods and merchandizes to be imported into this kingdom; and by the same act, an additional inland duty on coffee and chocolate. This duty is of 12 d. in the pound, or 5 per cent. granted on tobacco, foreign linens, sugar, and other grocery, as the same is understood in the Book of Rates, except currants; East-India goods, except coffee and raw silks; foreign brandy and spirits, except rum of the produce of the British sugar plantations; and paper, imported.—Said subsidy is granted to be paid on goods, as the same are valued in the Book of Rates, and to be levied and paid into the Exchequer, as the subsidy of 5 per cent. granted by 21 Geo. II. or of the year 1747. See the Conclusion of the Letter A, relating to the **BUSINESS OF THE CUSTOM-HOUSE**.—Prize goods are to be charged only with the duties payable by act of Geo. II. unless taken out of the warehouses for home consumption.—Allowance to be made to the importer of tobacco, on paying down the duty.—Bond to be given on non-payment of the duty; and the importers to have the usual allowances and discounts.—Drawback of the duty allowed upon the exportation of goods within 3 years; except for such goods as are by former acts declared no drawback shall be paid or allowed on exportation thereof.—Drawback of the duty allowed on paper used in printing books in the learned languages in both universities, as is prescribed by act of 10 Annæ.—Like drawback allowed on paper used in printing books in the learned languages in the universities of Scotland.—A drawback of 3 shillings per hundred weight allowed on sugar refined in Great Britain, and exported.—Refiner to make oath.—Exporter to make oath.—Searcher to certify the shipping thereof, and all other requisites being performed according to the Book of Rates.

Besides the several foregoing subsidies payable at the custom-house, there are a variety of other duties paid there, under various circumstances, as the same are set forth in the portable Book of Rates; in all which the merchant should be well informed, as follow, viz. The **PETTY CUSTOMS**, or **ALIEN'S DUTY**, **ADDITIONAL DUTY**, **COMPOSITION** ON **PETTY SEIZURES**, **IMPOST** ON **WINE** and **VINEGAR**, **IMPOST** ON **TOBACCO**, **IMPOST** 1690, **IMPOST** 1692, **DUTY** ON **WHALE-FINS**, **DUTY** OF 15 PER CENT ON **MUSLINS**, **DUTY** ON **SPICES**, **PICTURES**, &c. **ADDITIONAL DUTY** ON **SPICES**, **PICTURES**, AND **DUTY** ON **DRUGS**, &c. **SECOND 25 PER CENT.** ON **FRENCH GOODS**, **COINAGE DUTY** ON **WINE**, AND **COINAGE DUTY** ON **SPIRITS**, **DUTY** ON **PEPPER**, **RAISINS**, AND **SPICE**, **DUTY** ON **CANDLES**, **ADDITIONAL DUTY** ON **CANDLES**, **DUTY** ON **COALS** IMPORTED, AND ON **COALS**, **CULM**, AND **CINDERS**, **BROUGHT COASTWISE**, **ADDITIONAL DUTY** ON **COALS** IMPORTED, AND ON **COALS**, **CULM**, AND **CINDERS** **BROUGHT COASTWISE**. **DUTY** ON **COALS** AND **CULM**, FOR **BUILDING CHURCHES**, &c. **DUTY** ON **HOPS**, **DUTY** ON **HIDES**, **SKINS**, &c. **DUTY** ON **SOAP** AND **PAPER**, **ADDITIONAL DUTY** ON **SOAP** AND **PAPER**, &c. **DUTY** ON **COALS** EXPORTED, **DUTY** ON **SAIL-CLOTH**, **DUTY** ON **WROUGHT PLATE**, **DUTY** ON **APPLES**, **DUTY** ON **WINE** 1745, **DUTY** ON **GLASS**, **DUTY** ON **LINEN YARN**, **DUTY** ON **GUM SENEGA**, OF **UNRATED GOODS** IMPORTED, **UNDervalued**, OF **PRISAGE** AND **BUTLERAGE**. And the last additional duties on **WINE**, **CYDER**, and **PERRY**, see the **BUSINESS OF THE CUSTOMS**, the end of W.

The following three branches, though no part of the REVENUE OF CUSTOMS, but being payable on foreign Goods imported, should be here taken notice of, as the EXCISE ON SALT IMPORTED, EXCISE ON LIQUORS IMPORTED, INLAND DUTY ON COFFEE, TEA, AND CHOCOLATE.

R E M A R K S.

SUBSIDIES, &c. at the Custom-house.

In the first year after the restoration of king Charles the II^d. * the parliament passed the act, granting the subsidy of TONNAGE and POUNDAGE, payable on merchandize imported or exported, as also the act for encouragement and increase of shipping and navigation; and two years after, in order to improve and enforce the execution of those laws, was passed the act for preventing frauds, and regulating abuses in the CUSTOMS: and these three acts established the foundation of the present system of the customs, which has been regulated and extended by subsequent laws, as occasions have required.

* Of the customs payable before the restoration, there yet remains a duty on wine, called PRISAGE || or BUTLERAGE, which are ancient duties payable to the crown of England (by prerogative) upon the importation of wines, but are now, and generally have been, granted from the crown by gift or patent.

|| PRISAGE is a certain taking or purveyance of wines to the king's use, out of every ship bringing wines belonging to the natives of England, except the merchants of London, the Cinque Ports, Southampton and Chester, which are exempted by particular charters: to be taken upon the breaking of bulk, or unloading any part of the ship's cargo, according to the whole quantity on board, though there be not more than one ton landed.

This duty is either SINGLE or DOUBLE.

SINGLE PRISAGE is one ton, and is due in kind, when the quantity imported amounts to, or exceeds, 10 tons, but is under 20 tons: for if under 10 tons, there is not any prisage due.

DOUBLE PRISAGE is 2 tons, and is due in kind, when the quantity imported amounts to, or exceeds, 20 tons, which is the most due out of any one ship: one ton to be taken before, and the other behind the mast, at the pleasure of the king's butler or prisage-master; who may taste the whole cargo, and chuse the best wines, and fill up the casks, or chuse those that are the fullest, and take them away, allowing only $\frac{1}{2}$ 20s. per ton for freight: but it may be compounded for at a certain price, as is the practice in London, &c.

But in regard to wines imported into Scotland; on a cause in the court of Exchequer, between her Majesty's attorney-general and James Gordon, merchant, it was decreed in the year 1713, that prisage was not payable thereon.

BUTLERAGE is a duty of two shillings on every ton of wine imported by merchants, strangers, by Charta Mercatoria I. in lieu of prisage, to be paid within 40 days after the wines are landed.

|| 40 Hen. III. 28 Edw. I. 6 Edw. III. 20 Rich. II.

† 28 Edw. I. cap. 2.

† 31 Edw. I. cap. 1 and 2. 27 Edw. III. cap. 26.

The subsidy granted by the first of these acts was, by the wisdom of our ancestors, contrived on very simple, though comprehensive principles, being payable by a determinate sum on every ton of wine imported, and every ton of beer exported, and therefore called TONNAGE; and on other goods imported and exported, by a certain portion (generally one shilling in the pound sterling) according to the respective valuations in a BOOK OF RATES referred to, and authorized by the said act, and therefore called a POUNDAGE, together with a small duty on WOOLLEN CLOTHS exported; so that all goods liable to customs, except wine imported, beer and woollen cloths exported, were comprehended under this simple regulation of poundage; and this subsidy, so far as it relates to merchandize imported, is known by the name of Customs, or Old Customs.

But this simplicity of principles was not long adhered to with that care and attention it deserved; for by 15 and 22 of Car. II. the Subsidy on Corn imported was altered from a poundage duty on the Rates of Valuations, to certain sums payable by the quarter, according to the several species, and the various circumstances of importation; and by 25 Car. II. whale-fins and whale-oil underwent the like alterations.

In the short reign of king James II. two new duties were granted, the IMPOST ON WINE, and the IMPOST ON TOBACCO; that on wine was strictly on the principles of TONNAGE; but that on tobacco being by a certain sum payable on each pound weight, no regard was had, so as to regulate it by a poundage on the valuation thereof in the Book of Rates. There were other duties laid on, but having been temporary, and not continued, it is not necessary to take notice of them.

The necessities of the state, in order to support a war against France in the reigns of king William and queen Anne, occasioned the laying on many additional duties of customs,

the two first of which were, Impositions 1690, and 1692, on merchandizes imported, &c. Though, in drawing the acts for those duties, due regard was not had to the principle of POUNDAGE; yet it was not altogether unattended to, there being many species of goods in both these duties, which are regulated by a poundage duty on their respective valuations in the Book of Rates. Some branches are strictly according to the principles of poundage; and some being on the plan of the old customs, are consonant to the original principles of tonnage and poundage: in other branches, to the number of above 20, laid on during the reigns of king William, queen Anne, king George the First and king George the Second, these principles have been either not understood, or altogether neglected, except, says Mr. Saxby, in the subsidy of 1747, which being designed as a poundage duty only, and therefore formed on that species of the principles of the old customs, was constructed with great judgment and simplicity; and the more so, as it is not incumbered or obscured with discounts.

What Mr. Saxby has here observed, we think is liable to objection. For however simple and judicious that subsidy was constructed, we cannot apprehend it ever the more so, by reason of its being unincumbered with discount, in favour of the merchant, as the old subsidy, the new subsidy, the $\frac{1}{2}$ subsidy, and the $\frac{3}{4}$ subsidies, are not unincumbered with the allowance of discount to the merchants, on consideration of the present payment of the duty. For it is no less easy to compute the subsidy of 1747, with a discount of 5 per cent. than either of the other subsidies before mentioned. But if the subsidy of 1747 is unincumbered with the allowance of discount to our merchants, as in the cases of the other said discount, we should be glad to be informed, by what authority the merchants are not intitled to the discount on payment of the duties pursuant to the act of 1747? Is not this subsidy-act of 1747, founded on that of 12 Car. II? And does not that act allow the merchants the discount of 5 per cent. in the 17th rule contained in that act? In what peculiar clause or part of the subsidy-act of 1747, does it deviate from that particular allowance in the act of 12 Car. II? Is not also the subsidy-act of 1747, founded on that of the 11th of Geo. I? and is not this latter grounded on that of Car. II. and wherein does that of Geo. I. deviate from that of Car. II. with relation to the discount allowed to the merchant, according to the 27 rules, signed Sir Harbottle Grimstone, Bart. then speaker of the house of commons? We can discover nothing in the act of 1747, which does repeal the said 17th rule, and thereby deprive the merchants of the discount legally allowed them. If we are mistaken in this matter, we shall thankfully be set to rights.—We started our doubts on this point, when we printed the first edition of this work; but as we did not judge it eligible to oppose the practice of the custom-house, lest we should err in our private judgment, we then computed the duty, consistent with such practice. Since that, we have more deliberately considered this affair, and confess, that we have not found sufficient reason to dissipate our doubts; and we have given our reasons more fully on this occasion, in the Custom-house Business treated of in this edition at the end of our Letter A; and for the reasons there urged, we have declined to make any further tabular computation of the duties of customs, lest we should misguide the whole mercantile body in a point that materially concerns their interest.

Another motive to induce us to decline these computations is, that we are informed that Mr. Saxby of the custom-house is about this work already, and has been engaged some time therein; because, since his Book of Rates was published, there has been another fresh subsidy-act of 1759; which has rendered his former book out of date, with respect to the totals of those computed duties that render his book consistent with the last subsidy-act of 1759.

The remainder of the introduction of Mr. Saxby's Book of Rates is spent chiefly in animadverting upon the errors of the books of rates that were composed by others, his predecessors; on which subject it is wished he had dwelt longer, as he seems to have intended; seeing, as he intimates, that he received great assistance from several gentlemen in various departments of the custom-house. However, for several of the judicious observations he has made, the public are obliged to him; and we hope and expect that his new Book of Rates will rectify more of the errors of those who treated on the same subject before him; and that he will render the whole business of the customs more intelligible, as well to the merchants as the officers of that revenue.

* The allowances, bounties, and drawbacks payable on British goods exported, Mr. Saxby observes, and the premiums on other goods imported, &c. being a part of business not so immediately obvious to the officers of the customs, have not been heretofore so well digested and collected as they might have been; for though part of them have been extremely well done, others have been but slightly touched, and some quite omitted: but, continues he, as they are now become very numerous, and in regard to bounties and premiums a very extensive and formidable branch of business of the customs, it became necessary that the merchants, as well as officers,

officers, should be well instructed therein, &c.' In these particulars Mr. Saxby's book is more accurate and extensive than any of those of his predecessors. What we would chiefly intimate here is, that these candid acknowledgements, and useful improvements made by that gentleman, will serve to convince us, that there has been as little infallibility in books of rates wrote by officers of the customs as by others; and therefore it is not impossible that there may be mistakes therein relative to the subsidy of 1747, as well as so many other points already explained by Mr. Saxby. See the conclusion of our Letter A, with respect to the BUSINESS OF THE CUSTOM-HOUSE.

Mr. Saxby concludes his introduction, by remarking, 'that it must not be omitted, that a distant prospect and hope that the legislature might some time undertake to reform and reduce the rates, branches, &c. of this revenue, strongly pointed out the necessity of refforing and preserving the true text of the rates, as it would be in vain to attempt any regulations of that kind, till this were well executed; and this naturally leads to further speculations on the same subject; for the book of rates, of 1660, bears the marks of great antiquity, many of the terms therein being so obsolete as not now to be found elsewhere in the English language; and by comparing it with that of 1642, it is apparent to be no other than an old book of rates of former times, revised and corrected, so as to suit the circumstances of import and export of that period; and when one considers the great alterations and improvements which have been made in every branch of trade and manufactures throughout the world during the last age, it may be easily conceived that the names and value of such species of goods as were made and consumed an hundred years ago, will in many respects but ill fit those of the present times: but this is a large field to range in; I shall therefore for the present forbear to explain myself further on this subject, and shall only take the liberty to recommend to the present age an aphorism of a great man in the last: As time changes things for the worse, so should prudence alter them for the better.'—So far Mr. Saxby, who not only gives us hope of a more correct book of rates than we ever had before, but that a general reform may be made in the customs, by the legislature, with respect to the rates of goods; which the sooner the same is done, we think the better it will be for the interest of the nation. See our INTRODUCTION to this edition.

Before we leave this article, we shall only notice another paragraph in Mr. Saxby: 'The branches of the customs having many of them gone through various alterations of appropriation since their first establishment, the detail of such alterations, is herein purposely omitted, and no more is inserted than their present situation, that being sufficient for the use and instruction of the officers.' To which we shall only observe, that as those alterations of appropriation in this branch of the revenue have never proved injurious to the PUBLIC CREDIT; so we may presume that the like alterations of appropriation in other branches of the revenue could not prove so neither; for if the national creditors are secure of their interest by parliament, they do not seem to pay so much regard to the appropriation of any peculiar duties or taxes for that purpose.

SUFFOLK is a maritime county in England, having the German Ocean on the east, Cambridgeshire on the west, the river Stour on the south, which divides it from Essex, and the rivers Ouse, the Lef, and Waveney on the north, which part it from Norfolk; and is in compass about 140 miles.

The air is very clear and wholesome, even near the sea-shore, because the beach is generally sandy and shelly. As to the soil, it is various. Its chief commodities are butter and cheese, and the principal manufactures of Suffolk are woollen and linen cloth.

IPSWICH, the county-town, has a considerable trade by sea, but not so great as formerly, when its harbour was more commodious. Its chief manufactures are linen and woollen.

ALDBOROUGH, on the coast, has a good harbour and trade in the fishery, abundance of sprats, soles, and lobsters, being caught in the sea here.

SUDBURY stands on the river Stour, which almost surrounds it. They drive here a good trade in perpetuanas, fays, ferges, &c. The Stour has of late years been made navigable for barges and small craft, as far as Maningtree in Essex, which is a great benefit to the trade of this place, and no small addition to its wealth.

EYE is a mean-built town, in the road betwixt Ipswich and Norwich. Its chief manufacture is bone-lace and spinning.

HALESWORTH is a large and populous town on the river Blythe, with a manufacture of linen yarn, of which great quantities are sold here, spun by the women of this town and the adjacent villages.

SOUTHWOLD, a small corporation on the coast, has a good harbour. It is a populous town, and drives a considerable trade in salt, old beer, herrings, sprats, &c. which last are cured here in the same manner as herrings at Yarmouth.

LEOSTOFF stands on the easternmost point of England. The chief trade of the inhabitants is fishing for cod in the North Sea; and for herrings, mackarel, and sprats, at home.

STOW-MARKET on the Orwel, has a manufacture of tammies and other Norwich stuffs.

WOODBIDGE, on the river Deben, which being navigable by ships of considerable burthen to the town, its inhabitants drive a pretty good trade to London, Newcastle, Holland, &c. with butter, cheese, salt, plank, and several other sorts of merchandize, in their pinks and hoys, which go to and from London every week.

LAVENTHAM is a pretty large town on a branch of the river Bret. It has a considerable manufacture of ferges, shalloons, fays, stuffs, and spinning fine yarn for London; which has flourished the more by setting up a wool-hall, of which many hundred loads are sent from hence in a year. Its fair, which is on Michaelmas-day, is in great repute, especially for good butter and cheese.

BILDESTON is noted for its woollen manufacture, but it is a dirty place, and the buildings are mean.

CLARE is another mean-built, dirty town, but has a manufacture of fays.

HADLEY is a pretty large populous town, and tolerably well built. It is of some note still, though of much greater formerly, for a manufacture of woollen cloth.

NEYLAND on the Stour is a large town, and has a manufacture of bays and fays, which also was formerly much greater than now.

STRATFORD on the same river, is a thoroughfare-stage from Ipswich to London, of great traffic, and employed in the woollen manufactures. It is said that 300 droves of turkies have passed in one season over its bridge towards London, computed at 500 in a drove, one with another.

EASTERBERGHOLT is another large handsome village, employed also in the woollen manufacture, but not so much as formerly.

SUGAR.

The manner in which SUGAR is drawn from the canes.

The Americans having cut their canes above the first joint, and freed them from their leaves, make them into bundles and carry them to the mill, which is composed of three rollers of an equal size, and equally armed with plates of iron, where the canes are to pass. The roller in the middle is raised much higher than the rest, to the end that the two poles, which are affixed crossways at the top, and to which the beasts are yoked, may turn about freely, without being hindered by the machine. The great roller in the middle is surrounded with a cog full of teeth, which bite upon the sides of the two other rollers adjoining to it, which makes them turn about, grind and bruise the canes, which pass quite round the great roller, and come out dry, and squeezed from all their juice.

If by accident the Indian, or whoever feeds the mill with canes, should happen to have his fingers caught in the mill, they must immediately cut off his arm, lest the whole body should be drawn in and ground to pieces: therefore, as soon as they see any one have his finger or hand caught, the person standing by cuts off his arm with a hanger, and he is afterwards cured, and kept for other service. The juice falling into a vessel which is below the mill, and being drawn off, runs by a little channel into the first boiler, which holds about two hogheads, where it is heated by a small fire, and set a boiling, in order to make a very thick scum arise: the West-Indians keep this scum to feed their cattle with. This liquor being well scummed is put into a second boiler, where they make it boil again, throwing in, from time to time, warm water, in which they have beat up some eggs: having been thus purified, they pass it through strainers; and, after it has done running, put it into a third boiler, which is of brass or copper, and then again, upon another refining, into a fourth boiler; and when it begins to cool, and they find it rises to a grain, they pass a skimmer, or wooden spatula, underneath it, from the right to the left, to see what quality the graining is of: the sugar being thus ready, while it remains hot, is cast into moulds, or earthen-pots with holes in their bottoms, yet shut: at the end of twenty-four hours, which is the ordinary time, the sugar takes to incorporate, the negroes carry their pots into their warehouses, and after they have opened the holes, and pierced the sugar, they set the moulds upon little pots, or jars, in order to receive the syrup or molasses which runs from it. When the syrup is run from the sugar, they take it out of the mould, and cut it afterwards with a knife; and this sugar cut in this manner, is called the grey muscavado sugar; which, to be in its perfection, ought to be of a whitish grey, dry, have the least fat, or smelling of the fire, that may be. This muscavado is the basis and foundation of all the other sugars sold among us.

It is but little in use, though very proper to make syrups and coloured comfits.

OF CASSONADE, OR POWDER SUGAR.

The cassonade is made from the grey muscavado run again, and after it has been clarified, strained, and boiled, and cast into the moulds, and so prepared as we have been speaking before. After the syrup is drained out, they lay upon the

fuga

fugar about an inch thickness of clay, wetted with common water, that the moisture which is in the clay, may get through the fugar, and take away with it whatever fat or bad matter might remain in it: when it will run no longer, and the clay at the top is dry, they take the fugar out of the moulds, and cut the cakes into three pieces, the top, the middle, and the bottom, which they dry separately, according to their fineness. The finest powder fugar is that of Brazil, which is extremely white, dry, and well grained, of a violet taste and flavour. The cañonade, or powder fugar, is much in use among the confectioners; above all, that of Brazil, by reason that it is less subject to candy, upon which account the confectioners value it the more. The fugar, which we improperly call fugar of seven pounds weight, because it as often weighs ten or twelve, is made of the grey muscavado, formed into loaves, as we have described before. The fugar of seven pounds is distinguished into three sorts, to wit, the white, the second, and the last, which is of a browner colour; the whiter the fugar is, the better stoved, grained, and dried, the more it is esteemed. The less the moulds are, that is, the less the loaf is made, and the whiter it is, so much the dearer it is. The use of this is to make choice syrups, white confections, and to preserve apricots, and the like.

OF SUGAR ROYAL, and DEMY ROYAL.

The fugar called royal, from its extraordinary whiteness, is made from the small white fugar, or powder fugar of Brazil, melted and cast into a loaf as the former. This fugar royal ought to be extremely white throughout the whole, that is to say, as fine at the top as the bottom, of a clear, compact, shining grain, notwithstanding easy to break; which is the general observation of sugars that are well baked, and of a kindly sort. We sell, besides, another sort we call demy royal, which is a small fugar-loaf, very white, and wrapped in a blue paper, which comes from Holland.

The Dutch formerly brought us sugars of eighteen and twenty pounds, wrapped in palm-leaves instead of paper; for which reason it was called palm-fugar, which was a white fat fugar of a good sort, and a violet taste. We used to have, besides, another fugar from the Madeiras; but we have no more of it now, because we have it from several other islands much better.

OF BROWN SUGAR.

This brown fugar is one sort of the muscavado, which they turn to powder fugar, and is made of the syrup of the seven-pound fugar, after the same manner as the others are made. It ought to be of a greyish red colour, dry, and not smelling of burning; for there is some to be met with so moist, and with so much of the burnt smell, that it is almost impossible to use it. The use of the brown fugar was formerly very considerable, it serving to put in clysters, &c. These molasses are better for distilling rum than the muscavado fugar.

SUGAR COLONIES, BRITISH.

OF BARBADOES.

The growing success of this sugar colony promoted the settlement of the others, and, as the sugar plantations increased, more hands were required to carry on the works than could, at that time, be spared from home. This gave birth to the Guinea trade, for supplying those colonies with negro slaves; and as the planters flourished and increased, so did their demands for all sorts of British manufactures, and such necessities of life as they could not produce in those climates, which opened another scene of trade to the British merchants, to furnish these new colonies with wine from Madeira. These branches of trade were of the utmost advantage to Great-Britain, inasmuch as they drew no money out of the kingdom, but yearly brought in large sums, for British manufactures exported thither. The trade to this island was commonly open and free; for, before the civil war in England, the Dutch ships came hither to purchase sugars, as well as the English; but, since the Restoration, several acts of parliament have been made, to confine the trade of the sugar colonies to Great-Britain, and British ships only; which restraints soon made London the chiefest mart in Europe for fugar; and, as there was yearly more imported than was necessary for home consumption, the merchants exported the surplus to foreign markets, and, by underselling the Portuguese, who had considerable fugar-works in the Brazils, they gradually beat them almost out of all their fugar trade to the northward of Cape Finisterre.

This trade of re-exporting sugars, was carried on for many years with great success. Mr. Gee says, that, by this trade only, such an increase of treasure and wealth was brought into this kingdom, as yearly added three or four hundred thousand pounds to the stock of the nation; which, in thirty years time, amounted to upwards of ten millions sterling. Others have computed the clear profits accruing to Great-Britain from the fugar trade, and those other branches which chiefly

depend upon those islands, to amount to more than a million a year. A few years since, it appeared, by the custom-house accounts, that the value of the annual exports from Great-Britain to the sugar colonies, was five hundred thousand pounds sterling; and on importations from those islands, more than twelve hundred thousand pounds per annum. And if the value of our exports to Guinea and the Madeiras, which are the effects of the sugar trade, were added to the former, it would greatly augment the sum, and, consequently, enlarge the profit, which our mother-country received from the sugar colonies, and the several branches of trade depending thereon. Certain it is, that while the sugar trade flourished, both planters and merchants grew immensely rich, and the trade and navigation of Great-Britain was carried on to a much greater height than ever it was before. And this great source of wealth and treasure to their mother-country, arose from so small a beginning as a few families seeking shelter in a desolate island.

This shews what may be done by industry and trade, rightly applied. When the sugar trade was at this height, the flourishing state of Great-Britain alarmed her neighbours, and put them upon ways to circumvent her in trade, as the only means to put a stop to the growing strength of the kingdom, which they feared might become too formidable, from the great increase of seamen and shipping employed in the West-India and Guinea trades, both flourishing at the same time. Upon a parliamentary enquiry into the state of the trade to Africa, in the year 1728, it appeared, to the house, that, in three years time only, the number of negroes imported at Barbadoes, Jamaica, and Antigua, amounted to 42,000, besides what were carried to St Christopher's, Nevis, and Montserrat.

True it is, however, that our sugar trade in general has, of late years, greatly declined. The French spared no expence or labour to rival Great-Britain in this capital article, they well knowing, if that sunk, her Guinea and Madeira trades must sink in proportion; for which purpose they embraced every opportunity to improve their fugar plantations, which they have done to a very extraordinary height; and such has been the wisdom of their councils, that the effect could not be otherwise.—For proof of which, see our articles FRENCH AFRICAN TRADE and COMPANY, and FRENCH AMERICA, where we have laid before the nation the measures which the French have many years taken for that purpose. The French having thus put their sugar colonies into a flourishing condition, the next thing they had in view, was to beat the British merchants out of the foreign markets for fugar, and thereby destroy their trade for exportation; and this they effected, by giving liberty for their ships to carry their sugars directly to the foreign markets, while ours were obliged to import all into Great-Britain, which enabled them to sell so much cheaper than our merchants could carry it from London, which almost put an entire stop to that valuable branch of trade to their mother-country.

