MISCELLANEOUS LITERATURE;

Conſtructed on a PLAN,

BY WHICH

THE DIFFERENT SCIENCES AND ARTS

Are digeſted into the FORM of Diſtinct

TREATISES OR SYSTEMS,

COMPREHENDING

THE HISTORY, THEORY, and PRACTICE, of each,

According to the Lateſt Diſcoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL, CIVIL, MILITARY, COMMERCIAL, &c.

Including ELUCIDATIONS of the moſt important Topics relative to RELIGION, MORALS, MANNERS, and the OECONOMY of LIFE:

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c. throughout the WORLD;

A General HISTORY, *Ancient* and *Modern*, of the different Empires, Kingdoms, and States;

A N D

An Account of the LIVES of the moſt Eminent Perſons in every Nation, from the earlieſt ages down to the preſent times.

Compiled from the writings of the beſt Authors, in ſeveral languages; the moſt approved Dictionaries, as well of general ſcience as of its particular branches; the Tranſactions, Journals, and Memoirs, of various Learned Societies, the MS. Lectures of Eminent Profeſſors on different ſciences; and a variety of Original Materials, furniſhed by an Extenſive Correſpondence.

THE FIRST AMERICAN EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.

ILLUSTRATED WITH FIVE HUNDRED AND FORTY-TWO COPPERPLATES.

VOL. II. ANG——BAR

INDOCTI DISCANT, ET AMENT MEMINISSE PERITI.

PHILADELPHIA:

PRINTED BY THOMAS DOBSON, AT THE STONE HOUSE, Nº 41, SOUTH SECOND STREET.

M.DCC.XCVIII.

ENCYCLOPÆDIA.

ANGERMANIA, a province of the kingdom of Sweden, bounded on the N. by Lapland and Bothnia, on the E. by the gulph of Bothnia and Medelpadia, and on the W. by Jemti and Herndel. It is full of rocks, mountains, and forests; and there is one very high mountain called *Scull*. It has excellent iron-works, and lakes abounding with fish.

ANGERMOND, a town of the duchy of Berg, in Germany, on the E. side of the Rhine, subject to the elector Palatine. E. Long. 6. 20. N. Lat. 51. 10.

ANGERONA, in mythology, the name of a pagan deity whom the Romans prayed to for the cure of the *quinzy*: In Latin, *angina*. Pliny calls her the *goddess of silence* and *calmness of mind*, who banishes all uneasiness and melancholy. She is represented with her mouth covered, to denote patience and refraining from complaints. Her statue was set up, and sacrificed to, in the temple of the goddess Volupia, to show that a patient enduring of affliction leads to pleasure.

ANGERONALIA, in antiquity, solemn feasts held by the Romans the 21st of December, in honour of Angerona, or Angeronia, the goddess of patience and silence. Festus and Julius Modestus, quoted by Macrobius, Saturn. lib. i. cap. 10. derive the name from *angina*, "quinzy;" and suppose the goddess to have been thus denominated, because she presided over that disease.—Others suppose it formed from *angor*, "grief, pain;" to intimate that she gave relief to those afflicted therewith. Others deduce it from *angeo*, "I press, I close," as being reputed the goddess of silence, &c.

ANGERS, a great city of France, and capital of the duchy of Anjou, with a bishop's see. It is seated a little above the place where the Sarte and the Loire lose themselves in the Maine. This last river divides the city into two equal parts, called the high and the Low Town. There are twelve parishes in the city and four in the suburbs, which contain upwards of 36,000 inhabitants. Besides these, there are eight chapters, and a great number of convents for both sexes. Its greatest extent is along the declivity of a hill, which reaches quite down to the river side. The castle was built by St Louis, about the middle of the 13th centery. The walls, fosses, and numerous towers which yet subsist, evince its former magnificence; and its situation in the centre of the city, on a rock overhanging the river, conduces to give it an air of grandeur, though at present in decay. It was the principal residence of the kings of Sicily, as dukes of Anjou, but is now in a state of total ruin. The cathedral of Angers is a venerable structure; and although it has un-

dergone many alterations in the course of ages since its construction, yet the architecture is singular and deserves attention. Here lies interred with her ancestors the renowned Margaret, daughter of René king of Sicily, and queen of Henry VI. of England. She expired, after her many intrepid, but ineffectual, efforts to replace her husband on the throne, in the year 1482, at the castle of Dampierre in Anjou. Near the church of St Michael is the handsomest square in the city, from whence runs a street which has the name of the church. On one side of this street is the town-house; which has a fine tower, with a clock, raised upon an arch, which serves for a passage into the great square. There are two large bridges, which keep up a communication between the two parts of the city; and in the lesser of these there is another square, which serves for a market. The university of Angers was founded in 1398, and the academy of belles lettres in 1685. This last consists of thirty academicians. At the end of the suburbs of Bresigny are the quarries of Angiers, so famous for the fine slate which is got from thence. The pieces are of the thickness of a crown piece, and a foot square. All the houses in Angers are covered with this slate, which has gained it the appellation of the *Black City*. The walls with which king John of England surrounded it in 1214 remain nearly entire, and are of very great circumference. W. Long. 0. 30. N. Lat. 47. 28.

ANGHIERA, a town of Italy, in the duchy of Milan, and capital of a country of the same name. It is seated on the eastern side of the lake Maggiore, in E. Long. 9. 5. N. Lat. 45. 42.

ANGINA, in medicine, a violent inflammation of the throat, otherwise called *quinzy*. See Medicine-*Index*.

Angina Pectoris. See *Medicine-Index*.

ANGIOSPERMIA, in the Linnæan system of botany, the second order in the class Didynamia. It consists of those plants, of that class, whose seeds are inclosed in the pericarpium. In this order the stigma is generally obtuse. These are the *personati* of Tournefort.

ANGITIÆ lucus or Nemus (Virg.), situated on the west side of the Lacus Fucinus. The inhabitants are called *Lucenses*, by Pliny. Angitia was sister of Medea, who taught antidotes against poison and serpents, according to Sil. Italicus. But Servius on Virgil says, that the inhabitants called Medea by this name for the same reason. The town is now called *Luco*.

ANGLE, the inclination of two lines meeting one another in a point. See Geometry.

Angle ‖ Anglesey.

Angle of Incidence, in optics, the angle which a ray of light makes with a perpendicular to that point of the surface of any medium on which it falls: tho' it is sometimes understood of the angle which it makes with the surface itself.

Angle of Refraction, now generally means the angle which a ray of light, refracted by any medium, makes with a perpendicular to that point of the surface on which it was incident; but has sometimes been understood of the angle which it makes with the surface of the refracting medium itself.

ANGLER, a person who practises the art of angling, whether as a diversion, or otherwise. See the article ANGLING.

ANGLER, in ichthyology, the English name of a species of lophus. See LOPHUS.

ANGLES, an ancient German nation, originally a branch of the Suevi; who, after various migrations, settled in that part of Denmark, and duchy of Sleswick, which to this day is called *Angel*, and of which the city of Flensburgh is the capital. Here they were known, even in the time of Tacitus, by the name of *Angli*. The origin of this name is variously accounted for. According to Saxo-Grammaticus, they were called *Angli* from one Angulus, son to Humblus king of Denmark. Windischind, a Saxon writer, will have them to be called *Angli*, from an island in the corner or angle of the sea, which they conquered. Goropius derives their name from the Saxon word *Angel* or *Engel*, signifying a fish-hook; the Angles, like the other Saxon nations, being greatly addicted to piracy, and on that account being so named by the neighbouring nations; as if, like hooks, they caught all that was in the sea. To this nation the British ambassadors are said to have applied when soliciting succours against the Scots and Picts. The Angles therefore went over in greater numbers than any other Saxon nation; and accordingly had the honour of giving the name of *Anglia* to England. See ENGLAND.

ANGLESEY (Isle of,) is the most western country of North Wales. It is 24 miles in length, 18 in breadth, and sends one member to parliament. It is separated from Caernarvonshire by a strait called *Menai*, and on every other side is surrounded by the sea. It is a fertile spot, and abounds in corn, cattle, flesh, fish, and fowls.

At port Aethwy, the most general ferry into the island, there is a great passage of cattle. It is computed that the island sends forth annually from 12,000 to 15,000 heads, and multitudes of sheep and hogs. It is also computed that the remaining stock of cattle is 30,000. In 1770 upwards of 90,000 bushels of corn were exported, exclusive of wheat. The improvement in husbandry has greatly increased since the suppression of smuggling from the Isle of Man: before that time every farmer was mounted on some high promontory, expecting the vessel with illicit trade; but since that period, he has set in earnest to industry and cultivation. Not but that the island was in most remote time famous for its fertility: Mon, Mam Gymry, the Nursing-mother of Wales, was a title it assumed even in the 12th century.

This island is divided into 74 parishes, of which most of the churches are situated near the shores. By an account given on the 13th of August 1563, there were 2010 housholds, or families, in Anglesey; allowing five to a family, the whole number of inhabitants in that period was 10,050. It 1776, the number of houses in Anglesey was about 3,956: allowing five persons to a family, the whole number of inhabitants was at that time 19,780; which wants only 340 of doubling the number of inhabitants in the intervening space. The chief town is BEAUMARIS.

In ancient times this island was called *Mon*, *Mona*, or *Moneg*. It was the great nursery of the religion of the Druids; being the residence of the Grand Druid, or chief pontiff, and consequently of all the learned doctors in that religion.

Many ancient monuments of Druidism still remain in the island.—At Tre'r Dryw, or the habitation of the arch-druid, are several mutilated remains, which have been described by Mr Rowland. His *Bryn Gwyn*, or *Brein Gwyn*, or royal tribunal, is a circular hollow of 180 feet in diameter, surrounded by an immense agger of earth and stones, evidently brought from some other place, there not being any mark of their being taken from the spot. It has only a single entrance. This is supposed to have been the grand consistory of the druidical administration.—Not far from it was one of the *Gorseddau*, now in a manner dispersed, but which once consisted of a great copped heap of stones, on which sat aloft a druid, instructing the surrounding people *multa de Deorum immortalium vi et potestate disputare, et juventuti tradunt*; Cæs. lib. 6.—Here were also the relics of a circle of stones, with the *cromlech* in the midst; but all extremely imperfect. Two of the stones are very large; one, which serves at present as part of the end of a house, is 12 feet 7 inches high and 8 feet broad; and another 11 feet high and 23 feet in girth. Some lesser stones yet remain. The circle, when complete, was one of the temples of the druids, in which their religious rites were performed. It is the conjecture of Mr Rowland, that the whole of these remains were surrounded with a circle of oaks, and formed a deep and sacred grove: *Jam per se roborum elegunt lucos, neque ulla sacra sine ea fronde conficiunt*; (Plin. Hist. Nat. xv. 44.)—Near this is *Caer Leb*, or the moated entrenchment; of a square form, with a double rampart, and broad ditch intervening, and a lesser on the outside. Within are foundations of circular and of square buildings. This Mr Rowland supposes to have been the residence of the arch druid, and to have given the name, *Tre'r Dryw*, to the township in which it stands. At Trev-Wry are several faint traces of circles of stones, and other vestiges of buildings; but all so dilapidated, or hid in weeds, as to become almost formless. *Bod-drudan*, or the habitation of the druids, *Tre'r-Beirdd*, or that of the bard, and *Bodowyr*, or that of the priests, are all of them hamlets, nearly surrounding the seat of the chief druid, composing the essential part of his suite. At the last is a thick cromlech, resting on three stones.

The shore near Porthamel, not far from hence, is famed for being the place where Suetonius landed, and put an end in this island to the druid reign. His infantry passed over in flat-bottom boats, perhaps at the spot still called *Pant yr Yscraphie*, or the valley of *Skiffs*. His cavalry crossed partly by fording, partly by swimming. Of the conflict on this occasion we have the following animated description by Tacitus*:

* Annal. xiv. 30.

"Stat

Anglesey.

"Stat pro littore diversa acies, densa armis virisque, intercursantibus fæminis in modum furiarum, veste ferali, crinibus dejectis, faces preferebant; *druidæque* circum, preces diras sublatis ad cœlum manibus fundentes. Novitate aspectus percutere militem, ut quasi hærentibus membris, immobile corpus vulneribus præberent. Dein cohortionibus ducis, et se ipse stimulantes, ne muliebre et fanaticum agmen pavescerent, inferunt signa, sternuntque obvios et igni suo involvunt. Præsidium posthac impositum vicis, excisque luci, sævis superstitionibus sacri. Nam cruore captivo adolere aras, et hominum fibris consulere deos fas habebant."—Thus Englished: "On the shore stood a motley army in close array; and well armed; with women running wildly about in black attire with dishevelled hair, and like the furies brandishing their torches; surrounded by the druids, lifting up their hands to heaven, and pouring forth the most dreadful imprecations. The soldier stood astonished with the novelty of the sight. His limbs grew torpid, and his body remaining motionless resigned to every wound. At length, animated by their leader, and rousing one another not to be intimidated with a womanly and fanatic band, they displayed their ensigns, overthrew all who opposed them, and flung them into their own fires. After the battle, they placed garrisons in the towns, and cut down the groves consecrated to the most horrible superstitions: for the Britons held it right to sacrifice on their altars with the blood of their captives, and to consult the gods by the inspection of human entrails."—There are no traces of any Roman works left in this country. Their stay was so short, that they had not time to form any thing permanent.

Near the ferry of Moel y Don appear the fine woods of Sir Nicholas Bayley, skirting the Menni for a considerable way. The wooded part of the island is on this side. It commences at Llanidan, and recals the ancient British name of Anglesey, *Ynys Dywyll*, or the *Dark Island*, on account of the deep shade of its groves: but at present it is (except in this part) entirely divested of trees; and the climate so averse to their growth, that in most parts it is with great difficulty the gentry can raise a plantation round their houses. Plas Newydd, the seat of Sir Nicholas Bayley, lies close upon the water, protected on three sides by venerable oaks, and ashes. The view up and down this magnificent riverlike strait is extremely fine. The shores are rocky; those on the opposite side covered with woods; and beyond soar a long range of Snowdonian alps. Here stood a house built by Gwenllian, a descendent of Cadrod Hardd. The mansion has been improved, and altered to a castellated form by the present owner.

In the woods are some very remarkable druidical antiquities. Behind the house are to be seen two vast cromlechs. The upper stone of one is 12 feet 7 inches long, 12 broad, and four thick, supported by five tall stones. The other is but barely separated from the first: is almost a square of five feet and a half, and supported by four stones. The number of supporters to cromlechs are merely accidental, and depend on the size or form of the incumbent stone. These are the most magnificent in the island, and the highest from the ground; for a middle-sized horse may easily pass under the largest. In the lands of Llugwy, indeed, there is a most stupendous one of a rhomboidal form. The greatest diagonal is 17½ feet, the lesser 15, and the thickness three feet nine inches; but its height from the ground is only two feet: it is supported by several stones. The Welsh, who ascribe every thing stupendous to the famous king Arthur, call it *Arthur's Quoit*. In the woods at this place are some druidical circles nearly contiguous to each other.

At a small distance from Beaumaris, on the shore, stand the remains of Llanvaes, or the Friars. It was founded by Prince Llewelyn ap Jerwerth, and, according to the general tradition of the country, over the grave of his wife Joan, daughter of king John, who died in 1237, and was interred on the spot. Here also were interred a son of a Danish king, Lord Clifford, and many barons and knights who fell in the Welsh wars. It was dedicated to St Francis, and consecrated by Howel bishop of Bangor, a prelate who died in 1240. The religious were Franciscans, or minor friars. Their church and house were destroyed, and their lands wasted, in the insurrection made soon after the death of Llewelyn, last Welsh prince, by his relation Madoc. Edward II. in consideration of their misfortunes, remitted to them the payment of the taxes due to him, which before the war were levied at the rate of L.12, 10s. These friars were strong favourers of Glendwr. Henry, in his first march against Owen, plundered the convent, put several of the friars to the sword, and carried away the rest; but afterwards set them at liberty, made restitution to the place, but peopled it with English recluses. It possibly was again reduced to ruin; for Henry V. by patent, established here eight friars, but directed, that two only should be Welsh. At the dissolution, Henry VIII. sold the convent and its possessions to one of his courtiers. They became in later days the property of a family of the name of *White* (now extinct), who built here a good mansion. It of late became, by purchase, the property of Lord Bulkely. The church is turned into a barn, and the coffin of the princess Joan now serves for a watering-trough. A little farther is Castell Aber Llienawg, a small square fort, with the remains of a little round tower at each corner. In the middle one stood a square tower. A foss surrounds the whole. A hollow way is carried quite to the shore, and at its extremity is a large mound of earth, designed to cover the landing. This castle was founded by Hugh Lupus Earl of Chester, and Hugh the Red Earl of Shrewsbury, in 1098, when they made an invasion, and committed more savage barbarities on the poor natives, especially on one Kenred a priest, than ever stained the annals of any country. Providence sent Magnus king of Norway to revenge the cruelties. His coming was to all appearance casual. He offered to land, but was opposed by the earls. Magnus stood in the prow of his ship, and calling to him a most expert bowman, they at once directed their arrows at the Earl of Shrewsbury, who stood all armed on the shore. An arrow pierced his brain through one of his eyes, the only defenceless part. The victor, seeing him spring up in the agonies of death, insultingly cried out, in his own language, *Leit loupe*, "Let him dance." This fort was garrisoned so lately as the time of Charles I. when it was kept for the parliament by Sir Thomas Cheadle; but was taken by Colonel Robinson in 1645.

Above Llanddona is a high hill, called *Bwrdd Arthur*, Anglesey. thur, or Arthur's round table: the true name was probably *Din*, or *Dinas-Sulwy*; for a church immediately beneath bears that of *Llanvihangle Din-Sulwy*. On the top of it is a great British post, surrounded by a double row of rude stones with their sharp points uppermost; and in some parts the ramparts are formed of small stones. In the area are vestiges of oval buildings: the largest is formed with two rows of flat stones set on end. These had been the temporary habitations of the possessors. It had been a place of vast strength; for, besides the artificial defence, the hill slopes steeply on all sides, and the brink next to the ramparts is mostly precipitous. It is worth while to ascend this hill for the sake of the vast prospect; an intermixture of sea, rock, and alps, most savagely great.

About two miles south of Plas-Gwyn, the seat of Paul Panton, Esq; was situated Penmynnydd, once the residence of the ancestors of Owen Tudor, second husband to Catherine of France, queen dowager of Henry V.; "who beyng (as honest Halle informs us) young and lustye, folowyng more her owne appetyte than frendely consaill, and regardyng more her private affection than her open honour, toke to husband privily (in 1428) a goodly gentylman, and a beautiful person, garniged with manye godly gyftes both of nature and of grace, called *Owen Teuther*, a man brought furth and come of the noble lignage and auncient lyne of Cadwalader, the last kynge of the Britonnes." The match, important in its consequences, restored the British races of princes to the kingdom: These reigned long, under the title of the House of Tudor; the mixed race having ceased on the accession of Henry VII. grandson to our illustrious countryman. The remains of the residence of the Tudors are, the door of the gateway: part of the house, and the great chimney-piece of the hall, are to be seen in the present farm-house. Some coats of arms, and dates of the building or time of repairs, are to be seen, with the initial letters of the names of the owners. The Tudors, for a considerable space before the extinction of their race, assumed the name of *Owen*. Richard was the last male of the family, and was sheriff of the county in 1657. Margaret, heiress of the house, married Coningsby Williams, Esq; of Glan y gors, in this island, who possessed it during his life. It was afterwards sold to Lord Bulkley, in whose descendant it still continues. In the church of Penmynnydd is a most magnificent monument of white alabaster, removed at the dissolution from the abbey of Llanvaes to this place; probably erected in memory of one of the house of Tudor; who had been interred there. On it is the figure of a man in complete armour, a conic helm, and mail-guard down to his breast; his lady is in a thick angular hood; their feet rest on lions, and their heads are supported by angels.

On the western point of the bay is a small cape, flat at top, called *Castell-mawr*, joined to the land by a low isthmus. It is composed of lime-stone, which is carried to distant parts in small vessels, which lie in a small channel near the rock, and by their numbers frequently enliven the view. Roman coins have been found in this neighbourhood; but there are no vestiges of their having been any station. Beyond Castell-mawr, on the shore, are vast blocks of black marble filled with shells, coralloids, and fungitæ.

At Tresclwyn mountain is the most considerable body of copper ore perhaps ever known. The part of Tryfclwyn which contains it is called *Parys mountain*. Of this mountain, and the works there carried on, we have the following very curious and particular account by Mr Pennant *:—"The external aspect of the hill is extremely rude, and rises into enormous rocks of coarse white quartz. The ore is lodged in a bason or hollow, and has on one side a small lake, on whose waters, distasteful as those of Avernus, no bird is known to alight. The whole aspect of this tract has, by the mineral operations, assumed a most savage appearance. Suffocating fumes of the burning heaps of copper arise in all parts, and extend their baneful influence for miles around. In the adjacent parts vegetation is nearly destroyed; even the mosses and lichens of the rocks have perished; and nothing seems capable of resisting the fumes but the purple melic grass, which flourishes in abundance. It is thought that the ore had been worked in a very distant period. Vestiges of the ancient operations appear in several parts, carried on by trenching, and by heating the rocks intensely, then suddenly pouring on water, so as to cause them to crack or scale; thus aukwardly supplying the use of gunpowder. Pieces of charcoal were also found, which proves that wood was made use of for that purpose. As the Britons imported all works in brass, it is certain that the Romans were the undertakers of these mines; and it is very probable that they sent the ore to Caerhên to be smelted, the place where the famous cake of copper was discovered. They might likewise have had a smelting-hearth in this island; for a round cake of copper was discovered at Llanvaethlle, a few miles from this place. Its weight was fifty pounds, and it had on it a mark resembling an *L*.

* *Tour in Wales*, ii. 263.

"In the year 1762, one Alexander Frazier came into Anglesey in search of mines. He visited Parys mountain; called on Sir Nicholas Bayley, and gave him so flattering an account of the prospect, as induced him to make a trial, and sink shafts. Ore was discovered; but before any quantity could be gotten, the mines were overpowered with water. In about two years after, Messrs Roe and Co. of Macclesfield, applied to Sir Nicholas for a lease of Penrhyn ddu mine in Caernarvonshire; with which they were, much against their wills, compelled to take a lease of part of this mountain, and to carry on a level, and make a fair trial. The trial was accordingly made; ore was discovered; but the expences overbalanced the profits. They continued working to great loss; and at length determined to give the affair up. They gave their agent orders for that purpose; but he, as a final attempt, divided his men into ten several companies, of three or four in a partnership, and let them sink shafts in various places, about eight hundred yards eastward of a place called the *Golden Venture*, on a presumption that a spring, which issued from near the place, must come from a body of mineral. His conjecture was right; for in less than two days they met with, at the depth of seven feet from the surface, the solid mineral, which proved to be that vast body which has since been worked to such advantage. The day that this discovery was made was March 2d, 1768; which has ever since been observed as a festival by the miners. Soon after this discovery, another adventure was begun by

Anglesey. by the reverend Mr Edward Hughes, owner of part of the mountain, in right of his wife Mary Lewis of Llys Dulas; so that the whole of the treasure is the property of Sir Nicholas Bayley and himself. The body of copper ore is of unknown extent. The thickness has been ascertained in some places by the driving of a level under it, several years ago, and it was found to be in some places twenty-four yards. The ore is mostly of the kind called by Cronsted *Pyrites cupri flavo viridescens*, and contains vast quantities of sulphur. It varies in degrees of goodness; some of it is rich, but the greater part poor in quality.

"There are other species of copper ore found here. Of late a vein of the *Pyrites cupri griseus* of Cronsted, about seven yards wide, has been discovered near the west end of the mountain: some is of an iron grey, some quite black; the first contains sixteen lb of copper per ctb. the last forty. An ore has been lately found, in form of loose earth, of a dark purplish colour; and the best of it has produced better than eight in twenty. Some years ago, above thirty pounds of native copper was found in driving a level through a turbery; some was in form of moss, some in very thin leaves.

"It is quarried out of the bed in vast masses; is broken into small pieces; and the most pure part is sold raw, at the rate of about 3*l*. to 6*l*. per ton, or sent to the smelting-houses of the respective companies to be melted into metal. Mr Hughes has great furnaces of his own at Ravenhead, near Liverpool, and at Swansey, in South Wales. An idea of the wealth of these mines may be formed, by considering that the Macclesfield company have had at once fourteen thousand tons of ore upon bank, and Mr Hughes thirty thousand.

"The more impure ore is also broken to the size of about hen's eggs; but in order to clear it from the quantity of sulphur with which it abounds, as well as other adventitious matter, it must undergo the operation of burning. For that purpose, it is placed between two parallel walls of vast length: some kilns are 20, others 40, and 50 yards in length; some 10, others 20 feet wide, and above 4 feet in height. The space between is not only filled, but the ore is piled many feet higher, in a convex form, from end to end. The whole is then covered with flat stones closely luted with clay, and above is placed a general integument of clay, and small rubbish of the work, in order to prevent any of the fumes from evaporating. Of late, some kilns have been constructed with brick arches over the ore, which is found to be the best method of burning. Within these few years, attempts are made to preserve the sulphur from flying away; and that is done by flues made of brick, whose tops are in form of a Gothic arch, many scores of feet in length. One end of these opens into the beds of copper which are to be burnt. Those beds are set on fire by a very small quantity of coal, for all the rest is effected by its own phlogiston. The volatile part is confined, and directed to the flues; in its course the sulphureous particles strike against their roofs, and fall to the bottom in form of the finest brimstone; which is collected and carried to adjacent houses, where it is melted into what is called in the shops *stone brimstone*.

"The beds of copper, thus piled for burning, are of vast extent. Some contain 400 tons of ore, others 2000. The first require four months to be completely burnt, the last near ten. Thus burnt, it is carried to proper places to be dressed, or washed, and made merchantable. By this process the ore is reduced to a fourth part in quantity, but considerably improved in quality: and by this means the water is strongly or richly impregnated with copper, which is dissolved by the acid quality of the sulphur; and is collected or precipitated again by iron in the above-described pits. The iron is all dissolved.

"But a far richer produce of copper is discovered from the water lodged in the bottom of the bed of ore, which is highly saturated with the precious metal. This is drawn up, either by means of whimsies or windmills, to the surface, and then distributed into numbers of rectangular pits 36 feet long, some pits more, some less, 12 or 15 feet broad and 20 inches deep. To speak in the language of the adept, Venus must make an assignation with Mars, or this solution will have no effect. In plain English, a quantity of iron must be immersed in the water. The kind of iron is of no moment; old pots, hoops, anchors, or any refuse will suffice: but of late, for the convenience of management, the adventurers procure new plates, four feet long, one and a half broad, and three quarters of an inch thick. These they immerse into the pits. The particles of copper instantly are precipitated by the iron, and the iron is gradually dissolved into a yellow ocher. Great part of it floats off by the water, and sinks to the bottom. The plates, or the old iron (as it happens), are frequently taken out, and the copper scraped off; and this is repeated till the whole of the iron is consumed. The copper thus procured differs little from native copper, and is prized accordingly, and sold for prices of £. 25 to £. 45 a ton.

"This discovery is far from new: it has been practised long in the Wicklow mines in Ireland; and above a century in those of Hern-grundt in Hungary, where it is called *ziment copper*. The waters of the Hungarian mines are much more strongly impregnated with copper than those of Parys mountain. The first effects its operation in 12 or about 20 days, the last requires two months. Horse-shoes, iron made in the shape of hearts, and other forms, are put into the foreign waters; and when perfectly transmuted, are given as presents to curious strangers.

"The ore is not got in the common manner of mining, but is cut out of the bed in the same manner as stone is out of a quarry. A hollow is now formed in the solid ore open to the day, and extends about 100 yards in length, about 40 yards in breadth, and 24 yards in depth. The ends are at present undermined, but supported by vast pillars and magnificent arches, all metallic; and these caverns meander far under ground. These will soon disappear, and thousands of tons of ore be gotten from both the columns and roofs. The sides of this vast hollow are mostly perpendicular, and access to the bottom is only to be had by small steps cut in the ore; and the curious visitor must trust to them and a rope, till he reaches some ladders, which will conduct him the rest of the descent. On the edges of the chasms are wooden platforms, which project far; on them are windlasses, by which the workmen are lowered to transact their business on the face

of

of the precipice. There suspended, they work in mid air, pick a small space for a footing, cut out the ore in vast masses, and tumble it to the bottom with great noise. In such situations they form caverns, and there appear safely lodged till the rope is lowered to convey them up again. Much of the ore is blasted with gunpowder, eight tons of which are said to be annually used for the purpose.

"Nature hath been profuse in bestowing her mineral favours on this spot: for above the copper ore, and not more than three quarters of a yard beneath the common soil, is a bed of yellowish greasy clay, from one to four yards thick, containing lead ore, and yielding from 600 to 1000 pounds weight of lead from one ton; and one ton of the metal yields not less than 57 ounces of silver. Mixed with the earth are frequently certain parts of the colour of cinnabar. Whether these are symptomatic of the sulphureous arsenical silver ores or of quicksilver, I will not pretend to decide. Something interferes with the successful smelting of this earth in the grate; insomuch that it has not yet been of that profit to the adventurers which might reasonably be expected from the crucible-assays of it, and they have at this time about 8000 tons on bank undisposed of. This place has been worked for lead ore in very distant times. In the bottom of the pool was found an ancient smelting-hearth of grit-stone, and several bits of smelted lead, of about four inches in length, two in breadth, and half an inch thick.

"These works have added greatly to the population of the island; for about 1500 persons are employed; who, with their families, are supposed to make near 8000 persons, getting their bread from these mines. The little village of Amlwch, the port of the place, is increasing fast, and the market grows considerable. At the season of the greatest work, Mr Hughes's men alone receive for many weeks £. 200 in one week, and £. 150 in another, merely for subsistence. The port is no more than a great chasm between two rocks, running far into land, and dry at low-water; into which sloops run, and lie secure to receive their lading."

Near Kemlyn Bay is a quarry of marble, common to this place, some parts of Italy, and to Corsica, and known in the shops by the name of *Verde di Corsica*. Its colours are green, black, white, and dull purple, irregularly disposed. In different blocks one or other of the colours are frequently wanting; but among the green parts are often found narrow veins of a most elegant and silky white asbestos. It is a compound species of marble: part is calcareous and may be acted on by aquafortis. The green parts partake of the nature of jasper. It is apt to be intersected by small cracks, or by asbestine veins, therefore incapable of taking a high polish. This quarry lies on the lands of Monachty, in the parish of Llan-Fair-Ynghornwy; and it is found again in the isle of Skerries, off this parish. Neither the quarry not the asbestos are at present in use. In Rhoscolyn parish, a green amianthus, or brittle asbestos, is met with in great plenty in a green marble similar to the above; but by reason of the inflexible quality of its fibres not applicable to the same use.

ANGLING, among sportsmen, the art of fishing with a rod, to which are fitted a line, hook, and bait. See FISHING-*Rod*, FISHING-*Hook*, FISHING-*Fly*.

The angler's first business is to attract the fish to the place intended for angling. The method of doing this, in standing waters, by throwing in grain, chopped worms, and the like, is well known: but the chief difficulty is in running rivers and brooks. The method, in this case, is to prepare a tin box capable of holding some hundreds of worms, bored on all sides, and full of holes of such a size as they may be just able to crawl out at; there must be a plummet fastened to this box to sink it, and a line to draw it back at pleasure; in this case it is to be thrown into the water in a proper place, above which the angler may stand under cover. The worms will slowly and gradually crawl out of this box, and the fish will be gathered about to feed on them; the baited hook is to be thrown in higher up and carried down by the stream. If this method do not bring the fish about the place in a little time, there is reason to suspect that some pike lies lurking thereabout, and deters them: in this case, it is proper to throw out a baited hook, and he will generally be taken; after this the attempt will succeed.

When the angler takes his stand, he is to shelter himself under some tree or bush, or stand so far from the brink of the water that he can only discern his float; as the fish are timorous and easily frighted away. The angling rod must be kept in a moderate state, neither too dry nor too moist: in the first case it will be brittle; in the other rotten. When pastes are used, it is proper to mix a little tow with them, and rub them over with honey; finally, a small anointing with butter is of great use to keep them from washing off the hook. The eyes of any fish that is taken are an excellent bait for almost any other kind of fish. The best way of angling with the fly is down the river, and not up; neither need the angler ever make above half a dozen of trials in one place, either with fly or ground bait, when he angles for trout: by that time the fish will either offer to take, or refuse the bait and not stir at all.

In a pond, the best place for the angler to take his stand is usually that where the cattle go up to water: in rivers, if breams are fished for, it should be in the deepest and most quiet places; if eels, under the banks of rivers that hang over; perch are to be expected in clean places, where the stream is swift; and chub in deep shaded holes: roach are mostly found where the perch are, and trout only in swift and clear streams. Places where there are many weeds, or old stumps of trees, harbour fish in great numbers, and they usually bite freely there; but there is danger of entangling the line, or fastening the hook to the weeds. In case of this accident, recourse is to be had to a ring of lead, of about six inches round, fastened to a small pack-thread: this ring is to be thrust over the rod, and let fall into the water. It will descend to the place where the hook is entangled; and then, by pulling the pack-thread gently, the hook will be soon disengaged, or at the worst it can only be broke off near the end of the line; whereas, when this is not employed, the rod itself is sometimes broken, or the line nearer its upper end.

