The artists in the Florentine and Roman schools painted most commonly in water colours or in fresco; and in the exercise of their profession, instead of nature, they finished their works from their first sketches. Titian painted in oil, and finished from the objects in nature; and this practice, joined to his exquisite talents, gave the greatest truth to his colours. His being a portrait painter was also of advantage to him as a colourist,

Schools.

School's.

a colourist. In this department he was accustomed to the colours of nature in carnations and draperies. He was a landscape-painter; and here also he took the colours from nature.

"As Titian perceived (says Mengs) that the objects which are beautiful in nature have often a bad effect in painting, he found it necessary to make a choice in the objects of imitation; and he observed, that these were objects of which the local colours were extremely beautiful, which nevertheless were in a great measure destroyed by the reflection of light, by the porosity of the body, and by different luminous tints, &c. He perceived also, that in every object there was an infinite number of half tints, which conducted to the knowledge of harmony. In short, he observed in the objects of nature a particular agreement of transparency, of opacity, of rudeness, and of polish, and that all objects differed in the degrees of their tints and their shades. It was in this diversity he sought the perfection of his art; and in the execution he moderated the effect of natural colours. For example, in a carnation which had many demi-tints, he confined himself to one; and he employed even less than a demi-tint, where there were few in the natural object. By this means he obtained a colouring exquisitely fine; and in this part he was a great master, and deserves to be carefully studied."

Titian has in general little expression in his pictures, and he sometimes introduces figures which augment the coldness of the piece; for if it be true that the heads, even in historical painting, ought to be studied after nature, it is true also that an individual nature ought not to be presented, but one general and ideal. It is necessary that they should be men, while they resemble not men we are accustomed to see. The painter fails in the effect which he ought to produce, if, when he represents Achilles, Hector, and Cæsar, his personages are familiar to our observation.

The colours of his paintings are so mingled together, as to give no idea of the colours on his pallet; which distinguishes him from Rubens, who placed his colours one at the side of another. It is impossible to say, on the narrowest inspection, with what colours he produced his tints. This practice, which enabled him to imitate so exactly the colours of nature, gives a marked distinction to his manner of painting. In the examination of his works, the critics lose an ordinary source of pleasure which arises from marking the freedom of hand; but they may console themselves with the natural and exquisite touches of this artist.

He is of historical painters one of those who have succeeded in landscape. His situations are well chosen; his trees are varied in their forms, and their foliage well conceived. He had a custom of representing some remarkable appearance in his landscapes to render them more striking.

Lombard  
schools.

The distinguishing characteristics of this school are, grace, an agreeable taste for design, without great correction, a mellowness of pencil, and a beautiful mixture of colours.

Antonio Allegri, called *Corregio*, was the father and greatest ornament of this school. He began like the painters of his time to imitate nature alone; but, as he was chiefly delighted with the graceful, he was

Careful to purify his design from all short turnings and unnecessary angles. He perceived that largeness contributed to grace; and therefore he not only rejected all small figures, but enlarged as much as possible the outlines, avoided acute angles and strait lines, and by these means gave an easy grandeur to his design. He made his figures elegant and large; he varied the outlines by frequent undulations; but he was not always pure and correct.

Corregio painted in oil, a kind of painting susceptible of the greatest delicacy and sweetness; and as his character led him to cultivate the agreeable, he gave a pleasing captivating tone to all his pictures. He sought transparent colours to represent shades conformable to nature, and adopted a manner of glazing which actually rendered his shadows more obscure. Obscurity in painting cannot be fully obtained without transparent colours; for these absorb the rays of light, and of consequence give less reflection. He laid his colours very thick on the brightest parts of his pictures, to make them capable of receiving, by a proper touch, the greatest degree of light. He perceived, that the reflections of light correspond with the colour of the body from which they are reflected; and on these principles he founded his theory of colours with respect to light and shade and reflection. But it is chiefly in the colour of his shades that he deserves to be imitated; for his lights are too clear, and somewhat heavy; and his fleshy parts are not sufficiently transparent.

Harmony and grace are connected together; and on this account Corregio excelled also in harmony. As the delicacy of his taste suffered him not to employ strong oppositions, he naturally became a great master in this part, which chiefly consists of easy gradations from one extreme to another. He was harmonious in his design, by making the lines which formed the angles of the contour arched and undulated. Both in the lights and shades, he placed always between the two extremes a space which served to unite them, and to form a passage from the one to the other. The delicacy of his organs made him perceive, better than any other artist, what relief was necessary to the eye after a violent exertion; and he was therefore careful to follow a bold and prevailing colour with a demi-tint, and to conduct the eye of the spectator, by an invisible gradation, to its ordinary state of tension. In the same manner (says Mengs) does agreeable and melting music pull one so gently out of sleep, that the awaking resembles enchantment more than the disturbing of repose. A delicate taste in colours, a perfect knowledge of the *claro obscuro*, the art of uniting light to light, and shade to shade, together with that of detaching the objects from the ground, inimitable, grave, and perfect harmony, were the qualities which distinguished Corregio from all the painters, and placed him near the head of his profession.

The Carracci, Lewis, Augustin, and Hannibal, formed what is called the *second Lombard school*, which is frequently distinguished by the name of the *school of Bologna*.

Lewis was the master of the other two; he had studied the works of Titian and Paul Veronese at Venice, those of André del Sarte at Florence, those of Corregio at Parma, and those of Jules Rameau at Mantua,

School's.

**Schools.** Mantua; but he chiefly endeavoured to imitate the manner of Corregio. Hannibal fluctuated between Corregio and Titian. Augustin their rival in painting had his mind cultivated by learning, and devoted part of his time to poetry and music, to dancing and to other manly exercises. These three painters often employed their talents on the same piece; and it was admirable that their united labours seemed to be animated with the same spirit.

They established an academy at Bologna, which their zeal for the advancement of their art made them call *l'Accademia degli Desiderosi*; but it was afterward called the *Academy of the Carracci*, because the reputation which these artists acquired, permitted not a more illustrious name to be given to an establishment of which they were the founders. In this school were taught the art of constructing models, perspective, and anatomy; lessons were given on the beautiful proportions of nature, on the best manner of using colours, and on the principals of light and shade. They held frequent conferences, in which not only artists, but men of general knowledge, were permitted to elucidate points relative to the art of painting; but they were separated upon Hannibal's going to Rome to adorn the gallery of the cardinal Farnese.

The works of the Carracci are often, from the resemblance of their manner, confounded together: especially those which were finished previous to the residence of Hannibal at Rome. Meanwhile each of them has a decided character, distinct from the other two. Lewis had less fire, but more of gracefulness and grandeur; Augustin had more spirit in his conception, and more pleasantness in his execution: Hannibal is characterized by boldness, by a design more profound, by an expression more lucky, and by an execution more solid.

Sir Joshua Reynolds, who saw the works of Lewis at Bologna, holds him out in his discourses as the best model for what is called *style* in painting; which is the faculty of disposing colours in such a manner as to express our sentiments and ideas. "Lodovico Carracci," says he, "(I mean in his best works) appears to me to approach the nearest to perfection. His unaffected breadth of light and shadow, the simplicity of colouring, which, holding its proper rank, does not draw aside the least part of the attention from the subject, and the solemn effect of that twilight which seems diffused over his pictures, appears to me to correspond with grave and dignified subjects better than the more artificial brilliancy of sunshine which enlightens the pictures of Titian."

Hannibal is esteemed by the best judges as a model for beauty and design. Those who blame him for becoming less a colourist at Rome than he was at Bologna, ought to recollect that it is his performances at Rome which have chiefly secured his reputation. Severe critics have maintained that his design is too little varied in his figures; that he excels only in male beauty; that in imitating ancient statues, he excites some resemblance, but without arriving at the sublimity of ideas and of style which characterize the ancients; or, in other words, that he hath successfully imitated the exterior of their manner, but that he was incapable of reaching the interior and profound reasonings which determined those admirable artists.

The success of Hannibal, and the reputation which  
VOL. XIII.

he acquired have been pernicious to the art. His successors, deluded by these considerations, have made him the object of their imitation, without ascending to the sources from which he derived his knowledge, and which he never could equal. The result has been, that instead of becoming equal to Hannibal, they have often copied his imperfections.

**Schools.** This school has been so different under different masters, that it is difficult to characterize it. Some of its artists have been formed on the Florentine and Lombard manner, others on the Roman, others on the Venetian, and a few of them have distinguished themselves by a manner which may be called their own. In speaking in general terms of this school, it appears to have no peculiar character; and it can only be distinguished by its aptitude to imitate easily any impression: and it may be added, speaking still in general terms, that it unites, in a moderate degree, the different parts of the art, without excelling in any one of them.

It is equally difficult to determine the progress of painting in France. Miniature painting, and painting on glass, were early cultivated in that country; and in these two kinds, the Italians had often recourse to the French artists. When Francis I. encouraged Rosso a Florentine, and Primatice a Bolognian, the painters in France were not remarkable for any superior talent; but they were capable of working under these foreign artists.

Cousin, a painter on glass and portrait-painter, was the first who established any kind of reputation in France. He was correct, but possessed very little elegance of design.

Painting, for some time encouraged by Francis I. fell into a state of languor, from which it was not recovered till the reign of Louis XIII. Jacques Blanchard, formed at the Venetian school, and called *the French Titian*, flourished about this period. But as he died young, and without educating any pupils to perpetuate his manner, he must be regarded as a single good artist, and not as a founder of the French school.

In the same manner Poussin, one of the greatest French painters, and whom they call *the Raphael of France*, educated no pupils, nor formed any school. His style and character of painting are described by Sir Joshua Reynolds as simple, careful, pure, and correct. No works of any modern (adds the same author) have so much of the air of antique painting as those of Poussin. His best performances have a remarkable, dryness of manner, which though by no means to be recommended for imitation, yet seems perfectly correspondent to that ancient simplicity which distinguishes his style.

In the latter part of his life he changed from this manner to one much softer and richer; where there is a greater union between the figures and the ground. His favourite subjects were ancient fables; and no painter was ever better qualified to paint such subjects, not only from his being eminently skilled in the knowledge of the ceremonies, customs, and habits of the ancients, but from his being so well acquainted with the different characters which those who invented them gave their allegorical figures.

If Poussin, in the imitation of the ancients, represents Apollo driving his chariot out of the sea by way

Schools. of representing the sun rising, if he personifies lakes and rivers, it is no way offensive in him, but seems perfectly of a piece with the general air of the picture. On the contrary, if the figures which people his pictures had a modern air or countenance, if they appeared like our countrymen, if the draperies were like cloth or silk of our manufacture, if the landscape had the appearance of a modern view, how ridiculous would Apollo appear? instead of the sun, an old man; or a nymph with an urn, instead of a river or a lake.

Poussin, however, more admired than imitated, had no manner of influence in forming the French school. Simon Vouet, his enemy and persecutor, had this honour, because his pupils, in the happy age of the arts in France, conferred on it the greatest splendour. Vouet was a man of distinguished abilities; but the school which he erected would have had no countenance if his scholars had pursued his manner of painting. He had a kind of grandeur and facility; but his design was false with regard to colours, and without any idea of expression. It was said of him, that he only needed to take the pencil in his hand to finish with one stroke the subject which he had conceived; and on this account one is tempted to be pleased, because he is astonished. He had the merit of destroying the insipid manner which reigned in France and of pointing the way to a better taste.

If Vouet laid the foundation of the French school Le Brun finished the edifice. When Le Brun was placed under the tuition of Vouet, he astonished his master and the rest of his pupils with the rapidity of his progress. At the age of 26 he finished his piece called the *borjes of Diomed* which gained a place in the palace royal (A), beside those of the most eminent painters. He was afterwards recommended to Poussin; but the young artist was more disposed by his natural inclinations to that modern part of the art which is called the *great machine*, than to the profound and studied manner of the Greek artist. Poussin at the same time was of great service to him, in recommending to his study the monuments, the customs, the dress of the ancients; their architecture, their rites, their spectacles, their exercises, their combats, and their triumphs.

Le Brun had a noble conception and a fruitful imagination. He was on no occasion inferior to the vast compositions which he undertook, and he chiefly excelled in rigorous costume and exact likenesses.

Few painters have united so great a number, of essential qualities and accessories of the art: and if he had superiors, it consisted in this, that they possessed some particular quality in a more eminent degree.—He was a good drawer, but his design was far from being so elegant as that of Raphael, or so pure as that of Domenique, and it was less lively than that of Hannibal Carracci, whom he had taken for a model. In drapery he followed the Roman school; the clothes which he gave to his figures were not like those of the Venetian school, of such and such a stuff; they were draperies and nothing more, and this manner agreed with the heroic style of his works, but in this part he was not equal to the painter of Urbino.—He had studied the expression of the affections of the

soul, as is evident from his treatise on the character of the passions; but after observing the general character, and establishing the principal strokes of expression, he thought he reached the whole extent of this subject, which is so infinitely extended. He always employed the few characters which he had once found out, and neglected to study the prodigious variety of gradations by which the interior affections are manifested in the exterior appearance. He fell then into the manner of repeating always; and possessed neither the delicacy, nor the depth, nor the extreme justness, of Raphael's expression. He loved and possessed in a high degree the grand machine of the art; he was delighted with great compositions; and he gave them life, and animation, and variety; but he wanted the vigour and inspiration of Raphael. His compositions are formed on philosophical principles, but those of Raphael are created. Le Brun thought well; Raphael, Poussin, Le Sueur, thought most profoundly.—Le Brun had elevation, but he was not elevated like Raphael, to the sublime.

In colouring, Le Brun did not imitate the painters of the Venetian school. The sweet attractions and strong and solid colours of the schools of Rome and Lombardy seem rather to have been the object of his imitation; and from them also he learned an easy, agreeable, and bold management of the pencil.

As Le Brun possessed a great share of lively imagination, he delighted in allegory, which gives the greatest scope for ingenious invention. The fecundity and resources of his imagination appeared still farther, in his inventing symbols for his allegorical figures, without resting contented with those employed by the ancients. But fanciful representations of this kind are distant from the operations of true genius. Spirit and thought in the arts are very different from spirit and thought in literary productions. A painter of moderate abilities may introduce into his works a great deal of the invention which belongs to poetry without enriching his peculiar art. The true spirit of painting consists in making the figures appear in the very circumstances and attitudes in which they are supposed to act, and penetrated with the sentiments with which they ought to be affected. By these means the spectator is more certainly interested than if the actions and thoughts were represented by allegorical symbols. Poussin appears to have less waste of spirit and imagination than Le Brun, while at the same time he gives more delight to people of spirit and imagination.

Eustach le Sueur was the compeer and rival of Le Brun; and no painter approached nearer to Raphael in the art of drapery, and disposing the folds in the most artful and the noblest manner. His design was in general more slender than that of Raphael, but, like his, it was formed on the model of the ancients. Like Raphael he represented with art and precision the affections of the soul; like him he varied the air of the head, according to the condition, the age, and the character of his personages; and, like him, he made the different parts of every figure contribute to the general effects. His intention in composing was to express his subject, not to make shining contrasts

(A) Where it may now be is uncertain. Perhaps it has perished in the wreck of taste, art, science, and elegance, against which French democracy has waged a ruinous war.

Schools.

contrasts or beautiful groups of figures, not to astonish and bewitch the spectator by the deceitful pomp of a theatrical scene, or the splendor of the great machine. His tones are delicate, his tints harmonious, and his colours, though not so attractive as those of the schools of Venice and Flanders, are yet engaging. They steal peaceably on the soul, and fix it without distraction on the parts of the art, superior to that of colouring.

His preaching of St Paul, and the picture which he painted at St Gervais, which the critics compare with the best productions of the Roman school, and the 22 pictures which he painted for the Carthusian monastery at Paris, and which were lately in possession of the king, are esteemed his best pieces. His contemporaries affirm, that he considered as sketches merely those excellent performances which are the glory of the French school.

If Le Sueur had lived longer, or if, like Le Brun, he had been employed under a court, fond of the arts and of learning, to execute the great works of the age, the French school would have adopted a different and a better manner. The noble beauty of his heads, the simple majesty of his draperies, the lightness of his design, the propriety of his expression and attitudes, and the simplicity of his general disposition—would have formed the character of this school. The deceitful pomp of theatrical decoration would have been more lately introduced, or perhaps would never have appeared, and Paris might have been the counterpart to Rome. But as Le Brun, by an accidental concurrence of favourable circumstances, was the fashionable painter, to be employed or rewarded it was necessary to imitate his manner; and as his imitators possessed not his genius, his faults became not only current but more deformed.

The French school not long ago changed its principles; and if, when peace shall be restored to this unhappy nation, they continue to follow the road which, while the arts flourished among them, they marked out for themselves, they have the chance of becoming the most rigid observers of the laws imposed on the Greek artists. The Count de Ceyles, pupil of Bouchardon, who by his rank and fortune had the means of encouraging the imitators of the ancients, and of the masters of the 15th century, first formed the design of restoring a pure taste to the art of painting. He was seconded by the talents of M. Vien, an artist who had only occasion to have his lessons and his example laid before him.—In this manner commenced a revolution, so much the more wonderful, as it was scarcely ever known that any nation substituted a system of simple and rigid excellence in place of a false and glittering taste. The history of all nations, on the contrary, discovers a gradual progress from a rude beginning to perfection, and afterwards to irremediable decay. The French had the prospect of stopping short in this ordinary course. They began in a manner which promised success; and the best consequences may be expected, if the internal commotions of France do not destroy the taste for the arts, the exercise of which they have suspended.

18  
The German school

In Germany there can hardly be said to be a school, as it is a continuation of single artists, who derived their manner from different sources of originality and imitation. There were some German pain-

ters of eminence, when the art, emerging from its barbarous state, first, began to be cultivated with success in Europe. As they were totally unacquainted with the ancients, and had scarcely access to the works of their contemporaries in Italy, they copied nature alone, with the exception of somewhat of that stiffness which forms the Gothic manner. It is this manner, if we speak of the early German painters, which characterizes their school. But this is by no means the case with their successors, part of whom were educated in Flanders and part in Italy: For if Mengs or Dietrich were comprehended in this school, there would be nothing peculiar to its manner discovered in their works. And it is therefore necessary to confine our observations to the more ancient German painters, in whom the Gothic style is conspicuous.

Albert Durer was the first German who corrected the bad taste of his countrymen. He excelled in engraving as well as painting. His genius was fertile, his compositions varied, his thoughts ingenious and his colours brilliant. His works, though numerous, were finished with great exactness; but as he owed every thing to his genius, and as works of inferior merit were by the false taste of the time preferred to his, it was impossible for him altogether to avoid the faults of his predecessors. He is blamed for stiffness and aridity in his outlines, for little taste or grandeur in his expression, for ignorance of the costume of aerial perspective and of gradations of colours: but he had carefully studied lineal perspective, architecture, and fortification.

John Holbein or Holbein, nearly contemporary with Albert Durer painted in oil and water colours. He excelled chiefly in history and in portrait painting. His colours are fresh and brilliant, and his works are highly finished; but in his historical subjects, his draperies are not of so good a taste as those of Albert, Durer.

The Flemish school is recommended to the lovers of the art by the discovery, or at least the finest practice of oil painting. Van Mander gives us the account of this wonderful discovery in the following words: "John Van Eyck was so excellent a chemist, that he discovered a method of varnishing his distemper colours with a varnish, which was made of some oils, and was very pleasing on account of the gloss and lustre it gave them. Many artists in Italy had vainly attempted to find out that secret; they never hit on the true method. It happened once that John in his usual manner, having highly finished one of his pictures on boards, and having varnished it with his new invented varnish, exposed it to dry in the sun; but whether the boards were not well joined, or whether the heat of the sun was too violent, the boards split asunder and opened in the junctures. John saw with concern that his work was spoiled, and resolved to contrive something against future accidents of the same kind. Being disgusted at distemper painting, and varnishing, he thought of a varnish that might dry without sunshine; and having tried many oils and substances, he found that linseed and nut oil dried better than any other. He boiled them with some other drugs, and produced the best varnish in the world. Ever bent on improvement, he found after much inquiry, that colours mixed with these oils worked and dried extremely well, and when dried would

Schools.

be water proof. He observed likewise, that these oils would animate and give them a gloss and lustre without any farther varnishing." The truth, however, of this account is now very much questioned; and it is even proved by the manuscripts of Theophilus Presbyter, and also by some old oil paintings in England, that this method of painting was discovered long before the time of John Van Eyck. At the same time we admit, that John and his brother Hubert may have been the first who brought oil painting into general practice, not only by showing the excellence of which it was susceptible, but also by making several improvements on the art. And this is the more probable, from the great reputation which their pictures acquired over all Europe by the softness and delicacy of their colours. The attention of the Italian painters was chiefly excited, inasmuch that Antoine de Messina performed a journey into Flanders for the express purpose of acquiring the confidence of John Van Eyck, and of discovering the secret.

John de Bruges was the founder of painting as a profession in Flanders; Peter Paul Rubens was the founder of the art. This extraordinary person produced an immense number of works. He excelled equally in historical, portrait, and landscape painting; in fruits, flowers, and in animals. He both invented and executed with the greatest facility; and to show the extent of his powers, he frequently made a great number of sketches of the same subject altogether different, without allowing any time, to elapse between them. The works of Rubens were destitute of that soft inspiration, productive of sweet and pleasant effects, so conspicuous in the works of Raphael; but he possessed that sprightliness of genius and strength of mind which is ever ready to burst forth in wonderful and astonishing effects. His figures appear to be the exact counter-part of his conceptions, and their creation nothing more than a simple act of the will.

His talent for design is unjustly censured, for on every occasion his design is noble and easy. He had great knowledge of anatomy, but he was hurried away by the impetuosity of his imagination and the ardour for execution; he preferred splendour to the beauty of forms, and sacrificed correctness of design too often to the magic of colours. In short, his qualities suppose a mind full of fire and vigour, rather than accuracy or profound thought. His drapery may be considered rather as fine than properly adapted to his figures: for, in the language of the art, to *clothe* and to *give drapery* are not synonymous terms. A portrait painter may excel in clothing his personages, while he is totally incapable of giving good drapery to an historical painting. His chief merit consists in colouring; though in this branch of the art he has not equalled Titian. He is the first among painters eminent for pomp and majesty; the first among those who speak to the eye, and the power of the art is often carried by him almost to enchantment.

It is evident from the works of Rubens, that his method of painting was to lay the colours in their place, one at the side of another, and mix them afterwards by a slight touch of the pencil. Titian mingled his tints as they are in nature, in such a manner as to make it impossible to discover where they began or terminated; the effect is evident, the labour is concealed. Thus Rubens is more dazzling, and Titian

more harmonious. In this part, the first excites the attention, the second fixes it. The carnations of Titian resemble the blush of nature; those of Rubens are brilliant and polished like satin, and sometimes his tints are so strong and separated as to appear like spots.

"Rubens (says Sir Joshua Reynolds) is a remarkable instance of the same mind being seen in all the various parts of the arts. The whole is so much of a piece, that one can scarce be brought to believe but that if any one of them had been more correct and perfect, his works would not be so complete as they appear. If we should allow a greater purity and correctness of drawing, his want of simplicity in composition, colouring, and drapery, would appear more gross."

In his composition his art is too apparent. His figures have expression and act with energy, but without simplicity or dignity. His colouring, in which he is eminently skilled, is notwithstanding too much of what we call *tinted*. Throughout the whole of his works there is a proportionable want of that nicety of distinction and elegance of mind, which is required in the higher walk of painting; and to this want it may be in some degree ascribed, that those qualities which make the excellency of this subordinate style appear in him with their greatest lustre.—Indeed the facility with which he invented, the richness of his composition, the luxuriant harmony and brilliancy of his colouring, so dazzle the eye, that whilst his works continue before us, we cannot help thinking that all his deficiencies are fully supplied.

The Flemish school, of which Rubens is the greatest master, is remarkable for great brilliancy of colours and the magic of the *claro-obsuro*. To these may be joined a profound design which is yet not founded on the most beautiful forms; a composition possessed of grandeur, a certain air of nobleness in the figures, strong and natural expressions; in short a kind of national beauty, which is neither copied from the ancients nor from the Roman nor Lombard schools, but which deserves to please, and is capable of pleasing.

To speak in general terms, and without regarding a great number of exceptions, the Dutch school carries none of the above qualities to great perfection, except that of colouring. Far from excelling in the beauty of heads and forms, they seem chiefly to delight in the exact imitation of the lowest and most ignoble. Their subjects are derived from the tavern, the smiths shop, and from the vulgar amusements of the rudest peasants. The expressions are sufficiently marked; but it is the expression of passions which debase instead of ennobling human nature. One would think that they practised the art of degrading the bodies and souls of men.

It must be acknowledged, at the same time, that the Dutch painters have succeeded in several branches of the art. If they have chosen low objects of imitation, they have represented them with great exactness; and truth must always please. If they have not succeeded in the most difficult parts of the *claro-obsuro*, they at least excel in the most striking, such as in light confined in a narrow space, night illuminated by the moon or by torches, and the light of a smiths forge. The Dutch understand the gradations of colours; and by their knowledge of contrast they have arrived at the art of painting light itself. They have no rivals

**Schools.** in landscape painting considered as the faithful representation or picture of a particular scene; but they are far from equalling Titian, Poussin, Claude Lorrain, &c. who have carried to the greatest perfection the ideal landscape, and whose pictures, instead of being the topographical representation of certain places, are the combined result of every thing beautiful in their imagination or in nature. The Dutch, however, distinguish themselves by their perspective, by their clouds, sea-scenes, animals, fruits, flowers, and insects; and they excel in miniature painting. In short, every thing which requires a faithful imitation, colour, and a nice pencil is well executed by Dutch painters.

Holland has also produced history painters, as Octavius Van Been, and Vander Hilft the rival of Vandike, and perhaps his superior: but it is not in the works of those artists that we find the character of the Dutch school.

Neither is the origin of their style to be derived from the works of Lucas of Leyden, though from the time he flourished, viz. about the end of the 15th century, he may be considered as the patriarch of the Dutch school. Lucas painted in oil, in water colours, and on glass; and the kinds of his painting were history, landscape, and portrait. His picture of the Last Judgment is preserved in the Hotel-de-ville of Leyden; it possesses vast merit in point of composition, and a great variety of figures.

If miniature painting be considered as a characteristic of the Dutch school, Cornelius Polemburg may be regarded as the father of it. He possessed the colour, delicacy of touch, and disposition of the *claro-obscuro*, which chiefly distinguish this school; and if any thing is to be added, it is want of correctness in his design.

But if the choice of low figures is its chief characteristic, this is to be found in the greatest perfection in the works of the celebrated Rembrandt Vanryn; and it is the more offensive in this artist, as his composition frequently required an opposite choice of figures. As his father was a miller near Leyden, his education must altogether have depended on the exertion of great talents on the study of nature. He studied the grotesque figure of a Dutch peasant, or the servant of an inn with as much application as the greatest masters of Italy would have studied the Apollo of Belvidere or the Venus de Medicis. This was not the manner of elevating himself to the noble conceptions of Raphael; but it was acquiring the imitation of truth in vulgar painting.

“Rembrandt (says M. Descamps) may be compared to the great artists for colour and delicacy of touch and *claro-obscuro*. It appears that he would have discovered the art, though he had been the first person that ever attempted it. He formed to himself rules and a method of colouring, together with the mixture of colours and the effect of the different tones. He delighted in the great oppositions of light and shade: and he seems to have been chiefly attentive to this branch of the art. His workshop was occasionally made dark, and he received the light by a hole, which fell as he chose to direct it on the place which he desired to be enlightened. On particular occasions he passed behind his model a piece of cloth of the same colour with the ground he wanted; and this piece of cloth receiving the same ray which en-

lightened the head, marked the difference in a sensible manner, and allowed the painter the power of augmenting it according to his principles.

“Rembrandt’s manner of painting is a kind of magic. No artist knew better the effects of different colours mingled together, nor could better distinguish those which did not agree from those which did. He placed every tone in its place with so much exactness and harmony, that he needed not to mix them, and so destroy what may be called the flower and freshness of the colours. He made the first draught of his pictures with great precision, and with a mixture of colours altogether particular; he proceeded on his first sketch with a vigorous application, and sometimes loaded his lights with so great a quantity of colour, that he seemed to model rather than to paint. One of his heads is said to have a nose nearly as much projected as the natural nose which he copied.”

Such is the power of genius, that Rembrandt, with all his faults, and they are enormous, is placed among the greatest artists by M. Descamps, who saw his works, and was himself an artist. It is necessary to observe, that if Rembrandt was ignorant of the essential parts of his art, or neglected them, he was yet acquainted with expression, which alone was capable of giving animation to his works. His expressions are not noble, but they are just, lively, and executed with great judgment.

John de Laer, a miniature painter, and who made choice of his subjects from common life, deserves a distinguished place in the Dutch school. He painted hunting-scenes, the attacks of robbers, public festivals, landscapes, and sea views; and he ornamented his pictures with old ruins, and enriched them with figures of men and animals. He had a correct design, and employed vigorous and lively colouring.

Van-Ostade, although born at Lubeck, Gerard Dow, Metzu, Miris, Wouwermans, Berghem, and the celebrated painter of flowers Van Huysum, belong to the Dutch school.

The greater part of the schools of which we have treated have no longer any existence. Italy alone had four schools, and there only remain at present a very few Italian artists known to foreigners. The school of Rubens is in vain sought for in Flanders. If the Dutch school still exists, it is not known beyond the precincts of Holland. Mengs a German artist has made himself famous in our days; but it was in Italy that he chiefly improved his talents and exercised his art. M. Dietrich, another German, has made himself known to strangers; but two solitary artists do not form a school.

A new school is formed in our times and in <sup>2E.</sup> The Eng- Great Britain, called the *English school*. It is connected with the academy in London instituted in 1766 by letters patent from the king, and formed only in 1769. Sir Joshua Reynolds is the undoubted founder of it. His works give him a distinguished rank among the artists of the present age, and exhibit a genius in their author which has seldom been surpassed: but the effects which he has contrived to give to them by the formation of a new school, and by the good principles which his discourses to academicians and his example as a painter, have disseminated, will secure his reputation as long as England shall esteem the advantages and the worth of great abilities. The English taste appears to be formed on the great masters

Schools.

of the Italian and the Flemish schools. Sir Joshua was a great admirer of Michael Angelo, and particularly recommends him to the attention of the academicians. "I feel (says Sir Joshua) a self-congratulation in knowing myself capable of such sensations as he intended to excite. I reflect, not without vanity, that these discourses bear testimony of my admiration of that truly divine man; and I should desire that the last words which I should pronounce in this academy, and from this place, might be the name of—*Michael Angelo*." But though he thus enthusiastically admired this very great man, yet he allows, what cannot indeed be denied, that he was capricious in his inventions; "and this (says he) may make some circumspection necessary in studying his works; for though they appear to become him, an imitation of them is always dangerous, and will prove sometimes ridiculous. 'In that dread circle none durst tread but he.' To me, I confess, his caprice does not lower the estimation of his genius, even though it is sometimes, I acknowledge, carried to the extreme; and however those eccentric excursions are considered, we must at the same time recollect, that those faults, if they are faults, are such as never could occur to a mean and vulgar mind; that they flowed from the same source which produced his greatest beauties; and were therefore such as none but himself was capable of committing; they were the powerful impulses of a mind unused to subjection of any kind, and too high to be controuled by cold criticism."

The effect of Sir Joshua's discourses is visible in the pictures of this school. The Death of General Wolf, the Departure of Regulus for Carthage, the Arrival of Agrippina, and some other subjects, are decided proofs that the English school is acquainted with greatness of style, boldness of expression, and the art of managing a great number of figures. It will be fortunate for the painters of this school, if more rigid with regard to their forms than ambitious of poignant and astonishing effects, they support the character which they have already acquired. But although England had not enjoyed this brilliant success in painting, she would have immortalized herself by the excellency of her engravings.

It is easy to perceive in all those schools the cause of the character which distinguishes them. In the Roman school, it is the excellent education of its first masters, together with the precious remains of antiquity found in the ruins of ancient Rome. In the Venetian school, the magnificence derived from the commerce of the east, the frequency of feasts and masquerades, and the necessity of painting to the rich and luxurious, who were accustomed to behold these magnificent objects, were the causes of its gaudy taste. In the Dutch school, the peculiarity of its grovelling manner may be accounted for from the habits of the artists. Accustomed to visit taverns and workshops, and having most commonly exposed to their view low and grotesque figures, they represent in their pictures the objects which were most familiar to them in life.

\*Encyclop.  
Beaux Arts  
tom. i.

"Beauty (says a French writer \*) ought to be the characteristic of the English school, because the artists have it often exposed to their view. If this beauty is not precisely similar to that among the ancients, it is not inferior to it. The English school should also distinguish itself for truth of expression:

because the liberty enjoyed in that country gives to every passion its natural and unbiassed operation. It will probably long preserve its simplicity unpolluted by the pomp of theatrical taste and the conceit of false graces, because the English manners will long preserve their simplicity. Comparison between the Ancient and Modern.

"Examine the picture of a French woman (continues he) painted by an artist of that nation and you will generally find, in place of expression, a forced grin, in which the eyes and the forehead does not partake, and which indicates no affection of the soul. Examine the picture of an English woman done by one of their painters, and you observe an elegant and simple expression, which makes you at once acquainted with the character of the person represented."

### SECT. III. *Comparison between the Ancient and Modern Painting.*

No person of judgment or taste hesitates to give the superiority to the ancient sculpture; but the moderns comfort themselves with refusing the same superiority to the Greek artists in the art of painting. The small number of their productions which remain, and the probable conjectures which may be formed concerning those which have perished, go the length to prove that the Greek painters conducted themselves on other principles than those which have received the sanction of custom and the force of laws in our schools. But this censure might be applied with equal justice to Homer as an epic poet, and to Sophocles and Euripides as writers of tragedy.

The principal difference between the ancient and modern manner of painting consists in the complication of figures and the pompous decoration of scenery which prevails in the modern, when compared with the unity and simplicity of the ancient painters. This simplicity, however does not seem to arise from the want of capacity, but from a choice, as Polygnotus, one of their most ancient painters, represents in one of his pieces the siege of Troy, and in another the descent of Ulysses into hell; but they soon decided in favour of simplicity, and their pieces generally contain one or two figures, and very rarely more than three or four.

Poetry in this particular is conducted on very different principles. A poet may with great propriety multiply his characters, and enter into details of a variety of actions, because the whole of his characters and actions do not occupy the mind of his reader at the same time. The whole of his art consists in making one naturally succeed another; but every part of the poem which contains a separate transaction would make a picture capable of fixing the attention. In painting, the eye takes in the whole; and it is by no means satisfied if 20 or 30 figures are presented to it, which it cannot possibly comprehend. It is in vain to group the figures, or to call the attention to the principal object by a greater degree of light; the spectator is anxious to examine every object which is presented to him; and if they are not to be examined for what reason are they painted. An excellent piece, at the same time, consisting of a great number of figures, will give pleasure; but it is accompanied with that fatigue which one experiences when he runs over a gallery furnished with a great variety of excellent pictures.

Those

Comparison between the Ancient and Modern.

Those observations on the attention of the spectator led the Greeks to make similar ones on the attention of the artist. They perhaps thought that the painter who had to execute a great variety of figures in the same work, could not study each of them with equal accuracy and care; and of consequence that he might produce something astonishing in the extent, and yet disgusting in the detail.

This difference, however, between ancient and modern painting, cannot give any decided principle to determine on their comparative merit. We are accustomed to behold assemblages in nature: and it is a fact, that even in affecting scenes a great number of figures may not only be brought together, but that they may heighten the distress. It is supposing a picture to have little effect, to imagine that we can coolly, and with the same kind of attention, examine the principal and the accessory figures. If it is highly finished, our whole soul must be absorbed in that object which the artist intended to be most conspicuous; and if we give any attention to the surrounding figures, we shall consider them as spectators of the same scene, and derive from them an addition of sympathy and of feeling. The whole question in this particular point of view amounts to this, that the moderns have chosen a more difficult part; and if they have executed it with success, their merit is greater. And this observation will hold good, unless it can be proved that it is utterly impossible to make an assemblage of figures lead to one general and common effect.

The proper manner of deciding the comparative merit of the ancients and moderns, is to consider, as far as we have sufficient data to go upon, to what degree the ancients excelled in the particular departments of this art. There are two sources from which we can derive information; namely, from the morsels of antiquity which yet remain, and from what the ancient writers have said on the subject of painting, both of which are extremely defective. It is allowed, however, by every skilful person who has viewed the remains of ancient paintings, that none of them appear to be the performances of superior artists, notwithstanding much merit in the design and accuracy in the drawing, which indeed seems to have been habitual to almost every ancient artist. The best among these paintings (according to Sir Joshua Reynolds), "the supposed marriage in the Aldrobandine palace," is evidently far short of that degree of excellence undoubtedly implied in the descriptions of ancient authors, and which from them we are fairly led to expect.

Still more defective, if possible, is this last species of evidence: for we have no direct treatise remaining on the subject by any of the ancients, although many were composed by their artists. The passages from which we are to decide are, either the cursory remarks of writers not expressly treating on the subject of painting, or the descriptions of those who at best can rank but as *amateurs* of a fashionable art. From these indeed we may pretty safely assert the degree of excellence which the passages imply; but we should reason very inconclusively, were we to deny them any higher or any other merit than appears to be strictly contained in these scattered observations. Let any one for a moment place the modern painters in his mind in the same situation as the ancients, and he will quickly decide on the truth of these remarks.

Nevertheless, it is necessary on this subject to derive some conclusions from the information which is occasionally given in ancient authors. That the ancients paid a particular attention to design, would be evident from the manner in which they speak of this department of the graphic art, even though the moderns were not in possession of such remaining proofs of their excellence herein (though by artists of an inferior class), as to place this point beyond the reach of doubt.

Indeed, when it is considered that, with respect to freedom and correctness of outline, painting and sculpture are very nearly connected; that Phidias and Apelles were nearly contemporaries; that many of the ancient painters, such as Zeuxis, Protogenes, Apelles, &c. were accustomed to modelling for the purpose of sculpture or of calling; that the extreme elegance of design in the ancient statues is so notorious as to be the acknowledged model even for modern artists; and that these ornaments of sculpture were well known and universally admired among the ancients—we shall have little hesitation in admitting their equality with the moderns so far as design is concerned. But should any doubt remain on this point, the drawings from the antiquities of Herculaneum will be striking proofs that truth, elegance, and spirit, in a degree rarely to be met with among the moderns, were habitual even to the common run of artists in the declining age of ancient painting.

The ancients excelled moreover not merely in the common and obvious parts of design; but they appear to have had no inconsiderable degree of skill in the art of *foreshortening*. The performance of Paulus is a proof of this: *Fecit autem grandes tabulas sicut spectatam in Pompeii porticibus boum immolationem. Eam enim picturam primus invenit, quam postea imitati sunt multi, equavit nemo. Ante omnia, cum longitudinem bovis ostendere vellet, adversum cum pinxit, non transversum, et abunde intelligitur amplitudo. Dein cum omnes qui volunt eminentia videri, candicantia faciant, coloremque condant, hic totum bovem atri coloris fecit; umbræque corpus ex ipso dedit; magna prorsus arte in æquo extantia ostendens et in constracto solidam omnia.*

Nor will it be difficult to show, that the ancient painters were not inferior to the moderns in *expression*. The state of sculpture alone among the ancients would almost furnish a decisive proof that the sister art of painting could not be deficient. Among the ancient statues which yet remain, expression is carried to a wonderful height; not merely the features of the face, but almost every muscle of the body, combining to enforce the idea intended to be conveyed.

Mr Webb\* very properly observes, that "the ancients thought characters and manners so essential to painting, that they expressly term *picture* an art descriptive of manners. Aristotle in his *Poetics* says of Polygnottus, that he was a painter of the manners: and objects to Zeuxis, his weakness in this part." We have in Philostratus the following description of a picture: "We may instantly (says he) distinguish Ulysses by his severity and vigilance; Menelaus by his mildness; and Agamemnon by a kind of divine majesty. In the son of Tydeus is expressed an air of freedom; Ajax is known by his fullen fierceness: and Antilochus by his alertness. To give to these such sentiments and actions as are consequential from their peculiar characters, is the ethic of painting."

Comparison between the Ancient and Modern.

\*On Painting and Poetry, p. 149.

Compari-

and Mo-  
dern.

Another instance of excellence in expression among the ancient paintings was the Medea of Timomachus. She was painted about to kill her infants. Ausonius speaks with admiration of the mingled expression of anger and maternal fondness in her face and manner.

*Immem exhaufit rerum in diverfa laborem  
Fingeret affectum matris ut ambiguum,  
Ira fubft lachrymis, miferatio non caret ira,  
Al erutrum videas ut fit in alterutro.*

It may not be amiss, however, at this period of our inquiry, to make some observations on the testimonies of ancient authors respecting this subject.

It is certainly true, that when the works of an ancient artist are praised for any real or supposed merit, the commendations will be relative to the degree of perfection to which the art had arisen at the time, and to the opportunities of information, the taste, and judgment of the person who bestows them. Excellence will always be ascribed to him who leaves his contemporaries far behind; and those performances will often be considered as supremely beautiful which exceed in beauty all that have gone before.

In like manner, a person of natural sensibility, but who has been accustomed all his life to performances of an inferior stamp, will be in raptures at any which much exceed the best he has heretofore been taught to admire; and whatever opportunities of information he may have, his evidence will not be of much weight, if he do not possess a sufficient degree of taste and judgment to use them properly.

In ascertaining therefore the degree of credit due to the praises bestowed on any performance in a branch of the fine arts, we must take into consideration the general state of the art at the time, and the competence of the person who bestows the praise.

No slight degree of probability, however, may be attained on both these points, by attending to a circumstance not generally noticed, *viz.* that in an advanced state of the art, and when the observer is acquainted with his subject, the praise will seldom be given in loose, general, and comprehensive expressions; but the terms in which it is conveyed will be characteristic and determinate, and often technical; they will frequently show the state of the art, by marking the subdivisions and the skill of the observer by judicious discrimination. When, added to these, the latter can resort for comparison to any existent standard of perfection, his praise may fairly be adopted in its full extent, and regarded as evidence upon the point in question.

To apply these observations to painting, it is clear, with respect to the most difficult, the most fundamental, and the highest in rank among the departments of the art, *viz.* design and expression, that the ancients were fully equal to the moderns; and their expressions of praise must be allowed to imply an equal degree of absolute skill, with similar expressions, if applied to the great masters of modern art. It is also clear that painting was extremely cultivated among the ancients, and that their good painters were more esteemed than artists of equal merit in modern times; that what we should term gentlemen artists were frequent with them, (*apud Romanos quoque honos nature huic arti contigit*); and that the expression of the ancient connoisseurs

evinced much theoretical and technical knowledge of the art, and display a distribution of its parts almost as minute, complete, and scientific, as the present state of it can boast.

With regard to colouring, the praises of the ancient authors chiefly relate to the style of it as exerted upon single figures or particular tints. It may therefore be doubted whether the ancients were possessed of the art of distributing their colours through the whole of a picture, so as to produce an harmony and general tone of colouring similar to that which we admire in the Lombard and Flemish schools. The present remains of ancient paintings do not appear to warrant any such conclusions; but being undoubtedly the works of inferior hands, their authority is very small when alleged against the general or particular merit of the ancient artists. The following extracts will be sufficient to evince, that the ancients did attend to this technical branch of colouring.

Indeed the modern technical expressions appear borrowed from the following passage of Pliny, which may be regarded as decisive on the subject. *Tandem sese ars ipsa distinxit, et invenit lumen atque umbras, differentia colorum alterna vice sese excitante. Dein adjectus est splendor; a'ius hic quam lumen; quem quia inter hoc et umbram esset, appellaverunt tonon. Commixturas vero colorum et transitus, harmogen.* The *lumen atque umbras* of this passage might have been regarded as merely descriptive of the light and shade necessary to relieve single figures, if it were not for the subsequent definition of *tone*. The *harmogen* of Pliny means the *blending* or skilful blending and softening colours into one another, rather than what we now call *harmony*.

Lucian†, in his fine description of that spirited painting by Zeuxis of the male and female centaurs, after relating the treatment of the subject itself, proceeds to notice the technical execution of the picture; and he praises particularly the truth and delicacy of the drawing, the perfect blending of the colours, the skilful shading, the scientific preservation of size and magnitude, and the equality and harmony of the proportions throughout the whole piece.

Painters, says Plutarch, increase the effect of the light and splendid parts of a picture by the neighbourhood of dark tints and shades. And Maximus Tyrius observes, that bright and vivid colours are always pleasant to the eye; but this pleasure is always lessened if you omit to accompany them with somewhat dark and gloomy. These passages seem to imply a knowledge of the use of cold and dark tints even where a brilliancy of tone is required. The best among the ancient painters, however, seem to have preferred a chaste and sober style of colouring to the gaudiness and flutter of the later artists.

Upon the whole, therefore, with respect to colouring as employed upon single figures, as the ancients were fully as competent to judge of excellence herein as the moderns; as the expressions of the ancient connoisseurs are very warm in praise of the colouring of many of their painters; as they appear also to have attended very much to the art of colouring; and, moreover as probable evidence can be adduced that they attended to miniature painting—a considerable degree of merit may be allowed them in the use of the colours they possessed.

† In his  
Zeuxis.

Comparison between the Ancient and Modern.

Chiaro-scuro, or the art of placing and proportioning light and shade in such a manner as to produce a pleasing effect, independently of any other circumstance connected with the picture, has been commonly deemed a characteristic difference between the knowledge of ancient and modern painters. On this subject the works of the ancients now remaining give little or no information; hence Sir Joshua Reynolds observes, "that this, which makes so considerable a part of the modern art, was to them totally unknown. If the great painters had possessed this excellence, some portion of it would have infallibly been diffused, and have been discovered, in the works of the inferior rank of artists which have come down to us, and which may be considered as on the same rank with the paintings that ornament our public gardens." But the accounts of the places where these paintings have been found, make it evident that they were thus ornamented at a very inconsiderable expence. The generality of them consist of single figures; some of them of two or three figures, generally relieved by an uniform ground; and except in a few instances, evidently designed as mere reliefs to a compartment, and answering, as near as may be, the stuccoed ornaments in our modern rooms; nor do any of them seem the works of artists equal in their day to those at present employed on the painted ceilings of private houses.

The Abbé du Bos maintains, on the other hand, that what Pliny and other ancient writers say concerning the *Claro obscuro*, and the delightful distribution of light and shade, is altogether decisive; and that their writings are full of so many probable circumstances, that it cannot be denied that the ancients at least equalled the most celebrated of the moderns in this part of the art.

On the examination of the greater part of the passages from antiquity, it is evident that they may relate to the light and shade of single figures, without involving what is now called the science of the *claro-obscuro*. The passage of Pliny, however, already quoted, and several others, go very near to prove that this branch of painting was understood among the ancients. The dark, the light, and mezzotint are evidently and accurately described in that passage.

Equally strong is that expression in Quintilian: *Zeuxis luminum utrarumque rationem invenisse traditur*. This cannot be otherwise translated than by the science of light and shade.

That some technical knowledge of the effect producible by masses of light and shade was possessed by the ancients, appears indubitable from the passages adduced: to what extent it was carried cannot now be ascertained. In all probability they were much inferior in this respect to the moderns; otherwise, although much science of this kind could hardly be expected from the trifling performances that remain, much more would have occurred on the subject, it would have been more largely dwelt on, and more precisely expressed among the observations of ancient authors on the best paintings of the ancient masters.

Neither is there sufficient evidence that the ancients were eminent in that important branch of the composition of a picture, which consists in distributing the figures and objects in groups or masses. There are few

examples of this difficult branch of the art among the remaining antiquities; and indeed, from the paucity of the figures introduced in the generality of these ancient paintings, there is little room to expect them. But what makes it still more doubtful whether the ancients attained any degree of eminence in grouping is, that among the many paintings of these great masters enumerated by Pliny, Lucian, or Philostratus, there is none of them praised for this species of excellence. This, however, it must be confessed, may as well arise from want of knowledge in the writer as of skill in the artist; for in a picture found in Herculaneum, which represents in all probability the education of Achilles, the figure of an old man holding a child on his knees, together with that of a woman behind him, form a very agreeable group. A work of the same collection, painted in one colour on marble, consists of five figures grouped very much after the modern idea, if it were not that three of the heads are at the same height. It is extremely probable, that this morsel had been the copy of a picture finished in the purest times of the art. But although it were proved that the ancients did not attempt grouping their figures, it is still uncertain whether this might not arise from their peculiar and perhaps excellent taste in the arts. Wishing to enjoy in the fullest manner their painted figures as they enjoyed the aspect of a statue, they took care that every figure should be detached from another in the same picture, which permitted them to give their objects more relief, and to render them more distinct to the eye of a distant spectator.

We are not therefore to conclude, that they were entirely ignorant of grouping, on the one hand; or that they declined the execution of it from want of skill, on the other. Indeed it actually appears to have been technically attended to by them, whatever might be their comparative excellence in it; for Appelles is expressly asserted by Pliny to have been inferior to Melanthius in composition (*de dispositione*); and one of their paintings, mentioned by the same author, is said to have contained one hundred figures; but this unwieldy number must have been offensive, if they were not grouped with some skill.

From the connection between the sister arts of poetry painting, and sculpture, and the admirable performances of the ancients in the other two departments of the fine arts, it is reasonable to conclude, that the ancient painters were not deficient in invention. Many instances, were it necessary, might be collected in support of their well founded claim to this branch of the art: but it will be sufficient to observe, that as invention is rather a natural endowment than an acquired talent, and as the ancients universally seem to be at least equal to the moderns in the gifts of genius and good sense, we cannot but admit, on their part, an equality with ourselves so far as invention is concerned.

Very nearly connected with the subject of invention is that of the *costume*; by which is meant an attention to probability with respect to times, places, objects, persons, and circumstances in the transaction represented.

The ancient paintings now remaining, so far from exhibiting any proofs of attention to this important branch of the art, are full of gross violations of probability.

Comparison between the Ancient and Modern.

probability, and representations of impossible connection. But very little stress is to be laid on these instances: first, because they are evidently the performances of artists of no reputation; secondly because none of them to which this objection can be made are regular thirdly, because, as they were (for the most part) manifestly intended as ornaments to apartments, the taste of the owner, and not of the artist, would of course be chiefly consulted. Nothing, however, can be more clear than that the ancients required an attention to probability in the works of their artists; and from the manner in which their writers express themselves on the subject (not so much recommending the practice of it as taking it for granted), we may reasonably conclude, that their best painters were seldom guilty of any gross violation of the costume. *Sint fides simillima* *ve. is* was an apophthegm generally known, and when known must have been universally admitted.

The principles of the costume are well expressed and illustrated by Horace in the first lines of his Art of Poetry; and Vitruvius, lib. vii. chap. 5. says, that no pictures can be approved of which have not a resemblance to truth and nature. Whether the ancient painters put in practice a greater share of good sense with respect to the costume than the moderns, cannot now be accurately determined; the advantage seems to be in favour of the former: for, as we shall have occasion more particularly to observe afterwards, the most celebrated of modern painters from Raphael to Sir Joshua Reynolds have been guilty of such flagrant breaches of probability, as would appear astonishing to those who are not in the habit of expecting them.

It has been doubted whether the ancients were acquainted with the science of *perspective*; and if the remains of ancient painting were alone to decide the question, it must be determined against them; for the works of the ancient painters now in possession of the moderns afford no proof of attention to the rules of representations of any person or transaction; and perspective equal to the performance of a modern sign-painter. The picture of the sacrifice among the Herculean antiquities, and the fourth of the prints which Bellori has published and described, taken from the paintings in the sepulchre of the Nasonii, are barely tolerable; but the other landscapes (almost the only remaining antique paintings which admit of perspective) are grossly defective in this particular; so much so indeed, that considering the late period when landscape-painting was introduced among the ancients, together with this manifest imperfection in point of perspective of such as are yet extant, we cannot help suspecting the inferiority of the ancients in this respect. In perspective, as in the *chiaro-scuro*, had good practice been common, some traces would have been discovered in the works of their lowest artists.

And yet some general knowledge of the principles, and some degree of attention to the practice, of perspective, cannot well be denied to the ancients. They were good mathematicians, they were excellent architects, and some of them are celebrated for their skill in scene-painting. Geminus the Rhodian, contemporary with Cicero, was the author of an express treatise on perspective; and Euclid, Heliodorus, Larissæus, Agatharcus, wrote also on the same subject. It is well known, besides, that the ancients practised the

art of painting in perspective on walls in the same way that it is now done by the moderns; and Pliny (Nat. Hist. lib. xxxv. c. 4.) says, that one of the walls of the theatre of Claudius Pulcher, representing a roof covered with tiles, was finished in so masterly a manner, that the rooks, birds of no small sagacity, taking it for a real roof, attempted to light upon it. We are likewise told that a dog was deceived to such a degree by certain steps in a perspective of Dantos, that expecting to find a free passage, he made up to them in full speed, and dashed out his brains. But what is still more, Vitruvius tells us in express terms by whom and at what time this art was invented. It was first practised by Agatharcus, a contemporary of Æschylus, in the theatre of Athens; and afterwards reduced to certain principles, and treated as a science, by Anaxagoras and Democritus; thus faring like other arts which existed in practice before they appeared in theory.

Portrait-painting seems to have been a principal employment of the first artist whom the ancients have to boast of, since Alexander is said to have permitted no painter but Appelles, and no sculptor but Phidias, to take his likeness. Pliny particularizes several instances of Apelles as a portrait-painter.

In the drawing and colouring of single figures, to which the ancients paid peculiar attention, they must be allowed to be equal, if not superior, to the moderns. That spirit and animation, ease and dignity, were common to the performances of ancient artists, the ancient statues and paintings still remaining most evidently evince; and as they possessed, therefore, all the requisites to excel in portrait-painting, a branch of the art at all times much in request among them, there is good reason to infer, in favour of the ancients, at least an equality with the moderns in this respect.

On the whole, all the principal parts of the art, as purity of design, and beauty and expression in the forms, were not only to be found in the ancient statues, but were actually the foundation of excellence in modern painting; and hence we may conclude, that their painters, formed on the same models, and very often the same men who excelled in sculpture, were not inferior in those branches of the art. But with regard to the inferior parts, the allurement of colouring, the ingenuity of the *claro-obsuro*, the splendor of composition, the art of grouping figures, and the nice *handling* of the pencil, the moderns are superior to those ancient painters who have most deserved the notice of their contemporary writers. It is still to be observed, however, that the progress of the arts among the ancients, from the principal parts to the more splendid, was somewhat similar to that among the moderns; and as the painters of the first rank were more immediately the objects of criticism and delight to authors of genius, it is impossible at this distance of time to state any accurate comparison between the ancients and moderns in what may be termed the decay of the art. This is particularly the case with regard to colours, there being in ancient as well as in modern times two epochs; the one comprehending Polygnotus and his immediate successors, and the other the painters both of Greece and Rome after the art began to decay. The colouring of Polygnotus was hard, and his manner had something of wildness;

Comparison between the Ancient and Modern.

*Anatomy.* nefs; but his design was in the highest style of perfection. In the succeeding ages the colouring was more varied, more brilliant, more harmonious, and the handling more agreeable; but the design was less elegant and exact. And the true connoisseurs continued to prefer the works of the ancient school, in the same manner that the best writers in our times prefer the works of the Roman and Venetian masters to the

more brilliant pictures of their successors. From this *Anatomy.* statement of facts it is abundantly evident, that from the ancient authors we can form some comparison between the best ancient and modern painters in those things which are most excellent in the art; while in the inferior parts, from the silence of authors, and the loss of paintings, we have no grounds upon which a comparison can be accurately made.

## P A R T I. Principles of the ART, and the Order of the Artist's STUDIES.

WE have joined these together, because they are like cause and effect; and comprehend both on what parts in the execution of the art the painter is to employ his chief attention, and also the manner in which he is to employ it. We shall not therefore be confined to the dry and abstract, and as it were unembodied principles, but connect them with the useful and agreeable branches of the art, in that order in which it appears to us they should be studied.

### SECT. I. *Of Anatomy.*

To ask if the study of anatomy is requisite to a painter, is the same thing as to ask if, in order to learn any science, a man must first make himself acquainted with the principles of it. It would be an useless waste of time to cite, in confirmation of this truth, the authorities of the ancient masters, and the most celebrated schools. A man, who is unacquainted with the form and construction of the several bones which support and govern the human frame, and does not know in what manner the muscles moving these bones are fixed to them, can make nothing of what appears of them thro' the integuments with which they are covered; and which appearance is, however, the noblest object of the pencil. It is impossible for a painter to copy faithfully what he sees, unless he thoroughly understand it. Let him employ ever so much time and study in the attempt; it cannot but be attended with many and great mistakes: just as it must happen to a man, who undertakes to copy something in a language which he does not understand; or to translate into his own, what has been written in another, upon a subject with which he is not acquainted.

It seldom happens, that nothing more is required of a painter than to copy exactly an object which he has before him. In still and very languid attitudes, in which every member is to appear motionless and dead, a living model may no doubt, yield for a long time a faithful image, and prove an useful pattern to him. But in regard to gestures any way sudden, motions any way violent, or those momentary attitudes which it is more frequently the painter's business to express, the case is quite different. In these a living model can hold but one instant or two; it soon grows languid, and settles into a fixed attitude, which is produced by an instantaneous concurrence of the animal spirits. If, therefore, a painter possess not so thoroughly all the principles of anatomy, as to be at all times able to have immediate recourse to them; if he know not the various manners in which the several parts of the human body play, according to their various positions; living models, far from proving an useful pattern to him, will

rather tend to lead him astray, and make him lose sight of truth and nature, by exhibiting the very reverse of what is required, or at least exhibiting it in a very faint and imperfect manner. In living models, we often behold those parts flow, which should be very quick; those cold and torpid, which should have the greatest share of life and spirit in them.

Nor is it, as some may be apt to imagine, merely to represent athletic and vigorous bodies, in which the parts are most bold and determined, that anatomy is requisite; it should be understood, to represent persons of the most delicate frame and condition, even women and children, whose members are smoothest and roundest, though the parts made known by it are not to be strongly expressed in such objects; just as logic is equally requisite under the polished insinuations of the orator and the rough arguments of the philosopher.

But it is needless to spend much time in proving that a painter should be acquainted with anatomy; or in showing, how far his acquaintance with it should extend. For instance, it is unnecessary for him to enter into the different systems of the nerves, blood-vessels, bowels, and the like; parts which are removed from the sight, and which therefore may be left to the surgeon and the physician, as being a guide in the operations of the former and in the prescriptions of the latter. It is enough for the painter, to be acquainted with the skeleton; in other words, with the figure and connection of the bones, which are, in a manner, the pillars and props of the human body; the origin, progress, and shape, of the muscles which cover these bones; as also the different degrees in which nature has clothed the muscles with fat, for this substance lies thicker upon them in some places than in others. Above all, he should know in what manner the muscles effect the various motions and gestures of the body. A muscle is composed of two tendinous and slender parts, one called the *head*, the other the *tail*, both terminating at the bones; and of an intermediate part, called the *belly*. The action of a muscle consists in an extraordinary swelling of this intermediate part, while the head remains at rest, so as to bring the tail nearer the head, and consequently the part, to which the tail of the muscle is fixed, nearer to that part into which the head is inserted.

There are many motions, to effect which several of the muscles (for this reason called *co-operating muscles*,) must swell and operate together, while those calculated to effect a contrary motion (and therefore called *antagonist muscles*) appear soft and flaccid. Thus, for example, the biceps and the brachii internus labour

Anatomy

when the arm is to be bent, and becomes more prominent than usual; while the *gemellus*, the *brachiius externus*, and the *anconæus*, whose office is to extend the arm, continue, as it were, flat and idle. The same happens respectively in all the other motions of the body. When the antagonist muscles of any part operate at one and the same time, such part becomes rigid and motionless. This action of the muscle is called *tonic*.

Michael Angelo intended to give the public a complete treatise upon this subject; and it is no small misfortune, that he never accomplished so useful a design. This great man, having observed, as we are told in his life by Condivi, that Albert Durer was deficient on the subject, as treating only of the various measures and forms of bodies, without saying a word of their attitudes and gestures, though things of much greater importance, resolved to compose a theory, founded upon his long practice, for the service of all future painters and statuary. And, certainly, no one could be better qualified to give anatomical precepts for that purpose, than he who, in competition with Da Vinci, designed that famous cartoon of naked bodies, which was studied by Raphael himself, and afterwards obtained the approbation of the Vatican, the greatest school of the art we are now treating of.

The want of Michael Angelo's precepts may, in some measure be supplied by other books written on the same subject by Moro, Cesio, and Torteat; and lately by Boucherdon, one of the most famous statuary in France. But nothing can be of equal service to a young painter, with the lessons of some able dissector; under whom, in a few months, he may make himself master of every branch of anatomy which he need to be acquainted with. A course of osteology is of no great length: and of the infinite number of muscles discovered by curious myologists, there are not above 80 or 90, with which nature sensibly operates all those motions which he can never have occasion to imitate or express. These, indeed, he should closely study, these he should carefully store up in his memory, so as never to be at the least loss for their proper figure, situation, office, and motion.

But there is another thing, besides the dissection of dead bodies, by which a young painter may profit greatly; and that is anatomical casts. Of these we have numbers by several authors; nay some which pass under the name of *Buonarroti* himself. But there is one in which, above all the rest, the parts are most distinctly and lively expressed. This is the performance of Hercules Lelli, who has perhaps gone greater lengths in this kind of study than any other master. We have, besides, by the same able hand, some casts of particular parts of the human body, so curiously coloured for the use of young painters as to represent these parts exactly as they appear on removing the integuments; and thus, by the difference in their colour as well as configuration, render the tendinous and the fleshy parts, the belly and the extremities, of every muscle surprisingly distinct; at the same time that, by the various direction of the fibres, the motion and play of these muscles become very obvious; a work of the greatest use, and never enough to be commended! Perhaps indeed, it would be an

Anatomy.

improvement, to give the muscles various tints; those muscles especially which the pupil might be apt to mistake for others. For example, though the *maïoïdes*, the *deltoïdes*, the *sartorius*, the *fascia lata*, the *gastrocnemii*, are of themselves, sufficiently distinguishable, it is not so with regard to the muscles of the arm and of the back, the right muscles of the belly, and some others, which either on account of the many parts into which they branch, or of their being interwoven one with another, do not so clearly and fairly present themselves to the eye. But let the cause of confusion to young beginners be what it will, it may be effectually removed, by giving, as already hinted, different colours to the different muscles, and illuminating anatomical figures; in the same manner that maps are coloured, in order to enable us readily to distinguish the several provinces of every kingdom, and the several dominions of every prince.

The better to understand the general effect, and remember the number, situation, and play of the muscles, it will be proper to compare, now and then, the anatomical casts, and even the dead body itself, with the living body covered with its fat and skin; and above all things, with the Greek statues still in being. It was the peculiar happiness of the Greeks, to be able to characterize and express the several parts of the human body much better than we can pretend to do; and this, on account of their particular application to the study of naked figures, especially the fine living ones which they had continually before their eyes. It is well known, that the muscles most used are likewise the most protuberant and conspicuous; such as, in those who dance much, the muscles of the legs; and in boatmen, the muscles of the back and arms. But the bodies of the Grecian youth, by means of their constant exertion of them in all the gymnastic sports, were so thoroughly exercised, as to supply the statuary with much more perfect models than ours can pretend to be.

There are a great many exercises, which a young painter should go through while engaged in the study of anatomy, in order to make himself more thoroughly master of that science. For example: The thighs of any figure, a *Laocoon* for instance, being given, he should add to them legs suitable to that state in which the muscles of the thighs are represented, that is, the muscles which serve to bend and extend the legs, and to effectuate in them such a precise position and no other. To the simple contours of an anatomy, or a statue, he should add the parts included by it, and give it a system of muscles conformable to the quality of that particular contour; for every contour denotes some one certain attitude, motion, exertion, and no other. Exercises of this kind would soon establish him in the most fundamental principles of painting, especially if he had an opportunity of comparing his drawings with the statue or cast from which the parts given him to work upon were taken, and thereby discovering and correcting his mistakes. This method is very like that used by those who teach the Latin tongue; when having given their scholars a passage of *Livy* or *Cæsar* already translated into their mother-tongue, to translate back into Latin, they make them compare their work with the original text.

THE study of perspective should go hand in hand with that of anatomy, as not less fundamental and necessary. In fact, the contour of an object drawn upon paper or canvas, represents nothing more than such an interfection of the visual rays sent from the extremities of it to the eye, as would arise on a glass put in the place of the paper or canvas. Now, the situation of an object at the other side of a glass being given, the declination of it on the glass itself depends entirely on the situation of the eye on this side of the glass; that is to say, on the rules of perspective: a science which, contrary to the opinion of most people, extends much farther than the painting of scenes, floors, and what generally goes under the name of *quadratura*. Perspective, according to that great master da Vinci, is to be considered as the reins and rudder of painting. It teaches in what proportion the parts fly from, and lessen upon, the eye; how figures are to be marshalled upon a plain surface, and fore-shortened. It contains, in short, the whole rationale of design.

Such are the terms which the masters best grounded in their profession have employed to define and commend perspective: so far were they from calling it a *fallacious art*, and an *insidious guide*; as some amongst the moderns have not blushed to do, insisting that it is to be followed no longer than it keeps the high road, or leads by easy and pleasant paths. But these writers plainly show, that they are equally ignorant of the nature of perspective, which, founded as it is on geometrical principles, can never lead its votaries astray; and of the nature of their art, which, without the assistance of perspective, cannot, in rigour, expect to make any progress, nay, not so much as to delineate a simple contour.

When a painter has formed a scene in his mind, and supposed, as it is customary, that the capital figures of this scene lie close, or almost close, to the back of his canvas, he is, in the next place, to fix upon some point on this side of the canvas, from which he would choose his piece should be seen. But in choosing this point, which is called the *point of sight*, regard should be had to its situation to the right or left of the middle of the canvas: but above all things, to its distance and its height with respect to the lower edge of the canvas; which edge is called the *base line*, and is parallel with the horizontal line that passes through the eye. For by assuming the point of sight, and consequently the horizontal line, too low, the planes upon which the figures stand will appear a great deal too shallow; as, by assuming it too high, they will appear too steep, so as to render the piece far less light and airy than it ought to be. In like manner, if the point of sight is taken at too great a distance from the canvas, the figures will not admit of degradation enough to be seen with sufficient distinctness; and if taken too near it, the degradation will be too quick and precipitate to have an agreeable effect. Thus, then, it appears, that no small attention is requisite in the choice of this point.

When a picture is to be placed on high, the point of sight should be assumed low, and *vice versa*; in or-

der that the horizontal line of the picture may be, as near as possible, in the same horizontal plane with that of the spectator; for this disposition has an amazing effect. When a picture is to be placed very high, as, amongst many others, that of the Purification by Paolo Veronese, engraved by Le Fevre, it will be proper to assume the point of sight so low, that it may lie quite under the picture, no part of whose ground is, in that case, to be visible; for, were the point of sight to be taken above the picture, the horizontal ground of it would appear sloping to the eye, and both figures and buildings as ready to tumble head foremost. It is true, indeed, that there is seldom any necessity for such extraordinary exactness; and that, unless in some particular cases, the point of sight had better be rather high than low: the reason of which is, that, as we are more accustomed to behold people on the same plane with ourselves, than either higher or lower, the figures of a piece must strike us most when standing on a plane nearly level with that upon which we ourselves stand. To this it may be added, that by placing the eye low, and greatly shortening the plane, the heels of the back figures will seem to bear against the heads of the foremost, so as to render the distance between them far less perceptible than otherwise it would be.

The point of sight being fixed upon, according to the situation in which the picture is to be placed, the point of distance is next to be determined. In doing this, a painter should carefully attend to three things: first, that the spectator may be able to take in, at one glance, the whole and every part of the composition; secondly, that he may see it distinctly; and thirdly, that the degradation of the figures and other objects of the picture be sufficiently sensible. It would take up too much time to lay down certain and precise rules for doing all this, considering the great variety in the sizes and shapes of pictures; for which reason we must leave a great deal to the discretion of the painter.

But there is a point still remaining, which will not admit of the least latitude. This is, the delineation of the picture, when once the point of sight has been fixed upon. The figures of a picture are to be considered as so many columns erected on different spots of the same plane; and the painter must not think of designing any thing, till he has laid down, in perspective, all those columns which are to enter his composition, with the most scrupulous exactness. By proceeding in this manner, he may not only be sure of not committing any mistake in the diminution of his figures according to their different distances, but may flatter himself with the thoughts of treading in the steps of the greatest masters. It is to the punctual observance of these laws that we are to attribute the grand effect of some paintings by Carpaccio and Mantegna, so careless in other respects; whereas a single fault against them is often sufficient entirely to spoil the works of a Guido, in spite of the sublimity and beauty of his superior style.

Now, as the demonstration of the rules of perspective depends on the doctrine of proportions, on the properties of similar triangles, and on the intersection of planes, it will be proper to put an abridgement of Euclid into the hands of the young painter, that he may

Perfective.

may understand these rules fundamentally, and not stand confined to a blind practice of them: but, then, there is nothing in this author relative to the art of painting, which may not easily be acquired in a few months. For, as it would be of no use to a painter to launch out into the anatomical depths of a Monro or an Albinus, it would be equally superfluous to perplex himself with the intricacies of the higher geometry with a Taylor, who has handled perspective with that rich profoundness, which we cannot help thinking does a great deal more honour to a mathematician, than it can possibly bring advantage to a simple artist.

But though a much longer time were requisite to become a perfect master of perspective, a painter, surely, ought not to grudge it; as no time can be too long to acquire that knowledge, without which he cannot possibly expect to succeed. Nay, we may boldly affirm, that the shortest road in every art is that which leads through theory to practice. From theory arises that great facility, by means of which a man advances the quicker, in proportion as he is surer of not taking a wrong step: whilst those, who are not grounded in the science, labour on in perpetual doubt; obliged, as a certain author expresses it, to feel out their way with a pencil, just as the blind, with their sticks, feel for the streets and turnings, with which they are not acquainted.

As practice, therefore, ought in every thing to be built upon principle, the study of Optics, as far as it is requisite to determine the degree in which objects are to be illuminated or shaded, should proceed hand in hand with that of perspective: And this, in order that the shades, cast by figures upon the planes on which they stand, may fall properly, and be neither too strong nor too light; in a word, that those most beautiful effects of the chiaro-scuro may run no risk of ever receiving the lie from truth, which sooner or later discovers itself to every eye.

### SECT. III. Of Symmetry.

THE study of symmetry, it is obvious, should immediately follow that of anatomy; for it would avail us little to be acquainted with the different parts of the human body, and their several offices, were we at the same time ignorant of the order and proportion of those parts in regard to the whole in general, and to each other in particular. The Greek statuary distinguished themselves above all others, as much by the just symmetry of their members, as by their skill in anatomy; but Polycletes surpassed them all by a statue, called the *Rule*, from which, as from a most accurate pattern, other artists might take measures for every part of the human body. These measures, to say nothing of the books which treat professedly of them, may now be derived from the Apollo of Belvedere, the Laocoon, the Venus of Medicis, the Fannus, and particularly the Antinous, which last was the rule of the learned Poussin.

It is the general opinion of painters, that the ancients were not as happy in representing the bodies of children, as they are allowed to have been in representing those of women and men; especially those of their gods; in which they excelled to such a degree,

that with these gods were often worshipped the artists who had carved them. Yet the Venus of Gnidos by Praxiteles was not more famous than her Cupid, on whose account alone people flocked to Thespiaz §. To children, say they, the ancients knew not how to impart that softness and effeminacy which Flaminio has since contrived to give them, by representing their cheeks, hands, and feet, swelled, their heads large, and with scarce any belly. But such critics seem to forget, that these first sketches of nature very seldom come in the painter's way, and that this puny and delicate state has not in its form even the least glimmering of perfection. The ancients never undertook to represent children less than four or five years old; at which age the superfluous humours of the body being in some measure digested, their members begin to assume such a contour and proportion as may serve to point out what they are afterwards likely to be. This observation is confirmed by the children which we meet with in ancient basso-relievos and paintings: for they are all doing one thing or another; like the most beautiful little Cupids in a picture at Venice, who are playing with the arms of Mars, and lifting up the ponderous sword of that deity; or that little urchin in the Danie of Caracci, who empties a quiver of its arrows in order to fill it with the golden shower. Now, what can be a greater blunder in point of costume, than to attribute actions, which require some degree of strength and judgment, to infancy, to that raw and tender age so totally unable to govern and support itself?

Let a young painter consider the Greek statues ever so often, of whatever character or age they may be represented, it is impossible he should ever consider them without discovering new beauties in them. It is therefore impossible he can copy them too often, according to that judicious motto placed by Maratti on his print called *The school*. This truth was acknowledged by Rubens himself; for though, like one bred, as he was in the foggy climate of the Low Countries, he generally painted from the life; in some of his works he copied the ancients; nay, he wrote a treatise on the excellency of the ancient statues, and on the duty of a painter to study and imitate them. As to the satirical print, or rather pasquinade, of the great Titian, in which he has represented a parcel of young monkeys aping the group of Laocoon and his sons; he intended nothing more by it than to lash the dullness and poverty of those artists, who cannot so much as draw a figure without having a statue before them as a model.

In fact, reason requires, that an artist should be so much master of his art, as seldom to stand in need of a pattern. To what other purpose is he to sweat and toil from his infancy, and spend so many days and nights in studying and copying the best models; especially the finest faces of antiquity, which we are still possessed of; such as the two Niobes, mother and daughter; the Ariadne, the Alexander, the young Nero, the Silenus, the Nile: and likewise the finest figures; for instance, the Apollo, the Gladiator, the Venus, and others; all which (as was said of Pietro Fetta), he should have, as it were, perfectly by heart? With a stock of excellencies like these, treasured up in his memory; he may one day hope to produce something

Symmetry.

§ Cic. in Verrem, de signis Strabo, lib. ix. Plin. Nat. Hist. lib. xxxvi. c. 5.

Plinii Nat. Hist. lib. xxxiv. c. 8.

Symmetry. thing of his own without a model; form a right judgement of those natural beauties which fall in his way; and when occasion offers, avail himself properly of them.

It is very injudicious to send boys to an academy to draw after naked figures, before they have imbibed a proper relish for beautiful proportions, and have been well grounded in the true principles of symmetry. They should first learn, by studying the precious remains of antiquity, to improve upon life; and discern where a natural figure is faulty through stiffness in the members, or clumsiness in the trunk, or in any other respect; so as to be able to correct the faulty part, and reduce it to its proper bounds. Painting, in this branch, is, like medicine, the art of taking away and adding.

It must not, however, be dissembled, that the methods hitherto laid down are attended with some danger; for by too slavish an attention to statues, the young painter may contract a hard and dry manner; and by studying anatomies too fervently, a habit of representing living bodies as stripped of their skin; for after all, there is nothing but what is natural, that, besides a certain peculiar grace and liveliness, possesses that simplicity, ease, and softness, which is not to be expected in the works of art, or even in those of nature when deprived of life. Poussin himself has now and then given into one of these extremes, and Michael Angelo very often into the other: but from this we can only infer, that even the greatest men are not infallible. It is, in short, to be considered as one instance, among a thousand, of the ill use those are wont to make of the best things, who do not know how to temper and qualify them properly with their contraries.

But no such danger can arise to a young painter from confining himself for a long time to mere design, so as not to attempt colouring till he has made himself master of that branch. If, according to a great master\*, colours in painting are in regard to the eye what numbers in poetry are in regard to the ear, so many charms to allure and captivate that sense; may we not affirm, that design is in the same art what propriety of language is in writing, and a just utterance of sounds in music? Whatever some people may think, a picture designed according to the rules of perspective and the principles of anatomy, will ever be held in higher esteem by good judges, than a picture ill designed, let it be ever so well-coloured. Hannibal Caracci set so great a value upon the art of contour, that, according to some expressions of his which have reached us, he considered almost every thing else as nothing in comparison with it. And this his judgement may be justified, by considering, that nature, though she forms men of various colours and complexions, never operates in the motions contrary to the mechanical principles of anatomy, nor, in exhibiting these motions to the eye, against the geometrical laws of perspective; a plain proof, that in point of design, no mistake is to be deemed trifling. Hence we are enabled to feel all the weight of those words in which Michael Angelo, after he considered a picture drawn by a prince of the Venetian school, addressed Vasari: "What a pity it is," said he, "that this man did not set out by studying design!" As the energy of nature

shines most in the smallest subjects, so the energy of Imitation. art shines most in imitating them.

#### SECT. IV. *Of Imitation.*

WHEN you consider art as the imitation of nature (says Mengs), it is not to be understood that nature which is the object, is more perfect than art which imitates it. Nature, it is confessed, offers some views of which the imitation must for ever remain imperfect, as in the instance of the *claro-obscuro*; but, on the other hand, in every thing relative to beauty of form, imitation may even surpass nature. Nature, in her productions, is subject to many accidents. Art, labouring on passive and obedient materials, renders perfect the objects of its creation, chooses every thing in nature the most excellent, and collects the different parts and the different beauties of many individuals into one whole. It is seldom that we find in the same man greatness of soul and the due proportions of body, vigour, suppleness, firmness, and agility, joined together. Art constantly represents what is rarely or never to be met with in human nature; regularity in the outlines, grandeur in the forms, grace in the attitudes, beauty in the members, force in the breast, agility in the limbs, address in the arms, frankness in the forehead, spirit in the eyes, and affability over the whole countenance. Let an artist give force and expression to all the parts of his subject, let him vary this force and expression as different circumstances make it necessary, and he will soon perceive that art may surpass nature. But although this be granted, the artist is not to imagine that art is *actually* arrived at this supreme degree of perfection, and can proceed no farther. The moderns seem never to have perceived the tract pointed out by the ancient Greeks; for, since the revival of painting, the true and the agreeable, instead of the beautiful, have been the objects of cultivation. Still, however, imitation is the first part of the art of painting, though not the most excellent or beautiful. It is a necessary step in the progress which leads forward to greater perfection.

A painter ought attentively to consider, compare together, and weigh in the balance of reason and truth, all the different styles of the great masters; but he ought likewise carefully to guard against too great a fondness for any one of them in particular that he may think proper to adopt; otherwise, to use the expression of a first-rate master\*, instead of the child, he would become the grand child of nature.

Besides, his imitation must be of generals, and not of particulars. Whatever a young painter's natural disposition may be, whether to paint boldly and freely like Tintoret and Rubens, or to labour his works like Titian or Da Vinci, let him follow it. This kind of imitation is very commendable. It is thus that Dante, at the same time that he carefully avoided adopting the particular expressions of Virgil, endeavoured to seize his bold and free manner, and at last caught from him that elegance of style which has done him so much honour.

As to the rest, nothing should hinder an able master from making use now and then of any antique, or even modern figure, which he may find his account in employing. Sanzio, in a *St Paul at Lystra*, scrupled not

\* Poussin, in his *Life* by Bellori.

\* Da Vinci on Painting.

Imitation not to avail himself of an ancient sacrifice in basso-relievo : nor did Buonarroti himself disdain to use, in his paintings of the Sistine chapel, a figure taken from that famous cornelian which tradition tells us he wore on his fingers, and which was lately in the possession of the most Christian king. Men like these avail themselves of the productions of others in such a manner as to make us apply to them, what La Bruyere said of Despreaux, that one would imagine the thoughts of other men had been of his own creation.

In general, a painter should have his eye constantly fixed on nature, that inexhaustible and varied source of every kind of beauty ; and should study to imitate her in her most singular effects. As beauty, scattered over the whole universe, shines brighter in some objects than in others, he should never be without his little book and crayon, in order to make drawings of every beautiful or uncommon object that may happen to present itself ; and take sketches of every fine building, every situation, every effect of light, every flight of clouds, every flow of drapery, every attitude, every expression of the passions, that may happen to strike him. He may afterwards employ these things as occasion offer ; and in the mean time will have the advantage of acquiring a grand style.

It is by carefully studying the best masters, and imitating nature, that a painter arrives at the style of perfection which the Italians call *gusto grande*, the French *le beau id. a'*, and the English *the great style*.

"A mind (says Sir Joshua Reynolds), enriched by an assemblage of all the treasures of ancient and modern art, will be more elevated and fruitful in resources in proportion to the number of ideas which have been carefully collected and thoroughly digested.

"The addition of other mens judgment is so far from weakening, as is the opinion of many, our own, that it will fashion and consolidate those ideas of excellence which lay in their birth feeble, ill shaped, and confused ; but which are finished and put in order by the authority and practice of those, whose works may be said to have been consecrated by having stood the test of ages.

"When we speak of the habitual imitation and continued study of masters, it is not to be understood that I advise any endeavour to copy the exact peculiar colour and complexion of another man's mind ; the success of such an attempt must always be like his who imitates exactly the air, manners, and gesture, of him whom he admires. His model may be excellent, but he himself will be ridiculous ; and this ridicule arises not from his having imitated, but from his not having chosen the right mode of imitation.

"It is a necessary warrantable pride to disdain to walk servilely behind any individual, however elevated his rank. The true and liberal ground of imitation is an open field, where, though he who precedes has had the advantage of starting before you, yet it is enough to pursue his course : you need not tread in his footsteps ; and you certainly have a right to outstrip him if you can.

"Nor, whilst I recommend studying the art from artists, can I be supposed to mean that nature is to be neglected : I take this study in aid, and not in exclusion of the other. Nature is, and must be, the foun-

tain, which alone is inexhaustible ; and from which all Colouring. excellencies must originally flow.

"The great use of studying our predecessors is to open the mind, to shorten our labour, and to give us the result of the selection made by those great minds of what is grand or beautiful in nature : her rich stores are all spread out before us ; but it is an art, and no easy art to know how or what to choose, and how to attain and secure the object of our choice.

"Thus the highest beauty of form must be taken from nature : but it is an art of long deduction and great experience to know how to find it. I cannot avoid mentioning here an error which students are apt to fall into.

"He that is forming himself must look with great caution and wariness on those peculiarities or prominent parts which at first force themselves on view, and are the marks, or what is commonly called the manner, by which that individual artist is distinguished.

"Peculiar marks I hold to be generally, if not always, defects, however difficult it may be wholly to escape them.

"Peculiarities in the work of art are like those in the human figure ; it is by them that we are cognizable and distinguished one from another ; but they are always so many blemishes, which however, both in the one case and in the other, cease to appear deformities to those who have them continually before their eyes. In the works of art, even the most enlightened mind, when warmed by beauties of the highest kind, will by degrees find a repugnance within him to acknowledge any defects : nay his enthusiasm will carry him so far as to transform them into beauties and objects of imitation.

"It must be acknowledged, that a peculiarity of style, either from its novelty, or by seeming to proceed from a peculiar turn of mind, often escapes blame ; on the contrary, it is sometimes striking and pleasing ; but it is vain labour to endeavour to imitate it, because novelty and peculiarity being its only merit, when it ceases to be new, it ceases to have value.

"A manner, therefore, being a defect, and every painter, however excellent, having a manner, it seems to follow, that all kinds of faults as well as beauties may be learned under the sanction of the greatest authorities."

#### SECT. V. *Of Colouring.*

COLOURING, though a subject greatly inferior to many others which the painter must study, is yet of sufficient importance to employ a considerable share of his attention ; and to excel in it, he must be well acquainted with that part of optics which has the nature of light and colours for its object. Light, however simple and uncompounded it may appear, is nevertheless made up, as it were, of several distinct substances ; and the number, and even dose, of these ingredients, has been happily discovered by the moderns. Every undivided ray, let it be ever so fine, is a little bundle of red, orange, yellow, green, azure, indigo, and violet rays, which, while combined, are not to be distinguished one from another, and form that kind of light called

*white* ;

Colouring.  
Trattato  
della Pittura, c. 14.

*white*; so that white is not a colour *per se*, as the learned Da Vinci (so far, it seems, the precursor of Newton) expressly affirms, but an assemblage of colours. Now, these colours, which compose light, although immutable in themselves, and endued with various qualities, are continually, however, separating from each other in their reflection from and passage through other substances, and thus become manifest to the eye. Grass, for example, reflects only green rays, or rather reflects green rays in greater number than it does those of any other colour; one kind of wine transmits red rays, and another yellowish rays; and from this kind of separation arises that variety of colours with which nature has diversified her various productions. Man, too, has contrived to separate the rays of light by making a portion of the sun's beams pass through a glass prism; for after passing through it, they appear divided into seven pure and primitive colours, placed in succession one by the other, like so many colours on a painter's pallet.

Now, though Titian, Corregio, and Vandyke, have been excellent colourists, without knowing any thing of these physical subtleties, that is no reason why others should neglect them. For it cannot but be of great service to a painter to be well acquainted with the nature of what he is to imitate, and of those colours with which he is to give life and perfection to his designs; not to speak of the pleasure there is in being able to account truly and solidly for the various effects and appearances of light. From a due tempering, for example, and degrading, of the tints in a tincture; from making colours partake of each other, according to the reflection of light from one object to another: there arises, in some measure, that sublime harmony which may be considered as the true music of the eye. And this harmony has its foundation in the genuine principles of optics. Now this could not happen in the system of those philosophers, who held, that colours did not originally exist in light, but were, on the contrary, nothing else than so many modifications which it underwent in being reflected from other substances, or in passing through them; thus subject to alterations without end, and every moment liable to perish. Were that the case, bodies could no more receive any hues one from another, nor this body partake of the colour of that, than scarlet, for example; because it has the power of changing into red all the rays of the sun or sky which immediately fall upon it, has the power of changing into red all the other rays reflected to it from a blue or any other colour in its neighbourhood. Whereas, allowing that colours are in their own nature immutable one into another, and that every body reflects, more or less, every sort of coloured rays, though those rays in the greatest number which are of the colour it exhibits, there must necessarily arise, in colours placed near one another, certain particular hues or temperaments of colour: nay, this influence of one colour upon another may be so far traced, that three or four bodies of different colours, and likewise the intenseness of the light falling upon each, being assigned, we may easily determine in what situations and how much they would tinge each other. We may thus too, by the same principle of optics, account for several other things practised by painters; inasmuch that a person, who has carefully observed natural ef-

Vol. XIII.

fects with an eye directed by solid learning, shall be able to form general rules, where another can only distinguish particular cases. Colouring.

But after all, the pictures of the best colourists are, it is universally allowed, the books in which a young painter must chiefly look for the rules of colouring; that is, of that branch of painting which contributes so much to express the beauty of objects, and is so requisite to represent them as what they really are. Corregio and Titian seem to have discovered circumstances in nature which others have entirely overlooked; and the last in particular has been happy enough to express them with a pencil as delicate as his eye was quick and piercing. In his works we behold that sweetness of colouring which is produced by union; that beauty which is consistent with truth; and all the insensible transmutations, all the soft transitions, in a word, all the pleasing modulations, of tints and colours. When a young painter has, by close application, acquired from Titian, whom he can never sufficiently dwell upon, that art which, of all painters, he has best contrived to hide, he would do well to turn to Bassano and Paolo, on account of the beauty, boldness and elegance of their touches. That richness, softness, and freshness of colouring, for which the Lombard school is so justly cried up, may likewise be of great service to him. Nor will he reap less benefit by studying the principles and practice of the Flemish school; which, chiefly by means of her varnishes, has contrived to give a most enchanting lustre and transparency to her colours.

But whatever pictures a young painter may choose to study the art of colouring upon, he must take great care that they are well preserved. There are very few pieces which have not suffered more or less by length, not to say the injuries, of time; and perhaps that precious patina, which years alone can impart to paintings, is in some measure akin to that other kind which ages alone impart to medals; inasmuch as, by giving testimony to their antiquity, it renders them proportionably beautiful in the superstitious eyes of the learned. It must indeed be allowed, that if, on the one hand, this patina bestows, as it really does, an extraordinary degree of harmony upon the colours of a picture, and destroys, or at least greatly lessens their original rawness, it, on the other hand, equally impairs the freshness and life of them. A piece seen many years after it has been painted, appears much as it would do, immediately after painting, behind a dull glass. It is no idle opinion, that Paolo Veronese, attentive above all things to the beauty of his colours, and what is called *strepito*, left entirely to time the care of harmonizing them perfectly, and (as we may say) mellowing them. But most of the old masters took that task upon themselves; and never exposed their works to the eyes of the public, until they had ripened and finished them with their own hands. And who can say whether the *Christ* of Moneta, or the *Nativity* of Bassano, have been more improved or injured (if we may so speak) by the touchings and retouchings of time, in the course of more than two centuries? It is indeed impossible to be determined. But the studious pupil may make himself ample amends for any injuries which his originals may have received from the hand of time, by turning to truth, and to Nature which never grows old,

Colouring.

old, but constantly retains its primitive flower of youth, and was itself the model of the models before him. As soon, therefore, as a young painter has laid a proper foundation for a good colouring, by studying the best masters, he should turn all his thoughts to truth and nature. And it would perhaps be well worth while to have, in the academies of painting, models for colouring as well as designing; that as from the one the pupils learn to give their due proportions to the several members and muscles, they may learn from the other to make their carnations rich and warm, and faithfully copy the different local hues which appear quite distinct in the different parts of a fine body. To illustrate still farther the use of such a model, let us suppose it placed in different lights; now in that of the sun, now in that of the sky, and now again in that of a lamp or candle; one time placed in the shade, and another in a reflected light. Hence the pupil may learn all the different effects of the complexion in different circumstances, whether the livid, the lucid, or transparent; and, above all, that variety of tints and half tints, occasioned in the colour of the skin by the epidermis having the bones immediately under it in some places, and in others a greater or less number of blood-vessels or quantity of fat. An artist who had long studied such a model, would run no risk of degrading the beauties of nature by any particularity of style, or of giving into that preposterous fulness and floridness of colour which is at present so much the taste. He would not feed his figures with roses, as an ancient painter of Greece shrewdly expressed it, but with good beef; a difference, which the learned eye of a modern writer could perceive between the colouring of Barocci and that of Titian. To practise in that manner, is, according to a great master, no better than inuring one's self to the commission of blunders. What statues are in design, nature is in colouring; the fountain head of that perfection to which every artist, ambitious to excel, should constantly aspire: and accordingly the Flemish painters, in consequence of their aiming solely to copy nature, are in colouring as excellent as they are wont to be awkward in designing. The best model for the tone of colours and the degradation of shades is furnished by the means of the *camera obscura*. See DIOPTRICS, Sect. 6th and 9th.

5.

#### SECT. VI. *Of Drapery.*

DRAPERY is one of the most important branches of the whole art, and accordingly demands the greatest attention and study. It seldom happens that a painter has nothing but naked figures to represent; nay, his subjects generally consist of figures clothed from head to foot. Now the flowing of the folds in every garment depends chiefly upon the relief of the parts that lie under it. A certain author, we forgot his name, observes, that as the inequalities of a surface are discoverable by the inequalities in the water that runs over it, so the posture and shape of the members must be discernible by the folds of the garment that covers them. Those idle windings and gatherings, with which some painters have affected to cover their figures, make the clothes made up of them look as if the body had fled from under them and left nothing in its place

but a heap of empty bubbles, fit emblems of the brain that conceived them. As from the trunk of a tree there issue here and there boughs of various forms, so from one mistress fold there always flow many lesser ones: and as it is on the quality of the tree that the elegance, compactness, or openness of its branches chiefly depends; it is, in like manner, by the quality of the stuff of which a garment is made, that the number, order, and size of its folds must be determined. To sum up all in two words, the drapery ought to be natural and easy, so as to show what stuff it is, and what parts it covers. It ought, as a certain author expresses it, to cover the body, as it were merely to shew it.

Drapery.

It was formerly the custom with some of our masters to draw all their figures naked, and then drape them: from the same principle that they first drew the skeletons of their figures, and afterwards covered them with muscles. And it was by proceeding in this manner that they attained to such a degree of truth in expressing the folds of their drapery, and the joints and direction of the principal members that lay under it, so as to exhibit in a most striking manner the attitude of the person to whom they belonged. That the ancient sculptors clothed their statues with equal truth and grace appears from many of them that are still in being; particularly a Flora lately dug up in Rome, whose drapery is executed with so much judgment, and in so grand and rich a style, that it may vie with the finest of their naked statues, even with the Venus of Medicis. The statues of the ancients had so much beauty when naked, that they retained a great deal when clothed. But here it must be considered, that it was usual with them to suppose their originals clothed with wet garments, and of an extreme fineness and delicacy, that by lying close to the parts, and in a manner clinging to them, they might the better show what these parts were. For this reason a painter is not to confine himself to the study of the ancient statues, lest he should contract a dry style, and even fall into the same faults with some great masters who accustomed to drape with such light stuffs as fit close to the body, have afterwards made the coarsest lie in the same manner, so as plainly to exhibit the muscles underneath them. It is therefore proper to study nature herself, and those modern masters who have come nearest to her in this branch; such as Paolo Veronese, Andrea del Sarto, Rubens, and above all, Guido Reni. The flow of their drapery is soft and gentle; and the gatherings and plaits are so contrived, as not only not to hide the body but to add grace and dignity to it. There gold, silk, and woollen stuffs, are so distinguishable one from another, by the quality of their several lustres, and the peculiar light and shade belonging to each, but above all by the form and flow of their folds, that the age and sex of their figures are hardly more discoverable by their faces. Albert Durer is another great master in this branch, inasmuch that Guido himself was not ashamed to study him. There are still extant several drawings made with the pen by this great man, in which he has copied whole figures from Albert, and scrupulously retained the flow of his drapery as far as his own peculiar style, less harsh and sharp, but more easy and graceful, would allow. It may be said that

he

Drapery. he made the same use of Albert that our modern writers ought to make of the best authors of the 13th century.

To drape a figure well, it is necessary that the folds be large and few in number; because large folds produce great masses of light and shadow, while small ones multiply the objects of view and distract the attention. But if the character of the drapery or kind of stuff require small folds, they should at least be distributed in groups, in such a manner that a great number of small folds shall be subordinate to an equal mass formed by a principal fold.

It is also proper to observe, that the colour of the drapery contributes to the harmony of the whole, and produces effects which the *claro-obscuro* cannot do alone. At the same time, the principles of the *claro-obscuro* should preside over, or at least regulate, the art of drapery. If the folds of the stuff which cover the members exposed to the light are too strongly shaded, they will appear to enter into the members, and cut them.

Drapery contributes to the life, to the character, to the expression of the figures, provided all the movements of the folds announce the lively or more tranquil movement of those figures. The colour, and the kind of stuff concur also to promote the general expression; brilliant or fine drapery cannot be properly introduced in a mournful subject, nor the opposite in a gay one.

The drapery must also agree with the age and character of the figures: And if nature in any instance is found to contradict those principles, it is because they relate to the ideal of the art; and it is this ideal which carries it to the greatest perfection.

Great attention is also necessary to the situation in which the figures are placed, and the actions about which they are employed. If they are in the act of ascending, a column of air weighs down the drapery; if, on the contrary, they are descending, the drapery is supported and spread out. The folds placed on every member, and the general play of the drapery, should indicate whether the figure is in action or about to be so; whether action be beginning or ending; and whether it be slow, or quick, or violent. All this is agreeable to nature; but it also partakes of the ideal, since nature never can be copied in such fluctuating situations. The practice of the Roman schools, first to draw after nature, and then to paint after the drawing, cannot be adopted by colourists; because nature, according to the kind of the stuffs, produces tones and lights which give more perfection and truth to the work. Meanwhile Raphael, who followed this practice, enjoys the first reputation for giving play to his drapery, and disposing the folds in the best order. In this part he has even attained the height of ideal beauty. He is the greatest painter of drapery, as the Venetians are the greatest in painting stuffs.

Raphael, says Mengs, imitated at first his master Perugin's manner of drapery; and he brought this manner to perfection, by studying the works of Masaccio and of Bartholomew: but he departed entirely from the taste of the school in which he was educated when he had seen the works of the ancients. It was the basso-relievo of antiquity which pointed out to him the true flowing of drapery, and he was not

backward to introduce it. He discovered, by attending to the principles of the ancients, that the naked is the principal part; that drapery is to be regarded altogether as an accessory, and that it is intended to cover, not to conceal: that it is employed from necessity, not caprice; that of consequence the clothes should not be so narrow as to constrain the members, nor so ample as to embarrass them; but that the artist should adapt them to the size and attitude of the figures intended to wear them.

He understood that the great folds should be placed at the large places of the body; and where the nature of the drapery required small folds, that it was necessary to give them a projection, which indicates a subordination to the principal parts.

He made his ample draperies without useless folds, and with bendings at the articulations. It was the form of the naked figure which pointed out to him the form of his folds, and on the great muscles he formed great masses. When any part required to be foreshortened, he covered it with the same number of folds as if it had been straight; but then he crowded them in proportion to the foreshortening.

He frequently discovered the border of his drapery, to show that his figures were not dressed in a simple sack. The form of the principal parts, and the specific weight of the air, were always the causes of his folds. It was easy to discover in his works, by the folds of his drapery, the attitude of the figure previous to the one in which it was placed: and whether, for example, the arm was extended or otherwise, immediately before the action. This was an expression which he had carefully studied on all occasions, because he found it in nature.

When the drapery was to cover the leg or arm but half, or in an imperfect manner, he made it cut obliquely the member which was partly to be covered. His folds were of a triangular form. The reason of this form is in nature: for all drapery has a tendency to enlarge itself and be extended; and as at the same time its own weight obliges it to fall back on itself, it is naturally formed into triangles.

He knew perfectly, that the movements of the body and of its members are the causes of the actual situation of drapery, and of the foundation of its folds. All his practice is nothing else but the unfolding and demonstrating of this theory; and drapery executed in any other manner must be in a false and vicious taste.

#### SECT. VIII. *Of Landscape and Architecture.*

WHEN our young painter has made a sufficient progress in those principal branches of his art, the designing, perspective, colouring, and drapery of human figures, he should turn his thoughts to landscape and architecture: for, by studying them, he will render himself universal and qualified to undertake any subject; so as not to resemble certain literati, who, though great masters in some articles, are mere children in every thing else.

The most eminent landscape-painters are Poussin, Lorenese, and Titian.

Poussin was remarkable for his great diligence. His pieces are quite exotic and uncommon; being set off with buildings in a beautiful but singular style; and

Landscape  
and Archi-  
tecture.

with learned episodes, such as poets reciting their verses to the woods, and youths exercising themselves in the several gymnastic games of antiquity; by which it plainly appears, that he was more indebted for his subjects to the descriptions of Pausanias than to nature and truth.

Lorenese applied himself chiefly to express the various phenomena of light, especially those perceivable in the heavens. And, thanks to the happy climate of Rome, where he studied and exercised his talents, he has left us the brightest skies, and the richest and most gloriously cloud-tipt horizons, that can be well conceived. Nay, the sun himself, which, like the Almighty, can be represented merely by his effects, has scarce escaped his daring and ambitious pencil.

Titian, the great confident of nature, is the Homer of landscape. His scenes have so much truth, so much variety, and such a bloom in them, that it is impossible to behold them, without wishing, as if they were real, to make an excursion into them. And perhaps the finest landscape that ever issued from mortal hands, is the back grounds of his *Martyrdom of St Peter*; where by the difference between the bodies and the leaves of his trees, and the disposition of their branches, one immediately discovers the difference between the trees themselves; where the different soils are so well expressed, and so exquisitely clothed with their proper plants, that a botanist has much ado to keep his hands from them. See Part II. Sect. ii.

Paolo Veronese is in architecture what Titian is in landscape. To excel in landscape, we must, above all things, study nature. To excel in architecture, we must chiefly regard the finest works of art; such as the fronts of ancient edifices, and the fabrics of those moderns who have best studied and best copied antiquity. Next to Brunelleschi and Alberti, who were the first revivers of architecture, came Bramante, Giulio Romano, Sanfovino, Sanmicheli, and lastly Palladio, whose works the young painter should above all the rest diligently study and imprint deeply on his mind. Nor is Vignola to be forgot; for some think he was a more scrupulous copier of antiquity, and more exact, than Palladio himself, inasmuch that most people consider him as the first architect among the moderns. For our part, to speak of him, not as fame, but as truth seems to require, we cannot help thinking, that rather than break through the generality of the rules contrived by him to facilitate practice, he has in some instances deviated from the most beautiful proportions of the antique, and is rather barren in the distribution and disposition of certain members. Moreover, the extraordinary height of his pedestals and cornices hinders the column from showing in the orders designed and employed by him, as it does in those of Palladio. Amongst that great variety of proportions to be met with in ancient ruins, Palladio has been extremely happy in choosing the best. His profiles are well contrasted, yet easy. All the parts of his buildings hang well together. Grandeur, elegance, and beauty, walk hand in hand in them. In short, the very blemishes of Palladio, who was no slave to conveniency, and sometimes perhaps was too profuse in his decorations, are picturesque. And we may reasonably believe, that it was by following so great a master, whose works he had continually before his eyes, that Paolo Veronese formed that fine and masterly taste

which enabled him to embellish his compositions with such beautiful structures.

The study of architecture cannot fail, in another respect, of being very useful to the young painter, inasmuch as it will bring him acquainted with the form of the temples, thermæ, basilics, theatres, and other buildings of the Greeks and Romans. Besides, from the basso-relievos with which it was customary to adorn these buildings, he may gather, with equal delight and profit, the nature of their sacrifices, arms, military ensigns, and dress. The study of landscape, too, will render familiar to him the form of the various plants peculiar to each soil and climate, and such other things as serve to characterise the different regions of the earth. Thus by degrees he will learn what we call *costume*, one of the chief requisites in a painter; since by means of it he may express with great precision the time and place in which his scenes are laid.

#### SECT. VIII. *Of the Expression of the Passions.*

THAT language which above all others a painter should carefully endeavour to learn, and from nature herself, is the language of the passions. Without it the finest works must appear lifeless and inanimate. It is not enough for a painter to be able to delineate the most exquisite forms, give them the most graceful attitudes, and compose them well together; it is not enough to dress them out with propriety, and in the most beautiful colours; it is not enough, in fine, by the powerful magic of light and shade, to make the canvass vanish. No; he must likewise know how to clothe his figures with grief, with joy, with fear, with anger; he must, in some sort, write on their faces what they think and what they feel; he must give them life and speech. It is indeed in this branch that painting truly soars, and in a manner rises superior to itself; it is in this branch she makes the spectator apprehend much more than what she expresses.

The means employed in her imitations by painting, are the circumscription of terms, the *chiaro-scuro*, and colours; all which appear solely calculated to strike the visual faculty. Notwithstanding which, she contrives to represent hard and soft, rough and smooth surfaces, which are objects of the touch; and this by means of certain tints, and a certain *chiaro-scuro*, which has a different look in marble, in the bark of trees, in downy and delicate substances. Nay, she contrives to express sound and motion, by means of light and shade, and certain particular configurations. In some landscapes of Diderich, we almost hear the water murmur, and see it tremble along the sides of the river and of the boats upon it. In the *Battle of Burgogne*, we are really apt to fancy that the trumpet sounds; and we see the horse, who has thrown his rider, scamper along the plain. But what is still more wonderful, painting, in virtue of her various colours and certain particular gestures, expresses even the sentiments and most hidden affections of the soul, and renders her visible, so as to make the eye not only touch and hear, but even kindle into passion and reason.

Many have written, and amongst the rest the famous Le Brun, on the various changes that, according to the various passions, happen in the muscles of the face, which is, as it were, the dumb tongue of the soul.

They

Expression  
of the  
Passions.

Expression  
of the  
Passions.

They observe, for example, that in fits of anger the face reddens, the muscles of the lips puff out, the eyes sparkle; and that on the contrary, in fits of melancholy, the eyes grow motionless and dead, the face pale, and the lips sink in. It may be of service to a painter to read these and such other remarks; but it will be of infinitely more service to study them in nature itself, from which they have been borrowed, and which exhibits them in that lively manner which neither tongue nor pen can express.

Upon Le Brun's Treatise on the Passions, we have the following just, though severe, criticism by Winckelmann. "Expression, though precarious in its nature (says he), has been reduced into a system, in a Treatise on the Passions by Charles Le Brun, a work generally put into the hands of young artists. The plates which accompany this treatise do not only give to the face the affections of the soul in too high a tone, but there are many of the heads in which the passions are represented in an outrageous manner. He appears to give instructions in expression, as Diogenes gave examples of morality: I act like musicians, said that cynic, who give a high tone, in order to indicate a true one. But the fervour of youth has naturally more inclination to seize the extreme than the middle; and hence it is difficult for the young artist, in copying after Le Brun, to seize the true tone. Youth in general may be supposed to have that regard for the calm and moderate in the arts, which they have for the precepts of wisdom and virtue."

Other French writers have given instructious respecting the expression of the passions, equally exceptionable with those of Le Brun. All of them whom we have consulted make so many divisions and subdivisions of passions, that a philosopher cannot follow them in metaphysical theory, nor a painter exhibit their effects upon canvass. Nature therefore must be his guide particularly in treating those very minute and almost imperceptible differences, by which, however, things very different from each other are often expressed. This is particularly the case with regard to the passions of laughing and crying; as in these, however contrary, the muscles of the face operate nearly in the same manner. As the famous Pietro de Cortona was one day finishing the face of a crying child in a representation of the Iron Age, with which he was adorning the floor called the *Hot-bath* in the royal palace of Pitti, Ferdinand II. who happened to be looking over him for his amusement, could not forbear expressing his approbation, by crying out, "Oh how well that child cries!" To whom the artist,—"Has your majesty a mind to see how easy it is to make children laugh? Behold, I'll prove it in an instant:" And taking up his pencil, by giving the contour of the mouth a concave turn downwards, instead of the convex upwards which it before had, and with little or no alteration in any other part of the face, he made the child, who a little before seemed ready to burst its heart with crying, appear in equal danger of bursting its sides with immoderate laughter; and then by restoring the altered features to their former position, he soon set the child a-crying again.

Lectures of  
Philip Bal-  
dinucci in  
the Aca-  
demy of La  
Crucca il  
Lustrato,  
&c.

The different expressions of laughter and weeping are thus described by Le Brun. "The movements of laughter are expressed by the eye-brows elevated to-

wards the middle of the eye, and lowered towards the sides of the nose; the eyes almost shut, appear sometimes moistened with tears: the mouth a little open, allows the teeth to be seen: the extremities of the mouth drawn back, make a dimple in the cheeks, which appear to be swelled; the nostrils are open: and the face becomes red. The changes which weeping occasions are equally visible. The eye-brow is lowered on the middle of the forehead; the eyes are almost shut, moistened and lowered toward the sides of the cheeks: the nostrils are swelled, and the veins of the forehead very apparent: the mouth shut, by the lowness of its sides, occasions wrinkles in the cheeks; the under lip is turned down, and presses at the same time the upper lip: the whole countenance is wrinkled and becomes red; especially the eye-brows, the eyes, the nose, and the cheeks."

According to Leonardo da Vinci, the best masters that a painter can have recourse to in this branch are those dumb men who have found out the method of expressing their sentiments by the motion of their hands, eyes, eye-brows, and in short every part of the body. If this advice be at all proper, such gestures must be imitated with great sobriety and moderation, lest they should appear too strong and exaggerated; and the piece should show nothing but pantomimes, when speaking figures alone are to be exhibited; and so become theatrical and second-hand, or at best, look like the copy of a theatrical and second hand nature.

The artist will reap greater benefit from studying such fine ancient heads as those of Mithridates, Seneca, Alexander dying, Cleopatra, Niobe, &c. and above all, from attentively observing such movements of nature as we daily meet with in the world. But let him chiefly consult his looking glass, and study after his own face, what, in certain expressions, are the muscles, the lineaments, the tints, and the accidental circumstances which characterise the situation of the soul. It rarely happens that a model, which is affected with no sentiment, presents that to us which we ourselves feel, and which we are capable of expressing when we are our own model. Puget executed the legs of his Milo after his own; and many ingenious artists have had recourse to a similar expedient. In short to be affected ourselves is the true secret of affecting the spectator.

We must not neglect, at the same time, to secure the fleeting characters which nature presents to us on a thousand occasions. We must distrust our memory, and all the resources which are not easily employed when we happen to stand in need of them. It is necessary to watch the circumstances from which we can derive any useful hint: to seize them when they present themselves; and to be careful never to lose, by an irreparable negligence, the fruit of a happy incident.

Let us also endeavour to possess the feeling of what we are to express; whether it be by forming the image of a thing absent as if it were present, or by being affected with the lively idea of a situation which we have either experienced, or with which we have seen another person remarkably affected. We must never forget, that all the terrible or agreeable, the violent or slight movements, are to be treated in a natural manner, and bear a relation to the age, condi-

Expression  
of the  
Passions.

Expression  
of the  
Passions.

tion, sex, and dignity of the person. Those gradations, which art varies according to the nature of the situation, and the character of men, compose the principal ingredients of discernment, knowledge, and taste. They have been the objects of attention and inquiry to the most eminent painters of every age; and they were of the last importance in assisting them to arrive at that degree of excellence to which they have carried expression.

We are told strange things of the ancient painters of Greece in regard to expression: especially of Aristides; who in a picture of his, representing a woman wounded to death at a siege, with a child crawling to her breast, makes her appear afraid, lest the child, when she was dead, should, for want of milk, suck her blood. *A Medea murdering her children*, by Timomachus, was likewise much cried up, as the ingenious artist contrived to express, at once, in her countenance, both the fury that hurried her on to the commission of so great a crime, and the tenderness of a mother that seemed to withhold her from it. Rubens attempted to express such a double effect in the face of Mary of Medicis, still in pain from her past labour, and at the same time full of joy at the birth of a Dauphin. And in the countenance of Sancta Polonia, painted by Tiepolo for St Anthony's church at Padua, one may clearly read a mixture of pain from the wound given her by the executioner, and of pleasure from the prospect of paradise opened to her by it.

Few, to say the truth, are the examples of strong expression afforded by the Venetian, Flemish, or Lombard schools. Deprived of that great happiness, the happiness of being able to contemplate, at leisure, the works of the ancients, the purest sources of perfection in point of design, expression, and character; and having nothing but nature constantly before their eyes; they made strength of colouring, blooming complexions, and the grand effects of the chiaro-scuro, their principal study, they aimed more at charming the senses than at captivating the understanding. The Venetians, in particular, seem to have placed their whole glory in setting off their pieces with all that rich variety of personages and dresses, which their capital is continually receiving by means of its extensive commerce, and which attracts so much the eyes of all those who visit it. It is much to be doubted, if in all the pictures of Paolo Veronese, there is to be found a bold and judicious expression, or one of those attitudes which, as Petrarch expresses it, speak without words; unless, perhaps, it be that remarkable one in his *Marriage Feast of Cana of Galilee*. At one end of the table, and directly opposite to the bridegroom, whose eyes are fixed upon her, there appears a woman in red, holding up to him the skirt of her garment; as much as to say, we may suppose that the wine miraculously produced was exactly of the colour of the stuff on her back. And in fact it is red wine we see in the cups and pitchers. But all this while the faces and attitudes of most of the company betray not the least sign of wonder at so extraordinary a miracle. They all, in a manner, appear intent upon nothing but eating, drinking, and making merry. Such in general, is the style of the Venetian school. The Florentine, over which Michael Angelo presided, above all things curious of design, was most minutely and scrupulously ex-

of the  
Passions.

act in point of anatomy. On this she set her heart, and took singular pleasure in displaying it. Not only elegance of form and nobleness of invention, but likewise strength of expression, triumph in the Roman school, nursed as it were amongst the works of the Greeks, and in the bosom of a city which had once been the seminary of learning and politeness. Here it was that Domenichino and Poussin, both great masters of expression, refined themselves, as appears more particularly by the *St Jerome* of the one, and the *death of Germanicus*, and the *Slaugher of the Innocents*, by the other. Here it was that Raphael arose, the sovereign master of them all. One would imagine, that pictures, which are generally considered as the books of the ignorant, and of the ignorant only, he had undertaken to make the instructors even of the learned. One would imagine, that he intended, in some measure, to justify Quintilian\*, who affirms that painting has more power over us than all the arts of rhetoric. There is not, indeed a single picture of Raphael's, from the study of which those who are curious, in point of expression may not reap great benefit; particularly his *Martyrdom of St Felicitas*, his *Transfigurations*, his *Joseph explaining to Pharaoh his dream*, a piece so highly rated by Poussin. His *School of Athens*, in the Vatican, is, to all intents and purposes, a school of expression. Among the many miracles of art with which this piece abounds, we shall single out that of the four boys attending on a mathematician, who stooping to the ground with his compasses in his hand, is giving them the demonstration of a theorem. One of the boys, recollecting within himself, keeps back, with all the appearance of profound attention to the reasoning of the master; another, by the briskness of his attitude, discovers a greater quickness of apprehension; while the third, who has already seized the conclusion, is endeavouring to beat it into the fourth, who standing motionless, with open arms, a staring countenance, and an unspeakable air of stupidity in his looks, will never perhaps be able to make any thing of the matter. And it is probably from this new group that Albani, who studied Raphael so closely, drew the following precept of his: "That it behoves a painter to express more circumstances than one by every attitude; and so to employ his figures, that, by barely seeing what they are actually about, one may be able to guess, both what they have been already doing, and are next going to do." This is indeed a difficult precept; but it is only by a due observance of it that the eye and the mind can be made to hang in suspense on a painted piece of canvass. It is expression that a painter, ambitious to soar in his profession, must, above all things, labour to perfect himself in. It is the last goal of his art, as Xenoph. Socrates proves to Parrhasius. It is in expression that dumb poetry consists, and what the prince of our poets calls a visible language. lib. iii.

#### SECT. IX. Of Invention.

As the operations of a general should all ultimately tend to battle and conquest, so should all the thoughts of a painter to perfect invention. Now, the studies which we have been hitherto recommending, will prove so many wings by which he may raise himself, as it were, from the ground, and soar on high, when

\* Instit. lib. xi. cap. 3.

Xenoph. Memorab. lib. iii.

Invention

when desirous of trying his strength this way, and producing something from his own fund. Invention is the finding out probable things, not only such as are adapted to the subject in hand, but such, besides, as by their sublimity and beauty are most capable of exciting suitable sentiments in the spectator, and of making him, when they happen to be well executed, fancy that it is the subject itself in its greatest perfection, and not a mere representation of it, that he has before him. We do not say true things, but probable things; because probability or verisimilitude is, in fact, the truth of those arts which have the fancy for their object. It is, indeed, the business and duty of both naturalists and historians to draw objects as they find them, and represent them with all those imperfections and blemishes, to which as individuals, they are subject. But an ideal painter, and such alone is a true painter, resembles the poet: instead of copying, he imitates; that is, he works with his fancy, and represents objects endowed with all that perfection which belongs to the species, and may be conceived in the archetype.

“’Tis nature all, but nature methodis’d;”

says an eminent poet, speaking of poetry: And the same may be said of painting: it is nature methodized, and made perfect. Inasmuch, that the circumstances of the action, exalted and sublimed to the highest degree of beauty and boldness they are susceptible of, may, though possible, have never happened exactly such as the painter fancies and thinks proper to represent them. Thus, the piety of Æneas, and the anger of Achilles, are things so perfect in their kind, as to be merely probable. And it is for this reason that poetry, which is only another word for invention, is more philosophical, more instructive, and more entertaining, than history.

Here it is proper to observe, what great advantages the ancient had over the modern painters. The history of the times they lived in, fraught with great and glorious events, was to them a rich mine of the most noble subjects, which besides often derived no small sublimity and pathos from the mythology upon which their religion was founded. So far were their gods from being immaterial, and placed at an infinite distance above their worshippers; so far was their religion from recommending humility, penance, and self-denial, that, on the contrary, it appeared calculated merely to flatter the senses, inflame the passions, and poison the fancy. By making the gods partake of our nature, and subjecting them to the same passions, it gave man hopes of being able to mix with those who though greatly above him, resembled him, notwithstanding in so many respects. Besides, those deities of theirs were in a manner visible, and to be met at every step. The sea was crowded with Tritons and Nereids, the rivers with Naiads, and the mountains with Dryads. The woods swarmed with Fauns and Nymphs, who, in these obscure retreats sought an asylum for their stolen embraces. The most potent empires, the most noble families, the most celebrated heroes, all derived their pedigree from the greater divinities. Nay gods interested themselves in all the concerns of mankind. Apollo, the god of long arrows, stood by the side of Hector in the fields of Troy, and inspired him with new strength and courage to batter

down the walls and burn the ships of the Greeks. These, on the other hand, were led on to the fight and animated by Minerva, preceded by Terror, and followed by Death. Jove nods, his divine locks shake on his immortal head; Olympus trembles. With that countenance, which allays the tempest, and restores serenity to the heavens, he gathers kisses from the mouth of Venus, the delight of gods and of men. Among the ancients, every thing spiced with the fancy; and in those works which depends entirely on the imagination, some of our greatest masters have thought they could not do better than borrow from the Pagan, if we may be allowed to say it, their pictures of Tartarus in order to render their own drawings of hell more striking.

After all, there have not been wanting able inventors in painting among the moderns. Michael Angelo, notwithstanding the depth and boldness of his own fancy, is not ashamed, in some of his compositions, to *Dantize*; as Phidias and Apelles may be said formerly to have *Homerized*. Raphael, too, tutored by the Greeks, has found means, like Virgil, to extract the quintessence of truth; has seasoned his works with grace and nobleness, and exalted nature, in a manner above herself, by giving her an aspect more beautiful, more animating, and more sublime, than she is in reality accustomed to wear. In point of invention, Domenichino and Hannibal Carracci come very near Raphael, especially in the pieces painted by them in Rome; nor does Poussin fall very short of him in some of his pictures, particularly in his *Esper before Abasuerus*, and his *Death of Germanicus*, the richest jewel belonging to the Barberine family. Of all the painters who have acquired any extraordinary degree of reputation, no one studied less to set off his pieces by bold and beautiful circumstances, or was more a stranger to what is called *poetical perfection*, than Jacopo Bassano. Among the numberless instances we could produce of his carelessness this way, let it suffice to mention a *Preaching of St Paul*, painted by him in a place, near that of his birth, called *Marostega*. Instead of representing the apostle full of a divine enthusiasm, as Raphael has done, and thundering against the superstitions of the heathen in an assembly of Athenians; instead of exhibiting one of his auditors struck to the quick, another persuaded, a third inflamed; he makes him hold forth, in a village of the Venetian state, to a parcel of poor peasants and their wives, who take not the least notice of him; the women especially, who seem to mind nothing but the country labours, in which he had found them employed.

With regard to invention, painting and poetry resemble each other so much in many other respects, besides that of combining in every action all the beauty and elegance it will admit, that they well deserve the name of *sister arts*. They differ, however in one point, and that too of no small importance. It is this, The poet, in the representation of his story, relates what has already happened, prepares that which is still to come, and so proceeds, step by step, through all the circumstances of the action; and, to produce the greater effect on his hearers, avails himself of the succession of time and place. The painter, on the contrary, deprived of such helps, must be content to de-

pend

pend upon one single moment. But what a moment! A moment, in which he may conjure up, at once, to the eyes of the spectator, a thousand objects; a moment, teeming with the most beautiful circumstances that can attend the action; a moment, equivalent to the successive labours of the poet. This the works of the greatest masters, which are everywhere to be seen, sufficiently evince; among others, the *St Paul at Lystra*, by Raphael, whom it is impossible not to praise as often as this picture is mentioned. In order to give the spectator a thorough insight into the subject of this piece, the painter has placed, in the front of it, the cripple already restored to his limbs by the apostle, fired with gratitude towards his benefactor, and exciting his countrymen to yield him all kinds of honour. Round the cripple are some figures lifting up the skirts of his coat, in order to look at the legs reduced to their proper shape, and acknowledging by gesture full of astonishment the reality of the miracle; an invention, says a certain author, a professed admirer of antiquity, which might have been proposed as an example in the happiest age of Greece.

Webb, dial.  
f.

We have another shining instance of the power of painting to introduce a great variety of objects on the scene at the same time, and the advantage it has in this respect over poetry, in drawing by the celebrated La Fage. This drawing represents the descent of Æneas into hell. The field is the dark caverns of Pluto's kingdom, through the middle of which creeps slowly the muddy and melancholy Acheron. Nearly in the centre of the piece appears Æneas with the golden bough in his hand, and with an air of astonishment at what he sees. The Sybil, who accompanies him, is answering the questions which he asks her. The personage there is the ferryman of the pitchy lake, by which even the gods themselves are afraid to swear. Those who, crowding in to the banks of the river, numberless as the leaves shaken off the trees by autumnal blasts, express, with outstretched hands, an impatience to be ferried to the opposite shore, are the unhappy manes, who for want of burial, are unqualified for that happiness. Charon, accordingly, is crying out to them, and with his lifted up oar driving them from his boat; which has already taken in a number of those who had been honoured with the accustomed funeral rites. Behind Æneas and the Sybil we discover a confused group of wretched souls, lamenting bitterly their misfortune in being denied a passage; two of them wrapped up in their clothes, and, in a fit of despair, sunk upon a rock. Upon the first lines of the piece stands a third group of uninbumed shades, Landscapes, Orontes, and, in the midst of them, the good old Palinurus, formerly master and pilot of the hero's own vessel, who with joined hands most earnestly desires to be taken along with him into the boat, that, after death, at least, he may find some repose, and his dead body no longer remain the sport of winds and waves. Thus, what we see scattered up and down in many verses by Virgil, is here, as it were, gathered into a focus, and concentrated by the ingenious pencil of the painter, so as to form a subject well worthy of being exposed, in more shapes than one, to the eyes of the public.

When a painter takes a subject in hand, be it historical be it fabulous, he should carefully peruse the

books which treat of it, imprint well on his mind all the circumstances that attend it, the persons concerned in it, and the passions with which they must have been feverally animated; not omitting the particulars of time and place. His next business is to create it, as it were, anew, observing the rules already laid down for that purpose. From what is true, choosing that which is most striking; and clothing his subject with such accessory circumstances and actions, as may render it more conspicuous, pathetic and noble, and best display the powers of the inventive faculty. But, in doing this, great discretion is requisite; for, let his imagination grow ever so warm, his hand is never to execute any thing that is not fully approved by his judgment. Nothing low or vulgar should appear in a lofty and noble argument; a fault, of which some of the greatest masters, even Lampieri and Poussin, have been now and then guilty.

The action must be one, the place one, the time one. We need not say any thing of these painters, who like the writers of the Chinese and Spanish theatre, cram a variety of actions together, and so give us, at once, the whole life of a man. Such blunders, it is presumed, are too gross to be feared at present. The politeness and learning of the age seem to demand considerations of a more refined nature; such as, that the episodes introduced in the drama of a picture, the better to fill and adorn it, should be not only beautiful in themselves, but indispensably requisite. The games celebrated at the tomb of Anchises, in Sicily, have a greater variety in them, and more sources of delight, than those that had been before celebrated at the tomb of Patroclus under the walls of Troy. The arms forged by Vulcan for Æneas, if not better tempered, are at least better engraved, than those which the same god had forged several ages before for Achilles. Nevertheless, in the eyes of judges, both the games and the arms of Homer are more pleasing than those of Virgil, because the former are more necessary in the Iliad than the latter in the Æneid. Every part should agree with, and have a relation to, the whole. Unity should reign even in variety; for in this beauty consists. This is a fundamental maxim in all the arts whose object it is to imitate the works of nature.

Pictures often borrow no small grace and beauty from the fictions of poetry. Albani has left us, in several of his works, sufficient proofs of the great share the belles lettres had in refining his taste. But Raphael, above all others, may in this branch too be considered as a guide and master. To give but one instance out of many; what a beautiful thought was it to represent the river himself, in a *Passage of Jordan*, supporting his waters with his own hands, in order to open a way to the army of the Israelites! Nor has he displayed less judgment in reviving, in his designs engraved by Agostino of Venice, the little loves of Æ-

Among the ancients, Apelles and Parhastus were those who distinguished themselves most in allegorical subjects, in which the inventive faculty shows itself to the greatest advantage: the first by his picture of *Calumny*\*, the second by that of the *Genius of the Athenians*†. The ancient painter called *Galaton* gave

\* See Lucian upon Calumny; and Carlo Dati, in the Life of Apelles, note 20.  
† C. Plinii Nat. Hist. lib. xxxv. likewise c. 10.

**Invention.** likewise a fine proof of his genius in this branch, by representing a great number of poets greedily quenching their thirst in the waters gushing from the mouth of the sublime Homer. And to this allegory, according to Guigni, Pliny \* has an eye, when he calls that prince of poets the *fountain of evils*. But it is, after all, no way surprising that we should often meet such fine flights of fancy in the ancient artists. They were not guided in their works by a blind practice: they were men of polite education; conversant with the letters of the age in which they lived; and the companions, rather than the servants, of the great men who employed them. The finest allegorical painter among the moderns was Rubens; and he was accordingly much celebrated for it. The best critics, however, find fault with his uniting in the Luxemburg gallery, the queen mother, in council, with two cardinals and Mercury. Nor is there less impropriety in his making Tritons and Nereids, in another piece of the same gallery, swim to the queen's vessel through the galleys of the knights of St Stephen. Such freedoms are equally disgusting with the prophecies of Sannazaro's Proteus, concerning the mystery of the incarnation, or the Indian kings of Camoens, reasoning with the Portuguese on the adventures of Ulysses.

The best modern performances in picturesque allegory are certainly those of Poussin; who availed himself, with great discretion and judgment, of the vast treasures with which, by a close study of the ancients, he had enriched his memory. On the other hand, Le Brun, his countryman, has been very unhappy this way. Ambitious to have every thing his own, instead of allegories, he has filled the gallery of Versailles with enigmas and riddles, of which none but himself was qualified to be the Œdipus. Allegory must be ingenious, it is true; but then it must be equally perspicuous; for which reason, a painter should avoid all vague and indeterminate allusions, and likewise those to history and heathen mythology, which are too abstruse to be understood by the generality of spectators. The best way, perhaps, to symbolize moral and abstract things, is to represent particular events: as Caracci did, by advice of Monsignore Agucchi, in the Farnesian palace. For example, what can better express a hero's love towards his country, than the virtuous Decius consecrating himself boldly to the infernal gods, in order to secure victory to his countrymen over their enemies? What finer emblems can we desire of emulation, and an insatiable thirst for glory, than Julius Cæsar weeping before the statue of Alexander in the temple of Hercules at Gades? of the inconstancy of fortune, than Marius sitting on the ruins of Carthage, and receiving, instead of the acclamations of an army joyfully saluting him imperator, orders from a licitor of Sextilius to quit Africa; of indiscretion, than Candaules, who, by showing the naked beauties of his wife to his friend Giges, kindled a passion that soon made him repent his folly? Such representations as these require no comment; they carry their explanation along with them. Besides, supposing, and it is the worst we can suppose, that the painter's aim in them should happen not to be understood, his piece would still give delight. It is thus that the fables of Ariosto prove so entertaining, even to those who understand nothing of the moral

couched under them; and likewise the *Æneids*, though all do not comprehend the allusions and double intent of the poet.

#### SECT. X. Of Disposition.

So much for invention. *Disposition*, which may be considered as a branch of invention, consists in the proper stationing of what the inventive faculty has imagined, so as to express the subject in the most lively manner. The chief merit of disposition may be said to consist in that disorder, which, wearing the appearance of mere chance, is in fact the most studied effect of art. A painter, therefore, is equally to avoid the dryness of those ancients who always planted their figures like so many couples in a procession, and the affectation of those moderns who jumble them together as if they were met merely to fight and squabble. In this branch Raphael was happy enough to choose the just medium, and attain perfection. The disposition of his figures is always exactly such as the subject requires. In the *Battle of Constantine*, they are confusedly clustered with as much art, as they are regularly marshalled in *Christ's commitment of the keys to St Peter* and constituting him prince of the apostles.