The first declension of our exportation trade was attended with such ill consequences to the sugar colonies, that it lowered the price of fugar so much at home, as discouraged the merchants from sending to purchase sugars. This obliged the sugar planters to turn merchant-adventurers in a declining trade, and to ship their sugars upon their own account and risk. This put a stop to the currency of cash, which was before brought over yearly to purchase sugars, and laid the whole burthen of freight, duty, and commission, upon the plantation, that were formerly paid by the British merchants; and suppose but 15,000 hogheads of fugar to be shipped in a year from this island of Barbadoes, on gentlemen's own accounts, these three articles will amount to upwards of 60,000*l.* sterling. Another great evil, that followed from the same cause, was, combinations among the buyers, by which the price of sugars sunk so low, as greatly to prejudice the planters, and yet turned to the benefit only of a few private persons, who were the first purchasers, and not at all to that of the consumers in general; by which that island was greatly prejudiced, and this received very little benefit.

The island of Barbadoes is generally esteemed to be little bigger than the Isle of Wight, and to contain 100,000 acres. About the year 1626, this country was not only unsettled, but uninhabitable, as affording nothing for the support of life, and over-run with shrub-wood, which gave a great deal of trouble to the first planters; yet, in the space of 50 years, this plantation came to an extraordinary height, and peopled with 50,000 whites, of whom 20,000 were able to bear arms, and 80,000 negroes. Within 20 years after the colony was settled, they mustered 11,000 horse and foot, which would be incredible, if we had not such proofs of these facts as put them beyond doubt.

In short, this island rose to such a pitch in the year 1661, that king Charles II. created, on the same day, 13 baronets, in Barbadoes, none of them having less than 1000, and some of them 10,000*l.* a year. At this time their trade actually maintained 400 sail of ships; and it was computed that the running cash of the island was not less than 200,000*l.* and their annual exportation to Great-Britain, in fugar, indico, ginger, and other commodities, at least 300,000*l.* These facts

facts demonstrate the great value of this island, at the time we are speaking of; and, by the gradual increase of this colony, it has, since we first possessed it, contributed beyond conception to the riches of its mother-country.

When this colony was in its most flourishing condition, which was in the year 1676, there were 400 sail of ships, of 150 tons, one with another, employed annually in this trade; and if we reckon only that the sea-men, ship-builders, and other trades that live by these vessels, amounted, in the whole, to 10,000 souls, that will be no immoderate computation. The fugars that came from Barbadoes, were either spent at home, or sent abroad; and I reckon, that, in the manufacturing the fugars, and vending them at home and abroad, there might be 20,000 people more employed. To these we must add, such as got their bread by the goods and manufactures yearly exported from hence to Barbadoes, for almost all that the people eat, drink, and wear there, are the product of England; so that the computation cannot be thought to rise too high, if we allow, that in this way 20,000 more get their bread, which will make about 50,000 in the whole, all supported here by the labour and industry of the whites and negroes in that country. We are next to compute the money brought into this nation by the export of the commodities imported from thence, which was that year allowed to be above 200,000*l.* and it was also agreed, that as much, or more, had been gained every year, between that time and the Restoration.

I shall say nothing of the money arising to the Exchequer from the duties, though this might be computed at 30,000*l.* per annum; but that, from the year 1636 to 1656, which is 20 years, this colony produced but half so much: and, though it may be true, that, before the year 1640, it did not produce a quarter so much, yet, in the remaining part of that period, it certainly brought in a great deal more; and therefore we cannot be far from the truth, in computing that this nation acquired two millions in money, by Barbadoes, in that 20 years. In the next 20, that is, from 1656 to 1676, when it is allowed this island was in its most flourishing condition, there must have been gained four millions of money; and allowing for the gradual falling off of this trade, by a multitude of unlucky accidents, but more particularly by the settling the French fugar islands, we shall compute the last 70 years, from 1676 to 1736, at the same rate we did the first 20 years, and the gains will then amount to SIX MILLIONS: so that in the space of 100 years, the inhabitants of Great-Britain have received 12 millions in silver, by the means of this plantation, and had 50,000 of her inhabitants maintained by the people of that colony all the time.

I have insisted the longer upon this topic, because it may enable us to form some notion of what might be made of our plantations, if we attended to them as much as they deserve; for though it may be, and perhaps is, impossible, to improve any of them in proportion to what has been done in Barbadoes, yet we may well enough discern from hence, that they might be made incontestibly more profitable to us than they now are, or, indeed, than the whole trade that we now possess; and if, at the same time we reflect on this, we likewise consider that there is nothing so absolutely in our power as the improvement of our colonies, it will most certainly appear to be the point, which, of all others, imports us most.

We are next to speak of the island of ST CHRISTOPHER, which was discovered by Christopher Columbus. It is situated in the latitude 17 degrees, 25 minutes, on this side the Line, and is about 75 miles in circuit; the Caribbeans inhabited it when Sir Thomas Warner, an English adventurer, took possession thereof; and Mons. Desnambue, a French gentleman, who commanded for the French in America, took possession the same day. These two adventurers settled this colony harmoniously, 'till queen Anne's war broke out, when the English drove the French intirely from their settlements; and the country being yielded to the crown of Great-Britain by the peace of Utrecht, all the French territories were sold, for the benefit of the public, which must have produced a very large sum, since out of it there was 80,000*l.* paid for the marriage-portion of her royal highness the princess of Orange.

There were some indeed, who pretended, that notwithstanding the French part of the island of St Christopher's was by far the richest, we were no gainers by obtaining it, but that, on the contrary, the French received benefit thereby, because it enabled them to people the rest of their islands more effectually; but whoever considers that the fugars of this island are inferior to none in all America, that the plantations were in perfect order, and that the French ventured a war to prevent our settling St Lucia and St Vincent, will scarce be brought to believe that they parted with a country ready settled, and more valuable than both those islands, with their goodwill. The treaty of Utrecht was so indifferent a treaty, that I think there is no fort of necessity for making it appear worse than it really was. The same persons who first settled St Christopher's, likewise settled NEVIS, about the year 1628; and notwithstanding the misfortune of being dispossessed by

VOL. II.

the Spaniards, in 20-years time there were at least 4000 people upon the island, and they continued increasing in the same manner, by a succession of prudent governors, for a considerable space. After the Restoration, when trade and peace flourished, this isle enjoyed its share of the benefit, and increased the inhabitants and riches; the only enemy they had to struggle with was the hurricane, which generally visited them once a year.

We are to proceed next to the island of MONTSERRAT, which name the Spaniards gave to this island, from the resemblance it has to a mountain in Catalonia, not far from Barcelona.

This island flourished, at first, more than Antigua; but since the lord Willoughby's time, the latter has got, and kept, the start of it. There were 700 men in Montserrat, 16 years after it was first inhabited. As to the climate, soil, animals, trade, and productions of this isle, they are much the same with those of the other Caribbee islands, only this has more mountains, which are covered with cedars, and other trees, that make it a lovely prospect from the sea. The vallies are fruitful, and better stored with fresh water than those of Antigua. According to the best accounts that have been received from this island of late years, it is rather increasing, both in the number of people, and in the value of their settlements, than not; as to the former, it is computed there may be about 4,500 white persons, and about 12,000 negroes, in this country.

The island of BARBUDA lies in the latitude 17 degrees 30 minutes north, is about 15 miles long, and lies north-east from the island we were last speaking of. The land is low and fruitful, and the English began to plant it as early as Nevis, Montserrat, or any other of the Leeward Islands, St Christopher's excepted. There are now about 1,200 persons upon it, and their number is daily increasing. The proprietor is the honourable Christopher Codrington, Esq; and he puts in a governor here, having the same prerogative as the other lords proprietors, in their several jurisdictions in America. This island has bred great store of cattle, and the inhabitants employ themselves mostly in that sort of husbandry, corn and provisions coming generally to a good market in the sugar islands. There is plenty of almost all sorts of tame cattle, as in Europe; and the English live here much after the same manner as they do in the counties in England, only their labour in the field is not so hard as here, the country being so much hotter.

The next plantation to this, if it may be properly so called, is ANGUILLA: it lies in 18 degrees 12 minutes. The country is level and woody, the soil fruitful, and the tobacco that grew there formerly was reckoned very good in its kind.

They have no great quantities of fugars upon the island, but addit themselves rather to farming, in which they have had very good success; and this it is that enables them to live in the old patriarchal way, every man being a kind of sovereign in his own family, and no other government there is in Anguilla.

We have now gone through the Leeward Islands, except ANTIGUA, which we now take notice of, according to the order of time in its settlement. This island lies in 16. 11. north latitude, 63 longitude west from London: it is about 20 miles in diameter, and 60 in circumference. The climate, though not to be greatly boasted of, yet it is a very considerable and thriving plantation. It has greater plenty of cattle, and particularly venison, than any other of the Caribbee islands; the animals whereof are much the same, as also their productions. Their sugar and tobacco were formerly very indifferent, but the planters have since improved their art, and as good muscavado sugar is now made there, as in any of our sugar islands: they have also clayed some sugar, which was unknown in Antigua about 40 years ago.

Though there is not much tobacco planted in this island, what there is at present is far preferable to what it was formerly. After Jamaica and Barbadoes, this has been considered by some as the most considerable of our islands in America; and as there is still a great quantity of land capable of improvement, and it is allowed the people there might make a third more sugar than they do; and if we consider what must have been gained by our commerce with this island for upwards of eighty years, we cannot but judge that it has been highly advantageous to this nation, and well deserves all concern for its protection.

We have now gone through our chief Leeward Islands. As to the general produce, or value, of these islands, which may serve to shew of how great consequence they are to Great-Britain, the best account we have been able to obtain, is to the following effect: St Christopher's is the largest of all the islands, but the middle part of it being extremely mountainous, it is thought that there are not above 20,000 acres of land fit for sugar, in the whole island, which produces about 10,000 hogheads of that valuable commodity. Antigua contains about 70,000 acres, and produces 16,000 hogheads of sugar yearly. Nevis is said to be about 20 miles in circumference, and produces 16,000 hogheads. Montserrat, which is less than any of them, produces 2,500, and sometimes

10 H

3,000

3,000 hogsheds of sugar. In Barbuda they breed cattle, and in Anguilla they raise corn.

As to the produce of the island of JAMAICA, it is not easy to give an account thereof in a narrow compass; however, we shall give the best idea of it we can, and in as few words. In the first place, it produces large quantities of cocoa, of which there still comes more from this than from any of our other plantations; and as it is known to be a very rich and valuable commodity, the reader will probably be pleased with a particular account of it. See COCAO.

Pimento is another natural production of Jamaica, from whence it is called Jamaica pepper, alluding to its figure, and the chief place of its growth.

The wild cinnamon-tree, commonly called, though falsely, cortex winteranus, grows in this island.

It is not doubted but that there are both silver and copper mines in the island, though they have not yet been discovered by the English, as it seems they were by the Spaniards.

But, after all, it is the sugar-cane that is the glory of Jamaica, by which the inhabitants have acquired such immense riches. It is generally said, that the sugar from St Christopher's is the best in the Leeward Islands; but I think it is agreed on all hands, that the sugar made in Jamaica exceeds that of all our plantations, though it is made there with much greater ease, since it cures faster in 10 days in Jamaica, than in six months in Barbadoes. There were, in the year 1670, upwards of 60 mills in Jamaica, which were computed to make about 2,000,000 of pounds weight of sugar; but some writers inform us, they make 10 times as much at present: whether that computation be right or not, is impossible for me to decide; but this is certain, that there is ground enough unoccupied in that country to make much more, since it is 140 miles long, and 60 broad; and it contains, according to a moderate computation, 4,000,000 of acres, of which, though there may be about one fourth in which English subjects have property, yet, it is certain, that not above a fourth of that fourth is actually planted, and a great deal of this is employed to other purposes than that of raising sugar. It is impossible to say precisely what quantity may be made here, because seasons differ, and other accidents intervene: some have thought they did not rise beyond the truth, in affirming that it has heretofore produced 100,000 hogsheds, which, though it appears a prodigious quantity, yet there are many circumstances that concur to render it credible. As for the number of people in this island, they are computed to be, at this time, 70,000 white people, and 120,000 negroes.

We may from hence judge of the real advantages which this island affords to Great-Britain; for as all our histories of Jamaica, and almost every voyage thither that has been printed, speaks largely of the luxury and expence of all degrees of people there, which is a plain proof of their great wealth and acquisitions; so we may rest satisfied, that, whatever appearance there may be of magnificence among them, yet the real produce of all their labour, and of all their commerce, comes over here to Britain, and maintains and enriches the industrious part of our people; so that there can be nothing more absurd or unreasonable, than to grudge or envy the people settled there the great fortunes they acquire and possess, or to repine at the pomp and splendor in which they live, because, whatever it may be in appearance, it is, perhaps, an indifferent reward for their dwelling at such a distance from home, and for the hazards and labours they run through to acquire such fortunes; but this will appear much more clearly, if we advert a little to the situation of Jamaica, and consider the vast benefits that accrue from thence, in all times, and under all circumstances, of war as well as peace.

There is constantly, in time of war, a considerable naval force kept there; and though this be attended with a great expence to the British nation, yet it certainly is, or at least ought to be, a great comfort to us, that our money is spent with our countrymen, that it increases the value of their plantation, and, which is still more to our purpose, that, sooner or later, all that is spent and circulated there, by some channel or other, returns hither; so that, at the long run, the nation loses nothing by the charge she may occasionally be at in maintaining fleets upon this coast. We ought likewise to reflect, that, in a time of war, there are many prizes taken and carried into Jamaica, which makes an unusual, and almost incredible plenty of silver, and is the true cause of the dearness and high price of necessaries in that country, all which, likewise, in time, centers in the mother country: so that when we hear of great estates raised there in a short space of time, it ought to afford us the highest satisfaction, because those who make those large fortunes, or their immediate descendants, come over hither, and either vest their money in our funds, or purchase lands here. Thus a state of war, which implies a suspension of trade, produces few of the inconveniences that usually attend such a suspension, because in Jamaica the very consequences of war become a kind of trade, and the wealth arising from them takes the same course, and runs in the very individual channels that any other trade would do; that is, they finally enrich, and tend to the benefit of, England.

But, in time of peace, besides what we draw from Jamaica, considered barely in the light of a sugar plantation, we are to

consider, likewise, whatever accrues to the inhabitants from their intercourse and dealings with other people, since whatever they gain is really our gain.

Before we quit this subject, it may be necessary to take notice of another branch of trade carried on from Jamaica, which has been made the subject of much debate; we mean the cutting of logwood in the bay of Campeachy. This matter came to be considered with the utmost care and circumspection by the Board of Trade and Plantations, in the year 1717, who solemnly reported, That we had an undoubted right to that trade, in which the subjects of the crown of England had been maintained and supported by former kings, his Majesty's royal predecessors. See the articles LOGWOOD, and LEeward ISLANDS in AMERICA.

REMARKS on the British sugar colonies before the last war.

We have seen, in as narrow a compass as we possibly could, the real value and importance of these sugar colonies to the crown of Great-Britain; and certain it is, it highly becomes the wisdom of the nation, that all possible care be taken to give the inhabitants of those colonies all manner of encouragement, and relief from any hardships under which they may labour; such as exorbitant salaries to their governors, large sums levied upon them, without being applied to their service; and the difficulties under which they too often are, in obtaining speedy and effectual justice, when persons in public stations are inclined to extend their power too far, with a view to promote their private interest. They should likewise have all possible encouragement given them for recovering that foreign trade they heretofore had, and beating out the French, and other nations, who have interfered therein; since in regard to both those points, that the enriching the subjects of Great-Britain, by the ballance of trade in general, and augmenting her naval power, are the grand particulars ever to be attended to: for if it could be once brought about that either the old markets for sugar were retrieved, or new ones opened, there is no doubt that Jamaica, and other of those islands where there are lands fit for the purpose, uncultivated, would be more fully PLANTED, the inhabitants become more numerous, and their demands for manufactures from Great-Britain consequently larger than they are at present. On the other hand, the same diligence and alacrity are requisite, with regard to the colonies on the continent; and whatever is done to promote the trade of the sugar colonies, must necessarily tend to the emolument of our continent plantations, which supply the sugar islands with lumber and other things requisite for carrying on their trade: and if, besides this, ways and means could be found to open new channels, for the benefit of these colonies also, it ought to be done, and the protection of all our colonies secured by all the power that Great-Britain can possibly exert, consistent with her own particular safety. See our articles BRITISH AMERICA, COLONIES, PLANTATIONS.

That the French sugar colonies in America, from a very small beginning, are arrived to an extraordinary pitch of prosperity, even since the beginning of queen Anne's reign, is very apparent; and by what wise and gradual steps they have been so highly advanced, deserves the most serious attention of this nation. See our article FRENCH AMERICA.

The island of Martinico is the chief of these French settlements: the number of people in this island, by which we are obliged to compute the rest, is affirmed to be 10,000 whites, and 20,000 negroes. Whence it appears that the French are very numerous in these islands, and they make more sugar here than we do in the island of Barbadoes.—They also cultivate here indico, cotton, and cacao, to great advantage, and draw no little profit from the ginger, cassia, and pimento, of which they export considerable quantities. They likewise manufacture roucou, for the use of dyers, and send home variety of medicinal gums, and sweetmeats. The French sugar islands, besides, produce several kinds of very valuable woods, used for dyeing, inlaying, and cabinet-work, such as rose-wood, the Indian-wood, and the iron-wood, brazelletto-wood, or fustic, and ebony, which is used as well by the cabinet-makers as the dyers.—We may add to these commodities, raw hides and tortoise-shells, and then we may have a tolerable comprehension of the wealth of the French West-Indies.

Though these islands produce so many estimable commodities, yet they stand in need of supplies of divers essential necessaries, without which they could not possibly subsist; such as horses, and cattle of all kinds, corn, roots, dry fish, and all sorts of lumber, of which they receive some from Canada, and the rest from our northern colonies, in exchange for sugar, tobacco, indico, and other goods, sent to Canada, and for molasses, &c. to our northern colonies.—See our article FRENCH AMERICA, particularly our REMARKS on French America.

The inhabitants of this island also stand in constant need of negroes, with which they are now supplied by the French East-India company, by whom the slave-trade is now carried on with great regularity, and great advantage to the French colonies and nation. The negroes are sent to Martinico, where they are purchased by the inhabitants of the other islands, at a settled price, of so many hogsheds of sugar a

head

head, as in the Spanish ports they are bought for so many pieces of eight. See the article FRENCH AFRICAN TRADE and COMPANY.—And how our African trade might be greatly advanced, as well for the interest of the British colonies, as of the kingdom in general, see our article EAST-INDIA COMPANY, for what we have there humbly suggested. To what degree the French have increased in the commerce of all their sugar colonies considered together, see our article FRENCH AMERICA.—But of all the sugar colonies that the French possess in America, there is none of more high concernment to them than that of St Domingo.—And should the French once carry their point, and become sole masters of this island, we may reasonably believe that, in few years, it would become the richest and most estimable country in that part of the world, especially if the French should abandon their other islands, and transport their inhabitants thither; and, even in that case, there would be no danger of its being over-peopled; and its fertility is such, that they would all find room to exercise their industry, and that industry would be richly rewarded: besides, this would afford them many advantages; for whereas their other islands are subject to many inconveniences, but more especially the want of provisions, these would all be remedied there, and it would afford them an opportunity of increasing their strength there to such a degree, as would put it out of the power of any of their neighbours to give them much disturbance. On the contrary, they would soon become formidable, both to us and to the Spaniards; which is an evil, that, as it has been foreseen in time, it is to be hoped due care will be taken to prevent its ever coming to pass. Can we, therefore, give too much encouragement to our own sugar colonies, when the French may one day prove so formidable to us by means of theirs? Nor can we affect the French in a more tender point than in that of their sugar colonies, if a rupture at this conjuncture should prove inevitable.

It is not many years since the principal inhabitants of Jamaica addressed his Majesty, to shew him the decay of their trade and planting interest; whereby they represented, 'That the low value of their produce might be very justly attributed to the great improvement the French have made in their sugar colonies, by the encouragement given them, particularly in allowing them to export their commodities to foreign markets, without first introducing them into any of the ports of France; and from the lowness of their duties, they could undersell them. That sugar, and other commodities produced in the French and Dutch colonies, were frequently imported into Ireland, without introducing them into the ports of Great-Britain, and paying the duties, and, consequently, those foreigners were supplied with provisions at easier rates. That the British northern colonies imported into Jamaica great quantities of provisions, and other goods, for which they took no part of the produce of that island in exchange, a small quantity of molasses excepted, but were paid in bullion, which they carried to Hispaniola, and bought sugar, rum, and molasses, for their own use: which trade was not only unequal and injurious to the inhabitants of Jamaica, but prejudicial even to the northern colonies, and highly so to their mother-country, draining Jamaica of so much bullion in favour of France, which otherwise might have centred in Great-Britain.'

Though one part of this complaint has been remedied, the other is still subsisting: it is true, sugar can be exported from the plantations immediately to foreign countries, but the northern colonies still continue to supply the French with lumber, which gives them an opportunity of underselling us both at home and abroad. The case is also the same with the Dutch at Curassoa and Surinam, where our northern colonies send horses, whereby they carry on their sugar-making, which promotes the Dutch colonies in this manufacture: and the Dutch are so sensible of this advantage, that it is a law, or order, in Surinam, That these northern vessels shall not be admitted to trade with them, unless they bring such a number of horses; besides, they import from the colonies dry goods, whereby the consumption from Great-Britain and the southern plantations is greatly diminished.

The breed of seamen, with the increase and encouragement of the navigation of this kingdom, principally depend on our plantation trade and Newfoundland fishery; therefore their state and condition ever deserve the consideration of our best patriots, for preventing the decay, loss, or destruction of the trade and maritime strength of Great-Britain: but we may presume that this is most essentially to be done by DESTROYING THE FRENCH SETTLEMENTS, instead of encouraging their manufacture: and I wish that our gallant admiral Vernon had laid Hispaniola in ashes, which it was once in his power to have accomplished, if——

Should the English be dispossessed of Jamaica, which they may soon be, if the sugar-trade is ruined; and however some people may believe, we shall not only lose an island of very great consequence to us in point of commerce, but must never afterwards expect to be formidable by our naval force in that part of the world, as we have been for many years past, by means of that island; for, as Dr Davenant has justly observed, 'The loss of Jamaica must probably be followed with the absolute ruin of our interest in America.'

It was observed by a gentleman of Barbadoes in a speech to the council and general assembly of that island, 'That their neighbour colonies, so long kept by foreign fears from improving, were then encouraging trade, increasing their people, enlarging their plantations, and cultivating their lands: that their fertile soil yielded them many crops from one planting, while the soil of the English plantations required the utmost art, industry, and manure, and that too annually.

We shall readily grant that the produce of Jamaica has not been less in value than 500,000 l. a year; and a friend to this island has acknowledged, that it is capable of producing THREE TIMES what it does at present, were but some laws made to prevent such quantities of land being monopolized by particular persons, obliging such persons as have very great runs of land, and will neither settle or sell the same, that they do the one or the other, and to give encouragement for white people to come and reside in that island. But it is quite different at Barbadoes, for no country known to Europeans ever exceeded this in agriculture: it had been said, That if the soil of this island had not been improved, but dug, and put on board of the ships and vessels that have traded hither since the settlement, they might have been sufficient to have carried the whole island away: for there is such great industry in planting and manuring the sugar-canes, that, the land being poor, the inhabitants are obliged to dung and improve their plantations like so many gardens: and I with the same poverty of soil is not equally apparent in the other Caribbee Islands subject to Great-Britain.

It is not above 70 years ago that Martinico was the only settlement the French were possessed of in the West-Indies: since which time, they have settled Guadalupe, and increased their settlements in Hispaniola ten to one, for which they had an encouragement given them, by the duty laid upon all clayed or refined sugar imported into France; which duty effectually prohibited, or prevented, either the English or the Dutch from sending any thither, and, consequently, caused an increase of the French plantations.

About 40 years ago the observation was made, That as the French had, within four or five years, beat us almost out of our indico trade, so it could not be much longer time before our condition would be the same with our sugar trade. The observation has been too early verified.

The French endeavoured to strengthen all trade in general; and by giving such tracks of land on Hispaniola, as also by not permitting any person to enjoy more than what he planted and manured, they have become powerful; nay, they did not scruple saying, That, in a few years, they would have the whole island of HISPANIOLA: on which account, in 1709 and 1710, the British ministry were applied to, and it was intended by them that, at the general treaty of peace, it should be demanded for the French to restore to the Spaniards such part as they possessed, by the cession of the whole island granted by king Philip to his grandfather; however, this cession was never put in execution, though it was required by France, for her assistance to Spain in the Mediterranean engagement, in 1744, but refused through the interest of his present Catholic Majesty, then prince of Asturias.

By an order issued by his Most Christian Majesty, for the better settling and peopling his colonies in America, every ship or vessel was obliged, when required, to carry a certain number of people thither, freight free: so that, by this encouragement to the increase of their inhabitants, and the fertility of the country in producing materials for enlarging and improving their SUGAR-WORKS, as also by the great extent of Hispaniola, it was observed, that the French colonists would not only make much greater quantities of sugar than the British colonists could in their plantations, but at a cheaper price, by being furnished with most materials for doing thereof within themselves: whereas the British islands were obliged to be supplied from the northern colonies, at a great expence, and, therefore, their product must necessarily be made up at a much dearer rate than the French; whereby the consequence would be, that the French, in a little time, must beat us out of that most valuable article to the whole kingdom, the SUGAR TRADE.

Earthquakes, inundations of the sea, insurrections of negroes, blasts in the canes, and other concomitant circumstances, have been great impediments to the prosperity of our sugar plantations, which require lenitives, more than corrosives, in their present feeble condition. Upon the whole, our SUGAR TRADE has received a violent blow from the French; our NEWFOUNDLAND FISHERY has decayed by their encroachments; and our TOBACCO COLONIES, if proper care is not taken of that valuable branch of trade, may also be outvalled by the French of LOUISIANA; which must give every Englishman a very melancholy prospect, since it is by our SUGAR and TOBACCO, and other COLONIES, we have such a balance in trade on our side with Hamburg, and other parts of the Eastland countries, as also a profitable trade with the United Provinces; and from our Newfoundland fishery, great sums have been annually brought into England from Spain, Portugal, and Italy: besides, our northern colonies being dependent on our sugar settlements to take off their product, and having not wherewithal to answer the exports to them from Great-Britain, are only valuable as they bear relation

lation to such colonies as are furnished by them, which cease on the decay of the trade from whence it arises.

Thus sad and melancholy is our present condition, as to these branches of our trade and navigation; which must be aggravated, from the consideration of the present conduct of the FRENCH in AMERICA.

REMARKS since the last war, and the peace of 1763.

To what degree many of the before-intimated evils, wherewith we seemed to be threatened before the last war and peace, may be presumed to be remedied in time, we refer the reader to our articles AMERICA, BRITISH AMERICA, FRENCH AMERICA, LOUISIANA, MISSISSIPPI, CANADA, FLORIDA, LEEWARD ISLANDS, NEW-FOUNDLAND FISHERIES, INDIAN NATIONS, and to the various other articles to which from the preceding we refer.

The ACT continued for granting liberty to carry sugars from the British sugar colonies of the product and manufacture of the said sugar colonies in America, from the said colonies directly to foreign parts, &c. &c.