Deep waters are best for angling in, for the fish do not love to be disturbed by wind and weather.

The

The openings of sluices and mill-dams always bring fish up the current to seek for the food which is brought with the stream; and angling in these places is usually successful.

The best season is from April to October; for, in very cold stormy weather, the fish will not bite: the best times of the day are from three till nine in the morning, and from three in the afternoon till sun-set. In an easterly wind, there is never much sport for the angler; the southerly winds are the best for his purpose, and a warm but lowering day is most of all to be chosen; a gentle wind, after a sudden shower, to disturb the water, makes a very good opportunity for the angler: the cooler the weather in the hottest months, the better; but in winter, on the contrary, the warmer the day the better. A cloudy day, after a bright moonlight night, is always a good day for sport; for the fish do not care for going after prey in the bright moonshine, and are therefore hungry the next morning.

Those who are fond of angling might save themselves some fruitless trouble, by observing when small fish in a jar take or refuse food. See FISH.

The several methods of angling for salmon, trout, carp, tench, pearch, pike, dace, gudgeons, roach, flounder, &c. may be seen under the article FISHING.

ANGLO-CALVINISTS, a name given by some writers to the members of the church of England, as agreeing with the other Calvinists in most points except church-government.

ANGLO-Saxon, an appellation given to the language spoken by the English Saxons: in contradistinction from the true Saxon, as well as from the modern English.

ANGLUS (Thomas), an English priest, well known for the singularity of his opinions, and several little tracts which he wrote in the 17th century. He went by several names. Mr Baillet says his true name was *White*; but that he used to disguise it under that of *Candidus*, *Albus*, *Bianchi*, and *Richworth*: but he was most known in France by the name of *Thomas Anglus*. Des Cartes generally called him Mr *Vitus*. He passed some time in most countries of Europe; but his longest stay was at Rome and Paris. When he was in England, he lived a considerable time in the family of Sir Kenelm Digby; and seems to have had a great esteem for the opinions of this gentleman, as may be seen in his writings, particularly in the Preface to his Latin work concerning the Institutions of the Peripatetic Philosophy, according to the hypothesis of Sir Kenelm. He was a great advocate for the peripatetic philosophy. He attempted even to make the principles of Aristotle subservient to the explaining the most impenetrable mysteries of religion; and with this view, he engaged in the discussion of predestination, free-will, and grace. Mr Baillet says, "What he wrote upon this subject resembles the ancient oracles for obscurity." In such abstruse points as we have mentioned, he was much embarrassed; and, by giving too great scope to his own thoughts, he pleased neither the Molinists nor Jansenists. He is allowed, however, to have been a man of an extensive and penetrating genius. On the 10th of June 1658, the congregation of the Index Expurgatorius at Rome condemned some treatises of Thomas Anglus. The doctors of Douay censured also 22 propositions extracted from his Sacred Institutions. He published his *Supplicatio postulativa justitiæ*, in opposition to their censure; wherein he complains that they had given him a vague undetermined censure, without taxing any particular proposition. He died some time after the restoration of Charles II. but in what year is uncertain.

ANGOL, a city of Chili in South America, situated in W. Long. 78°. and S. Lat. 38°.

ANGOLA, a kingdom on the western coast of Africa, lying, according to the most probable accounts, between Lat. 8. 30. and 16. 21. South, forming a coast of upwards of 480 miles; but how far it extends from west to east, has never been exactly determined. Angola Proper is bounded on the north by the river Danda, which separates it from Congo; and on the south by the Coanza, by which it is separated from Benguela. This last, however, is now included in the kingdom of Angola, having been conquered by its monarchs, tho' it still retains the name of kingdom, and is included in the dimensions we have just now given. The air here is very hot and unwholesome, and the country mountainous; there being but few plains to be met with in it, except on the sea-coast, and between the huge ridges of mountains.

1 Originally a province of Congo.

That part of the kingdom which we have distinguished by the name of *Angola Proper*, was subject to the kings of Congo in the year 1484, when the Portuguese first discovered the country: but how long it had been so before that time, is not known; the inhabitants being utterly destitute of chronology, and have no other way of distinguishing past events but by saying they happened in such a king's reign. Neither, though Angola became a distinct kingdom since its discovery by the Portuguese, is it known with more certainty at what time that revolution happened; or whether the Portuguese were not concerned in assisting the viceroy of the king of Congo, who governed the province of Angola, to set up for himself.

2 Tradition concerning its becoming a distinct kingdom.

All accounts agree, that this kingdom was founded by one *Ngola*, or *Angola*, from whom it took its name. According to the tradition of the country, this Ngola was a smith, and the inventor of that trade, in which he had been instructed by the dæmons of the country. In consequence of this, he became exceeding rich, not in gold, silver, or shell-money, which were not at that time in use; but in corn, cattle, and fruits, which were then exchanged in traffic. The country being not long after visited by a grievous famine, Ngola generously relieved his distressed countrymen, and saved the lives of some thousands. In gratitude for this generosity, he was unanimously chosen king; and hence the smith's trade is reckoned among the royal arts of Angola.

3 More authentic account.

According to other accounts which can be more depended upon, Ngola was the king of Congo's viceroy; who, having become powerful by the reduction of several of the neighbouring states, was induced to set up for himself. Dreading, nevertheless, the power of his old master, he chose to send him the usual tribute and presents annually, till he reckoned himself firmly seated on the throne, and had secured it to his descendents. His measures were greatly facilitated by the wars which the king of Congo was then engaged in with the *Giagas*, a barbarous nation in the neighbourhood. These made such a powerful inroad into his dominions, that he was glad to ask assistance from Ngola; not as a subject, but

Angola. as a friend and ally. This was readily granted; and the two monarchs continued ever after sending presents and assistance to each other, and encouraging a mutual commerce between their subjects.

4 Ngola the first king. Ngola lived to a great age, highly respected by his subjects, and in alliance with the king of Congo and the Portuguese, whose numerous settlements on the coast had made them become very powerful. According to the custom of the country, he had many wives and concubines. By his chief favourite he had three daughters, *Zunda Riangola*, *Tumba Riangola*, and another whose name is unknown. Towards the latter part of his life, the king's chief care was to secure the crown to the eldest of these; for which purpose he consulted his beloved queen, who encouraged him in the design with all the eloquence in her power. By her advice, he sent for his lieutenant-general; a favourite slave, whom he had created viceroy over the whole kingdom, to acquaint him with his resolution. The artful minister did not fail to applaud his design, though his intention was to defraud the princess, and seize the throne for himself. He accordingly took the opportunity, one day, when that princess and the whole court were employed in sowing their lands, to spread a report that the Angolic enemies had entered the kingdom, and were destroying every thing with fire and sword. In this confusion, the treacherous viceroy conducted the three princesses to the royal palace; and acquainting Ngola with the pretended danger, urged him

5 Murdered by his prime minister, who seizes the throne. to betake himself to a speedy flight. The frighted monarch, unable to stir with age, desired his minister to take the most proper means for his safety: whereupon, being a stout young fellow, he takes his majesty on his back, and carries him into a neighbouring wood; where he no sooner had him in a convenient place, than he stabbed him with a dagger. This stratagem was too shallow to remain long concealed; the murderer was quickly discovered, and many of the nobles rose in arms against him; but finding his party too strong to be opposed, they were at last obliged to submit, and suffer him quietly to ascend the throne, upon his publicly declaring that he had not seized it but with a view of securing it to the princess Zunda Riangola.

To this princess, the usurper palliated his conduct in the best manner he could; and she had art enough to disguise her resentment so effectually, that he never

6 Death of the usurper, who is succeeded by Zunda Riangola. discovered the smallest occasion for jealousy. At last, his sudden death gave Zunda an opportunity of ascending the throne peaceably; when she behaved with such moderation and justice, as to gain the love and affection of all her subjects. Her jealous temper prevented her from marrying; and, by giving too much way to it, she came at last to dread as rivals the two sons of her younger sister Tumba, and to form designs against their life. To accomplish her purposes, she ordered them to be brought to court, pretending to have them educated under her own eye. This was declined for some time; but at length the queen prevailed so far as to have the eldest sent to her; whom she no

7 Murders her nephew. sooner got into her power, than she caused him to be massacred, with all his attendants; only one escaping, all covered with wounds, to carry the dreadful news to the princess and her husband.

On hearing of this bloody act, the afflicted parents immediately sallied forth at the head of all their vassals. They were waited for by Queen Zunda at the head of a numerous army; but, no sooner did her soldiers perceive the parents of the deceased prince, than they immediately abandoned the queen to their resentment.

8 Is herself murdered by her sister. Tumba immediately rushed upon her sister, and stabbed her to the heart; after which, she commanded her entrails to be taken out, and thrown into the hole in which her son's body had been cast. Upon this Tumba was crowned queen of Angola, and invited her husband to participate with her in the management of public affairs. This offer he was too wise to accept; and Tumba, upon his refusal, resigned the crown into the hands of her surviving son, named *Angola Chilvagni*. He proved a great and wise prince, extending his dominions by conquest, and gaining the love of his subjects by the moderation and equity of his government. He was succeeded by one of his younger sons, named *Dambi Angola*; who no sooner ascended the throne,

9 Dambi Angola a cruel tyrant. than he put all his brethren to death, lest they should unite in favour of the eldest. The rest of his reign proved conformable to such a beginning. He was a monster of cruelty, avarice, lewdness, and perfidy. Death, however, in a short time, happily delivered his subjects from this tyrant; who, notwithstanding his infamous life, was buried with the greatest magnificence; and a mount was erected over his grave, consisting, according to the custom of the country, of a prodigious nnmber of human victims which had been sacrificed to his ghost. Dambi Angola was succeeded by Ngola Chilivagni, a warlike and cruel prince. He

10 Ngola Chilivagni; his conquests. conquered many nations, and made the most dreadful inroads into the kingdom of Congo, along the rivers of Danda, Lucalla, Zanda, and Coanza; whose waters were often tinged with the blood of thousands whom he massacred in his excursions. Notwithstanding these butcheries, Ngola Chilivagni showed such generosity to those who readily submitted to him, that he was sure to conquer, not only wherever he came, but wherever he seemed to direct his forces. At last, as if weary of conquest, he planted a tree on the banks of the Coanza, about eight leagues from Loanda San Paulo, as a boundary to his ravages. This tree the Portuguese called *Isanda*, or *Isandaura*; and afterwards erected a fortress near it.

11 Fancies himself a god. The same folly and insolence which took place in the breast of Alexander the Great, on account of his rapid conquests, soon puffed up the mind of this petty African tyrant. Because he had conquered and ravaged some of the neighbouring countries, and brought under his subjection a few cowardly barbarians; he first fancied himself invincible, and then that he was a god. He demanded the same respect and adoration that was paid to their other deities; and with this demand his subjects were servile enough to comply. This pretended deity, however, was forced to submit to the fate of other mortals, and died without leaving a successor behind him.

On the decease of Ngola Chilivagni, the states elected Ngingha-Angola-Chilombo-Kickasanda, great-nephew to queen Tumba's husband, as his successor. He proved such a rapacious and cruel tyrant, that his subjects universally wished for his death; which, luckily for them, soon happened. He was interred with the usual pomp and solemnities, particularly that of having a whole hecatomb of human victims sacrificed upon his grave.

Angola.

grave. His son Bandi Angola, who succeeded him, proved yet a greater tyrant than his father; so that he soon became intolerable to his subjects. A general revolt ensued, in which his subjects called in the cannibal Giagas to their assistance. They immediately poured in like a band of hungry dogs hastening to feed upon a carcase; and having defeated and devoured the forces of the tyrant, besieged him in an inaccessible mountain; where not being able to come at him, they resolved to reduce him by famine. Bandi Angola applied to the king of Congo for assistance. As it was the interest of that prince to hinder the ravenous Giagas from entering into the Angolic dominions, whence they could so easily pass into his own, he did not hesitate at granting his request; and ordered a strong reinforcement of the Portuguese, of whose valour he had a high opinion, and of whom he entertained a great number at his court, to march to the assistance of the king of Angola. The command of the army was given to one of the most experienced Portuguese officers; who, depending more on the handful of Europeans he had under his command than on the Congoese, attacked the rebels, though greatly superior in number; and, having utterly defeated them, restored the king of Angola to his throne.

12 Revolt against Bandi Angola.

13 Quelled by the assistance of the king of Congo and the Portuguese.

This essential piece of service so endeared the Portuguese to Bandi Angola, that he took them into his service, and even into his council. Their general became a great favourite of the king, but much more so of his daughter, who conceived a violent passion for him Unfortunately for them both, the amour was carried on with so little precaution on her part, that the king quickly discovered it; and immediately formed a resolution of exterminating the Portuguese all at once. Such violent measures, however, could not be concerted so privately but the princess got some intelligence of it; and having apprised her lover of the danger, he immediately withdrew into Congo, taking with him as many of his countrymen as he conveniently could. The king of Congo expressed such strong resentment against Bandi Angola for his ingratitude, that the Portuguese general would have probably prevailed upon him to declare war against Angola, had he not been obliged to defend his own dominions against a neighbouring prince who then made an invasion. This afforded that general a fair pretence of asking leave to return home; promising to come with such reinforcements as would enable the king of Congo to revenge himself for the affront put upon him by the Angolic monarch. His real intention, however, was, to give the king of Portugal an opportunity of seizing upon the kingdom of Angola.

14 The king's daughter falls in love with the Portuguese general;

15 Who retires to Congo.

On his return to Lisbon, the Portuguese general having laid his plan before the king, it was so well relished, that an armament was ordered to be fitted out, well furnished with every necessary for building fortresses, &c. and a sufficent number of men. The wind proving favourable all the way back, the Portuguese soon arrived safe at Loando San Paulo; whence the general dispatched a messenger to acquaint the king of Congo with his arrival, and to make him some rich presents. These were no sooner gone than the admiral sailed up the Coanza; and, landing without opposition in the kingdom of Angola, set about erecting a fortress in a convenient situation, which was completed in a few days.

16 Lays a plan for the conquest of Angola before the king of Portugal.

The king being informed of the return of the Portuguese, and of their fortifying themselves on advantageous ground, gathered together a numerous army: but his forces though upwards of 100,000 in number, were utterly defeated by the Portuguese; vast numbers killed, and many more carried into slavery. The admiral now ravaged the whole country, putting all to fire and sword, and making himself master of every advantageous spot of ground. The king, however, had still the good luck to escape all the stratagems that were laid for him; and once more got safe to his inaccessible fortress.

17 Defeats the Angolans.

All this time Bandi Angola had himself tyrannized, and allowed his favourites to tyrannize, in such a manner, that his subjects were become no less weary of his government than when they formerly revolted. Being now exasperated beyond measure at the calamitous war of which he had been the occasion, they formed a design of putting an end to his life; and in order to draw him out of his retreat, where he wallowed in all manner of debauchery, they had recourse to the following stratagem: A deputation was sent, acquainting him with the revolt of one Cuculo Cabazzo; who, at the head of a numerous band, committed the most cruel ravages. They besought his majesty either to levy a sufficient number of troops, and march in person against him, or to allow them to arm themselves against him. The credulous king complied with this last proposal; and granted them leave to raise what forces might be thought necessary. Four days after, notice was sent to the king, that his subjects had attacked the rebels, and had been repulsed with loss; but that, if his majesty would but condescend to animate them with his presence, the sight of him would inspire them with such courage, that they would assuredly prove victorious. This had the desired effect; and the king set out a few days after, without any other precaution than his own guards, to head his army which was encamped on the banks of the Lucalla. He no sooner appeared in view, than all the chief officers came out to meet him; and having under pretence of paying their respects, gradually separated him from his guards, they fell upon him and dispatched him at once.

18 Bandi Angola murdered.

Bandi Angola was succeeded by his son Ngola Bandi, whose mother had been a slave; and whose title to the crown was consequently disputable, according to the laws of the country. Of this the new king being well apprised, thought proper to begin his reign by murdering every person who had opposed his election. He began with the *Tendula*, or commander of the king's rear-guard; who, by his office, is the chief of the electors, and the person who governs the kingdom during the interregnum. Him he ordered to be put to death, with all his family. These were followed by the principal officers of his father's court; all his concubines, together with their parents and near relations, whom he caused to be butchered; together with his half-brother. his father's son by a favourite concubine, and then but an infant. He did not spare even the son of his sister Zingha Bandi, whom she had by one of her paramours. The interest of his sister had contributed greatly to raise this tyrant to the throne; and his ingratitude

19 Cruelty of the new king.

Angola. gratitude, with the murder of her son, so exasperated her, that she swore to be revenged on him in the same way.

20 Makes war on the Portuguese and is reduced to great distress. The Portuguese were the next objects of his resentment. These he so much dreaded on account of their valour and policy, that he immediately declared war, resolving not to lay down his arms till he had exterminated them to the last man, or driven them totally out of his dominions. His rashness, however, cost him dear. Myriads of the Angolic poltroons were overthrown by an handful of Portuguese; and the king himself was forced to fly, first into the island of Chiconda in the river Coanza, and then into the desarts of Oacco. Here his conquerors, out of great clemency, allowed him to live among the wild beasts, without any other sustenance than what the desarts afforded. He had the misfortune also to lose his queen and two sisters Cambi and Fungi, who were taken prisoners by the Portuguese, but honourably treated.

The king being informed of this, sent an embassy to treat of their ransom and an exchange of prisoners. The proposal was readily agreed to; and the princesses were sent back, laden with presents. The king,

21 His treachery. however, refused to perform his part of the agreement, and thereby plunged himself into still greater difficulties. A new Portuguese viceroy being arrived about this time, Ngola was quite at a loss how to excuse the non-performance of his part of the treaty. At last

22 Sends his sister Zingha on an embassy. he had recourse to his exasperated sister Zingha; and having excused, as well as he could, the murder of her son, proposed to send her on a splendid embassy to the viceroy. Having consented, but without forgetting her resentment, she set out, as plenipotentiary for the king of Angola, with a magnificent retinue, was received with all the honour due to her rank, and lodged in a splendid palace prepared for her.

23 Her haughty behaviour. At the first audience Zingha had of Don John (the Portuguese viceroy), she was greatly surprized to find a stately elbow-chair prepared for him to sit upon, and for herself only a rich tapestry spread on the floor, with a velvet cushion embroidered with gold, and placed over against the chair of state. Dissembling her displeasure however, she beckoned to one of the ladies of her retinue, commanded her to lay herself down on her elbows and knees upon the carpet, and sat herself upon her back during the whole time of the audience. She behaved with such address and dignity, as to gain the admiration of the whole council. A proposal was made of entering into an alliance offensive and defensive with the king of Angola, provided he acknowledged himself the vassal of the king of Portugal, and submitted to pay a yearly tribute. To this Zingha replied, that such conditions were indeed fit to be imposed upon those who had been conquered by the sword; but not upon a great and powerful monarch, who only sought their friendship and alliance: upon which the treaty was concluded on both sides, without any other conditions than the exchange of prisoners. The audience being over, Don John took notice to Zingha, as he conducted her out of the hall, that the lady who had served her as a seat, continued still in the same posture; upon which she replied, That it did not become the ambassadress of a great monarch to make use of the same chair twice, so she looked upon her as a piece of cast-off goods not worthy of further notice.

Zingha was so taken with the honours done her by the Portuguese, and so intent upon observing the order, dress, arms, &c. of their troops, that she staid at Loando a considerable time; during which she was instructed in the Christian religion, and consented to be baptized. Don John and his spouse were her sponsors; who dismissed her soon after, with all possible honours, and highly satisfied with her reception and success. At her return she took care to have the articles ratified by her brother; who expressed his approbation of them, and the highest obligations to her. He even went so far as to desire the viceroy to send him some proper persons to instruct him in the Christian religion, which he said he was very desirous of embracing. This request was immediately granted; and Don Denis de Faria, a negro priest, a native of Angola, was dispatched, along with an officer of distinction, to stand godfather to the king. These met at first with a gracious reception; but when they come to talk of baptism, Ngola altered his tone, and told him it was too much below his dignity to receive it from the son of one of his slaves, and sent them both back. This was cried up by the courtiers as a princely act: but Zingha represented that it could not fail to exasperate the viceroy; and tried all possible means to dissuade him from it, but in vain. He suffered, however, his other two sisters, Cambi and Fungi, to be baptized; which was performed in 1625, with a splendor suited to their dignity. Angola. 24 Embraces the Christian religion.

As no experience seems to have been a sufficient antidote against the innate folly of Ngola Bandi, he soon after took it into his head to make war on the Portuguese and invaded some of their territories. This last action proved his ruin: his troops were all cut off, and himself forced to swim for his life to a small island in the Coanza, about a mile long, and two bow-shots in breadth; whither the Portuguese pursued and surrounded him, so that he had no other chance, but either to fall into their hands, or be devoured by the wild beasts with which the place swarmed. From both these dangers he was relieved by a dose of poison, given him, as was supposed by his sister Zingha. Before this time, however, he had taken care to send his eldest son to the country of the Giagas, and put him under the care of one of their chiefs called *Giaga Caza*, whom he besought to take care of him and protect him from his aunt Zingha, as he rightly imagined she would not fail of attempting his life, in order to secure herself on the throne. 25 War again declared against the Portuguese 26 The king poisoned.

Zingha Bandi was crowned queen of Angola, without opposition, in 1627—She was a very artful woman, endowed with great presence of mind, firm in her resolutions, of an intrepid courage, and a great mistress in the art of dissimulation. She inherited a large share of her brother's jealous and cruel temper, to which she would not hesitate to sacrifice her nearest relations, if they gave her the least umbrage.—To this jealousy therefore she resolved to sacrifice her nephew, as well knowing he had a better title to the crown than herself. She made use of the most solemn oaths to draw him out of the hands of his guardian, protesting that she had accepted of the throne with no other view than to preserve it for him. But Giaga, being well acquainted with her temper, was proof against all her oaths and fair speeches—Zingha, finding this method ineffectual, pretended 27 Zingha Bandi crowned queen.

Angola.

pretended a desire of resigning the crown to her nephew; to which she said she had no other objection, than that she was afraid he was yet incapable of assuming the reins of government. She therefore desired an interview with him, though ever so short that she might satisfy herself in this particular, and promised to detain him no longer than Giaga should think necessary. Giaga thought there could be no danger in consenting to a short interview; and therefore sent the unfortunate

28 She murders her nephew.

prince to her, attended by a magnificent retinue. The cruel queen no sooner got him in her power, than she murdered him with her own hand, and caused his body to be thrown into the Coanza, ridding herself, by that inhuman act, of a formidable rival, as well as revenging herself on her brother, as she had sworn to do, for the murder of her son.

Zingha's next scheme was to rid herself of the Portuguese, who had established themselves in such a manner as to be almost entire masters of the country. They had built fortresses on every convenient spot that suited them, especially near her principal towns, which they could level with the ground with the greatest ease. They had engrossed all her commerce, were become very wealthy, and their numbers increased daily; so that they were dreaded not only by her subjects, but by all the neighbouring nations. As Zingha was of a

29 Declares war against the Portuguese.

martial temper, she did not long hesitate. She quickly made all necessary provisions, strengthened herself by alliances with the Giagas, and other idolatrous nations, and even with the Dutch and the king of Congo, With this combined force she attacked the Portuguese so suddenly and unexpectedly, that she gained some advantages over them; and the Dutch made themselves masters of San Paulo de Loando, and soon after of some of the best provinces in the kingdom. This happened in the year 1641; and the Portuguese did not recover these places till the year 1648, when the Dutch were entirely driven out of Angola.

30 Her bad success.

Zingha's successes proved still more short-lived. Her allies the Congoese were so completely overthrown, that they were forced to sue for peace; which the Portuguese did not grant till they had obtained a sufficient number of hostages, and obliged the Congoese to deliver up to them some considerable posts, upon which they immediately erected fortresses. Zingha's troops were now defeated in every battle; and these defeats followed one another so close, that she was soon abandoned, not only by her allies, but by her own troops. She was now constrained to abandon her dominions, and retire to some of the eastern deserts, whether the Portuguese did not think it worth while to follow her.

Zingha being reduced to such distress, the Portuguese, after giving her some time to ruminate on her situation, sent her proposals of peace, upon condition that she should become tributary to the crown of

31 Refuses to become tributary to them.

Portugal. This proposal was rejected with scorn; and she let them know, that, however her dastardly subjects might submissively and shamefully behave towards them, their queen disdained subjection to any foreign power. On this haughty answer, the Portuguese, to mortify

32 They set up a king.

her still more, set up a king in her place. The person they pitched upon was named *Angola Oarij*, or *Aaru*, who was of the royal family. Before he was crowned, the Portuguese obliged him to turn Christian; and he was accordingly baptized by the name of John. The new king, however, soon died of grief, at seeing himself so hardly treated by his new masters the Portuguese, they quickly set up another, named *Philip;* who bore the yoke with more patience, and lived to the year 1660.

Angola.

33 Zingha's apostacy and horrid barbarity.

In the mean time Zingha, exasperated at seeing herself deprived of eleven of the best provinces in her dominions, and her authority in the remaining six greatly weakened, renounced the Christian religion, and embraced all the horrid and bloody customs of the Giagas, whom she outdid even in their own barbarity.—We have already hinted the barbarity of this nation in eating human flesh. In this Zingha not only joined them, but took pleasure in devouring the raw flesh of human victims, and drinking their blood while warm, both at her sacrifices and at her public meals.—She affected a martial and heroic spirit, together with an utter aversion to the male sex; but, according to the Portuguese, maintained a number of the strongest and lustiest youths, in whose embraces she gave a full scope to her inclinations, and managed matters with such secrecy that her intrigues could never be discovered. At the same time she ordered many of her own sex to be ripped up, when their incontinency was manifested by their pregnancy; and their bodies, with those of the infants, to be cast to wild beasts.

But what made her most admired, as well as dreaded, by her subjects, was a notion that she had by various stratagems inculcated upon them, of her being able to penetrate into the most secret thoughts. To keep up this apprehension, she ordered the bones of her deceased brother to be brought from the island where he was poisoned, locked up in a chest covered with coarse plates of silver, and laid on a fine carpet upon a pedestal. A number of singhillos or priests were ordered to offer sacrifices to these bones, and to keep lamps continually burning before them. To this place she herself frequently repaired, to assist at those rites, which, as she gave out, and every body believed, engaged the spirit of the deceased to inform her of every thing that was done, said, or even designed, either in the kingdom or out of it.—To procure, however, as much real intelligence as possible, she kept vast numbers of spies all over the kingdom, who constantly gave her notice of what happened in their respective circles; and this she so cunningly improved to her own ends, that her subjects looked upon her as a kind of deity from whom nothing could be concealed.

34 Her influence over the Giagas.

By such means as these, Zingha gained such authority over the Giagas, that they were ready, at the very first indication of her will, to follow her through the most dreadful dangers, and to engage in the most desperate enterprizes. She now made many strenuous and daring efforts to drive out the Portuguese; but though she had, in all probability, more valour and skill than her enemies, the fire-arms gave them such an advantage, that she was always defeated with great loss. Perceiving therefore the folly of attempts of this kind, she contented herself with making continual inroads into their country, carrying off or destroying every thing that fell in her way. Though she spared nei-

35 Her terrible ravages.

ther Europeans, nor blacks who were subjects of the mock-monarchs set up by the Portuguese, yet the case of the former were peculiarly dreadful when they happened to be taken prisoners. They were either roasted

by

Angola.

by a slow fire, or had their flesh cut off in pieces, and devoured before their faces, in the manner related by Mr Bruce of the Abyssinian oxen *. In this manner she infested the Portuguese territories for 28 years, scarce ever allowing them a moment's cessation of arms. Their mock-kings were often obliged to shelter themselves from her fury in an inaccessible rock called *Maopongo;* and they themselves could never hope to enjoy their dominions with any kind of peace so long as this furious queen continued alive. They in vain exhausted all their politics either to reduce her by force, or to mollify her by presents and fair offers. The one she rejected with disdain, and always found means to baffle the other. Nor would she hearken to any terms, unless they consented to resign all their conquests. The refusal of this demand was so commonly followed by some marks of her resentment, that it was with the utmost difficulty the Portuguese could prevail on any body to carry their proposals to her; and as for Zingha she disdained to make any to them, except those of the hostile kind. The terror of her arms procured her a free passage wherever she directed her course; all the inhabitants of the province making no less haste to abandon, than she to invade it. Thus she continued to advance, till at length she was got so far as the small island of Dangii in the river Coanza. The Portuguese now found themselves under a necessity of raising an army of negroes, in order to drive her out of it. Accordingly they surrounded the island, and intrenched themselves along the banks on both sides of the river; but while they were busy at their work, Zingha attacked them with such advantage, that she killed and wounded several hundreds of the blacks, and some of the white men. Elated with this advantage, she was preparing for another attack; when she perceived, to her surprise, that the Portuguese had drawn their lines so close, and raised them to such a height, that they overlooked her whole camp, and could fire upon her naked soldiers as if they shot at a mark.—Thus great numbers of her men were cut off, particularly her chief officers. The queen, now perceiving the danger of her situation, amused the Portuguese with proposals of an accommodation; and having obtained a truce for three days, crossed the river in the dead of the night, and led her forces to the province of Oacco. The next morning, the Portuguese, seeing no human creature upon the island, began to apprehend some new stratagem; but, upon landing some of their troops, they perceived themselves over-reached, and deprived of the fairest opportunity they ever had of forcing her to surrender at discretion.

* See *Abyssinia*.

36 Outwits the Portuguese.

Zingha staid no longer in the province whither she had retired, than till she was assured that the Portuguese were retired from the Coanza; and then, crossing that river once more marched directly towards the kingdom of Metamba, which had been invaded by some of the neighbouring princes. The speed with which she led her forces thither, and recruited her army with multitudes of Giagas, who were all emulous of fighting under her banners, quickly enabled her to recover some of her territories in that kingdom. Beginning now to think herself successful, she again attacked the Portuguese; but was defeated with great loss, so as to be obliged to send for fresh troops. To complete her misfortune, she received news that the Giaga Cassangi had taken the advantage of her absence, to enter the kingdom of Metamba with a numerous army, had carried off the greatest part of the inhabitants, destroyed all the fruits of the earth, plundered the towns of all that was valuable, and set fire to the rest, leaving that kingdom in a manner desolate. To add to all this, her troops, exasperated at the loss of their wives, children, and goods, which were carried to the farthest corner of Benguela, were all on the point of revolting.

37 Her complicated misfortunes

Notwithstanding these disasters, Zingha behaved with such resolution and address, that the Portuguese, who, according to character, had probably instigated the Giaga against her, were so much afraid of her joing with him in alliance against them, that they dispatched one Anthony Coglio, a learned priest, and an excellent negociator, with Don Gaspar Borgia, an eminent officer, under pretence of negociating a peace between them, first to the Giaga, and afterwards to the queen. They met with a very civil reception from the first, who told them he was very willing to live at peace with that princess, and even to let her enjoy the kingdom of Metamba, though he was the rightful heir to it, provided she would lay down her arms. This answer encouraged the priest to try whether he could prevail on him to embrace the Christian religion; but this was declined by the Giaga in such strong terms, that the priest thought proper to desist, and set out for Zingha's camp. 38

38 The Portuguese send an embassy to her

The ambassadors, at their first arrival, met with such a polite reception, as made them hope for success: but after she had heard their proposals, she assumed a haughty threatening tone; and told them, in the conclusion of her speech, "That it did not become her dignity to lay down her arms, till she had brought the war she had begun, to an honourable conclusion: that as to the Giagas, whose sect she had embraced some years before, and who had furnished her with such a prodigious number of forces to fight in her defence, her honour and interest required that she should still keep them in her service, and under her protection: and lastly, that as to herself, she remembered, indeed, that she had formerly embraced Christianity; but that it was not now a proper season to propose her returning to it, and they ought to remember that they themselves were the cause of her abandoning it." 39

39 Their proposals rejected.

Borgia, perceiving that she was not to be wrought upon by religious motives, shifted the topic; and told her, that she had gained honour enough in war, and that it was now high time to think of granting peace and tranquillity to the subjects of two such powerful kingdoms, and accept of the favour and friendship of the king of Portugal. which was offered her by his viceroy. To this the queen made answer, that she was perfectly well acquainted with the valour and strength of the Portuguese, and should esteem it an honour to be allied to that monarch; but that she thought it just that their respective claims to the dominions which she justly inherited from her ancestors, and of which he had unjustly deprived her, should first of all be decided, either by the sword or by some equitable judges.

Borgia, vainly imagining that he had now obtained enough, set off immediately for Loanda San Paulo; but left the priest, on some pretence or other, to see whether, in the time of sickness, he could make any im-

Angola.

impreſſion on the inflexible mind of Zingha, who now laboured under a lingering diſeaſe. Coglio, however, found all his arts to no purpoſe; and, upon the queen's recovery, ſhe recommenced the war with more fury than ever.