Let the inferior figures of a piece be placed as they will, the principal figure should strike the eye most, and stand out, as it were, from among the rest. This may be effected various ways, as by placing it on the foremost lines, or in some other conspicuous part of the piece; by exhibiting it, in a manner, by itself; by making the principal light fall upon it; by giving it the most resplendent drapery: or, indeed, by several of these methods, nay, by all of them together. For, being the hero of the picturesque fable, it is but just that it should draw the eye to itself, and lord it, as it were, over all the other objects.

According to Leon Batista Alberti, painters should follow the example of comic writers, who compose their fable of as few persons as possible. For, in fact, a crowded picture is apt to give as much pain to the spectator, as a crowded road to the traveller.

Some subjects, it must be granted, require a number, nay, a nation, as it were, of figures. On these occasions, it depends entirely on the skill of the painter to dispose of them in such a manner, that the principal ones may always make the principal appearance, and contrive matters so, that the piece be not overcrowded, or want convenient rests and pauses. He must, in a word, take care that his piece be full, but not charged. In this respect, the *Battles of Alexander* by Le Brun are master-pieces which can never be sufficiently studied; whereas nothing, on the other hand, can be more unhappy than the famous *Paradise* of Tintoret, which covers one entire side of the great council chamber at Venice. It appears no better than a confused heap of figures, a swarm, a cloud, a chaos, which pains and fatigues the eye. What a pity it is that he did not dispose the subject after a model of his own, now in the gallery of Bevilacqua at Verona! In this last, the several choirs of myrtirs, virgins, bishops, and other saints, are judiciously thrown into so many clusters, parted here and there by a fine fleece of clouds: so as to exhibit the innumerable host of hea-

See Bellori's Life of Carracci.

Disposition ven drawn up in a way that makes a most agreeable and glorious appearance. There goes a story, to our purpose, of a celebrated master, who in a drawing of the Universal Deluge, the better to express the immensity of the waters that covered the earth, left a corner of his paper without figures. Being asked, if he did not intend to fill it up: No, said he: do not you see that my leaving it empty is what precisely constitutes the picture?

The reason for breaking a composition into several groups is, that the eye, passing freely from one object to another may the better comprehend the whole. But the painter is not to stop here; for these groups are besides, to be so artfully put together, as to form rich clusters, give the whole composition a singular air of grandeur, and afford the spectator an opportunity of discerning the piece at a distance, and taking the whole in, as it were, at a single glance. These effects are greatly promoted by a due regard to the nature of colours, so as not to place together those which are apt to pain by their opposition, or distract by their variety. They should be so judiciously disposed as to temper and qualify each other.

A proper use of the *chiaro-scuro* is likewise of great service on this occasion. The groups are easily parted, and the whole picture acquires a grand effect, by introducing some strong falls of shade, and, above all, one principal beam of light. This method has been followed with great success by Rembrandt in a famous picture of his, representing the Virgin at the foot of the cross on Mount Calvary; the principal light darting upon her through a break of the clouds, while the rest of the figures about her stand more or less in the shade. Tintoret, too, acquired great reputation, as well by that briskness with which he enlivened his figures as by his masterly manner of shading them; and Poliodro de Carravagio, though he scarce painted any thing but basso-relievos, was particularly famous for introducing with great skill the effects of the *chiaro-scuro*, a thing first attempted by Mantegna in his *Triumph of Julius Caesar*. It is by this means that his compositions appear so strikingly divided into different groups, and, among their other perfections, afford so much delight through the beautiful disposition that reigns in them.

In like manner, a painter by the help of perspective, especially that called *aerial*, the opposition of local colours, and other contrivances which he may expect to hit upon by studying nature, and those who have best studied her before him, will be able not only to part his groups, but make them appear at different distances, so as to leave sufficient passages between them.

But the greatest caution is to be used in the pursuit of the methods here laid down: especially in the management of the *chiaro-scuro*, that the effects, attributed to light and shade and to their various concomitants, may not run counter to truth and experience. This is a capital point. For this purpose, a painter would do well to make, in little figures, as Tintoret and Poussin used to do, a model of the subject that he intends to represent, and then illuminate it by lamp or candle light. By this means he may come to know with certainty, if the *chiaro-scuro*, which he has formed in his mind, does not clash with the reason of things.

By varying the height and direction of his light, he may easily discover such accidental effects as are most likely to recommend his performance, and so establish a proper system for the illuminating it. Nor will he afterwards find it a difficult matter to modify the quality of his shades, by softening or strengthening them, according to the situation of his scene, and the quality of the light falling upon it. If it should happen to be a candle or lamp light scene, he would then have nothing to do but consider his model well, and faithfully copy it.

In the next place, to turn a group elegantly, the best pattern is that of a bunch of grapes adopted by Titian. As, of the many grains that compose a bunch of grapes, some are struck directly by the light and those opposite to them are in the shade, whilst the intermediate ones partake of both light and shade in a greater or less degree; so, according to Titian, the figures of a group should be so disposed, that by the union of the *chiaro-scuro*, several things may appear as it were but one thing. And in fact it is only from his having pursued this method, that we can account for the very grand effect of his pieces this way, in which it is impossible to study him too much.

The mannerists, who do not follow nature in the track of the masters just mentioned, are apt to commit many faults. The reason of their figures casting their shades in this or that manner seldom appears in the picture, or at least does not appear sufficiently probable. They are, besides, wont to trespass all bounds in splashing their pieces with light, that is, in enlivening those parts which we usually term the deafts of a picture. This method, no doubt, has sometimes a very fine effect; but it is, however, to be used with no small discretion, as otherwise the whole loses that union, that pause, that majestic silence, as Carracci used to call it, which affords so much pleasure. The eye is not less hurt by many lights scattered here and there over a picture, than the ear is by the confused noise of different persons speaking all together in an assembly.

Guido Reni, who has imparted to his paintings that gaiety and splendor in which he lived, seems enamoured with a bright and open light; whereas Michael Angelo da Caravagio, who was of a sullen and savage disposition, appears fond of a gloomy and clouded sky; so that neither of them were qualified to handle indifferently all objects. The *chiaro scuro* may likewise prove of great service to a painter in giving his composition a grand effect; but, nevertheless, the light he chooses must be adapted to the situation of the scene where the action is laid: nor would he be less faulty, who in a grotto or cavern, where the light entered by a chink, should make his shades soft and tender, than he who should represent them strong and bold in an open sky-light.

But this is by no means the only fault which mannerists are apt to be guilty of in historical pieces, and particularly in the disposition of their figures. To say nothing of their favourite group of a woman lying on the ground with one child at her breast, and another playing about her, and the like, which they generally place on the first lines of their pieces; nor of those half-figures in the back ground peeping out from the hollows contrived for them: they make a common practice

Disposition

Hogarth's  
Analysis of  
Beauty.

tice

**Disposition.** tice of mixing naked with clothed figures; old men with young; placing one figure with its face towards you and another with its back; they contrast violent motions with languid attitudes, and seem to aim at opposition in every thing! whereas oppositions never please but when they arise naturally from the subject, like antitheses in a discourse.

As to foreshortened figures, too much affectation in using or avoiding them is equally blameable. The attitudes had better be composed than otherwise. It very seldom happens that there is any occasion for making them so impetuous as to be in danger of losing their equilibrium; a thing too much practised by some painters.

In regard to drapery, equal care should be taken to avoid that poverty, which makes some masters look as if through mere penury, they grudged clothes to their figures; and that profusion which Albani imputed to Guido, saying, that he was rather a tailor than a painter. The ornaments of dress should be used with great sobriety; and it will not be amiss to remember what was once said to an ancient painter; "I pity you greatly; unable to make Helen handsome, you have taken care to make her fine."

Let the whole, in a word, and all the different parts of the disposition, possess probability, grace, costume, and the particular character of what is to be represented. Let nothing look like uniformity of manner; which does not appear less in the composition than it does in colouring, drapery and design; and is, as it were, that kind of accent, by which painters may be as readily distinguished as foreigners are, by pronouncing in the same manner all the different languages they happen to be acquainted with.

#### SECT. XI. *Of Illusion.*

AMONG painters, and the writers on painting, there is one maxim universally admitted and continually inculcated: it is, that *nature ought to be imitated*, and objects are said to be represented naturally, when they have such relief that they may seem real. If we inquire to what degree painting may carry this illusion, we shall find that it deceives the eye, and obliges the spectator to employ the touch in mouldings and in basso-relievos where they are a little projected; but that it is weakened and the effect partly destroyed where the projection is one or two feet. It is possible also to make it in the highest degree complete in pictures of flowers, fruits, and other representations of still life, provided they be seen in a certain point of view, and at a considerable distance; but there is no example of a picture containing a number of figures, and placed in a proper light, being mistaken for real life. We are told, indeed, of a bust of an abbé painted by Charles Coypel, which, placed in a certain direction behind a table, and in a certain light, deceived several persons so completely as to induce them to salute it; but without admitting any thing very extraordinary in the projection or illusion of this painting, it is evident, from the circumstances attending the relation, that the deception arose from surprise and inattention, which might happen to a production of an inferior artist. And hence we may conclude, that it is vain to pretend to perfect the illusion, especially in pic-

tures consisting of a number of figures, and with considerable distances supposed between them.

Among the obstacles which are opposed to the perfection of this branch of the art, we shall chiefly attend to this which naturally proceeds from our habits of thinking and judging on all occasions. These, together with the experience we daily have of light on all kinds of surfaces, and of all colours, are sufficient to demonstrate the want of reality in the mere representation of any scenes.

It has been elsewhere shown, that distance, figure, and magnitude, are not naturally objects of perception by the sense of sight; that we judge of these things by the eye only, in consequence of associations early formed between the perceptions of touch and the corresponding impressions on the retina and optic nerve by the rays of light; and that a painter makes his picture resemble the original, merely by laying his colours on a plain surface in such a manner, as that they reflect the same rays of light with the convex or concave original, when the spectator stands at the proper distance (see METAPHYSICS, n<sup>o</sup> 49, 50, 51, 52, and 95). But if this be admitted, illusion in painting can never be made perfect, on account of the inevitable falsity of the shades which mark the most distant parts of the picture. The painter can only imitate those shades by obscure colours, laid on a plane surface, and susceptible of reflecting the light with a degree of force relative to the real distance. Now our eyes give us the true plane of this surface, opposed to the idea of deepening which the painter wishes to produce, a contrariety which prevents the deception. On this account, the faults found in the works of the greatest masters, with regard to the effects produced by the whole, most frequently relate to their manner of shading, which is sufficient to prove, that the want of illusion in painting depends chiefly on the imperfection of the shades.

The defect, though it cannot be wholly avoided, may yet be rendered less perceptible. There has yet indeed, been no painter able to imitate shadow, nor is it probable that any one will ever perfectly accomplish this task. Shadow in nature is not a body, but the privation of light, which destroys colours in a greater or less degree, in proportion as it is more or less complete. Now the painter can only imitate this privation and real darkness, by colours which must from their very nature be capable of reflecting light—The colours may be more or less obscure, but they preserve always something which gives a mixture of reflection. To carry the imitation of the shadow to the highest degree of perfection, it would be necessary to apply a colour capable of darkening all others more or less as there should be occasion, and which might have no visible trace of its existence, that is, no one part of it which reflected one coloured ray more strongly than another. Perhaps this kind of negative colour might be found in practice to be of service to the art; but it would not render the surface totally invisible, for it would be necessary, further, that it should have the property of not reflecting a single ray of light when exposed to it, which is altogether impossible, as there is no colour or body in nature without reflection in such a situation.

We shall be further convinced of the impossibility

*Illusion.* of painting shadow, if we attend to the pictures of the greatest masters, with regard to the imitation of truth. Every part, when taken by itself, connected with light, or with demitints, presents a perfect imitation. Even the different degrees of light or the objects are sufficiently exact; but notwithstanding this assemblage of circumstances corresponding with truth, and of which the result should be perfect *illusion*, yet in considering the whole, we are never so completely deceived, as to take a picture for a reality; from which we may conclude, that the want of illusion proceeds almost entirely from the imperfection of shading.

Illusion in the strictest sense, cannot exist in painting; but there is another kind of illusion, perhaps improperly so called, which is one of the principal parts of the art, and worthy of the greatest attention: It is, that the picture shall resemble truth to such a degree by the justness of its forms, by the combination of colours, and by all its general effects, that the image shall give all the pleasure to be expected from the imitation of truth. This is not illusion in the proper sense of the word, since it exists as well in pictures on a small scale as in those of equal dimensions with the original; but it is that truth of imitation of which painting is susceptible, even in pictures containing any number of figures at any reasonable distance from each other.

But it remains to be considered whether this imitation of truth, taken by itself, be the highest attainable perfection in painting. It is generally granted, that the greatest beauty is that which not only pleases at first view, but on the nearest and most critical examination. But if illusion, such as we have described it, were the sole merit of the art, it would follow, that the person who was least acquainted with its beauties would experience the same pleasure as he who had studied them most. Farther, in examining the works of the greatest masters, it is easy to perceive, that it is not their illusion which has excited the attention and admiration of the critic. Even the works of the divine Raphael do not deceive the eye in any point of view more completely than those of an ordinary painter. Raphael, pure in his character and design, is, without doubt, very deficient in this part of the art. Meanwhile the grandeur of his ideas in composition, and the choice of his forms: the beauty of his heads, wherein one does not admire simply the imitation of any known truth; his ingenious and noble manner in drapery, which yet does not resemble any known stuff, or the garb of any nation; in short, all his beauties are superior to the simple imitation of truth, and contrast the sentiment of the greatest pleasure arising from illusion.

If we pass to those who have pursued colouring with the greatest success, we shall find them, doubtless, approach nearer to illusion than those who have neglected it; and it is also a fact, that their works have been more universally admired.

At the same time it is not the illusion occasioned by colours which has altogether excited this admiration. The exquisite demitints and the freshness of Corregio and Titian, which excel the ordinary beauties of nature, and even imitate her most perfect productions, may perhaps not be considered as destroying illusion;

but it is no less a fact, that weaker and less precious colouring would carry it to greater perfection. Besides this large, easy, and exquisite manner of painting, this harmony, of which they have given us the best examples, are owing to qualities in them much more excellent than what would be sufficient to produce the simple imitation of truth. Guido, Cortona, and some others, appear to approach nearer to illusion. But even those masters prove by their works, that the most estimable beauties in painting do not all tend to this branch of the art; for notwithstanding the high character which they have gained, they are much inferior to Raphael, Corregio, and Titian, although the first failed in colouring and in the knowledge of the *claro obscuro*, the second in point of correctness, and the third in the choice of noble subjects.

From this we may conclude, that the nearest resemblance to truth is not the sole object in painting; that it acquires a superior degree of elevation by the art of adding beauty and perfection to the most exact resemblance; and that it is this art which distinguishes and characterizes extraordinary men.

If we run over the great branches of painting, we shall find a number of essential beauties different from those which are capable of carrying illusion to the greatest possible height. In composition, we principally admire the extent of genius, the choice of picturesque and graceful attitudes, the ingenious combination of groups, whether in uniting the light and shade in order to obtain the greatest effect, or in disposing a whole in such a manner as to make no part superfluous; and finally, that kind of practical talent by which the mind takes possession of nature, and forces it to produce all the beauties of which the art is susceptible. In this enumeration of particulars it is easy to perceive that the beauties of composition are very distant from those of illusion.

To obtain illusion in design, there is no occasion for correctness nor taste beyond what is perceived in nature by the most ignorant spectator. And with regard to colouring, that is not always most admired which is most natural. What departs widely from truth, indeed, is not of consequence beautiful, but many qualities are required besides the simple imitation of truth. Freshness, ease, and transparency in certain tones, are deemed absolutely requisite; and the most esteemed colourists have carried their beauties in all these respects beyond what they have seen in nature. If some tones in the fleshy parts have approached towards vermilion, to a light blue, or a silver grey, they have made them more apparent, not only to point them out to the spectator, but to show their knowledge in the discovery and their art in painting them. This would have been going beyond the limits of perfection, if these had consisted in simple illusion.

The opposition of colour, of light and of shade, would have been in this case also superfluous; for nature is always true, without any pointed attempt to make her more engaging. The suppression of certain lights, which truth would require, and which art extinguishes, in order to augment the harmony of effect, would be also worthy of censure, whatever pleasure would result from it.

Finally,

*Illusion.*

Illusion.

Finally, one of the greatest beauties of the art, namely, the peculiar manner of a great master, has no relation to illusion. This is not even founded in nature, but depends on the genius or singularity of the artist. It is this manner which distinguishes the original of a great master from the most exact copy; and which characterizes the talents of the artists so well, that the smallest part of the picture, and even the least interesting, is sufficient to discover the painter. The distinction between the beautiful and illusive in painting has made Sir Joshua Reynolds, in express terms, recommend a perfection superior to the imitation of nature. "The principle now laid down (says he), that the perfection of the art does not consist in mere imitation, is far from being new or singular. It is, indeed, supported by the general opinion of the enlightened part of mankind. The poets, orators, and rhetoricians of antiquity, are continually enforcing this position, that all the arts receive their perfection from an ideal beauty, superior to what is to be found in individual nature. They are ever referring to the practice of the painters and sculptors of their times, particularly Phidias the favourite artist of antiquity to illustrate their assertions. As if they could not sufficiently express their admiration of his genius by what they knew, they have recourse to poetical enthusiasm. They call it inspiration; a gift from heaven. The artist is supposed to have ascended the celestial regions to furnish his mind with this perfect idea of beauty. 'He (says Proclus) who takes for his model such forms as nature produces, and confines himself to an exact imitation of them, will never attain to what is perfectly beautiful. For the works of nature are full of disproportion, and fall short of the true standard of beauty. So that Phidias, when he formed his Jupiter, did not copy any object ever presented to his sight; but contemplated only that image which he had conceived in his mind from Homer's description.

"It is not easy to define in what this great style consists, nor to describe by words the proper means of acquiring it, if the mind of the student should be at all capable of such an acquisition. Could we teach taste or genius by rules, they would be no longer taste and genius. But though there neither are nor can be any precise invariable rules for the exercise or the acquisition of these great qualities; yet we may truly say that they always operate in proportion to our attention in observing the works of nature, to our skill in selecting, and to our care in digesting, methodizing, and comparing our observations. There are many beauties in our art that seem at first to lie without the reach of precept, and yet may easily be reduced to practical principles. Experience is all in all; but it is not every one that profits by experience; and most people err not so much from want of capacity to find their object, as from not knowing what object to pursue. This great ideal perfection and beauty are not to be sought in the heavens, but upon the earth. They are about us, and upon every side of us: But the power of discovering what is deformed in nature, or, in other words, what is particular or uncommon, can be acquired only by experience; and the whole beauty and grandeur of the art consists in being able to get

above all singular forms, local customs, particularities, and details of every kind."

After these opinions, however, derived from the practice of the art, and this high authority, it may not be improper to hazard a few observations. Although illusion can be distinguished from many of the most excellent parts of the art taken separately, yet it does not follow that it shall not add in every picture to the beauty of the whole. It is impossible to state it in opposition to design, to composition, to colouring, or to the peculiar manner of a great artist; because all these may exist where there also exists the most perfect illusion. This is evident from the works of art; which have real relieve, and which at the same time are capable of perfection in all those branches, and of showing the peculiar manner of the artist. Again, it appears evident, that *illusion*, properly so called, should be a proper object of attention in painting. We may rate the ideal beauty very high, and with great justice; but it still consists in overcoming the defects in individual objects in nature, and not in departing from the truth of representation. And perhaps it may be alleged, that the impossibility of giving perfect illusion on a plain surface has pushed the greatest masters too far, and made them crowd artificial beauties into their pictures to conceal their want of power to give real ones. It is not improbable, that on this very account the art is less perfect than otherwise it might have been: For in all subjects thought to be impossible, there is not only great room for exertion, but the person carries the art to greater perfection as he comes nearer to show that it may not be impossible. And if the works of Raphael, in point of illusion, are not superior to an ordinary artist, we may be permitted to say that there is great room for improvement in this branch.

SECT. XII. *Of the Costume.*

THE costume in painting corresponds with the unities of time, place, and action, in tragedy and in epic poetry. It is chiefly confined to history-painting; and regards the customs of different periods, the manners, the dress, and the colour, of different nations. Great exactness in the costume is scarcely practicable; but too sensible a departure from it denotes unpardonable negligence. It frequently happens that a piece composed of picturesque figures derives considerable advantage from certain liberties which are calculated to please both the artist and the spectator: for the judges of painting are not habitually occupied with the details of ancient and modern history, or profoundly versed in all the circumstances which make a departure from the costume conspicuous. On the other hand, if they were so ignorant as not to understand, or so indifferent as not to regard those circumstances, this branch of the art would be altogether arbitrary. The road of the painter is between these two extremes, not to despise beauty on the one hand, nor probability on the other. But in pursuing this part of the art, it is in vain to seek for perfect models in ancient or modern painting.

"When Raphael in his cartoons introduces monks and Swiss guards; when he puts into a boat more figures

Illusion.

p. 564, &c.

Costume.

figures than it is evident the boat could actually contain; when in the chastisement of Heliodorus, who attempted to despoil the temple of Jerusalem, Pope Julius II. is depicted as being present; when, in the donation of Constantine in the Vatican, a naked boy is placed conspicuous in the fore-ground, astride upon a dog in the immediate presence of the pope and the emperor; when Venetian senators are introduced while Pope Alexander excommunicates Barbarossa; when Aristotle, Plato, Dante, and Petrarch, are brought together in the school of Athens, to omit the lesser improprieties of shoeless apostles, &c.—every person must acknowledge that such offences as these against truths so obvious, if they do not arise from a defect of understanding, are instances of inexcusable carelessness.

“In like manner, when the same great master paints the dreams of Joseph and his fellow-prisoner in circles over their heads; when similar contrivances to express future events are used by Albani, Pameggiano, and Fuseli—is it not evident that no possibility can make the fiction true; and that real and feigned existences are unnaturally introduced in one narration?

When Polydore chooses to represent the death of Cato, and exposes to the spectators the hero of the piece with his bowels gushing out; when Paul Veronese, at a banquet painted with his usual magnificence, places before us a dog gnawing a bone, and a boy making water: however such disgusting circumstances may be forgiven in the *chef d'œuvre* of a Michael Angelo, had he represented these instead of the horrible figures of his Day of Judgment, the performance of an inferior artist cannot atone for them.

“So also, when one of the first rate among the modern painters, we mean Paul Veronese, introduces Benedictine monks at the marriage of Cana; when, in a picture of the crucifixion, he puts the Roman soldiers in the jerkins of the 16th century, and adorns their heads with turbans; when Guido, in a painting of Jesus appearing to his mother after his resurrection, places St Charles Borromée in a kind of desk in the back ground as witness to the interview: when Tintoret, at the miraculous fall of manna, arms the Israelites with fusils: and Corregio appoints St Jerome as the instructor of the child Jesus—common sense revolts at the impropriety; and we are compelled to exclaim, *Quicquid ostendat mihi sic, incredulus odi!*

“The mythological taste of the learned Poussin is well known; but Rubens seems to claim the merit of having presented to the world a still greater number of supreme absurdities in this learned style: nor is it easy to conceive a more heterogeneous mixture of circumstances, real and imaginary, sacred and profane, than the Luxembourg gallery, and the other works of that great master, perpetually exhibit.

“When so great an authority as Sir Joshua Reynolds\* contends for the rejection of common sense in favour of somewhat he terms a *higher sense*; when he laments, indirectly, that art is not in such high estimation with us, as to induce the generals, lawgivers, and kings of modern times, to suffer themselves to be represented naked, as in the days of ancient Greece; when he defends even the ridiculous aberrations from possibility, which the extravagant pencil of Rubens has so plentifully produced—it is not surprising that the

artists of the present day should be led to reject the company of common sense; or that Sir Joshua's performances should furnish examples of his own precepts.

“Mrs Siddons is represented by Sir Joshua in the character (as it is said) of the tragic muse: She is placed in an old-fashioned arm chair, this arm-chair is supported by clouds, suspended in the air: on each side of her head is a figure not unapt to suggest the idea of the attendant imps of an enchantress: of these figures, one is supposed to represent Comedy, and the other Tragedy; Mrs Siddons herself is decently attired in the fashionable habiliments of 20 or 30 years ago.

“If this be a picture of the tragic muse, she ought not to appear in a modern dress, nor ought she to be seated in an old arm-chair. If this be a portrait of Mrs Siddons, she has no business in the clouds, nor has she any thing to do with aerial attendants. If this be Mrs Siddons in the character of the tragic muse, the first set of objections apply; for she is placed in a situation where Mrs Siddons could never be.

“In the death of Dido, Sir Joshua Reynolds introduces her sister, lamenting over the corpse of the unfortunate queen. This is possible; but he has also introduced Atropos cutting Dido's hair with a pair of scissors, a being equally real and apparent in the painting with Dido or her sister. This (continues our author) appears to me a gross offence against mythological probability; nor is it the only offence against the costume with which that picture is chargeable.

“There is one other breach of the costume, however common among painters, more gross and offensive than any of the instances hitherto alleged; we mean the perpetual and unnecessary display of the naked figure. We shall not stay to enquire whether more skill can be shown in painting the human body clothed or unclothed. If the personages introduced in any picture are more naked in the representation than can be justified by the probability of the times, persons, places, or circumstances, it is a breach of the costume proportionate to the deviation. *This* fault, however, is so common, as hardly to be noticed; so slight indeed, when compared with that general taste for voluptuous imagery and obscene representation, which has so long disgraced the art of painting in every stage of its progress, that science and morality are callous to the *slight* offence.

“This depravity of imagination, this prostitution of the pencil to the base purposes of lascivious inclination, was a subject of much complaint among the ancients. Nor is there less reason to complain in modern times, that this delightful art, which might be employed in exciting the noblest sentiments, and become subservient to the best interests of society, should so often be exercised upon subjects solely calculated to please the eye of the voluptuary and debauchee. It is hardly possible to pass through any admired collection without meeting with some of these; of which, however excellent the performance may be, the common feelings of decency and morality (if we are neither professed artists nor connoisseurs) prevent us from viewing them without a mixture of disgust.”

*Et pudor averfos texit velamine vultus\*.*

\* Abbé de Marly.

\* Dis-  
comfcs, 8vo  
p. 286.

**Costume.** It is impossible to express how much a picture suffers by such looseness of fancy, and sinks as a bastard of the art in the esteem of good judges. Some people, indeed, are of opinion, that so scrupulous an observance of the costume is apt to hurt pictures, by depriving them of a certain air of truth arising, they think, from those features and habits to which we are accustomed; and which are therefore apt to make a greater impression, than can be expected from things drawn from the remote sources of antiquity; adding withal, that a certain degree of licence has ever been allowed those artists who in their works must make fancy their chief guide. See, say they, the Greeks, that is, the masters of Raphael and Poussin themselves. Do they ever trouble their heads about such niceties? The Rhodian statuary, for example, have not scrupled to represent Laocoon naked; that is, the priest of Apollo naked in the very act of sacrificing to the gods, and that too in the presence of a whole people, of the virgins and matrons of Ilium. Now, continue they, if it was allowable in the ancient statuary to neglect probability and decency to such a degree, to have a better opportunity of displaying their skill in the anatomy of the human body; why may it not be allowable in modern painters, the better to attain the end of their art, which is deception, to depart now and then a little from the ancient manners and the too rigorous laws of the costume? But these reasons, we beg leave to observe, are more absurd than they are ingenious. What! are we to draw conclusions from an example, which, far from deciding the dispute, gives occasion to another? The learned are of opinion, that those Rhodian masters would have done much better had they looked out for a subject in which, without offending so much against truth, and even probability, they might have had an equal opportunity of displaying their knowledge of the naked. And certainly no authority or example whatever should tempt us to do any thing contrary to what both decency and the reason of things require, unless we intend, like Carpioni, to represent

*Sogni d'inferni, e fole di romanzi.*

The dreams of sick men and the tales of fools.

No: a painter, the better to attain the end of his art, which is deception, ought carefully to avoid mixing the antique with the modern, the domestic with the foreign; things, in short, repugnant to each other, and therefore incapable of gaining credit. A spectator will never be brought to consider himself as actually present at the scene, the representation of which he has before him, unless the circumstances which enter it perfectly agree among themselves, and the field of action, if we may use the expression, in no shape belies the action itself. For instance, the circumstances, or if you please, the accessories, in a *Finding of Moses*, are not, surely, to represent the borders of a canal planted with rows of poppies, and covered with country houses in the European taste; but the banks of a great

river shaded with clusters of palm-trees, with a Sphinx or an Anubis in the adjacent fields, and here and there in the back ground a towering pyramid. And indeed the painter, before he takes either canvas or paper in hand, should on the wings of fancy transport himself to Egypt, to Thebes, or to Rome; and summoning to his imagination the physiognomy, the dress, the plants, the buildings, suitable to his subject, with the particular spot where he has chosen to lay his scene, so manage the pencil, as, by the magic of it, to make the enraptured spectators fancy themselves there along with him.

Books for a  
Painter.

#### SECT. XIII. *Of proper Books for a Painter.*

FROM what has been already said it may be easily gathered, that a painter should be neither illiterate nor unprovided with books. Many are apt to imagine, that the Iconologia of Ripa, or some such collection, is alone sufficient for this purpose; and that all the apparatus he stands in need of, may be reduced to a few casts of the remains of antiquity, or rather to what Rembrandt used to call his *antiques*, being nothing more than coats of mail, turbans, sherds of stuff, and all manner of old household trumpery and wearing apparel. Such things, no doubt, are necessary to a painter, and perhaps enough for one who wants only to paint half-lengths; or is willing to confine himself to a few low subjects. But they are by no means sufficient for him who would soar higher: for a painter who would attempt the Universe, and represent it in all its parts, such as it would appear, had not matter proved refractory to the intentions of the sovereign Artist. Such a painter alone is a true, an universal, a perfect painter — No mortal, indeed, must ever expect to rise to that sublimity; yet all should aspire to it, on the pain of otherwise ever continuing at a very mortifying distance from it: as the orator, who wishes to make a figure in his profession, should propose to himself no less a pattern than that perfect orator described by Tully; nor the courtier, than that perfect courtier delineated by Castiglione. It cannot, therefore, appear surprising, if we insist on the propriety of reckoning a good collection of books as part of such a painter's implements. The Bible, the Greek and Roman historians, the works of Homer that prince of poets, and of Virgil, are the most classical. To these let him add the *Metamorphoses* of Ovid, some of our best poets, the voyage of Pausanias, Vinci, Vasari, and others, upon painting.

It will also be of considerable advantage to him to have a well chosen collection of drawings by the best masters (p), in order to trace the progress and history of his art, and make himself acquainted with the various styles of painting which have been, and now are, in the greatest vogue. The prince of the Roman school was not ashamed to hang up in his study the drawings of Albert Durer; and spared no pains or expence to acquire

(p) We have formerly (see ANATOMY, p. 672. column 2.) mentioned a great anatomical work carrying on by Andrew Bell, Esq; in Edinburgh, of the figures of which, as they are engraved under the inspection of so able an anatomist as Mr Fyfe, and with the approbation of Dr Monro, we may at least form a favourable opinion; and if well executed, of which there can be but little doubt, they will unquestionably be of essential service to the painter.

Proper  
Books for a  
Painter.

acquire all the drawings he could meet with that were taken from basso relieves; things which the art of engraving has since rendered so common as to be in every one's hands. This art of multiplying drawings by means of the graver is of the same date, and boasts the same advantages, with the art of printing, by means of which the works of the mind are multiplied, as it were, at one stroke, and dispersed over the whole world.

The sight of fine subjects treated by able masters, and the different forms which the same subjects assume in different hands, cannot fail both of enlightning and enflaming the mind of the young painter. The same may be said of the perusal of good poets and historians, with the particulars and proofs of what they advance; not to mention those ideas and flights of invention, with which the former are wont to clothe, beautify, and exalt every thing they take in hand. Bouchardon after reading Homer, conceived, to use his own words, that men were three times taller than before, and that the world was enlarged in every respect. It is very probable, that the beautiful thought of covering Agamemnon's face with the skirt of his mantle at the sacrifice of Iphigenia, was suggested to Timantes by the tragedy of Euripides. And the sublime conceit of Raphael, who, in a *Creation* of his, represents God in the immense space, with one hand reaching to the sun and the other to the moon, may be considered as the child of the following words of the Psalmist: *The heavens declare the glory of God, and the firmament sheweth his handy-work.*

This thought of Raphael has been, indeed, censured by Mr Webb. "A God (says this gentleman), extending one hand to the sun, and another to the moon, destroys that idea of immensity which should accompany the work of creation, by reducing it to a world of a few inches." But the opinion of Count Algarotti is very different. "For my part (says that elegant critic), I cannot discover in this painting a world of a few inches, but a world on a much greater scale; a world of millions and millions of miles: and yet this so immense a world, by means of that act of the God-head, in which with one hand he reaches to the sun, and with the other to the moon, shrinks, in my imagination, to a mere nothing, in respect to the imminity of God himself. This invention is, though in a contrary sense, of the same kind with that of Timantes, who, to express the enormous size of a sleeping Polyphemus, placed round him some satires measuring the monster's thumb with a thyrsus. Hence Pliny, who relates the fact, takes occasion to tell us, that his works always imply more than they express; and that how great soever he may be in execution, he is still greater in invention: *Atque in omnibus ejus operibus intelligitur plus semper quam pingitur; et cum ars summa sit, ingenium tamen ultra artem est.*" Nat. Hist. lib. xxxv. c. 10.

The perusal of good authors cannot but be very serviceable to a painter in another respect; as, among the great number of subjects afforded by history and poetry, he may expect to meet with many on which his talents may display themselves to the greatest advantage. A painter can never be too nice in the choice

of his arguments; for on the beauty of them, that of his piece will greatly depend. How much to be pitied, therefore, were our first masters, in being so often obliged to receive their subjects from the hands of simple and illiterate persons! and what is worse, to spend all the riches of their art upon barren or unworthy subjects! Such are the representations of those saints, who, though they never had the least intercourse with each other, and perhaps even lived in different ages, are notwithstanding, to be introduced, *tete a tete*, as it were in the same picture. The mechanic of the art may, indeed, display itself on these occasions; but by no means the ideal. The disposition may be good and praise-worthy, as in the works of Cortoni and Lanfranc: but we are not to expect in them either invention or expression, which require for their basis the representation of some fact capable of producing such effects. Who does not, on the bare mention of this abuse, immediately recollect many sad instances of it? such as the famous St Cecilia of Raphael, surrounded by St Paul, St Mary Magdalen, St John, and St Augustin; and the picture of Paolo Veronese, in the vestry of the Nuns of St Zachary at Venice, in which St Francis of Assizium, St Catherine, and St Jerome richly habited in his cardinal's robes, form a ring round the Virgin seated on a throne with the child Jesus in her arms; perhaps the most beautiful and picturesque of all the insipid and insignificant pieces with which Italy abounds. It is very shocking to think that young painters should be obliged to study their art from such wretched compositions.

The subjects in which the pencil triumphs most, and with which a judicious painter may stock himself by the perusal of good books, are no doubt, those which are most universally known, which afford the largest field for a display of the passions, and contain the greatest variety of incidents, all concurring in the same point of time, to form one principal action. Of this the story of Coriolanus besieging Rome, as related by Livy, is a shining example. Nothing can be imagined more beautiful than the scene of action itself, which ought to take in the prætorium in the camp of the Volscians, the Tiber behind it, and the seven hills, among which the towering Capitol is, as it were to lord it over the rest. It is impossible to conceive a greater variety, than what must appear in that crowd of soldiers, women, and children, all which are to enter the composition; unless, perhaps, it be that of the different passions with which they are severally agitated; some wishing that Coriolanus may raise the siege, others fearing it, others again suspecting it. But the principal groupe forms the picturesque part of the piece. Coriolanus, hastily descending from his tribunal, and hurried on by filial affection, to embrace his mother, stops short through shame, on her crying out to him, Hold! let me first know, it is a son, or an enemy, I am going to embrace? Thus a painter may impart novelty to the most hackneyed subject, by taking for his guides those authors who possess the happy talent of adding grace and dignity, by their beautiful and sublime descriptions, even to the most common and trifling transactions.

Books for a  
Painter.

Livy. Dec.  
II. lib. 2.

SECT. XIV. *Of the Painter's Balance.*

THE celebrated De Piles, who by his writings has thrown so much light upon painting, in order to assist young painters in forming a right judgment of these masters who hold the first rank in the profession, and to reduce such judgment to the greater precision, be- thought himself of a pictorial balance, by means of which a painter's merit may be weighed with the greatest exactness. This merit he divides into Composition, Design Colouring, and Expression; and in each of these branches he has assigned to every painter that share to which he thought him intitled, according as he approached more or less the highest degree of excellence and summit of perfection; so that, by summing up the numbers which, standing against each master's name, express his share of merit in each of these branches, we have his total merit or value in the art, and may hence gather what rank one painter holds in regard to another. Several objections, it is true, have been started to this method of calculation, by a famous mathematician of our days, who, among other things, insists, that it is the product of the above numbers multiplied by each other, and not the sum of them, that gives the merit of the artist. But this is not a place to enter into such niceties, nor indeed would the doing of it be of any service to the art. The only thing worth our notice is, whether the original numbers, standing for the painter's merit in the several branches of his art, are such as he is really intitled to, without suffering ourselves to be biased by any partiality, as De Piles has been, in favour of the prince of the Flemish school; the consequence of which, strange as it may appear, is, that in his balance Raphael and Rubens turn out exactly of the same weight.

The idea of the painter's balance is doubtless curious, and therefore deserved to be mentioned; but as the merits of the most eminent painters have been already appreciated under the second section of the historical part of our article, to which we refer, it is needless to be more particular here, or to repeat what has been already treated of at sufficient length.

SECT. XV. *Practical Observations.*

HAVING thus laid down the principles of the art, and ventured to give the student some directions with respect to his studies, we shall conclude this part of the subject with a few observations relative wholly to practice.

And, 1, The young painter must be careful not to be led astray by the ambition of composing easily, or attaining what is called a *masterly handling* of the chalk or the pencil; a pernicious attempt, by which students are excluded from all power of advancing in real excellence. To this attempt however, young men have not only the frivolous ambition of being thought masterly, inciting them on the one hand, but also their natural sloth tempting them on the other. They are terrified at the prospect before them, and of the toil required to obtain exactness; whilst the lives of the most eminent painters furnish us with examples of the most unceasing industry. When they conceived a subject,

Vol. XIII.

they first made a variety of sketches; then a finished drawing of the whole; after that a more correct drawing of every separate part, heads, hands, feet, and pieces of drapery; they then painted the picture and after all retouched it from the life. The pictures thus wrought with such care, now appear like the effects of enchantment, and as if some mighty genius had struck them off at a blow.

But a student is not always advancing because he is employed; he must apply his strength to that part of the art where the real difficulties lie; to that part which distinguishes it as a liberal art, and not by mistaken industry lose his time in that which is merely ornamental. The students, instead of vying with each other who shall have the readiest hand, should be taught to labour who shall have the purest and most correct outline; instead of striving who shall produce the brightest tint, or endeavouring to give the gloss of stuffs so as to make them appear real, let their ambition be directed to contend, who shall dispose his drapery in the most graceful folds, and give the greatest dignity to the human form.

He who endeavours to copy accurately the figure before him, not only acquires a habit of exactness and precision, but is continually advancing in his knowledge of the human figure; and though he seems to superficial observers to make a slower progress, he will be found at last capable of adding (without running into capricious wildness) that grace and beauty which is necessary to be given to his more finished works, and which cannot be got by the moderns, as it was not acquired by the ancients, but by an attentive and well-directed study of the human form.

2. It is, in the next place, a matter of great importance, that the drawings on which the young artist first exercises his talents be of the most excellent kind. Let the profiles, the hands, and the feet given him to copy, be of the best masters, so as to bring his eye and his hand early acquainted with the most elegant forms and the most beautiful proportion. A painter who has early acquired a fine taste, finds it an easy matter to give dignity to the meanest features, while even the works of a Praxiteles or a Glycon are seen to suffer in the hands of another. A vessel will ever retain the scent which it has first contracted.

3. It would be proper also to make the pupil copy some fine heads from the Greek and Roman medals; not so much for the reason just laid down, as to make him acquainted, if we may use the expression, with those personages which in time he may have occasion to introduce into his pieces, and, above all, to improve him early in the art of copying from relief. Hence he will learn the rationale of light and shade, and the nature of that chiaro-scuro by which it is properly speaking that the various forms of things are distinguished.

There is no danger of studying too much the works of the greatest masters, either in painting or sculpture; but how they may be studied to advantage is an inquiry of great importance. "Some says Sir Joshua Reynolds), who have never raised their minds to the consideration of the real dignity of the art, and who rate the works of an artist in proportion as they excel or are defective in the mechanical parts, look on theory as something that may enable them to talk,

4 L

but

Practical  
Observations.

but not to paint better; and, confining themselves entirely to mechanical practice, very assiduously toil in the drudgery of copying, and think they make a rapid progress, while they faithfully exhibit the minutest part of a favourite picture. This appears to me a very tedious, and, I think, a very erroneous method of proceeding. Of every large composition, even of those which are most admired, a great part may be truly said to be common place. This, though it takes up much time in copying, conduces little to improvement. I consider general copying, as a delusive kind of industry; the student satisfies himself with the appearance of doing something; he falls into the dangerous habit of imitating without selecting, and of labouring without any determinate object: as it requires no effort of the mind, he sleeps over his work; and those powers of invention and composition which ought particularly to be called out, and put in action, lie torpid, and lose their energy for want of exercise.

“However, as the practice of copying is not entirely to be excluded, since the mechanical practice of painting is learned in some measure by it, let those choice parts only be selected which have recommended the work to notice. If its excellence consists in its general effect, it would be proper to make slight sketches of the machinery and general management of the picture. Those sketches should be kept always by you, for the regulation of your style. Instead of copying the touches of those great masters, copy only their conceptions. Instead of treading in their footsteps, endeavour only to keep the same road. Labour to invent on their general principles and way of thinking. Possess yourself with their spirit. Consider with yourself how Michael Angelo or a Raphael would have treated this subject, and work yourself into a belief that your picture is to be seen and criticised by them when completed. Even an attempt of this kind will rouse your powers.”

The same great master recommends to students to keep their minds fixed on the highest excellencies.—“If you compass them, and compass nothing more,

you are still in the first class. We may regret the innumerable beauties which you may want: you may be very imperfect; but still you are an imperfect person of the highest order.

“I inculcate as frequently as I can your forming yourselves upon great principles and great models.—Your time will be much mispent in every other pursuit. Small excellencies should be viewed, not studied; they ought to be viewed, because nothing ought to escape a painter’s observation, but for no other reason.

“There is another caution which I wish to give you. Be as select in those whom you endeavour to please, as in those whom you endeavour to imitate. Without the love of fame you can never do any thing excellent: but by an excessive and undistinguishing thirst after it, you will come to have vulgar views: you will degrade your style; and your taste will be entirely corrupted. It is certain that the lowest style will be the most popular, as it falls within the compass of ignorance itself, and the vulgar will always be pleased with what is natural in the confined and misunderstood sense of the word.”

Genius he considers as an improveable talent, never to be destroyed by the most excessive, if well directed, application, and displaying the elegancies of the art in proportion to the number of ideas which have been carefully collected and digested in the mind.

He cautions painters, therefore in every stage of their progress to beware of that false opinion, but too prevalent among artists, of the imaginary power of native genius, and its sufficiency in great works.

This opinion, according to the temper of mind it meets with, almost always produces, either a vain confidence or a sluggish despair, both equally fatal to all proficiency. “Study, therefore, the great works of the great masters for ever. Study as nearly as you can, in the order, in the manner, on the principles on which they studied. Study nature attentively, but always with those masters in your company; consider them as models which you are to imitate, and at the same time as rivals whom you are to combat.”

## PART II. Of the Different CLASSES of PAINTING.

### SECT. I. General Enumeration.

AS all the objects in nature are susceptible of imitation by the pencil, the masters of this art have applied themselves to different subjects, each one as his talents, his taste, or inclination, may have led him.—From whence have arisen the following classes.

I. *History Painting*; which represents the principal events in history sacred and profane, real or fabulous; and to this class belongs *allegorical expression*. These are the most sublime productions of the art; and in which Raphael, Guido, Rubens, Le Brun, &c. have excelled.

II. *Rural History*; or the representation of a country life, of villages and hamlets, and their inhabitants. This is an inferior class; and in which Teniers Breughel, Watteau, &c. have great reputation, by rendering it at once pleasing and graceful.

III. *Portrait Painting*; which is an admirable branch of this art, and has engaged the attention of the greatest masters in all ages, as Apelles, Guido, Vandvke, Rembrandt, Regauds, Pefne, Kneller, La Tour, &c.

IV. *Grotesque histories*; as the nocturnal meetings of witches; forceries and incantations; the operations of mountebanks, &c. a sort of painting in which the younger Breughel, Teniers, and others, have exercised their talents with success.

V. *Battle pieces*; by which Huchtemberg, Wouwerman, &c. have rendered themselves famous.

VI. *Landscapes*; a charming species of painting that has been treated by masters of the greatest genius in every nation.

VII. *Landscapes diversified with waters*, as rivers, lakes, cataracts, &c.; which require a peculiar talent to express the water sometimes smooth and transparent,

Practical  
Observations.

General  
Enumera-  
tion.

parent, and at others foaming and rushing furiously along.

VIII. *Sea-pieces*; in which are represented the ocean, harbours, and great rivers; and the vessels, boats, barges, &c. with which they are covered; sometimes in a calm, sometimes with a fresh breeze, and at others in a storm. In this class Backhuysen, Vandervelde, Blome, and many others, have acquired great reputation.

IX. *Night pieces*; which represent all sorts of objects, either as illuminated by torches, by the flames of a conflagration, or by the light of the moon. Schalck, Vanderneer, Vanderpool, &c. have here excelled.

X. *Living Animals*: A more difficult branch of painting than is commonly imagined; and in which Rosa, Carre, Vandervelde, and many others, have succeeded marvellously well.

XI. *Birds of all kinds*; a very laborious species, and which require extreme patience minutely to express the infinite variety and delicacy of their plumage.

XII. *Culinary pieces*; which represent all sorts of provisions and animals without life, &c. A species much inferior to the rest, in which nature never appears to advantage, and which requires only a servile imitation of objects that are but little pleasing. The painting of fishes is naturally referred to this class.

XIII. *Fruit-pieces*, of every kind, imitated from nature.

XIV. *Flower-pieces*; a charming class of painting, where art in the hands of Huyzum, P. Segerts, Merian, &c. becomes the rival of Nature. *Plants and insects* are usually referred to the painters of flowers, who with them ornament their works.

XV. *Pieces of architecture*; a kind of painting in which the Italians excel all others. Under this class may be comprehended the representations of ruins, sea ports, streets, and public places; such as are seen in the works of Canaletti, and other able masters.

XVI. *Instruments of music, pieces of furniture*, and other inanimate objects: a trifling species, and in which able painters only accidentally employ their talents.

XVII. *Imitations of bas-reliefs*; a very pleasing kind of painting, and which may be carried by an able hand to a high degree of excellence.

XVIII. *Hunting pieces*; these also require a peculiar talent, as they unite the painting of men, horses, dogs, and game, to that of landscapes.

It will not be expected that we should here give the rules that the painter is to observe in handling each particular subject. What has been said on historical painting (Part I.\*) may throw some light on the rest, and the particular rules must be learned from the study of the art itself. Good masters, academies of reputation, and a rational practice, are the sources from whence the young painter must derive the detail of his art. We shall however insert some rules and observations relative to *Landscape* and *Portrait*; these, with *History painting* (already pretty fully treated), forming the principal branches of the art.

## SECT. II. Of Landscapes.

LANDSCAPE-painting includes every object that the

country presents; and is distinguished into the *heroic*, and the *pastoral* or *rural*; of which indeed all other styles are but mixtures.

The *heroic style* is a composition of objects, which in their kinds draw both from art and nature every thing that is great and extraordinary in either. The situations are perfectly agreeable and surprising. The only buildings are temples, pyramids, ancient places of burial, altars consecrated to the divinities, pleasure-houses of regular architecture; and if nature appear not there as we every day actually see her, she is at least represented as we think she ought to be. This style is an agreeable illusion, and a sort of enchantment, when handled by a man of fine genius and a good understanding, as Poussin was, who has so happily expressed it. But if, in the course of this style, the painter has not talent enough to maintain the sublime, he is often in danger of falling into the childish manner.

The *rural style* is a representation of countries, rather abandoned to the caprice of nature, than cultivated: we there see nature simple, without ornament, and without artifice; but with all those graces wherewith she adorns herself much more when left to herself than when constrained by art.

In this style, situations bear all sorts of varieties: sometimes they are very extensive and open, to contain the flocks of the shepherds; at others very wild, for the retreat of solitary persons, and a cover for wild beasts.

It rarely happens that a painter has a genius extensive enough to embrace all the parts of painting; there is commonly some one part that pre-engages our choice, and so fills our mind, that we forget the pains that are due to the other parts; and we seldom fail to see, that those whose inclination leads them to the heroic style, think they have done all, when they have introduced into their compositions such noble objects as will raise the imagination, without ever giving themselves the trouble to study the effects of good colouring. Those, on the other hand, who practise the pastoral, apply closely to colouring, in order to represent truth more lively. Both these styles have their sectaries and partisans. Those who follow the heroic, supply by their imagination what it wants of truth, and they look no farther.

As a counterbalance to heroic landscape, it would be proper to put into the pastoral, besides a great character of truth, some affecting, extraordinary, but probable effect of nature, as was Titian's custom.

There is an infinity of pieces wherein both these styles happily meet; and which of the two has the ascendant, will appear from what we have been just observing of their respective properties. The chief parts of landscapes are, their openings or situations, accidents, skies and clouds, offshoots and mountains, verdure or turfing, rocks, grounds, or lands, terraces, fabrics, waters, fore-grounds, plants, figures, and trees; of all which in their places.

*Of Openings or Situations.* The word *sic*, or situation, signifies the "view, prospect, or opening of a country." It is derived from the Italian word *sito*; and our painters have brought it into use, either because they were used to it in Italy, or because, as we think, they found it to be very expressive.

Situations ought to be well put together; and so dis-

4 L 2

engaged

\* In the sections of Invention and Disposition.

engaged in their make, that the conjunction of grounds may not seem to be obstructed though we should see but a part of them.

Situations are various, and represented according to the country the painter is thinking of; as either open or close, mountainous or watery, tilled and inhabited, or wild and lonely; or, in fine, variegated by a prudent mixture of some of these. But if the painter be obliged to imitate nature in a flat regular country, he must make it agreeable by a good disposition of the *claro-obscuro*, and such pleasing colouring as may make one soil unite with another.

It is certain, that extraordinary situations are very pleasing, and cheer the imagination by the novelty and beauty of their makes, even when the local colouring is but moderately performed; because, at worst, such pictures are only looked on as unfinished, and wanting to be completed by some skilful hand in colouring; whereas common situations and objects require good colouring and absolute finishing, in order to please. It was only by these properties that Claude Lorrain has made amends for his insipid choice in most of his situations. But in whatever manner that part be executed, one of the best ways to make it valuable and even to multiply and vary it without altering its form, is properly to imagine some ingenious accident in it.

*Of Accidents.* An accident in painting is an obstruction of the sun's light by the interposition of clouds, in such manner, that some parts of the earth shall be in light and others in shade, which, according to the motion of the clouds, succeed each other, and produce such wonderful effects and changes of the *claro-obscuro*, as seem to create so many new situations. This is daily observed in nature. And as this newness of situations is grounded only on the shapes of the clouds, and their motions, which are very inconstant and unequal, it follows, that these accidents are arbitrary; and a painter of genius may dispose them to his own advantage when he thinks fit to use them: For he is not absolutely obliged to do it; and there have been some able landscape-painters who have never practised it either through fear or custom, as Claude Lorrain and some others.

*Of the Sky, and Clouds.* The sky, in painters terms, is the ethereal part over their heads; but more particularly the air in which we breath, and that where clouds and storms are engendered. Its colour is blue growing clearer as it approaches the earth, because of the interposition of vapours arising between the eye and the horizon; which being penetrated by the light, communicates it to objects in a greater or lesser degree, as they are more or less remote.

But we must observe, that this light being either yellow or reddish in the evening, at sunset, these same objects partake not only of the light but of the colour: thus the yellow light mixing with the blue, which is the natural colour of the sky, alters it, and gives it a tint more or less greenish, as the yellowness of the light is more or less deep.

This observation is general and infallible: but there is an infinity of particular ones, which the painter must make upon the natural, with his pencil in his hand, when occasion offers; for there are very fine and singular effects appearing in the sky, which it is diffi-

cult to make one conceive by physical reasons. Who can tell, for example, why we see, in the bright part of some clouds a fine red, when the source of the light which plays upon them is a most lively and distinguishing yellow? Who can account for the different reds seen in different clouds, at the very moment that these reds receive the light but in one place? for these colours and surprising appearances seem to have no relation to the rainbow, a phenomenon for which the philosopher pretends to give solid reasons.

These effects, are all seen in the evening when the weather is inclining to change, either before a storm, or after it, when it is not quite gone, but has left some remains of it to draw our attention.

The property of clouds is to be thin and airy, both in shape and colour; their shapes, though infinite, must be studied and chosen after nature, at such times as they appear fine. To make them look thin, we ought to make their grounds unite thinly with them, especially near their extremities, as if they were transparent: And if we would have them thick, their reflections must be so managed, as, without destroying their thinness they may seem to wind and unite, if necessary, with the clouds that are next to them. Little clouds often discover a little manner, and seldom have a good effect unless when, being near each other, they seem altogether to make but one object.

In short, the character of the sky is to be luminous; and as it is even the source of light, every thing that is upon the earth must yield to it in brightness; If, however, there is any thing that comes near it in light, it must be waters, and polished bodies which are susceptible of luminous reflections.

But whilst the painter makes the sky luminous, he must not represent it always shining throughout.

On the contrary, he must contrive his light so, that the greatest part of it may fall only upon one place: and, to make it more apparent, he must take as much care as possible to put it in opposition to some terrestrial object, that may render it more lively by its dark colour; as a tree, tower, or some other building that is a little high.

This principal light might also be heightened by a certain disposition of clouds having a supposed light, or a light ingeniously inclosed between clouds, whose sweet obscurity spreads itself by little and little on all hands. We have a great many examples of this in the Flemish school, which best understood landscape; as Paul Bril, Brugel, Saveri: And the Sadeliers and Merian's prints give a clear idea of it, and wonderfully awaken the genius of those who have the principal of the *claro-obscuro*.

*Of Offsips and Mountains.* Offsips have a nearer affinity with the sky; it is the sky which determines either the force or faintness of them. They are darkest when the sky is most loaded, and brightest when it is most clear. They sometimes intermix their shapes and lights; and there are times, and countries, where the clouds pass between the mountains, whose tops rise and appear above them. Mountains that are high, and covered with snow, are very proper to produce extraordinary effects in the offskip, which are advantageous to the painter, and pleasing to the spectator.

The disposition of offsips is arbitrary; let them only

Land-  
scapes.

only agree with the whole of the picture together, and the nature of the country we would represent. They are usually blue, because of the interposition of air between them and the eye; but they lose this colour by degrees, as they come nearer the eye, and take that which is natural to the objects.

In distancing mountains, we must observe to join them insensibly by the roundings off, which the reflections make probable; and must, among other things, avoid a certain edginess in their extremities, which makes them appear in slices, as if cut with scissars, and stuck upon the cloth.

We must further observe, that the air, at the feet of mountains, being charged with vapour, is more susceptible of light than at their tops. In this case, we suppose the main light to be set reasonably high, and to enlighten the mountains equally, or that the clouds deprive them of the light of the sun. But if we suppose the main light to be very low, and to strike the mountains, then their tops will be strongly enlightened, as well as every thing else in the same degree of light.

Though the forms of things diminish in bigness, and colours lose their strength, in proportion as they recede from the first plan of the picture, to the most remote offskip, as we observe in nature and common practice; yet this does not exclude the use of the accidents. These contribute greatly to the wonderfulness in landscape, when they are properly introduced, and when the artist has a just idea of their good effects.

*Of Verdure, or Turfing.* By turfing is meant the greenness with which the herbs colour the ground: This is done several ways; and the diversity proceeds not only from the nature of plants, which, for the most part, have their particular verdurs, but also from the change of season, and the colour of the earth when the herbs are but thin sown. By this variety, a painter may choose or unite, in the same tract of land, several sorts of greens, intermixed and blended together, which are often of great service to those who know how to use them; because this diversity of greens, as it is often found in nature, gives a character of truth to those parts where it is properly used. There is a wonderful example of this part of landscape, in the view of Mechlin by Rubens.

*Of Rocks.* Though rocks have all sorts of shapes, and participate of all colours, yet there are, in their diversity, certain characters which cannot be well expressed without having recourse to nature. Some are in banks, and set off with beds of shrubs; others in huge blocks, either projecting or falling back; others consist of large broken parts, contiguous to each other; and others, in short, of an enormous size, all in one stone, either naturally, as freestone, or else through the injuries of time, which in the course of many ages has worn away their marks of separation. But, whatever their form be, they are usually set out with clefts, breaks, hollows, bushes, moss, and the stains of time; and these particulars, well managed, create a certain idea of truth.

Rocks are of themselves gloomy, and only proper for solitudes: but where accompanied with bushes, they inspire a fresh air; and, when they have waters, either proceeding from, or washing them, they give

an infinite pleasure, and seem to have a soul which animates them, and makes them sociable.

*Of Grounds or Lands.* A ground or land, in painters terms is a certain distinct piece of land, which is neither too woody nor hilly. Grounds contribute, more than any thing, to the gradation and distancing of landscape; because they follow one another, either in shape, or in the *claro-obscuro*, or in their variety of colouring, or by some insensible conjunction of one with another.

Multiplicity of grounds, though it be often contrary to a grand manner, does not quite destroy it; for, besides the extent of country which it exhibits, it is susceptible of the accidents we have mentioned, and which, with good management, have a fine effect.

There is one nicety to be observed in grounds, which is, that in order to characterize them well, care must be taken, that the trees in them have a different verdure and different colours from those grounds; though this difference, withal, must not be too apparent.

*Of Terraces.* A terrace, in painting, is a piece of ground, either quite naked or having very little herbage, like great roads and places often frequented. They are of use chiefly in the foregrounds of a picture, where they ought to be very spacious and open, and accompanied, if we think fit, with some accidental verdure, and also with some stones, which, if placed with judgment, give a terrace a greater air of probability.

*Of Buildings.* Painters mean by buildings any structures they generally represent, but chiefly such as are of a regular architecture, or at least are most conspicuous. Thus building is not so proper a name for the houses of country-people, or the cottages of shepherds, which are introduced in the *rural* taste, as for regular and showy edifices, which are always brought into the *heroic*.

Buildings in general are a great ornament in landscapes even when they are Gothic, or appear partly inhabited and partly ruinous: they raise the imagination by the use they are thought to be designed for; as appears from ancient towers, which seem to have been the habitations of fairies, and are now retreats for shepherds and owls.

Poussin has very elegantly handled the Roman manner of architecture in his works, as Bourdon has done the Gothic; which, however Gothic, fails not to give a sublime air to his landscapes. Little Bernard has introduced into his sacred history what may be called a Babylonian manner; which, extraordinary as it is, has its grandeur and magnificence. Nor ought such pieces of architecture to be quite rejected: they raise the imagination; and perhaps would succeed in the heroic style, if they were placed among half-distant objects, and if we knew how to use them properly.

*Of Waters.* Much of the spirit of landscape is owing to the waters which are introduced in it. They appear in divers manners; sometimes impetuous, as when a storm makes them overflow their banks; at other times rebounding, as by the fall of a rock; at other times, through unusual pressure, gushing out and dividing into an infinity of silver streams, whose motion and murmuring agreeably deceive both the eye and

Land-  
scapes.

Land-  
scapes.

Land-  
scapes.

ear ; at other times calm and purling in a sandy bed ; at other times so still and standing, as to become a faithful looking-glass, which doubles all the objects that are opposite to it ; and in this state they have more life than in the most violent agitation. Consult Bourdon's works, or at least his prints, on this subject : he is one of those who have treated of waters with the greatest spirit and best genius.

Waters are not proper for every situation : but to express them well, the artist ought to be perfect master of the exactness of watery reflections ; because they only make painted water appear as real ; for practice alone without exactness, destroys the effect, and abates the pleasure of the eye. The rule for these reflections is very easy, and therefore the painter is the less pardonable for neglecting it.

But it must be observed, that though water be as a looking-glass, yet it does not faithfully represent objects but when it is still ; for if it be in any motion, either in a natural course or by the driving of the wind, its surface, becoming uneven, receives on its surges such lights and shades as, mixing with the appearance of the objects, confound both their shapes and colours.

*Of the Foreground of a Picture.* As it is the part of the foreground to usher the eye into the piece, great care must be taken that the eye meet with good reception ; sometimes by the opening of a fine terrace, whose design and workmanship may be equally curious ; sometimes by a variety of well distinguished plants, and those sometimes flowered ; and at other times, by figures in a lively taste, or other objects, either admirable for their novelty or introduced as by chance.

In a word, the artist cannot too much study his foreground objects, since they attract the eye, impress the first character of truth, and greatly contribute to make the artifice of a picture insensible, and to anticipate our esteem for the whole work.

*Of Plants.* Plants are not always necessary in foregrounds, because, as we have observed, there are several ways of making those grounds agreeable. But if we resolve to draw plants there, we ought to paint them exactly after the life ; or at least, among such as we paint practically, there ought to be some more finished than the rest, and whose kinds may be distinguished by the difference of design and colouring, to the end that, by a probable supposition, they may give the others a character of truth. What has been said here of plants may be applied to the branches and barks of trees.

*Of figures.* In composing landscape, the artist may have intended to give it a character agreeable to the subject he has chosen, and which his figures ought to represent. He may also, and it commonly happens, have only thought of his figures, after finishing his landscape. The truth is, the figures in most landscapes are made rather to accompany than to suit them.

It is true, there are landscapes so disposed and situated as to require only passing figures ; which several good masters, each in his style, have introduced, as Poussin in the heroic, and Fouquier in the rural, with all probability and grace. It is true also, that resting figures have been made to appear inwardly active. And these two different ways of treating figures are not to be blamed, because they act equally, though

in a different manner. It is rather inaction that ought to be blamed in figures ; for in this condition, which robs them of all connection with the landscape, they appear to be pasted on. But without obstructing the painter's liberty in this respect, undoubtedly the best way to make figures valuable is, to make them so to agree with the character of the landscape, that it may seem to have been made purely for the figures. We would not have them either insipid or indifferent, but to represent some little subject to awaken the spectator's attention, or else to give the picture a name of distinction among the curious.

Great care must be taken to proportion the size of the figures to the bigness of the trees, and other objects of the landscape. If they be too large, the picture will discover a little manner ; and if too small, they will have the air of pigmies ; which will destroy the worth of them, and make the landscape look enormous. There is, however, a greater inconvenience in making figures too large than too small ; because the latter at least gives an air of greatness to all the rest. But as landscape figures are generally small, they must be touched with spirit, and such lively figures as will attract, and yet preserve probability and a general union. The artist must, in fine, remember, that as the figures chiefly give life to a landscape, they must be dispersed as conveniently as possible.

*Of Trees.* The beauty of trees is perhaps one of the greatest ornaments of landscape ; on account of the variety of their kinds, and their freshness, but chiefly their lightness, which makes them seem, as being exposed to the air, to be always in motion.

Though diversity be pleasing in all the objects of landscape, it is chiefly in trees that it shows its greatest beauty. Landscape considers both their kinds and their forms. Their kinds require the painter's particular study and attention, in order to distinguish them from each other ; for we must be able at first sight to discover which are oaks, elms, firs, sycamores, poplars, willows, pines, and other such trees, which, by a specific colour, or touching, are distinguishable from all other kinds. This study is too large to be acquired in all its extent ; and, indeed, few painters have attained such a competent exactness in it as their art requires. But it is evident, that those who come nearest to perfection in it, will make their works infinitely pleasing, and gain a great name.

Besides the variety which is found in each kind of tree, there is in all trees a general variety. This is observed in the different manners in which their branches are disposed by a sport of nature ; which takes delight in making some very vigorous and thick, others more dry and thin ; some more green, others more red or yellow. The excellence of practice lies in the mixture of these varieties : but if the artist can distinguish the sorts but indifferently, he ought at least to vary their makes and colours ; because repetition in landscape is as tiresome to the eye, as monotony in discourse is to the ear.

The variety of their makes is so great, that the painter would be inexcusable not to put it in practice upon occasion, especially when he finds it necessary to awaken the spectator's attention ; for, among trees, we discover the young and the old, the open and close, tapering and squat, bending upwards and downwards, sloping

Land-  
scapes.

stooping and shooting: in short, the variety is rather to be conceived than expressed. For instance the character of young trees is, to have long slender branches, few in number, but well set out; boughs well divided, and the foliage vigorous and well shaped: whereas, in old trees, the branches are short, stocky, thick, and numerous; the tufts blunt, and the foliage unequal and ill shaped: but a little observation and genius will make us perfectly sensible of these particulars.

In the various makes of trees, there must also be a distribution of branches, that has a just relation to, and probable connection with, the boughs or tufts, so as mutually to assist each other in giving the tree an appearance of thickness and of truth. But, whatever their natures or manners of branching be, let it be remembered, that the handling must be lively and thin, in order to preserve the spirit of their characters.

Trees likewise vary in their barks, which are commonly grey; but this grey, which in thick air, and low and marshy places, looks blackish, appears lighter in a clear air: and it often happens, in dry places that the bark gathers a thin mois, which makes it look quite yellow; so that to make the bark of a tree apparent, the painter may suppose it to be light upon a dark ground, and dark on a light one.

The observation of the different barks merits a particular attention; for it will appear, that in hard woods, age chaps them, and thereby gives them a sort of embroidery; and that in proportion as they grow old, these chaps grow more deep. And other accidents in barks may arise either from moisture, or dryness, or green mosses, or white stains of several trees.

The barks of white woods will also afford much matter for practice, if their diversity be duly studied; and this consideration leads us to say something of the study of landscape.

*Of the Study of Landscape.* The study of landscape may be considered either with respect to beginners, or to those who have made some advances in it.

Beginners will find, in practice, that the chief trouble of landscape lies in handling trees; and it is not only in practice, but also in speculation, that trees are the most difficult part of landscape, as they are its greatest ornament. But it is only proposed here, to give beginners an idea of trees in general, and to show them how to express them well. It would be needless to point out to them the common effects of trees and plants, because they are obvious to every one; yet there are some things, which, though not unknown, deserve our reflection. We know, for instance, that all trees require air, some more, some less, as the chief cause of their vegetation and production: and for this reason, all trees (except the cypresses, and some others of the same kind) separate in their growth from one another and from other strange bodies as much as possible, and their branches and foliage do the same; wherefore to give them that air and thinness, which is their principal character, the branches boughs, and foliage, must appear to fly from each other, to proceed from opposite parts, and be well divided. And all this without order; as if chance aided nature in the fanciful diversity. But to say particularly how these trunks, branches, and foliages, ought to be distributed, would be needless, and only

a description of the works of great masters; a little reflection on nature will be of more service than all that can be said on this head. By great masters, we mean such as have published prints; for those will give better ideas to young copyists than even the paintings themselves.

Among the many great masters of all schools, De Piles prefers Titian's wooden prints, where the trees are well shaped; and those which Cornelius Cort and Agostino Carracci have engraved. And he asserts, that beginners can do no better than contrast, above all things, an habit of imitating the touches of these great masters, and of considering at the same time the perspective of the branches and foliages, and observing how they appear, either when rising and seen from below, or when sinking and seen from above, or when fronting and viewed from a point, or when they appear in profile; and, in a word, when set in the various views in which nature presents them, without altering their characters.

After having studied and copied, with the pen or crayon, first the prints, and then the designs of Titian and Carracci, the student should imitate with the pencil those touches which they have most distinctly specified, if their paintings can be procured: but since they are scarce, others should be got which have a good character for their touching; as those of Fouquier, who is a most excellent model: Paul Brill, Breugel, and Bourdon, are also very good; their touching is neat, lively, and thin.

After having duly weighed the nature of trees, their spread and order, and the disposition of their branches, the artist must get a lively idea of them, in order to keep up the spirit of them throughout, either by making them apparent and distinct in the foregrounds, or obscure and confused in proportion to their distance.

After having thus gained some knowledge in good manner, it will next be proper to study after nature, and to choose and rectify it according to the idea which the aforesaid great masters had of it. As to perfection, it can only be expected from long practice and perseverance. On the whole, it is proper for those who have an inclination for landscape, above all things to take the proper methods for beginning it well.

As for those who have made some advances in this part of painting, it is proper they should collect the necessary materials for their further improvement, and study those objects at least which they shall have most frequent occasion to represent.

Painters usually comprise, under the word *study*, any thing whatever which they either design or paint separately after the life; whether figures, heads, feet, hands, draperies, animals, mountains, trees, plants, flowers, fruits, or whatever may confirm them in the just imitation of nature: the drawings of these things is what they call *study*; whether they be for instruction in design, or only to assure them of the truth, and to perfect their work. In fact, this word *study* is the more properly used by painters, as in the diversity of nature they are daily making new discoveries, and confirming themselves in what they already know.

As the landscape-painter need only study such objects as are to be met with in the country, we would recommend

Land-  
scapes.

Land-  
scapes.Land-  
scapes

recommend to him some order, that his drawings may be always at hand when he wants them. For instance, he should copy after nature, on separate papers, the different effects of trees in general, and the different effects of each kind in particular, with their trunks, foliage, and colours. He should also take the same method with some sorts of plants, because their variety is a great ornament to terraces on fore-grounds. He ought likewise to study the effects of the sky in the several times of the day and seasons of the year, in the various dispositions of clouds, both in serene, thundering, and stormy weather; and in the offskip, the several sorts of rocks, waters, and other principal objects.

These drawings, which may be made at different times, should be collected together; and all that relate to one matter be put into a book, to which the artist may have recourse at any time for what he wants.

Now, if the fine effects of nature, whether in shape or colour, whether for an entire picture or a part of one, be the artist's study; and if the difficulty lies in choosing those effects well, he must for this purpose be born with good sense, good taste, and a fine genius; and this genius must be cultivated by the observations which ought to be made on the works of the best masters, how they chose nature, and how, while they corrected her, according to their art, they preserved her character. With these advantages, derived from nature and perfected by art, the painter cannot fail to make a good choice; and, by distinguishing between the good and the bad, must needs find great instruction even from the most common things.

To improve themselves in this kind of studies, painters have taken several methods.

There are some artists who have designed after nature, and in the open fields; and have there quite finished those parts which they had chosen, but without adding any colour to them.

Others have drawn, in oil colours, in a middle-tint, on strong paper; and found this method convenient, because, the colours sinking they could put colour on colour, though different from each other. For this purpose they took with them a flat box, which commodiously held their pallet, pencils, oil, and colours. This method, which indeed requires several implements, is doubtless the best for drawing nature more particularly, and with greater exactness, especially if, after the work be dry and varnished, the artist return to the place where he drew, and retouch the principal things after nature.

Others have only drawn the outlines of objects, and slightly washed them in colours near the life, for the ease of their memory. Others have attentively observed such parts as they had a mind to retain, and contented themselves with committing them to their memory, which upon occasion gave them a faithful account of them. Others have made drawings in pastil and wash together. Others, with more curiosity and patience, have gone several times to the places which were to their taste: the first time they only made choice of the parts, and drew them correctly; and the other times were spent in observing the variety of colouring, and its alterations through change of light.

Now these several methods are very good, and each may be practised as best suits the student and his tem-

per: but they require the necessities of painting, as colours, pencils, pastils, and lefure. Nature however, at certain times, presents extraordinary but transient beauties, and such as can be of no service to the artist who has not as much time as necessary to imitate what he admires. The best way perhaps to make advantage of such momentary occasions is this:

The painter being provided with a quire of paper, and a black-lead pencil, let him quickly, but slightly, design what he sees extraordinary; and, to remember the colouring, let him mark the principal parts with characters, which he may explain at the bottom of the paper, as far as is necessary for himself to understand them: A cloud, for instance, may be marked A, another cloud B, a light C, a mountain D, a terrace E, and so on. And having repeated these letters at the bottom of the paper, let him write against each that it is of such or such a colour; or for greater brevity, only *blue, red, violet, grey, &c.* or any other shorter abbreviation. After this, he must go to painting as soon as possible; otherwise most of what he has observed will, in a little time, slip out of his memory. This method is the more useful, as it not only prevents our losing an infinity of sudden and transitory beauties, but also helps, by means of the afore-said marks and characters, to perfect the other methods we have mentioned.

If it be asked, Which is the properest time for these studies? the answer is, That nature should be studied at all times, because she is to be represented at all seasons; but autumn yields the most plentiful harvest for her fine effects: the mildness of that season, the beauty of the sky, the richness of the earth, and the variety of objects, are powerful inducements with the painter to make the proper inquiries for improving his genius and perfecting his art.

But as we cannot see or observe every thing, it is very commendable to make use of other mens studies, and to look upon them as if they were our own. Raphael sent some young men into Greece to design such things as he thought would be of service to him, and accordingly made use of them to as good a purpose as if he himself had designed them on the spot: for this, Raphael is so far from deserving censure, that he ought, on the contrary to be commended; as an example, that painters ought to leave no way untried for improving in their professions. The landscape-painter may, accordingly, make use of the works of all those who have excelled in any kind, in order to acquire a good manner; like the bees, which gather their variety of honey from different flowers.

*General Remarks on Landscapes.* As the general rules of painting are the basis of all the several kinds of it, we must refer the landscape-painter to them, or rather suppose him to be well acquainted with them. We shall here only make some general remarks on this kind of painting.

I. Landscape supposes the knowledge and practice of the principal rules in *perspective*, in order to maintain probability.

II. The nigher the leaves of trees are to the earth, the larger they are, and the greener; as being aptest to receive, in abundance, the sap which nourishes them: and the upper branches begin first to take the redness

Land-  
scapes.

redness or yellowness which colours them in autumn. But it is otherwise in plants; for their stocks renew all the year round, and their leaves succeed one another, at a considerable distance of time, inasmuch that nature, employed in producing new leaves to adorn the stock as it rises, does by degrees desert the under ones; which, having first performed their office, are the first that die: but this effect is more visible in some than in others.

III. The under parts of all leaves are of a brighter green than the upper, and almost always incline to the silverish; and those which are wind-shaken are known from others by that colour: but if we view them from beneath, when penetrated by the sun's rays, they discover such a fine and lively green as is far beyond all comparison.

IV. There are five principal things which give spirit to landscape, viz. figures, animals, waters, wind-shaken trees, and thinness of pencilling; to which add smoke, when there is occasion to introduce it.

V. When one colour predominates throughout a landscape, as one green in spring, or one red in autumn, the piece will look either as of one colour, or else as unfinished. We have seen many of Bourdon's landscapes, which, by handling the colour one way throughout, have lost much of their beauty, though the situations and waters were very pleasant. The ingenious painter must endeavour to correct, and, as they say, redeem the harsh unsightly colouring of winter and spring by means of figures, waters, and buildings; for summer and autumn subjects are of themselves capable of great variety.

VI. Titian and Caracche are the best models for inspiring good taste, and leading the painter into a good track, with regard to forms and colours. He must use all his endeavours to gain a just idea of the principles which those great men have left us in their works; and to have his imagination filled with them, if he would advance by degrees towards that perfection which the artist should always have in view.

VII. The landscapes of these two masters teach us a great many things, of which discourse can give us no exact idea, nor any general principle. Which way, for example, can the measures of trees in general be determined, as we determine those of the human body? The tree has no settled proportions; most of its beauty lies in the contrast of its branches, an unequal distribution of boughs, and, in short, a kind of whimsical variety, which nature delights in, and of which the painter becomes a judge when he has thoroughly relished the works of the two masters aforesaid. But we must say, in Titian's praise, that the path he struck out is the surest; because he has exactly imitated nature in its variety with an exquisite taste and fine colouring: whereas Caracche, though an able artist, has not, more than others, been free from manner in his landscapes.

VIII. One of the greatest perfections of landscape, in the variety it represents, is a faithful imitation of each particular character: as its greatest fault is a licentious practice, which brings us to do things by rote.

IX. Among those things which are painted practically, we ought to intermix one degree after nature, to induce the spectator to believe that all are so.

VOL. XIII.

X. As there are styles of thought, so there are also styles of execution. We have handled the two relating to thought, viz. the heroic and pastoral; and find that there are two also with regard to execution, viz. the firm style, and the polished; these two concern the pencil, and the more or less ingenious way of conducting it. The firm style gives life to work, and excuse for bad choice; and the polished finishes and brightens every thing; it leaves no employment for the spectator's imagination, which pleases itself in discovering and finishing things which it ascribes to the artist, tho' in fact they proceed only from itself. The polished style degenerates into the soft and dull, if not supported by a good opening or situation; but when those two characters meet, the picture is fine.

SECT. III. *Of Portraiture.*

If painting be an imitation of nature, it is doubly so in a portrait; which not only represents a man in general, but such an one as may be distinguished from all others. And as the greatest perfection of a portrait is extreme likeness, so the greatest of its faults is to resemble a person for whom it was not made; since there are not in the world two persons quite like one another. But before we proceed to the particulars which let us into the knowledge of this imitation, it is necessary, for shortening this part of our subject, to attend to some general propositions.

I. Imitation is the essence of painting: and good choice is to this essence what the virtues are to a man; they raise the value of it. For this reason, it is extremely the painter's interest to choose none but good heads, or favourable moments for drawing them, and such positions as may supply the want of a fine natural.

II. There are views of the natural, more or less advantageous: all depends upon turning it well, and taking it in the favourable moment.

III. There is not a single person in the world who has not a peculiar character both in body and face.

IV. Simple and genuine nature is more proper for imitation; and is a better choice than nature much formed, and embellished too artificially.

V. To adorn nature too much is doing it a violence; and the action which attends it can never be free when its ornaments are not easy. In short, in proportion as we adorn nature, we make it degenerate from itself, and bring it down to art.

VI. Some means are more advantageous than others to come at the same end.

VII. We must not only imitate what we do see in nature, but also what we may possibly see that is advantageous in art.

VIII. Things are valuable by comparison; and it is only by this we are enabled to make a right judgment of them.

IX. Painters easily accustom themselves to their own tints, and the manner of their masters: and after this habit is rooted in them, they view nature not as she really is, but as they are used to paint her.

X. It is very difficult to make a picture, the figures of which are as big as the life, to have its effect near as at a distance. A learned picture pleases the ignorant only when it is at some distance; but judges

4. M

will

Portraiture will admire its artifice near, and its effect at a distance.

XI. Knowledge makes work pleasant and easy. The traveller who knows his road, comes to his journey's end with more speed and certainty than he who inquires and gropes it out.

XII. It is proper, before we begin a work, to meditate upon it, and to make a nice coloured sketch of it, for our own satisfaction, and an help to the memory.

We cannot too much reflect on these propositions; and it is necessary to be well acquainted with them, that they may present themselves to our mind, of their own accord, without our being at the trouble to recall them to our memory when we are at work.

There are four things necessary to make a portrait perfect; *air, colouring, attitude and dress.*

*Of Air.* The air respects the lines of the face, the head-attire, and the size.

The lines of the face depend upon exactness of draught, and agreement of the parts; which altogether must represent the physiognomy of the person painted in such a manner, that the picture of his body may seem to be also that of his mind.

It is not exactness of design in portraits that gives spirit and true air, so much as the agreement of the parts at the very moment when the disposition and temperament of the sitter are to be hit off. We see several portraits which, though correctly designed, have a cold, languishing, and stupid air; whilst others, less correct in design, strike us, however, at first sight with the sitter's character.

Few painters have been careful enough to put the parts well together: Sometimes the mouth is smiling, and the eyes are sad: at other times, the eyes are cheerful, and the cheeks lank: by which means their work has a false air, and looks unnatural. We ought therefore to remember, that, when the sitter puts on a smiling air, the eyes close, the corners of the mouth draw up towards the nostrils, the cheeks swell, and the eye brows widen: but in a melancholy air, these parts have a contrary effect.

The eye brows being raised, give a grave and noble air; but if arched, an air of astonishment.

Of all the parts of the face, that which contributes most to likeness is the nose; it is therefore of great moment to set and draw it well.

Though the hair of the head seems to be part of the dress which is capable of various forms without altering the air of the face; yet the head-attire which one has been most accustomed to, creates such a likeness, that we scarce know a familiar acquaintance on his putting on a perriwig somewhat different from that which he used to wear. It is necessary therefore, as far as possible, to take the air of the head ornament, and make it accompany and set off that of the face, if there be no reason to the contrary.

As to the stature, it contributes so much to likeness, that we very often know people without seeing their face; It is therefore extremely proper to draw the size after the sitter himself, and in such an attitude as we think fit; which was Vandyke's method. Here let us remark, that, in sitting, the person appears to be of a less free make, through the heaving of the shoulders; wherefore, to adjust his size, it is proper to make him

stand for a small time, swaying in the posture we would give him, and then make our observation. But here occurs a difficulty, which we shall endeavour to examine: "Whether it is proper, in portraiture, to correct the defects of nature?"

Likeness being the essence of portraiture, it would seem that we ought to imitate defects as well as beauties, since by this means the imitation will be more complete: it would be even hard to prove the contrary to one who would undertake the defence of this position. But ladies and gentlemen do not much approve of those painters who entertain such sentiments, and put them in practice. It is certain that some complaisance in this respect is due to them; and there is little doubt but their pictures may be made to resemble, without displeasing them; for the effectual likeness is a just agreement of the parts that are painted with those of nature; so that we may be at no loss to know the air of the face, and the temper of the person, whose picture is before us. All deformities, therefore, when the air and temper may be discovered without them, ought to be either corrected or omitted in women's and young men's portraits. A nose somewhat awry may be helped, or a shrivelled neck, or high shoulders, adapted to a good air, without going from one extreme to another. But this must be done with great discretion: for, by endeavouring to correct nature too much, we insensibly fall into a method of giving a general air to all our portraits; just as, by confining ourselves too much to the defects and littleness of nature, we are in danger of falling into the low and tasteless manner.

But in the faces of heroes and men of rank, distinguished either by dignities, virtues, or great qualities, we cannot be too exact, whether the parts be beautiful or not: for portraits of such persons are to be standing monuments to posterity; in which case, every thing in a picture is precious that is faithful. But after whatever manner the painter acquits himself in this point, let him never forget good air nor grace; and that there are, in the natural, advantageous moments for hitting them off.

*Of Colouring.*—Colouring, in portraiture, is an effusion of nature, discovering the true tempers of persons; and the temper being essential to likeness, it ought to be handled as exactly as the design. This part is the more valuable, as it is rare and difficult to hit. A great many painters have come to a likeness by strokes and outlines; but certainly they are few who have shown in colours the tempers of persons.

Two points are necessary in colouring; exactness of tints, and the art of setting them off. The former is acquired by practice, in examining and comparing the colours we see in life with those by which we would imitate it: and the art of those tints consists in knowing what one colour will produce when set by another, and in making good what either distance or time may abate of the glow and freshness of the colours.

A painter who does nothing more than what he sees, will never arrive at a perfect imitation; for though his work may seem, on the easel, to be good to him, it may not appear so to others, and perhaps even to himself, at a distance. A tint which, near, appears disjoined, and of one colour, may look of another at a distance, and be confounded in the mass it belongs to. If you would have your work, therefore, to produce a good

**Attitude.** good effect in the place where it is to hang, both the colours and lights must be a little loaded; but learnedly, and with discretion. In this point consult Titian, Rubens, Vandyke and Rembrandt's methods; for indeed their art is wonderful.

The tints usually require three times of observation. The first is at the person's first sitting down, when he has more spirit and colour than ordinary; and this is to be noted in the first hour of his sitting. The second is when, being composed, his look is as usual; which is to be observed in the second hour. And the third is when, through tiredness by sitting in one posture his colour alters to what weariness usually creates. On which account, it is best to keep to the sitter's usual tint, a little improved. He may also rise, and take some turns about the room, to gain fresh spirits, and shake off or prevent some tiredness.

In *draperies*, all sorts of colours do not suit all sorts of persons. In mens portraits, we need only observe great truth and great force: but in womens there must also be charms; whatever beauty they have must appear in a fine light, and their blemishes must by some means or other be softened. For this reason, a white, lively, and bright tint, ought never to be set off by a fine yellow, which would make it look like plaster; but rather by colours inclining to green, blue, or grey, or such others as, by their opposition, may make the tint appear more fleshy than usual in fair women. Vandyke often made a lillemot-coloured curtain for his ground; but that colour is soft and brown. Brown women on the other hand, who have yellow enough in their tints to support the character of fleshiness, may very well have yellowish draperies, in order to bring down the yellow of their tints, and make them look the fresher, and near very high-coloured and lively carnations linen does wonders.

In *grounds*, two things are observable; the tone and the colour. The colour is to be considered in the same manner as those of draperies, with respect to the head. The tone must be always different from the mass it supports, and of which it is the ground, that the objects coming upon it may not seem transparent, but solid and raised. The colour of the hair of the head usually determines the tone of the ground; and when the former is a bright chestnut, we are often embarrassed, unless helped by means of a curtain, or some accident of the *claro-obscuro*, supposed to be behind, or unless the ground is a sky.

We must further observe, that where a ground is neither curtain nor landscape, or such like, but is plain and like a wall, it ought to be very much party-coloured, with almost imperceptible patches or stains; for besides its being so in nature, the picture will look the more grand.

*Of Attitude, or Posture.*—Attitudes ought to suit the ages and qualities of persons and their tempers. In old men and women, they should be grave, majestic, and sometimes bold: and generally, in women, they ought to have a noble simplicity and modest cheerfulness; for modesty ought to be the character of women; a charm infinitely beyond coquetry! and indeed coquettes themselves care not to be painted such.

Attitudes are of two kinds: one in motion, the other at rest. Those at rest may suit every person; but those in motion are proper for young people only,

and are hard to be expressed; because a great part of the hair and drapery must be moved by the air; motion, in painting, being never better expressed than by such agitations. The attitudes at rest must not appear so much at rest as to seem to represent an inactive person, and one who sits for no other purpose: but to be a copy. And though the figure that is represented be at rest, yet the painter, if he thinks fit, may give it a flying drapery, provided the scene or ground be not a chamber or close place.

It is above all things necessary that the figures which are not employed should appear to satisfy the spectator's curiosity; and for this purpose show themselves in such an action as suits their tempers and conditions, as if they would inform him what they really were; and as most people pretend to sincerity, honesty, and greatness of mind, we must avoid, in attitudes, all manner of affectation; every thing there must appear easy and natural, and discover more or less spirit, nobleness, and majesty, in proportion to the person's character and dignity. In a word the attitudes are the language of portraits: and the skilful painter ought to give great attention to them.

But the best attitudes are such as induce the spectator to think that the sitter took a favourable opportunity of being seen to advantage, and without affectation. There is only one thing to be observed with regard to womens portraits, in whatever attitude they are placed; which is, that they sway in such a manner as to give their face but little shade; and that we carefully examine whether the lady appear most beautiful in a smiling or in a serious air, and conduct ourselves accordingly. Let us now proceed to the next article.

*Of Practice in Portraiture.*—According to De Piles, portraiture requires three different sittings and operations; to wit, dead-colouring, second-colouring, and retouching or finishing. Before the painter dead-colours, he must attentively consider what aspect will best suit the sitter, by putting him in different positions, if we have not any settled design before us: and when we have determined this, it is of the last consequence to put the parts well together, by comparing always one part with another; for not only the portrait acquires a greater likeness when well designed, but it is troublesome to make alterations at the second sitting, when the artist must only think of painting, that is, of disposing and uniting his colours.

Experience tells us, that the dead-colouring ought to be clean, because of the slope and transparency of the colours, especially in the shades: and when the parts are well put together and become clammy, they must be judiciously sweetened and melted into each other; yet without taking away the air of the picture, that the painter may have the pleasure of finishing it, in proportion as he draws. But if fiery geniuses do not like this method of scumbling, let them only mark the parts slightly, and so far as is necessary for giving an air.

In dead-colouring, it is proper to put in rather too little than too much hair about the forehead; that, in finishing, we may be at liberty to place it where we please, and to paint with all possible softness and delicacy. If, on the contrary, you sketch upon the forehead a lock which may appear to be of a good taste,

Practice of  
Vandyke.

and becoming the work, you may be puzzled in finishing it, and not find the life exactly in the same position as you would paint it. But this observation is not meant for men of skill and consummate experience, who have nature in their heads, and make her submit to their ideas.

The business of the second sitting is, to put the colours well in their places, and to paint them in a manner that is suitable to the fitter and to the effect we propose: But before they are made clammy, we ought to examine afresh whether the parts are rightly placed, and here and there to give some touches towards likeness, that, when we are assured of it, the work may go on with greater satisfaction. If the painter understand what he is about, and the portrait be justly designed, he ought as much as possible to work quick; the fitter will be better pleased, and the work will by this means have the more spirit and life. But this readiness is only the effect of long study and experience; for we may well be allowed a considerable time to find out a road that is easy, and such as we must often travel in.

Before we retouch or finish, it is proper to terminate the hair, that, on finishing the carnations, we may be able to judge of the effect of the whole head.

If, at the second sitting, we cannot do all we intended, which often happens, the third makes up the loss, and gives both spirit, physiognomy, and character.

If we would paint a portrait at once, we must load the colouring; but neither sweeten, nor drive, nor very much oil it: and if we dip the pencil in varnish as the work advances, this will readily enable us to put colour on colour, and to mix them without driving.

The use and sight of good pictures give greater light into things than words can express. What hits one artist's understanding and temper may be disagreeable to another's; and almost all painters have taken different ways, though their principles were often the same.

We are told that a friend of Vandyke's having observed to him now little time he bestowed on his portraits. Vandyke answered, "That at first he worked hard, and took great pains, to acquire a reputation, and also to get a swift hand, against the time he should work for his kitchen." Vandyke's custom is said to have been this: He appointed both the day and hour for the person's sitting, and worked not above an hour on any portrait, either in rubbing in or finishing; so that as soon as his clock informed him that the hour was out, he rose up, and made a bow to the fitter, to signify, that he had done enough for that day, and then appointed another hour some other day; whereupon his servant came to clean his pencils, and brought a fresh pallet, whilst he was receiving another fitter, whose day and hour he had before appointed. By this method he worked on several pictures the same day with extraordinary expedition.

After having lightly dead-coloured the face, he put the fitter into some attitude which he had before contrived: and on a grey paper, with white and black crayons, he designed, in a quarter of an hour, his shape and drapery, which he disposed in a grand

manner, and an exquisite taste. After this he gave the drawing to the skilful people he had about him, to paint after the fitter's own clothes, which at Vandyke's request, were sent to him for that purpose. When his disciples had done what they could to these draperies, he lightly went over them again; and so, in a little time, by this great knowledge, displayed the art and truth which we at this day admire in them. As for hands, he had in his house people of both sexes, whom he paid, and who served as models.

This conduct of Vandyke, however, is mentioned rather to gratify the reader's curiosity, than to excite his imagination; he may choose as much of it as he pleases, and as suits his own genius, and leave the rest.

We must observe by the way, that there is nothing so rare as fine hands, either in the design or colouring. It is therefore convenient to cultivate, if we can, a friendship with some woman who will take pleasure in serving for a copy: The way to win them is, to praise their beauty exceedingly. But if an opportunity serves of copying hands after Vandyke, it must not be let slip: for he drew them with a surprising delicacy, and an admirable colouring.

It is of great service to copy after the manners which come nearest to nature; as are those of Titian and Vandyke. We must, at such times, believe them, to be nature itself; and, at some distance, consider them as such, and say to ourselves.—*What colour and tint shall I use for such a part?* And then, coming near the picture, we ought to examine whether we are right or not; and to make a fixed rule of what we have discovered, and did not practise before without uncertainty.

It is recommended, before we begin colouring, to catch the very first moments, which are commonly the most agreeable and most advantageous, and to keep them in our memory for use when we are finishing: for the fitter, growing tired with being long in the same place, loses those spirits, which, at his first sitting down, gave beauty to the parts, and conveyed to the tint more lively blood, and a fresher colour. In short, we must join to truth a probable and advantageous possibility, which, far from abating likeness, serves rather to set it off. For this end, we ought to begin with observing the ground of a tint, as well what it is in lights as in shades; for the shades are only beautiful as they are proportioned to the light. We must observe, if the tint be very lively, whether it partake of yellowness, and where that yellowness is placed; because usually, towards the end of the sitting, fatigue diffuses a general yellowness, which makes us forget what parts were of this colour, and what were not, unless we had taken due notice of it, before. For this reason, at the second sitting, the colours must be everywhere readily clapped in, and such as appear at the first sitting down; for these are always the finest.

The surest way to judge of colours is by comparison; and to know a tint, nothing is better than to compare it with linen placed next it, or else placed next to the natural object, if there is occasion.—We say this only to those who have little practised nature.

The portrait being now supposed to be as much finished

Judgment  
of Tints.

Different Methods of Painting. finished as you are able, nothing remains, but, at some reasonable distance, to view both the picture and sitter together, in order to determine with certainty, whether there is any thing still wanting to perfect the work.

SECT. IV. *Of Theatrical Decorations; the Designs for Furniture, Embroidery, Carriages, &c.*

*Of Theatrical Decorations.*—This is a particular art which unites several of the general parts of painting with the knowledge of architecture, perspective, &c. They who apply themselves to it would do well to design their decorations by day, and to colour them by candle-light, as they will be much better able to judge of the effect of a painting intended to be viewed by that light. It is proper also to caution the young painter to avoid, as much as possible, the uniting the imitations of nature with nature itself; that is, he should not introduce with his decorations living horses, or other animals, real fountains or cascades, trees, or statues, &c. For such combinations are the effect of ignorance and a bad taste; they are the resource of painters of little ability; they discover a sterility of invention, and produce great inconvenience in the representation. Those pieces which they call moving pictures, where the painted landscape remains immoveable, and the figures move by means of springs, form a part of these decorations; and there are some of them, as those of Antwerp and Ghent, that have a pleasing effect.

The designs for *furniture, carriages, porcelain*, and other branches of manufacture, form also a very important article of painting in general, and of academy painting in particular. This is a distinct branch of the art; and without doubt not the least useful of its parts, as it concurs so essentially to the success of manufactures, and consequently to the prosperity of a state: and it is an art, to which it were much to be wished that youth of ability and invention would apply themselves. See the articles *JAPANNING* and *PORCELAIN*.

SECT. V. *Enumeration of the different Methods of Painting, or the different Means and Materials that Painters make use of to imitate all visible Objects on a plane Superficies.*

Those now in practice are,

1. Painting in *OIL*; which is preferable to all other methods, as it is more susceptible of all sorts of expressions, of more perfect gradations of colours, and is at the same time more durable.

2. *Mosaic* painting; an invention truly wonderful; it is composed of a great number of small pieces of marble of different colours, joined together with stucco. The works of this kind are made principally at Rome, where this art has been carried so far as to resemble the paintings of the greatest masters; and of these are made monuments for the latest posterity.

3. Painting in *Fresco*; which is by drawing, with colours diluted with water, on a wall newly plastered, and with which they so incorporate, that they perish only with the stucco itself. This is principally used on ceilings.

4. Painting in *WATER-COLOURS*; that is, with colours mixed with water and gum, or paste, &c.

5. *MINIATURE* painting; which differs from the preceding as it represents objects in the least discernible magnitudes.

6. Painting in *CRAYONS*; for which purpose colours, either simple or compound, are mixed with gum, and made into a kind of hard paste like chalk, and with which they draw on paper or parchment.

7. Painting in *ENAMEL*; which is done on copper or gold, with mineral colours that are dried by fire, and become very durable. The paintings on the *PORCELAIN* of China and Europe, on Delft ware, &c. are so many sorts of enamel.

8. Painting in *WAX*, or *ENCAUSTIC* painting: This is a new or rather an old invention renewed, in which there are in France performances highly pleasing. It is done with wax mixed with varnish and colours.

9. Painting on *GLASS*; of which there are various kinds.

See all the articles here enumerated, explained in the order of the alphabet. On one of them, however, some additional observations may here be subjoined.

§ 1. *Of painting in Fresco.*

Of all kinds of painting fresco is the most ancient, the most durable, the most speedily executed, and the most proper to adorn great buildings. It appears, that the fragments of ancient painting handed down to us by the Romans are all in fresco. Norden, quoted by Winkelman, speaks of the ruins of Egyptian palaces and temples, in which are Colossian paintings on walls 80 feet high. The description which those authors have given of these paintings, of the prepared ground, and of the manner in which the colours have been employed, &c. shows plainly that they have been executed in fresco.

The stability of fresco is demonstrated by the existence of those fragments of the highest antiquity. There are no other kinds of painting which could equally have resisted the injuries of the weather, the excessive aridity of certain elements, the moisture of subterraneous situations, and the encroachments of barbarians.

There are different opinions concerning the climate most proper to preserve this kind of painting. "It is observed (says Felibien), that the colours in fresco fade sooner in Italy and Languedoc than at Paris; perhaps from less heat in the last mentioned place, or better lime." M. Falconet contradicts this assertion in his notes on Pliny, vol. i. p. 223. of his miscellaneous works, published at Paris 1787. Painting in fresco, according to this author, is longer preserved in dry and warm, than in northern and moist climates. However opposite the sentiments of these two authors may appear to be, it is possible to reconcile them, when we consider, that the exposure to a burning sun is capable of operating a great change of the colours on the one hand, and that the frost in a cold climate inevitably destroys the paintings of fresco on the other. Frost is capable of bursting stones, of corroding the petrified veins of earth in the heart of coloured marble, and, in short, nothing can resist its destructive operation.

These observations on fresco painting, lead us to conclude, that the choice of place, when they are without doors, is of the greatest importance. In countries where

Fresco.

Fresco.

where there is little or no frost, an exposure to the north is the most favourable; and in cold climates a western exposure should be made choice of, because the first rays of the rising sun have a very pernicious effect after frost. We are not, however, wholly to adopt the sentiment of M. Falconet with regard to the pernicious effects of moisture on fresco paintings: for, 1. The ancient paintings recovered from moist places, in which they were buried for many ages, have, under enormous heaps of earth, preserved all their colours. Those from the ruins of Herculaneum have been observed, on the contrary, to lose their colours in a short time after they have been dried by the exterior air. 2. The mortar which composes the ground of this painting is not destroyed in our rainy climates. It is necessary frequently to use powder in removing pieces of this mortar, which are now found to obstruct some buildings in Paris.

After the choice of place, the choice of materials is the next thing of importance in executing fresco. To make it durable, the ground is the object of chief attention; and to make this perfect, the mortar used by the ancients, now unknown, would be necessary.

It is easy to perceive, that a minute detail of forms, an extensive mixture and gradation of tints, and the merit of a delicate and gentle touch, can make no part of the excellencies of this kind of painting. It cannot bear a close examination like a picture in oil. There is always something dry and rough which displeases. An artist who would flatter himself with success in a fresco placed near the eye would be grossly deceived: a common spectator would find it coarse and badly finished.

Fresco is chiefly employed in palaces, temples, and public edifices. In these vast places no kind of painting can be preferred to it; large, vivid in its strokes, and constantly fresh, it enriches the architecture, animates it, and gives relief to the eye from the repetition of the same forms, and the monotony of colour in a place where coloured marbles and bronzes are not employed. Still more a fine fresco gives the greatest effect to a lofty building, since this building serves as a frame and support to this enchanting art, which fixes the attention of every person of sensibility and taste.

We shall afterwards have occasion to show the manner of executing fresco, as well as the nature and application of the colours employed in it: it is necessary to demonstrate here, that it has a freshness, splendor, and vigour not to be found in oil or water colours.

A known principle in all kind of painting is, that the colouring is more perfect in proportion as it approaches to the lights and shades in nature. As colours applied to any subject can never reach this degree of perfection, the allusion which painters produce consists in the comparison and opposition of the tones of colours among themselves.

If the white of the finest and purest oil appears heavy and grey, compared with great lights in natural whites, it follows, that, in order to copy them with fidelity, the tones which follow the first white must be degraded in an exact proportion. Thus it is necessary that the shades of a picture be considerably deeper than those of the model; especially if, from the greatest lights to the browns, one hath propor-

tionally followed the distance which is found between the colours on the pallet and the tones of the object copied.

Now if the white of fresco be infinitely more bright than that of oil, the same effect will be obtained in a brown tone. On the other side, if it constantly happens that the brown tones of fresco are much more vigorous than those of water colours, and equal even to the browns of oil itself, it is certain that it possesses a splendor and vigour more extensive than any other kind of painting. Thus in the hands of an artist who is well acquainted with the colours fit for fresco, it is more susceptible of the general effect, and more capable than any other kind of giving projection and the semblance of life to the figures.

If we were to inquire why painting in fresco is now scarcely or never practised, we should perhaps ascribe it to the great talents required to execute it. "Many of our painters (says Vasari in his treatise on painting) excel in oil and water colours, and yet fail in fresco; because of all kinds this requires the greatest strength of genius, boldness in the strokes, and resolution." If in an age abounding in great masters, it was difficult to excel in this kind, it must be much more so in ours; but we should not require the characters of sublimity and style to which men were accustomed in the time of Vasari.

We should execute in fresco as we do in oils; for Italy herself, along with Michael Angelo and Zuccharo, had Cortonni Giardano and Francischini as middling fresco-painters. And in France, Lafosse, Bon Boulogne, and Perur, performed several works in fresco which might be imitated by the painters of our times. But let us proceed to the real causes for abandoning this art. These proceed from the want of knowledge and taste in the persons who employ the artists, and from the manners of the age. As a pleasant or licentious conceit, unfinished colouring, and bold effects of shade, are the chief objects of consideration, a very smooth painting enlivened by gentle touches completely gratifies the person who pays the price; and therefore the philosophical principles of the art, which require study, are not cultivated.

We shall now attend to the mechanical process of this useful and beautiful kind of painting. Before painting, it is necessary to apply two layers. If the wall on which you are to paint is of brick, the layer is easily applied; but if it is of freestone closely united, it is necessary to make excavations in the stone, and to drive into them nails or pegs of wood in order to hold the first layer.

The first layer is made of good lime and a cement of pounded brick, or, which is still better, river-sand: this latter forms a layer more uneven, and better fitted to retain the second smooth and polished layer applied to its surface.

There should be experiments to discover a layer still more compact, and more independent of the variations of the air; such for example, as covers the aqueducts and ancient reservoirs constructed by the Romans in the neighbourhood of Naples.

Before applying the second layer, on what you are to paint, it is necessary that the first be perfectly dry; for there issues from the lime, when it is moist, a smell both disagreeable and pernicious to the artist.

Fresco.

When

Fresco.

When the first layer is perfectly dry, it is wet with water in proportion to its dryness, that the second layer may the more easily incorporate with it.

The second layer is composed of lime flaked in the air and exposed for a year, and of river-sand, of an equal grain, and moderately fine.

It requires an active and intelligent mason to apply this layer, as the surface must be altogether equal. The operation is performed with a trowel; and the operator requires to have a small piece of wood to take away the large grains of sand, which remaining, might render the surface uneven.

To give a fine polish to this layer, one ought to take a sheet of paper, apply it to the wall, and pass and repass the trowel over the paper. By this means the little inequalities which hurt the exactness of the stroke, and which produce false appearances at a distance, are entirely smoothed.

The artist must not lay more than the painter can finish in a day, as this kind of painting must be executed on a fresh ground.

The layer being thus prepared, the painter begins his operation; but as painting in fresco must be executed rapidly, and as there is no time to retouch any of the strokes, the painter, as we have observed under the article *Fresco*, takes care to provide himself with large cartoons, on which he has drawn, with exactness, and in their full size, the figures which he is to paint, which leaves him nothing to do but to copy them on the wall.

The cartoons are composed of several sheets of large paper pasted one on another, neither too thick nor too slender.

The painter traces the tracks of the figures on the plaster, by passing a steel point over the tracks in the cartoons, or in pricking them.

Having in this manner attained an exact and speedy drawing, it now remains to execute the painting.

But it is essential, when one wishes to finish any small work of this kind, in the first place to be informed of the proper colours, and of those which cannot be used.

In general the colours which are extracted from earths, and those which have passed through the fire, are the only ones which can be employed in this kind of painting.

The colours are white, made of lime, the white of egg-shells, ultramarine, the black of charcoal, yellow ochre, burnt vitriol, red earth, green of Verona, Venetian black, and burnt ochre.

There are others which require to be used with great precaution, such as enamel blue, cinnabar, and white marble dust.

When enamel blue is used, it requires to be applied instantaneously, and when the lime is very moist, otherwise it does not incorporate with the plaster; and if one retouch with this colour, it must be done an hour or more after the first application, to increase its lustre.

With regard to the white marble dust, it is subject to turn black if it be not mixed up with a convenient quantity of white lime.

Cinnabar, which has a splendour almost superior to all other colours, loses it almost entirely when mixed with lime. At the same time, it may be employed in

places not exposed to the air, with a little degree of care in the preparation. Reduce a quantity of the purest cinnabar to powder, put it into an earthen vessel, and pour lime-water on it for two or three times. By this process the cinnabar receives some impression of lime-water, which makes it capable of being employed in fresco-painting.

One of the best colours, and the one most used in fresco for the gradation of tints, and for giving the requisite tone, is white of lime. This white is prepared by mixing lime flaked long before with good water. The lime deposits a sediment at the bottom of the vessel; when the water is poured off, this sediment is the white of lime.

Another kind of white might be used, the effects of which would be known by experience, namely, the white of egg-shells. To prepare this white one must take a great quantity of shells of eggs, which must be pounded and boiled in water along with a quantity of quicklime; and after this they are put into a strainer, and washed repeatedly with fountain-water.

The shells are again pounded until the water employed for that purpose become pure and limpid; and when they are in this manner reduced to powder, this powder is grinded in water, and formed into small pieces, and dried in the sun.

All the different kinds of ochres make excellent colours for fresco, and take different shades, being previously burned in iron chests.

With regard to the Naples yellow, it is dangerous to use it where the painting is much exposed to the air. The blacks of charcoal, of peach stones, and of vine twigs, are good; but that extracted from bones is of no value.

Roman vitriol gathered at the furnaces, and which is called *burnt vitriol*, grinded afterwards in spirit of wine, resists the air extremely well when employed in lime. There is also a red extracted from this preparation somewhat like that produced from lac.

This colour is very proper for preparing the layers to be coloured with cinnabar; and the draperies painted with these two colours will vie in splendor with those painted with fine lac in oil.

The ultramarine is the most faithful colour; and it not only never changes, but it communicates this precious quality to those colours with which it is mixed.

The manner of employing those colours, is to grind them in water, and to begin by arranging them into the principal tints you are to employ: these are afterwards put into pots; and it is necessary to use a great many pallets raised at the edges, to form the intermediate shades, and to have under your eye all the shades you require.

As all the tints, except burnt ochre, violet red, and blacks of all kinds, are apt to become clear, the painter must have beside him some pieces of brick or new tile very dry. A dash of the colours is applied to one of these with the pencil before using them; and as tile instantaneously imbibes the water, one perceives what the shade will be after the fresco is dry.

§ 2. *Elydoric Painting, invented by M. Vincent of Montpellier.*

THIS new kind of painting is little known, and capable of great improvement.

Elydoric Painting.

Elydoric  
Painting.

Its principal advantages are, that the artist is able to give the greatest finishing possible to small figures in oil; and to add to the mellowness of oil painting, the greatest beauty of water-colours in miniature, and to do it in such a manner that it appears like a large picture seen through a glass which diminishes objects.

This kind of painting takes its name from two Greek words expressive of *oil* and *water*; because these two liquids are employed in the execution. The following is the manner of proceeding: A piece of very fine linen or of white taffety, is sized with starch, in the most equal manner possible, on pieces of glass about two inches square, the angles of which are blunted in order that the cloth may cover them neatly and without wrinkles.

When these pieces of cloth are sufficiently dry, a layer composed of whitelead finely grinded, and oil of pinks or of poppies, the whitest that can be found, is applied to them with a knife. When this layer is dry enough to admit of scraping, more may be applied if necessary.

As it is of the greatest importance for the preservation of this kind of painting, that the different layers be purged oil, in order that they may imbibe the colours applied to them, it is necessary that their surface be very smooth, very dry, and very hard.

The artist is next provided with a circle of copper nearly two inches in diameter, one-fourth of an inch in height, extremely thin, and painted on the inside with black. This circle is employed to contain the water on the surface of the picture.

The preference is given to water distilled from rain or snow; because ordinary water, from the salts which it contains, is pernicious to this kind of painting.

It is necessary also to observe, that the colours must be grinded between two oriental agates, most carefully preserved from dust, and mixed with oil of poppies, or any other siccativ oil which has been extracted without fire, and pure as water.

All the colours being grinded, they are placed in a small heap on a piece of glass which is covered with distilled water in a tin-box.

When the materials are thus prepared, the subject is slightly traced on one of the pieces of cloth above-mentioned with a lead pencil.

The tints are formed on the pallets from the heaps of colours under the water, and the pallet placed as usual on the left arm with the thumb through the aperture.

The picture is held before the thumb and forefinger, supported by the middle, and the necessary pencils between the third and little fingers. The hand is supported on the back of a chair, that there may be full liberty of bringing the work near, or keeping it at a distance from the eye.

The pencils are cleaned with the essence of rectified turpentine.

After having made the rough draught with the colours still fresh, the circle of copper, which ought to surround the picture is fitted exactly to the surface.

The distilled water is poured within this circle to the height of one-eighth part of an inch; and the body is leaned forward till the sight fall perpendicularly on the object.

The third finger of the right hand must rest on the internal right angle of the picture.

The artist, with a fine and firm pencil, runs over the first draught, to give colour to the weak places, and to soften those which appear too strong.

As soon as the oil swims on the top, the water is poured off, and the picture is carefully covered with a watch-glass, and dried in a box with a gentle heat.

When it is sufficiently dry, to be scraped almost to a level with the knife: the above operation is renewed till the artist is satisfied with his work.

It is in this last work that the artist feels all the advantage of this new method for finishing.

The water poured on the picture discovers all the faults of the pencil, gives facility in searching into the bottom of the shades, and the power of correcting the work and rendering it perfect.

When the work is finished: it is put under a crystal where there is no admission of external air, and dried with a gentle heat.

Elydoric  
Painting.

## PART III. Or OECONOMICAL PAINTING.

### SECTION III.

THE object of this Part is to give an account of some mechanical proceedings in certain kinds of painting, calculated to preserve and embellish the walls of houses and furniture. This branch of the art extends to every part of architecture. The whole building becomes the workshop of the artist; the stairs, the balustrades, the fascies, the doors, and the railing of all kinds, occupying his first care, and then the ceilings and wainscoting.

The artist gives to all his subjects a chosen and uniform tint; but he has it in his power to vary the colours on different parts of the building in such a manner as to produce the most pleasing effect.

Among the utensils of the painter, it is needless, but for rendering the article complete, to mention the brushes and pencils of all sizes as absolutely necessary.

The brushes are made of boars bristles, or of hair with a mixture of bristles; they ought to be straight, very smooth, and of a round form. Half an hour before they are used, it is proper to soak them in water, in order to swell the wood of the handle, and prevent the hairs from falling off; after this they may be applied to all purposes, either in water colours or in oil; but it may be observed, that for the former they require less softening.

The pencils are made of badgers hair, or any fine hairs encased in the pipes of quills of all sizes.

The vessels wherein the pencils are cleaned is made of copper or of tin, smooth below, rounded at the ends, and divided into two parts by a thin plate in the middle. The oil, or the substance with which the pencil is cleaned, is contained in one of the divisions.

The pallet is made of the wood of the pear or apple tree, of an oval or square shape, very slender, but some

22  
Of the  
utensils for  
this kind of  
painting.

**Oeconomical Painting.** somewhat thicker at the centre than at the extremities. A hole is made in one of its sides sufficiently large to admit the thumb of the workman.

When the pallet is new, it is covered with oil of walnuts; and as often as it dries, the operation is repeated, till it be fully impregnated; it is afterwards polished, and finally rubbed with a piece of linen dipped in oil of common nuts,

The painter's knife is a thin flexible plate, equally slender on both sides, rounded at one extremity, and the other fixed into a handle of wood.

All the vessels employed to hold the colours should be varnished: a precaution necessary to prevent their drying too quickly.

<sup>23</sup> **Of grinding and diluting the colours.** To grind, is to reduce to powder the substances which give colours on a piece of marble or any hard stone by means of water, oil or essence.

To dilute, is to impregnate a liquid with a tint in such a manner as to make it capable of being applied by a brush.

When the materials are grinded in water, it is proper to dilute them in size made from parchment. If they are diluted in spirit-of-wine, there must be no more diluted than what serves the immediate occasion, as colours prepared in this manner dry very rapidly.

Colours grinded in oil are sometimes diluted with pure oil, more frequently with oil mixed with essence, and commonly with the pure essence of turpentine; the essence makes the colours easy to work. Those prepared in this manner are more solid, but they require more time to dry.

When colours are grinded with the essence of turpentine, and diluted in varnish, as they require to be immediately applied, it is necessary to prepare a small quantity at a time. This preparation of colours gives greater brilliancy, and dries more speedily, than those prepared in oil: but they require more art to manage them.

They grind colour or coloured substances with a mullet, which is employed on the stone till they become a very fine powder. The operation is facilitated by moistening them from time to time with a little water, and by collecting them under the mullet with the knife. They are afterwards laid in small heaps on a sheet of white paper, and allowed to dry in a situation not exposed to dust. Those who grind white lead have a stone for the purpose, as this colour is very easily tarnished. In executing this part well, it is necessary to grind the colours equally and moderately; to grind them separately, and not to produce a tint by mixture till the colours are well prepared.

Dilute no more at a time than what you have occasion to employ, to prevent them from growing thick.

In grinding the colours, put in no more liquid than what is necessary to make the solid substances yield easily to the mullet: the more the colours are grinded they mix better, and give a smoother and more agreeable painting.

It is also necessary to give all attention to the grinding and diluting of colours, that they may be neither too thick nor too thin.

#### SECT. II. *Application of Colours.*

1. PREPARE only the quantity necessary for the work you undertake, because they do not keep long;

VOL. XIII.

and those which are newly mixed are more vivid and beautiful.

2. Hold the brush straight before you, and allow only the surface to be applied to the subject: if you hold it inclined in any other direction, you will run the hazard of painting unequally.

3. It is necessary to lay on the colours boldly, and with great strokes; taking care at the same time to spread them equally over the surface, and not filling up the moulding and carved work. If this accident should happen, you must have a little brush to clean out the colours.

4. Stir them frequently in the vessel, that they may preserve always the same tint, and that no sediment may remain at the bottom.

5. Take care not to overcharge the brush with the colour.

6. Never apply a second layer till the first or preceding one be perfectly dry; which it is easily known to be when, in bearing the hand gently over it, it does not adhere.

7. In order to render this drying more speedy and uniform, make always the layers as thin as possible.

8. Before painting, it is necessary to prime the subject; that is, to give it a layer of size, or of white colouring oil, to fill up the pores, and render the surface smooth; by this means fewer layers of colour or of varnish are afterwards necessary.

9. Every subject to be painted or gilded, ought to have first a white ground; this preserves the colours fresh and vivid, and repairs the damage which they occasionally receive from the air.

#### § 1. *Of painting in Water-colours.*

To paint in water-colours, is to do it in those which are grinded in water and diluted in size. There are three kinds of this painting; namely, *common*, the *varnished*, and that which is called *king's white*; but before entering on these, it is necessary to make some preliminary observations.

1. Take care that there be no grease on the subject; and if there be, scrape it off, or clean it with a lye, or rub the greasy part with garlic and worm-wood.

2. Let all the diluted colour fall in threads from the end of the brush when you take it out of the vessel; if it adheres to it, it is a proof that it wants size.

3. Let the layers, especially at the beginning, be laid on very warm, provided that the liquid be not boiling, which would effectually spoil the subject; and if on wood, expose it to crack. The last layer, given immediately before the varnish, is the only one which ought to be applied cold.

4. In very fine work, where it is necessary to have beautiful and solid colours, the subjects are prepared by size and proper whites, which serve as a ground to receive the colour, and render the surface very equal and smooth.

5. Whatever colour is to be laid on, the white ground is the best, as it assimilates most easily with the painting, which borrows always something of the ground.

6. If knots of wood are found in the subject, it is necessary to rub them with garlic, to make the size adhere.

Applica-  
tion of  
Colours.

To make the following details sufficiently plain, we shall take the measures to which the quantity of colours are applied at fathoms: that is to say, six feet in height by six feet in breadth. We shall afterwards fix the quantity of materials, and of liquids necessary to cover this surface. This, however, cannot be exactly defined; as some subjects imbibe the colours much more than others. The manner of employing them also makes a difference; as habit enables one to manage them to greater advantage than another. And it is also to be observed, that the first layer will consume more than the second; and that a prepared subject requires less than one which has not been so.

When we speak of a fathom, it must be understood of a smooth and equal surface; for if the wood is varied with mouldings and carving, there must be a difference in the quantity of colours. In general it requires about a pound of colours to paint a square fathom in water-colours. In making up this quantity, take three-fourths of colours grinded in water, and one fourth pound, or six ounces, of size to dilute it.

#### § 2. Of painting in common Water-colours.

WORKS which require no great care or preparation, as cielings and staircases, are generally painted in common water colours, *i. e.* with earths infused in water and diluted in size.

For a common white kind of this painting, steep Spanish white moderately pounded in water for two hours. Infuse a proper quantity of the black of charcoal in water for the same space of time; mix the black and white in the proportion that the tint requires; afterwards mix them up with a pretty strong size, sufficiently thick and warm, and apply them to the subject in as many layers as may be thought necessary. It requires about two pounds of white in a pint of water, and a quantity of black in proportion to the tint, together with a part of size, to cover a square fathom. If this be employed on old walls, they must be well scraped, the dust brushed off with a hair besom, and washed carefully with lime-water. If on new plaster, the colours require more size.

All kinds of colours may be grinded in water only when the tint is made; and when they have been infused in water, they must be mixed up with size.

#### § 3. Walls done with the White Des Carmes,

THE white *des carmes*, is a manner of whitening interior walls, whereby they are rendered extremely beautiful.

1. Procure a quantity of the very best lime, and pass it through fine linen; pour it into a large tub, furnished with a spigot at the height equal to that which the lime occupies: fill the tub with clear fountain-water; beat the mixture with great pieces of wood, and then allow it to settle for 24 hours.

2. Open the spigot, allow the water to run off, supply the tub with fresh water, and continue this operation for several days until the lime receives the greatest degree of whiteness.

3. When you allow the water finally to run off, the lime will be found in the consistency of paste, but with the quantity you use it is necessary to mix a little Prussian blue or indigo to relieve the brightness of the

white, and a small quantity of turpentine to give it brilliancy. The size proper for it is made of glove-leather, with the addition of some alum; and the whole is applied with a strong brush in five or six layers to new plaster.

4. The wall is strongly rubbed over with a brush of hogs bristles after the painting is dry; which gives it its lustre and value, and which makes it appear like marble or stucco.

#### § 4. Of Badegon.

BADGEON is a pale yellow colour applied to plaster to make it appear like free stones. It gives to old houses and churches the exterior of a new building, by assuming the colour of stones newly cut.

1. Take a quantity of lime newly killed.

2. Add to it the half quantity of what the French call *sciure de pierre*, in which you have mixed of the ochre of *rue*, according to the colour of the stone you intend to imitate.

3. Steep the whole in a pail of water, in which is melted a pound of rock alum. When the *sciure de pierre* cannot be obtained, it is necessary to use a greater quantity of ochre of *rue*, or of yellow ochre, or grind the scales of the stone de St Leu; pass it through a sieve; and along with the lime it will form a cement, on which the weather will scarcely make any impression.

#### § 5. Of Cielings and the Roofs of Rooms.

WHEN the cielings or roofs are new, and you wish to whiten them, take white of Bougival, to which add a little of the black of charcoal to prevent the white from growing reddish: infuse them separately in water; mix the whole with half water and half size of glove-leather, which being strong would make the layer come off in rolls if it were not reduced with water. Give two layers of this tint while it is lukewarm.

If the roof has been formerly whitened, it is necessary to scrape to the quick all the remaining white; then give it two or three layers of lime to ground and whiten it: Brush it carefully over; and give it two or three layers of the white of Bougival prepared as before.

#### § 6. Of Colouring the backs of Chimneys with Lead Ore.

CLEAN them with a very strong brush, and carefully rub off the dust and rust; pound about a quarter of a pound of lead ore into a fine powder, and put it into a vessel with half a pint of vinegar; then apply it to the back of the chimney with a brush: When it is made black with this liquid, take a dry brush, dip it in the same powder without vinegar, and dry and rub it with this brush till it become shining as glass.

#### § 7. Of Varnished Water-colours.

THE advantages of this kind of painting are, that the colours do not fade; that they reflect the light; that they give no offensive smell, but permit the places to be inhabited as soon as finished; and that the varnish preserves the wood from insects and moisture.

To make a fine varnish on water colours, seven principal operations are necessary; namely, to size the wood, to prepare the white, to soften and rub the subject, to clean the moulding, to paint, to size, and to varnish.

Applica-  
tion of  
Colours.

Applica-  
tion of  
Colours.

24  
First ope-  
ration.

To size the wood is to give one or two layers of size to the subject which you intend to paint.

Take three heads of garlic and a handful of worm-wood leaves; boil them in three pints of water till they are reduced to one; pass the juice through a linen cloth, and mix it with a pint of parchment size; add half a handful of salt and half a pint of vinegar; and boil the whole on the fire.

Size the wood with this boiling liquor; allow it to penetrate into the carved and smooth places of the wood, but take care at the same time to take it as clean off the work as possible, or at least to leave it at no place thicker than another. This first sizing serves to fill up the pores of the wood, and to prevent the materials afterwards from collecting in a body, which would cause the work to fall off in scales.

In a pint of strong parchment size, to which you have added four pints of warm water, put two handfuls of white Bougival, and allow it to infuse for the space of half an hour.

Stir it well, and give a single layer of it to the subject very warm but not boiling, equally and regularly laid on, and dashed with repeated strokes of the brush into the mouldings and carved work.

25  
Second o-  
peration.

To prepare the white, take a quantity of strong parchment size, and sprinkle lightly over it, with the hand, Bougival white, till the size be covered with it about half an inch in thickness; allow it to soak for half an hour as near the fire as to keep it milk warm; and then stir it with the brush till the lumps are broken, and it be sufficiently mixed.

Give seven, eight, or ten layers of this white, or as many as the nature of the work or the defects in the wood shall render necessary, giving more white to the parts which require to be softened; but in general, the layers must be equal both with regard to the quantity of the white and the strength of the size.

The last layer of the white ought to be clearer than the rest, which is made by adding water. It must be applied more slightly, taking care with small brushes to cover all the difficult places in the mouldings and carved work. It is necessary also, between the drying of the different layers, to fill up all the defects with white mastich and size.

26  
Third ope-  
ration.

To soften, is to give to the subject after the whitening a smooth and equal surface, and to rub it over with a pumice-stone.

The wood being dry, take little pieces of white wood and of pumice-stone, grinded for the purpose into all necessary forms, either for the panels or the moulding.

Take cold water, heat being destructive of this kind of work; in summer it is common to add a little ice. Soften the wall with a brush, but only as much at a time as you can easily work, as the water might dilute the white and spoil the whole. Then smooth and rub it with the pumice stones and with the small pieces of wood: Wash it with a brush as you smooth it, and rub it over with a piece of new linen, which gives a fine lustre to the work.

27  
Fourth o-  
peration.

The mouldings and carved work are cleaned with an iron; and the only thing to be attended to in the operation is not to raise the grain of the wood.

The subject thus prepared is ready to receive the co-

lour you intend to give it. Choose your tint; suppose Painting in Oil-colours

Grind white ceruse and Bougival white separately in water, of each an equal quantity, and mix them together.—Add a little blue of indigo and a very small quantity of black of charcoal from the vine tree very fine, grinded also separately, and in water; more or less of the one or other gives the tint you require.—Dilute this tint in strong parchment size; pass it through a bolting cloth of silk very fine, and lay the tint on your work, taking care to spread it very equally; and then give it two layers, and the colour is applied.

Make a weak, beautiful, and clean size; stir it till it cools; strain it through a fine cloth, and give two layers to the work with a soft painting brush, which has been used, but which you have been careful to clean. Take care not to choak up the mouldings nor to lay on the size thicker on one place than another, and spread it over the work very slightly, otherwise you will dilute the colours, and occasion undulations in the painting.

The beauty of the work depends on this last sizing; for if any part is omitted, the varnish will penetrate into the colours and give it a darker shade.

When the sizing is dry, lay on two or three layers of spirit-of-wine varnish, taking care that the place on which you lay it be warm, and the work is finished.

#### § 8. *Of the King's White.*

This derives its name from the use of it in the apartments of the French king. It is in all respects conducted like the former, except that there is only a small quantity of indigo, to take the yellow from the white, without any black of charcoal, and without varnish.

This white answers extremely well for apartments which are seldom used; but otherwise it spoils easily, especially in bed-chambers. It is the best white where there is any kind of gilding; and in this case it receives a little varnish.

#### SECT. III. *Of Painting in Oil-colours.*

To paint in oil is to apply to all sorts of subjects, as walls, wood, cloths, and metals, coloured earths grinded and diluted in oil. The ancients are thought to have been ignorant of this art, and the honour of the discovery is generally ascribed to John Van Eyck a Flemish painter. The secret is nothing more than substituting oil in the place of water in grinding and diluting colours.

By means of oil the colours are longer preserved; and not drying so speedily, they give painters longer time to smooth, finish, and retouch, their works; the colours being more marked, and mixing better together, give more distinguishable tints, and more vivid and agreeable gradations, and the colouring is more sweet and delicate.

The painting in oil consists of two kinds, namely, of that in simple oil and of that in polished oil varnish.

#### § 1. *Observations on painting in Oil.*

1. When bright colours, as white or grey, are grinded and diluted in oil, it is necessary to make use of the

Painting in Oil colours oil of walnuts, but if the colours be dark, such as chestnut, or olive, or brown, you must make use of pure linseed oil.

2. When the colours are grinded and diluted in oil, they must be laid on cold, except on a new or moist plaster, which requires them to be boiling.

3. Every colour diluted in pure oil, or in oil mixed with essence, ought to fall in threads from the end of the brush.

4. Take care to stir from time to time your colour before taking it up on the brush, that it may preserve an equal thickness, and consequently the same tone. Notwithstanding the precaution of stirring, if it is found to be thicker towards the bottom, it will be necessary to pour in from time to time a little oil.

5. In general, every subject which is painted in oil ought first to receive one or two layers of white ceruse, grinded and diluted in oil.