Whereas the laws herein after-mentioned, which have by experience been found useful and beneficial, are near expiring; it is enacted, That an act made in the twelfth year of the reign of his present Majesty, intitled, An act for granting a liberty to carry SUGARS of the growth, produce, or manufactures of any of his Majesty's sugar colonies in America, from the said colonies DIRECTLY TO FOREIGN PARTS, in ships built in Great-Britain, and navigated according to law; which was to continue in force for five years, from the said twenty-ninth day of September, one thousand seven hundred and thirty-nine, and from thence to the end of the then next session of parliament; and which, by several subsequent acts, made in the seventeenth and twenty-fourth years of the reign of his present Majesty, was further continued the first day of September, one thousand seven hundred and fifty-seven, and from thence to the end of the then next session of parliament; shall be, and the same is hereby further continued, from the expiration thereof, until the twenty-ninth day of September, one thousand seven hundred and sixty-four, and from thence to the end of the then next session of parliament.

In the last war Great-Britain conquered the French sugar colonies of MARTINICO and GUADALOUPE, &c. and upon the conditions stipulated in the treaty of peace, concluded in the year 1763, the said sugar colonies were restored again to France. See our article AMERICA, for the treaty at large. The long standing disputes, concerning the NEUTRAL ISLANDS in America, are finally settled in the said treaty. See our article LEEWARD ISLANDS, where the new acquisitions of colonies in America are represented.

In the year 1758, an act was made for encouraging the exportation of rum and spirits, of the growth, produce, and manufacture, of the British sugar colonies, from this kingdom, and of British spirits made from melasses.—An abstract of the contents.

The duties of custom, payable upon the importation of rum and spirits, from the British sugar colonies, to be repaid upon the exportation thereof.—And the duties of excise to be remitted upon all such as shall be exported before payment is made of the said duties.—Exporter to give bond for the due exportation thereof.—Upon producing a certificate of such bond having been given, the rum or spirits mentioned therein, are to be delivered out of the warehouse, and a certificate of the quantity, and size and marks of the casks, &c. to be given therewith, and produced to the officer attending the shipping.—Due entry to be made of such delivery.—Bonds given for the duties are to be delivered up, upon oath made of the intended exportation, and certificate produced, &c. of the quantity shipped, and that the same are proof spirits; and also of the delivery thereof from the warehouses, &c.—If part only of the rum or spirits mentioned in the bond are certified to be delivered and shipped, the quantity is to be indorsed on the bond; and the bond to be delivered up, when the remaining part shall be certified to be delivered and shipped; provided the same be before the time stipulated for payment of the duties.—All rum and spirits intitled to the said drawback, &c. are to be exported in casks, containing not less than 100 gallons, and in vessels not less than 100 tons burthen.—The quantity delivered out is to be computed according to the gauge taken upon the importation thereof.—If, after delivery, any shall be concealed, or not shipped within twelve hours, or the cask be opened, or the same be reduced or altered in quantity or quality; such rum or spirits are forfeited, and the bond is to be put in suit; unless the commissioners see cause to forbear the same.—Bonds given for exportation are not to be discharged, till certificates be produced of the due exportation and landing, and proof made thereof on oath, in manner required by the act for preventing the excessive use of spirituous liquors, &c.—If such rum or spirits shall not be exported, or shall be fraudulently reloaded, the same, together with the vessels, cattle and carriages employed therein, are forfeited; and the persons concerned forfeit double the amount of the duties; and the master, &c. if he assist or connive thereto, is to suffer also six months imprisonment:

or if the package be altered before arrival at the place of discharge, he forfeits 100 l.—The rum or spirits to be exported are to be proof; and the exporter is to give five days previous notice of the shipping thereof; and allow the officers to mark the casks, and take samples, paying for the same, if demanded; upon penalty of forfeiting 100 l.—If any rum or spirits shall be altered or reduced in quantity or quality, after being shipped, the same is forfeited, and the persons concerned therein forfeit also 100 l. and no drawback is to be allowed for the same.—Penalty of granting false certificate, or of counterfeiting, altering, &c. any oath or certificate, is 500 l. one moiety to the crown, the other to the prosecutor.—An additional drawback of 3 l. 3 s. per ton allowed on all British-made spirits, drawn from melasses, exported; oath being made of the truth thereof, and of the duties being duly paid; and certificate produced of the quantity shipped, and that the same were proof-spirits, &c.—The powers, regulations, forfeitures and clauses, &c. in the recited act, relating to the drawback hereby granted on the exportation of spirits; and to the preventing or punishing frauds, &c. extended to this act.

SURREY, a county in England, joins on the west to Berkshire and Hampshire, on the south to Sussex, on the east to Kent, and it is parted from Middlesex on the north by the river Thames, and is 112 miles in circumference.

The air, as well as the soil of the middle and extreme parts, is vastly different.

The chief commodities of this county, besides its corn, are box-wood, walnuts, and fuller's earth, which last is sold at a groat a bushel at the pits near Ryegate.

SOUTHWARK, though it seems a suburb of London, yet for extent and number of people, and their trade and wealth, &c. is inferior to few cities in England.

GUILDFORD is a large well-built town on the river Wey, which falls into the Thames. Its market is reckoned one of the greatest in England for wheat. By the navigation of its river, a great quantity of timber is brought to London, not only from its neighbourhood, but from the woody parts of Sussex and Hampshire. It had formerly a considerable manufacture of cloth.

KINGSTON upon Thames, is a populous, trading, well-built town. The market is kept in the town, so large that it might pass for a fair.

WANDLESWORTH, or WANSWORTH, is of note for a manufacture of brass plates and kettles, skillets and frying-pans.

FARNHAM on the river Loddon, is a large and populous town, and one of the greatest wheat-markets in England, especially between All-saints-day and Midsummer, when, one day with another, 250 load of wheat, and sometimes 400 have been sold here in a day. The plantation of hops hereabouts is also very considerable, and said to outdo the Kentish hop-yards, both in quantity and quality.

GODALMING is the most eminent town in the county for making cloth, particularly mixed kerries and blue ones, said to be the best coloured in the kingdom for the Canaries. It stands on the Loddon, which abounds with good fish, especially pike, and drives a grist-mill, two paper-mills, and three corn-mills. The best whited brown paper is said to come from hence.

CHERTSEY has a bridge over the Thames to Shepperton in Middlesex. Its principal trade is in malt, which it sends in barges to London.

CROYDON is a large handsome town on the edge of Banstead-downs. Its market is chiefly for oats and oatmeal for London, though there is a great sale here too of wheat and barley. The town is encompassed with hills, well stored with wood, of which great quantities of charcoal are made, and sent to London.

DORKING is noted for its meal-trade, and its market for poultry, particularly the fattest geese and the largest capons, which are brought hither from Horsham in Sussex; where it is the business of all the country for many miles to breed and fatten them.

SUSSEX is bounded on the west with Hampshire, on the south with the British Channel, on the north with Surrey, and on the east with Kent, and is 170 miles in circumference. Its chief rivers are the Arun, Adur, Ouse, and Rother; the Arun has lately had a new outlet cut from it, to improve its navigation, which carries barges above Pulborough, and ships of 100 tons as high as Arundel; from whence they carry the largest and best timber in England to the docks of Portsmouth and Plymouth, Chatham, Woolwich, and Deptford.

The air and soil of this country are both various, according to the different parts of it. On the sea-coast are very high green hills, called the South-downs, well known to such as deal in wool or sheep, there being great flocks fed here, whose wool, which is very fine, is too often exported clandestinely to France by farmers and jobbers, who are called OWLERS. The north-quarter is shaded with woods, from which they make abundance of charcoal; and fuel for the iron-works, there being plenty of ore on the east side towards Kent, and many great forges, furnaces, and water-mills, for both cast and wrought iron; which, though it is said to be more.

more brittle than Spanish, yet cannon are cast with it; and the best gunpowder is made in this county.

CHICHESTER has a very great market for corn, and every Wednesday fortnight here is also one of the greatest cattle markets in England. Its chief manufactures are malt and needles. Here is some foreign trade, and a collector, with other officers of the customs at Dell Key, a small harbour about four miles from the sea.

LEWES is one of the largest and most populous towns in the county. It carries on a good trade, and a little river runs through the middle of the town, to which it brings goods in boats and barges from a port eight miles off: on this river are several iron-works.

SHOREHAM is a populous place, and has a very good harbour for vessels of considerable burthen; and many ships are built here both for the navy and merchants service.

RYE is a pretty populous town. Its trade consists in hops, wool, timber, kettles, cannon, chimney-backs, &c. which are cast at the iron-work at Bakely, four miles from Rye to the north-east, and at Breed five miles to the south-west.

BRIGHTHELMSTON, is a pretty large populous town, chiefly inhabited by fishermen, as is also Newhaven. A pretty many small vessels bring coals, deals, &c. from Lewes hither, and load from hence with corn, timber, tan, &c. Some small craft are also built here.

SWABIA, the circle of, in Germany, is bounded on the north with the Palatinate and Franconia; on the south with Tyrol and Swisserland; on the west with Alsace; and on the east with Bavaria.

Its air is healthy, and the soil generally fruitful: for though some parts are mountainous and woody, yet the hills afford mines of silver, copper, and other metals, and the forests much pine and fir-timber, besides great store of game, and good breeds of horses, black cattle, and sheep; and other parts yield great store of corn, wine and flax. The inhabitants are chiefly employed in making linen cloth, of which they export great quantities. Its chief rivers are the Danube and Neckar, but great part of it is also watered by the Rhine.

The usual division of it is as follows, viz.

The marquisate of **BADEN**. This country, which is one of the finest in Germany, is extended along the eastern banks of the Rhine, having the Palatinate on the north, the Black Forest on the east, Alsace on the west, and Swisserland on the south. It is very populous, and fruitful in corn and wine, but chiefly in hemp, which they sell to the Dutch and Flemings; they have, also, in some places, agate, which they polish and export.

The chief towns here are only of note on account of their baths, for which they are much frequented.

ORTNAN is separated by the Rhine, on the west, from Alsace, has the the Brisgaw on the south, the margraviate of Baden on the north, and the dutchy of Wirtemberg on the east.

The **BRISGAW** lies on the east side of the Rhine, which divides it from Alsace; betwixt Ortnan on the west, and the principality of Furtemberg on the east.

FRIEBURG is a large populous city, on the river Threisem: here are famous lapidaries for polishing the granates, jaspers, and other precious stones that are found in Lorrain, and the neighbouring countries.

The territory of **SUNTGAW** has Montbeliard on the west, Upper Alsace on the north, the bishopric of Basil, and Mount Jura the principality of Porentru, and the Franche Comte, on the south, and the canton of Basil on the east. The country, though mountainous, abounds with vines, and great quantities of its corn are transported to Swisserland, Lombardy, Lorrain, &c. There are no towns of any note for trade, neither in this territory, nor in the county of Montbeliard, nor the bishopric of Basil.

The bishopric of **CONSTANCE** lies on both sides of the lake of that name, and on the borders of Swisserland.

CONSTANCE, the capital, is a populous rich place, and has a considerable trade, by means of its lake, and the neighbourhood of the Rhine.

UBORLINGEN stands on the lake of Constance; it has a good haven, from whence barges are sent with wine and fruits to Constance, and other cities on the lake, to the great gain of the inhabitants, who are very industrious and frugal.

SALMANSWEILER is a small town, but has a good trade in corn.

BUCKORN has a good trade with the neighbouring countries, by the lake.

LINDAW stands on the north bank of the lake, by means of which, and the Rhine, it lies so convenient for trade, that it is called the Venice of Swabia. Part of the city is built on an island in the lake, to which there is a wooden bridge: this part is mostly inhabited by fishermen, watermen, and weavers. This place is so considerable a staple for goods of divers nations, and its market is so frequented by merchants for eight or nine leagues round, as well as others from a great number of towns, that it is said near 1500 load of merchandize enters every week at the gate next to the main land. The traders both of Swabia and Bavaria amass great quanti-

VOL. II.

ties of corn, salt, iron, and copper here, which they sell to the Swifs and Grifons; and every Saturday vast stores of wheat and wine are brought hither by the lake, from Hegow and Tergow; as also an incredible quantity of butter and cheese is brought from Bregent, and the mountains of Swisserland, Appenzel, and the Grifons; besides fish and fruits of all sorts, and variety of other merchandize, from the neighbourhood, and from the northern countries, and which pass through Nuremberg and Augsburg, for Italy.

WANGEN stands on the river Arg, which falls into the same lake, and is noted for a trade in paper and flax, and for the best pickles, which are made here in great numbers, and sent all over the empire.

BIBRACK stands in a pleasant fruitful valley, surrounded with hills. The great trade of this town consists in fustians; so that, of all the trading companies, the weavers are most numerous.

LEUTHIRK, on the river Escach, is a small town, but the inhabitants have a good trade in corn, flax, and linen cloth, of which they make great quantities.

KEMPTEN, on the Aigow, is one of the ancientest cities in Germany. The trade of the place is weaving and whitening linen cloth, which, with its being on the road to Italy, and by the Swifflers bringing salt from Tirol, makes it one of the richest cities in Swabia.

MEMMINGEN has a good manufacture and trade in linen, cotton, stuffs, and paper, which last is reckoned the best in Germany.

AUGSBURG, the metropolis of Swabia, stands near the confines of Bavaria, at the conflux of the rivers Lech and Werdach, which fall into the Danube 25 miles below it. It is one of the biggest and most beautiful cities in Germany. Its trade, at present, besides the bank of commerce, and the Tirol wines, with which it almost wholly supplies Germany, consists in goldsmiths wares, clocks, and ivory, with which, and all kinds of toys, not inferior to those of Nuremberg, it furnishes Germany, Poland, and the north of Europe; but even in several of those things, the English artizans have, of late years, excelled, and served foreign countries, to the great detriment of both Augsburg and Nuremberg, which had, for several centuries, been in possession of this trade.

ULM stands on the Danube, which here begins to be navigable; it is a great and very populous city, here being a great number of hands employed in the manufactures of stuffs, linen, cotton, and fustians; in dressing leather; and in the iron, and other manufactures, as well as clock-work; by which this is become one of the richest cities in Germany.

NORDLINGEN, the capital of a county, or division, of its name, stands on the river Eger. The principal trade carried on here is in linen cloth and dressed skins. There is a considerable yearly fair here, the week after Easter, to which merchants bring goods from very remote countries, and return with the manufactures of this.

WIRTEMBERG duchy, in that called Lower Swabia, is bounded on the north by part of Franconia, the archbishopric of Mentz, and the Palatinate of the Rhine; on the east by the county of Oetingen, and several other petty states of Swabia; on the south by the Danube; and on the west by the marquisate of Baden, and the Black Forest. It is reckoned the largest dominion in the circle of Swabia; and there are few countries in Germany so fruitful, it abounding with all sorts of corn, besides pasture. Its mountains are full of mines and vineyards, and its vallies of cattle; but being surrounded with the Palatinate, Franconia, and Alsace, that are altogether as fertile, the Wirtembergers have hardly any export for their commodities.

ESLINGEN, on the Neckar, is a place of some trade, and noted for good baths.

HAILBRON stands in a pleasant fruitful country, on the same river, and has a good trade, and several fairs.

The principal trade of **GEMUND** is in beads, which they send abroad.

HALLE stands amongst rocks and mountains, on the river Kocher, and owes its rise to its spring of salt, which, though not so white nor piquant as other salt, is carried to Nuremberg.

SWEDEN. This kingdom is bounded by the Baltic Sea, the Sound, and the Categate, on the south; by the mountains of Norway on the west; by Danish, or Norvegian Lapland, on the north; and by Muscovy on the east.

The soil, where capable of cultivation, is tolerably fruitful. For want of industry, they have not a competent supply of corn, and, therefore, import many sorts of grain from Livonia. The cattle are small in size; their sheep bear a coarse wool, fit only to make cloathing for peasants; their horses are of a delicate kind.—They have plenty of wild beasts, which are hunted for their flesh, as well as their hides and furs. Fowl, both wild and tame, are in great plenty, and good in their kind.—Their lakes are well stored with variety of fine fish.—Their woods and forests over-spread great part of the country, and are, for the most part, of pines, fir, beech, birch, alder, juniper, and some oak.—They have variety of mines, particularly of copper and iron, and one

of silver, adjacent to which, the woods are much destroyed for fuel; but that want is so well supplied from distant places, by the conveniency of rivers and winter-carriages, that they have charcoal above six times as cheap as in England, though not so good in quality.

Iron mines and forges are in great number towards the mountainous parts, where they have the conveniency of water-falls to turn their mills. From these, besides supplying the country, there is yearly exported iron to the value of near 300,000*l*. but of late years the number of these forges has been so much increased, that each endeavouring to undersell others, the price has been much lowered; and since the prohibition of foreign manufactures, in exchange of which iron was plentifully taken off, it is grown so cheap, that it is found necessary to lessen the number of forges. Neither has that expedient had the effect intended; but, on the contrary, many more are like to fall of themselves, because they cannot work but with loss: in which case, many thousands of poor people, whose livelihood depends upon these forges and mines, will be reduced to a starving condition.

What we have been saying in relation to Sweden in general, is, in the main, applicable to Finland, except only that hitherto no mines have been discovered there. Its chief commodities are pitch, tar, and all sorts of wooden ware, cattle, dried fish, train-oil, &c.

The country of Sweden has no considerable manufactures, and yet they have a very great trade, and are very strong in shipping; the reason is, the produce of their land, notwithstanding its northern situation and barren soil, is an immense treasure, and, in a great measure, makes up for their want of manufactures. This product is not only great, but is inexhaustible in its fund, and is as follows:

Silver,	Iron,	Flax,	Tar,	Furrs,
Copper,	Timber,	Pitch,	Hemp,	Hides.

1. The silver; this they have peculiar to themselves, it being found in no other place in all these parts of the world, except in Norway, and this is the product of one mine only, at a place called Nola. The ore in the mine lies 145 fathom deep, the working of which has continued near 300 years, and yet, as they relate, is unexhausted. The mine itself is very curious, and strangers are often carried down to see it: it brings in a revenue to the king according to the degree to which it is worked.

2. Their mines of copper and iron are very valuable indeed, and are a fund of wealth considerably greater than the mine of silver, and which will support Sweden, perhaps, to the end of time: for as the quantity is inexhaustible, so the advantage of working these mines is very great. Without this, Sweden, which is otherwise a poor and barren place, excepting some few valleys and flat countries on the sea-coast, would not be able, on any terms, to import such great quantities of the manufactures and product of other countries as they now do: had they not copper and iron to pay with, they could never import such quantities of wine and brandy, wrought silks, and fine linens, from France and Holland; or of broad cloth, fine stuffs, wrought iron and brass, clock-work and watch-work, with other things, from England; but their copper and their iron supply them with all things, and the balance is always very much in their favour: which is not to be wondered at; inasmuch as before the last calamitous war, which drained them both of money and men, the Swedish nation was a formidable power; and they tell us that Sweden only, without including their provinces in Germany, furnished king Charles XII. for his wars, from the time of his first expedition against the king of Denmark, to his death at Frederickshall, above 300,000 men for soldiers, and 227 tons of gold, either in specie, or bills of exchange, made good in Sweden, or bills at Hamburgh, when exchange failed from Sweden; and this was always made good in copper or iron.

If this be true, and that we add to this the dreadful havoc and destruction of the mines of copper, and of the iron-works, which the Muscovites made in their several invasions upon them, at the end of that war, and by which the late king of Sweden was obliged to consent to a disadvantageous peace, we need not wonder that the Swedes at present are in a low condition, in comparison to what they were, both as to their real wealth and their trade. The Muscovites carried away 70,000 tons of iron, besides copper, and did an irreparable damage, by destroying the copper mines, which had cost immense sums to bring to perfection, and by cutting down the woods, which were the life and support of the iron-works, and which will require many years growth to be rendered useful for the same works.

Yet notwithstanding all this, we see the Swedes, by an application never enough to be commended, begin to recover, and their government and gentry contributing to the repair of the great copper-mines, and of their iron-works, which had suffered so much; they begin to apply themselves vigorously to agriculture, and even manufactures, and export great quantities, and to fill their coffers again: and, in a few years, it is not doubted but they will be able to make a

considerable figure, though, perhaps, not quite so great as before.

I find no considerable manufactures, at present, in Sweden for exportation, except such as are the immediate product of the metals above; that is, brass-wire, drawn from their copper converted into brass, also some steel, and a great quantity of latten-wire, drawn from their iron. These they export in very great quantities, as they do also deals, masts, timber, pitch, and tar.

A few years since they set up a coarse manufacture of woollen cloth in Sweden, which they make with tolerable good success, for cloathing their poorer people, and for their armies; but we do not find they export any of it, except some into Muscovy and Poland, and that but lately. However, it is of great advantage to them, as it sets their poor at work, and finds employment especially for the women and children, who are the most incapable to get their bread in Sweden and Norway of any country in those parts of the world.

All the product of Sweden, except as above, finds no work for women, and therefore it is that in the country villages the women manage the plough and the cart, and till the land as much, and perhaps more, than the men.

As for the men, they are taken up in four employments, in which the women can do no service at all, viz.

1. In the woods, which makes good a proverb in those countries, That the Swedes are born carpenters.
2. In the mines, where they are also very skilful.
3. In the army, where they are acknowledged to be very good foldiers.

4. In the ships; but here they make not the best seamen.

It is almost as natural for the countrymen of Sweden to be carpenters or miners, as it is to children to suck: they take it just as a Dutchman takes to fishing, or as a negro to swim. In the woods their business is with the ax or the saw, felling timber or fawing deals, extracting the tar, turpentine, &c. and making the charcoal: all these are laborious works, fit only for the men: the like is the working in the mines, or at the forges and smelting-huts, which the women can do little or nothing at.

But now they have a woollen manufacture, the women begin to spin and card, and weave; and the children have the winding and spinning too, in their degree; so that many thousands get their bread, who could not do it before. It is true, their own wool being very coarse, they can make no great improvements in this manufacture; but they have wool from Poland, and the cloathing the poor is a trade very advantageous for,

(1.) It furnishes their poor with cloaths much cheaper than they were before, when the country people were cloathed chiefly with sheep's-skins, dressed with the wool on them.

(2.) It employs their own poor, who got nothing before.

(3.) It keeps all that money at home, which went annually abroad for cloathing for the meaner sort of people, which, notwithstanding their sheep-skin dress, was a very great sum. The Swedes have two countries distant from their native one, in which they have still some interest; and these are Finland and Pomeran.

1. In Finland they have very few ports left, having lost Elfsingvas and Wiborg to the Muscovites; however, at Abo, and some other small places remaining to them, they drive a considerable trade in Swedish deals, which are very valuable in England and Holland, being of a good durable and uncommon kind of yellow fir.

Also they export the best masts for ships of any place, except Wiborg, in all those seas. The inland country is famed for good horses, and the Finlanders horse were once esteemed the best cavalry in all Germany.

2. Pomeran: here the Swedes have still the port of Stralsund, which is a very considerable rich trading city, and a good port; and the isle of Rugen is a large, fruitful, and well-cultivated island: and from hence Sweden itself, in times of scarcity, is often supplied with corn.

This country of Pomeran is one of the most considerable in all the seas, for the best oak timber and plank; and the Dutch fetch great quantities hence every year, especially of plank; as also from Stetin, on the north of the Oder, which formerly belonged to the Swedes. The Swedes themselves, also, have the greatest part of the oak timber and plank from hence, with which they build their ships of war at Carelsroon.

They export from this country also great quantities of corn to Holland, and of linseed for making of oil, and also some linen, such as canvas, and other coarse linens; but the Swedes having quitted the Oder to the Prussians, has greatly lessened their trade on that side.

Though Sweden has for many centuries furnished a great part of Europe with those necessary commodities with which it so plentifully abounds, yet either their warlike temper, the idleness, or the ignorance of the inhabitants, has formerly kept them from being much concerned in trade, they having given the management and advantage of it too much to strangers, which was for a long time monopolized by the Hanse-Towns situate on the Baltic Sea, 'till the Seven Pro-

vinces of the Netherlands being erected into a republic, became sharers with them. [See the article HANSE-TOWNS.] Before that time, very little iron was made in Sweden; but the ore, being run into pigs, was transported to Dantzic, and other parts of Prussia, and there forged into bars. The nation owes the greatest improvements it has made in trade, to the art and industry of some ingenious mechanics, whom the cruelty of the duke of Alva drove into these parts. Their success invited great numbers of the reformed Walloons to remove thither, whose language and religion remain in the places they settled in, where they erected forges, and other conveniences for making of iron guns, wire, and all other manufactures of copper, brass, and iron.

The Swedish navigation was very inconsiderable till queen Christina, at the conclusion of the war in 1664, obtained from Denmark a freedom and custom for all ships and merchandize belonging to Swedish subjects, in their passage through the Sound [see the article DENMARK] and established in her own dominions that difference of custom which still subsists between Swedish and foreign ships, and is in the proportion of 4, 5, 6: the first being called whole-free, the second half-free, and the last unfree: so that where a whole-free Swedish ship pays 400 crowns, a half-free one pays 500, and a foreign vessel 600.

But, as great as this advantage was, it had but little effect, till the English act of navigation bridled the Hollanders, and opened the intercourse between England and Sweden. Since that time, their commerce has been much augmented, as well as ours, that way, and goods transported by both, or either party, according to the various junctures of affairs. When Sweden has been engaged in a war, the English ships have had the whole employ: but, in time of peace, the advantage is so great on the Swedish side, and merchants so much encouraged by freedom in customs, to employ their own ships, that English bottoms cannot be used in that trade, but only when Sweden is unprovided with a number of ships sufficient for the transportation of their own commodities.

The general direction of their trade belongs to the College of Commerce, which consists of the president of the Treasury, and four counsellors, who hear causes relating to trade, and redress any disorders that happen. The bank at Stockholm is of great benefit to trade, as well in regard that the king's customs for that city are paid there, as also that the merchants commonly make payments to each other, by bills drawn upon it; which eases them of great trouble in transporting their money from place to place, that would otherwise be very difficult and chargeable. This bank is well constituted, and in good credit, as it has the states of the kingdom for its guarantees. See our article BANKING. The interest of England, in the trade of Sweden, may be computed by the necessity of their commodities to us, and the vent of our's there. Their copper, iron, tar, pitch, masts, &c. cannot be had elsewhere, except from America, from whence such supplies may certainly be furnished: and if so, this consideration ought, in reason, to have an influence on the Swedish councils, and engage them to make the English trade with them as easy as possible, lest we should, in time, cease in the importation of their commodities. As to our exportations thither, they scarce amount to one third of what we import from thence, and consist chiefly in cloth, stuffs, and other woollen manufactures; of which there was formerly vended there, yearly, to the amount of 50,000 l. Besides these, tobacco, Newcastle coals, pewter, lead, tin, fruits, and sugar, with several other of our own commodities, are sold at this market, as also good quantities of herrings from Scotland: so that, in all, we are supposed to vend goods to about 100,000 l. a year; whereof, if any more than one half be paid for, it is extraordinary. But the making cloth in Sweden to supply the army, &c. which had formerly been endeavoured without success, being now encouraged and assisted by the public, and undertaken by some Scots, and others, has proved of late, and does still prove, a great hinderance to the vent of our cloth there. And, to favour this undertaking, English cloth is now (unless it be such fine cloths as cannot be made there) clogged with such excessive duties, as render the importation of it impracticable. The undertakers have got workmen from Germany, and some from England; and, besides the German wool they use, they receive great quantities from Scotland (supposed to be had from England) without which they cannot work. Yet as at present the English trade in Sweden is of the importance above mentioned, notwithstanding the abatements aforesaid, it is considerable, and will be so, while their commodities continue to be necessary to us.