40 Zingha's narrow eſcape.

For ſome time hoſtilities were carried on with various ſucceſs; Zingha being ſometimes victorious and ſometimes defeated. In one attempt of the latter kind, before the fortreſs of Maſſangana, ſhe not only loſt a great number of men, but had her two ſiſters Cambi and Fungi taken priſoners, ſhe herſelf eſcaping with the utmoſt difficulty. Exaſperated by this loſs, ſhe led her troops into ſome of the beſt provinces of the Portugueſe, and reduced them to a mere wilderneſs. Still, however, ſhe had the mortification to find her loſſes vaſtly greater than what ſhe gained; and had now the additional misfortune of loſing her ſiſter Fungi, who was put to death by the Portugueſe for treachery, and ſeeing her allies the Dutch totally expelled out of Angola.

41 Begins to relent;

Zingha being thus oppreſſed with a complication of misfortunes, and conſcious of the crimes ſhe had committed, began ſeriouſly to conſider whether ſuch a continued ſeries of diſaſters was not owing to the diſpleaſure of the God of the Chriſtians. To this opinion ſhe ſeemed to have inclined; and therefore began to treat with more lenity ſuch Chriſtians as fell into her hands, eſpecially if they happened to be prieſts or monks. To theſe ſhe now began to liſten with ſome attention; and ordered them, under ſevere penalties, to be treated with all poſſible reſpect; yet without loſing in the leaſt that invincible hatred ſhe had conceived againſt thoſe who had ſtripped her of her dominions, or dropping her reſolution never to make peace till ſhe had recovered them.

The viceroy, Don Salvador Correa, who had driven out the Dutch, being appriſed of the regard ſhown to the clergy by Queen Zingha, thought proper to ſend ſome capuchins to her, in hopes that they might now find her more tractable. But Zingha was ſtill proof againſt their utmoſt art; obſerving, however, that if they would conſent to reſtore what they had unjuſtly taken from her, ſhe would not only return to the Chriſtian religion, but encourage it to the utmoſt of her power.

42 But ſtill reſiſts the artifices of the Portugueſe

The viceroy, being now afraid that Zingha might make an alliance againſt him with the king of Congo, firſt raiſed a powerful army, and then acquainted that monarch, that, if he deſigned to prevent the total ruin of his dominions, he muſt immediately make reparation for all the damage he had cauſed to the Portugueſe by his alliance with the Dutch. The fame of the Portugueſe valour ſo intimidated the king, that he ſubmitted to a treaty almoſt on the viceroy's own terms; and as ſoon as this treaty was concluded, Don Ruy Pegado, an old experienced officer, was diſpatched to Zingha, offering a firm and laſting alliance with her, provided ſhe renounced the Giagan ſect, and returned to the boſom of the church. To this embaſſy ſhe returned the old anſwer, namely, that the Portugueſe themſelves had been the occaſion of all that had happened; as they had not only ſtripped her of her hereditary dominions, but dared to proclaim one of her vaſſals king of Angola; but, provided theſe dominions were reſtored, ſhe would immediately embrace Chriſtianity.

All this time the furious Queen Zingha went on with her ravages, notwithſtanding the viceroy kept plying her with letters for near three years. At laſt he had recourſe to the artifice of taking advantage of the remorſe for her crimes with which Zingha was ſometimes affected, in order to procure the peaceable enjoyment of his own ill-gotten conqueſts.

Angola. 43 Their infamous conduct.

It is eaſy to ſee, that had this viceroy, or the prieſts he employed, really intended to convert Zingha to Chriſtianity, they ought to have ſo far ſet her an example as at leaſt to abandon part of the countries of which they had robbed her: But, inſtead of this, they impiouſly made uſe of the ſacred name of our Saviour, in order to deter a poor ſavage African from recovering what juſtly belonged to her.

Queen Zingha, at laſt, came to incline ſo much to return to the Chriſtian religion, that a general murmur ran through her army. But having, by various artifices reconciled the minds of her ſubjects to this event, ſhe explained her deſign in a ſet ſpeech; offering at the ſame time liberty to thoſe who choſe to abandon her on this account to go where they would; and ſuch was their attachment to her, that even in ſuch a ſudden and important change in her reſolutions they expreſſed no uneaſineſs, but on the contrary applauded her to the higheſt degree. 44 She returns to Chriſtianity.

The Portugueſe, after having been harraſſed in a terrible manner for 28 years, and at laſt obliged to profane the name of their Saviour to procure a peace, began now freely to enjoy the fruits of their villany. A treaty was ſet on foot between the viceroy and Zingha; which, however, was not eaſily concluded. She demanded the releaſe of her ſiſter Cambi, whoſe Chriſtian name was Donna Barbara; and the Portugueſe demanded a ranſom of 200 ſlaves, or an equivalent in money. This Zingha did not well reliſh; and, being preſſed to a compliance, threatened them with a more furious war than any they had yet experienced. Upon this the viceroy was obliged to have recourſe to the uſual method of ſending prieſts to perſuade her to comply through motives of religion. Theſe hypocrites effected their purpoſe; and the ſlaves were ſent, as if Chriſtianity required the delivering up innocent people to thoſe who had no lawful authority over them: but not being able to conclude a laſting peace about the ceſſion of the Angolic provinces, they were forced to conclude a ſhort truce, and ſent back her ſiſter. 45 Treaty with the Portugueſe propoſed.

This princeſs was received by Zingha in a very affectionate manner: and ſome time after, the queen, her mind being probably weakened through the infirmity of old age, not only was thoroughly reconciled to the Portugueſe, but looking upon them as her beſt friends. She encouraged the Chriſtian religion; had a church built in her capital; made ſeveral laws againſt Paganiſm; and, *to encourage marriage*, ſhe herſelf wedded a handſome young fellow in the 75th year of her age.

The Portugueſe now imagining they would at laſt gain their point, propoſed to her the following terms, as the baſis of a laſting treaty between the two nations. 1. "That they ſhould yield to her, *as a preſent*, ſome of the countries of which they had already robbed her. 2. That, in conſideration of the ſaid preſent, which ſhould in noways be interpreted as an inveſtiture, the queen ſhould pay yearly a certain acknowledgment to the 46 The Portugueſe terms.

the king of Portugal, who ſhould be at liberty to withdraw the ſaid preſent whenever ſhe failed of making the ſaid acknowledgment. 3. That a free commerce ſhould be opened between thoſe two ſtates, as well for ſlaves as for other merchandizes. 4. That the queen ſhould moleſt none of the lords that were feudatory to the Portugueſe, whatever damages and ravages they might have committed during the late wars between them. 5. That ſhe ſhould reſtore all the Portugueſe ſlaves that had taken refuge in her dominions. 6. That ſhe ſhould deliver up the Giaga Colanda, who had revolted from the Portugueſe, upon condition that his crime ſhould go unpuniſhed."

The queen, having now a thorough view of the deep-rooted villany of thoſe with whom ſhe had to do, conceived ſuch diſpleaſure againſt the Portugueſe, that ſhe fell ſick. During this ſickneſs, father Anthony, her chief confident, and a creature of the viceroy, never left off ſoliciting her to make her peace with God, and to accept of the terms offered her by the Portugueſe: but Zingha, though worn out with age and ſickneſs, had ſtill the good ſenſe to perceive, that there was no connection between making her peace with God and complying with ſuch infamous terms; and therefore gave the following anſwer, which, under ſuch circumſtances, ſhows a magnanimity ſcarce equalled in any
47 The Queen's noble anſwer.
age or in any country. 1. "That as to her converſion, as it was neither owing to any deſire of obtaining a peace, or other worldly motives, but the Divine Grace by which ſhe was recalled, ſhe was reſolved to perſevere in it to her laſt breath. 2. That as to her going over to the Giagan ſect, ſhe had in a great meaſure been forced to it by the Portugueſe viceroy. 3. That the king of Portugal would do a generous act in reſtoring ſome of her Angolic dominions; but it would be more ſo, were he to reſtore them all. 4. That as to her paying homage to him, neither her mind nor heart were baſe enough to conſent to it; and that as ſhe had refuſed the propoſal while ſhe lived among the Giagas, much more did ſhe think herſelf above it now ſhe was a Chriſtian queen, and owed neither tribute nor homage to any but to the Supreme Power, from whom ſhe had received both her being and her kingdom: That, nevertheleſs, if ſhe could be convinced that there was any thing in her dominions that would be acceptable to his Portugueſe majeſty, ſhe would voluntarily make him a preſent of it; and as to the reſt of the articles, ſuch was her deſire of making a firm and laſting peace with them, that ſhe ſhould make no difficulty of conſenting to them."

This anſwer was not altogether ſatisfactory to the viceroy; but the prieſt, finding it impoſſible to make
48 Articles of the treaty.
any impreſſion upon her mind, eaſily prevailed upon him to conſent to the following terms. 1. "That the river Lucalla ſhould be the boundary between the dominions of the Portugueſe and of Queen Zingha. 2. That neither ſide ſhould thenceforth give any reception to the fugitive ſlaves of the other, but ſend them back without any delay, together with the priſoners which had been taken during the laſt war. 3. That the queen ſhould remain wholly free and exempt from all tribute and homage whatever, provided ſhe agreed to the other articles."

49 The peace ſigned.
Theſe terms were at laſt ſigned by the queen and viceroy in the month of April 1657, and ratified by the king of Portugal in the month of November the ſame year.—The only difficulty the queen had concerning this treaty was with regard to the Giaga Colanda: and the manner in which ſhe extricated herſelf from it, with her ſubſequent behaviour, cannot fail to give us an high idea of the mental abilities of this African heroine.

50 Zingha's honourable behaviour.
This Giagan chief, weary of the Portugueſe yoke, had retired from them, at the head of 1000 ſtout ſoldiers, and a much greater number of ſlaves, ſome leagues beyond the river Lucalla, and put himſelf under the queen's protection. This ſhe readily granted, as he was very able to be ſerviceable to her in caſe the perfidious conduct of the Portugueſe ſhould oblige her to renew the war. She could not therefore but look upon it as unjuſt and diſhonourable, to deliver up a brave chief who had devoted himſelf to her ſervice, and whom ſhe had taken under her ſpecial protection, to a nation with whoſe perfidy ſhe was ſo well acquainted. To ſave her honour, therefore, ſome time before the ratification of the treaty, ſhe ſent privately for the Giaga, and acquainted him with the demand of the Portugueſe; telling him, at the ſame time, that though ſhe doubted not of the viceroy's keeping his word, and forgiving his offence, yet ſhe adviſed him to go out of her dominions, and ſettle himſelf and his men in ſome diſtant country from the Portugueſe frontiers; but forbad him, on pain of her higheſt diſpleaſure, to commit the leaſt outrage or hoſtility within their dominions.

The Giaga thanked her majeſty, and ſeemed to acquieſce with her advice, but did not follow it. On the contrary, he had no ſooner reached his fortreſs, than he ſet himſelf about fortifying it in ſuch a manner as looked rather like defiance than defence; and, having gathered a conſiderable army, ſoon ſpread a general terror around him. Of this the Portugueſe failed not to complain to the queen; who immediately marched
51 Defeats and kills the Giaga Colanda.
againſt him, ſurpriſed and defeated his army; and he himſelf being killed in the action, his head was cut off and ſent to the Portugueſe.

This was among the laſt memorable actions performed by this famous queen; who, now finding herſelf unfit for the fatigues of war, contented herſelf (in 1658) with diſpatching an old experienced general againſt a neighbouring prince who had invaded her territories. He proved no leſs ſucceſsful than herſelf, and quickly
52 Encourages Chriſtianity.
forced the aggreſſor to ſubmit to her terms. She now gave herſelf up to ſtudy the beſt method of propagating Chriſtianity among her ſubjects; and for this purpoſe ſent a ſolemn embaſſy to Rome, to pay homage to the Pope in her name, and to requeſt a freſh ſupply of miſſionaries. To this letter ſhe received an anſwer from his Holineſs in 1662; and it was read in the church, that ſame year, in the moſt public and ſolemn manner. The day appointed was the 15th of July; on which ſhe repaired to the church at the head of a numerous retinue, and having the letter hanging about her neck in a purſe made of cloth of gold. The concourſe was ſo great, that the church could not contain one half of the people, ſo that none were admitted but perſons of rank. The father having finiſhed the maſs, read the letter at the altar in the Portugueſe language; and the ſecretary interpreted it in that of the country. The queen, who had ſtood all the while it was reading, went towards the

Angola.

53 Ceremonies at receiving a letter from the Pope.

the altar, and on her knees received it from the father: and having kiſſed it, and ſworn afreſh upon the goſpel to continue in obedience to the church of Rome, kiſſed the letter again, put it into the purſe, and returned to the palace amidſt the ſhouts and acclamations of many thouſands of her ſubjects. On that day ſhe gave a magnificent treat to the Portugueſe reſident, and to all her court, in two great porticos, and ſhe herſelf vouchſafed to eat after the European manner; that is, ſitting on a ſtately elbow chair, with a high table before her, covered with the fineſt linen, and with diſhes, plates, knives, and forks, all of ſilver gilt. She beſtowed ſome largeſſes upon her chief officers, releaſed a good number of ſlaves, and at night appeared at the head of her ladies of honour, both ſhe and they dreſſed in the Amazonian manner. They performed a kind of combat, in which the queen, though upwards of eighty years of age, behaved with the great vigour and activity of a woman of thirty.

54 Zingha dies.

Her life, however, was not lengthened in proportion to her vigour and activity: for in the month of September ſhe was ſeized with an inflammation in her throat; which, in December, having ſeized her breaſt and lungs, ſhe expired on the 7th of that month, and was ſucceeded by her ſiſter Barbara.

55 Succeeded by her ſiſter Barbara.

The deceaſed queen was buried with extraordinary pomp; and, out of regard to her, Barbara was inaugurated a ſecond and third time, with the greateſt pomp, and the moſt joyful acclamations.—She was a very zealous chriſtian, but wanted her ſiſter's abilities, and had the misfortune to be in the decline of life, lame, and almoſt blind. Beſides this, ſhe had been married to a proud ill-natured huſband, named Mona Zingha; who, though to her he owed all his fortune and advancement, being himſelf no more than the ſon of a ſlave, uſed her with ſuch cruelty, even in the late queen's life, that ſhe was obliged to take refuge in the palace, from whence he had the inſolence immediately to fetch her. This ſo exaſperated queen Zingha, that ſhe had well nigh ordered him to be cut in pieces before her face; but pardoned him at the requeſt of father Anthony, who probably knew he was privy to ſome religious ſecrets, which he might, in a caſe of ſuch emergency, have diſcloſed. On Barbara's acceſſion to the throne, however, he not only redoubled his cruelty to her, in hopes of getting the management of affairs entirely into his own hands, but invented accuſations againſt Anthony himſelf, with a deſign to extirpate both him and his religion. He gave out that the late queen had been poiſoned by ſome favourite European diſhes, with which brother Ignatio uſed to regale her during her laſt illneſs; and attributed his wife's lameneſs and blindneſs to ſome ſorceries or charms uſed by the convent againſt her. He had even perſuaded, or rather forced, his queen to conſent that ſome of the ſinghillos or prieſts ſhould be brought to countercharm her diſtemper.

56 Cruelty of her huſband Mona Zingha to her.

57 He accuſes Father Anthony.

58 Who reprimands the queen.

Father Anthony, far from being intimidated at the accuſations brought againſt him, repaired immediately to the palace; where he boldly reprimanded the queen for giving ear to theſe jugglers, threatening at the ſame time to leave her dominions, and carry off with him all the croſſes and other religious utenſils, from which alone they could have any benefit. The queen returned a very ſubmiſſive anſwer; and promiſed to deliver up the counter-charms which ſhe at that time had upon her, before ſunſet; which ſhe accordingly did, and ſent them to the convent by the hands of her ſecretary. This ſo exaſperated her huſband, and all the Giaga ſect, that they reſolved upon the deſtruction of all the prieſts and Europeans, and even the queen herſelf. This, however, was found improper to be attempted; and Mona Zingha was ſo much chagrined at his diſappointment, that he retired to his own eſtate; giving out, that he deſigned no more to meddle with ſtate-affairs; but, in reality, to concert meaſures for engroſſing the ſovereignty to himſelf, and to deprive his wife of her life and crown.

Angola.

To accompliſh his purpoſe, he ſent a meſſenger to her, deſiring her to repair to his houſe, where he had ſomething of importance to communicate; but ſhe declining the invitation by the advice of father Anthony, he found himſelf diſappointed, and begged leave to retire to a neighbouring province, which was under his government. He was again diſappointed, and forbid to ſtir out of the province of Metamba. The queen was, however, guilty of an error not long after, in ſending Mona Zingha at the head of an army to quell a revolt on the frontiers. On his returning victorious, he thought himſelf ſtrong enough to revive the ancient Giagan rites, and therefore ordered 100 ſlaves to be ſacrificed to the manes of the deceaſed queen. Though the queen was immediately appriſed of his intention, and diſpatched a meſſenger expreſsly commanding him to deſiſt; yet Mona, by diſtributing ſome preſents, particularly ſome European wines among the counſellors, effected his purpoſe with impunity. He did not forget to ſend ſome of his wine to father Anthony: but to prevent ſuſpicion, preſented him only with a ſmall quantity, to be uſed, as he ſaid, at the maſs; adding, that if it proved agreeable, he would ſupply him with a larger quantity. The unſuſpecting prieſt drank about two glaſſes of it; and in about a quarter of an hour was ſeized with violent convulſions in his bowels, and other ſymptoms of being poiſoned. By proper aſſiſtance, however he recovered; yet ſo far was he diſabled by this doſe, that he was obliged to abandon his miſſion.

59 Mona Zingha revives the Gigan rites;

60 And poiſons Father Anthony,

The queen's infirmities in the mean time daily increaſing, Mona Zingha was ſoon delivered from all further oppoſition on her part, by her death, which happened on the 24th of March 1666. Upon this, Mona Zingha made all poſſible haſte to get himſelf elected king; and immediately renounced the Chriſtian religion, raiſing a perſecution at the ſame time againſt its profeſſors. He even wrote to the Portugueſe viceroy, acquainting him with his having renounced Chriſtianity, which he had only embraced out of complaiſance to his queen, and with his deſign to revive the Giagan rites. To ſhow that he meant to be as good as his word, he ordered all the children under ſix years of age, that could be found, to be ſacrificed in honour of their infernal deities. He alſo recalled the ſinghillos, and heaped many favours upon them; ſo that they became entirely devoted to his purpoſes. He likewiſe cauſed many of his ſubjects to be privately poiſoned; and then gave out, that their unaccountable deaths were owing to their having abandoned the religion of their anceſtors, and embraced Chriſtianity; which he ſtyled the religion of a parcel of famiſhed ſtrangers, who through their extreme miſery, had been forced to leave their native country,

61 The Queen dies.

62 Cruelties of Mona Zingha.

Angola. try and seek for a livelihood in the richest provinces of Africa.

By these and such like stratagems he almost entirely extirpated Christianity, and any appearances of civilization which had been introduced among his subjects. His career, however, was stopped by Don John the princess Barbara's first husband, from whom she had been divorced on account of his having another wife. He soon compelled the usurper to fly into an island in the Coanza; but not having the precaution to reduce him entirely, Mona Zingha found means to retrieve his affairs, and at last found means to kill Don John himself, by which he became master of the throne without any further opposition. He was no sooner re-established, than he began to pursue his butcheries with more fury than ever: when, on a sudden, Don Francisco, the son of Don John, appeared at the head of an army in opposition to the usurper; and in the first engagement Mona Zingha being defeated and killed, Don Francisco became sole master of the empire.

63 He is defeated and killed.

It is not known whether this prince kept to the terms of the alliance made by Queen Zingha with the Portuguese or not.—These, however, have preserved their conquests, and for some time they allowed the natives to choose a king for themselves, or rather they chose him for them, as we have already noticed. These kings enjoyed only a mere shadow of royalty; their whole grandeur consisting in being allowed to breed peacocks, and adorn themselves with their feathers, which was forbidden to their subjects under pain of perpetual slavery. The last of these kings was named Ngola Sedesio, who, disliking an empty name of royalty, revolted from the Portuguese, and carried on a long war with them; but being at last defeated and killed, his head was cut off, salted, and sent to Lisbon in pickle. After this the Portuguese seem not to have thought it safe to trust their Angolic subjects even with the name of a king of their own, but have vested the power entirely in their viceroy; but as to the extent of his dominions, and how matters stand between him and that race of Angolic princes who have preserved their liberty, we are entirely in the dark.

64 Low state of the kings set up by the Portuguese

Division into provinces.

When in its greatest splendor, the kingdom of Angola contained the 17 following provinces: Chessama, Sumbi, Benguela, Rimba, Sietta, High and Low Bembea, Temba, Oacco, Cabezzo, Lubolo, Loanda, Bengo, Danda, Mosiche, Higher and Lower Ilamba, Oraij, and Embacca,. The provinces conquered by the Portuguese during the wars abovementioned were, Danda, Mosiche, Bengo, the Higher and Lower Ilamba, Oraij, Embacca, Benguela, Sietta, Cabezzo, Lubolo, and Oacco.

Rivers.

The principal rivers are those already mentioned, viz. The Danda and Coanza. The Coanza is large, deep, and rapid. It empties itself into the Atlantic ocean about Latitude 9° 20' S. twelve leagues south of Loando the capital of the kingdom. It is navigable for 150 miles, and abounds with variety of fish. It forms several islands, has some cataracts,, and one in particular which bears its name. As for its source, and the length of ground it crosses from east to west before it comes to the Portuguese settlement, it is absolutely unknown, as well as the countries through which it runs. Its mouth, which runs between the capes Palmerino and Lego, is above a league wide; the northern shore is the deepest, and along which the vessels sail. The fall of this river into the ocean is so rapid, that the sea appears quite muddy for two or three leagues below it. Its mouth is not easily perceived from the open sea, by reason of an island quite covered with high trees which lies just before it. The two principal islands formed by this river are called *Massander* and *Motchiamia*. The one is six leagues long, and about two miles broad: it is very fertile in maize, millet, and some other grains, which are reaped at three different seasons of the year. It produces likewise vast quantities of Manhioc, a root, of which they make a coarse kind of meal, which serves instead of bread. Here also grow great numbers of palm and other fruit trees of various kinds. The island of Motchiamia is four or five miles long, and one in breadth, mostly plain, and producing variety of roots and herbs. It likewise abounds in cattle; and there were formerly five or six Portuguese families settled upon it, who drove a considerable trade in these commodities, and likewise in slaves.

Angola ‖ Angoumois.

Concerning the river Danda we know little or nothing: only, that though its mouth is not above 70 or 80 miles distant from that of the Coanza, yet their distance grows so considerably wider as you penetrate further into the inlands, as to be much above twice if not thrice that space; though how much, is not exactly known.

The manners, religion, and dress, &c. of the inhabitants, are much the same with the Congoese. See CONGO.

ANGOLA Pea, or *Pigeon-Pea*. See CYTISUS.

ANGON, in the ancient military art, a kind of javelin used by the French. They darted it at a considerable distance. The iron head of this weapon resembled a flower-de-luce. It is the opinion of some writers, that the arms of France are not flowers-de-luce, but the iron point of the angon or javelin of the ancient French.

ANGOR, among ancient physicians, a concentration of the natural heat; the consequence of which is a pain of the head, palpitation, and sadness.

ANGOT, a province or kingdom of Abyssinia, formerly rich and fertile, but almost ruined by the Gallas, a wandering nation in the internal parts of Africa, who dispossessed the Abyssinian monarchs of all that was worth possessing.

ANGOULESME, a city of France, the capital of the duchy of Angoumois, and see of a bishop. It is seated on the top of a hill, surrounded with rocks, at the foot of which runs the river Charante. The inhabitants are said to be about 8000, and to drive a considerable trade in paper, which is their manufacture. E. L. 0. 10. N. Lat. 45. 39.

ANGOUMOIS, a province of France, bounded on the north by Poitou, on the east by Limousin, and March, on the south by Perigord, and on the west by Saintonge. Through this province run the rivers Touvre and Charante. This last is full of excellent fish; and though it often overflows its banks, it is so far from doing any damage, that it greatly enriches the soil. The Touvre is full of trouts. The air is generally warmer than at Paris, though the country is hilly. The

soil

soil produces plenty of wheat, rye, oats, Spanish corn, saffron, grapes, and all sorts of fruit. Here are several iron mines, which yield a very good sort of iron.

ANGOURA, Angra, or Angori, a city of Asia, in Anatolia, formerly called *Ancyra*, and still full of remarkable antiquities, which are so many marks of its ancient magnificence. It is at present one of the best cities in Anatolia; its streets are full of pillars and old marbles, among which are some of porphyry and jasper. The greater part of the pillars are smooth and cylindrical; some are channelled spirally; but the most singular are oval, with plate bands before and behind from the top to the bottom of the pedestal. The houses are now made of clay, which is sometimes intermixed with fine pieces of marble. The walls of the city are low, with very mean battlements. The masonry of the walls is intermixed with pillars, architraves, capitals, and other ancient fragments, especially that of the towers and gates. The castle of Angora has a triple inclosure; and the walls are of large pieces of white marble, and a stone much like porphyry.

The basha of Angora has about 30 purses income; and there are here about 300 janisaries, under the command of a sardar. The Turks are said to be 40,000, the Armenians 4000 or 5000, and the Greeks 600. The Armenians have seven churches, besides a monastery; and the Greeks two. They breed the finest goats in the world; and their hair which is of a dazzling white, is almost as fine as silk, and nine inches in length: it is worked into very fine stuffs, particularly camblet. All the inhabitants are employed in this manufacture. Several large caravans pass through this city to different places. E. Long. 32. 5. N. Lat. 39. 30. See Ancyra.

ANGOY, a kingdom of Loango in Africa, bounded on the north by Cacongo, and on the south by Congo; from the former of which it is separated by the river Cabinda, and from the latter by the river Zaire. It is but of small extent; being only a vassal province of Cacongo, till the mani or prince, who had married a Portuguese's daughter, was persuaded by his father-in-law to make himself independent. This he effected at a favourable juncture, the king of Loango having but just before revolted from the king of Congo, and the king of Cacongo from the new king of Loango. The country is full of woods and thickets; and has no towns of any note, except one called Bomangoy, situated on the north banks of the Zaire, and not far from its mouth. Its chief port is Cubinda, called also Kabenda, or Cubenda, situated on the mouth of a river of the same name about five leagues north of Cape Palmerino, on the north side of the Zaire's mouth. The bay is very commodious for trade, or wooding and watering along the shore. It is flat and marshy in some places; but ascends gradually about three miles inland, and then forms itself into a ridge of hill. On the ascent of these is situated a town belonging to the father-in-law of the king above mentioned, where he constantly kept a stock of wood ready cut, to sell to foreign ships at an easy rate. From these wood-piles, south-west along the bay, lie scattered a number of fishermen's huts, on each side a small fresh water river which falls into the bay; and thence all the water for ships is brought in casks to the mouth of the river, which is so shallow, that even at full flood it can only be entered by a yawl carrying a cask or two. The town stands on the round point of the bay looking to the westward; and the English have a factory on the south-west of the road.

The country round the bay is mostly barren; owing chiefly to the laziness of the inhabitants, which often occasions a scarcity of provisions. The wild beasts swarm so in the woods, that they destroy all the tame kinds; so there are no cattle bred here but hogs. From the woods in this county some monkeys have been brought away, which in shape and stature resembled the human species. Civet-cats abound here in great plenty, and parrots may be bought for three or four ordinary knives. The coasts abound so with oysters, that the sailors quickly load their boats with them; they being found lying in great heaps like small rocks. The natives follow the occupation of fishing more than any other. They fish both on the sea and in the rivers, making use of drag-nets, which have long canes fixed at equal distances, instead of corks, to show when any fish is caught. These nets are made of a peculiar kind of root, which, after being beaten, may be spun like hemp.

The dress of the inhabitants is the same with that of the Congoese. They allow polygamy, and the best beloved wife hath the command of the rest; but is no less liable to be turned out, if she proves unfaithful. The ladies of the blood-royal have the privilege of choosing their husbands out of any, even the meanest rank; and even the power of life and death over them; as likewise over their paramours, if any of them are caught tripping: but the husbands are by no means entitled to expect the same fidelity from their royal ladies. Women of the lower rank are obliged, when they receive a stranger, to admit them for a night or two into their embraces. This obliged the missionaries, who travelled through this country, to give notice of their approach to any of their houses, that none of the female sex might enter within their doors.—Their religion consists chiefly in a variety of superstitious customs; such as powdering their public and domestic idols with the dust of a kind of red wood, on the first day of the moon, and paying a kind of worship to that planet. If, on that night, it happens to shine clear and bright, they cry out, "Thus may I renew my life as thou dost;" but if the air is cloudy, they imagine the moon hath lost her virtue, and pay her no respect. We do not hear of their offering any sacrifices to their idols; though they commonly consult them about the success of their enterprises, thefts, or such like. The king of Congo still styles himself sovereign of Angoy; but the king of this little state pays neither tribute nor homage to any foreign power.

ANGRA, a city of Tercera one of the Azores; the capital, not only of that island, but of all the rest, and the residence of the governor. It is seated on the south side, near the middle of the longest diameter of the island, on the edge of the sea. The harbour is the only tolerable one in the whole island, being equally secured against storms and the efforts of an enemy. It is of the form of a crescent; the extremes of which are defended by two high rocks, that run so far into the sea as to render the entrance narrow, and easily covered by the batteries on each side. From this harbour the town is said to be derive its name, the word *Angra* ſignifying a creek, bay, or ſtation for ſhipping; and this is the only convenient one among all the Azores. The opening of the port is from the eaſt to the ſouth-weſt; and, according to Frezier, it is not above four cables-length in breadth, and not two of good bottom. Here ſhips may ride in great ſafety during the ſummer; but as ſoon as the winter begins, the ſtorms are ſo furious, that the only ſafety for ſhipping is the putting to ſea with all poſſible expedition. Happily, however, theſe ſtorms are preceded by infallible ſigns, with which experience has made the inhabitants perfectly well acquainted. On theſe occaſions the Pico, a high mountain in another of Azores, is overcaſt with thick clouds, and grows exceedingly dark; but what they look upon as the moſt certain ſign is the fluttering and chirping of flocks of birds round the city for ſome days before the ſtorm begins.

The town is well-built and populous, is the ſee of a biſhop, under the juriſdiction of the archbiſhop of Liſbon. It hath five pariſhes, a cathedral, four monaſteries, as many nunneries, beſides an inquiſition and biſhop's court, which extends its juriſdiction over all the Azores, Flores, and Corvo. It is ſurrounded by a good wall, a dry ditch of great depth and breadth, and defended by a ſtrong caſtle rendered famous by the impriſonment of king Alphonſo by his brother Peter in 1668. Though moſt of the public and private buildings have a good appearance externally, they are but indifferently furniſhed within; but for this poverty the Portugueſe excuſe themſelves, by ſaying, that too much furniture would prove inconvenient in ſo warm a climate.

At Angra are kept the royal magazines for anchors, cables, ſails, and other ſtores for the royal navy, or occaſionally for merchantmen in great diſtreſs. All maritime affairs are under the inſpection of an officer called *Deſembergrador*, who hath ſubordinate officers and pilots for conducting ſhips into the harbour, or to proper watering-places. The Engliſh, French, and Dutch, have each a conſul reſiding here, though the commerce of any of theſe nations with the Azores is very inconſiderable.

ANGRIVARII, (Tacitus); a people of Germany, ſituated between the Weſer and the Ems, and eaſtward reaching beyond the Weſer, as far as the Cheruſci, on which ſide they raiſed a rampart (Tacitus); to the ſouth, having the Tubantes on the Ems, and on the Weſer where it bends to the foreſt Bacemis; to the weſt, the Ems and the confines of the Bructeri; and to the north, the territory of the Angrivarii lay between the Chamavi and Anſibarii. Ptolemy places them between the Cauchi and Suevi or Catti. Suppoſed now to contain a part of the country of Schaumburg, the half of the biſhopric or principality of Minden: to the ſouth, the greateſt part of the biſhopric of Oſnabrug, the north part of the country of Teclenburg, and a part of the country of Ravenſberg. A trace of the name of the people ſtill remains in the appellation *Engern*, a ſmall town in the county of Ravenſberg.

ANGUILLA, one of the Weſt-India or Carribbee iſlands, lying in about 15° N. Lat. It has its name from its ſnake-like form; and is about ten leagues in length and three in breadth. It was firſt diſcovered by the Engliſh in 1650, when it was filled with alligators and other noxious animals; but they, finding the ſoil fruitful, and proper for raiſing tobacco and corn, ſettled a colony on it, and imported live cattle, which have ſince multiplied exceedingly. But the colony not being ſettled under any public encouragement, each planter laboured for himſelf, and the iſland became a prey to every rapacious invader, which diſheartened the inhabitants ſo much that all induſtry was loſt among them. Their chief ſuffering was from a party of wild Iriſh, who landed here after the Revolution, and treated them worſe than any of the French pirates who had attacked them before. The people of Barbadoes, and other Engliſh Carribbees, knowing the value of the ſoil, ſeveral of them removed to Anguilla, where they remained for many years, and even carried on a profitable trade, though without any government either civil or eccleſiaſtical. In 1745, their militia, though not exceeding 100 men, defended a breaſtwork againſt 1000 French who came to attack them, and at laſt obliged them to retire with the loſs of 150 men, beſides carrying off ſome of their arms and colours as trophies of their victory. Since that time the inhabitants have ſubſiſted moſtly by farming; though they ſtill plant ſugar, and the iſland is ſaid to be capable of great improvements.