6. When the painting is exposed to the air, as in doors, windows, and other works, which cannot be varnished, it is necessary to make these layers with pure oil of walnuts, mixed up with about one ounce of essence to a pound of colours; more would make the colours brown, and occasion them to fall off in dust; but this quantity prevents the sun from blistering the work.

7. In subjects on the inside of the house, or when the painting is varnished, the first layer ought to be grinded and diluted in oil, and the last diluted with pure essence.

8. If copper or iron, or other hard substances, are to be painted, it is necessary to mix a little essence with the first layers, to make the oil penetrate into them.

9. When there are many knots in the subject, as is particularly the case with fir-wood, and when the colour does not easily take impression on these parts, it is necessary, when you paint with simple oil, to lay on a little oil mixed with litharge on the knots. If you paint with polished oil varnish, it is necessary to apply a hard tint, which we shall have occasion to speak of afterwards. A single layer well applied is generally sufficient to give a body to the wood, and make the other layers apply easily.

10. There are colours, such as what the French call *filz-de-grain*, black of charcoal, and especially bone and ivory-blacks, which are difficult to dry when grinded in oil. To remedy this inconveniency, the following ficcative are mixed with the colours, to make them dry, viz. litharge both of the silver and gold colour, vitriol or copperas, and what is called *ficcative oil*.

#### § 2. *Observations on the Siccatives.*

1. Do not mix the ficcative with the colours till they are to be employed, otherwise it will thicken them.

2. Mix it only in very small quantities in tin, where there is white lead or ceruse, because those colours are ficcative of themselves, especially when they are diluted in essence.

3. In painting which is to be varnished, give the ficcative only to the first layer, and allow the other layers, in which there is essence, to dry of themselves.

4. In dark colours in oil, give to every pound of

colours in diluting them half an ounce of litharge; to bright colours, a drachm of white copperas grinded in walnut oil. Painting in Oil-colours

5. When in place of litharge or copperas the ficcative oil is employed, it requires a quarter of this oil to every pound of colour.

The ficcative oil is prepared of one half ounce of litharge, as much of calcined ceruse, as much of *terre d'ombre*, a colour with which the French paint shadows, and as much of talc boiled for two hours on a slow and equal fire, with one pound of linseed oil, and stirred the whole time. It must be carefully skimmed and clarified, and the older it grows it is better.

#### § 3. *Observations on the Quantities of Substances and Liquids.*

1. Ochres and earths require more liquids both in grinding and diluting than ceruse.

2. Different quantities of liquids are required in the grinding only on account of greater or less dryness; but in diluting, the quantity is always the same.

3. For the first layer after the priming, which has no relation to the colours laid on afterwards, to a square fathom give fourteen ounces of ceruse, about two ounces of liquid to grind, and four ounces to dilute it. If there is a second layer of the same materials, the quantities will require to be less.

4. It will require three pounds of colour for three layers of a square fathom. The first may consume eighteen ounces, the second sixteen, and the third fourteen.

5. To compose these three pounds of colour, take two or two and a half pounds of grinded colours, and dilute them in a pint or three half pints of oil, mixed with essence or pure oil. But if the first layer of ceruse is not used, there will be a necessity for a greater quantity of colours.

N. B. In the following kinds and applications of oil painting, we are to hold those proportions in our eye.

#### § 4. *Painting in simple Oil.*

On doors and windows give a layer of ceruse grinded in oil of walnuts diluted in the same oil, together with a little ficcative; then give another layer of the same preparation; to which, if you want a greyish colour, add a little black of charcoal and Prussian blue, grinded also in oil of walnuts. If to those you incline to add a third layer, grind and dilute it in pure walnut oil; observing that the two last layers be less clear, or have less oil in them, than the first; the colour in this case is more beautiful and less apt to blister with the sun.

Walls that are to be painted must be very dry; and this being supposed, give two or three layers of boiling linseed oil to harden the plaster; then lay on two layers of ceruse or ochre, grinded and diluted in linseed oil; and when these are dry, paint the wall.

To paint tiles of a slate colour, grind separately ceruse and German black in linseed oil; mix them together in the proportion which the colour requires, and dilute them in linseed oil; then give the first layer very clean to prime the tiles; and make the three next layers thicker to give solidity to the work.

To paint arbours and all kinds of garden work, give

<sup>31</sup> Of doors, windows, and window-shutters.

<sup>32</sup> Of Walls.

<sup>33</sup> Of Tiles.

Painting in give a layer of white ceruse grinded in oil of walnuts, Oil-colours and diluted in the same oil, with the addition of a

34 Of arbours, &c. little litharge, then give two layers of green, composed of one pound of verdigrise and two pounds of white lead, grinded and diluted in oil of walnuts. *N.B.* This green is of great service in the country for doors, window shutters, arbours, gardens, seats, rails, either of wood or iron; and in short for all works exposed to the injuries of the weather.

35 Of statues and vases. To whiten statues, vases, and all ornaments of stone, either within or without doors: first clean the subject well, then give one or two layers of white ceruse, grinded and diluted in pure oil of pinks, and finish with giving one or many layers of white lead prepared in the same manner.

36 Painting on the inside of the house. If you wish to paint on walls not exposed to the air, or on new plaster, give one or two layers of boiling linseed oil, and continue the brush till the walls are fully soaked; then give a layer of white ceruse, grinded in oil of walnuts and diluted with three fourths of the same oil and one fourth essence; and lastly, give two layers more of white ceruse, grinded in oil of walnuts and diluted in oil mixed with essence, if it is not to be varnished; but in pure essence if it is. It is in this manner that walls are painted white. If you adopt another colour, it is necessary to grind and dilute it in the same quantities of oil and essence.

37 Chairs, benches, stone, and plaster. To paint chairs, benches, stone, or plaster, give a layer of white ceruse grinded in oil of walnuts and diluted in the same oil, into which you have cast a little litharge to make it dry; then apply a layer of the tint you fix on, grinded in oil and diluted in one part oil and three parts essence; and afterwards give two more layers of the same tint grinded in oil and diluted in pure essence: This may be varnished with two layers of spirit of wine.

38 Steel-colour for locks. To make a steel colour, grind separately in essence, white ceruse, Prussian blue, fine lac, and verdegrise. The tone which you require is procured by the proper mixture of those ingredients. When you have fixed on the tone of colour, take about the size of a walnut of the ingredients, and dilute them in a small vessel in one part of essence and three parts of white oily varnish. *N.B.* This colour is generally made of white ceruse, of black charcoal, and Prussian blue, grinded in thick oil, and diluted in essence, which is the cheapest method of procuring it; but the former is the most beautiful.

39 Ballustrades and railings. For painting ballustrades and railings, dilute lamp-black with varnish of vermilion; giving two layers of it, and afterwards two layers of spirit-of-wine varnish.

40 Wainscoting of apartments. Since the discovery of oil painting, and the knowledge that wood is preserved by it, and especially since the discovery of a varnish without smell, and which even takes away that of oil, the painting of apartments in oil has been with justice preferred.

In fact the oil stops up the pores of the wood; and although it does not altogether resist the impression of moisture, yet the effect is so little perceptible, that it is to be recommended as the best method of preserving wood.

To preserve wainscoting in the most effectual manner from moisture, it is necessary to paint the wall be-

hind it with two or three layers of common red, grinded and diluted in linseed oil. Painting in Oil-colours

To paint the wainscoting itself, give a layer of white ceruse grinded in oil of walnuts, and diluted in the same oil mixed with essence. This layer being dry, give two more of the colour you have adopted, grinded in oil and diluted in pure essence. If you wish the mouldings and sculpture to be painted in a different colour, grind and dilute it in the same manner.

Two or three days after, when the colours are fully dry, give two or three layers of your white varnish without smell, and which also prevents the offensive smell of the oil colours. *N.B.* Those who begin their operations in water colours, if they find it more agreeable, may finish it in oil colours as above.

When the pores of the wood are well stopped by the prepared white, a layer of white ceruse grinded in oil of walnuts, and diluted in the same oil, mixed with essence, may be applied. This will be sufficient, the wood being previously primed; and afterwards lay on your intended colour and varnish.

#### § 5. *Painting in Oil with the polished Varnish.*

THIS is the best kind of oil painting, owing more to the care it requires than to the proceedings, for they are nearly the same with those of simple oil-painting; the difference consisting only in the preparation and manner of finishing.

To paint wainscottings of apartments with the polished varnish, it is necessary, in the first place, that the pannels be new. Then,

1. Make the surface of the subject which you mean to paint very smooth and level, which is done by a layer, which serves to receive the hard tint or polished ground and the colours.

This layer ought to be of white, whatever colour you are afterwards to apply. It consists of white ceruse grinded very fine in linseed oil, with a little litharge, and diluted in the same oil mixed with essence.

2. Make the polished ground by seven or eight layers of the hard tint. In painting equipages, a dozen is necessary.

The hard tint is made, by grinding pure white ceruse, which has not been much calcined, very finely in thick oil, and diluting it with essence. You must take care that the layers of the hard tint be not only equal as to the application, but to the quantity of the white ceruse and the oil, and to the degree of calcination. Then,

3. Soften this ground with pumice-stone.

4. Polish it moderately with a piece of serge soaked in a pail of water, in which you have put some powder of pumice-stone finely grinded and passed through a fine sieve. There is no occasion to spare washing, as this part of the operation will not spoil with water.

5. Choose the tint with which you intend to decorate your apartment; grind it in oil, and dilute it in essence; pass it through a piece of very fine silk, give two or three layers carefully and thinly spread over the surface, as on this part of the operation depends in a great measure the beauty of the colour. All sorts of colours:

Painting in colours may be employed in this manner in oil of essence.

6. Give two or three layers of a spirit of wine varnish, if it is to wainscoting; if to the body of a coach, a varnish of oil is employed. If the varnish is to be polished, it is necessary to get seven or eight layers at least, laid on equally and with great precaution, not to be thicker in one place than another, which occasions spots.

7. It is again polished with pumice-stone reduced to powder, and water and a piece of serge. If the wainscoting has been painted before, it is necessary to rub off the colour till you come to the hard tint, which is done with pumice stone and water, or with a piece of linen dipped in essence.

<sup>42</sup> White varnish polish in oil. There is a white painting in oil, called *white varnish*, which corresponds to the king's white in water colours, and is equal to the freshness and gloss of marble if it is applied to wood. To paint in this manner,

1. Give a layer of white ceruse grinded in oil of walnuts, with a little calcined copperas, and diluted in essence. But if it is applied to stone, it is necessary to employ oil of walnuts and calcined copperas alone.

2. Grind white ceruse very fine in essence, and dilute it in fine white oil varnish with copal.

3. Give seven or eight layers of it to the subject.—The varnish mixed with the white ceruse dries so promptly, that three layers of it may be given in a day.

4. Soften and polish all the layers as above.

5. Give two or three layers of white lead grinded in oil of walnuts, and diluted in pure essence.

6. Give seven or eight layers of white spirit of wine varnish, and then polish them.

#### § 6. Of painting in Varnish.

To paint in varnish, is to employ colours grinded and diluted in varnish, either in spirits of wine or oil, on all sorts of subjects. Wainscoting, furniture, and equipages are painted in this manner, though we shall confine ourselves to the first.

1. Give two layers of white of Bougival, diluted in a strong size boiling hot.

2. Give a layer of what the French call *de blanc apprêt*.

3. Fill up the defects of the wood with mastich in water; and when the layers are dry, smooth them with the pumice stone.

4. When the wood is smooth, suppose the paint a grey colour, take one pound of white ceruse, one drachm of Prussian blue, or of black of charcoal or ivory black; put the white into a piece of leather, so tied that the colours cannot escape; shake them till they are sufficiently mixed.

5. Put two ounces of colours into a quartern of varnish, mix them carefully; give one layer above the white.

6. This layer being dry, put one ounce of colours into the same quantity of varnish as above, and give a second layer.

7. To the third layer give half an ounce of colour to the same quantity of varnish.

8. As each of these layers dry, be careful to rub them with a piece of new coarse cloth, in such a man-

ner, however, as not to injure the colour. *N.B.* The three layers may be given in one day.

9. If you want to give a perfect lustre, add a fourth layer prepared as the third.

All other colours, as blue, &c. may be applied in the same manner. This method is the only one by which orpiment can be employed in all its beauty, but not without some of its inconveniences.

Another manner of performing this kind of work, is to apply the colours and the varnish without previously using the size and the white ground. This is extremely expeditious, but it is easy to perceive it will want the polish and brilliancy of the other.

#### SECTION IV.

WE cannot perhaps more properly conclude this article, than with an account of M. de Morveau's attempts to render more perfect the proportion of colours, and especially of *white*, employed in painting. These we shall extract from a memoir of his read in the academy of Dijon.

"White (says the ingenious academician) is the most important of all colours in painting. It affords to the painter the materials of light, which he distributes in such a manner as to bring his objects together, to give them relief, and that magic which is the glory of his art. For these reasons I shall confine my attention at present to this colour.

"The first white which was discovered, and indeed <sup>43</sup> Examination of known whites. the only one yet known, is extracted from the calx of lead. The danger of the process, and the dreadful distemper with which those employed in it are often seized, have not yet led to the discovery of any other white. Less anxious, indeed, about the danger of the artist than the perfection of the art, they have varied the preparation, to render the colour less liable to change. Hence the different kinds of white, viz. white of creams in Austria, white lead in shells, and white ceruse. But every person conversant in colours, knows that the foundation of all these is the calx of lead, more or less pure, or more or less loaded with gas. That they all participate of this metallic substance, will indeed appear evident from the following experiment, which determines and demonstrates the alterability of colours by the phlogistic vapour.

"I poured into a large glass bottle a quantity of liver of sulphur, on a basis of alkali, fixed or volatile, it makes no difference; I added some drops of distilled vinegar, and I covered the mouth of the bottle with a piece of pasteboard cut to its size, on which I disposed different samples of creams, of white lead, and of ceruse, either in oil or in water; I placed another ring of pasteboard over the first, and tied above all a piece of bladder round the neck of the bottle with a strong packthread. It is evident, that in this operation I took advantage of the means which chemistry offers to produce a great quantity of phlogistic vapour, to accomplish instantaneously the effect of many years; and, in a word, to apply to the colours the very same vapours to which the picture is necessarily exposed, only more accumulated and more concentrated. I say the same vapour, for it is now fully established, that the smoke of candles, animal exhalations of all kinds, calefactive, odours, the electric effluvia, and even light, furnish continually

Proportion of Colours. continually a quantity more or less of matter, not only analogous, but identically the same with the vapour of vitriolic acid mixed with sulphur.

"If it happens that the samples of colours are sensibly altered by the phlogistic vapour, then we may conclude with certainty, that the materials of which the colours are composed, bear a great affinity to that vapour; and since it is not possible to preserve them entirely from it in any situation, they will be more or less effected with it, according to the time and a variety of circumstances.

"After some minutes continuance in this vapour, I examined the samples of colours submitted to its influence, and found them wholly altered. The ceruse and the white lead both in water and oil were changed into black, and the white of creams into a brownish black; and hence those colours are bad, and ought to be abandoned. They may indeed be defended in some measure by varnish: but this only retards for a time the contact of the phlogistic vapour: for as the varnish loses its humidity, it opens an infinite number of passages to this subtle fluid.

"After having ascertained the instability of the whites in common use, I made several attempts to discover such as would prove more lasting; and tho' many of these attempts were without effect, I shall give a succinct account of the whole, which may save a great deal of trouble to those who wish to travel over the same field.

"There are three conditions essential to a good colour in painting.

"*First*, That it dilute easily, and take a body both with oils and with mucilages, or at least with the one or other of these substances, a circumstance which depends on a certain degree of affinity. Where this affinity is too strong, a dissolution ensues; the colour is extinguished in the new composition, and the mass becomes more or less transparent; or else the sudden refraction absorbs the fluid, and leaves only a dry substance which can never again be softened. But if the affinity is too weak, the particles of colour are scarcely suspended in the fluid, and they appear on the canvass like sand, which nothing can fix or unite.

"The *second* condition is, That the materials of which colours are composed do not bear too near an affinity with the phlogistic vapour. The experiments to which I submitted whites from lead, is an infallible means of ascertaining the quality of colours in this respect, without waiting for the slow impression of time.

"A *third* condition equally essential is, That the colouring body be not volatile, that it be not connected with a substance of a weak texture, susceptible of a spontaneous degeneracy. This consideration excludes the greater part of substances which have received their tint from vegetable organization: at least it makes it impossible to incorporate their finer parts with a combination more solid.

"After these reflections, my researches were directed, first, to the five pure earths; next, to the earthy compounds; in the third place, to the earthy salts, which can scarcely be dissolved; lastly, to the metallic earths, either pure or precipitated by Prussian alkali. M. Wenzel has discovered a sixth earth, which I call *eburne*, and which, after other experiments I thought of applying to the purposes of painting; but I soon

perceived that it would have the same fault with other kinds of earth, and, besides, that it could not be obtained but at a very considerable expence.

"The five pure earths possess fixity in a very great degree, and at the same time are little affected by the phlogistic vapour; but they refuse to unite with oil or mucilages, and the white is totally extinguished when they are grinded with these liquids. I made several attempts on earth from allum, not only because M. Beaume recommended the use of it in painting, and because it enters into the composition of Prussian blue, but also because it is a chief ingredient in ochres, and other earths of that nature, which supposes that it should unite in a certain degree with diluting liquors; notwithstanding, in whatever manner I treated it, it would not yield a white; but one would be less surprised at this want of success, when he considers that in the ochres and Prussian blue, the earth from alum is only the vehicle of the colouring body, whereas here it is the colour itself.

"To be convinced of the truth of this observation, it is only necessary to mix equal parts of this earth, or even of clay not coloured, with ceruse or any other white: the mixture will be susceptible of being grinded in oil or in gum without being extinguished; it will easily unite with any coloured substance, and be productive of no bad consequences to the pure earths.

"Nature and art present to us a considerable number of earthy compositions sufficiently white for the purposes of painting; such as the jasper white, the feldspar white, the schirl white, &c. But all these substances, in all the trials which I made, had the fault which I have already mentioned; and originating from the same cause, they wanted a fixed colouring body, which would not change when it is pulverized, nor be extinguished when it is diluted.

"The ultramarine blue, which is extracted from the blue jasper, and known by the name of lapis lazuli, seems at first view to warrant the possibility of appropriating to painting all the opaque half-vitrified compositions of the nature of jasper.

"Prepossessed with this idea, I conceived the hope of producing a true white lapis; but I soon perceived that the experiment confirmed the principle which I had laid down from my observations on pure earths: since it is not the substance peculiar to the jasper which constitutes the ultramarine blue, but the metallic substance which accidentally colours this particular kind of jasper.

"In the same manner, art in this imitation of nature should have for its object to give a permanent base to a colour already formed, to fix it without altering, and to augment perhaps its splendor and its intensity, without attempting to produce a colour.

"In excepting from earthy and metallic salts all those of which the acid is not completely saturated, which would easily attract the humidity of the air, or which would be easily dissolved, you have but a very small number to make experiments on.

"The natural and artificial *selenite* gives with oil a paste without colour, and tasting somewhat like honey; its white is better preserved with a gum, but even in this case it resembles a half transparent pap.

"The natural or regenerated *spat perant* is the most likely salt to produce white. As it is of all others the

most

Proportion of Colours. most difficult to dissolve, it appears after pulverization to be a very fine white, but is scarcely touched with oil when it becomes grey and half transparent: the mucilage alters it also, although less discernibly; and it does not even resume its white colour after it becomes dry on the canvass.

"The same is the case with *calcareous borax*, formed by the dissolution of borax in lime water; its white is completely extinguished with oil, less so with gum; but it hardens so instantaneously with the latter, that it is impossible ever to dilute it again.

"Calcareous tartar, obtained by casting quick lime into a boiling dissolution of cream of tartar, is affected with oil in the same manner as selenite; but with mucilaginous water it gives a pretty good white, only possessed of little reflection, and appearing like plaster; it applied very well to the canvass, and resisted the phlogistic vapour.

"According to M. Weben, in his work entitled *Fabriken, und Kunste*, published 1781, the white called in Germany *kremhofer wies*, is nothing but the vitriol of lead, prepared by dissolving lead in nitrous acid, and precipitating in it vitriolic acid; and forming it afterwards into solid tablets by means of gum water. It is certain that this resembles in no shape the white called in France the white of crems; at least I never found that it could be dissolved in vinegar: but I tried the white prepared in M. Weben's manner, and the result was the same as above, that is to say, it turned completely black.

"The vitriols of lead and of bismuth alter more speedily than the calces of those metals. And thus, with the exception of calcareous tartar, which may be of some use in water-colours, the best earthy salts on which I have made experiments, may all, or the most of them give a basis to some colours, but cannot constitute by themselves a colour useful in painting.

"Of the known metallic substances, there are nine which yield white calces; namely, silver, mercury, lead, tin, antimony, bismuth, zinc, arsenic, and manganese.

"Of these nine substances, we may almost pass over silver and mercury; because, though they yield a very fine white, precipitated by means of crystallized vegetable alkali, yet it is soon altered when exposed to the air; that from silver changing into black, and this from mercury into yellow.

"It is well known that lead gives a very good white, and one which unites easily with oil or size; but that it is extremely liable to change, has been my principal object to prove; and the experiments which I have made place it beyond contradiction.

"I shall add, that if there is a preparation able to correct this fault, it should be the precipitation of the earth of this metal in its acetous dissolution by Prussian alkali; but the white which results from this preparation becomes sensibly brownish when it is exposed a few minutes only to the phlogistic vapour.

"It would be therefore unreasonable to persevere in the use of this substance, or to wish to render it fixed, since the changes which it undergoes do not alter its nature, and the indestructible order of its affinities.—

The calx of tin is easily applied to any purpose, and experiences no change from the concentrated phlogistic vapour. These considerations induced me to endeavour to obtain the calx perfectly white; and here follows the result of my operations: The tin of calcined *melac* gives a pretty white calx; but whatever attention I paid to take off the red surface which the violence of the fire occasioned, it takes always a shade of grey when it is diluted. Tin calcined by nitre infusion, gives a tarnished and gross calx, which multiplied washings could not deprive of a yellowish tint.

"Having precipitated, by means of crystallized vegetable alkali, a dissolution of English tin, which had been made in the muriatic acid, after the manner of M. Bayen to extract the arsenic, I had a calx of the greatest whiteness, so light that it buoyed up to the surface of the liquor, and so thin that the greater part of it passed through the filter; but it experiences at the same time a kind of adherence with the salts, which makes the part of it retained by the filter incapable of being pulverized, gummy, half transparent, and even a little changed into yellow. In this condition it is extinguished when diluted; it is necessary, therefore, to moisten it in boiling water, and afterwards to calcine slightly the sediment after it has had sufficient time to settle.

"I have tried the calcination by means of moisture, in employing the tin of the purest *melac*, and a rectified nitrous acid, according to the method of Meyer. It formed a very white sparkling calx, which remained in the filter in the consistency of jelly.—Meanwhile, I observed that it was always a little yellow by the mixture of a portion of that earth, which took in the operation, the colour of turbid mineral.

"A very fine white calx is extracted from antimony, calcined by nitre infusion; but the earth of this semi-metal must be placed in the number of those which combine too easily with the phlogistic vapour. The diaphoretic antimony, grinded in oil, took in ten minutes in my phlogistic apparatus a colour somewhat like sulphur.

"The property of bismuth to give a very fine white calx, known by the name of *magftery*, or white sand, is generally known; it is easily prepared, since it is only necessary to dissolve the bismuth in nitrous acid, and to precipitate the dissolution by pure water: it dilutes perfectly with oil and mucilages. But this colour ought to be rejected, as the most alterable by the phlogistic vapour. It became completely black in ten minutes in my apparatus; and this fact is also proved from what happens to women who use this colour, when they are exposed to the vapours of sulphur, of garlic, or of any putrid substances.

"Zinc furnishes by all the processes of calcination and precipitation a pretty white calx, when it is pure and separated from iron; otherwise the dissolutions of the vitriol of zinc will become yellow when exposed to the air. I have precipitated those dissolutions by lime-water, by caustic, and effervescent alkalis; I have calcined this semi-metal alone and with nitre; and in all those operations I have obtained an earthy substance of different degrees of whiteness, which, after it was dried and prepared, mixed readily with oil and mucilages

Proportion of Colours. mucilages without losing its colour: and which experienced no sensible change when exposed to the phlogistic vapour.

"These valuable properties, the chief object of my researches, engaged me to multiply my experiments, to determine at once the most economical process, and the most advantageous and infallible preparation.—These attempts have convinced me, that the calcination of this semi-metal alone in a crucible, placed horizontally on the corners of a reverberating furnace, gives the purest, the whitest, and the least reducible calx; and that to make an excellent colour, it is sufficient to separate the parts not burned with water, and grind it with a little of the earth of alum or chalk to give it a body. Zinc precipitated in Prussian alkali, even in distilled vinegar, retains always a shade of yellow, does not unite so well in oil, and takes a demitransparent consistence like cheesc.

"White arsenic extinguishes much less in diluting than one would believe from its saline nature; it preserves its colour best in gum water: and it is remarkable, that instead of turning black in the phlogistic vapour, it takes a very distinct shade of yellow. This property is sufficiently singular and constant to furnish a new method of analysing arsenic, so as to know it. And this alteration of colour makes it of no use in painting, although its deleterious qualities did not forbid the practice.

"The semi-metal known by the name of *manganese* gives also a white calx. I had at first great hopes from this colour, as, contrary to all those extracted from the other metals, it became white by the phlogistic vapour. There remained, therefore, but one difficulty to overcome, viz. to separate from the *manganese* the portion of iron which it usually contained, and which infallibly makes the earth a little yellow. To accomplish this in the cheapest manner, I submitted the black ore of the *manganese* to a long calcination, to render its iron insoluble: I afterwards applied vinegar to it, after the example of M. de la Peyrouse: and in precipitating the dissolution by effervescent alkali, I easily obtained a pure white precipitate. But I soon perceived that the facility with which a colouring body loses its phlogiston, is no less an inconvenience than that of attracting it, and productive of the same alterations.

"The white of *manganese* became very soon yellow when exposed to the air; and this is not to be ascribed to the iron contained in it, since neither the galls nor Prussian alkali had discovered any of it in the dissolution. This substance, therefore, can be of no use in producing a white colour for painting."

The experiment by which M. de Morveau tried the colours not alterable by the phlogistic vapour, was performed before the academy, the prince of Conde being president. "I placed (says he) in my apparatus pieces of cloth, on which were laid the white of calcareous tartar in water, different preparations of white from tin and zinc, in oil and water; and I al-

lowed them to continue exposed to the phlogistic vapour during a sitting of the academy: if they were not altered, their superiority over the whites in use would be sufficiently established. The sitting continued for near an hour; and the bottle having been opened, all the colours continued to have the same shade which they had before. I can, therefore, recommend to painters those three whites, and particularly that of zinc, the preparation of which is exposed to less variation, the shade more lively and uniform, and moreover it is fit for all purposes, and perhaps procured at less expence.

"I will assert farther, that it may be procured in sufficient quantities to supply the place of ceruse in every branch of the art, even in interior house-painting:—I would recommend it, less with the view of adding new splendor to this kind of ornament, than for the safety of those who are employed in it, and perhaps for the safety of those who inhabit houses ornamented in this manner.

"But without being too sanguine, altho' the processes in the fabrication be simplified in proportion to the demand, as is usually the case, yet there is reason to apprehend, that the low price of ceruse will always give it the preference in house-painting. With regard to those who apply colours to nobler purposes, they will not hesitate to employ the white of zinc. I am assured that four franks is paid for the pound of white of crems; and I believe the white in question, prepared in the manner which I have pointed out, might be sold for six.

"M. Courtors, connected with the laboratory of the academy, has already declared that it is used for house-painting: less, however, in regard to its unalterability, than to its solubility: and this can be the more readily believed, as the flower of zinc enters into many compositions of the apothecary. The same M. Courtors has arrived at the art of giving more body to this white, which the painters seemed to desire, and also of making it bear a comparison with white lead either in water or oil. The only fault found with it, is its drying slowly when used in oil; but some experiments which I have made, incline me to believe that this fault may be easily remedied, or at least greatly corrected, by giving it more body. At any rate, it may be rendered siccativ at pleasure, by adding a little vitriol of zinc or copperas slightly calcined.

"Painters already know the properties of this salt, but perhaps they do not know that it mixes with the white of zinc better than with any other colour; the reason is, they have chemically the same base. It is prepared by purging the white copperas of that small portion of iron which would render it yellow; and this is easily done in digesting its dissolution, even when cold, on the filings of zinc.

"The mixture of this salt thus prepared is made on the pallet, without producing any alteration, and a small quantity will produce a great effect."

Pair,  
Pairing.

PAIR; two of a sort, a couple.

PAIRING, the uniting or joining in couples.

The instinct of pairing is bestowed on every species of animals to which it is necessary for rearing their young; and on no other species. All wild birds pair; but with a remarkable difference between such as place their nests on trees and such as place them on the ground. The young of the former, being hatched blind, and without feathers, require the nursing care of both parents till they be able to fly. The male feeds his mate on the nest, and cheers her with a song. As soon as the young are hatched, singing yields to a more necessary occupation, that of providing food for a numerous issue; a task that requires both parents.

Eagles and other birds of prey build on trees, or on other inaccessible spots. They not only pair, but continue in pairs all the year round; and the same pair procreates year after year. This at least is the case of eagles: the male and female hunt together, unless during incubation, at which time the female is fed by the male. A greater number than a single pair are never seen in company.

Gregarious birds pair, in order probably to prevent discord in a society confined to a narrow space. This is the case particularly of pigeons and rooks. The male and female sit on the eggs alternately, and divide the care of feeding their young.

Partridges, plovers, pheasants, sea-fowl, grouse, and other kinds that place their nests on the ground, have the instinct of pairing; but differ from such as build on trees in the following particular, that after the female is impregnated, she completes her task without needing any help from the male. Retiring from him, she chooses a safe spot for her nest, where she can find plenty of worms and grass-feed at hand; and her young, as soon as hatched, take foot, and seek food for themselves. The only remaining duty incumbent on the dam is, to lead them to proper places for food, and to call them together when danger impends. Some males, provoked at the desertion of their mates, break the eggs if they stumble on them. Eider ducks pair like other birds that place their nests on the ground; and the female finishes her nest with down plucked from her own breast. If the nest be destroyed for the down, which is remarkably warm and elastic, she makes another nest as before. If she is robbed a second time, she makes a third nest; but the male furnishes the down. A lady of spirit observed, that the eider duck may give a lesson to many a married woman, who is more disposed to pluck her husband than herself. The black game never pair: in spring, the cock on an eminence crows, and claps his wings; and all the females within hearing instantly resort to him.

Pairing birds, excepting those of prey, flock together in February, in order to choose their mates. They soon disperse; and are not seen afterward but in pairs.

Pairing is unknown to quadrupeds that feed on grass. To such it would be useless; as the female gives suck to her young while she herself is feeding. If M. Buffon deserves credit, the roe-deer are an exception. They pair, though they feed on grass, and have but one litter in a year.

Beasts of prey, such as lions, tygers, wolves, pair not. The female is left to shift for herself and for her

young; which is a laborious task, and often so unsuccessful as to shorten the life of many of them. Pairing is essential to birds of prey, because incubation leaves the female no sufficient time to hunt for food. Pairing is not necessary to beasts of prey because their young can bear a long fast. Add another reason, that they would multiply so fast by pairing, as to prove troublesome neighbours to the human race.

Among animals that pair not, males fight desperately about a female. Such a battle among horned cattle is finely described by Lucretius. Nor is it unusual for seven or eight lions to wage bloody war for a single female.

The same reason that makes pairing necessary for gregarious birds, obtains with respect to gregarious quadrupeds: those especially who store up food for winter, and during that season live in common. Discord among such would be attended with worse consequences than even among lions and bulls, who are not confined to one place. The beavers, with respect to pairing, resemble birds that place their nests on the ground. As soon as the young are produced, the males abandon their stock of food to their mates, and live at large; but return frequently to visit them while they are suckling their young.

Hedgehogs pair as well as several of the monkey-kind. We are not well acquainted with the natural history of these animals; but it would appear that the young require the nursing care of both parents.

Seals have a singular economy. Polygamy seems to be a law of nature among them, as a male associates with several females. The sea-turtle has no occasion to pair, as the female concludes her task by laying her eggs in the sand. The young are hatched by the sun, and immediately crawl to the sea.

PAISLEY, a town of Renfrewshire, in Scotland, situated about six miles and a half west of Glasgow, on the river White-Cart, over which there are two stone-bridges of two arches each, and one which consists of three arches. The town is very ancient; but was of much less consequence formerly than it is at present. "No satisfactory etymology has hitherto occurred of the name *Paisley*. The following has been suggested by a good Gaelic scholar: 'A ridge of rocks that runs across the river and forms a beautiful cascade, would prior to the building of the town, be undoubtedly the most striking object that this place would present. The brow or face of a rock is in Gaelic *Pais-licht*. A church in front of the rock would be the church in *Pais-licht*. A church did stand here previous to 1160; it is named in the foundation charter *Eccl'ia de Paflet*, Latinized, in the records of the monastery, *Paflatum*, an easy derivative from *Pais-licht* in all probability the original of the modern *Paisley*.' It was erected into a burgh in barony by James IV. in the year 1488, at that time probably deriving all its importance from the rich monastery, which had been established there for several ages; for George Schaw, who was then abbot of that monastery obtained this privilege from the king. Even in Mr Crawford's time, who wrote the history of the shire of Renfrew near the beginning of this century, it seems to have been but an inconsiderable place; for he describes it as consisting only of one principal street, about half a mile in length, with several lands belonging to it; whereas

Account of  
Scotland,  
vol. vii.

*Paisley.* now the town, with its suburbs, occupies such an extent of ground, that strangers are apt to consider it as, next to Edinburgh and Glasgow, the largest and most populous town in Scotland. Its buildings of late years have been greatly improved; its streets are well paved; and the different parts of the town and suburbs, where the river intervenes, are connected with one another by three bridges at convenient distances."

The affairs of the community are managed by three bailies, of which the eldest is commonly in the commission of the peace, a treasurer, a town-clerk, and 17 counsellors, who are annually elected upon the first Monday after Michaelmas. It enjoys all the powers necessary for government and police, without any of the burdens to which royal boroughs are subjected. The freedom of the place is conferred on very moderate terms. The revenues of the town are not great, but they have been managed to the best advantage. The rapid increase of the place has not been attended with a proportional increase of revenue; therefore several necessary improvements, and intended public buildings, are not yet carried into execution. It gives the title of baron to the earls of Abercorn; the first of whom was a younger son of the Duc de Chateilhaut. The *black book of Paisley*, frequently mentioned in Scottish history, was a chronicle of the public affairs and remarkable events, kept by the monks who resided in the monastery. It agreed in every material fact with the *Scoti-chronicon* of Fordun; and is by many thought to be the same performance.

The old part of the town runs from east to west upon the south slope of a ridge of hills, from which there is a fine prospect of the city of Glasgow and the adjacent country; but to the southward, the view terminates in a ridge of green hills, about two miles distant. Including the late buildings and suburbs, it is fully a mile long, and nearly as much in breadth. On the east side of the river Cart, stand the abbey and new town. This new town was some years ago feued off by the earl of Abercorn, and now consists of a number of handsome buildings. The streets are laid off in a regular manner, but (rather unfortunately for the convenience and elegance of some of the houses) not in right angles. Here the earl of Abercorn has built at his own expence one of the largest, most commodious, and most elegant inns in Scotland. In the vicinity of this his lordship is likewise to build several convenient and necessary market-places. A little way south of the inn stands the abbey-church, the only one which Paisley formerly required. This church, when entire, has been a most noble building, and consisted of several distinct and separate places of worship: what now remains of this magnificent Gothic structure is not yet unworthy the notice of the curious in antiquities. Mr Pennant says, the great north window is a noble ruin, the arch very lofty, the middle pillar wonderfully light, and still entire: only the chancel now remains, which is divided into a middle and two side-aisles, all very lofty pillars, with Gothic arches; above these is another range of pillars much larger, being the segment of a circle, and above a row of arched niches from end to end, over which the roof ends in a sharp point. The outside of the building is decorated with a profusion of ornaments, especially the great west and north

doors, than which scarce any thing lighter or richer can be imagined. *Paisley.*

The town of Paisley continued a part of the original or abbey parish of Paisley till the year 1738; when the magistrates and council having purchased the right of patronage from the then earl of Darnley, a new church was built, and the town was erected into a separate parish. This is called the *Laigh Church*, is built in the form of a Greek cross, very well laid out, and capable of containing a great number of people. In 1756 another church was built, upon a very extended plan, to accommodate its multiplied inhabitants; in which, though it is one of the largest in Scotland, yet the most distant of the congregation can hear a tolerably good speaker with ease and distinctness; and as it stands upon the highest part of the town, it was afterwards ornamented with a lofty and well-proportioned spire visible at a great distance. This is called the *High Church*, and is a very fine building: it is an oblong square of 82 feet by 62 within the walls, built of free-stone well smoothed, having rustic corners and an elegant stone cornice at the top. In the construction of the roof (which is a pavilion covered with slate, having a platform covered with lead on the top), there is something very curious, and it is admired by every person of taste. In 1781, the number of the inhabitants still rapidly increasing, another church, called the *Middle Church*, was built, not quite so large as the former, but very handsomely and elegantly finished: and in the following year, the town was divided and erected into three separate parishes, exclusive of the Abbey parish, and named according to their respective churches.

There are two large dissenting congregations in the town; those of the Antiburgher persuasion, and the Relief. The first of these has existed there for upwards of 30 years; the other is of a late date. There is besides a small congregation of Cameronians.

The town-house is a very handsome building of cut stone, with a tall spire and a clock. The flesh-market has a genteel front of cut stone, and is one of the neatest and most commodious of the kind in Britain. Butchers-meat, butter, cheese, fish, wool, and several other articles, are sold here by what they call the tron-pound, of 22 English ounces and an half.

The poor-house is a large building, very well laid out; and stands opposite to the quay, in a fine free air. It is supported by a small tax laid upon the inhabitants quarterly.

Close by the Abbey church is the earl of Abercorn's burial place, the greatest curiosity in Paisley. It is a vaulted Gothic chapel, without pulpit, pew, or any other ornament, but has the finest *echo* perhaps in the world. When the end door (the only one it has) is shut, the noise is equal to a loud and not very distant clap of thunder. If you strike a single note of music, you hear the sound gradually ascending, with a great number of repetitions, till it dies away as if at an immense distance, and all the while diffusing itself thro' the circumambient air. If a good voice sings, or a musical instrument is well played upon, the effect is inexpressibly agreeable. The *deepest*, as well as the most *acute tones*, are distinctly reverberated, and these in regular intervals of time. When a musical instrument

Paisley. is founded, it has the effect of a number of instruments of a like size and kind playing in concert. When a number of different instruments in unison sounds the same note, a good ear is able to distinguish the variety of sound produced by each. A single instrument sounding a particular note, and then instantly its fifth, of any other concordant note, the two sounds can be heard, as it were, running into and uniting with each other in a manner peculiarly agreeable. But the effect of a variety of instruments playing in concert is particularly charming, and must excite such emotions in the soul as it is impossible to describe. In this chapel is the monument of Marjory Bruce (A); she was daughter of Robert Bruce, and wife of Walter, great steward of Scotland, and mother of Robert II. In this same chapel were interred Elizabeth Muir and Euphemia Ross, both consorts to Robert II.

A particular account of the abbey of Paisley would fill many pages. It was founded as a priory for monks of the order of Clugni about the year 1160 by Walter great steward of Scotland. It was afterwards raised to the rank of an abbacy; and the lands belonging to it were by Robert II. erected into a regality, under the jurisdiction of the abbot. After the reformation, the abbacy was secularized by the Pope in favour of Lord Claud Hamilton, third son of the Duke of Chateherault, in reward of his steady adherence to the cause of Queen Mary: and, in 1588, it was by the king and parliament erected into a temporal lordship, and Lord Claud was created Lord Paisley. The revenues of the abbacy were very considerable: They consisted of the tythes of 28 different parishes, with the property of the lordships of Paisley, of Kilpatrick in Dunbartonshire, and of Monkton in Ayrshire, extending each to a hundred merk land; and the forty pound land of Glen in Lochwinnoch; with the lands of Achengown, Grange, &c. and a considerable detached property in different parts of the kingdom. All this property, with the patronage of the several churches, fell to Lord Claud Hamilton, last abbot of Paisley. It continued in that family till 1653, when his grandson James Earl of Abercorn sold the lordship of Paisley to the Earl of Angus, who next year sold it to William Lord Cochran, Kilpatrick to Sir John Hamilton of Orbistoun, Monkton to Lord Bargenny, and Glen to Lord Semple and others. Great part of the lordship of Paisley was at different times sold off by the family of Dundonald; and what remained of it was in 1764 repurchased by the late Earl of Abercorn. The fabric of the abbey owed much of its magnificence to Abbot George Schaw, who about 1484 enlarged and beautified the building, surrounding the church, the precincts of the convent, the gardens, and

a small deer-park with a noble wall of hewn free-stone. The abbey was after the reformation successively the seat of the Earls of Abercorn and Dundonald. The late Earl of Dundonald demolished the ancient gateway; and, by feuing off the immediately adjoining grounds for building, entirely changed the appearance of the place. As it was thus rendered totally unfit for a family residence, it has since that time been let out into separate dwellings, and is now in a very mean and almost ruinous state. The wall stood almost entire till 1781, when the garden being feued off for building upon by the late Earl of Abercorn, the wall was sold to the feuers, and the stones of it employed in their houses.

The vestiges of the Roman camp and *prætorium*, at the west end of the town, are at present almost annihilated. It was supposed to be vaulted underneath.

The number of inhabitants in the town of Paisley amounted in 1695 to 2200; in 1755 they were 4290 in 1782, 11,100; and in 1792 they were 13,800. At present the number of inhabitants in the town and suburbs certainly exceeds 20,000.

Paisley is now the first manufacturing town in Scotland, and is greatly celebrated on account of some of its branches. The manufactory of silk gauze, in this respect, first claims our notice. This branch is brought here to the utmost perfection, and is wrought to an amazing variety of patterns. It has been computed, that there have been no less than 5000 weavers employed in Paisley and in the country adjacent; and the number of winders, warpers, clippers, and others necessary in other parts of the silk-manufacture, has been likewise computed to be no less than 5000. Each loom will produce in an average value 70*l.* yearly; the whole will then be 350,000 *l.*

It appears, from the best calculation that could be made, that in the year 1784, the manufactures of Paisley, in silk gauze, lawn and linen gauze, and white sewing thread (B), amounted to the value of 579,185 *l.* 16*s.* 6*d.* and that no fewer than 26,484 persons were employed in carrying them on. It is difficult to give an exact account of the state of its manufactures at present. The silk branch has evidently declined, but the muslin has so far come in its room, and the thread manufacture has considerably increased. There is, however, reason to conclude, that though it is daily advancing, it has not yet recovered its former greatness. Besides these principal manufactures, there are some others carried on there of too much importance to be overlooked; for instance, considerable tan-works, four in number, two soap and candle works, a manufacture of ribbons, and another

---

(A) Her story is singular: In the year 1317, when she was big with child, she broke her neck in hunting near this place; the Cæsarian operation was instantly performed, and the child taken out alive: but the operator chancing to hurt one eye with his instrument, occasioned the blemish that gave him afterwards the epithet of *Blar-eye*; and the monument is also styled that of *Queen Blar-y*. Elizabeth Muir died before the accession of her husband Robert.

(B) This was introduced into this town about 60 or 70 years ago. A gentleman in this place lately discovered the method of making what is called *glazed white thread*, to as great perfection as that made by Mr Lealand and Son, London. The value of this branch is computed at about 60,000 *l.* annually.

Paisley.

another of inkle or tape. In 1789 the annual value of all the manufactures in Paisley of every sort amounted to 660,385 l. 16s.

In the various weaving branches there were employed at Whitsunday 1791, in the suburbs of Paisley, 1108 looms, which added to 2494 employed in the town, gives 3602 in all. But it is to be observed, that the extent to which the weaving branches are carried on by the manufacturers of Paisley, is not to be judged of from the number of looms in the town and suburbs. Besides about 150 in the country part of the parish, there are great numbers employed by them in the villages of Niddloun, Bar-head, Beith, Dalry, Kilwinning, &c. &c. In 1744, when all the business was confined to the town and suburbs, there were 867 looms at work.—The thread-making in Abbey parish employs 9 mills, which, added to 128 employed in Paisley, makes 137 in all. The number in 1744 was 93. The spinning of cotton was introduced into Abbey parish in 1783. The principal seat of that manufactory is at Johnstoun, a neat and regularly built village about three miles west from Paisley, upon the estate of Mr Houston of Johnstoun. The feuing of that village was begun in 1782; and it contained, at Whitsunday 1792, 293 families, or 1434 souls. There are five companies established in it for cotton spinning. Two of these carry on their principal operations by water-machinery. In the two mills employed in them, there are going at present 11, 672 spindles: but, when the whole machinery in both shall be completed, there will be 22,572. The number of persons, young and old, at present employed in both mills is 660. There is also in the neighbourhood of Paisley a calico printing work and a copperas work.

The bleaching business in the Abbey parish is carried on to a very considerable extent. There are 10 fields for whiening muslins and lawns, and about as many for thread, almost wholly employed by the manufacturers in Paisley. About 300 persons are at work in this branch of business, of whom about 240 are women, who are hired for the season. A soap and candle manufacture pays about 2000 l. of duty *per annum* to government, and has in some years paid upwards of 3000 l. A black and hard soap manufacture, 4500 l. *per annum*. The starch manufacture is but lately established. The distillery business is to be mentioned under this head: it has for some time past been carried on to a great extent, and the spirit manufactured in great perfection. A considerable quantity of it is exported, but too much of it is consumed at home.

The river on which Paisley stands runs from south to north; and falls into the Clyde, after it has joined the conflux of the rivers Grief and Black-Cart at Inchinnan bridge, about three miles below the town. At spring-tides, vessels of 40 tons burthen come up to the quay. The communication by water is of great importance to the inhabitants: for in this way they are frequently served with fish of different kinds, and can send their goods and manufactures to port-Glasgow and Greenock, and to Glasgow likewise; and now, by means of the great canal, they have also a communication with the frith of Forth.

The air here is moist; a necessary consequence of the prevailing south-west winds, which, coming loaded with vapour from the Atlantic, produce frequent and

heavy rains. The effects of this moist atmosphere appear in rheumatisms, quinsys, pneumonic ailments, and all the tribe of inflammatory disorders. Upon the whole, however, neither the town nor country adjacent can be said to be unhealthy. Contagions, indeed, at times visit this as other places, which run their usual course as epidemics; but none are remembered of any uncommon violence except a pleurisy in summer 1771, and which, contrary to the received opinion, was truly epidemic. There are no disorders that can be said to be endemic, unless scrofula is to be excepted, which is still but too common. This has been ascribed to the water used by the inhabitants in Paisley: It more probably proceeded from, and certainly was greatly aggravated by, poor living, and by the damp shops which were necessary for the linen manufacture; for since silk-weaving became the general employment, and increase of trade has introduced better living, this disorder is less frequent. From the same causes probably it is that swelled and fore-legs, once extremely common here, are now but rarely met with. Dysentery raged with great violence in 1765; since that time it has been scarcely complained of. Nervous fevers at times appear; but they are neither very general nor uncommonly fatal. It is to be apprehended, that the confinement and sedentary posture of the weaver, and the laborious life of the bleacher, are frequent causes of consumptive complaints. Intermittents, which from the damp air, and adjoining moss, might be expected to be common, are not so much as known. W. Long. 4. 20. N. Lat. 55. 52.

PAIX, a town of America, in the island of Hispaniola, and on the north coast. It was built by the French, to whom it is subject, and has a pretty good harbour. W. Long. 72. 55. N. Lat. 19. 58.

PAITA, a sea-port of America, in Peru, and in the audience of Quito. The town consists of about 200 houses but one story high; and the walls are made of split cane and mud, and the roofs only a covering of leaves. The only defence of Paita is a fort without either ditch or out-work; but is surrounded by a brick wall of little or no strength, on which are mounted eight pieces of cannon. It has frequently been plundered by the buccaners; and Commodore Anson got possession of its fort in 1741, and took and burnt the town because the governor refused to ransom it. W. Long. 81. 19. S. Lat. 6. 12.

PALACE, PALATIUM, a name generally given to, the dwelling-houses of kings, princes, and other great personages; and taking different epithets, according to the quality of the inhabitants, as *imperial* palace, *royal* palace, *pontifical* palace, *cardinal* palace, *ducal* palace, *episcopal* palace, &c.

It is customary in China to build palaces in honour of great ancestors. Hu-pi-lay, of the Mogul empire, in the year 1263, built one for his ancestors; and he is the first who borrowed this Chinese custom. Amongst the works of the ancient Egyptians, we have an account, in the Ancient Universal History, of a most magnificent palace in the Upper Egypt, not far from Aswan, the ancient Syene; the ruins whereof are enough to strike a spectator with astonishment. It is as large as a little city, having four avenues of columns, leading to as many porticoes. At each gate, between two pillars of porphyry, stand two gigantic figures of fine black

Paisley  
Palace.

Palace  
Palæpa-  
phos.

black marble, armed with maces. The avenues consist of columns set three and three together, in a triangle, on one pedestal: on the chapter of each triangle is placed a sphinx and a tomb alternately. Every column is 70 feet high, all of one stone. There are in all the four avenues about 5000 or 6000 of these columns, a great many of which are fallen down.

The first hall of this palace is adorned with pieces of history, which seem as fresh as if the painting had not been long finished. In some places they have represented the hunting of antelopes; in others, feasts, and a great many young children playing with all kinds of animals. From thence you go into other apartments, incrufted with marble, the roof being supported with pillars of porphyry and black marble. Notwithstanding the vast quantity of rubbish, our author made shift to get up to the top of this building, from whence he had a prospect of the ruins of the greatest city that ever had been, as he thought, in the world. He supposes it might be the ancient Thebes but that city stood much lower.

*PALACE COURT.* See MARSHALSEA.

*PALÆMON, or MELICERTA.* See MELICERTA.

*PALÆMON* (Q. Rhemius,) a famous grammarian of Rome, in the reign of Tiberius. He was born of a slave at Vienna. We are told he was first brought up in the business of a weaver: but attending his master's son to school, he used this opportunity to procure knowledge; and acquired so much skill in the common learning, that he obtained his freedom, and became a teacher or preceptor at Rome. His claim to learning cannot be questioned, since he is recorded as a scholar even by Juvenal:

*Quis gremio Enceladi doctique Palæmonis affert,  
Quantum Gramaticus meruit labor? Sat. 7.*

He had also an excellent memory, a ready elocution, and could make verses extempore. On account of these qualities, notwithstanding his debauched course of life, which was such that nobody was more unworthy to have the preceptorship of youth, he held the first rank among those of his profession. But his arrogance surpassed his merit; he had the confidence to assert, that learning was born when he was born, and would die when he died; and that Virgil had inserted his name in his Eclogues by a certain prophetic spirit: for that he, Palæmon, would infallibly become one day sole judge and arbiter of all poetry. He was excessively prodigal for the gratification of his voluptuous humour; inasmuch that neither the immense sums he gained by teaching, nor the great profit he made both by cultivating his lands and in the way of traffic, proved a sufficient fund to support his extravagancies. We have only some fragments of his works.

*PALÆOLOGUS* (Michael), a very able man who was governor of Asia under the emperor Theodorus Lascaris; and who, by various stratagems and cruelties, procured the empire for himself and his posterity. See CONSTANTINOPLE, from n° 145 to the end of that article.

*PALÆPAPHOS* (Strabo, Virgil, Pliny), a town of Cyprus, where stood a temple of Venus; and an adjoining town called *Nea Paphos*; where St Paul struck Elymas blind, and converted the proconsul Sergius Paulus.

Palæstra:

*PALÆSTRA*, in Grecian antiquity, a public building where the youth exercised themselves in wrestling, running, playing at quoits, &c. To prevent the combatants from hurting themselves by falling, the bottom of the palæstra was covered with dust or gravel. Some will have the palæstra to be only a part of the gymnasium. Many authors imagine that the palæstra was of two kinds; the one for the exercise of the body, the other for the cultivation of the mind: but the derivation of the word seems to confine it to bodily exercise.

We have this account of the palæstræ in Barthelemi's Anacharxis\*: "They are nearly of the same form with the gymnasia. We visited the apartments appropriated to all the species of baths; those where the wrestlers leave their clothes, where, they rub their bodies with oil to render their limbs supple, and where they roll themselves in the sand in order to give their antagonists a hold.

\* Vol. ii.

"Wrestling, leaping, tennis, and all the exercises of the lyceum, were here repeated before us with greater varieties, and with more strength and skill on the part of the performers. Among the different groups before us, we distinguished men of the most perfect beauty, and worthy of serving as models for artists; some with vigorous and boldly marked outlines, as Hercules is represented; and others of a more slim and elegant shape, as Achilles is described. The former devoting themselves to wrestling and boxing, had no object but to increase their bodily strength; the latter, educated to less violent exercises, such as running, leaping, &c. confined themselves to acquirements of agility.

"Their regimen is suited to the different exercises for which they are designed. Some of them abstain from women and wine; others lead a very abstemious life; but those who make laborious exertions stand in need of a great quantity of substantial food, such as roasted beef and pork, to restore their strength. If they require only two minæ a-day, with bread in proportion, they give a very favourable idea of their temperance. But several are mentioned who have made a terrible consumption of provisions. Theagenes of Thafos, for instance, is said to have eaten a whole ox in a day. The same exploit is attributed to Milo of Crotona, whose usual quantity of food for a day was twenty minæ of meat, as many of bread, and three congii of wine. It is said likewise, that Atydamas of Miletus, when at the table of Ariobarzanes the Persian satrap, devoured alone the supper prepared for nine guests. These stories, no doubt exaggerated, prove at least the idea generally entertained of the voracity of this class of wrestlers. When they are able to gratify it without danger, they acquire extraordinary strength: their stature becomes sometimes gigantic; and their adversaries, struck with terror, either decline entering the lists, or sink under the weight of their enormous bodies.

"They are so oppressed by excess of nutriment as to be obliged to pass part of their lives in a profound sleep, and soon become so extremely corpulent as to be no longer known to be the same persons: this is succeeded by disorders which render them as wretched as they have always been unserviceable to their country; for it cannot be denied that wrestling, boxing, and

and all those combats disputed with so much fury and obstinacy in the public solemnities, are no longer any thing but ostentatious exhibitions, since tactics have been brought to perfection. Egypt at no time adopted them, as they give only a temporary strength. Lacedæmon has corrected their inconveniences by the wisdom of her institutions. In the other states of Greece men have discovered, that, by subjecting their children to them, they incur the risk of injuring their shape and preventing their growth; and that, in a more advanced age, professed wrestlers never make good soldiers, because they are unable to support hunger, thirst, watching, the smallest wants, or the most trifling deviation from their usual habits." See *PENTATHLUM* and *PANCRATIUM*.

*PALÆSTROPHYLAX*, was the director of the palæstra, and the exercises performed there.

*PALAMBOANG*, or *PALAMBANG*, a town of Asia in the East Indies, and in the island of Java, capital of a kingdom: seated at the east end of the island, on the straits of Bally, and separated from the island of Bally by a narrow channel. E. Long. 115. 10. S. Lat. 7. 10.

*PALAMEDEA*, in ornithology, a genus belonging to the order of grallæ. The character of this genus, according to Latham, is, the bill bends down at the point, with a horn, or with a tuft of feathers erect near the base of it; the nostrils are oval; the toes are divided almost to their origin, with a small membrane between the bottoms of each.

There are two species of it; the first of which is the *palamedea cornuta*, or horned screamer. It is about the size of a turkey; in length about three feet four inches. The bill is two inches and a quarter long, and black: the upper mandible is a little gibbous at the base, the under shuts beneath it, as in the gallinaceous tribe: the nostrils are oval and pervious, and placed near the middle of the bill. From the crown of the head springs a slender horn of more than three inches in length, and pointed at the end: the irides are the colour of gold: the plumage on the head, neck, and upper part of the body, is black, margined with grey on the first, and downy: some of the feathers round the neck are likewise edged with the same: the under parts of the wings are pale rufous, appearing on the shoulders and edges of them when closed: at the bend of the wing are two strong, sharp, horny, yellow spurs, one above another, the uppermost an inch and a half in length: the belly, thighs, and vent are white: the tail is eight inches and a half long, and black: the legs are stout and dusky: the fore claws are moderately bent; the hind one is nearly straight, not unlike that of a lark, and is about an inch long.—The female, we are told, is very like the male.

It is remarked, that they are always met with in pairs; and if one dies, the other mourns to death for

the loss. They frequent places near the water; make a large nest of mud, in the shape of an oven, upon the ground (A); and lay two eggs, the size of those of a goose. The young are brought up in the nest till able to shift for themselves. They have but one nest in a year, which is in January or February, except the first eggs are taken away, when they make a second in April or May. The young birds are frequently eaten by the natives, though the colour of the flesh is very dark; that of the old ones is tough and ill tasted. By some authors this species is said to feed on crabs and birds, such as pigeons, poultry, and even to attack sheep and goats; but this is denied by others, who say that its principal food is reptiles. In the stomach of one which M. Bajon dissected, there were only found herbs and seeds of plants; however, he adds, that the bird has no gizzard. The *cornuta* is a rare species. It is found in certain districts in Cayenne, Guiana, Surinam, and other parts of South America, chiefly in the marshes and wet savannas, and for the most part near the sea. These should seem to be the birds mentioned by Ulloa (B), which are called by the inhabitants of Quito *dispretadores*, or "awakeners," from their giving notice to others of the approach of danger; as on hearing the least noise, or seeing any one, though at a great distance, they rise from the ground, and make a loud chattering like a magpie, continuing the noise, and hovering over the object which caused the alarm, whereby the rest of the birds, taking the hint, are able in time to escape the impending danger. This screaming noise, which some authors relate as being exceedingly loud and terrible (C), has occasioned Mr Pennant to give the genus the name annexed to it. In Dr Hunter's museum there is a fine specimen of this bird brought from Cayenne.

The second species of *palamedea* is the *crestata*, or crested screamer. This bird is about the size of an heron: the bill is short, bent like that of a bird of prey, and of a yellowish brown: the irides are gold-coloured: on the forehead, just above the bill, is a tuft of black feathers, variegated with ash-colour: the head, neck, and body, are grey, mixed with rufous and brown, most inclining to the last on the wings and tail: the wings are not furnished with spurs: the legs pretty long, of a dull yellow: claws brown; the hind toe placed high up, so as not to touch the ground in walking.

This bird inhabits Brasil. Linnæus makes it to belong to the screamer genus, perhaps from its cry; for it is said to be heard at a great distance, and is not unlike that of a hen turkey. None of our later writers seem to have seen it, all of them relying on Marcgrave both for description and figure. It is said to feed on the same food as the heron tribe: the flesh is good, and the bird by some kept tame.

*PALAMEDES*, a Greek chief, son of Naupilius king

(A) Authors differ. Bajon says that it makes the nest both in thickets, at some distance from the ground, and often among the rushes. Fermin tells us, that it builds on high trees. See *Mem. sur Cay.* and *Descr. Surin.*

(B) Voy. vol. ii. p. 243.—Ulloa makes their size no bigger than that of a cock. He says, that the head is adorned with a tuft of feathers. Perhaps he may mean the next species.

Latham's  
General  
Synopsis of  
Birds,

**Palamedes** king of Eubœa, by Clemene. He was sent by the Grecian princes who were going to the Trojan war, in order to bring Ulysses to the camp, who, to avoid the expedition, pretended insanity; and the better to carry on the imposition, he often harnessed different animals to a plough, and sowed salt instead of barley. Palamedes soon discovered the cheat. He knew that regret to part with Penelope, whom Ulysses had lately married, was his only reason for pretending insanity; and to demonstrate this, Palamedes took Telemachus, of whom Penelope had lately been delivered, and put him before his father's plough. Ulysses turned the plough a different way, not to hurt the child. He was therefore obliged to attend the Greek princes to the war; but an immortal enmity took place between Ulysses and Palamedes. The king of Ithaca determined to take every opportunity to distress him; and when all his expectations were frustrated, he was mean enough to bribe one of his servants, and to make him dig a hole in his master's tent, and there conceal a large sum of money. After this Ulysses forged a letter in Phrygian characters, as from Priam to Palamedes. In the letter the Trojan king seemed to beg Palamedes to deliver into his hands the Grecian army, according to the conditions which had been previously agreed upon when he received the money. This forged letter was carried, by means of Ulysses, before the princes of the Grecian army. Palamedes was summoned, and made the most solemn protestations of innocence, but in vain. The money that was discovered in his tent served to corroborate the accusation; and he was therefore found guilty by the whole army, and stoned to death. Homer is silent about the unfortunate fate of Palamedes; and Pausanias mentions, that it had been reported by some that Ulysses and Diomedes had drowned him in the sea as he was fishing on the coast. Philostratus, who mentions the tragical story as above related, adds, that Achilles and Ajax buried his body with great pomp on the sea-shore; and that they raised upon it a small chapel, where sacrifices were regularly offered by the inhabitants of Troas. Palamedes was a man of learning as well as a soldier; and according to some he completed the alphabet of Cadmus by the addition of the four letters θ, ζ, χ, φ, during the Trojan war. To him also is attributed the invention of dice and backgammon; and it is said that he was the first who regularly ranged an army in a line of battle, and who placed sentinels round the camp, and excited their vigilance and attention by giving them a watchword.

**PALARIA**, among the Romans, a kind of exercise performed at a stake by the soldiers. The stake being fixed in the ground, and six feet high above it, the young undisciplined soldiers advanced against it, armed with a hurdle and cudgel, instead of a sword and shield, and went through all the rules of attack and defence, as if actually engaged with an adversary. Sometimes they stood at a distance, and attacked with missile weapons; at the same time using all the requisite motions for defending themselves, and warding off what might be thrown against them.

**PALATE**, in anatomy, the flesh that composes the roof, or the upper and inner part, of the mouth.

The palate has much the same structure with the gums; but it has also a great number of glands, dis-

covered so early as the time of Fallopius: these are principally situated in the hinder part near the uvula, where it is pendulous, in the manner of a curtain, which part is called the *velum* or *claustrum*, of the palate. The glands situated particularly in this part, secrete a mucous fluid, serving to lubricate the mouth and throat, and to facilitate deglutition: they have a great number of apertures there for the discharge of this humour into the mouth.

The great uses of this membrane are to defend the bones of the palate from corrupting; and for preventing, by its claustrum or velum, the things to be swallowed from getting up into the nostrils.

**PALATINATE**, a province or signiory, possessed by a palatine.

**PALATINATE** of the Rhine, a province of Germany, divided into two parts by the Rhine, called the *Upper* and *Lower Palatinate*. The former lies in the circle of Bavaria, and belongs to the elector thereof; but the latter, in the circle we are now treating, belongs to the elector Palatine. The latter part is bounded to the east by the county of Katzenellenbogen, the archbishopric of Mentz, the bishopric of Worms, and part of the territory of the Teutonic order in Franconia; to the west by Alsace, the duchy of Deuxponts, the county of Sponheim, the duchy of Simmern, and certain districts of the electorate of Mentz; to the south by the duchy of Wurtemberg and the bishopric of Spire; and to the north by a part of the archbishopric of Mentz and the county of Katzenellenbogen. It contains 41 towns, besides several boroughs; and is about 100 miles in length and 70 in breadth. The air is healthful, and the soil fruitful in corn, pasturage, wine, tobacco, and all sorts of pulse and fruits, particularly walnuts, chestnuts, and almonds. This country also breeds abundance of cattle, and is well watered by the Neckar, the Nahe, and the Rhine. In the last of these, near Germersheim and Selz, is found gold; the exclusive right of searching for which is farmed out by the elector. The state of religion hath varied greatly here since the Reformation, Lutheranism and Calvinism having been uppermost by turns, till the electorate devolved to the Popish branches of the family, when Popery, with all its superstition and mummery, was established anew: so that the Protestant religion is now on a very precarious footing in the Palatinate, though most of the natives are still of that persuasion; but the two sects of Protestants, namely, the Lutherans and Calvinists, have greatly contributed to their own ruin, by their mutual jealousy and animosity, being no less rancorous against one another than against their common adversaries the Papists. The Lutherans reckon themselves 50,000 strong, and are possessed of about 85 churches; but not one half of their preachers and schoolmasters have a competent maintenance. The number of Calvinist clergy here is estimated at 500, and that of the Roman Catholics at 400. Besides schools and Jesuits colleges in this country, there is one university, namely, that of Heidelberg; but there is very little trade in it except in wine. Authors are divided about the origin of the name *Palatines*, or *Pfalzgraves*, as the Germans call them; but it seems most likely to be derived from the *palatia*, or palaces, which the old Frankish and German kings and Roman emperors were possessed of in different parts of the country,

**Palatinate.** country, and over which they appointed supreme stewards or judges, who were called *Palatines* or *Pfalzgraves*. The countries where these Palatines kept their courts, were, from them, called *Palatinates*; which name came at last to be appropriated, by way of eminence, to this country, as being the most considerable of them. The ancient electoral line failing in 1685, the electorate devolved to Philip-William duke of Neuburg; and upon the death of his second son Charles-Philip, to the prince of Sultzbach. This elector has the title of arch-treasurer of the empire, as well as the elector of Brunswic-Lunenbourg, and is the fifth in rank among the secular electors. He is also one of the vicars of the empire alternately with the elector of Bavaria, and enjoys many other prerogatives. In his own dominions, he disposes of all vacant benefices; but allows the ecclesiastical council, composed of two clergymen and two laymen, to present two candidates, of which he chooses one. He is also master of all the tithes in his dominions; but he either grants them to the clergy, or salaries in lieu of them, out of the revenues of the church. His title is Pfalzgrave of the Rhine; arch-treasurer and elector of the holy Roman empire; duke in Bavaria, Juliers, Cleve, and Berg; prince of Mors; marquis of Bergen-op-Zoom; count of Veldens, Sponheim, the Mark, and Ravensberg; and lord of Ravenstein. His quota to the army of the empire is 30 horse and 138 foot, or 914 florins monthly. To the Chamber of Wetzlar he contributes each term, 404 rix-dollars, 82 kruit-zers. There is an order of knighthood in this country, viz. that of St Hubert; the badge of which is a quadrangular cross pendant to a red ribbon, with a star on the breast. The whole of the elector's revenue arising from the Palatinate, the duchies of Berg and Juliers, the seigniory of Ravenstein, and the duchies of Neuburg and Sultzbach, hath been estimated at about 300,000*l. per annum*. The military establishment consists of several regiments of horse and foot, besides the horse and Swiss life guards: in time of peace he is said to maintain about 6000 men. All the different courts and councils, usual in other countries for the different departments of government, are also to be found here.

In general, the Lower Palatinate has suffered more by the preceding wars with France than all the provinces of Germany put together during the space of 30 years; for the French have plundered the country, and demolished some of its first towns more than once. In the modern part of the Universal History, we have the following account of the rise of the Palatinate, of the Rhine, under the history of Germany.

"Though Conrad the son of Everhard inherited from his father the duchy of Franconia, with the counties of Hesse and Alsace, he could not succeed him in the dignity of count-palatine, because Otho had taken it from his father, and conferred it on Herman third son of Arnold duke of Bavaria: but as this honour was unattended with any solid advantage, the emperor began to annex to it the lands and castles situated on the Rhine, whence he acquired the title of Count Palatine of the Rhine: and, in process of time, these counts made great acquisitions by marriages, purchases, mortgages, and imperial donations, so as to form a very considerable province." The powers of

Vol. XIII.

counts palatine in the German empire have always been ample; we have this account of it in the same learned work.

"When the counts palatine of the Rhine began to execute their office, they neither possessed on that river lands, cities, nor castles; but having by degrees made great acquisitions by marriages, purchases, agreements, imperial donations, or otherwise, they have at length formed a very considerable principality. We are told, that under the emperors of the house of Suabia, their authority and power increased greatly, tho' it was a gradual increase. Under the reign of the emperor Henry IV. the credit of the counts palatine was very considerable at the court; and by the German law, the count palatine of the Rhine enjoys not only during the absence of the emperor, but likewise during a vacancy of the empire, the right of the ban beyond the Rhine, till within a mile of the city of Metz, and as far as the ocean, as well as in Flanders. However, this right of the ban has not been granted to him by the emperors. There is likewise an ancient ordonnance, in which the office of count palatine is mentioned; it imports, that the count palatine is always by right the representative or lieutenant of the kingdom. Lastly, how great the power of the counts palatine was, may be understood from this, that in the election of Rodolphus of Hapsburgh, and in that of Henry VII. the other electors promised to acknowledge him as emperor whom he should name. Although, however, the power of the counts palatine had as it were secured to them the vicariate of the empire, nevertheless the emperors still reserved to themselves the right of establishing vicars." See BAVARIA.

**PALATINATES of POLAND.** Previous to the Revolution in this unfortunate country, it was divided into palatinates; whether those will be now changed cannot be at present ascertained, tho' it seems likely. A Polish palatine is thus described in the Universal History:

"A palatine may be regarded as the governor of a province, who levies and leads the troops of his own jurisdiction to join the army of the republic. His civil power is likewise considerable, as he presides at the assemblies of his palatinate, rates the prices of all commodities and merchandise in the province, regulates the weights and measures, and judges and defends the Jews within his jurisdiction. This part of his function is particularly specified, that a set of men the most useful and industrious in Poland may not be oppressed; the king being likewise obliged, by his oath, to afford them the protection of the laws and his sovereignty. Under him is appointed a substitute or vice-palatine, who takes an oath to his superior, and must be possessed of a land-estate to a certain value."

**PALATINE, or COUNT PALATINE,** a title anciently given to all persons who had any office or employment in the prince's palace: but afterwards conferred on those delegated by princes to hold courts of justice in the provinces; and on such among the lords as had a palace, that is, a court of justice, in their own houses.

**Counties-PALATINE in England.**—Chester, Durham, and Lancaster, are called *counties palatine*. The two former are such by prescription, or immemorial custom;

**Palatine** from; or, at least as old as the Norman conquest; the latter was created by king Edward III. in favour of Henry Plantagenet, first earl and then duke of Lancaster; whose heirs being married to John of Gaunt the king's son, the franchise was greatly enlarged and confirmed in parliament, to honour John of Gaunt himself, whom, on the death of his father-in-law, the king had also created duke of Lancaster. Counties palatine are so called a *palatio*; because the owners thereof, the earl of Chester, the bishop of Durham, and the duke of Lancaster, had in those counties *jura regalia*, as fully as the king hath in his palace; *regalem potestatem in omnibus*, as Bracton expresses it. They might pardon treasons, murders, and felonies; they appointed all judges and justices of the peace; all writs and indictments ran in their names, as in other counties in the king's; and all offences were said to be done against their peace, and not, as in other places, *contra pacem domini regis*. And indeed by the ancient law, in all peculiar jurisdictions, offences were said to be done against his peace in whose court they were tried; in a court-leet, *contra pacem domini*; in the court of a corporation, *contra pacem ballivorum*; in the sheriff's court or tourn, *contra pacem vice-comitis*. These palatine privileges (so similar to the regal independant jurisdictions usurped by the great barons on the continent during the weak and infant state of the first feudal kingdoms in Europe) were in all probability originally granted to the counties of Chester and Durham, because they bordered upon enemies countries, Wales and Scotland: in order that the owners, being encouraged by so large an authority, might be the more watchful in its defence; and that the inhabitants, having justice administered at home, might not be obliged to go out of the county, and leave it open to the enemy's incursions. And upon this account also there were formerly two other counties palatine, Pembrokehire and Hexamshire, the latter now united with Northumberland: but these were abolished by parliament, the former in 27 Hen. VIII. the latter in 14 Eliz. And in 25 Hen. VIII. likewise, the powers before mentioned of owners of counties-palatine were abridged; the reason for their continuance in a manner ceasing: though still all writs are witnessed in their names, and all forfeitures for treason by the common law accrue to them.

Of these three the country of Durham is now the only one remaining in the hands of a subject. For the earldom of Chester, as Camden testifies, was united to the crown by Hen. III. and has ever since given title to the king's eldest son. And the county-palatine or duchy of Lancaster was the property of Henry of Bolingbroke, the son of John of Gaunt, at the time when he wrested the crown from king Richard II. and assumed the title of Hen. IV. But he was too prudent to suffer this to be united to the crown; lest, if he lost one, he should lose the other also. For, as Plowden and Sir Edward Coke observe, "he knew he had the duchy of Lancaster by sure and indefeasible title, but that his title to the crown was not so assured; for that after the decease of Richard II. the right of the crown was in the heir of Lionel duke of Clarence, second son of Edward III.; John of Gaunt, father to this Henry IV. being but the fourth son." And therefore he procured an act

of parliament, in the first year of his reign, ordaining that the duchy of Lancaster, and all other his hereditary estates, with all their royalties and franchises, should remain to him and his heirs for ever; and should remain, descend, be administered, and governed, in like manner as if he never had attained the regal dignity; and thus they descended to his son and grandson, Henry V. and Henry VI.; many new territories and privileges being annexed to the duchy by the former. Henry VI. being attainted in 1 Edward IV. this duchy was declared in parliament to have become forfeited to the crown, and at the same time an act was made to incorporate the duchy of Lancaster, to continue the county-palatine (which might otherwise have determined by the attainder), and to make the same a parcel of the duchy: and, farther, to vest the whole in king Edward IV. and his heirs, kings of England, for ever; but under a separate guiding and governance from the other inheritances of the crown. And in 1 Hen. VII. another act was made, to resume such part of the duchy lands as had been dismembered from it in the reign of Edward IV. and to vest the inheritance of the whole in the king and his heirs for ever, as amply and largely, and in like manner, form, and condition, separate from the crown of England and possession of the same, as the three Henries and Edward IV. or any of them, had and held the same.

The isle of Ely is not a county-palatine, though sometimes erroneously called so, but only a royal franchise: the bishop having, by grant of king Henry I. *jura regalia* within the isle of Ely; whereby he exercises a jurisdiction over all causes, as well criminal as civil.

**PALATINE Games**, in Roman antiquity, games instituted in honour of Augustus by his wife Livia, after he had been enrolled among the gods. They were celebrated in the palace, from whence the name, and were confirmed by the succeeding emperors.

Some authors say that these games were instituted in honour of Julius Cæsar, and others again confound them with the *Ludi Augustales*; but neither of these opinions seem to be well supported. See **AUGUSTALES**.

**PALATINUS MONS**, or *Palatium*; the first mountain of Rome, occupied by Romulus, and where he fixed his residence and kept his court, as did Tullus Hostilius, Augustus, and all the succeeding emperors; and hence it is that the residence of princes is called *palatium*. The reason of the name is variously assigned: some say it is derived from the goddess Pales, or from the Palatini, who originally inhabited the place, or from *balare* or *palare*, the bleatings of sheep, which were frequent there; or perhaps from the word *palantes*, wandering, because Evander, when he came to settle in Italy, gathered all the inhabitants, and made them all one society. To the east it has the mount Cælius, to the south the Aventine; to the west the Capitoline, and to the north the Forum.—*Palatinus*, the surname of Apollo from this place; where Augustus built a temple to that god, adorned with porticoes and a library, valuable for the various collections of Greek and Latin manuscripts which it contained.

**PALATIUM** (anc. geog.), a place in the territory of Reate, distant from it 25 stadia, Dionysius Halicarnassensis.

Palatine  
||  
Palatium.

**Palatium** *carnassæus* reckons it one of the first towns of the Aborigines; and from it Varro accounts for the name of the *Mons Palatinus*; namely, that a colony from Palatium settled there.

||  
**Palermo.**

**PALATIUM** (Pliny,) *Pallantium* (Pausanias), *Palanteum* (Livy); *Pallanteum* (Solinus). This last is the true writing; the great grandfather of Evander, from whom it took its name, being called *Pallas*, not *Palas*: A town of Arcadia, which concurred to form Megatopolis (Pausanias). From it the *Palatium*, or *Mons Palatinus*, takes also its name, according to Virgil and Pliny.

**PALATIUM Dioclesiani**; the villa of Dioclesian, near Salonæ, where he died, (Eusebius). Afterwards called *Spalatum*; which rose to a considerable city from the ruins of Salonæ; situated in Dalmatia on the Adriatic. Now *Spalatto*, or *Spalatro*.

**PALATIUM Luculli**, (Plutarch), or *Villa Luculli*; a place between Milænum and Baiæ in Campani, of wonderful structure. Now in ruins, and called *Pescina Mirabile*.

**PALATO-SALPINGÆUS**, } See ANATOMY, *Talle*  
*PALATO-Staphylinus*, } *of the Muscles*, p. 708.

**PALE**, a little pointed stake or piece of wood used in making inclosures, separations, &c. The *pale* was an instrument of punishment and execution among the ancient Romans, and still continues so among the Turks. Hence empaling, the passing a sharp pale up the fundament through the body.

**PALF**, in heraldry. See HERALDRY, p. 446.

**PALEARIUS** (Aonius), was a man of the greatest probity, and one of the best writers of the 16th century. He gained the esteem of the men of wit and learning of his time by a noble poem on the immortality of the soul. He was appointed professor of polite literature at Sienna; where his tranquillity was disturbed by contests with an envious colleague, and by the malicious aspersions of his enemies: against which, however, his eloquence proved always a sufficient defence. At last he left Sienna, and accepted the invitation of the magistrates of Lucca, who gave him several marks of their esteem, and settled a considerable stipend upon him. Some years after he removed to Milan; where he was seized by order of pope Pius V. and carried to Rome. He was convicted of having spoken in favour of the Lutherans, and against the inquisition; and therefore was condemned to be burnt. This sentence was executed in 1566. He wrote several pieces in verse and prose: of which the one above-mentioned is the most esteemed.

**PALENCIA**, a town of Spain, in the kingdom of Leon, with a rich archbishop's see. It had an university, but it was removed to Salamanca. It is seated in a fertile soil on the river Carion on the frontiers of Castile, in W. Long. 3. 7. N. Lat. 42. 10.

**PALERMO**, a city of Sicily, in the Val-di-Mazara, with an archbishop's see and a large harbour. "This city (says Mr Hill \*), which is the capital of Sicily, is of great antiquity; and if a conjecture may be formed from its ancient name *Panormus*, which signifies an universal harbour, it was formerly in a very flourishing condition. By whom it was founded is uncertain, nor have we any authentic accounts of its inhabitants till it became a colony of the Phœnicians, after which it passed into the hands of the various nations

that became masters of this island. The present city principally consists of two wide, uniform, and well-built streets, each about a mile in length, crossing each other at right angles in the centre, where there is a small octagon space, ornamented with four statues." Most of the cities of Sicily have surnames: Palermo is denominated *the happy*. It has gained this epithet, no doubt, on account of the advantages of its situation. It has two harbours: in the one, which is very large, and in which there is a mole 1300 paces in length, ships lie at anchor; in the other their cargoes are laden and unladen. Both the harbours open to the west: there is also a superb quay which extends a mile from west to east, in a rectilinear direction, and is called *La marina*. The prospect is, on the one side, lost in the wide expanse of the ocean, and on the other confined by the walls of the city; the walls appear adorned with pilasters, and crowned with a row of ballustrades through which the eye discovers a long range of palaces. These objects altogether form a delightful spectacle. Indeed nothing can be more picturesque than the bay of Palermo. It forms a large amphitheatre, with the capital of Sicily in the centre; surrounded for some miles by a most delightful country, and inclosed by romantic rocks and mountains. The town was formerly surrounded by a strong wall; but the fortifications are now entirely neglected, except towards the sea, where there are still a few weak works. The quay is the principal public walk here. Palermo is embellished all round with avenues of trees, and has four principal entrances, facing the four cardinal points which are at the extremities of the two spacious streets which cross each other. The most frequented of these two streets is called *Cassero*. It begins where the quay ends, with the north gate called *Porta Felice*, the happy gate; and terminates on the south, at the new gate, which opens on the road to Montreale. Near the last of these gates, this city, which so well merits the attention of a lover of the arts, exhibits in a large square, round which stand some extensive monasteries, the palace of the archbishop, and the palace of the viceroy. Directly opposite to the palace of the viceroy stands, on a pedestal richly ornamented with a variety of figures, a statue of Philip IV. The statue, the pedestal, and the ornaments, are all of marble.

Palermo is quite filled with public monuments, churches, monasteries, palaces, fountains, statues, and columns. These are not all eminently beautiful; for they have not been all erected under the reign of *good taste*; but every one of them shows that the nation is fond of the arts, and possesses a genius for decoration. Spring waters are very copious in this city. Not a quarter in Palermo but is liberally supplied with fountains, most of which are marble, all of them adorned with pieces of sculpture, and all afford large quantities of water.

The situation of this city is truly happy: the sea, the hills, the lofty mountains, present on all sides beautiful and striking prospects, which render it one of the most favourable situations for the genius of the artist, whose object is to copy the beauty and sublimity of nature. Freed from the fetters of the Inquisition, the abolition of which was procured by the marquis of Caraccioli, and from the influence of some

through Si-  
cily and  
Calabria.

Palermo. other unfavourable institutions, which are rapidly declining, Palermo must become one of the finest cities in the world; and the island of which it is the capital, being all cultivated like a garden, one of the most enchanting spots on the face of the earth. Nature has denied none of her best gifts to Sicily. It was the benignity of nature, which, in the happy ages of antiquity, when the political circumstances of the Sicilians were not such as to repress their genius, prompted and enabled them to erect so many illustrious monuments. "Adjoining to the town, and near the sea, is a public garden or promenade, planted with orange and lemon-trees, formed into arcades, and now loaded with fruit\*; the stems of the trees stand in furrows, and are continually watered by a small stream. In the middle is a fountain on which stands a colossus of white marble, surrounded by four grotesque temples, in two of which are canary birds. Among the oranges is a kind called *sanguine* or bloody, which are stained in the middle with red, and have usually the finest flavour. Some of the lemons are sweet, but very flat, tasting like sugar and water. The citrons grow to an immense size; the rind, which occupies at least three-fourths of the bulk of the fruit, is eaten with sugar; the juice is sharper than the sourest lemon. Indian figs in very great abundance grow wild in the fields and hedges, to the height of twelve or fourteen feet; of these there are three kinds, one with large spines, another with smaller, and the third almost smooth. Their fruit is cooling and delicious, 10,000 l. worth of which is sold annually to the poor people in the neighbourhood of this city. Another plant, very common in this country, is the aloe, which usually blossoms every fifth or sixth year. Of these there are five or six species, which grow mostly in the hedges, and, together with the Indian figs, form a most impenetrable fence.

\* Feb.

"The palace, which is an indifferent old building, is situated in a square, near the south gate of the city, and commands a delightful prospect of the adjacent country. At the top is an observatory, inhabited by an ingenious old priest, who has been in England, and brought from thence several astronomical instruments constructed by Ramsden." Neither the structure, situation, nor architectural ornaments of the palace are such as to merit any extraordinary praise. It is, like many others, an assemblage of buildings erected in various ages, as need of accommodation or fancy suggested; and, of consequence, it must unavoidably be defective in architectural order and beauty. The chapel is the only part of it that merits any attention. It was founded by the Counts Roger, the Norman conquerors of Sicily. Within, it is decorated with beautiful pieces of marble and porphyry, and of Mosaic work in gold and various colours. It is in the same taste with the cathedral of Montreale. It is built on the same plan with common churches, only on a smaller scale. The nave is encircled with pillars; on the right and the left are two narrower openings, called *lateral* or low passages: the choir and sanctuary are at the end of the nave. Among all the pillars which inclose the nave, it would be hard to find two exactly of the same form and workmanship. Opposite to a channelled column stands another on which the gravestool has made no such impressions; several have neither astragal, nor base, nor scale: they are formed of various kinds of marble,

and are of different orders and unequal in height. The walls, the arcades, and the arches, are covered with Mosaic work, in gold and colours, representing angels, and male and female saints.

Over the entrance into the choir, and fronting the nave, there is an Eternal Father of a huge size; the design of which has, in all probability been to impress the beholder with a sufficiently awful idea of the greatness of God. Such representations of the Deity, however improper, not to say impious, occur pretty commonly in the churches of Sicily. The cathedrals of both Montreale and Palermo display the Divine Majesty with equal dignity. Over the walls of the chapel there are many pieces of granite, porphyry, and serpentine, cut into a round, or a square, or some other form, and set like panes of glass. Their edges are encircled with various draughts in gold and colours; decorations unquestionably expensive, as they are indeed very finely executed in their kind. But it is amazing that such irregularity of design was admitted in a building of such magnificence and raised at such an enormous expence. The pavement of the chapel has been originally laid, and still consists in part of large blocks of tin, porphyry, and serpentine. Most of these are round; ornamented with compartments of draughts, and covered over, as well as the walls, with incrustations of coloured Mosaic work. The seat designed for the viceroy is of the same kind, and highly ornamented. The candlestick intended to receive the wax-lights at the festival of Easter is of white marble. All the riches of sculpture are lavished on it with such profusion as renders it a prodigy of labour; but in a fantastic unnatural taste.

In a long gallery in the palace of the viceroy, stand two figures of rams in bronze, concerning which we find the following tradition. Archimedes is said to have long ago erected in one of the public squares of Syracuse four columns with a brazen ram upon the top of each. He is said to have placed them there in such a posture, as that some one of them always indicated which of the four principal winds was blowing; and it is added, that they were fabricated with such art, that the wind caused them to utter sounds exactly similar to the bleating of sheep; and whenever any one of the four bleated, he thereby gave notice that the wind was blowing from that quarter towards which he stood. It is certain (as travellers inform us) that the two brazen rams in this gallery are perforated with small holes in their flanks, close to their thighs, and in other places over their bodies; and that by blowing through those holes a sound is produced pretty much like the bleating of sheep. The wind appears to pass through the holes, and to issue out at the mouth: there might, however, be other holes in the pedestal on which the ram stood, or in other parts of the body, which might contribute to produce the bleating; for travellers agree in saying, that those which they could observe, do not appear to be sufficient to produce the effect. The prince of Torre Muzza, one of the most enlightened men in Sicily, informed M. Houel, that these two rams were dug up from among the ruins of Syracuse in the fourteenth century, as they were buried under-ground, they had probably lain there for many centuries. They were bought by the Marquis Geraci, of the family of Ventimiglia, and lay long in

Palermo.

his

Palermo. his castle. About the end of the fifteenth century they were brought to Palermo and placed in the palace of the viceroy. It is not known what is become of the other two. They are probably buried in some ancient ruins, and may be one day or other discovered in digging for the foundation of some new building. The proportions of these two rams are larger than nature. They are pieces of very fine workmanship: both the heads and the horns are formed with taste, delicacy, and truth; the wool is not so well executed; the forms all together are not absolutely the finest that might be selected from among the whole species.

The cathedral of Palermo is dedicated to St Rosalia. The Sicilians, though so exceedingly devout, have however neglected to repair it; and it is at present in a most miserable state, as the interior parts appear to be falling into ruins. Proposals have been made for rebuilding it, and various plans have been shown.

The present church appears to have been built by the Counts Roger. The external parts are in a Gothic taste, and very heavy: within, it has been at different periods repaired and embellished. The pillars of the nave are adorned with pilastres of the Corinthian order; these are joined by arches through which you pass to the sides of the building. In some places it is overloaded with ornaments, in others but very poorly ornamented: viewed all together, it is so destitute of order or proportion as to be absolutely ridiculous.

In a chapel on one side of the cathedral are four Gothic tombs of the same period. They have been originally sarcophagi; and having escaped the fate of most of the other works of antiquity, have been spoiled by attempts to repair or improve them, and have been set up here to preserve the remains of some of the kings of Sicily. The only thing about them that can deserve attention is the beauty of the stone: they are of a fine red porphyry.

In the same chapel there is a fine large tabernacle; the whole of which, when viewed without distinction of the parts, resembles the dome and the front gate of the Val de grace at Paris. It is of rich lapis lazuli, of the very first colour. The whole of it is plated, and the pillars are said to be solid. All its ornaments are of gilt brass. And on the whole it is extremely beautiful.

Around the church are several statues of saints by Guagini, the celebrated sculptor. On the way from the cathedral down the Cassero there is, on the right hand, a small square, at the entrance of which stands a pedestrian statue of Charles V. in bronze. Near the place where the two great streets cross stands the senate-house, in a small court, before which there is a fine marble fountain; there are besides about this edifice many curious fragments of antiquity. It would extend this article beyond all proportion if we were to mention all the curiosities which are to be found in Palermo. We shall now endeavour to give our readers an idea of the internal government of the place, which we shall do in the words of Mr Hill.

"The magistrates appointed to preserve the order of society in this city are, first, the supreme judge, to whom belongs the administration of justice in criminal cases: he is the head of the nobility, and immediately

Palermo. follows the viceroy in all the solemn functions. Secondly, the prætor, who regulates the affairs of the city. He is the perpetual deputy of the kingdom; chief in parliament of the order to whom appertains the right of regulating the king's demesne, and possessed of the prerogative of captain general during the absence of the viceroy. Thirdly, the prætorian court, which consists of three judges, citizens of Palermo, who are chosen annually by the king. They assist the supreme judge in the decision of criminal affairs, and the prætor in the deliberations upon the finances; these two officers, however, have neither vote nor signature, except the prætor, in the business respecting the public bank and first fruits. Fourthly, the senate of Palermo, composed of the prætor and six practitioners of the law, named by the king, who wear the toga after the manner of the ancient Roman senators, and principally inspect the police which regards the grain and provisions. There are besides seven great officers of state, to each of which is assigned a peculiar employment. First, *Il Maestro Portulano*, to whom is committed the care of the public granaries, and who manages the sale of the corn both at home and abroad. The imposition of a tax upon this commodity has nearly proved the ruin of agriculture, especially as the exportation of it is prohibited to all those who are not able to pay an exorbitant price for that privilege. The quantity of corn annually produced in the island does not at present amount to more than a tenth part of what was collected in former years. Secondly, the auditor general, who passes judgment without appeal upon all offences committed within the precincts of the palace. Thirdly, the high-admiral, whose jurisdiction extends over the marine. Fourthly, the chancellor, who overlooks all the notaries of the kingdom, prepares all official patents, reads the propositions when the parliament assembles, and at the time of a coronation tenders the oath of fidelity to the people; and also proclaims that of the monarch, who thereby binds himself to maintain and defend the privileges of the city of Palermo. The same ceremony takes place upon the installation of a viceroy. Fifthly, the protonotary of the queen's chamber, who has the inspection of the demesnes of six cities, *viz.* Syracuse, Lentini, Carlenti, St Filippo, Mineo, and Virini, which were formerly appropriated to the queen of Sicily. Sixthly, the chief Secretary, who presides over the officers appointed to receive the taxes and duties in the places of their respective jurisdictions. And seventhly, the lieutenant of the royal exchequer, who has the administration of all effects that have been sequestered or confiscated.

"Palermo is the principal residence of the greater part of the Sicilian nobility; and as it is not the custom for any gentleman to walk in the streets, at least 1000 carriages are said to be kept in the town. They are for the most part in the English taste, very elegant, shown to the greatest advantage, with beautiful horses, richly caparisoned, and as many footmen in splendid liveries as can be crowded together behind. Every evening all the people of rank drive about in this manner on the grand public terrace by the sea side. There are also very convenient hackney-coaches, covered and open, waiting all day in their respective stations."

Palermo.

It is very remarkable, that the dead in Palermo are never buried. Captain Sutherland gives the following account of this circumstance in his Tour to Constantinople. The dead bodies are carried to the capuchin convent, which is one of the largest in Italy; "where, after the funeral service is performed, they are dried in a stove, heated by a composition of lime, which makes the skin adhere to the bones. They are then placed erect in niches, and fastened to the wall by the back or neck. A piece of coarse drab is thrown over the shoulders and round the waist; and their hands are tied together, holding a piece of paper with their epitaph, which is simply their names, age, and when they died. We of course (says Captain Sutherland) visited this famous repository; and it is natural to suppose, that so many corpses would impress one with reverence and awe. It was nearly dusk when we arrived at the convent. We passed the chapel, where one of the order had just finished saying vespers, by the gloomy glimmering of a dying lamp. We were then conducted through a garden, where the yew, the cypress, and the barren orange, obscured the remaining light; and where melancholy silence is only disturbed by the hollow murmuring of a feeble water-fall. All these circumstances tuned our minds for the dismal scene which we were going to behold; but we had still to descend a flight of steps impervious to the sun; and these, at last conveyed us to the dreary mansion of the dead. But (will you believe me?) notwithstanding the chilling scene through which we had passed, notwithstanding our being in the midst of more than a thousand lifeless bodies, neither our respect for the dead, nor for the holy fathers who conducted us, could prevent our smiling. The physiognomies of the deceased are so ludicrously mutilated, and their muscles are so contracted and distorted in the drying, that no French mimic could equal their grimaces. Most of the corpses have lost the lower part of the nose; their necks are generally a little twisted; their mouths drawn awry in one direction, their noses in another: their eyes sunk and pointed different ways; one ear perhaps turned up, the other drawn down. The friars soon observed the mirth which these unexpected visages occasioned; and one of them, as a kind of *memento*, pointed out to me a captain of cavalry, who had just been cut off in the pride of his youth: but three months ago, he was the minion of a king—the favourite of a princess—Alas! how changed! Even on earth there is no distinction between him and the meanest beggar. This idea in a moment restored my reflection; and I felt with full force the folly of human vanity. I turned to the holy father, who gave me this lesson. His eyes were fixed on what was once a captain of horse—I saw in them, 'Read this, titled pomp, and shrink to thy original nothingness. Hie thee to my lady's chamber, tell her, though she paint an inch thick, to this must she come at last—make her laugh at that.' The relations of the deceased are bound to send two wax tapers every year for the use of the convent; in default of which, the corpse is taken down and thrown into the charnel house. Were it not for the number of vacancies occasioned by the nonpayment of this stipend, the capuchins would be unable to find niches for the number of men who must die every year in so populous a city as this. Women are dried as well as

the men, but are not exposed. Nobles are shut up in chests."

The number of the inhabitants is above 200,000; and the harbour, though very large, is not so commodious as might be expected, and the vessels that ride therein are not always very safe. There is a magnificent castle built near the sea-side, wherein the viceroy resides six months in the year; and his presence draws a great number of nobility to this place. This city has suffered greatly by earthquakes, particularly in 1693; and it was greatly damaged by a fire in 1730, when a magazine of powder was blown up, containing 400 tons. It stands in a pleasant fruitful country on the north-east coast of the island, and at the bottom of the gulph of the same name. E. Long. 13. 23. N. Lat. 38. 15.

PALES, in Pagan worship, the goddess of the shepherds; to whom they offered milk and honey, in order that she might deliver them and their flocks from wild beasts and infectious diseases. This goddess is represented as an old woman. She was worshipped with great solemnity at Rome; and her festivals called *Parilia*, were celebrated on the 21st of April, the very day that Romulus began to lay the foundation of the city of Rome. The ceremony of which consisted in burning heaps of straw, and in leaping over them. No sacrifices were offered, but purifications were made with the smoke of horses blood, and with the ashes of a calf that had been taken from the belly of its mother after it had been sacrificed, and with the ashes of beans. The purification of the flocks was also made with the smoke of sulphur, of the olive, the pine, the laurel, and the rosemary. Offerings of mild cheese, boiled wine, and cakes of millet, were afterwards made to the goddess. Some call this festival *Parilia, quasi a pariendo*, because the sacrifices were offered to the divinity for the fecundity of the flocks.

PALESTINE, in its present state, is a part of Asiatic Turkey, situated between 31° 30' and 33° 20' north latitude, and between 34° 50' and 37° 15' east longitude. It is bounded by Mount Libanus, which divides it from Syria, on the north; by Mount Hermon, which separates it from Arabia Deserta, on the east; by the mountains of Seir and the deserts of Arabia Petræa, on the south; and by the Mediterranean sea on the west.

This once fertile and happy spot was first called the land of *Canaan*, or *Chanaan*, from Noah's grandson. In Scripture, however, it is frequently distinguished by other names: such as the *Land of Promise*, the *Land of God*, the *Land of Israel*, &c. It received the name of *Palestine* from the *Palestines* or *Philistines*, who possessed a great part of it; and it had the name of *Judea*, or *Judea Palestina*, from *Judah*, the most considerable of the twelve sons of Jacob. The Christians have denominated it the *Holy Land*; partly on account of the many singular blessings it received from the Divine Providence, and partly on account of its metropolis being made the centre of God's worship and his peculiar habitation; but much more for its being the place of our Saviour's birth, the scene of his preaching and manifold miracles; especially the place in which he accomplished the great work of our redemption. As to the name of *Judea*, it did not begin to receive that till after the return of the Jews from the Babylo-

Pales.  
Palestine.

nista

**Palestine.** nish captivity, though it had been styled long before the *Kingdom of Judah*, in opposition to that of *Israel*, which revolted from it under Jeroboam, in the reign of Rehoboam the son of Solomon. But after the return, the tribe of Judah, the only one that made any figure, settling at Jerusalem, and in the countries adjacent, quickly gave its name to the whole territory. By profane authors it was called by many different names; such as Syria, Palestina Syria, Cælosyria, Iduma, Idumæa, and Phœnicia or Phœnice; but these are supposed only to have been given out of contempt to the Jewish nation, whom they looked upon as unworthy of any other name than what distinguished the most obscure parts of the neighbouring provinces.

That part of the country which was properly called the *Land of Promise*, was inclosed on the west by the Mediterranean; on the east by the lake Asphaltites, the Jordan, and the sea of Tiberias or of Galilee, and the Samachonite lake; to the north it had the mountains of Libanus, or rather of Antilibanus, or the province of Phœnicia; and to the south, that of Edom or Idumæa, from which it was likewise parted by another ridge of high mountains. The boundaries of the other part, which belonged to the two tribes and an half beyond the river Jordan, are not so easily defined, as well as those of the conquests made by the more prosperous kings of the Jews. All that can be said with any probability is, that the river Arnon was the first northern boundary on that side; and with respect to those on this side of the Jordan, there is a considerable disagreement between the Hebrew and Samaritan versions of the Pentateuch.

The extent of this country is likewise variously settled by geographers; some giving it no more than 170 or 180 miles from north to south, and 140 in breadth where broadest, though not much above half that breadth where narrowest. But from the latest and most accurate maps, it appears to extend near 200 miles in length, and about 80 in breadth about the middle, and about 10 or 15, more or less, where it widens or shrinks.

The climate is certainly very happy, its situation being neither too far south nor too far north. The longest day is not above 14 hours 15 minutes: But the limits of Palestine appear so small, considering that the country is likewise intersected by high ridges or mountains, woods, deserts, &c. that many learned men have been induced to question what we read of its fertility and populousness in former times. It must be owned, indeed, that when we compare its ancient and flourishing state, when it was cultivated with the utmost diligence by persons well skilled in every branch of agriculture, with what it hath been since the total extirpation of the Jews out of it, and more especially since it fell into the hands of the Turks, the contrast is amazingly great; but when we consider the many evident causes which have contributed to effect this change, and even yet consider the nature of the country itself, we find not the least reason to doubt the truth of what the sacred historians have related. Moses describes the richness of it in the strongest terms, even before the Israelites got possession of it. It even exceeded the land of Egypt, so much celebrated by ancient historians; especially in the vast numbers of cattle which it produced; in the quantity and excellence of its wine, oil, and

**Palestine.** fruits. With respect to the oil and fruits, it is plain, that the olives and oil of Canaan exceeded in goodness those of Egypt, since the tribes sent them thither from thence; and as for vines, Herodotus tells us, that the Egyptians had none at all, but supplied the want of them by a liquor brewed from barley. The presents which Jacob sent to his son Joseph, of honey, spices, myrrh, almonds, and other fruits of Palestine, show that they must have been much better in the land of Judea than in Egypt. The wines of Gaza, Ascalon, and Sarepta, were famous among the most remote nations; though it is allowed, that the wine which was made at and in the neighbourhood of Bethlehem, in great quantities, was equal at least, if not superior, to any of the rest: and that of Libanus, mentioned by the prophet Hosea, was no less celebrated for its excellent flavour.

Several circumstances contributed to this wonderful fecundity: such as, the excellent temperature of the air, which was never subject to excessive heats or colds; the regularity of its seasons, especially the former and latter rain; and the natural fatness and fertility of its soil, which required neither dunging nor manuring, and could be ploughed with a single yoke of oxen and a small kind of plough; for the soil was, and is still, so shallow, that to have gone deep into it, would rather have endangered than improved the crop. With respect to the excellency of its corn, we are told, that the bread of Jerusalem was preferred above all other; and the tribe of Aser produced the best of both, and in greater quantity than any other tribe; and such plenty was there of it, that, besides what sufficed the inhabitants, who made it their chief sustenance, Solomon, we read, could afford to send 20,000 cors, or measures, of it, and as many of oil, yearly, to Hiram king of Tyre; besides what they exported into other countries. And we find, even so late as King Herod, surnamed Agrippa, the countries of Tyre and Sidon received most of their sustenance from his tetrarchy.

As to their fruits, the grapes were delicious, finely flavoured, and very large. The palm-tree and its dates were in no less request; and the plain of Jericho, among other places, was famed for the great plenty and excellence of that fruit; inasmuch, that the metropolis of that territory was emphatically styled *the city of palm-trees*. But what both this plain, and other parts of Palestine, were most celebrated for, was the balsam shrub, whose balm was esteemed so precious a drug among the Greeks, Romans, Egyptians, and other nations, and is still to this day under the name of *balm of Gilead*. They had likewise the greatest variety of other fruit-trees in the highest perfection; and which might be, in some sense, styled *perpetual*, because they were not only covered with a constant verdure, but because the new buds always appeared on the same boughs before the old fruit was ripe; and of those buds, which were in too great quantities to be allowed to come to maturity, they gathered enough to make very delightful pickles and sweetmeats, especially of their citrons, oranges, and apples of paradise, which last commonly hung by hundreds in a cluster, and as big as hens eggs, and of an excellent taste and flavour. Their vines yielded grapes twice, and sometimes three times a year, great quantities of which were dried up, and preserved for use, as

well,

Palestine. well as their figs, plums, and other fruits. They had plenty of honey; the very trees distilled it; and the rocks yielded it in great quantities; but whether that of the latter kind was there deposited by the industrious bees, or produced some other way, is much disputed by travellers and naturalists. They likewise cultivated sugar-canes in great abundance; and the cotton, hemp, and flax, were mostly of their own growth and manufacture, except some of a finer sort, that were brought to them from Egypt, and worn by those of the higher rank. Their vicinity to Libanus made the cedars, cypresses, and other stately fragrant trees, very common in most parts of the land, but more especially in Jerusalem. Cattle, both large and small, they fed in vast quantities; and the hilly countries not only afforded them variety and plenty of pasture but also of water, which descended thence into the valleys and lowlands, and fertilized them to the degree we have seen; besides several other rivers and brooks, some of the most remarkable of which we shall speak of in their proper places. But the most fertile pasture grounds were those on each side the river Jordan; besides those of Sharon, or Saron, the plains of Lydda, Jamnia and some others then justly famed for their fecundity. As for fish, the rivers above-mentioned, the lake of Tiberias, and the Mediterranean sea, afforded, as they do to this day, great plenty and variety. Vast quantities were brought to Jerusalem, on which the inhabitants mostly subsisted; and hence one of the gates of that metropolis was, according to St Jerome, called the *fish-gate*. The lake Asphaltites yielded salt in abundance, wherewith to season and preserve their fish, which Galen affirms to have been preferable to any other for wholesomeness, digestion, and extenuation. In short, the Scripture is so pregnant with proof of the extraordinary richness and fecundity of this once happy land, and the vast number of people that lived in it, almost wholly upon its product, to say nothing of the vast exports of its corn, wine, oil, raisins, and other fruits, &c. that a man must have taken a strange warp to infidelity, that can call it in quest on, merely on account of the melancholy and quite opposite figure it now makes under its present tyrannical government.

But its fertility has been called in question; and Voltaire and other infidel writers have raised difficulties and objections against the authority of Scripture, from the pretended sterility of the land of Judea. In answer to which, the Abbé Guéné, about the year 1780, communicated to the academy of inscriptions and belles lettres at Paris, *Two Memoirs concerning the Fertility of Palestine*, in order to show that such objections had no solid foundation.

In the first of them, the author proves, that from the captivity of Babylon to the war of Adrian, Judea was always considered as a rich and fertile country. The positive and multiplied authorities of the writers of that period, Jews, Greeks, and Romans, not only attest in general the fertility of that country, but many of these writers, entering into a particular detail of circumstances, prove it from the nature of the climate, the qualities of the soil, and the excellencies and variety of its productions. These are confirmed by proofs of another kind, but which are of a very

Palestine convincing nature, even those resulting from a great number of medals struck under the reigns of the kings of Syria and Judea, and under the Romans, both by Jews and Pagans, and which all bear the symbols of a rich fertility. To these proofs are added a multitude of facts, recorded in the history of the Jews during this period; the efforts of the neighbouring kings to conquer their country: the long and bloody wars that the Jews carried on with vigour, and sometimes with success, against powerful princes and nations; the tribute and taxes they paid to the kings of Egypt and Syria, to the Romans, and to their own princes; the magnificence of their sovereigns, and among others of Herod; the troops he raised and kept on foot; the temples, fortresses, palaces and cities, which he erected and embellished, not only in his own country, but also in Syria, Asia Minor, and even in Greece; the immense sums he lavished among the Romans, the donations he made to his own people, and the vast treasures which he left behind him: all these circumstances concur in proving the fertility and riches of Palestine during that period.

In the second memoir, the Abbé Guéné considers the state of Palestine as it was from the time of the Emperor Adrian to the caliphate of Omar, which comprehends a period of four centuries. From sundry facts he shows, that it could not then have been the barren country which it has been represented by some sceptical writers. He particularly mentions the project formed by Adrian of rebuilding and embellishing Jerusalem, of forming it into a Roman colony, and giving it his own name; a project of which he could never have entertained a thought, if Judea, which he had seen and examined with his own eyes, had appeared to him such a barren and wretched country, as it is said to be by some who have neither seen that country nor examined the matter with care and attention. Our author also produces a variety of other facts, to show that Judea, after all that it had suffered from the desolations of war both in ancient and latter times, still remained at the period in question fertile, rich, and populous. This is the idea which the writers of the time, Pagan and Christian, as well as Jewish, have given of Palestine. Antoninus Martyr, a citizen of Placentia, who in the 6th century travelled to Palestine, and composed an account of his voyage, which is still extant, says, that the canton of Nazareth was not inferior to Egypt in corn and fruits; and that though the territory of that city was not very extensive, it abounded in wine and oil, and excellent honey. The country about Jericho appeared to him still more fertile. He saw mount Tabor, which he represents as surrounded with cities: and he observed, in the neighbourhood of Jerusalem, vineyards, great plantations of fruit trees, and through the whole country a considerable number of hospitals, monasteries, and beautiful edifices. Our learned Abbé, in concluding his work, acknowledges, that the opulence and fertility of Judea might begin to diminish towards the middle of the period treated of in his second memoir: but he does not think that any argument can be drawn from hence against its having been at the commencement of this period in a flourishing state; and much less can any proof be brought from hence, that in preceding periods,

Palestine. riods, under the kings, or under the administration of Moses, the country of Palestine was a barren and uncultivated district.

Besides, it ought to be considered, that it was then inhabited by an indolent people, who knew how to improve every inch of their land, and had made even the most desert and barren places to yield some kind of productions, by proper care and manure; so that the very rocks, which now appear quite bare and naked, were made to produce corn, pulse, or pasture; being, by the industry of the old inhabitants, covered with mould, which, through the laziness of the succeeding proprietors, has been since washed off with rains and storms. We may add, that the kings themselves were not above encouraging all kind of agriculture, both by precept and example; and, above all, that they had the divine blessing promised to their honest endeavours and industry; whereas it is now, and hath been long since, inhabited by a poor, lazy, indolent people, groaning under an intolerable servitude, and all manner of discouragements; by which their aversion to labour and agriculture, farther than what barely serves to supply their present wants, is become in a manner natural and invincible. We may farther observe, after the judicious Mr Maundrell, that there is no forming an idea of its ancient flourishing state when under the influence of heaven, from what it is now under a visible curse. And, if we had not several concurring testimonies from profane authors, who have extolled the fecundity of Palestine, that single one of Julian the apostate, a sworn enemy to Jews and Christians, as well as to all the sacred writings, would be more than sufficient to prove it; who frequently makes mention, in his epistles, of the perpetuity, as well as excellence and great abundance, of its fruits and product. The visible effects of God's anger, which this country has felt, not only under Titus Vespasian (when myriads of inhabitants were either slain, or perished by the most severe famine, pestilence, and other calamities; and the rest sold for slaves, into all lands; and new colonies sent to repopulate it; who found it in such a desolate state, as quite discouraged them from restoring it to its pristine fruitfulness); but much more since that emperor's time, in the inundations of the northern barbarians, of the Saracens, and of the more cruel and destructive Christians during the holy war; and in the oppression it now feels under the Turkish yoke; may be easily owned to be more than sufficient to have wrought the dismal change we are speaking of, and to have reduced the far greater part into a mere desert.

Nevertheless, if we may credit those who have viewed it in this doleful condition, they will tell us, there are still such visible signs of its natural richness and fertility, as plainly show, that the bare want of culture is the main if not the only cause of its present poverty and barrenness. We shall hint, as a further proof of this, what a learned traveller hath lately written of it from his own observations.

"The Holy Land (says Dr Shaw), were it as well peopled and cultivated as in former times, would still be more fruitful than the very best part of the coast of Syria and Phœnice; for the soil is generally much richer, and, all things considered, yields a preferable crop. Thus the cotton that is gathered in the

VOL. XIII.

plains of Ramah, Esdraelon, and Zabulon, is in greater esteem than what it cultivated near Sidon and Tripoli. Neither is it possible for pulse, wheat, or any sort of grain, to be more excellent than what is sold at Jerusalem. The barrenness, or scarcity rather, which some authors may, either ignorantly or maliciously, complain of, doth not proceed from the incapacity or natural unfruitfulness of the country, but from the want of inhabitants, and the great aversion there is to labour and industry in those few who possess it. There are, besides, such perpetual discords and depredations among the petty princes who share this fine country, that, allowing it was better peopled, yet there would be small encouragement to sow, when it was uncertain who should gather in the harvest. Otherwise, the land is a good land, and still capable of affording its neighbours the like supplies of corn and oil which it is known to have done in the time of Solomon."

And Volney, in his Travels in Egypt and Syria, observes, that though the whole of Palestine is almost an entire level plain, without either river or rivulet in summer, and only watered by the winter torrents, the soil is yet good, and may even be termed fertile; for when the winter rains do not fail, every thing springs up in abundance; and the earth, which is black and fat, retains moisture sufficient for the growth of grain and vegetables during the summer. More doura, fefamum, water-melons, and beans, are sown here than in any other part of the country. They also raise cotton, barley, and wheat; but though the latter be most esteemed, it is less cultivated, for fear of too much inviting the avarice of the Turkish governors and the rapacity of the Arabs.

Judea, in its largest sense, was divided into maritime and inland, as well as into mountainous and champaign; and again subdivided into Judea on this side, and Judea beyond Jordan. But the most considerable division is that which was made among the twelve tribes, by lot, to prevent all murmuring and discontent among that stubborn people\*; of these, two and a half were seated beyond Jordan, and the rest on this side. The next remarkable division was made by king Solomon, who divided his kingdom into twelve provinces or districts, each under a peculiar officer; and every one of these was to supply the king with provisions for his household in his turn; that is, each for one month in the year†. But the most fatal division of all was, that which obtained under his imprudent son Rehoboam; when ten of the twelve tribes revolted, under the conduct of Jeroboam, who became head of this new monarchy, styled *The kingdom of Israel*, in opposition to that of *Judah*, the title which distinguished the maimed kingdom of Rehoboam from that time downwards. Under the second temple the distinction lasted a considerable time, and the same bloody hatred and hostilities continued between these two kingdoms; that of Israel taking the name of *Samaria* from its capital. The inhabitants were a mixture of the old Israelites, and of new colonies sent thither by the kings of Assyria after their conquest of it, till they were subdued by the Maccabees, and their metropolis destroyed. Under the Romans it began to be divided into tetrarchies and toparchies: the larger were those of Judea, Samaria, and Galilee, Upper and Lower; the lesser, those of Geraritica, Sarona, and others of less note;

lib. xiv.

all which lay on this side of the Jordan. The rest, on the other side, were those of Gilead, Peræa, Gaulonitis, Auranitis, Batanea, and Decapolis. Josephus mentions † another division made in Gabinus's time into five districts, or, as he styles them, *counties*, agreeable to the Roman manner: these were Jerusalem, Jericho, and Sephoris on this side Jordan; and Gadaris and Amathus on the other. In the reigns of the Christian emperors, it was divided afresh into Palestina Prima, Palestina Secunda, and Palestina Tertia or Salutaris; which last included the far greater part if not the whole country, as is known to all who are acquainted with history. On that account we shall wave all other divisions and changes that happened to it under the northern barbarians, Saracens, &c. and conclude this article with the present state and division of it under the Turks.—The whole country of Palestine is now reduced to a district or province, under the beglerbegate or bassahip of Scham or Damascus, who hath the seven following sangiacs or subgovernors under him, styled, according to the different places of their residence, 1. The sangiac of Damascus, who is under the bassah of that province: 2. Of Jerusalem, or, as the turks call it, *Cudjem'arie* or *Coudscherif*; 3. Aglum; 4. Bahara; Scifat; 6. Gaza; 7. Nabolos. Each of these has a number of ziamets, and each ziamet a number of timariots under them; for the better understanding of which terms we shall refer our readers to Sir Paul Ricaut's account of the Ottoman empire. At present it will be sufficient to say of these inferior subdivisions, under the sangiac of this district, or sangiacate of Jerusalem, that it hath nine of the former and sixteen of the latter class. Neither must the reader imagine those sangiacates or sub-governments to be any thing considerable, or the residence of these officers to be places of any note or opulence. The former indeed live by oppressing the people under them, and extort contributions of every thing that comes within their reach, such as the protection of travellers, merchants and caravans; but being all under their respective bassas, who are still more gripping than their underlings, they are commonly fleeced of some considerable part of their unjust gains. As for the places of their residence, except it be here and there one in a considerable city, as at Damascus and Jerusalem, the rest are either some old cities or even inconsiderable villages.

There are a variety of curiosities in Palestine both natural and artificial: but they are so very numerous as almost to preclude description; we therefore refer our readers to the Ancient Universal History, Vol. II. where they are mentioned and particularly described. The principal mountains, rivers, and other places of note, have already been, or will be noticed under their respective names.

PALESTRINA, a town of Italy, in the Campagna di Roma, with a bishop's see. It is the capital of a principality of the same name, and the bishop is one of the six cardinal bishops. It was anciently famous for the temple of Fortune, being then called *Præneste*, and seated on the top of a mountain, the ruins of which may yet be seen. E. Long. 12. 55. N. Lat. 41. 51.

PALESTRINA, is one of the largest and most populous of the islands called the Lagues, near Venice,

and where the most considerable of the nobleman have houses of pleasure. It is 15,000 paces in length and 400 in breadth; the principal harbour has also the same name.

PALFIN (John), an eminent surgeon, anatomist, and reader in surgery at Ghent, the place of his birth; acquired great reputation by his learning and works.

The principal of these are, 1. A Treatise on Osteology, in 12mo, Paris, 1731. 2. Anatomy of the Human Body, in 2 vols 8vo, Paris, 1734, he died at Ghent at a great age, in 1730.

PALFREY, is one of the better sort of horses used by noblemen or others for state; and sometimes of old taken for a horse fit for a woman to ride. Camden says, that William Fauconberge held the manor of Cukeny, in the county of Nottingham, in fergeantry, by the service of shoeing the king's palfrey when the king should come to Mansfield.

PALICAUD; or PALGATCHERRY, a fortress of considerable strength in India, which commands the passage between the two coasts of Malabar and Coromandel, by way of the Trichinopoly and Coimbatore countries: there is also a communication with it thro' the Nayre country. It is in the hands of the English; and is of great importance to them, because as Coimbatore is in the hands of Tippoo, by their holding this place on the west, and Dindigul on the east of Coimbatore, the province is rendered of little use to Tippoo in time of war, unless he keeps a very large force there to protect it. See Memoir of a Map of the Peninsula of India by Major Rennel.

PALLICATE, a seaport town of India, on this side of the Ganges. It is seated on the coast of Coromandel in the kingdom of Carnate, 70 miles north of Fort St George. Here the Dutch have a factory and fort called the *Fort of Guelderland*. E. Long. 80. 1. N. Lat. 13. 34.

PALICI, or PALISCI (fab. hist.), two deities, sons of Jupiter by Thalia, whom Æschylus, according to Macrobius, calls *Ætina*, in a tragedy which is lost. The nymph Ætina, when pregnant begged Jupiter to remove her from the pursuit of Juno. Upon which he concealed her in the bowels of the earth; and when the time of her delivery arrived, the earth opened and brought into the world two children, to whom were given the name of *Palici* *απο του παλι ικεσθαι*, *because they came again into the world from the bowels of the earth*. These deities were worshipped with many ceremonies by the Sicilians; and near their temple were two small lakes, which were supposed to have sprung out of the earth when they were born. Near these pools it was usual to take the most solemn oaths when any body wished to decide controversies and quarrels. If any of the persons who took the oaths were perjured, they were immediately punished supernaturally; and those whose oath, by the deities of the place, was sincere, departed unhurt. The Palici had also an oracle, which was consulted upon some great emergencies, and which rendered the truest and most unequivocal answers. In a superstitious age, the altars of the Palici were stained with the blood of human sacrifices; but this barbarous custom did not last long, as the deities were satisfied with the usual offerings.

PALINDROMUS, a verse or sentence which runs the

Palfin  
Palindromus.

Palinge-  
nesia

Palifades.

the same when read either backwards or forwards. Such is the verse.

*Roma tibi subito motibus ibit amor.*

Some people of leisure have refined upon the Palindromus, and composed verses, each word of which is the same backwards as forwards; for instance, that of Camden.

*Odo tenet mulum, madidam mappam tenet Anna.*

*Anna tenet mappam madidam, mulum tenet Odo.*

PALINGENESIA, among divines, the same with regeneration. Among chemists, it denotes the producing of a body from its principles.

PALIGENIUS (Marcellus), well known by a poem divided into 12 books, and intitled *Zodiacus Vita*, which he was several years of composing and dedicated to Hercules II. of Este, duke of Ferrara. Some say he was physician to the prince; others rank him among the learned Lutherans, to whom the duchess of Ferrara gave a reception in her court and honoured with her protection. His *Zodiac* contains good things, and is a philosophical satire against immorality and false prejudices. Though this poem has borne a multitude of impressions, the author's life is but little known. He died some time between the years 1537 and 1543.

PALINODY, a discourse contrary to a preceding one; hence the phrase of *palinodiam canere* was taken for a recantation.

PALINURI, PROMONTORIUM (Virgil, Velleius), with a cognominal port, was situated at the south extremity of the Sinus Pæstanus, on the coast of Lucania; so called from Palinurus, Æneas's steerman, who there perished (Mela Dionysius Halicarnassæus).

PALINURUS (fab. hist.), Æneas's pilot, whose fate Virgil very particularly describes. He fell into the sea when asleep; and was three days exposed to the tempests and its agitation, and at last came safe ashore, where the cruel inhabitants of the place murdered him to get his clothes. His body was left unburied on the seashore; and since, according to the religion of the old Romans, no one could cross the Stygian lake before 100 years were elapsed, if his remains had not been decently buried, we find Æneas, when he went down to hell, speaking to Palinurus, and assuring him that though his bones were deprived of a funeral, yet the place where his body was exposed would soon be adorned with a monument, and bear his name; and accordingly the promontory was called *Palinurus*.

PALISADES, in fortification, stakes made of strong split wood, about nine feet long, six or seven inches square, three feet deep in the ground, in rows about two and an half or three inches asunder, placed in the covert way, three feet from, and parallel to, the parapet or side of the glacis, to secure it from surprise. They are also used to fortify the avenues of open forts, gorges, half-moons, the bottoms of ditches, and in general all posts liable to surprise. They are usually fixed perpendicularly, though some make an angle inclining towards the ground next the enemy, that the ropes cast over them to tear them up may slip off.

*Turning PALISADES*; an invention of Mr Coehorn.

in order to preserve the palisades of the covert way from the besiegers shot. They are so ordered, that as many of them as stand in the length of a rod, or about ten feet, turn up and down like traps, so as not to be in sight of the enemy till they just bring on their attack; and yet are always ready to do the proper service of palisades.

PALISSE, in heraldry, a bearing like a range of palisades before a fortification, represented on a fesse, rising up a considerable height, and pointed at top, with the field appearing between them.

PALIURUS, in botany. See RHAMNUS.

PALL, in heraldry, a figure like a Greek  $\pi$ , about the breadth of a pallet; it is by some heralds called a *cross-pall* on account of being looked upon as an archiepiscopal bearing.

PALLA, in Roman antiquity, a mantle which women wore over the gown called *stola*. It was borne on the left shoulder; whence passing to the other side, under the right arm, the two ends were bound under the left arm, leaving the breast and arm quite bare. It had a great many folds, and derived its name from  $\piαλλω$ , to *shake* or *tremble*.

PALLADIO (Andrea), a celebrated Italian architect of the 16th century, was a native of Vicenza in Lombardy, and the disciple of Trissin. He made exact drawings, of the principal works of antiquity to be met with at Rome, adding commentaries to them which went through several impressions. But this, though a very useful work, was greatly exceeded by the Treatise of Architecture in four books, which he published in 1570. Inigo Jones wrote some excellent remarks on it; which were included in an edition of Palladio, published by Leoni, in two vols folio. 1742.

PALLADIUM in antiquity, a statue of the goddess Pallas. It was about three cubits high, and represented the goddess sitting and holding a pike in her right hand and in her left a distaff and a spindle. It fell down from heaven near the tent of Ilius, as he was building the citadel of Ilium. Some, however, suppose, that it fell at Pessinus in Phrygia, or, according to others, Dardanus got it as a present from his mother Electra. There are some who maintain, that the Palladium was made with the bones of Pelops by Abarris; but Apollodorus says, that it was no more than a piece of clock-work which moved of itself. However various the opinions of ancient authors be about this celebrated statue, it is universally allowed, that on its preservation depended the safety of Troy. This fatality the Greeks, during the Trojan war, were well aware of; and therefore Ulysses and Diomedes were commissioned to steal it. This they effected; and if we can rely upon the authority of some, they were directed how to carry it away by Helenus a son of Priam, who in this betrayed his country, because his brother Deiphobus, at the death of Paris, had married Helen, of whom he was enamoured. Minerva was enraged at the violence offered to her statue: and, according to Virgil, the palladium itself seemed to have received life and motion; and by the flashes which started from its eyes, and sudden springs from the earth, it seemed to show the resentment of the goddess. The true palladium, as is observed by some, was not carried away from Troy by the Greeks, but

Palisse  
||  
Palladium.

**Palladius** only a statue of similar size and shape, which was placed near it, to deceive whatever sacrilegious persons attempted to steal it. The palladium, therefore, as they maintain, Æneas conveyed safe from Troy to Italy, and it was afterwards preserved by the Romans with the greatest secrecy and veneration in the temple of Vesta; a circumstance which none but the vestal virgins knew. It was esteemed the destiny of Rome; and there were several others made perfectly like it, to secure it from being stolen, as was that at Troy, which the oracle of Apollo declared should never be taken so long as the palladium was found within its walls. A palladium was also placed by Nicias in the citadel of Athens.

**PALLADIUS**, bishop of Helenopolis in Bithyria, and then of Aspona. He was a Galatian, and born at Cappadocia. He became an Anchorite in the Mountain of Nebria in 388, and was consecrated a bishop in 401. He was an intimate friend of St John Chrysostom, whom he never forsook during the time of his persecution, nor even in his exile. He went to Rome some time after Chrysostom's death, and at the request of Lausus governor of Cappadocia, composed the history of the Anchorites or Hermits, and intitled it *Lausiacæ*, after the name of that lord, to whom he dedicated it in 420, when it was written, being then in the 20th year of his episcopacy, and 53d of his age. Palladius was accused of being an Origenist. If it be true, he was an enemy to St Jerome, of whom he does not speak well, and was intimately connected with Rufinus, but perhaps no good proof can be brought of his Origenism. He had been the disciple of Evagrius of Pontus, and was even suspected of entertaining the sentiments of Pelagius. He died in the 5th century, but in what year is not certain. His History was published in Greek by Meursius at Amsterdam in 1619, and in Latin in the *Bibliotheca Patrum*: but he seems not to have been the writer of the life of St John Chrysostom, in Greek and Latin by M. Bigot, printed in 1680.

**PALLAS**, a freed man of Claudius, celebrated for the power and the riches which he obtained. He advised the emperor his master to marry Agrippina, and to adopt her son Nero for his successor. It was through him and Agrippina that the death of Claudius was hastened, and that Nero was raised to the throne. Nero, however, forgot to whom he was indebted for it. He discarded Pallas, and some time after caused him to be put to death, that he might procure his great riches.

**PALLAVICINI** (Perrante), an Italian wit of considerable note, was descended from a branch of a noble family seated in Placentia, where he was born about the close of the 16th century. He soon gave great proofs of an extraordinary genius, and quickly acquired a masterly knowledge in the elements of classical erudition. He was afterwards sent to complete his education in the monastery of Augustin friars at Milan, where he took the habit, lived much esteemed, improved himself in piety as well as learning, and raised great expectations of future fame; but being somewhat amorously inclined, he engaged in an intrigue with a young courtesan of Venice, whose charms proved irresistible; and in order to enjoy them without restraint, he obtained leave from his

general to make the tour of France. Accordingly, Pallavicini he pretended to set out for that country; but it was only a blind to cover his real design. He never left Venice, but lived there privately, enchanted in the arms of his Venus: and having too ready a talent at invention, he imposed upon his friends, by often sending them in letters feigned accounts of his travels through France; also informing them of several things respecting that court, which he learned from the advices of many considerable persons with whom he corresponded.

His money in the mean time flew with expanded wings, and he soon found his purse much drained. In this exigence he naturally had recourse to his wits for supplies. He wrote for the booksellers; and composed several pieces, more for the sake of lucre than out of fondness for authorship. Among other things, he wrote a collection of letters, mostly satirical, which he called *the Courier robbed of his Mail*. The work appeared at first in such a cast, as could not give great offence except to the Spaniards, against whom he had some grudge. The piece was accordingly licensed by the inquisitors; but falling into the hands of the secretary of the republic of Venice, who at that time was licenser of books, he would not give his imprimatur, though great interest was employed for that purpose, neither would he return the manuscript. This enraged Pallavicini so much, that had not his friends restrained him, he would have pursued the affair to his ruin.