THE EXCHANGES OF SWEDEN, OR STOCKHOLM.

Gives *		To receive †	
* 15 marks,	cop. mon. more or less,	† in France,	1 crown of 60 sols.
24 ditto,	idem	in Holland,	1 rixdol cur. mon.
25 ditto,	idem	at Hamb.	1 rixdollar banco.
18 ditto,	idem	at Cadiz,	128 quartos.

As Stockholm negotiates by exchange only with Amsterdam or Hamburg, the number of days must be stipulated for the bill of exchange to run, after the expiration of which, there are no regulated days of grace.

Merchants keep their accounts in rixdollars, copper dollars, and runticks, reckoning 32 runticks to a copper dollar, and 6 copper dollars to a rixdollar, valued at 3 Polish florins, or about 4 s. 6 d.—They reckon 8 runticks to a mark, and 4 marks to a copper dollar.—They have a silver dollar, which is called the Swedes rixdollar of Germany, or Poland, worth about 2 s. 3 d. sterling.—In this specie the custom of all exported goods must be paid; and it is divided into 32 ore.—The dollar in which the custom of all imported goods must be paid, is the Swedish copper-plate dollars, which are of double the value of the silver dollar, viz. 90 groffen, or 3 Polish gilders, or 4 s. 6 d. sterling; the copper-plate dollar they divide into 48 ore.

The exchange with Hamburg is upon the mark, whereof 20 are reckoned to be par with the specie, or rixdollar banco, of Hamburg, and they give 24 or 25, more or less, of marks, for the said rixdollar.

To Amsterdam they give the same for the rixdollar current. To London they mostly exchange by the way of Amsterdam, or Hamburg; but sometimes exchange may be made directly to London; and then, although they do reckon 20 copper dollars to be par with 20 s. sterling, yet the course is frequently at 28 or 30 of the said copper dollars for the pound sterling; but this rise and fall happen according to the course of trade.

SWEDISH EAST-INDIA COMPANY.

A succinct HISTORY of the SWEDISH EAST-INDIA COMPANY.

It was the ruin of the late Ostend East-India company [see the articles AUSTRIAN NETHERLANDS, and OSTEND EAST-INDIA COMPANY] that gave birth to the establishment of a Swedish one, of which one Henry Koning was the chief author, a rich merchant, and one who had a just notion of the East-India commerce. He represented to the Swedish ministry, that this was a very favourable juncture to undertake a design of this nature; that there were a multitude of places in Africa and the Indies neglected by the Europeans, who had constantly followed one the other, and had scarce ever undertaken to strike out of the ordinary road; that besides, there were numbers of persons who, by the dissolution of the Imperial company of the Netherlands, were thrown out of business, and, which was worse, deprived of the means of returning into their own country, by the steps taken to hinder the Ostend company from carrying on their trade; that, consequently, there could be nothing easier than to procure proper people for carrying this commerce on, and fixing it in such a manner as not to be liable to any hazard, either of loss by trade, or opposition from other powers.

This proposition being maturely considered, it was resolved to authorize this Henry Koning to associate such persons as should be willing to contribute to his design, and to grant them the following privileges, by virtue of a charter, dated June 14, 1731. The king thereby concedes to Henry Koning and his associates, the liberty of navigating and trading to the East-Indies for 15 years, from beyond the Cape of Good Hope to the islands of Japan, wherever they shall think proper or convenient, with this restriction only, that they shall not trade in any port belonging to any prince or state in Europe, without their permission first had and obtained. The ships employed in this commerce shall constantly take in their lading at Gottenburgh, to which port they shall return, with all the merchandize they bring home from the East-Indies, and shall there cause the same to be publicly sold, as soon as conveniently they can. The said Henry Koning and company shall pay to the crown of Sweden, during the said 15 years, 100 dalers per last for every ship they employ, the freight of such ships being measured before their departure from Gottenburgh; which money is to be paid within six months after the safe return of the said ship from the Indies; and they shall likewise pay two dalers per last, in full satisfaction for the town duties.

The said Henry Koning and company may employ, equip, and arm, as many vessels as they shall think proper, provided that those vessels are built or bought in Sweden, and whatever else is necessary for equipping and furnishing them, be had in the Swedish dominions. But in case this should be found at any time impracticable, then the company may provide themselves with ships, or whatever else shall be found requisite for their commerce, wherever they shall think fit, provided always that they give the preference to, and promote, as far as in them lies, the building, manufactures, and produce of Sweden. The said ships shall carry the Swedish flag, and shall be furnished with passports under the king's hand, and also from the republic of Algiers. The said company shall be at liberty to raise what sum they think fit, for the carrying on their commerce, by a voluntary subscription,

or otherwise, as they think proper; and such as shall become subscribers, shall be obliged to pay in their money at the times prescribed, on pain of forfeiting their interest in the said commerce.

The company may transport what ordnance or small arms they think proper; as also SILVER, COINED OR UNCOINED, Swedish MONEY only excepted; and may likewise bring from the Indies what kind of goods or manufactures they think fit, without any restriction whatever. The vessels of the company, when freighted ready to sail, shall not be hindered, on any pretence whatsoever; nor shall they, at their return, be impeded from entering into the port to which they are consigned. The goods of the said company may be transported at their pleasure, from place to place within his Swedish Majesty's dominions, being first furnished with proper passports, without paying any other duties than those before stipulated. The captains of the company's ships shall have the same power for maintaining discipline amongst their crews, as the captains of the KING's ships; and, with respect to trade, they shall conform to the instruction given by Henry Koning and company, provided always, those instructions are not repugnant to the privileges granted by this charter.

The seamen and soldiers entering on board the company's ships shall not be liable to be *pressed* into the king's or any other service; and, on the other hand, it shall not be lawful for the company to take into their service any who shall have deserted that of the crown. The seamen and soldiers belonging to the ships in the company's service, and deserting from them, may be apprehended and detained, but according to the usual forms of laws, and by the hands of the proper officers. The ships belonging to the company being returned, and having landed the merchandize on board them, the said goods shall be duty free, excepting only a very small acknowledgement to be paid upon removing them.

The persons acting under this charter shall constantly chuse out of their number at least three directors, who shall be all men of distinguished probity and known abilities, of which the said Henry Koning shall be one; and, in case of his demise, the members of the company are impowered to make choice of another person in his stead, provided always, that these three directors shall be natives of the kingdom of Sweden, at least naturalized Swedes, Protestants, and resident in the king's dominions, unless necessarily absent in foreign parts, for the service of the company; in which case, the proprietors may substitute another director at home. The said Henry Koning, and his associates, may make such regulations for the management of their commerce as they shall think proper, provided they be agreeable to this charter. They shall render a faithful account to all the persons interested, as well of the profit and loss, as of the capital of the said company; but they shall not be obliged to discover the names of their subscribers, or the sums they subscribed; nor shall they be obliged to produce, or suffer their books to be inspected, on any pretence whatsoever. In case any of the directors shall find that the rest betray their secrets, or are guilty of any other fraud or misdemeanor; they may apply to the Board of Trade for justice and reparation, and, upon due proof, such offender shall be suspended from his office of director, and the company shall be at liberty to chuse another in his room.

In like manner, if any of the proprietors shall find that the said Henry Koning, and the rest of the directors, betray their trust, or are guilty of any frauds, they may make the same application, and obtain the same redress. The said Henry Koning, and company, may employ what number of supercargoes, officers, mariners, or soldiers, they shall think fit, either Swedes or foreigners, who, on their being so employed, shall enjoy the same privileges as if they were born Swedes; and the money employed, either by natives or foreigners, in the capital of this company, shall not be liable to any detention or seizure.

Such persons as are interested in, or employed by, the company, shall be naturalized, according to their respective qualities, upon their applying themselves to the king for that purpose. The said Henry Koning, and company, and such as are authorized by them, in case they are molested, or disturbed in their commerce, by any person, or in any part of the world whatever, shall have full power from his Majesty to obtain ample justice and satisfaction, by all convenient methods, and shall be at liberty to oppose force by force, and to consider such disturbers as pirates, and enemies to the public peace.

His Majesty will grant them these powers, especially in such commissions as their captains shall receive, and in case, notwithstanding, they should be attacked, and suffer any injury or injustice from any nation whatever, in the carrying on of this commerce, his Majesty, upon due information thereof, will grant them his high protection, and endeavour to procure for them speedy and ample satisfaction, either by way of reprisal, or otherwise. The rest of the subjects of the crown of Sweden are expressly prohibited and forbid to engage in, or interfere with, the trade of the said company, under pain

of his Majesty's high displeasure, and the confiscation of their vessels and effects. The king promises to alter or augment these privileges, upon application from the company, as often, and in such manner, as shall be found necessary for promoting the trade to the East-Indies, and the interest of the persons concerned therein.

REMARKS.

There were great expectations formed of this company, for various reasons; first, because they had all the powers granted them that they could reasonably expect or desire. Secondly, Because they were not limited in their capital, but allowed to raise such sums, and in such a manner, as they shall esteem most for their benefit. Thirdly, From their being prohibited from interfering with the commerce of other nations, and thereby running themselves and their country into difficulties and disputes. Fourthly, From their having the king's protection secured to them, in such a manner, and for such purposes, as might serve to answer all good ends, without involving the crown of Sweden in any controversies with the maritime powers, or any other of her allies. And, lastly, Because from the nature of the present constitution in Sweden, there seemed to be as high securities for the properties of such as interested themselves in this affair, as in any other country whatever.

These expectations were greatly heightened, by the company's meeting with no disturbance or opposition from foreign powers, who neither knowing who the subscribers were, or to what their subscriptions amounted, were the less alarmed by this new company; and besides, seeing themselves secure from any apprehensions of their interfering with the trade already established in the East-Indies, found it more difficult to assign any rational cause of complaint; to which we may add, that the company going on very slowly at the beginning, and being a long time before they completed their subscriptions, or prepared to fit out ships for the Indies, it was generally believed, both in England and Holland, that the design would come to nothing, and the company would vanish of itself.

But though the author of this design, M. Henry Koning, and his associates, were not hasty in equipping ships for the Indies, yet they took care to provide themselves in every respect with what might be found necessary for carrying on their scheme with success. They built for this purpose two very large and strong ships, one called after the king, the Frederick, the other by the name of the queen, the Ulrica. These they furnished in such a manner, as to be equally fit for trade or for defence. They made choice of such supercargoes as had not only established characters both for honesty and abilities, but were likewise well versed in the particular business in which they were to be employed, and men of experience in the trade to China. They proceeded with no less caution in the choice of their officers and mariners; and though they spent full two years in making preparations, yet that loss of time was well compensated, by the exactness with which those preparations were made: so that at the time their ships left the harbour of Gottenburgh, they were as well equipped, and in all respects as completely furnished for an East-India voyage, as any that were employed in that trade by the maritime powers; and the same care and diligence they have used ever since: so that it may, with great truth, be said, that as scarce any company was better established at first, so the affairs of none have been hitherto better conducted.

Their first voyages, though not attended with so much eclat as might have been expected, were, however, tolerably successful; and the company established their factory on the river of Canton in China, with the consent of the Chinese, who were very well pleased with their new comers, and well disposed to favour and promote their trade; so that they were very soon on the same footing there with other European nations. At home; indeed, they met with some difficulties; for the company being obliged to make use of a great many foreigners in all capacities, for the better carrying on of their trade, and there being no nation in Europe naturally more jealous of foreigners than the Swedes, this occasioned a great clamour, especially among the common people, which, however, was in some measure got over, by publishing an order, that at least two thirds of the mariners should be, for the future, natives of the kingdom; and as the execution of this order was apparently attended with great inconveniences, it convinced even the vulgar of their mistake, and that the company had done no more than what they were warranted to do by their charter, and what the circumstances of their affairs, more especially at the beginning, rendered not only expedient, but necessary.

Since that time, the Swedish company have been very regular, both in fitting out their ships, and in their returns, which being sold to foreigners, have brought in great sums of money to the kingdom; yet, inasmuch as a great part of this money has been exported again, for the carrying on this trade, a new complaint has been created thereby, in respect to the silver carried to the East-Indies. We need the less

admire

admire at this in Sweden, because, though the trade of the kingdom is not large, yet it produces annually a considerable balance in ready money, as is known experimentally here, since it is certain that two-thirds of the trade we carry on thither is managed with READY MONEY only; and it is also pretty much the same thing with other nations who trade thither, the French only excepted, who have a balance in their favour from the Swedes, which, however, has gradually grown less and less, in proportion as they have taken more naval stores of them of late years, than they did formerly; and as their subsidy treaties bring in considerable sums to Sweden, or at least keep the money there, that would otherwise be employed in discharging the balance of trade: so that the Swedes being used to see great sums of money brought in by every other branch of commerce, and being not so immediately acquainted with the profits arising from this, are the less disposed to consider it as nationally advantageous.

SWITZERLAND is surrounded by the territories of France, Germany, and Italy: it is separated from other countries by high mountains. It is divided into various cantons and free provinces, too well known to need a minute description here. Every canton, or province, in summer affords good pasture to the sheep, and in some of them there are ploughed fields. A considerable part of the cantons, especially that of Bern, the largest and most considerable, is a plain fruitful country, abounding in corn. The largest rivers in Europe have their source from these mountains, particularly the Rhine, the Rhone, the Danube, the Rufs, and the Inn; and there are many extensive lakes, as those of Constance and Geneva: here are also abundance of fine woods, especially of pine and fir-trees. The soil produces some corn and wine, though not in great quantity, and the fruits of the earth are frequently destroyed by storms or cold rains. They abound most in cattle, wherein they carry on no inconsiderable trade in the neighbouring countries; and their lakes abound with plenty of fish.

A flourishing trade is not to be expected in a country situate like this, out of the reach of the sea, and among mountains, passable only by mules, without native commodities sufficient to export, and without any peculiar genius in the natives to erect manufactures. However, the towns of Zurich, Basil, Schaffhausen, Geneva, and St Gall, carry on a pretty general traffic; the first and last of which have some manufactures: and Basil and Schaffhausen, being situate on the frontiers of the empire, are convenient magazines for merchandise to be exchanged between France, Italy, and Germany; which trades bring employment and profit to the inhabitants, among whom are some considerable merchants.

The Switzers not having a competency of wine or corn within themselves, are supplied with both from the Milanese, and the circle of Swabia; and the Tirol, Franche Comté, and Bavaria, supply them with salt. The sovereign of each canton is the general salt-merchant, and profits by retailing it.—Their necessaries for apparel and furniture come likewise from abroad.—They make, indeed, some coarse stuffs for cloathing their peasants, but their other people are generally clothed with the manufactures of other countries. Specie, either of gold or silver, is very scarce in the circulation of their commerce, from its being locked up in those cantons that have

a public treasury, and for want of proper occasions to place it at interest on good security; which induces monied people, as well as their public treasuries, to put it into foreign funds for interest sake.—In consequence of their situation and circumstances, it is no wonder that the balance of trade is against these people; which has put them under the necessity of preventing the consumption of foreign commodities, by sumptuary laws, which prevent the wear of jewels, gold and silver, silk, thread, lace, and what is costly in apparel; yet these measures prove no effectual remedy against their exportation of specie: nor can any effectual remedy be found for this, but by establishing manufactures, which was attempted by numbers of French Protestants, who formerly retired hither from persecution; but, for want of due protection and encouragement, and even toleration by the native citizens, who were weak enough not to suffer foreigners to exercise their trade in any of their capital cities, they were forced to carry their arts and trades to other countries: and they being but very mean workmen themselves, there is little hopes, from this mistaken policy, of seeing any considerable manufactures flourish in these cantons. So ridiculously obstinate are these people to their trading interests, that the poor nobility of the canton of Zurich may not engage in trade without degrading themselves. See the astonishing folly hereof, under our articles COMMERCE, FRANCE, ARTIFICERS, and MANUFACTURERS.

Of the EXCHANGES of ST GALL.

Usances, in regard to the payment of bills of exchange, is reckoned at 14 days after sight. The days of grace are not regulated there, bills of exchange, according to rigour, being payable 24 hours after the expiration of the usance. Some traders keep their accounts in florins, kruitzers; and fenings, money of St Gall; or in florins, kruitzers, and fenings, money of the empire. The florin is 60 kruitzers, and the kruitzer 4 fenings. The effective rixdollar is 102 kruitzers, money of St Gall; the crown of the empire is 2 florins, money of the empire, or 106 kruitzers, money of St Gall. The money of St Gall is regulated, at present, at 106 kruitzers. In this money they exchange on the following places:

ST GALL	
Gives *	To receive †
*58 kruitz. more or less,	† at Paris, 1 crown of 60 sols.
103 ditto, idem,	at Amster. 1 rixdollar banco.

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE, continued from the End of Letter R.

SAIL-CLOTH.

SAIL-CLOTH, British-made, the BOUNTY AND REGULATIONS thereon.

— British-made, for which bounty has been given on exportation, afterwards reloaded, is forfeited; and every person concerned in bringing back, or reloading the same, forfeits 2s. for every ell. 12 Ann. c. 16. §. 3. and 27 Geo. II. c. 18. §. 6.

— Every ship or vessel built in Great-Britain, or his Majesty's plantations in America, upon her being first navigated, is to be furnished with a complete set of NEW SAILS of SAIL-CLOTH MANUFACTURED in Great-Britain, which shall, bona fide, belong to such ship, on forfeiture of 50l. by the master thereof. 9 Geo. II. c. 37. §. 4 and 19. c. 27. §. 11 and 24.—c. 52. §. 3 and 26.—c. 32. §. 3.

— Every manufacturer must affix or impress a stamp, containing his name and place of abode, on every piece of fail-cloth made by him. 9 Geo. II. c. 37. §. 3.

— If any person shall sell, or expose to sale, or work up into fails, any piece of British fail-cloth, without BEING SO STAMPED, and be convicted thereof by the oath of a credible witness, before one or more justices of the peace of the

VOL. II.

county, &c. where the offence is committed, he is to forfeit 10l. for every piece. 9 Geo. II. c. 37. §. 3.

— Any person wilfully cutting off, or obliterating such stamp, or using a stamp containing the name and place of abode of any other person, is upon conviction to forfeit 5l. for every offence, to be recovered by distress and sale of the offender's goods, by warrant from two or more justices, to be applied to the use of the informer. 9 Geo. II. c. 37. §. 3.

— Or canvas, foreign made, usually entered as HOLLAND-DUCK or vitery canvas, fit to be made use of for making fails, upon importation thereof into Great-Britain, to be stamped at landing by a stamp, to be provided by the commissioners of the customs, of eight inches diameter, dipped in red-lead, mixed with linseed-oil well boiled, expressing the place and port where they are entered. 19 Geo. II. c. 27. §. 5, 6. and 26 Geo. II. c. 32. §. 3.

— For counterfeiting such stamp, or the impression, or knowingly selling any foreign fail-cloth with a counterfeit stamp, the penalty is 50l. 19 Geo. II. c. 27. §. 6. and 26 Geo. II. c. 32. §. 3.

— No person in Great-Britain, or his Majesty's plantations in America, may make into fails or tarpaulins any foreign fail-cloth or canvas, not so stamped, on forfeiture thereof;

10 K

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

thereof; and the person so offending, on conviction thereof by the oath of a credible witness before a justice of the peace of the county, &c. where the offence is committed, is to forfeit 50*l.* for every fail or tarpawling, for the use of the informer; to be levied by distress, and sale of his goods, by a warrant from two justices of the peace of the county, &c. where the offence is committed; and for want of such distress, to be committed to gaol for six months, or until he pays the penalty. 19 Geo. II. c. 27. §. 7. and 26 Geo. II. c. 32. §. 3.

— Any person making up foreign fail-cloth or canvas into fails, must place the stamps, on the after side of such fails, and in such manner, that the number of stamps may appear proportionable to the number of bolts or pieces in each fail, on forfeiture of such fails, and 10*l.* for every offence. 19 Geo. II. c. 27. §. 8. and 26 Geo. II. c. 32. §. 3.

— No person may alter or mend a fail of foreign fail-cloth or canvas, not so stamped, on forfeiture of 20*l.* 19 Geo. II. c. 27. §. 9. and 26 Geo. II. c. 32. §. 3.

— Every fail-maker, or other person in Great-Britain, or his Majesty's plantations in America, must impress, on every new fail he makes, a stamp of eight inches diameter, dipped in lamp-black mixed with linseed oil well boiled, containing his name and place of abode in plain and distinct letters and words at length, on forfeiture thereof, and of ten pound for every new fail delivered to any captain or master of a vessel without such stamp. 19 Geo. II. c. 27. §. 10. and 26 Geo. II. c. 32. §. 3.

— Sail-cloth of the manufacture of Ireland, imported into Great-Britain, (during the continuance of a bounty on exportation granted by an act of the parliament of Ireland, 19 Geo. II.) is subject to a new duty. 23 Geo. II. c. 32. §. 1. 3.

— No canvas or fail-cloth may be imported from Ireland, but in whole and entire bolts or pieces; and if the loops or double threads of the bolts (which are directed to be part of the warp in the middle of that end of the web, which is last in weaving) are cut off; or if the bolts have a stamp importing the payment of either of the bounties, they shall be deemed to have received the bounty. 23 Geo. II. c. 32. §. 2.

— If any dispute arises about the duty, which ought to be paid, such duty is to be ascertained in the same manner, and under the same forfeitures and penalties, as upon goods subject to payment of duty ad valorem. 23 Geo. II. c. 32. §. 5.

— Upon the importation of canvas, or fail-cloth, from Ireland, the proper officer of the customs may open, view, and examine the same; and if it appears, that the said bounty has been paid, and no regular entry made at importation, the canvas or fail-cloth so omitted to be entered shall be forfeited, and may be seized by any officer of the customs. 23 Geo. II. c. 32. §. 4.

WITH REGARD TO SAILS.

Sails.— Every master of a vessel, belonging to any of his Majesty's subjects, navigated with, or having on board, any foreign-made sails, is, at the time of reporting his ship, to make an entry and report upon oath of every such fail, and, before the ship is cleared, to pay for them the same duty as by 12 Ann. cap. 16. is laid upon foreign-made sails imported by way of merchandize, on forfeiture of the fails to his Majesty, and 50*l.* for every offence by the master; and such fails are to be stamped at the port of entry, in the same manner as directed for foreign fail-cloth. 19 Geo. II. c. 27. §. 1. 2. and 26 Geo. II. c. 32. §. 3.

— But if the master, before the ship is cleared, declares his intention of not paying the duty, and delivers up the fails to the officer of the customs, the fails only are to be forfeited. 19 Geo. II. c. 27. §. 3. and 26 Geo. II. c. 32. §. 3.

— No captain of a ship coming from the East-Indies liable to this duty or forfeiture for any foreign-made sails, bona fide, brought from the East-Indies. 19 Geo. II. c. 27. §. 4. and 26 Geo. II. c. 32. §. 3.

— Pecuniary penalties and forfeitures by this act (not otherwise directed and applied) may be prosecuted in any of his Majesty's courts of record in Great-Britain, or such of his Majesty's plantations in America where the offence is committed; one moiety to his Majesty, the other to the prosecutor. 19 Geo. II. c. 27. §. 12. and 26 Geo. II. c. 32. §. 3.

WITH REGARD TO SALT.

SALT—Ships laden with salt, hovering on the coast, and not proceeding directly to some port, may be compelled, by the officers of the customs or salt duties, to come into port; officers to continue on board till the salt is unladen, or the ship departs for her intended voyage; neglecting to enter and unlade the salt, or to proceed on her voyage in 20 days, the salt forfeited, and double the value to be recovered of the master. 1 Ann. c. 21. §. 7. and 5 Geo. II. c. 6. §. 1.

— Officers of the customs or salt duties may search any vessel lying in port, or riding on the sea coasts; and if any salt, not duly entered, be found on board any vessel in which it was not imported, it is forfeited, or the value, and the master is subject to the same penalties and forfeitures as if it had been landed without entry. 5 Geo. I. c. 18. §. 22.

— Officers obstructed, every offender is to forfeit 40*l.* 5 Geo. I. c. 18. §. 22.

— Neglecting or refusing to enter or unlade salt for the space of 20 days after a ship is come into port, or within that time to depart and proceed regularly on her voyage to some other place (unless permitted to make longer stay by the chief officer of the customs, the salt on board is forfeited, and double the value to be recovered of the master. 1 Ann. c. 21. §. 7.

— Imported in ships under 40 tons, or otherwise than in bulk (except for the ship's provisions) forfeited, and double the value. 1 Ann. c. 21. §. 8. and 5 Geo. II. c. 6. §. 1.

— Of the produce or manufacture of Great-Britain or Ireland, or other salt coming from Ireland, or the Isle of Man, may not be imported, or brought into any port or place of Great-Britain, nor taken out of any ship or vessel, nor put on shore within any of the said ports or places, upon forfeiture thereof, together with the vessel, and all her tackle and apparel. 2 and 3 Ann. c. 14. §. 1. and 5 Ann. c. 8. art. 2.

— Persons delivering, conveying or assisting, forfeit 20*l.* each, or six months imprisonment. 2 and 3 Ann. c. 14. §. 1. and 5 Ann. c. 8. art. 2.

— Such salt may be seized within two months; and if not claimed within 20 days, and security given for the value, the salt and ship are to be sold to the best advantage. 2 and 3 Ann. c. 14. §. 2.

(Salt (from Ireland or other foreign parts) taken in for the necessary provision of the ship, or for curing fish, which may be landed; but entry thereof must be made within 10 days after coming into port, and the duties paid or secured before landing, upon forfeiture, and double the value. 2 and 3 Ann. c. 14. §. 6. and 5 Geo. I. c. 18. §. 18.

Except — Salt regularly entered and exported to foreign parts, and the ship forced in by stress of weather, &c. in which case the salt may be landed within 20 days after coming in, provided the duties be again paid down (before relanding) for the whole quantity of salt entered for exportation. 2 and 3 Ann. c. 14. §. 4.

(— Carried coastwise by certificate. 2 and 3 Ann. c. 14. §. 3.

Except — Taken in by fishermen to cure fish at sea, upon oath before the salt-officer, that it was taken on board from some port in Great-Britain, mentioning the place, and not out of any vessel at sea. 2 and 3 Ann. c. 14. §. 5.

— Imported from Jersey, Guernsey, Sark, and Alderney, liable to the same duties as any other foreign salt. 5 Geo. I. c. 18. §. 11.

— From Ireland, or other foreign parts, though taken on board for necessary provision for the ship, or for curing fish, not entered within ten days after coming into port, and before the landing, &c. is forfeited, with double the value by the master of the ship, or the owner of the salt. 2 and 3 Ann. c. 14. §. 6. and 5 Geo. I. c. 18. §. 18.