ANGUINA. See TRICOSANTHES.

ANGUILLIFORM, an appellation given by zoologiſts, not only to the different ſpecies of eels, but to other animals reſembling them in ſhape.

ANGUINUM OVUM, a fabulous kind of egg, ſaid to be produced by the ſaliva of a cluſter of ſerpents, and poſſeſſed of certain magical virtues. The ſuperſtition in reſpect to theſe was very prevalent among the ancient Britons, and there ſtill remains a ſtrong tradition of it in Wales. The account Pliny* gives of it is as follows: "Præterea eſt ovorum genus in magna "Galliarum fama, omiſſum Græcis. Angues innumeri "æſtate convoluti, ſalivis faucium corporumque ſpumis "artifici complexu glomerantur; anguinum appellatur. "Druidæ ſibilis id dicunt in ſublime jactari, ſagoque "oportere intercipi, ne tellurem attingat: profugere "raptorum equo: ſerpentes enim inſequi, donec arce-"antur amnis alicujus interventu."—Of which the following may ſerve as a tranſlation: (from *Maſon's Caractacus*; the perſon ſpeaking, a Druid.)

* Lib. xix. c. 3.

But tell me yet
From the grot of charms and ſpells,
Where the matron ſiſter dwells,
Brennus, has thy holy hand
Safely brought the Druid wand,
And the potent *Adder-ſtone*,
Gender'd 'fore the autumnal moon?
When, in undulating twine,
The foaming ſnakes prolific join;
When they hiſs, and when they bear
Their wond'rous egg aloof in air:
Thence before to earth it fall,
The *Druid* in his hallow'd pall,
Receives the prize,
And inſtant flies,
Follow'd by the envenom'd brood,
'Till he croſs the cryſtal flood.

This wondrous egg ſeems to be nothing more than a bead of glaſs, uſed by the Druids as a charm to impoſe on the vulgar, whom they taught to believe, that the poſſeſſor would be fortunate in all his attemps, and that it would gain him the favour of the great.

Our

Anguis.

Our modern Druideſſes (ſays Mr Pennant, from whom we extract) give much the ſame account of the *ovum anguinum, glain neidr*, as the Welſh call it, or the *adder-gem*, as the Roman philoſopher does; but ſeem not to have ſo exalted an opinion of its powers, uſing it only to aſſiſt children in cutting their teeth, or to cure the chincough, or to drive away an ague.

Theſe beads are of a very rich blue colour; ſome plain, others ſtreaked. For their figure, ſee Plate XXXIV. fig. 22. nº 1, 2, 3.

ANGUIS, or SNAKE, in zoology, a genus belonging to the order of amphibia ſerpentes. The characters of the anguis are theſe: They are ſqamous or ſcaly in the belly and under the tail; without any ſcuta.* There are 15 ſpecies of the anguis, viz. 1. The eryx, a native of Britain and likewiſe of America, is about a ſpan in length, and about the thickneſs of a man's finger. One from Aberdeenſhire, deſcribed by Mr Pennant, was 15 inches long; tongue broad and forked; noſtrils ſmall, round, and placed near the tip of the noſe; eyes lodged in oblong fiſſures above the angle of the mouth; belly of a bluiſh lead colour, marked with ſmall white ſpots irregularly diſpoſed: The reſt of the body of a greyiſh brown, with three longitudinal duſky lines; one extending from the head along the back to the point of the tail; the others broader, and extending the whole length of the ſides. It was entirely covered with ſmall ſcales; largeſt on the upper part of the head. 2. The fragilis, blind-worm, or ſlow-worm, grows to about a foot in length, and the thickneſs of a man's little finger: the irides are red; the head is ſmall; the neck ſtill more ſlender; from that part the body grows ſuddenly, and continues of an equal bulk to the tail, which ends quite blunt. The colour of the back is cinerous, marked with very ſmall lines compoſed of minute black ſpecks: the ſides are of a reddiſh caſt; the belly duſky; both marked like the back. The tongue is broad and forky; the teeth are minute, but numerous; the ſcales ſmall. The motion of this ſerpent is ſlow, from which, and from the ſmallneſs of the eyes, are derived its name. It reſembles the viper in the manner of producing its young, which are put forth alive. It frequents gardens and paſtures, where it lives principally under ground feeding on worms. Like others of the genus, they lie torpid during winter, and are ſometimes found in vaſt quantities twiſted together. 3. The ventralis, or glaſs-ſnake of Cateſby, has 127 ſquamæ on the belly, and 223 on the tail. The head is very ſmall, and the tongue of a ſingular form. The upper part of the body is of a colour blended brown and green, moſt regularly and elegantly ſpotted with yellow, the undermoſt part of which is brighteſt. The ſkin is very ſmooth; and ſhining with ſmall ſcales, more cloſely connected, and of a different ſtructure from thoſe of other ſerpents. A ſmall blow with a ſtick will cauſe the body to ſeparate, not only at the place ſtruck, but at two or three other places, the muſcles being articulated in a ſingular manner quite through to the vertebra. They appear earlier in the ſpring than any other ſerpent, and are numerous in the ſandy woods of Virginia and Carolina. They are generally ſaid to be harmleſs. 4. The jaculus, or dart-ſnake, is about three hand-breadths long, and about the thickneſs of one's little finger. Its colour is a milky grey on the back, variegated with ſmall black ſpots like ſo many eyes; and on the belly it is perfectly white. The neck is wholly black; and from that two milk-white ſtreaks run all the way along the back to the tail: the black ſpots alſo are each ſurrounded with a ſmall circle of white. It has its name from its vibrating its body in the manner of a dart. It is a native of Egypt, Libya, and the iſlands of the Mediterranean. 5. The quadrupes: The body of this ſpecies is cylindrical, with 14 or 15 longitudinal aſh-coloured ſtreaks; the teeth are extremely ſmall; it has no ears: the feet are at a great diſtance from each other, very ſhort, with five toes and ſmall nails; but the toes are ſo minute, that they can hardly be numbered: It is a native of Java. 6. The bipes, is a native of the Indies; it has two ſhort feet, with two toes, near the anus. In every ſcale of the bipes there is a brown point. 7. The meleagris, is likewiſe a native of the Indies; it has ſmall teeth, but no ears. This ſpecies has a great reſemblance to the former. 8. The colubrina, an inhabitant of Egypt, is beautifully variegated with pale and yellow colours. 9. The maculata, a native of America, is yellow, and interſperſed with aſh-coloured lines on the back: the head is ſmall in proportion to the body. 10. The reticulata, a native of America, has browniſh ſcales, with a white margin. 11. The ceraſtes, with 200 ſqamæ on the belly and 15 on the tail, is a native of Egypt. 12. The lumbricalis, a native of America, has 230 ſquamæ on the belly and 7 on the tail; its colour is a yellowiſh white. 13. The platura: The head is oblong and without teeth; the body is about a foot and a half long, black above and white below; the tail is about one-ninth of the length of the animal, much compreſſed or flatted, and variegated with black and white; the ſcales are roundiſh, ſmall, not imbricated, but they cannot be numbered. 14. The laticauda, a native of Surinam: the tail is compreſſed, acute, pale, with browniſh belts. 15. The ſcytale, a native of the Indies, with 220 ſquamæ on the belly and 13 on the tail. The head is ſmall and oval, and the eyes are little; the body is cylindrical, about a foot and a half long, covered with oval obtuſe ſcales: the tail is thick and obtuſe like the head; its colour is white, interſperſed with browniſh rings; the margins of the ſcales are of an iron colour; and the top of the head is blue.—According to Linnæus, none of this genus are poiſonous.

* See Plates XVII. and XXXI.

Anguis. Anguria.

ANGURIA, the WATER-MELON: A genus of the diandria order, belonging to the monœcia claſs of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The eſſential characters are theſe: the *male* calyx is quinquefid, and the corolla quinquepetalous: The *female* calyx and corolla the ſame: The pericarpium is a pome beneath, with two cells: The ſeeds are numerous.

Species. Of this genus, Linnæus reckons three ſpecies, the trilobata, pedata, and trifoliata. The fruit is cultivated in Spain, Portugal, Italy, and other warm countries of Europe; as alſo in Africa, Aſia, and America; where it is eſteemed on account of its wholeſome cooling quality.

Culture. To have this fruit good, ſome ſeeds muſt be procured of three or four years old; new ſeeds being apt to produce vigorous plants, which are ſeldom ſo fruitful as thoſe of a moderate ſtrength. Theſe are to be ſown in the hot-bed for early cucumbers. Some new dung is to be prepared in the beginning of February, which ſhould be thrown into a heap to heat, as is practiſed for early cucumbers. The bed is then to be made in the ſame manner as for the muſk-melon, covering the dung about five inches thick with loamy earth; but as theſe plants require much more room than either cucumbers or common melons, there ſhould be but one plant put into a three-light frame. A hill of the ſame loamy earth ſhould therefore be raiſed a foot and a half high, in the middle light of each frame; into which, when the bed is of a proper temper for heat, the plants ſhould be carefully planted, obſerving to water and ſhade them until they have taken good root. As to other particulars, their management differs very little from that of the muſk-melon: only they muſt frequently have freſh air admitted to them; and, when the nights are cold, the glaſſes muſt be covered with mats to keep the beds warm.

ANGUS, a diſtrict of the country of FORFAR, in Scotland. It was an earldom belonging to the Douglaſes, now extinct.

ANGUSTICLAVIA, in Roman antiquity, a tunica embroidered with little purple ſtuds. It was worn by the Roman knights, as the laticlavia was by the ſenators.

ANHALT, an iſland of Denmark, in North Jutland, lying in the Categut, eight miles from the coaſt of Jutland, ten from Zealand, and ſeven from Holland. It is dangerous for ſeamen, for which reaſon there is a light-houſe.

ANHALT, a principality of Germany, in the circle of Upper Saxony, is a long narrow tract, ſituated for the moſt part betwixt the rivers Elbe and Saal, about 90 miles in length from eaſt to weſt, but of unequal breadth, the greateſt being on the eaſt ſide, which is but 35 miles. The houſe of Anhalt, from whence the electors of Saxony and Brandenburg are ſaid to derive their original, is a very ancient and honourable family. The beſt genealogiſts deduce their origin from Berenthobaldus, who made war upon the Thuringians in the ſixth century: it has produced many princes who make a great figure in the German hiſtory. Joachim Erneſt, who died in 1586, left five ſons, who divided the principality among them. All of them having children, and being of equal authority, they unanimouſly agreed to ſubmit to the eldeſt of the family, who has the ſupreme government, which is *Anhalt-Deſſau*. The others are, *Anhalt-Bernburg*, *Anhalt-Schaumburg*, *Anhalt-Coethen*, and *Anhalt-Zerbſt*. The Saxons acknowledge that the inhabitants of theſe little independent ſovereignties live in the land of milk and honey. Theſe petty princes poſſeſs lands ſufficient for their expences, the revenues being reckoned about half a million of dollars. The tax on lands is four *per cent.* which, rating them at 20 years purchaſe, is not quite one ſhilling in the pound. Upon an emergency the ſubjects are able to raiſe half a million extraordinary. The towns in theſe little ſtates are not ſo numerous in proportion to the extent of country as in Saxony, but better peopled. It is bounded on the S. by the country of Mansfield, on the W. by the duchy of Halberſtadt, on the E. by the duchy of Saxony, and on the N. by the duchy of Magdeburg. It abounds in corn, and is watered by the Salde and Mulda; its principal trade is in beer.

ANHELATIO, or ANHELITUS, among phyſicians, a ſhortneſs of breath.

ANIAN, the name of a ſtrait formerly ſuppoſed to lie between the north-eaſt of Aſia and the north-weſt of America; but now found to exiſt only in imagination.

ANIAN is alſo the name of a barren ſandy deſart lying on the eaſt coaſt of Africa. It is ſo exceſſively hot and otherwiſe inhoſpitable, that it contains but very few inhabitants, except ſome wandering Arabs who live in camps.

ANIELLO, or MASSANIELLO. See Hiſtory of NAPLES.

ANJENGO, a ſmall town and factory, with a fort, on the coaſt of Malabar, in the peninſula on this ſide the Ganges, belonging to the Engliſh Eaſt-India Company. The fort is ſmall, but neat and ſtrong; it is a ſquare with four baſtions, having eight guns mounted on each, carrying a ball of 18 pounds. Two of theſe baſtions face the ſea, the other two the country. Beſides theſe, there is a line of 18 or 20 guns pointing towards the ſea, of 18 and 24 pounders. About a piſtol-ſhot from the back of the fort runs a river, which, beſides being a ſecurity to the factory, adds much to the agreeable ſituation of the place. This river has its ſource in ſome diſtant mountains; and, deſcending in a courſe from the north and eaſt, it afterwards turns in ſeveral pleaſing meanders ſo far to the weſt as to waſh the bottom of the factory's garden, and at laſt winding to the ſouth, it empties itſelf into the ſea. Several beautiful ſmall iſlands too, which are waſhed by its current, diverſify the ſcenery, and greatly heighten the beauty of the proſpect. This ſettlement ſupplies the Eaſt-India Company with pepper; and its ſituation is alſo very convenient for giving proper intelligence to their Company's ſhips touching here from Europe, or from any part of India. E. Long. 76. 1. N. Lat. 7. 0.

ANIL, in botany, a ſynonime of a ſpecies of indigofera. See INDIGOFERA.

ANIMA, among divines and naturaliſts, denotes the ſoul, or principle of life, in animals. See SOUL.

ANIMA, among chemiſts, denotes the volatile or ſpirituous parts of bodies.

ANIMA Hepatis, is a name by which ſome call *ſal martis* or *ſalt of iron*, on account of its ſuppoſed efficacy in diſeaſes of the liver.

ANIMA Mundi, a certain pure ethereal ſubſtance or ſpirit, diffuſed, according to many of the ancient philoſophers, through the maſs of the world, informing, actuating, and uniting the divers parts thereof into one great, perfect, organical, and vital body or animal. Plato treats at large of the ψυχη τȣ κοσμȣ, in his *Timæus;* and is even ſuppoſed to be the author of the *dogma;* yet are interpreters much at a loſs about his meaning. Ariſtotle, however, taking it in the common and obvious ſenſe, ſtrenuouſly oppoſes it. The modern Platoniſts explain their maſter's *anima mundi* by a certain univerſal ethereal ſpirit, which in the heavens exiſts perfectly pure, as retaining its proper nature; but on earth pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it aſſumes ſomewhat of their nature, and becomes of a peculiar kind.—So the poet:

Spiritus

Spiritus intus alit, totosque infusa per artus
Mens agitat molem, et magno se corpore miscet.

They add, that this *anima mundi*, which more immediately resides in the celestial regions as its proper seat, moves and governs the heavens in such a manner, as that the heavens themselves first received their existence from the fecundity of the same spirit: for that this *anima*, being the primary source of life, every where breathed a spirit like itself, by virtue whereof various kinds of things were framed conformable to the divine ideas.

ANIMA *Saturni*, a white powder obtained by pouring distilled vinegar on litharge, of considerable use in enamelling. See ENAMEL.

ANIMADVERSION, in matters of literature, is used to signify, sometimes correction, sometimes remarks upon a book, &c. and sometimes a serious consideration upon any point.

ANIMAL, in natural history, an organized and living body, which is also endowed with sensation: thus, minerals are said to grow or increase, plants to grow and live, but animals alone to have sensation.

It is this property of sensation alone that can be deemed the essential characteristic of an animal; and by which the animal and vegetable kingdoms seem to be so essentially separated, that we cannot even imagine the least approximation of the one to the other. Those naturalists, indeed, who have supposed the distinction between animals and vegetables to consist in any thing else than what we have already mentioned, have found themselves greatly embarrassed; and have generally agreed, that it was extremely difficult, if not impossible, to settle the boundaries between the animal and vegetable kingdoms. But this difficulty will be easily seen to arise from their taking the characteristic marks of the animal kingdom, from something that was evidently common to both. Thus Boerhaave attempted to distinguish an animal from a vegetable, by the former having a mouth, which the latter has not: but here, as the mouth of an animal is only the instrument by which nourishment is conveyed to its body, it is evident that this can be no essential distinction, because vegetables also require nourishment, and have instruments proper for conveying it into their bodies; and where the end is the same, a difference in the means can never be essential. The fixing the difference in an animal's having a gula, stomach, and intestines, as is done by Dr Tyson, is as little to the purpose.

The power of moving from one place to another, hath by many been thought to constitute their difference; and indeed, in most cases, it is the obvious mark by which we distinguish an animal from a vegetable: but Lord Kames hath given several very curious instances of the locomotive power of plants; some of which, he says, would do honour to an animal.—"Upon the slightest touch, the sensitive plant shrinks back and folds up its leaves, similar to a snail; which on the slightest touch retires within its shell. A new species of the sensitive plant hath been lately discovered. See DIONÆA. If a fly perch upon one of its flower-leaves, it closes instantly, and crushes the insect to death. There is not an article in botany more admirable than a contrivance, visible in many plants, to take advantage of good weather, and to protect themselves against bad. They open and close their flowers and leaves in different circumstances: some close before sunset, some after: some open to receive rain, some close to avoid it. The petals of many flowers expand in the sun; but contract at night, or on the approach of rain. After the seeds are fecundated, the petals no longer contract. All the trefoils may serve as a barometer to the husbandman; they always contract their leaves on an impending storm. Some plants follow the sun, others turn from it. Many plants, on the sun's recess, vary the position of their leaves, which is styled the *sleep of plants*. A single plant † was lately discovered in Bengal. Its leaves are in continual motion all day long; but when night approaches, they fall down from an erect posture to rest.

† A species of the *Hedysarum*. See that article.

"A plant has a power of directing its roots for procuring food. The red whortle-berry, a low evergreen plant, grows naturally on the tops of our highest hills, among stones and gravel. This shrub was planted in an edging to a rich border, under a fruit-wall. In two or three years, it over-ran the adjoining deep-laid gravel-walk; and seemed to fly from the border, in which not a single runner appeared. An effort to come at food in a bad situation, is extremely remarkable in the following instance. Among the ruins of Newabbey, formerly a monastery in Galloway, there grows on the top of a wall a plane-tree about 20 feet high. Straitened for nourishment in that barren situation, it several years ago directed roots down the side of the wall, till they reached the ground ten feet below; and now the nourishment it afforded to those roots during the time of their descending is amply repaid, having every year since that time made vigorous shoots. From the top of the wall to the surface of the earth, these roots have not thrown out a single fibre; but are now united in a single root.

"Plants, when forced from their natural position, are endowed with a power to restore themselves. A hop-plant, twisting round a stick, directs its course from south to west, as the sun does. Untwist it, and tie it in the opposite direction: it dies. Leave it loose in the wrong direction: it recovers its natural direction in a single night. Twist a branch of a tree so as to invert its leaves, and fix it in that position: if left in any degree loose, it untwists itself gradually, till the leaves be restored to their natural position. What better can an animal do for its welfare? A root of a tree, meeting with a ditch in its progress, is laid open to the air. What follows? It alters its course like a rational being, dips into the ground, surrounds the ditch, rises on the opposite side to its wonted distance from the surface, and then proceeds in its original direction. Lay a wet sponge near a root laid open to the air; the root will direct its course to the sponge. Change the place of the sponge; the root varies its direction. Thrust a pole into the ground at a moderate distance from a scandent plant: the plant directs its course to the pole, lays hold of it, and rises on it to its natural height. A honeysuckle proceeds in its course, till it be too long for supporting its weight; and then strengthens itself by shooting into a spiral. If it meet with another plant of the same kind, they coalesce for mutual support; the one screwing to the right, the other to the left. If a honeysuckle twig meets with a dead branch, it screws from the right to the left. The claspers of briony shoot into a spiral, and lay hold of whatever comes in their way

for

for support. If, after completing a spiral of three rounds, they meet with nothing, they try again by altering their course."——

By comparing these and other instances of seeming voluntary motion in plants, with that share of life wherewith some of the inferior kinds of animals are endowed, we can scarce hesitate at ascribing the superiority to the former; that is, putting sensation out of the question. Muscles, for instance, are fixed to one place as much as plants are; nor have they any power of motion, besides that of opening and shutting their shells: and in this respect they have no superiority over the motion of the sensitive plant; nor doth their action discover more sagacity, or even so much, as the roots of the plane-tree mentioned by Lord Kames.

Mr Buffon, who seems to be desirous of confounding the animal and vegetable kingdoms, denies sensation to be any essential distinction. "Sensation (says he) more essentially distinguishes animals from vegetables: but sensation is a complex idea, and requires some explication. For if sensation implied no more than motion consequent upon a stroke or an impulse, the sensitive plant enjoys this power. But if, by sensation, we mean the faculty of perceiving and comparing ideas, it is uncertain whether brute animals are endowed with it. If it should be allowed to dogs, elephants, &c. whose actions seem to proceed from motives similar to those by which men are actuated, it must be denied to many species of animals, particularly to those which appear not to possess the faculty of progressive motion. If the sensation of an oyster, for example, differed only in degree from that of a dog; why do we not ascribe the same sensation to vegetables, though in a degree still inferior? This distinction, therefore, between the animal and vegetable, is neither sufficiently general nor determined.

"From this investigation we are led to conclude, that there is no absolute and essential distinction between the animal and vegetable kingdoms; but that nature proceeds, by imperceptible degrees, from the most perfect to the most imperfect animal, and from that to the vegetables; and the fresh-water polypus may be regarded as the last of animals and the first of plants."

It were to be wished, that philosophers would on some occasions consider, that a subject may be dark as well on account of their inability to see, as when it really affords no light. Our author boldly concludes, that there is no essential difference between a plant and an animal, because we ascribe sensation to an oyster, and none to the sensitive plant; but we ought to remember, that though we cannot perceive a distinction, it may nevertheless exist. Before Mr Buffon, therefore, had concluded in this manner, he ought to have proved that some vegetables were endowed with sensation.

It is no doubt, however, as much incumbent on those who take the contrary side of the question, to prove that vegetables are not endowed with sensation, as it was incumbent on Mr Buffon to have proved that they are. But a little attention will show us, that the difficulty here proceeds entirely from our inability to see the principle of sensation. We perceive this principle in ourselves, but no man can perceive it in another. Why then does every individual of mankind conclude that his neighbour has the same sensations with himself? It can only be from analogy. Every man perceives his neighbour formed in a a manner similar to himself; he acts in a similar manner on similar occasions, &c. Just so it is with brute animals. It is no more doubtful that they have sensations, than that we have them ourselves. If a man is wounded with a knife, for instance, he expresses a sense of pain, and endeavours to avoid a repetition of the injury. Wound a dog in the same manner, he will also express a sense of pain; and, if you offer to strike him again, will endeavour to escape, before he feels the stroke. To conclude here, that the action of the dog proceeded from a principal different from that of the man, would be absurd and unphilosophical to the last degree.

We must further take notice, that there are sensations essentially distinct from one another; and in proportion as an animal is endowed with more or fewer of these different species, it is more or less perfect as an animal: but, as long as one of them remains, it makes not the least approach to the vegetable kingdom; and, when they are all taken away, is so far from becoming a vegetable, that it is only a mass of dead matter. The senses of a perfect animal, for instance, are five in number. Take away one of them, suppose sight; he becomes then a less perfect animal, but is as unlike a vegetable as before. Suppose him next deprived of hearing: his resemblance to a vegetable would be as little as before; because a vegetable can neither feel, taste, nor smell, and we suppose him still to enjoy these three senses. Let us, lastly, suppose him endowed only with the sense of feeling, which, however, seems to include that of taste, and he is no more a vegetable than formerly, but only an imperfect animal. If this sense is then taken away, we connect him not with the vegetable kingdom, but with what Mr Buffon calls *brute-matter*. It is to this kingdom, and not to the vegetable, that animals plainly approximate as they descend. Indeed, to suppose an approximation between the vegetable and animal kingdoms, is very absurd: for, at that rate, the most imperfect animal ought to be the most perfect plant; but we observe no such thing. All animals, from the highest to the lowest, are possessed of vegetable life; and that, as far as we can perceive, in an equal degree, whether the animal-life is perfect or imperfect: nor doth there seem to be the smallest connection between the highest degree of vegetation and the lowest degree of sensation. Though all animals, therefore, are possessed of vegetable life, these two seem to be as perfectly distinct and incommensurate to one another as any two things we can possibly imagine.

The power of vegetation, for instance, is as perfect in an onion or leek, as in a dog, an elephant, or a man: and yet, though you threaten a leek or an onion ever so much, it pays no regard to your words, as a dog would do; nor, though you wound it, does it avoid a second stroke. It is this principle of self-preservation in all animals, which, being the most powerful one in their nature, is generally taken, and with very good reason, as the true characteristic of animal-life. This principle is undoubtedly a consequence of sensation; and as it is never observed to take place in vegetables, we have a right to say that the foundation of it, namely sensation, belongs not to them. There is no animal, which makes any motion in consequence of external impulse where danger is threatened, but what puts itself in a posture of defence; but no vegetable whatever

ever does so. A muscle, when it is touched, immediately shuts its shell; and as this action puts it in a state of defence, we conclude that it proceeded from the principle of self-preservation. When the sensitive plant contracts from a touch, it is no more in a state of defence than before; for whatever would have destroyed it in its expanded state, will also do it in its contracted state. We conclude, therefore, that the motion of the sensitive plant proceeds only from a certain property called by physicians *irritability*; and which, though our bodies possess it in an eminent degree, is a characteristic neither of animal nor vegetable life, but belongs to us in common with brute-matter. It is certain, that an electrified silk-thread shews a much greater variety of motions than any sensitive plant. If a bit of silk-thread is dropt on an electrified metal-plate, it immediately erects itself; spreads out the small fibres like arms; and, if not detained, will fly off. If a finger is brought near it, the thread seems greedily to catch at it. If a candle approaches, it claps close to the plate, as if afraid of it.—Why do we not conclude that the thread in this case is really afraid of the candle? For this plain reason, That its seeming flight is not to get away from the candle, but to get towards the electrified metal; and, if allowed to remain there, will suffer itself to be burnt without offering to stir.—The sensitive plant, in like manner, after it has contracted, will suffer itself to be cut in pieces, without making the least effort to escape. The case is not so with the meanest animal. An hedge-hog, when alarmed, draws its body together, and expands its prickles, thereby putting itself in a posture of defence. Throw it into water; and the same principle of self-preservation prompts it to expand its body and swim. A snail, when touched, withdraws itself into its shell: but if a little quicklime is sprinkled upon it, so that its shell is no longer a place of safety, it is thrown into agonies, and endeavours to avail itself of its locomotive power in order to escape the danger. In muscles and oysters, indeed, we cannot observe this principle of self-preservation so strongly, as nature has deprived them of the power of progressive motion: but, as we observe them constantly to use the means which nature has given them for self-preservation, we can have no reason to think that they are destitute of that principle upon which it is founded.

But there is no need of arguments drawn from the inferior creation. We ourselves are possessed both of the animal and vegetable life, and certainly must know whether there is any connection between vegetation and sensation or not.—We are conscious that we exist; that we hear, see, &c.: but of our vegetation we are absolutely inconscious. We feel a pleasure, for instance, in gratifying the calls of hunger and thirst; but of the process by which our aliment is formed into chyle, the chyle mixed with the blood, the circulation of that fluid, and the separation of all the humours from it, we are altogether ignorant. If we then, who are more perfect than other vegetables, are utterly insensible of our own vegetable life, why should we imagine that the less perfect vegetables are sensible of it?

To illustrate our reasoning here by an example.—The direction of the roots of the plane-tree mentioned by Lord Kames, shows as much sagacity, if we are to look only to the outward action, as can be observed in any motion of the most perfect animal whatever; nevertheless, we have not the least suspicion, either that the tree saw the ground at a distance, or that it was informed of its being there by the rest of its roots. If a wound is made in the body of a man, and a loss of substance is to be repaired, the same sagacity will be observed in the arrangement of the fibres, not only as if they were animated, but they will dispose of themselves seemingly with a degree of wisdom far superior to what we have any idea of; yet this is done without our having the least knowledge either how it is done, or of its being done at all. We have therefore in ourselves a demonstration, that vegetable life acts without knowing what it does: and if vegetables are ignorant of their most sagacious actions, why should we suspect that they have a sensation, let it be ever so obscure, of any of their inferior ones, such as contracting from a touch, turning towards the sun, or advancing to meet a pole?

Thus we may easily give Mr Buffon a reason why we ascribe sensation to an oyster, and none to a vegetable; namely, because we perceive the vegetable do nothing but what is also performed in our own bodies, without our having the least sensation of it; whereas an oyster puts itself in a defensive posture on the approach of danger; and this being an action similar to our own upon a like occasion, we conclude that it proceeds from the same principle of sensation. Here it may also be observed, that though the inferior animals are deficient in the number, they are by no means so in the acuteness of their sensations; on the contrary, though a muscle or an oyster is probably endowed with no other sense than that of feeling, yet this sense is so exquisite, that it will contract upon the slightest touch, such as we would be altogether insensible of.

As to that power of contractility, or iritability, which is observed in some plants; our solids have it, when deprived both of vegetable and animal life: for a muscle, cut out of a living body, will continue to contract, if it is irritated by pricking it, after it has neither sensation nor vegetation.

A very good moral reason may also be adduced why we do not believe vegetables to be endowed with sensation.—Had they been so, we must suppose them to suffer pain when they are cut or destroyed; and, if so, what an unhappy state must they be in, who have not the least power to avoid the injuries daily offered them? In fact, the goodness of the Deity is very conspicuous in not giving to vegetables the same sensations as to animals; and, as he hath given them no means of defence, though we have not been told it by himself, we might have known that he gave them for food to animals; and, in this case, to have endowed them with sensation would have been a piece of cruelty. Though animals without number prey upon one another, yet all of them have some means of defence; from whence we may justly conclude, that their mutual destruction was not an original appointment of the Creator, but what he foresaw would happen in the course of time, and which he therefore gave every one of them some means of guarding against. It may no doubt be here objected, that the giving some means of self-defence to every animal cannot be reckoned a sufficient proof that it was not the original design of the Creator that they should be destroyed, seeing these means are not always effectual for their preservation.—This objection, however, Animal.

ever, cannot be completely obviated without a solution of the question concerning the origin of evil among the works of a perfectly good Being. But whatever difficulty there may be in solving this question, it is certain, that, as some means of self-defence is given to every animal, it has been the original design of the Creator, that in all cases one species of animals should not be destroyed at the pleasure of any other species; and as no means of self-defence is given to any vegetable, it is plain that they have been destined for a prey to every species of animals that had access to them. Philosophers have insisted much on the necessity of one animal's devouring another, that there might be room sufficient for all; but this, so far from being a system worthy of the divine wisdom, seems to us to be a reflection upon it, as if the Author of nature could not have found means to preserve the life of one part of his creatures, without the destruction and misery of the rest. The sacred writings leave us at no loss to see how this carnivorous disposition came in; and, in the next world, this piece of perfection (as the sanguinary philosophers above-mentioned would have it to be) seems to be left out; for there, it is said, "They shall not hurt nor destroy; the lion shall eat straw like the ox, and there shall be no more pain."

When speaking of the food of plants, we took occasion to mention a certain power, totally different from that of attraction or repulsion, by which the food of a plant, after it was attracted, or otherwise brought to it, was assimilated to its substance. This power which we there distinguish by the name of *transmutation*, belongs in a more eminent degree to animals. The alimentary substance is changed into two kinds of matter. (1.) An excrementitious one, which passes off through the intestines; and (2.) A fluid, which is the direct pabulum of the animal. Different substances, however, are not equally changeable by this process. The human stomach is not capable of acting upon any animal substance till it has lost its vital principle: the stomachs of some animals cannot act upon creatures of their own species: some have an apparatus for grinding their food after it is swallowed, &c. and there are no animals but what are subject to death by taking certain substances into their stomach. Some substances also, though they resist the action of the stomach, and pass unchanged into the system, produce no bad effects. Thus, madder will turn the bones of animals red; rhubarb will communicate its purgative nature to the milk, and its deep yellow colour to the urine.—All these changes, however, seem to belong to the vegetative part of our system: for as every one of them are performed without our knowledge of the manner how; and not only so, but while we are absolutely unconscious of their being done; we can have no reason to suppose, that the *animal* life, properly so called, is at all connected with them, any farther than as they are at present the means of preserving the creature alive, and making the connection betwixt the principle of life and this visible creation.

The description and classing of animals make a considerable part of Natural History, known by the name of *Zoology*. See the article ZOOLOGY.

For particulars relating to different animals, their analogous structure, sagacity, instinct, peculiarities, &c. see COMPARATIVE *Anatomy*, INSTINCT, MIGRATION, AMPHIBIOUS, QUADRUPED, SINGING, ORNITHOLOGY, VIVIPAROUS, OVIPAROUS, ICHTHYOLOGY, ENTOMOLOGY, &c.

ANIMAL, used adjectively, denotes any thing belonging to, or partaking of, the nature of animals. Thus, animal actions, those that are peculiar to animals; such are sensation and muscular motion.