At length he found an opportunity of travelling into Germany with duke Amalfi as his chaplain.—This journey, as was to be expected, had no good effect either upon his wit or his morals. On the contrary, finding himself, from the manners of the Germans, more at liberty, he indulged his genius and passions with greater ease; and after a residence there of upwards of a year with the duke, he returned to Venice, with a face marked all over with blotches like the evil, and a spirit resolved to sacrifice to his resentment at the risk of his life. He was resolved to have his full measure of revenge against the secretary of the republic for keeping his manuscript; and with him his resentment joined the family of the Barberini, pope Urban VIII. and his nephews, because they also endeavoured, at the instigation of the Jesuits, to get all his manuscripts forbid the press. In this rancorous spirit he cast his Courier into a new model, and enlarged it with many letters and discourses. Thus new modelled, he offered it to a bookseller, who undertook to get it printed; but our author was betrayed by a pretended friend, who acted the part of a spy, and informed the archbishop of Vitelli, then the Pope's nuncio at Venice, just as the work was finished at the press: at the same time, this treacherous friend bought the whole impression; and upon the nuncio's complaint, Pallavicini was imprisoned. In this miserable condition he found a friend in one of his mistresses, who, seeing him abandoned by most of his patrons, not only supported him, but conveyed letters to him, by which she gave him such informations as enabled him to make a proper defence, and to recover his liberty.

But war having in the mean time broke out between the Barberini and the duke of Parma; Pallavicini,

Pallavicini. vicini, in order to revenge himself upon the supposed instruments of his imprisonment, wrote a piece intitled "The tinkling Instrument to call together the Barberini Bees;" and dedicated it in terms of the profoundest contempt to the nuncio Vitelli. The nuncio finding that little notice was taken of his complaints on the occasion, procured by bribery one Charles Morfu, a Frenchman of infamous character, who pretended to pass for a gentleman, to ensnare Pallavicini: to which end, the traitor used his best endeavours to insinuate himself into his friendship, and at length exhorted him to accompany him to France. He declared that his fortune would be made by the extraordinary encouragements which was given to men of letters by Cardinal Richelieu; and the better to favour the deceit, he produced feigned letters from the Cardinal, inviting our author to France, and expressing a desire he had to establish in Paris an academy for the Italian tongue, under the direction of Pallavicini. The snare took; and now fascinated by the prospect of gain, Pallavicini suffered himself to be led like an ox to the slaughter, whithersoever Morfu thought proper. He left Venice much against the advice of his friends, and went first to Bergamo, where he spent a few days with some of his relations, by way of giving some entertainment to Morfu. They then set off for Geneva, to the great satisfaction of our author, who proposed to get some of his works printed there, which he had not been able to do in Italy. Morfu, however, instead of conducting him to Paris, took the road to Avignon; where, crossing the bridge of Soraces, in the county of Venaissin, they were seized by a gang of *Sbirri*, or sheriff's officers, on pretence of carrying contraband goods, and confined. Morfu was quickly discharged and very liberally rewarded; but Pallavicini, being carried to Avignon, was imprisoned; and notwithstanding, on his examination concerning some papers found upon him he made a very artful defence, it was in vain. The sentence was already brought from Rome, and he was to undergo a trial merely for form's sake. For this purpose being put into a dark dungeon, he made another effort to escape. He managed matters so well with his keeper, as to procure wax candles to be allowed him, under pretence of amusing himself with reading; and when he had got a number of these, he set fire one night to the prison-door, in order to get off by that means; but the stratagem did not succeed, and he was of course confined much closer, and treated with great inhumanity. After a year's suffering, he was brought to trial, in which he made an excellent defence, and flattered himself with hopes of relief. He had even begun a whimsical piece on the subject of melancholy; but, contrary to his expectations, he was sentenced to die, and lost his head on a scaffold in the flower of his age.

He was of so heedless and profuse a disposition, that had he possessed an immense estate he would have spent it all. He was never engaged in a virtuous passion, being inflamed to a prodigious and unnatural degree with the love of the meanest and most infamous prostitutes. On the other hand, no one could be more sincere and faithful in his friendships, nor was ever a man a greater prey to treachery; inasmuch, that when released from prison in Venice, he was told that a wretch had betrayed him, he could not be prevailed upon to believe it, saying, "How can this be, since

he declared himself my friend, and I made him privy to all my concerns!" He used, while he wore a religious habit, to study or write two or three hours in bed every morning. The rest of the day he spent either in the company of idle persons or else with the ladies; but after he had wholly left the monastic life, upon pretence of securing himself from the snares of his enemies, he lived in a very irregular manner. He was possessed of a fine genius, and had a great facility in writing; and till he was corrupted by the commerce of mean lewd women, he wrote pieces worthy of immortality. He did not spend much time or pains either in composition or in revision, for he frequently sent to the press the very first exertions of his genius; yet nature had given him so noble a vein of eloquence, which he had greatly improved by perusing the best authors, that his first thoughts were often equal to the most laboured compositions. He was modest, and spoke of himself with diffidence; but his works are strongly tinged with envy, malice, and gall. He made but a poor figure in conversation; and when with persons of worth and distinction, would often retire to a corner of the room, and seem quite wrapt up in thought. He never exerted his wit or humour after his return from Germany, but when he was in the company of some mean women. Upon the whole, it is difficult to determine whether vice or virtue was the most predominant feature in his character. His death gave birth to a dialogue, intitled, *Anima erranti di Ferrante Pallavicini*, or, "The wandering Ghost of Pallavicini." Besides his life at the head of his works in two volumes, there is another prefixed to the "Divortio celeste," at Amsterdam in 1696.

PALLENE, a small peninsula of Thrace or Macedonia, formerly called *Phlegra*. It is situated near the bay of Thermæ, and contains five cities, the principal of which is called *Pallene*. It was famous, according to some of the ancients, for an engagement between the gods and the giants.

PALLET, among painters, a little oval table, or piece of wood, or ivory, very thin and smooth; on and round which the painters place the several colours they have occasion for, to be ready for the pencil. The middle serves to mix the colours on, and to make the tints required in the work. It has no handle, but, instead thereof, a hole at one end to put the thumb, through to hold it.

PALLET, among potters, cracible makers, &c. a wooden instrument, almost the only one they use, for forming, heating, and rounding their works. They have several kinds; the largest are oval, with a handle; others are round, or hollowed triangularly; others, in fine, are in manner of large knives serving to cut off whatever is superfluous on the moulds of their work.

PALLER, in gilding, an instrument made of a squirrel's tail, to take up the gold leaves from the pillow, and to apply and extend them on the matter to be gilt. See GILDING.

PALLET, in heraldry, is nothing but a small pale, consisting of one half of it in breadth, and therefore there are sometimes several of them upon one shield.

PALLET, is also a part belonging to the balance of a watch or movement. See the article WATCH.

PALLIATÆ, a name which the Romans give to such plays as laid the plot in Greece, and required the

Pallavicini  
||  
Palliatæ.

**Palliation** performers to appear in Grecian habits. It is used in contradistinction to *toga*, in which the scene was laid at Rome, and in which the dresses were Roman. The word *palliatæ* is derived from *pallium*, which was a part of dress peculiar to the Greeks; whereas the *toga* belonged to the Romans only. See **TOGATÆ**, **COMEDY**, &c.

**PALLIATION**, or a **PALLIATIVE Cure**, in medicine, is when in desperate and incurable diseases, after predicting the fatal event, the physician prescribes some remedies for mitigating the pain or some other urgent symptoms, as in ulcerated cancers, or cancerous fistulas, and the like.

**PALLIO Cooperire**. It was an ancient custom, where children were born out of lawful wedlock, and their parents were afterwards married, that those children, together with the father and mother, should stand *pallio cooperiti*, under a cloth, while the marriage was solemnizing; which was a kind of adoption, and had the effect of a legitimation. Thus Robert Grosthead, the famous bishop of Lincoln, in one of his letters, says: *In signum legitimatōis, nati ante matrimonium confueverunt poni sub pallio super parentes eorum extento, in matrimonii solemnizatione.*

Selden in his notes on Fleta, adds, that the children of John of Gaunt duke of Lancaster, by Catharine Swinford, though legitimated by act of parliament, yet were covered with the *pall* when their parents were married.

**PALLIUM**, a word often mentioned in our old historians. Durandus tells us, that it is a garment made of white wool, after the following manner, viz. The nuns of St Agnes, every year, on the feast-day of their saint, offer two white lambs on the altar of their church, during the time they sing *Agnus Dei*, in a solemn mass; which lambs are afterwards taken by two of the canons of the Lateran church, and by them given to the pope's subdeacons, who send them to pasture till shearing time, and then they are shorn, and the *pall* is made of their wool mixed with other white wool. The *pall* being thus made, is carried to the Lateran church, and there placed on the high altar, by the deacons of that church, on the bodies of St Peter and St Paul; and after an usual watching, it is carried away in the night, and delivered to the subdeacons, who lay it up safe. And because it was taken from the body of St Peter, it signifies the plenitude of ecclesiastical power: and therefore it was the prerogative of popes, who pretend to be the immediate successors of this saint, to invest other prelates with it; which at first was done nowhere but at Rome, though afterwards at other places.

**PALLIUM**, in antiquity an upper garment or mantle worn by the Greeks, as the *toga* was by the Romans. Each of these was so peculiar to the respective nations, that *Palliatum* is used to signify a Greek, and *Togatus* a Roman.

**PALM**, has among almost all nations been regarded as an emblem of victory, and assigned as the reward of it. The reason why this tree was adopted, and made use of to represent victory, is said to be, because it is so elastic, that if pressed by the greatest weight, it will rise superior to the pressure, and be able to restore itself to its former state, appearing almost invincible.

**PALM Sunday**, in the Christian church, the Sunday

next before Easter; being so called in memory of our Saviour's triumphal entry into Jerusalem, when the multitude that attended him strewed branches in his way.

The ancients had other names for this day. For, 1. They called it *Dominica competentium*, i. e. Sunday of the Competentis; because on that day the catechumens came to ask the bishop leave to be admitted to baptism, which was conferred the Sunday following. They had also then given them the symbol or credo, to get off by heart, to be repeated to the bishop in the ceremony of baptism. 2. They called it *Capitulum*, the Sunday of washing the head; because those who were to be baptized the following Sunday, were prepared by washing their heads on this day. Some time afterwards they called it *Indulgence Sunday*, because the emperors and patriarchs used to distribute gifts on that day.

**PALM-Tree**, in botany. See **PHOENIX**.

**PALMA**, or *PALMA Nova*, a very strong town of Italy in the territory of Venice, and in Friuli. It is a very important place, for the defence of the Venetians against the Austrians and Turks; and was built in 1593, for that very purpose. They have cut a canal near this place, which is very advantageous. It is seated on the sea-side, 10 miles south-east of Udino, and 55 north-east of Venice. E. Long. 13. 15. N. Lat. 46. 2.

**PALMA**, an island in the Atlantic Ocean, and one of the Canaries, 36 miles north-west of Gomera, and about 75 in circumference. It abounds in wine and sugar; and has a handsome town of the same name, which carries on a trade in wine to the West Indies and other parts. Their best vines grown in a soil called the *Brenia*, where they make 12,000 butts of wine every year, which is well known by the name of *palm-wine*. There is plenty of cattle, and all sorts of fruits. In 1625 a volcano broke out in this island, with a most violent earthquake; the flame was seen for six weeks together, and a great quantity of ashes were thrown as far as Teneriff. It was conquered by the Spaniards in 1460.

**PALMÆ**, *Palms*. Under this name Linnæus has arranged several genera, which, although capable of a place in separate classes of his system, he chooses rather on account of their singular structure, to place apart, in an appendix to the work.—See **ARECA**, **CHAMÆROPS**, **PHOENIX**, **COCOS**, &c.; and **CORYPHA**.

The same plants constitute one of the seven families or tribes into which all vegetables are distributed by Linnæus in his *Philosophia Botanica*. They are defined to be plants with simple stems, which at their summit bear leaves resembling those of the ferns, being a composition of a leaf and a branch; and whose flowers and fruit are produced on that particular receptacle or seat called a *spadix*, protruded from a common calyx in form of a sheath or scabbard, termed by Linnæus *spatha*.

*Palme* is likewise the name of the first order in Linnæus's Fragments of a Natural Method. See **BOTANY**, p. 457.

**PALMARIS MUSCLE**, in anatomy. See there, *Table of the Muscles*.

**PALMATED**, something resembling the shape of the hand: thus we say, palmated leaves, roots, stones, &c.

**PAL-**

Palmerston  
||  
Palmyra.

**PALMERSTON'S ISLAND**, situated in the South Seas, which Captain Cook visited in his second and last voyages. It consists of a group of small islets, nine or ten in number, connected by a reef of coral rocks, and lying in a circular direction. It admits of no anchorage, nor are there any inhabitants on it, though it abounds with cocoa-nuts, scurvy-grass, and the wharra-tree. This island is not more than a mile in circumference, and is not elevated above three feet above the level of the sea. It consists entirely of a coral sand, with a small mixture of blackish mould, which appeared to be produced from rotten vegetables. "At one part of the reef (say our navigators), which bound the lake within, almost even with the surface, there was a large bed of coral, which afforded a most enchanting prospect. Its base, which was fixed to the shore, extended so far that it could not be seen, so that it appeared to be suspended in the water. Even this delightful scene was greatly improved by the multitude of fishes that gently glided along, seemingly with the most perfect security. Their colours were the most beautiful that can be imagined, blue, yellow, black, red, &c. far excelling any thing that can be produced by art. The richness of this submarine grotto was greatly increased by their various forms; and the whole could not possibly be surveyed without a pleasing transport, accompanied at the same time with regret that a work so astonishingly elegant should be concealed in a place so seldom explored by the human eye." E. Long. 196, 35. S. Lat. 18. 8.

**PALMIPEDS**, among ornithologists, the same with web-footed birds. See **ORNITHOLOGY**.

**PALMISTRY**, a kind of divination, or rather a deceitful art practised by gypsies, who pretend to foretell events by looking upon the lines and marks of the hand.

**PALMUS**, a long measure used both by the Greeks and Romans. The Grecian palmus was of two sorts; the greater, which contained nine finger breadths, and the less which contained four. The Roman palmus was also of two sorts; the greater, which contained twelve finger breadths, or eight inches and an half English; and the less, which contained four finger-breadths, or near three inches English.—The great palmus was taken from the length of the hand or span; the less from the breadth of it. The Greek palmus was called *doron*. See **MEASURE**.

**PALMYRA**, or **TADMOR**, a noble city of ancient Syria, now in ruins, the origin of whose name is uncertain. Neither is it well known by whom that city was built; for though, from the identity of the names it is thought by many to have been the *Tadmor in the wilderness* built by Solomon\*, this point, however is much controverted by many learned men. For the world have been long and justly astonished to find in the Desert of Syria, at a distance from the sea, with a very precarious and scanty supply of water only, and without a particular connection with any great monarchy, ruins of a city more extensive and splendid than Rome itself, the deposit of all the arts which Greece in its most flourishing periods could afford. The problem is an intricate one; yet when we divest it of many of its difficulties, we shall bring this stupendous prodigy to no very uncommon magnitude. The coast of Syria was in very early ages rich and populous; and either

from the convenience of procuring water, or from the vicinity of India and Egypt, the population, instead of increasing on the mountains, extended to Judea, and from thence through its plains only to the internal-parts. The ruins of this numerous people, and of their habitations remain; but as their edifices were not uncommonly splendid, or, as the causes of their destruction were powerful, they have not attracted much attention. Yet the ruins of more than 30 towns are discoverable to the south east of the Dead Sea, and from thence towards Tadmor or Palmyra: we know the cause of the destruction of these towns, and we know that it did not reach Palmyra. This splendid city was not, therefore, insulated in a mass of sand: it was probably a link of a continued chain of population, or perhaps its termination. The situations of towns in the Sandy Desert must necessarily be determined by local advantages. Tadmor is situated where two hills converge, and beyond the point where they approach these hills afforded water, that necessary aid to animal life; and the aqueducts through which it was brought from them were discovered and described by Mr Wood. Though the other towns now in ruins afford some remains of luxury and opulence, yet in these respects they are much inferior to Palmyra; and this deserves to be explained. Palmyra was undoubtedly very ancient. "The two springs of fresh water it possesses (says Volney†) were above all, a powerful inducement in a desert every where else so parched and barren. These doubtless, were the two principal motives which drew the attention of Solomon, and induced that commercial prince to carry his arms so remote from the limits of Judea." "He built strong walls there (says the historian Josephus), to secure himself in the possession, and named it *Tadmor*, which signifies the Place of Palm-trees." Hence it has been inferred that Solomon was its first founder; but we should, from this passage, be rather led to conclude that it was already a place of known importance. The palm-trees he found there are not the trees of uninhabited countries. Prior to the days of Moses, the journeys of Abraham and Jacob from Mesopotamia into Syria, sufficiently prove a communication between these countries, which must soon have made Palmyra flourish. The cinnamon and pearls mentioned in the time of the Hebrew legislator, demonstrate a trade with India and the Persian Gulph, which must have been carried on by the Euphrates and Palmyra. At this distance of time, when the greater part of monuments of these early ages have perished, we are liable to form very false opinions concerning the state of these countries in those remote times, and are the more easily deceived, as we admit as historical facts antecedent events of an entirely different character. If we observe, however, that men in all ages are united by the same interests and the same desires, we cannot help concluding, that a commercial intercourse must early have taken place between one nation and another, and that this intercourse must have been nearly the same with that of more modern times. Without, therefore, going higher than the reign of Solomon, the invasion of Tadmor by that prince is sufficient alone to throw a great light on the history of this city. The king of Jerusalem would never have carried his attention to so distant and detached

Palmyra.

† Travels through Syria and Egypt.

\* 1 Kings, ix. 18. and 2 Chron. viii. 4. and Josephus Ant. Jud. lib. i.

Palmyra. tached a spot, without some powerful motive of interest; and this interest could be no other than that of an extensive commerce, of which this place was already the emporium. This commerce extended itself to India, and the Persian Gulph was the principal point of union."

From the nature of the commodities, from the requisite assistance of the Tyrians, and other forcible arguments, M. Volney shows that the Persian Gulph was the centre of the most ancient commerce of the eastern world; and that it was with a view of obtaining a shorter route, by means of the Euphrates, that Solomon turned his attention to Tadmor, distant but three days journey from it. Our author goes on, "We may even reasonably conjecture, when we reflect on the revolutions of the following ages, that this commerce became a principal cause of those various wars in Lower Asia, for which the barren chronicles of those early times assign no motives. If, after the reign of Solomon, the Assyrians of Nineveh turned their ambitious views towards Chaldea, and the lower part of the Euphrates, it was with the intention to approach that great source of opulence the Persian Gulph. If Babylon, from being the vassal of Nineveh, in a short time became her rival, and the seat of a new empire, it was because her situation rendered her the emporium of this lucrative trade; in short, if the kings of this great city waged perpetual wars with Jerusalem and Tyre, their object was not only to despoil these cities of their riches, but to prevent their invading their trade by the way of the Red Sea. An historian who has informed us that Nabuchodonosor, before he laid siege to Jerusalem, took possession of Tadmor, clearly indicates that the latter city acted in concert with the two neighbouring capitals. Their gradual decline became, under the Persian empire and the successors of Alexander, the efficient cause of the sudden greatness of Palmyra in the time of the Parthians and Romans; she then enjoyed a long peace for many centuries, which allowed her inhabitants to erect those monuments of opulence whose ruins we still admire." If the former observations showed the connection of this remote spot with a more populous country, these remarks explain the cause of the renovation, and of the magnificence of this city. Our author's remarks are at least probable, and are, in our opinion, very convincing. Cairo, in another probably a subordinate route, never attained the splendor of Palmyra; but the genius of the Egyptians, perhaps the laws of Egypt, prevented it.

There is, however, no authentic history of Palmyra till after the captivity of the Roman emperor Valerian by the Persians. It is first mentioned by the Roman historians, as a place which Mark Antony attempted to plunder, upon pretence that it had not observed a just neutrality between the Romans and Parthians. Pliny takes notice of it as being situated in a rich soil, among pleasant streams, and totally separated from the rest of the world by a vast sandy desert, which had preserved its independence between Parthia and Rome. There is still a considerable spot of good soil next the town and on the hills: and even in the wilderness, there were palms and fig-trees, some of which remained till the latter end of the 17th century, though not one is now to be found.

Palmyra. After the captivity of Valerian, it was become an opulent city, to which the situation in the vicinity of the Roman and Parthian empires greatly contributed: as the caravans, in going to or returning from the East, frequented the place, and thus rendered it a considerable seat of merchandize. It enjoyed an independency till the time of Trajan; who, having made himself master of almost all the Parthian empire, reduced Palmyra likewise, and it was afterwards accounted part of the Roman dominions. But when the defeat and captivity of Valerian had so much weakened the empire, that the Persians seemed to be in a fair way of becoming masters of all the eastern provinces, the Palmyrenians began to entertain thoughts of recovering their liberty. Odenathus, prince of Palmyra, sent a very respectable letter to Sapor on his return, accompanied with considerable presents; but by that haughty conqueror his letter and embassy were treated with the most provoking contempt. The presents were thrown into the Euphrates: and to his letter Sapor replied, That his insolence in presuming to write to his lord was inexcusable; but if he could atone for it in any way, it would be by presenting himself before the throne bound hand and foot, in token of a consciousness of his crime, and the punishment he deserved. With this injurious treatment Odenathus was so provoked, that he swore either to bring down the pride of the haughty conqueror, or die in the attempt. Accordingly, having assembled what forces he could, he fell upon the Persians, destroyed a number of them, took a good part of their baggage, and some of the king's concubines. Of the war of Odenathus with the Persians, however, we know very little; only that though the latter were often vanquished, and the independency of Palmyra established for the present; yet Valerian was never released from his captivity, though Odenathus earnestly wished to have the honour of rescuing him from his enemies.

Odenathus enjoyed his sovereignty but a very short time; being murdered by his nephew, who was soon after put to death by Zenobia the wife of Odenathus. This lady is said to have been possessed of very extraordinary endowments both of body and mind, being, according to Mr Gibbon, almost the only Asiatic woman who is recorded to have overcome the obstacles arising from the confined situation of the fair sex in that part of the world. Immediately on taking vengeance for the murder of her husband, she assumed the government and soon strengthened herself so much, that she resolved to submit neither to the Roman nor Persian powers. The neighbouring states of Arabia, Armenia, and Persia, dreaded her enmity, and solicited her alliance. To the dominions of Odenathus, which extended from the Euphrates to the frontiers of Bithynia, his widow added the inheritance of her ancestors, the populous and fertile kingdom of Egypt. The emperor Claudius acknowledged her merit, and was content that while he pursued the Gothic war, she should assert the dignity of the empire in the East. The conduct, however, of Zenobia, was attended with some ambiguity; nor is it unlikely that she had conceived the design of erecting an independent and hostile monarchy. She blended with the popular manners of Roman princes the stately pomp of the courts of Asia, and exacted from her subjects the same adoration that

was

**Palmyra.** was paid to the successors of Cyrus. She bestowed on her three sons a Latin education, and often showed them to the troops adorned with the imperial purple. For herself she reserved the diadem, with the splendid but doubtful title of *Queen of the East*.

When Aurelian passed over into Asia, against an adversary whose sex alone could render her an object of contempt, his presence restored obedience to the province of Bithynia, already shaken by the arms and intrigues of Zenobia. Advancing at the head of his legions, he accepted the submission of Ancyra; and was admitted into Tyana, after an obstinate siege, by the help of a perfidious citizen. The generous, though fierce temper of Aurelian, abandoned the traitor to the rage of the soldiers; a superstitious reverence induced him to treat with lenity the countrymen of Appollonius the philosopher. Antioch was deserted on his approach; till the emperor, by his salutary edicts, recalled the fugitives, and granted a general pardon to all who, from necessity rather than choice, had been engaged in the service of the Palmyrenian queen. The unexpected mildness of such a conduct reconciled the minds of the Syrians, and as far as the gates of Emesa, the wishes of the people seconded the terror of his arms.

Zenobia would have ill deserved her reputation, had she indolently permitted the emperor of the West to approach within 100 miles of her capital. The fate of the East was decided in two great battles; so similar in almost every circumstance, that we can scarcely distinguish them from each other, except by observing that the first was fought near Antioch, and the second near Emesa. In both, the queen of Palmyra animated the armies by her presence, and devolved the execution of her orders on Zabdas, who had already signalized his military talents by the conquest of Egypt. The numerous forces of Zenobia consisted for the most part of light archers, and of heavy cavalry clothed in complete steel. The Moorish and Illyrian horse of Aurelian were unable to sustain the ponderous charge of their antagonists. They fled in real or affected disorder, engaged the Palmyreans in a laborious pursuit, harassed them by a desultory combat, and at length discomfited this impenetrable but unwieldy body of cavalry. The light infantry, in the mean time when they had exhausted their quivers, remaining without protection against a closer onset, exposed their naked sides to the swords of the legions. Aurelian had chosen these veteran troops, who were usually stationed on the Upper Danube, and whose valour had been severely tried in the Allemannic war. After the defeat of Emesa, Zenobia found it impossible to collect a third army. As far as the frontier of Egypt, the nations subject to her empire had joined the standard of the conqueror; who detached Probus, the bravest of his generals, to possess himself of the Egyptian provinces. Palmyra was the last resource of the widow of Odenathus. She retired within the walls of her capital: made every preparation for a vigorous resistance; and declared with the intrepidity of a heroine, that the last moment of her reign and of her life should be the same.

In his march over the sandy desert between Emesa and Palmyra, the emperor Aurelian was perpetually harassed by the Arabs; nor could he always defend his army, and especially his baggage from those flying

**Palmyra.** troops of active and daring robbers, who watched the moment of surprise, and defied the slow pursuit of the legions. The siege of Palmyra was an object far more difficult and important; and the emperor, who with incessant vigour pressed the attacks in person, was himself wounded with a dart. "The Roman people," (says Aurelian, in an original letter), *speak with contempt of the war which I am waging against a woman. They are ignorant both of the character and of the power of Zenobia. It is impossible to enumerate her warlike preparations, of stones, of arrows, and of every species of missile weapons. Every part of the walls is provided with two or three balistæ, and artificial fires are thrown from her military engines. The fear of punishment has armed her with a desperate courage. Yet I trust still in the protecting deities of Rome, who have hitherto been favourable to all my undertakings.* Doubtful, however, of the protection of the gods, and of the event of the siege, Aurelian judged it more prudent to offer terms of an advantageous capitulation: to the queen, a splendid retreat; to the citizens, their ancient privileges. His proposals were obstinately rejected, and the refusal was accompanied with insult.

The firmness of Zenobia was supported by the hope, that in a very short time famine would compel the Roman army to repass the desert; and by the reasonable expectation that the kings of the East, and particularly the Persian monarch, would arm in the defence of their most natural ally. But fortune, and the perseverance of Aurelian, overcame every obstacle. The death of Sapor, which happened about this time, distracted the councils of Persia; and the inconsiderable succours that attempted to relieve Palmyra were easily intercepted either by the arms or the liberality of the emperor. From every part of Syria a regular succession of convoys safely arrived in the camp, which was increased by the return of Probus with his victorious troops from the conquest of Egypt. It was then that Zenobia resolved to fly. She mounted the fleetest of her dromedaries; and had already reached the banks of the Euphrates, about 60 miles from Palmyra, when she was overtaken by the pursuit of Aurelian's light-horse, seized, and brought back a captive to the feet of the emperor. Her capital soon after surrendered, and was treated with unexpected lenity. The arms, horses, and camels, with an immense treasure of gold, silver, silk, and precious stones, were all delivered to the conqueror; who, leaving only a garrison of 600 archers, returned to Emesa, and employed some time in the distribution of rewards and punishments at the end of so memorable a war, which restored to the obedience of Rome those provinces that had renounced their allegiance since the captivity of Valeria.

When the Syrian queen was brought into the presence of Aurelian, he sternly asked her, How she had presumed to rise in arms against the emperors of Rome? The answer of Zenobia was a prudent mixture of respect and firmness: "Because I disdained to consider as Roman emperors an Aureolus, or a Gallienus. You alone I acknowledge as my conqueror and my sovereign." But as female fortitude is commonly artificial, so it is seldom steady or consistent. The courage of Zenobia deserted her in the hour of trial; she trembled at the angry clamours of the soldiers, who called

Palmyra.

aloud for her immediate execution; forgot the generous despair of Cleopatra, which she had proposed as her model; ignominiously purchased life by the sacrifice of her fame and her friends. It was to their councils, which governed the weakness of her sex, that she imputed the guilt of her obstinate resistance; it was on their hands that she directed the vengeance of the cruel Aurelian. The fame of Longinus, who was included among the numerous and perhaps innocent victims of her fear, will survive that of the queen who betrayed, or the tyrant who condemned him. Genius and learning were incapable of moving a fierce unlettered soldier, but they had served to elevate and harmonise the soul of Longinus. Without uttering a complaint, he calmly followed the executioner, pitying his unhappy mistress, and bestowing comfort on his afflicted friends.

Returning from the conquest of the East, Aurelian had already crossed the straits which divide Europe from Asia, when he was provoked by the intelligence that the Palmyrenians had massacred the governor and garrison which he had left among them, and again erected the standard of revolt. Without a moment's deliberation, he once more turned his face towards Syria. Antioch was alarmed by his rapid approach, and the helpless city of Palmyra felt the irresistible weight of his resentment. We have a letter of Aurelian himself, in which he acknowledges that old men, women, children, and peasants, had been involved in that dreadful execution, which should have been confined to armed rebellion: and although his principal concern seems directed to the re-establishment of a temple of the sun, he discovers some pity for the remnant of the Palmyrenians, to whom he grants the permission of rebuilding and inhabiting their city. But it is easier to destroy than to restore. The seat of commerce, of arts, and of Zenobia, gradually sunk into an obscure town, a trifling fortress, and at length a miserable village.

Little is known concerning the fortunes of Palmyra since the time of Mahomet, except that it was considered as a place of strength; and that in the 12th century there were 2000 Jews in it. With respect to the ruins they appeared to be of two different and distinct periods; the oldest are so far decayed as not to admit of mensuration, and look as if they had been reduced to that state by the hand of time; the others appear to have been broken into fragments by violence. Of the inscriptions none are earlier than the birth of Christ, and none are later than the destruction of the city by Aurelian, except one, which mentions Dioclesian.

Mr Wood is of opinion, that the face of the country which surrounds Palmyra was always the same; but though Palmyra was always said to be situated in a wilderness, it does not follow that the wilderness was always of the same extent; it is perhaps more probable, that when Palmyra was first settled the rich soil mentioned by Pliny extended much farther; for whatever were the reasons for making a settlement there, Palmyra can scarcely be supported to have invited a greater number of people than it could feed. The palms and fig trees that were formerly found on the hills, and in the borders of the desert, that are now

totally barren confirm this opinion. Mr Wood observes, that while he was there a whirlwind happened, which took up such quantities of sand as quite darkened the sky; this sand therefore might by degrees encroach upon the fertile environs of Palmyra, and reduce the number of inhabitants as it reduced their sustenance, till the few wretched families only were left, who found it difficult to furnish food for Mr Wood and his company, though they did not continue longer than a fortnight among them. It will also appear from history, that what is supposed to have happened here has happened at other places, where such an event was much less probable. \* On the sea coast in the neighbourhood of St Pol de Leon, in Lower Bretagne, there is a considerable tract of land which before the year 1666 was inhabited, but which was rendered uninhabitable by a sand, which encroaching every year, covered it to the depth of above 20 feet. In the year 1718 it had advanced more than six leagues, and within one league of St Pol; so that it was then thought probable that the town would of necessity be abandoned. This sand is raised by the east or north-east wind, which drives it in clouds with great swiftness, and in a prodigious quantity. It was also attested by the captain of a ship, and all on board, that in the year 1719 there fell in the Atlantic Ocean, at 15 degrees of north latitude, and at the distance of more than eight leagues from any land, a shower of sand, some of which they produced, and deposited in the academy at Paris †.

The company with whom Mr Wood, the publisher of the Ruins of Palmyra, travelled, arrived at length at the end of the plain, where a ridge of barren hills, by which it was divided on the right and left, seemed to meet; between them there was a vale, through which an aqueduct formerly conveyed water to Palmyra. On each side of this vale they remarked several sepulchres of the ancient Palmyrenes, which they had scarce passed, when the hills opening on a sudden, they discovered such piles of ruin as they had never seen. They were all of white marble; and beyond them, towards the Euphrates, was a wide level stretching farther than the eye could reach, totally desolate, without variety, and without bounds. After having gazed some time upon this prospect, which rather exceeded than fell short of their expectations, they were conducted to one of the huts of the Arabs, of which there are about 30 in the court of the great temple. The inhabitants of both sexes were well shaped, and the women, though very swarthy, had good features. They were veiled, but did not so scrupulously conceal their faces as the eastern women generally do. They paint the ends of their fingers red, their lips blue, and their eye-brows and eye-lashes black. They had large rings of gold or brass in their ears and nostrils, and appeared to be healthy and robust. The walls of the city are flanked by square towers, into which some ancient funeral monuments have been converted; but the walls are in most places level with the ground, and sometimes not to be traced. It is, however, probable, by their general direction, that they included the great temple, and are three miles in circumference. The Arabs showed a tract which was near ten miles in circumference, the soil of which was raised.

Palmyra.

† Hist. of  
the Acad.  
1772.

Palmyra. raised a little above the level of the desert: this, they said, was the extent of the old city; and that by digging in any part of it ruins were discovered.

These ruins consist of temples, palaces, and porticoes of Grecian architecture; and lie scattered over an extent of several miles. They were accidentally discovered by some English travellers from Aleppo somewhat more than a century ago. By far the most remarkable of them is the Temple of the Sun, of which the ruins are spread over a square of 220 yards. It was encompassed with a stately wall, built of large square stones, and adorned with pilasters within and without, to the number of 62 on a side. Within the court are the remains of two rows of very noble marble pillars 37 feet high, with their capitals of most exquisite workmanship. Of these only 58 remain entire; but there must have been many more, for they appear to have gone round the whole court, and to have supported a double piazza. The walks on that side of the piazza which is opposite to the front of the castle seem to have been the most spacious and beautiful. At each end of this line are two niches for statues, with their pedestals, borders, supporters, and canopies, carved with the utmost propriety and elegance. The space within this inclosure, which is now filled with the dirty huts of the inhabitants, seems to have been an open court, in the middle of which stood the temple, encompassed with another row of pillars of a different order, and much taller, being 50 feet high; but of these 16 only remain. The whole space contained within these pillars is 59 yards in length, and near 28 in breadth. The temple is no more than 33 yards in length, and 13 or 14 in breadth. It points north and south; and exactly into the middle of the building, on the west side, is a most magnificent entry, on the remains of which are some vines and clusters of grapes, carved in the most bold and masterly imitation of nature that can be conceived. Just over the door are discerned a pair of wings, which extends its whole breadth; the body to which they belonged is totally destroyed; and it cannot now certainly be known whether it was that of an eagle or a cherub, several representations of both being visible on other fragments of the building. It is observed of the windows of this building, which were not large, that they were narrower at the top than below. The north end of the building is adorned with the most curious fret-work and bas-relief; and in the middle there is a dome or cupola about ten feet diameter, which appears to have been either hewn out of the rock, or moulded of some composition which by time is grown equally hard. North of this place is an obelisk, consisting of seven large stones, besides its capital and the wreathed work about it. It is about 50 feet high; and, just above the pedestal, is 12 feet in circumference. There was probably a statue upon it, which the Turks, in their zeal against idolatry, destroyed. At about the distance of a quarter of a mile from this pillar, to the east and west, are two others, besides the fragment of a third; so that perhaps they were originally a continued row.

About 100 paces from the middle obelisk, straight forward, is a magnificent entry to a piazza, which is 40 feet broad, and more than half a mile in length, inclosed with two rows of marble pillars 26 feet high, and eight or nine feet in compass. Of these there still

remain 129; and, by a moderate computation, there could not originally have been less than 560. The upper end of the piazza was shut in by a row of pillars, standing somewhat closer than those on each side. A little to the left are the ruins of a stately building, which appears to have been a banqueting-house. It is built of better marble, and is finished with yet greater elegance, than the piazza. The pillars which supported it were of one entire stone, which is so strong, that one of them which has fallen down has received no injury. It measures 22 feet in length, and in compass 8 feet 9 inches. In the west side of the piazza are several apertures for gates into the court of the palace. Each of these were adorned with four porphyry pillars, not standing in a line with those of the wall, but placed by couples in the front of the gate facing the palace, two on each side. Two of these only remain entire, and but one standing in its place. They are 30 feet long and 9 in circumference. On the east side of the piazza stands a great number of marble pillars, some perfect, but the greater part mutilated. In one place 11 are ranged together in a square: the space which they inclose is paved with broad flat stones, but there are no remains of a roof. At a little distance are the remains of a small temple, which is also without a roof, and the walls are much defaced. Before the entry, which looks to the south, is a piazza supported by six pillars, two on each side of the door, and one at each end. The pedestals of those in front have been filled with inscriptions both in the Greek and Palmyrene languages, which are become totally illegible. Among these ruins are many sepulchres: they are ranged on each side of a hollow way, towards the north part of the city, and extend more than a mile. They are all square towers, four or five stories high. But though they are alike in form, yet they differ greatly in magnitude and splendour. The outside is of common stone, but the floors and partitions of each story are marble. There is a walk across the whole building, just in the middle; and the space on each hand is subdivided into six partitions by thick walls. The space between the partitions is wide enough to receive the largest corpse; and in these niches there are six or seven piled upon one another.

Many inscriptions have been found at Palmyra, which have occupied much of the attention of the learned; and if any thing certain could be derived from them, there is no doubt but they would tend very considerably to the elucidation of ancient history. See Barthélemy's *Reflections on the Palmyrene Alphabet*, published at Paris in 1754; and *An Explication of the Inscriptions at Palmyra* hitherto published, by John Swinton of Christ church, Oxford. See also *Phil. Trans.* n° 217. and 218; the first volume of the *Ancient Universal History*; and, above all, consult the *Ruins of Palmyra, or Tadmor in the Desert*, published by Mr R. Wood, who with M. Bouverie and Mr Dawkins, travelled thither in 1751. The result of their observations was published in 1758, in the form of an atlas. The ruins of this once mighty and celebrated city are represented in 57 copperplates, 16 by 12 inches, printed on imperial paper. They are admirably executed; the drawing is correct and masterly; and the gravings highly finished: nor can they fail to give satisfaction to those who are connoisseurs in the art, or to those who

delight in the labours of antiquity. In a work like ours, however, it is impossible to give these views at length; we shall content ourselves then, after referring to this splendid work, with a view of the ruins of the Temple of the Sun, and of some other miscellaneous ruins.

Palmyra was visited by Mr Bruce before his journey into Abyssinia; but, on account of the many publications concerning these celebrated ruins, he has declined saying much concerning them. He informs us, that, before he came in sight of the ruins, he ascended a hill of white gritty stone, in a very narrow winding road, such as is called a pass; but on getting up to the top his eyes were struck with the most stupendous sight which, he believes, ever mortal saw. The whole plain below, which is very extensive, was so covered with magnificent buildings, that they seemed to touch one another. All of them are finely proportioned, agreeably shaped, and composed of white stones, which at that distance appeared like marble. In taking a draught of these ruins, Mr Bruce divided the whole into six angular views, for which the situation of the place is very convenient. The columns are all uncovered to the very bases, the ground on which they are built being hard and solid. The views he took were upon large paper; some of the columns being represented a foot long, and some of the figures in the foreground of the Temple of the Sun (a magnificent building which stood at one end of the town) being near four inches. Before he left Palmyra he observed its latitude with a reflecting quadrant of Hadley; but as the instrument was out of order, he could not determine it exactly. In his opinion, however,  $33^{\circ} 58'$  is not far distant from truth. From such observations as he could make on the longitude, he concluded it to be  $37^{\circ} 9'$  east from Greenwich. Mr R. Wood makes the latitude  $34^{\circ}$  north.

From Palmyra Mr Bruce proceeded to Baalbec, distant about 130 miles, where he found ruins still more magnificent. The interior part of the great temple at this place, according to our author, surpasses any thing he had seen at Palmyra, or anywhere else. "All these views of Palmyra and Baalbec (says he) are now in the king's collection. They are the most magnificent offering, in their line, that ever was made by one subject to his sovereign."—In the neighbourhood of Palmyra are some salt-marshes; and to the adjacent country a trade is carried on in kelp from Tripoli in Syria. There are two Arab tribes, almost equally powerful; one of them, called Annecy, remarkable for the finest horses in the world. They possess the country to the south-west, at the back of Liburnus, about Bozrah, and southward towards the borders of Arabia Petræa and Mount Horeb. The other tribe, named Mowalli, inhabit the plains east from Damascus, to the Euphrates, and north to near Aleppo. They are fewer in number than the Annecy, but much better soldiers; and their breed of horses not greatly inferior.

Respecting the latitude and longitude there are still various opinions: that which appears to be nearest the truth is E. Long.  $38. 50$ . N. Lat.  $33. 20$ . It stands about 50 leagues south-east of Aleppo, as much from Damascus, and 20 leagues west of the Euphrates.

PALPABLE, something perceivable by the senses, particularly that of feeling.

PALPITATION of the Heart. See MEDICINE, Palpitation n° 97. 290.

PALSGRAVE (John), a learned writer, who flourished in the reigns of Henry VII. and Henry VIII. He received his grammatical learning at London, his native place. He studied logic and philosophy at Cambridge, at which university he resided till he became bachelor of arts; after which he went to Paris, where he spent several years in the study of philosophy and other parts of learning, took the degree of master of arts, and acquired such excellence in the French tongue, that in 1514, when a treaty of marriage was negotiated between Louis XII. king of France, and the princess Mary, sister of Henry VIII. of England, Mr Palsgrave was appointed to be her tutor in that language. But Louis XII. dying soon after his marriage, Palsgrave attended his fair pupil back to England, where he taught the French language to many of the young nobility, obtained good preferment in the church, and was appointed by the king one of his chaplains in ordinary. In 1531 he settled at Oxford for some time, and the next year was incorporated master of arts there, as he had before been in Paris, and a few days after was admitted to the degree of bachelor of divinity. At this time he was much esteemed for his learning; and, what is very remarkable, though an Englishman, he was the first who ever reduced the French tongue to grammatical rules, or that had attempted to fix it to any kind of standard. This he undertook, and executed with great ingenuity and considerable success, in a large work which he published in that language at London, intitled *L'Eclaircissement de la Langue Françoise*, in three books in thick folio, 1530, to which he has prefixed a large English introduction; so that the French nation seems to stand originally indebted to England for that universality which their language at present possesses, and on which they so much pride themselves. He translated into English a Latin comedy called *Acollastus*, written by one Will. Fullonius, an author then living at Hagen in Holland.

At what time Mr Palsgrave was born, or how long he lived, it is not easy to say; yet, from the concurrence of several facts, he appears to have been much less than 60 years of age at the time of his publishing the above-mentioned translation, which was in the year 1540.

PALSY. See MEDICINE, n° 92. 265, &c. and 269.

PALUDAMENTUM, in Roman antiquity, a habit that differed but little from the chlamys, except that this last belonged chiefly to the lower class of people. It was worn by the officers and principal men among the Romans in time of war, who are therefore called *Paludati*; which distinguished them from the common soldiers, who, because they wore the sagum, were called the *Sagati*. The paludamentum came down only to the navel, was open on the sides, had short sleeves resembling angels wings, and was generally white or red. It is sometimes used to signify the common soldier's coat.

PALUS MEOTIS, the ancient name of a gulph between Europe and Asia, to the north of the Black Sea, now called the *sea of Zabach*, or *Asoph*.

PALY, or PALE, in heraldry, is when the shield is divided;

divided into four or more equal parts, by perpendicular lines falling from the top to the bottom.

*Paly Bende*, is when the escutcheon is divided by perpendicular lines, which is *paly*; and also by diagonals, which is called *bendy*.

**PAMBOUK**, the Turkish name of the ruined city of Hierapolis. See **HIERAPOLIS**.

**PAMPELUNA**, the capital of the kingdom of Navarre in Spain, with a very strong citadel and rich bishopric. It is handsome and populous, and carries on a great trade, seated in a very fertile plain, in E. Log. 1. 25. N. Lat. 42. 42.

**PAMPELUNA**, a town of New Granada in South America, famous for its gold mines and numerous flocks of sheep. W. Long. 68 30. N. Lat. 6. 30.

**PAMPHILUS**, a celebrated painter of Macedonia, in the age of Philip. He was founder of the school for painting at Sicyon; and he made a law which was observed not only in Sicyon but all over Greece, that none but the children of noble and dignified persons should be permitted to learn painting. Apelles was one of his pupils.

**PAMPHYLIA**, the ancient name of a country of Natolia, in Asia, now called *Carimania* and *Cay-bay*, between Lycia and Cilicia, on the south coast, to the north of the Mediterranean sea.

**PAN**, the god of shepherds, hunters, and all country exercises. Such he is described by the Greek and Roman poets; but he bore a higher character among the earliest Greeks, as well as among the Egyptians; from whom his worship was borrowed by that people. In Egypt he was known by the name of *Mendes*, which, according to Jablonski\*, signifies fecundity. Hence his symbol was a living he-goat, the most salacious of all animals: "Hircum Mendesium colunt Ægyptii, eo quod virtuti prolificæ ac genitivæ, consecratus est.—Nam animal hoc coitus valde cupidum est." His principal temple was a magnificent building in a city of lower Egypt, called after his name. It is well known (see **POLYTHEISM**) that from dedicating certain animals to certain gods, the Egyptians proceeded to consider the animals themselves as actuated by the divinities to whom they were sacred. Hence the origin of brute worship. In the temple of Mendes was kept a *he-goat*, to whom sacrifices of a very monstrous kind were offered. Herodotus, speaking of the præfecture of *Mendes*, says †, *Εργετο δ' εν τῷ ναῷ τούτῳ ἐπ' ἐμὲν τούτῳ τὸ τερας γυναικὶ τραγὸς ἐμισγέτο ἀναφανδόν. Τούτῳ ἐπεπείδειν ἀνθρώπων ἀπικατό.* Our readers, learned and unlearned, will forgive us for not translating this passage, which contains, however, nothing that is not confirmed by the testimony of other writers; particularly of Plutarch, and Pindar as he is quoted by Strabo. The most wonderful circumstance of this monstrous sacrifice is, that it was made publicly in the presence of a great concourse of men? But to what divinity was it made? To a mere goat, or to some superior principle animating the goat? Doubtless to the latter; for it is said that the fair worshippers were of the first rank, and of unspotted fame; and that if they had borne a different character, the deity would not have accepted of their devotions.

The deity whom the Egyptians adored by the name of *Mendes*, was no other than the Soul of the Uni-

verse; for he was their most ancient god: and we are told by Plutarch ‡, "That they took the first God and the Universe for one and the same thing." Hence his name Παν among the Greeks: not that either the Greeks or their masters in theology worshipped, as the first god, mere brute matter, but that spirit which they conceived to be coeternal with matter, and to animate all things, making them *one*. Thus Orpheus, who imported the Egyptian doctrine into Greece, declares that all things are one: and after him Parmenidas, and other philosophers, taught, *οὐκ εἶναι τὸ πᾶν*, that "one is the universe;" and that "the universe is immoveable." That the ancient Grecian *Pan*, or the Egyptian *Mendes*, was not the corporeal world, as senseless and inanimate, but the whole system of things, animated and eternal, appears further from the following testimony of Macrobius. "Hunc deum Arcades colunt, appellantes τῶν τῆς οὐλῆς κυρίων, non sylvarum dominum, sed universæ substantiæ materialis dominatorem;—The Arcadians worship this god, calling him the lord of *HYLE*; i. e. not the lord of the woods, but the lord of all material substance." In the same manner, Pharnubius § describes the Pan ¶ Inter of the other Greeks, not as the mere corporeal world, but as the intellectual principle actuating it and presiding over it: and he adds, that "Pan was feigned to be lascivious, because of the multitude of *spermatic reasons* in the world, and the continual mixtures and generation of things." Pan. De l'id. et Oñr.

The Egyptians, as we learn from Jablonski, had nearly the same notion with the Greeks of the spirit which they worshipped as the Soul of the Universe; only they gave to it both sexes. As the maker, governor, and bountiful father of universal nature, they considered it as a *male*, whose symbol was the *he-goat* of Mendes; and as a *female* it was adored by the name of *Isis*, to whom the *she-goat* was consecrated, though not held in such veneration as the male. From this view of the Egyptian creed, the sacrifice which we have mentioned appears no longer unaccountable. It was made to a god, believed to be the universal source of fecundity, and to whom, from the well-known character of the animal, whom he was supposed to actuate, they had reason to believe it would be most acceptable.

The Greeks never worshipped their Pan by the emblem of a living goat; but they painted him with the lower parts of a goat, for a reason which shall be afterwards mentioned. How he came to degenerate among that people, from one of the *Dii majorum gentium*, or rather from the first principle of all things, to the rank of a daemon or demi-god, we cannot pretend to say: but that such was his fate, is certain; for under this last character mention is made both of his birth and his death.

Whose son he was, is not agreed among them. Homer makes him the son of Mercury, and says he was called *Pan* from πᾶν, *omne*, because he charmed all the gods with his flute; others say that he was the son of Demogorgon, and first invented the organ, of seven unequal reeds, joined together in a particular manner; Having on a time fought with Cupid, that god in spite made him fall in love with the coy nymph Syrinx, who, flying from him to the banks of Faddon, a river of Arcadia, at the instant prayers of the Nymphs was turned into.

\* Pantheon  
Egyptio-  
rum.

† Lib. ii.  
ch. 26.

**Pan.** a reed, as her name in Greek signifies, which the god grasping instead of her, made a pipe of it, and for his music was adored by the Arcadians. The most common opinion was, that he was the son of Mercury and Penelope. But *Nat. Comes*, out of *Duris Samius*, makes his birth scandalous, by saying he was called *παις*, because begot by all Penelope's suitors. He was painted half-man half-goat, having large goats horns, a chaplet of pine on his red face, a pleasant laughter, with the feet and tail of a goat; a motely skin covering his body, with a crooked stick in one hand and his pipe in the other. See him nicely described by *Sil. Ital.* 13. 326. & *seq.* a sight enough to fright women and children, yea, armed men too; for when Brennus the Gaul was about to pillage the temple of Apollo at Delphos, he by night struck such a terror into his army, that he quitted his sacrilegious design: hence *Panici terrores*. Yet, as homely as he was, he pleased the goddesses Luna, turning himself easily into a white ram, *Virgil, Georg. III.* 392. & *deinceps*; and the nymph Dryope also, almost putting off his divinity, and turning shepherd for her sake. Neither was he displeasing to other nymphs, who are generally made dancing round about him to hear the charms of his pipe. The usual offerings made him were milk and honey, in shepherd's wooden bowls; also they sacrificed to him a dog, the wolf's enemy; whence his usual epithet is *λυκαίος*; and whence also his priests were called *Luperci*.

His festival was celebrated on February 15th by the Romans, brought into Italy by Evander the Arcadian, and revived afterwards by Romulus, in memory of his preserver. He was also called by the Romans *Inuus*, ab ineundo. *Vid. Liv. l. 5. Macrob. Sat. I. 22. and Serv. in Virg. Æn. VI. 775.* The ancients, by giving so many adjuncts and attributes to this idol as we have observed above, seem to have designed him for the symbol of the universe; his upper parts being human, because the upper part of the world is fair, beautiful, smiling, like his face; his horns symbolize the rays of the sun and of the moon; his red face, the splendor of the sky; the spotted skin where-with he is clothed, the stars which bespangle the firmament; the roughness of his lower parts, beasts and vegetables; his goat's feet, the solidity of the earth; his pipe, compact of seven reeds, the seven planets, which they say make the harmony of the spheres: his crook, bending round at the top, the years circling in one another. *Serv. Interpr.*

Having said so much of Pan, both as a self-existent god and as a generated dæmon, we shall conclude the article with some observations on Plutarch's account of the prodigy which happened at his death; for in the Pagan creed, dæmons were not all believed immortal — "In the reign of Tiberius (says our author\*), certain persons on a voyage from Asia to Italy, and sailing towards the evening by the Echinades, were there becalmed, and heard a loud voice from the shore calling on one Thamus an Egyptian pilot whom they had on board. Thamus, as may be supposed, listened with attention; and the voice, after repeating his name thrice, commanded him when he came to the Pelodes, to declare that the *Great Pan* was dead. The man, with the advice of his companions, resolved, that if they should have a quick gale

off the Palodes, he would pass by in silence; but that if they should be becalmed, he would perform what the voice had commanded. Adhering to this resolution, they soon arrived off the destined islands, and were immediately becalmed, there being neither breath of wind nor agitation of water. Upon this Thamus looking from the hinder part of the ship towards the land, pronounced with a loud voice *ὁ μέγας Παν ὁ θνήσκε*, *The Great Pan is dead!* and was instantly answered from the shore by numberless howlings and lamentations.

This story, which has so much the air of imposture, has not only been admitted as truth by men of the first eminence for learning and acuteness, but has been applied to our Saviour, whose death (says Cudworth) the dæmons mourned, not from love, but from a preface that it would put a period to the tyranny and domination which they had so long exercised over the souls and bodies of men. In support of this opinion, he quotes several passages of Scripture, such as, "Now is the prince of this world judged;" and, "Having spoiled principalities and powers (by his death upon the cross), he triumphed over them in it." He affirms likewise, that "Pan being taken for that reason or understanding by which all things were made, and by which they are all governed, or for that divine wisdom which diffuseth itself through all things, is a name which might very well signify *God manifested in the flesh*."

The authority of Cudworth is great; but a groundless opinion has seldom been propped by weaker reasoning than he makes use of on this occasion. Plutarch indeed says, and seems to believe, that this prodigy fell out during the reign of Tiberius; but as he mentions not the year of that reign, there is no evidence that it was at the crucifixion of our Saviour. The dæmons who inhabited the Echinades knew what had been transacted at Jerusalem far distant from their islands; they knew the name of the pilot of a strange ship; they knew that the mariners of that ship had resolved to disobey their command, unless becalmed off the Pelodes; they had power over both the winds and waves at the *Pelodes*, and exerted that power to enforce obedience to their command; and yet these all knowing and powerful beings were under the necessity of calling in the aid of a *man* to deliver a message to their companions, inhabiting a place to which the very same story assures us that their own power and knowledge reached. Should it be said that the dæmons were compelled by divine power thus publicly to make known to man Christ's triumph over the kingdom of darkness, we beg leave to ask why they were not likewise compelled to give him another name, since it is certain, that at the æra of Tiberius, and long before, illiterate Pagans, such as common seamen must be supposed to have been, knew no other *Pan* than the fabled son of Penelope and Mercury? — Indeed the other Pan, taken for that reason or understanding by which all things were made, could not possibly be the being here meant; for, erroneous as the Pagan system was, there is nothing in it so completely absurd as the death of the soul of the universe, the maker of all things; nor do we believe that any Pagan ever existed, who dreamed that such a death was possible.

What then, it will be asked, are we to understand by

\* Lib de  
Oracul.  
Defect.

Pan  
||  
Panama.

by this story? Plutarch was eminent for knowledge and integrity, and he relates it without expressing a doubt of its truth. He does so; but many a man of worth has been credulous; and though that was not his character, this *prodigy* may be accounted for by natural means. Germanicus was believed to have been poisoned, at least with the knowledge, if not by the command, of Tiberius; and there was nothing which the Romans so deeply deplored as the untimely death of that accomplished prince\*. They fancied that his body was animated, not by a human soul, but by a superior dæmon: and they decreed to him statues, religious ceremonies, and even sacrifices. His widow was highly honoured, as having been nearly related to a divinity, and his children were adored as demi gods. These facts being admitted, nothing appears to us more probable than the opinion of the learned Mosheim†, who thinks that some shrewd statesman, in order to excite the popular fury against Tiberius to the highest pitch, invented this story, and bribed foreign mariners to spread it among the people, who would naturally believe, that by the great Pan was meant their favourite Germanicus. This hypothesis is at least countenanced by what Plutarch tells us of the anxiety of the emperor to discover what personage could be meant by the Pan whose death was announced to the seamen: he consulted the learned men of Rome, who, in order to restore peace to the city, declared that they understood it of none other than the son of Penelope and Mercury.

PANACEA, among physicians, denotes an universal medicine, or a remedy for all diseases; a thing impossible to be obtained.

PANADA, a diet consisting of bread boiled in water to the consistence of pulp, and sweetned with a little sugar.

PANAMA, the capital city of the province of Darien in South America, where the treasures of gold and silver, and the other rich merchandises of Peru, are lodged in magazines, till they are sent into Europe. W. Long. 82. 15. N. Lat. 8. 57.

When Guzman first touched at this place in 1514, it consisted entirely of fishermen's huts. Orius d'Avila settled a colony here in a few years after, and in 1521 it was constituted a city by the emperor Charles V. with the proper privileges. In 1670 it was sacked and burnt by John Morgan, an English adventurer, who had the preceding year taken Porto Bello. This misfortune induced the inhabitants to remove the city to its present situation, distant about a league from the place where it stood before. For the greater security, the new city was inclosed by a free-stone wall, and the houses were built of stone and brick. Since that time several battions have been added, and now there is always a complete garrison maintained, and the walls are mounted with large cannon. But all these precautions could not save this city from another misfortune; it was entirely consumed by fire in the year 1737. After this accident it was again rebuilt; in the manner as it now stands, with neat elegant houses, but not magnificent. The inhabitants are rather independent in their fortunes than rich; there are few of them opulent, and scarce any in a state of poverty. As to the harbour, it is convenient, and well secured against storms by a number of

surrounding islands, and is capable of containing the largest fleets. Here the royal audience is seated, at which the governor of Panama resides; for which reason, this city is commonly deemed the capital of the province.

This place, a little while after it was founded, became the capital of the kingdom of Terra Firma. Some hopes were at first entertained from the three provinces of Panama, Darien, and Veragua, which composed it; but this prosperity vanished instantaneously. The savages of Darien recovered their independence; and the mines of the two other provinces were found to be neither sufficiently abundant, nor of an alloy good enough to make it worth while to work them. Five or six small boroughs, in which are seen some Europeans quite naked, and a very small number of Indians who have come to reside there, form the whole of this state, which the Spaniards are not ashamed of honouring with the great name of kingdom. It is in general barren and unwholesome, and contributes nothing to trade but pearls.

The pearl fishery is carried on in the islands of the gulph. The greatest part of the inhabitants employ such of their negroes in it as are good swimmers. These slaves plunge and replunge in the sea in search of pearls, till this exercise has exhausted their strength or their spirits.

Every negro is obliged to deliver a certain number of oysters. Those in which there are no pearls, or in which the pearl is not entirely formed, are not reckoned. What he is able to find beyond the stipulated obligation, is considered as his indisputable property; he may sell it to whom he pleases; but commonly he cedes it to his master at a moderate price.

Sea monsters, which abound more about the islands, where pearls are found than on the neighbouring coasts, render this fishing dangerous. Some of these devour the divers in an instant. The manta fish, which derives its name from its figure surrounds them, rolls them under its body, and suffocates them. In order to defend themselves against such enemies, every diver is armed with a poniard: the moment he perceives any of these voracious fish, he attacks them with precaution, wounds them, and drives them away. Notwithstanding this, there are always some fishermen destroyed, and a great number crippled.

The pearls of Panama are commonly of a very fine water. Some of them are even remarkable for their size and figure; these were formerly sold in Europe. Since art has imitated them, and the passion for diamonds has entirely superseded or prodigiously diminished the use of them, they have found a new mart more advantageous than the first. They are carried to Peru, where they are in great estimation.

This branch of trade has, however, infinitely less contributed to give reputation to Panama, than the advantage which it hath long enjoyed of being the mart of all the productions of the country of the Incas that are destined for the old world. These riches, which are brought hither by a small fleet, were carried, some on mules, others by the river Chagre, to Porto Bello, that is situated on the northern coast of the isthmus which separates the two seas. See DARIEN.

PANARI, one of the Lipari islands, lying in the Tuscan Sea. It is only five miles in circumference, and

PANARO, a river of Italy, which rises in the Appennines, crosses the valley of Frignano, and running on the confines of the Modonese and Bolognese, waters Fenal, and falls into the Po at Bondeno, ten miles above Ferrara.

PANATHENÆA, *παναθηναία*, in Grecian antiquity an ancient Athenian festival, in honour of Minerva the protectress of Athens, and called *Athenæa*. Harpocration and Suidas refer the institution of this festival to Erichthonius IV. king of Athens, who lived before Theseus. Theodoret alone says the feast was established by Orpheus. Be this as it will, till Theseus it was never a particular feast of the city of Athens, and was called simply *Athenæa*: but that prince, uniting all the people of Attica into one republic, they afterwards all assisted at the feast; whence the name *Panathenæa*, i. e. the feast of all Attica. In effect all Attica was present; and each people sent a bullock for the sacrifices, and for the entertainment of the vast multitude of people assembled.

There were two festivals under this denomination, the greater and the lesser. The greater panathenæa were exhibited every five years; the less every three, or, according to some writers, annually. Though the celebration of neither, at first, employed more than one day; yet in after-times they were protracted for the space of many days, and solemnized with greater preparations and magnificence than at their first institution.

The ceremonies were the same in the great and the little panathenæa; excepting for a banner, wherein the actions of the goddesses were represented in embroidery, performed by maids, with the names of those who had distinguished themselves in the service of the republic; which was only borne at the greater.

Prizes were established there for three different kinds of combat: the first consisted of foot and horse races; the second, of athletic exercises; and the third, of poetical and musical contests. These last are said to have been instituted by Pericles. Singers of the first class, accompanied by performers on the flute and cithara, exercised their talents here, upon subjects prescribed by the directors of these exhibitions.

The following is the order observed in this festival, according to M. Barthelemi, who quotes numerous authorities on the occasion: "The inhabitants of the different towns of Attica thronged to the capital, leading with them a great number of victims destined for sacrifices to the goddesses. In the first morning were the horse-races, in which the sons of the first citizens of Athens contended for the honour of the victory. In the stadium were other young men struggling for the prize at wrestling, and different exercises of the body; and in the Odæum were several musicians engaged in gentler and less perilous contests. Some executed pieces on the flute or cithara; others sang, and accompanied their voices with one of these instruments. The subject proposed to them was the eulogium of Harmodius, Aristogiton, and Thraſybulus, who had rescued the republic from the yoke of the tyrants by which it was oppressed: for, among the Athenians, public institutions are so many monuments for the citizens who have served the state, and lessons for those who are

Anacharſis,  
vol. ii.  
p. 434.

called upon to render it service. A crown of olive, and a vessel filled with oil, were the prizes bestowed upon the victors. Crowns were afterwards conferred on individuals, who appeared to the people to have merited that mark of honour by their zeal in the service of their country.

Panathe-  
næa.

"At the Ceramicus passed a procession, formed without the walls, and which began at that place to file off. It was composed of different classes of citizens crowned with chaplets of flowers, and remarkable for their personal beauty. Among the number were old men of a majestic and venerable appearance, bearing branches of olive; middle-aged men, who, armed with lances and with bucklers, seemed only to respire war; youth from eighteen to twenty, who sang hymns in honour of the goddesses; beautiful boys, clad in a simple tunic, adorned only with their native graces; and, lastly, girls, who were of the first families in Athens, and whose features shone, and deportment, attracted every eye. With their hands they held baskets on their heads, which, under a rich veil, contained sacred utensils, cakes, and every thing necessary for the sacrifices. Female attendants, who followed them, with one hand held over them an umbrella, and carried in the other a folding chair. This is a species of servitude imposed on the daughters of all foreigners settled at Athens: a servitude they share in common with their fathers and mothers, who likewise carried on their shoulders vessels filled with water and honey, for the purpose of libations. They were followed by eight musicians; four of whom played on the flute and four on the lyre. After them came rhapsodists singing the poems of Homer; and dancers armed at all points, who, attacking each other at intervals, represented, to the sound of the flute, the battle of Minerva with the Titans. Next came a ship that appeared to glide over the ground by the power of the wind, and the efforts of a great number of rowers, but which really was put in motion by concealed machinery. The vessel had a sail of light stuff, on which young girls had represented in embroidery the victory of Minerva over the Titans. On it also they had depicted, by order of the government, some heroes whose illustrious deeds had merited to be celebrated with those of the gods. This procession marched on with solemn steps, under the direction of several magistrates; and traversed the most frequented quarter of the city amidst a crowd of spectators, most of whom were placed on scaffolds erected for the occasion. When it had reached the temple of the Pythean Apollo, the sail of the ship was taken down and carried to the citadel, where it was deposited in the temple of Minerva.

"In the evening, at the academy, was the torch race. The course is only six or seven stadia in length. It extends from the altar of Prometheus, which is at the gate of this garden, to the walls of the city. Several young men are stationed in this interval at equal distances. When the shouts of the multitude have given the signal, the first lights his flambeau at the altar, and running with it hands it to the second, who transmits it in the same manner to the third, and so successively. He who suffers it to be extinguished can no more enter the lists; and they who slacken their pace are exposed to the raileries, and even blows, of the

**Panax.** the populace. To gain the prize, it is necessary to have passed through the different stations with success. This trial of skill was frequently repeated, and is diversified according to the nature of the festivals.

"The candidates who had been crowned at the different exercises invited their friends to supper. Sumptuous repasts were given in the prytaneum and other public places, which lasted till the following day. The people among whom the immolated victims were distributed spread tables on every side, and gave a loose to their lively and tumultuous mirth."

**PANAX, GINSENG:** A genus of the diœcia order, belonging to the polygamia class of plants. There are five species of this plant. 1. *Quinquifolium*. 2. *Trifolium*. 3. *Fruticolum*. 4. *Arborea*. 5. *Spinosa*.

The first and second are natives of North America.

**Plate**  
**ccclxxiii.** The *quinquifolium* is generally believed to be the same with the Tartarian ginseng; the figures and descriptions of that plant which have been sent to Europe by the missionaries agreeing perfectly with the American plant. This hath a jointed, fleshy, and taper root, as large as a man's finger, frequently divided into two smaller fibres downwards. The stalk rises near a foot and an half high, and is naked at the top, where it generally divides into three smaller foot-stalks, each sustaining a leaf composed of five spear-shaped lobes, sawed on their edges: they are of a pale green, and a little hairy. The flowers grow on a slender foot-stalk, just at the division of the foot-stalks which sustain the leaves, and are formed into a small umbel at the top: they are of an herbaceous yellow colour, composed of small yellow petals which are recurved. Woodville\*

\* Medical Botany. says they are white; that they are produced in a roundish terminal umbel, and are hermaphrodite or male on separate plants. The former (see the Plate) stand in close simple umbels: the involucre consists of several small, tapering, pointed, permanent leaves; the proper calyx is tubular, and divided at the rim into five small teeth: the corolla consists of five petals, which are small, oval, equal, and reflexed: the filaments are five, short, and furnished with simple anthers: the germea is roundish, placed below the corolla, and supports two short erect styles, crowned by simple stigmata: the fruit is an umbilicated two-celled berry, each containing a single irregularly heart-shaped seed. The flowers appear in the beginning of June; and are succeeded by compressed, heart-shaped berries, which are first green, but afterwards turn red; inclosing two hard, compressed, heart-shaped seeds, which ripen in the beginning of August. The second sort grows naturally in the same countries: but Mr Miller never saw more than one plant, which was sent to him from Maryland, and did not live beyond the first year; being planted in a dry soil, in a very dry season. The stalk was single, and did not rise more than five inches in height, dividing into three foot-stalks, each sustaining a trifoliate leaf, whose lobes were longer, narrower, and deeper indented on their edges, than the former.

Vol. XII.

The flower-stalk rose from the divisions of the foot-stalk of the leaves; but before the flowers opened, the plant decayed.

Ginseng was formerly supposed to grow only in Chinese Tartary, affecting mountainous situations, shaded by close woods; but it has now been long known that this plant is also a native of North America, whence M. Sarrafin transmitted specimens of it to Paris in the year 1704 (A); and the ginseng since discovered in Canada, Pennsylvania, and Virginia, by Lafiteau, Kalm, Bartram, and others, has been found to correspond exactly with the Tartarian species; and its roots are now regularly purchased by the Chinese, who consider them to be the same as those of eastern growth, which are known to undergo a certain preparation, whereby they assume an appearance somewhat different. For it is said, that in China the roots are washed and soaked in a decoction of rice or millet-seed, and afterwards exposed to the steam of the liquor, by which they acquire a greater firmness and clearness than in their natural state (B). The plant was first introduced into England in 1740 by that industrious naturalist Peter Collinson. They thrive in those places where it hath a light soil and shady situation, and will produce flowers and seeds; but the latter, though in appearance ripe and perfect, will not produce any new plants, as Mr Miller says he has repeatedly made the experiment, and waited for them three years without disturbing the ground. There are many good specimens in the Royal Botanic Garden at Kew.

The dried root of ginseng, as imported here, is scarcely the thickness of the little finger, about three or four inches long, frequently forked, transversely wrinkled, of a horny texture, and both internally and externally of a yellowish white colour. On the top are commonly one or more little knots, which are the remains of the stalks of the preceeding years, and from the number of which the age of the root is judged of. "To the taste it discovers a mucilaginous sweetness, approaching to that of liquorice, accompanied with some degree of bitterishness, and a slight aromatic warmth, with little or no smell. It is far sweeter, and of a more grateful smell, than the roots of fennel, to which it has by some been supposed similar; and differs likewise remarkably from those roots in the nature and pharmaceutic properties of its active principles, the sweet matter of the ginseng being preferred entire in the watery as well as the spirituous extract, whereas that of fennel roots is destroyed or dissipated in the impulsion of the watery tincture. The slight aromatic impregnation of the ginseng is likewise in good measure retained in the watery extract, and perfectly in the spirituous\*."

**Properties.** The Chinese ascribe extraordinary virtues to the root of ginseng; and have long considered it as a sovereign remedy in almost all diseases to which they are liable, having no confidence in any medicine unless in combination with it. It is observed by Jar-

toux,

(A) Sarrafin was correspondent of the Royal Academy of Sciences, in the history of which his account was published in 1718.

(B) The Chinese value these roots in some measure according to their figure, esteeming those very highly which are regularly forked, or have a fancied resemblance to the human form.

Panax,  
Panay.

toux, that the most eminent physicians in China have written volumes on the medicinal powers of this plant; asserting, that it gives immediate relief in extreme fatigue either of body or mind; that it dissolves pituitous humours, and renders respiration easy; strengthens the stomach; promotes appetite; stops vomitings; removes hysterical, hypochondriacal, and all nervous affections; and gives a vigorous tone of body even in extreme old age. These, and many other effects of this root equally improbable and extravagant are related by various authors; and Jartoux was so much biased by this eastern prejudice in favour of ginseng, that he seems to have given them full credit, and confirms them in some measure from his own experience. He says "Nobody can imagine that the Chinese and Tartars would set so high a value upon this root, if it did not constantly produce a good effect."—"I observed the state of my pulse, and then took half of a root raw: in an hour after I found my pulse much fuller and quicker; I had an appetite, and found myself much more vigorous, and could bear labour much better and easier than before. But I did not rely on this trial alone, imagining that this alteration might proceed from the rest we had that day: but four days after, finding myself so fatigued and weary that I could scarcely sit on horseback, a mandarin who was in company with us perceiving it, gave me one of these roots: I took half of it immediately, and an hour after I was not the least sensible of any weariness. I have often made use of it since, and always with the same success. I have observed also, that the green leaves, and especially the fibrous parts of them, chewed, would produce nearly the same effect\*." We know, however, of no proofs of the efficacy of ginseng in Europe; and from its sensible qualities we judge it to possess very little power as a medicine. Dr Cullen says, "We are told that the Chinese consider ginseng as a powerful aphrodisiac; but I have long neglected the authority of popular opinions, and this is one instance that has confirmed my judgment. I have known a gentleman, a little advanced in life, who chewed a quantity of this root every day for several years, but who acknowledged he never found his faculties in this way improved by it†."

\* Phil.  
Transf.  
vol. xxviii.  
p. 239.

† Mat.  
Med vol. iii.  
p. 161.

A dram of the ginseng root may be sliced and boiled in a quarter of a pint of water to about two ounces; then a little sugar being added it may be drank as soon as it is cool enough. The dose must be repeated morning and evening; but the second dose may be prepared from the same portion of root which was used at first, for it may always be twice boiled.

PANAY, an island of Asia, and one of the Philippines, lying between those of Paraguay and Negro. It is 250 miles in circumference, and is the most populous and fertile of them all. It is watered by a great number of rivers and brooks, and produces a great quantity of rice. Its shape is triangular. The names of its principal capes are Potol, Nafu, and Bulacabi. The coast from Bulacabi to Potol lies east and west, from Potol to Nafu, north and south; from Bulacabi to Iloilo, another cape, less than the great ones, is also north and south; from Iloilo to Cape Nafu, east and west. The middle of the island is in the latitude of ten degrees. On the north side, almost in the middle between the two capes of Potol and Bu-

Modern  
Un. Hist.  
vol. viii.

lacabi, the famous river Panay falls into the sea; and the mouth of the harbour is covered by a small island called *Lutaya*, in which port the Spaniards had a safe retreat before they discovered and conquered Manila and Cavite. The fertility of Panay is caused by the many rivers that water it, for there is no travelling a league without meeting a river; but more particularly by the Panay, which gives its name to the island, and runs a course of 40 leagues. The island, for the better administering of justice, is divided into jurisdictions: the first, called *Panay*, contains all that lies between Cape Potol and Bulacabi; the rest of the island is subject to the alcaide of Otton, who resides at Iloilo, a point of land running out into the sea, on the south side, between the two rivers of Tig Bavan and Jaro, and, with the island Imaras, forms a strait not above half a league over, or rather an open harbour. On this point the governor Don Gonzalo Ronquillo caused a fort to be built in the year 1681. The island contains about 16,360 tributary Indians, partly belonging to the king and partly to particular encomenderos or lords; but they all pay in rice, the island producing 100,000 bushels, Spanish measure, and but little other grain. The inhabitants are stout, lusty, and industrious farmers, and expert hunters, the country being full of wild boars and deer. The women make cloth of several colours. There are in the island 14 parishes, belonging to the fathers of the order of St Augustin, three benefices of secular priests, and formerly one college of the society of Jesus, where they administer the sacraments to the garrison of Iloilo. Besides the tributary Indians, there are here those blacks the Spaniards call *Negrillos*, who were the first inhabitants of the island, and afterwards driven into the thick woods by the Bisayas who conquered it. Their hair is not so stiff curled, nor are they so stout and strong, as the Guinea blacks. They live in the most uncouth parts of the mountains with their wives and children, all naked like beasts. They are so swift that they often overtake wild boars and deer. They stay about the dead beast as long as it lasts; for they have no other subsistence but what they acquire with their bow and arrows. They fly from the Spaniards, not so much through hatred as from fear. Among the islands about Panay lies Imaras opposite to Iloilo, and about a quarter of a league distant. It is long and low, ten leagues in compass and three in length, the soil fertile, abounding in sarsaparilla, and exceeding good water. On the mountains there are wild boars, deer, and good timber. It has also in it the port of St Anne, three leagues from Iloilo.

PANCARPUS, in Roman antiquity, a kind of show which the Roman emperors frequently exhibited to the people. The word is formed from the Greek *παν* all, and *καρπος* fruit. Whence the name was also given by the Athenians to a sacrifice wherein all kinds of fruits were offered. In this spectacle, the Circus being all set over with large trees, represented a forest, into which the beasts being let from the dens underground, the people at a sign given by the emperor, pursued, shot, and killed all they could lay hold of, which they afterwards carried away, to regale upon at home. The beasts usually given on these occasions were boars, deer, oxen, and sheep.

Casaubon, Cujas, Pithou, &c. make the pancarpus and

Panay,  
Pancarpus.

**Pancirollus** and sylva the same thing; Salmasius will have them different. The sylva, according to him, was such a diversion as that above described; but the pancarpus a combat, wherein robust people, hired for that purpose, fought with wild beasts; which opinion he confirms from Cassian, Justinian, Claudian, Firmicus, Manilius, and Cassiodorus.

||

**Pandataria**

**PANCIROLLUS** (Guy), a famous lawyer of Rhegium, was a person of an excellent genius which he cultivated with the greatest care in the principal universities of Italy; and was afterwards ordinary professor of law at Padua. Philibert Emanuel, duke of Savoy, invited him to his university in 1571, where he composed his ingenious treatise *De rebus inventis et perditis*. But the air of Turin not agreeing with him, he there lost an eye; and, for fear of losing the other, returned to Padua, where he died in 1591.

**PANCRAS**, a town of England, in the county of Middlesex, on the north-west side of London, in the highway to Centish-town. Its church is one of the prebends of St Paul's, of which cathedral some call it the mother, it being thought to be as old as that church even in the reign of Queen Elizabeth, when it is represented as weather-beaten and standing alone, without any company, though it had formerly many buildings about it. In its church-yard lie many Roman Catholics. At a public-house on the south side of the church is a medicinal spring.

**PANCRATIUM** (compounded of *παν* all, and *κρατω* I overcome), among the ancients, a kind of intermixed exercise, consisting of the lucta or wrestling, and the boxing or pugilate: but it differs in this, that as the *athletæ* are not to seize the body their hands are not armed with gauntlets, and give less dangerous blows.

The *pancratium* was the third gymnastic exercise, and was not introduced till long after the others. The people who were engaged in these exercises were called *pancratiastæ*; which name was also given to such as did not confine themselves to one exercise, but succeeded in several different ones.

Anacharsis,  
vol. iii.

Barthelemi, in his travels of Anacharsis, gives us a short account of one of those at which he supposes him to have been present in these words: "The action was soon terminated: a Sicyonian named *Sofratus*, a champion celebrated for the number of prizes he had won, and the strength and skill which had procured them, had arrived the preceding day. The greater part of the combatants yielded up all pretensions to the crown as soon as he appeared, and the others on the first trial; for in those preliminary essays, in which the *athletæ* try their strength by taking each others hands, he squeezed and twisted the fingers of his adversaries with such violence as instantly to decide the victory in his favour."

**PANCREAS**, in anatomy. See there, n° 95.

**PANDA**, in mythology, a goddess who was invoked and honoured as the protectress of travellers and navigators. The goddess of peace was also called *Pandar*, because she opened the gates of cities which were shut in time of war. According to Varro, Panda is a surname of Ceres, derived *a pane dando*, because she gave bread to mankind.

**PANDATARIA** (Suetonius, Pliny, Strabo); **PANDATERIA** (Mela, Tacitus): An island in the Tuscany sea; a place of banishment for the more illustrious

exiles. Hiher Julia, the Daughter of Augustus, was banished for her incontinence. To this island Tiberius banished Agrippina, his daughter-in-law (Suetonius). It was the place of confinement of Octavia the daughter of Clodius, married to Nero; a sight that affected every eye (Tacitus). Now *San'a Maria*, situated between Pontia and Ischia (Holstenius).

**PANDECTS**, **PANDECTÆ**, in jurisprudence, the digest or collection, made by Justinian's order, of 534 decisions or judgments of the ancient lawyers, on so many questions occurring in the civil law; to which that emperor gave the force and authority of law, by the epistle prefixed to them.—The word is Greek, *Πανδεκται*, compounded of *παν* "all," and *δεχομαι* *capio*, "I take;" i. e. a compilation, or a book containing all things.—Though others, as Bartoli, will have it formed from *παν*, and *δεχομαι*; as if these books contained the whole doctrine of the law.

The pandects consist of 50 books, and make the first part of the body of the civil law.

They were denoted by two *ππ*; but the copists taking those *ππ* for *ff*, the custom arose of quoting them by *ff*.

In the year 1137, the pandects of Justinian, which had been brought by an Amalitan merchant from the east, fell into the hands of the Pisans. Angelus Politianus believes this copy to be that which had been compiled by order of the emperor. However that be, it is certain that all other copies are taken from it, as being the most ancient. The Pisans having obtained their request from the emperor, carried the volumes to Pisa, and for near three centuries they were known by the name of the *Pandectæ Pisane*. But, about the year 1416, Pisa being taken by the Florentines, they were transported from thence to Florence, where they are now preserved in the library of the Medici, and known by the name of the *Pandectæ Florentina*. Some authors allege, that Lotharius ordained by an edict that the Pandects should be publicly read and explained at Bologna, and pleaded in the tribunals; but Corringius and Lindenbrogius fully refute their opinion.

Papias extends the denomination of *Pandects* to the Old and New Testament.

There are also *PANDECTÆ Medicine*, "Pandects of Medicine;" a kind of dictionary of things relating to medicine, compiled by Mat. Sylvaticus of Mantua, who lived about the year 1297. Leunclavius has published *Pandects of Turkey*; and bishop Beveridge, *Pandecta canonum*.

**PANDICULATION**, a stretching; or that violent and tensive motion of the solids, which usually accompanies the act of yawning.

**PANDORA**, in fabulous history, a woman formed by Prometheus, to whom each of the gods gave some perfection. Venus bestowed upon her beauty; Pallas, wisdom; Juno, riches; Apollo, music; and Mercury, eloquence; but Jupiter being displeased at Prometheus for having stolen fire from heaven to animate the mass he had formed, gave Pandora a box, which she was ordered not to open; and then sent her to the earth with this box, in which were inclosed age, diseases, pestilence, war, famine, envy, discord, and all the evils and vices that could afflict mankind. This fatal box was opened by Epimethius, Prometheus's brother, when instantly all the diseases and mischiefs with which

Pandects  
|  
Pandora.

Pandours  
||  
Panegyri-  
cum.

it was filled spread over the earth, and Hope alone remained at the bottom. Hesiod says she was the first woman.

**PANDOURS**, are Hungarian infantry: they wear a loose garment fixed tight to their bodies by a girdle, with great sleeves, and large breeches hanging down to their ancles. They use fire-arms, and are excellent marksmen: they have also a kind of sabre near four feet long, which they use with great dexterity.

**PANDOSIA** (Livy, Justin, Strabo), an inland town of the Brutti, and a place of strength on the river Acheron, where Alexander of Epirus, deceived by the oracle of Dodona, met his fate and perished. Now *Mendicino* (Holstenius). Another of Epirus (Strabo) situated on the river Acheron (Livy); which Alexander of Epirus was advised to avoid as fatal, but which he met with in Italy. This last is said to have been the residence of the Cenotrian kings, (Strabo).

**PANDURA**, or **PANDORON**, a musical instrument, used among the ancients, resembling the lute. The word is said to be formed from the Greek παν and δωρον, *i. e.* "all gifts, all sorts of gifts." Isidore derives the name from its inventor *Pandorus*; others from *Pan*, to whom they attribute its invention, as well as that of the flute. It has the same number of strings with the lute; but they are of brass, and of consequence give a more agreeable sound than those of the lute. Its frets are of copper, like those of the cistre; its back is flat, like those of the guitar; and the rims of its table, as well as its ribs, are cut in semicircles. Du-Cange observes, that Varro, Isidore, and others of the ancients, mention it as having only three strings; whence it is sometimes also spoken of under the denomination τριχορδον, *trichordum*.

**PANEAS** (Pliny, Josephus); the apparent spring from which the Jordan rises, on the extremity of the west side of the Trachonitis (Pliny).

**PANEAS** (Coins, Pliny, Josephus), the name of a district adjoining to the spring *Paneas*, with a cognominal town, either enlarged and adorned, or originally built, by Philip son of Herod, and called *Cæsaria* by Josephus; and in St Matthew, *Cæsaria of Philip*; with a temple erected to Augustus his benefactor, who conferred the Trachonitis upon him (Coin). It was afterwards called *Neronias*, in honour of Nero (Josephus).

**PANEGYRIC**, an oration in praise of some extraordinary thing, person, or virtue.

The name is Greek, πανηγυρις; formed of παν "all," and αγω "I assemble;" because anciently held in public and solemn assemblies of the Greeks, either at their games, their feasts, fairs, or religious meetings.

To make their panegyrics the more solemn, the Greeks used to begin with the praises of the deity in whose honour the games, &c. were celebrated; then they descended to the praise of the people or country where they were celebrated; then to the princes or magistrates who presided at them; and at length to the champions, especially the conquerors, who had gained the prizes in them.

**PANEGYRICUM**, in church-history, an ecclesiastical book, used by the Greek church, containing the panegyric orations of various authors, on the solemnities of Jesus Christ and the saints. It is found in MS.

in most churches, but it is not the same in all; each church having its particular saints; and the compilers of this kind of books usually suited their collections to the taste of their own devotion. They are disposed according to the order of months, and frequently consist of twelve volumes, answering to the twelve months of the year.

Among the principal authors of this work are Athanasius, Cyrill, Basil, Chrysostom, &c.

**PANEL** (*Panella*, *Panellum*), according to Sir Edward Coke, denotes "a little part;" but the learned Spelman says, that it signifies *schedula vel pagina*, "a schedule or roll;" as a panel of parchment, or a counterpane of an indenture: but it is used more particularly for a schedule or roll, containing the names of such jurors as the sheriff returns to pass upon any trial. And the *impanelling* a jury is the entering their names in a panel or little schedule of parchment.

**PANEL**, in Scots law, signifies the prisoner at the bar, or person who takes his trial before the court of justiciary for some crime.

**PANGOLIN**, a species of the manis peculiar to Hindostan. It is certainly a remarkable variety, if not a different species, of the pangolin of Buffon. According to a paper in the first volume of the Asiatic Researches, "it has hardly any neck; and, though some filaments are discernible between the scales, they can scarce be called bristles. But the principal difference is in the tail; that of Buffon's animal being long, and tapering almost to a point; while that of ours is much shorter, ends obtusely, and resembles in form and flexibility the tail of a lobster. In other respects it seems to have all the characters of Buffon's pangolin; a name derived from that by which the animal is distinguished in Java, and consequently preferable to Manis, or Pholidotus, or any other appellation deduced from an European language. We are told that the Malabar name of this animal is *alungu*. The natives of Bahar call it *bajar-cit*, or, as they explain the word, *stone-vermine*; and in the stomach of the animal before us was found about a tea-cup-full of small stones, which had probably been swallowed for the purpose of facilitating digestion; but the name alludes, we believe, to the hardness of the scales; for *vajracita* means in Sanscrit the *diamond* or *thunderbolt reptile*; and *vajra* is a common figure in the Indian poetry for any thing excessively hard. The vajracita is believed by the Pandits to be the animal which gnaws their sacred stone called *salgramusila*: but the pangolin has apparently no teeth; and the salgrams, many of which look as if they had been worm-eaten, are perhaps only decayed in part by exposure to the air.

"A female pangolin, described in the first volume of the Asiatic Researches, had a long tongue shaped like that of theameleon; and if it was nearly adult, as we may reasonably conclude from a young one found in it, the dimensions of it were much less than those which Buffon assigns generally to his pangolin; for he describes its length as six, seven, or eight feet, including the tail, which is almost, he says, as long as the body when it has attained its full growth: whereas ours is but 34 inches long from the extremity of the tail to the point of the snout, and the length of the tail is 14 inches; but, exclusively of the head, which is five inches long, the tail and body are indeed nearly of the same length; and the small difference between them may shew, if

Buffon

Pangolin.

Buffon be correct in this point, that the animal was young. The circumference of its body in the thickest part is 20 inches, and that of the tail only 12. There are on each foot five claws, of which the outer and inner are small when compared with the other three. There are no distinct toes; but each nail is moveable by a joint at its root. This creature is extremely inoffensive. It has no teeth, and its feet are unable to grasp. Hence it would appear, that nature, having furnished it with a coat of mail for its protection, has, with some regard to justice, denied it the powers of acting with hostility against its fellow creatures. The nails are well adapted for digging in the ground; and the animal is so dexterous in eluding its enemies by concealing itself in holes and among rocks, that it is extremely difficult to procure one.

"The upper jaw is covered with a cross cartilaginous ridge, which, though apparently not at all suited to any purposes of mastication, may, by increasing the surface of the palate, extend the sense of taste. The œsophagus will admit a man's forefinger with ease. The tongue at the bottom of the mouth is nearly about the size of the little finger, from whence it tapers to a point. The animal at pleasure protrudes this member a great way from the mouth. The tongue arises from the ensiform cartilage and the contiguous muscles of the belly, and passes in form of a round distinct muscle from over the stomach, through the thorax, immediately under the sternum; and interior to the windpipe in the throat. When dissected out, the tongue could be easily elongated so as to reach more than the length of the animal exclusive of its tail. There is a cluster of salivary glands seated around the tongue, as it enters the mouth. These will necessarily be compressed by the action of the tongue; so as occasionally to supply a plentiful flow of their secretion.

"The stomach is cartilaginous, and analogous to that of the gallinaceous tribe of birds. When dissected, it is generally found full of small stones and gravel, which in India are almost universally calcareous. The inner surface of the stomach is rough to the feel, and formed into folds, the interstices of which are filled with a frothy secretion. The guts are filled with a sandy pulp, in which, however, are interpersed a few distinct small stones. No vestiges of any animal or vegetable food have been traced in the whole primæ viæ. The gall bladder is commonly distended with a fluid resembling in colour and consistence the dregs of beer. It is a viviparous animal.

"From the contents of its stomach and primæ viæ, the pangolin has been supposed by Mr Burt, a very eminent surgeon in Bengal, to derive its nourishment from mineral substances. Tho' we have perhaps no clear idea of the manner in which vegetables extract their nourishment from earth, yet the fact being so, it may not be unreasonable to suppose, that some animal may derive nutriment by a process somewhat similar.

"When other substances (says our author) shall have been detected in the stomach of this animal, my inference, from what I have seen, must necessarily fall to the ground. But if, like other animals with muscular and cartilaginous stomachs, this singular quadruped consume grain, it must be surprising that no vestige of such food was found present in the whole alimentary canal, since in that thinly inhabited coun-

try, the wild animals are free to feed without intrusion from man. Nor can it be inferred from the structure of the stomach, that this animal lives on ants or on insects. Animals devoured as food, though of considerable size and solidity, with a proportionally small extent of surface to be acted on by the gastric juice and the action of the stomach, are readily dissolved and digested by animals possessing not a cartilaginous but a membranaceous stomach, as, for instance, a frog in that of a snake.

"In the stomach many minerals are soluble, and the most active things which we can swallow. Calcareous substances are readily acted on. Dr Priestley has asked, 'May not phlogistic matter be the most essential part of the food and support of both vegetable and animal bodies? I confess, that Dr Priestley's finding cause to propose the question, inclines me to suppose, that the affirmative to it may be true. Earth seems to be the basis of all animal matter. The growth of the bones must be attended with a constant supply, and in the human species there is a copious discharge of calcareous matter thrown out by the kidneys and salivary glands. May not the quadruped in question derive phlogiston from earth; salt, from mineral substances? And, as it is not deprived of the power of drinking water, what else is necessary to the subsistence of his corporeal machine?

"Considering the scaly covering of this animal, we may conceive, that it may be at least necessary for its existence, on that account, to imbibe a greater proportion of earth than is necessary to other animals. It may deserve consideration, that birds are covered with feathers, which, in their constituent principles, approach to the nature of horn and bone. Of these animals, the gallinaceous tribe swallow stones; and the carnivorous take in the feathers and bones of their prey: the latter article is known to be soluble in the membranaceous stomachs; and hence is a copious supply of the earthy principles. In truth I do not know that any thing is soluble in the stomach of animals, which may not be thence absorbed into their circulating system; and nothing can be so absorbed without affecting the whole constitution. These conjectures are not a little confirmed by the experiments of M. Bruquattelli, of Pavia, on the authority of M. Crell, by which we learn, that some birds have so great a dissolvent power in the gastric juice, as to dissolve in their stomachs flints, rock-crystal, calcareous stones, and shells." See *MAXIS*.

PANGONIA, in natural history, the name of a genus of crystals, consisting of such as are composed of many angles. The word is derived from *παν* numerous, and *γωνία* an angle or bending. The bodies of this genus are single-pointed or imperfect crystals, composed of dodecangular or twelve planed columns, terminated by twelve planed pyramids, and the whole body therefore made up of twenty-four planes. Of this genus there are only three known species.

PANIC, denotes an ill-grounded terror or fright. Polyænus says, it originates from *παν*, one of the captains of Bacchus, who with a few men put a numerous enemy to rout, by a noise which his soldiers raised in a rocky valley, favoured with a great number of echoes. This stratagem making their number appear far greater than it was, the enemy quitted a very commodious encampment,

Pangolin

Panic.

Fanicle,  
Panicum.

encampment, and fled. Hence all ill-grounded fears have been called *panics*, or *panic-fears*; and it was this that gave occasion to the fable of the nymph Echo's being beloved by the god Pan. Others derive the origin of it hence; that in the wars of the Titans against the gods, Pan was the first who struck terror into the hearts of the giants. Theon on Aratus says, he did it by the means of a sea shell, which served him for a trumpet, whereof he was the inventor.

PANICLE, in botany, denotes a soft woolly beard, on which the seeds of some plants hang pendulous; as in millet, reeds, and hay.

PANICUM, in botany; a genus of the digynia order, belonging to the triandria class of plants. The calyx is trivalved; the third valvule being very small.

The species are, 1. Polytachion; 2. Verticillatum; 3. Glaucum; 4. Viride; 5. Italicum; 6. Crus corvi; 7. Crus galli; 8. Coronum; 9. Bifoides; 10. Dimidiatum; 11. Hirtellum; 12. Conglomeratum; 13. Sanguinale; 14. Dactylon; 15. Filiforme; 16. Lineare; 17. Distachion; 18. Elatum; 19. Compositum; 20. Halvoium; 21. Dichotomum; 22. Ramosum; 23. Coloratum; 24. Repens; 25. Miliaceum; 26. Capillare; 27. Grossarium; 28. Latifolium; 29. Clandestinum; 30. Arborefcens; 31. Curvatum; 32. Virgatum; 33. Patens; 34. Brevifolium; 35. Divaricatum.

At this place it is proper to take notice of the Guinea-grass. By some authors it is classed as a panicum; but by expert botanists, who have lately examined the plant, it is the *holcus polygamum*. It is a native of Africa, and brought from thence to the West Indies. About 70 years ago Mr John Ellis got some birds from the coast of Guinea, and with them some seeds for their support: The birds dying soon after, the seeds were thrown out of doors as useless. From these seeds a new luxuriant grass sprung up, which attracted the notice of Mr Ellis and his family. He had a horse, and afterwards a cow, brought where it was; both of them eat of it greedily. It was then transplanted into a garden, and gradually cultivated; at this day it is common all over Jamaica; and next to the sugar cane and plaintain-tree, the greatest blessing to that island. It agrees with every soil and situation; and in many of the rocky and barren parts of Jamaica, which formerly could not support a goat, may now be seen large herds of cattle, sheep, and horses, in excellent order, and fitted for all the purposes of rural œconomy or the market. Since Guinea-grass became so common, salted beef and pork is but little used by the white people in Jamaica. Fresh beef, mutton, pork, and poultry, are in abundance; and on the whole cheaper than salted meats from Ireland or America: By these means, too, people live better, and enjoy as good health as others in Europe.

Guinea-grass is best propagated by the roots, and planted about three feet asunder. In six months it grows very tall, so as often to be six feet high. At this time horses and cattle are turned in to eat what they please of it; and while they plough up the surface of the ground with their feet, they shake the ripe feed. The rank grass is afterwards cut down, burned off, and the old stocks rooted up and thrown away. The seeds vegetate and throw up a plentiful crop; which with common attention will last many years.

For this purpose a Guinea-grass pasture requires to be kept clean, and supplied in particular places as may be necessary from time to time. The fields ought to be divided into parks by fences, and the cattle shifted from one inclosure to another occasionally.

PANINI (Paolo), a painter of perspective and architecture. He was born at Placentia in 1691, with a most happy genius to painting, which he cultivated by studying at Rome, where he designed every vestige of ancient magnificence, the ruins of superb Roman edifices, cenotaphs, columns, baths, arches, and obelisks, as also some of the most entire buildings, the ornaments of modern Rome.

He studied the works of Ghisolfi with peculiar pleasure; he formed his taste, style, and manner, by the compositions of that esteemed artist; and his strongest ambition was to imitate him: so that he soon became eminent in that style beyond all his contemporaries. His composition is rich; the truth of his perspective is critically exact; and his paintings are universally esteemed for the grandeur of the architecture, for the clearness of his colouring, for the beautiful figures which he generally introduced, and also for the elegant taste with which he disposed them. He always designed them correctly, and set them off with suitable attitudes and expression.

However, this description of his merit must be supposed to allude to his early and prime performances; for in his latter time, his pictures were distinguishable by a free and broad touch, but they are feeble in their colouring and effect. At all times, indeed, he was too apt to design his figures rather too large for the architecture, which diminished the grandeur of the most magnificent parts of his composition, and was quite contrary to the practice of Ghisolfi; whose works must perpetually afford a pleasing deception to the eye, by the perspective proportions observed between the figures, buildings, and distances.

At Rivoli, a pleasure-house belonging to the king of Sardinia, there are several of Panini's paintings, which are views of that fine retreat and its environs. They are beautifully coloured, well handled, and with a touch full of spirit; though in some parts the yellow seems a little too predominant, and the lights are not always distributed in such a manner as to produce the most striking effect.

PANIONIA, in antiquity, a festival celebrated in honour of Neptune by a concourse of people from all the cities of Ionia. It is remarkable in this festival, that if the bull offered in sacrifice happened to bellow, it was accounted an omen of divine favour; because that sound was thought to be acceptable to Neptune.

PANNARIA, one of the Lipari islands. See LIPARA, and LIPARI.—The ancients called it *Thernissa*, from the hot waters which they found in it. It may be about eight or nine miles in circumference. It bears wheat, and grapes from which the inhabitants make wine. Pannaria, like the other adjacent islands, appears to be a volcano, its original having been destroyed by continued eruptions. It is now no longer of a conical figure. It contains about 100 inhabitants, reckoning every soul, men, women, and children. It is, like Stromboli, governed by a curate, who depends on the priest of the parish of St Joseph in Lipari; and when

Panini  
||  
Pannaria.

Pannaria. when any couple in the island determine to marry, they must cross the sea to Lipari to receive the nuptial benediction in the parish of St Joseph, or pay a sum for a licence to empower the curate of Pannaria to perform the ceremony. All the other adjoining islands are subject to the same regulation.

The inhabitants of Pannaria live by fishing, and by taking small quantities of game on this and the little contiguous islands. They bring up and tame those birds known by the name of *gulls*, which are seen in tempestuous weather flying near the surface of the sea. They are here called *corraccio*. The body of the bird and the tips of its wings are white; but the head, the tail, and the rest of the wings, are grey: they are of the size of Indian hens: their wings are prodigiously large: they have their nests on the steep inaccessible cliffs of the several islands. When the islanders bring these birds up tame, they feed them with fish, which, though of such size that you would think it impossible for their stomachs to receive them, they eagerly stretch their necks and swallow rapaciously. These birds are thus brought up to be as tame as pullets or pigeons: and such an attachment do they often acquire to the places in which they are reared, that some of them have been known to return to these islands after being conveyed to Melazzo and Messina.

On the summit of a hill in this island, which projects over the sea, the inhabitants pretend to show a castle and an inscription. But their castle is only an elevated peak of the rock, which nature seems to have prepared as a retreat for birds. It consists of puzzolana; and has been actually formed by the action of winds and rains, for a long course of time, into a fantastic figure, which may appear, when carelessly viewed from a distance by an undistinguishing eye, the remains of some ancient structure. The good people of the island, not being able to judge of it otherwise than from appearance, are persuaded, that it can be nothing but a castle, which must have been reared for the defence of the island against the Turks and the corsairs of Barbary. These they consider as the most dreadful scourge with which mankind can possibly be afflicted, and fear them much more than the eruptions of the volcano. When they feel their island shaken, they embark with all their wealth, which a single sloop easily contains; and on board they are safe from both the shaking of the earth and the eruptions of the lava, but not from an hostile fleet.

In this island there appear various remains of ancient buildings, but very ruinous and very scanty. In ploughing the fields, many remains of sepulchres, in different modes of construction are found; some of rough stones, tiles, or bricks; others consisting each of a single stone. Vases of various sorts and sizes are also said to have been found in the same fields, utensils of different kinds, money, chains, and medals of lead. But none of these relics of antiquity have been preserved: the good people who found them were ignorant of their value, and therefore neglected them as trifles. In places along the shore of the island, where the sea appears to have encroached, there are some hewn stones to be seen: they seem to be remains of walls which must have been very strong and of elegant architecture. In other places farther distant from the shore, there likewise appear fragments of walls sunk in the ground, and appar-

rently overwhelmed with mud, which the winds and rain have brought down from the mountain above. These remains show, that Pannaria, either under the Greeks, or in that period when all the elements were taxed for the gratification of Roman luxury, must have been adorned with superb buildings, as well as the adjacent islands of Lipari, Stromboli, and Basiluzzo.

PANNELS of a SADDLE, are two cushions or bolsters filled with cow's, deer, or horse's hair, and placed under the saddle on each side to prevent the bows and bands from galling the horse.

PANNICULUS CARNOSUS, in comparative anatomy, a robust fleshy tunic, situated in beasts between the skin and the fat; by means of which they can move their skin in whole or in part. It is altogether wanting in mankind.

PANNONIA (Pliny, Strabo, Dio), an extensive country of Europe, having the Danube on the north, Dalmatia on the south, Noricum on the west, and Moesia on the east. It is divided into *Superior* and *Inferior* (Ptolemy, Dio). The common boundary between both were the river Arabo and mount Cetius, having the Superior to the west, and the Inferior on the east side. This division is thought to be no older than the times of the Antonines. *Pannonicus* the epithet (Martial).

PANOMPHÆUS, in antiquity, a designation given to Jupiter, because he was said to be the original author of all sorts of divination, having the books of fate, and out of them revealing either more or less, as he pleased, to inferior demons.

PANOPOLIS. See ACHMIM.

PANORMUS (Polybius, Pausanias), a town of Achaia, in Peloponnesus, near the promontory Rhium.—Another (Ptolemy, Pliny), a town on the north side of Crete.—A third (Ptolemy), in Macedonia, on the Ægean sea, near mount Athos.—A fourth, of Samos (Livy).—A fifth, of Sicily; an ancient city, built by the Phœnicians (Thucydides); a principal town of the Carthaginians (Polybius); situated between Lilybæus and Pelorus (Mela): a Roman colony. Now *Palmis*, capital of the island, on the north side. E. Long. 13. N. Lat. 38. 30.—A sixth Panormus of the Thracian Chersonesus, placed by Pliny on the west side of the peninsula, and mentioned by no other writer.

PANORMUS (Ptolemy), a port of Attica; its name denoting it to be capacious.—Another, of Epirus (Strabo, Ptolemy); a large harbour in the heart of the Montès Cerauni, below the citadel Chimæra.—A third, of Ionia (Strabo); near Ephesus, with the temple of the Ephesian Diana.

PANOPRA, the SCORPION FLY, in zoology, a genus of insects belonging to the order of neuroptera. The rostrum is horny and cylindrical; there are two pappi, and three stemonata; the feelers are longer than the thorax. The body of this insect is of a black brown colour, yellow on the sides, with a few spots of the same on the top. Its tail, formed by the three last segments of the abdomen, is of a maroon colour; of those three segments, the last is larger, almost round, and terminates in two hooks, which constitutes a tail like that of the scorpion. The wings as long as the body, are diaphanous, reticulated, with fibres and stripes of spots of a brown colour. Sometimes we meet with different varieties of this insect, consisting in the colour of

Pannels  
||  
Panorpa.

Plate  
CCCLXXII.

Barbut on  
Insects.

**Pantalaria** of the wings. Some, instead of several stripes of spots upon their wings, have only a single black stripe, transverse and irregular, situated on the middle of the wing, the extremity whereof is also black: others have their wings entirely white, excepting the extremity, which is black. The kind of forceps that is seen at the hinder part of this insect is used by the males to lay hold of their females in their amorous embraces: the threatening tail of the male does no mischief. This insect is found in meadows, by the side of ditches. There are four species, distinguished by the colour and shape of their wings.

**PANTALARIA**, an island in the Mediterranean sea, between Sicily and the main land of Africa, about 17 miles in circumference. It is near the coast of Tunis, and abounds in cotton, fruits, and wine; but the inhabitants are obliged to bring all their corn to Sicily, as it belongs to the king of the two Sicilies. E. Long. 12. 25. N. Lat. 36. 55.

**PANTÆNUS**, a stoic philosopher, born in Sicily (though some have erroneously supposed him to be a Hebrew) about the beginning of the reign of Commodus. He presided over the celebrated school of Alexandria, where, from the time of St Mark, the founder of that church, they had always a divine that was eminent for his learning and piety, to explain the Holy Scriptures, and to instruct them in human learning. This employment he was obliged to leave; for when the Indians required of Demetrius bishop of Alexandria to send them one to instruct them in Christianity, he sent Pantænus, who undertook the mission with joy, and behaved himself very properly in it. We are told, that the Indians had been tinctured with Christianity by St Bartholemew the apostle; and that Pantænus met with the Hebrew original of St Matthew's gospel, which the apostle had left there. St Jerome says that Pantænus brought it with him; and that it was, in his time, preserved in the library of Alexandria. But we suspect St Jerome to be mistaken in this respect. When Pantænus returned to Alexandria, he reassumed the government of the school of that city, which, it is probable he had, during his absence, committed to the care of St Clement, a presbyter of Alexandria. He explained the scriptures publicly, under the reign of Severus and Antoninus Caracalla; and was, in St Jerome's opinion, more serviceable to the church by his discourses than by his writings. He published some commentaries upon the Bible, which are lost. "That the prophets often express themselves in indifferent terms, and that they make use of the present time instead of the past and future," is a rule of Pantænus, which has been followed by all succeeding interpreters. The dorus has related this rule; but he speaks of it as if Pantænus had rather said than written it.

We may have some notion of Pantænus's manner of explaining the scriptures by the like performances of St Clement of Alexandria, Origen, and others who were brought up in that school.

**PANTALOON**, a sort of garment consisting of breeches and stockings all of one piece; said to have been first introduced by the Venetians.

**PANTALOON**, on the theatre, is a buffoon or masked person, who performs high and grotesque dances, and shows violent and extravagant postures and airs. The word is likewise used for the habit or dress these

buffoons usually wear; which is made precisely to the form of their body, and all of a piece from head to foot.

And hence those who wear a habit of this kind, for convenience, under their other clothes, are called *pantaloons* of Venice.

**PANTARBE**, in natural history, a name given to an imaginary stone, the effects of which upon gold were similar to those of the loadstone upon iron. The ancients, as well as some modern writers, seem to have had an opinion that there was such a stone; and the *amphitane* of Pliny is described as possessing this remarkable quality; but neither they nor we have ever found reason, from any experiment well ascertained, to believe that there ever was such a stone.

**PANTHEA**, in antiquity, were single statues, composed of the figures, or symbols, of several different divinities together. Father Joubert, who calls them *panthea*, and who has remarked them sometimes on medals, says their heads are most commonly adorned with the symbols or attributes belonging to several gods. An instance of this appears in a medal of Antonius Pius; which represents Serapis by the bushel it bears; the Sun by the crown of rays; Jupiter Ammon by the rams horns; Pluto by the large beard; and Æsculapius by the serpent twisted in his hand. M. Boudelot, in a dissertation on the Lares, observes, that the *panthea* had their origin from the superstition of those, who, taking several gods for the protectors of their houses, united them all in the same statue, by adorning it with the several symbols proper to each of these deities.

**PANTHEISM**, a philosophical species of idolatry leading to atheism, in which the universe was considered as the supreme God. Who was the inventor of this absurd system, is, perhaps, not known; but it was of early origin, and differently modified by different philosophers. Some held the universe to be one immense animal, of which the incorporeal soul was properly their God, and the heavens and earth the body of that God; whilst others held but one substance, partly active and partly passive; and therefore looked upon the visible universe as the only *Numen*. The earliest Grecian Pantheist of whom we read was Orpheus, who called the world *the body of God*, and its several parts *his members*, making the whole universe one *divine animal*. According to Cudworth, Orpheus and his followers believed in the immaterial soul of the world; therein agreeing with Aristotle, who certainly held that God and matter are coeternal; and that there is some such union between them as subsists between the souls and bodies of men. See METAPHYSICS, n° 264.

In the ancient Orphic theology, we are taught, that "this universe, and all things belonging to it, were made *within* God; that all things are contained together in the *womb* of God; that God is the *head* and *middle* of all things; that he is the *basis* of the *earth* and *heaven*; that he is the *depth* of the *sea*, the *air* we breathe, the force of the untameable *fire*; that he is the *sun*, *moon*, and *stars*; that there is one divine *body*; for,

Πάντα γὰρ ἐν μεγάλῳ τῷ θεῷ σωματικαίται

"all these things lie in the great body of God."—But further, to prove that the most ancient Greek philo-

Pantarbe

Pantheism.

**Pantheism**, sophers resolved all things into God, and made God **Pantheon**, *all*, we shall cite a most remarkable passage from Plutarch's *Deest of Oracles*. "Whereas there are two causes of all generations, the divine and the human, the most ancient theologers and poets attended only to the more excellent of these two; resolving all things into God, and pronouncing this of them universally;

*Zeus αρχη, Zeus μεση, Διος δ' εκ παντα πελονται*

'that God is both the beginning and middle, and that all things are out of God;' inasmuch, that they had no regard at all to the other natural and necessary causes of things: but on the contrary, their juniors, who were called *naturalists*, deviating from this most excellent and divine principle, placed all in *bodies*, their passions, collisions, mutations, and commixtures."

That by the most ancient theologers here mentioned, Plutarch meant Orpheus and his immediate followers, is plain from the Orphic verse by which he proves their antiquity. By their juniors, whom he calls *naturalists*, he could mean no other than the first Grecian philosophers, *Anaximander*, *Anaximenes*, and *Hippo*, who were followed by the atheistical atomists, *Leucippus*, *Democritus*, *Protagoras*, and *Epicurus*. But with respect to the universe being God, and all things divine and human being modifications of mere matter, the stoics undoubtedly agreed with *Anaximander* and his followers; for the school of *Zeno* held but one substance. See *METAPHYSICS*, n° 265. This impious doctrine, that all things are God, and that there is but one substance, was revived in modern times by *Spinoza*, an apostate Jew. As we shall give a life of him and a view of his principles, we must refer the reader for a fuller account of Pantheism to *SPINOZA*. See also **PAN**.

**PANTHEON**, a beautiful edifice at Rome, anciently a temple, dedicated to all the gods; but now converted into a church, and dedicated to the Virgin and all the martyrs.

This edifice is generally thought to have been built by *Agrippa* son-in-law to *Augustus*, because it has the following inscription on the frieze of the portico.

M. AGRIPPA L. F. COS. TERTIUM FECIT.

Several antiquarians and artists, however, have supposed that the pantheon existed in the times of the commonwealth; and that it was only embellished by *Agrippa*, who added the portico. Be this as it will, however, the pantheon, when perfected by *Agrippa*, was an exceedingly magnificent building; the form of whose body is round or cylindrical, and its roof or dome is spherical: it is 144 feet diameter within; and the height of it, from the pavement to the grand aperture on its top, through which it receives the light, is just as much. It is of the Corinthian order. The inner circumference is divided into seven grand niches, wrought in the thickness of the wall: six of which are flat at the top; but the seventh, opposite to the entrance, is arched. Before each niche are two columns of antique yellow marble fluted, and of one entire block, making in all 14, the finest in Rome. The whole wall of the temple, as high as the grand cornice inclusive, is cased with divers sorts of precious marble in compartments. The frieze is entirely of porphyry. Above the grand cornice arises an attic, in which were wrought, at equal distances, 14 oblong square niches: between each niche were four marble pilasters, and between the pila-

VOL. XIII.

sters marble tables of various kinds. This attic had a complete entablature; but the cornice projected less than that of the grand order below. Immediately from the cornice springs the spherical roof, divided by bands, which cross each other like the meridians and parallels of an artificial terrestrial globe. The spaces between the bands decrease in size as they approach the top of the roof; to which, however, they do not reach, there being a considerable plain space between them and the great opening. That so bold a roof might be as light as possible, the architect formed the substance of the spaces between the bands of nothing but lime and pumice-stones. The walls below were decorated with lead and brass, and works of carved silver over them; and the roof was covered on the outside with plates of gilded bronze. There was an ascent from the springing of the roof to the very summit by a flight of seven stairs. And if certain authors may be credited, these stairs were ornamented with pedestrian statues ranged as an amphitheatre. This notion was founded on a passage of *Pliny*, who says, "That *Diogenes* the sculptor decorated the pantheon of *Agrippa* with elegant statues; yet that it was difficult to judge of their merit, upon account of their elevated situation." The portico is composed of 16 columns of granite, four feet in diameter, eight of which stand in front, with an equal intercolumniation all along, contrary to the rule of *Vitruvius*, who is for having the space answering to the door of a temple, wider than the rest. Of these columns is a pediment, whose tympanum, or flat, was ornamented with bas-reliefs in brass; the cross beams which formed the ceiling of the portico were covered with the same metal, and so were the doors. The ascent up to the portico was by eight or nine steps.

Such was the pantheon, the richness of which induced *Pliny* to rank it among the wonders of the world.

The eruption of *Vesuvius*, in the reign of *Tiberius*, damaged the Pantheon very considerably: it was repaired by *Domitian*; which occasioned some writers to mention that prince as the founder of the building. The emperor *Adrian* also did something to it. But it appears, that the pantheon is more indebted to *Septimius Severus*, than to any one since its erection. The most, perhaps, that any of his predecessors had done, was the adding some ornament to it: *Septimius* bestowed essential reparations upon it. The following inscription appears upon the architrave:

IMP. CAES. SEPTIMIUS. SEVERUS.

PIVS. PERTINAX.

ARABICVS. PARTHICVS. PONTIF.

MAX. TRIB. POT.

XL COS. III. P. P. ET. IMP. CAES.

RESTITVERVNT.

It is really a matter of astonishment, that a structure, which, granting it to have been built by *Agrippa*, was not more than 200 years old, should have fallen into decay through age. This single consideration seems sufficient to confirm the opinion of those

Pantheon. who believe it to have stood in the time of the commonwealth.

The temple subsisted in all its grandeur till the incursion of Alaric in the time of Honorius. Zozyms relates, that the Romans having engaged to furnish this barbarian prince with 3000 pounds weight of gold and 5000 pounds weight of silver, upon condition that he should depart from their walls; and it proving impossible to raise those sums either out of the public treasury or private purses, they were obliged to strip the temples of their statues and ornaments of gold and silver. It is probable that the pantheon supplied a good part, as that of Jupiter Capitolinus was the only one in Rome that could vie with it for riches.

Alaric carried off nothing from the Romans besides their precious metals. Thirty-nine years after this, Genseric king of the Vandals took away part of their marbles; and whether from a greediness of plunder, or from a relish of the productions of art, loaded one of his ships with statues. It cannot be questioned, but that on this occasion the pantheon was forced to part with more of its ornaments, and that the inestimable works of Diogenes became the prey of this barbarian.

Before these unwelcome visits of the Goths and Vandals, the Christian emperors had issued edicts for demolishing the Pagan temples. But the Romans, whatever were their motives, spared the pantheon, which is known to have suffered no damage from the zeal of the pontiffs, or the indignation of the saints, before the first siege of Rome by Alaric. It remained so rich till about the year 655, as to excite the avarice of Constantine II. who came from Constantinople to pillage the pantheon, and executed his purpose so far as to strip it both of its inside and outside brazen coverings, which he transported to Syracuse, where they soon after fell into the hands of the Saracens.

About fifty years before this, pope Boniface IV. had obtained the pantheon of the emperor Phocas, to make a church of it. The artists of these days were totally ignorant of the excellence of the Greek and Roman architecture, and spoiled every thing they laid their hands upon. To this period certain alterations are to be referred, of which we shall speak by and by.

After the devastations of the barbarians, Rome was contracted within a narrow compass: the seven hills were abandoned; and the Campus Martius, being an even plain, and near the Tyber, became the ground-plat of the whole city. The pantheon happening to stand at the entrance of the Campus Martius, was presently surrounded with houses, which spoiled the fine prospect of it; and it was yet more deplorably disgraced by some of them which stood close to its walls. Pedlars shades were built even within its portico, and the intercolumniations were bricked up, to the irreparable damage of the matchless pillars, of which some lost part of their capitals, some of their bases, and others were chiseled out six or seven inches deep, and as many feet high, to let in posts. Which excavations are to this day half filled up with brick and mortar; a sad monument of the licentiousness of the vulgar, and of the stupid avarice of those who sold them the privilege to ruin the noblest piece of art in the world!

This disorder continued till the pontificate of Eu-

gene IV. whose zeal for the decency of a consecrated place, prevailed upon him to have all the houses cleared away that incumbered the pantheon, and so the miserable barracks in the portico were knocked down.

From the time Constantius carried off the brass plating of the external roof, that part was exposed to the injuries of the weather, or at best was but slightly tiled in, till Benedict II. covered it with lead, which Nicholas V. renewed in a better style.

It does not appear that from this time to Urban VIII. any pope did any thing remarkable to the pantheon.

Raphael Urban, who had no equal as a painter, and who as an architect had no superior, left a considerable sum by his will for the reparation of the pantheon, where his tomb is placed. Perino de la Vagua, Jacomo Udino, Hannibal Carracci, Flamingo Vacca, and the celebrated Archangelo Corelli, did the same. All the ornaments within, that have any claim to be called good, are of the later times; the paintings merit esteem; and the statues, though not masterpieces, do honour to sculpture, which alone is a proof that they are posterior to the 15th century.

But, with all the respect due to a pontiff, who was otherwise a protector, and even a practitioner of the arts, it were much to be wished that Urban VIII. had not known that the pantheon existed. The inscription cut at the side of the door informs us, that he repaired it; yet, at the same time that he built up with one hand, he pulled down with the other. He caused two bel-fries of a wretched taste to be erected on the ancient front work, and he divested the portico of all the remains of its ancient grandeur, viz. the brazen cover-ture of the cross beams, which amounted to such a prodigious quantity, that not only the vast baldaquin or canopy of the confessional in St Peter's was cast out of it, but likewise a great number of cannon for the castle of St Angelo. This pope, who was of the family of Barberini, presented also as much of this metal to his nephew, as was sufficient for the decoration of his new palace; on which occasion this remarkable palquinade was stuck up:

*Quod non fecerunt Barbari fecere Barberini.*

If ever gingle added force to wit, it was certainly in this instance.

It is surprising, that whilst all these operations were carrying on in the portico, he never once thought of repairing the damages which time had wrought in it! Of the 16 pillars which supported this magnificent pile, there were no more than 13 left; the three next the temple of Minerva had disappeared; with these the entablature and an angle of the front had tumbled down. There were not wanting in Rome fragments enough of antique columns that might have been put together, and set up, to have prevented the downfall of a pile which deserved to stand as long as the world endured.

Alexander VII. did what Urban VIII. had neglected to do. At the same time that Bernini was constructing the colonnade of St Peter, this pontiff ordered search to be made for pillars to match those of the portico of the pantheon; and some were found not far from the French church of St Lewis of the very same model. They were granite of the isle of Ilva, and those

**Pantheon**, those of the portico were Egyptian granite; the colour, however, was the same, so that the effect was equal. **Pantheon**, The pope's zeal did not stop here; he caused all the old houses before the portico to be pulled down, and the soil and rubbish to be cleared away which covered the steps, and even the bases of some of the pillars. He began covering the roof with marble, and raised a lantern over the aperture, to keep out rain; but death took him off before his project was completed. Clement IX. his successor, inclosed the portico within iron rails. Several later popes have added to its decorations, which were all in the taste of the times they were done in; and the body of the edifice and its architecture gained nothing from them. The main object of their holinesses liberality was the embellishment of the grand altar. One gave purple curtains, another bestowed silver tabernacles; others again vases, and superb dresses, suited to the solemn ceremonies of religion. All these might be called rich; but they had in no sense a tendency to retrieve the ancient majesty or original splendor of the temple. The true gusto of the ornaments was a little imitated at the revival of the arts. Good statues took place of the skeletons and squat figures that ridiculously disgraced the altars for the space of eight centuries. The paintings of Perugino, Cozza, and Gressi, covered the dull mosaics with which the Greeks of Constantinople had loaded the walls of most of the churches in Rome. The porphyry and the green and yellow antique found among the old ruins were employed to much advantage.

There was besides at Rome another pantheon, dedicated to Minerva as the goddess of medicine. It was in the form of a decagon, and the distance from one angle to another measured about 22 feet and an half. Between the angles there were nine round chapels, each of which was designed for a deity; and over the gate there was a statue of Minerva. The pantheon of Athens was in many respects little inferior to the Roman one built by Agrippa. The Greek Christians also converted it into a church, dedicated to the Virgin, under the name of *Panagia*; and the Turks changed it into a mosque. The pantheon of Nîmes was a temple in that city, wherein were 12 niches or statues supposed to have been destined for the 12 great gods. In the Escorial is a most magnificent chapel, called *pantheon*, 35 feet in diameter, and 38 feet high from the pavement, which is composed of marble and jasper inlaid. The whole inside of the chapel is of black marble, except the luthern, and some ornaments of jasper and red marble. In this chapel are deposited the bodies of the kings and queens; there are only places for 26, and eight of them are already filled.

**PANTHER**, in zoology. See **FELIS**.

**PANTING**, consists in a rapid succession of in-

spirations and expirations, which happens when we run or perform any violent motion.

**PANTOMIME**, *παντομιμος*, among the ancients, a person who could imitate all kind of actions and characters by signs and gestures without speaking.

The pantomimes made a part in the theatrical entertainments of the ancients; their chief employment was to express, in gestures and action, whatever the chorus sung, changing their countenance and behaviour as the subject of the song varied. They were very ancient in Greece, being derived from the heroic times, according to some; but however this may be, they were certainly known in Plato's time. In Rome, it was so late as the time of Augustus before they made their appearance. As to their dress, it was various, being always suited as near as possible to that of the person they were to imitate. The crocota was much used among the Roman pantomimes, in which and other female dresses they personated women.

We have this account of them in Gibbon's history: "The pantomimes (A), who maintained their reputation from the age of Augustus to the sixth century, expressed, without the use of words, the various fables of the gods and heroes of antiquity; and the perfection of their art, which sometimes disarmed the gravity of the philosopher, always excited the applause and wonder of the people. The vast and magnificent theatres of Rome were filled by 3000 female dancers, and by 3000 singers, with the masters of the respective chorusses. Such was the popular favour which they enjoyed, that in a time of scarcity, when all strangers were banished from the city, the merit of contributing to the public pleasures exempted them from a law which was strictly executed against the professors of the liberal arts (B)."

Pantomimes are still very common in England; they differ indeed in some respects from those of antiquity; but they retain the name, and like these they consist in the representations of things merely by gestures.

**PANUCO**, a town and province of North America, in New Spain, lying to the north of Mexico, with a bishop's see. There are veins of gold, and salt-works, which are the principal revenue of the inhabitants.—It is seated near the mouth of a river of the same name, at a small distance from the Gulph of Mexico. W. Long. 100. 5. N. Lat. 24. 0.

**PANZACCHIA** (Maria Helena), This paintress was born at Bologna in 1668, of a noble family, and appeared to have an extraordinary genius for painting. She learned design under the direction of Emilio Taruffi, and in a short space of time made an astonishing proficiency; so that in the compass of a few years she acquired great readiness in composition, correctness of outline, and a lovely tint of colouring.

She also excelled in painting landscapes; and by

4 T 2

the

(A) "See the dialogue of Lucian, intitled, *De Saltatione*, tom. ii. p. 265—317. edit. Reitz. The pantomimes obtained the honourable name of *χερροσκοποι*; and it was required that they should be conversant with almost every art and science. Burette (in the *Memoires de l'Academie des Inscriptions*, tom. i. p. 127, &c.) has given a short history of the art of pantomimes.

(B) "Ammianus, l. xiv. c. 6. He complains, with decent indignation, that the streets of Rome were filled with crowds of females, who might have given children to the state, but whose only occupation was to curl and dress their hair; and *jacitari volubilibus gyris, dum experimunt innumera simulacra, quæ fixere fabula theatralis*."

Pao  
||  
Pap.

the beauty of her situations and distances allured and entertained the eye of every judicious beholder. The figures which she inserted had abundance of grace; she designed them with becoming attitudes, and gave them a lively and natural expression. Her merit was incontestably acknowledged, and her works were exceedingly prized and coveted.

PAO-TING-FOU, in China, where the viceroy resides, is the most considerable city in the province next to Pekin. It has 20 others under its jurisdiction, three of the second and 17 of the third class. The country around it is pleasant, and inferior in fertility to no part of China. It is necessary to pass the city in going from Pekin to the province of Chan-si.

PAOLO (Marco). See PAULO.

PAPA, a small but strong town of Lower Hungary, in the country of Vespriin. It was taken from the Turks in 1683, after raising the siege of Vienna, and is subject to the house of Austria. It is seated on a mountain, near the river Marchaez, in E. Long. 19. 10. N. Lat. 47. 20.

PAP-CASTLE, in England, in Bridekirk parish, Cumberland, stood two miles from Cockermouth, on the other side of the Derwent, whose Roman antiquity is proved by several monuments; and a large green stone vessel found here, with little images upon it, is supposed to have been formerly a Danish font for dipping of infants; and has been since used at Bridekirk, in the neighbourhood for their sprinkling.

The name of *Pap-castle* seems to be contracted from Pipard its owner: it is said to have been demolished, and the materials employed to build Cockermouth castle.

Mr Routh, in a letter to Mr Gale, thus describes the ruins discovered at Pap-castle, Jan. 16. 1744.

"I made particular inquiry of the man in whose grounds they were discovered, and of some of the neighbours present at the discovery. The close in which they lay is a little to the south of the fort, on the declivity of the hill to the river, and bounded on the west by a narrow lane, probably the *via militaris* continued; and is usually shown to strangers as the most remarkable here for finding Roman coins. They are the largest ruins ever known to be discovered in these parts: for they met with three walls besides the pavement; the first lay east and west, and was covered with earth near a foot high: parallel to it at seven yards, they found a second; and between these two, about two yards deep (the height of the walls, which were six yards broad, and strongly cemented), they came to a pavement curiously laid with large flags, three quarters of a yard square, and two or three inches thick, as I measured them: but imagining there must be money under it, they covered it up till night, and then tore it all up. It was composed of flags of different thickness: under the thinner was a coarse strong cement, which caused them to be broken in taking up; but the thicker are pretty entire. Part of the wall stood on the floor, and the edge was secured by a fine red cement two inches thick, supposed to be intended to keep the floor dry. They imagined themselves at the corner of the building, the third wall standing at right angles with the first, and the second parallel to the stony lane, on which was an old hedge. On the floor they found a stone trough, or rather base of a pillar, about a foot high, and the hollowed part

square, and two inches deep. They likewise found a small earthen patera, which I procured, of the fine red clay, beautifully smooth, with letters impressed on the bottom; but so defaced as not to be intelligible.—Some years ago, the man's father who found these ruins, dug up a conduit. The owner had no coins, nor knew of any. One of his neighbours showed me a large brass one defaced."

Mr Routh, in another letter to Mr Gale, April 13. 1743, describes a fibula, a coin of Trajan, . . . IANO AVG. . . . P. M. Rev. the emperor seated on a pile of arms, a trophy before him, S. P. Q. R. OPTI . . . S. C. and two oaken pieces of the adjoining timber of a house which appeared to have been burnt, in the gardens of Jerom Tully, Esq; of Carlisle. The earth as far as they dug was artificial, and antiquities are only found at a considerable depth.