— Foreign, landed before entry, and the excise duty be satisfied, or without a warrant from the collector, or officer appointed for the duty on salt, is forfeited, or the value thereof, and 10*s.* per bushel; and every person concerned is to forfeit 100*l.* 5 and 6 W. III. c. 7. §. 4. and 5 Geo. I. c. 18. §. 24. and 9 and 10 W. III. c. 44. §. 6. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— The persons in whose custody such salt is found are liable to the same penalties, as if they had been the importers, unless they make it appear from whom they had it. 1 Ann. c. 21. §. 3.

— Imbezzled after importation, and before warehousing, the forfeiture is 20*s.* for every bushel of 84*lb.* 5 Geo. I. c. 18. §. 4. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Cellared and locked up, may not be removed without a warrant or permit for the conveyance, upon forfeiture thereof, besides 10*s.* per bushel, and 20*l.* for every such offence to be recovered of the importer, and of every person concerned in the removal. 5 Ann. c. 29. §. 2.

— Importers to be charged with the full quantity of salt cellared, though upon clearing such cellar or warehouse there may appear to be a deficiency. 5 Ann. c. 29. §. 17.

— At the end of every fishing season, the officer is to take an account of the salt remaining, which must be forthwith locked up as before; and the proprietors are to deliver them an account, upon oath, of the quantity of fish exported (confirmed

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

(confirmed by a certificate of the officers of the port of exportation) or of the red or white herrings entered for home consumption, on which the said salt had been used. But as to white herrings sent to foreign markets, immediately sent from sea, without being brought into port by the society of the Free British Fishery, the quantity is to be ascertained by the oath of the society's superintendent before a justice of the peace, or officer of the salt duties; and a certificate under the hands of their secretary and accountant, either that it appears by the letters or accounts from their correspondents or agents, to whom such fish were consigned, that they have come to their hands, or that such fish have been lost at sea. 5 Geo. I. c. 18. §. 1. and 8 Geo. I. c. 4. §. 3. 10 and 8 Geo. I. c. 16. §. 3. 6. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1. and 26 Geo. II. c. 9. §. 5. 6.

— But if delivered over by the proprietors to any other persons for the curing of fish, it must be so expressed in his accounts, and made appear by oath or otherwise, that it was so used, upon forfeiture of 50l. and the persons to whom delivered must, upon oath likewise, give an account of the salt by them used in the curing of fish exported; confirmed by the certificate of the officers of the port of exportation. 5 Geo. I. c. 18. §. 1. and 8 Geo. I. c. 4. §. 10. and 11 Geo. I. c. 30. §. 41. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Such salt not so accounted for within 3 months after the expiration of each year, the forfeiture is 10s. per bushel. 5 Geo. I. c. 18. §. 1. and 8 Geo. I. c. 4. §. 10. and 11 Geo. I. c. 30. §. 41. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Such salt as cannot be accounted for, having been sold, given away, or used for any other purpose, the proprietor, or the persons to whom delivered, and the buyer, are each of them to forfeit 20s. per bushel; 1-3d to the use of his Majesty, and the remainder to the informer or suer. 5 Geo. I. c. 18. §. 2. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— In default of payment within 14 days, if sufficient effects cannot be found, the offenders must be sent to the house of correction, for any time not exceeding three months. 5 Geo. I. c. 18. §. 2. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Fish cured with salt, delivered out of warehouses, not exported while good and merchantable, may be destroyed in the presence of an officer, and his certificate thereof accepted instead of that for exportation. 3 Geo. I. c. 4. §. 4.

— Foreign salt from Scotland into England, and all salt brought coastwise — May not be delivered, nor a warrant granted for the landing, till certificate of the true quantity on board, signed by the custom and salt officers of the loading-port, be produced to the salt-officer of the delivering-port, and oath be made before the salt-officer by the master, mate or boatwain, that to his knowledge there has not been taken on board any salt since he came from such port, upon forfeiture of double the value, and 10s. per bushel. 5 and 6 W. and M. c. 7. §. 9. and 9 and 10 W. III. c. 44. §. 12. and 5 Geo. I. c. 18. §. 20. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Part only of such salt landed, and the ship proceeding with the remainder, the quantity delivered must be certified by the officers, on the back on the cocket, transire or other warrant, or else by a separate certificate under the hand and seal of the officers. 5 and 6 W. and M. c. 7. §. 9. and 9 and 10 W. III. c. 44. §. 12. and 5 Geo. I. c. 18. §. 20. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Officers at the delivering port may demand a sight of the permit and cocket, and are to weigh the salt upon unloading; and if found to be more in weight than expressed in such permit and cocket, the surplusage is forfeited. 10 and 11 W. III. c. 22. §. 12, 13. and 5 Geo. I. c. 18. §. 21. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Matters refusing to shew the permit and cocket, the salt may be seized and detained; and if not produced within four days, the salt is forfeited. 10 and 11 W. III. c. 22. §. 12, 13. and 5 Geo. I. c. 18. §. 21. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— For which the duties have been drawn back, fraudulently relanded, without entry and repayment of the duties; the offender is to forfeit double the value thereof, and 10s. per bushel, and to be subject to such other penalties and forfeitures, as in case of foreign salt illegally landed. 5 and 6 W. and M. c. 7. §. 20. and 9 and 10 W. III. c. 44. §. 27. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Landed in Ireland, not to have any drawback, unless entered outwards for some port in Ireland. 5 Ann. c. 29. §. 13. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Shipped for Ireland — Debentures not to be made out, nor draw-backs allowed, till a certificate, under the hand of the collector of some port in Ireland, of the particular quantity there landed, be produced; the draw-back may not be allowed for any more than such quantity. 1 Ann. c. 21. §. 11. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

Except { — The allowances for waste, being four bushels for every 40 bushels of white salt, and two bushels for every 40 bushels of rock salt, 5 Ann. c. 29. §. 14.

— Shipped for Ireland, and lost at sea by sinking of the ship, or taken by enemies; upon due proof made within two years, by the oaths of two credible witnesses before the justices of the peace at the general quarter-sessions, and their certificate thereof produced, the draw-back may be allowed, or the security vacated. 4 and 5 Ann. c. 12. §. 11. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1. and 26 Geo. II. c. 32. §. 7.

— After put on board any boat, barge, &c. in order to be exported to foreign parts, may not be taken out, unless to be put into the ship wherein it is to be exported; nor landed in Great-Britain, except in the presence of a salt-officer, upon forfeiture of the boat, &c. goods, and 20l. by every person concerned, or six months imprisonment. 5 Geo. I. c. 18. §. 23. and 26 Geo. II. c. 3. §. 1.

— Ships laden with salt to be exported, drove into port by stress of weather, or other unavoidable necessity, salt-officers may go and remain on board till the salt be re-entered, or the ships proceed on their voyages. 1 Ann. c. 21. §. 12. and 2 and 3 Ann. c. 14. §. 4. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Such salt may be relanded, within 20 days, upon due entry and repayment of the duty for the whole quantity entered outwards. 1 Ann. c. 21. §. 12. and 2 and 3 Ann. c. 14. §. 4. 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Refusing officers to come on board, penalty 20l. 1 Ann. c. 21. §. 12. 2 and 3 of Ann. c. 14. §. 4. 5 Geo. II. c. 6. §. 1. 26 Geo. II. c. 3. §. 1.

— Unladen before due entry, or repayment of duty forfeited, with the whole cargo remaining on board. 1 Ann. c. 21. §. 12. and 2 and 3 Ann. c. 14. §. 4. and 5 Geo. II. c. 6. §. 1. and 2 Geo. II. c. 3. §. 1.

— Shipped for exportation, or to be carried coastwise — The particular quantity must be expressed in the cocket, which must be signed by the salt-officer, and given without fee or delay; and if the ship puts into any port of Great-Britain, the officers of the customs and salt duty may demand a sight thereof; and upon oath made before the collector or customers, that they have just cause to suspect that there is less on board than expressed in such cocket, the salt may be weighed. 1 Ann. c. 21. §. 13.

— If, upon weighing, a deficiency be found, after a reasonable allowance made for waste, &c. the remainder is forfeited. 1 Ann. c. 21. §. 13.

— Shipped for exportation, or to be carried coastwise — Perishing by the sinking of the ship before gone out of port, and before the exporter is entitled to the drawback; upon proof of such loss before the justices of the peace at the general quarter-sessions, they are to grant the exporter or proprietor a certificate thereof; which being produced to the officers, they are to permit the like quantity, therein mentioned, to be bought, without payment of any duty of excise. 2 and 3 Ann. c. 14. §. 10.

— Or such salt lost, in carrying down the river to be shipped for exportation, or lost after it is so shipped, and before the exporter is entitled to a debenture, and proof thereof made as above, the certificate shall be applied by the collector of the duties on salt to discharge and vacate the security given for the duty of so much as appears thereby to be lost. 26 Geo. II. c. 32. §. 6.

— Not to be shipped in order to be sent coastwise by a retailer or shopkeeper, till it be made appear, by oath or otherwise, before the officers, that the duty has been paid, or secured to be paid, or that it was bought of some other retailer, or shopkeeper, that had paid the duty. 5 and 6 W. and M. c. 7. §. 3. and 9 and 10 W. III. c. 44. §. 11. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Upon re shipping from any boat, &c. on board any ship, to be carried coastwise, the master of the boat, &c. must, before any dispatches be granted, make oath before the salt-officer, that it is truly re-shipped, and not augmented or diminished, upon forfeiture of double the value, and 10s. per bushel. 5 Geo. I. c. 18. §. 25. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Belonging to British subjects that have paid the duty, perished or lost in any port of Great-Britain, or shipped coastwise, and lost at sea by storms, &c. upon proof of such loss, and that it was not occasioned by leakage or negligence, made by the oaths of two or more credible witnesses (whereof the master or mate to be one) before the justices of the peace at the general quarter-sessions, they are to grant a certificate of such proof being made; which being produced to any of the officers appointed to collect the duty upon salt, he is to permit the like quantity to be bought free of excise. 5 and 6 W. and M. c. 7. §. 21. and 9 and 10 W. III. c. 44. §. 28. and 2 and 3 Ann. c. 14. §. 18. and 8 Geo. I. c. 4. §. 11. and 5 Geo. II. c. 6. §. 1. and 26 Geo. II. c. 3. §. 1.

— Imported,

moiety of the rate or value thereof is to be for the use of his majesty, his heirs and successors, and the other moiety to the person that seizes, informs, or sues for the same. 12 Car. II. c. 4. §. 4. and the several other acts quoted for goods inwards (art. 25.) and those which inflict the forfeitures and penalties.

—Except in { Alamodes, arrack, brandy, calicoes, cat-
tle, coin, East-India goods coastwise in-
the following { wards, mullins, plantation goods, South-
casles, viz. { seas, tea, tobacco, wool.

—On all trials of seizures, the seizure, together with the method and form of making it, shall be taken to have been done in the manner as set forth in the information, without any evidence thereof; and all judges and justices of the peace are to proceed to the trial of the merits of the cause, without enquiring into the fact, form, or manner of making the seizure. 9 Geo. II. c. 35. §. 34.

—In any information brought to trial, on account of the seizure of any ship or goods, as forfeited, wherein a verdict is found for the claimer, if it appears to the court there was a probable cause of seizure, and is so certified upon the record, the defendant shall not be intitled to any costs, nor the seizer liable to any action, indictment, or prosecution. 19 Geo. II. c. 34. §. 16. and 26 Geo. II. c. 32. §. 1.

—In any action, indictment or prosecution, brought against any person for seizing any ship or goods, wherein a verdict is given against the defendant, if the court shall certify upon the record, that there was a probable cause of seizure, the plaintiff, besides his ship or goods, or the value thereof, shall not be intitled to above two-pence damage, nor to any costs, nor the defendant fined above one shilling. 19 Geo. II. c. 34. §. 16. & 26 Geo. II. c. 32. §. 1.

—The produce of the seizures of prohibited and uncaptured goods is to be applied towards the support of his majesty's household, and of the honour and dignity of the crown. 1 Geo. II. c. 1. §. 4.

The LAWS of the CUSTOMS, with regard to SHEEP.

SHEEP—Lambs or rams, alive, exported: for the first offence the exporter, his aiders or abettors, are to forfeit all their goods for ever, and to suffer a year's imprisonment, without bail or main-prize; and then to have their left hands cut off in a market-town, upon a market-day, and be there publicly nailed up. 3 Hen. VII. c. 2. §. 1. & 8 Eliz. c. 3. §. 1, 2, 4.

—Persons offending a second time, are to be adjudged felons, and to suffer death accordingly. 3 Hen. VII. c. 2. §. 1. 8 Eliz. c. 3. §. 1, 2, 4.

—The offences to be heard and determined by the justices of oyer and terminer, gaol-delivery, and justices of the peace. 3 Hen. VII. c. 2. §. 1. & 8 Eliz. c. 3. §. 1, 2, 4.

The chief LAWS of the CUSTOMS with respect to SHIPS.

SHIPS INWARDS, of 50 tons, or under, laden with customable and prohibited goods, hovering on the coasts within the limits of any port, or if laden with brandy, within two leagues of the shore, pretending to be bound to foreign parts, and not proceeding on their voyages, the master may be compelled to give security in treble the value of the goods, to proceed and to land them in foreign parts: on default whereof, (unless permitted by the collector to make a longer stay, which must not exceed 20 days) the goods must be secured, and the duties paid; or if they are wool, or such goods as are prohibited, they will be forfeited. 5 Geo. I. c. 11. §. 8. & 27 Geo. II. c. 18. §. 4.

—After the goods are brought on shore, and secured by the officers, the bond must be delivered up. 5 Geo. I. c. 11. §. 9. & 27 Geo. II. c. 18. §. 4.

—Or if not brought on shore, upon producing a certificate, under the common seal of the chief magistrate of any place beyond the seas, or under the hands and seals of two known British merchants there residing, testifying the landing, or upon due proof that the goods were taken by enemies, or perished at sea, the said bond is to be vacated and discharged. 5 Geo. I. c. 11. §. 9. & 27 Geo. II. c. 18. §. 4.

—Masters of such ships suffering foreign goods to be put out, or wool, woolfells, mortlings, shortlings, yarn made of wool, wool-flocks, fuller's earth, fulling-clay, or tobacco pipe clay, to be taken in, besides former penalties, are to suffer six months imprisonment, without bail or main-prize. 6 Geo. I. c. 21. §. 32.

—The tonnage of such ships is to be measured and ascertained by the following rule, viz. Take the length of the keel within board (so much as the treads on the ground) and the breadth within board by the midship beam, from plank to plank, and half the breadth for the depth: then multiply the length by the breadth, and that product by the depth, and divide the whole by 94; the quotient will give the true contents of the tonnage. 6 Geo. I. c. 21. §. 33.

—Freighted towards Great-Britain or elsewhere, may not be compelled to come into any port of Great-Britain, nor to tarry there against the wills of the masters, &c. and if such ship comes voluntarily, or be driven in, part of the goods

VOL. II.

may be delivered, and the duties paid, and the ships be permitted to proceed with the remainder, where the masters, &c. please, without payment of duties. 28 Edw. III. c. 13. §. 3. & 20 Ric. I. c. 4. §. 1.

—But no brandy, or other spirits, in casks less than 60 gallons, can be reported for exportation. 28 Geo. II. c. 21. §. 1.

—In distress—Upon application by, or on behalf of, the commander of any ship stranded, or being in danger of stranding, sheriffs, or the deputies, justices of the peace, all mayors, bailiffs, or other head officer of the corporations and port-towns, constables, headboroughs, tything-men, officers of the customs or excise, coroners, and commissioners of the land-tax, are required to command the constables of the several ports nearest the place to summon persons to assist in preserving such ships and cargoes; and the officers of the customs, and said constables, may command ships, riding at an anchor near the place, to assist by their boats, and as many hands as they can conveniently spare: commanders of such ships, refusing or neglecting their assistance, forfeit 100l. to the commander of the ship in distress. 12 Ann. sess. 2. c. 18. §. 1. & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 6, 9, 16.

—Persons acting in the preservation of such ships and cargoes, are to be rewarded within thirty days; on default whereof, the ships and cargoes may be detained by the officers of the customs; and in case of dispute about the quantum for such service, three justices of the peace may adjust the same. Provided no person appears to claim the goods so saved, the chief officer of the customs, in the next port, shall apply to three of the nearest justices of the peace, who shall put him, or some other responsible person, in possession thereof; and if not claimed within twelve months, are to be publicly sold (or, if the goods be perishable, forthwith sold); and after deduction of charges, the residue is to be transmitted into the exchequer, there to remain, to be applied for by the proprietor. 12 Ann. sess. 2. c. 18. §. 2. & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 16.

—Persons not empowered, entering, or endeavouring to enter, ships in distress, or molesting the preservation thereof, or defacing the marks of goods saved, before an account thereof be taken, are to make double satisfaction within twenty days, or else to be put to hard labour for 12 months. Persons entering such ships without leave, may be repelled by force. 12 Ann. sess. 2. c. 18. §. 3. & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 16.

—Goods saved from ships in distress, stolen, or carried off, the person on whom found is to restore them to the proprietor, upon forfeiture of treble the value. 11 Ann. sess. 2. c. 18. §. 4. & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 16.

—Holes made in the bottoms, &c. of ships in distress, the pump taken away, or any thing done tending to the destruction thereof, the persons so offending are to be made guilty of felony, without benefit of clergy. 12 Ann. sess. 2. c. 18. §. 5. & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 16.

—Officers of the customs abusing the trust hereby reposed in them, are to forfeit treble damages to the party aggrieved, and to be rendered incapable. 12 Ann. sess. 2. c. 18. §. 7. & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 16.

—In distress, wrecked, stranded, or cast on shore, in his majesty's dominions (whether any living creature be on board or no) any person convicted of plundering, taking away, or destroying any goods or merchandize, furniture, tackle, apparel, provision, or part belonging to her; or of beating, or wounding, with intent to kill; or obstructing the escape of any persons endeavouring to save their lives from her; or of putting out false lights, with intent to bring any vessel into danger, is to suffer death as a felon, without benefit of clergy. 26 Geo. II. c. 19. §. 1.

—But if the goods or effects stranded, lost or cast on shore, are of small value, and stolen without circumstances of cruelty, outrage, or violence, the offender may be prosecuted by indictment for petit larceny, and punished accordingly. 26 Geo. II. c. 19. §. 2.

—Such goods being stolen, upon information upon oath before a justice of the peace, of their being unlawfully conveyed away, or concealed in any place, or of some reasonable ground of suspicion thereof, such justice may grant warrants for search; and if they are found there, or in custody of any person not legally intitled to keep them, the owner or occupier of the place, or the person upon whom they are found, not immediately delivering them upon demand to the owner or person lawfully authorized to demand them, or not giving a good account how he came by them, is to be committed to gaol for six months, or until he pays the owner treble the value of the goods. 26 Geo. II. c. 19. §. 3.

—Such goods stolen, or suspected to be so, and offered to sale, may be stopped and seized by the person to whom they are offered, or by any officer of the customs or excise, or any peace officer, who must carry them, or give notice of the seizure, to a justice of the peace; and if the person who offered them to sale does not, within ten days, prove, to the

10 L

statu-

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

satisfaction of the justice, the property to be in him, or the person who employed him, the goods, by order of the justice, are to be delivered over to the use of the owner, upon payment of reasonable reward for the seizure, to be ascertained by the justice, who is also to commit the person who offered them to sale to gaol for six months, or until he has paid tithle the value of the goods to the owner. 26 Geo. II. c. 19. §. 4.

—Any person not employed by the master, mariners, or owners, or persons lawfully authorized, who, in the absence of those who are so, shall save any ship or effects, and cause them to be carried into port, or to any custom-house near, or other place of safe custody, immediately giving notice thereof to some justice of the peace, magistrate, or custom-house or excise officer, or shall discover to them where such effects are wrongfully bought, sold or concealed, shall be entitled to a reasonable reward from the master or owners, to be adjusted, in case of disagreement, in the same manner as salvage. 11 Geo. I. c. 19. §. 5.

—Upon oath being made before a proper magistrate of any such plunder or theft, or of the breaking any ship contrary to 12 Ann. sess. 2. c. 18. the examination taken thereupon in writing is to be delivered to the clerk of the peace of the county, &c. where the fact was committed, or to his deputy, who is to cause the offenders to be prosecuted in that county, or any one next adjoining; or, if the fact is committed in Wales, in the next adjoining English county. The necessary charges are to be paid him by the treasurer of the county, &c. where the fact was committed, and amount to be ascertained by justices of the peace at the general or quarter-sessions. Such clerk of the peace, refusing or neglecting to prosecute, forfeits 100l. to any person who shall sue for it. 26 Geo. II. c. 19. §. 8.

—Such indictments may be laid in the next adjoining county by any other person. 26 Geo. II. c. 19. §. 8.

—SHIPS OR GOODS STRANDED.—The justice of the peace, mayor, bailiff, collector of the customs, or chief constable nearest the place, must forthwith give public notice for a meeting of the sheriff, or his deputy, the justices of the peace, mayors, or chief magistrates, of towns corporate, coroners, and commissioners of the land-tax, or any five of them, who are required to give aid in execution of this act. 12 Ann. sess. 2. c. 18. and to employ proper persons in saving the vessels or effects, and to examine persons upon oath concerning them or the salvage, to adjust the quantum of salvage, and distribute it among the persons concerned in case of disagreement; and every one who attends and acts, is to be paid four shillings a day for his expences, out of the goods saved by his care and direction. 26 Geo. II. c. 19. §. 6.

—The charges and rewards for salvage not being paid, or security given for it, within 40 days after the service performed, the officer of the customs concerned may borrow money to satisfy the same, upon a bill of sale under his hand and seal of the ship and cargo; redeemable, nevertheless, upon payment of the principal borrowed, and interest at four per cent. per annum. 26 Geo. II. c. 19. §. 7.

—Persons assembled to save any vessel or effects, are, to conform to orders in the following subordination, as the person happens to be present. In the first place, to the orders of the master, or other officers or owners, or persons employed by them: in the next place, to the orders of officers of the customs; then of the officers of excise; then of the sheriff or his deputy; then of any justice of the peace; then of the mayor or chief magistrate of a corporation; then of the coroner; then of the commissioners of the land-tax; then of any chief constable; then of any petty constable, or other peace-officer. Any person wilfully acting contrary to such orders, forfeits any sum not exceeding 5l. to be levied by warrant of a justice of the peace; and for non-payment the offender is to be committed to the house of correction, not exceeding three months. 26 Geo. II. c. 19. §. 13.

—For assaulting, wounding, or beating any person lawfully authorized, on account of their acting in the salvage of any vessel or effects, the offender, upon conviction at the assizes, or the general or quarter-sessions for the county, &c. where the offence was committed, is to be transported for seven years. 26 Geo. II. c. 19. §. 11.

—Justices of the peace, in case of need, may, in the absence of the high-sheriff, take sufficient power of the county, to repel all unjust violence, and to enforce the execution of this act. 26 Geo. II. c. 19. §. 12.

—SHIPS IN DISTRESS.—The officer of the customs, who acts in preservation thereof, must, as soon as conveniently may be, cause all persons belonging to the ship, or others who can give an account thereof, to be examined upon oath before a justice of the peace, as to the name and description, the name of the commander and owners, and owners of the cargo, of the port from and to which bound, and the occasion of the distress. The examination is to be taken in writing, and a copy to be delivered to the officer of the customs, with a copy of the account of the goods, who is to transmit it to the secretary of the admiralty, to be published in the London Gazette, for information of the persons concerned. 26 Geo. II. c. 19. §. 15.

—Nothing in this act to extend to Scotland. 26 Geo. II. c. 19. §. 18.

—This act not to prejudice any in the right to wrecks, or goods that shall be, flotsam, jetsam, or logan. 12 Ann. sess. 2. c. 18. §. 9. & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 14, 16.

—Nor to extend to, or any ways affect the ancient jurisdiction and usage of the admiralty court of the cinque-ports; but the officers thereof are to have the same power as other persons in other ports. 4 Geo. I. c. 12. §. 2. & 26 Geo. II. c. 19. §. 10, 16.

—These acts to be read in every parish church or chapel of all the sea-port towns of this kingdom, on the Sundays next before Michaelmas-day, Christmas-day, Lady-day, and Midsummer-day. 12 Ann. sess. 2. c. 18. §. 8, 10, & 4 Geo. I. c. 12. §. 1. & 26 Geo. II. c. 19. §. 16.

—SHIPS INWARDS.—Arriving in the port of London, from foreign parts, may not be above three days in coming from Graveyard to the place of discharge, without touching or staying at any wharf, key, &c. adjoining to either shore between Graveyard and Chester's key, unless apparently hindered by contrary winds, &c. or other just impediment, to be allowed by the principal officers of the customs; and in the out-ports they must come directly up to the place of unloading, upon forfeiture of 100l. 13 & 14 Car. II. c. 11.

—Upon, or before their arrival, and before any goods are unladed, the masters or purfers for that voyage must, upon oath, make a just and true entry of the burthen, contents and lading of their ships, with the particular marks, numbers, qualities, and contents of every parcel of goods on board, to the best of their knowledge; also where laden, of what country built, how manned, who was master during the voyage, and who are owners; and must answer all questions concerning the same, that shall be demanded by the customer, &c. upon forfeiture of 100l. 1 Eliz. c. 11. §. 5. & 13 & 14 Car. II. c. 11. §. 2.

—And upon making such declaration upon oath before any two principal officers of the port, bulk may be broke in any port allowed by law, and duty paid for no more goods than are entered and landed; but upon arrival at the next port, declaration must likewise be made upon oath, before the customer, collector, comptroller, or surveyor, or two of them, of the quantity and quality of the goods landed at the first port, and to whom they did belong.

—No customer, collector, or other officer of the customs, is to clear inwards any ship or vessel liable to the payment of 6d. per month towards the support of the hospital for seamen, &c. disabled in the merchants service, or grant any warrant or other discharge, or suffer such ship to go out of port, till a certificate is produced of payment of the duty, and that the master is not more in arrear than three months for the same, or is exempted from payment thereof, on forfeiture of 20l. In case the certificate is not produced to the tide-surveyor when he comes on board to clear the ship, the tide-waiters are to be continued at the expence of the master, or owners, till it is produced. 20 Geo. II. c. 38. §. 22, 23.

—SHIPS OF WAR.—from parts beyond the seas, having any goods on board, may not unlade them, till the captain has signified under his hand, to the customer, collector, and comptroller inwards, the names of every importer, with the marks, numbers, quantity and quality of every parcel of goods, and has answered upon oath to such questions as shall be demanded by the said officers, upon forfeiture of 100l. 13 & 14 Car. II. c. 11. §. 3.

—Such ships liable to all searches and rules as merchant-ships are subject to; except victualling-bills and entering. And captains refusing to make such entries, as well inwards as outwards, the officers may bring all customable and prohibited goods on shore to the king's store-house. 13 & 14 Car. II. c. 11. §. 3.