ANIMAL-Flower, in zoology, a name given to several species of animals belonging to the genus of ACTINIA of Linnæus. They have likewise been distinguished by the names of *Urtica Marina*, or *Sea-nettle*, from their supposed property of stinging; and *Sea-anemone*, from their claws or tentacles being disposed in regular circles, and tinged with a variety of bright lively colours, resembling the petals of some of our most beautiful flowers. As to one species particularly, mentioned by Abbé Diequemarre, (Phil. Transf. for 1773, art. 37.) the purest white, carmine, and ultramarine, are said to be scarce sufficient to express their brilliancy. The bodies of some of them are hemispherical, of others cylindrical, and of others shaped like a fig. Their substance likewise differs; some are stiff and gelatinous, others fleshy and muscular; but all of them are capable of altering their figure when they extend their bodies and claws in search of food. They are found in many of the rocky coasts of the West-India islands, and likewise on some parts of the coast of England.

They have only one opening, which is in the centre of the uppermost part of the animal; round this are placed rows of fleshy claws; this opening is the mouth of the animal, and is capable of great extension. The animals themselves, though exceedingly voracious, will bear long fasting. They may be preserved alive a whole year, or perhaps longer, in a vessel of sea-water, without any visible food; but, when food is presented, one of them will successively devour two muscles in their shells, or even swallow a whole crab as large as a hen's egg. In a day or two the crab-shell is voided at the mouth, perfectly cleared of all the meat. The muscle-shells are likewise discharged whole, with the two shells joined together, but entirely empty, so that not the least particle of fish is to be perceived on opening them. An anemone of one species will even swallow an individual of another species; but, after retaining it ten or twelve hours, will throw it up alive and uninjured. Through this opening also it produces its young ones alive, already furnished with little claws, which, as soon as they fix themselves, they begin to extend in search of food.

One of the extremities of the sea-anemone resembles, as we have said, the outward leaves of that flower; while its limbs are not unlike the shag or inner part of it. By the other extremity it fixes itself, as by a sucker, to the rocks or stones lying in the sand; but it is not totally deprived of the power of progressive motion, as it can shift its situation, though very slowly.

A particular species of animal-flowers has been found in some of the British West-India islands; and the following account of them was published by the Philosophical Transactions, vol. 75. by Mr Ellis, in a letter to Lord Hillsborough.

"This compound animal, which is of a tender fleshy substance, consists of many tubular bodies, swelling gently towards the upper part, and ending like a bulb or

Animal Flower.

or very ſmall onion; on the top of each is its mouth, ſurrounded by one or two rows of tentacles, or claws, which when contracted look like circles of beads.

"The lower part of all theſe bodies have a communication with a firm fleſhy wrinkled tube, which ſticks faſt to the rocks, and ſends forth other fleſhy tubes, which creep along them in various directions. Theſe are full of different ſizes of theſe remarkable animals, which riſe up irregularly in groups near to one another.

"This adhering tube, that ſecures them faſt to the rock, or ſhelly bottom, is worthy of our notice. The knobs that we obſerve, are formed in ſeveral parts of it by its inſinuating itſelf into the inequalities of the coral rock, or by graſping pieces of ſhells, part of which ſtill remain in it, with the fleſhy ſubſtance grown over them.

"This ſhows us the inſtinct of nature that directs theſe animals to preſerve themſelves from the violence of the waves, not unlike the anchoring of muſcles, by their fine ſilken filaments that end in ſuckers; or rather like the ſhelly baſis of the ſerpula, or worm-ſhell, the tree-oyſter, and the ſlipper barnacle, &c. whoſe baſes conform to the ſhape of whatever ſubſtance they fix themſelves to, graſping it faſt to their teſtaceous claws, to withſtand the fury of a ſtorm.

"When we view the inſide of this animal diſſected lengthwiſe, we find like a little tube leading from the mouth to the ſtomach, from whence there riſe eight wrinkled ſmall guts, in a circular order, with a yellowiſh ſoft ſubſtance in them; theſe bend over in the form of arches towards the lower part of the bulb, from whence they may be traced downwards, to the narrow part of the upright tube, till they come to the fleſhy adhering tube, where ſome of them may be perceived entering into a papilla, or the beginning of an animal of the like kind, moſt probably to convey it nouriſhment till it is provided with claws: the remaining part of theſe ſlender guts are continued on in the fleſhy tube, without doubt for the ſame purpoſe of producing and ſupporting more young ones from the ſame common parent.

"The many longitudinal fibres that we diſcover lying parallel to each other, on the inſide of the ſemitranſparent ſkin, are all inſerted in the ſeveral claws round the animal's mouth, and are plainly the tendons of the muſcles, for moving and directing the claws at the will of the animal: theſe may be likewiſe traced down to the adhering tube.

"As this ſpecimen has been preſerved in ſpirits, the colour of the animal, when living, cannot be certainly known; it is at preſent of a pale yellowiſh brown.

"With regard to its name, it may be called *Actinia ſociata*, or the *Cluſter Animal-flower.*"

The Abbé Dicquemarre, by many curious though cruel, experiments related in the Phil. Tranſ. for 1773, has ſhown that theſe animals poſſeſs, in a moſt extraordinary degree, the power of reproduction; ſo that ſcarce any thing more is neceſſary to produce as many ſea-anemonies as we pleaſe, than to cut a ſingle one into as many pieces. A ſea-anemone being cut in two by a ſection through the body, that part, where the limbs and mouth are placed, eat a piece of a muſcle offered to it ſoon after the operation, and continued to feed and grow daily for three months after. The food ſometimes paſſed through the animal; but was generally thrown up again, conſiderably changed, as in the perfect ſea-anemone. In about two months, two rows of limbs were perceived growing out of the part where the inciſion was made. On offering food to this new mouth, it was laid hold of and eat; and the limbs continually increaſing, the animal gradually became as perfect as thoſe which had never been cut. In ſome inſtances, however, he found, that, when one of theſe creatures was cut through, new limbs would be produced from the cut place, thoſe at the mouth remaining as before; ſo that a monſtrous animal was the conſequence, having two mouths, and feeding at both ends. Having put ſome of them into a pan of water, ſet over a ſlow fire, he found that they loſt their life at 50 degrees of Reamur's thermometer. To avoid the imputation of cruelty in theſe experiments, the author argues the favourable conſequences that have attended his operations on the ſea-anemonies which have been ſo fortunate as to fall into his hands; as he hath not only multiplied their exiſtence, but alſo renewed their youth; which laſt, he adds, "is ſurely no ſmall advantage."

Animal-Flower.

In Hughes's Natural Hiſtory of Barbadoes an account is alſo given of ſeveral ſpecies of animal-flowers. They are there deſcribed as only found in a baſon in one particular cave; and of the moſt remarkable ſpecies mentioned by him we have the following deſcription.

"In the middle of the baſon, there is a fixed ſtone, or rock, which is always under water. Round its ſides, at different depths, ſeldom exceeding 18 inches, are ſeen, at all times of the year, iſſuing out of little holes, certain ſubſtances that have the appearance of fine radiated flowers, of a pale yellow, or a bright ſtraw colour, ſlightly tinged with green, having a circular border of thick-ſet petals, about the ſize of, and much reſembling thoſe of a ſingle garden-marigold, except that the whole of this ſeeming flower is narrower at the diſcus, or ſetting on of the leaves, than any flower of that kind.

"I have attempted to pluck one of theſe from the rock, to which they are always fixed; but never could effect it: for as ſoon as my fingers came within two or three inches of it, it would immediately contract cloſe together its yellow border, and ſhrink back into the hole of the rock; but if left undiſturbed for about four minutes, it would come gradually in ſight, expanding, though at firſt very cautiouſly, its ſeeming leaves, till at laſt it appeared in its former bloom. However, it would again recoil, with a ſurpriſing quickneſs, when my hand came within a ſmall diſtance of it. Having tried the ſame experiment by attempting to touch it with my cane, and a ſmall ſlender rod, the effect was the ſame.

"Though I could not by any means contrive to take or pluck from the rock one of theſe animals entire; yet I once cut off (with a knife which I had held for a long time out of ſight, near the mouth of an hole out of which one of theſe animals appeared) two of theſe ſeeming leaves. Theſe, when out of the water, retained their ſhape and colour; but, being compoſed of a membrane-like ſubſtance, ſurpriſingly thin, it ſoon ſhrivelled up, and decayed."

The reproductive power of the Barbadoes animal-flower is prodigious. Many people coming to ſee theſe ſtrange creatures, and occaſioning ſome inconve-

Animal-Food ‖ Animalcule. nience to a person through whose grounds they were obliged to pass, he resolved to destroy the objects of their curiosity; and, that he might do so effectually, caused all the holes out of which they appeared to be carefully bored and drilled with an iron instrument, so that we cannot suppose but their bodies must have been entirely crushed to a pulp: nevertheless, they again appeared in a few weeks from the very same places.

Plate XXXII. fig. 1. represents the actinia sociata, or clustered animal-flower, described by Mr Ellis, with its radical tube adhering to a rock: (a) One of the animals stretching out its claws. Fig. 2. A perpendicular dissection of one of the bodies, to show the gullet, intestines, stomach, and fibres or tendons that move the claws: (a) A young one arising out of the adhering tube. Fig. 3. The actinia aster, or animal-flower of the newly ceded islands. Fig. 4. The actinia anemone, or sea-anemone from the same place. Fig. 5. The under part of the same by which it adheres to the rocks. Fig. 6. The actinia helianthus, or the sea-sunflower from ditto. Fig. 7. The under part of the same. Fig. 8. The actinia dianthus, or sea-carnation, from the rocks at Hastings in Sussex. This animal adheres by its tail, or sucker, to the under part of the projecting rocks opposite to the town; and, when the tide is out, has the appearance of a long white fig: this is the form of it when put into a glass of sea-water. It is introduced here as a new variety of this animal not yet described.

Pairing of Animals. See Pairing.

1 Common acceptation of the word. ANIMALCULE, in general, signifies a little animal; and thus the term might be applied to every animal which is considerably inferior in size to ourselves. It hath been customary, however, to distinguish by the name of *animalcules* only such animals as are of a size so diminutive, that their true figure cannot be discerned without the assistance of glasses; and more especially it is applied to such as are altogether invisible to the naked eye, and cannot even be perceived to exist but by the assistance of microscopes.

By the help of magnifying glasses, we are brought into a kind of new world; and numberless animals are discovered, which, from their minuteness, must otherwise for ever have escaped our observation: and how many kinds of these invisibles there may be, is still unknown; as they are discerned of all sizes, from those which are barely invisible to the naked eye, to such as resist the action of the microscope, as the fixed stars do that of the telescope, and with the best magnifiers hitherto invented appear only as so many moving points. 2 Different sizes of animalcules.

The smallest living creatures our instruments can show are those that inhabit the waters: for though possibly animalcules equally minute, or perhaps more so, may fly in the air, or creep upon the earth, it is scarce possible to bring such under our examination; but water being transparent, and confining the creatures in it, we are able, by applying a drop of it to our glasses, to discover, to a certain degree of smallness, all that it contains.—Some of the most curious of these animalcules, which have been described by microscopical observers, we shall here give an account of. Animalcule.

3 Hair-like insect. 1. *The Hair-like Insect.* This is so called by Mr Baker on account of its shape; being extremely slender, and frequently an hundred and fifty times as long as broad. The body or middle part, which is nearly straight, appears, in some, composed of such rings as the wind pipe of land-animals is made up of; but in others, seems rather scaled, or made up of rings that obliquely cross one another. Its two ends are hooked or bent, pretty nearly in the same degree, but in a direction opposite to one another; and as no eyes can be discerned, it is difficult to judge which is the head or tail. Its progressive * motion is very singular, being performed by turning upon one end as a centre, and describing almost a quarter of a circle with the other, as represented in the figure. Its motions are very slow, and require much patience and attention in the observer. These creatures are so small, that millions of millions of them might be contained in an inch square. When viewed singly, they are exceedingly transparent, and of a beautiful green colour; but when numbers of them are brought together, they become opaque, lose their green colour, and grow entirely black. 4 Its extreme smallness, &c.

* Plate, XXXIII. fig. 1.

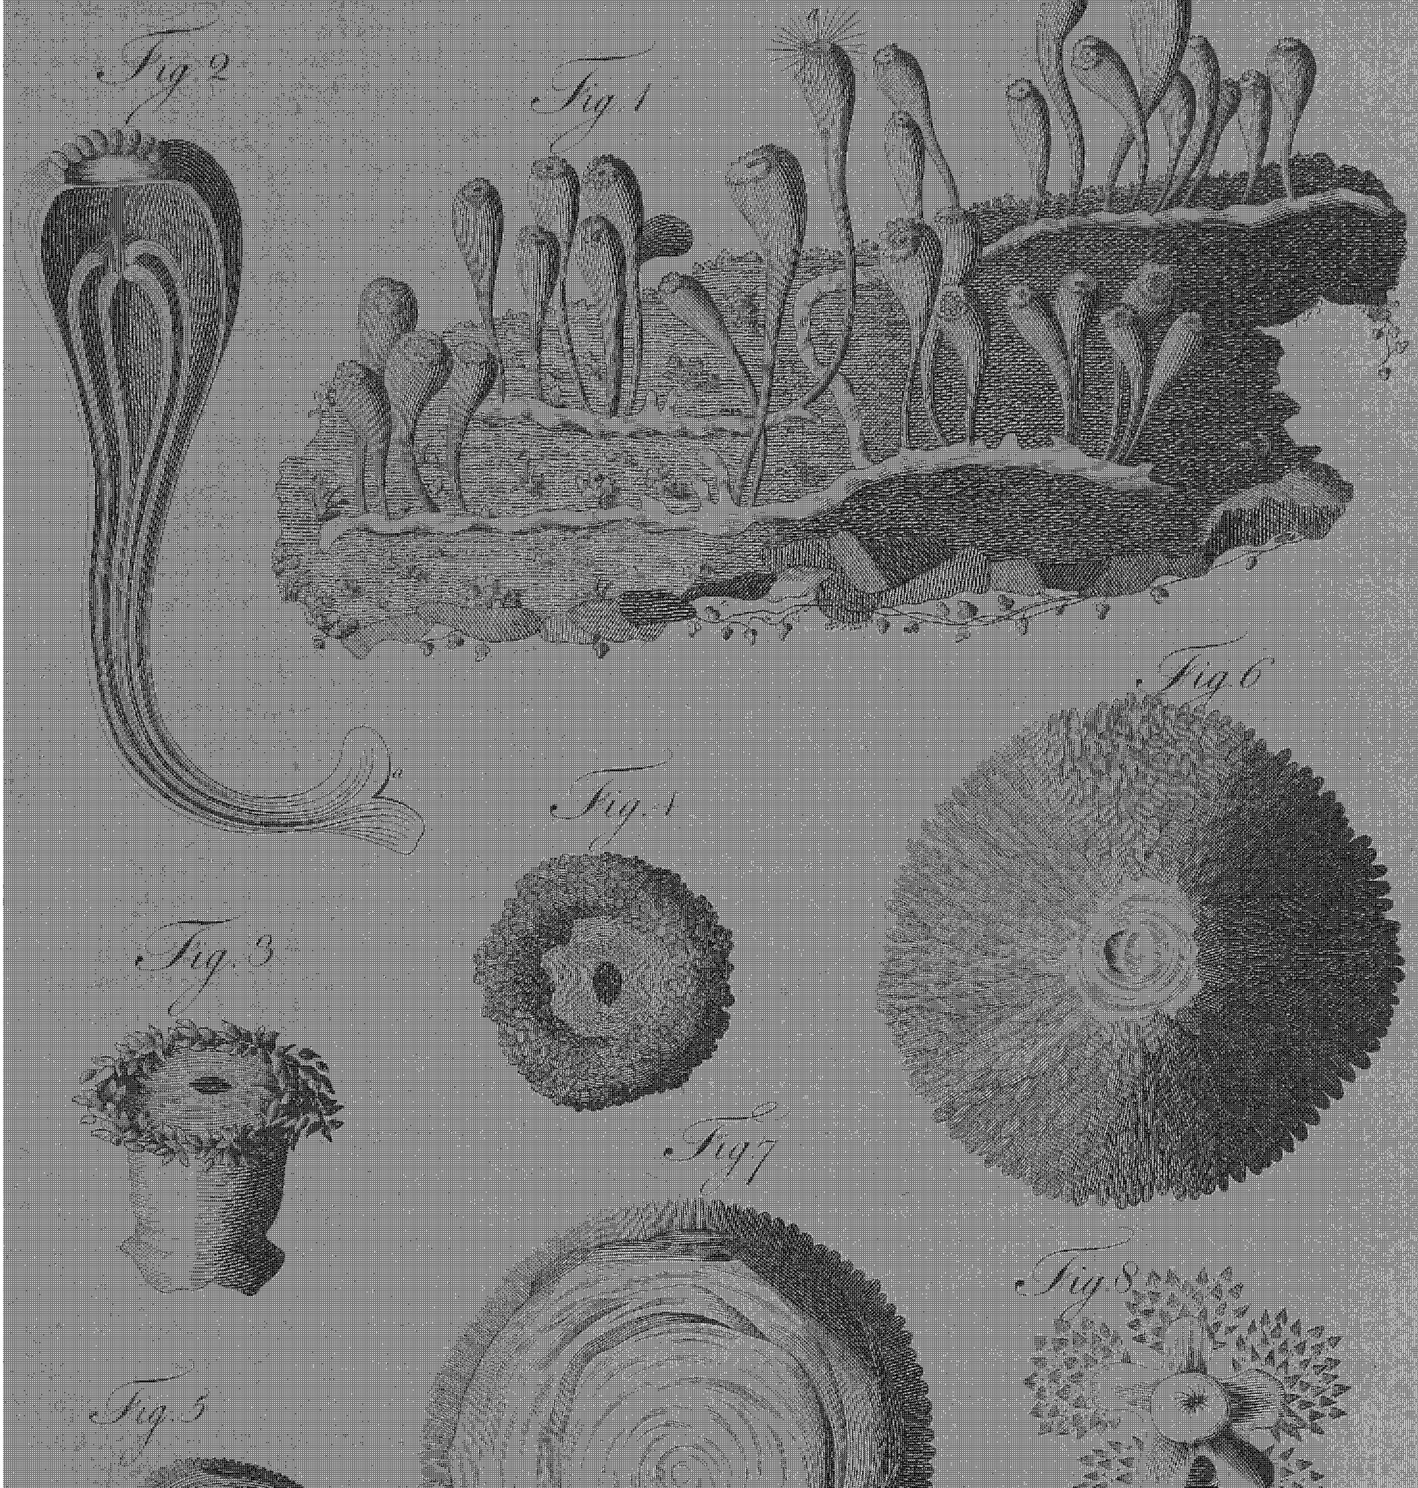
5 Delights in society. Notwithstanding the extreme minuteness of these animalcules, they seem to be fond of society; for, after viewing for some time a parcel of them taken up at random, they will be seen disposing themselves in a kind of regular order †. If a multitude of them are put into a jar of water, they will form themselves into a regular body, and ascend slowly to the top, where, after they have remained for some time exposed to the air, their green colour changes to a beautiful sky-blue. When they are weary of this situation, they form themselves into a kind of rope, which slowly descends as low as they intend; but if they happen to be close to the side of the jar, they will descend upon it. They are so nearly of the specific gravity of water itself, that they will either remain at the bottom, float on the surface, or be suspended in the middle, according as they are originally placed, or as they themselves have a mind.

† Fig. 2.

A small quantity of the matter containing these animalcules ‡ having been put into a jar water, it so happened, that one part went down immediately to the bottom, whilst the other continued floating on the top. When things had remained for some time in this condition, each of these swarms of animalcules began to grow weary of its situation, and had a mind to change its quarters. Both armies, therefore, set out at the same time, the one proceeding upwards, and the other downwards; so that, after some hours journey, they met in the middle. A desire of knowing how they would behave on this occasion, engaged the observer to watch them carefully; and to his surprise he saw the army that was marching upwards, open to the right and left, to make room for those that were descending. Thus, without confusion or intermixture, each held on its way; the army that was going up, marching in two columns to the top, and the other proceeding in one column to the bottom, as if each had been under the direction of wise leaders. 6 Seems possessed of a considerable degree of sagacity.

‡ Fig. 3.

The hair-like insect was first discovered in a ditch at Norwich, ANIMAL FLOWERS Plate XXXII



Animalcule

7 Found in prodigious quantity.

Norwich, one end of which communicates with the river there, and the other end with a fecond ditch into which feveral kennels empty themfelves. The length of this ditch, when Mr Baker wrote his account of this animalcule, was as leaft 100 yards, and its breadth nine. The bottom, for more than a foot thick, was covered with a blackifh green fubftance, in appearance like mud, made up for the moft part of thefe infects; but, fuppofing only an half or a quarter part of it to be compofed of them, according to the dimenfions we have given, their numbers muft exceed all imagination.

2. *Eels in pafte*, &c. When pafte is allowed to ftand till it becomes four, it is then found to be the habitation of numberlefs animalcules, which may be difcerned by the naked eye; and though their form cannot be perfectly diftinguifhed, their motion is very perceptible, and the whole pafte will feem to be animated.

8 Eels in pafte viviparous.

Fig. 4. reprefents one of thefe anguillæ magnified. The moft remarkable property of thefe infects is, that they are viviparous. If one of them is cut thro' near the middle, feveral oval bodies of different fizes will be feen to iffue forth. Thefe are young anguillæ, each of them coiled up and inclofed in its proper membrane, which is fo exquifitely fine, as fcarce to be difcernible by the greateft magnifier, while it inclofes the embryo animal. The largeft and moft forward immediately break through this covering, unfold themfelves, and wriggle about in the water nimbly; others get out, uncoil, and move themfelves about more flowly; and the leaft mature continue entirely without motion. The *uterus*, or veffel that contains all thefe oval bodies, is compofed of many ringlets, not unlike the afpera arteria of land-animals, and feems to be confiderably elaftic; for as foon as the animalcule is cut in two, the oval bodies are thruft out with fome degree of violence, from the fpringing-back or action of this bowel. An hundred and upwards of the young ones have been feen to iffue from the body of one fingle eel, whereby the prodigious increafe of them may be accounted for; as probably feveral fuch numerous generations are produced in a fhort time. They feem to be all prolific; and unlefs trial happens to be made upon one that has brought forth all its young, or when the pafte has been kept for a very long time, the experiment will always fucceed.—This property of thefe eels being viviparous renders it highly improbable that they ever become flies.

Animalcules of a fimilar kind are likewife found in vinegar; and like thofe already defcribed, are found to be viviparous. But it is not only in acid matters that fuch appearances are obferved. In fome fields of wheat, many grains may be obferved, that appear blackifh outwardly, as if fcorched; but, when opened, are found to contain a foft white fubftance, which, attentively confidered, appears to be nothing elfe than a congeries of threads or fibres lying clofe to each other in a parallel direction, much refembling the unripe down of fome thiftles on cutting open the flower-heads before they begin to blow. This fibrous matter difcovers not the leaft fign of life or motion, unlefs water is applied; but immediately on wetting, provided the grains of wheat have been newly gathered, the fuppofed fibres feparate, and appear to be living creatures. Their motions at firft are very languid; but gradually become more vigorous, twifting and wriggling themfelves fomewhat in the manner of the eels in pafte, but always flower than they, and with a great deal of lefs regularity.

9 Similar creatures found in blighted wheat.

If the grains of wheat are grown dry by keeping, and in that condition are cut open, the fibrous matter is very diftinguifhable; and, on putting water to it, will feparate with great readinefs, and feem like fine tubes or threads tapering at both ends: but not the leaft motion will be perceived till they have been in water for feveral hours, and fometimes they will never move at all. But if the fame grains are fteeped in water for three or four hours, or buried for fome days in the earth till they are fully faturated with moifture, and then opened with a penknife; on taking out a fmall portion of the white matter carefully, and fpreading it thin upon a flip of glafs, the animalcules will be feen bundled together, and extended longitudinally, but without motion: and though, upon the application of water, they will not revive fo foon as thofe taken from frefh grains, whofe moifture has never been exhaled; yet, after remaining an hour or two in water, they are conftantly found alive and vigorous, even though the grains have been kept in a dry condition for feveral years.—It is neceffary, however, to adapt, in fome meafure, the time of continuing the grains in water or earth to the age and drynefs of them: for if they are not opened before they are too much foftened, the animalcules will be dead; and unlefs the hufks are opened to let thofe creatures out after they have been fteeped, they inevitably perifh in them: otherwife, they will continue alive in water for many months; and fhould the water dry away, may be revived again by giving them a frefh fupply.

10 How difcoverable.

11 Precautions neceffary in making the experiment

3. *The Proteus.* This animacule has been dignified by Mr Baker with the name of *Proteus*, on account of its affuming a great number of different fhapes, fo as fcarce to be known as the fame animal in its various transformations; and indeed unlefs it be carefully watched while paffing from one fhape to another, it will often become fuddenly invifible, as happened more than once to Mr Baker.

12 Proteus why fo called.

When water, wherein any fort of vegetable has been infufed, or animals preferved, has ftood quietly for fome days, or weeks, in any glafs or other veffel, a flimy fubftance will be collected about the fides: fome of which being taken up with the point of a penknife, placed on a flip of glafs in a drop of water, and looked at through the microfcope, will be found to harbour feveral kinds of little animals that are feldom found fwimming about at large; among which the proteus is one. Its fhape is better underftood from the figure, than from any defcription that could be given. Its fubftance and colour feems to refemble that of a fnail; and its whole fhape feems to bear a confiderable refemblance to that of a fwan. It fwims to and fro with great vivacity: but will now and then ftop for a minute or two; during which time its long neck is ufually employed as far as it can reach, forwards, and on every fide, with a fomewhat flow, but equable motion, like that of a fnake, frequently extending thrice the length of its body, and feemingly in fearch of food.

13 Where found.

14 Its fhape, colour, &c.

There are no eyes, nor any opening in the head like a mouth, to be difcerned: but its actions plainly prove it to be an animal that can fee; for though multitudes of different animalcules fwim about in the fame water, and its own progreffive motion is very fwift, it never

Animalcule. ſtrikes againſt any of them, but directs its courſe between them with a dexterity wholly unaccountable ſhould we ſuppoſe it deſtitute of ſight.

15 Its transformations. When the proteus is alarmed, it ſuddenly draws in its long neck, repreſented in fig. 5. and 6. transforming itſelf into the ſhape repreſented in fig. 7. when it becomes more opaque, and moves about very ſlowly with the large end foremoſt. When it has continued ſome time in this poſture, it will often, inſtead of the head and neck it had formerly, put forth a new one, with a kind of wheel machinery, repreſented fig. 8. the motions of which draw a current of water to it from a conſiderable diſtance. Having often pulled in and thruſt out this ſhort head, ſometimes with and ſometimes without the wheel-work, the creature, as if weary, will remain motionleſs for a while; then its head and long neck will be very ſlowly protruded, as in fig. 9. and it ſoon reſumes its former agility. Sometimes it diſpoſes of its neck and head as repreſented in fig. 10.

16 Vorticella, where found. 4. *The Wheel-Animal, or Vorticella.* This wonderful animalcule is found in rain water that has ſtood ſome days in leaden gutters, or in hollows of lead on the tops of houſes; or in the ſlime or ſediment left by ſuch water; and perhaps may alſo be found in other places: but if the water ſtanding in gutters of lead, or the ſediment left behind it, has any thing of a red colour in it, one may be almoſt certain of finding them therein. Though it diſcovers no ſigns of life except when in the water, yet it is capable of continuing alive for many months after it is taken out of the water, and kept in a ſtate as dry as duſt. In this ſtate it is of a globular ſhape, exceeds not the bigneſs of a grain of ſand, and no ſigns of life appear: but, being put into water, in the ſpace of half an hour, a languid motion begins, the globule turns itſelf about, lengthens itſelf by ſlow degrees, aſſumes the form of a lively maggot, and moſt commonly in a few minutes afterwards puts out its wheels; ſwimming vigorouſly through the water, as if in ſearch of food; or elſe, fixing itſelf by the tail, works the wheels in ſuch a manner as to bring its food to it.

Fig. 23. and 24. ſhow the wheel-animal in its globular form; fig. 11. and 12. in its maggot ſtate; and fig. 13, 14, 15, 16, 17, 18, 19, 20, 21, and 22. ſhow the different appearances of its wheels, and alſo its various intermediate changes between the globular and maggot ſtate.

17 Its wheel-work deſcribed. The moſt remarkable part of this animalcule is its wheel-work. This conſiſts of a couple of ſemicircular inſtruments, round the edges of which many little fibrillæ move themſelves very briſkly, ſometimes with a kind of rotation, and ſometimes in a trembling or vibrating manner. When in this ſtate, it ſometimes unfaſtens its tail, and ſwims along with a great deal of ſwiftneſs, ſeemingly in purſuit of its prey. Sometimes the wheels ſeem to be entire circles, armed with ſmall teeth like thoſe of the balance-wheel of a watch, appearing projected forwards beyond the head, and extending ſideways ſomewhat wider than its diameter. The teeth or cogs of theſe wheels ſeem to ſtand very regularly at equal diſtances: but the figure of them varies according to their poſition, the degree of their protruſion, and perhaps the will of the animal itſelf. They appear ſometimes like minute oblong ſquares, riſing at right angles from the periphery of a circle, like ancient battlements on a round tower; at other times they terminate in ſharp points, and all together reſemble a kind of Gothic crown. They are often ſeen in a kind of curvular direction, all bending the ſame way, and ſeeming like ſo many hooks; and now and then the ends of them will be perceived to be clubbed like mallets. This figure, however, as well as the firſt, they aſſume but rarely.

As theſe wheels are every where exceſſively tranſparent, except about their circular rim or edge, where the cogs are ſet, it is very difficult to determine by what contrivance they are turned about, or what their real figure is, though they ſeem exactly to reſemble wheels moving round upon an axis. It is alſo hardly poſſible to be certain whether thoſe circular bodies in which the teeth are ſet, are of a flat form, or hollow and conical; but they ſeem rather to be of a conical figure. The difficulty of conceiving how an articulation could be contrived ſo as to cauſe a real rotation, hath cauſed many people imagine that there was a deception in this caſe: But Mr Baker aſſures us, that when the wheels are fully protruded, they never fail to ſhow all the viſible marks of a regular rotation; and, in ſome poſitions, the ſame cogs or teeth may be traced by the eye during a complete revolution. 18 Shows all the marks of real rotation.

All the actions of this creature ſeem to imply ſagacity and quickneſs of ſenſation. At the leaſt touch or motion in the water, they inſtantly draw in their wheels; and Mr Baker conjectures, that their eyes are lodged ſomewhere about the wheels: becauſe, while in the maggot-ſtate, its motions are ſlow and blundering; but, after the wheels are protruded, they are performed with great regularity, ſwiftneſs, and ſteadineſs. 19 Shows great quickneſs of ſenſation.

Notwithſtanding the minuteneſs of this animalcule, the microſcope generally diſcovers others in the ſame drop of water, compared with which the wheel-animal may be ſaid to be a whale. The tranſparency of its body, therefore, allows its internal parts to be ſeen, which cannot be perceived in the minuteſt animalcules on account of the ſmallneſs of their ſize. *a*, Is the appearance of the head; and though it is every where tranſparent, a ring or circle more particularly remarkable for its clearneſs is commonly perceived about the middle of the forehead, a little above the mouth. This, Mr Baker thinks, might juſtly be called the ſeat of the brain. Many veſſels which ſeem to take their origin from thence are diſcernible in the head, wherein ſome tranſparent fluid appears continually agitated by a kind of fluctuating motion. Fig. 15. 20 Deſcription of its internal parts.

The thorax, *b*, is joined to the head by a very ſhort neck, *c*, and appears to be about the ſixth part of the whole length of the animal. In the middle of the thorax is placed the heart, *d*, where its ſyſtole and diaſtole are plainly viſible. It is ſeen through the back of the inſect, ſhutting and opening alternately with great regularity and exactneſs. Its ſize is proportionable to the creature's bigneſs; and its ſhape, during the ſyſtole, is nearly circular, being compoſed ſeemingly of two ſemilunar parts, which then approach each other laterally, and form between them a roundiſh or horſe-ſhoe like figure, whoſe upper ſide is flat, and the under one convex. The diaſtole is performed by a ſeeming ſeparation, or opening, of theſe two ſemilunar parts, whereby the tranverſe diameter of the heart is very much enlarged. This ſeparation begins exactly in the middle

Animalcule.

middle of the lower part next the tail; and opens to ſuch a conſiderable width upwards, that the two parts, when at their utmoſt diſtenſion, ſeem only joined by an arched veſſel at their anterior end. The alternate motions of contraction and dilatation are performed with great ſtrength and vigour, in pretty much the ſame time as the pulſation of the arteries of a man in health. The motions of the heart are communicated to all the internal parts of the thorax; and ſeem to extend a great deal further; for a ſtrict examination diſcovers, at the ſame time, throughout the whole animal, contractions and dilatations going on, that are apparently correſpondent thereto. Theſe motions of the heart, however, are ſometimes ſuſpended, or imperceptible, for two or three minutes; after which they are renewed, and go on again with the ſame regularity as before. From the under part of the thorax proceeds a ſmall tranſparent horn repreſented at *a* fig. 11. and 12. It is never viſible but when the animal turns on its back or ſide.

The blood or circulating fluid of the wheel-animal is ſo abſolutely colourleſs, that the current of it through the veſſels is indiſtinguiſhable by glaſſes. A ſort of irregular agitation of ſome fluid is indeed perceived, which is perhaps a compound motion of currents running different ways, and forming ſuch an appearance, tho' no ſingle current is any where diſtinctly viſible.