Dr Stukely says, the Roman castrum lies on the top of the hill above the village, and he traced its whole circumference, a bit of the Roman wall by the river side going to Wigton, and there the ditch is plainly visible, though half filled up with the rubbish of the wall. A subterraneous vault, floored with large slabs of free-stone, was found in the pasture of the south-east angle. The name of *Boroughs* includes both closes where it stood; and they find stones and slates with iron pins in them, coins, &c. on the whole spot below it, towards the water-side. It was a beautiful and well chosen plan, on the south-west side of a hill, a noble river running under, and pretty good country about it. Coins of Claudius, Adrian, and a silver Geta, PONT. REV. PRINCEPS IVVENTVTIS. He supposes its ancient name *Derwentio*, derived from the Derwent.

PAPAYER, the POPPY: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 27th order, *Rhoæadæ*. The corolla is tetrapetalous; the calyx diphyllous; the capsule bilocular, opening at the pores below a persisting stigma.

*Species.* 1. The somniferum, or somniferous common garden-poppy, rises with an upright smooth stalk, dividing or branching a yard or more high; garnished with large, deeply jagged, amplexicaule, smooth leaves; and terminated by large, spreading, dark-purple, and other coloured flowers, in the varieties, having smooth cups and capsules. There are a great many varieties, some of them extremely beautiful. The white official poppy is one of the varieties of this sort. It grows often to the height of five or six feet, having large flowers, both singles and doubles, succeeded by capsules or heads as large as oranges, each containing about 8000 seeds.

We are told, that in the province of Bahar in the East Indies, the poppy-seeds are sown in the months of October and November, at about eight inches distance, and well watered till the plants are about half a foot high, when a compost of dung, nitrous earth, and ashes, is spread over the areas; and a little before the flowers appear, they are again watered profusely till the capsules are half grown, at which time the opium is collected; for when fully ripe, they yield but little juice; two longitudinal incisions from below upwards, without penetrating the cavity, are made at sunset for three or four successive evenings; in the morning the juice is scraped off with an iron scoop, and

Gough's  
edit.

**Papaver.** and worked in an iron pot in the sun's heat till it is of a consistence to be formed into thick cakes of about four pounds weight; these are covered over with the leaves of poppy, tobacco, or some other vegetable, to prevent their sticking together, and in this situation they are dried.

The somniferous quality of the white poppy is well known. This quality resides in the milky juice of the capsule containing the seeds, nor is it evaporated by drying the juice; hence the dried capsules are preserved in the shops for making the syrup. The inspissated juice itself is a kind of opium; and for an account of its virtues see the article *Opium*. The seeds also make a very agreeable emulsion, but have no soporific virtue.

Wood-  
ville's Me-  
dical Bo-  
tany.

It grows in England, generally in neglected gardens, or uncultivated rich grounds, and flowers in July and August. This species is said to have been named *white poppy* from the whiteness of its seeds; a variety of it, however, is well known to produce black seeds; the double-flowered white poppy is also another variety: but for medicinal purposes, any of these may be employed indiscriminately, as we are not able to discover the least difference in their sensible qualities or effects. The seeds, according to some authors, possess a narcotic power; but there is no foundation for this opinion: they consist of a simple farinaceous matter, united with a bland oil, and in many countries are eaten as food. As a medicine, they have been usually given in the form of emulsion, in catarrhs, stranguries, &c. The heads or capsules of the poppy, which are directed for use in the pharmacopœias, like the stalks and leaves, have an unpleasant smell, somewhat like that of opium, and an acrid bitterish taste. Both the smell and taste reside in a milky juice, which more especially abounds in the cortical part of the capsules, and in its concrete state constitutes the officinal opium. These capsules are powerfully narcotic or anodyne; boiled in water, they impart to the menstruum their narcotic juice, together with the other juices which they have in common with vegetable matters in general. The liquor, strongly pressed out, suffered to settle, clarified with whites of eggs, and evaporated to a due consistence, yields an extract which is about one-fifth or one-sixth of the weight of the heads. This possesses the virtues of opium, but requires to be given in double its dose to answer the same intention, which it is said to perform without occasioning a nausea and giddiness, the usual effects of opium. This extract was first recommended by

Mr Arnot; and a similar one is now received in the Edinburgh Pharmacopœia. It is found very convenient to prepare the syrup from this extract, by dissolving one dram in two pounds and a half of simple syrup. The *syrupus papaveris albi*, as directed by both colleges, is a useful anodyne, and often succeeds in procuring sleep, where opium fails; it is more especially adapted to children. White poppy heads are also used externally in fomentations, either alone, or more frequently added to the decoction *pro fœmen o*.

2. The rhœas, or wild globular-headed poppy, rises with an upright, hairy, multiflorous stalk, branching a foot and an half high; garnished with long, pinnatifid, deeply cut, hairy leaves; the stalk terminated by many red and other coloured flowers in the varieties, succeeded by globular smooth capsules.

This plant is common in corn-fields, and flowers in June and July. It may be distinguished from *p. dubium*, to which it bears a general resemblance, by its urn-shaped capsules, and by the hairs upon the peduncles standing in a horizontal direction. The capsules of this species, like those of somniferum, contain a milky juice, of a narcotic quality, but the quantity is very inconsiderable, and has not been applied to any medical purpose; but an extract prepared from them has been successfully employed as a sedative. The flowers have somewhat of the smell of opium, and a mucilaginous taste, accompanied with a slight degree of bitterness. A syrup of these flowers is directed in the London Pharmacopœia, which has been thought useful as an anodyne and pectoral, and is therefore prescribed in coughs and catarrhal affections; but it seems valued rather for the beauty of its colour than for its virtues as a medicine.

3. The Cambricum, or Welsh poppy, has a perennial root, pinnated cut leaves, smooth, upright, multiflorous stalks, a foot and an half high; garnished with small pinnated leaves, and terminated by many large yellow flowers, succeeded by smooth capsules. The flowers appear in June.

4. The orientalis, or oriental poppy, hath a large, thick, perennial root; long, pinnated sawed leaves; upright, rough, uniflorous stalks, terminated by one deep red flower, succeeded by oval, smooth, capsules. The flowers appearing in May.

**Propagation.** All the kinds are hardy, and will prosper anywhere. The two first species being annual, are to be propagated only by seeds; but the two last by parting the roots as well as the seeds.

PAPAW, or PAPA-TREE. See *CARICA*.

## P A P E R.

**P**APER is a word evidently derived from the Greek *πapyrus*; *papyrus*, the name of that celebrated Egyptian plant which was so much used by the ancients in all kinds of writing. It would be unnecessary particularly to describe the different expedients which men in every age and country have employed for giving stability to their ideas, and for handing them down to their children. When the art of writing was once discovered, stones, bricks, leaves of trees, the exterior and

interior bark, plates of lead, wood, wax, and ivory, were employed. In the progress of society, men have invented the Egyptian paper, paper of cotton, paper manufactured from the bark of trees, and in our times from old rags.

The inhabitants of Ceylon, before the Dutch made themselves masters of the island, wrote on the leaves of the talipot. The manuscript of the bramins, sent to Oxford from Fort St George, is written on the leaves

of a palm of Malabar. Herman speaks of another palm in the mountains of that country which produces leaves of several feet in breadth. Ray, in his History of Plants, Vol. II. Book xxxii. mentions some trees both in India and America, the leaves of which are proper for writing. From the interior substance of these leaves they draw a whitish membrane, large, and somewhat like the pellicle of an egg; but the paper made by art, even of the coarsest materials, is much more convenient in use than any of these leaves.

The Siamese, for example, make two kinds of paper, the one black and the other white, from the bark of a tree which they call *Pliokkloi*. These are fabricated in the coarsest manner; but they can be used on both sides with a bodkin of fullers earth.

The nations beyond the Ganges make their paper of the bark of many trees. The other Asiatic nations within the Ganges, excepting those toward the south, make it of old rags of cotton cloth; but from their ignorance of the proper method, and the necessary machinery, their paper is coarse. This, however, is by no means the case with that made in China and Japan, which deserves attention from the beauty, the regularity, the strength, and fineness of its texture. In Europe they have discovered, or rather carried to perfection, the ingenious art of making paper with old rags, originally either from flax or hemp; and since this discovery the paper produced from our manufactures is sufficient for every purpose. And though these materials have been hitherto abundant, several philosophers have attempted to substitute other vegetable substances in their place. In the 6th volume of the Transactions of the Society for the Encouragement of Arts, we have an account of paper made by Mr Greeves near Warrington from the bark of willow-twigs; and it has been observed by a society of able critics, that hop-buds would probably answer this purpose better. The rags in common use for paper-making are a texture of supple and strong fibres separated by a lee from the bark of the plants. It would be in vain to employ the whole body of the plant, as this substance forms a very improper stuff for the operations of the paper-mill. From these principles we are directed in the choice of vegetable substances fit for the present purpose. The greater or less degree of purity in the materials is not absolutely necessary; for flax itself, without any preparation, could be made into paper; but it would be extremely coarse, and the bark of nettles or mallows would not bear the expence of labour. Although cotton be used in the fabrication of paper in the Levant, and perhaps in China, we are not to conclude that the down of plants in Europe, without the strength or suppleness of cotton, will answer the same purpose.

#### HISTORY.

The chief kinds of paper which merit attention in this work are, 1. The Egyptian paper; 2. The paper made from cotton; 3. Paper from the interior bark of trees or liber; 4. Chinese paper; 5. Japanese paper; 6. Paper made from asbest; and, 7. Paper made from linen rags.

This is the famous paper used by the ancients, which was made of a kind of reed called *papyrus*,

growing in Egypt on the banks of the Nile. According to Isidorus, this paper was first used at Memphis, and Lucan seems to be of the same opinion,

*Nondum flamineas Memphis connexere biblos*

*Noverat.*

PHARSAL. lib. iii. ver. 222.

Whatever truth may be in this, it is certain, that of all the kinds of paper used by the ancients, the papyrus was the most convenient, both from its flexibility and from the ease of fabrication. It was a present from nature, and required neither care nor culture.

It is not certain at what particular period the ancients began to make paper of papyrus; but there are several authorities which prove the use of it in Egypt long before the time of Alexander the Great.

Pliny, lib. xiii. cap. 11. gives a full description of the method of making this paper in Egypt. They divide, says he, with a kind of needle the stem of the papyrus into thin plates or slender pellicles, each of them as large as the plant will admit. These are the elements of which the sheets of paper are composed. The pellicles in the centre are the best; and they diminish in value as they depart from it. As they were separated from the reed, they were extended on a table, and laid across each other at right angles. In this state they were moistened by the water of the Nile, and while wet were put under a press, and afterwards exposed to the rays of the sun. "It was supposed that the water of the Nile \* had a gummy quality necessary \* Pliny, to glue these stripes together. This, says Mr Bruce, lib. xiii. we may be assured is without foundation, no such quality being found in the water of the Nile; on the contrary, I found it of all others the most improper, till it had settled and was absolutely divested of all the earth gathered in its turbid state. I made several pieces of this paper both in Abyssinia and Egypt; and it appears to me, that the sugar or sweetness with which the whole juice of this plant is impregnated, is the matter that causes the adhesion of these stripes together; and that the use of the water is no more than to dissolve this, and put it perfectly and equally in fusion." When there was not enough of sugar in the plant, or when the water did not sufficiently dissolve it, the pellicles were united by a paste made of the finest wheat flour, mixed with hot water and a little vinegar, and when dried they were flattened and smoothed by the beating of a mallet.

The size of this paper varied much; it seldom exceeded two feet, but it was oftentimes smaller. It had different names, according to its size and quality: The first was called *Imperial*, which was of the finest and largest kind, and was used for writing letters by the great men amongst the Romans. The second sort was called by the Romans the *Livian* paper, from Livia the wife of Augustus; each leaf of this kind was 12 inches. The third sort was called the *Sacerdotal* paper, and was 11 inches in size.

The paper used in the amphitheatres was of the dimensions of nine inches. But what was esteemed of greatest value in it, was its strength, whiteness, and polish. The ink, however, sunk less in paper highly polished; and therefore the characters were more liable to be effaced. When it was not carefully soaked in the first preparation, the paper brought a less price; because

*Panorpa*

*Panicum Quinquifolium*

*Papaver Rhoeas*

*Papaver Somniferum*

because letters were with difficulty formed upon it, and it sent forth a disagreeable smell. To remedy this defect, the paper went through a new course of sizing and hammering; and the sizes used on that occasion was made of light bread steeped in boiling water, and passed through a filtering cloth. By this means the paper became in the highest degree united, and smoother than the finest linen. It was this paper which gave so long a duration to the works of the Gracchi, Tiberius, and Caius, in their own hand-writing. "I have seen them (says Pliny) in the library of Pomponius Secundus, a poet and citizen of the first rank, near 200 years after they were written." We may add, that manuscripts of this paper still remain, which have undoubtedly been written 1000 or 1200 years ago. It appears from Pliny, that the Egyptians passed together the pellicles of the papyrus by means of the water of the Nile; but that the polishing with ivory, and the operations of the hammer and the press, were added by the invention and industry of the Roman artists. The Egyptians seem to have known the use of size; but it is evident from the same author, that the Romans used a stronger size in the making of paper. Notwithstanding the care which was taken to give strength and consistency to the paper of Egypt, the leaves, although collected into a book, were too weak to support themselves; and for this reason it was a common practice, after every five leaves, to insert a leaf of parchment. There still remains in the abbey de St Germain de-pres, a fragment of the epistles of St Augustine written in this manner. The manuscript is at least 1100 years old, and in a high state of preservation.

This paper was an important branch of commerce to the Egyptians, which continued to increase towards the end of the Roman republic, and became still more extensive in the reign of Augustus. The demand from foreign nations was often so great, as to occasion a scarcity at Rome; and we read in the reign of Tiberius of a tumult among the people in consequence of this scarcity. In a letter of the Emperor Adrian, the preparing of the papyrus is mentioned as one of the principal occupations at Alexandria. "In this rich and opulent city (says he) nobody is seen idle: Some are employed in the manufactory of cloth, some in that of writing paper," &c. During the time of the Antonines, this commerce continued equally to flourish. Apuleius says, that he wrote on the paper of Egypt with a reed of the Nile prepared at Memphis.

The demand for this paper was so great towards the end of the third century, that when the tyrant Firmus conquered Egypt, he boasted that he had seized as much paper and size as would support his whole army.

St Jerom informs us, that it was as much in use in the fifth century when he flourished. The duty on the importation of this commodity had grown excessive towards the end of this or the beginning of the sixth century; and being abolished by Theodoric king of Italy, Cassiodorus, in the 38th letter of the 11th book, congratulates the whole world on the discharge of an impost on a merchandise so essentially necessary to mankind.

The fathers Montfaucon and Mabillon mention several fragments written on this paper in the sixth cen-

tury. One of them was a charter of the Emperor Justinian, intitled, *Charta plenarie securitatis*. Father Montfaucon saw in 1698, in the library of Julio Juliani, three or four fragments of paper of Egypt of the same antiquity. And Mabillon speaks of some books of the Jewish antiquities by Josephus translated into Latin, which seemed to have been written in the same century, and which were preserved in the library of St Ambrose of Milan, but he had not seen the manuscripts. The same father mentions to have seen in the library of St Martin of Tours the remains of an old Greek manuscript of the paper of Egypt, and which appeared to him to be of the seventh century. He also believes, that the copy of St Mark's gospel preserved in the register-office of Venice is written on the same paper, that it is the most ancient of any of the evangelical manuscripts, and may be supposed to be written at the latest in the fourth century.

According to the same antiquarian, the paper of Egypt was used in France, and Italy, and other European countries, both for books of learning and public records; and there still remains, adds he, a great number of these in the archives of the church at St. Dennis, at Corbie, in the abbey de Graffe, and in other convents.

It is probable, that the invention of paper made of cotton, of which we are afterwards to treat, insensibly destroyed the reputation and manufacture of the paper of Egypt; but it is still a question at what particular period the fabrication of the latter totally ceased. Eustachius, the learned commentator on Homer, assures us, that in his time in 1170 it was no longer in use; but father Mabillon maintains, that many of the popish bulls were written on the papyrus in the 11th century.

The Count Maffei, in his *Istor. Diplomat.* lib. ii. *Biblioth. Ital.* tom. ii. p. 251. is decidedly of opinion, that the paper of Egypt was not in use in the fifth century. He considers all records written on this paper dated posterior to this period as not authentic; and the popish bulls mentioned by father Mabillon appear to this learned person, as well as the copy of St Mark's gospel, to be written on paper manufactured from cotton. To reconcile in some measure these contradictory accounts, it may be observed, that on some particular occasion, and by some particular persons, the paper of Egypt might have been employed for several hundred years after it ceased to be of general use. Whoever wishes for a fuller account of the paper of Egypt, may consult among the ancients Pliny, lib. xiii. and Theophrastus, lib. iv. chap. ix. and among the moderns, Guillaudinus, Scaliger, Saumaïse, Kerchmayer, Nigrisoli; Father Hardouin in his edition of Pliny; Father Mabillon in his work, *De re Diplomat.*; Montfaucon in his *Paleography*, and in his *Collections*; the illustrious Maffei in his *Istor. Diplomat.*; the Count de Caylus in the *Memoirs of the Academy of Inscriptions*; and Mr Bruce in his *Travels* to discover the Source of the Nile.

It is generally supposed that the invention of the Paper<sup>2</sup> paper, called *charta bombycina*, supplanted the Egyptian paper in Greece. This paper is incomparably<sup>2</sup> more lasting, and better calculated for all the purposes of writing. It is not precisely known at what period this art, which supposes a great variety of previous<sup>2</sup>

experiments, was first reduced to practice. The application of cotton to the purposes of paper-making requires as much labour and ingenuity as the use of linen rags; and for this reason if we could determine the precise time that paper was made from cotton, we should also fix the invention of the art of paper-making as it is presently practised in Europe. Father Montfaucon proves, by incontestable authorities, that paper from cotton was in use in 1100. This paper in the Greek language is called χαρτις βυμβυνιον, or βυμβυνιον; for although βυμβιξ is the Greek word for silk, yet in those times it was applied, as well as βαμβας, to cotton; and hence the Italians to this day call cotton *bumlaccio*.

The most ancient manuscript of this paper which Father Montfaucon saw with the date, was that in the French king's library, written A. D. 1050; but as the manuscripts without date are infinitely more numerous than those which are dated, and as some conjecture can be formed concerning them from the manner of writing, this father believes some of these to have been written in the tenth century.

The researches of the same learned antiquarian amount almost to a proof that this paper was discovered towards the end of the ninth century or beginning of the tenth; for before the twelfth century it was commonly used in the eastern empire, and even in Sicily. Roger king of Sicily says, in a diploma written in 1145, that he had renewed on parchment a charter which had been written on paper of cotton, in the year 1100, and another which was dated in the year 1112. About the same time the empress Irene, in the statutes for some religious houses at Constantinople, says that she had left three copies of the same statutes, two in parchment and one in paper from cotton. From that period this paper was still more in use through all the eastern empire; and innumerable Greek manuscripts are found written on it in all the great libraries.

This discovery happened at a time when there seems to have been a great scarcity of parchment; for it was about this period that the Greeks erased the writings of Polybius, Diodorus of Sicily, and many valuable ancient authors, for the sake of the parchment.

It was the invention of this paper of cotton which destroyed the manufacture of the paper of Egypt; for, if we may believe Eustathius, who wrote towards the end of the twelfth century, the latter paper had gone into disuse but a little before his time. We may easily believe, however, that this new invention, although of great advantage to mankind was introduced by degrees.

The manufacture of this kind of paper has flourished in the Levant for many ages, and is carried on with great success even to this day. It is not necessary to say any thing farther, than that the paper produced from cotton is extremely white, very strong, and of a fine grain.

This paper of the ancients was made from the white pellicle or inner coat found in many trees between the bark and the wood. The trees commonly in use were the maple, the plane tree, the elm, the beech, the mulberry, and most frequently the lindin tree. The ancients wrote on this inner coat after they had separated it from the bark, beat, and dried it.

The fathers Mabillon and Montfaucon speak frequently of manuscripts and diplomas written on paper made from bark; and positively distinguish it from the Egyptian paper, because it was thicker and composed of parts less adhering together.

There are many palm trees in India and America to which botanists have given the name *papyraceous*, because the natives have written with bodkins either on the leaves or the bark. Such is the American palm, called *tal* by the Indians; and of the same kind is the guajaraba of New Spain. Every palm, the bark of which is smooth, and the leaves large and thick, may be used for this purpose.

The art of making paper from vegetables reduced to stuff was known in China long before it was practised in Europe; and the Chinese have carried it to a degree of perfection hitherto unknown to the European artists. The fine paper in China is softer and smoother than that of Europe; and these qualities are admirably adapted to the pencil, which the Chinese use in writing. Several kinds of their paper discover the greatest art and ingenuity, and might be applied with much advantage to many purposes. They are capable of receiving, for example, the impression of types; and both maps and prints have been executed with success on the Chinese paper.

The different sorts of paper vary in China according to the materials of which they are composed, and to the different manner of manufacturing those materials. Every province has its peculiar paper. That of Se-chwen is made of linen rags as in Europe; that of Fo-kion, of young bamboo; that of the northern provinces, of the interior bark of the mulberry; that of the province of Kiang-nan, of the skin which is found in the webs of the silk-worm; finally, in the province of Hu-quang, the tree chu or ko-chu furnishes the materials with which they make paper.

The method of fabricating paper with the bark of different trees is nearly the same with that which is followed in the bamboo. To give an idea, therefore, of the manner of manufacturing the interior barks of the mulberry, the elm, and the cotton tree, it will be sufficient to confine our observations to the bamboo.

The bamboo is a kind of cane or hollow reed divided by knots; but larger, more elastic, and durable than any other reed.

The whole substance of the bamboo, composed of filaments, and a great abundance of fibrous materials, is employed in this operation. The shoots of one or two years, nearly the thickness of a man's leg, are preferred. They strip the leaves from the stem, cut them into pieces of four or five feet long, make them into parcels, and put them into water to macerate. As soon as they are softened, which generally happens in five days; they wash them in pure water; put them into a dry ditch: cover them with lime for some days, which they water for the purpose of slacking: they wash them carefully a second time; cut every one of the pieces into filaments, which they expose to the rays of the sun to dry and to bleach them. After this they are boiled in large kettles; and then reduced to stuff in mortars of wood, by means of a hammer with a long handle, which the workman moves with his foot.

The stuff being thus prepared, they take some shoots of

of a plant named *kateng*, which, steeped in water four or five days, is reduced to an unctuous or glutinous substance; and when they proceed to make the paper, that is mixed with the stuff in certain exact quantities, for on this mixture depends the goodness of the paper.

When the extract from the *kateng* is mixed with stuff of the bamboo, the whole mixture is beat together in mortars till it becomes a thick and viscous liquor. This is poured into large tubs or reservoirs, so exactly framed as that no part of the liquor can escape.

The workmen after this plunge their forms into the liquor; take out what is sufficient for a sheet of paper; which immediately, from the glutinous substance, becomes firm and shining; and is detached from the form by turning down the sheet on the heap of paper already made, without the interposition of pieces of woolen cloth, as in Europe.

In order to dry this paper, they have a hollow wall, the two fronts of which are smooth and extremely white. At the extremity of this wall is placed a stove, the pipes of which are carried in a circular manner through the whole empty space. The sheets of paper are laid on the surface, to which they adhere till they come over them with a soft brush; and after they are dry, it is easy to distinguish the side which received impressions from the brush from that which adhered to the wall. By means of this stove the Chinese dry their paper as fast as they can make it; but it is only in cold seasons, or in certain provinces, that they find this expedient necessary.

The Chinese paper must be dipped in a solution of alum before it can take either ink or colours. They call this operation *faner*, from the Chinese word *fan*, which signifies alum. The following is the manner of preparing this solution: Six ounces of isinglass cut very small is put into boiling water, and constantly stirred that it may dissolve equally. When the isinglass is wholly dissolved in the water, they throw in twelve ounces of calcined alum, which is also stirred till it is completely dissolved and mixed with the isinglass. This composition is afterwards poured into a large and deep basin, at the mouth of which is a little round piece of wood; the extremity of every sheet of paper is fixed in another piece of wood, with a slit made to receive it; by means of this equipage they plunge the sheet of paper into the composition of alum and isinglass; and when it is fully penetrated they draw it out, making it glide over the little round piece of wood. The long piece of wood which holds the sheet by one end, and keeps it from tearing, is afterwards suspended with it on a wall till it is sufficiently dry.

The Chinese give the paper intended for different purposes different preparations. We shall confine our observations to the silver colour which they give to some paper. They take two scruples of paste made of cows hide, one scruple of alum, and a pint of water: the whole is boiled on a slow fire till the water be evaporated. The sheets of paper are then stretched on a smooth table, and covered over with two or three layers of this paste. They take afterwards a certain quantity of talc, washed and boiled in water, with the proportion of one third of alum: this is dried, reduced

to a powder, passed through a sieve, boiled a second time in water, dried in the sun, and again passed through the sieve. This powder is spread equally over the sheets of paper, prepared as we mentioned above; and then they are dried slowly in the shade.

The sheets of paper, covered in this manner with talc, are laid upon a table, and rubbed with a little cotton; which fixes a certain quantity of the talc in the paper, and carries off the overplus to be used on another occasion. By means of this composition the Chinese draw all manner of figures on their paper.

Formerly the Chinese wrote with a bodkin of iron on tablets of bamboo; afterwards on satin with a pencil; and during the dynasty of their tyrants, about 160 years before Christ, they discovered the art of making paper.

The paper made from the bamboo is sufficiently white, soft, closely united, without the least inequality on the surface to interrupt the motion of the pencil, or to occasion the rising of the materials which compose it. Meanwhile every kind of paper made from the bamboo or the bark of trees is readier to crack than that made in Europe; besides, it is more susceptible of moisture, and sooner destroyed with dust and worms. To obviate this last inconvenience, they are obliged frequently to beat their books in China, and to expose them to the sun. It may be observed, however, that the Chinese paper, employed for various purposes in Europe, has been preserved for a long time without receiving damage either from moisture or insects.

According to Kempfer, the bark of the *morus papaverifera* <sup>Japanese</sup> *pifera sativa*, or true paper-tree, is chiefly employed for making paper in Japan. Every year after the fall of the leaves, which happens in the tenth month, corresponding to our December, the Japanese cut the young shoots of this tree into pieces of about three feet, collect them into parcels, which they boil in water into which they have cast a certain quantity of ashes. If the wood is dry, they take care to steep it 23 hours in water before it is boiled. The parcels are kept in a close copper till the bark at the extremity of the shoots is separated from the stem about half an inch; they are then cooled; and the bark alone is fit for making paper. They begin by a preparation which consists of cleaning the bark, and separating the good from the bad. For this purpose they steep it in water three or four hours; and as soon as it is softened they scrape off with a knife whatever is blackish or green, and at the same time separate the strong bark of a year's growth from the slender which covers the young shoots. The first of these gives the whitest and best paper. If there is any of the bark of more than a year's growth, it is laid aside for the coarsest.

After the bark has been culled and cleaned in this manner, it is boiled in a clear ley till the matter is of that consistency, that, being touched gently with the finger, it draws off in the form of hairs, or like a collection of fibres. During the time of boiling it is constantly stirred with a strong reed, and the waste by evaporation supplied from time to time with additional quantities of the clear ley. To make this ley, they put two pieces of wood across the mouth of a tub, cover them with straw, on which they lay a bed

of ashes a little moistened; and pouring boiling water on the ashes, the salts contained in them are carried down to the tub. This is what is called a *clear ley*.

After the bark is in the condition we have just now stated, it is washed with great care; for on this washing depends in a great measure the goodness of the paper. It is put into a kind of sieve through which the water can flow freely; and great care is taken to turn it with the hand till it is sufficiently diluted, and reduced to soft and tender fibres. For the finest paper a second washing is requisite, and a piece of cloth is used instead of a sieve.

When the bark is washed it is laid on a strong and smooth table, and beat with a kind of baton of hard wood till it is reduced to a proper consistency. It becomes indeed so soft, that it resembles paper steeped in water.

The bark prepared in this manner is put into a narrow tub, with a glutinous extract from rice and the root *oreni*, which is very viscous. These three substances, mixed together, are stirred with the reed till they form a liquor of an equal and uniform consistency. This composition is poured into tubs similar to those used for filling the forms in our paper-mills.

As soon as the sheets are made and detached from the form, they are laid in a heap on a table covered with a double mat. A small chip of cane is placed betwixt every sheet. This piece of cane jutting out, serves to distinguish the sheets and afterwards to raise them. Every one of the heaps is covered with a plate or thin board of the exact size of the paper. In proportion as the paper dries, or is able to bear it without danger of being compressed into one mass, they lay on additional weights. This pressure, intended to carry off any unnecessary moisture, is continued for 24 hours, when the sheets are suspended, by means of the little piece of reed, to long plants, in the open air, till they are completely dried.

The extract from rice is made in an unvarnished earthen pot. The pot agitated at first gently, then more briskly: new water is poured in, and then it is filtered through a linen cloth. The finishing of the process is determined by the viscosity of the substance.

The infusion of the root *oreni* is made in the following manner: The root is peeled and cut into small pieces, is infused into water for one night, during which time it communicates a viscosity sufficient for the purpose to which it is applied.

The Japanese paper is of so prodigious a strength, that the materials of which it is composed might be manufactured into ropes. There is sold at Serige, the capital city of the province of Japan of that name, a kind of it fit for bed-hangings and wearing apparel; resembling so much stuffs of wool and silk that it is often taken for them. The following is Kempfer's catalogue of trees used in Japan for the manufactory of paper. 1. The true paper-tree, called in the Japanese language *kaadsi*, Kempfer characterizes thus: *Papyrus fructu mori celsæ, sive morus. foliis urticae mortuæ cortice papifera.* 2. The false paper-tree, called by the Japanese *kaatsi ka-sire*; by Kempfer, *papyrus procumbens lætescens folio longo lanceata cortice chartaceo.* 3. The plant which the Japanese call *oreni* is named by Kempfer *alba radice viscosa flore ephemero magno pu-*

*nico.* 4. The fourth tree used for paper is the *futo-kadsura*, named by Kempfer *frutex viscosus procumbens folio telephii vulgaris amulo fructu racemoso.*

The description of these trees given more particularly by Kempfer than the limits of this work will permit, may be of great service to lead botanists to discover the European plants and shrubs adapted, like the Japanese, for the fabrication of paper.

Before finishing our reflections on this part of the subject, it will be proper to give a just idea of the attempts which have been made to increase the original materials of paper in Europe.

A slight attention to the process in China in reducing the bamboo to a paste, by a careful and ingenious analysis, and to the long and proper method of the Japanese of separating the principal fibres of the bark of the mulberry, will shew the absurdity not only of taking plants without any kind of choice, but of giving them no preparation except that of pounding them with mallets.

With a proper selection, and good principles, it appears not improbable that many of the European plants might be used with great advantage in constructing several kinds of paper.

It is evident that the materials used by the Chinese require less labour and preparation than the stuff of linen rags. The sheets of the Chinese paper are easily detached from the form; they are laid in heaps without the interposition of pieces of woollen cloth: the superfluous water is immediately discharged; and they require not, as in Europe, the vigorous action of presses to unite the parts more closely together.

The asbestos is a fibrous substance of little strength, Paper made from asbestos. the threads of which are easily broken. This substance has the peculiar quality of supporting the action of fire without receiving any damage; whence pieces of cloth and garters made of it are incombustible. From the knowledge of this property paper has been made of the asbestos. Dr Brukmann, professor at Brunswick, published the natural history of this fossil; and four copies of his book, in the library of Wolfenbottle, are on this paper.

The manner of fabricating this paper is described by M. Lloyd in the Philosophical Transactions, N° 166. A certain quantity of the asbestos is pounded in a mortar of stone till it be reduced to a substance like cotton. All the parts of earth or stone remaining in the asbestos are then taken off by means of a fine sieve, and it is formed into sheets of paper by an ordinary paper-mill. Mixing it with water reduces it to stuff; only, as it is heavier than that from linen rags, it requires to be continually stirred when they are taking it up with the frames. The only excellence of this paper is, that the writing disappears when it is cast into the fire. It must be observed, at the same time, that as it is of a slender consistency, and easily torn, it is more an object of curiosity than use.

This paper is manufactured through all Europe of Paper made from linen rags collected in the cities and in the country. This kind of paper was utterly unknown to the ancients. The *libri lintei* mentioned by Livy, I. lib. iv. Pliny, XIII. c. xi. and by other Roman writers, are demonstrated by Guilandin, in his commentary on Pliny, &c. to have been written on pieces of linen cloth, or canvasses prepared in the manner of painters.

But

But it is not sufficient to be certain that paper from linen is a modern invention; it is necessary to know by what nation, and at what period, it was discovered. Polydore Virgil, *De Inventoribus Rerum*, C. II. c. viii. confesses his ignorance of these facts. Scaliger, without any kind of proof, gives the glory to the Germans; and count Maffei to the Italians. Other writers ascribe this honour to some Greek refugees at Basil, to whom the manner of making paper from cotton in their own country had suggested the idea. Du Halde is persuaded that Europe derived this invention from the Chinese, who, in several provinces, make paper of rags nearly in the same manner that we do. But this invention was practised by the Europeans before they had any communication with China, and before the taking of Constantinople, at which time the Greek refugees were supposed to have retired to Basil. The precise time of this discovery in Europe is not exactly known. Father Mabillon believes that it was in the twelfth century; and cites a passage of Pierre de Clugny, born A. D. 1100, to prove it. The books which we read every day, says that Abbé in his treatise against the Jews, are written on sheep and calves skin; or on oriental plants; or, finally, *ex rafuris veterum pannorum*. If these last words signify paper, such as we use, there were books of it in the twelfth century. But this citation is the more to be suspected, as Montfaucon himself, after the minutest search in France and Italy, could find no book on this paper antecedent to the death of St Louis, A. D. 1270.

The epocha of this invention was not determined till 1762, M. Mierman having proposed a reward to the person who could procure the most ancient manuscript written on this kind of paper. The collection of all the memoirs sent to him along with the manuscripts was published at the Hague in 1767; and it appeared that this paper had been used in Europe before the year 1300.

In 1782 the Abbé Andrez published a work intitled *Dell' Origine, Progressi e Stato attuale d'Ogni letteratura*; wherein he speaks of the discovery of many kinds of paper, and particularly of that made of rags. The Abbé Andrez maintains, that paper made from flax was very anciently fabricated in China, and in the eastern parts of Asia; that the art of making this paper was carried from China to Persia about the year 652, and to Mecca in 706. The Arabs substituted cotton, the commodity of their own country, in place of flax, or rather bamboo. The paper of cotton was carried into Africa and Spain by the Arabs. The Spaniards, from the quantity of linen to be found in the kingdom of Valencia, seem first to have adopted the idea of using linen rags; and the most ancient paper of this kind is of Valencia and Catalonia. From Spain it passed into France, as may be learned from a letter of Joinville to St Louis about the year 1260. It is discovered to have been in Germany in 1312, and in England in 1320 and 1342. In consequence of the paper made from cotton in the Levant, the paper from linen was introduced much later into Italy. See the work of Abbé Andrez, printed at Parma, 1782, in 8vo; and Mierman's Collection, published at the Hague, 176.

SECT. I. *Art of Making Paper in Europe.*

To give a concise view of this subject, it will be necessary to proceed with all the important parts of the operation in their order.

The selection of the rags, is the arranging of them into different lots, according to their quality and to the demand of the paper-mill. In general this selection is very much neglected: The degrees of fineness and whiteness, distinguished with little care, are thought to be the only objects of importance; whereas the hardness and softness, the being more or less worn, are much more essential in this selection. It is certain, that a mixture of soft and hard rags occasions much more loss in the trituration than a difference in point of fineness or of colour. This exactness in the selection is still more necessary where cylinders are used instead of mallets. We cannot do better than to give the method practised in Holland as worthy of imitation.

They begin by a general separation of the rags into four lots; superfine, fine, middle, and coarse. These lots are given to selectors, who subdivide each of them into five chests. They have besides a bench, on which is fixed vertically a hook, and a piece of scythe which is terminated by a crooked point.

The person, for example, who has the charge of the fine lot, puts into one of the chests the hard rags, or those which are little used, into another the soft, into a third the dirty, into a fourth those which are stitched or hemmed, and, finally, into the fifth the superfine rags which happens to be among the fine.

After this process, the women who have the charge of it are at extreme pains to pick out every kind of sewing, and especially the knots of thread and the hems, by means of the hook or scythe which they have under their hands. They take care also by the same means to cut and reduce the rags exactly by the warp and the woof into small pieces. It is of great advantage to cut or tear the pieces of rags by a thread, whether it be by the warp or woof; because if it is done obliquely, many of the ends are lost in the operation.

When they have selected a certain quantity of each of these subdivisions, they are placed on an iron grate, which covers a large chest where they are beat, and otherwise turned, till the filth and dust pass through the bars of the grate and fall into the chest.

The number of lots in the selection of rags must be proportioned to the mass from which the selection is made, and to the kinds of paper produced by the mill. Some mills, the work of which is considerable, make nine lots of their rags, five of which respect the fineness, and the rest the cleanness and the colour. In ordinary mills there are only four lots, and in some two.

We have already observed, that the selection which regards the hardness of the materials is the most essential; because it is of great importance to obtain stuff composed of equal parts, and without any loss. But it is necessary to add, that the fineness and beauty of the paper depend in some cases on a selection not rigorous. Thus, for example, it is of great service to

Art of Making Paper in Europe.

allow the middle to retain some part of the fine, and the fine some part of the superfine; for without this the inferior kinds of paper can never be of great value. The most common fault is to mix the rags of the inferior lots with the superior; which, though it augments the quantity of paper, is extremely injurious to the quality. It does much better to mix part of the superior lots with the inferior. It is the want of attention to this mixture which makes some paper-mills excel in the superior sorts of paper, while the inferior kinds are of a very bad quality.

The selection of rags being made with exactness, however, and the lots being fermented and triturated separately, the mixture may be made with much greater advantage when they are both reduced to stuff: always taking care that it be in the same proportion as if it were in the state of rags, and only in the manner which we just now mentioned; for the inferior sorts gain more in beauty and quality by this mixture than is lost in stuff; whereas if the fine stuff receives a certain quantity of the inferior, the paper is more damaged in its value than increased in quantity. In this manner the interest of the manufacturer, as in all cases, is intimately connected with the goodness of his commodities.

9  
The washing and fermentation of rags.

In some mills the place for fermentation is divided into two parts, one of which serves for washing away the filth from the rags. After allowing them to steep for some time in a large stone vat, they stir them, and pour in fresh water till the impurities connected with the rags run over. When they are as clean as they possibly can be made by this kind of washing, they are laid in a heap to putrefy. In this condition they experience a degree of fermentation, which is first discovered by a mouldiness of the different pieces of cloth. Afterwards the mass grows warm; and then it is of great consequence to attend to the progress of this heat, in order to moderate its effects: for this purpose, the middle of the heap, where the fermentation is strongest, is turned out, and *vice versa*. In mills where mallets are used, the putrefaction is carried to a great height, which is frequently attended with two inconveniences. The first, is, that a part of the rags is reduced to an earthy substance, which is found in great abundance about the cutting-table, as we shall afterwards have occasion to see. But besides this waste, excessive fermentation makes the stuff incapable of sustaining the action of the mallets till it is equally pounded. A paper made from stuff too hard and too little fermented, is coarse and ill compacted; that made from rags too much fermented is composed of fibres without softness and without strength.

The second inconveniency is, that the rags turn greasy by too much fermentation, and of consequence it is very difficult to separate and reduce them by all the washings of the trituration.

We shall not describe the form of the place for fermentation, because in different paper-works these places are of different constructions: it is sufficient to say, that they are all placed in low situations and made very close. The selected rags are placed in them in heaps, and watered from time to time to bring on the fermentation. In different paper-mills they practise different methods in the putrefaction of their rags.

In certain provinces in France, they lay in the place

for putrefaction a heap equivalent to what the mill can triturate in a month. When this is equally and sufficiently moistened by means of moveable pipes, they cover it with an old heap, which has lain a month in a state of fermentation. When this old heap is exhausted by the mill, the new one becomes a covering to another, and so on. From this detail it is easy to perceive, that there must be near three weeks difference of putrefaction in the same heap, and also that in this method there is no allowance for those seasons in which the fermentation advances more rapidly.

In general the putrefaction goes on more slowly in proportion to the fineness of the rags. But when, on any occasion, it advances more rapidly than the demand from the mill, the rags are turned over and watered, to stop the fermentation and prevent the bad effects.

All the inconveniences attending the excess of putrefaction are remedied in Holland by machines which triturate the rags without having recourse to it; and their success in this manner of preparing the stuff has attracted the notice of the French artists, some of whom have adopted with advantage the Dutch machinery.

Meanwhile, it is possible to carry the method of putrefaction to much greater perfection; and several manufacturers have made attempts so well concerted, as to deserve the attention of those who study the subject.

In the neighbourhood of Brussels some paper-manufacturers, who have constructed their mills after the Dutch plan, have still found it necessary to putrefy their rags; but, at the same time, they have an excellent method for moderating the effects of this putrefaction. In the great galleries connected with the buildings of the paper-mill, they have constructed a continuation of chests, capable each of them of containing a certain quantity of rags; for example, the quantity which the cylinder can triturate in one day. The number of chests is equal to the number of days which the rags in any season require for putrefaction; and the number actually employed is greater or less according to the season. In prosecuting this plan, they lay a heap of rags in one chest, as often as they take one from another. It should also be observed, that, for the sake of the fermentation, the rags are first moistened in a large hollow stone before they are arranged into the chests.

The peculiar advantages of this method are, the equal fermentation of the rags, without any part of them being weakened; great ease in washing them; and it is even pretended, that a less degree of fermentation renders the impurities and the discoloured parts both of hemp and linen more soluble, and consequently the stuff of a purer white.

When the rags are reduced to a proper state of putrefaction, they are carried to the cutting table, which is placed on solid tressels, and inclosed on three sides to contain the rags cut on it. Before the table is fixed vertically a part of the blade of a scythe, the edge of which is turned from the operator. This workman, in a situation rather elevated, takes from the left side a handful of the putrefied rags, and arranging them the long way, gives them a gentle twist, presses the half-formed rope against the blade of the scythe, and, in the

10  
Cutting table.

Art of Making Paper in Europe.

Art of Making Paper in Europe.

11  
Mills for triturating the rags.

the manner of sawing, cuts it into three or four pieces, which he throws to the right side of the table. In this operation the rags lose part of their filth, and especially of the earthy particles occasioned by too much putrefaction.

When the rags have been submitted to all the foregoing operations, they are in a condition to be reduced into a fibrous stuff, of which the paper is made. To obtain this stuff, mills are constructed on different principles. Those which have been used for a long time over all Europe, and which by a statement in the *Encyclopédie Methodique*, published at Paris in 1789, are still used in France, are mills with mallets. But the mills invented by the Dutch, and used in the neighbouring provinces, and, excepting one instance, in every part of Great Britain, are mills with cylinders or rollers. In the former of these, the mallets are raised by notches fixed at convenient distances in a large circular beam of wood. The teeth fixed on the end of the mallet fall into a corresponding gap made the whole breadth of the plate, and the strokes are repeated till the rags are reduced to a proper consistency. On supplying the vat with water, and carrying off all the impurities, the operation is nearly similar to that in the mills with cylinders.

Such is the nature of what may be called the *old method of making paper*. It was proper to speak of this old method, because at one time, and that not very distant, it universally prevailed. That it was inferior to that now in practice, seems very evident; and that the rotting of the rags was peculiarly absurd, cannot be denied, as the paper made of fermented stuff could neither be so strong nor so durable as that which is made in the common way without putrefaction. The only kind of paper that, with any propriety, could be made from putrefied stuff, was pasteboard; but we are informed by the most intelligent paper-makers in Britain, that they seldom or never even putrefy the rags or ropes of which pasteboard is made. It will now be requisite to state the method presently in practice, with the improvements lately made in the art.

12  
The duster

The duster is made in the form of a cylinder, four and an half feet in diameter, and five feet in length. It is altogether covered with a wire net, and put in motion by its connection with some part of the machinery. A convenient quantity of rags before the selection are inclosed in the duster, and the rapidity of its motion separates the dust from them, and forces it through the wire. It is of considerable advantage to use the duster before selection, as it makes that operation less pernicious to the selectors.

The selection is performed much in the same manner as we have already described; only it is found more convenient to have the tables for cutting off the knots and stitching, and for forming them into a proper shape, in the same place with the cutting table. The surface both of these and of the cutting table is composed of a wire net, which in every part of the operation allows the remaining dust and refuse of every kind to escape.

The rags, without any kind of putrefaction, are again carried from the cutting table back to the duster, and from thence to the engine, where, in general, they are in the space of six hours reduced to the stuff proper for making paper. The hard and soft of the same qua-

lity are placed in different lots; but they can be reduced to stuff at the same time, provided the soft be put somewhat later into the engine.

The engine is that part of the mill which performs the whole action of reducing the rags to paste, or, as it may be termed, of trituration. The number of the engines depend on the extent of the paper-work, on the force of water, or on the construction of the machinery.

It will afford a sufficient idea of the work, to give in detail a description of the different parts of the engine. See Plate CCCLXXVI. Figure 1. represents the chapter which covers the roller. It is four feet three inches in length, and two feet eight inches in breadth. The superior part is pierced with two openings running crosswise, 1, 2, 3, 4, into which enter the chasses or wicker-frames, figures 6. and 7.; the first, made of wire cloth, enters into the opening 3 and 4; the second, made of hair-cloth, and strengthened with several cross-bars of wood, enters into the opening 1, 2, serves to retain the small pieces of rags which escape through the first, and prevents them from falling into the dakt or hole-scupper, fig. 2. This hole-scupper is placed across the vat of the engine, parallel to the axle of the roller; the part *g* enters into the notch *c* of the chapter; and the extremity *b* enters into the opening *k* of the tunnel *kl* (fig. 3.), by which means the water dashed through the wicker-frames by every revolution of the roller, is precipitated into the canal *gh*, and loses itself below the engine. The figures 4, 9, and 10. represent the roller in perspective, in plane, and in profile. It is two feet in diameter, and two feet three inches in length. The trundle head *A* is 16 inches in diameter, about half as much in length, and furnished with seven spindles of iron, which are screwed to the end of the trundle head, made also of iron. The teeth or blades of the roller are 27 in number, and fitted strongly into the wood which composes its body, parallel to its axis. They are of that thickness as to leave as much empty space as they occupy. The exterior face of each of the blades should be made round, and divided into two parts, with a longitudinal motion, as in the profile: *aaa*, fig. 10.

The axis *AB* of the roller (fig. 4. and 9.) has two parts perfectly rounded in *A* and in *B*, which perform the office of pivots. These pivots rest in the sockets *A* and *B* (fig. 8.) in the middle of the levers *OAH* and *OBH*. It is by means of these levers that they raise at pleasure, or lower the axis of the roller, and fit it exactly, and in a parallel manner, to the plate. The plates (see fig. 5.) are made of steel cut into channels, in such a manner as to correspond with the blades of the roller. Their channels are not perpendicular, but oblique; and there are two rows of them, *bx*, *xd*, consisting of seven or eight blades each on one plate.—Those in *bx*, for the purpose of changing the plate, lie in an opposite direction to those in *xd*. The levers are kept in their position near the vat by bands of iron, *MN* and *mn*; between which they are made higher or lower by the cogged wheel *H*, which supports one of the extremities. Wedges *Nn* are likewise employed to fix the levers at a convenient height above the plates. Finally, every vat is supplied with a small slide-door, which is occasionally raised to carry the

Working of the engine.

the prepared stuff by means of the scuppers of wood to the general repositories.

Fig. 5. is placed in the vat fig. 8.; the roller (fig. 4) is placed above it in such a manner that the pivots rest in the sockets of the levers; the scupper (fig. 2.) and the chapter are disposed in the manner abovementioned. The vat is charged with a proper quantity of rags, and fresh water is admitted by a spigot placed at one of the corners. In this situation, when the engine is put in motion, the roller turning upon its axis draws the water and the rags by the least inclined plane, and making them pass between its blades and the channels of the plate, dashes them against the chapter and the wicker-frames; and, in short, part of them falls back into the vat, and returns into the circulation. The cause of this circulation is evidently the continual void occasioned by the movement of the roller on the one side, and the return of the water and the stuff on the other.

As all the rags are not thrown towards the part Bd of the chapter, from whence they might fall back into the vat, but a part of them to a greater distance; it is necessary to have the wicker-frames formerly described, not only to prevent their loss, but to allow the dirty water to escape. The spigot at the corner of the vat continually supplies this waste of water. This operation would be sufficient to whiten the rags, although the rollers were raised considerably from the plate; and therefore the force and action of the rollers reducing them to stuff must be much more effectual. It requires great skill to conduct the engine, whether it be with regard to the first quantity, to the proper time for adding the softer rags, to the augmenting or diminishing the water in proportion to the trituration; or, finally, to knowing exactly when the stuff is reduced to a proper consistency.

In the paper-manufactory at Montargis, it was attempted to introduce rollers of the greatest strength and the least weight possible, in order to give them the greater rapidity; but the experiment did not succeed: the rollers of prodigious rapidity were found to produce stuff neither in greater quantity nor of superior quality. The most experienced artists have established a proportion between the motion of the roller and the greater or less resistance of the rags. And the Dutch, who have arrived at a very great perfection in this art, have followed a method totally different from that practised at Montargis. A roller in Holland complete in all its parts weighs nearly 30 hundred weight; and they find this necessary for cutting the rags, especially if they have not been putrefied. In proportioning the rapidity to the resistance, they have also discovered, that a slow motion is preferable to a rapid one. The rollers at Saardom, by calculation made from the different parts of the machinery, make about 68 revolutions in a minute; those at Montargis about 166.—In Holland, too, this trituration of the rags is divided into two distinct operations, performed by rollers constructed on different principles: the first of them, for cutting the rags and preparing for the other, is furnished with blades of steel without any moisture, and with a considerable space between them; the second, intended to reduce the stuff to the proper consistency, has a greater number of blades, composed of a mixture

of brass and copper. The mills with rollers are in every respect superior to those formerly in use with mallets. Two Dutch rollers of the construction we have just now described will prepare as much stuff in the same time as 24 mallets; they require infinitely less room; they do it without putrefaction, and as they do it in less time, and with less water, they occasion much less waste of the stuff.

When the stuff is brought to perfection, it is conveyed into a general repository, which supplies the vat from which the sheets of paper are formed. This vat is made of wood, and generally about five feet in diameter, and two and an half in depth. It is kept in temperature by means of a grate introduced by a hole, and surrounded on the inside of the vat with a case of copper. For fuel to this grate, they use charcoal or wood; and, frequently, to prevent smoke, the wall of that building comes in contact with one part of the vat, and the fire has no communication with the place where they make the paper.

Every vat is furnished on the upper part with planks, inclosed inwards, and even railed in with wood, to prevent any of the stuff from running over in the operation. Across the vat is a plank which they call the *trapan*, pierced with holes at one of the extremities, and resting on the planks which surround the vat.

The forms or moulds are composed of wire-cloth, and a moveable frame. It is with these that they fetch up the stuff from the vat, in order to form the sheets of paper. The sides of the form are made of oak, which is previously steeped in water, and otherwise prepared to prevent warping. The wire-cloth is made larger than the sheet of paper, and the excess of it on all sides is covered with a moveable frame. This frame is necessary to retain the stuff of which the paper is made on the cloth; and it must be exactly adapted to the form, otherwise the edges of the paper will be ragged and badly finished. The wire-cloth of the form is varied in proportion to the fineness of the paper and the nature of the stuff.

The felts are pieces of woollen cloth spread over every sheet of paper, and upon which the sheets are laid, to detach them from the form, to prevent them from adhering together, to imbibe part of the water with which the stuff is charged, and to transmit the whole of it when placed under the action of the press. The two sides of the felt are differently raised: that of which the hair is longest is applied to the sheets which are laid down; and any alteration of this disposition would produce a change in the texture of the paper. The stuff of which the felts are made should be sufficiently strong, in order that it may be stretched exactly on the sheets without forming into folds; and, at the same time, sufficiently pliant to yield in every direction without injury to the wet paper. As the felts have to resist the reiterated efforts of the press, it appears necessary that the wrap be very strong, of combed wool, and well twisted. On the other hand, as they have to imbibe a certain quantity of water, and to return it, it is necessary that the wool be of carded wool, and drawn out into a slack thread.—These are the utensils, together with the press, which are used in the apartment where the sheets of paper are formed.

The vat being furnished with a sufficient quantity of stuff

Art of Making Paper in Europe.

stuff and of water, two instruments are employed to mix them; the one of which is a simple pole, and the other a pole armed with a piece of board, rounded and full of holes. This operation is repeat as often as the stuff falls to the bottom. In the principal writing mills in England, they use for this purpose what is called a *hog*, which is a machine within the vat that, by means of a small wheel on the outside, is made to turn constantly round, and keep the stuff in perpetual motion. When the stuff and water are properly mixed, it is easy to perceive whether the previous operations have been complete. When the stuff floats close, and in regular flakes, it is a proof that it has been well triturated; and the parts of the rags which have escaped the rollers also appear.

After this operation the workman takes one of the forms, furnished with its frame, by the middle of the short sides, and fixing the frame round the wire cloth with his thumbs, he plunges it obliquely four or five inches into the vat, beginning by the long side, which is nearest to him. after the immersion he raises it to a level: by these movements he fetches up on the form a sufficient quantity of stuff; and as soon as the form is raised the water escapes through the wire-cloth, and the superfluity of the stuff over the sides of the frame. The fibrous parts of the stuff arrange themselves regularly on the wire-cloth of the form, not only in proportion as the water escapes, but also as the workman favours this effect by gently shaking the form. Afterwards, having placed the form on a piece of board, the workman takes off the frame or deckle, and glides this form towards the coucher; who, having previously laid his felt, places it with his left hand in an inclined situation, on a plank fixed on the edge of the vat and full of holes. During this operation the workman applies his frame, and begins a second sheet. The coucher siezes this instant, takes with his left hand the form, now sufficiently dry, and laying the sheet of paper upon the felt, returns the form by gliding it along the trapan of the vat.

They proceed in this manner, laying alternately a sheet and a felt, till they have made six quires of paper, which is called a *post*; and this they do with such swiftness, that, in many sorts of paper, two men make upwards of 20 posts in a day. When the last sheet of the post is covered with the last felt, the workmen about the vat unite together and submit the whole heap to the action of the press. They begin at first to press it with a middling lever, and afterwards with a lever of about fifteen feet in length. After this operation another person separates the sheets of paper from the felts, laying them in a heap; and several of these heaps collected together are again put under the press.

The stuff which forms a sheet of paper is received, as we have already said, on a form made of wire-cloth, which is more or less fine in proportion to the stuff, and surrounded with a wooden frame, and supported in the middle by many cross bars of wood. In consequence of this construction, it is easy to perceive, that the sheet of paper will take and preserve the impressions of all the pieces which compose the form, and of the empty spaces between them.

The traces of the wire-cloth are evidently perceived on the side of the sheet which was attached to the

form and on the opposite side they form an assemblage of parallel and rounded risings. As in the paper which is most highly finished the regularity of these impressions is still visible, it is evident that all the operations to which it is submitted have chiefly in view to soften these impressions without destroying them. It is of consequence, therefore, to attend to the combination of labour which operates on these impressions. The coucher, in turning the form on the felt, flattens a little the rounded eminences which are in relieve on one of the surfaces, and occasions at the same time the hollow places made by the wire-cloth to be partly filled up. Meanwhile the effort which is made in detaching the form, produces an infinite number of small hairs in every protuberant part of the sheet.

Under the action of the press, first with the felts and then without them, the perfecting of the grain of paper still goes on. The vestiges of the protuberances made by the wires are altogether flattened, and of consequence the hollows opposite to them disappear also; but the traces formed by the interstices of the wire, in consequence of their thickness, appear on both sides, and are rounded by the press.

The risings traced on each side of the paper, and which can be discovered by the eye on that which is most highly finished, form what is called the *grain of paper*. The different operations ought to soften but not destroy it; which is effectually done by employing the hammer. This grain appears in the Dutch paper; which is a sufficient proof, that though they have brought this part of the art to the greatest perfection, they have not employed hammers, but more simple and ingenious means. The grain of paper is often disfigured by the felts when they are too much used, or when the wool does not cover the thread. In this case, when the paper is submitted to the press, it takes the additional traces of the warp and the wool, and composes a surface extremely irregular.

The paper, the grain of which is highly softened, is much fitter for the purposes of writing than that which is smoothed by the hammer: on the other hand, a coarse and unequal grain very much opposes the movements of the pen; as that which is beat renders them very uncertain. The art of making paper, therefore, should consist in preserving, and at the same time, in highly softening, the grain: the Dutch have carried this to the highest perfection.

The exchange succeeds the operation last described. It is conducted in a hall contiguous to the vat, supplied with several presses, and with a long table. The workman arranges on this table the paper newly fabricated, into heaps; each heap containing eight or ten of those last under the press, kept separate by a woollen felt. The press is large enough to receive two of them at once, placed the one at the other's side. When the compression is judged sufficient, the heaps of paper are carried back to the table, and the whole turned sheet by sheet, in such a manner that the surface of every sheet is exposed to a new one; and in this situation they are again brought under the press. It is in conducting these two operations sometimes to four or five times, or as often as the nature of the paper requires, that the perfection of the Dutch plan consists. If the stuff be fine, or the paper slender, the exchange is less frequently repeated. In this operation.

Art of Making Paper in Europe.

operation it is necessary to alter the situation of the heaps, with regard to one another, every time they are put under the press; and also, as the heaps are highest toward the middle, to place small pieces of felt at the extremities, in order to bring every part of them under an equal pressure. A single man with four or five presses may exchange all the paper produced by two vats, provided the previous pressing at the vats be well performed. The work of the exchange generally lasts about two days on a given quantity of paper.

When the paper has undergone these operations, it is not only softened in the surface, but better felted, and rendered more pliant in the anterior parts of the stuff. In short, a great part of the water which it had imbibed in the operation of the vat is dissipated. By the felting of paper is understood the approximation of the fibres of the stuff, and their adhering more closely together. The paper is felted in proportion as the water escapes; and this effect is produced by the management and reiterated action of the press. Were it not for the gradual operation of the press, the paper would be porous and composed of filaments adhering closely together. The superiority of the Dutch over the French paper depends almost entirely on this operation.

If the sheets of paper are found to adhere together, it is a proof that the business of the press has been badly conducted. To avoid this inconveniency, it is necessary to bring down the press at first gently, and by degrees with greater force, and to raise it as suddenly as possible. By this means the water, which is impelled to the sides of the heaps, and which has not yet escaped, returns to the centre; the sheets are equally dry, and the operation executed without difficulty.

According to the state of dryness in which the paper is found when it comes from the apartment of the vat, it is either pressed before or after the first exchange. The operation of the press should be reiterated and managed with great care; otherwise, in the soft state of the paper, there is a danger that its grain and transparency be totally destroyed. Another essential principal to the success of the exchange is, that the grain of the paper be originally well raised. For this purpose the wire-cloth of the Dutch forms is composed of a rounder wire than those used in France, by which they gain the greatest degree of transparency, and are in no danger of destroying the grain. Besides this, the Dutch take care to proportion the wires even where the forms are equal to the thickness of the paper.

Almost every kind of paper is considerably improved by the exchange, and receives a degree of perfection which renders it more agreeable in the use. But it is necessary to observe at the same time, that all papers are not equally susceptible of this melioration; on the contrary, if the stuff be unequal, dry, or weakened by the destruction of the fine parts, it acquires nothing of that lustre and softness, and appearance of velvet, which the exchange gives to stuff properly prepared.

18 The sheds for drying the paper are in the neighbourhood of the paper-mill; and are furnished with a vast number of cords, on which they hang the sheets

both before and after the sizing. The sheds are furnished with moveable lattices, to admit a quantity of air sufficient for drying the paper. The cords of the shed are stretched as much as possible; and the paper, four or five sheets of it together, is placed on them by means of a wooden instrument resembling a pick-ax. The principal difficulty in drying the paper, consists in gradually admitting the external air, and in preventing the cords from imbibing moisture. With regard to the first of these, the Dutch use very low sheds, and construct their lattices with great exactness. By this means the Dutch paper is dried equally, and is extremely supple before the sizing. They prevent the cords from imbibing the water by covering them with wax. In using such cords, the moisture does not continue in the line of contact between the paper and the cord, which prevents the sheet from stretching in that particular place by its weight, and from the folds which the moisture in the subsequent operations might occasion. The Dutch also employ cords of considerable thickness, and place fewer of them under the sheets; by which means they diminish the points of contact, and give a freer and more equal circulation to the air.

19 The size for paper is made of the shreds and pairings got from the tanners, curriers, and parchment-makers. All the putrefied parts and the lime are carefully separated from them, and they are inclosed into a kind of basket, and let down by a rope and pulley into the cauldron. This is a late invention, and serves two valuable purposes. It makes it easy to draw out the pieces of leather when the size is extracted from them by boiling, or easy to return them into the boiler if the operation be not complete. When the substance is sufficiently extracted, it is allowed to settle for some time; and it is twice filtered before it is put into the vessel into which they dip the paper.

Immediately before the operation, a certain quantity of alum is added to the size. The workman takes a handful of the sheets, smoothed and rendered as supple as possible, in his left hand, dips them into the vessel, and holds them separate with his right, that they may equally imbibe the size. After holding them above the vessel for a short space of time, he seizes on the other side with his right hand, and again dips them into the vessel. When he has finished ten or a dozen of these handfuls, they are submitted to the action of the press. The superfluous size is carried back to the vessel by means of a small pipe. The vessel in which the paper is sized is made of copper, and furnished with a grate, to give the size when necessary a due temperature; and a piece of thin board or felt is placed between every handful as they are laid on the table of the press.

The Dutch are very careful in sizing their paper to have every sheet in the same handful of equal dryness; because it is found that the dry sheets imbibe the size more slowly than those which retain some degree of moisture. They begin by selecting the *pages* in the drying-house; and after having made them supple, and having destroyed the adherence between the sheets, they separate them into handfuls in proportion to the dryness, each of them containing that number which they can dip at one time. Besides this precaution, they take care to apply two sheets of brown paper of

an

Art of Making Paper in Europe.

an equal size to every handful. This brown paper, firm, solid, and already sized, is of use to support the sheets.

As soon as the paper is sized, it is the practice of some papermills to carry it immediately to the drying house, and hang it before it cools sheet by sheet on the cords. The paper, unless particular attention be paid to the lattices of the drying-house, is apt to dry too fast, whereby a great part of the size goes off in evaporation; or, if too slow, it falls to the ground. The Dutch drying-houses are the best to prevent these inconveniences:—But the exchange after the sizing, which is generally practised in Holland, is the best remedy. They begin this operation on the handfuls of paper, either while they are still hot, or otherwise as they find it convenient. But, after the exchange, they are careful to allow the heaps to be altogether cold before they are submitted to the pres. Without this precaution, the size would either be wholly squeezed out by the pres of the exchange, or the surface of the paper become very irregular. It is of consequence that the paper, still warm from the sizing, grow gradually firm, under the operation of the exchange, in proportion as it cools. By this method it receives that varnish which is afterwards brought to perfection under the pres, and in which the excellency of the paper either for writing or drawing chiefly consists. It is in consequence of the exchanging and pressing that the Dutch paper is soft and equal, and that the size penetrates into the body of it, and is extended equally over its surface.

The exchange after the sizing ought to be conducted with the greatest skill and attention, because the grain of the paper then receives impressions which can never be eradicated. When the sized paper is also exchanged, it is possible to hang more sheets together on the cords of the drying house. The paper dries better in this condition, and the size is preserved without any sensible waste, because the sheets of paper mutually prevent the rapid operation of the external air. And as the size has already penetrated into the paper, and is fixed on the surface the insensible progress of a well conducted drying house renders all the good effects more perfect in proportion as it is slowly dried.

If to these considerations be added the damage done to the paper in drying it immediately after the pres of the sizing room, whether it be done in raising the hairs by separating the sheets, or in cracking the surface, it is evident that the trouble of the second exchange is infinitely overpaid by the advantage.

When the paper is sufficiently dry, it is carried to the finishing room, where it is pressed, selected, examined, folded, made up into quires, and finally into reams.—It is here put twice under the pres; first, when it is at its full size, and secondly, after it is folded.

The principal labour of this place consists in assorting the paper into different lots, according to its quality and faults; after which it is made up into quires. The person who does this must possess great skill, and be capable of great attention, because he acts as a check on those who separated the paper into different lots. He takes the sheets with his right hand, folds them, examines them, lays them over his left arm till he has the number requisite for a quire, brings the sides parallel to one another, and places them in heaps under the table. An expert workman, if proper care

has been taken in assorting the lots, will finish in this manner near 600 quires in a day.

The paper is afterwards collected into reams of 20 quires each, and for the last time put under the pres, where it is continued for 10 or 12 hours, or as long as the demand of the paper-mill will permit.

A method has lately been discovered of bleaching the rags or stuff, which will undoubtedly be adopted everywhere in the preparation of writing paper, provided the expence of the process be not too great. This discovery was made by Scheele, M. Berthollet, and M. Chaptal. The first of these illustrious writers communicated to the Swedish Academy of Sciences an Essay on Manganese, containing a numerous series of experiments, intended to investigate the nature and properties of that substance. Among these experiments were several which pointed out a new state of the muriatic acid, or the acid distilled from sea-salt, otherwise known under the name of the *acid* or *spirit of sea-salt*. This state of the muriatic acid was produced by Mr Scheele, in consequence of putting the said acid into a retort or distilling vessel, along with the abovementioned substance called *manganese*, and distilling over the acid into a proper receiver; it was found to have changed its nature and properties in a very remarkable manner, while at the same time the *manganese* remaining in the retort had suffered a very material alteration.

To the new state of the acid thus produced, in consequence of certain theoretic ideas which Mr Scheele entertained respecting the mutual action of the original muriatic acid and the manganese on each other during the process of distillation, he gave the name of *dephlogisticated muriatic acid*. Since the time of this original discovery, in consequence of certain changes which have occurred in the theory or philosophy of chemistry, this new state of the acid of sea-salt has been called the *oxygenated muriatic acid*. Among many other properties of it discovered by Mr Scheele, the most remarkable was, that it destroyed the colour of every vegetable substance which was exposed to its action; or, in other words, it bleached them: or, in the language of the dyers, it discharged their colours; that is to say, whatever happened to be the colour of any vegetable body that was submitted to the action of the oxygenated or dephlogisticated muriatic acid, it always became white, or lost its colouring matter.

In the year 1786, Dr Bedoes, now professor of chemistry in the university of Oxford, published an English translation of the Chemical Essays of Mr Scheele; and thereby made known to the chemists of great Britain the power of the oxygenated or dephlogisticated muriatic acid, to bleach or whiten vegetable substances, or to discharge or decompose their colours. But M. Berthollet, a celebrated chemist in France, and one of the members of the Academy of Sciences at Paris, appears to have been the first who thought of rendering the above recited discovery subservient to the purposes of manufacture.

In 1789, he published in the *Annales de Chimie* an essay calculated entirely for the use of manufacturers, by being divested of theoretic discussions; of which the title is, "Method of bleaching linen or cotton cloths, threads, and yarns, by means of oxygenated muriatic acid, and of some other properties of that liquor which may be useful in manufactures."

Art of Making Paper in Europe.

21  
A new method of bleaching the rags or stuff.

20  
Of the finishing room.

Art of Making Paper in Europe.

In the same work, and in the same year, M. Chaptal, another French chemist, published an account of some experiments, in which, among many other applications of the oxygenated muriatic acid to purposes useful in the æconomical arts, he gives information of having bleached or whitened coarse rags used by the paper makers, so as greatly to improve the quality of the paper into which they were afterwards manufactured. His preparation of this bleaching liquor differs not from Berthollet's, which is as follows: "Take six ounces of manganese and sixteen ounces of sea-salt, both reduced to a fine powder; mix these accurately, and introduce them into a retort or distilling vessel: Then take twelve ounces of oil of vitriol, and eight ounces of water, mixed together and allowed to cool; add these to the other ingredients in the retort, and connect the retort with a cask or receiver capable of holding twenty seven gallons and a half of water, but only containing twenty five gallons, which is to be impregnated with the gas or vapour of the oxygenated muriatic acid; and proceed to distillation, first without and afterwards with a fire gradually raised, till the whole acid comes over."

Experiments have been made with this liquor both by some of the principal paper makers in the neighbourhood of Edinburgh and by Messrs Clement and George Taylors of Maidstone in Kent. By the former it was found, that paper made of rags and pulp whitened in this manner, was superior to any other made of similar materials, not only in colour but in fineness of texture. By the latter, the excellence of the liquor was found to be so great, that probably having never heard of Scheele, Berthollet, and Chaptal, and conceiving themselves to be the first inventors of it, they obtained a patent for its exclusive use, which other manufacturers will doubtless disregard. It is not to be concealed, however, that, even with all the precautions which can possibly be taken at first, various circumstances of imperfection must necessarily remain to be removed by means of farther experience, both in the perfection of the bleaching process and the æconomy of its application to use; but for the attaining of this experience a short time will rarely be sufficient.

## SECT. II. *Of the different Kinds of Paper.*

<sup>22</sup>  
Writing paper.

THE paper proper for writing should be without knots, without any parts of the stuff not triturated, without folds, and without wrinkles, of a supple texture, its grain uniform and regular, softened in the exchange, and not destroyed by smoothing. The ground of this paper must be extremely white, or shaded with a very light blue, which adds to its natural splendor. It is of great importance that it be fully and equally sized, otherwise the writing cannot be well finished, and the turnings of the letters will be very imperfect. This paper should be made from stuff not putrefied, which takes a better grain, receives more benefit from the exchange, is more equally sized, and finally, is less subject to folds and wrinkles in the different operations. To make paper peculiarly fit for durable writing, Dr Lewis recommends the impregnation of it with astringent materials. "It is observable (says he) that writings first begin to fade or change their

<sup>23</sup>  
For durable writing.

colour on the back of the paper, where the larger strokes have sunk in, or are visible thro' it; as if part of the irony matter of the vitriol was in a more subtle or dissolved state than the rest, and sunk further, on account of its not being fully disengaged from the acid, or sufficiently combined with the astringent matter, of the galls. Hence, it should seem probable, that if the paper was impregnated with astringent matter, the colour of the ink would be more durable. To see how far this notion was well founded, I dipt some paper in an infusion of galls; and, when dry, repeated the dipping a second and third time. On the paper thus prepared, and some that was unprepared, I wrote with different inks; several of which, that the effects might be more sensible, had an over-proportion of vitriol. The writings being exposed to the weather till the best of the inks on the unprepared paper had faded and changed their colour, those on the prepared paper were all found to retain their blackness. It is therefore recommended to the consideration of the paper-makers, whether a particular kind of paper might not be prepared for those uses where the long duration of the writing is of principal importance, by impregnating it with galls or other astringents, in some of the operations it passes through before it receives the glazing; as for instance, by using an astringent infusion instead of common water, in the last operation, when the matter is reduced into a pulp for being formed into sheets. The brownish hue which the paper receives from the galling, would not perhaps be any great obstacle to its use; and, if the proposal should be thought worthy of being carried into execution, further inquiries may possibly discover the means of obviating the imperfection, and communicating astringency without colour."

Different kinds of Paper.

The paper used for drawing, or for coloured maps, is in some mills made from one kind of white stuff, either fine or middling; in others from a mixture of three or four kinds of stuff of different colours. The Dutch were not long ago almost wholly in possession of this manufacture. The same qualities are necessary in this paper as in that for writing. The grain, however, must be a little more raised, although softened by the exchange; for, without this grain, the pencil would leave with difficulty the traces of the objects. Great care is also necessary in the sizing of this paper, that the drawing be neatly performed, and also that the sinking of the ink or colours into the irregularities of the stuff be prevented.

<sup>24</sup>  
Paper fit for drawing, or for coloured maps.

This paper is also made in greatest perfection by stuffs not rotted. These take a more even gloss, and are in better condition to receive all the impressions of the painter. It is also necessary that furniture paper be well softened, and submitted to the exchange, to take more exactly the outlines of the figures. The French have carried this part of the manufacture of paper to the highest state of perfection.

<sup>25</sup>  
Of furniture paper.

The British and Dutch have had the greatest success in manufacturing pasteboard, which they make either from a single mass of stuff on the form, or from a collection of several sheets pasted together. In both cases, the sheets of pasteboard are made of stuff not rotted, and triturated with rollers furnished with blades of well tempered steel. By the operation of the exchange, and smoothing continued for a long time, the

<sup>26</sup>  
Pasteboard used in the manufacture of woollen cloth.

British

Different kinds of Paper.

British and Dutch obtain solid and smooth stuffs, which neither break under the folds of cloth nor adhere to them. The stuffs not putrefied have another advantage in this species of pasteboard, namely, that of resisting the action of heat, which they experience between the folds of cloth, without wasting or tarnishing, and of consequence they may be used for a long time.

27  
Printing paper.

In England they have at least equalled any other nation in the manufacture of this paper; and even in Scotland they have arrived to such a degree of perfection in this art, that great part of what they manufacture is sent into England. It requires to be made of a soft and equal stuff, without folds or wrinkles, of a natural whiteness, and with a shade of blue. It must be sized less strongly than writing paper, but sufficiently well to give neatness to the characters. This paper, thus properly prepared, yields easily to the printing-press, and takes a sufficient quantity of ink. The stuff must be without grease, and wrought with that degree of slowness as to make it spread equally over the form, and take a neat and regular grain; without this the characters will not be equally marked in every part of the page; and the smallest quantity of grease renders the sizing unequal and imperfect. Some artists with considerable success, both to meliorate the grain, and to reduce the inequalities of the surface, have submitted this paper to the exchange. And it is proper to add, that a moderate degree of exchanging and of pressing may be of great service after the sheets are printed, to destroy the hollow places occasioned by the press, and the relieve of the letters.

28  
Paper for engraving.

Engraving requires a paper of the same qualities with the last mentioned, with respect to the stuff, which must be pure, without knots, and equally reduced; the grain uniform, and the sheets without folds or wrinkles. To preserve the grain, it is necessary that it be dried slowly in the lowest place of the drying-house. If it is submitted to the exchange, the effects of it must be moderated with the greatest care, and the action of the two first presses must be equally distributed over the whole mass, otherwise the inequality of the moisture at the middle and sides will expose it to wrinkles in the drying. The sizing of this paper must also be moderate. These circumstances are necessary to make it receive with neatness all the soft and delicate touches of the plate.—The soft and yielding paper of Auvergne possesses all those advantages; and accordingly a great quantity of this and of printing paper were formerly imported into Britain and Holland from France, where they still continue to rot the materials from which they make engraving paper. The wire wove frame, though but lately invented, is, we are told, peculiarly adapted to this kind of paper.

29  
Paper for cards or any kind of painting on a smooth surface.

Paper for cards must be manufactured from a pretty firm stuff, in order to take that degree of smoothness which makes the cards glide easily over one another in using. For this reason the cardmakers reject every kind of paper which is soft and without strength. This paper requires to be very much sized, since the sizing holds the place of varnish, to which the smoothing gives a glazed and shining surface. To answer all these purposes, the rags require to be a little rotted, and the mallets strongly armed with iron studs. At present Angoumois is almost the only province in

France which sells card-paper to the Dutch and the other northern nations. The rags of Angoumois have the peculiar quality of not turning too soft in the putrefaction, and the mills of that province reduce them to stuff though they be not much putrefied. The French, we believe, excel every other nation in this branch of the manufacture of paper.

Miscellaneous Observations on Paper.

SECT. III. Miscellaneous Observations on Paper.

To hinder paper from sinking, take about the size of a nut of rock alum, dissolve it in a glass of clear water, and apply it to the paper, which has not been sufficiently sized, with a fine sponge. It is in this manner that the paper-manufacturers of Paris prepare the paper for drawing called *papiers laves*. When there is occasion to write on a printed book, or on paper too fresh, it is sufficient to mix a little gum with ordinary ink.

30  
To preserve paper from sinking.

To give to writing paper a brilliant varnish, take that which is of an ordinary fineness, very smooth, without any kind of stain or hairs on its surface; stretch it on a smooth plank, and by means of a hare's foot cover it with a thin and equal layer of sandarac finely powdered. Afterwards, if a whole ream is to be varnished, take eight ounces of rock alum and one ounce of white sugar candy; bring them to boil in six pints of water; and when the liquor is lukewarm, wet that side of the sheet which has been covered with the sandarac with a fine sponge; lay the sheets in a heap, one sheet exactly above another; and submit the ream to the press for the space of twelve hours: hang them afterwards sheet by sheet on the cords of the drying-house; put them again under the press for some days to stretch them; and finally, beat them with a book-binder's mallet. This paper can only be used for three or four months after it is prepared.

31  
Paper varnished for writing.

Painters prepare their paper for drawing, and give it a dark ground, which spares them much labour of the pencil afterwards in those places where shade is necessary. For this purpose, they take white paper and pass a sponge over it, which has imbibed water impregnated with soot, leaving the light places to be formed afterwards. They use also a kind of paper for drawing, which is called tainted paper. A light colour is passed over the whole ground, which deprives the paper of its original brightness, and makes the light places of the print appear more in relieve, and more luminous.

32  
Paper prepared for drawing.

The method most common and most convenient for copying a print, is to use oiled paper. The manner of preparing this paper is to take that which is thin and smooth, known commonly by the name of *serpent paper*, and moisten it with a composition, of two parts of the oil of walnuts and one part of the oil of turpentine mixed well together. A sheet of pasteboard and a sheet of paper are laid on a smooth table; above them are placed two sheets of paper to be prepared; and a layer of the oil applied to the uppermost is sufficient to penetrate both. This may be done to any number of sheets, and a strong sheet of pasteboard is placed over the whole. The heap is afterwards submitted to the press, under which it remains for two or three days till the oil be completely dry. Paper prepared in this manner serves to copy very readily and

43  
Paper prepared for copying a print.

Miscellaneous Observations on Paper.

34  
Incombustible paper.

exactly all kinds of figures and plans: because being altogether transparent, all the parts of the drawing, whether of light or shade, are easily distinguished.

Besides the paper made from the asbestos, it is necessary for wrapping up gunpowder and valuable writings, to have a paper that will not easily take fire. The manner in which this is prepared is extremely simple. Ordinary paper is dipped into boiling liquid, consisting of three-fourths of water and one fourth of dissolved alum. This salt, which is not inflammable, covers the surface of the paper, and renders it in some measure incombustible.

35  
A method of erasing ink from paper.

In the season of verjuice, a little of it diluted with water is sufficient for obliterating any fresh spot of ink. The salt of the verjuice dissolved in water answers the purpose equally well, and the salt of the forrel is also employed, though with less effect. If the spots be dry, and the above acids are insufficient to eradicate them, a little aquafortis diluted in water and applied with the feather of a quill or a fine hair pencil, will make them entirely disappear.

36  
A method for taking oil stains out of paper.

Books and manuscripts are sometimes defaced by accidental stains with oil. To remove such blemishes, burn sheeps bones and reduce them to a fine powder; lay a quantity of this powder on each side of the stain; place it between two sheets of white paper, and submit it for twelve hours to the press. If the stains have not disappeared it will be necessary to reiterate the process.

37  
A method of making oiled paper take colours.

To make oiled papers take colours; mix with the colours a very small quantity either of the gall of a pike or carp; and as these substances are of the nature of soap, they dissolve the grease that is in the paper, and permit the colours to be spread over the surface.

38  
To make emery paper.

Emery paper, which is employed for taking the rust from iron without wasting it, is made by impregnating coarse paper with gummed water or any other tenacious substance, and then covering it over with the finest emery.

39  
Staining or colouring of paper.

The colours proper for paper are not different from those used for other substances, and are enumerated under the article *Colour-Making*. They are applied with soft brushes, after being tempered to a due degree with size or gum water. If the paper on which they are to be laid is soft, so that the colours are apt to go through, it must also be sized before they are laid on, or a proportionably larger quantity must be used along with the colours themselves. If a considerable extent of the paper is to be done over with one colour, it must receive several coatings, as thin as possible, letting each coat dry before another is put on, otherwise the colour will be unequal.

40  
To gild paper.

Take yellow ochre, grind it with rain-water, and lay a ground with it upon the paper all over; when dry, take the white of eggs, beat it clear with white sugar-candy, and strike it all over: then lay on the leaf-gold; and when dry polish it with a tooth. Some take saffron, boil it in water, and dissolve a little gum with it; then they strike it over the paper, lay on the gold; and, when dry, they polish it.

41  
To silver paper after the Chinese method without silver.

Take two scruples of clear glue made of neats leather, one scruple of white alum, and half a pint of clear water; simmer the whole over a slow fire, till the water is consumed, or the steam ceases: Then, your sheets of paper being laid on a smooth table, you dip

a pretty large pencil into that glue, and daub it over as even as you can, repeating this two or three times: then sift the powder of talc through a fine sieve, made of horse-hair or gauze, over it; and then hang it up to dry; and, when dry, rub off the superfluous talc, which serves again for the same purpose. The talc you prepare in the following manner: Take fine white transparent Muscovy talc; boil it in clear water for four hours; then take it off the fire and let it stand so for two days: then take it out, wash it well, and put it into a linen rag, and beat it to pieces with a mallet: to 10 pounds of talc add 3 pounds of white alum, and grind them together in a little hand-mill; sift it through a gauze-sieve; and being thus reduced to a powder, put it into water, and just boil it up: then let it sink to the bottom, pour off the water from it, place the powder in the sun to dry, and it will become a hard consistence. This beat in a mortar to an impalpable powder, and keep it for the use above-mentioned, free from dust.

The common grounds laid in water are made by mixing whiting with the common glovers size, and laying it on the paper with a proper brush in the most even manner. This is all that is required, where the ground is to be left white; and the paper being then hung on a proper frame till it be dry, is fit to be painted. When coloured grounds are required, the same method must be pursued, and the ground of whiting first laid; except in pale-colours, such as straw-colours or pink, where a second coating may sometimes be spared, by mixing some strong colour with the whiting.

There are three methods by which paper-hangings are painted; the first by *printing* on the colours; the second by using the *stencil*; and the third by laying them on with a *pencil*, as in other kinds of painting.

When the colours are laid on by printing, the impression is made by wooden prints; which are cut in such manner, that the figure to be expressed is made to project from the surface by cutting away all the other part; and this being charged with the colours tempered with their proper vehicle, by letting it gently down on a block on which the colour is previously spread, conveys it from thence to the ground of the paper, on which it is made to fall more forcibly by means of its weight, and the effort of the arm of the person who uses the print. It is easy to conclude, that there must be as many separate prints as there are colours to be printed. But where there are more than one, great care must be taken, after the first to let the print fall exactly on the same part of the paper as that which went before; otherwise the figure of the design would be brought into irregularity and confusion. In common paper of low price, it is usual, therefore, to print only the outlines, and lay on the rest of the colours by stencilling; which both saves the expence of cutting more prints, and can be practised by common workmen, not requiring the great care and dexterity necessary to the using several prints.

The manner of *stencilling* the colours is this. The figure, which all the parts of any particular colour make in the design to be painted, is to be cut out, in a piece of thin leather or oil-cloth, which pieces of leather or oil-cloth are called *stencils*; and being laid flat on the sheets

Miscellaneous Observations on Paper.

42  
White and coloured grounds for paper hangings.

43  
Method of painting the paper hangings.

Miscellaneous Observations on Paper.

sheets of paper to be printed, spread on a table or floor, are to be rubbed over with the colour, properly tempered by means of a large brush. The colour passing over the whole is consequently spread in those parts of the paper where the cloth or leather is cut away, and give the same effect as if laid on by a print. This is nevertheless only practicable in parts where there are only detached masses or spots of colours: for where there are small continued lines, or parts that run one into another, it is difficult to preserve the connection or continuity of the parts of the cloth, or to keep the smaller corners close down to the paper; and therefore, in such cases, prints are preferable. Stencilling is indeed a cheaper method of ridding coarse work than printing; but without such extraordinary attention and trouble as render it equally difficult with printing, it is far less beautiful and exact in the effect. For the outline of the spots of colour want that sharpness and regularity that are given by prints, besides the frequent extralineations, or deviations from the just figure, which happens by the original misplacing of the stencils, or the shifting the place of them during the operation.

*Pencilling* is only used in the case of nicer work, such as the better imitations of the India paper. It is performed in the same manner as other paintings in water or varnish. It is sometimes used only to fill the outlines already formed by printing, where the price of the colour, or the exactness of the manner in which it is required to be laid on, render the stencilling or printing it less proper; at other times, it is used for forming or delineating some parts of the design, where a spirit of freedom and variety, not to be had in printed outlines, are desired to be had in the work.

The paper designed for receiving the flock is first prepared with a varnish-ground with some proper colour, or by that of the paper itself. It is frequently

practised to print some Mosaic, or other small running figure in colours, on the ground, before the flock be laid on; and it may be done with any pigment of the colour desired, tempered with varnish, and laid on by a print cut corresponding to that end.

The method of laying on the flock is this. A wooden print being cut, as is above described, for laying on the colour in such manner that the part of the design which is intended for the flock may project beyond the rest of the surface, the varnish is put on a block covered with leather or oil-cloth, and the print is to be used also in the same manner, to lay the varnish on all the parts where the flock is to be fixed. The sheet, thus prepared by the varnished impression, is then to be removed to another block or table and to be strewn over with flock; which is afterwards to be gently compressed by a board, or some other flat body, to make the varnish take the better hold of it: and then the sheet is to be hung on a frame till the varnish be perfectly dry; at which time the superfluous part of flock is to be brushed off by a soft camel's-hair brush; and the proper flock will be found to adhere in a very strong manner.

The method of preparing the flock is, by cutting woollen-rags or pieces of cloth with the hand, by means of a large bill or chopping knife; or by means of a machine worked by a horse-mill.

There is a kind of counterfeit flock-paper, which, when well managed, has very much the same effect to the eye as the real, though done with less expence. The manner of making this sort is, by laying a ground of varnish on the paper; and having afterwards printed the design of the flock in varnish, in the same manner as for the true; instead of the flock, some pigment, or dry colour, of the same hue with the flock required by the design, but somewhat of a darker shade, being well powdered is strewn on the printed varnish, and produces nearly the same appearance.

Miscellaneous Observations on Paper.

44  
Management of the flock paper.

## P A P

## P A P

Paper-Money.

*PAPER-Money* is a term frequently made use of for bank-bills, which pass currently in trade instead of gold and silver.

Concerning this species of currency, the national utility of which has been controverted by some, we have the following observations in Dr Smith's Treatise on the Wealth of Nations: "The substitution of paper in the room of gold and silver money replaces a very expensive instrument of commerce with one much less costly, and sometimes equally convenient. Circulation comes to be carried on by a new wheel, which it costs less both to erect and maintain than the old one.

"When the people of any particular country have such confidence in the fortune, probity, and prudence of a particular banker, as to believe that he is always ready to pay upon demand such of his promissory notes as are likely at any time to be presented to him, those notes come to have the same currency as gold and silver money, from the confidence that such money can at any time he had for them.

"A particular banker lends among his customers his own promissory notes, to the amount we shall sup-

pose, of 100,000*l*. As those notes serve all the purposes of money, his debtors pay him the same interest as if he had lent them so much money. This interest is the source of his gain. Though some of those notes are continually coming back upon him for payment, part of them continue to circulate for months and years together. Though he has generally in circulation, therefore, notes to the amount of 100,000*l*. 20,000*l*. in gold and silver, may frequently be a sufficient provision for answering occasional demands. By this operation, therefore, 20,000*l*. in gold and silver perform all the functions which 100,000*l*. could otherwise have performed. Eighty thousand pounds of gold and silver can therefore, in this manner, be spared from the circulation of the country; and if different operations of the same kind should at the same time be carried on by many different banks and bankers, the whole circulation may be thus conducted with a fifth part only of the gold and silver.

"Let us suppose for example, that the whole circulating money of some particular country amounted, at a particular time, to 1,000,000*l*. sterling, that sum being

Paper-Money.

being then sufficient for circulating the whole annual produce of their land and labour. Let us suppose too, that, some time thereafter, different banks and bankers issued promissory notes, payable to the bearer, to the extent of 1,000,000*l.* reserving in their different coffers 200,000*l.* for answering occasional demands. There would remain, therefore, in circulation 800,000*l.* in gold and silver, and 1,000,000*l.* of bank notes, or 1,800,000*l.* of paper and money together. But the annual produce of the land and labour of the country had before required only 1,000,000*l.* to circulate and distribute it to its proper consumers, and that annual produce cannot be immediately augmented by those operations of banking. One million, therefore, will be sufficient to circulate it after them. The goods to be bought and sold being precisely the same as before, the same quantity of money will be sufficient for buying and selling them. The channel of circulation, if I may be allowed such an expression, will remain precisely the same as before. One million we have supposed sufficient to fill that channel. Whatever, therefore, is poured into it beyond this sum, cannot run in it, but must overflow. One million eight hundred thousand pounds are poured into it. Eight hundred thousand pounds, therefore, must overflow, that sum being over and above what can be employed in the circulation of the country. But though this sum cannot be employed at home, it is too valuable to be allowed to lie idle. It will therefore be sent abroad, in order to seek that profitable employment which it cannot find at home. But the paper cannot go abroad; because, at a distance from the banks which issue it, and from the country in which payment of it can be exacted by law, it will not be received in common payments. Gold and silver, therefore, to the amount of 800,000*l.* will be sent abroad, and the channel of home circulation still remain filled with 1,000,000*l.* of paper instead of 1,000,000*l.* of those metals which filled it before.

“But though so great a quantity of gold and silver is thus sent abroad, we must not imagine that it is sent abroad for nothing, or that its proprietors make a present of it to foreign nations. They will exchange it for foreign goods of some kind or another, in order to supply the consumption either of some other foreign country or of their own.

“If they employ it in purchasing goods in one foreign country in order to supply the consumption of another, or in what is called the *carrying trade*, whatever profit they make will be an addition to the neat revenue of their own country. It is like a new fund, created for carrying on a new trade; domestic business being now transacted by paper, and the gold and silver being converted into a fund for this new trade.

“If they employ it in purchasing foreign goods for home-consumption, they may either first purchase such goods as are likely to be consumed by idle people who produce nothing, such as foreign wines, foreign silks, &c.; or, secondly, they may purchase an additional stock of materials, tools, and provisions, in order to employ an additional number of industrious people, who reproduce, with a profit, the value of their annual consumption.

“So far as it is employed in the first way, it promotes prodigality, increases expence and consumption,

without increasing production, or establishing any permanent fund for supporting that expence, and is in every respect hurtful to the society.

“So far as it is employed in the second way, it promotes industry; and though it increases the consumption of the society, it provides a permanent fund for supporting that consumption, the people who consume, reproducing with a profit, the whole value of their annual consumption. The gross revenue of the society, the annual produce of their land and labour, is increased by the whole value which the labour of those workmen adds to the materials upon which they are employed; and their neat revenue by what remains of this value, after deducting what is necessary for supporting the tools and instruments of their trade.

“That the greater part of the gold and silver which, being forced abroad by those operations of banking, is employed in purchasing foreign goods for home consumption, is and must be employed for purchasing those of this second kind, seems not only probable, but almost unavoidable. Though some particular men may sometimes increase their expence very considerably, though their revenue does not increase at all, we may be assured that no class or order of men ever does so; because, though the principles of common prudence do not always govern the conduct of every individual, they always influence that of the majority of every class or order. But the revenue of idle people, considered as a class or order, cannot in the smallest degree be increased by those operations of banking. Their expence in general, therefore, cannot be much increased by them, though that of a few individuals among them may, and in reality sometimes is. The demand of idle people, therefore, for foreign goods, being the same, or very nearly the same, as before, a very small part of the money, which being forced abroad by those operations of banking, is employed in purchasing foreign goods for home-consumption, is likely to be employed in purchasing those for their use. The greater part of it will naturally be destined for the employment of industry, and not for the maintenance of idleness.

“When we compute the quantity of industry which the circulating capital of any society can employ, we must always have regard to those parts of it only which consist in provisions, materials, and finished work: the other, which consists in money, and which serves only to circulate those three must always be deducted. In order to put industry into motion, three things are requisite; materials to work upon, tools to work with, and the wages or recompence for the sake of which the work is done. Money is neither a material to work upon, nor a tool to work with; and though the wages of the workman are commonly paid to him in money, his real revenue, like that of all other men, consists, not in the money, but in the money's worth; not in the metal pieces, but in what can be got for them.

“The quantity of industry which any capital can employ, must evidently be equal to the number of workmen whom it can supply with materials, tools, and a maintenance suitable to the nature of the work. Money may be requisite for purchasing the materials and tools of the work, as well as the maintenance of the workmen. But the quantity of industry which the whole capital can employ, is certainly not equal both

Paper-  
Money.

to the money which purchases, and to the materials, tools, and maintenance, which are purchased with it; but only to one or other of those two values, and to the latter more properly than to the former.

“When paper is substituted in the room of gold and silver money, the quantity of the materials, tools, and maintenance, which the whole circulating capital can supply, may be increased by the whole value of gold and silver which used to be employed in purchasing them. The whole value of the great wheel of circulation and distribution is added to the goods which are circulated and distributed by means of it. The operation, in some measure, resembles that of the undertaker of some great work, who in consequence of some improvement in mechanics, takes down his old machinery, and adds the difference between its price and that of the new to his circulating capital, to the fund from which he furnishes materials and wages to his workmen.

“What the proportion is which the circulating money of any country bears to the whole value of the annual produce circulated by means of it, is perhaps impossible to determine. It has been computed by different authors at a fifth, at a tenth, at a twentieth, and at a thirtieth part of that value. But how small soever the proportion which the circulating money may bear to the whole value of the annual produce, as but a part, and frequently but a small part, of that produce, is ever destined for the maintenance of industry, it must always bear a very considerable proportion to that part. When, therefore, by the substitution of paper, the gold and silver necessary for circulation is reduced to perhaps a fifth part of the former quantity, if the value of only the greater part of the other four-fifths be added to the funds which are destined for the maintenance of industry, it must make a very considerable addition to the quantity of that industry, and consequently to the value of the annual produce of land and labour.

“That part of his capital which a dealer is obliged to keep by him unemployed, for answering occasional demands, is so much dead stock, producing nothing either to him or to his country. The judicious operations of banking enable him to make it active and productive. The gold and silver money which circulates in any country, and by means of which the produce of its land and labour is annually circulated and distributed to the proper consumers, is, in the same manner as the ready money of the dealer, all dead stock.—It is a very valuable part of the capital of the country, which produces nothing to the country. The judicious operations of banking, by substituting paper in the room of a great part of it, enables the country to make a great part of this dead stock active and productive. The gold and silver money which circulates in any country, may very properly be compared to a highway, which while it circulates and carries to market all the grains and corn of the country, produces itself not a single pile of either. The judicious operations of banking, by providing, if I may be allowed so violent a metaphor, a sort of waggon-way through the air, enable the country to convert, as it were, a great part of its highways into good pastures and cornfields, and thereby to increase very considerably the annual produce of its land and labour. The commerce and

industry of the country, however, it must be acknowledged, though they may be somewhat augmented, cannot be altogether so secure, when they are thus, as it were, suspended upon the Dædalian wings of paper-money, as when they travel about upon the solid ground of gold and silver.

“The whole paper-money of every kind which can easily circulate in any country, never can exceed the value of the gold and silver, of which it supplies the place, or which (the commerce being supposed the same) would circulate there if there was no paper-money. If twenty-shilling notes, for example, are the lowest paper-money current in Scotland, the whole of that currency, which can easily circulate there, cannot exceed the sum of gold and silver which would be necessary for transacting the annual exchanges of twenty-shillings value and upwards usually transacted within that country. Should the circulating paper at any time exceed that sum, as the excess could neither be sent abroad, nor be employed in the circulation of the country, it must immediately return upon the banks to be exchanged for gold and silver. Many people would immediately perceive that they had more of this paper than was necessary for transacting their business at home, and as they could not send it abroad, they would immediately demand payment of it from the banks. When this superfluous paper was converted into gold and silver, they could easily find a use for it by sending it abroad; but they could find none while it remained in the shape of paper. There would immediately therefore, be a run upon the banks to the whole extent of this superfluous paper, and if they showed any difficulty or backwardness in payment, to a much greater extent; the alarm which this would occasion necessarily increasing the run.” See BANK and TRADE.

*PAPER OFFICE*, an office in the palace of Whitehall, in which all the public writings, matters of state and council, proclamations, letters, intelligences, negotiations abroad, and generally all dispatches that pass through the offices of the secretaries of state, are lodged, by way of library.

*PAPIER MACHE*. This is a substance made of cuttings of white or brown paper, boiled in water, and beaten in a mortar, till they are reduced into a kind of paste, and then boiled with a solution of gum arabic or of size, to give tenacity to the paste, which is afterwards formed into different toys, &c. by pressing it into oiled moulds. When dry, it is done over with a mixture of size and lamp-black, and afterwards varnished. The black varnish for these toys, according to Dr Lewis, is prepared as follows: Some colophony, or turpentine boiled down till it becomes black and friable, is melted in a glazed earthen vessel, and thrice as much amber in fine powder sprinkled in by degrees, with the addition of a little spirit or oil of turpentine now and then: when the amber is melted, sprinkle in the same quantity of sarcocolla, continuing to stir them, and to add more spirit of turpentine, till the whole becomes fluid; then strain out the clear through a coarse hair-bag, pressing it gently between hot boards. This varnish, mixed with ivory-black in fine powder, is applied, in a hot room, on the dried paper paste; which is then set in a gently heated oven, next day in a hotter oven, and the third day in

Paper-

Papier.

a very

Paphlago-  
nia,  
Paphos.

a very hot one, and let stand each time till the oven grows cold. The paste thus varnished is hard, durable, glossy, and bears liquors hot or cold.

**PAPHLAGONIA** (anc. geog.), a country of the Hither Asia, beginning at Parthenius, a river of Bithynia, on the west, and extending in length to the Halys eastward, with the Euxine to the north, and Galatia to the south. Pliny enlarges the limits on the west side to the river Billis, on this side the Parthenius. It is called *Pylamenia* by some (Pliny). *Paphlagonians*, the people, mentioned by Homer, and therefore of no small antiquity. A superstitious and silly people (Lucian); a brave people (Homer); taking their name from Phaleg (Bocchart).

**PAPHOS** (anc. geog.), two adjoining islands on the west side of the island of Cyprus; the one called *Hale Paphos* (Strabo, Ptolemy, Pliny); the other *Nea Paphos*; and when mentioned without an adjunct, this latter is always understood. Both dedicated to Venus, and left undistinguished by the poets (Virgil, Horace). Hence Venus is surnamed *Paphia*, *Paphii* the people, (Coins, Scephanus). It was restored by Augustus, after a shock of an earthquake, and called *Augusta* (Dio).

The Abbé Mariti, in his Travels through Cyprus, gives the following account of the island of Paphos. 'It is situated (says he) on the southern side: it contained the celebrated temple of Venus; which, together with the city, was destroyed by an earthquake, so that the least vestige of it is not now to be seen. A lake in the neighbourhood, which even in summer overflows with stagnant and corrupted water, renders the air in some degree unwholesome. On the western coast is the new Paphos, called by some of the modern geographers *Baffos*; a name which is unknown in the island of Cyprus. That we may not positively ascribe to the latter every thing that history tells us of Paphos in general, it may not be here improper to mention that it has been several times destroyed. This city had a port, where vessels trading upon that coast still cast anchor: but this happens only in summer; for, being exposed to every wind, it is extremely dangerous. The bottom of it is full of sharp rocks; which sometimes destroy the cables so much, that mariners are obliged to keep them afloat on the surface of the water, by means of empty casks fixed to them at certain distances. In the neighbourhood there are two castles; one on the borders of the sea, and the other on the summit of a little hill: but the latter is at present in ruins. The government of Paphos consists of a digdaban or commissary; a cadi; and an aga, who presides over the customhouse. Of all the Christian edifices, there is none remaining but the church of St George, in which service is performed by the Greek ministers. The productions of this part of the island, which are all of an excellent quality, are silk, barley, and other kinds of grain. To discover the origin of the old and new Paphos, would be carrying light into the midst of the thickest darkness. When we have added conjecture to conjecture, we are still in the same situation. As this is an attempt superior to my abilities, I shall leave it to the divining, though uncertain, knowledge of our antiquaries. I must, however, observe, that there was here formerly a temple dedicated to Venus, which was entirely destroyed by an

Paphos  
Papilio.

earthquake. In this island St Paul by his eloquence converted Sergius, a Roman proconsul. He here likewise conferred the deaconship on his disciple and colleague Titus, who soon after suffered martyrdom. Paphos was an episcopal city in the time of the Lufignans: and it is still the seat of a bishop, who is a suffragan to the archbishop of Nicosia. On the western side of the island there are a great number of scattered villages; but they are not worthy of notice, being either abandoned or in ruins."

Mr Bruce informs us, that in the neighbourhood of this place many silver medals of excellent workmanship are dug up; they are, however, but of little estimation among the antiquarians, being chiefly of towns of the size of those found at Crete and Rhodes, and in all the islands of the Archipelago. There are some excellent Greek Intaglios: generally upon better stones than usual in the islands. This illustrious traveller informs us, that he has seen some heads of Jupiter, remarkable for bushy hair and beard, which were of excellent workmanship, and worthy of any price. All the inhabitants of the island are subject to fevers, but especially those in the neighbourhood of Paphos. The same traveller observes, that Cyprus was very long undiscovered; for though ships had been sailing on the Mediterranean 1700 years before Christ, and though the island is only a day's sailing from the continent of Asia on the north and east, and little more from that of Africa on the south, it was not known at the building of Tyre, a little before the Trojan war, that is, 500 years after the neighbouring seas had been navigated. It was covered with wood at its first discovery; and our author is of opinion, that it was not well known even at the time of building of Solomon's temple; because we do not find that Hiram king of Tyre, though just in its neighbourhood, ever had recourse to it for wood: though the carriage would undoubtedly have been easier from thence, than to have brought it down from the top of Mount Lebanon. Eratosthenes informs us, that in ancient times the island was so overgrown with wood, that it could not be tilled; so that they first cut down the timber to be used in the furnaces for melting silver and copper; that after this they built fleets with it: but finding even this insufficient, they gave liberty to all strangers to cut it down for whatever purpose they pleased; and not only so, but they gave them afterwards the property of the ground they had cleared. Matters are now quite altered; and the want of wood is a principal complaint in most parts of the island. About Acamas, however, on the west side of the island, the wood is still thick and impervious, inhabited by large stags and wild boars of a monstrous size. Mr Bruce was informed, that a live elephant had lately been seen there, but gave no credit to the account.

**PAPIAS**, bishop of Hieropolis, a city of Phrygia, was the disciple of St John the Evangelist, and the companion of Polycarp, as St Jerome observes, and not of John the Ancient, as some other authors have maintained. He composed a work in five books, intitled *Expositions of the Discourses of our Lord*, of which there are only some fragments now remaining. He it was who introduced the opinion of the Millennarians.

**PAPILIO**, the BUTTERFLY; in zoology, a genus of insects belonging to the order of lepidoptera. It has

Papilio.

has four wings, imbricated with a kind of downy scales: the tongue is convoluted in a spiral form; and the body is hairy. The antennæ grow thicker towards their extremity, and are in most subjects terminated by a kind of capitulum or head. The wings, when sitting, are erect, inasmuch that their extremities meet or touch one another above the body. They fly in the day-time. There are 273 species, principally distinguished by the colour of their wings. Mr Barbut has divided them into four sections, which he thus characterizes, 1. The equites, or riders, the upper wings being longer from the hindmost angle to the point than to the base: their antennæ are often filiform. They are divided into Trojans; which for the most part are black, with blood-like spots on the breast: and Greeks, whose breast has no such marks; the small eye being placed at the angle of the anus; and of these some are without bands or fillets; others with bands or fillets. 2. The heliconians, whose wings are narrow throughout, often bare; the upper oblong, the under ones very short. 3. The Danaï, whose wings are entire; the candidi, with whitish wings; the festivi, with variegated wings. 4. The nymphals, whose wings are denticulated: divided into the gemmati, whose wings have eyes; subdivided into those which have eyes on all the wings; those which have them on the upper wings; those which have them on the under ones; and the phalerati, whose wings are without eyes. 5. The plebeians, whose larva is often contracted: divided into the rurales, with darkish spots on their wings; and the urbicolæ, with spots generally transparent on their wings.

Barbut on  
Insects.

The beauties of this elegant part of the creation are well known; and there are few who can contemplate them without astonishment. We have the following account of their various stages of existence in Barbut\*. "The caterpillar (says he) informs us in what manner it prepares for the lethargic sleep, which is to serve as a transition to its metamorphosis. The period of its reptile life being accomplished, it changes its form to become an inhabitant of the air. The chrysalis is at once the tomb of the caterpillar and the cradle of the butterfly. It is within a silken cod, or under a transparent veil, that this great miracle of nature is daily wrought. But how does the weak defenceless butterfly, scarce unfolded into existence, go about to make its way through the impenetrable walls that preserved it from insult during its torpid state? How will it bear the effulgence of the light, and keenness of the air? Take one of their cods, make an aperture in it with a pair of scissors, fix it against a glass, observe the insect, you will perceive the organs gradually displaying themselves: follow his operation with your eye; he struggles to break loose from his confinement. Observe the frothy liquor which it disgorges; that liquor serves to soften the end of the cod, which at length yields to the butting of the insect's head. By degrees the bar is removed, and the butterfly springs forth; the impression of the air acts upon its wings, slightly apparent at first, but which afterwards expand with remarkable rapidity. The display of them is sometimes checked by drought, in which case the insect is deprived of the faculty of flying. The rostrum, extended under the covering of the chrysalis, is in this last state rolled up into a spiral, and lodged in a recess

\* Ibid.

prepared for it. The fly is now perfectly formed; it gently flutters, then takes its flight, and pursues its mazy wanderings over the enamelled meads, plunging its rostrum into the cups of nectareous flowers."

Papilio.

Plate

CCCLXXIV.

Of papilio N<sup>o</sup> 1, Barbut gives the following account. "The ground colour of the insect is a beautiful glossy black, the superior wings are ornamented with white forked clouds; the inferior ones are adorned with spots of a blood-colour, those nearest the extremities being of a lunular form, and are indented, terminating in an extended tail, and are edged with white. The apex, or crown of the head, is tipped with the same red colour which encircles the shoulders, and terminates the abdomen the space of about five rings."

Of N<sup>o</sup> 2. he speaks thus: "The form of the wings resembles the preceding insects. They are beautifully variegated with black and yellow; the inferior ones terminate in a tail, and, according to the character of the section, are adorned with an eye of a yellowish red colour, encircled with blue, which is situated at the edge, nearest the extremity of the abdomen. This is the largest, and one of the most beautiful insects England produces. The caterpillar is large and smooth, of a bright green colour, with transversal bands, of a deep glossy purple upon every ring, which bands are enriched with yellow spots; it feeds on wild fennel and other umbelliferous plants; changes into the chrysalis in July, assumes the winged state in August, and frequents meadows. It sometimes appears in May."

And of N<sup>o</sup> 3. we have this account: "The peacock, or peacock's eye, is easily known by the peacock's eyes which it bears above, four in number, one upon each wing, which has given it the name it has. Its wings, very angulous, are black underneath; above they are of a reddish dun colour. The upper ones have on their superior edge two black oblong spots, with a yellow one between the two. At their extremity is found the eye, large, reddish in the middle, surrounded with a yellow circle, accompanied by a small portion of blue towards the exterior side. On that same side, following the direction of the margin, there are five or six white spots, set in order. The inferior wings are browner, and have each a large eye of a very dark blue in the middle, surrounded by an ash-colour circle. The caterpillar of this butterfly is of a deep black, dotted with a little white."

We cannot conclude this article without noticing some very singular species; of which Mr Reaumur has given an account, and which deserve particular regard.

One species of these he has called the *bundle of dry leaves*. This, when it is in a state of rest, has wholly the appearance of a little cluster of the decayed leaves of some herb. The position and colour of its wings greatly favour this resemblance, and they have very large ribs; wholly like those of the leaves of plants, and are indented in the same manner at their edges as the leaves of many plants are. This seems to point out the care of nature for the animal, and frequently may preserve it from birds, &c.

The skull butterfly is another singular species, so called from its head resembling in some degree a death's head or human skull. This very remarkable appearance is terrible to many people; but it has another yet greater singularity attending it, which is,

Papilio  
||  
Papinian.

that, when frightened, it has a mournful and harsh voice. This appeared the more surprising to Mr Reaumur, as no other known butterfly had any the least voice at all; and he was not ready of belief that it was a real voice. but suspected the noise, like that of the cicada, to be owing to the attrition of some part of the body; and, in fine, he, by great pains, discovered that this noise was not truly vocal, but was made by a hard and brisk rubbing of the trunk against two other hard bodies between which it is placed.

Another butterfly there is, so small that it might be mistaken for a small fly. This is certainly the extreme in degree of size of all the known butterflies, and cannot but have been proportionably small in the state of a caterpillar and chrysalis; this creature spends its whole life in all the three stages of caterpillar, chrysalis, and butterfly, on the leaf of the calendine. It lives on the under side of the leaf; and though in the caterpillar state it feeds on it, yet it does no damage. It does not eat the substance of the leaf, but draws from it only a fine juice, which is soon repaired again, without occasioning any change in the appearance of the leaf. This species is very short-lived; and passes through its three states in so short a time, that there are frequently ten generations of it in one year; whereas, in all the other butterflies, two generations in the year are all that are to be had. These two generations are sufficient to make a prodigious increase; in a large garden, if there are twenty caterpillars in spring, these may be overlooked, and there may be easily concluded to be none there, even on a narrow search; but if these twenty caterpillars afterwards become twenty butterflies, ten of which are male and ten female, and each female lay the same number of eggs that the common silk-worm does, that is, four hundred; if all the caterpillars hatched of these become butterflies, and these lay eggs in the same proportion, which remain the winter, and come to be hatched in the succeeding spring; then from these twenty, in only one year, you will have eight hundred thousand; and if we add to this the increase of these in a succeeding year, the account must appear terrible, and such as no art could guard against. The great Ruler of the world has put so many hindrances in the way of this over-abundant production, that it is very rare such years of destruction happen. Some such have happened, however, and much mischief has been dreaded from them, not only from their eating all the herbage, but from themselves being eaten with herbs in salads and otherwise; but experiments have proven this to be an erroneous opinion, and they are found to be innocent, and eatable as snails or oysters.

**PAPILIONACEOUS**, among botanists, an appellation given to the flowers of plants belonging to various classes, from their resembling the wings of a butterfly.

**PAPINIAN**, a celebrated Roman lawyer of the third century, under the Emperor Severus; who had so high an opinion of his worth, that he recommended his sons Caracalla and Geta to his care. Caracalla having first murdered his brother, ordered Papinian to compose a discourse to excuse this murder to the senate and people; which when he refused to undertake, the brutal emperor ordered him to be beheaded; and his body was dragged through the streets of Rome. Pa-

pinian wrote several treatises in the line of his profession.

**PAPISTS**, are those who believe the pope or bishop of Rome to be the supreme pastor of the universal church, who profess to believe all the articles of pope Pius's creed, and who promise implicit obedience to the edicts of the church, especially the decrees of the council of Trent. See **POPE** and **TRENT**.

**PAPPENHEIM**, a town of Germany, in the circle of Franconia, and capital of a county of the same name, with a castle where the counts reside. It is seated near the river Altmal, 17 miles north-west of Neuberg, and 32 south of Nuremberg; is subject to its own count. E. Long. 10. 51. N. Lat. 48. 58. The count of Pappenheim is hereditary marshal of the empire, and performs his office at the coronation of the emperor.

**PAPPUS**, an eminent philosopher of Alexandria, said by Suidas to have flourished under the Emperor Theodosius the Great, who reigned from A. D. 379 to 395. His writings show him to have been a consummate mathematician: Many of them are lost; the rest continued long in manuscript, detached parts having only been occasionally published in the last century, until Carolus Manoleffius published his remains entire at Bologna in 1660, in folio.

**PAPPUS**, in botany, a soft downy substance that grows on the seeds of certain plants, as thistles, hawkweed, &c. serving to scatter and buoy them up in the air.

**PAPYRUS**, the famous reed from which was made the far-famed paper of Egypt. Before entering on the description of the papyrus, it is natural to say a word or two on the opinion generally received in Europe concerning the loss of this plant. Supposing this loss possible, the date of it must be fixed at no distant period; for it is not 200 years since Guilandin and Prosper Alpin observed the papyrus on the banks of the Nile. Guilandin saw the inhabitants of the country eating the inferior and succulent part of the stem in the manner of the ancients; a fact which alone shows it to be the papyrus, and of which other travellers seem not to have availed themselves. This practice, together with those related by Prosper Alpin, are sufficient to convince us, that this plant is not wholly useless, although it is not now employed in the fabrication of paper. The alteration on the soil of Egypt, and on the methods of agriculture, have in all probability rendered this plant less common; but causes altogether local could not occasion the destruction of the papyrus, especially as its residence in the marshes would prevent their operation. But it is needless to reason from probabilities or analogy: Mr Bruce not only saw the papyrus growing both in Egypt and Abyssinia, but actually made paper of it in the manner in which it was made by the ancients. He tells us likewise, that, so far from any part of its being useless, the whole plant is at this day used in Abyssinia for making boats, a piece of the acacia tree being put in the bottom to serve as a keel. That such were the boats of ancient Egypt, we know from the testimony of Pliny, who informs us that the plants were first sewed together, and then gathered up at stem and stern, and tied fast to the keel: "Conferitur bibula Memphitis cymba papyro."

Papists.  
||  
Papyrus.

Papyrus.  
Appendix  
to Bruce's  
Travels,

"The bottom, root, or woody part of this plant, was likewise of several uses before it turned absolutely hard; it was chewed in the manner of liquorice, having a considerable quantity of sweet juice in it. This we learn from Dioscorides; it was, I suppose, chewed, and the sweetness sucked out in the same manner as is done with sugar-cane. This is still practised in Abyssinia, where they likewise chew the root of the Indian corn, and of every kind of cyperus; and Herodotus tells us, that about a cubit of the lower part of the stalk was cut off, and roasted over the fire, and eaten.

"From the scarcity of wood, which was very great in Egypt, this lower part was likewise used in making cups, moulds, and other necessary utensils: we need not doubt, too, one use of the woody part of this plant was, to serve for what we call *boards* or *covers* for binding the leaves, which were made of the bark; we know that this was anciently one use of it, both from Alceus and Anacreon."

The papyrus, says Pliny, grows in the marshes of Egypt, or in the stagnant places of the Nile, made by the flowing of that river, provided they are not beyond the depth of two cubits. Its roots are tortuous, and in thickness about four or five inches; its stem is triangular, rising to the height of ten cubits. Prosper Alpin gives it about six or seven cubits above the water; the stem tapers from the bottom, and terminates in a point. Theophrastus adds, that the papyrus carries a top or plume of small hairs, which is the thyrsus of Pliny. Guilandin informs us, that its roots throw to the right and left a great number of small fibres, which support the plant against the violence of the wind, and against the waters of the Nile. According to him, the leaves of the plant are obtuse, and like the typha of the marshes. Mr Bruce, on the other hand, assures us, that it never could have existed in the Nile,

"Its head (says he) is too heavy; and in a plain country the wind must have had too violent a hold of it. The stalk is small and feeble, and withal too tall; the root too short and slender to stay it against the violent pressure of the wind and current; therefore I do constantly believe it never could be a plant growing in the river Nile itself, or in any very deep or rapid river;" but in the calishes or places where the Nile had overflowed and was stagnant.

The Egyptians made of this plant paper fit for writing (see PAPER), which they call *βιβλος* or *philuria*, and also *χαρτις*, and hence the Latin *charta*; for in general the word *charta* is used for the paper of Egypt.

The papyrus was produced in so great quantities on the banks of the Nile, that Cassiodorus (lib. xi. 38.) compares it to a forest. There, says he, rises to the view, this forest without branches, this thicket without leaves, this harvest of the waters, this ornament of the marshes. Prosper Alpin is the first who gives us a plate of the papyrus, which the Egyptians call *berdi*. However badly this may be executed, it corresponds in some degree with the description of the plant mentioned by Theophrastus; but by much the best drawing of it has been given by Mr Bruce, who has very obligingly permitted us to give a copy of it. See Plate CCCLXXV.

The ancient botanists placed the papyrus among the graminous plants or dog-grass; ignorant of the

particular kind to which it belonged, they were contented to specify it under the name of *papyrus*, of which there were two kinds, that of Egypt, and that of Sicily. The moderns have endeavoured to show, that these two plants are one and the same species of cyperus. It is under this genus that they are found in the catalogues and descriptions of plants published since the edition of Morrifon's work, where the papyrus is called *cyperus niloticus vel Syriacus maximus papyraceus*.

In the manuscripts of the letters and observations of M. Lippi physician at Paris, who accompanied the envoy of Louis XIV. to the emperor of Abyssinia, we find the description of a cyperus which he had observed on the banks of the Nile in 1701. After having described the flowers, he says that many ears covered with young leaves are supported by a pretty long pedicle; and that many of those pedicles, equally loaded and coming from one joint, form a kind of parasol. The disk of this parasol is surrounded with a quantity of leaves which form a crown to the stem which supports it. The stem is a pretty long prism, the corners of which are a little rounded; and the leaves, not at the top but at the side, are formed like the blade of a sword; the roots are black and full of fibres; and this plant is called *cyperus Nileacus major, umbella multiplici*.

The same Lippi describes another kind which rises not so high: the stem and leaves correspond with the former, but the ears form rather a kind of head than any thing like the spreading of an umbrella; this head was very soft, shining, and gilded, rich and airy, much loaded, supported by pedicles which were joined together at the bottom like the knitting of a parasol. It is called by him *cyperus Nileacus major aurea, divisa pannicula*. These two kinds of cyperus have a marked resemblance in their leaves, their stem, their foliage, and the marshy places where they grow. The only difference consists in their size, and in the position of the ears, which serve to distinguish them; and they seem to bear a resemblance to the papyrus and the fari, described by ancient authors. The first is perhaps the papyrus, and the second the fari; but this is only conjecture.

The papyrus, which grew in the waters, is said to have produced no seed; but this Mr Bruce very properly calls an absurdity. "The form of the flower (says he) sufficiently indicates, that it was made to resolve itself into the covering of one, which is certainly very small, and by its exalted situation and thickness of the head of the flower, seems to have needed the extraordinary covering it has had to protect it from the violent hold the wind must have had upon it. For the same reason, the bottom of the filaments composing the head are sheathed in four concave leaves, which keep them close together, and prevent injury from the wind getting in between them." Its plume was composed of slender pedicles, very long, and somewhat like hair, according to Theophrastus. The same peculiarity exists in the papyrus of Sicily; and the same is found to exist in another kind of papyrus sent from Madagascar by M. Poivre, correspondent of the academy of sciences.

It is impossible to determine whether the papyrus of Sicily was used in any way by the Romans. In Italy it is called *papero*, and, according to Cespilpin, *pipero*.

Papyrus.

Papyrus.

This papyrus of Sicily has been cultivated in the garden of Pisa; and if we can depend on the authority of Cefalpin, who himself examined the plant, it is different from the papyrus of Egypt.

The papyrus, says he, which is commonly called *pipero* in Sicily, has a longer and thicker stem than the plant cyperus. It rises sometimes to four cubits; the angles are obtuse, and the stem at the base is surrounded with leaves growing from the root; there are no leaves on the stem even when the plant is at the greatest perfection, but it carries at the top a large plume which resembles a great tuft of dishevelled hairs; this is composed of a great number of triangular pedicles, in the form of reeds; at the extremity of which are placed the flowers, between two small leaves of a reddish colour like the cyperus. The roots are woody, about the thickness of reeds, jointed, and they throw out a great number of branches which extend themselves in an oblique direction. These are scented somewhat like the cyperus, but their colour is a lighter brown; from the lower part issue many small fibres, and from the higher a number of stems shoot up, which in proportion as they are tender contain a sweet juice.

The plume of the papyrus of Sicily is pretty well described in a short account of it in the second part of the *Musæum de Boccone*. This plume is a tuft or assemblage of a great number of long slender pedicles, which grow from the same point of division, are disposed in the manner of a parasol, and which carry at the top three long and narrow leaves, from which issue other pedicles, shorter than the former, and terminating in several knots of flowers. Micheli, in his *Nova Plantarum Genera*, printed at Florence 1728, has given an engraving of one of the long pedicles in its natural length: it is surrounded at the base with a case of about one inch and a half in height; towards the extremity it carries three long and narrow leaves, and four pedicles, to which are fixed the knots of flowers. Every pedicle has also a small case surrounding its base. In short, we find in the *Groß-Graphia* of Schenckzer a very particular description of the plume of a kind of cyperus, which appears to be the Sicilian plant. From this account it appears that the papyrus of Sicily is well known to botanists. It were to be wished that we had as particular a description of the papyrus of Egypt; but meanwhile it may be observed, that these two plants have a near affinity to one another; they are confounded together by many authors: and according to Theophrastus, the *sari* and the *papyrus nilotica* have a decided character of resemblance, and only differ in this, that the papyrus sends forth thick and tall stems, which being divided into slender plates, are fit for the fabrication of paper; whereas the *sari* has small stems, considerably shorter, and altogether useless for any kind of paper.

The papyrus, which served anciently to make paper, must not be confounded with the papyrus of Sicily, found also in Calabria; for, according to Stribon, the papyrus was to be found in no place excepting Egypt and India. The greatest part of botanists have believed that the Sicilian plant is the same with the *sari* of Theophrastus; others have advanced that the papyrus of Egypt and the *sari* were the same plant in two different stages of its existence, or considered with

respect to the greater or less height; which, according to them, might depend on the qualities of the soil, the difference of the climate, or other accidental causes. In proof of this, it is maintained, that there is an essential difference between the papyrus growing in the waters and the same plant growing on the banks of rivers and in marshes. The first of these have thick and tall stems, and a plume in the form of a tuft of hair very long and slender, and without any seed: the second differs from the first in all these particulars; it has a shorter and more slender stem, its plume is loaded with flowers, and of consequence it produces seed. In whatever way we consider these facts, it is sufficient for us to know, that the difference between the papyrus and the *sari* neither depends on climate, nor soil, nor on situation. The plants whose difference depended on these circumstances, both grew in Egypt, and were both employed in the manufacture of paper. But it is an established fact, that the *sari* cannot be employed for this purpose.

Finally, the papyrus of Sicily began to be known by botanists in 1570, 1572, 1583, at which periods the works of Lobel, of Guilandin, and of Cefalpin, first appeared. The ancients had no manner of knowledge of this plant. Pliny makes no mention of it in his Natural History; from which it is evident that it was neither used in Rome nor in Sicily. If he had seen this plant, he must have been struck with its resemblance to the papyrus and the *sari*, as they were described by Theophrastus; and since he gives a particular description of these last mentioned, he would have most naturally hinted at their conformity to the Sicilian papyrus.

Among many dried plants collected in the East Indies by M. Poivre, there is a kind of papyrus very different from that of Sicily. It carries a plume composed of a considerable tuft of pedicles, very long, weak, slender, and delicate, like single threads, terminating most frequently in two or three small narrow leaves, without any knot of flowers between them; hence this plume must be altogether barren. Those pedicles or threads are furnished with a pretty long membranous case, in which they are inserted; and they issue from the same point of direction, in the manner of a parasol. The plume, at its first appearance, is surrounded with leaves like the radii of a crown. The stem which supports it, is according to M. Poivre, about ten feet in height, where there is two feet under water; it is of a triangular form, but the angles are rounded; its thickness is about the size of a walking staff which fills the hand.

The interior substance, although soft and full of fibres, is solid, and of a white colour. By this means the stem possesses a certain degree of strength, and is capable of resistance. It bends without breaking; and as it is extremely light, it serves in some sort for a cane: The same M. Poivre used no other during a residence of several months at Madagascar. This stem is not of equal thickness in its whole length; it tapers insensibly from the thickest part towards the top. It is without knots, and extremely smooth. When this plant grows out of the waters, in places simply moist, it is much smaller, the stems are lower, and the plume is composed of shorter pedicles or threads, terminating at the top in three narrow leaves, a little longer than those

*Papyrus.*

Plate CCCLXXV

Papyrus  
||  
Paracelsus.

those at the plume, when the plant grows in the water. From the base of these leaves issue small knots of flowers, arranged as they are in the cyperus; but these knots are not elevated above the pedicles, they occupy the centre of the three leaves, between which they are placed, and form themselves into a small head. The leaves which spring from the root and the lower part of the stem resemble exactly those in the cyperus. This plant, which the inhabitants call *funga-funga*, grows in great abundance in their rivers and on their banks, but particularly in the river Tartas, near the Foule-point in Madagascar. The inhabitants of these cantons use the bark of this plant for mats; they make it also into sails, into cordage for their fishing-houfes, and into cords for their nets.

This kind of papyrus, lately discovered, and different from the papyrus of Sicily by the disposition of its flowers, shows, that there are two kinds of the cyperus which might easily be confounded with the papyrus of Egypt; whether we consider, on the one hand, to what purposes the inhabitants of the places where they grow have made them subservient; or, on the other, compare their form, their manner of growth, and the points in which they resemble each other. This comparison can be easily made from the accounts which Pliny and Theophrastus gave of the papyrus of Egypt, and by the figure and description given by Prosper Alpin, after having observed the plant on the banks of the Nile. But if we can depend on the testimony of Strabo, who affirms that the papyrus is found nowhere but in Egypt and in India, it is perhaps possible that the papyrus of the isle of Madagascar, situated at the mouth of India, is the same with that of Egypt.

Whatever truth may be in this conjecture, the inhabitants of this island have never derived from it those advantages which have immortalised the papyrus of Egypt. They have not made that celebrated paper *quo usu maxime humanitas, vita, constat et memoria*. This remarkable expression of Pliny not only characterizes the Egyptian paper, but every kind which art and industry have substituted in its place.

PAR, in commerce, signifies any two things equal in value. See EXCHANGE.

PARABLE, a fable or allegorical instruction, founded on something real or apparent in nature or history, from which a moral is drawn by comparing it with something in which the people are more immediately concerned; such are the parables of Dives and Lazarus, of the Prodigal Son, of the Ten Virgins, &c. Dr Blair observes, that "of parables, which form a part of allegory, the prophetic writings are full; and if to us they sometimes appear obscure, we must remember, that in those early times it was universally the mode throughout all the eastern nations to convey sacred truths under mysterious figures and representations."

PARABOLA. See CONIC SECTIONS.

PARABOLE. See ORATORY, n° 84.

PARACELSUS (Aurelius Philip Theophrastus Bombastus de Hohenheim), a famous physician, born at Einsiedlen, a town in the canton of Schwytz in Switzerland. He was educated with great care by his fa-

ther, who was the natural son of a prince, and in a little time made a great progress in the study of physic. He afterwards travelled into France, Spain, Italy, and Germany, in order to become acquainted with the most celebrated physicians. At his return to Switzerland, he stopped at Basil, where he read lectures on physic in the German tongue. He was one of the first who made use of chemical remedies with success, by which he acquired a very great reputation. Paracelsus gloried in destroying the method established by Galen, which he believed to be very uncertain; and by this means drew upon himself the hatred of the other physicians. It is said, that he boasted of being able, by his remedies, to preserve the life of man for several ages: but he himself experienced the vanity of his promises, by his dying at Saltzburg, in 1504, at 37 years of age according to some, and at 48 according to others. The best edition of his works is that of Geneva in 1658, in 3 vols. folio.