—Any commander, or other officer of any of his majesty's ships or vessels, receiving, or permitting to be received, any goods or merchandize, other than for the use of the ship, except gold, silver, jewels; and except goods of merchants, wrecked or in imminent danger; and except goods ordered on board by the lords of the admiralty; being convicted thereof by a court-martial, to be cashiered, and rendered incapable of any office in the naval service; and moreover to forfeit the value of all such goods so put on board, or the sum of 500l. one moiety to the informer, or person who shall sue for the same, the other to the use of Greenwich hospital; to be recovered in any court of record at Westminster, or in the high court of admiralty, at the election of the prosecutor; and the court where judgment shall be given against the offender is, with all convenient speed, to certify the same to the lords of the admiralty. 22 Geo. II. c. 33. art. 18. §. 24.

—SHIPS INWARDS.—The masters of any ships from foreign parts, or any other person, suffering any package to be opened, and the goods imbezelled, carried away, or put into any other form or package, after the ship comes into the port of discharge, are to forfeit 100l. 13 & 14 Car. II. c. 11. §. 4.

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

— Or knowing of, or consenting to, the unshipping of any goods inwards, without a warrant, and the presence of an officer, are to forfeit the value of the goods. 13 and 14 Car. II. c. 11. §. 7.

— Ships belonging to the subjects of the French king, lading or unlading any goods, or taking in, or setting on shore, any passengers, were to pay to the collector of the customs at that port, a duty of five shillings for every ton burthen, upon forfeiture of 10*l.* besides the duty: to continue as long as a duty of 50 *sois* per ton on British ships was collected in France, and three months after. 12 Car. II. c. 18. §. 17. and 14 Car. II. c. 11. §. 24.

— Watermen, &c. going out from any port to fetch goods from such ships, were liable to the payment of this duty, and to forfeit 40*l.* 12 Car. II. c. 18. §. 17. and 14 Car. II. c. 11. §. 24.

But this duty is made void by the 11th article of the treaty of commerce, concluded at Utrecht, 1713.

SHIPS OUTWARDS—Bound for parts beyond the seas, may not take in any British goods (fish taken by British excepted) till such ships are entered by the masters in the book of the customer or collector, and comptroller OUTWARDS, with the burthens, the masters names, the number of guns and ammunition, and to what places bound. 1 Eliz. c. 11. §. 4. and 13 and 14 Car. II. c. 11. §. 3.

— Before departure out of the port, the masters are to bring to the said officers a content in writing, under their hands, of the names of every exporter, with the marks and number of the goods; and are, upon oath, to answer publicly in the custom-house to such questions, as shall be demanded concerning the same, upon forfeiture of 100*l.* 1 Eliz. c. 11. §. 4. and 13 and 14 Car. II. c. 11. §. 3.

— If bound to Ireland with certificate goods, the masters must take with them a duplicate of their contents in writing, certified under the hands and seals of the collector and comptroller of the port in Great-Britain, in order to be delivered to the officers of the customs in Ireland. 8 Ann. c. 13. §. 19.

— The masters suffering the package of any foreign goods to be opened on board, or put into any other form or package, or unshipped whilst the ship remains in port, without leave of the principal officers, are to forfeit 100*l.* and to suffer six months imprisonment, without bail or mainprize. 5 Geo. I. c. 11. §. 7. and 27 Geo. II. c. 18. §. 4.

— May not be detained by the officers above three tides after their arrival at Gravesend, and in the OUT-PORTS not above one tide, after they are ready to sail, upon forfeiture of office, and rendering damage to the merchant and owner. See the latter end of letter A.

— **FOREIGN-BUILT SHIPS TRADING COASTWISE**, so employed, bought after the passing of this act, are to pay at the port of discharge, for every voyage, 5*s.* per ton, one moiety for the use of the chest at Chatham, and the other moiety to the Trinity-house at Deptford-strand, 1 Jac. II. c. 18. §. 2.

— But such ships bought before the 29th of September, 1689, and not made free, are to pay only 12*d.* per ton. 1 Jac. II. c. 18. §. 3.

— To be received and recovered as directed for the customs, by 12 Car. II. c. 4. and 1 Jac. II. c. 18. §. 4.

BRITISH-BUILT, which any where in the Book of Rates are designed to entitle the importer or exporters of goods to any abatement or privilege, are to be understood, ships built in GREAT-BRITAIN, IRELAND, GUERNSEY, JERSEY, or the BRITISH PLANTATIONS in ASIA, AFRICA, or AMERICA, and whereof the master, and at least $\frac{3}{4}$ of the mariners, are British, i. e. his Majesty's subjects of Great-Britain, Ireland, or the said plantations, and have been so during the whole voyage, unless in case of sickness, death, &c. 12 Car. II. c. 18. §. 7. and 13 and 14 Car. II. c. 11. §. 6.

— But British ships laden with CORN, intitled to the BOUNTY, may be sailed with the master, and at least $\frac{3}{4}$ of the mariners his Majesty's subjects. 1 W & M. c. 12. §. 1.

— During the present war, merchants ships may be navigated by $\frac{3}{4}$ foreigners, and $\frac{1}{4}$ British; and in any future war his Majesty, by his royal proclamation, may permit them to be navigated in the same manner. 13 Geo. II. c. 3. §. 1, 4.

SHIPS BELONGING TO GREAT-BRITAIN OR IRELAND.

— Foreign-built ships are not to be deemed or pass as ships belonging to Great-Britain or Ireland, till the owner has made it appear to the chief officer of the customs, in the port next to his abode, that he is not an alien, and has made oath before the said officer, that such ships were bona fide, and without fraud, by him bought for a valuable consideration, expressing the sum, as also the time, place, and persons from whom bought, and who are his part-owners, if any (all which part-owners are also liable to the same oath) and that no foreigner, directly or indirectly, hath any part, interest, or share therein: whereupon the officer is to grant a certificate under his hand and seal, which he is to register, and return a duplicate thereof to the chief officers of the cu-

stoms in London, with the names of the seller and part-owners, and the sum paid. 12 Car. II. c. 18. §. 10.

— **BUT FOREIGN-BUILT SHIPS**, that is, not built in any of his Majesty's dominions of Asia, Africa, or America, are not to enjoy the privilege of ships belonging to Great-Britain or Ireland, although owned or manned by British (except such ships as are taken at sea by letters of mart or reprisal, and condemned as lawful prize in the court of admiralty) but are to be deemed alien ships, and to be liable to aliens duties. 13 and 14 Car. II. c. 11. §. 6.

— The **ALIENS DUTY**, or petty-customs, payable for certain goods imported in such ships. See **ALIENS**.

— Officers of the customs may not allow foreign-built ships the privilege of ships British-built, or belonging to Great-Britain or Ireland, until a certificate be produced, or proof of the property be made, or until examination whether the master and $\frac{3}{4}$ of the mariners are British; nor allow a foreign-built ship the privilege of bringing in goods of the growth of the country, where it was built, till examination and proof, upon forfeiture of office. 12 Car. II. c. 18. §. 11.

— Governors of the British plantations may not suffer foreign-built ships to lade or unlade any goods, till certificate be produced, and examination be made, whether the master and $\frac{3}{4}$ of the mariners are British, upon forfeiture of their government. 12 Car. II. c. 18. §. 11.

SHIPS belonging to his Majesty's subjects of SCOTLAND—though foreign-built, if registered upon oath, before the first of May, 1708, are to be deemed as of the built of Great-Britain. 5 Ann. c. 8. art. 5.

— A duplicate of the register is to be transmitted to the chief officers at the customs in Edinburgh, and from thence to the port of London, in order to be entered in the general register of all ships belonging to Great-Britain (art. 5.) 5 Ann. c. 8. art. 5.

— Are not to be lost, or forfeited, for a small thing put therein, not customed, without the owners knowledge. 38 Edw. III. c. 8. §. 1.

— Arrested for unlawful cause, the officer being convicted thereof, forfeits 40*l.* to be sued for within two months. 28 Hen. VI. c. 5. §. 1.

— Wilfully cast away, burnt or otherwise destroyed, to the prejudice of the insurers, or of the merchant that shall load goods thereon: the owners, masters, mariners, or other officers belonging to the ship, doing it, or directing or procuring the same to be done, are to suffer death. 4 Geo. I. c. 12. §. 3.

THE CHIEF LAWS OF THE CUSTOMS WITH REGARD TO SILKS.

SILKS—Wrought, mixed with gold or silver, or other materials, secretly or clandestinely imported, are forfeited with 200*l.* by every importer and each of his assistants, besides former penalties, and 100*l.* by the receiver, seller, or concealer. 6 Ann. c. 19. §. 14, 15.

— Such silks are to be sold by inch of candle at the custom-house in London or Edinburgh. 6 Ann. c. 19. §. 14, 15.

— Wrought by itself, or with any other stuff, in any place out of this realm, in ribbons, laces, girdles, corsets of cauls, corsets of tiffue, or points, may not be imported to be sold, upon forfeiture; but silks wrought and unwrought, or raw, may be imported by any persons. 19 Hen. VII. c. 21. §. 1.

— **THROWN**, of the growth or product of TURKEY, PERSIA, EAST-INDIA, CHINA, or any other country (except ITALY, SICILY, and NAPLES, brought directly from those places respectively, by sea, in ships legally navigated) may not be imported, on forfeiture thereof. 2 W. & M. c. 9. §. 2.

— Calicoes, linens, or fluffs, printed, painted, stained, or dyed, wheresoever found, not having a stamp, to denote the payment of duty, are forfeited, with the penalty of 50*l.* on the possessor. 5 Geo. I. c. 11. §. 15.

— After recovered, may not be delivered out of the custom-house warehouse till stamp. 5 Geo. I. c. 11. §. 15.

— **RAW**, of the growth and culture of the British plantations in America, may be imported directly from thence into the port of London, FREE OF ALL DUTIES; provided entry is made at the custom-house in the same manner as before this act, and it is landed in the presence, and examined by the proper officer of the customs, and imported in vessels which may lawfully trade thither, manned according to law. 23 Geo. II. c. 20. §. 1.

— But to entitle the importer to this exemption, the person who ships the silk in America, must, before clearing the ship, make oath before the collector and comptroller of the customs and naval officer, or any two of them, that such silk is, bona fide, of the growth and culture of SOME OR ONE OF THE BRITISH COLONIES OR PLANTATIONS IN AMERICA, expressing the parish wherein, and by whom it was cultivated and produced; who must likewise make oath thereto before the governor or justice of the peace, &c. Upon producing such oath, the collector and comptroller of the customs and

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

and naval-officer, or any two of them, are to grant a certificate under their hands and seals, expressing the marks, numbers, tale, and weight in each bale; with the names and places of abode of the exporter, of the person or persons who have sworn to the growth and culture, and the name of the person to whom consigned in London; which certificate the master of the ship is to deliver to the collector, comptroller, or chief officer of the port of London, at or before entry; and at the same time make oath, that the bales and parcels, and goods contained in the certificate, are the same that were taken on board in the said British colonies in America. 23 Geo. II. c. 20. §. 2.

— Any person entering foreign RAW SILK as RAW SILK OF THE GROWTH OR CULTURE OF BRITISH PLANTATIONS IN AMERICA, or mixing foreign with that of the British plantation, in order to evade the payment of the duty, forfeits 50*l.* and all the silk, together with the bales and packages. 23 Geo. II. c. 20. §. 3.

— In any dispute about the growth, the ONUS PROBANDI to lie on the owner or claimer. 26 Geo. II. c. 20. §. 4.

— Wrought or mixed with any other materials, and velvets (not manufactured in Great-Britain, and not prohibited to be worn therein) imported, are after entry at the custom-house, and before delivery to the importer, to be marked or sealed, at each end of every piece, with such mark or seal, and by such officer, as the commissioners of the customs shall appoint. 26 Geo. II. c. 21. §. 1.

— Upon exportation, the exporter, before they are shipped, must give notice to the proper officer, when and where he will pack them up, who is (without fee or reward) to take care that such seals, stamps, or marks, are taken off from every piece intended to be exported, without which no drawback is to be allowed. 26 Geo. II. c. 21. §. 2.

— Such goods found in any shop, warehouse, or other place upon land, not so marked or sealed, upon both ends of a whole piece, or one end of a remnant, are forfeited, and may be seized by any officer of the customs, and secured in the king's warehouses; and after condemnation, are to be publicly sold to the best bidder; one moiety of the produce to be for the use of his Majesty, and the other for the officer who seized and secured them: and the person in whose possession they are found, also forfeits 200*l.* 26 Geo. II. c. 21. §. 3.

— Such goods not to be consumed in this kingdom, but are to be sold for exportation only, and not to be delivered out of the warehouse, 'till security is given accordingly. 26 Geo. II. c. 21. §. 4.

— For counterfeiting such stamp, mark, or seal, or the impression thereof, upon the goods above mentioned, or for knowingly selling, or exposing to sale, the said goods, with a counterfeit stamp, the offender, his aiders, abettors, and assistants, are to forfeit for every offence 500*l.* and to stand in the pillory for two hours. 26 Geo. II. c. 21. §. 5.

— The pecuniary forfeitures by this act, may be sued for in any court of record at Westminster, or the court of exchequer at Edinburgh, by action, bill, plaint, or information, in the name of the attorney-general, or of the advocate in Scotland, or of an officer of the customs; $\frac{1}{2}$ to his Majesty, and $\frac{1}{2}$ to the officer of the customs who informs or prosecutes. 26 Geo. II. c. 21. §. 6.

— A capias, in the first process, may issue, specifying the sum of the penalty sued for; and the defendant shall be obliged to give bail by natural-born subjects, persons naturalized, or denizens, for his appearance at the day of the return of the writ; and at such appearance to give sufficient bail, to answer the forfeiture in case of conviction. 26 Geo. II. c. 21. §. 8.

— If any officer of the customs refuses or neglects, for one month, to prosecute such offender to effect, any other person may do it in the same manner, and shall be entitled to the same share of the forfeiture. 26 Geo. II. c. 21. §. 7.

— In case of any question arising where the goods were manufactured, the proof is to lie upon the owner or claimer. 26 Geo. II. c. 11. §. 10.

SILKS, CHINA—Raw silk imported from China, by the united East-India company, is to pay the same duties, subsidies, and impositions, and to be allowed the same DRAWBACK, as RAW SILKS of the growth and produce of ITALY. 23 Geo. II. c. 9. §. 2 and 4.

WROUGHT SILKS, BENGALS, and STUFFS, mixed with silk or herba, of the manufacture of East-India, China, or Persia, and calicoes printed, painted, stained, or dyed there, prohibited in Great-Britain; and are, upon importation, to pay only the HALF-SUBSIDY. 11 and 12 W. III. c. 17. §. 1 and 10.

WROUGHT SILKS, stuffs, &c. muslins and calicoes, of the manufacture of East-India, China, or Persia, may not be imported into IRELAND, but from GREAT BRITAIN, upon forfeiture thereof, or the value, and the ship, furniture, &c. 5 Geo. I. c. 11. §. 12.—Officers of the customs conniving thereat in Ireland, forfeit 500*l.* and rendered incapable.

THE CHIEF LAWS OF THE CUSTOMS WITH RESPECT TO SILVER.

SILVER—The OLD STANDARD of eleven ounces two penny-weights restored. 6 Geo. I. c. 11.

— The OLD STANDARD of eleven ounces two penny-weights, and the NEW STANDARD of eleven ounces ten penny-weights, continued; and no plate may be made of coarser alloy. 6 Geo. I. c. 11. §. 40.

— Molten silver may not be exported, unless marked or stamped at Goldsmiths-hall, and a certificate be produced to one of the commissioners of the customs, under the hands of one or more of the wardens, of oath having been made before him or them by the owner, and one credible witness, that it is lawful silver, and that no part thereof (before molten) was the current coin, nor clippings thereof, nor plate wrought within this kingdom. 6 and 7 W. III. c. 17. §. 5, 6.

— Shipped, without being so marked or stamped, and without such certificate, is forfeited, and may be seized by the officers of the customs. 6 and 7 W. III. c. 17. §. 6.

— Molten silver or bullion, either in bars, ingots, wedges, cakes, pina's, or any other form, may not be shipped, unless a certificate be produced to the commissioners of the customs, or four of them, from the court of the lord-mayor and aldermen of London, of oath having been made before the said court, by the owners, and two or more credible witnesses, that the same, and every part and parcel thereof, was, and is, foreign bullion; and that no part thereof (before molten) was the coin of this realm, or clippings thereof, nor plate wrought within this kingdom. 7 and 8 W. III. c. 19. §. 6.

— Shipped without entry, and such oath and certificate, is forfeited, and may be seized by any persons; and the proprietor forfeits double the value. 7 and 8 W. III. c. 19. §. 7.

— The master of any ship belonging to a subject, knowingly permitting the shipping, forfeits 200*l.* and if it be a man of war, the captain likewise forfeits his employment, and is rendered incapable of any office, civil or military. 7 and 8 W. III. c. 19. §. 7.

— Officers granting a cocket, before certificate be produced, and entry made by the commissioners, forfeit 200*l.* and are rendered incapable of any other place. 7 and 8 W. III. c. 19. §. 8.

— Seized, proof of its being foreign, &c. is to lie on the proprietor or claimer. 7 and 8 W. III. c. 19. §. 9.

— Watches, sword-hilts, wrought-plate, and other silver manufactures, of the fineness of 11 ounces 10 penny-weights to every pound troy, so many may be exported yearly, as shall be allowed by the commissioners of the customs, or any three of them. 9 and 10 W. III. c. 28. §. 1.

— But boxes, cases, or dial-plates, of gold, silver, brass, or other metal, for clocks or watches, may not be exported without the movements made up fit for use, with the makers name engraved thereon, upon forfeiture, and 20*l.* 9 and 10 W. III. c. 28. §. 2.

SILVER THREAD.

BOUNTY OR ALLOWANCE ON GOLD AND SILVER THREAD, LACE, OR FRINGE, MADE IN GREAT-BRITAIN, EXPORTED.

Silver thread, lace or fringe, made of plate-wire, and spun on silk, every pound weight avoirdupoise *	} 0 5 0
Gold lace, thread, or fringe, made of plate-wire, and spun on silk, every pound weight avoirdupoise *	
} 0 6 8	

* 10 Ann. c. 26. §. 62. and 3 Geo. I. c. 7. §. 1.

To be paid to the exporter by the collector of the duties on gilt and silver wire, or a debenture, expressing the kinds and quantities, to be made forth by the collector of the customs at the port of exportation, and the shipping thereof testified by the searcher: the exporter first making proof upon oath, before the collector of the customs, that the said thread, lace, or fringe, was actually made after the first of July, 1712, and also giving sufficient security that they shall not be reloaded in Great-Britain.

THE CHIEF LAWS OF THE CUSTOMS RELATING TO SNUFF.

SNUFF—made, mixed, or coloured with oaker, amber, &c. (except water tinged with Venetian red) or fustic, yellow ebony, touch-wood, or other wood, dirt, sand, or tobacco dust mixed therewith, is forfeited, with 3*l.* for every pound weight, by the maker or seller. 1 Geo. I. c. 46. §. 7. The powers and provisions relating to counterfeit tobacco, are to extend to the abuses in making and mixing of snuff. 5 Geo. I. c. 11. §. 22.

Removed

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

— Removed by land.—Tobacco or tobacco-stalks exceeding 24lb. weight, or snuff exceeding 10lb. weight, may not be conveyed from the place of importation to any other place in Great Britain, without a certificate from the collector, comptroller, or chief officer of the customs, at the place of importation; and if manufactured, with the importer's oath thereto (if the importer applies for it) that the duties were paid or secured at importation, by whom, when, and in what ship imported; or with the purchaser's oath thereto (if he applies for it) attesting the marks and numbers of the hogheads, out of which it was taken, from whom purchased, and when: if tobacco stalks, or SNUFF, or manufactured tobacco, are so removed, then the certificate must have the importer's oath thereto (if he applies for it) that such stalks were stripped, or such SNUFF, or manufactured tobacco, was made from one or more hogheads, for which the duties were by him paid or secured at importation; or the purchaser's oath thereto (if he applies for it) that such stalks were stripped, or the snuff, or MANUFACTURED TOBACCO, was made from one or more hogheads, which had been delivered and received according to the directions of this act: which certificates such officers are to grant; and after entering in their books, to deliver to the person applying for the same, without fee or reward for certificate or oath, on forfeiture of 10l. for every offence. 24 Geo. II. c. 41. §. 9.

— Removed by water.—No tobacco, tobacco-stalks, or SNUFF, may be shipped on board any vessel, to be carried by water, from any place in Great-Britain, to any other, until every part thereof is entered at the custom-house, at the port nearest the place where they are shipped; and if unmanufactured, it must be shipped in the original package in which it was imported, preserving the same marks and numbers, but not without a certificate from the collector or comptroller, or chief officer of the customs, at the port of importation, by whom, the time when, and in what vessel imported: if it is tobacco-stalks, or SNUFF, or other manufactured tobacco, it is not to be so shipped, without a certificate from the said officers, that the duties were paid or secured at importation, for the tobacco from which they were stripped, made, or manufactured: which certificates the said officers are required to grant to the importer, or his known agent, applying for the same, without fee or reward, on forfeiture of 10l. for every offence. 24 Geo. II. c. 41. §. 13.

Tobacco, or tobacco-stalks, exceeding 24lb. weight, or SNUFF, exceeding 10 pounds weight (which has been removed by water from the place of importation to any other place in Great-Britain) may not be removed afterwards from thence by land, without a certificate from the collector and comptroller, or chief officer of the customs, at the place to which they were carried by water; that it appears to them by the entry of the certificate, which came with the goods from the place of importation, that the duties thereof were paid or secured there, and in what vessel they were brought by water, and when; and that the person applying for the same, had made oath to the truth thereof: which certificate such officers are required (after writing it in their books) to deliver to any person applying for it. 24 Geo. II. c. 41. §. 22.

— Any certificate for removal of tobacco, tobacco-stalks, or SNUFF, by land or water, is to be deemed a proper one, though the name of the importer is not inserted therein, provided his name is expressed in the bill from which the certificate is prepared. 26 Geo. II. c. 13. §. 5.

— Tobacco-stalks and SNUFF, seized and condemned, are to be burnt in the presence of the collector and comptroller of the customs, at the place where the goods are at the time of condemnation; or, for want of such, in the presence of the collector or supervisor of excise for that district. 24 Geo. II. c. 41. §. 27, 28.

— Tobacco-stalks or SNUFF, removed from one place to another in greater quantities than by 24 Geo. II. c. 21. is allowed, and not attended with the certificate required; may be seized and prosecuted by any officer of the customs or excise; and the proof that it was removed from the port of importation, with a proper certificate, and that the duties thereon were paid or secured, is to lie on the claimer, and not on the officer who seized it. 26 Geo. II. c. 13. §. 2.

THE CHIEF LAWS OF THE CUSTOMS WITH REGARD TO SPICES.

SPICERY, viz. cinnamon, cloves, mace, and nutmegs, may be imported in British ships, whereof the master and $\frac{1}{2}$ of the mariners are British, from any parts beyond the seas; upon licence first had from the commissioners of the customs, or any three of them, or from the customer, or collector and comptroller of the port. 6 and 7 W. III. c. 7. §. 3. and 3 and 4 Ann. c. 4. §. 6. and 8 Ann. c. 7. §. 26. and 6 Geo. I. c. 21. §. 45. and 8 Geo. I. c. 15. §. 19. and 26 Geo. II. c. 32. §. 2.

— The quantity, quality, and the port of importation, VOL. II.

are to be expressed in such licences; and if more be found than therein mentioned, it is forfeited. The package to be in casks or bales, unless from the East-Indies; the bale of cinnamon to weigh net 70lb. or upwards, and each cask of nutmegs, cloves, or mace, 300lb. or upwards, upon forfeiture thereof. 6 and 7 W. III. c. 7. §. 3. and 3 and 4 Ann. c. 4. §. 6. and 6 Geo. I. c. 21. §. 45. and 8 Geo. I. c. 15. §. 19. and 8 Geo. I. c. 18. §. 21. and 27 Geo. II. c. 18. §. 5.

— The licences are to be delivered up by the masters at entry of their ships, and annexed to the report, with the marks and numbers of each cask, bale, or parcel, and the quantity and quality endorsed on the back, upon forfeiture of ship and goods. 6 Geo. I. c. 21. §. 46. and 8 Geo. I. c. 15. §. 19. and 8 Geo. I. c. 18. §. 21. and 27 Geo. II. c. 18. §. 5.

— Found on board any ship in small parcels, packed in hogheads, bales, or casks, are forfeited. 6 Geo. I. c. 21. §. 47. and 8 Geo. I. c. 15. §. 19. and 26 Geo. II. c. 32. §. 2.

THE CHIEF LAWS OF THE CUSTOMS WITH REGARD TO SPIRITS.

SPIRITS, or low wines, brought by sea coastwise, without a certificate from the officer of excise, where distilled, are forfeited; to be sued for as any other forfeiture by the laws of excise. 3 Geo. I. c. 4. §. 17.

THE BOUNTY ON SPIRITS DRAWN FROM BARLEY, MALT, OR OTHER CORN, EXPORTED.

By 6 Geo. II. cap. 17. §. 10. was granted without limitation, viz.

Spirits drawn from barley, malt, or other corn, } Bounty for every ton thereof } 1 to 0

To be paid to the exporter by the commissioners of the customs, or other proper officer belonging to them, when barley is at 24s. per quarter, or under, upon such proof of the exportation, as is directed by 1 W. and M. cap. 12. and out of such duties as are liable to the payment or the bounties on corn exported, in the same manner as if the respective quantity of barley, malt, or other corn, had been exported, allowing that twelve quarters of barley or malt are made use of in making one ton of spirits. 6 Geo. II. c. 17. §. 10.

THE CHIEF LAWS OF THE CUSTOMS WITH REGARD TO STARCH.

Drawback or repayment of the duty of excise on British-made Starch exported.

Starch *, for every pound weight thereof	0 0 1	} Drawb. 0 0 2
avoidupoise		
Starch †, for every pound weight thereof	0 0 1	
avoidupoise		

* 10 Ann. c. 26. §. 27. and 3 Geo. I. c. 7.

† 12 Ann. sess. 2. c. 9. §. 13. and 6 Geo. I. c. 4.

To be repaid to the exporter thereof (by the collector of the duties) for such starch, exported to foreign parts by way of merchandize, on a debenture, to be made forth by the collector of the customs at the port of exportation, expressing the true kinds and quantities, and the exportation thereof testified by the searcher: the exporter having first made proof of the payment of the duties (on oath) before the said collector; and also having given sufficient security, that the starch shall not be re-landed in Great-Britain. 10 Ann. c. 26. §. 25; 27. and 12 Ann. c. 9. §. 13.

If re-landed (over and above the penalty of the bond) forfeited, or the value. 10 Ann. c. 26. §. 26.

STARCH, shipped for exportation, and afterwards re-landed, is forfeited, or the value, besides the penalty of the bond. 10 Ann. c. 26. §. 26.

— Or hair-powder, found in any ship, waggon, &c. is seizable by officers of excise or customs, upon suspicion of its having been privately made, or clandestinely imported, or exported and re-landed again after the duty hath been repaid. 4 Geo. II. c. 14. §. 3.

— Within ten days after seizure, the officer is to exhibit an information before three commissioners of excise, or two justices of the peace. 4 Geo. II. c. 14. §. 3.