Immediately below the thorax is another anular diviſion, *e*, joining upwards to the thorax, and downwards to the abdomen, the entrance whereof it ſerves occaſionally to enlarge or diminiſh. The abdomen, *f*, is by much the largeſt part of the animal, and contains the ſtomach and inteſtines. When the inſect is full of food, theſe bowels appear opaque and of a blood-red colour, extending quite through the belly and great part of the tail, and exhibiting a variety of contractions and dilatations. The belly is capable of ſtretching out greatly in length, or being ſhortened very much, and widening its diameter. It aſſumes many ſhapes, and becomes occaſionally a caſe for all the other parts of the body.

21 other kinds of wheel-animals.

Beſides the abovementioned one, there are found in the waters ſeveral other ſpecies of animals furniſhed with wheels, ſome of which appear to have a rotatory, and others a vibratory, motion. Fig. 25. repreſents a kind found in the ditch at Norwich, where the hair-like inſect is produced. They differ from the foregoing only in having very long tails. Fig. 26, 27, and 28, repreſent a ſpecies of wheel-animals, which are alſo covered with ſhells. The body of this ſpecies conſiſts of three parts, in like manner as the other; only the thorax and abdomen, in this, are not ſeparated by any gut, or intermediate veſſel, but are joined immediately together. The heart is plainly perceived, having a regular ſyſtole and diaſtole, at *a*, as in the former ſpecies. Theſe creatures occaſionally draw themſelves entirely within their ſhells; and the ſhell then appears terminated by ſix ſhort ſpikes on one ſide and two on the other.

22 Manner of producing their young ones.

The young ones of this ſpecies are carried in oval ſacculi, or integuments, faſtened externally to the lower part of their ſhells ſomewhere about the tail: theſe ſacculi are ſometimes opaque only at one end, and ſeemingly empty at the other; ſometimes they appear opaque in the middle, with a tranſparency all round, as in fig. 26. When a young one is about to burſt its integuments, the parent aſſiſts it greatly, by wagging its tail, and ſtriking the oval bag, ſo that the young one's head becomes as it were forced into the water, though the tail cannot be ſo ſoon diſengaged. In this condition the young one ſets its wheel a-going, and exerts all its endeavours to free itſelf from its confinement. (Fig. 28. *b*.) When it has got clear, it ſwims away, wagging its tail as the old one does, and leaving the integument adhering to the ſhell of the parent. The old one then uſes a number of efforts to get rid of this incumbrance, ſtriking againſt it with her tail; fixing the end of her tail upon it, and then darting her body forward; with ſeveral very odd motions not eaſy to be deſcribed. This kind of wheel-animals are great tormentors of the water-flea, *Pulex aquaticus arboreſcens* of Swammerdam; of which a figure is given from that author (Plate XXXIV.): fig. 2. ſhows the natural ſize of the flea; and fig. 1. ſhows it magnified, with ſome of the wheel-animals adhering to it. Theſe inſects are often found in great numbers in the ſame water: and when that is the caſe, it is not uncommon to diſcover five or ſix of theſe cruſtaceous wheel-animals faſtened by their tail to the ſhell or horns of the flea; cauſing it, ſeemingly, a vaſt deal of uneaſineſs; nor can they be driven away, or ſhaken off, by all the efforts the flea can uſe for that purpoſe.

23 Infeſt the Pulex Aquaticus.

24 Bell-flower animal.

5. *The bell-flower Animal, or Plumed Polype*. Theſe animalcules dwell in colonies together, from ten to fifteen (ſeldom falling ſhort of the former number, or exceeding the latter), in a ſlimy kind of mucilaginous or gelatinous caſe; which, out of the water, has no determined form, appearing like a little lump of ſlime; but, when expanded therein, has ſome reſemblance to the figure of a bell with its mouth upwards; and is uſually about half an inch long, and a quarter of an inch in diameter. Theſe bells, or colonies, are to be found adhering to the large leaves of duckweed, and other aquatic plants. They may be moſt eaſily diſcovered by letting a quantity of water, with duckweed in it, ſtand quietly for three or four hours in glaſs-veſſels in a window, or other place whence a ſtrong light comes: for then, if any are about the duckweed, they will be found, on careful inſpection, extending themſelves out of their caſes, and making an elegant appearance.

25 Where diſcovered.

The bell, or caſe, which theſe animals inhabit, being very tranſparent, all the motions of its inhabitants may be diſcerned through it diſtinctly. It ſeems divided internally into ſeveral apartments, or rather to contain ſeveral ſmaller ſacculi, each of which incloſes one of theſe animals. The openings at the tops of theſe ſacculi, are but juſt ſufficient to admit the creature's head and a ſmall part of its body to be thruſt out beyond them, the reſt remaining always in the caſe. It can, however, occaſionally retire into its caſe altogether; and never fails to do ſo when alarmed by any ſudden motion of the water, or of the veſſel which contains it.

26 Motions of the whole colony.

Beſides the particular and ſeparate motion which each of theſe creatures is able to exert within its own caſe, and independent of the reſt; the whole colony together has a power of altering the poſition of the bell; or even of removing it from one place to another; and hence this bell is ſometimes found ſtanding perfectly upright, as in fig. 29. and 33. and ſometimes bending the upper

part

part downwards, as in fig. 30. As these animalcules seem not to choose to stay together in societies whose number exceeds 15, when the colony happens to increase in number, the bell may be observed to split gradually, beginning from about the middle of the upper or anterior extremity, and proceeding downwards towards the bottom, as in fig. 32. till they at last separate entirely, and become two complete colonies independent of each other, one of which sometimes removes to another part of the vessel.

27 Description of an individual.

The arms of each individual of this colony are set round the head, to the number of 40, having each the figure of an Italic *ſ*, one of whose hooked ends is fastened to the head; and altogether, when expanded, compose a figure shaped somewhat like a horse's-shoe, convex on one side next the body, but gradually opening and turning outwards, so as to leave a considerable area within the outer extremities of the arms. When the arms are thus extended, the creature, by giving them a vibrating motion, can produce a current in the water, which brings the animalcules, or whatever other minute bodies are within the sphere of its action, with great velocity to its mouth, situated between the arms; where they are taken in if liked, or driven away by a contrary motion. The food is conveyed immediately from the mouth or opening between the arms, through a narrow neck, into a passage seemingly correspondent to the œsophagus in land-animals; down which it passes into the stomach, where it remains for some time, and then is voided upwards, in small round pellets, thro' a gut whose exit is near the neck. The body consists of three divisions; in the uppermost of which are contained all the abovementioned intestines, which are only to be discerned when the creature is full, at which time they become opaque. The other two divisions, which are probably fixed to the bell, seem to be of no other use than to give the creature a power of contraction and extension. The arms are not able to contract like those of the common polype; but, when the animal retires into its case, they are brought together in a close and curious order, so as to be easily drawn in. Though their general appearance when expanded is that of a cup whose base and top are of an horse-shoe form, they sometimes separate into four parts, and range themselves as in fig. 36. so as to resemble four separate plumes of feathers. Tho' their eyes cannot be discovered, yet Mr Baker thinks they have some perception of the light: for when kept in the dark, they always remain contracted; but on being exposed to the light of the sun or of a candle, they constantly extend their arms, and show evident signs of being pleased.

28 Seem to have a perception of light.

Fig. 29. represents one complete colony or bell standing erect, with all the animals out of their kingdom, and their arms extended, exhibiting altogether a very pretty appearance. *a* represents two oval bodies, supposed by Mr Baker to be eggs.

Fig. 30. shows all the creatures withdrawn into their cells, and the end of the bell hanging downwards.

Fig. 33. shows the bell erect, with only one of the animals coming out, in order to show its connection with the bell.

Fig. 34. shows the head and arms of a single polype closing together, and disposing themselves in order to be drawn into the ball.

Fig. 35. shows one complete animal greatly magnified, to show its several parts more distinctly; viz. *a*, the head, resembling a horse-shoe; *b b*, the arms seen from one side; *c*, The narrow neek; *d*, the œsophagus; *e*, the stomach; *f*, the gut or last intestine thro' which the food passes after being digested in the stomach; *g*, the anus, where the feces are discharged in little pellets; *h i*, that part of the bell which surrounds the body of the animal, and closes upon it when it retires down.

Fig. 37. the head and arms seen in front.

29 Globe-animal.

6. *The Globe-animal.* This animalcule, represented fig. 38. seems exactly globular, having no appearance of either head, tail, or fins. It moves in all directions, forwards or backwards, up or down, either rolling over and over like a bowl, spinning horizontally like a top, or gliding along smoothly without turning itself at all. Sometimes its motions are slow, at other times very swift; and when it pleases, it can turn round, as it were upon an axis, very nimbly, without removing out of its place. The whole body is transparent, except where the circular black spots are shown in the figure. Some of the animals have no spots, and others from one to seven. The surface of the whole body appears, in some, as if all over dotted with points; in others, as if granulated like shagreen: but their more general appearance is, as if beset thinly round with short moveable hairs or bristles, which probably are the instruments by which their motions are performed. These animalcules may be seen by the naked eye, but appear only like moving points.

30 Pipe-animal.

7. *The Pipe-animal.* These creatures are found on the coast of Norfolk, living in small tubes or cases of sandy matter, in such multitudes as to compose a mass sometimes of three feet in length. Fig. 39. shows a piece of such a congeries broke off, where *a a a a* represent the mouths or openings of the pipes wherein the little animals make their abode. Fig. 40. shows one single pipe, with its inhabitants, separated from the rest, and magnified nine or ten times in diameter. The pipe or case *b* is made of sand, intermixed here and there with minute shells, and all cemented together by a glutinous slime, probably issuing from the animal's own body *c*, which is composed of muscular ringlets like those of a worm, capable of great extension or contraction. The anterior end or head, *d*, is exceedingly beautiful, having round it a double row of little arms disposed in a very regular order, and probably capable of extension, in order to catch its food, and bring it to its mouth. Some of these tubes are found petrified, and constitute one species of syringoides.

31 Sometimes found petrified.

32 Insect with net-like arms.

8. *An insect with net-like arms.* The properties and shape of this little animal are very extraordinary. It is found only in cascades, where the water runs very swift. There these insects are found in clusters, standing erect on their tails; and resembling, when all together, the combs of bees at the time they are filled with their aureliæ. On being taken out of the water, they spin threads, by which they hang exactly in the same manner as the garden-spider. Fig. 42. shows one of these insects magnified. Its body appears curiously turned as on a lathe; and at the tail are three sharp spines, on which it raises itself, and stands upright in the water: but the most curious apparatus is about its head, where it is furnished with two instruments like fans or nets, which serve to provide its food. These it frequently spreads out and draws in again; and when drawn up they

Animalcule.

are folded together with the utmoſt nicety and exactneſs, ſo as to be indiſcernible when brought cloſe to the body. At the bottom of of theſe fans a couple of claws are faſtened to the lower part of the head, which, every time the nets are drawn in, conduct to the mouth of the animal whatever is taken in them. When the creature doth not employ its nets, it thruſts out a pair of ſharp horns, as in fig. 41. where the inſect is ſhown magnified about 400 times.

Some of theſe creatures being kept with water in a vial, moſt of them died in two days; and the reſt, having ſpun themſelves tranſparent caſes (which were faſtened either to the ſides of the glaſs, or to pieces of graſs put into it), ſeemed to be changed into a kind of chryſalis: but before taking this form, they appeared as in fig. 43. which ſhape they likewiſe aſſumed when weary with catching their food, or when lying in wait for it. None of them lived above three days;

33 Surpriſing property of ſpoiling water.

and though freſh water was given them two or three times a-day, yet in a few hours it would ſtink to a degree ſcarce conceivable, and that too at ſeveral yards diſtance, though, in proportion to the water, all the included inſects were not more than as 1 to 1,150,000. This makes it probable, that it is neceſſary for them to live in a rapid ſtream, leſt they ſhould be poiſoned by the effluvia iſſuing from their own bodies, as no doubt they were in the vial.

34 An aquatic worm.

9. *A curious aquatic worm.* This animalcule is ſhown, magnified, at fig. 31. It is found in ditch-water; and is of various ſizes, from $\frac{1}{40}$ to $\frac{1}{2}$ an inch in length. About the head it has ſomewhat of a yellowiſh colour; but all the reſt of the body is perfectly colourleſs and tranſparent, except the inteſtines, which are conſiderably opaque, and diſpoſed as in the figure. Along its ſides are ſeveral papillæ, with long hairs growing from them: it has two black eyes, and is very

35 Its horn or proboſcis.

nimble. But the moſt remarkable thing in this creature is a long horn or proboſcis; which, in the large ones, may be ſeen with the naked eye, if the water is clear, and is ſometimes $\frac{1}{10}$ of an inch in length: this it waves to and fro as it moves in the water, or creeps up the ſide of the glaſs; but it is not known whether it is hollow, or of what uſe it is to the creature itſelf.

36 Spermatic animals, when diſcovered.

10. *Spermatic Animals*, and *Animalcula Infuſoria*. The diſcovery of living animalcules in the ſemen of moſt animals is claimed by Mr Liewenhoeck and Mr Nicholas Hartſoeker; who both ſay they publiſhed it about the end of the year 1677 or beginning of 1678: but Mr Liewenhoeck having given the moſt particular deſcription of, and made by far the greateſt number of experiments concerning them, the diſcovery is commonly attributed to him.

37 General appearance the ſame in every animal.

According to this naturaliſt, theſe animalcules are found in the ſemen maſculinum of every kind of animal; but their general appearance is very much the ſame, nor doth their ſize differ in proportion to the bulk of the animal to which they belong. The bodies of all of them ſeem to be of an oblong oval form, with long tapering ſlender tails iſſuing from them; and as by this ſhape they reſemble *tadpoles*, they have been frequently called by that name; tho' the tails of them, in proportion to their bodies, are much longer than the tails of tadpoles are: and it is obſervable, that the animalcules in the ſemen of fiſhes have tails much longer and more ſlender than the tails of thoſe in other animals; inſomuch, that the extremity of them is not to be diſcerned without the beſt glaſſes, and the utmoſt attention. Fig. 21. N° 1, 2, 3, 4, repreſent the ſpermatic animalcula of the rabbit; and N° 5, 6, 7, 8, thoſe of a dog; according to Mr Liewenhoeck.

Animalcule. Plate, XXXIV.

38 Inconceivable numbers and minuteneſs.

The numbers of theſe animalcula are inconceivable. On viewing with a microſcope the milt or ſemen maſculinum of a living cod-fiſh, innumerable multitudes of animalcules were found therein, of ſuch a diminutive ſize, that he ſuppoſed at leaſt 10,000 of them capable of being contained in the bulk of a grain of ſand; whence he concludes, that the milt of this ſingle fiſh contained more living animalcules than there are to be found people living in the whole world. To find the comparative ſize of theſe animalcules, Mr Liewenhoeck placed an hair of his head near them; which hair, through his microſcope, appeared an inch in breadth; and he was ſatisfied, that at leaſt 60 ſuch animalcules could eaſily lie within that diameter; whence, their bodies being ſpherical, it follows, that 216,000 of them are but equal to a globe whoſe diameter is the breadth of a hair. He obſerved, that when the water wherewith he had diluted the ſemen of a cod-fiſh was exhaled, the little bodies of the animalcules burſt in pieces; which did not happen to thoſe in the ſemen of a ram: and this he imputes to the greater firmneſs and conſiſtency of the latter, as the fleſh of a land-animal is more compact than fiſh.

39 Are continually in motion.

Theſe animalcules appear to be very vigorous, and tenacious of life; for they may be obſerved to move long after the animal from which they are taken is dead. They have this peculiarity alſo, that they are continually in motion, without the leaſt reſt or intermiſſion, provided there is fluid ſufficient for them to ſwim about in. Theſe animalcula are peculiar to the ſemen; nothing that has the leaſt token of life being diſcovered, by the beſt glaſſes, either in the blood, ſpittle, urine, gall, or chyle. Great numbers, however, are to be found in the whitiſh matter that ſticks between the teeth; ſome of which are of an oval figure, and others reſemble eels.

40 Animalcula Infuſoria.

The *Animalcula Infuſoria*, take their name from their being found in all kinds either of vegetable or animal infuſions. Indeed, there is ſcarce any kind of water, unleſs impregnated with ſome mineral ſubſtance, but what will diſcover living creatures.—Mr Liewenhoeck

41 Mr Liewenhoeck's account of animalcules in rain-water.

ſays, that at firſt he could diſcern no living creatures in rain-water; but after ſtanding ſome days, he diſcovered innumerable animalcules, many thouſands of times leſs than a grain of ſand, and in proportion to a mite as a bee is to a horſe.—In other rain-water, which had likewiſe ſtood ſome time, he found the ſmalleſt ſort he had ever ſeen; and, in a few days more, met with others eight times as big as theſe, and almoſt round.—In another quantity of rain-water, that had been expoſed like the former, he diſcovered a kind of animalcules with two little horns in continual motion. The ſpace between the horns was flat, though the body was roundiſh, but tapering a little towards the end; where a tail appeared, four times as long as the body, and the thickneſs of a ſpider's web. He obſerved ſeveral hundreds of theſe within the ſpace a grain of ſand would occupy. If they happened on the leaſt filament or ſtring, they were entangled in it; and then would extend their bodies into an oblong round, and ſtruggle hard to diſengage their tails. He obſerved a ſecond

ſort

ſort of an oval figure, and imagined the head to ſtand at the ſharpeſt end. The body was flat, with ſeveral ſmall feet moving exceeding quick, but not diſcernible without a great deal of attention. Sometimes they changed their ſhape into a perfect round, eſpecially when the water began to dry away. He met alſo with a third ſort, twice as long as broad, and eight times ſmaller than the firſt: yet in theſe he diſcerned little feet; whereby they moved very nimbly. He perceived likewiſe a fourth ſort, a thouſand times ſmaller than a louſe's eye, and which exceeded all the reſt in briſkneſs: he found theſe turning themſelves round, as it were upon a point, with the celerity of a top. And he ſays, there were ſeveral other ſorts.

42 Surpriſing production of theſe animalcules.

The production of *animalcula infuſoria* is very ſurpriſing. In four hours time, an infuſion of cantharides has produced animalcula leſs than even the tails of the ſpermatic animals we have already deſcribed. Neither do they ſeem to be ſubject to the fate of other animals; but, ſeveral kinds of them at leaſt, by dividing themſelves in two, to enjoy a ſort of immortality. Nor do the common methods by which other animals are deſtroyed, ſeem to be effectual for deſtroying their vital principle. Hot mutton-gravy, ſecured in a phial with a cork, and afterwards ſet among hot aſhes to deſtroy as effectually as poſſible every living creature that could be ſuppoſed to exiſt in it, has nevertheleſs been found ſwarming with animalcules after ſtanding a few days.

43 Mr Ellis's account of animalcules from infuſion of potatoes.

In the Philoſophical Tranſactions, Vol. LIX. we have the following curious account, given us by Mr Ellis, of animalcules produced from an infuſion of potatoes and of hempſeed.

"On the 25th of May 1768, Fahrenheit's thermometer 70°, I boiled a potatoe in the New-River water till it was reduced to a mealy conſiſtence. I put part of it, with an equal proportion of the boiling liquor, into a cylindrical glaſs-veſſel that held ſomething leſs than half a wine-pint, and covered cloſe immediately with a glaſs-cover. At the ſame time, I ſliced an unboiled potatoe; and, as near as I could judge, put the ſame quantity into a glaſs-veſſel of the ſame kind; with the ſame proportion of New-River water not boiled; and covered it with a glaſs-cover; and placed both veſſels cloſe to each other.

"On the 26th of May, 24 hours afterwards, I examined a ſmall drop of each, by the firſt magnifier of Wilſon's microſcope, whoſe focal diſtance is reckoned at $\frac{1}{50}$ part of an inch; and, to my amazement, they were both full of animalcula of a linear ſhape, very diſtinguiſhable, moving to and fro with great celerity; ſo that there appeared to be more particles of animal than vegetable life in each drop.

"This experiment I have repeatedly tried, and always found it to ſucceed in proportion to the heat of the circumambient air; ſo that even in winter, if the liquors are kept properly warm, at leaſt in two or three days the experiment will ſucceed.

"What I have obſerved are infinitely ſmaller than ſpermatic animals, and of a very different ſhape: the truth of which every accurate obſerver will ſoon be convinced of, whoſe curioſity may lead him to compare them; and I am perſuaded he will find they are no way akin.

"At preſent I ſhall paſs over many other curious obſervations, which I have made on two years experiments, in order to proceed to the explaining a hint which I received laſt January from Mr De Sauſſure of Geneva, when he was here; which is, that he found one kind of theſe animalcula infuſoria that increaſe by dividing acroſs into nearly two equal parts.

"I had often ſeen this appearance in various ſpecies a year or two ago, as I found upon looking over the minutes I had taken when I made any new obſervation; but always ſuppoſed the animal, when in this ſtate, to be in coition.

"Not hearing, till after M. De Sauſſure left this kingdom, from what infuſion he had made his obſervation; his friend Dr de la Roche of Geneva informed me, the latter end of February laſt, that it was from hempſeed.

"I Immediately procured hempſeed from different ſeedſmen in diſtant parts of the town. Some of it I put into New-River water, ſome into diſtilled water, and ſome I put into very hard pump-water. The reſult was, that in proportion to the heat of the weather, or the warmth in which they were kept, there was an appearance of millions of minute animalcula in all the infuſions; and, ſome time after, ſome oval ones made their appearance, as at fig. 3. *b c*. Theſe were much larger than the firſt, which ſtill continued; theſe wriggled to and fro in an undulatory motion, turning themſelves round very quick all the time that they moved forwards. 44 From an infuſion of hempſeed.

I was very attentive to ſee theſe animals divide themſelves; and at laſt I perceived a few of the appearance of fig. 3. *a*, as it is repreſented by the firſt magnifier of Wilſon's microſcope; but I am ſo well convinced by experience that they would ſeparate, that I did not wait to ſee the operation: however, as the following ſketches, which I have drawn from five other ſpecies, will very fully explain this extraordinary phenomenon, there will be no difficulty in conceiving the manner of the firſt. See fig. 4, 5, 6, 7, 8. 45 Divide themſelves in two.

"The proportion of the number of theſe animals which I have obſerved to divide in this manner, to the reſt, is ſcarce 1 to 50; ſo that it appears rather to ariſe from hurts received by ſome few animalcula among the many, than to be the natural manner in which theſe kinds of animals multiply; eſpecially if we conſider the infinite quantity of young ones which are viſible to us through the tranſparent ſkins of their bodies, and even the young ones that are viſible in thoſe young ones while in the body of the old ones.

"But nothing more plainly ſhows them to be zoophytes than this circumſtance, That when, by accident, the extremity of their bodies has been ſhrivelled for want of a ſupply of freſh water, the applying more freſh water has given motion to the part of the animal that was ſtill alive; by which means, this ſhapeleſs figure has continued to live and ſwim to and fro all the time it was ſupplied with freſh water.

"I cannot finiſh this part of my remarks on theſe animals, without obſerving, that the excellent Linnæus has joined the *beroë* with the *volvox*, one of the animalcula infuſoria. The beroë is a marine animal, found on our coaſts; of a gelatinous tranſparent nature, and of an oval or ſpherical form, about half an inch to an inch diameter; divided like a melon into longitudinal ribs, each of which is furniſhed with rows of minute fins; by means of which, this animal, like the animalcula infuſoria, can ſwim in all directions with great ſwiftneſs. 46 Beroë deſcribed.

Animalcule.

swiftness. In the same manner I have seen most of those minute animals move so swift that we could not account for it, without supposing such a provision in nature, which is really true, but cannot be seen till the animals grow faint for want of water; then, if we attend, we may with good glasses plainly discover them.

47
Method of discovering the fins of animalcules.

"I have lately found out, by mere accident, a method to make their fins appear very distinctly, especially in the larger kind of animalcula, which are common to most vegetable infusions; such as the terebella. This has a longish body, with a cavity or groove at one end, like a gimlet: by applying, then, a small stalk of the horse-shoe geranium (or geranium zonale of Linnæus), fresh broken, to a drop of water in which these animalcula are swimming, we shall find that they will become torpid instantly; contracting themselves into an oblong oval shape, with their fins extended like so many bristles all round their bodies. The fins are in length about half the diameter of the middle of their bodies. Before I discovered this expedient, I tried to kill them by different kinds of salts and spirits; but though they were destroyed by this means, their fins were so contracted, that I could not distinguish them in the least. After lying in this state of torpidity for two or three minutes, if a drop of clean water is applied to them, they will recover their shape, and swim about immediately, rendering their fins again invisible."

Fig. 3, 4, 5, 6, 7, 8. represent different species of animalcula infusoria, mentioned by Mr Ellis as belonging to the genus of volvox of Linnæus.

Fig. 3. represents the volvox ovalis, or egg-shaped volvox; at (b) and (c) it is expressed in its natural shape; at (a) the manner in which it becomes two animals, by separating across the middle. This was found in the infusion of hempseed; but is found in other vegetable infusions, particularly that of tea-seed.

Fig. 4. is the volvox torquilla, or wryneck. At (a) is represented its divided state; at (b) and (c) its natural state: this is common to most vegetable infusions, as is the following.

Fig. 5. is the volvox volutans, or the roller. At (a) the animal is separated, and becomes two distinct beings, each swimming about and providing for itself; this is often the prey of another species of this genus, especially while it is weak by this separation, not being so active for some time till it can recover itself. At (c) the animal appears to be hurt on one side; this impression in a little time is succeeded by another in the opposite side, as at (b), which soon occasions a division. At (d) is the side-view, and at (e) the front-view, of the natural shape of the animal.

Fig. 6. is the volvox oniscus, or wood-louse. At (a) is the natural shape of it, as it appears full of little hairs both at the head and tail; with those at the head, it whirls the water about to draw its prey to it; the feet, which are many, are very visible, but remarkably so in a side-view at (d). At (b) it is represented beginning to divide; and at (c) the animals are ready to part: in this state, as if in exquisite pain, they swim round and round, and to and fro, with uncommon velocity, violently agitated till they get asunder. This was found in an infusion of different kinds of pine-branches.

Fig. 7. is the volvox terebella, or the gimlet. This is one of the largest of the kind, and is very visible to the naked eye. It moves along swiftly, turning itself round as it swims, just as if boring its way. (a) and (b) are two views of its natural shape, (c) shows the manner of its dividing. When they are separated, the lower animal rolls very awkwardly along, till it gets a groove in the upper part. (d) represents one of them lying torpid, by means of the juice of the horse-shoe geranium, with its fins extended. This animal is found in many infusions, particularly of grass or corn.

Fig. 8. is the volvox vorax, or glutton. This animal was found in an infusion of the Tartarian pine; it varies its shape very much, contracting and extending its proboscis, turning it to and fro, in various directions, as at a, b, c, d, e. It opens its proboscis underneath the extremity, when it seizes its prey. The less active animals, that have lately been divided, such as those at fig. 3. (a), and at fig. 4. (a), serve it as food, when they come in its way: these it swallows down instantly, as it is represented at fig. 8. h and i. At (f) it is ready to divide, and at (g) it is divided; where the hinder-part of the divided animal has got a proboscis or beak, to procure nourishment for itself, and soon becomes a distinct being from the fore-part.

Thus we have given as full an account as our limits would admit, of the most curious kinds of animalcules that have hitherto been observed. We cannot, however, dismiss this subject, without taking notice of some of the most remarkable hypotheses which have been formed concerning their nature and origin.

48
Doctrine of equivocal generation exploded.

Before the invention of microscopes, the doctrine of equivocal generation, both with regard to animals and plants of some kinds, was universally received: but this instrument soon convinced every intelligent person, that those plants which formerly were supposed to be produced by equivocal generation arose from seeds, and the animals, in like manner, from a male and female. But as the microscope threw light upon one part of nature, it left another involved in darkness; for the origin of the animalcula infusoria, or of the spermatic animals already mentioned, remains as yet as much unknown as that of many other kinds was when the doctrine of equivocal generation reigned in full force.

49
Supposed discovery concerning generation.

The discovery of spermatic animalcules was thought to throw some light on the mysterious affair of generation itself, and these minute creatures were imagined to be each of them individuals of the same species with the parent. Here the infinite number of these animalcules was an objection, and the difficulty remained as great as before; for, as every one of these animalcules behoved to be produced from a male and female, to explain their origin by animalcular generation in the same manner, was only explaining generation by itself.

This hypothesis, therefore, having proved unsatisfactory, others have been invented. M. Buffon, particularly, hath invented one, by which he at once annihilates the whole animalcular world; and in this he hath been followed by several very ingenious philosophers. For a particular account of this, so far as it concerns generation, we must refer to that article; but as he gives such a particular account of his having examined the human semen, that we cannot doubt of his accuracy, we shall here contrast his account with that of Mr Liewenhoeck already mentioned.

Animalcule.

50 M. Buffon's experiments on the human semen.

Having procured the seminal vessels of a man who died a violent death, he extracted all the liquor from them while they were still warm; and having examined a drop of it with a double microscope, it had the appearance fig. 9. Large filaments appeared, which in some places spread out into branches, and in others intermingled with one another. These filaments clearly appeared to be agitated by an internal undulatory motion, like hollow tubes, which contained some moving substance. He saw distinctly this appearance changed for that fig. 10. Two of these filaments, which were joined longitudinally, gradually separated from each other in the middle, alternately approaching and receding, like two tense cords fixed by the ends, and drawn asunder in the middle. These filaments were composed of globules that touched one another, and resembled a chaplet of beads. After this, he observed the filaments swelled in several places, and perceived small globular bodies issue from the swelled parts, which had a vibratory motion like a pendulum. These small bodies were attached to the filaments by small threads, which gradually lengthened as the bodies moved. At last, the small bodies detached themselves entirely from the filaments, drawing after them the small thread, which looked like a tail. When a drop of the seminal liquor was diluted, these small bodies moved in all directions very briskly; and had he not seen them separate themselves from the filaments, he would, he says, have thought them to be animals. The seminal matter was at first too thick, but gradually became more fluid; and, in proportion as its fluidity increased, the filaments disappeared, but the small bodies became exceedingly numerous. Each of them had a long thread or tail attached to it, from which it evidently endeavoured to get free. Their progressive motion was extremely slow, during which they vibrated to the right and left, and at each vibration they had a rolling unsteady motion, in a vertical direction.

At the end of two or three hours, the seminal matter becoming still more fluid, a greater number of these moving bodies appeared. They were then more free of incumbrances; their tails were shorter; their progressive motion was more direct, and their horizontal motion greatly diminished. In five or six hours, the liquor had acquired almost all the fluidity it could acquire, without being decomposed. Most of the small bodies were now disengaged from their threads; their figure was oval. They moved forward with considerable quickness, and, by their irregular motions backward and forward, they had now more than ever the appearance of animals. Those that had tails adhering to them, seemed to have less vivacity than the others; and of those that had no tails, some altered both their figure and their size. In twelve hours, the liquor had deposited at the bottom of the vial a kind of ash-coloured gelatinous substance, and the fluid at top was almost as transparent as water. The little bodies being now entirely freed from their threads, moved with great agility, and some of them turned round their centres. They also often changed their figures, from oval becoming round, and often breaking into smaller ones. Their activity always increased as their size diminished. In 24 hours, the liquor had deposited a greater quantity of gelatinous matter, which, being with some difficulty diluted in water, exhibited an appearance somewhat resembling lace. In the clear semen itself only a few small bodies were now seen moving; next day, these were still farther diminished; and after this nothing was to be seen but globules, without the least appearance of motion. Most of the abovementioned appearances are shown fig. 10, 11, 12, 13, 14, 15, 16. Fig. 17. and 18. represent an appearance of the globules in another experiment, in which they arranged themselves in troops, and passed very quickly over the field of the microscope. In this experiment they were found to proceed from a small quantity of gelatinous mucilage.

From these experiments, M. Buffon concludes, that what have been called spermatic animals, are not creatures really endowed with life, but something proper to compose a living creature; and he distinguishes them by the name of *organic particles*. The same individual kinds of animals he declares he has found in the fluids separated from the ovaria of females; and for the truth of this appeals to the testimony of Mr Needham, who was an eye witness of his experiments. He also brings an additional proof of his doctrine from Mr Needham's observations on the milt of the *calmar*, a species of cuttle-fish. Here the spermatic animals, at least what have the only appearance of life, are vastly larger than in any other creature, so as to be plainly visible to the naked eye. When magnified, they appear as at fig. 19. and 20. *a*. Their first appearance is at fig. 19. *a* and *b*, when they resemble springs inclosed in a transparent case. These springs were equally perfect at first as afterwards; only in time they contracted themselves, and became like a kind of screw. The head of the case is a species of valve which opens outward, and through which every thing within may be forced out. It contains, besides, another valve *b*, a little barrel *c*, and a spongy substance *d e*. Thus the whole machine consists of an outer transparent cartilaginous case *a*, the superior extremity of which is terminated by a round head formed by the case itself, and performs the office of a valve. This external case contains a transparent tube; which includes the spring, a piston or valve, a little barrel, and a spongy substance. The screw occupies the superior part of the tube and case, the piston and barrel are situated in the middle, and the spongy substance occupies the inferior part. These machines pump the liquor of the milt; the spongy substance is full of this liquor; and before the animal spawns, the whole milt is only a congeries of these bodies which have sucked up all the liquor of it. Whenever these small machines are taken out of the body of the animal, and put in water, or exposed to the air, they begin to act, as represented fig. 19. and 20; the spring mounts up, and is followed by the piston, the barrel, and the spongy substance which contains the liquor: and, as soon as the spring and the tube in which it is contained begin to issue out of the case, the spring plaits, and the whole internal apparatus moves, till the spring, the piston, and the barrel, have entirely escaped from the case. When this is effected, all the rest instantly follow, and the milty liquor which had been pumped in, and confined in the spongy substance, runs out through the barrel.