PARACENTESIS, an operation in surgery, commonly called *tapping*. See SURGERY.

PARACLET, the COMFORTER, a name given to the Holy Ghost.

PARADE, in a military sense, the place where troops assemble or draw together, to mount guard, or for any other purpose.

PARADE, in fencing, implies the action of parrying or turning off any thrust.

PARADIS (Francis Augustine) de MONCRIF. See MONCRIF.

PARADISE, a term principally used for the garden of Eden, in which Adam and Eve were placed immediately upon their creation.

As to this terrestrial paradise, there have been many inquiries about its situation. It has been placed in the third heaven, in the orb of the moon, in the moon itself, in the middle region of the air, above the earth, under the earth, in the place possessed by the Caspian sea, and under the arctic pole. The learned Huetius places it upon the river that is produced by the conjunction of the Tigris and Euphrates, now called the *river of the Arabs*, between this conjunction and the division made by the same river before it falls into the Persian sea. Other geographers have placed it in Armenia, between the sources of the Tigris, the Euphrates, the Araxis, and the Phasis, which they suppose to be the four rivers described by Moses. But concerning the exact place we must necessarily be very uncertain, if indeed it can be thought at all to exist at present, considering the many changes which have taken place on the surface of the earth since the creation.

"Learned men (says Mr Miln \*) have laboured to find out the situation of Paradise, which seems to be but a vague and uncertain inquiry; for the Mosaic description of it will not suit any place on the present globe. He mentions two rivers in its vicinity, viz. Pison and Gihon, of which no vestiges can now be found. The other two still remain, viz. the Hiddekel, supposed to be the Tigris, and the Euphrates, whose streams unite together at a considerable distance above the Persian gulph; in some part of which, it is highly probable the happy garden once lay (A). This gulph is

Paracel-  
tells  
Paradise.

(A) "God (we are told) placed at the east of the garden of Eden cherubims and a flaming sword, which turned every

Paradise. is eastward both of the land of Midian and the wilderness of Sinai; in one of which places Moses wrote his history. But since the formation of this earth, it has undergone great changes from earthquakes, inundations, and many other causes. The garden, however, seems to have been a peninsula, for the way or entrance into it is afterwards mentioned. We are told that a 'river went out of it;' which, according to some, should be rendered 'run on the outside of it,' and thus gave it the form of a horse-shoe: for had the Euphrates run through the middle of the garden, one half of it would have been useless to Adam, without a bridge or boat wherewith to have crossed it."

The learned authors of the Universal History, in their account of rarities natural and artificial in Syria, mention "a spot which is still shown as the place where once stood the garden of Eden, or Terrestrial Paradise. And indeed it is in all respects so beautiful and rich, and yields so delightful a prospect from the adjacent hills, that there is hardly another place in the world that has a fairer title to the name it bears. Its proximity to Damascus, the capital of Syria, near the fountain head of the Jordan; its situation between the Tigris or Hiddekel, the Euphrates, the Phasis or Phison, the Araxes or Gihon (which last has those names from its vast rapidity above all other known rivers), its bordering upon the land of Chus, famed for its fine gold; all these and many other marks specified by Moses, together with its charming and surprising fruitfulness, and constant verdure, have induced a great number of commentators to settle that celebrated and so much sought-after spot here, and to deem it the most valuable of all the natural rarities of this country."

Christians, however, need not be told, that however curious or amusing this inquiry may be, the determination of it is of no importance, since we are all well assured that the celestial paradise is that place of pure and refined delight in which the souls of the blessed enjoy everlasting happiness.

It may not be improper, however, in this place to give a description of the paradise of the Mohammedans. The sensuality and absurdity of that impostor must be apparent to all men. Their religion has no consistency in its parts, and the descriptions of the future enjoyment of the faithful are miserable instances of human weakness and folly.

"The paradise of the Mohammedans is said by them to be situated above the seven heavens, or in the seventh, and next under the throne of God; and to express the amenity of the place, they tell us that the earth of it is of the finest wheat flour, or of the purest musk, or of saffron; and that its stones are pearls and jacinths, the walls of its buildings enriched with gold and silver, and the trunks of all its trees of gold, amongst

which the most remarkable is the tree *tuba*, or tree of happiness. They pretend that this tree stands in the palace of Mohammed, though a branch of it will reach to the house of every true believer, loaded with pomegranates, dates, grapes, and other fruits of surprising bigness, and delicious tastes, unknown to mortals. If a man desires to eat of any particular kind of fruit, it will immediately be presented to him; or if he chooses flesh, birds ready dressed will be set before him, and such as he may wish for. They add, that this tree will supply the blessed, not only with fruit, but with silk garments also, and beasts to ride on, adorned with rich trappings, all which will burst forth from the fruit; and that the tree is so large, that a person mounted on the fleetest horse would not be able to gallop from one end of its shade to the other in 100 years. Plenty of water being one of the greatest additions to the pleasantness of any place, the Alcoran often speaks of the rivers of paradise as the principal ornament. Some of these rivers are said to flow with water, some with milk, some with wine, and others with honey: all of them have their sources in the root of this tree of happiness; and, as if these rivers were not sufficient, we are told that the garden of this paradise is also watered by a great number of lesser springs and fountains, whose pebbles are rubies and emeralds, their earth of camphor, their beds of musk, and their sides of saffron. But all those glories will be eclipsed by the resplendent and exquisite beauty of the girls of paradise, the enjoyment of whose company will constitute the principal felicity of the faithful. These (they say) are not formed of clay, as mortal women, but of pure musk; and are, as their prophet often affirms in his Alcoran, free from all the natural defects and inconveniences incident to the sex. Being also of the strictest modesty, they keep themselves secluded from public view in pavilions of hollow pearls, so large, that, as some traditions have it, one of them will be no less than 16, or, as others say, 60 miles long, and as many broad. With these the inhabitants of paradise may taste pleasures in their height; and for this purpose will be endowed with extraordinary abilities, and enjoy a perpetual youth."

*PARADISE-LOST*, the name of a modern epic poem, the first and finest of those composed by Milton.

The subject of this poem is extraordinary; it had never before been attempted, and seemed to be above the efforts of human genius. Angels and devils are not the machinery, but the principal actors in it; so that what would appear marvellous in any other composition, is in this only the natural course of events.—The poet's intention was, as he expresses it himself, to vindicate the ways of God to men. How far Milton was happy in the choice of his subject, may be questioned.

---

*every way, to keep the way of the tree of life.* In Scripture, the extraordinary judgments of God are said to be executed by his angels, who are sometimes compared to flames of fire. Therefore the cherubim and the flaming sword may probably mean nothing more than that a large portion of ground on the eastward of Paradise was set on fire during the above awful occasion, and continued burning with such violence, that the flame thereof at a distance appeared like a brandished sword turning every way with the wind. Now if the soil of Eden was bituminous, like that of Gomorrah (which was once so fertile as to be compared to the "garden of the Lord"), the fire would continue burning till it produced the same effect in the one place as it did in the other, and turned a great part of that tract into sea: which seems to countenance the opinion of those who place the situation of Paradise in some part of the Persian Gulph."

Paradise.

Paradise,  
Paradisea.

questioned. It has led him into difficult ground, though it certainly suited the daring sublimity of his genius. It is a subject for which he alone was fitted; and, in the conduct of it, he has shown a stretch both of imagination and invention which is perfectly wonderful.

*Bird of PARADISE.* See the following article.

Plate  
CCCLXXIV.

PARADISEA, in ornithology; a genus of birds belonging to the order of dicæ. The beak is covered with a belt or collar of downy feathers at the base; and the feathers on the sides are very long.

“Birds of this genus (says Latham) have the bill slightly bending; the base covered with velvet-like feathers. The nostrils are small, and concealed by the feathers. The tail consists of 10 feathers; the two middle ones, and sometimes more in several of the species, are very long, and webbed only at the base and tips. The legs and feet are very large and strong: they have three toes forward, one backward, and the middle connected to the outer one as far as the first joint. The whole of this genus have, till lately, been very imperfectly known; few cabinets possessing more than one species, viz. the Greater, or what is called the *common bird of Paradise*; nor has any set of birds given rise to more fables, the various tales concerning which are to be found in every author; such as, their never touching the ground from their birth to death; living wholly on the dew; being produced without legs; and an hundred such stories, too ridiculous even to mention. This last error is scarcely at this moment wholly eradicated. The circumstance which gave rise to it did not indeed at first proceed from an intention to deceive, but merely from accident. In the parts of the world which produce these birds, the natives made use of them as *sigrets*, and other ornaments of dress; and in course threw away the less brilliant parts. The whole trouble they were at on this occasion, was merely to skin the bird, and, after pulling off the legs, coarser parts of the wings, &c. thrust a stick down the throat into the body, letting an inch or two hang out of the mouth, beyond the bill; on the bird's drying the skin collapsed about the stick, which became fixed, and supported the whole. They had then no more to do than to put this end of it into a socket fitted to receive it, or fasten it in some manner to the turban, &c. By degrees these were imported into the other isles for the same uses, and afterwards were coveted by the Japanese, Chinese, and Persians, in whose countries they are frequently seen, as well as in many parts of India; the grandees of these last parts not only ornamenting themselves with these beautiful plumes, but adorning even their horses with the same.”

The Portuguese first found these birds on the island of Gilolo, the Papua islands, and New Guinea; and they were known by the name of *birds of the sun*. The inhabitants of Ternate call them *manuco dewato*, the “bird of God;” whence the name *manuco diata*, used by some naturalists, is derived. According to some fabulous accounts, this bird has no legs, lives constantly on wing, and in the air; and, in confirmation of these accounts, the legs of all the dead birds offered to sale were cut off. But the inhabitants of Aroo, who resort yearly to Banda, undeceived the Dutch, and freed them from those prejudices. Another reason for cutting off

the legs is, that the birds are more easily preserved without them; besides that the Moors wanted the birds without legs, in order to put them on in their mock fights as ornaments to their helmets. The inhabitants of Aroo, however have brought the birds with legs for 80 or 90 years; and Pijafeta, shipmate of Ferdinand Magellan, proved, about the year 1525, an eye-witness that these creatures were not without legs. However, the peculiar length and structure of their scapular feathers hinders them from settling, in high winds, on trees, and when they are thrown on the ground by these winds, they cannot rise again. If taken by the natives, they are immediately killed, as their food is not known; and they defend themselves with great courage with their formidable bills.

Latham enumerates eight species, but suspects there may be more. We shall satisfy ourselves with the following:

1. The largest bird of Paradise is commonly two feet four inches in length; the head is small; the bill hard and long, of a pale colour. The head and back-part of the neck is lemon-coloured, a little black about the eyes; about the neck, the bird is of the brightest glossy emerald green, soft like velvet; as is also the breast which is black: the wings are large, and chestnut-coloured; the back-part of the body is covered with long, straight, narrow feathers, of a pale brown colour, similar to the plumes of the ostrich. These feathers are spread when the bird is on the wing; for which reason he can keep very long in the air. On both sides of the belly are two tufts of stiff and shorter feathers, of a golden yellow, and shining. From the rump proceed two long stiff shafts, which are feathered on their extremities.

These birds are not found in Key, an island fifty Dutch miles east of Banda; but they are found at the Aroo islands, lying 15 Dutch miles farther east than Key, during the westerly or dry monsoon; and they return to New Guinea, as soon as the easterly or wet monsoon sets in. They come always in a flock of 30 or 40, and are led by a bird which the inhabitants of Aroo call the *king*. This leader is black, with red spots; and constantly flies higher than the rest of the flock, which never forsake him, but settle as soon as he settles: a circumstance that frequently proves their ruin when the king lights on the ground, whence they are not able to rise on account of the singular structure and disposition of their plumage. They are likewise unable to fly with the wind, which would ruin their loose plumage; but take their flight constantly against it, cautious not to venture out in hard blowing weather, as a strong wind frequently obliges them to come to the ground. During their flight they cry like starlings. Their note, however, approaches more to the croaking of ravens; which is heard very plainly when they are in distress from a fresh gale blowing on the back of their plumage. In Aroo, these birds settle on the highest trees, especially on the ficus benjamina of the hortus malabaricus, commonly called the *awa-tig-tree*. The natives catch them with bird-lime or in nooses, or shoot them with blunt arrows; but though some are still alive when they fall into their hands, the catchers kill them immediately, and sometimes cut the legs off; then they draw out the entrails, dry and fumigate the bodies

Paradise.  
—

Paradisea. dies with sulphur or smoke only, and sell them at Banda for half a rix-dollar each; but at Aroo they may be bought for a spike-nail or a piece of old iron. Flocks of these birds are often seen flying from one island to the other against the wind. In case they find the wind become too powerful, they fly straight up into the air, till they come to a place where it is less agitated, and then continue their flight. During the eastern monsoon their tails are moulted, so that they have them only during four months of the western monsoon.

2. The smaller bird of Paradise is about 20 inches long. His beak is lead-coloured, and paler at the point. The eyes are small, and inclosed in black about the neck. The head and back of the neck are of a dirty yellow; the back of a greyish yellow; the breast and belly of a dusky colour; the wings small, and chestnut-coloured. The long plumage is about a foot in length, and paler than in the large species; as in general the colours of this bird are less bright than the former. The two long feathers of the tail are constantly thrown away by the natives. This is in all respects like the greater sort; and they likewise follow a king or leader, who is, however, blacker, with a purplish cast, and finer in colour than the rest. The neck and bill are larger in the male than the female. They roost on the tops of the highest trees, and do not migrate like the other kind. Some say, that the birds of this species, finding themselves weak through age, fear straight towards the sun till they are tired, and fall dead to the ground. The natives draw the entrails, fear the birds with a hot iron, and put them in a tube of bamboo for preservation.

3. and 4. The large black bird of Paradise is brought without wings or legs for sale; so that no accurate description of it hath yet been given. Its figure, when stuffed, is narrow and round, but stretched in length to the extent of four spans. The plumage on the neck, head, and belly, is black and velvet-like, with a hue of purple and gold, which appears very strong. The bill is blackish, and one inch in length. On both sides are two bunches of feathers, which have the appearance of wings, although they be very different, the wings being cut off by the natives. This plumage is soft, broad, similar to peacocks feathers, with a glorious gloss and greenish hue, and all bent upwards; which Valentine thinks is occasioned by the birds being kept in hollow bamboo-reeds. The feathers of the tail are of unequal length; those next to the belly are narrow, like hair; the two uppermost are much longer, and pointed; those immediately under them are a span and a half longer than the upper ones; they are stiff, on both sides fringed with a plumage like hair, black above, but glossy below. Birds of this kind are brought only from one particular place of New Guinea. Besides the large black bird of Paradise, there is still another sort, whose plumage is equal in length, but thinner in body, black above, and without any remarkable gloss, not having those shining peacock-feathers which are found on the greater species. This wants likewise the three long pointed feathers of the tail belonging to the larger black species.

5. The white bird of Paradise is the most rare, and has two varieties; one quite white, and the other black

and white. The former is very rare. The second has the fore-part black, and the back-part white; with 12 crooked wiry shafts, which are almost naked, tho' in some places, covered with hairs.

6. In the year 1689 a new species of the black bird of Paradise was seen in Amboyna. This was only one foot in length, with a fine purple hue, a small head, and a straight bill. On its back, near the wings, are feathers of a blue and purple colour, as on the other birds of Paradise; but under the wings and over all the belly they are yellow coloured, as in the common sort: on the back of the neck they are mouse-coloured mixed with green. It is remarkable in this species, that there are before the wings two roundish tufts of feathers, which are green-edged, and may be moved at pleasure by the bird, like wings. Instead of a tail, he has 12 or 13 black, naked, wire-like shafts, hanging promiscuously like feathers. His legs are strong, and have sharp claws. The head is remarkably small; and the eyes are also small, and surrounded with black.

7. The last species we shall mention is the king's bird. This creature is about seven inches long, and somewhat larger than a titmouse. Its head and eyes are small; the bill straight; the eyes included in circles of black plumage; the crown of the head is flame-coloured; the back of the neck blood-coloured; the neck and breast of a chestnut colour, with a ring of the brightest emerald-green. Its wings are in proportion strong; and the quill-feathers dark, with red shining plumes, spots, and stripes. The tail is straight, short, and brown. Two long naked black shafts project from the rump, at least a hand-breadth beyond the tail; having at their extremities semilunar twisted plumage, of the most glaring green colour above, and dusky below. The belly is white and green sprinkled; and on each side is a tuft of long plumage, feathered with a broad margin, being on one side green and on the other dusky. The back is blood-red and brown, shining like silk. The legs are in size like those of a lark, three fore-toes and one back-toe. This bird associates not with any of the other birds of Paradise; but sits solitary from bush to bush, wherever he sees red-berries, without ever getting on tall trees.

Those who wish for minuter information respecting this curious genus, we must refer to Latham's Synopsis, and Buffon's Birds, vol. ix. &c.

PARADOX, *παράδοξον*, in philosophy, a proposition seemingly absurd, as being contrary to some received opinions, but yet true in fact.

The vulgar and illiterate take almost every thing, even the most important, upon the authority of others, without ever examining it themselves. Although this implicit confidence is seldom attended with any bad consequences in the common affairs of life, it has nevertheless, in other things, been much abused; and in political and religious matters has produced fatal effects. On the other hand, knowing and learned men, to avoid this weakness, have fallen into the contrary extreme; some of them believe every thing to be unreasonable, or impossible, that appears so to their first apprehension; not adverting to the narrow limits of the human understanding, and the infinite variety of objects, with their mutual operations, combinations, and affections, that may be presented to it.

Paradox.

It must be owned, that credulity has done much more mischief in the world than incredulity has done, or ever will do; because the influences of the latter extend only to such as have some share of literature, or affect the reputation thereof. And since the human mind is not necessarily impelled, without evidence, either to belief or unbelief, but may suspend its assent to, or dissent from any proposition till after a thorough examination: it is to be wished that men of learning, especially philosophers, would not hastily, and by first appearances, determine themselves with respect to the truth or falsehood, possibility or impossibility, of things.

A person who has made but little progress in the mathematics, though in other respects learned and judicious, would be apt to pronounce it impossible that two lines, which were nowhere two inches asunder, may continually approach towards one another, and yet never meet, though continued to infinity: and yet the truth of this proposition may be easily demonstrated. And many, who are good mechanics, would be as apt to pronounce the same, if they were told, that though the teeth of one wheel should take equally deep into the teeth of three others, it should affect them in such a manner, that, in turning it any way round its axis, it would turn one of them the same way, another the contrary way, and the third no way at all.

No science abounds more with paradoxes than geometry: thus, that a right line should continually approach to the hyperbola, and yet never reach it, is a true paradox; and in the same manner a spiral may continually approach to a point, and yet not reach it in any number of revolutions, however great.

The Copernican system is a paradox to the common people; but the learned are all agreed as to its truth. Geometricians have of late been accused of maintaining paradoxes; and some do indeed use very mysterious terms in expressing themselves about asymptotes, the sums of infinite progressions, the areas comprehended between curves and their asymptotes, and the solids generated from these areas, the length of some spirals, &c. But all these paradoxes and mysteries amount to no more than this; that the line or number may be continually acquiring increments, and those increments may decrease in such a manner, that the whole line or number shall never amount to a given line or number. The necessity of admitting it is obvious from the nature of the most common geometrical figures: thus, while the tangent of a circle increases, the area of the corresponding sector increases, but never amounts to a quadrant. Neither is it difficult to conceive, that if a figure be concave towards a base, and have an asymptote parallel to the base (as it happens when we take a parallel to the asymptote of the logarithmic curve, or of the hyperbola, for a base), that the ordinate in this case always increases while the base is produced,

VOL. XIII.

but never amounts to the distance between the asymptote and the base. In like manner, a curvilinear area may increase while the base is produced, and approach continually to a certain finite space, but never amount to it; and a solid may increase in the same manner, and yet never amount to a given solid. See *M'Laurin's Fluxions*. See *LOGARITHMIC-Curve*.

PARADOXI, a sort of mimes or buffoons among the ancients, who entertained the people with extempore effusions of drollery. They were also called *Paradoxologi*, *Ordonarii*, *Neanicologi*, and *Areologi*. See *MIMI*.

PARAGAUDÆ, among the Romans, were wreaths of gold, or silk and gold, interwoven in, not sewed to, their garments. The garment was sometimes of one colour, with one paragaudæ; sometimes of two colours, with two paragaudæ; or three colours, with three paragaudæ, &c. They were worn both by men and women.

PARAGOGE, in grammar, a figure whereby a letter or syllable is added to the end of a word; as *med*, for *me*; *dicier*, for *dici*, &c.

PARAGRAPH, in general, denotes a section or division of a chapter; and in references is marked thus, ¶.

PARAGUAY, or LA PLATA, a province of Spanish America, bounded on the north by the river of the Amazons; on the east, by Brazil; on the south, by Patagonia; and on the west, by Chili and Peru. This country was first discovered by Sebastian Cabot, who, in 1526, passed from Rio de la Plata to the river Parana in small barks, and thence entered the river called *Uraguay*. It was not, however, thoroughly reduced till the Jesuits obtained possession of it. A few of these went to Paraguay soon after the city of Assumption was founded, and converted about 50 Indian families, who soon induced many others to follow their example, on account of the peace and tranquillity they enjoyed under the fathers. They had long resisted the Spaniards and Portuguese; but the Jesuits, by learning their language, conforming to their manners &c. soon acquired great authority among them; till at last, by steadily pursuing the same artful measures, they arrived at the highest degree of power and influence, being in a manner the absolute sovereigns of a great part of this extensive country; for above 350,000 families are said to have been subject to them, living in obedience and awe bordering on adoration, yet procured without the least violence or constraint.

We have the following particular account of the missions of Paraguay, in the words of Don Jorge Juan, &c. 1753. Gent. Mag.

“The territories of the missions of Paraguay comprehended not only the province of that name, but also a great part of the provinces of Santa Cruz de la Sierra, Tucuman, and Buenos Ayres. The temperature (A) of the air is good, though somewhat moist, and in some part rather cold: the soil in many places is fertile;  
4 Z tile;

(A) The climate of Paraguay differs but little from that of Spain; and the distinctions between the seasons are much the same. In winter, indeed, violent tempests of wind and rain are very frequent, accompanied with such dreadful claps of thunder and lightning as fill the inhabitants, though used to them, with terror and consternation. In summer, the excessive heats are mitigated by gentle breezes, which constantly begin at eight or nine in the morning.

Paradox  
||  
Paraguay.

Paraguay. tile (B); and produces in great abundance not only the fruits and vegetables peculiar to America, but also those of Europe which have been introduced there. The chief articles of their commerce are cotton, tobacco, some sugar, and the herb called *Paraguay*. Every town gathers annually more than 2000 arrobas of cotton of a quarter of an hundred weight each, which the Indians manufacture into stuffs. There are also great quantities of tobacco produced. But the chief article is the herb *Paraguay*: for it grows only in the districts of the missions; and there is a vast consumption of this herb in all the provinces of Chili and Peru, especially of that called *camini*, which is the pure leaf; the infusion of which is called *mate*, and is drank by the inhabitants of Lima twice a day in lieu of tea or chocolate. The *mate* which is made by the infusion of the stalk is not so much esteemed.

“ ’Tis now almost two centuries since these missions were first set on foot by the Jesuits. The bad management of the Portuguese greatly favoured the views of these fathers. There was a nation of Indians called *Guaranies*, some whereof were settled upon the banks of the rivers Uruguay and Parana, and others an hundred leagues higher up in the country to the north-west of Guayra. The Portuguese frequently came upon them, and by force carried away as many as they thought proper to their plantations, and made slaves of them. Offended by such treatment, the *Guaranies* resolved to quit their settlements in the neighbourhood of the Portuguese, and to remove into the province of Paraguay. Accordingly a migration of 12,000 persons, great and small, ensued. These the Jesuits soon converted; and having had the like success in converting about an equal number of the natives of Tape, a district in Paraguay, they united the two nations, and laid the foundation of their future dominion. These fathers seem to have trode in the steps of the first Incas, and to have civilized nations and converted souls in order to acquire subjects. According to a very exact account taken in the year 1734, there were then 32 towns of the *Guaranies*, which were reckoned to contain above 30,000 families, and as

the new converts were continually increasing, they were then about laying the foundations of three new towns. There were also then seven very populous towns inhabited by the converted Chiquito Indians, and they were preparing to build others for the reception of the new converts of that nation which were daily made.

“ The missions of Paraguay are surrounded on all sides with wild or unconverted Indians; some of whom live in friendship with the towns, but others harass them by frequent incursions. The father-missionaries frequently visit these Indians, and preach to them; and from these expeditions they seldom return without bringing along with them some new converts to incorporate with their civilized subjects. In the performance of this duty they sometimes penetrated 100 leagues into those uncultivated tracts where wild Indians range; and it is observed that they meet with the least success amongst those nations with whom any fugitive Mestizos, or Spanish criminals, have taken refuge. The diligence of these fathers is certainly worthy the imitation of the protestant clergy.

“ Every town has its curate, who is assisted by one and very often by two priests of the same order, according to the largeness and extent of the town and its district. These two or three priests, together with six boys who assist them in the service of the church, form a small college in every town, wherein the hours and other exercises are regulated with the same formality and exactness as in the large colleges in the cities of Peru and Chili. The most troublesome part of the duty of the assistant priests are the personal visitations which they are obliged to make to the Indians to prevent their giving themselves up to idleness; for such is the slothfulness of the *Guaranies*, that if they were not very carefully looked after, the society would receive no benefit or advantage from them. They also attend the public shambles, where the cattle necessary for the sustenance of the Indians are daily slaughtered, and distribute the flesh amongst all the families in the town, in proportion to the number of persons whereof each family consists; so that all may have what is necessary,

---

(B) It produces maiz, manioc, and potatoes, besides many fruits and simples unknown in Europe. Vines, however, do not thrive, except in some particular places. Wheat has also been tried; but it is only used for cakes, and other things of that kind. There are great numbers of poisonous serpents, and others of enormous size, many of which live on fish. It produces also abundance of sugar, indigo, pimento, ipecacuanha, and variety of other drugs; and above all the herb *Paraguay*, which it exports to the value of 100,000 l. annually to the provinces of Chili and Peru. It is the leaf of a middle-sized tree, resembling an orange-tree, in taste not unlike mallows. There are three gatherings: first, the buds before it unfolds its leaves, which is the best, but soonest subject to decay; the second gathering is the full-grown leaves at the first expansion; the third is when the leaves have remained on, some time after they are full blown. The leaves are roasted and then kept in pits dug in the ground to be ready for sale. These trees grow principally in the morasses on the east side of Paraguay, but now are distributed all over the country. The manner of using it is, to dry and reduce it almost to powder, then put it into a cup with lemon-juice and sugar; boiling water is then poured on it, and the liquor drank as soon as may be. It is supposed to be serviceable in all disorders of the head, breast, and stomach; it preserves the miners from the noxious mineral steams with which they would otherwise be suffocated; is a sovereign remedy in putrid fevers and the scurvy; allays hunger; and purifies all kind of water, by infusing it therein. The country is diversified with forests, mountains, lowlands (great part of the year under water), fertile meadows, and morasses. Almost every forest abounds with bees, which have their hives in hollow trees. Besides cotton, the country produces hemp, flax, corn, rice, and wool; and there are such numbers of wild cattle, that they are killed only for their hides. The natives differ not materially from those described under the article AMERICA.

Paraguay. cessary, none what is superfluous. They also visit the sick, and see that they are properly taken care of. They are generally employed the whole day in these affairs, so that they have seldom time to assist the curate in his spiritual functions. All the boys and girls in the parish go to church every day in the week (except on festivals and Sundays), where they are instructed by the curate. On Sundays the whole parish goes to church to be instructed. The curate is besides obliged to go to confess the sick, and to administer the viaticum to those who desire it, and also to perform all the other functions peculiar to this office. In strictness the curate should be appointed in this manner. The society should nominate three persons to the governor of Buenos Ayres (in whose government the missions of Paraguay are included), as being vice-patron of the missions, that he may choose one of them for curate; and the curates should be instructed in the duties of their office by the bishop: but as the provincials of the order can best judge who are properly qualified for the office, the governor and bishop have ceded their rights to them, and by them the curates are always appointed. The missions of the Guaranies and the missions of the Chiquitos, into which the missions of Paraguay are divided, have each their distinct father-superior, by whom the coadjutors or assistant curates of the several towns in their respective divisions are appointed. These superiors are continually visiting the towns, to see that they be well governed, and to endeavour to improve and augment them. They likewise from time to time take care to send out some fathers of the order into the countries of the wild Indians to make new converts. The better to enable him to discharge these duties, the superior of the Guaranies is assisted by two vice superiors; one of whom resides in Parana, the other upon the banks of the river Uruguay, and the superior himself resides in the town of Candelaria. The post of superior of the Chiquitos is not near so troublesome as that of the superior of the Guaranies; for the Chiquitos are not only less numerous, but much more docile and industrious than the Guaranies, so that they need not be continually watched and attended in order to prevent their idleness. The king allows an annual stipend of 300 pezas to each curate of the Guaranies, for the maintenance of himself and his assistants. The money is paid to the superior, who issues out monthly to each curate as much as is necessary for his subsistence; and when they want any thing extraordinary, their wants are supplied upon application to him. But the Chiquitos maintain their own curates. In every town there is a plantation set apart for the maintenance of the curate, which is cultivated by the joint labour of all the inhabitants. The produce of these plantations is generally more than sufficient for the subsistence of the curates, and the surplus is sold to buy ornaments for the

churches. Nor are the curates the spiritual rectors of the towns only; they are also in effect the civil governors. It is true there are in every town of the millions a governor, regidores, and alcaldes, as there are in the other towns and cities under the Spanish government. But though the governor is elected by the Indians, he must be approved by the curate before he enters upon his office; nor can he chastize or punish delinquents without the curate's permission. The curate examines those who are accused of offences; and, if he finds them guilty, delivers them to the governor to be punished, according to the nature and quality of the offence committed. He sometimes orders them to be imprisoned for a few days, sometimes to fast, and, when the fault is considerable, to be whipped, which is the severest punishment that is ever inflicted; for the regulations and instructions of the curates have been so efficacious, that murder and such like heinous crimes are never here committed. And even before they undergo these gentle corrections, the curate discourages the offenders in a mild friendly manner; and endeavours to excite in them a due sense of their crime, and of the ill consequences that might flow from it, and to convince them that they merit a much greater punishment than is inflicted. This mild treatment prevents tumults and insurrections, and acquires the curates universal veneration and esteem. The alcaldes are chosen annually by the regidores. The governor, regidores, and alcaldes are all Indians of the best capacities; and are in effect only so many overseers appointed by the curate, and dignified with these empty titles (c).

"Every town has its armory or magazine, in which are lodged the fire arms and other weapons wherewith the militia are armed when they take the field to repel the irruptions of the Portuguese and wild Indians. The militia are very dexterous and expert in the management of their arms; and are exercised on the eves of festivals in the squares or public places of the towns. The militia is composed of all these who are able to bear arms: they are formed into companies, which have each a proper number of officers chosen from amongst those who are most distinguished for judgment and conduct. The dress of the officers is rich, adorned with gold and silver, and the device of the town to which they belong: they always appear in their uniforms on festivals, and on the days of military exercise. The governor, alcaldes, and regidores have also proper robes and dresses suitable to their respective offices, in which, they appear on public occasions. There are schools in every town, in which the common people are taught reading and writing, and also music and dancing; in which arts they become very skilful. The Jesuits are very careful in consulting the natural bent and genius of their scholars, and in directing their studies and application accordingly.

The

---

(B) We call them *empty titles*; because in all causes the Jesuit or curate of the parish was a kind of sovereign, regarded as a petty prince, and obeyed as an oracle. Whatever forms might take place in the choice of the chiefs of the several departments, their success ultimately depended on him. The cacique held of him; the general received his commission and instructions from him; and all his decisions were without appeal. There were, we are informed, not less than 60,000 parishes on the banks of the rivers Uruguay and Parana, not exceeding the distance of 30 miles from each other; in each of which was a Jesuit or curate.

Paraguay. The lads of the most promising genius are taught the Latin tongue with great success. In one of the court-yards of every curate's house are various shops or workhouses of painters, carvers, gilders, silversmiths, carpenters, weavers, and clockmakers, and of several other mechanics and artizans, who daily work for the public under the direction of the coadjutors, and at the same time teach the youth their respective arts and occupations.

The churches are large, well built, finely decorated and enlightened, and not inferior to the richest in Peru. Each church has a choir of music, composed of instruments of all sorts, and very good voices; so that divine service is celebrated here with as much pomp and solemnity as in cathedrals: nor are the public processions less splendid, especially that of the host; which, whenever it is carried abroad, is attended by the governor, alcaldes, and regidores, in their robes, and also by the militia in a body. The houses of the Indians are as well built and as well furnished as most of the Spanish houses in Peru. The greatest part indeed have mud walls, others are built with brick, and some with stone, but all are covered with tiles. In every town there is an house where gunpowder is made, that they may never want it when they are obliged to take arms, and always have it ready to make artificial fire-works on rejoicing days: for all festivals are here observed with as great ceremony and exactness as in the greatest cities. Upon the proclamation of a new king of Spain, the governors, alcaldes, regidores, and officers of the militia, appear dressed in new robes and uniforms of a different fashion from those they wore before. There is a sort of a convent in every town; in one part whereof are confined women of an ill life, and the other part is destined for the reception of married women who have no family, and who retire thither when their husbands are absent. For the maintenance of this house, and for the support of orphans, and of old and infirm people, all the inhabitants of the town work two days in every week; and the profits of their labour, which is called *the labour of the community*, are set apart for this purpose. If the produce of this labour be more than is necessary for their subsistence, the surplus is laid out to buy ornaments for the churches, and clothes for the orphans and aged and infirm people; so that here are no beggars, nor any who want the necessities of life. In short, by the wise policy and prudent regulations of the Jesuits, the whole community enjoys peace and happiness.

"The Guaranies are so profuse and negligent, that the curates are obliged to take into their hands all their goods and stuffs as soon as they are manufactured and made ready for sale; otherwise they would waste and destroy them, and not be able to maintain themselves. The Chiquitos, on the contrary, are diligent and frugal; so that the curates have no other trouble with them than the assisting them in the disposal of their goods, and procuring returns for them. For this purpose the society keeps a factor or procurator at Santa Fé and Buenos Ayres, to whom the merchandise of the missions is sent to be disposed of; and these factors return the value to the fathers in such sorts of European commodities as are wanted. The goods of every town are kept separate; and the royal taxes are taken out of them without any other dis-

counts or allowances, save the stipends of the curates of the Guaranies and the pensions of the caciques. The fathers choose to manage the commerce of their subjects themselves, lest they should contract vices by their communication with other people. In this respect the fathers are so careful, that they will not suffer any of the people of Peru, whether they be Spaniards, Mestizos, or Indians, to enter into the territories of the missions. They say that the Indians are but just recovered from a barbarous and dissolute way of life, and that their manners are now pure and innocent; but that if strangers were suffered to come among them, the Indians would soon get acquainted with people of loose lives: and as the Guaranies especially are very prone to vice, wickedness, disorder, and rebellion would soon be introduced; the society would lose all the souls they have converted; and their little republic would be utterly subverted. However, there are some who suspect that these are all specious pretences; and that the society's real motive for prohibiting all intercourse with strangers, is the fear of rivals in the beneficial commerce of Paraguay, which is now entirely in their hands."

Such is the account they themselves have given us of their own conduct: but others have treated their characters with more severity; accusing them of pride, haughtiness, and abusing their authority to the greatest degree; insomuch that they would have caused the magistrates to be whipped in their presence, and obliged persons of the highest distinction within their jurisdiction to kiss the hem of their garment, as the greatest honour at which they could possibly arrive. To this might be added, the utter abolition of all ideas of property; which indeed was rendered useless by the general magazines and store-houses which they established, and from which, together with the herds of cattle kept for the public use, they supplied the want of individuals as occasion required; yet still it was objected to the character of the fraternity, that they possessed large property themselves, and claimed the absolute disposal of the meanest effects in Paraguay. All manufactures belonged to them; every natural commodity was brought to them; and the treasures annually remitted to the superior of the order were thought to be a proof that zeal for religion was not the only motive by which they were influenced.

Besides the parochial or provincial governments, there was a kind of supreme council, composed of an annual meeting of all the fathers, who concerted the measures necessary for promoting the common concerns of the mission, framed new laws, corrected or abolished old ones, and, in a word, adapted every thing to circumstances. It is said to have been one of the great objects of the annual councils to take such measures as should effectually deprive strangers of all intelligence concerning the state of the mission. Hence the natives were restrained from learning the Spanish tongue, and were taught, that it was dangerous for their salvation to hold any conversation with a subject of Spain or Portugal. But the circumstance that rendered their designs most suspicious, was the establishment of a military force. Every parish had its corps of horse and foot, who were duly exercised every Sunday; and it was said, that the whole amounted to a body of 70,000 or 80,000 troops, well disciplined.

Such

Paralipo-  
mena.  
||  
Parallax.

Such was the state of this country some time ago; but as to its situation since the abolition of the sect of Jesuits we can say nothing, as very little authentic intelligence is permitted to pass from that country to this.

PARALIPOMENA, in matters of literature, denotes a supplement of things omitted in a preceding work.

PARALEPSIS. See ORATORY, n° 87.

PARALLACTIC, in general, something relating to the parallax of heavenly bodies. See PARALLAX.

PARALLAX, in astronomy, is the difference between the places of any celestial object as seen from the surface, and from the centre of the earth at the same instant.

<sup>1</sup> Illustration. Let E in figure of parallax, Plate CCCLXXVI. represent the centre of the earth, O the place of an observer on its surface, whose visible horizon is OH, and true horizon EF: Now let ZDT be a portion of a great circle in the heavens, and A the place of any object in the visible horizon: join EA, and produce it to C; then C is the true place of the object, and H is its apparent place, and the angle CAH is the parallax; or, because the object is in the horizon, it is called the *horizontal parallax*. But OAE, the angle which the earth's radius subtends at the object, is equal to CAH: Hence the horizontal parallax of an object may be defined to be the angle which the earth's semidiameter subtends at that object. For the various methods hitherto proposed to find the quantity of the horizontal parallax of an object, see ASTRONOMY, n° 384—399 inclusive.

The whole effect of parallax is in a vertical direction: For the parallactic angle is in the plane passing through the observer and the earth's centre; which plane is necessarily perpendicular to the horizon, the earth being considered a sphere.

<sup>2</sup> The parallax decreases with the distance of the object from the zenith. The more elevated an object is above the horizon, the less is the parallax, its distance from the earth's centre continuing the same. When the object is in the zenith, it has no parallax; but when in the horizon, its parallax is greatest. The horizontal parallax being given, the parallax at any given altitude may be found by the following rule.

<sup>3</sup> To the logarithmic cosine of the given altitude, add the log. sine of the horizontal parallax, the sum, rejecting 10 from the index, will be the log. sine of the parallax in altitude.

*Demonstration.* Let B be the place of an object produce OB, ED to F and D; then the angle BOZ will be the apparent altitude of the object, BEZ the true altitude, and OBE the parallax in altitude. Now in the triangle AOE,

$$R : \text{fine OAE} :: EA : EO.$$

And in the triangle OBE

$$BE (=EA) : EO :: \text{fine BOE} : \text{fine OBE}.$$

$$\text{Hence } R : \text{cosine BOA} :: \text{fine OAE} : \text{fine OBE}.$$

As the two last terms are generally small quantities, the arch may be substituted in place of its sine without any sensible error.

*Example.* Let the apparent altitude of the moon's centre be  $39^{\circ} 25'$ , and the moon's horizontal parallax  $56' 54''$ . Required the parallax in altitude?

Moon's apparent alt.  $39^{\circ} 25'$  cosine 9.8879260

Moon's horizontal par.  $56' 54''$  sine 8.2188186

Moon's par. in altitude  $43' 57''$  sine 8.1076446

As the apparent place of an object is nearer the horizon than its true place, the parallax is therefore to be added to the apparent altitude, to obtain the true altitude. Hence also an object will appear to rise later and set sooner.

The sine of the parallax of an object is inversely as its distance from the earth's centre.

*Demonstration.* Let A be the place of an object, and H the place of the same object at another time, or that of another object at the same instant; join EH, then in the triangles AOE, HOE.

$$R : \text{fine OAE} :: AE : OE$$

$$\text{fine OHE} : R :: OE : EH.$$

$$\text{Hence fine OHE} : \text{fine OAE} :: AE : EH.$$

The parallax of an object makes it appear more distant from the meridian than it really is.

*Demonstration.* The true and apparent places of an object are in the same vertical, the apparent place being lower than the true; and all verticals meet at the zenith: hence the apparent place of an object is more distant from the plane of the meridian than the true place.

The longitude, latitude, right ascension, and declination of an object, are affected by parallax. The difference between the true and apparent longitudes is called the *parallax in longitude*; in like manner, the difference between the true and apparent latitudes, right ascensions, and declinations, are called the *parallax in latitude*, *right ascension*, and *declination*, respectively.—When the object is in the nonagesimal, the parallax in longitude is nothing, but that in latitude is greatest; and when the object is in the meridian, the parallax in right ascension vanishes, and that in declination is a maximum. The apparent longitude is greater than the true longitude when the object is east of the nonagesimal, otherwise less; and when the object is in the eastern hemisphere, the apparent right ascension exceeds the true, but is less than the true right ascension when the object is in the western hemisphere. The apparent place of an object is more distant from the elevated poles of the ecliptic and equator than the true place: hence, when the latitude of the place and elevated pole of the ecliptic are of the same name, the apparent latitude is less than the true latitude, otherwise greater; and the apparent declination will be less or greater than the true declination, according as the latitude of the place, and declination of the object, are of the same or of a contrary denomination.

The parallaxes in longitude, latitude, right ascension, and declination, in the spheroidal hypothesis, may be found by the following formulæ; in which  $L$  represents the latitude of the place, diminished by the angle contained between the vertical and radius of the given place;  $P$  the horizontal parallax for that place;  $a$  the altitude of the nonagesimal at the given instant;  $d$  the apparent distance of the object from the nonagesimal;  $\lambda$  the true and apparent latitudes of the object;  $D$  the true and apparent declinations respectively; and  $m$  its apparent distance from the meridian.

Then par. in long. =  $P \cdot \text{fine } a \cdot \text{fine } d \cdot \text{secant } l$ , to radius unity; and par. in lat. =  $P \cdot \text{cosine } a \cdot \text{cosine } \lambda = p \cdot \text{cosine } d \cdot \text{fine } a \cdot \text{fine } \lambda$ .

The fine — is used when the apparent distance of the object from the nonagesimal and from the elevated pole of the ecliptic are of the same affection, and the sign

Parallax.

<sup>4</sup> The sine of the parallax of an object in the inverse ratio of its distance from the earth's centre.

<sup>5</sup> Parallax increases the apparent distance of an object from the meridian.

<sup>6</sup> Parallax in longitude, latitude, right ascension, and declination

Parallax  
||  
Parallelo-  
pipedia.

sign + if of different affection. If the greatest precision be required, the following quantity  $0.00000121216$ .  $\text{pa. long.}^2$ , sine  $2L$ , is to be applied to the parallax in latitude found as above, by addition or subtraction, according as the true distance of the object from the elevated pole of the ecliptic is greater or less than  $90^\circ$ .

Again,  $\text{par. in right ascen.} = P. \cosine L. \text{ sine } m. \text{ secant } D$ , to radius unity : and  $\text{par. in declination} = P. \text{ sine } L. \cosine \delta = P. \cosine L. \text{ sine } \delta, \cosine m$ .

The upper or lower sign is to be used, according as the distance of the object from the meridian and from the elevated pole of the equator are of the same or different affection. Part  $2d$ , of  $\text{par. in declination} = 0.00000121216. \text{ par. in right ascen.}^2$ , sine  $2D$ ; which is additive to, or subtractive from, part first of parallax in declination, according as the true distance of the object from the elevated pole of the equator is greater or less than  $90^\circ$ . For the moon's parallax see ASTRONOMY, N<sup>o</sup> 384 and 385. There is also a curious paper in the first volume of Asiatic Researches, p. 320, &c. on the same subject, to which we refer our readers.

*PARALLAX of the Earth's annual Orbit*, is the difference between the places of a planet as seen from the sun and earth at the same instant. The difference between the longitudes of the planet as seen from the sun and earth is called the *parallax in longitude*; and the difference between its latitudes is the *parallax in latitude*.

PARALLAX, is also used to denote the change of place in an object arising from viewing it obliquely with respect to another object. Thus the minute hand of a watch is said to have a parallax when it is viewed obliquely; and the difference between the instants shown by it, when viewed directly and obliquely, is the quantity of parallax in time.

PARALLEL, in geometry, an appellation given to lines, surfaces, and bodies, everywhere equidistant from each other. See GEOMETRY.

*PARALLEL Sphere*, that situation of the sphere wherein the equator coincides with the horizon, and the poles with the zenith and nadir.

*PARALLEL Sailing*. See NAVIGATION, Book I. Ch. iv. p. 689.

*PARALLELS of Latitude*, in astronomy, are lesser circles of the sphere parallel to the ecliptic, imagined to pass through every degree and minute of the colures.

*PARALLELS of Altitude*, or *Almucantars*, are circles parallel to the horizon, imagined to pass through every degree and minute of the meridian between the horizon and zenith, having their poles in the zenith.

*PARALLELS of Declination*, in astronomy, are the same with parallels of latitude in geography.

PARALLELOPIPED, in geometry, a regular solid comprehended under six parallelograms, the opposite ones whereof are similar, parallel, and equal to each other.

PARALLELOPIPEDIA, in natural history, a genus of spars, externally of a determinate and regular figure, always found loose, detached, and separate from all other bodies; and in form of an oblique parallelo-piped, with six parallelogram sides and eight solid angles; easily fissile either in an horizontal or perpendicular direction; being composed of numbers of

thin plates, and those very elegantly and regularly arranged bodies, each of the same form with the whole mass, except that they are thinner in proportion to their horizontal planes, and naturally fall into these and no other figures, on being broken with a slight blow.

PARALOGISM, in logic, a false reasoning, or a fault committed in demonstration, when a consequence is drawn from principles that are false; or, though true, are not proved; or when a proposition is passed over that should have been proved by the way.

PARALYSIS, the Palsy. See MEDICINE, N<sup>o</sup> 265.

PARAMECIA, in natural history, a name given to such animalcules as have no visible limbs or tails, and are of an irregularly oblong figure.

PARAMOUNT, (compounded of two French words *par*, i. e. *per*, and *monter*, *ascendere*), signifies in the English law the "highest lord of the fee, of lands, tenements, and hereditaments." As there may be a lord mesne where lands are held of an inferior lord, who holds them of a superior under certain services; so this superior lord is lord *paramount*. Also the king is the chief lord, or lord *paramount* of all the lands in the kingdom. *Co. Lit.* 1.

PARANYMPH, among the ancients, the person who waited on the bridegroom, and directed the nuptial solemnities; called also *pronubus* and *auspex*, because the ceremonies began by taking auspices. As the paranymphe officiated only on the part of the bridegroom, a woman called *pronuba* officiated on the part of the bride.

PARAPET, in fortification, an elevation of earth designed for covering the soldiers from the enemy's cannon or small-shot. See FORTIFICATION.

PARAPHERNALIA, or PARAPHERNA, in the civil law, those goods which a wife brings her husband besides her dower, and which are still to remain at her disposal exclusive of her husband, unless there is some provision made to the contrary in the marriage-contract. Some of the English civilians define the paraphernalia to be such goods as a wife challengeth over and above her dower or jointure, after her husband's death; as furniture for her chamber, wearing apparel, and jewels, which are not to be put into the inventory of her husband's goods; and a French civilian calls paraphernalia the moveables, linen, and other female necessities, which are adjudged to a wife in prejudice of the creditors, when she renounces the succession of her husband.

PARAPHIMOSIS, a disorder of the penis, wherein the prepuce is shrunk, and withdrawn behind the glans, so as not to be capable of being brought to cover the same; which generally happens in venereal disorders. See SURGERY.

PARAPHRASE, an explanation of some text in clearer and more ample terms, whereby is supplied what the author might have said or thought on the subject. Such are esteemed Erasmus's paraphrase on the New Testament, the Chaldee Paraphrase on the Pentateuch, &c.

PARAPHRENITIS, an inflammation of the diaphragm. See DIAPHRAGM, and *Index to MEDICINE*.

PARAPHROSYNE, a word used by medical writers to denote a delirium, or an alienation of mind in fevers, or from whatever other cause.

Parcæ.

PARAPLEGIA, a species of palsy. See MEDICINE, n° 268.

PARASANG, an ancient Persian measure, different at different times, and in different places; being usually 30, sometimes 40, and sometimes 50 stadia, or furlongs.—The word, according to Littleton, has its rise from *paraseb angarius*, *q. d.* the space a post-man rides from one station, *angaria*, to another.

PARASCENIUM, in the Grecian and Roman theatres, was a place behind the scenes whither the actors withdrew to dress and undress themselves. The Romans more frequently called it *Posscenium*. See THEATRE.

PARASELENE, in natural philosophy, a mock moon; a meteor or phenomenon encompassing or adjacent to the moon, in form of a luminous ring; wherein are observed sometimes one and sometimes two or more images of the moon.

PARASEMON, among the Greeks, was the figure carved on the prow of the ships to distinguish them from each other. This figure was generally that of a bull, lion, or other animal; sometimes the representation of a mountain, tree, flower, &c.

PARASITE, among the Greeks, was originally a very reputable title; the parasites being a kind of priests, at least ministers, of the gods, in the same manner as the epulones were at Rome. They took care of the sacred corn, or the corn destined for the service of the temples and the gods, *viz.* sacrifices, feasts, &c. They had even the intendance over sacrifices; and took care that they were duly performed. At Athens there was a kind of college of 12 parasites; each people of Attica furnishing one, who was always chosen out of the best families. Polybius adds, that a parasite was also an honourable title among the ancient Gauls, and was given to their poets. But of late it has been made a term of reproach, and used for a flatterer or mean dependent.

PARASITES, or *PARASITICAL Plants*, in botany, such plants as are produced out of the trunk or branches of other plants, from whence they receive their nourishment, and will not grow on the ground. Such are the Mistletoe, &c.

PARASTATÆ, in anatomy. See PROSTATE.

PARATALASSIA. See PRIMORIE.

PARBUNCLE, in a ship, the name of a rope almost like a pair of slings: it is seized both ends together, and then put almost double about any heavy thing that is to be hoisted in or out of the ship; having the hook of the runner hitched into it, to hoist it up by.

PARCÆ, in heathen mythology, goddesses who were supposed to preside over the accidents and events, and to determine the date or period of human life.

The Parcæ were three, Clotho, Lachesis, and Atropos; because, forsooth, all things have their beginning, progress, and end. Hence the poets tell us, the Parcæ spun the thread of mens lives; that Clotho held the distaff, and drew the thread; Lachesis twirled the spindle, and spun it; and Atropos cut it. *Clotho colum retinet, Lachesis net, Atropos occa.*

The ancients represent the Parcæ divers ways: Lucian, in the shape of three poor old women, having large locks of wool, mixed with daffodils on their heads; one of which holds a distaff, the other a wheel, and the third a pair of scissars, wherewith to cut the

thread of life. Others represent them otherwise: Clotho appearing in a long robe of divers colours, wearing a crown upon her head adorned with seven stars, and holding a distaff in her hand; Lachesis in a robe beset with stars, with several spindles in her hand; and Atropos, clad in black, cutting the thread with a pair of large scissars.

The ancients imagined that the Parcæ used white wool for a long and happy life, and black for a short and unfortunate one. See *Necessity* in MYTHOLOGY.

PARCHMENT, the skins of sheep or goats prepared after such a manner as to render it proper for writing upon, covering books, &c.

The word comes from the Latin *pergamena*, the ancient name of this manufacture; which is said to have been taken from the city Pergamos, to Eumenes king whereof its invention is usually ascribed; though, in reality, that prince appears rather to have been the improver than the inventor of parchment. For the Persians of old, according to Diodorus, wrote all their records on skins; and the ancient Ionians, as we are told by Herodotus, made use of sheep skins and goat-skins in writing, many ages before Eumenes's time. Nor need we doubt that such skins were prepared and dressed for that purpose, after a manner not unlike that of our parchment; though probably not so artificially.—The manufacture of parchment is begun by the skinner, and finished by the parchment-maker.

The skin having been stripped of its wool, and placed in the lime-pit, in the manner described under the article SHAMMY, the skinner stretches it on a kind of frame, and pares off the flesh with an iron instrument; this done, it is moistened with a rag; and powdered chalk being spread over it, the skinner takes a large pumice stone, flat at bottom, and rubs over the skin, and thus scowers off the flesh; he then goes over it again with the iron instrument, moistens it as before, and rubs it again with the pumice stone without any chalk underneath: this smooths and softens the flesh-side very considerably. He then drains it again, by passing over it the iron instrument as before. The flesh-side being thus drained, by scraping off the moisture, he in the same manner passes the iron over the wool or hair-side; then stretches it tight on a frame; and scrapes the flesh-side again: this finishes its draining; and the more it is drained the whiter it becomes. The skinner now throws on more chalk, sweeping it over with a piece of lamb-skin that has the wool on; and this smooths it still farther. It is now left to dry, and when dried, taken off the frame by cutting it all round. The skin thus far prepared by the skinner, is taken out of his hands by the parchment-maker, who first, while it is dry, pares it on a summer, (which is a calf-skin stretched in a frame), with a sharper instrument than that used by the skinner; and working with the arm from the top to the bottom of the skin, takes away about one half of its thickness. The skin thus equally pared on the flesh-side, is again rendered smooth, by being rubbed with the pumice stone, on a bench covered with a sack stuffed with floes; which leaves the parchment in a condition fit for writing upon. The parings thus taken off the leather, are used in making glue, size, &c. See the article GLUE, &c.

What is called *vellum* is only parchment made of the skins of abortives, or at least sucking calves. This has

Parchment

Pardalis  
||  
Pardon.

has a much finer grain, and is whiter and smoother than parchment: but is prepared in the same manner, except its not being passed through the lime-pits.

PARDALIS, in natural history. See FELIS.

PARDIES (Ignatius Gaston), an ingenious and learned French Jesuit, born at Paris in 1636. He taught polite literature for several years; during which time he composed several small pieces, both in prose and verse, with peculiar delicacy of thought and style. At length he devoted himself entirely to mathematics and natural philosophy, and read all authors, ancient as well as modern, in those branches of knowledge. He died in 1673, of an infectious disorder contracted by confessing and preaching to the prisoners in the Bicetre during the Easter holidays. Father Pardies published several works; of which his *Elements of Geometry* are well known in England, where a translation of them has gone through several editions. In 1672 he had a dispute with Sir Isaac Newton respecting his *Theory of Light and colours*; which may be seen in the *Philosophical Transactions* for that year.

PARDON, in criminal law, is the remitting or forgiving an offence committed against the king.

Beccaria on  
Crimes and  
Punish-  
ments.

Law (says an able writer), cannot be framed on principles of compassion to guilt; yet justice, by the constitution of England, is bound to be administered in mercy: this is promised by the king in his coronation oath; and it is that act of his government which is the most personal and most entirely his own. The king condemns no man; that rugged task he leaves to his courts of justice: the great operation of his sceptre is mercy. His power of pardoning was said by our Saxon ancestors to be derived *à lege sua dignitatis*: and it is declared in parliament, by stat. 27 Hen. VIII. c. 24. that no other person hath power to pardon or remit any treason or felonies whatsoever; but that the king hath the whole and sole power thereof, united and knit to the imperial crown of this realm.

This is indeed one of the great advantages of monarchy in general above any other form of government, that there is a magistrate who has it in his power to extend mercy wherever he thinks it is deserved; holding a court of equity in his own breast, to soften the rigour of the general law, in such criminal cases as merit an exemption from punishment. Pardons (according to some theorists) should be excluded in a perfect legislation, where punishments are mild, but certain; for that the clemency of the prince seems a tacit disapprobation of the laws. But the exclusion of pardons must necessarily introduce a very dangerous power in the judge or jury; that of continuing the criminal law by the spirit instead of the letter; or else it must be holden, what no man will seriously avow, that the situation and circumstances of the offender (though they alter not the essence of the crime) ought to make no distinction in the punishment. In democracies, however, this power of pardon can never subsist; for there nothing higher is acknowledged than the magistrate who administers the laws: and it would be impolitic for the power of judging and of pardoning to centre in one and the same person. This (as the president Montesquieu observes) would oblige him very often to contradict himself, to make and to unmake his decisions: it would tend to confound all ideas of right among the mass of people; as they would find it dif-

ficult to tell, whether a prisoner were discharged by his innocence, or obtained a pardon through favour. In Holland, therefore, if there be no stadtholder, there is no power of pardoning lodged in any other member of the state. But in monarchies the king acts in a superior sphere; and though he regulates the whole government as the first mover, yet he does not appear in any of the disagreeable or invidious parts of it. Whenever the nation see him personally engaged, it is only in works of legislation, magnificence, or compassion. To him therefore the people look up as the fountain of nothing but bounty and grace; and these repeated acts of goodness, coming immediately from his own hand, endear the sovereign to his subjects, and contribute more than any thing to root in their hearts that filial affection and personal loyalty which are the sure establishment of a prince.

The king may pardon all offences merely against the crown or the public; excepting, 1. That, to preserve the liberty of the subject, the committing any man to prison out of the realm, is by the *habeas corpus* act, 31 Car. II. c. 2. made a *præmunire*, unpardonable even by the king. Nor, 2. can the king pardon, where private justice is principally concerned in the prosecution of offenders: *Non potest rex gratiam facere cum injuria et damno aliorum*. Therefore, in appeals of all kinds (which are the suit, not of the king, but of the party injured), the prosecutor may release; but the king cannot pardon. Neither can he pardon a common nuisance, while it remains unredressed, or so as to prevent an abatement of it; though afterwards he may remit the fine: because though the prosecution is vested in the king to avoid the multiplicity of suits, yet (during its continuance) this offence favours more of the nature of a *private* injury to each individual in the neighbourhood, than of a *public* wrong. Neither, lastly, can the king pardon an offence against a popular or penal statute, after information brought; for thereby the informer hath acquired a private property in his part of the penalty.

There is also a restriction of a peculiar nature, that affects the prerogative of pardoning, in case of parliamentary impeachments, viz. that the king's pardon cannot be pleaded to any such impeachment, so as to impede the inquiry, and stop the prosecution of great and notorious offenders. Therefore, when, in the reign of Charles II. the earl of Danby was impeached by the house of commons of high treason and other misdemeanors, and pleaded the king's pardon in bar of the same, the commons alleged, "That there was no precedent that ever any pardon was granted to any person impeached by the commons of high treason, or other high crimes, depending the impeachment;" and thereupon resolved, "That the pardon so pleaded was illegal and void, and ought not to be allowed in bar of the impeachment of the commons of England:" for which resolution they assigned this reason to the house of lords, "That the setting up a pardon to be a bar of an impeachment defeats the whole use and effect of impeachments: for should this point be admitted, or stand doubted, it would totally discourage the exhibiting any for the future; whereby the chief institution for the preservation of the government would be destroyed." Soon after the Revolution, the commons renewed the same claim, and  
voted;

Pardon.

Pardon. voted, "That a pardon is not pleadable in bar of an impeachment." And at length, it was enacted by the act of settlement, 12 & 13 W. III. c. 2. "That no pardon under the great seal of England shall be pleadable to an impeachment by the commons in parliament." But, after the impeachment has been solemnly heard and determined, it is not understood that the king's royal grace is farther restrained or abridged: for, after the impeachment and attainder of the six rebel lords in 1715, three of them were from time to time reprieved by the crown; and at length received the benefit of the king's most gracious pardon.

The effect of such pardon by the king, is to make the offender a new man; to acquit him of all corporal penalties and forfeitures annexed to that offence for which he obtains his pardon; and not so much to restore his former, as to give him a new credit and capacity. But nothing can restore or purify the blood when once corrupted, if the pardon be not allowed till after attainder, but the high and transcendent power of parliament. Yet if a person attainted receives the king's pardon, and afterwards hath a son, that son may be heir to his father; because the father being made a new man, might transmit new inheritable blood; tho', had he been born before the pardon, he could never have inherited at all.

Such is the nature of pardons in Britain. These, like other good things, may doubtless be abused; and if they are in any instance, their abuse deserves censure: but that in their nature they should be counted absurd, arbitrary, and destructive of morality, can, we suspect, proceed from nothing but from the presumptive petulence of modern reformers, or from a mistake in the system of civil equality.

Godwin's  
Inquiry  
concerning  
Political  
Justice.

We are told, however, by a late champion for the Rights of Man, that "the very word to a reflecting mind is fraught with absurdity. 'What is the rule that ought in all cases to prescribe to my conduct?' Surely justice: understanding by justice the greatest utility of the whole mass of beings that may be influenced by my conduct. 'What then is clemency?' It can be nothing but the pitiable egotism of him who imagines he can do something better than justice. 'Is it right that I should suffer constraint for a certain offence?' The rectitude of my suffering must be founded in its tendency to promote the general welfare. He therefore that pardons me, iniquitously prefers the imaginary interest of an individual, and utterly neglects what he owes to the whole. He bestows that which I ought not to receive, and which he has no right to give. 'Is it right, on the contrary, that I should not undergo the suffering in question? Will he, by rescuing me from suffering, do a benefit to me, and no injury to others?' He will then be a notorious delinquent, if he allow me to suffer. There is indeed a considerable defect in this last supposition. If, while he benefits me, he do no injury to others, he is infallibly performing a public service. If I suffered in the arbitrary manner which the supposition includes, the whole would sustain an unquestionable injury in the injustice that was perpetrated. And yet the man who prevents this odious injustice, has been accustomed to arrogate to himself the attribute of clement, and the apparently sublime, but in reality tyrannical, name of

VOL. XIII.

forgiveness. For, if he does more than has been here described, instead of glory he ought to take shame to himself, as an enemy to the interest of human kind. If every action, and especially every action in which the happiness of a rational being is concerned, be susceptible of a certain rule, then caprice must be in all cases excluded: there can be no action, which if I neglect, I shall have discharged my duty; and, if I perform, I shall be entitled to applause."

Such is the reasoning of this zealous democrat; reasoning which, in our opinion, betrays want of feeling or ignorance of human nature. That human nature is such as, in the aggregate, to need controul, no one who is acquainted with it will deny; and there appears to be no other method of controuling mankind but by general laws; and these laws may, through the natural imperfection of human affairs, be cruel in one case, where they are just in another. Cases may likewise occur where the sentence of the law, without its execution, will answer every purpose which could be expected from it; and where the execution of it would be extreme cruelty though it might in strict unfeeling language be called *justi e*, because in conformity with the letter of the law: Yet though such cases may and do often occur, it would indeed be absurd to abolish any of those laws which the security of civil society has required; and therefore the only natural remedy against *legal injustice* is the *system of pardons*.

Our author next goes on to trace the origin of pardons; and instead of a definite system of law, we are told that it is necessary to have a court of reason, to which the decisions of a court of law shall be brought for revival: a remedy apparently too vague and indeterminate to produce any lasting or good effect; and the proposal of which results from supposing mankind more virtuous and more knowing than they really are. We are next led to consider the abuses of pardons: from whence our author would draw an argument for their abolition; a species of reasoning unfair and unphilosophical. He tells us, that the authority in this case is placed first in the judge and next in the king and council. "Now (says he), laying aside the propriety or impropriety of this particular selection, there is one grievous abuse which ought to strike the most superficial observer. These persons, with whom the principal trust is reposed, consider their functions in this respect as a matter purely incidental, exercise them with supineness, and in many instances with the most scanty materials to guide their judgment. This grows in a considerable degree out of the very name of pardon, which implies a work of supererogatory benevolence."

Now it is obvious to remark, that pardons are in general granted in consequence of an application from people who have more than *scanty materials to guide their judgments*, and on whose fidelity in relating the circumstances of the case, confidence is placed or not according to the several characters. Our author next proceeds to the arbitrary character of pardons. "Such a system (he says), to speak it truly, is a lottery of death, in which each man draws his ticket for reprieve or execution, as undefinable accidents shall decide." The allusion here to a lottery ticket is peculiarly unfortunate and indelicate, nor does the whole sentence show any great degree of candour. It is possible to define

5 A

a parti-

Pardon.

Pardon.

a particular crime, and to annex a particular punishment to the commission of it; but the nature of morality consists not in the external action, but in the motives which prompted to it. Definite law cannot, however, always make this distinction; and after the sentence of the law is pronounced, it comes to be considered whether there are any alleviating circumstances in the case; and whether there are or not, must depend on the particulars or accidents of the case: and it is indeed impossible to suppose that these accidents could be previously defined; their nature does not admit of it. To particularize and define every mode of an action which imagination can conceive, or which experience has shown us may happen, would indeed be an Herculean labour; and we might literally say with the apostle, *that the world could not contain the books that might be written*. We are, however, told that "reason is a thousand times more explicit and intelligible than law; and when we are accustomed to consult her, the certainty of her decisions would be such, as men practised in our present courts are totally unable to conceive." Were reason, however, appointed to be appealed to in all cases, and to be the final criterion, it would leave far greater room for villany than any mode at present in practice. *Reason* is a very uncertain and indefinite term, and may be made any thing, according to the circumstances or passions of men. In the present perturbed state of mankind there are many appeals to Reason contradictory to one another, and the dictates of genuine unbiassed reason are rarely attended to.

We are next told that pardons are destructive to morality. "Another very important consequence (says our author) grows out of the system of pardons. A system of pardons is a system of unmitigated slavery. I am taught to expect a certain desirable event, from what? From the clemency, the uncontrolled, unmerited kindness of a fellow mortal. Can any lesson be more degrading? The pusillanimous servility of the man who devotes himself with everlasting obsequiousness to another, because that other having begun to be unjust, relents in his career; the ardour with which he confesses the rectitude of his sentence and the enormity of his defects, will constitute a tale that future ages will find it difficult to understand. What are the sentiments in this respect that are alone worthy of a rational being? Give me that, and that only, which without injustice you cannot refuse. More than justice it would be disgraceful for me to ask, and for you to bestow. I stand upon the foundation of right. This is a title which brute force may refuse to acknowledge, but which all the force in the world cannot annihilate. By resisting this plea you may prove yourself unjust, but in yielding to it you grant me but my due. If, all things considered, I be the fit subject of a benefit, the benefit is merited: merit in any other sense is contradictory and absurd. If you bestow upon me unmerited advantage, you are a recreant from the general good. I may be base enough to thank you; but if I were virtuous, I should condemn you. These sentiments alone are consistent with true independence of mind. He that is accustomed to regard virtue as an affair of favour and grace, cannot be eminently virtuous. If he occasionally perform an action of apparent kindness, he will applaud the generosity of his senti-

ments; and if he abstain, he will acquit himself with the question, 'May I not do what I will with my own?' In the same manner, when he is treated benevolently by another, he will in the first place be unwilling to examine strictly into the reasonableness of this treatment, because benevolence, as he imagines, is not subject to any flexibility of rule; and, in the second place, he will not regard his benefactor with that erect and unembarrassed mien; that complete sense of equality, which is the only immoveable basis of virtue and happiness."

Such is Mr. Godwin's conclusion on this subject; and we leave it with our readers to determine, whether his system or that which we at present enjoy would be the more rigorous or unjust; or whether mankind are indeed arrived at that eminent pitch of virtue, as to disdain every favour which they do not absolutely merit. The Christian religion speaks a different language: but amidst the rage of popular reform, its *small still voice* is unheard and neglected.

**PAREGORICS**, in pharmacy, medicines that assuage pain, otherwise called **ANODYNES**.

**PAREIRA FRAYA**, in the materia medica, a kind of oblong and large root brought from the Brasils.—It is certainly a diuretic of no mean character, and has done great service in nephritic cases. In pleurifies and quinsies, it has been used with more success than almost any medicine we know of singly.

**PARELCON**, in grammar, a figure by which a word or syllable is added to the end of another.

**PAREMBOLE**, in rhetoric, a figure wherein something relating to the subject is inserted in the middle of a period. All the difference between the parembole and parenthesis, according to Vossius, is, that the former relates to the subject in hand, whereas the latter is foreign to it.

**PARENCHYMA**, in anatomy, a term introduced by Erasistratus, signifying all that substance which is contained in the interstices betwixt the blood-vessels of the viscera, which he imagined to be extravasated and concreted blood.

**PARENCHYMA of Plants**. Grew applies the term *parenchyma* to the pith or pulp, or that inner part of a fruit or plant through which the juice is supposed to be distributed. See **PLANTS**.

**PARENT**, a term of relation applicable to those from whom we immediately derive our being. See *MORAL Philosophy*, n° 129 and 137.

To this article belongs an enquiry into, 1. The legal duties of parents to their legitimate children. 2. Their power over them.

I. The duties of parents to legitimate children consist in three particulars; their *maintenance*, their *protection*, and their *education*.

1. The duty of parents to provide for the *maintenance* of their children, is a principle of natural law; an obligation, says Puffendorf, laid on them not only by nature herself, but by their own proper act, in bringing them into the world; for they would be in the highest manner injurious to their issue, if they only gave their children life, that they might afterwards see them perish. By begetting them, therefore, they have entered into a voluntary obligation, to endeavour, as far as in them lies, that the life which they have bestowed shall be supported and preserved. And thus the

Pardon

||  
Parent.Blackst.  
Comments.

Parent.

the children will have a perfect right of receiving maintenance from their parents. And the preside<sup>t</sup> Montequieu has a very just observation upon this head, that the establishment of marriage, in all civilized states, is built on this natural obligation of the father to provide for his children; for that ascertain<sup>s</sup> and makes known the person who is bound to fulfil this obligation; whereas, in promiscuous and illicit conjunctions, the father is unknown; and the mother finds a thousand obstacles in her way; shame, remorse, the constraint of her sex, and the rigour of laws, that stifle her inclinations to perform this duty; and besides, she generally wants ability.

The municipal laws of all well regulated states have taken care to enforce this duty: though providence has done it more effectually than any laws, by implanting in the breast of every parent that natural *sensu*, or insuperable degree of affection, which not even the deformity of person or mind, not even the wickedness, ingratitude, and rebellion of children, can totally suppress or extinguish.

The civil law obliges the parent to provide maintenance for his child; and if he refuses, *judex de ea re cognoscet*. Nay, it carries this matter so far, that it will not suffer a parent at his death totally to disinherit his child, without expressly giving his reason for so doing; and there are 14 such reasons reckoned up, which may justify such disinherison. If the parent alleged no reason, or a bad, or a false one, the child might set the will aside, *tantum testamentum inofficium*, a testament contrary to the natural duty of the parent. And it is remarkable under what colour the children were to move for relief in such a case; by suggesting, that the parent had lost the use of his reason when he made the *inofficium* testament. And this, as Puffendorff observes, was not to bring into dispute the testator's power of disinheriting his own offspring; but to examine the motives upon which he did it; and if they were found defective in reason, then to set them aside. But perhaps this is going rather too far: every man has, or ought to have, by the laws of society, a power over his own property: and, as Grotius very well distinguishes, natural right obliges to give a *necessary* maintenance to children; but what is more than that they have no right to, than as it is given by the favour of their parents, or the positive constitutions of the municipal law.

Let us next see what provision our own laws have made for this natural duty. It is a principle of law, that there is an obligation on every man to provide for those descended from his loins; and the manner in which this obligation shall be performed, is thus pointed out. The father and mother, grandfather and grandmother, of poor impotent persons, shall maintain them at their own charges, if of sufficient ability, according as the quarter-sessions shall direct; and, if a parent runs away, and leaves his children, the churchwardens and overseers of the parish shall seize his rents, goods, and chattels, and dispose of them toward their relief. By the interpretations which the courts of law have made upon these statutes, if a mother or a grandmother marries again, and was before such second marriage of sufficient ability to keep the child, the husband shall be charged to maintain it; for this being a debt of her's, when single, shall, like others, extend

to charge the husband. But, at her death the relation being dissolved, the husband is under no farther obligation.

No person is bound to provide a maintenance for his issue, unless where the children are impotent and unable to work, either through infancy, disease, or accident; and then is only obliged to find them with necessities, the penalty on refusal being no more than 20s. a month. For the policy of our laws, which are ever watchful to promote industry, did not mean to compel a father to maintain his idle and lazy children in ease and indolence; but thought it unjust to oblige the parent, against his will, to provide them with superfluities, and other indulgencies of fortune; imagining they might trust to the impulse of nature, if the children were deserving of such favours. Yet, as nothing is so apt to stifle the calls of nature, as religious bigotry, it is enacted, that if any Popish parent shall refuse to allow his Protestant child a fitting maintenance, with a view to compel him to change his religion, the lord chancellor shall by order of court constrain him to do what is just and reasonable. But this did not extend to persons of another religion, of no less bitterness and bigotry than the Popish: and therefore, in the very next year, we find an instance of a Jew of immense riches, whose only daughter having embraced Christianity, he turned her out of doors; and on her application for relief, it was held she was intitled to none. But this gave occasion to another statute, which ordains, that if Jewish parents refuse to allow their Protestant children a fitting maintenance, suitable to the fortune of the parent, the lord chancellor, on complaint, may make such order therein as he shall see proper.

Our law has made no provision to prevent the disinheriting of children by will; leaving every man's property in his own disposal, upon a principle of liberty in this as well as every other action; though perhaps it had not been amiss if the parent had been bound to leave them at the least a necessary subsistence. Indeed, among persons of any rank or fortune, a competence is generally provided for younger children, and the bulk of the estate settled upon the eldest by the marriage-articles. Heirs also, and children, are favourites of our courts of justice, and cannot be disinherited by any dubious or ambiguous words; there being required the utmost certainty of the testator's intentions to take away the right of the heir.

2. From the duty of maintenance we may easily pass to that of *protection*; which is also a natural duty, but rather permitted than enjoined by any municipal laws; nature, in this respect, working so strongly as to need rather a check than a spur. A parent may, by our laws, maintain and uphold his children in their law-suits, without being guilty of the legal crime of maintaining quarrels. A parent may also justify an assault and battery in defence of the persons of his children; nay, where a man's son was beaten by another boy, and the father went near a mile to find him, and there revenged his son's quarrel by beating the other boy, of which beating he afterwards unfortunately died; it was not held to be murder, but manslaughter merely. Such indulgence does the law show to the frailty of human nature, and the workings of parental affection.

3. The last duty of parents to their children is that

Parent.

Parent.

of giving them an *education* suitable to their station in life: a duty pointed out by reason, and of far the greatest importance of any. For, as Puffendorff very well observes, it is not easy to imagine or allow, that a parent has conferred any considerable benefit upon his child by bringing him into the world, if he afterwards entirely neglects his culture and education, and suffers him to grow up like a mere beast, to lead a life useless to others and shameful to himself. Yet the municipal laws of most countries seem to be defective in this point, by not constraining the parent to bestow a proper education upon his children. Perhaps they thought it punishment enough to leave the parent who neglects the instruction of his family, to labour under those griefs and inconveniences which his family, so uneducated, will be sure to bring upon him. Our laws, though their defects in this particular cannot be denied, have in one instance made a wise provision for breeding up the rising generation; since the poor and laborious part of the community, when past the age of nurture are taken out of the hands of their parents, by the statutes for apprenticing poor children; and are placed out by the public in such a manner as may render their abilities, in their several stations, of the greatest advantage to the commonwealth. The rich indeed are left at their own option, whether they will breed up their children to be ornaments or disgraces to their family. Yet in one case, that of religion, they are under peculiar restrictions: for it is provided, that if any person sends any child under his government beyond the seas, either to prevent its good education in England, or in order to enter into, or reside in, any Popish college, or to be instructed, persuaded, or strengthened in the Popish religion; in such case, besides the disabilities incurred by the child so sent, the parent or person sending shall forfeit 100 l. which shall go to the sole use and benefit of him that shall discover the offence. And if any parent, or other, shall send or convey any person beyond sea, to enter into, or be resident in, or trained up in, any priory, abbey, nunnery, Popish university, college, or school, or house of Jesuits or priests, or in any private Popish family, in order to be instructed, persuaded, or confirmed, in the Popish religion; or shall contribute any thing towards their maintenance when abroad by any pretext whatever, the person both sending and sent shall be disabled to sue in law or equity, or to be executor or administrator to any person, or to enjoy any legacy or deed of gift, or to bear any office in the realm, and shall forfeit all his goods and chattels, and likewise all his real estate for life. See NONCONFORMISTS.

II. The *power* of parents over their children is derived from the former consideration, their *duty*; this authority being given them, partly to enable the parent more effectually to perform his duty, and partly as a recompence for his care and trouble in the faithful discharge of it. And upon this score the municipal laws of some nations have given a much larger authority to the parents than others. The ancient Roman laws gave the father a power of life and death over his children; upon this principle, that he who gave had also the power of taking away. But the rigour of these laws was softened by subsequent constitutions: so that we find a father banished by the emperor Hadrian for killing his son, though he had com-

mitted a very heinous crime; upon this maxim, *tha patris potestas in pietate debet, non in atrocitate, consistere*. But still they maintained to the last a very large and absolute authority: for a son could not acquire any property of his own during the life of his father; but all his acquisitions belonged to the father, or at least the profits of them, for his life.

The power of a parent by the English law is much more moderate; but still sufficient to keep the child in order and obedience. He may lawfully correct his child, being under age, in a reasonable manner: for this is for the benefit of his education. The consent or concurrence of the parent to the marriage of his child under age, was also directed by our ancient law to be obtained: but now it is absolutely necessary; for without it the contract is void. And this also is another means which the law has put into the parent's hands, in order the better to discharge his duty; first, of protecting his children from the snares of artful and designing persons; and next, of settling them properly in life, by preventing the ill consequences of too early and precipitate marriages. A father has no other power over his son's estate, than as his trustee or guardian; for though he may receive the profits during the child's minority, yet he must account for them when he comes of age. He may indeed have the benefit of his children's labour while they live with him, and are maintained by him; but this is no more than he is intitled to from his apprentices or servants. The legal power of a father (for a mother, as such, is intitled to no power, but only to reverence and respect), the power of a father, we say, over the persons of his children ceases at the age of 21; for they are then enfranchised by arriving at years of discretion, or that point which the law has established (as some must necessarily be established) when the empire of the father, or other guardian, gives place to the empire of reason. Yet, till that age arrives, this empire of the father continues even after his death; for he may by his will appoint a guardian to his children. He may also delegate part of his parental authority, during his life, to the tutor or schoolmaster of his child; who is then *in loco parentis*, and has such a portion of the power of the parent committed to his charge, *viz.* that of restraint and correction, as may be necessary to answer the purposes for which he is employed.

In the Gentleman's Magazine for 1750, we have the following case of conscience. "A person has his own parents and his own children living, both parties equally indigent, both equally incapable of assisting themselves, and both equally earnest in calling upon him for relief. Things are so circumstanced that he can possibly assist but one party, and not both. *Query.* Which party has the greatest claim to his assistance, and to which he is obliged, by all ties human and divine, to give the preference?" One solves this difficulty, by informing us of a pretty print done at Rome, representing a young woman suckling her aged father, on which the following lines are quoted.

My child and father vital nurture crave,  
Parental, filial, fondness both would save;  
But if a nursing only one can live,  
I choose to save the life I cannot give.

Here we find the preference given to the parent;  
and

Parent.

Parent.

and another correspondent gives the same decision in these words. "The obligations arising from nature, and natural affection, seem to be in this case reciprocal and equipollent: the child is as strongly attracted to the parent, as the parent to the child. But will not filial gratitude operate and decide in favour of the parents? Does not the person, either mediately or immediately, owe his present power and abilities to relieve to his parents? and are not they on that account best intitled to relief? Does not the fifth commandment declare more strongly in favour of the parents, than any other divine precept does in favour of the children? If a person had an opportunity given him of delivering either his parent or his child (but not both) from certain death, I dare say the voice of nature and of mankind would applaud him that saved his parent, and condemn him that should prefer his child. There is more of selfishness in preferring the child; and to save the parent seems to me to be much the more generous, noble, and exalted conduct. 'Tis indeed, upon the whole, a melancholy alternative; but if both parties continue importunate, and neither will relinquish their claims in favour of the other, I say relieve the parent." There are two correspondents, however, who think differently, and their reasons are as follow: "A person's children have the greatest claim to his assistance, and he is obliged by all ties to prefer them, in that respect, to his parents. It is true, when a man's parents are in want, they have a claim to his assistance; but that claim is not equal to that which his children have. His parents he has of necessity: his children, of choice. It is his duty, before he beget children, to consider how he is to provide for them: and by being wilfully the cause of their existence, he comes under such an obligation to provide for their comfortable subsistence, as must be stronger than any obligation of that kind he can be under to persons with whom his connection is involuntary. Both nature and reason point it out as the duty of all parents to provide for their children; but not *vice versa*. If a man's parents happen to be indigent, and he himself able, he is bound to maintain them out of respect and gratitude: but his obligation to provide for his children is a debt of strict justice; and therefore ought to be preferred. Nevertheless, the description of the case to which the query is subjoined, is so general, that it is easy to figure a case according to that description in which the person ought to prefer his parents. This obligation to provide for his children may have been dissolved by monstrous ingratitude, such as their plotting against his life; or he may have given them proper education, and ample provisions, which they have riotously squandered away: in either of which cases it is thought he is undoubtedly discharged from his obligation. But if they have lost their portions purely by misfortunes, without their fault, it is thought his obligation to assist them is not wholly extinguished; and in that case there may be great reason to doubt whether their claim to his assistance, or that of his parents, is preferable: it is thought, however, the children's is preferable." "I find (says the author of the last answer) that all your correspondents agree, that the life of the parent is to be preserved. It is very certain that the relation between me and my child is exactly equal to that which is between me and my parent; and therefore relation

cannot decide in favour of the one or the other: I must then be determined by a different consideration; and I know of none more weighty than the following. If I preserve the life of my child, I am instrumental in giving life to all his descendants, which may, perhaps, be very numerous; but if I preserve the life of my parent, I preserve a single life only, and that a short one. I therefore say, *relieve the child*. But it is thought that the voice of nature will applaud the person who preserves the parent: if so, nature must applaud a rule which she herself does not observe: it is natural for old men to die before young ones. Besides, the command, *Be fruitful and multiply, and replenish the earth*, may be opposed to the fifth commandment." Still, however, it is doubtless difficult to determine in such cases when they occur, as there are no fixed rules whereby to decide. With respect to the power of parents and the duty of children, much may be said. There is, however, scarcely any instance where either are oftener abused than with respect to marriage. This, as it is the most important event in the civil life either of a man or woman, so it is often rendered peculiarly unfortunate, by precipitate folly and want of duty in children; and as often through the unreasonable severity of parents. As a child is bound not to give unreasonable offence to a parent in the choice of a partner; so neither ought the parent to impose any improper or arbitrary restraint upon the child.

The power of a parent in China is very great; for a father, while living, has the power of an absolute despotic tyrant, and after his death is worshipped as a god. Let a son become ever so rich, and a father ever so poor, there is no submission, no point of obedience, that the latter cannot command, or that the former can refuse. The father is absolute master, not only of his son's estate, but also of his concubines and children, whom, whenever they displease him, he may sell to strangers. If a father accuses his son before a mandarine, there needs no proof of his guilt; for they cannot believe that any father can be so unnatural as to bring a false accusation against his own son. But should a son be so insolent as to mock his father, or arrive at such a pitch of wickedness as to strike him, all the province where this shameful act of violence is committed is alarmed; it even becomes the concern of the whole empire; the emperor himself judges the criminal. All the mandarines near the place are turned out of their posts, especially those of the town where he lived, for having been so negligent in their instructions; and all the neighbours are reprimanded for neglecting by former punishments, to put a stop to the wickedness of the criminal before it arrived to such flagitiousness. As to the unhappy wretch himself, they cut him into a thousand pieces, burn his bones, level his house to the ground, and even those houses that stand near it, and set up monuments and memorials of the horrid deed.

The emperor of China, who is one of the most powerful and despotic monarchs upon earth, pays the greatest attention to his mother. An instance of this, Pere Amyot relates as having happened at Pekin, A. D. 1752, when the emperor's mother entered her 60th year, which, among the Chinese, is accounted a very remarkable period. Grofier likewise particularly describes the homage the emperor pays his mother

Parent.

Geography.

Parent.

mother every new year's day in the palace, at which ceremony all the great officers of his court assist. See CHILDREN, *FILIAL Piety*, *PARENTAL Affection*, &c.

PARENT (Unsoine), a mathematician, was born at Paris in 1666. He showed an early propensity to mathematics. He accustomed himself to write remarks upon the margins of the books which he read; and he had filled a variety of books with a kind of commentary at the early age of thirteen. At fourteen he was put under a master, who taught rhetoric at Chantres. It was here that he happened to see a dodecaëdron, upon every face of which was delineated a fun-dial, except the lowest, whereon it stood. Struck as it were instantaneously with the curiosity of these dials, he attempted drawing one himself: but having a book which only showed the practical part without the theory, it was not till after his rhetoric master came to explain the doctrine of the sphere to him that he began to understand how the projection of the circles of the sphere formed fun-dials. He then undertook to write a Treatise upon Gnomonics. The piece was indeed rude and unpolished; but it was entirely his own, and not borrowed. About the same time he wrote a book of Geometry, in the same taste, at Beauvois. His friends then sent for him to Paris to study the law; and, in obedience to them, he studied a course in that faculty: which was no sooner finished than, urged by his passion for mathematics, he shut himself up in the college of Dormans, that no avocation might take him from his beloved study; and, with an allowance of less than 200 livres a year, he lived content in this retreat, from which he never stirred but to the Royal College, in order to hear the lectures of M. de la Hire or M. de Sauveur. When he found himself capable of teaching others, he took pupils: and fortification being a branch of mathematics which the war had brought into particular notice, he turned his attention to it; but after some time began to entertain scruples about teaching what he had never seen, and knew only by the force of imagination. He imparted this scruple to M. Sauveur, who recommended him to the Marquis d'Aligre, who luckily at that time wanted to have a mathematician with him. Parent made two campaigns with the marquis, by which he instructed himself sufficiently in viewing fortified places; of which he drew a number of plans, though he had never learned the art of drawing. From this period he spent his time in a continual application to the study of natural philosophy, and mathematics in all its branches, both speculative and practical; to which he joined anatomy, botany, and chemistry. His genius managed every thing, and yet he was incessant and indefatigable in his application. M. de Billettes, who was admitted in the academy of sciences at Paris in 1699, with the title of their mechanician, nominated for his disciple Parent, who excelled chiefly in this branch. It was soon discovered in this society, that he engaged in all the various subjects which were brought before them; and indeed that he had a hand in every thing. But this extent of knowledge, joined to a natural impetuosity of temper, raised in him a spirit of contradiction, which he indulged on all occasions: sometimes to a degree of precipitancy highly culpable, and often with but little regard to decency. Indeed the same behaviour was shown to

him, and the papers which he brought to the academy were often treated with much severity. He was charged with obscurity in his productions; and he was indeed so notorious for this fault, that he perceived it himself, and could not avoid correcting it. The king had, by a regulation in 1716, suppressed the class of scholars of the academy, which seemed to put too great an inequality betwixt the members. Parent was made a joint or assistant member for geometry: but he enjoyed this promotion but a short time; for he was taken off by the small-pox the same year, at the age of 50. He was author of a great many pieces, chiefly on mechanics and geometry.

PARENTAL, something belonging to the relation of parent. See PARENT.

PARENTAL *Affection*, the endearing attachment of parents to their children, including in it love; a desire of doing good to those who by an act of our own depend upon us for all that they enjoy. Nature even excites this affection in brutes: but in them it continues only so long as it is necessary for the preservation of their offspring; for when these are able to provide for themselves, it ceases, and the relation is forgotten. In man, however, though it lessens, or at least becomes less anxious as the dependence of the child becomes less, it never entirely ceases, except in some few instances of extreme depravity. Authors, however, have imagined, and Lord Kames \* among the rest, that after the child is provided for, and no more depends on the parent, all affection would cease, were it not artificially preserved and confirmed by habit. Whether his lordship, in this opinion, be right or wrong, we shall not pretend to say. One thing, however, is certain, that be it natural or not, it is one of the greatest comforts of life, even when all dependence has ceased. It matters not that there are many instances where this comfort is not felt. Human depravity has often obliterated the finest feelings of the mind; and it is not to be wondered at if in some instances it do so in the case before us. A good heart certainly can enjoy no greater satisfaction than that arising from grateful returns of kindness and affection to an aged parent. As the vexations which parents receive from their children hasten the approach of age, and double the force of years; so the comforts which they reap from them are balm to all other sorrows, and disappoint the injuries of time. Parents repeat their lives in their offsprings; and their concern for them is so near, that they feel all their sufferings, and taste all their enjoyments, as much as if they regarded their own persons. However strong we may suppose the fondness of a father for his children, yet they will find more lively marks of tenderness in the bosom of a mother. There are no ties in nature to compare with those which unite an affectionate mother to her children, when they repay her tenderness with obedience and love.

We have a remarkable instance of parental affection in Zaleucus ‡ prince of the Locrines; who made a decree, that whoever was convicted of adultery should be punished with the loss of both his eyes. Soon after this establishment, the legislator's own son was apprehended in the very fact, and brought to a public trial. How could the father acquit himself in so tender and delicate a conjuncture? Should he execute the law in all its rigour, this would be worse than death

Parental.

\* Sketches of the Hist. of Man.

‡ Ælian. l. b. 13.

Parental  
||  
Paretone-  
um.

death to the unhappy youth: should he pardon so notorious a delinquent, this would defeat the design of his salutary institution. To avoid both these inconveniences, he ordered one of his own eyes to be pulled out and one of his son's.

Diodorus Siculus also, lib. 34. gives us a surprising instance of the same warm affection. Cambalus, a young gentleman of character and fortune in the city of Mulgeatum, being one day out a courting, was way-laid, and very near being robbed and murdered by the banditti who infested that part of the country. Gorgus, the young gentleman's father, happened to come by at the very instant, to whom Cambalus related the danger he was in. The son was on foot, the father on horseback; but no sooner had he heard the melancholy tale, than he leapt from his horse, desired his son to mount, and make the best of his way into the city: but Cambalus, preferring his father's safety to his own, would by no means consent to it; on the contrary, conjured his father to leave him, and take care of himself. The father, struck with the generosity and affection of his son, added tears to entreaties, but all to no purpose. The contest between them is better conceived than described—while bathed in tears, and beseeching each other to preserve his own life, the banditti approached and stabbed them both.

Amongst the ancient Greeks, the sentiments of parental affection were exceedingly strong and ardent. The mutual tenderness of the husband and the wife was communicated to their offspring; while the father viewed in his child the charms of its mother, and the mother perceived in it the manly graces of its father. As parental kindness is the most simple and natural expansion of self-love, so there are innumerable instances of it in all countries savage and civilized.

PARENTALIA, in antiquity, funeral obsequies, or the last duties paid by children to their deceased parents.

PARENTHESIS, in grammar, certain intercalary words inserted in a discourse, which interrupt the sense or thread, but seem necessary for the better understanding of the subject.

PARENZO, a small but strong town of Italy, and in Istria, with a bishop's see and a good harbour; seated on the gulf of Venice, in E. Long. 13. 46. N. Lat. 39. 28. It submitted to the Venetians in 1267.

PARESIS, in medicine, a palsy of the bladder, wherein the urine is either suppressed or discharged involuntarily.

PARETONEUM, in natural history, the name of an earth found on the shores of Egypt, Cyrene, and the island of Crete, used by the ancients in painting.

It had its name either from a part of Egypt, near which it was gathered, or from the name of a town in that kingdom, where it was usually sold. Vitruvius is of the first opinion, and Volaterrus of the other. Of late it was thought to be lost; but it is still common on the shores of most of the islands of the Archipelago, though not observed or regarded; and is truly a very heavy and tough clay of a fine white colour, found in masses of different sizes, generally as soft as the softer clays within the strata; and, by rolling about on the beach in this state, it gathers up the sand, small

shells, and other foulnesses, we always find about it. It is likely that there are strata of it fine and pure in the cliffs there, and that the sea washes off masses of them in storms and high tides, which are what we find.

PARGET, in natural history, a name given to several kinds of gypsum, or plaster-stone.

PARGETING, in building, is used for the plastering of walls, and sometimes for plaster itself.

Pargeting is of various kinds: as, 1. White-lime and hair mortar laid on bare walls. 2. On bare laths, as in partitioning and plain cieling. 3. Rendering the insides of walls, or doubling partition walls. 4. Rough-casting on heart laths. 5. Plastering on brick-work, with finishing mortar, in imitation of stone-work; and the like upon heart-laths.

PARHELION, or PARHELIUM, formed from *παρά* near, and *ἥλιος* sun, in natural philosophy, a mock-sun or meteor, in form of a very bright light, appearing on one side of the sun.

Appearances of this kind have been made mention of both by the ancients and moderns. Aristotle observes, that in general they are seen only when the sun is near the horizon, though he takes notice of two that were seen in Bosphorus from morning to evening; and Pliny has related the times when such phenomena were observed at Rome. Gassendi says, that in 1635 and 1636 he often saw one mock-sun. Two were observed by M. de la Hire in 1689; and the same number by Cassini in 1693, Mr Grey in 1700, and Dr Halley in 1702: but the most celebrated appearances of this kind were seen at Rome by Scheiner, by Muschenbroeck at Utrecht, and by Hevelius at Sedan. By the two former, four mock-suns were observed, and by the latter seven.

Parhelia are apparently of the same size with the sun, though not always of the same brightness, nor even of the same shape; and when a number appear at once, there is some difference in both these respects among them. Externally they are tinged with colours like the rainbow; and many have a long fiery tail opposite to the sun, but paler towards the extremity. Parhelia are generally accompanied with coronas, some of which are tinged with rainbow colours, but others are white. They differ in number and size; but all agree in breadth, which is that of the apparent diameter of the sun.

A very large white circle, parallel to the horizon, generally passes through all the parhelia; and, if it were entire, it would go through the centre of the sun. Sometimes there are arcs of lesser circles concentric to this, touching those coloured circles which surround the sun. They are also tinged with colours, and contain other parhelia. There are also said to have been other circles obliquely situated with respect to all those we have mentioned; but of this we have met with no authentic account. The order of the colours in these circles is the same as in the rainbow; but on the inside, with respect to the sun, they are red, as is also observed in many other coronas.

Parhelia have been visible for 1, 2, 3, and 4 hours together; and in North America they are said to continue some days, and to be visible from sunrise to sunset.

When the parhelia disappear, it sometimes rains, or there

Target  
||  
Parhelion.

**Parhelion.** there falls snow in the form of oblong spiculæ, as Maraldi, Weidler, Krafft, and others, have observed; and because the air in North America abounds with such frozen spiculæ, which are even visible to the eye according to Ellis and Middleton, such particles have been thought to be the cause of all coronas and parhelia.

Mr Wales says, that, at Churchill in Hudson's Bay, the rising of the sun is always preceded by two long streams of red light, one on each side of him, and about  $20^{\circ}$  distant from him. These rise as the sun rises; and as they grow longer begin to bend towards each other, till they meet directly over the sun, just as he rises, forming there a kind of parhelion or mock sun. These two streams of light, he says, seem to have their source in two other parhelia, which rise with the true sun; and in the winter-season, when the sun never rises above the haze or fog, which he says is constantly found near the horizon, all these accompany him the whole day, and set with him in the same manner as they rise. Once or twice he saw a fourth parhelion directly under the true sun; but this, he says, is not common. These facts being constant, are very valuable, and may throw great light on the theory of these remarkable phenomena.

Sometimes parhelia appear in a different manner; as when three suns have been seen in the same vertical circle, well defined, and touching one another. The true sun was in the middle, and the lowest touched the horizon; and they set one after the other. This appearance was seen by M. Maleziew in 1722. Other appearances similar to this are recited by M. Muschenbroeck.

Sometimes the sun has risen or set with a luminous tail projecting from him, of the same breadth with his diameter, and perpendicular to the horizon. Such an appearance was seen by Cassini in 1672 and 1692, by De la Hire in 1702, and by Mr Ellis in Hudson's Bay.

As M. Feuillée was walking on the banks of the river La Plata, he saw the sun rising over the river with a luminous tail projecting downwards, which continued till he was six degrees high.

Paraselenæ, or mock-moons, have also been seen, accompanied with tails and coloured circles, like those which accompany the parhelia. An account of several, and a particular description of a fine appearance of this kind, may be seen in Muschenbroeck.

The Roman phenomenon, observed by Scheiner, is famous on account of its having been the first appearance of the kind that engaged the attention of philosophers. It is represented in fig. 1.; in which A is the place of the observer, B his zenith, C the true sun, AB a plane passing through the observer's eye, the true sun, and the zenith. About the sun C, there appeared two concentric rings, not complete, but diversified with colours. The lesser of them, DEF, was fuller, and more perfect; and though it was open from D to F, yet those ends were perpetually endeavouring to unite; and sometimes they did so. The outer of these rings was much fainter, so as scarcely to be discernible. It had, however, a variety of colours; but was very inconstant. The third circle, KLMN, was very large, and all over white, passing through the middle of the sun, and everywhere parallel to the ho-

zizon. At first this circle was entire; but towards the end of the appearance it was weak and ragged, so as hardly to be perceived from M towards N.

In the intersection of this circle, and the outward iris GKI, there broke out two parhelia or mock-suns, but N and K, not quite perfect; K being rather weak, but N shone brighter and stronger. The brightness of the middle of them was something like that of the sun; but towards the edges they were tinged with colours like those of the rainbow; and they were uneven and ragged. The parhelion N was a little wavering, and sent out a spiked tail, NP, of a colour somewhat fiery, the length of which was continually changing.

The parhelia at L and M in the horizontal ring were not so bright as the former; but were rounder, and white, like the circle in which they were placed. The parhelion N disappeared before K; and while M grew fainter, K grew brighter, and vanished the last of all.

It is to be observed farther, that the order of the colours in the circles DEF, GKN, was the same as in the common halos, namely, red next the sun; and the diameter of the inner circle was also about  $45^{\circ}$  degrees; which is the usual size of a halo.

The reverend Dr Hamilton sent the following account of parhelia seen at Cookstown to the Royal Irish Academy.

"Wednesday September 24th, 1783, as I was preparing to observe the sun passing the meridian, before the first limb touched the centre wire, it was obscured by a dark well defined cloud, about  $10^{\circ}$  in diameter. Upon going to the door of the transit room, to see if it was likely soon to pass off the disk of the sun, I observed the following phenomena: From the western edge of the cloud issued a luminous arc parallel to the horizon, perfectly well defined, extending exactly to the northern meridian; it was about  $30'$  broad, white, and ended in a blunted termination. On it were two parhelia; the nearest to the sun displaying the prismatic colours; the remote one white, and both ill defined. In a short time the cloud had passed off, and showed the luminous almicantar, reaching perfect to the true sun. While things were thus situated, I measured with an accurate sextant the distances of the parhelia; I found the coloured one  $26^{\circ}$ , the remote one  $90^{\circ}$ , from the true sun. Just as I had done this, a new and prismatic circle surrounded the sun, immediately within the prismatic parhelion. And now another coloured parhelion appeared on the eastern board. The sextant with its face up and down, exactly measured this and the former at the original distance of  $26^{\circ}$ ; the luminous almicantar still remaining perfect. In about 10 or 12 minutes whitish hazy clouds came on, and obscured all these uncommon appearances.—I did not observe that the atmospheric phenomena before or after were at all uncommon. The wind a light breeze at SSW. Bar. 29.6 rising. Thermometer 55.

In Fig. 2. SM represents the fourth meridian; NM north meridian; PP the prismatic circle, with two prismatic suns or parhelia, at  $26^{\circ}$  distance on each side the true sun; W the white parhelion, at  $90^{\circ}$  distance from the true sun; LA the luminous almicantar; and HQ the horizon.

Paria  
||  
Parias.

Various hypotheses have been framed by philosophers to account for this phenomenon, particularly by M. Marriotte, Descartes, and Huygens. None of them, however, are satisfactory; but those readers who wish to become acquainted with them may consult Huygen's Dissertation on this subject, in Smith's Optics, book i. ch. 11. Muschenbrock's Introduction, &c. vol. xi. p. 1038, &c. 4to.; but especially Dr Priestley's History of Vision, Light, and Colours, vol. ii. p. 613, &c.

PARIA, or NEW ANDALUSIA, a country of Terra Firma in South America; bounded on the north by the north sea; on the east by Surinam; on the west by New Granada and the Caraccas; and on the south by Guiana. It produces colouring drugs, gums, medicinal roots, Brazil-wood, sugar, tobacco, and some valuable timber; the inland parts being woody and mountainous, but interspersed with fine valleys that yield corn and pasturage. Comana is the capital town.

PARIAN-CHRONICLE. See ARUNDELIAN-Marbles, and *Parian-CHRONICLE*.

Under the article *Parian-CHRONICLE*, we have been as full as the subject seemed to require, or as the nature of our work would admit. It is unnecessary, therefore, to resume it in this place. Such of our readers, however, as wish for further information on this subject (which is equally interesting to the scholar and to the antiquarian) we must refer to Robertson's attack upon their authenticity, and to Gough's learned and judicious vindication of their authenticity, published in *Archæologia* for 1789. The extent of his learning, and the solidity of his arguments, appear upon the whole to outweigh the objections of his sensible and plausible opponent. Hewlett's book upon the same side of the question may command some degree of attention. It is ingenious. See *SANDWICH-Marble*.

PARIAN-Marble, in the natural history of the ancients, the white marble used then, and to this day, for carving statues, &c. and called by us at this time *statuary marble*.

Too many of the later writers have confounded all the white marbles under the name of the *Parian*; and among the workmen, this and all the other white marbles have the common name of *alabasters*; so that it is in general forgotten among them, that there is such a thing as alabaster different from marble; which, however, is truly the case. Almost all the world also have confounded the Carrara marble with this, though they are really very different; the Carrara kind being of a finer structure and clearer white than the Parian; but less bright and splendid, harder to cut, and not capable of so glittering a polish.

The true Parian marble has usually somewhat of a faint bluish tinge among the white, and often has blue veins in different parts of it. It is supposed by some to have had its name from the island *Paros*\*, one of the Cyclades in the Ægean Sea, where it was first found; but others will have it to have been so called from Agoracritus Parius, a famous statuary, who ennobled it by cutting a statue of Venus in it.

PARIAS, or PERREAS, a tribe of Hindoos, so peculiarly distinguished from all others, that they live by themselves in the outskirts of towns; and, in the country, build their houses apart from the villages, or

rather have villages of their own, furnished with wells; for they dare not so much as fetch water from those which other families made use of; and, lest these latter should inadvertently go to one of theirs, they are obliged to scatter the bones of dead cattle about their wells, that they may be known. They dare not in cities pass through the streets where the Bramins live; nor set foot in the villages where they dwell.—They are likewise forbidden to enter a temple, either of their god Wisnaw or Esware; because they are held impure. They get their bread by sowing, digging, and building the walls of mud houses; most of those inhabited by the common people being raised by these Parias; who also do such kinds of dirty work as other people do not care to meddle with. Nor is their diet much more cleanly; for they scruple not to eat cows, horses, fowl, or other carrion, which die of themselves, and even stink. One would scarce imagine, that contentions for precedence should ever enter into the thoughts of a people who have renounced all cleanliness, and, like swine, wallow in filth; and yet pride has divided the Parias into two classes: the first are simply called *Parias*, the other *Seriperes*. The employment of these latter is to go about selling leather, which they dress; also to make bridles, and such kind of things: some of them likewise serve for soldiers. The Parias, who reckon themselves the better family, will not eat in the house of the Seriperes; but the Seriperes will readily eat with the Parias. For this reason they are obliged to pay them respect, by lifting their hands aloft, and standing upright before them. The Seriperes, when they marry, cannot set up a pandal, a kind of garland, before their doors, made with more than three stakes or trees; should they exceed that number, the whole city would be in motion. The Seriperes are likewise subject to some sort of slavery; for when any person of credit or authority dies in the families of the Komitis, Sittis, Palis, farriers, or goldsmiths, and the friends have a mind to be at the expence of some clothes to give the Seriperes, these latter must suffer their beards to be shaven; and when the corpse is carried out of town to be burned or interred, they must do that office; for which each receives a *fanum*, or one piece and a half of silver, worth three sous and a half. These are the same sort of people who are called at Surat *Halalchers*; that is, in the Persian language, "eat-alls, or eaters at large." Nothing can offend an Hindoo more than to be called an Halalchor: yet these poor people are not offended, cringe and bow to all they pass, and go through their drudgery without noise or concern.

The Parias are very vicious, stupid, and ignorant, occasioned by their wretched way of life: The Bramins and nobility shun them as if they had the plague, and look on the meeting a Parias as the greatest misfortune. To come near one of them is a sin, to touch them a sacrilege. If a Parias were dying, it is infamy to visit him, or to give him the least assistance, in the utmost danger or distress. A Bramin who unavoidably should touch a Parias, immediately washes himself from the impurity. Even their shadow and breath being reckoned contagious, they are obliged to live on the east side of their towns, that the westerly winds which reign in this country may keep back their breath. And it is lawful for a Bramin to kill one

Paria.

Paris.

of these unhappy creatures, if he does not avoid it by getting out of his way: In short, they think them reprobated by God, and believe the souls of the damned enter into the Parias, to be punished for their crimes.— Yet the mission have found among these dregs of the people very active zealous catechists, who by their labours have very much contributed to the conversion of their countrymen, particularly one Rajanaiken a Paria soldier, who, of all the inferior missionaries, has distinguished himself most by his labours and sufferings.

**PARIETALIA** *ossa*, in anatomy. See there n° 13.

**PARIETARIA**, *PELLITORY of the WALL*: A genus of the monœcia order, belonging to the polygamia class of plants; and in the natural method ranking under the 53d order, *Scabride*. The calyx of the hermaphrodite is quadrifid; there is no corolla; there are four stamina; one style; and one seed, superior and elongated. The female calyx is quadrifid; there is no corolla; nor are there any stamina. There is one style; and one seed superior, and elongated. There are six species, of which one named the *Officinalis* is used in medicine. This has a creeping root. The stalk grows erect, is rough to the touch, and adhesive. The leaves are alternate, elliptical, lanceolate, veined, and a little rough. The flowers grow out of the axæ of the leaves, in sessile, branched, verticillate clusters, of a greenish colour tinged with red. The antheræ have a great degree of sensibility; for, if irritated with the point of a pin, they fly from the calyx with elastic force, and throw out their powder. The plant has a cooling and diuretic quality. Three ounces of the juice taken internally, or a fomentation externally applied, have been found serviceable in the strangury. The plant laid upon heaps of corn infested with weevils, is said to drive away those destructive insects.

**PARIETES**, in anatomy, a term used for the inclosures or membranes that stop up or close the hollow parts of the body; especially those of the heart, the thorax, &c. The parietes of the two ventricles of the heart are of unequal strength and thickness; the left exceeding the right, because of its office, which is to force the blood through all parts of the body; whereas the right only drives it through the lungs.

**PARIS** (Matthew), one of our best historians from William the Conqueror to the latter end of the reign of Henry III. but of his life few particulars have been transmitted to us. Leland, his original biographer, without determining whether he was born in France or England, informs us, that he was a monk of St Alban's, and that he was sent by Pope Innocent to reform the monks of the convent at Holm in Norway. Bishop Bale, the next in point of time, adds to the above relation, that, on account of his extraordinary gifts of body and mind, he was much esteemed, particularly by King Henry III. who commanded him to write the history of his reign. Fuller makes him a native of Cambridgeshire, because there was an ancient family of his name in that county. He also mentions his being sent by the pope to visit the monks in the diocese of Norwich. Bishop Tanner, Bishop Nicholson, Doctor Du Pin, and the *Nouveau Dictionnaire Historique*, add not a single fact to those above related. Matthew Paris died in the

monastery of St Alban's in the year 1259. He was doubtless a man of extraordinary knowledge for the 13th century; of an excellent moral character, and, as an historian, of strict integrity. His style is unpolished; but that defect is sufficiently atoned for by the honest freedom with which he relates the truth, regardless of the dignity or sanctity of the persons concerned. His works are, 1. *Historia ab Adamo ad Conquestum Angliæ*, lib. i. manuscript. col. C. C. Cantab. c. ix. Most of this book is transcribed, by Matthew of Westminster, into the first part of his *Florilegium*. 2. *Historia major, seu rerum Anglicanarum historia à Gul. Conquestoris adventu ad annum 43 Henrici III.* &c. several times printed. The first part of this history, viz. to the year 1235, is transcribed almost verbatim from the Chronicle of Roger Wendover; and the Appendix, from the year 1260, is the work of William Rashington, who was also a monk of St Alban's. 3. *Vita duorum Offarum, Mercia regum, S. Albani fundatorum*. 4. *Gesta 22 abbatum S. Albani*. 5. *Addamenta chronicorum ad hist. majorem*; printed. 6. *Historia minor, sive epitome majoris historie*; manuscript. Besides many other things in manuscript.

**PARIS**, son of Priam, king of Troy, by Hecuba, also named *Alexander*. He was decreed, even before his birth, to become the ruin of his country; and when his mother, in the first months of her pregnancy, had dreamed that she should bring forth a torch which would set fire to her palace, the soothsayers foretold the calamities which were to be expected from the imprudence of her future son, and which would end in the ruin of Troy. Priam, to prevent so great and so alarming an evil, ordered his slave Archelaus to destroy the child as soon as he was born. The slave either touched with humanity, or influenced by Hecuba, did not obey, but was satisfied to expose the child on mount Ida, where the shepherds of the place found him, and educated him as their own. Some attribute the preservation of his life, before he was found by the shepherds, to the motherly tenderness of a she-bear who suckled him. Young Paris, though educated among shepherds and peasants, gave very early proofs of courage and intrepidity; and from his care in protecting the flocks of mount Ida from the rapacity of the wild beasts, he was named *Alexander*, "helper of men." He gained the esteem of all the shepherds, and his graceful countenance and manly deportment recommended him to the favours of Cœnone, a nymph of Ida, whom he married, and with whom he lived with the most perfect tenderness. Their conjugal peace was, however, of no long duration. At the marriage of Peleus and Thetis, the goddesses of discord, who had not been invited to partake of the entertainment, showed her displeasure, by throwing into the assembly of the gods who were at the celebration of the nuptials, a golden apple, on which were written the words *Detur pulchriori*. All the goddesses claimed it as their own; the contention at first became general; but at last only three, Juno, Venus, and Minerva, wished to dispute their respective right to beauty. The gods, unwilling to become arbiters in an affair so tender and so delicate in its nature, appointed Paris to adjudge the prize of beauty to the fairest of the goddesses; and indeed the shepherd seemed sufficiently qualified.

Paris.

qualified to decide so great a contest, as his wisdom was so well established, and his prudence and sagacity so well known. The goddesses appeared before their judge without any covering or ornament, and each endeavoured by promises and entreaties to gain the attention of Paris, and to influence his judgment. Juno promised him a kingdom; Minerva military glory; and Venus the fairest woman in the world for his wife, as Ovid expresses it, *Heroid* 17. v. 118.

*Unaque cum regnum; belli daret altera laudem;  
Tyndaridis conjux, tertia dixit, eris.*

After he had heard their several claims and promises, Paris adjudged the prize to Venus; and gave her the golden apple, to which perhaps she seemed entitled as the goddess of beauty. This decision of Paris drew upon the judge and his family the resentment of the two other goddesses. Soon after, Priam proposed a contest among his sons and other princes, and promised to reward the conqueror with one of the finest bulls of mount Ida. His emissaries were sent to procure the animal, and it was found in the possession of Paris, who reluctantly yielded it. The shepherd was anxious to regain his favourite, and he went to Troy and entered the lists of the combatants. He was received with the greatest applause, and obtained the victory over his rivals, Nestor the son of Neleus, Cyrenus son of Neptune, Polites, Helenus, and Deiphobus, sons of Priam. He likewise obtained a superiority over Hector himself; which prince, enraged to see himself conquered by an unknown stranger, pursued him closely; and Paris must have fallen a victim to his brother's rage, had he not fled to the altar of Jupiter. This sacred retreat preserved his life; and Cassandra the daughter of Priam, struck with the similarity of the features of Paris with those of her brothers, inquired his birth and his age. From these circumstances she soon discovered that he was her brother, and as such she introduced him to her father and to her brothers. Priam acknowledged Paris as his son, forgetful of the alarming dreams which had caused him to meditate his death, and all jealousy ceased among the brothers. Paris did not long suffer himself to remain inactive; he equipped a fleet, as if willing to redeem Hecione his father's sister, whom Hercules had carried away and obliged to marry Telamon the son of Æacus. This was the pretended motive of his voyage, but the causes were far different. Paris remembered that he was to be the husband of the fairest of women; and, if he had been led to form those expectations while he was an obscure shepherd of Ida, he had now every plausible reason to see them realised, since he was the acknowledged son of the king of Troy. Helen was the fairest woman of the age, and Venus had promised her to him. On these grounds, therefore, he went to Sparta, the residence of Helen, who had married Menelaus. He was received with great respect; but he abused the hospitality of Menelaus, and while the husband was absent in Crete, Paris persuaded Helen to elope with him and to fly to Asia. Helen consented; and Priam received her into his palace without difficulty, as his

sister was then detained in a foreign country, and as he wished to show himself as hostile as possible to the Greeks. This affair was soon productive of serious consequences. When Menelaus had married Helen, all her suitors had bound themselves by a solemn oath to protect her person, and to defend her from every violence; and therefore the injured husband reminded them of their engagements, and called upon them to recover her. Upon this all Greece took up arms in the cause of Menelaus; Agamemnon was chosen general of all the combined forces, and a regular war was begun. Paris, meanwhile, who had refused Helen to the petitions and embassies of the Greeks, armed himself, with his brothers and subjects, to oppose the enemy; but the success of the war was neither hindered nor accelerated by his means. He fought with little courage, and at the very sight of Menelaus, whom he had so recently injured, all his resolution vanished, and he retired from the front of the army, where he walked before like a conqueror. In a combat with Menelaus, which he undertook by means of his brother Hector, Paris must have perished, had not Venus interfered, and stolen him from the resentment of his antagonist. He wounded, however, in another battle, Machaon, Eurypylus, and Diomedes; and, according to some opinions, he killed with one of his arrows the great Achilles.

The death of Paris is differently related: some say that he was mortally wounded by one of the arrows of Philoctetes, which had been once in the possession of Hercules; and that when he found himself languid on account of his wounds, he ordered himself to be carried to the feet of Cænone, whom he had basely abandoned, and who in the years of his obscurity had foretold him that he would solicit her assistance in his dying moments. He expired before he came into the presence of Cænone; and the nymph, still mindful of their former loves, threw herself upon his body, and stabbed herself to the heart, after she had plentifully bathed it with her tears. According to others, Paris did not immediately go to Troy when he left the Peloponnesus, but he was driven on the coasts of Egypt, where Proteus, who was king of the country, detained him; and when he heard of the violence which had been offered to the king of Sparta, he kept Helen at his court, and permitted Paris to retire. Whatever was the mode of his death, it took place, we are told, about 1188 B. C. See *TROY*, &c.

PARIS, the capital of the kingdom of France; is situated on the river Seine, in the île of France; being one of the largest and finest cities in Europe. It derived its modern name from the ancient Parisii; and is supposed by some to have had the Latin name of *Lu-tetia*, from *Lutum* "mud," the place where it now stands having been anciently very marshy and muddy. Ever since the reign of Hugh Capet, that is, for near 800 years, this city hath been the usual residence of the kings of France; it is of a circular form, and, including the suburbs, about five French leagues, or 15 English miles, in circumference. The number of its inhabitants is computed at about 500,000 (A); that of its

5 B 2

streets

(A) The latest, and perhaps the most accurate, accounts, have stated the number of inhabitants in Paris at considerably upwards of 800,000. It is supposed to be less than London, but the difference is not thought to be very great.

streets 912; and that of its houses upwards of 20,000, exclusive of the public structures of all sorts. Its greatest defect according to some, is the want of good drinking water; but others tell us that very fine water is brought by an aqueduct from the village of Arcueil, not far from Paris, but own that the water of the Seine, and the city, is not good. The streets are of a proper breadth, well built, paved, and lighted. There is a great number of tribunals and officers here; most of which are kept in the Palais, situated on an island, to which it gives name. The number of churches, convents, hospitals, market-places, fountains, gates, and bridges, in this city is very great; besides the university, several academies, public libraries, royal palaces and castles, and above 100 hotels, some of them very stately. But to be more particular, that part called *la Cité*, lies in the centre, and consists of three islands formed by the Seine, *viz.* L'Isle de Palais, L'Isle de Notre Dame, and L'Isle Louviers. It is the principal of the three parts into which the city is divided, and contains the following remarkable structures: 1. Several bridges; of which some are of wood and others of stone, and have most of them a row of houses on each side. The chief of these are the Pont-neuf and Pont royal: the first consists of 12 arches, which, properly speaking, make two bridges, the one leading from the suburbs of St Germain to the city, and the other from thence to that part called *la Ville*: there is a carriage-way in the middle 30 feet broad, and foot-walks on each side, raised two feet high; and in the centre stands a brass statue of king Henry IV. on horse-back. On this bridge is also the building called *La Samaritaine*, from a group of figures upon it representing our Saviour and the Samaritan woman, standing near Jacob's well. Here is a pump to raise the water, which through several pipes supplies the quarter of the Louvre, and some other parts of the town. The Pont-royal, which leads to the Thuilleries, was built by order of Lewis XIV. in the room of a wooden bridge that was carried away by the current in 1684. 2. The cathedral of Notre Dame, or our Lady, being dedicated to the Holy Virgin, which is a large stately Gothic structure, said to have been founded by king Childeric, and built in the form of a cross. Here, besides other great personages, are interred the cardinals de Retz and Noailles. From the two square towers belonging to it, is a noble prospect of the city and neighbouring country. Here is a vast quantity of gold and silver plate, rich tapestry, and fine paintings; and the number of the canons is no less than 50. Near it stands the palace of the archbishop, in which is the advocates library: the revenue of the archbishop amounts to about 180,000 livres; and his taxation to the court of Rome is 4283 guillders. 3. The priory and parish-church of St Bartholomew; the last of which is the most beautiful in all this part of the city, and stands near the Palais. 4. The Palais, which gives name to an island, and in which the parliament, with a great many other courts, are held. It was anciently the residence of the kings; but was given to the officers of justice by Philip the Fair, who also settled the parliament here in 1302. The parliament, consisting of several chambers, each of which has its department, is opened the day after Martinmas with a solemn mass, celebrated by a bishop, and continues sitting till the

8th of September, when a vacation-chamber is appointed during the interval, for criminal causes, and others which require dispatch. The jurisdiction of this court is of great extent. There is a beautiful chapel belonging to the Palais: in which is also the prison, or jail, for the jurisdiction of the parliament, called in French *La Conciergerie*. 5. The Hotel Dieu, the most ancient and largest hospital in Paris, in which 8000 sick and infirm poor are taken care of, and attended by the nuns of the order of St Augustine. 6. The hospital of St Catharine, where poor women and maidens are entertained three days, and attended by the above-mentioned nuns. 6. The Grande Chatelet, where some of the inferior courts of justice hold their sessions. 8. Fort l'Eveque, in which is the mint and a prison. It stands in or near the street La Ferroniere, in which Henry IV. was stabbed by Ravilliac. 9. St Germain l'Auxerrois, which is called the *royal palace church*; because the palaces of the Louvre and Thuilleries stand in its parish. 10. The Louvre, an ancient royal palace, of which a part was rebuilt by Lewis XIV. Had it been completed on the same plan, it would have been a most magnificent structure. On one of its gates is the following inscription, *Dum totum impleat orbem*: the meaning of which is, "May it last till the owner of it hath extended his sway over the whole world:" which implies what the French kings have constantly aimed at. Another inscription shows, at the same time, the vanity of the nation, and their abject flattery of their grand monarch. It may be rendered in English thus:

Louvre is a palace for great Lewis fit:  
God him alone exceeds, as heaven does it.

This palace is joined to the Thuilleries by a gallery, in which are 180 models of fortresses, some situated in France, and some in other countries, executed with the utmost accuracy. Here is a valuable collection of paintings, the king's printing-house, the mint where the king's medals are struck, together with a prodigious quantity of rich tapestry hangings, and a collection of ancient arms, among which are those worn by Francis I. at the famous battle of Pavia. Here also the French academy, the academy of inscriptions and belles lettres, the royal academy of sciences, the academy of painting and sculpture, and the royal academy of architecture, have their meetings. The first of these was founded for the improvement of the French language: and as for the others, their names explain the design of their institution. 11. Le Palais Royal, which was built by cardinal Richlieu, in the year 1636, and belongs to the duke of Orleans. It is said to contain pictures to the value of four millions of livres, which were purchased by the regent of that title, and of which a part belonged to Christina queen of Sweden. 12. The palace des Thuilleries, so called from a tile or brick-kiln which stood there formerly. This palace, as we observed above, communicates with the Louvre by a gallery. Behind it are exceeding pleasant gardens, adorned with fine walks, planted with ever-greens, and other trees, and with beautiful parterres, where are to be seen, all the year round, every flower according to its season. There are also three fine fountains, the garden, and a canal. Behind the Thuilleries, on the bank of the river are pleasant walks,

com.

Paris.

composed of four rows of lofty elms, to which vast crowds of people resort in the fine weather, as well as to the gardens. In the palace is a spacious and magnificent theatre; and hard by it are the Elysian fields, where a surprising number of coaches are to be seen in fair weather: not far off is the church of St Roche, where the celebrated poet Corneille is interred. 13. La place de Louis le Grand, a very beautiful square, in the centre of which is an equestrian statue of that king, which is justly accounted a masterpiece. 14. The Place, or Square des Victoires, which is round, and contains a statue of Lewis XIV. of gilt brass, erected to him by the duke de la Fuillade, with this inscription, *viro immortalis*. 15. The Royal Library in the Rue Vivien, which contains 94,000 printed books, 30,000 manuscripts, and a prodigious collection of copperplates and medals. Near by, in the churchyard of St Joseph, lies the famous comic poet Moliere. 16. The parish church of St Eustace, which stands in the quarter of the same name, and contains the tomb of the great minister Colbert. 17. The gate of St Dennis, which was erected as a triumphal arch in honour of Lewis XIV. 18. The gate of St Martin, erected also in form of a triumphal arch, in honour of the same king. Not far from hence, in the churchyard of St Nicholas des Champs, Peter Gatiendi, and other learned men, are buried. 19. La Greve, an open place, where all public rejoicings are celebrated, and malefactors executed. 20. The Hotel de Ville, which is a large building of Gothic architecture, though adorned with columns of the Corinthian order. 21. The arsenal in the quarter of St Paul, consisting of many spacious buildings, among which are a foundery and a house for making saltpetre. Here is a musquetoon of two barrels, which it is said will pierce a thick board at the distance of six miles; and for discerning an object at that distance, has a telescope fixed to the barrel. 22. The Bastile, formerly a kind of fortress like the Tower of London, which was used as a prison for state-criminals, and for such as were taken up by letters de cachet, *i. e.* by warrants signed by the king, and sealed. 23. Le Temple, a commandery of the knights of Malta, which gives name to a quarter, wherein, being a privileged place, artificers that are not freemen may carry on their business without molestation. The temple is the residence of the grand prior of the French nation. 24. That formerly called *La Maison professe des Jesuites*, in the quarter of St Anthony, in the church of which the hearts of Lewis XIII. and XIV. are preserved, each in a casket of gold, supported by two angels of massy silver, and as big as ordinary men, hovering with expanded wings. In the same quarter is a fine looking-glass manufacture, where above 500 persons are employed in polishing plates cast at St Gobin; with a convent of Franciscans, the monks of which are called *Pique-puces*, or *Prick-flas*.

In that part of the city called the *University*, the principal places are,

1. The university, which gives name to it, and which was first founded, as it is said, by Charles the Great: all the arts and sciences are taught here, particularly law, physic, and divinity. There are above 40 colleges; of which the chief are those of Sorbonne, of Navarre, of the faculty of physic, and of the four nations; but lectures are read only in eleven of them.

Paris.

The head of the university is the rector, who is chosen every three months, but sometimes is continued several years. All the professors have settled salaries; the whole annual income of the university amounting, it is said, to about 50,000 livres. 2. The Gobelins, a house or palace, where a great number of ingenious artists, in various manufactures and handicrafts, are employed by the government. The most curious tapestry of all sorts is made here. 3. The General Hospital, a most noble foundation for the poor of the female sex, near 7000 objects being taken care of and provided for. The sick are carefully tended; and those that are in health are obliged to work; different wards being allotted for foundlings, for girls who sew or knit, prostitutes, idiots, and poor women: of the last, some are kept gratis, and others pay a small matter. In the castle of Bicetre, belonging to this hospital, and consisting of many large buildings, are near 4000 persons of the other sex, among which are persons disordered in their senses, and such as are afflicted with the venereal disease. To this hospital are also sent children who abuse their parents, and lead dissolute lives. The fund for the maintenance of it, and the hospital de la Pietie, where poor children are brought up, together with the Hotel Dieu, amounts to above two millions of livres *per annum*. 4. The King's Physic Garden, in which are an infinite variety of plants and trees, a certain sum being allotted by the king for keeping the garden in order, and improving it, and for lectures on botany, anatomy, chemistry, and the materia medica. A curious collection of natural curiosities is kept here. 5. The abbey of St Victor, in which is a public library, containing some very ancient and scarce books, several curious manuscripts, and a prodigious collection of maps and copperplates. 6. The College of Physicians, to which belong five professors. 7. The Little Chatelet, an old fortress, now used for a prison. 8. The Rue St Jacques, chiefly inhabited by bookfellers. 9. The Royal College, and that of Lewis the Great: to the former belong twelve professors. 10. The Abbey of St Genevieve, in which is the marble monument of king Clovis, the shrine of St Genevieve, a large library, with a cabinet of antiquities and natural curiosities. 11. The Royal Observatory, a most stately edifice, built on the highest part of the city. Several astronomers were maintained here by the king. 12. The Royal Academy of surgery, instituted in 1731. 13. The Convent of Franciscans, in the quarter of St Andrew, the richest in France. In the same quarter are some remains of the palace of Julian the Apostate, in which Childebert, and some other kings of the Franks, afterwards resided. 14. The Play-house. 15. The Convent of Carthusians, in the quarter of Luxembourg, containing fine paintings. 16. The palace of Luxembourg, or Orleans, a magnificent structure, containing also some fine paintings by Rubens, and embellished with a noble garden. In the Hotel des Ambassadeurs, ambassadors extraordinary are entertained for three days, and those of remote countries all the time they stay at Paris. 17. The Abbey of St Germain des Prez, which contains a very valuable library, the manuscripts alone making 8000 volumes: here also is a cabinet of antiquities. 18. The Hotel royal des Invalides, erected by Lewis XIV. in which

Paris.

lame and superannuated officers and soldiers are maintained. The buildings take up no less than 17 acres. The number of common soldiers here amount to about 3000, and of officers to about 500. The chapel is very magnificent. Hard by is a military academy in which 500 young gentlemen are instructed in the art of war.