— Upon information, the person in whose possession it is found, must make it appear, that the duty hath been paid for the same, upon penalty of the forfeiture of the goods, with horses and package, containing the same, and 5l. for every hundred weight; and the commissioners or justices are to proceed to give judgment accordingly. 4 Geo. II. c. 14. §. 3.

— Suspected to be privately making or concealed, may be searched for by officers of excise or customs, by day or by night (but if by night, in the presence of a constable or other peace-officer) by warrant from the commissioners of excise, or a justice of the peace. 4 Geo. II. c. 14. §. 4.

— Found privately making or concealing, is forfeited, with all materials and things in which it is contained; and the person privately making, or in whose possession it is found, 10 M

Of the PRACTICAL BUSINESS of the CUSTOM-HOUSE.

found, upon failure of proof that the duty has been paid, forfeits 50*l.* and for obstructing the officers 50*l.* 4 Geo. II. c. 14. §. 4.

THE CHIEF LAWS OF THE CUSTOMS, WITH REGARD TO SUGARS.

SUGAR must be imported only in ships belonging to Great-Britain or Ireland, or in ships of such port where the said goods can only, or most usually are first shipped for transportation, on forfeiture of ship and goods. 12 Car. II. c. 18. §. 8.

— But during the late war with France, this was not to extend to prevent any person importing the said goods in shipping built in Great-Britain, Ireland, Guernsey, Jersey, or any of the lands, islands, dominions, or territories belonging to his Majesty, in Asia, Africa, or America, provided the master and $\frac{3}{4}$ of the mariners are British, or of the country of which the said goods are the growth, production, or manufacture: but if such ships are the property of foreigners, although British-built, the goods are to pay aliens, and all other duties, in the same manner as if they were foreign-built. 29 Geo. II. c. 34. §. 19, 20.

— No sugars, panelles, syrups, or melasses of the produce of any of the plantations in America, nor any rum or spirits of America (except of the growth and manufacture of his Majesty's sugar colonies there) may be imported into Ireland, unless shipped in Great-Britain in ships legally navigated, upon forfeiture thereof, or the value, together with the ship and all her furniture; — but not to extend to restrain the importation of sugars of the produce of any of the dominions of the king of Spain or Portugal, from any place from whence they might have been lawfully imported before. 6 Geo. II. c. 13. §. 4, 13.

— Sugar, tobacco, cotton, wool, indigo, ginger, fustick or other dyeing wood, rice (except under the regulations in the 11. 12. 13. 14. 15. 16. 17. 18. art.) melasses, hemp, copper-ore, beaver-skins, or other furs, pitch, tar, turpentine, masts, yards and bowsprits, of the growth, production, or manufacture of any of the British plantations in America, Asia, or Africa, may not be carried from thence, unless to some other British plantations, or to the kingdom of Great-Britain only, to be there landed, upon forfeiture of the said goods, or their value, with the ship and furniture. 12 Car. II. c. 18. §. 18. and 22 and 23 Car. II. c. 26. §. 10, 11. and 25 Car. II. c. 7. §. 3. and 3 and 4 Ann. c. 5. §. 12. and c. 10. §. 7. and 12 Ann. c. 9. §. 1. and 8 Geo. I. c. 15. §. 25. and c. 18. §. 22. and 11 Geo. I. c. 29. §. 4. and 2 Geo. II. c. 28. §. 6. and c. 35. §. 17. and 3 Geo. II. c. 28. §. 1.

— And if, upon any pretence whatsoever, any goods of the British plantations in America be landed in Ireland, without being first landed in Great-Britain, and the duties thereof there paid, they are forfeited, with the ship; $\frac{3}{4}$ without composition to his Majesty, and $\frac{1}{4}$ to the fuer; unless stranded or driven in by leakiness, &c. in which case the goods must be delivered into the custody of the chief officer of the port, there to remain till re-shipped for Great-Britain, for which good security must be taken. 7 and 8 W. III. c. 28. §. 14, 15.

— Now to extend only to sugars, tobacco, cotton, wool, indigo, ginger, speckle-wood, or Jamaica wood, fustick or other dyeing wood, rice, melasses, beaver-skins, and other furs, copper-ore, pitch, tar, turpentine, masts, yards, and bowsprits, of the growth, product, or manufacture of the said plantations. All other goods, of the growth, product, and manufacture of any of the said plantations, may be imported from thence into Ireland (except hops, which are to continue under the regulations of 9 Ann. c. 12. and 1 Geo. I. c. 12.) provided it be in British shipping, whereof the master and at least $\frac{3}{4}$ of the mariners are British. 4 Geo. II. c. 15. §. 1, 2. and 5 Geo. II. c. 9. §. 1.

— Ships coming to the said plantation to take in any of the following enumerated goods with intent to carry the same to some other British plantations, bond not having been first given to bring the same to Great-Britain only, there must be paid for such goods the following duties, viz.

	1. s. d.
Sugar, white, the hundred weight	0 5 0
Sugar, brown, and muscovadoes the Cwt.	0 1 6
Tobacco, the pound	0 0 1
Cotton-wool, the pound	0 0 $\frac{1}{2}$
Indigo, the pound	0 0 2
Ginger, the hundred weight	0 1 0
Logwood, the hundred weight	5 0 0
Fustick, and all other dyeing wood, the Cwt.	0 0 6
Cocoa-nuts, the pound	0 0 1

And security must be taken to carry them to such plantations, or to Great-Britain. 25 Car. II. c. 7. §. 3. and 7 and 8 W. and M. c. 22. §. 8. and 1 Geo. I. c. 12. §. 4.

— British, in Asia, Africa, or America, rum or spirits, melasses, or syrups, sugars or panelles, of the product of any plantation in America, not in the possession of his Majesty, imported into any of the British plantations in America, are to pay the following duties in money of Great-Britain, according to the value of 5*s.* 6*d.* per ounce in silver; viz.

Rum or spirits, the gallon	-	1. s. d.
Melasses or syrups, the gallon	-	0 0 9
Sugars and panelles, the Cwt.	-	0 0 6
	-	0 5 0

and so in proportion for a greater or lesser quantity, to be paid down in ready money before landing. 6 Geo. II. c. 13. §. 1, 2.

— British, in Asia, Africa, or America. — Any of his Majesty's subjects in any vessel built in Great-Britain, and belonging to his Majesty's subjects, of which the major part reside in Great-Britain, and the residue either in Great-Britain, or in some of his Majesty's sugar colonies in America, or in any vessel belonging to his Majesty's subjects residing in Great-Britain, and navigated according to law, that shall clear outwards, from Great-Britain to any of the said colonies, may ship sugars of the growth, produce or manufacture of the said colonies, to carry to any foreign part of Europe; provided a licence be first taken out for that purpose, under the hands of three of the commissioners of the customs, subject to the regulations, and on the conditions, stipulated by act of parliament. 12 Geo. II. c. 30. §. 2. and 24 Geo. II. c. 57. §. 7.

— This act not to extend to granting a liberty to carry any sugars from the sugar colonies to Ireland. 12 Geo. II. c. 30. §. 16. and 24 Geo. II. c. 57. §. 7.

— Of the growth of the British colonies, exported within a year after the importation, to draw back the residue of the subsidy. 6 Geo. II. c. 13. §. 9. and 19 Geo. II. c. 23.

The allowance on British Refined Sugar exported.

By 9 and 10 W. III. cap. 23. §. 9.	Was granted from 31st January, 1699, during the continuance of the new subsidy,	1. s. d.
5 Ann. c. 8. art. 6.	Upon sugar refined in Great-Britain, for every cwt. exported	0 3 0
2 and 3 Ann. c. 9. §. 3.	Was granted during the continuance of the one-third subsidy,	1. s. d.
4 — 6. — 2.	A further allowance on	0 1 0
5 — 19. — 8.	the same, for every cwt. exported	0 1 0
1 Geo. I. — 12. — 8.	Was granted from 24th June, 1753, for five years.	
6 Geo. II. c. 13. §. 10.	Further continued for seven years.	
11 — 18. — 2.	Further continued for seven years.	
19 — 23. — 1.	Further continued for seven years.	
20 — 32. — 5.	Further continued to 24 June 1756.	
29 — 26. — 1.	Further continued for three years.	
	A further allowance on the same, for every cwt. exported	1. s. d.
	the same, for every cwt. exported	0 2 0
21 Geo. II. c. 2. §. 6.	Was granted from first March, 1747, during the continuance of the subsidy 1747,	1. s. d.
	A further allowance on the same, for every cwt. exported	0 3 0

Total bounty 0 9 0

To be paid at the custom-house to the exporter within thirty days after the demand thereof; oath being first made by the refiner, that the sugar, so exported, was produced from brown and muscovado sugar, charged by the acts of 9 and 10 W. III. c. 23. and of 2 and 3 Ann. c. 9. and by 21 Geo. II. c. 2. (that is to say, charged with the new subsidy, one-third subsidy, and subsidy 1747.) and that, as he verily believes, the same was imported from his Majesty's plantations in America, and the duty duly paid at the time of importation thereof, the exporter making oath, that the same was duly exported, and his Majesty's searcher also certifying the shipping thereof, and all other requisites being performed according to the Book of Rates. 9 and 10 W. III. c. 23. §. 9. and 2 and 3 Ann. c. 9. §. 3. and 6 Geo. II. c. 13. §. 10. and 21 Geo. II. c. 12. §. 8.

T.

T A P

TAPESTRY, a delicate kind of manufacture, serving to adorn apartments with hangings.

Of some curious improvements that have been made by Monf. Le Blon, on the principles of printing, in imitation of painting, and of weaving tapestry; in the same manner as brocades.

M. Le Blon endeavouring to fix the true harmony of colouring in painting, found that all visible objects may be represented by the three primitive colours, red, yellow and blue; for out of them, all others, even black itself, may be compounded. We are beholden to the great Sir Isaac Newton for the discovery of the difference of colours contained in the rays of the sun, and that the union of them all produces a white, which is light itself.

For distinction sake, M. Le Blon calls those colours which are comprehended in the rays of the sun impalpable colours, and those used in painting, material colours. In the material colours, a mixture of all three produces a black or darkness, contrary to what is observed in the impalpable, which I said just now produce white. M. Le Blon takes this phenomenon to be owing to the body or substance of which those three material colours consist, and to the particles of them being opaque, and not transparent; for they only reflect certain rays of light, they strike on their surfaces; and therefore, when small particles of different colours are placed close together, if they are so small that each of them cannot be seen separately by the eye, we do not discern the colour of each particular atom, but only the blended reflected rays, proceeding from the adjoining particles: thus yellow and red produce an orange, yellow and blue, a green, &c. which seems to be confirmed by placing two pieces of silk near together, viz. yellow and blue: when, by intermixing of their reflected rays, the yellow will appear of a light green, and the blue of a dark green, which deserves the farther consideration of the curious.

He hath reduced the harmony of colouring in painting to certain infallible rules built on this foundation. Whereas, according to the common practice of painters, their colouring is the effect of mere chance or guess-work at first, but improved by experience, all painters usually declaring, that there can be no certain rules given for mixing colours. M. Le Blon published, some years ago, an ingenious book on this subject, intitled *Coloritto*; or, *The Harmony of Colouring in Painting*.

By these rules he light on the manner of printing any object in its natural colours, by means of three plates, and the three primitive colours; an art attempted and sought after ever since the invention of printing, but in vain, and thought impossible, 'till he put it in practice a few years ago. The plates are engraved chiefly after the mezzotinto manner, only the darker shades, and sometimes the outlines, where they are to appear very sharp, are done with a common graver. Each plate is not completely engraved, but only contrived to take such a portion of the colour as is necessary with the other two plates, to make the picture complete.

This art of printing consists in six articles.

1. To produce any object with three colours, and three plates.
2. To make the drawings in each of the three plates, so as that they may exactly tally.
3. To engrave the three plates, so as that they cannot fail to agree.
4. To engrave the three plates in an uncommon way, so as that they may produce 3000 and more good prints.
5. To find the three true primitive material colours, and to prepare them, so as that they may be imprimable, durable, and beautiful.
6. To print the three plates, so as that they may agree perfectly in the impression.

The first of which is the most considerable, comprehending the theoretical part of the invention; and the other five are subservient to bring it into mechanical practice, and of such importance, that if any one of them be wanting, nothing can be executed with success or exactness. Sometimes more

T A P

than the three plates may be employed, viz. when beauty, cheapness, and expedition require it.

The observation of the compounded colours reflected from two pieces of silk of different colours, placed near together, first gave him the thought of what the effect of weaving threads of different colours would be, when all the threads were so fine, as not to be distinguished at a small distance one from another.

By the same principles of producing any visible object with a small number of colours, he arrived at the skill of producing in the loom all that the art of painting requires. An art likewise often attempted, but as often abandoned, and declared impossible till now, as well as the other, of printing in colours. And it is probable, many improvements may from hence be made in several trades, especially in combing of wool; where the mixing of several colours may be of important use.

The colours used in weaving, being only superficial, and so differing from both the impalpable and the material colours, and not being to be so closely joined or incorporated together as those, will not of themselves produce a white or black, but only a light cinnamon: wherefore in weaving he hath been obliged to make use of white or black threads, besides red, yellow, and blue; and though he found he was able to imitate any picture with these five colours, yet for cheapness and expedition, and to add a brightness where it was required, he found it more convenient to make use of several intermediate degrees of colours.

There are two ways in use at Brussels, and at the Gobelins in Paris, for making tapestry after the common manner: one they call the flat way, and the other the upright. In the flat way, they have the warp stretched in a frame lengthwise of the piece: it is made of white worsted, and the pattern lies close under it, so that the workman can see the figures through the warp: he is provided with bobbins of various colours of silk or worsted, as the piece requires: then he takes up with his fingers one thread after another, as they answer to any colour in the painting beneath; and with the other hand passes the bobbin with the same colour, and strikes the threads with an ivory comb. Some of these frames are made like a loom, with a warp passed through the leishes, and treddles for the feet, with which they open the threads of the warp, to pass a common shuttle through them, when it is necessary to make a long throw, as is required in grounds, pillars, and tall uprights.

In the upright way the warp runs from top to bottom of the piece; the pattern is placed upright, and close behind it, and the outlines are drawn in charcoal upon the fore-side of the warp. The workman is placed with his back to the light, by which means he can see the pattern the better; then he takes up the threads one by one, and passes the bobbin as in the other way, and strikes it close with the comb: all which is near as tedious as needle-work itself, which is the reason why the finest tapestry comes to such high prices, so that none but princes and persons of distinction care to buy it; and what can be had at a moderate price is always coarse, and of a low taste: for workmen who have any good notion of painting, and are capable of adjusting the colours, are not to be had, but for excessive wages, which much enhances the price likewise: but in M. Le Blon's new way of weaving tapestry in the loom with a draw-boy, tapestry may be performed almost as expeditious as fine brocades: for when the loom is once set and mounted, any common draught-weaver, though not acquainted with drawing or painting; nay, hardly knowing what figure he is about, exactly produceth what the painter hath represented in the original pattern. And thus a piece of tapestry may be woven in a month or two, which, in the common way of working, would, before this invention, take up several years: and what, in the common way, costs a thousand pounds, may, by this means, be afforded finer and better for a hundred. Therefore, it is likely, this woven tapestry may become a current merchandize, and that many thousand industrious families may be well employed about it.

The main secret of this art consists in drawing the patterns, from which any common draught-weaver can mount the loom;

loom; and when that is done, the piece may be made of any size, by only widening the reeds and the warp, and a reverse may be made with the same ease; which is done by the boy's pulling the leifhes up again, in the same order in which he pulled them down before; by which contrivance the tapestry may be suited to any room, whether the light comes in on the right-hand or on the left.

The patterns are painted upon paper, whereon are printed squares from copper-plates, and these subdivided by as many lines as answer to the threads of the warp, which run lengthwise of the piece; then they try how many threads of the shoot answer in breadth to every subdivision of the squares. Every thread of the warp goes through a small brass ring called a male, or through a loop in the leifh, and hath a small long weight or lingoe hung below, to counterbalance the packthreads, which going from the top of the rings or loops, are passed over the pulleys, in the table directly over the loom, and are continued nearly in a horizontal position on one side of the loom to a convenient distance, where they are all spread on a cross-piece fastened to two staples: these are called the tail of the mounture; and from each of these packthreads just by the side of the loom, are fastened other packthreads, called simples, which descend to the ground; so that by pulling these simple chords, you raise any of the threads of the warp at pleasure; wherefore they fasten a loop or potlart to as many of these simple chords as there are threads of the warp to be pulled up at every shoot, or every throw of the shuttle; by which means the shoot manifests itself on the right side, where the warp is pulled up: and in ordering this, they are guided by the pattern, on which they count the distances of the subdivisions, which contain the same colours in the same line, and can be shot at once: then they fasten potlarts to the several simple chords that draw up the rings, through which those threads of the warp run, which are to lie behind this colour; they tie all these loops together, and fasten a piece of worsted or silk to the knot, of the same colour that the workman is to throw; and the boy, when he pulls each loop, names the colour, that the weaver may take the proper shuttle, and so on for every colour to be thrown.

Of the upright-way of working TAPESTRY, with relation to TURKEY CARPETS.

The carpets which are made at the royal manufactory of La Savoniere, below the Louvre, at Paris, are, in some respects, wrought by the upright-way of tapestry. The two rollers are placed the same way: the warp is braced from the top downward: the chain, with its loops, keeps all the threads of the warp equally perpendicular: the stick, which facilitates their crossing, runs through them in the same manner, and separates the foremost threads from the rest: the lizier-pole holds all the strings, which serve to draw the fore threads in their turns, and then the opposite threads, in order to insert the spindles of woof. But the method of working in this manufactory differs from the upright way of tapestry in these particulars:

1. The warp is divided, both before and behind, into parcels of 10 threads each, nine white, and one blue; which is regularly continued through the whole width of the piece.
2. The weaver works on the fore-side, and consequently sees what he does.
3. The design, or pattern, is traced in its proper colours, on cartons, tied about the workman, who looks at it every moment, because every stitch is marked on it, as it ought to be in his work. By this means he constantly knows what colours and shades he is to use, and how many stitches of the same colour.
4. In this he is assisted by squares, into which the whole design is divided: each square is subdivided into 10 vertical lines, corresponding with each parcel of 10 threads of the warp: and besides, each square is ruled with 10 horizontal lines, crossing the vertical lines at right angles.
5. The workman having placed his spindles of woollen, silk, or other richer thread near him, begins to work on the first horizontal line of one of the squares. These lines marked on the carton are not traced on the warp, for this would be endless; because an iron wire, which is longer than the width of a parcel of 10 threads, supplies the place of a cross line. This wire is managed by a crook at one end, at the workman's right-hand; towards the other end it is flatted into a sort of knife, with a back and edge, and grows wider to the point. The workman fixes his iron wire, or rod, horizontally on the warp, by twisting some turns of a suitable thread of the woof round it, which he passes forward and backward, behind a fore thread of the warp, and then behind the opposite thread, drawing them in their turns by their leifhes. Afterwards, if it be necessary, he brings his woof-thread round the wire, in order to begin again to thrust it into the warp; or else he ties it to the wire with a running knot, and lets it hang on it, in order to take another woof, and pass it into the warp. He continues in this manner to cover the iron rod, or wire, and to fill up a line to the tenth thread of the warp, which is the blue one. He is at liberty either to stop here, or go on with the same cross line in the next division. According as he passes the thread of the woof round the iron wire,

and into the warp, the threads of which he causes to cross one another every instant: when he comes to the end of the line, he takes care to strike in, or close again all the stitches with an iron reed, whose teeth freely enter between the empty threads of the warp, and which is heavy enough to strike in the woof he has used. This row of stitches is again closed and levelled, by a dweet of blue thread doubled, which the workman puts into the warp, sliding his hand over the whole length of the line he has wrought. He crosses the same threads of the warp, and then stretches through them another single blue thread. He beats in these two threads, one after another, with his reed: these dweets of cross thread, which are a support to each line, will be hid by the pile on the fore side; they indeed diminish the beauty of the wrong side, but this is of no consequence.

This done, the workman draws the iron-rod or knife out of the loops of the woof that covered it: and as it is wider towards its end, these loops refit its passage; but being edged at its fore-part, it cuts them through. Then the workman with his left-hand lays a strong pair of shears along the finished line, cuts off the loose hairs, and thus forms a row of tufts perfectly even, which, together with those before and after it, form the shag. One line of this sort taking in the row of stitches and woollen pile, with the two blue threads which support them, somewhat surpasses, in thickness, the space between the first and second cross line of a square. There must be eight wires full of woollen thread, and sixteen blue threads, to answer to the ten cross lines of a square. By this means the workman always sees what he is doing. He follows stitch for stitch, and colour for colour, the place of his pattern which he is at, and paints magnificently without having the least notion of painting or drawing. It does not appear, that the directors of carpet-work among the Mahometans, are better draughtsmen than their workmen, for the Turkey carpets have nothing in them but a symmetry of colours.

REMARKS.

Under our articles of ARTIFICERS, CANDIDATE, CARPET, CLOTH, FRANCE, MECHANICS, MANUFACTURERS, and divers other articles, which the reader will observe from our GENERAL INDEX, we have shewn the great national advantages which arise to a trading state from manufactories in general, and how requisite it is, from time to time, to improve in the old, as well as to invent, or introduce, new manufactures, in order to fall in with the chargeable taste of foreign nations, that our rivals may not supplant us in trade, by their greater vigilance in these respects.—Under the preceding, and various other heads, we have also shewn by what gradations many states have increased in their mechanical and manufactural arts, and how the French, in particular, have arose to so great perfection in their manufactures, by sparing no encouragement, rewards, and honours, upon such ingenious artists who have proved the happy instruments of introducing any valuable NEW MANUFACTURE into their dominions.—We there have seen by what wise measures this politic and ingenious nation first established their woollen and filken fabrics of every species; how they first supplied themselves with the former sorts of manufactures, which they were wont to take from England, and by what degrees they afterwards have greatly supplanted this nation, at most of their best foreign markets in their woollen goods.—And under our article MEDALS, we shall find how they have commemorated those happy æras that have been productive of any blessings that have tended to the enlargement of the commerce and navigation of that neighbouring nation.

In the history of this part of the French polity, it will be difficult to find a single instance of any capital ingenious artist, that has proposed to the administration any laudable undertaking, tending to the improvement of the old, or the establishing of new manufactories, who has not been gratefully received, and liberally recompensed, and this even though he may have for a time proved unsuccessful in his attempt. By this generous treatment of the industrious and ingenious mechanic and manufacturer, it is not to be admired that they have drawn the most celebrated artists of every class into their country, from all corners of the world.—For such national munificence towards these people, will spread itself among them in all countries; and the glory that such a country derives therefrom, will influence these artists, maugre all laws to prevent it, to forsake their native country, where no due regard is had to their merit.

It would make, I am afraid, but a disagreeable scene: certain I am, that it would not redound to the honour of Great-Britain, if the history of great numbers of British, as well as foreign artists, who had great talents, and strong impulses to promote the commerce and navigation of this nation, was properly represented, and the difficulties and discouragements they have too generally met with; and which hath at length either broke their hearts, by shameful attendance and dependence, or forced them into other nations, where they have been caressed and rewarded, suitably to their merit: an history of this nature, with relation to our own country, compared with a like history in regard to France, would, I am confident,

confident, give great glory to the one, and no less ignominy to the other. Nay, was I to give a short history of many persons of this stamp, that have fell within the tether of my own knowledge, and that of some gentlemen of my acquaintance, it would be a disagreeable task, because it might be thought an invidious one, with respect to our rulers at different times.

There is a difference between the idle and designing projector, and the solid and well-intentioned artist. The former of these we have sufficiently exposed, under our article PROJECTORS, in order to guard the public against such impostors, who are as detrimental to the community in general, as ruinous to the private fortunes of those who are enchanted into their magic circle of PROJECTORSHIP.—But how these impostors may be prevented, and how the meritorious artists may be duly encouraged, and improved in their respective arts, see our articles ARTIFICERS, MECHANICS, PHILOSOPHY EXPERIMENTAL, and ROYAL SOCIETY OF LONDON. Nations that abound not with mines, especially those of gold and silver, or such other as will tend to enrich and people the state, must depend upon the productions of their lands, or their manufactories, or both: and the two latter are preferable in most states to the former, as being more permanent, if wisely regulated, according to the wants and the taste of other countries.

Because Great-Britain and Ireland abound with such immense quantities of wool, and which is of a quality superior to all other in the world for the fabric of general manufactures; and because the goodness of our wool has long been, and still is, a temptation to our competitors in trade to smuggle it out of our nation, and that chiefly in exchange for their commodities of luxury, which are likewise smuggled INTO this nation: as our commercial rivals have, chiefly by means of our own wool, greatly supplanted us in many of the capital branches of this our staple manufactory, it behoves the wisdom of the nation duly to cherish and encourage every manufacture that has a tendency to the consumption of this commodity amongst ourselves, if no other end could be answered by it than that of so lessening the quantity, as to deprive our competitors of having so much out of the kingdom as they at present obtain.

As these manufactural arts have an immediate practical tendency to the improvement of those of DRAWING and PAINTING, this, methinks, should be no indifferent motive with us to the effectual promotion and encouragement of such manufactories; for when these new commercial establishments take place in the kingdom, and will afford a handsome recompense to the ingenious artist in design and painting, this will induce numbers to breed up their children, especially those of tender constitutions, to so genteel an employment, whereby they can obtain an handsome maintenance. But it does not seem very politic to expect that numbers of people should apply themselves to the arts of DRAWING and PAINTING, without first being certain that there will be competent business, by which they may get a tolerable livelihood. But this is not the case at present; for, if I am rightly informed, we have now more artists already in these branches than can well live: so that if we would increase the numbers of these artists, who certainly would greatly contribute to the improvement of divers of our mechanical and manufactural arts, we must previously settle and establish such permanent manufactories as will afford them certain bread.

The beauty and delicacy of our woollen, as well as silken manufactures of every kind, greatly depend on the lustre of their colour; and as there are no manufactures that require a superior beauty and elegance in this respect than those of CARPETS and TAPESTRY, the promotion of these will have an inevitable tendency to improvements in the art of DYEING; and every advance towards a further degree of perfection herein is of consequence to our woollen manufactories in general. See our article DYEING.

Commerce has been considered as either active or passive; the latter consists in purchasing more commodities in value of other nations than they do of us; the former does the contrary, and, by selling more than we purchase, become the source of wealth and power. Every new manufactory settled in a trading nation, either tends to lessen the importation of the same from foreign states, or to supply us with an additional commodity to increase our active commerce; and it sometimes answers both these ends.

States, no more than private persons, should lose sight of that excellent maxim of Cato, *Patrem familias vendacem, non emacem, esse oportet*: THAT THE MASTER OF A FAMILY OUGHT TO BE A SELLER, AND NOT A BUYER. All the comforts of the head of a family, all the wealth of a city, all the grandeur of a kingdom, depends solely upon selling much, and buying little, or upon selling more than is bought. He that is constantly buying more than he sells, let him be a second Cæsus in treasure, must at length be reduced to the unhappy state of a beggar; for his stock is diminished in proportion to the over-balance of goods bought in. But whoever is constantly selling more than he buys, let him be poor as Lazarus, must, by such a transaction, acquire the happy circumstances of the prosperous; for as much as the balance is in favour of the

VOL. II.

amount of the SALES, just so much is added to his capital. This reason evinces the truth of it; and we have confirmation hereof in the vigilance of neighbouring nations to make provision for selling much and buying little.