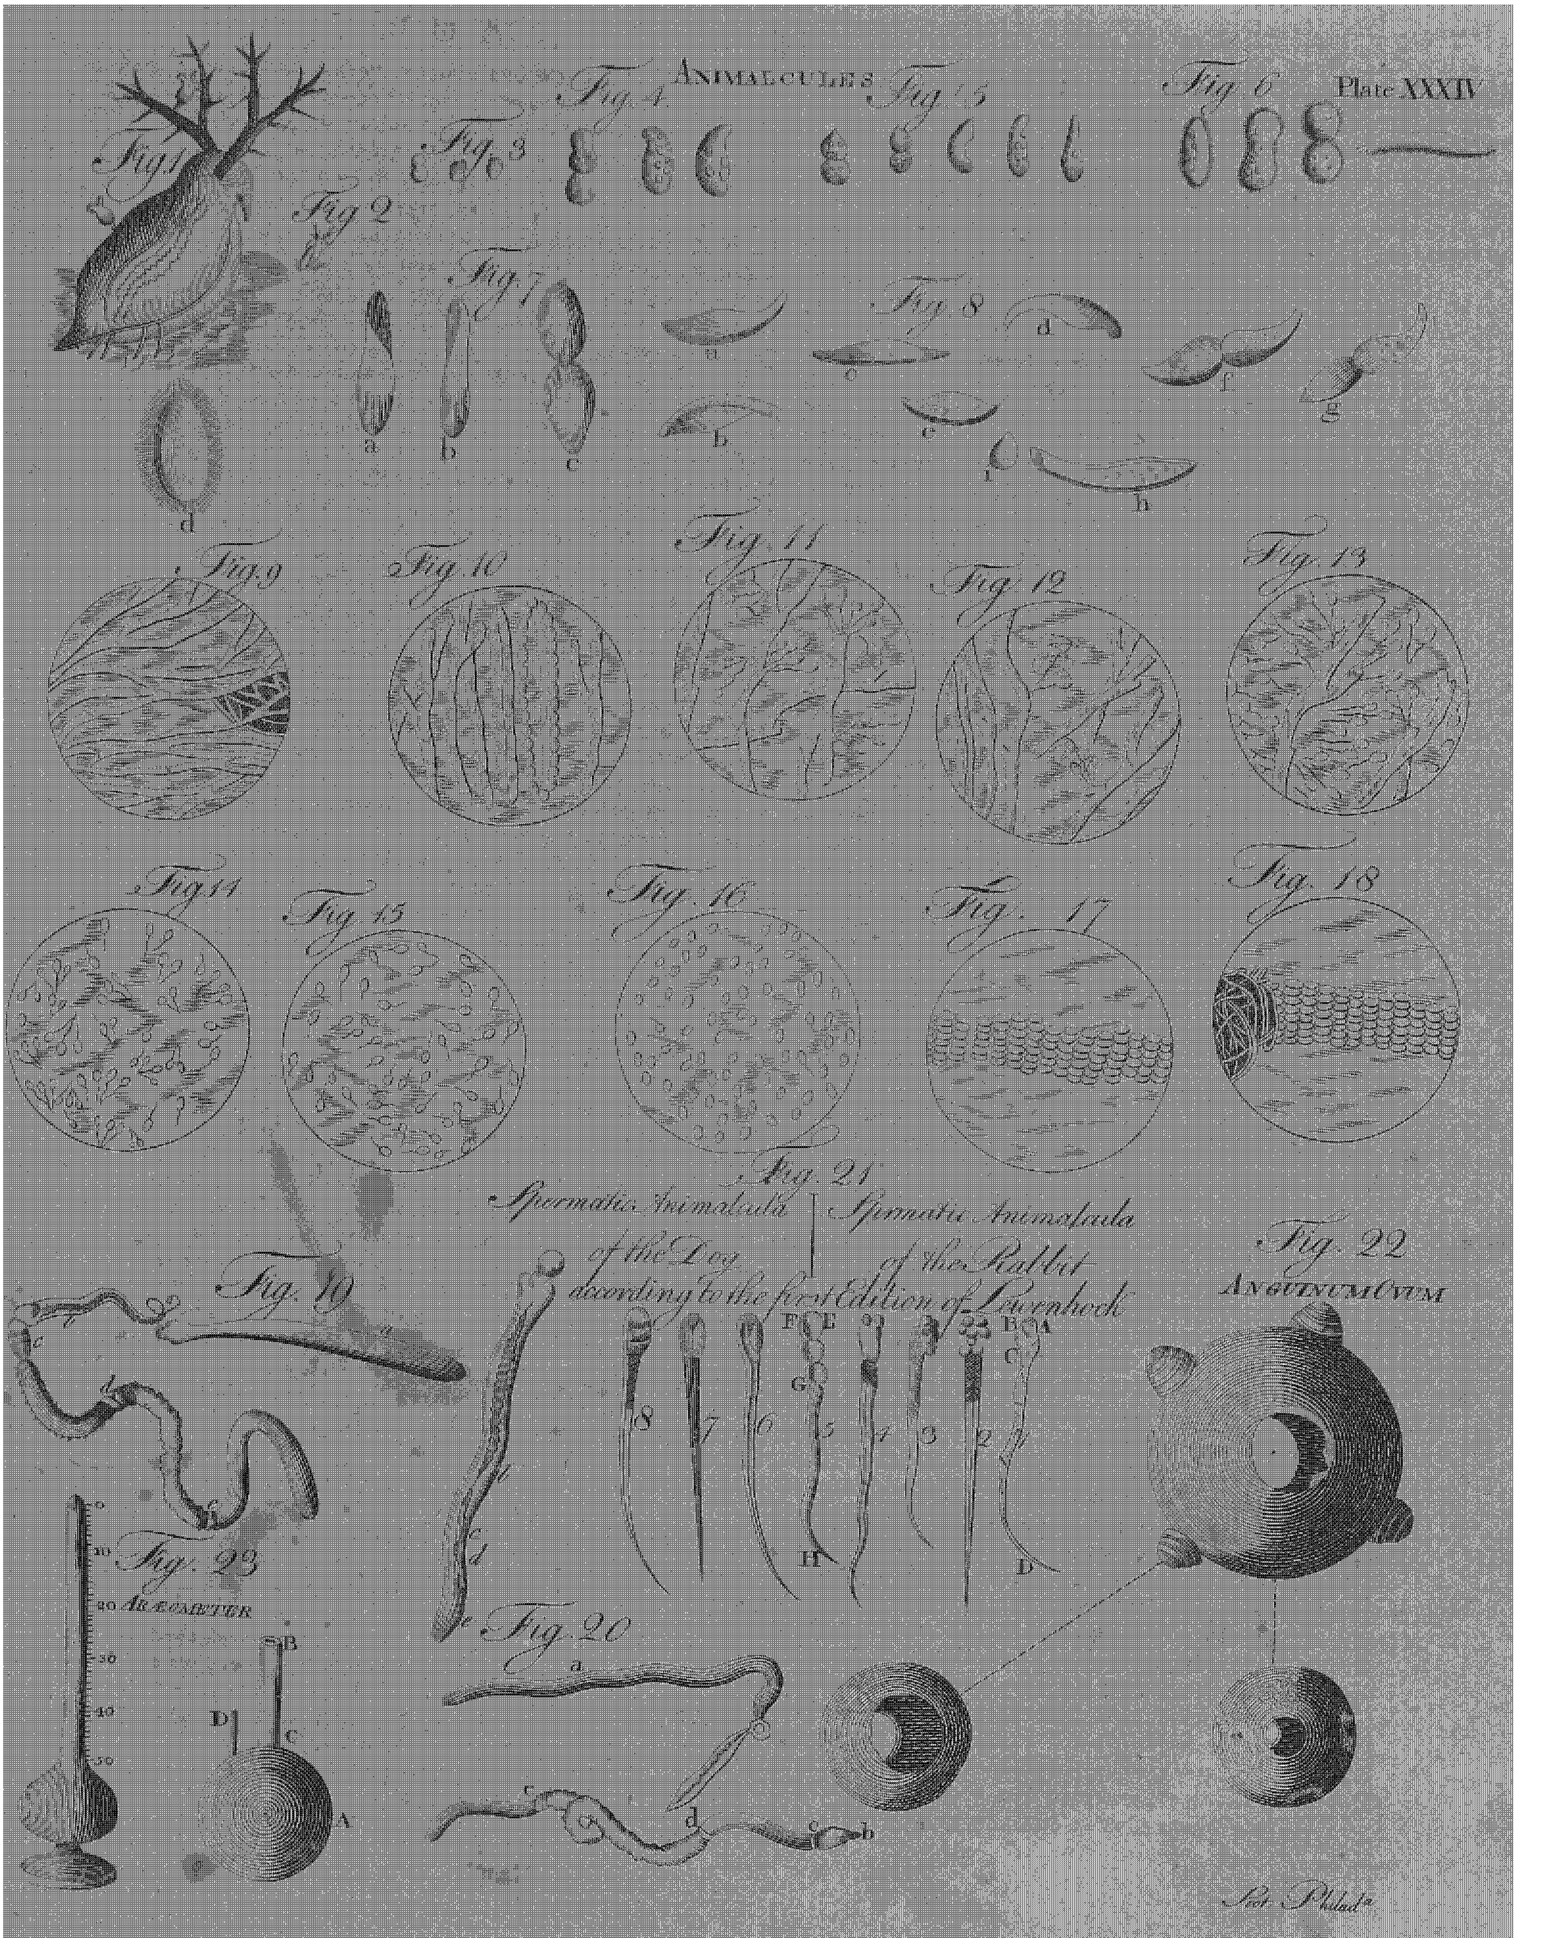
51 Needham's experiments on the milt of the calmar.

Fig. 20.

52 Conclusion against the existence of animalcules

According to this account, the milt of the calmar contains no animalcules; and therefore we may from analogy conclude, that the small moving bodies which are to be seen in the semen of other animals, are not

really



Animalcules

Animalcule. really creatures endowed with life. M. Buffon extends the analogy ſtill further; and concludes, that all the moving bodies which are to be found in the infuſions either of animal or vegetable ſubſtances are of a ſimilar nature. "To diſcover (ſays he) whether all the parts of animals, and all the ſeeds of plants, contained moving organic particles, I made infuſions of the fleſh of different animals, and of the ſeeds of more than 20 different ſpecies of vegetables; and after remaining ſome days in cloſe glaſſes, I had the pleaſure of ſeeing organic moving particles in all of them. In ſome they appeared ſooner, in others later; ſome preſerved their motions for months, and others ſoon loſt it. Some at firſt produced large moving globules reſembling animals, which changed their figure, ſplit, and became gradually ſmaller. Others produced only ſmall globules, whoſe motions were extremely rapid; and others produced filaments, which grew longer, ſeemed to vegetate, and then ſwelled and poured forth torrents of moving globules."

53 Baron Munchanſen's theory.

54 Diſproved by Mr Ellis.

This laſt obſervation gave riſe to a new ſyſtem. Baron Munchanſen, perceiving that the laſt mentioned moving globules, after moving for ſome time, began again to vegetate, concluded that they were firſt animals and then plants.—This ſtrange hypotheſis Mr Ellis has overturned in the paper already quoted; in which he aſſerts, that they are no other than the ſeeds of that genus of fungi called *mucor* or *mouldineſs*, and that their motion is owing to numbers of minute animalcules attacking them for food. "Having (ſays he), at the requeſt of Dr Linnæus, made ſeveral experiments on the infuſion of muſhrooms in water, in order to prove the theory of Baron Munchanſen, that their ſeeds are firſt animals, and then plants (which he takes notice of in his ſyſtem of Nature, p. 1326, under the genus of chaos, by the name of *chaos fungorum ſeminum*), it appeared evidently, that the ſeeds were put into motion by very minute animalcules, which proceeded from the putrefaction of the muſhroom: for, by pecking at theſe ſeeds, which are reddiſh, light, round bodies, they moved them about with great agility in a variety of directions; while the little animals themſelves were ſcarce viſible, till the food they had eaten had diſcovered them. The ſatisfaction I received from clearing up this point, led me into many other curious and intereſting experiments.

"The ingenious Mr Needham ſuppoſes theſe little tranſparent ramified filaments, and jointed or coralloid bodies, which the microſcope diſcovers to us on the ſurface of moſt animal and vegetable infuſions when they become putrid, to be zoophytes, or branched animals: but to me they appear, after a careful ſcrutiny with the beſt glaſſes, to be of that genus of fungi called *mucor*, or *mouldineſs*; many of which Michelius has figured, and Linnæus has accurately deſcribed.

"Their vegetation is ſo amazingly quick, that they may be perceived in the microſcope even to grow and feed under the eye of the obſerver.

"Mr Needham has pointed out to us a ſpecies that is very remarkable for its parts of fructification. (See Philoſophical Tranſactions, vol. xlv. tab. 5. fig. 3. a, A.). This, he ſays, proceeded from an infuſion of bruiſed wheat.

"I have ſeen the ſame ſpecies ariſe from the body of a dead fly, which was become putrid by lying floating for ſome time in a glaſs of water, where ſome flowers had been in the month of Auguſt 1768. This ſpecies of mucor ſends forth a maſs of tranſparent filamentous roots; from whence ariſe hollow ſtems, that ſupport little oblong oval ſeed-veſſels, with a hole on the top of each. From theſe I could plainly ſee minute globular ſeeds iſſue forth in great abundance with an elaſtic force, and turn about in the water as if they were animated.

"Continuing to view them with ſome attention, I could juſt diſcover that the putrid water which ſurrounded them was full of the minuteſt animalcula; and that theſe little creatures began to attack the ſeeds of the mucor for food, as I have obſerved before in the experiment on the ſeeds of the larger kind of fungi or muſhrooms. This new motion continued the appearance of their being alive for ſome time longer: but, ſoon after many of them aroſe to the ſurface of the water, remaining there without motion; and a ſucceſſion of them afterwards coming up, they united together in little thin maſſes, and floated to the edge of the water, remaining there quite inactive during the time of obſervation.

As this diſcovery cleared up many doubts which I had received from reading Mr Needham's learned diſſertation, I put into the glaſs ſeveral other dead flies, by which means this ſpecies of mucor was propagated ſo plentifully, as to give me an opportunity of frequently trying the ſame experiment to my full ſatisfaction.

"Laſtly, Theſe jointed coralloid bodies, which Mr Needham calls *chaplets* and *pearl necklaces*, I have ſeen frequently very diſtinctly. Theſe appear not only on an infuſion of bruiſed wheat when it becomes putrid, but on moſt other bodies when then they throw up a viſcid ſcum and are in a ſtate of putrefaction. Theſe, then, are evidently no more than the moſt common mucor, the ſeeds of which are every where floating in the air; and bodies in this ſtate afford them a natural proper ſoil to grow upon. Here they ſend downwards their fine tranſparent ramified roots into the moiſture which they float upon; and from the upper part of the ſcum, their jointed coralloid branches riſe full of ſeed into little grove-like figures. When a ſmall portion of theſe branches and ſeeds are put into a drop of the ſame putrid water upon which the ſcum floats, many of theſe millions of little animalcula with which it abounds, immediately ſeize them as food, and turn them about with a variety of motions, as in the experiments on the ſeeds of the common muſhrooms, either ſingly, or two or three ſeeds connected together; anſwering exactly to Mr Needham's deſcription, but evidently without any motion of their own, and conſequently not animated."

55 M. Buffon's opinion of different kinds of naimalcules.

M. Buffon, however, is not content with denying life only to thoſe beings where the ſigns of it are the moſt equivocal; but includes in the ſame rank of organic particles, almoſt every animal too ſmall to be diſcovered by the naked eye, and even ſome of thoſe whoſe motions are evidently perceptible to the eye. "Almoſt all microſcopic animals (ſays he), are of the ſame nature with the moving bodies in the ſeminal fluids and infuſions of animal and vegetable ſubſtances. The eels in paſte, in vinegar, &c. are all of the ſame nature, and derived from the ſame origin. There are, perhaps, as many beings that either live or vegetate, produced by a fortuitous aſſemblage of organic particles,

Animalcule.

cles, as by a conſtant and ſucceſſive generation. Some of them, as thoſe of the calmar, are only a kind of machines, which, though exceedingly ſimple, are very active. Others, as the ſpermatic animalcules, ſeem to imitate the movements of animals. Others reſemble vegetables in their manner of growth and extenſion. There are others, as thoſe of blighted wheat, which at pleaſure can be made alternately either to live or die, and it is difficult to know to what they ſhould be compared. There are ſtill others, and in great numbers, which are at firſt a kind of animals, then become a ſpecies of vegetables, and again return alternately to their vegetable ſtate. The eels in paſte have no other origin than the union of the organic particles of the moſt eſſential part of the grain. The firſt eels that appear are certainly not produced by other eels; but though they are not propagated themſelves they fail not to engender other living eels. By cutting them with the point of a lancet, we diſcover ſmaller eels iſſuing in great numbers out of their bodies. The body of this animal ſeems to be only a ſheath or ſac, containing a multitude of ſmaller animals, which perhaps are other ſheaths of the ſame kind, in which the organic matter is aſſimilated into the form of eels."

56 His reaſoning inconcluſive.

Though we can by no means pretend to account for the appearance of theſe animalcules, yet we cannot help obſerving, that our ignorance of the cauſe of any phenomenon is no argument againſt its exiſtence. Though we are not able to account in a ſatisfactory manner for the origin of the native Americans, we ſuppoſe M. Buffon himſelf would reckon it abſurd to maintain that the Spaniards on their arrival there found only *organic particles* moving about in diſorder. The caſe is the very ſame with the eels in paſte. They are exceedingly minute in compariſon with us; but with the ſolar microſcope, Mr Baker has made them aſſume a more reſpectable appearance, ſo as to have a diameter of an inch and an half, or two inches, and a length proportionable. They ſwam up and down very briſkly; the motion of their inteſtines was plainly viſible; when the water dried up, they died with apparent agonies, and their mouths gaped very wide. Were we to find a creature of the ſize of this magnified eel, gaſping in a place where water had lately been, we certainly would never conclude it to be an *organic particle*, or a fortuitous aſſemblage of them; but a fiſh. Why then ſhould we conclude otherwiſe with regard to the eel while in its natural ſtate, than that it is a little fiſh? In reaſoning on this ſubject, we ought always to remember, that, however eſſential the diſtinction of bodies into great and ſmall may appear to us they are not ſo to the Deity; with whom, as Mr Baker well expreſſes himſelf, "an atom is as a world, and a world but as an atom."— Were the Deity to exert his power for a little, and give a natural philoſopher a view of a quantity of paſte filled with eels, from each of whoſe bodies the light was reflected as when it paſſes through a ſolar microſcope; inſtead of imagining them organic particles, the paſte would appear like a little mountain, he would probably look upon the whole as a monſtrous aſſemblage of ſerpents, and be afraid to come near them. Wherever, therefore, we diſcover beings to appearance endowed with the principle of ſelf-preſervation, or whatever elſe we make the characteriſtic of animals, neither the ſmallneſs of their ſize, nor the impoſſibility of our knowing how they come there, ought to cauſe us doubt of their being really animated.—At the ſame time, it muſt alſo be remembered, that *motion* is not always a characteriſtic of animal life, even though the moving bodies ſhould avoid one another, or any ſeeming obſtacle placed in their way. We know, that inanimate bodies, when electrified, will avoid others endowed with an electricity of the ſame kind, and adhere to thoſe which have the oppoſite one. As we are by no means acquainted with the utmoſt powers of electricity, but on the contrary, from what we do know of it have all the reaſon in the world to conclude that it can produce effects utterly beyond our comprehenſion, it is impoſſible for us to know what ſhare it may have in producing the motions obſerved in vegetable infuſions, or in the ſemen of animals.—We may alſo further obſerve, that though in Mr Ellis's experiment of the boiled potatoe he took it for granted that every ſeed of animal life would be deſtroyed by the boiling water, yet even this cannot be proved; nay, on the contrary, it hath been proved by undeniable experiments, that the human body itſelf hath endured a heat of 240 degrees of Fahrenheit (28 degrees above that of boiling water) without injury. The eggs of theſe animalcula might therefore be ſtrong enough to reſiſt the heat hitherto uſed in Mr Ellis's or any other experiment.

57 Animals ſometimes found living in ſolid bodies.

A conſiderable objection to the exiſtence of animalcules in the ſemen or any other part of animal bodies, muſt ariſe from the total excluſion of air which is found ſo neceſſary to the life of larger animals. Some inſtances, however, have been obſerved of large animals being found in ſuch ſituations as they could not poſſibly have enjoyed the leaſt benefit from the air for a great number of years; and in this ſtate they have not only lived, but lived much longer than they would otherwiſe have done.

In Toulon harbour and the road, are found ſolid hard ſtones, and perfectly entire; containing, in different cells, ſecluded from all communication with the air, ſeveral living ſhell-fiſh, of an exquiſite taſte, called *Dactyli*, i. e. Dates: to come at theſe fiſh, the ſtones are broken with mauls. Alſo, along the coaſt of Ancona, in the Adriatic, are ſtones uſually weighing about 50 pounds, and ſometimes even more; the outſide rugged and eaſily broken, but the inſide ſo hard, as to require a ſtrong arm and an iron maul to break them: within them, and in ſeparate niches, are found ſmall ſhell-fiſh, quite alive, and very palatable, called *Solenes* or *Cappe lunghe*. Theſe facts are atteſted by Gaſſendi, Blondel, Mayol, the learned biſhop of Sulturara, and more particularly by Aldrovandi a phyſician of Bologna. The two latter ſpeak of it as a common fact which they themſelves ſaw.

In the volume for 1719, of the Academy of Sciences at Paris, is the following paſſage:

"In the foot of an elm, of the bigneſs of a pretty corpulent man, three or four feet above the root, and exactly in the centre, has been found a live toad, middle ſized, but lean, and filling up the whole vacant ſpace: no ſooner was a paſſage opened, by ſplitting the wood, than it ſcuttled away very haſtily: a more firm and ſound elm never grew; ſo that the toad cannot be ſuppoſed to have got into it. The egg whence it was formed, muſt, by ſome very ſingular accident, have been

been lodged in the tree at its first growth. There the creature had lived without air, feeding on the substance of the tree, and growing only as the tree grew. This is attested by Mr Hubert, professor of philosophy at Caen."

The volume for the year 1731 has a similar observation, expressed in these words:

"In 1719, we gave an account of a fact, which, though improbable, was well attested; that a toad had been found living and growing in the stem of a middling elm, without any way for the creature to come out or to have got in. M. Seigne, of Nantes, lays before the academy a fact just of the very same nature, except that, instead of an elm, it was an oak, and larger than the elm, which still heightens the wonder. He judges, by the time requisite for the growth of the oak, that the toad must have subsisted in it, without air, or any adventitious aliment, during 80 or 100 years. M. Seigne seems to have known nothing of the fact in 1719."

With the two foregoing may be classed a narrative of Ambrose Paré chief surgeon to Henry III. king of France, who, being a very sensible writer, relates the following fact, of which he was an eye witness:

"Being (says he) at my seat, near the village of Meudon, and over-looking a quarry-man whom I had set to break some very large and hard stones; in the middle of one we found a huge toad, full of life, and without any visible aperture by which it could get there. I began to wonder how it received birth, had grown and lived; but the labourer told me, it was not the first time he had met with a toad, and the like creatures, within huge blocks of stones and no visible opening or fissure."

Observations of living toads, found in very hard and entire stones, occur in several authors, particularly Baptist Fulgosa doge of Genoa, the famous physicians Agricola and Horstius, and lord Verulam: others give very specious accounts of snakes, frogs, crabs, and lobsters, being found alive, inclosed within blocks of marble, rocks, and large stones.

An instance similar to these, of the truth of which we have no reason to doubt, was observed in England in the year 1773, where a large toad was found in the middle of a piece of coal having not the least visible crack or fissure.

58 The subject still obscure.

Upon the whole, therefore, though philosophers are not yet able to discover how these minute creatures are produced; yet, that there really are animals much smaller than what we can discern with our naked eye, seems to be indisputable. The subject, however, is still evidently obscure, and will no doubt require the utmost attention of philosophers, as well as further improvements in the construction of microscopes, fully to investigate it.

Animalcula are said to be the cause of various disorders. The itch, from several experiments, is affirmed to be a disorder arising from the irritations of a species of animalcula found in the pustules of that ailment; whence the communication of it by contact from one to another is easily conceived, as also the reason of the cure being effected by cutaneous applications. On this foundation some have attributed the small-pox and measles, and infectious diseases; others the epilepsy, &c. to animalcules. Langius goes farther, and pretends to reduce all diseases in general to the same principle. A late writer at Paris, who assumed the title of an English physician, has done more. He not only accounts for all diseases, but for the operations of all medicines, from the hypothesis of animalcules. He has peculiar animals for every disease; scorbutic animalcules, podagrical animalcules, variolous animalcules, &c. all at his service. Journ. des Sçav. tom. lxxxii. p. 535, &c.

But as most discoveries in natural philosophy have laid a foundation for the warm imaginations of some men to form visionary theories, to the great prejudice of real knowledge; so those relating to animalcula have been drawn in, however improperly, to support the most whimsical and chimerical systems.

Animalcules Invisible.—Naturalists suppose another species or order of invisible animalcules, *viz.* such as escape the cognizance even of the best microscopes, and give many probable conjectures in relation to them. Reason and analogy give some support to the existence of infinite imperceptible animalcules. The naked eye, say some, takes in from the elephant to the mite; but there commences a new order reserved only for the microscope, which comprehends all these from the mite to those 27 millions of times smaller; and this order cannot be yet said to be exhausted, if the microscope be not arrived at its last perfection. See further on this subject the article Microscope.

ANIMATED, or Animate, in a general sense, denotes something endowed with animal life. It also imports a thing to be impregnated with vermin or animalcules.

Animated Horse-hairs. See *Horse-Hairs.*

ANIMATION signifies the informing an animal body with a soul.—The different hypotheses of physicians and philosophers, concerning the time of animation, have had their influence on the penal laws made against artificial abortions; it having been made capital to procure miscarriage in the one state, while in the other it was only deemed a venial crime. The emperor Charles V. by a constitution published in 1532, put the matter on another footing; instead of the distinction of an animated and unanimated fœtus, he introduced that of vital and non-vital fœtus, as a thing of more obvious and easy decision, and not depending on any system either of creation, traduction, or infusion. Accordingly a fœtus is said, in a legal sense, to be animated, when it is perceived to stir in the womb; which usually happens about the middle of the term of gestation.

ANIME, in heraldry, a term used when the eyes of a rapacious creature are borne of a different tincture from the creature itself.

Anime, a resin exsuding from the trunk of a large American tree, called by Piso *jetaiba*, by the Indians *courbaril*, (a species of Hymenæa). This resin is of a transparent amber colour, a light agreeable smell, and little or no taste. It dissolves entirely, but not very readily, in rectified spirit of wine; the impurities, which are often in large quantity, remaining behind. The Brazilians are said to employ anime in fumigations for pains and aches proceeding from a cold cause: with us, it is rarely, if ever, made use of for any medicinal purposes.

ANIMETTA, among ecclesiastical writers, denotes

notes the cloth wherewith the cup of the eucharist is covered.

ANINGA, in commerce, a root which grows in the Antilles islands, and is pretty much like the China plant. It is used by sugar-bakers for refining the sugar.

ANJOU, a province and duchy of France, bounded on the east by Touraine, on the south by Poictou, on the west by Bretagne, and on the north by Maine. It is 70 miles in length, and in breadth 60. Through this province run five navigable rivers: the Loire, which divides it into two parts; the Vienne, the Toue, the Maienne, and the Sarte.

The air is temperate, and the country agreeably diversified with hills and meadows. There are 33 forests of oak-trees mixed with beech. The country produces white-wine, wheat, barley, rye, oats, pease, beans, flax, hemp, walnuts, and some chesnuts. In Lower Anjou they make cyder. There are fruit-trees of all kinds, and pasture proper for horses. The greatest riches of the province consist in cows, oxen, and sheep. There are several coal and iron mines; and yet there are but two forges in the whole province. There are quarries of marble and of slate; as well as quarries of white stone, proper for building, on the side of the river Loire. Here are also several saltpetre-works and some glass-houses. The remarkable towns, besides Angers the capital, are Saumur, Brisac, Pons de Cea, La Fleche, and Beaufort.

ANIO, (Cicero, Horace, Priscian); ANIEN, (Statius); now *il Teverone:* a river of Italy, which falls into the Tiber, three miles to the north of Rome, not far from Antemnæ. It rises in a mountain near Treba, (Pliny); and, running through the country of the Æquiculi, or Æqui, it afterwards separated the Latins from the Sabines; but nearer its mouth, or confluence, it had the Sabines on each side. It forms three beautiful lakes in its course, (Pliny). In the territories of Tibur it falls from a great height, and there forms a very rapid cataract; hence the epithet *præceps*, and hence the steam caused by its fall, (Horace). *Anienus* is the epithet formed from it, (Virgil, Propertius): *Anienus* is also the god of the river, (Propertius, Statius).

ANISUM, or ANISE. See PIMPINELLA.

ANKER, a liquid measure at Amsterdam. It contains about 32 gallons English measure.

ANKLE, in anatomy, the joint which connects the foot to the leg.—We have an account of the menses being regularly evacuated at an ulcer of the ankle, *Edin. Med. Obs.* vol. iii. art. 29.

ANN, or ANNAT, in Scots law, is half a year's stipend, which the law gives to the executors of Ministers of the church of Scotland, over and above what was due to the minister himself, for his incumbency.

ANNA, one of the three principalities into which Arabia deserta is divided.

ANNA, one of the chief cities of the above principality, and formerly a famed mart-town, is situated in Lat. 33. 57. and E. Long. 42. 10. on the river Euphrates, in a fruitful and pleasant soil. It has two streets, which are divided by the river. That on the Mesopotamia side is about two miles long, but thinly peopled, and by none but tradesmen; that on the opposite side is about six miles in length, and it is there that the principal inhabitants of the city dwell. Every house has some ground belonging to it; and these grounds are loaded with noble fruit-trees, as lemons, oranges, citrons, quinces, figs, dates, pomegranates, olives, all very large and in great plenty. Some of the flat grounds are sown with corn and other grain, which yields likewise a considerable crop. This city is the common rendezvous of all the robbers that infest the country, and from which they disperse themselves into all parts of the Desart. Here they meet to consult; here they hold their grand council, and deliberate where to rob next with success. It is with great difficulty that the Turkish aga, and the janissaries, who are kept here, can levy the tribute imposed by the Turks on all the commodities carried through this city, which is one of the great thorough-fares for the passing of the caravans that go to and from Aleppo, Tripoli, Damascus, Bagdad, and some other parts of the Turkish empire.

ANNA Comnena. See COMNENA.

ANNABON. See ANNOBON.

ANNALE, in the Church of Rome, a term applied to the masses celebrated for the dead during a whole year.

ANNALIS CLAVUS, the nail which the Prætor, Consul, or Dictator, drove into the wall of Jupiter's temple annually upon the Ides of September, to show the number of years. But this custom was superseded by reckoning years by consulships. The ceremony was sometimes performed to avert the plague, &c.

ANNALS, in matters of literature, a species of history, which relates events in the chronological order wherein they happened. They differ from perfect history in this, that annals are but a bare relation of what passes every year, as a journal is of what passes every day; whereas history relates not only the transactions themselves, but also the causes, motives, and springs of actions. Annals require nothing but brevity; history demands ornament.—Cicero informs us of the origin of annals. To preserve the memory of events, the *Pontifex Maximus*, says he, wrote what passed each year, and exposed it on tables in his own house, where every one was at liberty to read; this they called *annales maximi*; and hence the writers who imitated this simple method of narrating facts were called *annalists*.

ANNAN, the capital of Annandale, a division of Dumfriesshire in Scotland; a small town, containing 500 or 600 inhabitants, and situated on a river of the same name, in W. Long. 3°. N. Lat. 54. 40. This place, which is a royal borough, has some trade in wine, and exports annually between 20 and 30,000 Winchester bushels (10 and 15,000 bolls) of corn. Vessels of about 250 tons can come within half a mile of the town; and of 60, as high as the bridge; which consists of five arches, defended by a gateway. A fabric for carding and spinning of cotton has lately been erected, and the town begins to increase. Here was formerly a castle; which was built by the Bruces after they became lords of Annandale. Upon the death of David II. the son of King Robert, in 1371, this castle (Lochmaben), and the lordship of Annandale, came to Thomas Randolf Earls of Murray, and went with his sister Agnes to the Dunbars, Earls of March: after their forfeiture it went to the Douglasses, who also, lost it by the same fate; and then having come to Alex-

Annan. Annand.