Our readers from the above account will be able to conceive what Paris was; what it is we cannot so easily show them. In the course of the violent commotions which have taken place, some buildings have been demolished, and others appropriated to very different purposes from those they were first designed for. Changes of men and measures have followed one another with such astonishing rapidity, that it is impossible to calculate what alterations may yet take place in the course of a short time. The Bastille, that dreadful engine of despotism, is levelled with the dust, though imprisonments have not ceased; many other places in that extensive capital have been filled with unfortunate persons, several of whom have been condemned and executed for reasons we are unacquainted with. The church of Notre Dame, one of the finest cathedrals in Europe, is no more a place of Christian worship, but has been solemnly dedicated by the people to *reason* and *philosophy*. Its archbishop has renounced the peaceful religion of Jesus (a thing almost unheard of in the history of Christianity); and has with his own hand knocked down those images which ancient superstition had erected. On the whole, such strange and unlooked for revolutions have taken place in this once flourishing city, as renders it impossible to say where they may end, or what may be their consequences, though it is to be hoped the government will now be more stable, the national convention being more moderate since the fall of Robespierre.—To give a history of the events that have occurred here within these few years, is not our business in an article of this sort. They have been partly, *i. e.* as far as they were then known, mentioned under the article FRANCE; and for further information, our readers were there referred to REVOLUTION. To this article we again refer them, in hopes that something decisive may (by the time that we arrive at that period of our work) have taken place with respect to the state of which Paris is the capital.

PARIS, *Herb Paris*, or *Truelove*: A genus of the trigynia order, belonging to the octandria class of plants; and in the natural method ranking under the 11th order, *Sarmentaceæ*. The calyx is tetraphyllous; there are four petals, narrow in proportion; the berry quadrilocular. There is but one species, growing naturally in woods and shady places both in Scotland and England. It hath a single naked stem, greenish blossoms, and bluish black berries.—The leaves and berries are said to partake of the properties of opium; and the juice of the berries is useful in inflammations of the eyes. Linnæus says, that the root will vomit as well as ipecacuanha, but must be taken in double the quantity. Goats and sheep eat the plant; cows, horses, and swine, refuse it. Though this plant has been reckoned of a poisonous nature, being ranked among the acorites; yet late authors attribute quite other properties to it, esteeming it to be a counter-poison, and good in malignant and pestilential fevers.

Paris, Parish.

*Herb PARIS of Canada or of America, Trillium*, in botany, a genus of the hexandria trigynia class; The characters are, that it has a three-leaved spreading empalement, and three oval petals; it has six awl-shaped stamina, terminated by oblong summits, and a roundish germen with three slender recurved styles; crowned by single stigmas; the germen afterwards becomes a roundish berry, with three cells filled with roundish seeds. There are three species.

*Plaster of PARIS.* See PLASTER of Paris.

PARISH, the precinct of a parochial church, or a circuit of ground inhabited by people who belong to one church, and are under the particular charge of its minister.

The word comes from the Latin *parochia*, the Greek *παροικια* habitation; compounded of *παρ* near, and *οικος* house.—Accordingly Du Cange observes, that the name *παροικια* was anciently given to the whole territory of a bishop, and derives it from *neighbourhood*; because the primitive Christians, not daring to assemble openly in cities, were forced to meet secretly in neighbourhoods.

In the ancient church there was one large edifice in each city for the people to meet in; and this they called *parochia*, "parish." But the signification of the word was afterwards enlarged, and by a parish was meant a diocese, or the extent of the jurisdiction of a bishop, consisting of several churches; unless we will suppose, as some do, that those bishops were only pastors of single churches. Du Pin observes, that country parishes had not their origin before the 4th century; but those of cities are more ancient. The city of Alexandria is said to have been the first that was divided into parishes.

How ancient the division of parishes is, is not indeed absolutely certain; for in the early ages of Christianity in Britain, parishes were unknown, or at least signified the same that a diocese now does. There was then no appropriation of ecclesiastical dues to any particular church; but every man was at liberty to contribute his tithes to any priest or church he pleased, but he was obliged to do it to some; or if he made no special appropriation thereof, they were paid to the bishop whose duty it was to distribute them among the clergy, and for other pious purposes, according to his own discretion. Cambden says England was divided into parishes by archbishop Honorius about the year 630. Sir Henry Hobart maintains that parishes were first erected by the council of Lateran, held A. D. 1179. But Mr Selden proves, that the clergy lived in common without any division of parishes, long after the time mentioned by Cambden; and it appears from the Saxon laws, that parishes were in being long before the council of Lateran in 1179. The distinction of parishes occurs in the laws of king Edgar, about the year 970. It seems pretty clear and certain, says judge Blackstone (Com. Vol. I. p. 112.), that the boundaries of parishes were first ascertained by those of a manor or manors; because it very seldom happens that a manor extends itself over more than one parish, though there are often many manors in one parish. The lords, he adds, as Christianity spread, began to build churches upon their own demesnes or wastes, in order to accommodate their tenants in one or two adjoining lordships; and that they might have divine service regularly

Parish  
||  
Park.

gularly performed therein, obliged all their tenants to appropriate their tithes to the maintenance of the one officiating minister, instead of leaving them at liberty to distribute them among the clergy of the diocese in general; and this tract of land, the tithes of which were so appropriated, formed a distinct parish; and this accounts for the frequent intermixture of parishes one with another. For if a lord had a parcel of land detached from the main of his estate, but not sufficient to form a parish of itself, it was natural for him to endow his newly-erected church with the tithes of such lands. Extra-parochial wastes and marsh lands, when improved and drained, are by 17 Geo. II. cap. 37. to be assessed to all parochial rates in the parish next adjoining. Camden reckons 9284 parishes in England; and Chamberlayne makes 9913. They are now generally reckoned about 10,000.

*PARISH-CLERK.* In every parish the parson, vicar, &c. hath a parish-clerk under him, who is the lowest officer of the church. These were formerly clerks in orders, and their business at first was to officiate at the altar; for which they had a competent maintenance by offerings; but they are now laymen, and have certain fees with the parson on christenings, marriages, burials, &c. besides wages for their maintenance. The law looks upon them as officers for life: and they are chosen by the minister of the parish, unless there is a custom for the parishioners or church wardens to choose them; in which case the canon cannot abrogate such custom; and when chosen it is to be signified, and they are to be sworn into their office by the archdeacon, for which the court of king's bench will grant a mandamus.

*PARISII* (anc. geog.), a people of Gallia Celtica, inhabiting the country about the Sequana and Marona. Now a great part of the isle of France.—*Parisi* (Ptolemy), a people of Britain, having the Brigantes to the north and west, the German sea to the east, and the Coritani to the south, from whom they were separated by the Humber. Now *Holderness*, a peninsula of the East Riding of Yorkshire.

*PARISIORUM CIVITAS.* See *LUTETIA*.

*PARIUM* (anc. geog.), a noble city of Mysia Minor, with a port on the Propontis; called *Adraftia* by Homer, according to Pliny; but Strabo distinguishes them: according to others, the *Paslos* of Homer. *Pariani*, the people (Strabo). The birth-place of Neoptolemus surnamed *Glossographus* (Strabo). Here stood a Cupid equal in exquisite workmanship to the Cnidian Venus.

*PARK* (French *parque*, i. e. *locus inclusus*), is a large quantity of ground inclosed and privileged for wild beasts of chase, by the king's grant or prescription. See *CHASE* and *FOREST*.

Manwood defines a chase to be "a privileged place, for beasts of venery, and other wild beasts of the forest and chase, *tam sylvestres, quam campestris*;" and differs from a chase or warren, in that it must be inclosed: for if it lies open, it is good cause of seizure into the king's hands, as a thing forfeited; as a free

chase is, if it be enclosed: besides, the owner cannot have an action against such as hunt in his park, if it lies open. No man can erect a park without a licence under the broad seal; for the common law does not encourage matter of pleasure, which brings no profit to the commonwealth. But there may be a park in reputation erected without any lawful warrant; and the owner may bring his action against persons killing his deer.

To a park three things are required. 1. A grant thereof. 2. Inclosures by pale, wall, or hedge. 3. Beasts of a park; such as the buck, doe, &c. And where all the deer are destroyed, it shall no more be accounted a park; for a park consists of vert, venison, and inclosure; and if it is determined in any of them, it is a total disparking.

Parks as well as chases are subject to the common law, and are not to be governed by the forest laws.

*PARK*, as connected with gardening. See *GARDENING*.

A park and a garden are more nearly allied than a farm and a garden\*, and can therefore be accommodated to each other without any disparagement to either. A farm loses some of its characteristic properties by the connection, and the advantage is on the part of the garden; but a park thus bordered retains all its own excellencies; they are only enriched, not counteracted, by the intermixture. The most perfect composition of a place that can be imagined, consists of a garden opening into a park, with a short walk through the latter to a farm, and ways along its glades to ridings in the country; but to the farm and the ridings the park is no more than a passage; and its woods and its buildings are but circumstances in their views; its scenes can be communicated only to the garden.

The affinity of the two subjects is so close, that it would be difficult to draw the exact line of separation between them. Gardens have lately encroached very much both in extent and in style on the character of a park; but still there are scenes in the one which are out of the reach of the other. The small sequestered spots which are agreeable in a garden would be trivial in a park; and the spacious lawns which are among the noblest features of the latter, would in the former fatigue by their want of variety; even such as, being of a moderate extent, may be admitted into either, will seem bare and naked, if not broken in the one; and lose much of their greatness, if broken in the other. The proportion of a part to the whole is a measure of its dimensions: it often determines the proper size for an object, as well as the space fit to be allotted to a scene; and regulates the style which ought to be assigned to either.

But whatever distinctions the extent may occasion between a park and a garden, a state of highly cultivated nature is consistent with each of their characters; and may in both be of the same kind, though in different degrees.

The excellencies both of a park and of a garden are happily blended at Hagley (A), where the scenes are equally

Park.

\* See Farm and Gardening.

Park.

equally elegant and noble. It is situated in the midst of a fertile and lovely country, between the Clent and the Witchberry hills; neither of which are within the pale, but both belong to the place. The latter rise in three beautiful swells. One of them is covered with wood; another is an open sheep-walk, with an obelisk on the summit; on the third, the portico of the temple of Theseus, exactly on the model of that at Athens, and little less in the dimensions, stands boldly out upon the brow, backed by the dark ground of a fir plantation, and has a most majestic appearance above the steep which fall before and beside it. The house is seen to the greatest advantage from these eminences, and every point of them commands some beautiful prospect. The busy town of Stourbridge is just below them; the ruins of Dudley castle rise in the off-skip; the country is full of industry and inhabitants; and a small portion of the moor, where the minerals, manufactured in the neighbourhood, are dug, breaking in upon the horizon, accounts for the richness, without derogating from the beauty, of the landscape. From the Clent hills the views are still greater; they extend on one side to the black mountains in Wales, a long ridge which appears, at 60 miles distance, in the interval between the unwieldy heap of the Malvern hills and the solitary peak of the Wrekin, each 30 miles off, and as many asunder. The smoke of Worcester, the churches in Birmingham, and the houses in Stourbridge, are distinctly visible. The country is a mixture of hill and dale, and strongly inclosed; except in one part, where a heath, varied by rising grounds, pieces of water, and several objects, forms an agreeable contrast to the cultivation which surrounds it. From the other extremity of the Clent hills, the prospect is less extensive; but the ground is more rude and broken; it is often overspread with large and beautiful woods; and the view is dignified with numerous seats. The hills also being very irregular, large advanced promontories frequently interrupt the sight, and vary the scene: in other parts, deep valleys shelving down towards the country below, exhibit the objects there in different lights. In one of these hollows is built a neat cottage, under a deep descent, sheltered besides by plantations, and presenting ideas of retirement in the midst of so much open exposure; from the heights above it, is seen all that view which before was commanded from the Witchberry hills, but which is seen here over Hagley park; a noble fore-ground, beautiful in itself, and completing the landscape.

The house, though low in the park, is yet above the adjacent country, which it overlooks to a very distant horizon. It is surrounded by a lawn of fine uneven ground, and diversified with large clumps, little groups, and single trees. It is open in front, but covered on one side by the Witchberry hills; on the other side, and behind, by the eminences in the park, which are high and steep, and all overspread with a lofty hanging wood. The lawn pressing to the foot, or creeping up the slopes of these hills, and sometimes winding along glades into the depth of the wood, traces a beautiful outline to a sylvan scene, already rich to luxuriance in massiness of foliage and stateliness of growth.

But though the wood appears to be entire, it in reality opens frequently into lawns, which occupy much of the space within it. In the number, the variety,

Park.

and the beauty of these lawns, in the shades of the separations between them, in their beauties also, and their varieties, the glory of Hagley consists. No two of the openings are alike in dimensions, in shape, or in character. One is of no more than five or six acres; another of not less than fifty; and others are of all the intermediate sizes. Some stretch out into lengthened glades; some widen every way: they are again distinguished by buildings, by prospects, and often by the style only of the plantations around them. The boundary of one is described by a few careless lines; that of another is composed of many parts, very different, and very irregular: and the ground is never flat; but falls sometimes in steep descents, sometimes in gentle declivities, waves along easy swells, or is thrown into broken inequalities, with endless variety.

An octagon seat, sacred to the memory of Thomson, and erected on his favourite spot, stands on the brow of a steep; a mead winds along the valley beneath, till it is lost on either hand behind some trees. Opposite to the seat, a noble wood crowns the top, and feathers down to the bottom of a large oval swelling hill. As it descends on one side, the distant country becomes the off-skip. Over the fall, on the other side, the Clent hills appear. A dusky antique tower stands just below them, at the extremity of the wood; and in the midst of it is seen a Doric portico, called *Poppe's Building*, with part of the lawn before it. The scene is very simple: the principal features are great; they prevail over all the rest, and are intimately connected with each other.

The next opening is small, circling about a rotunda on a knoll, to the foot of which the ground rises every way. The trees which surround it are large; but their foliage is not very thick; and their stems appearing beneath, their ramifications between the boughs are, in so confined a spot, very distinguished and agreeable circumstances. It is retired; has no prospect; no visible outlet but one, and that is short and narrow, to a bridge with a portico upon it, which terminates a piece of water.

The grove behind the rotunda separates this from a large, airy, forest glade, thinly skirted with wood, careless of dress and much overgrown with fern. The wildness is an acceptable relief in the midst of so much elegance and improvement as reign in the neighbouring lawns; and the place is in itself pleasant; in no part confined; and from a Gothic seat at the end is a perspective view of that wood and tower which were seen before in front, together with the Witchberry hills, and a wide range of country.

The tower, which in prospect is always connected with wood, stands however, on a piece of down, which stretches along the broad ridge of a hill, and spreads on each hand for some way down the sides. Thick groves catch the falls. The descent on the right is soon lost under the trees; but that on the left being steeper and shorter, it may be followed to the bottom. A wood hangs on the declivity, which is continued in the valley beneath. The tower overlooks the whole; it seems the remains of a castle, partly entire, partly in ruins, and partly overgrown with bushes. A finer situation cannot be imagined: It is placed in an exposed unfrequented spot; commands an extensive prospect; and is everywhere an interesting object.

At

Park.

At the end of the valley below it, in an obscure corner, and shut out from all view, is an hermitage, composed of roots and of moss: high banks, and a thick covert, darkened with horse-chestnuts, confine the sequestered spot: a little rill trickles through it, and two small pieces of water occupy the bottom. They are seen on one side through groups of trees; the other is open, but covered with fern. This valley is the extremity of the park; and the Clent hills rise in all their irregularity immediately above it.

The other descent from the castle is a long declivity, covered like the rest with noble woods, in which fine lawns are again embosomed, differing still from the former, and from each other. In one, the ground is very rough, the boundary is much broken, and marked only by the trunks of the trees which shoot up high before the branches begin. The next is more simple; and the ground falls from an even brow into one large hollow, which slopes towards the glen, where it sinks into the covert. This has a communication through a short glade, and between two groves, with another called the *Tinian lawn*, from the resemblance which it is said to bear to those of that celebrated island: it is encompassed with the stateliest trees, all fresh and vigorous, and so full of leaf, that not a stem, not a branch, appears, but large masses of foliage only describe an undulating outline; the effect, however, is not produced by the boughs feathering down to the bottom; they in appearance shoot out horizontally, a few feet above the ground, to a surprising distance, and form underneath an edging of shade, into which the retreat is immediate at every hour of the day. The verdure of the turf is as luxuriant there as in the open space: the ground gently waves in both, over easy swells and little dips, just varying, not breaking, the surface. No strong lines are drawn; no striking objects are admitted; but all is of an even temper, all mild, placid, and serene; in the gayest season of the day not more than cheerful, in the stillest watch of night not gloomy. The scene indeed is peculiarly adapted to the tranquillity of the latter, when the moon seems to repose her light on the thick foliage of the grove, and steadily marks the shade of every bough. It is delightful then to saunter here, and see the grass, and the gossamer which entwines it, glistening with dew, to listen and hear nothing stir, except perhaps a withered leaf dropping gently through a tree; and, sheltered from the chill, to catch the freshness of the evening air: a solitary urn, chosen by Mr Pope for the spot, and now inscribed to his memory, when shown by a gleam of moon-light through the trees, fixes that thoughtfulness and composure to which the mind is instantly led by the rest of this elegant scene.

The Doric Portico, which also bears his name, tho' not within sight, is near: it is placed on the declivity of a hill; and Thomson's seat, with its groves and appendages, are agreeable circumstances in the prospect before it. In the valley beneath is fixed a bench, which commands a variety of short views; one is up the ascent to the portico, and others through openings in the wood to the bridge and the rotunda.

The next lawn is large: the ground is steep and irregular, but inclines to one direction, and falls from every side into the general declivity: the outline is diversified by many groups of trees on the slopes: and

frequent glimpses of the country are seen in perspective through openings between them. In the brow is a seat in the proudest situation of all Hagley; it commands a view down the bold sweep of the lawn, and over a valley filled with the noblest trees, up to the heights beyond. One of those heights is covered with a hanging wood; which opens only to show Thomson's seat, and the groves and the steep about it: the others are the Witchberry hills, which seem to press forward into the landscape; and the massy heads of the trees in the vale, uniting into a continued surface, form a broad base to the temple of Theseus, hide the swell on which it is built, and crowd up to the very foundation. Farther back stands the obelisk; before it is the sheep-walk; behind it the Witchberry wood. The temple is backed by the firs; and both these plantations are connected with that vast sylvan scene which overspreads the other hill and all the intermediate valley. Such extent of wood; such variety in the disposition of it; objects so illustrious in themselves, and ennobled by their situations, each contrasted to each, every one distinct, and all happily united: the parts so beautiful of a whole so great, seen from a charming lawn, and surrounded by a delightful country, compose all together a scene of real magnificence and grandeur.

The several lawns are separated by the finest trees; which sometimes grow in airy groves, chequered with gleams of light, and open to every breeze; but more frequently, whose great branches meeting or crossing each other, cast a deep impenetrable shade. Large boughs feathering down often intercept the sight; or a vacant space is filled with coppice-wood, nut, hawthorn, and hornbeam, whose tufted heads mixing with the foliages and whose little stems clustering about the trunks of the trees, thicken and darken the plantation. Here and there the division is of such coppice-wood only, which then being less constrained and oppressed, springs up stronger, spreads further, and joins in a low vaulted covering: in other places the shade is high, over-arched by the tallest ash, or spreads under the branches of the most venerable oaks. They rise in every shape, they are disposed in every form in which trees can grow. The ground beneath them is sometimes almost level; sometimes a gentle swell; but generally very irregular and broken. In several places, large hollows wind down the sides of the hills, worn in the stormy months by water-courses, but worn many ages ago. Very old oaks in the midst of the channels prove their antiquity: some of them are perfectly dry most part of the year; and some are watered by little rills all the summer: they are deep and broad; the sides are commonly steep: often abrupt and hollow; and the trees on the bank sometimes extend their roots, all covered with moss, over the channels of the water. Low down in one of these glens, under a thick shade of horse-chestnuts, is a plain bench, in the midst of several little currents and water falls, running among large loose stones, and the stumps of dead trees, with which the ground is broken. On the brink of another glen, which is distinguished by a numerous rookery, is a seat in a still wilder situation, near a deeper hollow, and in a darker gloom: the falls are nearly perpendicular; the roots of some of the trees are almost bare, from the earth having crumbled

Park.

Park,  
Parker.

away; large boughs of others, sinking with their own weight, seem ready to break from the trunks they belong to; and the finest ash, still growing, lie all afloat the water-course below, which though the stream runs in winter only, yet constantly retains the black tinge of damp, and casts a chill all around.

Gravel-walks are conducted across the glens, through the woods, the groves, or the thickets, and along the sides of the lawns, concealed generally from the sight, but always ready for the communication, and leading to the principal scenes. The frequency of these walks, the number and the style of the buildings, and the high preservation in which all the place is kept, give to the whole park the air of a garden. There is, however, one spot more peculiarly adapted to that purpose, and more artificially disposed than the rest; it is a narrow vale, divided into three parts: one of them is quite filled with water, which leaves no room for a path, but thick trees on either side come down quite to the brink; and between them the sight is conducted to the bridge with a portico upon it, which closes the view: another part of this vale is a deep gloom, overhung with large ash and oaks, and darkened below by a number of yews: these are scattered over very uneven ground, and open underneath; but they are encompassed by a thick covert, under which a stream falls, from a stony channel, down a rock: other rills drop into the current, which afterwards pours over a second cascade into the third division of the vale, where it forms a piece of water, and is lost under the bridge. The view from this bridge is a perfect operascene, through all the divisions of the vale up to the rotunda. Both these buildings, and the other decorations of the spot, are of the species generally confined to a garden. The hermitage also, which has been described, and its appendages are in a style which does not belong to a park; but through all the rest of the place, the two characters are intimately blended. The whole is one subject; and it was a bold idea to conceive that one to be capable of so much variety; it required the most vigorous efforts of a fertile fancy to carry that idea into execution. See GARDENING.

*PARK of Artillery.* See ARTILLERY.

*PARK of Provisions*, in military affairs, the place where the sutlers pitch their tents in the rear, and sell their provisions to the soldiers. Likewise that place where the bread-waggons are drawn up, and where the troops receive their ammunition-bread, being the store of the army.

PARKER (Matthew), the second Protestant archbishop of Canterbury, was born at Norwich in the year 1504, the 19th of Henry VII. His father, who was a man in trade, died when our author was about 12 years old; but his mother took special care of his education, and at the age of 17 sent him to Corpus-

Christi college in Cambridge, where, in 1523, he took his bachelor's degree. In 1527 he was ordained, created master of arts, and chosen fellow of the college. Having obtained a licence to preach, he frequently held forth at St Paul's cross in London, and in other parts of the kingdom. In 1533 or 1534 he was made chaplain to queen Anne Boleyn, who obtained for him the deanery of Stoke-Clare in Suffolk, where he founded a grammar-school. After the death of the queen, king Henry made him his own chaplain, and in 1541 prebendary of Ely. In 1544, he was, by the king's command, elected master of Corpus-Christi college, and the following year vice chancellor of the university. In 1547 he lost the deanery of Stoke, by the dissolution of that college. In the same year he married the daughter of Robert Harlestone, a Norfolk gentleman.

In the year 1552 he was nominated, by Edward VI. to the deanery of Lincoln, which with his other preferments, enabled him to live in great affluence: but the papist Mary was hardly seated on the throne before he was deprived of every thing he held in the church, and obliged to live in obscurity, frequently changing his place of abode to avoid the fate of the other reformers.

Queen Elizabeth ascended the throne in 1558: and in the following year Dr Parker from indigence and obscurity, was at once raised to the see of Canterbury (A); an honour which he neither solicited nor desired. In this high station he acted with spirit and propriety. He visited his cathedral and diocese in 1560, 1565, 1570, and 1573. He repaired and beautified his palace at Lambeth at a vast expence. The sum which the repairs of the palace and great hall at Canterbury cost him was upwards of 14001. sterling, which is at least equal to ten times the sum now-a-days. Both the palace and great hall were in decay, partly through the injuries of time, and partly through that of fire. The hall, built by Archbishop Hubert in the 12th century, was famous in history for the great feasts that had been made there by archbishops and abbots in former times; in particular, at the nuptial feasts of king Edward I. in 1290; at the installation of the abbot of St Austm's in 1309; at the inthronization of George Nevill archbishop of York in 1464; and of Archbishop Warham in 1504, when Edward duke of Buckingham acted as lord high steward of his household; and, lastly, for the entertainment given by that archbishop in 1519 to the emperor Charles V. Henry VIII. Queen Catherine, &c. In 1565 Archbishop Parker gave three entertainments in this hall at Whitsuntide which lasted three days), on Trinity Sunday, and in affize time. At the two first of these the archbishop himself sat in the midst of the uppermost table; on his left hand the mayor, &c. and so

Parker.

(A) He was consecrated December 17th 1559, in Lambeth chapel, by Barlow bishop of Chichester, Scory bishop of Hereford, Coverdale bishop of Exeter, and Hodgkin suffragan bishop of Bedford. This deserves to be particularly mentioned, because the Romanists asserted afterwards that he had been consecrated at the Nag's-head inn or tavern in Cheapside. But this notorious and improbable falsehood hath been fully confuted by Mason in his Vindication of the Church of England concerning the Consecration and Ordination of Bishops, 1613, folio; by Bramhall in his Consecration of Protestant Bishops vindicated; and by Courayer in his Defence of the Validity of English Ordinations, 1723, 3 vols. 8vo; and even by many Catholics.

**Parker.** so on one side of the hall a continued row of men according to their rank filled the other tables; and on his right hand sat only some noble women and ladies of quality, the whole length of the hall, corresponding to the row of men on the other side: which order of placing the women was observed in honour of the queen. The first rank of guests being risen, and the tables cleared, they were furnished again, and filled the second time. At the last feast, which was grander than all the rest, the archbishop entertained the two judges who went that circuit (B), the attorney-general, the high sheriff, with all who met at these assizes, as justices of the peace, advocates and common lawyers, and all the rest of proctors and attorneys; who all (with a promiscuous company) in troops came in. The hall was set forth with much plate of silver and gold, adorned with much tapestry of Flanders; and dainties of all sorts were served in excellent order by none but the archbishop's servants, the table being often the same day furnished afresh with new guests: while the ladies were nobly entertained in inner parlours by Mrs Parker, the hall being now filled only with gentlemen. Otherwise, at these feasts, it was the archbishop's custom, in honour of matrimony, to entertain both men and their wives. Of this noble hall and palace, now within 200 years, there is little or nothing left except a few ruins. On Whitfunday 1570, and the two following days, this archbishop feasted the citizens of Canterbury and their wives in the same manner as he had done before: and on Trinity Sunday (after consecrating Bishop Curteis of Chichester) he made another most archiepiscopal feast, inviting another archbishop (viz. Grindal of York, who came thither for confirmation) to be his guest: besides whom were present Horn bishop of Winchester, and Curteis aforesaid of Chichester. At the lower tables sat all the ministers and servants whatsoever, even the children, who belonged to that church; and at the remotest tables, but in the same hall, in sight, sat the poor of both sexes of the hospitals of St John's and Harbledown. On July 11th, being assizes time, the judges, high-sheriff, gentlemen, and the common sort, were all feasted by the archbishop in as splendid manner as before. Soon after Bishop Sandys of Worcester, elect of London, came to Canterbury to be confirmed. The archbishop, on his return, lodged the first night at Sittingbourn, and the next night (after dining at Gravesend) came to Lambeth in barges by Thames, with all his family. Sept. 7. 1573, being Q. Elizabeth's birth-day, Archbishop Parker entertained her majesty, and as many noblemen, &c. as were present at Archbishop Warham's entertainment in the same hall 54 years before. The archbishop (to use his own words, in a letter to Archbishop Grindal of York) "met her highness, as she was coming to Dover, upon Folkestone Down. I left her at Dover, and came home to Bekefborn that night; and after that went to Canterbury to receive her majesty there. Which I did, with the bishops of Lincoln and Rochester, and my suffragan [of Dover], at the west door; where,

after the grammarian had made his oration to her upon her horse-back, she alighted. We then kneeled down, and said the psalm *Deus miseratur*, in English, with certain other collects briefly; and that in our chimes and roquets. The quire, with the dean and prebendaries, stood on either side of the church, and brought her majesty up with a square song; she going under a canopy, borne by four of her temporal knights, to her traverse, placed by the communion-board, where she heard evening song; and after departed to her lodging at St Austin's, whither I waited upon her. From thence I brought certain of the council, and divers of the court, to my house to supper, and gave them 14 or 15 dishes, furnished with two mefs, at my long table, whereat sat about 20; and in the same chamber a third mefs, at a square table, whereat sat 10 or 12; my less hall having three long tables furnished with my officers, and with the guard, and others of the court: and so her majesty came every Sunday to church to hear the sermon. And upon one Monday it pleased her highness to dine in my great hall, thoroughly furnished with the council, Frenchmen, ladies, gentlemen, and the mayor of the town, with his brethren, &c.; her highness sitting in the midst, having two French ambassadors [Gondius and Mothe-Fenelon] at the end of the table, and four ladies of honour at the other end. And so three mefs were served by her nobility at washing, her gentlemen and guard bringing her dishes, &c." On which the Archbishop of York, in his answer, made this reflection: "Your grace's large description of the entertainment at Canterbury did so lively set forth the matter, that in reading thereof I almost thought myself to be one of your guests there, and as it were beholding the whole order of all things done there. Sir, I think it shall be hard for any of our coat to do the like for one hundred years, and how long after God knoweth." In this progress Lord Treasurer Burghley was lodged with Mr Pearson, the eleventh prebendary, who, the archbishop says, "had a fine house."

He founded several scholarships in Bennet or Corpus-Christi college in Cambridge, and gave large presents of plate to that and to other colleges in this university. He gave 100 volumes to the public library. He likewise founded a free-school at Rochdale in Lancashire. He took care to have the sees filled with pious and learned men; and, considering the great want of bibles in many places, he, with the assistance of other learned men, improved the English translation, had it printed on a large paper, and dispersed through the kingdom. This worthy prelate died in the year 1575, aged 72, and was buried in his own chapel at Lambeth. He was pious without affectation or austerity, cheerful and contented in the midst of adversity, moderate in the height of power, and beneficent beyond example. He wrote several books; and also published four of our best historians; *Matthew of Westminster*, *Matthew Paris*, *Asher's Life of King Alfred*, and *Tho. Walsingham*. The learned archbishop also translated the Psalter. This version was printed, but without a name; and has been

(B) This proves that the judges of assize then came to Canterbury, though it was then a county in itself, being so made in 1461.

Parker.

attributed to an obscure poet of the name of Keeper. This was Wood's opinion; but it is more than probable that the learned author of the *Athenæ Oxon.* was wrong. See *Gentleman's Magazine* for 1781, p. 566. where Parker is proved to be the author of a version of the Psalms.

PARKER (Samuel), an English clergyman, who, by a temporizing spirit, aided by excellent parts and considerable learning, raised himself to the bishopric of Oxford. He was born September 1640, at Northampton, where his father John then practised the law. John had been bred to that profession, in one of the temples at London; and, being afterwards against the king, was made a member of the high court of justice in 1649, where he gave sentence against the three lords, Capel, Holland, and Hamilton, who were beheaded. During Cromwell's usurpation, he was made an assistant committee man for his county. In 1650 he published a book in defence of the new government, as a commonwealth, without a king or house of lords. June 1655, when Cromwell was declared protector, he was appointed a commissioner for removing obstructions at Worcester-house in the Strand, near London, and was sworn serjeant at law next day. January 1659, he was appointed one of the barons of the exchequer by the Rump-parliament; but, upon a complaint against him, was quickly displaced. However, he was again regularly made serjeant at law, on the recommendation of Chancellor Hyde, at the first call after the restoration. In the mean time, he carefully educated his son Samuel among the Puritans in Northampton; whence, being fit for the university, he was sent to Wadham college in Oxford, and admitted, in 1659, under a presbyterian tutor. Here he led a strict and religious life, entered into a weekly society, then called the *Gruellers*, because (as Wood observes) their chief diet was water-gruel; and it was observed that he put more graves in his pottage than all the rest. They fasted and prayed, and met at a house at Halywell, where he was so zealous and constant at prayers, sermons, and sacraments, that he was esteemed one of the most precious young men in the university. He took the degree of A. B. February 28, 1659-60. Upon the restoration, he hesitated what side to take; but continuing publicly to speak against Episcopacy, he was much discountenanced by the new warden Dr Blandford, who had been appointed to that office upon the dawn of the restoration in 1659. Upon this he removed to Trinity college, where, by the advice of Dr Ralph Ruthwell, then a senior fellow of that society, he was rescued from the prejudices of an unhappy education, which in fact he publicly avowed in print. He then became a zealous Anti-puritan, and for many years acted the part of what was then called a true son of the church. In this temper, having taken the degree of M. A. in 1663, he entered into holy orders, resorted frequently to London, and became chaplain to a nobleman; continuing to display his wit upon his old friends the Presbyterians, Independents, &c.

In 1665, he published some Philosophical Essays, and was elected a member of the Royal Society: these Essays, he dedicated to Sheldon archbishop of Canterbury, who became his patron; and in 1667 made him his chaplain. Being thus in the road to preferment, he left Oxford, and resided at Lambeth,

under the eye of his patron; who, in 1670, made him archdeacon of Canterbury, in the room of Dr Sancroft, afterwards archbishop. November the same year, he put himself in the train of William prince of Orange, who visited Cambridge, and had the degree of D. D. conferred upon him there. November 1672, he was installed a prebendary of Canterbury; and was made rector of Ickham and Chatham in Kent by the archbishop much about the same time. He was very obsequious to the court during the reign of Ch. II. and upon the accession of his brother to the throne, he continued the same servile complaisance; and he soon reaped the fruits of it in the bishopric of Oxford, to which he was appointed by James II. on the death of Dr Fell in 1686, being allowed to hold the archdeaconry of Canterbury in commendam. He was likewise made a privy-counsellor, and constituted by a royal mandamus president of Magdalen-college in Oxford. These favours, however, were the price of his religion, which he scrupled not to offer up a sacrifice to his ambition. In this new change, he became one of the Romish mercenaries, prostituting his pen in defending transubstantiation, and the worship of saints and images. The papists made sure of him as a profelyte; one of whom says that he even proposed in council, whether it was not expedient, that at least one college in Oxford should be allowed Catholics, that they might not be forced to be at such charges, by going abroad to study. In the same way, having invited two Popish noblemen, and one of the church of England, to an entertainment, he drank the king's health, wishing a happy success to all his affairs; adding, that the Protestant religion in England seemed to him to be in no better a condition than that of Buda was before it was taken, and that they were next to Atheists who dared to defend that faith. Nay, so shameful was his conduct, that the cooler among the Romanists condemned it as too hot and precipitate. For example, Father Peter, a Jesuit, and privy-counsellor to King James, in a letter to Father la Chaise, confessor to Louis XIV. writes thus: "The bishop of Oxford has not yet declared himself openly; the great obstacle is his wife, whom he cannot rid himself of; his design being to continue a bishop, and only change communion, as it is not doubted but the king will permit, and our holy father conform; though I don't see how he can be farther useful to us in the religion he is in; because he is suspected, and of no esteem among the heretics of the English church: nor do I see that the example of his conversion is like to draw many others after him, because he declared himself so suddenly. If he had believed my counsel, which was to temporize for some time longer, he would have done better; but it is his temper, or rather zeal, that hurried him on to it." Accordingly his authority in his diocese was so very insignificant, that when he assembled his clergy, and desired them to subscribe an "Address of Thanks to the King for his Declaration of Liberty of Conscience," they rejected it so unanimously, that he got but one clergyman to concur with him in it. Bishop Burnet represents him to be a man of no judgment, and of as little virtue; and as to religion rather impious: that he was covetous and ambitious, and seemed to have no other sense of religion but as a political interest, and

Parker  
Parliament

a subject of party and faction. He seldom came to prayers, or to any exercises of devotion; and was so proud, that he grew insufferable to all that came near him. (But this must be read with caution.) No doubt but the ill success he met with, in pushing on the design to introduce Popery, ruined him, as well as his royal master: the latter lost his crown by it, and the bishop his life; for, falling into contempt with all good men, trouble of mind threw him into a distemper, of which he died unlamented at Magdalen-college, March 20. 1687. He sent, however, a Discourse to James, persuading him to embrace the Protestant religion, with a Letter to the same purpose, which was printed at London in 1690, 4to. He wrote several pieces, in all which Burnet allows that there was an entertaining liveliness; though at the same time he accompanies that favourable censure, as his manner is, with a "But it was neither grave nor correct." Yet Dr Nichols's remark cannot be disputed, and may be extended to the present time, "that he has but few readers at this day." And Swift observes, that Marvell's remarks on Parker continued to be read, when the book which occasioned them was long ago sunk. He left a son, Samuel, an excellent scholar, and of singular modesty; who married a bookseller's daughter at Oxford, where he resided with a numerous family of children; to support which, he published some books, with a modest Vindication of his father. One of his sons is now, or was lately, a bookseller at Oxford.

**PARKINSONIA**, so called in honour of the English botanist *Parkinson*: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method it ranks under the 33d order, *Lomentaceæ*. The calyx is quinquefid; there are five petals, all of them oval except the lowest, which is reniform; there is no style; the legumen moniliform, or like string beads. We know but one species of this plant, which is very common in the Spanish West Indies, but has of late years been introduced into the English settlements, for the beauty and sweetness of its flowers. In the countries where it grows naturally, it rises to be a tree of 20 or more feet high, and bears long slender bunches of yellow flowers; which have a most agreeable sweet scent.

**PARLEY**, a conference with an enemy. Hence, to beat or sound a parley, is to give a signal for holding such a conference by beat of drum, or sound of trumpet.

1  
Definition.

**PARLIAMENT**, the grand assembly of the three states of Great Britain, summoned together by the king's authority, to consider of matters relating to the public welfare, and particularly to enact and repeal laws.

2  
Origin not  
certainly  
known.

The original or first institution of parliament is one of those matters which lie so far hidden in the dark ages of antiquity, that the tracing of it out is a thing equally difficult and uncertain. The word *parliament* itself (or *colloquium*, as some of our historians translate it) is, comparatively, of modern date; derived from the French, and signifying "the place where they met and conferred together." It was first applied to general assemblies of the states under Louis VII. in France, about the middle of the 12th century. But it is cer-

tain, that, long before the introduction of the Norman language into England, all matters of importance were debated and settled in the great councils of the realm. A practice which seems to have been universal among the northern nations, particularly the Germans; and carried by them into all the countries of Europe, which they over-ran at the dissolution of the Roman empire. Relicks of which constitution, under various modifications and changes, are still to be met with in the diets of Poland, Germany, and Sweden, and lately in the assembly of the estates in France: for what was there called the *parliament*, was only the supreme court of justice, consisting of the peers, certain dignified ecclesiastics, and judges; which neither is in practice, nor is supposed to be in theory, a general council of the realm.

In England, however, this general council hath been held immemorially, under the several names of *michelsynoth*, or "great council;" *michels-gemote*, or "great meeting;" and more frequently *wittena-gemote*, or "the meeting of wise men." It was also styled in Latin, *commune concilium regni*, *magnum concilium regis*, *curia magna*, *conventus magnatum vel procerum assisa generalis*, and sometimes *communitas regni Angliæ*. We have instances of its meeting to order the affairs of the kingdom, to make new laws, and to amend the old, or, as Fleta expresses it, *novis injuriis, emensis nova constituere remedia*, so early as the reign of Ina king of the West Saxons, Offa king of the Mercians, and Ethelbert king of Kent, in the several realms of the heptarchy. And after their union, the Mirror informs us, that King Alfred ordained for a perpetual usage, that these councils should meet twice in the year, or oftener, if need be, to treat of the government of God's people; how they should keep themselves from sin, should live in quiet, and should receive right. Our succeeding Saxon and Danish monarchs held frequent councils of this sort, as appears from their respective codes of laws; the titles whereof usually speak them to be enacted, either by the king with the advice of his *wittena-gemote*, or wise men, as, *Hæc sunt instituta, quæ Edgarus rex consilio sapientium suorum instituit*; or to be enacted by those sages with the advice of the king; as, *Hæc sunt judicia, quæ sapientes consilio regis Ethelstani instituerunt*; or, lastly, to be enacted by them both together as, *Hæc sunt institutiones, quas rex Edmundus et episcopi sui cum sapientibus suis instituerunt*.

There is also no doubt but these great councils were occasionally held under the first princes of the Norman line. Glanvil, who wrote in the reign of Henry II. speaking of the particular amount of an amercement in the sheriff's court, says, it had never yet been ascertained by the general assize or assembly, but was left to the custom of particular counties. Here the general assize is spoken of as a meeting well known, and its statutes or decisions are put in a manifest contradistinction to custom, or the common law. And in Edward III.'s time, an act of parliament, made in the reign of William the Conqueror, was pleaded in the case of the abbey of St Edmund's-bury, and judicially allowed by the court.

Hence it indisputably appears, that parliaments, or general councils, are coeval with the kingdom itself. How those parliaments were constituted and composed,

3  
Antiquity  
of, in Eng-  
land.

Parliament  
4  
The nature of these early parliaments not easily known.

sed, is another question, which has been matter of great dispute among our learned antiquarians; and particularly, whether the commons were summoned at all; or, if summoned, at what period they began to form a distinct assembly. But without entering into controversies of this sort, it may be sufficient to observe, that it is generally agreed, that in the main the constitution of parliament, as it now stands, was marked out so long ago as the 17th year of King John, A. D. 1215, in the great charter granted by that prince; wherein he promises to summon all archbishops, bishops, abbots, earls, and greater barons, personally; and all other tenants in chief under the crown, by the sheriff and bailiffs; to meet at a certain place, with 40 days notice, to assess aids and scutages when necessary. And this constitution has subsisted in fact at least from the year 1266, 49 Henry III. there being still extant writs of that date, to summon knights, citizens, and burghers, to parliament. We proceed therefore to inquire wherein consists this constitution of parliament, as it now stands, and has stood, for the space of at least 500 years. And in the prosecution of this inquiry, we shall consider, first, The manner and time of its assembling: Secondly, Its constituent parts: Thirdly, the Laws and customs relating to parliament: Fourthly, the methods of proceeding, and of making statutes, in both houses: And, lastly, The manner of the parliament's adjournment, prorogation, and dissolution.

5  
Parliament summoned only by the king.

I. *As to the manner and time of assembling.* The parliament is regularly to be summoned by the king's writ or letter, issued out of chancery by advice of the privy-council, at least 40 days before it begins to sit. It is a branch of the royal prerogative, that no parliament can be convened by its own authority, or by the authority of any, except the king alone. And this prerogative is founded upon very good reason. For, supposing it had a right to meet spontaneously, without being called together, it is impossible to conceive that all the members, and each of the houses, would agree unanimously upon the proper time and place of meeting: and if half of the members met, and half absented themselves, who shall determine which is really the legislative body, the part assembled, or that which stays away? It is therefore necessary, that the parliament should be called together at a determinate time and place; and, highly becoming its dignity and independence, that it should be called together by none but one of its own constituent parts; and, of the three constituent parts, this office can only appertain to the king; as he is a single person, whose will may be uniform and steady; the first person in the nation, being superior to both houses in dignity; and the only branch of the legislature that has a separate existence, and is capable of performing any act at a time when no parliament is in being. Nor is it an exception to this rule, that, by some modern statutes, on the demise of a king or queen, if there be then no parliament in being, the last parliament revives, and is to sit again for six months, unless dissolved by the successor: for this revived parliament must have been originally summoned by the crown.

It is true, that the convention-parliament which reformed King Charles II. met above a month before his

return; the lords by their own authority, and the commons in pursuance of writs issued in the name of the keepers of the liberty of England by authority of parliament; and that the said parliament sat till the 29th of December, full seven months after the restoration; and enacted many laws, several of which are still in force. But this was for the necessity of the thing, which supersedes all law; for if they had not so met, it was morally impossible that the kingdom should have been settled in peace. And the first thing done after the king's return was, to pass an act declaring this to be a good parliament, notwithstanding the defect of the king's writ. So that as the royal prerogative was chiefly wounded by their so meeting, and as the king himself, who alone had a right to object, consented to wave the objection, this cannot be drawn into an example in prejudice of the rights of the crown. Besides, we should also remember, that it was at that time a great doubt among the lawyers, whether even this healing act made it a good parliament, and held by very many in the negative; though it seems to have been too nice a scruple. And yet, out of abundant caution, it was thought necessary to confirm its acts in the next parliament, by statute 13 Car. II. c. 7. & c. 14.

7  
Nor that of 1688, because they originated ex necessitate rei.

It is likewise true, at the time of the Revolution, A. D. 1688, the lords and commons by their own authority, and upon the summons of the prince of Orange (afterwards King William), met in a convention, and therein disposed of the crown and kingdom. But it must be remembered, that this assembling was upon a like principle of necessity as at the Restoration; that is, upon a full conviction that King James II. had abdicated the government, and that the throne was thereby vacant: which supposition of the individual members was confirmed by their concurrent resolution, when they actually came together. And, in such a case as the palpable vacancy of a throne, it follows, *ex necessitate rei*, that the form of the royal writs must be laid aside, otherwise no parliament can ever meet again. For let us put another possible case, and suppose, for the sake of argument, that the whole royal line should at any time fail, and become extinct, which would indisputably vacate the throne: in this situation it seems reasonable to presume, that the body of the nation, consisting of lords and commons, would have a right to meet and settle the government; otherwise there must be no government at all. And upon this and no other principle did the convention in 1688 assemble. The vacancy of the throne was precedent to their meeting without any royal summons, not a consequence of it. They did not assemble without writ, and then make the throne vacant; but, the throne being previously vacant by the king's abdication, they assembled without writ, as they must do if they assembled at all. Had the throne been full, their meeting would not have been regular; but, as it was really empty, such meeting became absolutely necessary. And accordingly it is declared by statute 1 W. & M. st. 1. c. 1. that this convention was really the two houses of parliament, notwithstanding the want of writs or other defects of form. So that, notwithstanding these two capital exceptions, which were justifiable only on a principle of necessity (and each of

which,

Parliament which, by the way, induced a revolution in the government), the rule laid down is in general certain, that the king, only can convoke a parliament.

8 The king is obliged to convoke parliament as often as circumstances require. And this, by the ancient statutes of the realm, he is bound to do every year, or oftener if need be. Not that he is, or ever was, obliged by these statutes, to call a new parliament every year; but only to permit a parliament to sit annually for the redress of grievances, and dispatch of business, if need be. These last words are so loose and vague, that such of the monarchs as were inclined to govern without parliaments, neglected the convoking them, sometimes for a very considerable period, under pretence that there was no need of them. But, to remedy this, by the statute 16 Car. II. c. 1. it is enacted, that the sitting and holding of parliaments shall not be intermitted above three years at the most. And by the statute 1 W. & M. II. c. 2. it is declared to be one of the rights of the people, that for redress of all grievances, and for the amending, strengthening, and preserving, the laws, parliaments ought to be held frequently. And this indefinite frequency is again reduced to a certainty by statute 6 W. and M. c. 2. which enacts, as the statute of Charles II. has done before, that a new parliament shall be called within three years after the determination of the former.

9 II. *The constituent parts of a parliament are*, the king's majesty, sitting there in his royal political capacity, and the three estates of the realm; the lords spiritual, the lords temporal (who sit together with the king in one house), and the commons who sit by themselves in another. And the king and these three estates together form the great corporation or body politic of the kingdom, of which the king is said to be *caput, principium, et finis*. For upon their coming together the king meets them, either in person or by representation; without which there can be no beginning of a parliament; and he also has alone the power of dissolving them.

10 The propriety and necessity of the king's being a branch of the legislature. It is highly necessary for preserving the balance of the constitution, that the executive power should be a branch, though not the whole, of the legislature. The total union of them, we have seen, would be productive of tyranny; the total disjunction of them, for the present, would in the end produce the same effects, by causing that union against which it seems to provide. The legislature would soon become tyrannical, by making continual encroachments, and gradually assuming to itself the rights of the executive power. Thus the long parliament of Charles I. while it acted in a constitutional manner, with the royal concurrence, redressed many heavy grievances and established many salutary laws. But when the two houses assumed the power of legislation, in exclusion of the royal authority, they soon after assumed likewise the reins of administration; and, in consequence of these united powers, overturned both church and state, and established a worse oppression than any they pretended to remedy. To hinder therefore any such encroachments, the king is himself a part of the parliament; and as this is the reason of his being so, very properly therefore the share of legislation which the constitution has placed in the crown, consists in the power of rejecting, rather than resolving; this being sufficient to answer the end proposed. For we may apply to the

royal negative, in this instance, what Cicero observes of the negative of the Roman tribunes, that the crown has not any power of doing wrong, but merely of preventing wrong from being done. The crown cannot begin of itself any alterations in the present established law; but it may approve or disapprove of the alterations suggested and consented to by the two houses. The legislature therefore cannot abridge the executive power of any rights which it now has by law, without its own consent; since the law must perpetually stand as it now does, unless all the powers will agree to alter it. And herein indeed consists the true excellence of the British government, that all the parts of it form a mutual check upon each other. In the legislature, the people are a check upon the nobility, and the nobility a check upon the people, by the mutual privilege of rejecting what the other has resolved; while the king is a check upon both, which preserves the executive power from encroachments. And this very executive power is again checked and kept within due bounds by the two houses, through the privilege they have of inquiring into, impeaching, and punishing the conduct (not indeed of the king, which would destroy his constitutional independence; but which is more beneficial to the public) of his evil and pernicious counsellors. Thus every branch of the civil polity supports and is supported, regulates and is regulated, by the rest: for the two houses naturally drawing in two directions of opposite interest, and the prerogative in another still different from them both, they mutually keep each other from exceeding their proper limits; while the whole is prevented from separation, and artificially connected together by the mixed nature of the crown, which is a part of the legislative, and the sole executive magistrate. Like three distinct powers in mechanics, they jointly impel the machine of government in a direction different from what either, acting by itself, would have done; but at the same time in a direction partaking of each, and formed out of all; a direction which constitutes the true line of the liberty and happiness of the community.

Having already considered these constituent parts of the sovereign power of parliament, each in a separate view, under the articles KING, LORDS, and COMMONS, to which the reader is referred, we proceed,

III. To examine the laws and customs relating to parliament, united together and considered as one aggregate body. The power and jurisdiction of parliament, says Sir Edward Coke, is so transcendent and absolute that it cannot be confined either for causes or persons within any bounds. And of this high court he adds, it may be truly said, *Si antiquitatem spectes, est vetustissima; si dignitatem, est honoratissima; si jurisdictionem, est capacissima*. It hath sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal: this being the place where that absolute despotic power, which must in all governments reside somewhere, is entrusted by the constitution of those kingdoms. All mischiefs and grievances, operations and remedies, that transcend the ordinary course of the laws, are within the reach of this,

II. The power of parliament.

Parliament this extraordinary tribunal. It can regulate or new-model the succession to the crown; as was done in the reign of Henry VIII. and William III. It can alter the established religion of the land; as was done in a variety of instances in the reigns of king Henry VIII. and his three children. It can change and create afresh even the constitution of the kingdom and of parliaments themselves; as was done by the act of union, and the several statutes for triennial and septennial elections. It can, in short, do every thing that is not naturally impossible; and therefore some have not scrupled to call its power, by a figure rather too bold, the *omnipotence of parliament*. True it is, that what the parliament doth, no authority upon earth can undo. So that it is a matter most essential to the *liberties* of the kingdom, that such members be delegated to this important trust as are most eminent for their probity, their fortitude, and their knowledge; for it was a known apophthegm of the great lord treasurer Burleigh, "That England could never be ruined but by a parliament;" and as Sir Matthew Hale observes, this being the highest and greatest court, over which none other can have jurisdiction in the kingdom, if by any means a misgovernment should any way fall upon it, the subjects of that kingdom are left without all manner of remedy. To the same purpose the president Montesquieu, though we trust too hastily, presages, that as Rome, Sparta, and Carthage, have lost their liberty and perished; so the constitution of England will in time lose its liberty, will perish: it will perish whenever the legislative power shall become more corrupt than the executive.

<sup>12</sup> Mr Locke's opinion respecting this power. It must be owned, that Mr Locke, and other theoretical writers, have held, that "there remains still inherent in the people a supreme power to remove or alter the legislature, when they find the legislature act contrary to the trust reposed in them; for when such trust is abused, it is thereby forfeited, and devolves to those who gave it." But however just this conclusion may be in theory, we cannot adopt it, nor argue from it, under any dispensation of government at present actually existing. For this devolution of power, to the people at large, includes in it a dissolution of the whole form of government established by that people; reduces all the members to their original state of equality; and by annihilating the sovereign power, repeals all positive laws whatsoever before enacted. No human laws will therefore suppose a case, which at once must destroy all law, and compel men to build afresh upon a new foundation; nor will they make provision for so desperate an event, as must render all legal provisions ineffectual. So long therefore as the English constitution lasts, we may venture to affirm, that the power of parliament is absolute and without controul.

<sup>18</sup> The qualifications of members. In order to prevent the mischiefs that might arise, by placing this extensive authority in hands that are either incapable or else improper to manage it, it is provided by the custom and law of parliament, that no one shall sit or vote in either house, unless he be 21 years of age. This is also expressly declared by statute 7 and 8 W. III. c. 25: with regard to the house of commons, doubts have arisen, from some contradictory adjudications, whether or not a minor was incapacitated from sitting in that house. It is also en-

acted by statute 7 Jac. I. c. 6. that no member be permitted to enter the house of commons till he hath taken the oath of allegiance before the lord steward or his deputy: and by 30 Car. II. st. 2. and 1 Geo. I. c. 13. that no member shall vote or sit in either house, till he hath, in the presence of the house taken the oaths of allegiance, supremacy and abjuration, and subscribed and repeated the declaration against transubstantiation, and invocation of saints, and the sacrifice of the mass. Aliens, unless naturalized, were likewise by the law of parliament incapable to serve therein: and now it is enacted, by statute 12 & 13 W. III. c. 2. that no alien, even though he be naturalized, shall be capable of being a member of either house of parliament. And there are not only these standing incapacities; but if any person is made a peer by the king, or elected to serve in the house of commons by the people, yet may the respective houses, upon complaint of any crime in such person, and proof thereof, adjudge him disabled and incapable to sit as a member: and this by the law and custom of parliament.

For as every court of justice hath laws and customs for its direction, some the civil and canon, some the common law, others their own peculiar laws and customs; so the high court of parliament hath also its own peculiar law, called the *lex et consuetudo parliamenti*; a law which Sir Edward Coke observes is *ab omnibus querenda, a multis ignota, a paucis cognita*. It will not therefore be expected that we should enter into the examination of this law with any degree of minuteness; since as the same learned author assures us, it is much better to be learned out of the rolls of parliament, and other records, and by precedents and continual experience, that cannot be expressed by any one man. It will be sufficient to observe, that the whole of the law and custom of parliament has its original from this one maxim, "That whatever matter arises concerning either house of parliament, ought to be examined, discussed, and adjudged in that house to which it relates, and not elsewhere." Hence, for instance, the lords will not suffer the commons to interfere in settling the election of a peer of Scotland; the commons will not allow the lords to judge of the election of a burgess; nor will either house permit the subordinate courts of law to examine the merits of either case. But the maxims upon which they proceed, together with the method of proceeding, rest entirely in the breast of the parliament itself; and are not defined and ascertained by any particular stated laws.

<sup>15</sup> The privileges of parliament are likewise very large and indefinite; and therefore when, in 31st Hen. VI. the house of lords propounded a question to the judges concerning them, the chief justice, Sir John Fortescue, in the name of his brethren, declared, "That they ought not to make answer to that question; for it hath not been used aforetime, that the justices should in anywise determine the privileges of the high court or parliament; for it is so high and mighty in its nature, that it may make law; and that which is law, it may make no law: and the determination and knowledge of that privilege belongs to the lords of parliament, and not to the justices." Privilege of parliament was principally established, in order to protect its members not only from being molested by their fellow-subjects, but also more especially from being oppressed

<sup>14</sup> The customs of parliament which are not sanctioned by express laws.

<sup>15</sup> Its extensive privileges.

Parliament pressed by the power of the crown. If therefore all the privileges of parliament were once to be set down and ascertained, and no privilege to be allowed but what was so defined and determined, it were easy for the executive power to devise some new case, not within the line of privilege, and under pretence thereof to harass any refractory member, and violate the freedom of parliament. The dignity and independence of the two houses are therefore in great measure preserved by keeping their privileges indefinite. Some, however, of the more notorious privileges of the members of either house are, privilege of speech, of person, of their domestics, and of their lands and goods. As to the first, privilege of speech, it is declared by the statute 1. W. & M. st. 2. c. 2. as one of the liberties of the people, "That the freedom of speech, and debates, and proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament." And this freedom of speech is particularly demanded of the king in person, by the speaker of the house of commons, at the opening of every new parliament. So likewise are the other privileges, of person, servants, lands, and goods; which are immunities as ancient as Edward the Confessor: in whose laws we find this precept, *Ad synodos venientibus, siue summoniti sint, siue per se quid agendum habuerint, sit summa pax*; and so too in the old Gothic constitutions, *Extendiatur hæc pax et securitas ad quatuordecim dies, convocato regni senatu*. This included formerly not only privilege from illegal violence, but also from legal arrests and seizures by process from the courts of law. And still to assault by violence a member of either house, or his menial servants, is a high contempt of parliament, and there punished with the utmost severity. It has likewise peculiar penalties annexed to it in the courts of law by the statutes 5 Hen. IV. c. 6. and 11 Hen. VI. c. 11. Neither can any member of either house be arrested and taken into custody without a breach of the privilege of parliament.

16  
Some pri-  
vileges  
abolished.

But all other privileges which derogate from the common law are now at an end, save only as to the freedom of the member's person; which in a peer by the privilege of peerage) is for ever sacred and inviolable; and in a commoner (by the privilege of parliament) for forty days after every prorogation, and forty days before the next appointed meeting; which is now in effect as long as the parliament subsists, it seldom being prorogued for more than eighty days at a time. As to all other privileges which obstruct the ordinary course of justice, they were restrained by the statutes 12. W. III. c. 3. 2 & 3 Ann. c. 18. and 11 Geo. II. c. 24. and are now totally abolished by statute 10 G. III. c. 50.; which enacts, that any suit may at any time be brought against any peer or member of parliament, their servants, or any other person intitled to privilege of parliament; which shall not be impeached or delayed by pretence of any such privilege, except that the person of a member of the house of commons shall not thereby be subjected to any arrest or imprisonment. Likewise, for the benefit of commerce, it is provided by statute 4 Geo. III. c. 33. that any trader, having privilege of parliament, may be served with legal process for any just debt (to the amount of 100l.): and unless he makes satisfaction within two months, it shall be deemed an act of bankruptcy; and that com-

VOL. XIII.

missions of bankruptcy may be issued against such privileged traders in like manner as against any other.

The only way by which courts of justice could anciently take cognizance of privilege of parliament was by writ of privilege, in the nature of a *superfetas*, to deliver the party out of custody when arrested in a civil suit. For when a letter was written by the speaker to the judges, to stay proceedings against a privileged person, they rejected it as contrary to their oath of office. But since the statute 12 Will. III. c. 3. which enacts, that no privileged person shall be subject to arrest or imprisonment, it hath been held, that such arrest is irregular *ab initio*, and that the party may be discharged upon motion. It is to be observed, that there is no precedent of any such writ of privilege, but only in civil suits; and that the statute of 1 Jac. I. c. 13. and that of King William (which remedy some inconveniences arising from privilege of parliament), speak only of civil actions. And therefore the claim of privilege hath been usually guarded with an exception as to the case of indictable crimes; or, as it hath been frequently expressed, of treason, felony, and breach (or surety) of the peace. Whereby it seems to have been understood, that no privilege was allowable to the members, their families, or servants, in any crime whatsoever; for all crimes are treated by the law as being *contra pacem domini regis*. And instances have not been wanting, wherein privileged persons have been convicted of misdemeanors, and committed, or prosecuted to outlawry, even in the middle of a session; which proceeding has afterwards received the sanction and approbation of parliament. To which may be added, that a few years ago, the case of writing and publishing seditious libels was resolved by both houses not to be intitled to privilege; and that the reasons upon which that case proceeded, extended equally to every indictable offence. So that the chief, if not the only, privilege of parliament, in such cases, seems to be the right of receiving immediate information of the imprisonment or detention of any member, with the reason for which he is detained: a practice that is daily used upon the slightest military accusations, preparatory to a trial by a court-martial; and which is recognized by the several temporary statutes for suspending the *habeas corpus* act: whereby it is provided, that no member of either house shall be detained, till the matter of which he stands suspected be first communicated to the house of which he is a member, and the consent of the said house obtained for his commitment or detaining. But yet the usage has uniformly been, ever since the Revolution, that the communication has been subsequent to the arrest.

These are the general heads of the laws and customs relating to parliament, considered as one aggregate body. The laws and customs relating to each branch in particular being explained under the articles already referred to, viz KING, LORDS, and COMMONS, we should proceed, IV. To the method of making laws: which is much the same in both houses. But for this, too, we have to refer the reader to the article BILL; and shall only observe in this place, that, for dispatch of business, each house of parliament has its speaker. The speaker of the house of lords, whose office it is to preside there, and manage the formality of business, is the lord chancellor, or keeper of the king's great seal, or any other

appointed

Parliament appointed by the king's commission : and if none be so appointed, the house of lords (it is said) may elect. The speaker of the house of commons is chosen by the house ; but must be approved by the king. And herein the usage of the two houses differs, that the speaker of the house of commons cannot give his opinion or argue any question in the house ; but the speaker of the house of lords, if a lord of parliament, may. In each house the act of the majority binds the whole ; and this majority is declared by votes openly and publicly given ; not, as at Venice, and many other senatorial assemblies, privately, or by ballot. This latter method may be serviceable, to prevent intrigues and unconstitutional combinations ; but is impossible to be practised with us, at least in the house of commons, where every member's conduct is subject to the future censure of his constituents, and therefore should be openly submitted to their inspection.

19  
Of the adjournment of parliament.

V. There remains only, in the last place, to add a word or two concerning the manner in which parliaments may be *adjourned*, *prorogued*, or *dissolved*.

An *adjournment* is no more than a continuance of the session from one day to another ; as the word itself signifies ; and this is done by the authority of each house separately every day ; and sometimes for a fortnight or a month together, as at Christmas or Easter, or upon other particular occasions. But the adjournment of one house is no adjournment of the other. It hath also been usual, when his Majesty hath signified his pleasure that both or either of the houses should adjourn themselves to a certain day, to obey the king's pleasure so signified, and to adjourn accordingly. Otherwise, besides the indecorum of a refusal, a prorogation would assuredly follow ; which would often be very inconvenient to both public and private business. For prorogation puts an end to the session ; and then such bills as are only begun, and not perfected, must be resumed *de novo* (if at all) in a subsequent session ; whereas, after an adjournment, all things continue in the same state as at the time of the adjournment made, and may be proceeded on without any fresh commencement.

20  
Of prorogation of parliament.

A *prorogation* is the continuance of the parliament from one session to another ; as an adjournment is a continuation of the session from day to day. This is done by the royal authority, expressed either by the lord chancellor in his Majesty's presence, or by commission from the crown, or frequently by proclamation. Both houses are necessarily prorogued at the same time ; it not being a prorogation of the house of lords or commons, but of the parliament. The session is never understood to be at an end until a prorogation ; though, unless some act be passed, or some judgment given in parliament, it is in truth no session at all. And formerly the usage was, for the king to give the royal assent to all such bills as he approved at the end of every session, and then to prorogue the parliament, though sometimes only for a day or two ; after which all business then depending in the houses was to be begun again. Which custom obtained so strongly, that it once became a question, Whether giving the royal assent to a single bill did not of course put an end to the session ? And though it was then resolved in the negative, yet the notion was so deeply rooted, that the statute 1 Car. I. c. 7. was passed to declare, that the king's

assent to that and some other acts should not put an end to the session ; and even so late as the reign of Charles II. we find a proviso frequently tacked to a bill, that his Majesty's assent thereto should not determine the session of parliament. But it now seems to be allowed, that a prorogation must be expressly made, in order to determine the session. And if at the time of an actual rebellion, or imminent danger of invasion, the parliament shall be separated by adjournment or prorogation, the king is empowered to call them together by proclamation, with 14 days notice of the time appointed for their reassembling.

A *dissolution* is the civil death of the parliament ; and this may be effected three ways : 1. By the king's will, expressed either in person or by representation. For as the king has the sole right of convening the parliament, so also it is a branch of the royal prerogative, that he may (whenever he pleases) prorogue the parliament for a time, or put a final period to its existence. If nothing had a right to prorogue or dissolve a parliament but itself, it might happen to become perpetual. And this would be extremely dangerous, if at any time it should attempt to encroach upon the executive power ; as was fatally experienced by the unfortunate king Charles I. ; who, having unadvisedly passed an act to continue the parliament then in being till such time as it should please to dissolve itself, at last fell a sacrifice to that inordinate power which he himself had consented to give them. It is therefore extremely necessary that the crown should be empowered to regulate the duration of these assemblies, under the limitations which the English constitution has prescribed : so that, on the one hand, they may frequently and regularly come together for the dispatch of business and redress of grievances ; and may not, on the other, even with the consent of the crown, be continued to an inconvenient or unconstitutional length.

2. A parliament may be dissolved by the demise of the crown. This dissolution formerly happened immediately upon the death of the reigning sovereign : for he being considered in law as the head of the parliament, (*apud principium et finis*), that failing, the whole body was held to be extinct. But the calling a new parliament immediately on the inauguration of the successor being found inconvenient, and dangers being apprehended from having no parliament in being in case of a disputed succession, it was enacted by the statutes 7 & 8 W. III. c. 15. and 6 Ann. c. 7. that the parliament in being shall continue for six months after the death of any king or queen, unless sooner prorogued or dissolved by the successor ; that if the parliament be, at the king's death separated by adjournment or prorogation, it shall notwithstanding assemble immediately : and that if no parliament is then in being, the members of the last parliament shall assemble, and be again a parliament.

3. Lastly, a parliament may be dissolved or expire by length of time. For if either the legislative body were perpetual, or might last for the life of the prince who convened them as formerly, and were so to be supplied, by occasionally filling the vacancies with new representatives ; in these cases, if it were once corrupted, the evil would be past all remedy ; but when different bodies succeed each other, if the people see cause to disapprove of the present, they may rectify its faults in

21  
Parliament is dissolved by the king's will,

22  
Or in consequence of his death,

23  
Or thro' length of time.

Parliament in the next. A legislative assembly also, which is sure to be separated again, (whereby its members will themselves become private men, and subject to the full extent of the laws which they have enacted for others), will think themselves bound, in interest as well as duty, to make only such laws as are good. The utmost extent of time that the same parliament was allowed to sit, by the statute 6 W. & M. c. 3. was *three years*: after the expiration of which, reckoning from the return of the first summons, the parliament was to have no longer continuance. But by the statute 1 Geo. I. st. 2. c. 38. (in order, professedly, to prevent the great and continued expences of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government then just recovering from the late rebellion), this term was prolonged to *seven years*; and, what alone is an instance of the vast authority of parliament, the very same house that was chosen for three years, enacted its own continuance for seven. So that, as our constitution now stands, the parliament must expire, or die a natural death, at the end of every seventh year, if not sooner dissolved by the royal prerogative.

We shall conclude this article with an account of some general forms not taken notice of under any of the above heads.

24  
General forms observed in the house of peers;

In the house of lords, the princes of the blood sit by themselves on the sides of the throne; at the wall, on the king's right hand, the two archbishops sit by themselves on a form. Below them, the bishops of London, Durham, and Winchester, and all the other bishops, sit according to the priority of their consecration. On the king's left hand the lord treasurer, lord president, and lord privy-seal, sit upon forms above all dukes, except the royal blood; then the dukes, marquesses, and earls, according to their creation. Across the room are wool-sacks, continued from an ancient custom; and the chancellor, or keeper, being of course the speaker of the house of lords, sits on the first wool-sack before the throne, with the great seal or mace lying by him; below these are forms for the viscounts and barons. On the other wool-sacks are seated the judges, masters in chancery, and king's council, who are only to give their advice in points of law: but they all stand up till the king gives them leave to sit.

25  
In the house of commons.

The commons sit promiscuously; only the speaker has a chair at the upper end of the house, and the clerk and his assistant sit at a table near him.

When a member of the house of commons speaks, he stands up uncovered, and directs his speech to the speaker only. If what he says be answered by another, he is not allowed to reply the same day, unless personal reflections have been cast upon him: but when the commons, in order to have a greater freedom of debate, have resolved themselves into a committee of the whole house, every member may speak to a question as often as he thinks necessary. In the house of lords they vote, beginning at the puiſne, or lowest baron, and so up orderly to the highest, every one answering, *Content*, or *Not content*. In the house of commons they vote by *yeas* and *nays*; and if it be dubious which are the greater number, the house divides. If the question be about bringing any thing into the house, the *yeas* go out; but if it be about any thing the house

already has, the *nays* go out. In all divisions the speaker appoints four tellers, two of each opinion. In a committee of the whole house, they divide by changing sides, the *yeas* taking the right and the *nays* the left of the chair; and then there are but two tellers. If a bill pass one house, and the other demur to it, a conference is demanded in the painted chamber, where certain members are deputed from each house; and here the lords sit covered, and the commons stand bare, and debate the case. If they disagree, the affair is null; but if they agree, this, with the other bills that have passed both houses, is brought down to the king in the house of lords, who comes thither clothed in his royal robes; before him the clerk of the parliament reads the title of each bill, and as he reads, the clerk of the crown pronounces the royal assent or dissent. If it be a public bill, the royal assent is given in these words, *Le roy le veut*, "The king will have it so;" if private, *Si il suit comme il est désiré*, "Let the request be complied with;" if the king refuses the bill, the answer is, *Le roy s'avisera*, "The king will think of it;" and if it be a money-bill, the answer is, *Le roy remercie ses loyaux sujets, accepte leur benevolence, & aussi le veut*; "The king thanks his loyal subjects, accepts their benevolence, and therefore grants his consent."

26  
Manner of expressing the royal assent or dissent to bills.

*High Court of PARLIAMENT*, is the supreme court in the kingdom, not only for the making, but also for the execution, of laws; by the trial of great and enormous offenders, whether lords or commoners, in the method of parliamentary impeachment. As for acts of parliament to attain particular persons of treason or felony, or to inflict pains and penalties, beyond or contrary to the common law, to serve a special purpose, we speak not of them; being to all intents and purposes new laws, made *pro re nata*, and by no means an execution of such as are already in being. But an impeachment before the lords by the commons of Great Britain in parliament, is a prosecution of the already known and established law, and has been frequently put in practice; being a presentment to the most high and supreme court of criminal jurisdiction by the most solemn grand inquest of the whole kingdom. A commoner cannot, however, be impeached before the lords for any capital offence, but only for high misdemeanors; a peer may be impeached for any crime. And they usually (in case of an impeachment of a peer for treason) address the crown to appoint a lord high steward, for the greater dignity and regularity of their proceedings; which high steward was formerly elected by the peers themselves, though he was generally commissioned by the king; but it hath of late years been strenuously maintained, that the appointment of an high steward in such cases is not indispensably necessary, but that the house may proceed without one. The articles of impeachment are a kind of bills of indictment, found by the house of commons, and afterwards tried by the lords; who are in cases of misdemeanors considered not only as their own peers, but as the peers of the whole nation. This is a custom derived to us from the constitution of the ancient Germans; who in their great councils sometimes tried capital accusations relating to the public: *Licet apud concilium accusare quosque, et discrimen capitulis intendere*. And it has a peculiar propriety in the English constitution; which has much improved upon

Parliament the ancient model imported hither from the continent. For though in general the union of the legislative and judicial powers ought to be most carefully avoided, yet it may happen that a subject, intrusted with the administration of public affairs, may infringe the rights of the people, and be guilty of such crimes as the ordinary magistrate either dares not or cannot punish. Of these the representatives of the people, or house of commons, cannot properly judge; because their constituents are the parties injured, and can therefore only impeach. But before what court shall this impeachment be tried? Not before the ordinary tribunals, which would naturally be swayed by the authority of so powerful an accuser. Reason therefore will suggest, that this branch of the legislature, which represents the people, must bring its charge before the other branch, which consists of the nobility, who have neither the same interests, nor the same passions, as popular assemblies. This is a vast superiority which the constitution of this island enjoys over those of the Grecian or Roman republics; where the people were at the same time both judges and accusers. It is proper that the nobility should judge, to insure justice to the accused; as it is proper that the people should accuse, to insure justice to the commonwealth. And therefore, among other extraordinary circumstances attending the authority of this court, there is one of a very singular nature, which was insisted on by the house of commons in the case of the earl of Danby in the reign of Charles II. and is now enacted by statute 12 and 13 W. III. c. 2. that no pardon under the great seal shall be pleadable to an impeachment by the commons of Great Britain in parliament.

Such is the nature of a British parliament, and in theory at least we should presume it were nearly perfect; but some of our fellow-countrymen, more zealous perhaps than wise, see prodigious faults in it, such indeed as they think must inevitably prove fatal. The consequence of this persuasion has been a loud and incessant call for parliamentary reform. That abuses ought to be reformed, is certain; and that few institutions are so perfect as not to need amendment, is a fact equally indisputable. We shall even suppose that there are many abuses in our parliament which would require to be amended; but, granting all this, and something more if it were necessary, we would recommend in the mean time to the serious consideration of those who call themselves the *Friends of the People*, whose sincerity in their professions it would be impolite to question, the example of France, and that they would allow it to be a warning to Britain. France wanted reform indeed, and that which was first proposed had the countenance of the coolest and the best of men; but the consequences have been dreadful; and if ever a free and stable government take place in it, which we sincerely wish may be soon, it will have been purchased at an immense price, by enormities which will disgrace it whilst the remembrance of them lasts.

The former *PARLIAMENTS of France* were sovereign courts established by the king, finally to determine all disputes between particular persons, and to pronounce on appeals from sentences given by inferior judges.—There were ten of these parliaments in France, of which that of Paris was the chief, its privileges and jurisdiction being of the greatest extent. It consisted

of eight chambers: the grand chamber, where causes of audience were pleaded; the chamber of written law; the chamber of counsel; the Tournelle criminelle, for judging criminal affairs; the Tournelle civile, in and of the grand chamber; and three chambers of inquests, where processes were adjudged in writing: besides these, there was also the chamber of vacations, and those of requests. In 1771 the king thought fit to branch the parliament of Paris into six different parliaments, under the denomination of superior courts, each parliament having similar jurisdiction. Under their second race of king's, this parliament, like that of England, was the king's council; it gave audience to ambassadors, and consulted of the affairs of war and government. The French king, at that time presided in them, without being at all master of their resolutions. But in after times their authority was abridged; as the kings reserved the decision of the grand affairs of the public to their own councils; leaving none but private ones to the parliaments. The parliament of Paris also enjoyed the privileges of verifying and registering the king's arrets or edicts, without which those edicts were of little or no value.

*PARLIAMENT of Sweden*, consists of four estates, with the king at their head. These estates are, 1. The nobility and representatives of the gentry; with whom the colonels, lieutenant-colonels, majors, and captains of every regiment, sit and vote. 2. The clergy; one of which body is elected from every rural deanery of ten parishes; who with the bishops and superintendants, amount to about 200. 3. The burghers, elected by the magistrates and council of every corporation as their representatives, of whom there are four for Stockholm, and two for every other town, amounting in the whole to about 150. 4. The peasants, chosen by the peasants out of every district; who choose one of their own rank, and not a gentleman, to represent them: these amount to about 250.

All these generally meet at Stockholm: and after the state-affairs have been represented to them from the throne, they separate, and sit in four several chambers or houses, in each of which affairs are carried on by majority of votes; and every chamber has a negative in the passing any law.

*PARMA*, an ancient, rich, populous, and handsome town of Italy, capital of the duchy of the same name, with a citadel, a bishop's see, and an university. It has a magnificent cathedral, and the largest opera-house in Europe, which has seats for 8000 people; but as it required a vast number of candles, which occasioned great expence, they have contrived another which has room for 2000 spectators. The dome and the church of St John were painted by the famous Corregio, who was a native of this place. Don Carlos, king of the two Sicilies, carried away the library to Naples, which contained 18,000 volumes, and a very valuable cabinet of curiosities, as also the rich collection of medals. The citadel, which is very near the city, is built in the same taste as that at Antwerp. In 1734 there was a bloody battle fought here; and in 1741, by the treaty of Aix-la-Chapelle, the duchies of Parma, Placentia, and Guastalla, were given to Don Philip, brother to Don Carlos above-mentioned. It is 30 miles south-east of Cremona, and 30 south-east of Milan. E. Long. 10. 51. N. Lat. 44. 50.

*PARMA,*

*Parliament  
Parma.*

Parma  
||  
Parmigiano.

PARMA, the duchy of a province of Italy bounded on the north by the Po; on the north-east by the Mantuan; on the east by the duchy of Modena; on the south by Tuscany; and on the west by the duchy of Placentia. The air is very wholesome, on which account the inhabitants live to a great age. The soil is very fertile, in corn, wine, oil, and hemp; the pastures feed a great number of cattle, and the cheese is in very high esteem. Here are considerable mines of copper and silver, and plenty of truffles, which many are fond of.

PARMESAN CHEESE, a sort of cheese much esteemed among the Italians; so named from the duchy of Parma where it is made, and whence it is conveyed to various parts of Europe.

The excellent pasture-grounds of this country are watered by the Po; and the cows from whose milk this cheese is made yield a great quantity of it. Of this cheese there are three sorts; the *fromaggio di forma*, about two palms in diameter, and seven or eight inches thick; and the *fromaggio di riliolo* and *di ribolini*, which are not so large. This cheese is of a saffron-colour; and the best is kept three or four years. See CHEESE.

PARMIGIANO, a celebrated painter, whose true name was Francesco Mazzuoli: but he received the former from the city of Parma, where he was born, in 1504. He was brought up under his two uncles, and was an eminent painter when but 16 years of age. He was famous all over Italy at 19; and at 23 performed such wonders, that when the general of the emperor Charles V. took Rome by storm, some of the common soldiers having, in sacking the town, broke into his apartments, found him intent upon his work, and were instantly so struck with the beauty of his pieces, that instead of involving him in the plunder and destruction in which they were then employed, they resolved to protect him from all manner of violence; which they actually performed. His works are distinguished by the beauty of the colouring, the invention, and drawing. His figures are spirited and graceful, particularly with respect to the choice of attitude, and in their dresses. He also excelled in music, in which he much delighted.

In large compositions Parmigiano did not always reach an high degree of excellence; but in his holy families, and other similar subjects, the gracefulness of his heads, and the elegance of his attitudes, are peculiarly delightful. For the celebrity of his name he seems to be chiefly indebted to his numerous drawings and etchings; for his life being short, and a great part of it consumed in the idle study of alchemy, in pursuit of the philosopher's stone, and in the seducing avocations of music and gambling, there was but little time left for application to the laborious part of his business. His paintings in oil are few in number, and held in high esteem, as are also his drawings and etchings; good impressions of these last being very rarely to be found. He was the first that practised the art of etching in Italy; and probably he did not at first know that it had been for some year practised in Germany. When he set out for Rome, he was advised to take some of his pictures with him, as a means of getting himself introduced into the acquaintance of the nobility and artists in that celebrated city. One of them is

mentioned by his biographers as a masterpiece. It was his own portrait painted upon a piece of wood of a convex form, in imitation of a convex mirror. The surface is said to have been so wonderfully executed, that it had the appearance of real glass, and the head, as well as every part of the furniture of the chamber in which he was supposed to sit, were so artfully managed, that the whole formed a very complete piece of deception. At Rome he was employed by pope Clement VII. who was highly pleased with his performances, and rewarded him liberally. A circumcision which he painted for him was particularly esteemed as a capital work. In it Parmigiano was successful in introducing a variety of lights, without destroying the general harmony. When Charles V. came to Bologna to be crowned emperor of the Romans, Parmigiano failed not to be present at that singular ceremony; and so accurately marked the countenance of the emperor, that at his return home, he was enabled from memory to make out a surprising likeness. In the same piece he introduced the figure of Fame placing a crown of laurel on the head of the emperor, whilst a young Hercules presented him with a globe of the world. Before it was quite finished, the painter and his piece were introduced to Charles by the Pope, but to little purpose; for the emperor left Bologna a few days after, without ordering him any recompence for his labour. In the church of Madona della Stercata at Parma are still to be seen several of the works of this artist; among which one of Sybils, and two others of Moses, and of Adam and Eve, are much admired. So also is a Dead Christ, with the Virgin in sorrow, in the church of the Dominicans at Cremona. In the Houghton collection of pictures, now in the possession of the empress of Russia, is one of his best pictures, representing Christ laid in the sepulchre, for which he is said to have been knighted by the duke of Parma. His principal works are at Parma, where he died poor in 1540.

PARNASSIA, grass of Parnassus, in botany; a genus of the tetragynia order, belonging to the pentandria class of plants. The calyx is quinquepartite; there are five petals, and as many nectaria, heart shaped, and ciliated with globular tops; the capsule quadri-valved. There is but one species, having a stalk about a foot high, angular, and often a little twisted, bearing a single white flower at top. The flowers are very beautifully streaked with yellow; so that though it is a common plant, growing naturally in moist pastures, it is frequently admitted into gardens.

PARNASUS (Strabo, Pindar, Virgil), a mountain of Phocis, near Delphi, and the mounts Cithæron and Helicon, with two tops (Ovid, Lucan); the one called *Cirrha*, sacred to Apollo; and the other *Nisa*, sacred to Bacchus, (Juvenal). It was covered with bay trees, (Virgil); and originally called *Larnæssus*, from Deucalion's larnæx or ark, thither conveyed by the flood, (Stephanus, Scholiast on Apollonius); after the flood, *Parnæssus*; from Har Nahas, changing the *h* into *p*, the hill of divination or augury (Peucerus), the oracle of Delphi standing at its foot.

Chandler\*, who visited it, thus describes it:—  
“Parnassus was the western boundary of Phocis, and stretching northward from about Delphi toward the Cætan,

\* Travels in Greece.

Parnassus.

Ætæan mountains, separated the western Locri from those who possessed the sea coast before Eubœa. It was a place of refuge to the Delphians in times of danger. In the deluge, which happened under Deucalion, the natives were saved on it by following the cry of wolves. On the invasion by Xerxes, some transported their families over to Achaia, but many concealed them in the mountain, and in Corycium, a grotto of the Nymphs. All Parnassus was renowned for sanctity, but Corycium was the most noted among the hallowed caves and places. 'On the way to the summits of Parnassus, says Pausanias, as much as 60 stadia beyond Delphi, is a brazen image; and from thence the ascent to Corycium is easier for a man on foot, than for mules and horses. Of all the caves in which I have been, this appeared to me the best worth seeing. On the coasts, and by the sea-side, are more than can be numbered; but some are very famous both in Greece and in other countries. The Corycian cave exceeds in magnitude those I have mentioned, and for the most part may be passed through without a light. It is sufficiently high; and has water, some springing up, and yet more from the roof, which petrifies; so that the bottom of the whole cave is covered with sparry icicles. The inhabitants of Parnassus esteem it sacred to the Corycian Nymphs, and particularly to Pan.—From the cave to reach the summits of the mountain is difficult even to a man on foot. The summits are above the clouds, and the women called *Thyades* madden on them in the rites of Bacchus and Apollo.' Their frantic orgies were performed yearly. Wheler and his company ascended Parnassus from Delphi, some on horses, by a track between the Stadium and the clefts of the mountain. Stairs were cut in the rock, with a strait channel, perhaps a water-duct.—In a long hour, after many traverses, they gained the top, and entering a plain turned to the right, towards the summits of Castalia, which are divided by deep precipices. From this eminence they had a fine prospect of the gulph of Corinth, and of the coast; mount Cirphis appearing beneath them as a plain, bounded on the east by the bay of Asprospitia, and on the west by that of Salona. A few shepherds had huts there. They returned to the way which they had quitted, and crossed a hill covered with pines and snow. On their left was a lake, and beyond it a peak, exceedingly high, white with snow. They travelled to the foot of it through a valley, four or five miles in compass; and rested by a plentiful fountain called *Drosanigo*, the stream boiling up a foot in diameter, and nearly as much above the surface of the ground. It runs into the lake, which is about a quarter of a mile distant to the south-east. They did not discover Corycium, or proceed farther on, but keeping the lake on their right, came again to the brink of the mountain, and descended by a deep and dangerous track to Racovi, a village four or five miles eastward from Delphi. It was the opinion of Wheler, that no mountain in Greece was higher than Parnassus; that it was not inferior to mount Cenis among the Alps; and that, if detached, it would be seen at a greater distance than even mount Athos. The summits are perpetually increasing, every new fall of snow adding to the perennial heap, while the sun has power only to thaw the superficies. Castalis Pleisthus and innumerable springs are fed, some invisibly,

from the lakes and reservoirs, which without these drains and subterraneous vents, would swell especially after heavy rain and the melting of snow, so as to fill the valleys, and run over the tops of the rocks down upon Delphi, spreading wide an inundation, similar as, has been furnished, to the Deucalionian deluge."

PARNEILL (Dr Thomas), a very ingenious divine and poet in the early part of this century. He was archdeacon of Clogher, and the intimate friend of Mr Pope; who published his works, with an elegant copy of recommendatory verses prefixed. He died in 1718, aged 39.

Johnson \* says, "The Life of Dr Parnell is a task which I should very willingly decline, since it has been lately written by Goldsmith, a man of such variety of powers, and such felicity of performance, that he always seemed to do best that which he was doing; a man who had the art of being minute without tediousness, and general without confusion; whose language was copious without exuberance, exact without constraint, and easy without weakness."

"What such an author has told, who would tell again? I have made an extract from his larger narrative; and shall have this gratification from my attempt, that it gives me an opportunity of paying due tribute to the memory of a departed genius."

'To παρ παρὰς ἐστὶ δαμον-αυ.'

"The general character of Parnell is not great extent of comprehension, or fertility of mind. Of the little that appears still less his own. His praise must be derived from the easy sweetness of his diction: in his verses there is more happiness than pains; he is sprightly without effort, and always delights though he never ravishes; every thing is proper yet every thing seems casual. If there is some appearance of elaboration in the Hermit, the narrative, as it is less airy, is less pleasing. Of his other compositions, it is impossible to say whether they are the productions of Nature so excellent as not to want the help of Art, or of Art so refined as to resemble Nature."

PARODY, a popular maxim, adage, or proverb.

PARODY, is also a poetical pleasantry, consisting in applying the verses written on one subject, by way of ridicule, to another; or in turning a serious work into a burlesque, by affecting to observe as near as possible the same rhimes, words, and cadences.

The parody was first set on foot by the Greeks; from whom we borrow the name. It comes near to what some of our late writers call *travesty*. Others have more accurately distinguished between a parody and burlesque; and they observe, that the change of a single word may parody a verse: or of a single letter a word. Thus, in the last case, Cato exposed the inconstant disposition of Marcus Fulvius Nobilior, by changing Nobilior into Mobilior. Another kind of parody consists in the mere application of some known verse, or part of a verse of a writer, without making any change in it, with a view to expose it. A fourth instance is that of writing verses in the taste and style of authors little approved. The rules of parody regard the choice of a subject, and the manner of treating it. The subject should be a known and celebrated work; as to the manner, it should be by an exact imitation, and an intermixture of good natural pleasantry.

Parnell,  
Parody.

Parole  
" Paros.

**PAROLE**, in a military sense, the promise made by a prisoner of war, when he has leave to go anywhere, of returning at a time appointed, if not exchanged.

**PAROLE**, means also a word given out every day in orders by the commanding officer, both in camp and garrison, in order to know friends from enemies.

**PARONOMASIA**, in rhetoric, a pun; or a figure whereby words nearly alike in sound, but of very different meanings, are affectedly or deliquedly used. See **ORATORY**, n<sup>o</sup> 76.

**PARONYCHIA**, the **WHITLOW**, in surgery, is an abscess at the end of the fingers. According as it is situated more or less deep, it is differently denominated, and divided into species.

It begins with a slow heavy pain, attended with a slight pulsation, without swelling, redness, or heat: but soon the pain, heat, and throbbing, are insupportable; the part grows large and red, the adjoining fingers and the whole hand swell up; in some cases, a kind of red and inflated streak may be observed, which beginning at the affected part, is continued almost to the elbow; nor is it unusual for the patient to complain of a very sharp pain under the shoulder, and sometimes the whole arm is excessively inflamed and swelled; the patient cannot sleep, the fever, &c. increasing: and sometimes delirium or convulsions follow.

1. When it is seated in the skin or fat, in the back or the fore part of the finger, or under or near the nail, the pain is severe, but ends well. 2. When the periosteum is inflamed or corroded, the pain is tormenting. 3. When the nervous coats of the flexor tendons of the fingers or nerves near them are seized, the worst symptoms attend. If the first kind suppurates, it must be opened, and treated as abscesses in general; but the best method of treating the other two species is, on the first, or at furthest the second day, to cut the part where the pain is seated quite to the bone: if this operation is longer deferred, a suppuration will come on; on which case suppuration should be speedily promoted, and as early a discharge given to the matter as possible. As the pain is so considerable as to occasion a fever, and sometimes convulsions, the tinct. th. b. may be added to the suppurating applications, and also given in a draught at bed time. The second species proves very troublesome, and sometimes ends in a caries of the subjacent bone. The third species is very tedious in the cure, and usually the phalanx on which it is seated is destroyed.

**PAROS** (anc. geog.), an island of the **Ægean sea**, one of the **Cyclades**, with a strong cognominal town, 38 miles distant from **Delos** (Pliny, Nepos). Anciently

called *Paros* and *Minoa* (Pliny); also *Demetrias*, *Zacynthus*, *Hyria*, *Hyleessa*, and *Cabarnis*, (N. canor). The country of **Archilochus** the Iambic poet (Strabo). An island famous for its white marble (Virgil, Horace, Ovid), called *lychnites*, because dug with lamps (Pliny). The name of **Cabarnis** is borrowed, according to **Stephanus**, from one **Cabarnus**, who first informed **Ceres** of the rape of her daughter **Proserpine**; or, according to **Hesychius**, from the **Cabarni**, the priests of **Ceres** being so called by the inhabitants of this island. The name of **Minoa** is derived from **Minos** king of **Crete**, who subdued this as he did most of the other islands of the **Ægean sea**. It was called **Paros**, which name it retains to this day, from **Paros** the son of **Parrhasius**, or, as **Stephanus** will have it, of **Jason** the **Argonaut**. **Paros**, according to **Pliny's** computation, is distant from **Naxos** seven miles and a half, and 28 from **Delos**. Some of the modern travellers will have it to be 80, others only 50 miles in compass. **Pliny** says it is half as large as **Naxos**, that is, between 36 and 37 miles in compass. It was a rich and powerful island, being termed the most wealthy and happy of the **Cyclades**, and by **Cornelius Nepos** an island elated with its riches. The city of **Paros**, the metropolis, is styled by **Stephanus** a potent city, and one of the largest in the **Archipelago**; the present city of **Paros**, now **Parichia**, is supposed to have been built upon its ruins, the country abounding with valuable monuments of antiquity. The very walls of the present city are built with columns, architraves, pedestals mingled with pieces of ancient marble of a surprising magnitude, which were once employed in more noble edifices. **Paros** was indeed formerly famous for its marble, which was of an extraordinary whiteness, and in such request among the ancients that the best statuaries used no other (A). The island is provided with several capacious and safe harbours, and was anciently much resorted to by traders. It was according to **Thucydides**, originally peopled by the **Phœnicians**, who were the first masters of the sea. Afterwards the **Carians** settled here, as we are told by **Thucydides** and **Diodorus**. But these two authors differ as to the time when the **Carians** came first into the island; for **Thucydides** tells us, that the **Carians** were driven out by the **Cretans** under the conduct of **Minos**; and **Diodorus** writes, that the **Carians** did not settle here till after the **Trojan war**, when they found the **Cretans** in possession of the island. **Stephanus** thinks that the **Cretans**, mixed with some **Arcadians**, were the only people that ever possessed this island. **Minos** himself, if we believe **Pliny**, resided some time in the island of **Paros**, and received here the melancholy news of the death of his son **Androgeus**, who was killed in **Attica** after

(A) **Sutherland** says, "that while its marble quarries continued to be worked, **Paros** was one of the most flourishing of the **Cyclades**; but on the decline of the eastern empire they were entirely neglected, and are now converted into caves, in which the shepherds shelter their flocks. We have been in several of these subterraneous folds, which put me much in mind of **Homer's** description of **Polyphemus**. The common walls are almost entirely composed of marble; and in examining a very small part of one, we found several pieces of cornice and bas-relief. Several fine blocks of marble (fragments of columns) are lying close to the water's edge; and seem to have been brought there by travellers, who for want of a proper purchase to get them on board, have not been able to carry them farther."

Paros  
Parr.

Parr.

after he had distinguished himself at the public games. We find the inhabitants of this island chosen from among all the Greeks by the Milesians to compose the differences which had for two generations rent that unhappy state into parties and factions. They acquitted themselves with great prudence, and reformed the government. They assisted Darius in his expedition against Greece with a considerable squadron; but after the victory obtained by Miltiades at Marathon, they were reduced to great straits by that general. However, after blocking up the city for 26 days, he was obliged to quit the enterprize, and return to Athens with disgrace. Upon his departure, the Parians were informed that Timo, a priestess of the national gods, and then his prisoner, had advised him to perform some secret ceremony in the temple of Ceres, near the city; assuring him that he would thereby gain the place. Upon this information they sent deputies to consult the oracle of Delphi, whether they should punish her with death, for endeavouring to betray the city to the enemy, and discovering the sacred mysteries to Miltiades. The Pythian answered, that Timo was not the adviser: but that the gods, having resolved to destroy Miltiades, had only made her the instrument of his death. After the battle of Selamis, Themistocles subjected Paros and most of the other neighbouring islands to Athens, exacting large sums from them by way of punishment for having favoured the Persians. It appears from the famous monument of Adulas, which Cosmas of Egypt has described with great exactness, that Paros and the other Cyclades were once subject to the Ptolemies of Egypt. However, Paros fell again under the power of the Athenians, who continued masters of it till they were driven out by Mithridates the Great. But that prince being obliged to yield to Sylla, to Lucullus, and to Pompey, this and the other islands of the Archipelago submitted to the Romans, who reduced them to a province with Lydia, Phrygia, and Caria.

Mr Sutherland, who lately visited Paros, says, that "the water in it is excellent; and as that which we got at Messina has been complained of, as being too hard to make proper pease-soup for the people, all the casks are ordered to be emptied and refilled. The Russians made this place their grand arsenal; their powder magazines, and several other buildings, are still standing; and the island is considerably indebted to them for improving the convenience for water, and for the trade which the cash they expended introduced among the inhabitants."

PAROTIDES, in anatomy. See there, n<sup>o</sup> 128.

PAROXYSM, in medicine, the severe fit of a disease, under which it grows higher or exasperated; as of the gout, &c.

PARR (Catharine), was the eldest daughter of Sir Thomas Parr of Kendall. She was first married to John Nevil, lord Latymer; after whose death she so captivated her amorous sovereign, that he raised her to the throne. The royal nuptials were solemnized at Hampton Court on the 12th of July 1543. Being religiously disposed, she was, in the early part of her life, a zealous observer of the Romish rites and ceremonies; but in the dawning of the Reformation, she became as zealous a promoter of the Lutheran doc-

trine; yet with such prudence and circumspection as her perilous situation required. Nevertheless, we are told, that she was in great danger of falling a sacrifice to the Popish faction, the chief of whom was Bishop Gardiner: he drew up articles against her, and prevailed on the king to sign a warrant to remove her to the Tower. This warrant was, however, accidentally dropped, and immediately conveyed to her majesty. What her apprehensions must have been on this occasion may be easily imagined. She knew the monarch, and she could not help recollecting the fate of his former queens. A sudden illness was the natural consequence. The news of her indisposition brought the king to her apartment. He was lavish in expressions of affection, and sent her a physician. His majesty being soon after also somewhat indisposed, she prudently returned the visit; with which the king seemed pleased, and began to talk with her on religious subjects, proposing certain questions, concerning which he wanted her opinion. She answered, that such profound speculations were not suited to her sex; that it belonged to the husband to choose principles for his wife; the wife's duty was, in all cases, to adopt implicitly the sentiments of her husband: and as to herself, it was doubly her duty, being blessed with a husband who was qualified, by his judgment and learning, not only to choose principles for his own family, but for the most wise and knowing of every nation. "Not so, by St Mary," replied the king; "you are now become a doctor, Kate, and better fitted to give than receive instruction." She meekly replied, that she was sensible how little she was entitled to these praises; that though she usually declined not any conversation, however sublime, when proposed by his majesty, she well knew that her conceptions could serve to no other purpose than to give him a little momentary amusement; that she found the conversation a little apt to languish when not revived by some opposition, and she had ventured sometimes to feign a contrariety of sentiments, in order to give him the pleasure of refuting her; and that she also proposed, by this innocent artifice, to engage him into topics whence she had observed, by frequent experience, that she reaped profit and instruction. "And is it so, sweetheart?" replied the king; "then we are perfect friends again." He embraced her with great affection, and sent her away with assurances of his protection and kindness.

The time being now come when she was to be sent to the Tower, the king, walking in the garden, sent for the queen, and met her with great good humour; when so the chancellor, with forty of the guards, approached. He fell upon his knees, and spoke softly with the king, who called him knave, arrant knave, beast, fool, and commanded him instantly to depart. Henry then returned to the queen, who ventured to intercede for the chancellor: "Ah, poor soul," said the king, "thou little knowest how evil he deserveth this grace at thy hands. Of my word, sweetheart, he hath been toward thee an arrant knave; and so let him go." The king died in January 1547, just three years and a half after his marriage with this second Catharine; who in a short time was again espoused to Sir Thomas Seymour lord-admiral of England: for in  
September

Parr.

September 1548 she died in childbed. The historians of this period generally insinuate that she was poisoned by her husband, to make way for his marriage with the lady Elizabeth.

That Catharine Parr was beautiful is beyond a doubt: that she was pious and learned is evident from her writings: and that her prudence and sagacity were not inferior to her other accomplishments, may be concluded from her holding up the passion of a capricious tyrant as a shield against her enemies; and that at the latter end of his days, when his passions were enfeebled by age, and his peevish austerity increased by disease. She wrote, 1. *Queen Catharine Parr's lamentation of a sinner, bewailing the ignorance of her blind life*; Lond. 8vo, 1548, 1563. 2. *Prayers or meditations, wherein the mind is stirred patiently to suffer all afflictions here, to set at nought the vaine prosperities of this worlde, and always to long for the everlastynge felicitiee. Collected out of holy workes, by the most virtuous and gracious princeesse Katharine, queene of Englande, France, and Irelande.* Printed by John Wayland, 1545, 4to.—1561, 12mo. 3. *Other Meditations, Prayers, Letters, &c. unpublished.*

PARR (Thomas), or *Old Parr*, a remarkable Englishman, who lived in the reigns of ten kings and queens; married a second wife when he was 120, and had a child by her. He was the son of John Parr, a husbandman of Winnington, in the parish of Alderbury, in the county of Salop, where he was born in the year 1483. Though he lived to the vast age of upwards of 152 years, yet the tenor of his life admitted but of little variety; nor can the detail of it be considered of importance, further than what will arise from the gratification of that curiosity which naturally inquires after the mode of living which could lengthen life to such extreme old age. Following the profession of his father, he laboured hard, and lived on coarse fare. Taylor the water-poet says of him:

Good wholesome labour was his exercise,  
Down with the lamb, and with the lark would rise;  
In mair and toiling sweat he spent the day,  
And to his team he whistled time away:  
The cock his night-clock, and till day was done,  
His watch and chief fun-dial was the sun.  
He was of old Pythagoras' opinion,  
That greencheese was most wholesome with an onion;  
Coarse messlin bread, and for his daily swig,  
Milk, butter-milk, and water, whey and whig:  
Sometimes metheglin, and by fortune happy,  
He sometimes sipp'd a cup of ale most nappy,  
Cyder or perry, when he did repair  
T' a Whitson ale, wake, wedding, or a fair,  
Or when in Christmas-time he was a guest  
At his good landlord's house among the rest:  
Else he had little leasure-time to waste,  
Or at the ale-house huff-cap ale to taste.  
Nor did he ever hunt a tavern fox;  
Ne'er knew a coach, tobacco, or the—  
His phyfic was good butter, which the soil  
Of Salop yields, more sweet than Candy oil?  
And garlic he esteem'd above the rate  
Of Venice treacle, or best mithridate.  
He entertain'd no gout, no ache he felt,  
The air was good and temperate where he dwelt;  
VOL. XIII.

While mavisses and sweet-tongu'd nightingales  
Did chant him roundelays and madrigals.  
Thus living within bounds of Nature's laws,  
Of his long lasting life may be some cause.

Parr.

And the same writer describes him in the following two lines:

From head to heel, his body had all over  
A quick set, thick set, natural hairy cover.

The manner of his being conducted to London is also noticed in the following terms: "The Right Hon. Thomas Earl of Arundel and Surrey, earl-marshal of England, on being lately in Shropshire to visit some lands and manors which his worship holds in that county, or for some other occasions of importance which caused his lordship to be there, the report of this aged man was signified to his honour, who hearing of so remarkable a piece of antiquity, his lordship was pleased to see him; and in his innate, noble, and Christian piety, he took him into his charitable tuition and protection, commanding that a litter and two horses (for the more easy carriage of a man so feeble and worn with age) to be provided for him; also, that a daughter of his, named Lucy, should likewise attend him, and have a horse for her own riding with him: and to cheer up the old man, and make him merry, there was an antique-faced fellow, with a high and mighty no-beard, that had also a horse for his carriage. These were all to be brought out of the country to London by easy journeys, the charge being allowed by his lordship; likewise one of his lordship's own servants; named Bryan Kelly, to ride on horseback with them, and to attend and defray all manner of reckonings and expences. All which was done accordingly as follows.

"Winnington is a parish of Alderbury, near a place called the Welch Pool, eight miles from Shrewsbury; from whence he was carried to Wem, a town of the earl's aforesaid; and the next day to Shiffnal, a manor-house of his lordship's, where they likewise stayed one night: from Shiffnal they came to Wolverhampton, and the next day to Birmingham, and from thence to Coventry. Although Master Kelly had much to do to keep the people off, that pressed upon him in all places where he came, yet at Coventry he was most oppressed, for they came in such multitudes to see the old man, that those that defended him were almost quite tired and spent, and the aged man in danger of being stifled; and, in a word, the rabble were so unruly, that Bryan was in doubt he should bring his charge no farther; so greedy are the vulgar to hearken or to gaze after novelties. The trouble being over, the next day they passed to Daintree, to Stony Stratford, to Radburne, and so to London; where he was well entertained and accommodated with all things, having all the aforesaid attendance at the sole charge and cost of his lordship." When brought before the king, his majesty, with more acuteness than good manners, said to him, "You have lived longer than other men, what have you done more than other men?" He answered, "I did penance when I was an hundred years old." This journey, however, proved fatal to him; owing to the alteration in his diet, to the change of the air, and his general mode of life, he lived but a very short time, dying the 5th of November

Parr.

1635 (A); and was buried in Westminster Abbey. After his death, his body was opened; and an account was drawn up by the celebrated Dr Harvey, part of which we shall lay before our readers.

"Thomas Parr was a poor countryman of Shropshire, whence he was brought up to London by the Right Hon. Thomas Earl of Arundel and Surrey; and died after he had outlived nine princes, in the tenth year of the tenth of them, at the age of 152 years and nine months.

"He had a large breast, lungs not fungous, but sticking to his ribs, and distended with blood; a lividness in his face, as he had a difficulty of breathing a little before his death, and a long lasting warmth in his armpits and breast after it; which sign, together with others, were so evident in his body, as they use to be on those that die by suffocation. His heart was great, thick, fibrous, and fat. The blood in the heart blackish and diluted. The cartilages of the sternum not more bony than in others, but flexible and soft. His viscera were sound and strong, especially the stomach; and it was observed of him, that he used to eat often by night and day, though contented with old cheese, milk, coarse bread, small beer and whey; and, which is more remarkable, that he eat at midnight a little before he died. His kidneys were covered with fat, and pretty sound; only on the interior surface of them were found some aqueous or ferous abscesses, whereof one was near the bigness of a hen egg, with a yellowish water in it, having made a roundish cavity, impressed on that kidney; whence some thought it came that a little before his death a suppression of urine had befallen him; though others were of opinion, that his urine was suppressed upon the regurgitation of all the ferosity into his lungs. Not the least appearance there was of any stony matter either in the kidneys or bladder. His bowels were also found, a little whitish without. His spleen very little, hardly equalling the bigness of one kidney. In short, all his inward parts appeared so healthy, that if he had not changed his diet and air, he might perhaps have lived a good while longer. The cause of his death was imputed chiefly to the change of food and air; forasmuch as coming out of a clear, thin, and free air, he came into the thick air of London; and after a constant plain and homely country diet, he was taken into a splendid family, where he fed high and drank plentifully of the best wines, whereupon the natural functions of the parts of his body were overcharged, his lungs obstructed, and the habit of the whole body quite disordered; upon which there could not but ensue a dissolution. His brain was found, entire, and firm; and though he had not the use of his eyes, nor much of his memory, several years before he died, yet he had his hearing and apprehension very well; and was able, even to the 130th year of his age, to do any husbandman's work, even threshing of corn."

The following summary of his life is copied from Oldys's MS. notes on Fuller's Worthies: Old Parr

Parra.

was born 1483; lived at home until 1500, æt. 17, when he went out to service. 1518, æt. 35, returned home from his master. 1522, æt. 39, spent four years on the remainder of his father's lease. 1543, æt. 60, ended the first lease he renewed of Mr Lewis Porter. 1563, at 80, married Jane, daughter of John Taylor, a maiden; by whom he had a son and a daughter, who both died very young. 1564, æt. 81, ended the second lease which he renewed of Mr John Porter. 1585, æt. 102, ended the third lease he had renewed of Mr Hugh porter. 1588, æt. 105, did penance in Alderbury church, for lying with Katharine Milton, and getting her with child. 1595, æt. 112, he buried his wife Jane, after they had lived 32 years together. 1605, æt. 122, having lived 10 years a widower, he married Jane, widow of Anthony Adda, daughter of John Lloyd of Gilsells, in Montgomeryshire, who survived him. 1635, æt. 152, he died; after they had lived together 30 years, and after 50 years possession of his last lease. See LONGEVITY.

PARRA, in ornithology, a genus of birds belonging to the order of grallæ; the characters of which are: The bill is tapering and a little obtuse; the nostrils are oval, and situated in the middle of the bill; the forehead is covered with fleshy caruncles, which are lobated; the wings are small, and spinous. There are five species; of which the most remarkable is the chavaria, which is about the size of the domestic cock. The Indians in the neighbourhood of Carthage, who breed large flocks of poultry that stray in the woods, train up the chavaria to defend them against the numerous birds of prey, no one of which will dare to encounter it. It is never known to desert the flock, and it returns every evening to roost.

The parra Dominica is about the size of the lap-wing. The bill is yellow, as are also the head and upper parts; the under are of a yellowish white bordering on rose colour. The legs are also yellow. This species inhabits several of the warmer parts of America and St Domingo. The parra senegalla is about the same size with the former. Its bill is also yellow tipped with black: the forehead is covered with a yellow skin; the chin and throat are black; the head and upper parts of the body and lesser wing covers are grey-brown. The lower part of the belly, and the upper and under tail-covers are dirty white. At the bend of the wing is a black spur. It inhabits Senegal, and thence derives its name. The negroes call them *Uett Uett*, the French the *squallers*, because, as we are told, as soon as they see a man they scream and fly off. They always fly in pairs. The parra jacana, or spur-winged water hen, is about the size of the water-rail. The bill is in length about an inch and a quarter, of an orange colour; and on the forehead is a membranous flap half an inch long and nearly as broad. On each side of the head also is another of the same, about a quarter of an inch broad, and both together surround the base of the bill. The head, throat, neck, breast, and under-

parts,

(A) The author of a book intitled *Long Livers*, 8vo, 1722, which Oldys in his MS. notes on Fuller ascribes to one Robert Samber, against all evidence says, p. 89, that Parr died sixteen years after he had been presented to the king, 24th of November 1651.

Parra.

parts, are black; and sometimes the belly is mixed with white, &c. The birds of this species inhabit Brasil, Guiana, and Surinam; but are equally common at St Domingo, where they frequent the marshy places, sides of ponds, and streams, and wade quite up to the thighs in the water. They are also generally seen in pairs, and when separated call each other continually till they join again. They are very shy, and most common in the rainy seasons in May and November. They are at all times very noisy; their cry sharp and shrill, and may be heard a great way off. This, as well as the other species, is called by the French *chirurgien*. The flesh is accounted pretty good. The parra variabilis, or spur-winged water-hen, is about nine inches long. The bill is about 14 inches in length, and in colour is orange-yellow. On the forehead is a flap of red skin; the crown of the head is brown, marked with spots of a darker colour; the hind part of the neck is much the same, but of a deeper dye. The sides of the head, throat, forepart of the neck, breast, belly, thighs, and under-tail coverts are white, with a few red spots on the sides of the belly and base of the thighs. On the forepart of the wing is a yellow spur, &c. The legs are furnished with long toes, as in all the others, the colour of which is bluish ash. Mr Latham says, that one which came under his inspection from Cayenne was rather smaller. It had the upper parts much paler; over the eye was a streak of white passing no further, and unaccompanied by a black one. The hind part of the neck was dusky black. It had only the rudiment of a spur; and the red caruncle on the forehead was less, and laid back on the forehead. From these differences this learned ornithologist conceives it to have differed either in sex or age from the other. This species inhabits Brasil, and is said to be pretty common about Carthagera and in South America. The parra chavaria is, as we have already observed about the size of a dunghill cock, and stands a foot and a half from the ground. The bill is of a dirty white colour; the upper mandible similar to that in a dunghill cock; the nostrils are oblong, pervious: on both sides, at the base of the bill, is a red membrane, which extends to the temples. The irides are brown. On the hind head are about 12 blackish feathers, three inches in length, forming a crest and hanging downwards. The rest of the neck is covered with a thick black down. The body is brown, and the wings and tail inclined to black. On the bend of the wing are two or three spurs half an inch long. The belly is a light black. The thighs are half bare of feathers. The legs are very long, and of a yellow red colour. The toes are so long as to entangle one another in walking. "This species inhabits the lakes, &c. near the river Cinu, about 30 leagues from Carthagera, in South America, and is said to feed on vegetables. Its gait is solemn and slow; but it flies easily and swiftly. It cannot run, unless assisted by the wings at the same time. When any part of the skin is touched by the hand, a crackling is felt, though it is very downy beneath the feathers; and indeed this down adheres so closely as to enable the bird at times to swim. The voice is clear and loud, but far from agreeable. The natives, who keep poultry in great numbers, have one of these tame, which goes along with the flock about the neighbourhood to feed during the day, when this

Latham's  
Synopsis.

faithful shepherd defends them against birds of prey; Being able by means of the spurs on the wings, to drive off birds as big as the carrion vulture, and even that bird itself. It is so far of the greatest use, as it never deserts the charge committed to its care, bringing them all home safe at night. It is so tame as to suffer itself to be handled by a grown person; but will not permit children to attempt the same.—For the above account we are indebted to Linnæus, who seems to be the only one who has given any account of this wonderful bird." See *Latham's Synopsis*.

PARRELS, in a ship, are frames made of trucks, ribs, and ropes, which having both their ends fastened to the yards, are so contrived as to go round about the masts, that the yards by their means may go up and down upon the mast. These also, with the breast-ropes, fasten the yards to the masts.

PARRET or PEDRED river, has its rise in the southern part of Somersetshire in England. Near Langport it is joined by the Ordred, augmented by the Ivel; and, about four miles from this junction, it is joined by the Tone or Thone, a pretty large river; rising among the hills in the western parts of this county. About two miles below the junction of the Tone, the Parret receives another considerable stream; and, thus augmented, it passes by the town of Bridgewater, and falls into the Bristol channel in Bridgewater-bay.

PARRHASIUS, a famous ancient painter of Ephesus, or, as some say, of Athens: he flourished about the time of Socrates, according to Xenophon, who hath introduced him into a dialogue discoursing with that philosopher. He was one of the best painters in his time. Pliny says, that it was he who first gave symmetry and just proportions in that art; that he likewise was the first who knew how to express the truth and life of characters, and the different airs of the face; that he discovered a beautiful disposition of the hair, and heightened the grace of the visage. It was allowed even by the masters in the art, that he far outshone them in the glory of succeeding in the outlines, in which consists the grand secret of painting. But it is also remarked by Pliny, that Parrhasius became insupportable with pride; and was so very vain as to give himself the most flattering epithets: such as, the tenderest, the softest, the grandest, the most delicate, and the perfecter of his art. He boasted that he was sprung from Apollo, and that he was born to paint the gods; that he had actually drawn Hercules touch by touch: that hero having often appeared to him in dreams; when the plurality of voices was against him at Samos in favour of Timanthes, in the opinion of a picture of Ajax provoked against the Greeks, for adjudging to Ulysses the arms of Achilles, he answered a person who consoled him on this check, "For my part, I don't trouble myself at the sentence; but I am sorry that the son of Telamon hath received a greater outrage than that which was formerly put upon him so unjustly." Ælian relates this story, and tells us that Parrhasius affected to wear a crown of gold upon his head, and to carry in his hand a baton, studded with nails of the same metal. He worked at his art with pleasantry, often indeed singing. He was very licentious and loose in his pictures: and he is said by way of amusement, to have represented the

Parrhasius  
||  
Parrhasius.

Parrhasius most infamous objects. His Atalantis, with her spouse Meleager, was of this kind. This piece was afterwards devised as a legacy to the Emperor Tiberius, upon condition that, if he was displeased with the subject, he should receive a million sesterces instead of it. The emperor, covetous as he was, not only preferred the picture to that sum, but even placed it in his most favourite apartment. It is also said, that, though Parrhasius was excelled by Timanthes, yet he excelled Zeuxis. Among his pictures is a celebrated one of Theseus; and another representing Meleager, Hercules, and Perseus in a group together; as also Æneas, with Castor and Pollux, in a third.

PARRHASIUS (Janus), a famous grammarian in Italy, who was born at Cosenza in the kingdom of Naples, 1470. He was intended for the law, the profession of his ancestors; but he refused it, and cultivated classical learning. His real name was Johannes Paulus Parisius; but according to the humour of the grammarians of the age, he took instead of it Parrhasius. He taught at Milan with much reputation, being admired for a graceful delivery, in which he chiefly excelled other professors.—It was this charm in his voice, which brought a vast concourse of people to his lectures; and among others he had the pleasure to see General Trimoles, who was then threescore years old. He went to Rome when Alexander VI. was pope; and was like to be involved in the misfortunes of Bernardini Cajetan and Silius Savello, with whom he had some correspondence; but he escaped the danger, by the information of Thomas Phœdrus, professor of rhetoric, and canon of St John Lateran, whose advice he followed in retiring from Rome. Soon after, he was appointed public professor of rhetoric at Milan; but the liberty he took to censure the teachers there as arrant blockheads, provoked them in return to asperse his morals. They say he had a criminal converse with his scholars: which being a crime extremely abhorred by the Milanese, our professor was obliged to leave Milan. He went to Vicenza, where he obtained a larger salary; and he held this professorship till the states of the Venetians were laid waste by the troops of the League, upon which he went to his native country, having made his escape through the army of the enemies. He was at Cosenza, when his old friend Phœdrus persuaded Julius to send for him to Rome; and though, that design proved abortive by the death of the pope, yet, by the recommendation of John Lascaris, he was called thither under the successor Leo X. Leo was before favourably inclined to him; and on his arrival at Rome, appointed him professor of polite literature. He had been now some time married to a daughter of Demetrius Chalcondylas; and he took with him to Rome Basil Chalcondylas, his wife's brother, and brother of Demetrius Chalcondylas, professor of the Greek tongue at Milan. He did not long enjoy this employ conferred upon him by the pope: for, worn out by his studies and labours, he became so afflicted with the gout, that for some years he had no part of his body free, except his tongue; having almost lost the use of both his legs and both his arms. He laboured besides under so great a degree of poverty, as to put him out of all hopes of being ever in a better situation, so that he left Rome, and returned into Calabria, his native

country, where he was tormented a long while with a fever, and at last died in the greatest misery. He left his library to his friend Seripandus, brother to Cardinal Jerome Seripandus, who built him a tomb in the convent of the Austin friars at Naples. There are several books ascribed to him; and in the dedication of one of them, his character is drawn to great advantage by Henry Stephens.

PARRHESIA. See ORATORY, n° 88.

PARRICIDE, the murder of one's parents or children. By the Roman law, it was punished in a much severer manner than any other kind of homicide. After being scourged, the delinquents were sewed up in a leathern sack, with a live dog, a cock, a viper, and an ape, and so cast into the sea. Solon, it is true, in his laws made none against parricide; apprehending it impossible that one should be guilty of so unnatural a barbarity. And the Persians, according to Herodotus, entertained the same notion, when they adjudged all persons who killed their reputed parents to be bastards. And upon some such reason as this must we account for the omission of an exemplary punishment for this crime in the English laws; which treat it no otherwise than as simple murder, unless the child was also the servant of the parent.

For though the breach of natural relation is unobserved, yet the breach of civil or ecclesiastical connections, when coupled with murder, denominates it a new offence, no less than a species of treason, called *parva proditio*, or *petit treason*: which, however, is nothing else but an aggravated degree of murder; although, on account of the violation of private allegiance, it is stigmatized as an inferior species of treason. And thus, in the ancient Gothic constitution, we find the breach both of natural and civil relations ranked in the same class with crimes against the state and sovereign.

PARROT, in Ornithology. See PSITTACUS.

PARSHORE, a town of England in Worcestershire, seven miles from Worcester, and 102 from London, is a neat old town on the north side of the Avon, near its junction with the river Bow, being a considerable thoroughfare in the lower road from Worcester, to London. A religious house was founded here in 604, a small part of which now remains, and is used as the parish church of Holy Cross, the whole of which contained above 10 acres. The abbey church was 250 feet long, and 120 broad. The parish of Parshore is of great extent, and hath within its limits many manors and chapelries. At present it has two parishes, Holy Cross and St Andrew. In Holy Cross church are several very antique monuments. Its chief manufacture is stockings. It contains about 300 houses, and has markets on Tuesday and Saturday; fairs Easter-Tuesday, June 26th, and Tuesday before November st.

PARSNIP, in botany. See PASTINACIA.

PARSON and VICAR. A parson, *persona ecclesiæ*, is one that hath full possession of all the rights of a parochial church. He is called parson, *persona*, because by his person the church, which is an invisible body, is represented; and he is in himself a body corporate, in order to protect and defend the rights of the church (which he personates) by a perpetual succession.

Blackst.  
Comment.

Parson.

cession. He is sometimes called the *rector* or *governor* of the church: but the appellation of *parson* (however it may be depreciated by familiar, clownish, and indiscriminate use) is the most legal, most beneficial, and most honourable title that a parish-priest can enjoy; because such a one (Sir Edward Coke observes), and he only, is said *vicem seu personam ecclesie gerere*. A parson has, during his life, the freehold in himself of the parsonage-house, the glebe, the tithes, the other dues. But these are sometimes *appropriated*, that is to say, the benefice is perpetually annexed to some spiritual corporation, either sole or aggregate, being the patron of the living; whom the law esteems equally capable of providing for the service of the church as any single private clergyman\*.

\* See Appropriation.

The appropriating corporations, or religious houses, were wont to depute one of their own body to perform divine service, and administer the sacraments, in those parishes of which the society was thus the parson. This officiating minister was in reality no more than a curate, deputy, or vicegerent of the appropriator, and therefore called *vicarious*, or "vicar." His stipend was at the discretion of the appropriator, who was, however, bound of common right to find somebody, *qui illi de temporalibus, episcopo de spiritualibus, debeat respondere*. But this was done in so scandalous a manner, and the parishes suffered so much by the neglect of the appropriators, that the legislature was forced to interpose: and accordingly it is enacted, by statute 15 Ric. II. c. 6. that in all appropriations of churches the diocesan bishop shall ordain (in proportion to the value of the church) a competent sum to be distributed among the poor parishioners annually; and that the vicarage shall be sufficiently endowed. It seems the parish were frequently sufferers, not only by the want of divine service, but also by withholding those alms for which, among other purposes, the payment of tithes was originally imposed: and therefore in this act a pension is directed to be distributed among the poor parochians, as well as a sufficient stipend to the vicar. But he, being liable to be removed at the pleasure of the appropriator, was not likely to insist too rigidly on the legal sufficiency of the stipend; and therefore, by statute 4 Hen. IV. c. 12. it is ordained, that the vicar shall be a secular person, not a member of any religious house; that he shall be vicar perpetual, not removeable at the caprice of the monastery; and that he should be canonically instituted and inducted, and be sufficiently endowed, at the discretion of the ordinary; for these three express purposes, to do divine service, to inform the people, and to keep hospitality. The endowments, in consequence of these statutes, have usually been by a portion of the glebe or land belonging to the parsonage, and a particular share of the tithes, which the appropriators found it most troublesome to collect, and which are therefore generally called *petty* or *small tithes*; the greater, or *perdial tithes*, being still reserved to their own use. But one and the same rule was not observed in the endowment of all vicarages. Hence some are more liberally, and some more scantily, endowed: and hence the tithes of many things, as wood in particular, are in some parishes rectorial, and in some vicarial tithes.

The distinction therefore of a parson and vicar is this: The parson has for the most part the whole

right to all the ecclesiastical dues in his parish; but a vicar has generally an appropriator over him, intitled to the best part of the profits, to whom he is in effect perpetual curate, with a standing salary. Though in some places the vicarage has been considerably augmented by a large share of the great tithes; which augmentations were greatly assisted by the statute 27 Car. II. c. 8. enacted in favour of poor vicars and curates, which rendered such temporary augmentations (when made by the appropriators) perpetual.

The method of becoming a parson or vicar is much the same. To both there are four requisites necessary; holy orders, presentation, institution, and induction. The method of conferring the holy orders of deacon and priest, according to the liturgy and canons, is foreign to the present purpose; any farther than as they are necessary requisites to make a complete parson or vicar. By common law, a deacon, of any age, might be instituted and inducted to a parsonage or vicarage: but it was ordained, by statute 13 Eliz. c. 12. that no person under twenty-three years of age, and in deacon's orders, should be presented to any benefice with cure; and if he were not ordained priest within one year after his induction, he should be *ipso facto* deprived: and now, by statute 13 and 14 Car. II. c. 4. no person is capable to be admitted to any benefice, unless he hath been first ordained a priest; and then he is, in the language of the law, a clerk in orders. But if he obtains orders, or a licence to preach, by money or corrupt practices, (which seems to be the true, though not the common, notion of simony), the person giving such orders forfeits 40*l.* and the person receiving, 10*l.* and is incapable of any ecclesiastical preferment for seven years after.

Any clerk may be presented to a parsonage or vicarage; that is, the patron, to whom the advowson of the church belongs, may offer his clerk to the bishop of the diocese to be instituted. But when he is presented, the bishop may refuse him upon many accounts. As, 1. If the patron is excommunicated, and remains in contempt 40 days; or, 2. If the clerk be unfit: which unfitness is of several kinds. First, with regard to his person; as if he be a bastard, an outlaw, an excommunicate, an alien, under age, or the like. Next, with regard to his faith or morals; as for any particular heresy, or vice that is *malum in se*; but if the bishop alleges only in generals, as that he is *schismaticus inveteratus*, or objects a fault that is *malum prohibitum* merely, as haunting taverns, playing at unlawful games, or the like, it is not good cause of refusal. Or, lastly, the clerk may be unfit to discharge the pastoral office for want of learning. In any of which cases, the bishop may refuse the clerk. In case the refusal is for heresy, schism, inability of learning, or other matter of ecclesiastical cognizance, there the bishop must give notice to the patron of such his cause of refusal, who being usually a layman, is not supposed to have knowledge of it; else he cannot present by lapse; but if the cause be temporal, there he is not bound to give notice.

If an action at law be brought by the patron against the bishop for refusing his clerk, the bishop must assign the cause. If the cause be of a temporal nature, and the fact admitted, (as, for instance, outlawry), the judges of the king's courts must determine its validity,

or

Parson.

Parson.

or whether it be sufficient cause of refusal: but if the fact be denied, it must be determined by a jury. If the cause be of a spiritual nature, (as heresy, particularly alleged), the fact, if denied, shall also be determined by a jury: and if the fact be admitted or found, the court, upon consultation and advice of learned divines, shall decide its sufficiency. If the cause be want of learning, the bishop need not specify in what points the clerk is deficient, but only allege that he is deficient; for the statute 9 Edw. II. st. 1. c. 13. is express, that the examination of the fitness of a person presented to a benefice belongs to the ecclesiastical judge. But because it would be nugatory in this case to demand the reason of refusal from the ordinary, if the patron were bound to abide by his determination, who has already pronounced his clerk unfit; therefore if the bishop returns the clerk to be *minus sufficiens in literatura*, the court shall write to the metropolitan to re-examine him, and certify his qualifications; which certificate of the archbishop is final.

If the bishop hath no objections, but admits the patron's presentation, the clerk so admitted is next to be instituted by him; which is a kind of investiture of the spiritual part of the benefice; for by institution, the care of the souls of the parish is committed to the charge of the clerk. When a vicar is instituted, he (besides the usual forms) takes, if required by the bishop, an oath of perpetual residence; for the maxim of law is, that *vicarius non habet vicarium*: and as the non-residence of the appropriators was the cause of the perpetual establishment of vicarages, the law judges it very improper for them to defeat the end of their constitution, and by absence to create the very mischief which they were appointed to remedy; especially as, if any profits are to arise from putting in a curate and living at a distance from the parish, the appropriator, who is the real parson, has undoubtedly the elder title to them. When the ordinary is also the patron, and confers the living, the presentation and institution are one and the same act, and are called a *collation to a benefice*. By institution or collation the church is full, so that there can be no fresh presentation till another vacancy, at least in the case of a common patron; but the church is not full against the king till induction: nay, even if a clerk is instituted upon the king's presentation, the crown may revoke it before induction, and present another clerk. Upon institution also the clerk may enter on the parsonage house and glebe, and take the tithes; but he cannot grant or let them, or bring an action for them, till induction. See INDUCTION.

For the rights of a parson or vicar, in his tithes and ecclesiastical dues, see TITHES. As to his duties, they are so numerous, that it is impractical to recite them here with any tolerable conciseness or accuracy; but the reader who has occasion may consult *Bishop Gibson's Codex*, *Johnson's Clergyman's Vade Mecum*, and *Burn's Ecclesiastical Law*. We shall therefore only just mention the article of residence, upon the supposition of which the law doth style every parochial minister an incumbent. By statute 21 Henry VIII. c. 13. persons willingly absenting themselves from their benefices, for one month together, or two months in the year, incur a penalty of 5 l. to the king, and 5 l. to any person that will sue for the same; except chaplains to the king, or others therein mention-

ed, during their attendance in the household of such as retain them; and also except all heads of houses, magistrates, and professors in the universities, and all students under forty years of age residing there, *bona fide*, for study. Legal residence is not only in the parish, but also in the parsonage house; for it hath been resolved, that the statute intended residence, not only for serving the cure and for hospitality, but also for maintaining the house, that the successor also may keep hospitality there.