NEW MANUFACTORIES is the sure and fundamental provision for the introduction of riches and happiness into a kingdom; and, for the want of these, and due improvements in the OLD, will ever occasion the decline of our trade, and introduce poverty.

Further to evince the truth of these principles, we may appeal to experience; for what has been the principal occasion of the decay of our TURKEY TRADE, but the new-invented woollen fabrics of the French, which have hit the taste of the Turks, while our's grow more and more out of date among that people? And has not this been caused by an unaccountable perverseness in our English manufacturers not to strike out of the ordinary road, and to hit the goût of the Turks, as well as the French have done? [See our article MANUFACTURES.] If a Turk can purchase two suits of cloaths a year of the French fabric, for the price that he must give for one of the English, they will give the former the preference; especially so, since it seems he can have them of different, and more beautiful colours, than those of England; and although they may be of a lighter manufactory, yet, if the two French suits wear as long as one of the English will, and the Turk can have his fancy better pleased, the Englishman will ever experience the disadvantage arising from his adhering to his OLD FABRICS, while his rival is daily inventing New.

In order to induce our English manufacturers to turn their thoughts upon emulating the French, in regard to the present Turkish mode, that the French have so beneficially introduced among them, I have, under the article MANUFACTURERS, earnestly recommended to them the imitation of these French woollen fabrics, which are now so much in vogue in Turkey, and which have been greatly instrumental in supplanting us in a considerable part of that once valuable and important commerce; and I have the satisfaction to inform the public, that my zeal is likely to be attended with the desired success: for not long since I have received letters from a very ingenious English manufacturer, that, in consequence of my recommendation of such like manufactures to the trial of our English clothiers, he had cheerfully set about them; and, within this month, I have received an additional pleasure, by seeing patterns of his FIRST TRIAL, which he has sent me; and which having laid before some of the Turkey merchants, they have great expectations that this ingenious English artist will not only be able to make as good cloths of this kind as the French do, according to the Turkish taste, but to sell them equally cheap, if not cheaper, than they do.—And if so, this will enable us once more to get the start of the French in this commerce, or put us upon a level with them in that important branch of trade.

This is the case, likewise, with relation to the SPANISH TRADE: for as to the fine English cloths, no objection can be made to their quality; but the French have got the start of Britain in all the finer sorts of woollen goods, by making them as fine to the eye, and not of half the substance as the British superfines; therefore they can afford to sell them much cheaper than ours. The policy of these our commercial rivals is very remarkable, subtle, and conspicuous to such Britons as are disposed to think on the trade of their country. The French finding they could not make cloth of so good a quality as the British, very judiciously attempted to outdo them by cheapness, which they have effected; and, in order to take off the natural objection against the French cloths, viz. that they are not so durable as the British, they are continually making improvements in their COLOURS [see our article DYEING] and, as soon as a good approved colour appears, it is more unfashionable not to be dressed in that colour, than it would be in England to be dressed in a suit made of blanketing. By this artifice the French subjects in this kingdom, and even the English also themselves in Spain, are inticed into a wear of their cloths, on account of the difference in the price; and the wearers will tell the Spanish shopkeepers they can have two French coats for the price of one made of British cloth. The alteration in the fashionable colours is artfully contrived to return, before a coat of paltry French cloth can be worn out: so that the superlative goodness of the British cloth is not regarded by any people of fashion; and if our countrymen, the manufacturers of cloth in Great-Britain, cannot invent a cloth as cheap as the French, they must expect to be beaten by their enemies, not only out of their raw materials (of which the French can have what quantity they please now, and will be courted to take more, as the trade of England declines) but out of the trade also; for there are merchants in several ports in this kingdom, who have large quantities of the best superfine British cloths, that have lain by them ever since the cessation of arms previous to the last peace.

Nor is this less the case with respect to our PORTUGAL TRADE. For the French have done our commerce in the woollen manufactory with this kingdom an unpeakable detriment, by a new fabrick of FRENCH BLACK DRUGGETS,

10 N

which

which they have introduced there. Of this I have been apprized from Portugal by an English gentleman, who has greatly the prosperity and honour of his country at heart; and, in consequence of what I have observed under the article PORTUGAL TRADE, he has promised me that I shall soon receive patterns of these BLACK FRENCH DRUGGETS from Portugal; which I shall put into the hands of a celebrated English artist in this way, who has given me great hopes, that he likewise shall be able to beat the French in this manufacture, and put the English in Portugal upon a par in this trade with the French; which, when done, the public will be duly informed of.

These things are mentioned, with a view only to shew that if our manufacturers were to be properly encouraged in making such improvements in their respective branches, as would put this nation in a capacity to vie with its competitors in trade, they would never be behind-hand with them.—But if a ridiculous and unaccountable aversion to the introduction of NEW MANUFACTURES among us prevails, our manufacturers may starve by the old, and the nation be daily impoverished, while France is rendered more and more prosperous and powerful, by countenancing every valuable NEW invention made in their own, or introduced from other countries.

Manufactures of moderate expence, says a judicious writer, and quick growth, may safely be left to private adventurers, and run the common chance for success; the finer arts will never flourish, but under PUBLIC PROTECTION and NOBLE PATRONAGE; no encouragements in the hands of private persons, are adequate rewards to the man of genius. MONEY is the pay of common men, as praise is that of heroes; and HONOUR will ever be found a much stronger principle of fine invention, than GAIN. We may apply to the artist what Quintilian declares of his young orator—*Nolo mihi oratorem dari, quanti sint studiæ computaturum*—All that was great and noble in ancient wit and art, was produced by honours as well as rewards, by the countenance of PRINCES, and the favour and kind influence of GREAT MEN. Sometimes, indeed, the strength of a warm devotion has struck an enthusiasm and passion into the works of artists, beyond the power of human motives to inspire. A noble profusion of HONOURS and BOUNTY raised the GOBELINES in France to its present height; the united influence of these two being generally sufficient to call forth whatever human industry can attain to.

This house was the residence of two brothers, who first brought to Paris the secret of dyeing a curious scarlet, and failed in setting it on foot. Their buildings went under the popular name of the FOLLY of the GOBELINES for many years, till the opprobrium was taken off by a ROYAL EDICT, and the name changed by public authority to the more honourable one of the ROYAL MANSION OF THE GOBELINES. The scarlet colour was ordered to be called after the name of the inventors, and the little river Bievre, which runs by the building, received the same distinction. These in appearance were trifling matters, but will be sensibly felt by the man of genius. The same year the house was purchased by the KING, and intitled the MANUFACTORY OF THE CROWN FURNITURE; and provision was made by a ROYAL CHARTER, to render the place a perpetual SCHOOL and seminary of the curious arts. Here M. COLBERT collected together, from all parts of the world, the most able MASTERS and DESIGNERS, as well as inferior artists in the fine manufactures. SALARIES were appointed for the DIRECTORS, and PENSIONS for life to the workmen; these were TAPESTRY-WEAVERS, ENGRAVERS in ETCHING and METZOTINTOES, GOLDSMITHS, JEWELLERS, CARVERS, and WORKERS in EBONY. In this place was wrought all the magnificent furniture for fourteen ROYAL PALACES, which has since been deservedly the admiration of the world. Particular care was taken, that no part should be furnished elsewhere, much less from abroad. All honorary presents to foreign princes and noblemen abroad, and to the ornament of temples and public buildings at home, were made in their best performances, instead of jewels or money. Many of the superior artists invited from foreign countries were made NOBLE, and all of them had various honorary privileges and royal pensions: the whole number, superior and inferior, were comprehended amongst the natives of France, and made free of Paris, with full liberty to practise their trades where they pleased, after working for a certain term in the Gobelines. This indulgence extends to all, who shall at any time hereafter practise the limited time in this foundation. The whole quarter of the Gobelines was exempted from taxes and imposts, and had a court of judicature peculiar to itself, under the title of the court of the ROYAL ARTISTS.

Besides these, there are three other academies in Paris for the polite arts, with various privileges, honours, and pensions, to the members forming the governing part of each society. The academy of painting and sculpture, that of architecture, and the military one, of late foundation. Precedents inviting our attention and imitation, if the latter may not be said to command it. The two former and the academy of

sciences are copied in SPAIN, and are all equally liberal endowments.

In England, the stream of public favour and liberality has turned wholly to the advance of SCIENCES; we have few or no institutions in favour of ARTS, no place of residence but for speculation. The Royal Society are indebted to the public only for their name. How useful this honourable body has been, and how they may be rendered far more so, see our article ROYAL SOCIETY.

An academy for the fine arts above-mentioned, under a royal charter, with distinguishing honours and privileges for the higher members, and small pensions for the lower, might give us a prospect of some perfection in the branches of TAPESTRY-WEAVING, PAINTING, SCULPTURE, and STATUARY, and all the lower trades of elegance depending on fine DESIGN. Without some such public institution, they never yet were carried to an height in any country: no private fortune can stand out the time necessary to train up hands enough to extend the ART into a TRADE; but when once a sufficient number were made perfect in this seminary, private adventurers would be found ready enough to take up the business; for no place ever wanted a trade, that abounded with working hands well instructed therein.—In a word, the THEORETICAL ARTS, and PRACTICAL TRADES thereon depending, should go hand in hand.

TAXES. Under the article REVENUE, we have given a brief narrative of the methods of raising money in this kingdom, from the CONQUEST to the REVOLUTION in 1688: under the same article we have likewise shewn, that as this nation enjoyed neither civil nor religious liberty, till the time of our great deliverer King William III.; so the whole property of the people was either at the mercy of princes or priests, or both; the public revenue was raised in an arbitrary and oppressive manner; and what the civil power did not wrest from the people, the ecclesiastical did.—We shall here give a view of the money that has been raised in this nation, since the revolution in 1688 to the demise of his late majesty George II. in 1759.

SUMMARY OF THE TOTAL YEARLY SUPPLIES, granted by Parliament, during the Reigns of KING WILLIAM and MARY, WILLIAM III. QUEEN ANNE, KING GEORGE I. and KING GEORGE II.

SUMMARY OF THE TOTAL YEARLY WAYS and MEANS.

The distinct years of the supply continued on the other side,

‘ That a day or days should be appointed, after which no clipped crowns or half crowns, should be allowed in payment, or to pass, except only to the collectors and receivers of his Majesty’s revenues and taxes, or upon loans or payments into the Exchequer.
 ‘ That a day or days should be appointed, after which no clipped crowns or half-crowns should pass in any payment whatsoever.
 ‘ That all such crowns and half-crowns, as they came into his Majesty’s receipt, should be recoined into milled money.
 ‘ That a day or days should be appointed, after which no money clipped within the ring should be allowed in payment, or to pass, except only to the collectors and receivers of his Majesty’s revenues and taxes, or upon loans or payments into the Exchequer.
 ‘ That a day or days should be appointed, after which no money clipped within the ring should pass in any payment whatsoever.
 ‘ That a day or days should be appointed for all persons to bring in their clipped money, to be recoined into milled; after which no recompence should be made for the same.
 ‘ That a fund or funds should be settled, for supplying the deficiency of the clipped money.’
 And an address being presented, in consequence of these resolutions, his Majesty did, by a proclamation of the 19th of the same month, reciting the before-mentioned addresses of the two houses, ‘ command, that after the first of January then next ensuing, no clipped crowns or half-crowns should pass in any payment, except to his Majesty’s collectors and receivers, &c. nor after the 3d of February, in any payment whatsoever, within London, or 40 miles thereof; nor after the 22d of February, in any other part of the kingdom; and that after the 13th of February, no shilling clipped within the ring should pass in any payment, except to his Majesty’s collectors, &c. nor after the 2d day of March in any payment whatsoever. And after that the said 2d day of March, no other money clipped within the ring should pass, except to his Majesty’s collectors, &c. nor after the 2d day of April, in any payment whatsoever.’
 And by another proclamation, of the 4th day of January, in the same year 1695, reciting the former, and an address of the commons in parliament assembled, the receivers and collectors of his Majesty’s taxes and revenues were ‘ strictly charged and commanded, that, until the said several days mentioned in the last proclamation, they should receive in payment all clipped money of the several denominations therein mentioned, that were of standard silver.’

AN ABSTRACT OF THE ACCOUNTS OF THE GREAT RE-COINAGE IN KING WILLIAM’S REIGN.

Of the silver coined in the Tower of London from the 30th day of September, 1695, to the 31st day of December, 1699, there was, in 12 general remains of clipped hammered silver monies, taken in by the lords of the Treasury, melted at Westminster into 10,933 ingots, and then sent to the Mint, the weight of	lb.	oz.	dwt.	gr.
There was likewise of hammered money and wrought plate imported into the Mint, and there melted, the weight of	790,860	1	19	8
The hammered money and wrought plate imported into the five country mints, made in weight,	696,971	0	16	19
At Bristol	146,977	0	0	0
At Chester	101,660	0	0	0
At Exeter	147,296	0	0	0
At Norwich	83,040	0	0	0
At York	99,023	0	0	0
The total of the hammered and clipped silver mon. and of the wrought plate imported, amounted to the weight of	2065,827	2	16	3
Which makes, at 3l. 2s. the pound-weight, the sum of 6,404,064l. 8s. 6d. but which being coined somewhat lighter, though within the remedy allowed, produced really in tale the sum of	6,435,039	14	9	½
There was coined in the Tower of London, during the joint reign of king William and queen Mary; that is to say, from the 14th day of February, 1688, to the 28th day of December, 1694,				
In crown gold, the weight of 9,962 lb. 8 oz. 14 grs. making in money, at 44l. 10s. the pound weight, the value of	443,338	15	6	

Brought over	l.	s.	d.
In sterling silver, during the same time, the weight of 25,492 lb. 4 oz. 18 dwts. 8 grs. making in money, at 3l. 2s. the pound weight, the sum of	443,338	15	6
Total value of all the money, both gold and silver, coined during the joint reign of king William and queen Mary	522,365	4	10½
There was coined, during the remaining part of the reign of king William, after the queen’s death, in crown gold of the Tower of London, from the 29th day of February, 1694, to the 8th day of March, 1701, the weight of 66,866 lb. 3 oz. 14 dwts. 11 grs. making in money, at the aforelaid rate of 44l. 10s. the pound weight, the value of	2,975,550	16	1
In sterling silver, during the same time, in the Tower, the wt. of 1,684,600 lb. 19 dwts. 6 grs. and in the five country mints, the weight of 577,996 lb. making together the weight of 2,262,596 lb. 19 dwts. 6 grs. and which produced in money, at the aforelaid rate of 3l. 2s. the pound weight, the sum of	7,014,047	16	11½
Total value of all monies, both of gold and silver, coined from the decease of queen Mary to the decease of the king	9,989,598	13	1
And the whole value of all the said monies coined from the king’s accession to his death, amounted to the sum of	10,511,963	17	11½

QUEEN ANNE

Passes an act for the better support of her household, and of the honour and dignity of the crown.—An act for making good deficiencies, and preserving public credit.—An aid by divers subsidies, and a land-tax.—Has 4s. in the pound granted upon land.—Has a supply granted to her by several duties upon malt, mum, cyder, and perry.—An act for continuing the duties upon coals, &c.—An aid by sale of several annuities at the Exchequer.—Has several subsidies granted for carrying on the war against France and Spain.—Has 4s. in the pound granted upon land.—An aid by continuing the duties upon malt, mum, &c.—An aid for carrying on the war, &c. by selling annuities at several rates.—An additional subsidy of tonnage and poundage, for three years.—Has 4s. in the pound again granted upon land.—Passes an act for raising monies by the sale of several annuities, for carrying on the war.—Continues the duties upon malt, mum, &c. for one year.—Continues the duties upon low wines, and upon coffee, tea, &c.—Has a farther subsidy granted upon wines and merchandizes imported.—Has 4s. in the pound again upon land.—Continues the duties again upon malt, mum, &c.—An additional subsidy of tonnage and poundage continued, &c.—Passes an act for laying farther duties on low wines, &c.—Has 4s. in the pound again granted upon land.—Passes an act for continuing the duties upon malt, &c.—Passes an act for continuing the duties upon houses, &c.—An act for continuing the duties on low wines, &c.—An act for continuing several subsidies, impositions, and duties, and for making the provisions therein mentioned, to raise money by way of loan, for the service of the war, &c.—Has 4s. in the pound again upon land.—Has the duties on malt, mum, &c. continued.—Passes an act for raising a further supply by sale of annuities, charged on a fund, not exceeding 40,000l. per annum.—An act for continuing half the tonnage, poundage, and other duties on goods imported, &c.—Act for continuing the half subsidies therein mentioned, viz. on wine, vinegar, tobacco, &c.—Likewise the duties upon coffee, chocolate, spices, &c.—Has 4s. in the pound again upon land.—Has the duties on malt, &c. again continued.—Has the imposition on tobacco, India goods, &c. continued.—Has 4s. in the pound again upon land.—Duties on malt, &c. continued.—Duties on coals, &c. continued, and new duties on houses.—New duties of excise, and upon several commodities, granted.—An act for laying certain duties upon candles, and certain rates upon monies given with clerks and apprentices.—Has several duties, impositions, and additional taxes continued on wine, vinegar, tobacco, &c.—Has 4s. in the pound still upon land.—Duties on malt, &c. again continued.—An act for reviving, continuing, and appropriating certain duties on several commodities to be exported, &c.—Passes an act for establishing a general post-office, &c.—Passes an act for aying certain duties upon hides, skins, &c. for 32 years.—Passes an act

act for laying a duty upon hops.—An act for making good deficiencies, and satisfying the public debts, &c.—Passes an act for duties upon coals, for building fifty new churches.—An act for licensing and regulating hackney coaches and chairs, &c.—Has 4s. in the pound still upon land.—Duties upon malt, &c. again continued.—An act for laying several duties upon all soap and paper made in Great-Britain, or imported, &c.—An act for laying additional duties on hides and skins, &c.—Has the whole taxes continued as in other years anno 1712, amounting to 6,656,967 l.—In the next year has 4s. in the pound again upon land.—Duties upon malt, &c. again continued.—Passes an act to raise 1,200,000 l. for public uses, by circulating a farther sum in Exchequer bills, &c.—Has 4s. in the pound again upon land.—Duties upon malt, &c. continued.—Passes an act for laying additional duties on soap, paper, and upon certain linens, &c.

R E M A R K S.

Queen Anne coined of silver the same monies and of the same form as those of king William; excepting that the arms of Nassau in the center of the four larger pieces were now omitted, and that in their room the garter star was again replaced. In the year 1707, the union of the two kingdoms of England and Scotland being completed, and taking place on the first day of May, there was thereupon an alteration made in the royal arms, as represented on the money: England and Scotland being from that time impaled together in the first and third of the four crowned shields, in the second of which France was now placed, and Ireland in the fourth. All the old silver money of Scotland was also upon the same occasion recoined into money of Great-Britain, exactly the same as that coined in England, and only distinguishable from it by the letter E. for Edinburgh, stamped upon all the pieces under her Majesty's head.

There was coined in the Tower of London, during the reign of queen Anne, that is to say, from the 9th day of March 1701, to the 1st day of August 1714,

In crown gold, the weight of 55,832 lb.	l.	s.	d.
2 oz. making in money at the rate of	2,484,531	8	4
44 l. 10s. the pound weight, the value of			
And in sterling silver, the weight of 66,804 lb. 9 oz. 15 dwts. which produced in money, at the rate of 3 l. 2s. the pound weight, the sum of	207,094	18	4 $\frac{1}{2}$

Total value of both sorts - 2,691,626 6 8 $\frac{1}{2}$
It may be noted, that it appears by the particulars of the accounts from which the foregoing extract was taken, that in the years 1709 and 1711, during which the greatest coinages of silver were made in this reign, there was coined out of wrought plate brought in upon encouragement, the weight of 46,156 lb. 11 oz. 2 dwts. 3 gr. making in value about 144,000 l. sterling; which was more than two thirds of all the silver coined in the Tower, from her Majesty's accession to her decease.

But there was further coined in this reign at Edinburgh upon the Union, and by the English monies sent down thither, the weight of 103,346 lb. making in tale, at the aforesaid rate of 3 l. 2s. the pound weight, the sum of 320,372 l. 12s. sterling money; all which was of their first coinage, in the year 1707, or the very beginning of 1708. Besides which, there was again a second coinage soon after, and before the end of the last mentioned year 1708, when some silver that could not conveniently be minted before, was also like the other, converted into current money of Great-Britain: but of this last coinage we have met with no particular account.

When the war begun in this reign, nothing could be more menacing than our prospects. The house of Bourbon despising all treaties, and, as usual, the most solemn engagement, by seizing territories more extensive and considerable, than were ever gained by the most rapid conquests. All the powers of Europe were interested to oppose a monarch thus prepared for their destruction. No period of time afforded men more eminent for wisdom and abilities, and more distinguished by successes equal to their merit. Had not this been the case, notwithstanding the stand that king William made against France, Europe must still have submitted to an universal monarchy, which would not have indured any remains of civil or religious liberty.

In confederacies, wherein there are a variety of opposite interests, misfortunes are inevitable. Notwithstanding the several escapes of the enemy, the duke of Marlborough's progress, and the damages the French sustained elsewhere, reduced them to a state of distress and terror: notwithstanding their frontiers were impaired to such a degree, that we gained a secure admission into the defenceless parts of France, had his queen and country supported this great captain; yet we lost by the event every benefit which such advantages would have produced. For the queen unhappily exchanging the able, honest, and successful, for those whose management proved them the reverse, was the cause of our then not duly humbling the perfidious nation of France, who are eternally disturbing the happiness of man-

kind. No one of our monarchs ever had greater advantages of doing lasting good both at home and abroad, nor any reign been distinguished with such glorious and important events. Germany saved from destruction; the imperial crown preserved on the head of our ally; Flanders subdued; the exorbitant power of France reduced; the union of England and Scotland obtained, are events which will be had in everlasting remembrance. But by a dishonourable peace, how fruitless were these important events rendered? How soon again was the power of France restored to a condition of injuring, oppressing, and terrifying the world? And has not the power of this restless nation been daily aggrandized since this period? And do we not now experience the effect of it? And nothing, perhaps, but the queen's sudden removal, prevented the execution of those schemes in favour of a Popish pretender, which the peace-makers had laid.

KING GEORGE I.

Passes an act for the better support of his household, &c.—An act for rectifying mistakes in the names of the commissioners for the land-tax for the year 1714, &c.—Has an aid by the land-tax for the year 1715.—The duties on malt, &c. continued as in the former reign.—Passes an act for enlarging the fund of the governor and company of the Bank of England, relating to Exchequer bills, &c.—An act for raising 910,000 l. for public services, by sale of annuities, &c.—Passes an act for enlarging the capital stock and yearly fund of the South Sea company, &c.—Has the land-tax continued for the years 1715 and 1716.—Duties on malt, &c. again continued.—Passes an act to continue duties for encouraging of the coinage of money, &c.—An act for appointing commissioners to enquire into the estates of certain traitors, and of Popish recusants, and of estates given to superstitious uses, in order to raise money out of them severally for the use of the public.—The land-tax act passed again.—Duties on malt, &c. continued again.—Passes an act for redeeming the duties and revenues, &c.—An act for redeeming several funds of the governor and company of the Bank of England, &c.—An act for redeeming the yearly fund of the South Sea company, &c.—The land-tax continued.—Duties on malt, &c. continued.—Land-tax again continued.—As also duties on malt, &c. Passes an act for applying certain overplus monies, and farther sums to be raised, &c.—An act for continuing certain duties upon coals and culm, &c.—An act for redeeming the fund appropriated for payment of the lottery tickets, made forth for the service of the year 1718, &c.—Land-tax again continued.—Duties on malt, &c. continued.—Passes an act for enabling the South Sea company to increase their capital stock and fund, &c.—An act for making forth new Exchequer bills, not exceeding 1,000,000 l. at a certain interest.—Passes an act for laying a duty upon wrought plate, &c.—Land-tax again continued.—An act for continuing the duties on malt, &c.—An act for raising a sum not exceeding 500,000 l.—Land-tax continued.—Duties on malt, &c. continued.—Passes an act for paying off, and cancelling 1,000,000 l. of Exchequer bills, &c.—An act for reviving and adding 2,000,000 l. to the capital stock of the South Sea company, &c.—An act for reducing certain annuities, &c.—Passes an act for the more easy assigning or transferring certain redeemable annuities, &c.—An act for granting an aid to the crown, by laying a tax upon Papists, &c.—Passes an act to continue the duties for the encouragement of the coinage of money, &c.—Has an aid granted by a land-tax.—An act for continuing the duties on malt, &c.—An act for repealing certain duties, payable upon coffee, tea, &c. and for paying certain inland duties in lieu of them.—Has an aid again by a land-tax.—An act for rating unrated goods, &c.—An act for continuing the duties on malt, &c.—An act for continuing several annuities to the Bank, 'till Midsummer 1727, &c.—An act for redeeming certain annuities, charged on the civil-list revenues, &c.—An act for the more effectual preventing frauds and abuses in the public revenues, &c.—The land-tax continued.—Has one million granted him, to be raised by a lottery.—The duty on malt, &c. continued.—Has an aid by laying a duty on the victuallers in London and Westminster, &c.—Passes an act for repealing the duties laid on snuff, &c.—An act for laying an imposition of two pence Scots, upon all ale and beer, brewed and sold in the city of Glasgow.—Passes an act for the improvement of the revenues, &c.—Has an aid granted him by a land-tax.—An act for redeeming certain annuities transferrable at the Bank, &c.—The duty on malt, &c. continued.—Passes an act for granting the sum of 370,000 l. to the crown, &c.—Passes an act for the sale of such of the forfeited estates in Scotland as remain unfold, and are vested in the crown.

R E M A R K S.

The silver monies of king George the 1st were the same as those of queen Anne, and of the same form, excepting that his head was again adorned with laurel, like those of his predecessors, king Charles II. king James II. and king Wil-

liam; and that upon the reverse of the crowns, half crowns, shillings, and half shillings, the arms of Brunswic Lunenburg, &c. used by his Majesty as Elector, were placed in the last of the four crowned shields, the third of which was now given to Ireland.

There was coined in the Tower of London during the reign of king George I. that is to say, from the 2d day of August 1714, to the 11th day of June 1727,

In crown gold, the weight of 184,763 lb. which, computed at 46 l. 14 s. 6 d. the pound weight, guineas having been settled and made current at 21 s. each, by his Majesty's proclamation of the 22d of December 1717, and being therefore no longer esteemed as pieces of 20 s. but of 21 s. each, in the mint, produced after that rate in money, the value of	l.	s.	d.
	8,492,876	3	6
In sterl. silver, the weight of 75,176 lb. making in money, at the rate of 3 l. 2 s. the pound weight, the sum of	233,045	12	0

And the total value both of the gold and silver amounted to