We have seen that there is but one way whereby one may become a parson or vicar: there are many ways by which one may cease to be so. 1. By death. 2. By cession, in taking another benefice; for by statute 21 Hen. VIII. c. 13. if any one having a benefice of 8 l. *per annum*, or upwards, in the king's books, (according to the present valuation), accepts any other, the first shall be adjudged void, unless he obtains a dispensation; which no one is intitled to have but the chaplains of the king and others therein mentioned, the brethren and sons of lords and knights, and doctors and bachelors of divinity and law, admitted by the universities of this realm. And a vacancy thus made for want of a dispensation, is called *cessio*. 3. By consecration; for, as was mentioned before, when a clerk is promoted to a bishopric, all his other preferments are void the instant that he is consecrated. But there is a method, by the favour of the crown, of holding such livings *in commendam*. *Commenda* or *ecclesia commendata*, is a living commended by the crown to the care of a clerk, to hold till a proper pastor is provided for it. This may be temporary for one, two, or three years, or perpetual, being a kind of dispensation to avoid the vacancy of the living, and is called a *commenda retinere*. There is also a *commenda recipere*, which is to take a benefice *de novo* in the bishop's own gift, or the gift of some other patron consenting to the same; and this is the same to him as institution and induction are to another clerk. 4. By resignation. But this is of no avail till accepted by the ordinary, into whose hands the resignation must be made. 5. By deprivation, either by canonical censures, or in pursuance of divers penal statutes, which declare the benefice void, for some nonfeasance or neglect, or else some malfeasance or crime: as for simony; for maintaining any doctrine in derogation of the king's supremacy, or of the thirty-nine articles, or of the book of common-prayer; for neglecting after institution to read the liturgy and articles in the church, or make the declarations against Popery, or take the abjuration-oath; for using any other form of prayer than the liturgy of the church of England; or for absenting himself 60 days in one year from a benefice belonging to a Popish patron, to which the clerk was presented by either of the universities: in all which, and similar cases, the benefice is *ipso facto* void, without any formal sentence of deprivation.

PARSONAGE, a rectory, or parish-church, endowed with a glebe, house, lands, tithes, &c for the maintenance of a minister, with cure of souls within such parish. See PARSON.

PARSONS, or PERSONS (Robert), an eminent writer of the church of Rome, was born at Nether-Stowey, near Bridgewater, in Somersetshire, in 1546, and educated at Baliol college, Oxford, where he distinguished himself as a zealous Protestant and an acute

Parson  
||  
Parsons.

dis-

Parsons,  
Part.

disputant; but being charged by the society with incontinency and embezzling the college mony, he went to Flanders and declared himself a Catholic. After travelling to several other places he effected the establishment of the English seminary at Rome, and procured father Allen to be chosen rector of it. He himself was appointed the head of the mission to England, in order to dethrone Queen Elizabeth, and if possible extirpate the Protestant religion. He accordingly came over to Britain in 1580, and took some bold steps towards accomplishing his purpose, in which he concealed himself with great art, travelling about the country to gentlemen's houses, disguised in the habit sometimes of a soldier, sometimes of a gentleman, and at other times like a minister or an apparitor; but father Campian being seized and committed to prison, our author escaped out of England for fear of the same fate, and went to Rome, where he was made rector of the English seminary. He had long entertained the most sanguine hopes of converting to the Popish faith the young king of Scots, which he considered as the best and most effectual means of bringing over his subjects to the same religious principles; but finding it impossible to succeed in his design, he published in 1594 his celebrated book, under the feigned name of *Doleman*, in order to overthrow, as far as lay in his power, the title of that prince to the crown of England. He died at Rome in 1610, and was buried in the chapel of the English college. Besides the book already mentioned, he wrote 1. A Defence of the Catholic Hierarchy. 2. The Liturgy of the Sacrament of the Mass. 3. A Memorial for the Reformation and several other tracts.

**PART**, a portion of some whole, considered as divided or divisible.

**Logical PART**, is a division for which we are indebted to the schoolmen. It refers to some universal as its whole; in which sense the species are parts of a genus, and individuals or singulars are parts of the species.

**Physical PART**, is that which, though it enter the composition of a whole, may yet be considered apart, and under its own distinct idea; in which sense, a continuum is said to consist of parts. Physical parts, again, are of two kinds, homogeneous, and heterogeneous; the first are those of the same denomination with some other; the second of a different one: (See **HOMOGENEOUS**, &c.) Parts, again, are distinguished into subjective, essential, and integrant. The schoolmen were also the authors of this division.

**Aliquot PART**, is a quantity which, being repeated any number of times, becomes equal to an integer. Thus 6 is an aliquot part of 24, and 5 an aliquot part of 30, &c.

**Aliquant PART**, is a quantity which, being repeated any number of times, becomes always either greater or less than the whole. Thus 5 is an aliquant part of 17, and 9 an aliquant part of 10, &c.

The aliquant part is resolvable into aliquot parts. Thus 15, an aliquant part of 20, is resolvable into  $10\frac{1}{2}$ , and 5 a fourth part of the same.

**PARTS of Speech**, in grammar, are all the sorts of words which can enter the composition of a discourse. See **GRAMMAR**.

**PARTERRE**, in gardening, a level division of ground, which for the most part faces the south, or best front of a house, and is generally furnished with evergreens, flowers, &c. There are two kinds of these, the plain ones and the parterres of embroidery.

Plain parterres are most valuable in England, because of the firmness of the English grass turf, which is superior to that of any other part of the world; and the parterres of embroidery are cut into shell and scroll work, with alleys between them. An oblong, or long square is accounted the most proper figure for a parterre; and a parterre should indeed be always twice as long as it is broad, because according to the known laws of perspective, a long square always sinks to a square; and an exact square always appears less than it really is. As to the breadth of a parterre, it is to be proportionable to the front of the house; but less than 100 feet in breadth is too little.

There should be on each side the parterre a terrace-walk raised for a view, and the flat of the parterre between the terraces should never be more than 300 feet, at the utmost, in breadth, and about 140 feet in width, with twice and a half that in length, is esteemed a very good size and proportion.

**PARTHENIUM**, in botany: A genus of the pentandria order, belonging to the monœcia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The male calyx is common and pentaphyllous; the florets of the disk monopetalous: the female has five florets of the radius, each with two male florets behind it; the intermediate female superior; the seed is naked.

It has been much neglected in Europe, having on account of its smell been banished from their parterres. It is therefore indebted for its culture to the distinguished rank it holds among the Chinese flowers. General description of China.

The skill of the florists, and their continual care, have brought this plant to so great perfection, that Europeans scarcely know it. The elegance and lightness of its branches, the beautiful indentation of its leaves, the splendor and duration of its flowers, seem indeed to justify the *florimania* of the Chinese for this plant. They have, by their attention to its culture, procured more than 300 species of it: every year produces a new one. A list of the names of all these kinds would be equally tedious and disgusting; we shall only say in general, that in its flowers are united all the possible combinations of shapes and colours. Its leaves are no less various: some of them are thin, others thick; some are very small, and some large and broad; some are indented like those of the oak, while others resemble those of the cherry-tree; some may be seen cut in the form of fins, and others are found serrated on the margin, and tapering towards the points.

Parthenium is propagated in China by seed, and by suckers, grafts, and slips. When the florists have a fine plant, they suffer the seeds to ripen, and about the end of autumn sow them in well prepared earth. Some keep them in this manner during winter, others sow them in spring. Provided they are watered after the winter, they shoot forth, and grow rapidly. After the parthenium has flowered, all its branches are cut three inches from the root, the earth is hoed around, and a little dung is mixed with it; and when the cold be-

comes

Parthe-  
nium,  
Parthia.

comes severe, the plant is covered with straw, or an inverted pot. Those that are in vases are transported to the green-house, where they are not watered. In spring they are uncovered and watered, and they shoot forth a number of stems; of these some florists leave only two or three, others pull up the stalk, together with the whole root, and divide it into several portions, which they transplant elsewhere. There are some who join two slips of different colours, in each of which, towards the bottom, they make a long notch, almost to the pith, and afterwards tie them together with packthread, that they may remain closely united: by these means they obtain beautiful flowers, variegated with whatever colours they choose.

Parthenium requires a good exposure, and fresh moist air that circulates freely: when shut up closely by four walls, it soon languishes. The earth in which it is planted ought to be rich, moist, and loamy, and prepared with great care. For refreshing it, the Chinese use only rain or river-water; and in spring-time, they mix with this water the excrements of silk-worms or the dung of their poultry; in summer, they leave the feathers of ducks or fowls to infuse in it for several days, after having thrown into it a little saltpetre; but in autumn they mix with the water a greater or smaller quantity of dried excrement reduced to powder according as the plant appears more or less vigorous. During the great heats of summer, they water it morning and evening: but they moisten the leaves only in the morning; they also place small fragments of brick round its root, to prevent the water from pressing down the earth too much. All this attention may appear trifling: but it is certain that it is founded upon experience and observation, and it is only by the assistance of such minute care, that the patient and provident Chinese has been able to procure, from a wild and almost stinking plant, so beautiful and odoriferous flowers. The more common species are, 1. *Hysterophorus*. 2. *Integrifolium*.

1  
Ancient  
divisions.

PARTHIA, a celebrated empire of antiquity, bounded on the west by Media, on the north by Hyrcania, on the east by Aria, on the south by Carmania the desert; surrounded on every side by mountains, which still serve as a boundary, though its name is now changed, having obtained that of *Eyrac* or *Arac*; and to distinguish it from Chaldaea, that of *Eyrac Agami*. By Ptolemy it is divided into five districts, viz. Camisinae, or Gamisene, Parthyene, Choroane, Atticene, and Tabiene. The ancient geographers enumerate a great many cities in this country. Ptolemy in particular reckons 25 large cities: and it certainly must have been very populous, since we have accounts of 2000 villages, besides a number of cities, in this district being destroyed by earthquakes. Its capital was named *Hecatompolis*, from the circumstance of its having 100 gates. It was a noble and magnificent place; and according to some it still remains under the name of *Isfahan*, the capital of the present Persian empire.

2  
Whence  
peopled.

Parthia is by some supposed to have been first peopled by the Phetri or Pathri, often mentioned in scripture, and will have the Parthians to be descended from Pathrusim the son of Misraim. But however true this may be with regard to the ancient inhabitants, yet it is certain, that those Parthians who were so famous in

history, descended from the Scythians, though from what tribe we are not certainly informed.

Parthia.

The history of the ancient Parthians is totally lost. All that we know about them is, that they were first subject to the Medes, afterwards to the Persians, and lastly to Alexander the Great. After his death the province fell to Seleucus Nicator, and was held by him and his successors till the reign of Antiochus Theus, about the year 250 before Christ. At this time the Parthians, revolted, and chose one Arsaces for their king. The immediate cause of this revolt was the lewdness of Agathocles, to whom Antiochus had committed the care of all the provinces beyond the Euphrates. This man made an infamous attempt on Tetricates, a youth of great beauty; which so enraged his brother Arsaces, that he excited his countrymen to revolt; and before Antiochus had leisure to attend to the rebellion, it became too powerful to be crushed. Seleucus Calinicus, the successor of Antiochus Theus, attempted to reduce Arsaces; but the latter having had so much time to strengthen himself, defeated and drove his antagonist out of the country. Seleucus however, in a short time, undertook another expedition against Arsaces; but was still more unfortunate than he had been in the former, being not only defeated in a great battle, but taken prisoner, and died in captivity. The day on which Arsaces gained this victory was ever after observed among the Parthians as an extraordinary festival. Arsaces being thus fully established in his new kingdom, reduced Hyrcania and some other provinces under his power; and was at last killed in a battle against Arearathes IV. king of Capadocia. From this prince all the other kings of Parthia took the surname of *Arsaces*, as those of Egypt did that of *Ptolemy* from Ptolemy Soter.

5  
Cause of  
the Par-  
thians re-  
volt from  
Antiochus  
Theus.

Arsaces I. was succeeded by his son Arsaces II. who, entering Media, made himself master of that country, while Antiochus the Great was engaged in a war with Ptolemy Euergetes king of Egypt. Antiochus, however, was no sooner disengaged from that war, than he marched with all his forces against Arsaces, and at first drove him quite out of Media. But he soon returned with an army of 100,000 foot and 20,000 horse, with which he put a stop to the further progress of Antiochus; and a treaty was soon after concluded, in which it was agreed, that Arsaces should remain master of Parthia and Hyrcania, upon condition of his assisting him in his wars with other nations.

Arsaces II. was succeeded by his son Priapatius, who reigned 15 years, and left three sons, Phraates, Mithridates, and Artabanus. Phraates, the eldest, succeeded to the throne, and reduced under his subjection the Mardi, who had never been conquered by any but Alexander the Great. After him his brother Mithridates was invested with the regal dignity. He reduced the Bactrians, Medes, Persians, Elymeans, and over-ran in a manner all the east, penetrating beyond the boundaries of Alexander's conquests. Demetrius Nicator, who then reigned in Syria, endeavoured to recover those provinces; but his army was entirely destroyed, and himself taken prisoner, in which state he remained till his death; after which victory Mithridates made himself master of Babylonia and Mesopotamia, so that he now commanded all the provinces from between the Euphrates and the Ganges.

stroyed  
with his  
whole ar-  
my.

Mithridates died in the 37th year of his reign, and left the throne to his son Phraates II. who was scarce settled in his kingdom when Antiochus Sidetes marched against him at the head of a numerous army, under pretence of delivering his brother Demetrius, who was still in captivity. Phraates was defeated in three pitched battles; in consequence of which he lost all the countries conquered by his father, and was reduced within the limits of the ancient Parthian kingdom. Antiochus did not, however, long enjoy his good fortune; for his army, on account of their number, amounting to no fewer than 400,000, being obliged to separate to such distances as prevented them, in case of any sudden attack, from joining together, the inhabitants, whom they had most cruelly oppressed, taking advantage of this separation, conspired with the Parthians to destroy them. This was accordingly executed; and the vast army of Antiochus, with the monarch himself, were slaughtered in one day, scarce a single person escaping to carry the news to Syria. Phraates, elated with this success, proposed to invade Syria; but in the mean time, happening to quarrel with the Scythians, he was by them cut off with his whole army, and was succeeded by his uncle Artabanus.

6  
Alliance  
concluded  
with the  
Romans.

The new king enjoyed his dignity but a very short time, being, a few days after his accession, killed in another battle with the Scythians. He was succeeded by Pacorus I. who entered into an alliance with the Romans; and he by Phraates III. This monarch took under his protection Tigranes the son of Tigranes the Great, king of Armenia, gave him his daughter in marriage, and invaded the kingdom with a design to place the son on the throne of Armenia; but on the approach of Pompey he thought proper to retire, and soon after solemnly renewed the treaty with the Romans.

7  
Crassus re-  
solves on a  
war with  
the Par-  
thians.

Phraates was murdered by his children Mithridates and Orodes; and soon after the former was put to death by his brother, who thus became sole master of the parthian empire. In his reign happened the memorable war with the Romans under Crassus. This was occasioned not by any breach of treaty on the side of the Parthians, but through the shameful avarice of Crassus. The whole Roman empire at that time had been divided between Cæsar, Pompey, and Crassus; and by virtue of that partition, the eastern provinces had fallen to the lot of Crassus. No sooner was he invested with this dignity, than he resolved to carry the war into Parthia, in order to enrich himself with the spoils of that people, who were then looked upon to be very wealthy. Some of the tribunes opposed him, as the Parthians had religiously observed the treaty; but Crassus having, by the assistance of Pompey, carried every thing before him, left Rome in the year 55 B. C. and pursued his march to Brundisium, where he immediately embarked his troops, though the wind blew very high; and after a difficult passage, where he lost many of his ships, he reached the ports of Galatia.

8  
Plunders  
the temple  
at Jerusa-  
lem.

From Galatia Crassus hastened to Syria, and passing through Judea, plundered the temple at Jerusalem in his way. He then marched with as great expedition as he could to the river Euphrates, which he crossed on a bridge of boats: and, entering the Par-

thian dominions, began hostilities. As the enemy had not expected an invasion, they were quite unprepared for resistance; and therefore Crassus over-ran all Mesopotamia; and if he had taken advantage of the consternation which the Parthians were in, might have also reduced Babylonia. But instead of this, early in the autumn, he repassed the Euphrates, leaving only 7000 foot and 1000 horse to garrison the places he had reduced; and putting his army into winter-quarters in Syria, gave himself totally up to his favourite passion of amassing money.

Early in the spring, the Roman general drew his forces out of their winter-quarters, in order to pursue the war with vigour; but, during the winter, Orodes had collected a very numerous army, and was well prepared to oppose him. Before he entered upon action, however, the Parthian monarch sent ambassadors to Crassus, in order to expostulate with him on his injustice in attacking an ally of the Roman empire; but Crassus, without attending to what they said, only returned for answer, that "they should have his answer at Seleucia."

Orodes, finding that a war was not to be avoided, divided his army into two bodies. One he commanded in person, and marched towards Armenia, in order to oppose the king of that country, who had raised a considerable army to assist the Romans. The other he sent into Mesopotamia, under the command of Surenas or Surenas, a most experienced general, by whose conduct all the cities which Crassus had reduced were quickly retaken. On this some Roman soldiers who made their escape, and fled to the camp of Crassus, filled the minds of his army with terror at the accounts of the number, power, and strength, of the enemy. They told their fellow-soldiers, that the Parthians were very numerous, brave, and well-disciplined; that it was impossible to overtake them when they fled, or escape them when they pursued: that their defensive weapons were proof against the Roman darts, and their offensive weapons so sharp, that no buckler was proof against them, &c. Crassus looked upon all this only as the effects of cowardice: but the common soldiers, and even many of the chief officers, were so disheartened, that Crassus, the same who afterwards conspired against Cæsar, and most of the legionary tribunes, advised Crassus to suspend his march, and consider better of the enterprise before he proceeded farther in it. But Crassus obstinately persisted in his former resolution, being encouraged by the arrival of Artabanus king of Armenia, who brought with him 6000 horse, and promised to send 10,000 cuirassiers and 30,000 foot, whenever he should stand in need of them. At the same time, he advised him by no means to march his army through the plains of Mesopotamia, but to take his route over the mountains of Armenia. He told him, that as Armenia was a mountainous country, the enemy's cavalry, in which their main strength consisted, would there be entirely useless; and besides, his army would there be plentifully supplied with all manner of necessaries: whereas, if he marched by the way of Mesopotamia, he would be perpetually harassed by the Parthian horse, and frequently be obliged to lead his army through sandy deserts, where he would be distressed for want of water and all other provisions. This salutary advice, how-

Parthia.

9  
His soldiers  
dishearten-  
ed.

Parthia. ever, was rejected, and Crassus entered Mesopotamia with an army of about 40,000 men.

The Romans had no sooner crossed the Euphrates, than Cassius advised his general to advance to some of those towns in which the garrisons yet remained, in order to halt and refresh his troops: or if he did not choose to follow this advice, he said that his best way would be to march along the banks of the Euphrates to Seleucia; as by this method he would prevent the Parthians from surrounding him, at the same time that he would be plentifully supplied with provisions from his ships. Of this advice Crassus seemed to approve; but was dissuaded by Abgarus king of Edessa, whom the Romans took for an ally, but who was in reality a traitor sent by Surenas to bring about the destruction of the Roman army.

13  
Betrayed  
by Abgarus  
king of  
Edessa.

Under the conduct of this faithless guide, the Romans entered a vast green plain divided by many rivulets. Their march proved very easy through this fine country; but the farther they advanced, the worse the roads became, inasmuch that they were at last obliged to climb up rocky mountains, which brought them to a dry and sandy plain, where they could neither find food to satisfy their hunger, nor water to quench their thirst. Abgarus then began to be suspected by the tribunes and other officers, who earnestly intreated Crassus not to follow him any longer, but to retreat to the mountains; at the same time an express arrived from Artabazus, acquainting the Roman general that Orodes had invaded his dominions with a great army, and that he was obliged to keep his troops at home, in order to defend his own dominions. The same messenger advised Crassus in his master's name to avoid by all means the barren plains, where his army would certainly perish with hunger and fatigue, and by all means to approach Armenia, that they might join their forces against the common enemy. But all was to no purpose; Crassus, instead of hearkening either to the advice of the king or his own officers, first flew into a violent passion with the messengers of Artabazus, and then told his troops, that they were not to expect the delights of Campania in the most remote parts of the world.

Thus they continued their march for some days cross a desert, the very sight of which was sufficient to throw them into the utmost despair; for they could not perceive, either near them or at a distance, the least tree, plant, or brook, not so much as an hill, or a single blade of grass; nothing was to be seen all around them but huge heaps of burning sand. The Romans had scarcely got through this desert, when word was brought them by their scouts, that a numerous army of Parthians was advancing full march to attack them; for Abgarus, under pretence of going out on parties, had often conferred with Surenas, and concerted measures with him for destroying the Roman army. Upon this advice, which occasioned great confusion in the camp, the Romans being quite exhausted and tired out with their long and troublesome march, Crassus drew up his men in battalia, following at first the advice of Cassius, who was for extending the infantry as wide as possible, that they might take up the more ground, and by that means prevent the enemy from surrounding them; but Abgarus assuring the proconsul that the Parthian forces were not so nu-

merous as was represented, he changed this disposition, and believing only the man who betrayed him, drew up his troops in a square, which faced every way, and had on each side 12 cohorts in front. Near each cohort he placed a troop of horse to support them, that they might charge with the greater security and boldness. Thus the whole army looked more like one phalanx than troops drawn up in manipuli, with spaces between them, after the Roman manner. The general himself commanded in the centre, his son in the left wing, and Cassius in the right.

In this order they advanced to the banks of a small river called the *Balissus*, the sight of which was very pleasing to the soldiers, who were much harassed with drought and excessive heat. Most of the officers were for encamping on the banks of this river, or rather rivulet, to give the troops time to refresh themselves after the fatigues of so long and painful a march; and, in the mean time, to procure certain intelligence of the number and disposition of the Parthian army; but Crassus, suffering himself to be hurried on by the inconsiderate ardour of his son, and the horse he commanded, only allowed the legions to take a meal standing; and before this could be done by all, he ordered them to advance, not slowly, and halting now and then, after the Roman manner, but as fast as they could move, till they came in sight of the enemy, who, contrary to their expectation, did not appear either so numerous or so terrible as they had been represented; but this was a stratagem of Surenas, who had concealed his men in convenient places, ordering them to cover their arms, lest their brightness should betray them, and, starting up at the first signal, to attack the enemy on all sides. The stratagem had the desired effect; for Surenas no sooner gave the signal, than the Parthians, rising as it were out of the ground with dreadful cries, and a most frightful noise, advanced against the Romans, who were greatly surprised and dismayed at that sight; and much more so, when the Parthians, throwing off the covering of their arms, appeared in shining cuirasses, and helmets of burnished steel, finely mounted on horses covered all over with armour of the same metal. At their head appeared young Surenas, in a rich dress, and was the first who charged the enemy, endeavouring, with his pikemen to break through the first ranks of the Roman army; but finding it too close and impenetrable, the cohorts supporting each other, he fell back, and retired in a seeming confusion: but the Romans were much surprised when they saw themselves suddenly surrounded on all sides, and galled with continual showers of arrows. Crassus ordered his light-armed foot and archers to advance, and charge the enemy; but they were soon repulsed, and forced to cover themselves behind the heavy-armed foot. Then the Parthian horse, advancing near the Romans, discharged showers of arrows upon them, every one of which did execution, the legionaries being drawn up in such close order, that it was impossible for the enemy to miss their aim. As their arrows were of an extraordinary weight, and discharged with incredible force and impetuosity, nothing was proof against them. The two wings advanced in good order to repulse them, but to no effect: for the Parthians shot their arrows with as great dexterity when their backs were turned,

Parthia.

11  
The battle  
of Carrhae.

as

Parthia. as when they faced the enemy; so that the Romans, whether they kept their ground, or pursued the flying enemy, were equally annoyed with their fatal arrows.

The Romans, as long as they had any hopes that the Parthians, after having spent their arrows, would either betake themselves to flight, or engage them hand to hand, stood their ground with great resolution and intrepidity; but when they observed that there were a great many camels in their rear loaded with arrows, and that those who emptied their quivers wheeled about to fill them anew, they began to lose courage, and loudly to complain of their general for suffering them thus to stand still, and serve only as a butt to the enemy's arrows, which, they well saw, would not be exhausted till they were all killed to a man. Hereupon Crassus ordered his son to advance, at all adventures, and attack the enemy with 1300 horse, 500 archers, and 8 cohorts. But the Parthians no sooner saw this choice body (for it was the flower of the army) marching up against them, than they wheeled about, and betook themselves, according to their custom, to flight. Hereupon young Crassus, crying out as loud as he could, *They fly before us*, pushed on full speed after them, not doubting but he should gain a complete victory; but when he was at a great distance from the main body of the Roman army, he perceived his mistake; for those who before had fled, facing about, charged him with incredible fury. Young Crassus ordered his troops to halt, hoping that the enemy, upon seeing their small number, would not be afraid to come to a close fight: but herein he was likewise greatly disappointed; for the Parthians, contenting themselves to oppose his front with their heavy armed horse, surrounded him on all sides; and, keeping at a distance, discharged incessant showers of arrows upon the unfortunate Romans, thus surrounded and pent up. The Parthian cavalry, in wheeling about, raised so thick a dust, that the Romans could scarce see one another, much less the enemy: nevertheless, they found themselves wounded with arrows, though they could not perceive whence they came. In a short time, the place where they stood was all strown with dead bodies.

12  
Extreme  
distress of  
the Ro-  
mans.

Some of the unhappy Romans finding their entrails torn, and many overcome by the exquisite torments they suffered, rolled themselves in the sand with the arrows in their bodies, and expired in that manner. Others endeavouring to tear out by force the bearded points of the arrows, only made the wounds the larger and increased their pain. Most of them died in this manner; and those who outlived their companions were no more in a condition to act; for when young Crassus exhorted them to march up to the enemy, some showed him their wounded bodies, others their hands nailed to their bucklers, and some their feet pierced through and pinned to the ground: so that it was equally impossible for them either to attack the enemy or defend themselves. The young commander, therefore, leaving his infantry to the mercy of the enemy, advanced at the head of the cavalry against their heavy-armed horse. The thousand Gauls whom he had brought with him from the west, charged the enemy with incredible boldness and vigour; but their lances did little execution on men armed with cuirasses, and

horses covered with tried armour: however, they behaved with great resolution; for some of them taking hold of the enemy's spears, and closing with them, threw them off their horses on the ground, where they lay without being able to stir, by reason of the great weight of their armour; others dismounting, crept under the enemy's horses, and thrusting their swords into their bellies, made them throw their riders. Thus the brave Gauls fought, though greatly harassed with heat and thirst, which they were not accustomed to bear, till most of their horses were killed, and their commander dangerously wounded. They then thought it advisable to retire to their infantry, which they no sooner joined, than the Parthians invested them anew, making a most dreadful havoc of them with their arrows. In this desperate condition, Crassus, spying a rising ground at a small distance, led the remains of his detachment thither, with a design to defend himself in the best manner he could, till succours should be sent him from his father. The Parthians pursued him; and having surrounded him in his new post, continued showering arrows upon his men, till most of them were either killed or disabled, without being able to make use of their arms, or give the enemy proofs of their valour.

Young Crassus had two Greeks with him, who had settled in the city of Carrhæ. These, touched with compassion, at seeing so brave a man reduced to such straits, pressed him to retire with them to the neighbouring city of Ischæes, which had declared for the Romans; but the young Roman rejected their proposal with indignation, telling them, that he would rather die a thousand times than abandon so many valiant men, who sacrificed their lives for his sake. Having returned this answer to his two Greek friends, he embraced and dismissed them, giving them leave to retire and shift for themselves in the best manner they could. As for himself, having now lost all hopes of being relieved, and seeing most of his men and friends killed round him, he gave way to his grief; and, not being able to make use of his arm, which was shot through with a large barbed arrow, he presented his side to one of his attendants, and ordered him to put an end to his unhappy life. His example was followed by Censorius a senator, by Megabacchus an experienced and brave officer, and by most of the nobility who served under him. Five hundred common soldiers were taken prisoners, and the rest cut in pieces.

The Parthians, having thus cut off or taken the whole detachment commanded by young Crassus, on the first advice that the enemy fled before his son, and were closely pursued by him, had taken heart, the more because those who had remained to make head against him seemed to abate much of their ardour, the greatest part of them having marched with the rest against his son. Wherefore, having encouraged his troops, he had retired to a small hill in his rear to wait there till his son returned from the pursuit. Young Crassus had dispatched frequent expresses to his father, to acquaint him with the danger he was in; but they had fallen into the enemy's hands, and been by them put to the sword: only the last, who had escaped with great difficulty, arrived safe, and informed

Parthia.

Parthia.

ed him that his son was lost if he did not send him an immediate and powerful reinforcement. This news threw Crassus into the utmost consternation; a thousand affecting thoughts rose in his mind, and disturbed his reason to such a degree, that he scarce knew what he was doing. However, the desire he had of saving his son, and so many brave Romans who were under his command, made him immediately decamp, and march to their assistance; but he was not gone far before he was met by the Parthians, who, with loud shouts, and songs of victory, gave, at a distance, the unhappy father notice of his misfortune. They had cut off young Crassus's head, and, having fixed it on the point of a lance, were advancing full speed to fall on the father. As they drew near, Crassus was struck with that dismal and affecting sight; but, on this occasion, behaved like an hero: for though he was under the deepest concern, he had the presence of mind to stifle his grief, for fear of discouraging the army, and to cry out to the dismayed troops, "This misfortune is entirely mine; the loss of one man cannot affect the victory: Let us charge, let us fight like Romans; if you have any compassion for a father who has just now lost a son whose valour you admired, let it appear in your rage and resentment against these insulting barbarians." Thus Crassus strove to reanimate his troops; but his efforts were unsuccessful: their courage was quite sunk, as appeared from the faint and languishing shout which they raised, according to custom, before the action. When the signal was given, the Parthians, keeping to their old way of fighting, discharged clouds of arrows on the legionaries, without drawing near them; which did such dreadful execution, that many of the Romans, to avoid the arrows, which occasioned a long and painful death, threw themselves, like men in despair, on the enemy's heavy-armed horse, seeking from their spears a more quick and easy kind of death. Thus the Parthians continued plying them incessantly with their arrows till night, when they left the field of battle, crying out, that they would allow the father one night to lament the death of his son.

14  
Distress of  
Crassus.

This was a melancholy night for the Romans. Crassus kept himself concealed from the soldiery, lying not in the general's tent, but in the open air, and on the bare ground, with his head wrapped up in his paludamentum or military cloak: and was, in that forlorn condition, says Plutarch, a great example to the vulgar of the instability of fortune; to the wise, a still greater of the pernicious effects of avarice, temerity, and ambition. Octavius, one of his lieutenants, and Cassius, approached him, and endeavoured to raise him up and console him: but, seeing him quite sunk under the weight of his affliction, and deaf to all comfort, they summoned a council of war, composed of all the chief officers; wherein it was unanimously resolved, that they should decamp before break of day, and retire, without sound of trumpet, to the neighbouring city of Carrhæ, which was held by a Roman garrison. Agreeable to this resolution, they began their march as soon as the council broke up; which produced dreadful outcries among the sick and wounded, who, perceiving that they were to be abandoned to the mercy of the enemy, filled the camp with their complaints and lamentations: but their cries and tears,

though very affecting, did not stop the march of the others, which, indeed, was very slow, to give the stragglers time to come up. There were only 300 light horse, under the command of one Ægnatius, who pursued their march without stopping. These arriving at Carrhæ about midnight, Ægnatius, calling to the centinels on the walls, desired them to acquaint Coponius, governor of the place, that Crassus had fought a great battle with the Parthians; and, without saying a word more, or letting them know who he was, continued his march with all possible expedition to the bridge of Zeugma; which he passed, and by that means saved his troops, but was much blamed for abandoning his general.

However, the message he sent to Coponius was of some temporary service to Crassus. For that commander, wisely conjecturing, from the manner in which the unknown person had given him that intelligence, that some misfortune had befallen Crassus, immediately ordered his garrison to stand to their arms; and, marching out, met Crassus, and conducted him and his army into the city: for the Parthians, though informed of his flight, did not offer to pursue him, observing therein the superstitious custom which obtained among them and the Persians, not to fight in the night; but when it was day, they entered the Roman camp, and having put all the wounded, to the number of 4000, to the sword, dispersed their cavalry all over the plain, in pursuit of the fugitives. One of Crassus's lieutenants, named *Vargunteius*, having separated in the night from the main body of the army, with four cohorts, missed his way, and was overtaken by the enemy; at whose approach, he withdrew to a neighbouring hill, where he defended himself with great valour, till all his men were killed, except 20, who made their way through the enemy sword in hand, and got safe to Carrhæ: but Vargunteius himself lost his life on this occasion.

In the mean time Surenas, not knowing whether Crassus and Cassius had retired to Carrhæ, or chosen a different route; in order to be informed of the truth and take his measures accordingly, dispatched a messenger, who spoke the Roman language, to the city of Carrhæ, enjoining him to approach the walls, and acquaint Crassus himself, or Cassius, that the Parthian general was inclined to enter into a treaty with them, and demanded a conference. Both the proconsul and his quæster Cassius spoke from the walls with the messenger; and, accepting the proposal with great joy, desired that the time and place for an interview might be immediately agreed upon. The messenger withdrew, promising to return quickly with an answer from Surenas: but that general no sooner understood that Crassus and Cassius were in Carrhæ, than he marched thither with his whole army; and, having invested the place, acquainted the Romans, that if they expected any favourable terms, they must deliver up Crassus and Cassius to him in chains. Hereupon a council of the chief officers being summoned, it was thought expedient to retire from Carrhæ that very night, and seek for another asylum. It was of the utmost importance that none of the inhabitants of Carrhæ should be acquainted with their design till the time of its execution; but Crassus, whose whole conduct evidently shows that he was blinded, as Dio Cassius observes,

Parthia.

by

**Parthia.** by some divinity, imparted the whole matter in confidence to one Andromachus, choosing him for his guide, and relying injudiciously on the fidelity of a man whom he scarce knew. Andromachus immediately acquainted Surenas with the design of the Romans; promising at the same time, as the Parthians did not engage in the night, to manage matters so, that they should not get out of his reach before day-break. Pursuant to his promise, he led them through many windings and turnings, till he brought them into deep marshy grounds, where the infantry were up to the knees in mire. Then Cassius, suspecting that their guide had led them into those bogs with no good design, refused to follow him any longer; and, returning to Carrhæ, took his route towards Syria, which he reached with 500 horse. Octavius, with 5000 men under his command, being conducted by trusty guides, gained the mountains called by Plutarch and Appian *Sinnaci*, and there entrenched himself before break of day.

As for Crassus, he was still entangled in the marshes, when Surenas, at the rising of the sun, overtook him, and invested him with his cavalry. The proconsul had with him four cohorts, and a small body of horse, and with these he gained, in spite of all opposition, the summit of another hill within 12 furlongs of Octavius; who, seeing the danger that threatened his general, flew to his assistance, first with a small number of his men, but was soon followed by all the rest, who, being ashamed of their cowardice, quitted their post, tho' very safe, and, charging the Parthians with great fury, disengaged Crassus, and obliged the enemy to abandon the hill. Upon the retreat of the enemy, they formed themselves into an hollow square; and placing Crassus in the middle, made a kind of rampart round him with their bucklers, resolutely protesting, that none of the enemy's arrows should touch their general's body, till they were all killed fighting in his defence. Surenas, loth to let so fine a prey escape, surrounded the hill, as if he designed to make a new attack: but, finding his Parthians very backward, and not doubting but the Romans, when night came on, would pursue their march, and get out of his reach, he had recourse again to artifice; and declared before some prisoners, whom he soon after set at liberty, that he was inclined to treat with the proconsul of a peace; and that it was better to come to a reconciliation with Rome, than to sow the seeds of an eternal war, by shedding the blood of one of her generals.

Agreeable to this declaration, Surenas, as soon as the prisoners were released, advanced towards the hill where the Romans were posted, attended only by some of his officers, and, with his bow unbent, and open arms, invited Crassus to an interview. So sudden a change seemed very suspicious to the proconsul; who therefore declined the interview, till he was forced, by his own soldiers, to intrust his life with an enemy whose treachery they had all experienced; for the legionaries flocking round him, not only abused him in an outrageous manner, but even menaced him if he did not accept of the proposals made him by the Parthian general. Seeing, therefore, that his troops were ready to mutiny, he began to advance, without arms or guards, towards the enemy, after having called the

gods and his officers to witness the violence his troops offered him; and intreated all who were present, but especially Octavius and Petronius, two of the chief commanders, for the honour of Rome their common mother, not to mention, after his death, the shameful behaviour of the Roman legionaries. Octavius and Petronius could not resolve to let him go alone; but attended him down the hill, as did likewise some legionaries, keeping at a distance. Crassus was met at the foot of the hill by two Greeks; who, dismounting from their horses, saluted him with great respect: and desired him, in the Greek tongue, to send some of his attendants, who might satisfy him that Surenas, and those who were with him, came without arms. Hereupon Crassus sent two brothers, of the Roscian family; but Surenas, having caused them to be seized, advanced to the foot of the hill, mounted on a fine horse, and attended by the chief officers of his army. Crassus, who waited for the return of his two messengers, was surprised to see himself prevented by Surenas in person, when he least expected it. The Parthian general, perceiving, as he approached Crassus, that he was on foot, cried out, in a seeming surprise, "What do I see? a Roman general on foot, and we on horseback! Let an horse be brought for him immediately." "You need not be surprised (replied Crassus): we are come only to an interview, each after the custom of his country." "Very well (answered Surenas), there shall be henceforth a lasting peace between king Orodes and the people of Rome: but we must sign the articles of it on the banks of the Euphrates; for you Romans do not always remember your conventions." Crassus would have sent for an horse: but a very stately one, with a golden bit, and richly caparisoned, was brought to him by a Parthian; which Surenas presenting to him, "Accept this horse from my hands (said he), which I give you in the name of my master king Orodes." He had scarce uttered these words, when some of the king's officers, taking Crassus by the middle, set him upon the horse, which they began to whip with great violence before them in order to make him quicken his pace. Octavius, offended at this insult, took the horse by the bridle; Petronius, and the few Romans who were present, seconded him, and flocking all round Crassus, stopped his horse. The Parthians endeavoured to repulse them, and clear the way for the proconsul: whereupon they began to jostle and push one another with great tumult and disorder. At last, Octavius, drawing his sword, killed one of the king's grooms; but, at the same time, another coming behind Octavius, with one blow laid him dead at his feet. Both parties fought with great resolution, the Parthians striving to carry off Crassus, and the Romans to rescue him out of their hands. In this scuffle most of the Romans who came to the conference were killed; and, among the rest, Crassus himself, but whether by a Roman or a Parthian, is uncertain.

Upon his death, the rest of the army either surrendered to the enemy, or dispersing in the night, were pursued, and put to the sword. The Romans lost in this campaign at least 30,000 men; of which 20,000 were killed, and 10,000 taken prisoners.

When the battle of Carrhæ was fought, king Orodes was in Armenia, where he had made peace with Artabazus.

**Parthia.**

16  
Crassus  
killed.

- Parthia.** bazus. While the two kings were solemnizing their new alliance with expensive and public feasts, Syllaces, or Syllaces, a Parthian officer, whom Surenas had sent with the news of his late victory, and the head of Crassus as a proof of it, arrived in the capital of Armenia. The transports of joy which Orodes felt at this sight, and these news, are not to be expressed; and the lords of both kingdoms, who attended their sovereigns, raised loud and repeated shouts of joy. Syllaces was ordered to give a more particular and distinct account of that memorable action; which when he had done, Orodes commanded melted gold to be poured into Crassus's mouth; reproaching him thereby, with avarice, which had been always his predominant passion.
- 17** Surenas did not long enjoy the pleasure of his victory; for Orodes, jealous of his power and authority among the Parthians, soon after caused him to be put to death. Pacorus, the king's favourite son, was put at the head of the army; and, agreeable to his father's directions, invaded Syria: but he was driven out from thence with great loss by Cicero and Cassius, the only general who survived the defeat of Crassus. After this we find no mention of the Parthians, till the time of the civil war between Cæsar and Pompey, when the latter sent ambassadors to solicit succour against his rival. This Orodes was willing to grant, upon condition that Syria was delivered up to him; but as Pompey would not consent to such a proposal, the succours were not only denied, but, after the battle of Pharsalia, he put Lucius Hirtius in irons, whom Pompey had again sent to ask assistance, or at least to desire leave to shelter himself in the Parthian dominions.
- 18** Cæsar is said to have meditated a war against the Parthians, which in all probability would have proved fatal to them. His death delivered them from this danger. But, not long after, the eastern provinces, being grievously oppressed by Mark Antony, rose up in arms; and having killed the taxgatherers, invited the Parthians to join them, and drive out the Romans. They very readily accepted the invitation, and crossed the Euphrates with a powerful army under the command of Pacorus and Labienus a Roman general of Pompey's party. At first they met with great success, overran all Asia Minor, and reduced all the countries as far as the Hellespont and the Ægean Sea, subduing likewise Phœnicia, Syria, and even Judæa. They did not however long enjoy their new conquests: for being elated with their victories, and despising the enemy, they engaged Ventidius, Antony's lieutenant, before Labienus had time to join them, and were utterly defeated. This so disheartened Labienus's army, that they all abandoned him; and he himself, being thus obliged to wander from place to place in disguise, was at last taken and put to death at Cyprus. Ventidius pursuing his advantage, gained several other victories; and at last entirely defeated the Parthian army under Pacorus, cutting almost the whole of them in pieces, and the prince himself among the rest. He did not, however, pursue this last victory as he might have done; being afraid of giving umbrage to Antony, who had already become jealous of the great honour gained by his lieutenant. He therefore contented himself with reducing those places in Syria and Phœnicia which the Parthians had taken in the beginning of the war, until Antony arrived to take the command of the army upon himself.
- Orodes was almost distracted with grief on receiving the dreadful news of the loss of his army and the death of his favourite son. However, when time had restored the use of his faculties, he appointed Phraates, the eldest, but the most wicked, of all his children, to succeed him in the kingdom, admitting him at the same time to a share of the sovereign authority with himself. The consequence of this was, that Phraates very soon attempted to poison his father with hemlock. But this, contrary to expectation, proving a cure for the dropsy, which an excess of grief had brought upon the king, the unnatural son had him stifled in bed; and soon after not only murdered all his own brethren, who were 30 in number, but cut off all the rest of the royal family, not sparing even his own eldest son, lest the discontented Parthians should place him, as he was already of age, on the throne.
- 20** Many of the chief lords of Parthia being intimidated by the cruelty of Phraates, retired into foreign countries: and among these was one Monæses, a person of great distinction, as well as skill and experience in war. This man, having fled to Antony, soon gained his confidence, and was by him easily prevailed upon to engage in a war against his countrymen. But Phraates, justly dreading the consequences of such a person's defection, sent a solemn embassy to invite him home on such terms as he should think fit to accept: which greatly provoked Antony; though he did not hinder him from returning, lest others should thereby be discouraged from coming over to him. He therefore dismissed him with great civility, sending ambassadors at the same time to Phraates to treat of a peace. Thus he hoped to divert the Parthian monarch's attention from making the necessary preparations for war, and that he should be able to fall upon him in the spring when he was in no condition to make resistance. But herein he was greatly disappointed; for on his arrival at the Euphrates, which he intended to pass, and enter the Parthian dominions on that side, he found all the passes so well guarded, that he thought proper to enter Media, with a design first to reduce that country, and then to enter Parthia.
- 21** This plan had been suggested to him by Artabazus, king of Armenia, who in the end betrayed him; for instead of conducting the army the straight way from Zeugma on the Euphrates, to the Araxes which parted Media from Armenia, and which was about 500 miles distant from the place whence he first set out, Artabazus led them over rocks and mountains so far about, that the army had marched above 1000 miles before they reached the borders of Media, where they intended to begin the war. Thus they were not only greatly fatigued, but had not sufficient time, the year being far spent, to put in execution the design on which they had come. However, as Antony was impatient to get back to Cleopatra, he left behind him most of the baggage of the army, and 300 waggon loads with battering rams and other military engines for sieges; appointing Statianus, one of his lieutenants, with a body of 10,000 men to guard them, and to bring them, by slower marches, after the army.
- 19** Pacorus defeated and killed by Ventidius.
- 20** Orodes murdered.
- 21** Antony betrayed by Artabazus king of Armenia.

Parthia.  
22  
Ten thousand Romans cut off.

army. With the rest of the forces he marched more than 300 miles before, the rest, without allowing his men any respite till he arrived at Praaspa or Phrahata, the capital of Media, which he immediately invested. But the Parthians, well knowing that he could not make any progress without his military machines, passed by his army, in order to attack Statianus; which they did with such success, that the body commanded by him were all to a man cut off, and all their military engines taken, among which was a battering ram 80 feet long.

Antony, notwithstanding this disaster, continued the siege of Praaspa; but was daily harassed by sallies of the garrison from within, and the enemy's army without. At last he began to think of a retreat when his provisions were almost exhausted, finding it impossible to become master of the city. But as he was to march 300 miles through the enemy's country, he thought proper first to send ambassadors to the Parthian monarch, acquainting him that the Roman people were willing to allow him a peace, provided he would restore the standards and prisoners taken at Carthæ. Phraates received the ambassadors, sitting on a golden throne; and, after having bitterly inveighed against the avarice and unbounded ambition of the Romans, told them that he would not part with the standards and prisoners; but that if Antony would immediately raise the siege of Praaspa, he would suffer him to retire unmolested.

23  
Antony leaves Parthia in great distress.

Antony, who was reduced to great straits, no sooner received this answer than he broke up the siege, and marched towards Armenia. However, Phraates was not so good as his word; for the Romans were attacked by the enemy no fewer than 18 times on their march, and were thrice in the utmost danger of being cut off. A famine also raged in the Roman army; upon which they began to desert to the enemy; and indeed Antony would probably have been left by himself, had not the Parthians, in a very cruel as well as impolitic manner, murdered all those who fled to them in flight of the rest. At last, after having lost 32,000 men, and being reduced to such despair that he was with difficulty prevented from laying violent hands on himself, he reached the river Araxes; when his men, finding themselves out of the reach of the enemy, fell down on the ground, and kissed it with tears of joy.

Antony was no sooner gone, than the kings of Media and Parthia quarrelled about the booty they had taken; and after various contests Phraates reduced all Media and Armenia. After this, being elated with his conquests, he oppressed his subjects in such a cruel and tyrannical manner, that a civil war took place; in which the competitors were alternately driven out and restored, till the year 50, when one Vologeses, the son of Gortarzes, a former king, became peaceable possessor of the throne. He carried on some wars against the Romans, but with very indifferent success, and at last gladly consented to a renewal of the ancient treaties with that powerful people.

24  
Parthia subdued by Trajan.

From this time the Parthian history affords nothing remarkable till the reign of the emperor Trajan; when the Parthian king, by name *Cosdroes*, infringed the treaty with Rome, by driving out the king of Armenia. Upon this Trajan, who was glad of any pre-

tence to quarrel with the Parthians, immediately hastened into Armenia. His arrival there was so sudden and unexpected, that he reduced almost the whole country without opposition; and took prisoner Parthamasiris, the king whom the Parthians had set up. After this he entered Mesopotamia, took the city of Nisibis, and reduced to a Roman province the whole of that wealthy country.

Early in the spring of the following year, Trajan, who had kept his winter quarters in Syria, took the field again; but was warmly opposed by Cosdroes. He found him encamped on the banks of the Euphrates, with a design to dispute his passage: which he did with such vigour, that the emperor, after having several times attempted to ford that river, and been always repulsed with great slaughter, was obliged to cause boats to be built on the neighbouring mountains, which he privately conveyed from thence on carriages to the water side; and having in the night time formed a bridge with them, he passed his army the next day; but not without great loss and danger, the Parthians harassing his men the whole time with incessant showers of arrows, which did great execution. Having gained the opposite bank, he advanced boldly into Assyria, the Parthians flying every where before him, and made himself master of Arbela. Thence he pursued his march; subduing, with incredible rapidity, countries where the Roman standard had never been displayed before. Babylonia, or the province of Babylon, voluntarily submitted to him. The city itself was, after a vigorous resistance, taken by storm; by which means he became master of all Chaldea and Assyria, the two richest provinces of the Parthian empire. From Babylon he marched to Ctesiphon, the metropolis of the Parthian monarchy; which he besieged, and at last reduced. But as to the particulars of these great conquests, we are quite in the dark; this expedition, however glorious to the Roman name, being rather hinted at than described, by the writers of those times. While Trajan was thus making war in the heart of the enemy's country, Cosdroes, having recruited his army, marched into Mesopotamia, with a design to recover that country and cut off all communication between the Roman army and Syria. On his arrival in that province, the inhabitants flocked to him from all parts; and most of the cities, driving out the garrisons left by Trajan, opened their gates to him. Hereupon the emperor detached Lucius and Maximus, two of his chief commanders, into Mesopotamia, to keep such cities in awe as had not revolted, and to open a communication with Syria. Maximus was met by Cosdroes; and having ventured a battle, his army was entirely defeated, and himself killed. But Lucius being joined by Euricius and Clarius, two other commanders sent by Trajan with fresh supplies, gained considerable advantages over the enemy, and retook the cities of Nisibis and Seleucia, which had revolted.

And now Trajan, seeing himself possessed of all the best and most fruitful provinces of the Parthian empire, but at the same time being well apprised that he could not without a vast expence, maintain his conquests, nor keep in subjection so fierce and warlike a people at such a distance from Italy; resolved to set over them a king of his own choosing, who should hold the crown of him and his successors, and acknowledge them

Parthia.

Parthia.

25  
Parthianaspates appointed king by the Roman emperor, but soon after driven out.

them as his lords and sovereigns. With this view he repaired to Ctesiphon; and having there assembled the chief men of that nation, he crowned one of the royal family, by name *Parthaspates*, king of Parthia, obliging all who were present to pay him their allegiance. He chose Parthaspates, because that prince had joined him on his first entering the Parthian dominions, conducted him with great fidelity, and shown on all occasions an extraordinary attachment to the Romans. Thus the Parthians were at last subdued, and their kingdom made tributary to Rome. But they did not long continue in this state of subjection: for they no sooner heard of Trajan's death, which happened shortly after, than, taking up arms, they drove Parthaspates from the throne; and recalling Cofdroes, who had retired into the country of the Hyrcanians, openly revolted from Rome. Adrian, who was then commander in chief of all the forces in the east, and soon after acknowledged emperor by the army, did not care, though he was at that time in Syria with a very numerous army, to engage in a new war with the Parthians; but contented himself with preserving the ancient limits of the empire, without any ambitious prospects of further conquests. Therefore, in the beginning of his reign, he abandoned those provinces beyond the Euphrates which Trajan had conquered; withdrew the Roman garrisons from Mesopotamia; and, for the greater safety of other places, made the Euphrates the boundary of and barrier in those parts, posting his legions along the banks of that river.

26  
Unsuccessful wars of Vologeses with the Romans.

Cofdroes died after a long reign, and was succeeded by his eldest son Vologeses: in whose reign the Alani breaking into Media, then subject to the Parthians, committed there great devastations; but were prevailed upon, with rich presents sent them by Vologeses, to abandon that kingdom and return home. Upon their retreat, Vologeses, having no enemy to contend with at home, fell unexpectedly upon Armenia; surprised the legions there; and having cut them all in pieces to a man, entered Syria; defeated with great slaughter Attilius Cornelianus, governor of that province; and advanced without opposition to the neighbourhood of Antioch; putting everywhere the Romans, and those who favoured them, to the sword. Hereupon the emperor Verus, by the advice of his colleague Antoninus surnamed the *Philosopher*, leaving Rome, hastened into Syria: and having driven the Parthians out of that province, ordered Statius Priscus to invade Armenia; and Cassius, with Martius Verus, to enter the Parthian territories, and carry the war into the enemy's country. Priscus made himself master of Artaxata; and in one campaign drove the Parthians, though not without great loss on his side, quite out of Armenia. Cassius, on the other hand, having in several encounters defeated Vologeses, tho' he had an army of 400,000 men under his command, reduced, in four years time, all those provinces which had formerly submitted to Trajan, took Seleucia; burnt and plundered the famous cities of Babylon and Ctesiphon, with the stately palaces of the Parthian monarchs, and struck terror into the most remote provinces of that great empire. On his return, he lost above half the number of his forces by sickness and famine: so that, after all, the Romans, as Spartianus

observes, had no great reason to boast of their victories and conquests.

However, Verus, who had never stirred during the whole time of the war from Antioch and Daphne, took upon him the lofty titles of *Parthicus* and *Armenicus*, as if he had acquired them justly in the midst of his pleasures and debaucheries. After the revolt and death of Cassius, Antoninus the Philosopher, repaired into Syria to settle the affairs of that province. On his arrival there, he was met by ambassadors from Vologeses; who having recovered most of the provinces subdued by Cassius, and being unwilling either to part with them or engage in a new war, solicited the emperor to confirm him in the possession of them, promising to hold them of him and to acknowledge the sovereignty of Rome. To these terms Antoninus readily agreed, and a peace was accordingly concluded between the two empires; which Vologeses did not long enjoy, being soon after carried off by a distemper, and not murdered by his own subjects, as we read in Constantinus Manasses, who calls him *Belegesis*.

27  
Upon his death, Vologeses III. the son of his brother Sanatruces, and grandson of Cofdroes, was raised to the throne. He sided with Niger against the emperor Severus: who thereupon having settled matters at home, marched with all his forces against him; and advancing to the city of Ctesiphon, whither he had retired, laid close siege to that metropolis. Vologeses made a most gallant defence; but the city, after a long siege, and much bloodshed on both sides, was at length taken by assault. The king's treasures, with his wives and children, fell into the emperor's hands: but Vologesus himself had the good luck to make his escape; which was a great disappointment to Severus, who immediately dispatched an express to acquaint the senate with the success that had attended him in his expedition against the only nation that was then formidable to Rome. But he had no sooner crossed the Euphrates, than Vologeses recovered all the provinces, except Mesopotamia, which he had reduced. These expeditions were chargeable to the Romans, and cost them much blood, without reaping any advantages from them; for as they had not sufficient forces to keep in awe the provinces they had subdued, the inhabitants, greatly attached to the family of Arsaces, never failed to return to their ancient obedience as soon as the Roman armies were withdrawn. Vologeses was soon after engaged in a war still more troublesome and destructive, with his brother Artabanus, who, encouraged by some of the discontented nobles, attempted to rob him of the crown, and place it on his own head. Vologeses gained several victories over his brother and rebellious subjects; but died before he could restore the empire to its former tranquility.

Artabanus, who had a numerous army at his devotion, did not meet with any opposition in seizing the throne, vacant by the death of his brother, though Tiridates had a better title to it, as being his elder brother. He had scarce settled the affairs of his kingdom, when the emperor Caracalla, desirous to signalize himself, as several of his predecessors had done, by some memorable exploit against the Parthians, sent a solemn embassy to him, desiring his daughter in marriage. Artabanus, overjoyed at this proposal, which

28

Infamous treachery of the emperor Caracalla.

which he thought would be attended with a lasting peace between the two empires, received the ambassadors with all possible marks of honour, and readily complied with their request. Soon after, Caracalla sent a second embassy to acquaint the king that he was coming to solemnize the nuptials; whereupon Artabanus went to meet him attended with the chief of the nobility and his best troops, all unarmed, and in most pompous habits: but this peaceable train no sooner approached the Roman army, than the soldiers, on a signal given them, falling upon the king's retinue, made a most terrible slaughter of the unarmed multitude, Artabanus himself escaping with great difficulty. The treacherous Caracalla, having gained by this exploit great booty, and, as he thought, no less glory, wrote a long and boasting letter to the senate, assuming the title of *Parthicus* for this piece of treachery; as he had before that of *Germanicus*, for murdering, in like manner some of the German nobility.

Artabanus, resolving to make the Romans pay dear for their inhuman and barbarous treachery, raised the most numerous army that had ever been known in Parthia, crossed the Euphrates, and entered Syria, putting all to fire and sword. But Caracalla being murdered before this invasion, Macrinus, who had succeeded him, met the Parthians at the head of a mighty army, composed of many legions, and all the auxiliaries of the states of Asia. The two armies no sooner came in sight of each other, but they engaged with the utmost fury. The battle continued two days; both Romans and Parthians fighting so obstinately, that night only parted them, without any apparent advantage on either side; though both retired when night had put an end to the contest, crying, Victory, victory. The field of battle was covered all over with dead bodies, there being already above 40,000 killed, including both Romans and Parthians: nevertheless Artabanus was heard to say, that the battle was only begun, and that he would continue it till either the Parthians or Romans were all to a man cut in pieces. But Macrinus, being well apprised that the king came highly enraged against Caracalla in particular, and dreading the consequences which would attend the destruction of his army, sent an herald to Artabanus, acquainting him with the death of Caracalla, and proposing an alliance between the two empires. The king, understanding that his great enemy was dead, readily embraced the proposals of peace and amity, upon condition that all the prisoners who had been taken by the treachery of Caracalla should be immediately restored, and a large sum of money paid him to defray the expenses of the war.

These articles being performed without delay or hesitation, Artabanus returned into Parthia, and Macrinus to Antioch.

As Artabanus lost on this occasion the flower of his army, Artaxerxes, a Persian of mean descent, but of great courage and experience in war, revolting from the Parthians, prevailed on his countrymen to join him, and attempt the recovery of the sovereign power, which he said they had been unjustly deprived of, first by the Macedonians, and afterwards by the Parthians their vassals. Artabanus, upon the news of this revolt, marched with the whole strength of his kingdom to suppress it; but being met by Artaxerxes at the head of a no less powerful army, a bloody battle ensued,

VOL. XIII.

which is said to have lasted three days. At length the Parthians, though they behaved with the utmost bravery, and fought like men in despair, were forced to yield to the Persians, who were commanded by a more experienced leader. Most of their troops were cut off in the flight; and the king himself was taken prisoner, and soon after put death at Artaxerxes's order. The Parthians, having lost in this fatal engagement both their king and their army, were forced to submit to the conqueror, and become vassals to a nation which had been subject to them for the space of 475 years.

For an account of the manners, customs, &c. of the ancient Parthians, see the article PERSIA.

PARTI, *Partie*, *Pa ty*, or *Parted* in heraldry, is applied to a shield or escutcheon denoting, it divided or marked out into partitions.

*PARTI per pale*, is when the shield is divided perpendicularly into two halves, by a cut in the middle from top to bottom.

*PARTI per fess*, is when the cut is across the middle from side to side.

*PARTI per bend dexter*, is when the cut comes from the upper corner of the shield on the right hand, and descends athwart to the opposite lower corner.

*PARTI per bend sinister*, is when the cut, coming from the upper left corner, descends across to the opposite lower one.

All these partitions, according to M. de la Colombiere, have their origin from the cuts and bruises that have appeared on shields after engagements; and, being proofs of the dangers to which the bearers had been exposed, they gained them esteem; for which reason they were transmitted to posterity, and became arms and marks of honour to their future families.

PARTIALITY. See *SELF-partiality* and PREJUDICE.

PARTICIPLE, in grammar, an adjective formed of a verb; so called, because it participates partly of the properties of a noun, and partly of those of a verb. See GRAMMAR.

PARTICLE, in physiology, the minute part of a body, an assemblage of which constitutes all natural bodies.

In the new philosophy, particle is often used in the same sense with atom in the ancient Epicurean philosophy, and corpuscle in the latter. Some writers, however, distinguish them; making particle an assemblage or composition of two or more primitive and physically indivisible corpuscles or atoms; and corpuscle, or little body, an assemblage or mass of several particles of secondary corpuscles. The distinction, however, is of little moment, and, as to most purposes of physics, particle may be understood as synonymous with corpuscle. Particles are then the elements of bodies; it is the various arrangement and texture of these, with the difference of the cohesion, &c. that constitute the various kind of bodies, hard, soft, liquid, dry, heavy, light, &c. The smallest particles of corpuscles cohere with the strongest attractions, and always compose bigger particles of weaker cohesion; and many of these cohering compose bigger particles, whose vigour is still weaker; and thus on for divers successions, till the progression end in the biggest particles, whereon the operations in chemistry, and the

Particle. colours of natural bodies, depend, and which by cohering compose bodies of sensible bulks.

The cohesion of the particles of matter, according to the Epicureans, was effected by hooked atoms; the Aristotelians thought it managed by rest, that is, by nothing at all. But Sir Isaac Newton shows it is done by means of a certain power, whereby the particles mutually attract or tend towards each other, which is still perhaps giving a fast without the cause. By this attraction of the particles he shows that most of the phenomena of the lesser bodies are affected, as those of the heavenly bodies are by the attraction of gravity. See ATTRACTION and COHESION.

PARTICLE, a term in theology, used in the Latin church for the crumbs or little pieces of consecrated bread, called in the Greek church *μυρίδας*. The Greeks have a particular ceremony, called *των μυρίδων*, of the particles, wherein certain crumbs of bread, not consecrated, are offered up in honour of the Virgin, St John Baptist, and several other saints. They also give them the name of *προσφοράς*, oblation. Gabriel archbishop of Philadelphia wrote a little treatise expressing *περι των μυρίδων*, wherein he endeavours to show the antiquity of this ceremony, in that it is mentioned in the liturgies of St Chrysostom and Basil. There has been much controversy on this head between the reformed and catholic divines. Aubertin and Blondel explain a passage in the theory of Germanus patriarch of Constantinople, where he mentions the ceremony of the particles as in use in his time, in favour of the former; Messieurs de Port Royal contest the explanation; but M. Simon, in his notes on Gabriel of Philadelphia, endeavours to show that the passage itself is an interpolation, not being found in the ancient copies of Germanus, and consequently that the dispute is very ill grounded.

Organic PARTICLES, are those small moving bodies which are imperceptible without the help of glasses; for besides those animals which are perceptible to the sight, some naturalists reckon this exceedingly small species as a separate class, if not of animals properly so called, at least of moving bodies, which are found in the semen of animals, and which cannot be seen without the help of the microscope. In consequence of these observations, different systems of generation have been proposed concerning the spermatic worms of the male and the eggs of the female. In the second volume of Buffon's Natural history, several experiments are related, tending to show that those moving bodies which we discover by the help of glasses in the male semen are not real animals, but organic, lively, active, and indestructible molecules, which possess the propriety of becoming a new organized body similar to that from which they were extracted. Buffon found such bodies in the female as well as in the male semen; and he supposes that the moving bodies which he observed with the microscope in infusions of the germs of plants are likewise vegetable organic molecules. Needham, Wrisberg, Spallanzani, and several other writers on the animal economy, have pursued the same tract with M. de Buffon.

Some suppose that these organic molecules in the semen answer no purpose but to excite the venereal desire; but such an opinion cannot be well founded; for eunuchs, who have no seminal liquor, are nevertheless

subject to venereal desire. With respect to the beautiful experiments which have been made with the microscope on organic molecules, M. Bonnet, that learned and excellent observer of nature, remarks that they seem to carry us to the farthest verge of the sensible creation, did not reason teach us that the smallest visible globule of seminal liquor is the commencement of another universe, which, from its infinite smallness, is beyond the reach of our best microscopes. — *Animalcules*, properly so called, must not be confounded with the wonderful organic particles of Buffon. See ANIMALCULE.

PARTICLE, in grammar, a denomination for all those small words that tie or untie others, or that express the modes or manners of words. See GRAMMAR.

PARTING, in metallurgy. See METALLURGY.

PARTING, in chemistry an operation by which gold and silver are separated from each other. As these two metals resist equally well the action of fire and of lead, they must therefore be separated by other methods. This separation could not be effected if they were not soluble by different menstruums.

Nitrous acid, marine acid, and sulphur, which cannot dissolve gold, attack silver very easily; and therefore these three agents furnish methods of separating silver from gold, or of the operation called *parting*.

Parting by nitrous acid is the most convenient, and therefore most used, and even almost the only one employed by goldsmiths and coiners. Wherefore it is called simply *parting*. That made with the marine acid is only made by cementation, and is known by the name of *concentrated parting*. Lastly, parting by sulphur is made by fusion, which the chemists call the *dry way*, and is therefore called *dry parting*.

PARTING by *Aqua fortis*. Although parting by aqua fortis be easy, as we have said, it cannot however succeed or be very exact, unless we attend to some essential circumstances.

1. The gold and silver must be in a proper proportion: for if the gold was in too great quantity, the silver would be covered and guarded by it from the action of the acid.

Therefore, when essayers do not know the proportion of these two metals in the mass to be operated upon, they discover it by the following method.

They have a certain number of needles composed of gold and silver alloyed together in graduated proportions, and the alloy of each needle is known by a mark upon it. These are called *proof needles*.

When essayers want to know nearly the proportion of gold and silver in a mass, they rub this mass upon a touchstone, so as to leave a mark upon it. They then make marks upon the touchstone with some of the needles the colour of which they think comes nearest to that of the mass. By comparing the marks of these needles with the mark of the mass, they discover nearly the proportion of the gold and silver in the mass.

If this trial shows, that in any given mass the silver is not to the gold as three to one, this mass, is improper for the operation of parting by aqua fortis. In this case, the quantity of silver necessary to make an alloy of that proportion must be added.

This operation is called *Quartation*, probably because it reduces the gold to a fourth part of the whole mass.

2. That the parting may be exact, the nitrous acid

Particle, Parting.

Parting. or aquafortis employed must be very pure, and especially free from mixture of vitriolic and marine acids. For if this was not attended to, a quantity of silver proportionable to these two foreign acids would be separated during the solution; and this portion of silver reduced by these acids to vitriol of silver and to luna cornea would remain mingled with the gold, which consequently would not be entirely purified by the operation.

When the metallic mass is properly allayed, it is to be reduced to plates, rolled up spirally, called cornets; or to grains. These are to be put into a matrafs, and upon them a quantity of aquafortis is to be poured, the weight of which is to that of the silver as three to two: and as the nitrous acid employed for this operation is rather weak, the solution is assisted, especially at first, by the heat of a sand bath, in which the matrafs is to be placed. When, notwithstanding the heat, no further mark of solution appears, the aquafortis charged with silver is to be decanted. Fresh nitrous acid is to be poured into the matrafs, stronger than the former, and in less quantity, which must be boiled on the residuous mass, and decanted as the former. Aquafortis must even be boiled a third time on the remaining gold, that all the silver may be certainly dissolved. The gold is then to be washed with boiling water. This gold is very pure if the operation has been performed with due attention. It is called *gold of parting*.

No addition of silver is required, if the quantity of silver of the mass is evidently much more considerable than that of the gold: persons who have not proof needles and other apparatus to determine the proportion of the alloy, may add to the gold an indeterminate quantity of silver, observing that this quantity be rather too great than too small, and so considerable as to render the mass nearly as white as silver; for a large quantity of silver is rather favourable than hurtful to the operation: It has no other inconvenience than an useless expence, as the larger the quantity is of silver the more aquafortis must be employed. We ought to attend to this fact, that the colour of gold is scarcely perceptible in a mass two-thirds of which is silver and one-third is gold; this colour then must be much less perceptible when the gold is only one-fourth part, or less, of the whole mass.

If the quantity of gold exceeds that of the silver, the mass may be exposed to the action of aqua-regia, which would be a kind of inverse parting, because the gold is dissolved in that menstruum, and the silver is not, but rather reduced to a luna cornea, which remains in form of a precipitate after the operation. But this method is not much practised, for the following reasons.

First, the gold cannot be easily separated from the aqua-regia; for if the parting has been made with an aqua-regia prepared with sal-ammoniac, or if the gold be precipitated by a volatile alkali, this gold has a fulminating quality, and its reduction requires particular operations. If the aqua-regia has been made with spirit of salt, and the precipitation effected by a fixed alkali, the gold will not then be fulminating, but the precipitation will be very slow, and probably incomplete.

Secondly, in the parting by aqua regia, the silver is

Parting. indeed precipitated into a luna cornea, and thus separated; but this separation is not perfect, as a small quantity of luna cornea will always remain dissolved by the acids, if this solution even could be only effected by the superabundant water of these acids. Accordingly the silver is not so accurately separated from the gold by aqua-regia, as the gold is from the silver by aquafortis.

The gold, after the parting by aquafortis, is much more easily collected when it remains in small masses than when it is reduced to a powder.

When the mass has been regularly parted, that is, when it contains three parts of silver and one part of gold, we must employ, particularly for the first solution, an aquafortis so weakened that heat is required to assist the solution of the silver; by which means the solution is made gently; and the gold which remains preserves the form of the small masses before the solution. If the aquafortis employed were stronger, the parts of the gold would be disunited and reduced to the form of a powder, from the activity with which the solution would be made.

We may indeed part by aquafortis a mass containing two parts of silver to one part of gold: but then the aquafortis must be stronger; and if the solution be not too much hastened, the gold will more easily remain in masses after the operation. In both cases, the gold will be found to be tarnished and blackened, probably from what was lately called the *phlogiston* of the nitrous acid. Its parts have no adhesion together, because the silver dissolved from it has left many interstices; and the cornets or grains of this gold will be easily broken, unless they be handled very carefully. To give them more solidity, they are generally put into a test under a muffle and made red-hot; during which operation they contract considerably, and their parts are approximated. These pieces of gold are then found to be rendered much more solid, so that they may be handled without being broken. By this operation also the gold resumes its colour and lustre; and as it generally has the figure of cornets, it is called *gold in cornets*, or *grain gold*. Essayers avoid melting it, as they choose to preserve this form, which shows that it has been parted.

The gold and silver thus operated upon ought to have been previously refined by lead, and freed from all alloy of other metallic matters, so that the gold which remains should be as pure as is possible. However, as this is the only metal which resists the action of aquafortis, it might be purified by parting from all other metallic substances; but this is not generally done, for several reasons. First, because the refining by lead is more expeditious and convenient for the separation of the gold from the imperfect metals; secondly, because the silver, when afterwards separated from the aquafortis, is pure; lastly, because most imperfect metals do not remain completely and entirely dissolved in nitrous acid, from the portion of phlogiston which this acid deprives them of, the gold would be found after the parting mixed with the part of these metals which is precipitated.

The gold remaining after the parting ought to be well washed, to cleanse it from any of the solution of silver which might adhere to it; and for this purpose distilled water ought to be used, or at least water the purity

Parting.

of which has been ascertained by its not forming a precipitate with a solution of silver, because such a precipitate would alter the purity of the gold.

The silver dissolved in the aquafortis may be separated either by distillation, in which case all the aquafortis is recovered very pure, and fit for another parting; or it may be precipitated by some substance which has a greater affinity than this metal with nitrous acid. Copper is generally employed for this purpose at the mint.

The solution of silver is put into copper vessels. The aquafortis dissolves the copper, and the silver precipitates. When the silver is all precipitated, the new solution is decanted, which is then a solution of copper. The precipitate is to be well washed, and may be melted into an ingot. It is called *parted silver*. When this silver has been obtained from a mass which had been refined by lead, and when it has been well washed from the solution of copper, it is very pure.

Mr Cramer observes justly in his *Treatise on Essay-ing*, that however accurately the operation of parting has been performed, a small portion of silver always remains united with the gold, if the parting has been made by aquafortis; or a small portion of the gold remains united with the silver, if the parting has been made by aqua regia: and he estimates this small alloy to be from a two hundredth to a hundred and fiftieth part; which quantity may be considered as nothing for ordinary purposes, but may become sensible in accurate chemical experiments. *Chem. Dict.*

The mass of gold and silver to be parted ought previously to be granulated; which may be done by melting it in a crucible, and pouring it into a large vessel full of cold water, while at the same time a rapid circular motion is given to the water by quickly stirring it round with a stick or broom.

The vessels generally used for this operation, called *parting glasses*, have the form of truncated cones, the bottom being commonly about seven inches wide, the aperture about one or two inches wide, and the height about 12 inches. These glass-vessels ought to have been well annealed, and chosen free from flaws; as one of the chief inconveniences attending the operation is, that the glasses are apt to crack by exposure to cold, and even when touched by the hand. Some operators secure their glasses by a coating. For this purpose they spread a mixture of quicklime flaked with beer and whites of eggs upon linen cloth, which they wrap round the lower part of the vessel, leaving the upper part uncovered, that they may see the progress of the operation; and over this cloth they apply a composition of clay and hair. Schlutter advises to put the parting-glasses containing some water, and supported by trevets, with fire under them. When the heat communicated by the water is too great, it may be diminished by adding cold water, which must be done very carefully by pouring against the sides of the pan, to prevent too sudden an application of cold to the parting-glass. The intention of this contrivance is, that the contents of the glasses, if these should break, may be received by the copper vessel. Into a glass 15 inches high, and 10 or 12 inches wide at bottom, placed in a copper-pan 12 inches wide at bottom, 15 inches wide at top, and 10 inches high; he usually put about 80 ounces of metal, with twice as much aquafortis.

The aquafortis ought to be so strong as to be capable of acting sensibly on silver when cold, but not so strong as to act violently. If the aquafortis be very strong, however pure, and if the vessels be well closed, a small quantity of the gold will be dissolved along with the silver, which is to be guarded against.

Little heat ought to be applied at the beginning, the liquor being apt to swell and rise over the vessel; but when the acid is nearly saturated, the heat may be safely increased.

When the solution ceases, which may be known by the discontinuance of the effervescence, or emission of air-bubbles, the liquor is to be poured off. If any grains appear entire, more aquafortis must be added, that all the silver may be dissolved. If the operation has been performed slowly, the remaining gold will have still the form of distinct masses, which are to receive solidity and colour by fire, in the manner directed by the author of the dictionary. If the operation has been performed hastily, the gold will have the appearance of a black mud or powder, which after five or six washings with pure water must be melted.

The silver is usually recovered by precipitating it from the aquafortis by means of copper-vessels into which the liquor is poured, or of plates of copper which are thrown along with the liquor into glass-vessels. A considerable heat is required to accelerate this precipitation. Dr Lewis says, he has observed that when the aquafortis was perfectly saturated with silver, no precipitation was occasioned by plates of copper, till a drop or two of aquafortis was added to the liquor, and then the precipitation began and continued as usual.

The precipitated silver must be well washed in boiling water, and fused with some nitre; the use of which is to scorify any cupreous particles which may adhere to the silver.

From the solution of copper in aquafortis, a blue pigment, called *verditer*, is obtained by precipitation with whiting. *Notes to Chem. Dict.*

*Concentrated PARTING*, also called *Parting by Cementation*, because it is actually performed by cementation, is used when the quantity of it is so great in proportion to the silver, that it cannot be separated by aquafortis. This operation is done in the following manner.

A cement is first prepared, composed of four parts of bricks powdered and sifted, of one part of green vitriol calcined till it becomes red, and of one part of common salt. The whole is very accurately mixed together, and a firm paste is made of it by moistening it with a little water or urine. This cement is called *cement royal*, because it is employed to purify gold, which is considered by chemists as the king of metals.

The gold to be cemented is to be reduced to plates as thin as small pieces of money. At the bottom of the crucible or cementing-pot, a stratum of cement, of the thickness of a finger, is to be put, which is to be covered with plates of gold; upon these another stratum of cement is to be laid, and then more plates of gold, till the crucible or pot is filled with these alternate strata of cement and of gold. The whole is then to be covered with a lid, which is to be luted with a mixture of clay and sand. This pot is to be placed in a furnace, or oven, and heated by degrees till it is moderately

Parting.

Parting.

moderately red, which heat is to be continued during 24 hours. The heat must not be so great as to melt the gold. The pot or crucible is then left to cool, and the gold is to be carefully separated from the cement, and boiled at different times in a large quantity of pure water. This gold is to be essayed upon a touchstone or otherwise; and if it be found not sufficiently purified, it is to be cemented a second time in the same manner.

The vitriolic acid of the bricks and of the calcined vitriol disengages the acid of the common salt during this cementation: and this latter acid dissolves the silver alloyed with the gold, and separates it by that means.

This experiment proves, that although marine acid, while it is liquid, cannot attack silver, it is nevertheless a powerful solvent of that metal. But for this purpose it must be applied to the silver in the state of vapours, extremely concentrated, and assisted with a considerable heat. All these circumstances are united in the concentrated parting.

This experiment proves also, that notwithstanding all these circumstances, which favour the action of the marine acid, it is incapable of dissolving gold.

Lastly, the marine acid in this state more effectually dissolves the silver than the nitrous acid does in the parting by aquafortis, since this operation succeeds well when the silver is in so small a proportion as that it would be protected from the action of the nitrous acid in the ordinary parting.

Instead of sea-salt, nitre may be used with equal success; because the nitrous acid is then put in a state to attack the silver, notwithstanding the quantity of gold which covers it.

**Dry-PARTING.** Dry-parting, or parting by fusion, is performed by sulphur, which has the property of uniting easily with silver, while it does not attack gold.

This method of separating these two metals would be the cheapest, the most expeditious and convenient of any, if the sulphur could dissolve the silver, and separate it from the gold as well and as easily as nitrous acid does; but, on the contrary, we are obliged to employ a particular treatment, and a kind of concentration, to begin the union of the sulphur alloyed with gold. Then repeated and troublesome fusions must be made, in each of which we are obliged to add different intermediate substances, and particularly the metals which have the strongest affinity with sulphur, to assist the precipitation, which in that case does not give a regulus of pure gold, but a gold still alloyed with much silver, and even with a part of the precipitating metals: so that, to complete the operation, cupellation is necessary, and also parting by aquafortis.

From what we have said concerning this operation, we may perceive, that it ought not to be made but when the quantity of silver with which the gold is alloyed is so great, that the quantity of gold which might be obtained by the ordinary parting is not sufficient to pay the expences; and that it is only proper for concentrating a large quantity of gold in a smaller quantity of silver. As this dry parting is troublesome, and even expensive, it ought not to be undertaken but on a considerable quantity of silver alloyed with gold. Accordingly, Cramer, Schlutter, Schlinder, and all good chemists and artists who have given processes for the

Parting.

dry-parting, recommended its use only in the abovementioned cases. We wish that this operation could be improved: it would be much more advantageous if it could be done by two or three fusions; and if by these an exact separation could be obtained of a small quantity of gold mixed with a large quantity of silver.

*Chem. Dict.*

As this operation for extracting a small quantity of gold from a large quantity of silver is, notwithstanding its inconveniences, approved by Schlutter, Scheffer, and other authors, and practised in Hartz, we shall add what Dr Lewis, in his excellent History of Gold, has said upon the subject.

The most advantageous method of separating a small portion of gold from a large one of silver, appears to be by means of sulphur, which unites with and scorifies the silver without affecting the gold; but as sulphurated silver does not flow thin enough to suffer the small particles of gold diffused through it to reunite and settle at the bottom, some addition is necessary for collecting and carrying them down.

In order to the commixture with the sulphur, 50 or 60 pounds of the mixed metal, or as much as a large crucible will receive, are melted at once, and reduced into grains, by taking out the fluid matter, with a small crucible made red-hot, and pouring it into cold water stirred with a rapid circular motion. From an eighth to a fifth of the granulated metal, according as it is richer or poorer in gold, is reserved, and the rest well mingled with an eighth of powdered sulphur. The grains enveloped with the sulphur are again put into the crucible, and the fire kept gentle for some time, that the silver, before it melts, may be thoroughly penetrated by the sulphur: if the fire was hastily urged, great part of the sulphur would be dissipated without acting upon the metal.

If to sulphurated silver in fusion pure silver be added, the latter falls to the bottom, and forms there a distinct fluid not miscible with the other. The particles of gold, having no affinity with the sulphurated silver, join themselves to the pure silver, wherever they come in contact with it, and are thus transferred from the former into the latter, more or less perfectly according as the pure silver was more or less thoroughly diffused through the mixed. It is for this use that a part of the granulated metal was reserved. The sulphurated mass being brought into perfect fusion, and kept melted for near an hour in a close covered crucible, one-third of the reserved grains is thrown in; and as soon as this is melted, the whole is well stirred, that the fresh silver may be distributed through the mixed, to collect the gold from it. The stirring is performed with a wooden rod; an iron one would be corroded by the sulphur, so as to deprive the mixed of its due quantity of sulphur, and likewise render the subsequent purification of the silver more troublesome. The fusion being continued an hour longer, another third of the unsulphurated grains is added, and an hour after this the remainder; after which the fusion is further continued for some time, the matter being stirred at least every half hour from the beginning to the end, and the crucible kept closely covered in the intervals.

The sulphurated silver appears in fusion of a dark-brown colour; after it has been kept melted for a certain

Parting.

tain time, a part of the sulphur having escaped from the top, the surface becomes white, and some bright drops of silver, about the size of pease, are perceived on it. When this happens, which is commonly in about three hours after the last addition of the reserved grains, sooner or later according as the crucible has been more or less closely covered, and the matter more or less stirred, the fire must be immediately discontinued; for otherwise more and more of the silver, thus losing its sulphur, would subside and mingle with the part at the bottom in which the gold is collected. The whole is poured out into an iron mortar greased and duly heated; or if the quantity is too large to be safely lifted at once, a part is first taken out from the top with a small crucible, and the rest poured into the mortar. The gold, diffused at first through the whole mass, is now found collected into a part of it at the bottom, amounting only to about as much as was reserved unfulphurated. This part may be separated from the fulphurated silver above it by a chisel and hammer; or more perfectly, the surface of the lower mass being generally rugged and unequal, by, placing the whole mass with its bottom upwards in a crucible; the fulphurated parts quickly melt, leaving unmelted that which contains the gold, which may thus be completely separated from the other. The fulphurated silver is essayed by keeping a portion of it in fusion in an open crucible till the sulphur is dissipated, and then dissolving it in aquafortis. If it should be found to contain any gold, it is to be melted again; as much more unfulphurated silver is to be added as was employed in each of the former injections, and the fusion continued about an hour and a half.

The gold thus collected into a part of the silver, may be further concentrated into a smaller part, by granulating the mass and repeating the whole process. The operation may be again and again repeated, till so much of the silver is separated, that the remainder may be parted by aquafortis without too much expence.

The foregoing process, according to Mr Schlutter, is practised at Rammelsberg in the Lower Hartz. The prevailing metal in the ore of Rammelsberg is lead; the quantity of lead is at most 40 pounds on a quintal or 100 pounds of the ore. The lead worked off on a test or concave hearth yields about 110 grains of silver, and the silver contains only a 384th part of gold; yet this little quantity of gold amounting scarcely to a third of a grain in a hundred weight of this ore, is thus collected with profit. The author above-mentioned confines this method of separation to such silver as is poor in gold, and reckons parting with aquafortis more advantageous where the gold amounts to above a 64th of the silver: he advises also not to attempt concentrating the gold too far, as a portion of it will always be taken up again by the silver. Mr Scheffer, however, relates (in the Swedish Memoirs for the year 1752), that he has by this method brought the gold to perfect fineness; and that he has likewise collected all the gold which the silver contained; the silver of the last operations, which had taken up a portion of the gold, being reserved to be worked over again with a fresh quantity of gold-holding silver. The fulphurated silver is purified by continuing it in fusion for some time with a large surface exposed to the air; the

silver gradually exhales, and leaves the silver entire.

**PARTISAN**, in the art of war a person dexterous in commanding a party; who, knowing the country well, is employed in getting intelligence, or surprising the enemy's convoy, &c. The word also means an officer sent out upon a party, with the command of a body of light troops, generally under the appellation of the partisan's corps. It is also necessary that this corps should be composed of infantry, light-horse, and hussars.

**PARTNERSHIP**, is a contract among two or more persons, to carry on a certain business, at their joint expence, and share the gain or loss which arises from it. Of this there are four kinds.

I. Occasional joint trade, where two or more merchants agree to employ a certain sum in trade, and divide the gain or loss so soon as the adventure is brought to an issue. This kind of contract being generally private, the parties concerned are not liable for each other. If one of them purchase goods on trust, the furnisher, who grants the credit through confidence in him alone, has no recourse, in case of his insolvency, against the other partners. They are only answerable for the share of the adventure that belongs to the insolvent partner.

If it be proposed to carry the adventure farther than originally agreed on, any partner may withdraw his interest; and if it cannot be separated from the others, may insist that the whole shall be brought to an issue.

II. Standing companies, which are generally established by written contract between the parties, where the stock, the firm, duration, the division of the gain or loss, and other circumstances, are inserted.

All the partners are generally authorized to sign by the firm of the company, though this privilege may be confined to some of them by particular agreement. The firm ought only to be subscribed at the place, where the copartnery is established. If a partner has occasion, when absent, to write a letter relating to their affairs, he subscribes his own name on account of the company. When the same partners carry on business at different places, they generally choose different firms for each. The signature of each partner is generally sent to new correspondents; and when a partner is admitted, although there be no alteration in the firm, his signature is transmitted, with an intimation of the change in the copartnery to all their correspondents. Houses that have been long established, often retain the old firm, though all the original partners be dead or withdrawn.

The powers of each partner are, in general, discretionary; but they ought not to act, in matters of importance, without consulting together, when there is an opportunity. No partner is liable to make good the loss arising from his judging wrong in a case where he had authority to act. If he exceeds his power, and the event prove unsuccessful, he must bear the loss; but if it prove successful, the gain belongs to the company: yet if he acquaint the company immediately of what he has done, they must either acquiesce therein or leave him the chance of gain, as well as the risk of loss.

All debts contracted under the firm of the company are

Partisan,  
Partner-  
ship.

Partnership.

are binding on the whole partners, though the money was borrowed by one of them for his private use, without the consent of the rest. And if a partner exceeds his power, the others are nevertheless obliged to implement his engagements: though they may render him responsible for his misbehaviour.

Although the sums to be advanced by the partners be limited by the contract, if there be a necessity for raising more money to answer emergencies or pay the debts of the company, the partners must furnish what is necessary in proportion to their shares.

A debt to a company is not cancelled by the private debts of the partner; and when a partner becomes insolvent, the company is not bound for his debts beyond the extent of his share.

The debts of a company are preferable, on the company's effects, to the private debts of the partners.

Partnership is generally dissolved by the death of a partner; yet, when there are more partners than two, it may, by agreement, subsist among the survivors. Sometimes it is stipulated, that, in case of the death of a partner, his place shall be supplied by his son, or some other person condescended on. The contract ought to specify the time and manner in which the surviving partners shall reckon with the executors of the deceased for his share of the stock, and a reasonable time allowed for that purpose.

When partnership is dissolved, there are often outstanding debts that cannot be recovered for a long time, and effects that cannot easily be disposed of. The partnership, though dissolved in other respects, still subsists for the management of their outstanding affairs: and the money arising from them is divided among the partners, or their representatives, when it is recovered. But as this may protract the final settlement of the company's affairs to a very inconvenient length, other methods are sometimes used to bring them to a conclusion, either in consequence of the original contract, or by agreement at the time of dissolution. Sometimes the debts and effects are sold at auction; sometimes they are divided among the partners; and when there are two partners, one divides them into shares, as equal as possible, and the other chooses either share he thinks best.

If a partner withdraws, he continues responsible for his former partners till it be publicly known that he hath done so. A deed of separation, registered at a public office, is sufficient presumption of such notoriety.

III. Companies, where the business is conducted by officers. There are many companies of this kind in Britain, chiefly established for purposes which require a larger capital than private merchants can command. The laws with respect to these companies, when not confirmed by public authority, are the same as the former, but the articles of their agreement usually very different. The capital is condescended on: and divided into a certain number of shares, whereof each partner may hold one or more, but is generally restricted to a certain number. Any partner may transfer his share; and the company must admit his assignee as a partner. The death of the partners has no effect on the company. No partner can act personally in the affairs of the company: but the execution of their bu-

siness is intrusted to officers, for whom they are responsible; and, when the partners are numerous, the superintendency of the officers is committed to directors chosen annually, or at other appointed times, by the partners.

IV. Companies incorporated by authority. A state charter is necessary to enable a company to hold lands, to have a common seal, and enjoy the other privileges of a corporation. A charter is sometimes procured, in order to limit the risk of the partners: for, in every private company, the partners are liable for the debts, without limitation; in incorporated societies, they are only liable for their shares in the stock of the society. The incorporation of societies is sometimes authorized by act of the legislature; but this high authority is not necessary, unless for conferring exclusive privileges.

Mr Paley says, "I know of nothing upon the subject of partnership that requires explanation, but how the profits are to be divided where one partner contributes money and the other labour, which is a common case.

"*Rule.* From the stock of the partnership deduct the sum advanced, and divide the remainder between the moneyed partner and the labouring partner, in the proportion of the interest of the money to the wages of the labour, allowing such a rate of interest as money might be borrowed for upon the same security, and such wages as a journeyman would require for the same labour and trust.

"*Example.* A advances 1000 l. but knows nothing of the business; B produces no money, but has been brought up to the business, and undertakes to conduct it. At the end of the year the stock and effects of the partnership amount to 1200 l. consequently there are 200 l. to be divided. Now nobody would lend money upon the event of the business succeeding, which is A's security, under 6 per cent. therefore A must be allowed 60 l. for the interest of his money. B, before he engaged in the partnership, earned 30 l. a year in the same employment: his labour, therefore, ought to be valued at 30 l. and the 200 l. must be divided between the partners in the proportion of 60 to 30; that is, A must receive 133 l. 6s. 8d. and B 66 l. 13s. 4d. If there be nothing gained, A loses his interest, and B his labour, which is right. If the original stock be diminished, by this rule, B loses only his labour as before; whereas A loses his interest and part of the principal: for which eventual disadvantage A is compensated, by having the interest of his money computed at 6 per cent. in the division of the profits when there is any. It is true, that the division of the profit is seldom forgotten in the constitution of the partnership; and is therefore commonly settled by express agreement; but these agreements, to be equitable, should pursue the principle of the rule here laid down. All the partners are bound by what any one of them does in the course of the business; for, *quoad hoc*, each partner is considered as an authorized agent for the rest."

PARTRIDGE, in ornithology. See TETRAO.

The partridge is so valuable at the table, that a great many ways of taking it have been invented by sportsmen, all of which succeed from the natural folly and timidity of the animal.

The places partridges delight in most are corn-fields, especially

Partnership, Partridge.

Moral and Political Philosophy

Partridge. especially whilst the corn grows, for under that cover they shelter and breed; neither are those places unfrequented by them when the corn is cut down, by reason of the grain they find there, especially in wheat-stubble, the height of which they delight in, being to them as a covert or shelter. When the wheat stubble is much trodden by men or beasts, they then betake themselves to the barley stubble, provided it be fresh and untrodden; and they will, in the furrows, amongst the clots, branches, and long grafs, hide both themselves and coveys, which are sometimes 20 in number nay 30 in a covey.

When the winter-season is arrived, and the stubble-fields are ploughed up, or over-sowed with cattle, partridges resort into the upland meadows and lodge in the dead-grafs, or fog under hedges, amongst mole-hills, or under the roots of trees: sometimes they resort to coppices, and under-woods, especially if any corn-fields are adjacent, or where there is grown broom, brake, ferns, &c.

In the harvest-time, when every field is full of men and cattle, in the day time they are found in the fallow-fields which are next adjoining to the corn-fields, where they lie lorking till evening or morning, and then they feed among the sheaves of corn.

When their haunts are known, according to the situation of the country and season of the year, the next care must be to find them out in their haunts, which is done several ways. Some do it by the eye only; and this art can never be taught, but learned by frequent experience, the colour of the birds being so like that of the earth at a distance, that no eye but a very conversant one could distinguish them. When they are once seen, the business is to keep the eye upon them, and then to keep in continual motion. They are a very lazy bird, and by this means will let a person almost tread upon them; though if the person stands still to eye them, they will rise immediately though they be at a considerable distance.

Another method of discovering them is, by going to their haunts very early in the morning, or at the close of the evening, which is called the *jucking-time*. The noise of the cock partridge is to be at ended to at this time, and is very loud and earnest. The hen will soon come up to the cock after her making the noise, which she does by way of answer; and when they are got together, their chattering will discover them. Thus they may always be found at these times. But there is yet a better method of finding this bird, which is by the *call*. The business, in order to have success in this way, is carefully to learn the notes of the partridge, and be able to imitate all the several sounds. When perfect in this, the person is to go to the haunts morning and evening, and placing himself in some place where he can see the birds, without being seen by them, he is to listen to their calling; and when they are heard, he is to answer in the same notes, doubling again as they do: by continuing this, they may be brought so near, that the person lying down on his back may count their whole number. Having in this manner found where the birds are, the next care is to catch them.

They are so foolish, that it is extremely easy to take them in *nets*. In order to this, there needs no more than the going out, provided with two or three nets,

with meshes somewhat smaller than those of the pheasant nets, and walking round about the covey, a net is to be fixed so as to draw over them, on pulling a line at a distance. All this may be easily done; for so long as the sportsman continues moving about, and does not fix his eye too intensely upon them they will let him come near enough to fix the net without moving. If they lie so straggling, that one net will not cover them, then two or three must be fixed in the same manner. The sportsman may then draw the nets over them, and they will often lie still with the nets upon them till he comes up to fright them; then they will rise and be entangled in the net.

A second method of taking them is with *bird-lime*; this is done by means of wheat-straws. These must be large, and cut off between knot and knot; they must be well lined with the best and strongest bird-lime, and the sportsman must carry a great number out with him. Having found a field where there are partridges, he is to call; and if they answer, he is then to tick up the limed straws in rows across two or three lands, and going backward, call again to them, leading them on in the road where the straws are; they will follow one another like a flock of chickens, and come out to the call; and will in their way run upon the straws, and liming themselves they will daub one another by crowding together, so that very few of them will be able to escape.

But there is yet a pleasanter way of taking them than this, that is, by *driving* of them. In order to this, an engine is to be made of canvas, stuffed with straw, to represent a horse; this horse and nets are to be taken to the haunts of the partridges, and the nets being placed slanting or slopwise in the lower part of the field, the sportsman is to take the wind in his back and get above them, driving them downwards; his face is to be covered with something green or blue, and placing the horse before him, he is to go towards them slowly and gently; and by this means they will be raised on their legs, but not on their wings, and will run before the horse into the nets. If in the way they go into a wrong path, the horse is to be moved to face them; and they will thus be driven back again, and driven every way the sportsman pleases.

The partridges of Abyssinia, we are told, are very large, being as big as *capons*.

In Jeremiah xvii. 11. we have the following curious passage: "As the partridge sitteth on eggs and hatcheth them not; so he that getteth riches, and not by right, shall leave them in the midst of his days, and at his end shall be a fool;" which is explained by Mr Pool as follows. It is no wonder if we cannot be certain as to the sense of these words, so far as they concern natural history, when we are not certain what bird it is to which this doth relate. We translate it *partridge*; others would have it to be a *cuckoo*; but certain it is, that it is the same word which we translate *partridge*: (1 Sam. xxvi. 20.); and cuckoos use not to be much hunted after. How the partridge is said to sit on eggs and hatch them not, is yet a greater question. It may be occasioned so many ways, *viz.* either sitting upon wind-eggs: or being killed before the eggs are hatched; or having its eggs destroyed by the male partridge, or by some dog or other vermin; or, its nest being found, having her eggs taken from her, that it is hard

Parturition  
||  
Parvich,

to determine which the prophet means. Of all others, I least approve of that which Jerom makes the sense, though the thing be true (if we may believe, Calliodorus and several natural historians, Aldrovandus, &c.), that partridges have such a love and desire to hatch young ones, that having lost their own eggs, they will steal the eggs of other partridges and hatch them; which being hatched, the young ones knowing the cry of their proper dams, hearing them call, leave the partridge that hatched them (which is one thing quoted by Aldrovandus, to show the sagacity of that bird); but if this were the sense, the words would be, 'as the partridge sitteth on eggs, and hatcheth them, but enjoyeth them not;' whereas they are, 'hatcheth them not;' that is, having lost them, either by some man that hath taken them from her, or by some vermin or wild beast." *Poole's Annot in Loc.*

The words in the original are, *רָגַר וְלֹא יִרְקָרָה*, which the Septuagint translate *εφαρνευσε παραδιδωξ*, &c. "The partridge cried; it gathered together what it had not produced;" and some translate the Hebrew, "The partridge lays many eggs; but does not hatch them all." Le Clerc, upon the authority of Bochart, understands the Hebrew word *kore* here to signify a woodcock. Le Clerc's translation is as follows: *Rusticula ova colligit, sed non parit; facit sibi divitias, sed sine jure, mediis suis debus eas relinquit, atque ad extremum stulta est.*

PARTURITION, the act of bringing forth or being delivered of young. See MIDWIFERY.

PARTY, in a military sense, a small number of men, horse, or foot, sent upon any kind of duty: as into an enemy's country to pillage, to take prisoners and to oblige the country to come under contribution. Parties are often sent out to view the roads and ways, get intelligence, seek forage; to reconnoitre, or amuse the enemy upon a march; they are also frequently sent upon the flanks of an army or regiment, to discover the enemy if near, and prevent surprise or ambuscade.

PARU, in natural history, the name of a very singular American fish. It is broad, flat and rounded; not very thick, and usually of about five or six inches long and more than four broad. It has six fins one large and long, one on the back, and another on the belly behind the anus; each of these reaches from the tail, and has toward the end a long string or cord, made of a single filament, that on the back fin being longer than that on the belly; behind the gills it has also two fins of two fingers breadth long and one broad; and two others on the belly, which are very narrow; its head is small, and its mouth elevated and small, and furnished with small teeth; its scales are of a moderate size, and are half black and half yellow: so that the fish appears of a black colour, variegated with yellow half moons; its gills, and the beginning of its fins, are also yellow; and it has, on each side near the head, a yellow spot; it is eatable.

PARVICH, an island near Dalmatia, and one of the best peopled and most considerable of those which are under the jurisdiction of Sibenico. It contains a great number of fishermen, and a considerable number of persons who give themselves up to agriculture. It contains many Roman antiquities, which evidently show that it was a Roman station. It seems to be among the number of those islands which Pliny calls *Celaduffe*, which is supposed to be an inversion of *Parvichus*, which

means *ill sounding or noisy*. Parvich is not large of extent, but it is extremely fertile. Every product succeeds in perfection there; we mean those products of which a very shallow ground is susceptible; such as wine, oil, mulberry trees, and fruit. The aspect of this island is also very pleasant at a distance, whereas that of the others adjacent disgust the eye, by their too high, rocky, and bare hills. The name of *Parvich* seems to have been given it because it is the first one meets with on going out of the harbour of Sibenico; for the Illyric word *parvi* signifies *first*.

PARULIDES, in surgery, tumours and inflammations of the gums, commonly called *gum-boils*. They are to be treated with discutients like other inflammatory tumors.

PARUS, or TITMOUSE, in ornithology, a genus belonging to the order of passerres. The bill is very entire, covered at the basis with hairs; the tongue is truncated and hairy. There are 14 species, of which the most remarkable are,

1. The cristatus, or crested titmouse, weighs 13 penny weight; the bill is black, with a spot of the same colour above it; all the upper part of the body grey; the neck and under parts are white, with a faint tincture of red, which is deepest just below the wings. The legs are of a lead colour. It erects its crown feathers into a crest. It inhabits the warm parts of North America; and frequents forest trees, feeding upon insects.

2. The major, or great titmouse, has the head and throat black, the cheeks white, the back of a green colour, the belly yellowish green, divided in the middle by a bed of black which extends to the vent; the rump of a bluish grey, the legs of a lead colour, the toes divided to the very origin, and the back toe very large and strong. This species sometimes visits our gardens; but for the most part inhabits woods, where it builds in hollow trees, laying about ten eggs. It feeds on insects, which it finds in the bark of trees. In the spring they do a great deal of mischief by picking off the tender buds of the fruit-trees. Like woodpeckers, they are perpetually running up and down the bodies of trees in quest of food. This bird has three cheerful notes, which it begins to utter in the month of February.

3. The cœruleus, or blue titmouse, is a very beautiful bird. The bill is short and dusky; the crown of the head of a fine blue; from the bill to the eye is a black line; the forehead and cheeks white; the back of a yellowish green; the lower side of the body yellow; the wings and tail blue, the former marked transversely with a white bar; the legs of a lead colour. They frequent gardens; and do great injury to fruit-trees, by bruising the tender buds in search of the insects which lie under them. It breeds in holes of walls, and lays 12 or 14 eggs.

4. The virginianus, or yellow rump, is found in Virginia; and is distinguished by a yellow spot on its rump. All the rest of the feathers are brown with a slight tincture of green. It runs about the bodies of trees; and feeds on insects, which it pecks from the crevices of the bark.

5. The caudatus, or long-tailed titmouse, is about five inches and a quarter in length, and seven inches in breadth. The bill is black, very thick and convex,

Parulides  
Parus.

Parus.

differing from all others of this genus. The top of the head from the bill to the hind part, is white, mixed with a few dark-grey feathers: this bed of white is entirely furrounded with a broad stroke of black; which rising on each side of the upper mandible, passes over each eye, unites at the hind part of the head, and continues along the middle of the back to the rump. The feathers on each side of this black stroke are of a purplish red, as are those immediately incumbent on the tail. The tail is the longest, in proportion to the bulk, of any British bird, being in length three inches, the form, not unlike that of a magpie, consisting of 12 feathers of unequal lengths, the middlemost the longest, those on each side growing gradually shorter. These birds are often seen passing through our gardens, going from one tree to another, as if in their road to some other place, never making any halt. They make their nests with great elegance, of an oval shape, and about eight inches deep, having near the upper end a hole for admission. The external materials are mosses and lichens curiously interwoven with wool. On the inside it is very warmly lined with a thick bed of feathers. The female lays from 10 to 17 eggs. The young follow their parents the whole winter; and, from the slenderness of their bodies and great length of tail, appear, while flying, like as many darts cutting the air.

6. The *biarmicus*, or bearded titmouse, has a short, strong, and very convex bill, of box colour; the head of a fine grey; the chin and throat white; the middle of the breast flesh coloured; the sides and thighs of a pale orange; the hind part of the neck and back of orange bay; the tail is two inches and three quarters long; the legs of a deep shining black. The female wants the flesh-colour on the breast, and a triangular tuft of black feathers on each side the bill which adorn the male. They are found in marshy places.

7. The *remiz*, or small species of titmouse. It is called *parus pendulinus*, and is often found in Lithuania. Mr Coxe, in his Travels through Poland, gives the following account of this little animal. "The wondrous structure of its pendent nest induced me to give an engraving \* of both that and the birds themselves. They are of the smallest species of titmice. The head is of a very pale bluish ash colour; the forepart of the neck and the breast tinged with red; the belly white; wings black; back and rump of a yellowish rust colour; quill feathers cinereous, with the exterior sides white: the tail rust coloured. The male is singularly distinguished from the female by a pair of black-pointed whiskers. Its nest is in the shape of a long purse, which it forms with amazing art, by interweaving down, gossamer, and minute fibres, in a close and compact manner, and then lining the inside with down alone, so as to make a snug and warm lodge for its young brood. The entrance is at the side, small, and round, with its edge more strongly marked than the rest of this curious fabric: the bird, attentive to the preservation of its eggs or little ones from noxious animals, suspends it at the lesser end to the extremity of the slender twigs of a willow or some other tree over a river. Contrary to the custom of titmice, it lays only four or five eggs: possibly Providence hath ordained this scantiness of eggs to the *remiz*, because by the singular instinct imparted to it, it is enabled to secure

its young much more effectually from destruction, than the other species, which are very prolific."

PASCAL (Blaise), one of the greatest geniuses and best writers France has produced, was born at Clermont in Auvergne, in the year 1623. His father, Stephen Pascal, born in 1588, and of an ancient family, was president of the court of aids in his province: he was a very learned man, an able mathematician, and a friend of Descartes. Having an extraordinary tenderness for this child, his only son, he quitted his office in his province, and went and settled at Paris in 1631, that he might be quite at leisure for the instruction of him; and Blaise never had any master but his father. From his infancy he gave proofs of a very extraordinary capacity: for he desired to know the reason of every thing; and when good reasons were not given him, he would seek for better: nor would he ever yield his assent but upon such as appeared to him well grounded. There was room to fear, that with such a cast of mind he would fall into free thinking, or at least into heterodoxy; yet he was always very far from any thing of this nature.

What is told of his manner of learning the mathematics, as well as the progress he quickly made in that science, seems almost miraculous. His father, perceiving in him an extraordinary inclination to reasoning, was afraid lest the knowledge of the mathematics, would hinder his learning the languages. He kept him therefore as much as he could from all notions of geometry, locked up all his books of that kind, and refrained even from speaking of it in his presence. He could not, however, make his son refrain from musing upon proportions; and one day surprised him at work with charcoal upon his chamber-floor, and in the midst of figures. He asked him what he was doing? I am searching, says Pascal, for such a thing; which was just the 32d proposition of the first book of Euclid. He asked him then how he came to think of this? It was, says Pascal, because I have found out such another thing: and so going backward, and using the names of *bar* and *round*, he came at length to the definitions and axioms he had formed to himself. Does it not seem miraculous that a boy should work his way into the heart of a mathematical book, without ever having seen that or any other book upon the subject, or knowing any thing of the terms? Yet we are assured of the truth of this by Madam Pierier, and several other writers, the credit of whose testimony cannot reasonably be questioned. He had, from henceforward, full liberty to indulge his genius in mathematical pursuits. He understood Euclid's Elements as soon as he cast his eyes upon them: and this was not strange; for, as we have seen, he understood them before. At 16 years of age he wrote a treatise of conic sections, which was accounted by the most learned a mighty effort of genius; and therefore it is no wonder that Descartes, who had been in Holland a long time, should, upon reading it, choose to believe that Mr Pascal the father was the real author of it. At 19, he contrived an admirable arithmetical machine, which was esteemed a very wonderful thing, and would have done credit as an invention to any man versed in science, and much more to such a youth.—About this time his health became impaired, and he was in consequence obliged to suspend his labours;

Pascal.

Pascal.

nor was he in a condition to resume them till four years after. About that period, having seen Torricelli's experiment respecting a vacuum and the weight of the air, he turned his thoughts towards these objects; and in a conference with Mr Petit, intendant of fortifications, proposed to make farther researches. In consequence of this idea, he undertook several new experiments, one of which was as follows: Having provided a glass tube, 46 feet in length, open at one end, and sealed hermetically at the other, he filled it with red wine, that he might distinguish the liquor from the tube. He then elevated it in this condition; and having placed it perpendicularly to the horizon, stopped up the bottom, and plunged it into a vessel full of water, to the depth of a foot; after which he opened the extremity of the tube, and the wine descended to the distance of about 32 feet from the surface of the vessel, leaving a considerable vacuum at the upper extremity. He next inclined the tube, and remarked that the wine rose higher; and having inclined it till the top was within 32 feet of the ground, making the wine thus run out, he found that the water rose in it, so that it was partly filled with that fluid, and partly with wine. He made also a great many experiments with siphons, syringes, bellows, and all kinds of tubes, making use of different liquors, such as quicksilver, water, wine, oil, &c.; and having published them in 1647, dispersed his work throughout all France, and transmitted it also to foreign countries. All these experiments, however, ascertained effects, without demonstrating the causes. Pascal knew that Torricelli conjectured that those phenomena which he had observed were occasioned by the weight of the air (A); and, in order to discover the truth of this theory, he made an experiment at the top and bottom of a mountain in Auvergne, called *Le Puy de Dome*, the result of which gave him reason to conclude that air was weighty. Of this experiment he published an account, and sent copies of it to most of the learned men in Europe. He likewise renewed it at the top of several high towers, such as those of Notre Dame at Paris, St Jacques de la Boucherei, &c.; and always remarked the same difference in the weight of the air, at different elevations. This fully convinced him of the weight of the atmosphere; and from the discovery he drew many useful and important inferences. He composed also a large treatise, in which he thoroughly explained this subject, and replied to all the objections that had been started against it. As he thought this work rather too prolix, and as he was fond of brevity and precision, he divided it into two small treatises, one of which he entitled, a Dissertation on the Equilibrium of Liquors; and the other, An Essay on the Weight of the atmosphere. These labours procured Pascal so much reputation, that the greatest mathematicians and philosophers of the age proposed various questions to him, and consulted him

respecting such difficulties as they could not solve.— Some years after, while tormented with a violent fit of the tooth-ach he discovered the solution of a problem proposed by Father Merenne, which had baffled the penetration of all those who had attempted it. This problem was to determine the curve described in the air by the nail of a coach wheel, while the machine is in motion. Pascal offered a reward of 40 pistoles to any one who should give a satisfactory answer to it. No one however, having succeeded, he published his own at Paris; but as he began now to be disgusted with the sciences, he would not put his real name to it, but sent it abroad under that of A. d'Ettenville.— This was the last work which he published in the mathematics; his infirmities now encreasing so much that he was under the necessity of renouncing severe study, and of living so recluse, that he scarcely admitted any person to see him.

After he had thus laboured abundantly in mathematical and philosophical disquisitions, he forsook those studies and all human learning at once: and determined to know nothing, as it were, for the future, but Jesus Christ and him crucified. He was not 24 years of age, when the reading some pious books had put him upon taking this holy resolution; and he became as great a devotee as any age has produced. Mr Pascal now gave himself up entirely to a state of prayer and mortification. He had always in his thought these great maxims, of renouncing all pleasure and all superfluity; and this he practised with rigour even in his illnesses, to which he was frequently subject, being of a very invalid habit of body: for instance, when his sickness obliged him to feed somewhat delicately, he took great care not to relish or taste what he eat. He had no violent affection for those he loved; he thought it sinful, since a man possesses a heart which belongs only to God. He found fault with some discourses of his sister, which she thought very innocent; as if she had said upon occasion, that she had seen a beautiful woman, he would be angry, and tell her, that she might raise bad thoughts in footmen and young people. He frequently wore an iron girdle full of points next to his skin; and when any vain thought came into his head, or when he took particular pleasure in any thing, he gave himself some blows with his elbow, to redouble the prickings, and to recal himself to his duty.

Though Mr Pascal had thus abstracted himself from the world, yet he could not forbear paying some attention to what was doing in it; and he even interested himself in the contest between the Jesuits and the Jansenists. The Jesuits, though they had the popes and kings on their side, were yet decried by the people, who brought up afresh against them the assassination of Henry the Great, and all the old stories that were likely to make them odious. Pascal went farther; and by his *Lettres Provinciales* (B), published in

5 H 2

1656,

(A) Before this period, all those effects which are now known to be produced by the weight of the atmosphere, were attributed to Nature's abhorrence of a vacuum.

(B) The origin of these letters was this: for the sake of unbending his mind, Pascal used often to go to Port Royal des Champs, where one of his sisters had taken the veil, and where he had an opportunity of seeing the celebrated Mr Arnaud, and several of his friends. This gentleman's dispute with the Doctors of the Sorbonne,

Pascal.

1656, under the name of *Louis de Montalte*, made them the subject of ridicule. "These letters (says Voltaire) may be considered as a model of eloquence and humour. The best comedies of Moliere have not more wit than the first part of these letters; and the sublimity of the latter part of them is equal to any thing in Bossuet. It is true, indeed, that the whole book was built upon a false foundation; for the extravagant notions of a few Spanish and Flemish Jesuits were artfully ascribed to the whole society. Many absurdities might likewise have been discovered among the Dominican and Franciscan casuists; but this would not have answered the purpose; for the whole raillery was to be levelled only at the Jesuits. These letters were intended to prove, that the Jesuits had formed a design to corrupt mankind; a design which no sect or society ever had, or can have." Voltaire calls Pascal the first of their satirists; for Despreaux, says he, must be considered as only the second. In another place, speaking of this work of Pascal, he says, that "examples of all the various species of eloquence are to be found in it. Though it has been now written almost 100 years, yet not a single word occurs in it, favouring of that vicissitude to which living languages are so subject. Here then we are to fix the epocha when our language may be said to have assumed a settled form. The bishop of Lucon, son of the celebrated Buffy, told me, that asking one day the bishop of Meaux what work he would covet most to be the author of, supposing his own performances set aside, Bossuet replied, *The Provincial Letters*." These letters have been translated into all languages, and printed over and over again. Some have said, that there were decrees of formal condemnation against them;

and also that Pascal himself, in his last illness, detested them; and repented of having been a Jansenist: but both these particulars are false and without foundation. Father Daniel was supposed to be the anonymous author of a piece against them, intitled, *The Dialogues of Cleander and Eudoxas*.

Pascal was only about the age of 30 when these letters were published, yet he was extremely infirm, and his disorders increasing soon after, so much that he conceived his end fast approaching, he gave up all farther thoughts of literary composition. He resolved to spend the remainder of his days in retirement and pious meditation; and with this view he broke off all his former connections, changed his habitation, and spoke to no one, not even to his own domestics. He made his own bed, fetched his dinner from the kitchen, carried it to his apartment, and brought back the plates and dishes in the evening; so that he employed his servants only to cook for him, to go to town, and to do such other things as he could not absolutely do himself. In his chamber nothing was to be seen but two or three chairs, a table, a bed, and a few books. It had no kind of ornament whatever; he had neither a carpet on the floor nor curtains to his bed; but this did not prevent him from sometimes receiving visits; and when his friends appeared surprised to see him thus without furniture, he replied, that he had what was necessary, and that any thing else would be superfluity, unworthy of a wise man. He employed his time in prayer, and in reading the Holy Scriptures; and he wrote down such thoughts as this exercise inspired. Though his continual infirmities obliged him to use very delicate food, and though his servants employed the utmost care to provide only what

Pascal.

Sorbonne, who were endeavouring to condemn his opinions, was of course frequently brought upon the carpet. Mr Arnaud, solicited to write a defence, had composed a treatise, which, however, did not meet with approbation, and which he himself considered as a very indifferent work. Pascal being one day in company, some of those present, who were sensible of his abilities, having said to him, "You who are a young man ought to do something;" he took the hint, and composed a letter, which he showed to his friends, and which was so much admired, that they insisted on its being printed. The object of this letter is an explanation of the terms, *next power*, *sufficient grace*, and *actual grace*; and the author here shows, as well as in two others which followed it, that a regard for the faith was not the motive which induced the Doctors of the Sorbonne to enter into dispute with Mr Arnaud, but a desire of oppressing him by ridiculous questions. Pascal, therefore, in other letters which he published afterwards, attacks the Jesuits, whom he believed to be the authors of this quarrel, and in the most elegant style, seasoned with wit and satire, endeavours to render them not only odious but ridiculous. For this purpose he employs the form of dialogue, and introduces an ignorant person, as men of the world generally are, who requests information respecting the questions in dispute from these Doctors, whom he consults by proposing his doubts; and his answers to their replies are so conspicuous, pertinent, and just, that the subject is illustrated in the clearest manner possible. He afterwards exposes the morality of the Jesuits, in some conversation between him and one of their casuists, in which he still represents a man of the world, who seeks for instruction, and who, hearing maxims altogether new to him, seems astonished, but still listens with moderation. The casuist believes that he is sincere, and relishes these maxims; and under this persuasion he discovers every thing to him with the greatest readiness. The other is still surprised; and as his instructor attributes this surprise only to the novelty of his maxims, he still continues to explain himself with the same confidence and freedom. This instructor is a simple kind of man, who is not overburdened with acuteness, and who insensibly engages himself in details which always become more particular. The person who listens, wishing neither to contradict him nor to subscribe to his doctrine, receives it with an ambiguous kind of raillery; which, however sufficiently shows what opinion he entertains of it. The Jesuits reproached the author with having employed only raillery against them, and with having misrepresented several passages of their authors; which induced Pascal to write eight more in vindication of himself. All these letters, in number 18, written in a style altogether new in France, appeared in 4to, one after another, from the month of January 1656, to the month of March of the year following.

Pascal.

what was excellent, he never relished what he eat, and seemed quite indifferent whether what they brought him was good or bad. When any thing new and in season was presented to him, and when he was asked, after he had finished his repast, how he liked it, he replied, "You ought to have informed me before hand, I should have then taken notice of it." His indifference in this respect was so great, that though his taste was not vitiated, he forbade any sauce or ragout to be made for him which might excite his appetite. He took without the least repugnance all the medicines that were prescribed him for the re-establishment of his health; and when Madame Perrier, his sister, seemed astonished at it, he replied ironically, that he could not comprehend how people could ever show a dislike to a medicine, after being apprised that it was a disagreeable one, when they took it voluntarily; for violence or surprise ought only to produce that effect.

Though Pascal had now given up intense study, and though he lived in the most temperate manner, his health continued to decline rapidly; and his disorders had so enfeebled his organs, that his reason became in some measure affected. He always imagined that he saw a deep abyss on his left side, and he never would sit down till a chair was placed there, to secure him from the danger which he apprehended. His friends did every thing in their power to banish this melancholy idea from his thoughts, and to cure him of his error, but without the desired effect; for though he would become calm and composed for a little, the phantom would in a few moments again make its appearance and torment him. The cause of his seeing this singular vision for the first time, is said to have been as follows: His physicians, alarmed on account of the exhausted state to which he was reduced, had advised him to substitute easy and agreeable exercise for the fatiguing labours of the closet. One day, in the month of October 1654, having gone according to custom to take an airing on the Pont de Neuilly, in a coach and four, the two first horses suddenly took fright, opposite to a place where there was no parapet, and threw themselves violently into the Seine; but the traces luckily giving way, the carriage remained on the brink of the precipice. The shock which Pascal, in his languishing situation, must have received from this dreadful accident, may easily be imagined. It threw him into a fit, which continued for some time, and it was with great difficulty that he could be restored to his senses. After this period his brain became so deranged, that he was continually haunted by the remembrance of his danger, especially when his disorders prevented him from enjoying sleep. To the same cause was attributed a kind of vision or ecstasy that he had some time after; a memorandum of which he preserved during the remainder of his life in a bit of paper, put between the cloth and the lining of his coat, and which he always carried about him. Some of the Jesuits had the baseness and inhumanity to reproach this great genius with the derangement of his organs. In

Pascal.

the Dictionary of Janseist Books, he is called a *typhochondriac*, and a man of a *wrong head*, and a *bad heart*. But, as a celebrated writer has observed, Pascal's disorder had in it nothing more surprising or disgraceful than a fever, or the vertigo. During the last years of his life, in which he exhibited a melancholy example of the humiliating reverses which take place in this transitory scene, and which, if properly considered, might teach mankind not to be too proud of those abilities which a moment may take from them, he attended all the salutations (c), visited every church in which relics were exposed, and had always a spiritual almanac, which gave an account of all those places where particular acts of devotion were performed. On this occasion it has been said, that "Religion renders great minds capable of little things, and little minds capable of great."

In company, Pascal was distinguished by the amiableness, of his behaviour; by his easy, agreeable, and instructive conversation, and by great modesty. He possessed a natural kind of eloquence, which was in a manner irresistible. The arguments he employed for the most part produced the effect which he proposed; and though his abilities intitled him to assume an air of superiority, he never displayed that haughty and imperious tone which may often be observed in men of shining talents. The philosophy of this great man consisted in renouncing all pleasure, and every superfluity. He not only denied himself the most common gratifications; but he took also without reluctance, and even with pleasure, either as nourishment or as remedies, whatever was disagreeable to the senses; and he every day retrenched some part of his dress, food, or other things, which he considered as not absolutely necessary. Towards the close of his life, he employed himself wholly in pious and moral reflections, writing down those which he judged worthy of being preserved. The first piece of paper he could find was employed for this purpose; and he commonly put down only a few words of each sentence, as he wrote them merely for his own use. The bits of paper upon which he had written these thoughts, were found after his death filed upon different pieces of string, without any order or connection; and being copied exactly as they were written, they were afterwards arranged and published.

The celebrated Bayle, speaking of this great man, says, An hundred volumes of sermons are not of so much avail as a simple account of the life of Pascal. His humility and his devotion mortified the libertines more than if they had been attacked by a dozen of missionaries. In a word, Bayle had so high an idea of this philosopher, that he calls him a *paradox in the human species*. "When we consider his character (says he), we are almost inclined to doubt that he was born of a woman, like the man mentioned by Lucretius:

*"Ut vix humana videatur stirpe creatus."*

Mr Pascal died at Paris the 19th of August 1662, aged

(c) Certain solemn prayers, which are repeated at certain hours, and on certain days, in the Popish churches.

Pascal  
Pasiphaë.

aged 39 years. He had been some time about a work against atheists and infidels, but did not live long enough to digest the materials he had collected. What was found among his papers was published under the title of *Pensées*, &c. or *Thoughts upon religion and other subjects*, and has been much admired. After his death appeared also two other little tracts; one of which is intitled, *The equilibrium of fluids*; and the other, *The weight of the mass of air*.

The works of Pascal were collected in five volumes 8vo, and published at the Hague by De Tune, and at Paris by Nyon senior, in 1779. This edition of Pascal's works may be considered as the first published; at least the greater part of them were not before collected into one body; and some of them had remained only in manuscript. For this collection, the public were indebted to the Abbe Bossu, and Pascal deserved to have such an editor. "This extraordinary man (says he) inherited from nature all the powers of genius. He was a geometrician of the first rank, a profound reasoner, and a sublime and elegant writer. If we reflect that in a very short life, oppressed by continual infirmities, he invented a curious arithmetical machine, the elements of the calculation of chances, and a method of resolving various problems respecting the cycloid; that he fixed in an irrevocable manner the wavering opinions of the learned respecting the weight of the air; that he wrote one of the completest works which exist in the French language; and that in his thoughts there are passages, the depth and beauty of which are incomparable—we shall be induced to believe that a greater genius never existed in any age or nation. All those who had occasion to frequent his company in the ordinary commerce of the world, acknowledged his superiority; but it excited no envy against him, as he was never fond of showing it. His conversation instructed, without making those who heard him sensible of their own inferiority: and he was remarkably indulgent towards the faults of others. It may be easily seen by his Provincial Letters, and by some of his other works, that he was born with a great fund of humour, which his infirmities could never entirely destroy. In company, he readily indulged in that harmless and delicate raillery which never gives offence, and which greatly tends to enliven conversation: but its principal object generally was of a moral nature. For example, ridiculing those authors who say, *My Book, my Commentary, my History*, they would do better (added he) to say, *Our Book, our Commentary, our History*; since there are in them much more of other people's than their own." An elegant Latin epitaph was inscribed on his tomb.

PASCHAL, something belonging to the passover, or Easter. See PASSOVER and EASTER.

PAS-EP-A, the chief of the Lamas, particularly eminent for having invented characters for the Moguls. He was much esteemed by the Chinese, though the literati exclaimed against the manner in which the people demonstrated their affection. There is still at Pekin a *myau* or temple, built in honour of Pas-ep-a in the time of the Mogul emperors. He died in 1279.

PASIPHAË (fab. hist.), daughter of the Sun by Perseus, who married Minos king of Crete. She disgraced herself by an unnatural passion for a bull, which we are

told she was enabled to gratify by means of the artist Dædalus. This celebrated bull had been given to Minos by Neptune, to be offered on his altars. But as the monarch refused to sacrifice the animal on account of his beauty, the god revenged his disobedience by inspiring Pasiphaë with an unnatural love for him. This fable, which is universally believed by the poets, who observe, that the minotaur was the fruit of this infamous commerce, is refuted by some writers; who suppose that the infidelity of Pasiphaë to her husband was betrayed in her affection for an officer of the name of Taurus, and that Dædalus, by permitting his house to be the asylum of the two lovers, was looked upon as accessory to the gratification of Pasiphaë's lust. From this amour with Taurus, as it is farther remarked, the queen became mother of twins; and the name of *Minotaurus* arises from the resemblance of the children to the husband and the lover of Pasiphaë. Minos had four sons by Pasiphaë, Castreus, Deucalion, Glaucus, and Androgeus; and three daughters, Hecate, Ariadne, and Phædra.

PASQUIN, a mutilated statue at Rome, in a corner of the palace of the Ursini. It takes its name from a cobbler of that city called *Pasquin*, famous for his sneers and gibes, and who diverted himself by passing his jokes on all that went through that street. After his death, as they were digging up the pavement before his door, they found in the earth the statue of an ancient gladiator, well cut, but maimed and half spoiled: this they set up in the place where it was found, and by common consent named it *Pasquin*. Since that time all satires are attributed to that figure; and are either put into its mouth, or pasted upon it, as if they were written by Pasquin redivivus; and these are addressed by Pasquin to Marforio, another statue at Rome. When Marforio is attacked, Pasquin comes to his assistance; and, when Pasquin is attacked, Marforio assists him in his turn; that is, the people make the statues speak just what they please.

PASQUINADE, a satirical libel fastened to the statue of Pasquin; these are commonly short, witty and pointed; and from hence the term has been applied to all lampoons of the same cast.

PASS, or PASSADE, in fencing an advance or leap-forward upon the enemy. Of these there are several kinds; as passes above, within, beneath, to the right, the left, and passes under the line, &c. The measure of the pass is when the swords are so near as that they may touch one another.

PASS, in a military sense, a strait and difficult passage which shuts up the entrance into a country.

PASS PAROLE, in military affairs, a command given at the head of an army, and thence communicated to the rear, by passing it from mouth to mouth.

PASSADE, in the manege, is a turn or course of a horse backwards or forwards on the same spot of ground. Hence there are several sorts of passades, according to the different ways of turning, in order to part or return upon the same tread, which is called *closing the passade*; as the passade of one time, the passade of five times, and the raised or high passades into which the demivolts are made into curvets. See HORSMANSHIP.

Passage.

Right

Passage  
||  
Passau.

*Right of PASSAGE*, in commerce, is an imposition or duty exacted by some princes, either by land or sea, in certain close and narrow places in their territories, on all vessels and carriages, and even sometimes on persons or passengers, coming in or going out of ports, &c. The most celebrated passage of this kind in Europe is the Sound: the dues for passing which strait belong to the king of Denmark, and are paid at Elsinore or Cronenburg.

PASSANT, in heraldry, a term applied to a lion or other animal in a shield, appearing to walk leisurely: for most beasts, except lions, the *trippant* is frequently used instead of *passant*.

PASSAU, an ancient, handsome, and celebrated town of Germany, in Lower Bavaria, with a bishop's see and fort. The houses are well-built, and the cathedral is thought to be the finest in all Germany. It is divided into four parts, three of which are fortified; but the other is only a suburb, and has nothing but an old castle in which the bishop generally resides. It is seated at the confluence of the rivers Inn and Ilz. in E. Long. 13. 34. N. Lat. 48. 26.

PASSAU, a bishopric of Germany, lying between Lower Bavaria, Austria, and Bohemia. It extends not above 20 miles where largest; and has no considerable place, except the capital, which is of the same name.

PASSERAT (John), a celebrated professor of eloquence in the royal college of Paris, and one of the politest writers of his time, was born at Troyes, in the province of Champagne, in 1534. He spent three years in studying the law under the famous Cujacius at Bourges, where he became professor of eloquence in 1572. He was an indefatigable student, passing frequently whole days without eating a morsel; yet to an extraordinary erudition he joined an uncommon politeness of manners and pleasantry, having nothing of the mere scholar except the gown and hood. He gained the esteem of the kings Charles IX. Henry III. and of all the men of wit and learning in his time. He died in 1602, and left several admired works behind him.

PASSERES, the name of a class of birds. See ZOOLOGY.