Alexander Duke of Albany, he, for rebelling against his brother King James III. and plundering the fair of Lochmaben in 1484, was also forfeit. Since which time it continued in the hands of the King, and became the great key of the west border.

The stewarty or district of Annandale, of which Lochmaben castle was the chief fortalice, is a fertile vale, 24 miles long and about 14 miles broad: from its vicinity to England, and the continual incursions and predatory wars of the borderers, the greatest part of it was uncultivated and common: but since the beginning of the present century, or rather within the last thirty years, all these wastes and commons have been divided and brought into culture, and the country has assumed a new appearance; which may be ascribed not only to the division of the commons, but likewise to the improvement made in the roads, and particularly in the great western road from Edinburgh to London by Moffat, Gratney, and Carlysle, running through this vale, and carried on by some gentlemen of the country, after they had obtained an act of parliament for levying a toll to defray the expence of making and keeping it in repair.

Annandale formed a part of the Roman province of Valentia; and Severus's wall ending here, it abounds with Roman stations and antiquities. The camps at Birrens in Middlebie, and on the hill of Burnswork, are still entire, and their form is preserved; and the traces and remains of a military road are now visible in different parts of the country. The ruins of the house or castle of Auchincass, in the neighbourhood of Moffat, once the seat of that potent baron, Thomas Randolph, Earl of Murray, Lord of Annandale, and Regent of Scotland, in the minority of David II. covers above an acre of ground, and even now conveys an idea of the plan and strength of the building. The ancient castle of Comlongan formerly belonging to the Murrays, Earls of Annandale, and now to Lord Stormont, is still in a tolerable state of preservation; but except this castle and that of Hoddom, most of the other old fortalices and towers are now taken down, or in ruins.

Annandale is a marquisate belonging to the Johnstons, and the chief of the name.

ANNAND (William), dean of Edinburgh, in Scotland, the son of William Annand minister of Air, was born at Air in 1633. Five years after, his father was obliged to quit Scotland with his family, on account of their loyalty to the king, and adherence to the episcopal government established by law in that country. In 1651, young Annand was admitted a scholar in University college in Oxford; and though he was put under the care of a presbyterian tutor, yet he took all occasions to be present at the sermons preached by the loyal divines in and near Oxford. In 1656, being then bachelor of arts, he received holy orders from the hands of Dr Thomas Fulwar, bishop of Ardfert or Kerry in Ireland, and was appointed preacher at Weston on the green near Bicester in Oxfordshire, where he met with great encouragement from Sir Francis Norris lord of that manor. After he had taken his degree of master of arts, he was presented to the vicarage of Leighton-Buzzard in Bedfordshire; where he distinguished himself by his edifying manner of preaching, till 1662, when he went into Scotland, in quality of chaplain to John Earl of Middleton the king's high-commissioner to the church of that kingdom. In the latter end of the year 1663, he was instituted to the tolbooth church at Edinburgh, and from thence was removed some years after to the trone church of that city, which is likewise a prebend. In April 1676, he was nominated by the king to the deanery of Edinburgh; and in 1685, he commenced Doctor of Divinity in the university of St Andrew's. He wrote, 1. *Fides Catholica*, or The Doctrine of the Catholic Church in eighteen grand Ordinances, referring to the word, sacraments, and prayer, in purity, number, and nature, catholically maintained, and publicly taught against heritics of all sorts. Lond. 1661-2, 4to. 2. Solutions of many proper and profitable questions, suitable to the nature of each Ordinance, &c. printed with the Fides Catholica. 3. *Panem Quotidianem*; or A short Discourse tending to prove the legality, decency, and expediency, of set forms of prayers in the Churches of Christ, with a particular Defence of the Book of Common Prayer of the Church of England. Lond. 1661, 4to. 4. *Pater Noster*, Our Father; or The Lord's Prayer explained, the sense thereof, and duties therein, from Scripture, History, and the Fathers, methodically cleared, and succinctly opened. Lond. 1670, 8vo. 5. *Mysterium Pietatis*, or The Mystery of Godliness, &c. Lond. 1672, 8vo. 6. *Doxologia*, or Glory to the Father, the Church's Hymn, reduced to glorifying the Trinity. Lond. 1672, 8vo. 7. *Dualitas*, or A twofold subject displayed and opened, conduceable to godliness and peace in order: first *Lex loquens*, the honour and dignity of magistracy, with the duties thereupon, &c. Secondly, *Duorum Unitas*, or The agreement of magistracy and ministry at the election of the honourable magistrates at Edinburgh, and opening of the Diocesan Synod of the Reverend Clergy there. Edin. 1674, 4to. Dr Annand died the 13th of June 1689, and was honourably interred in the Grey-Friars church in Edinburgh.

Annand Annapolis.

ANNANO, a strong fort of Italy, in the duchy of Milan. It has been twice taken by the French; but was restored to the duke of Savoy in 1706. It is seated on the river Tanaro, in E. Long. 8. 30. N. Lat. 44. 40.

ANNAPOLIS, the capital of Maryland, in North America; said to be the wealthiest town of its size in America. Situated at the mouth of the river Severn, about 30 miles south of Baltimore. It was formerly known by the name of Severn, and received its present name in 1694, when it was made a port town, and the residence of a collector and naval officer. The houses are generally large and elegant. The streets generally diverge from the state house like the radii of a circle, the state house is the noblest building of the kind in America. W. Long. 78. 10. N. Lat. 39. 25.

ANNAPOLIS ROYAL, a town of Nova Scotia, is seated in the bay of Fundy; and, though a mean place, was formerly the capital of the province. It has one of the finest harbours in America, capable of containing 1000 vessels at anchor in the utmost security. The place is also protected by a fort and garrison. At the bottom of the harbour is a point of land, which divides two rivers; and on each side there are pleasant meadows, which in spring and autumn are covered with all sorts of fresh-water fowl. There is a trade carried on by the Indians with furs, which they exchange for European goods. W. Long. 64. 5. N. Lat. 45. 10.

ANNATES,

Annates. Annealing.

ANNATES, among ecclesiastical writers, a year's income of a spiritual living.

These were, in ancient times, given to the Pope through all Christendom, upon the decease of any bishop, abbot, or parish-clerk, and were paid by his successor. At the Reformation they were taken from the Pope, and vested in the king; and, finally, Queen Anne restored them to the church, by appropriating them to the augmentation of poor livings.

ANNEALING, by the workmen called *nealing*, is particularly used in making glass: it consists in placing the bottles, &c. whilst hot, in a kind of oven, or furnace, where they are suffered to cool gradually; they would otherwise be too brittle for use.—Metals are rendered hard and brittle by hammering: they are therefore made red hot, in order to recover their malleability; and this is called *nealing*.

The difference between unannealed and annealed glass, with respect to brittleness, is very remarkable. When an unannealed glass-vessel is broken, it often flies into a small powder, with a violence seemingly very unproportioned to the stroke it has received. In general, it is in greater danger of breaking from a very slight stroke than from one of some considerable force. One of those vessels will often resist the effects of a pistol-bullet dropt into it from the height of two or three feet; yet a grain of sand falling into it, will make it burst into small fragments. This takes place sometimes immediately on dropping the sand into it: but often the vessel will stand for several minutes after, seemingly secure; and then, without any new injury, it will fly to pieces. If the vessel be very thin, it does not break in this manner, but seems to possess all the properties of annealed glass.

The same phenomena are still more strikingly seen in glass drops or tears. They are globular at one end, and taper to a small tail at the other. They are the drops which fall from the melted mass of glass on the rods on which the bottles are made. They drop into the tubs of water which are used in the work; the greater part of them burst immediately in the water. When those that remain entire are examined, they discover all the properties of unannealed glass in the highest degree. They will bear a smart stroke on the thick end without breaking; but if the small tail be broken, they burst into small powder with a loud explosion. They appear to burst with more violence, and the powder is smaller in an exhausted receiver than in the open air. When they are annealed, they lose those properties.

Glass is one of those bodies which increase in bulk when passing from a fluid to a solid state. When it is allowed to crystallize regularly, the particles are so arranged, that it has a fibrous texture: it is elastic, and susceptible of long continued vibrations; but when a mass of melted glass is suddenly exposed to the cold, the surface crystallizes, and forms a solid shell round the interior fluid parts: this prevents them from expanding when they become solid. They, therefore, have not the opportunity of a regular crystallization; but are compressed together with little mutual cohesion: On the contrary, they press outward to occupy more space, but are prevented by the external crust. In consequence of the effort of expansion in the internal parts, the greater number of glass drops burst in cooling; and those which remain entire are not regularly crystallized. A smart stroke upon them communicates a vibration to the whole mass, which is nearly synchronous in every part; and therefore the effort of expansion has little more effect than if the body were at rest; but the small tail and the surface only are regularly crystallized. If the tail be broken, this communicates a vibration along the crystallized surface, without reaching the internal parts. By this they are allowed some expansion; and overcoming the cohesion of the thin outer shell, they burst it and are dispersed in powder.

Annealing.

In an unannealed glass-vessel the same thing takes place. Sometimes the vibration may continue for a considerable time before the internal parts overcome the resistance. If the vessel be very thin, the regular crystallization extends through the whole thickness; or at least the quantity of compressed matter in the middle is so inconsiderable, as to be incapable of bursting the external plate.

By the process of annealing, the glass is kept for some time in a state approaching to fluidity; the heat increases the bulk of the crystallized part, and renders it so soft, that the internal parts have the opportunity of expanding and forming a regular crystallization.

A similar process is now used for rendering kettles and other vessels of cast-iron less brittle: of it the same explanation may be given. The greater number of metals diminish in bulk when they pass from a fluid to a solid state; iron, on the contrary, expands.

When cast-iron is broken, it has the appearance of being composed of grains: forged or bar iron appears to consist of plates. Forged iron has long been procured, by placing a mass of cast-iron under large hammers, and make it undergo violent and repeated compression. A process is now used for converting cast-iron into forged, by heat alone. The cast-iron is placed in an air-furnace, and kept for several hours in a degree of heat, by which it is brought near to a fluid state. It is then allowed to cool gradually, and is found to be converted into forged-iron. This process is conducted under a patent; although, if Reaumur's experiments upon cast-iron be consulted, it will appear not to be a new discovery.

By these experiments it is ascertained, that if cast-iron be exposed for any length of time to a heat considerably below its melting point, the texture and properties are not changed: but if it be kept in a heat near the melting point, the surface soon becomes lamellated like forged-iron; and the lamellated structure extends farther into the mass in proportion to the length of time in which it is exposed to that degree of heat. When it is continued for a sufficient time, and then allowed to cool gradually, it is found to possess the lamellated structure throughout.

Cast-iron, then, is brittle, because it has not had the opportunity of crystallizing regularly. When it is exposed to cold while fluid, the surface becoming solid, prevents the inner parts from expanding and arranging themselves into regular crystals. When cast-iron is brought near to the melting-point, and continued for a sufficient length of time in that degree of heat, the particles have the opportunity of arranging themselves into that form of crystals by which forged-iron is distinguished, and by which it possesses cohesion and all its properties.

There

Anne.

There appears, therefore, to be no other essential difference between forged and cast iron, except what arises from the crystallization. Cast-iron is indeed often not sufficiently purified from other substances which are mixed with the calx. It appears also to contain a considerable quantity of calx unreduced; for during the process for converting it into forged-iron by heat alone, a pale flame rises from the metal till near the end of the process. This is owing to fixed air which the heat forces off from the calx. The expulsion of this air reduces the calx, and thereby frees the metal from that injurious mixture.

That this explanation of the annealing of iron is probable, appears also from the well-known fact of forged-iron being incomparably more difficult of fusion than cast-iron. A piece of forged iron requires a very violent heat to melt it; but when it is reduced to a small powder, it melts in a much lower degree of heat. Iron diminishes in bulk when it passes into a fluid state, while most other metals increase in volume. The expansion which heat occasions in bringing them to their melting point, will be favourable to their fluidity, by gradually bringing the particles to the same state of separation in which they are when the mass is fluid; but the expansion of iron by heat removes it farther from that state, and keeps it in the state which is favourable to the continuance of it in a crystallized form. It will not melt till the heat expand it so much that the cohesion of crystallization be overcome. When it is reduced to a minute powder before it be exposed to the heat, it melts sooner. The crystals having been destroyed, that cohesion has no effect in preventing it from passing into a state of fluidity.

Upon the same principles may be explained the almost peculiar property of welding possessed by iron, and and the conversion of forged iron into steel.

But perhaps they may also be applied to platina, a metal which has lately gained much attention. It possesses some of the properties of iron. It is still more difficult of fusion than that metal. It is susceptible of being welded. The natural grains of it can scarcely be melted in the focus of the most powerful burning glass; but when it is dissolved in aqua regia, and precipitated by the vegetable alkali, it has been melted in small globules by the blow-pipe. When precipitated by sal ammoniac, it has been melted in a considerable mass in the heat of a furnace; but it is said to be hard and brittle.

Many attempts have been made to procure a mass of it in a malleable state, but without success. It is said that the process is now discovered by a chemist in Spain. The treatment of the metal is probably very simple. Perhaps it only consists in precipitating it in a minute powder from aqua regia, exposing it to strong heat which melts it, and keeping it for some time in a state nearly fluid, that it may, like iron, crystallize regularly: by this it will possess all its metallic properties.

ANNE, Queen of Great-Britain, daughter of James II. when Duke of York, was born in 1664, and married to Prince George of Denmark in 1683, by whom she had several children, but survived them all. Upon the death of William III. March 8, 1702, she succeeded to the throne, and to a war with France, which was prosecuted under her reign by the great Duke of Marlborough, with more glory than profit to the nation. She effected the long wished-for union between England and Scotland, which took place May 1st, 1707; and dying August 1st, 1714, was succeeded by George Lewis Augustus Elector of Hanover, as the direct descendant from James I. by his daughter Elizabeth queen of Bohemia.

Annecy. Annesley.

St Ann's Day, a festival of the Christian church, celebrated by the Latins on the 26th of July, but by the Greeks on the 9th of December. It is kept in honour of Anne, or Anna, mother of the Virgin Mary.

ANNECY, a city of Savoy, seated between Chamberry and Geneva, on the banks of a lake of the same name, from whence run several brooks, which flow through the town, and uniting at length form a river. There are piazzas in most of the streets of the town, which serve to shelter the inhabitants from rain. It has several collegiate and parish churches, as well as convents for men and women. The lake is about nine miles long and four broad. E. Long. 6. 12. N. Lat. 45. 53.

ANNESLEY (Arthur), Earl of Anglesey, and lord privy seal in the reign of King Charles II. was the son of Sir Francis Annesley, Bart. Lord Mount Morris, and Viscount Valentia, in Ireland; and was born at Dublin on the 10th of July 1614. He was for some time at the university of Oxford, and afterwards studied the law at Lincoln's-Inn. He had a considerable share in the public transactions of the last century: for in the beginning of the civil war he sat in the parliament held at Oxford; but afterwards became reconciled to the opposite party, and was sent commissioner to Ulster, to oppose the designs of the rebel Owen Roe Oneal. He engaged in several other affairs with great success. He was president of the council of state after the death of Oliver, and was principally concerned in bringing about the Restoration: soon after which King Charles II. raised him to the dignity of a Baron, by the title of Lord Annesley, of Newport Pagnel, Bucks; and a short time after, he was made Earl of Anglesey. During that reign he was employed in some very important affairs, was made treasurer of the navy, and afterwards lord privy-seal. In October 1680, his lordship was charged by one Dangerfield, in an information delivered upon oath, at the bar of the house of commons, with endeavouring to stifle evidence in relation to the Popish plot, and to promote the belief of a Presbyterian one. The uneasiness he received from this attack did not prevent his speaking his opinion freely of those matters in the house of lords, particularly in regard to the Popish plot. About the same time he answered the Lord Castlehaven's Memoirs, in which that nobleman endeavoured to paint the Irish rebellion in the lightest colours; and a sharp dispute was raised, which ended in the seals being taken from him. He was a person of great abilities, had uncommon learning, and was well acquainted with the constitution and laws of England. He wrote, besides his Animadversions on Castlehaven's Memoirs, 1. The Privileges of the House of Lords and Commons stated. 2. A Discourse on the House of Lords. 3. Memoirs. 4. The History of the Troubles in Ireland, from the rebellion in 1641 till the restoration. 5. Truth Unveiled, in behalf of the Church of England;—and some other works. He died in April 1686, in the 73d year of his age; and was succeeded by his son James.

Annexation, Annihilation.

ANNEXATION, in law, a term used to imply the uniting of lands or rents to the crown.

ANNIHILATION, the act of reducing any created being into nothing.

Christians, Heathens, Jews, Siamese, Persians, divines, philosophers, &c. have their peculiar systems, sentiments, conjectures, not to say dreams, concerning annihilation; and we find great disputes among them about the reality, the possibility, the means, measures, prevention, ends, &c. of annihilation.

The first notions of the production of a thing from, or reduction of it to, nothing, Dr Burnet shows, arose from the Christian theology; the words *creation* and *annihilation*, in the sense now given to them, having been equally unknown to the Hebrews, the Greeks, and the Latins.

The ancient philosophers in effect denied all annihilation as well as creation, resolving all the changes in the world into new modifications, without supposing the production of any thing new, or destruction of the old. By daily experience, they saw compounds dissolved; and that in their dissolution nothing perished but their union or connection of parts: when in death the body and soul were separated, the man they held was gone, but that the spirit remained in its original the great soul of the world, and the body in its earth from whence it came; these were again wrought by nature into new compositions, and entered new states of being which had no relation to the former.

The Persian bramins hold, that after a certain period of time, consisting of 71 joogs, God not only annihilates the whole universe, but every thing else, angels, souls, spirits, and all, by which he returns to the same state he was in before the creation; but that, having breathed a while, he goes to work again, and a new creation arises, to subsist 71 joogs more, and then to be annihilated in its turn. Thus they hold there have been almost an infinite number of worlds: but how many joogs are elapsed since the last creation, they cannot certainly tell; only in an almanac written in the Shanscrit language in 1670, the world is said to be then 3,892,771 years old from the last creation.

The Siamese heaven is exactly the hell of some Socinians and other Christian writers; who, shocked with the horrible prospect of eternal torments, have taken refuge in the system of annihilation. This system seems countenanced by Scripture; for that the words *death*, *destruction*, and *perishing*, whereby the punishment of the wicked is most frequently expressed in Scripture, do most properly import annihilation and an utter end of being. To this Tillotson answers, that these words, as well as those corresponding to them in other languages, are often used, both in Scripture and other writings, to signify a state of great misery and suffering, without the utter extinction of the miserable. Thus God is often said in Scripture to bring destruction on a nation, when he sends judgments upon them, but without exterminating or making an end of them. So, in other languages, it is frequent, by *perishing*, to express a person's being made miserable; as in that known passage in Tiberius's letter to the Roman senate: *Ita me dii, deæque omnes, pejus perdant, quam hodie perire me sentio.* As to the word *death*, a state of misery which is as bad or worse than death may properly enough be called by that name; and thus the punishment of wicked men after the day of judgment is in the book of Revelations frequently called the *second death*.

Annihilation.

Some Christian writers allow a long time of the most terrible torments of sinners; and after that suppose that there shall be an utter end of their being. Of this opinion Irenæus appears to have been; who, according to M. du Pin, taught that the souls, at least of the wicked, would not subsist eternally; but that, after having undergone their torments for a certain period, they would at last cease to be at all. But Tillemont, Petit, Didier, and others, endeavour to defend Irenæus from this imputation, as being too favourable to the wicked.

It has been much disputed among divines, whether, at the consummation of all things, this earth is to be annihilated, or only purified, and fitted for the habitation of some new order of beings. Gerard in his Common Places, and Hakewil in his Apology, contend earnestly for a total abolition or annihilation. Ray, Calmet, and others, think the system of renovation or restitution more probable, and more consonant to Scripture, reason, and antiquity. The fathers who have treated on the question are divided; some holding that the universe shall not be annihilated, but only its external face changed; others asserting, that the substance of it shall be destroyed.

How widely have the sentiments of mankind differed as to the possibility and impossibility of annihilation! According to some, nothing so difficult; it requires the infinite power of the Creator to effect it: some go further, and seem to put it out of the power of God himself. According to others, nothing so easy: Existence is a state of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all; it will do itself; nay, what is more, it requires an infinite power to prevent it.

Many authors consider preservation as a continual reproduction of a thing, which, subsisting no longer of itself, would every moment return into nothing. Gassendi on the contrary asserts, that the world may indeed be annihilated by the same power which first created it, but that to continue it there is no occasion for any power of preservation.

Some divines, of which number the learned Bishop King seems to be, hold annihilation for the greatest of all evils, worse than even the utmost torments of hell-flames; while others, with some of the eastern philosophers, acknowledge annihilation for the ultimate pitch of happiness human nature is capable of; that sovereign good, that absolute beatitude, so long vainly sought for by the philosophers, is found here. No wonder it had been so long concealed; for who would have thought of looking for the *summum bonum*, where others have placed the sum of misery?

The said prelate proposes it as a question, Whether suffering eternal torments be a greater evil than not existing? He thinks it highly probable, that the damned will be such fools, that, feeling their own misery in the most exquisite degree, they will rather applaud their own conduct, and choose to be, and to be what they are, rather than not to be at all; fond of their condition, however wretched, like people enraged, they will persist in their former sentiments without opening their eyes to their folly, and persevere by way of indignation and revenge. Mr Bayle refutes him on this head; but might, one would think, have saved himself the trouble.

The

The Talapoins hold it the supreme degree of happiness to have the soul totally annihilated, and freed from the burden and slavery of transmigrations. They speak of three Talapoins, who, after a great number of transmigrations, became gods; and when arrived at this state, procured this further reward of their merit to be annihilated. The ultimate reward of the highest perfection man can arrive at is *nieurepan*, or annihilation; which at length is granted to those who are perfectly pure and good, after their souls have wandered many thousand years through various bodies.

ANNI NUBILES, in law denotes the marriageable age of a woman, viz. after she has arrived at twelve.

ANNIVERSARY, the annual return of any remarkable day. Anniversary days, in old times, more particularly denoted those days in which an office was yearly performed for the souls of the deceased, or the martyrdom of the saints was yearly celebrated in the church.

ANNOBON, a small island of Africa, on the coast of Loango, belonging to the Portuguese. It lies in E. Long. 5. 10. S. Lat. 1. 50. and receives its name from being discovered on New-year's day. According to Pyrard, it is about five or six French leagues in compass; but Bandrand says, it is ten leagues round. Here are two high mountains, the tops of which being continually covered with clouds, occasion frequent rains. On the south-east of the island are two rocks; one of which is low, and upon a level with the surface of the sea; the other higher and larger, but both dangerous in the night to shipping; but between them the channel is deep and clear. These rocks are inhabited by vast numbers of birds, so tame, that the sailors frequently catch them with their hands. On the same side of the island is a convenient watering-place at the foot of a rivulet, which tumbles from the mountains down to a valley covered with orange and citron trees, &c. and affording a pleasant and refreshing shade; but the road on the north-west side is difficult and dangerous, though most frequented by ships who have no intention of touching upon the continent. In either place it is difficult to take in a sufficient quantity of water, on account of the violent breakings of the sea, and a stone intrenchment erected by the negroes, from which they annoy all strangers that attempt to land. The true road for shipping lies on the north-east side, where they may anchor in seven, ten, thirteen, or sixteen fathoms, on a fine sand close to the land, opposite to the village where the negroes have thrown up their intrenchments.

The climate is wholesome, and the air clear and serene for the greatest part of the year. Every part of the island is watered by pleasant brooks, and fresh-water springs, which, however, at the new and full moons, or in all high tides acquire a brackishness. The banks of every rivulet are covered with palms, whence the inhabitants extract their wine by incision. Here a number of fertile valleys, which produce Turkey corn, rice, millet, yams, potatoes, &c. and afford pasture for abundance of oxen, sheep, goats, &c. Poultry and fish also abound here; but the only mercantile production is cotton, which is esteemed equal in quality to any produced in India, though the quantity is small.

In the year 1605, the Dutch admiral Matelief found 200 negroes, and two Portuguese, on Annobon, most of them able to bear arms, expert in the use of them, and trained up in military discipline. La Croix says, it has a town opposite to the road that contains above 100 houses, the whole surrounded by a parapet. Most of their dwellings are cane-huts. In the whole island there is not a single house built of stone, and only two of wood, which belong to the Portuguese. All the inhabitants are meanly clothed; the women go bare-headed, and have also the upper part of the body naked, modesty being defended by a piece of linen wrapt under their stomach, and falling down in the form of a petticoat, or wide apron to the knees. As to the men, they wear only a linen girdle round the loins, with a small flap before. The women carry their children on their backs, and suckle them over the shoulder. All the inhabitants are subject to the Portuguese governor, who is the chief person in the island; at the same time that the negroes have their own chief, subordinate to him. They are all rigid catholics, having been either compelled or persuaded by the arguments of the Portuguese to embrace, and, like all other converts, they are bigotted in proportion to the novelty of their belief, and their ignorance of the true tenets.

ANNO DOMINI, i. e. the year of our Lord; the computation of time from our Saviour's incarnation.

ANNOMINATION, in rhetoric, the same with what is otherwise called *paronomasia*. See PARONOMASIA.

ANNONA, in Roman antiquity, denotes provision for a year, of all sorts, as of flesh, wine, &c. but especially of corn. Annona is likewise the allowance of oil, salt, bread, flesh, corn, wine, hay, and straw, which was annually provided by the contractors for the maintenance of an army.

ANNONA, the *Custard Apple*: A genus of the polygynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 52d order, *Coadunatæ*. The characters are: The *calyx* is a triphyllous perianthium: The *corolla* consists of six heart-shaped petals: The *stamina* have scarcely any filaments; the antheræ are numerous, sitting on the receptaculum: The *pistillum* has a roundish germen; no styli; the stigmata obtuse and numerous: The *pericarpium* is a large roundish, unilocular berry covered with a scaly bark: The *seeds* are numerous.

Species. 1. The reticulata, or custard-apple, is a native of the West-Indies, where it grows to the height of 25 feet, and is well furnished with branches on every side: the bark is smooth, and of an ash colour; the leaves are of a light green, oblong, and have several deep transverse ribs or veins, ending in acute points; the fruit is of a conical form, as large as a tennis-ball, of an orange colour when ripe, having a soft, sweet, yellowish pulp, of the consistence of a custard, from whence it has its name. 2. The muricata, or sour-sop, rarely rises above 20 feet high, and is not so well furnished with branches as the other; the leaves are broader, have a smooth surface without any furrows, and are of a shining green colour: the fruit is large, of an oval shape, irregular, and pointed at the top, of a greenish yellow colour, and full of small knobs on the outside: the pulp is soft, white, and of a sour and sweet taste, intermixed, having many oblong, dark-

 coloured

coloured feeds. 3. The fquamofa, or fweet fop, feldom rifes higher than 15 feet, and well furnifhed with branches on every fide. The leaves have an agreeable fcent when rubbed; the fruit is roundifh and fcaly, and when ripe turns of a purple colour, and hath a fweet pulp. 4. The paluftris, or water-apple, grows to the height of 30 or 40 feet. The leaves are oblong, pointed, with fome flender furrows, and have a ftrong fcent when rubbed; the fruit is feldom eaten but by negroes. The tree grows in moift places in all the Weft-India iflands. 5. The Cherimola, with oblong fcaly fruit, is a native of Peru, where it is much cultivated for the fruit, and grows to be a very large tree well furnifhed with branches. The leaves are of a bright green colour, and much larger than thofe of any of the other forts. The fruit is oblong, and fcaly on the out fide, of a dark purple colour when ripe, and the flefh is foft and fweet, intermixed with many brown feeds which are fmooth and fhining. 6. The Africana, with fmooth bluifh fruit. 7. The Afiatica, or purple apple. This grows in fome of the French iflands, as alfo in Cuba, in great plenty. The trees rife to the height of 30 feet or more. The fruit is efteemed by the inhabitants of thofe iflands, who frequently give them to fick perfons. 8. The triloba, or North-American annona, called by the inhabitants *papaw*, is a native of the Bahama iflands, and likewife of Virginia and Carolina. The trunks of the trees are feldom bigger than the fmall of a man's leg, and are about 10 or 12 feet high, having a fmooth greenifh-brown bark. In March, when the leaves begin to fprout, the bloffoms appear, confifting of fix greenifh white petals. The fruit grows in clufters of three, and fometimes of four together: when ripe, they are yellow, covered with a thin fmooth fkin, which contains a yellow pulp of a fweet lufcious tafte. In the middle of this pulp, lie in two rows twelve feeds, divided by as many thin membranes. All parts of the tree have a rank, if not a fetid fmell, nor is the fruit relifhed by many except negroes. Thefe trees grow in low fhady fwamps, and in a very fat foil.

Culture. The laft fort will thrive in the open air in Britain, if it is placed in a warm and fheltered fituation; but the plants fhould be trained up in pots, and fheltered in winter for two or three years till they have acquired ftrength. The feeds frequently remain a whole year in the ground; and therefore the earth in the pots ought not to be difturbed, though the plants do not come up the firft year. If the pots where thofe plants are fown are plunged into a new hot-bed, they will come up much fooner than thofe that are expofed to the open air. All the other forts require to be kept in a warm ftove, or they will not live in Britain.

ANNONÆ PREFECTUS, in antiquity, an extraordinary magiftrate, whofe bufinefs it was to prevent a fcarcity of provifion, and to regulate the weight and finenefs of bread.

ANNONAY, a fmall town of France, in the Upper Vivarais, feated on the river Deunre. E. Long. 4. 52. N. Lat. 45. 15.

ANNOT, a fmall city in the mountains of Provence in France. E. Long. 7. 0. N. Lat. 44. 4.

ANNOTATION, in matters of literature, a brief commentary or remark, upon a book or writing, in order to clear up fome paffage, or draw fome conclufion from it.

ANNOTTA. See ANOTTA.

ANNUAL, in a general fenfe, an appellation given to whatever returns every year, or is always performed within that fpace of time.

ANNUAL Motion of the Earth. See ASTRONOMY.

ANNUAL Leaves, are fuch leaves as come up afrefh in the fpring, and perifh in winter. Thefe ftand oppofed to *Ever-greens*.

ANNUAL Plants, called alfo fimply *annuals*, are fuch as only live their year, *i. e.* come up in the fpring and die again in the autumn; and accordingly are to be recruited every year.

ANNUALRENT is ufed, in Scots law, to denote an yearly profit due by a debtor in a fum of money to a creditor for the ufe of it.

Right of ANNUALRENT, in Scots law, the original method of burdening lands with an yearly payment for the loan of money, before the taking of intereft for money was allowed by ftatute.

ANNUEL OF NORWAY, of which mention is made in the acts of parliament of king James III. was an annual payment of an hundred marks Sterling, which the kings of Scotland were obliged to pay to the kings of Norway, in fatisfaction for fome pretenfions which the latter had to the Scottifh kingdom, by virtue of a conveyance made thereof by Malcom Kenmore, who ufurped the crown after his brother's deceafe. This annuel was firft eftablifhed in 1266; in confideration whereof the Norwegians renounced all title to the fucceffion of the ifles of Scotland. It was paid till the year 1461, when the annuel, with all its arrears, was renounced in the contract of marriage between king James III. and Margaret daughter of Chriftian I. king of Norway, Denmark, and Sweden.

ANNUITY, a fum of money, payable yearly, half yearly, or quarterly, to continue a certain number of years, for ever, or for life.

An annuity is faid to be an arrear, when it continues unpaid after it falls due. And an annuity is faid to be in reverfion, when the purchafer, upon paying the price, does not immediately enter upon poffeffion; the annuity not commencing till fome time after.

Intereft on annuities may be computed either in the way of fimple or compound intereft. But compound intereft being found moft equitable, both for buyer and feller, the computation by fimple intereft is univerfally difufed.

I. *Annuities for a certain time*.

PROBLEM I. Annuity, rate, and time, given, to find the amount, or fum of yearly payments, and intereft.

RULE. Make 1 the firft term of a geometrical feries, and the amount of 1 l. for a year the common ratio; continue this feries to as many terms as there are years in the queftion; and the fum of this feries is the amount of 1l. annuity for the given years; which multiplied by the given annuity, will produce the amount fought.

EXAMPLE. An annuity of 40l. payable yearly, is forborn and unpaid till the end of 5 years; What will then be due, reckoning compound intereft at five *per cent*. on all the payments then in arrear?

1 : 1.05

Annuity.

1 5 5 4 5
1 : 1.05 : 1.1025 : 1.157625 : 1. 21550625 ? whose ſum is 5.525631251. ; and 5.25563125 × 40 = 221.02525 = 221 l. 0s. 6d. the amount ſought.

The amount may alſo be found thus : Multiply the given annuity by the amount of 1 l. for a year ; to the product add the given annuity, and the ſum is the amount in 2 years ; which multiply by the amount of 1 l. for a year ; to the product add the given annuity, and the ſum is the amount in 3 years, &c. The former queſtion wrought in this manner follows.

40 am. in 1 year.	126.1 am. in 3 years
1.05	1.05
42.00	132.405
40	40
82 am. in 2 years,	172.405 am. in 4 years.
1.05	1.05
86.10	181.02525
40	40
126.1 am. in 3 years.	221.02525 am. in 5 years.

If the given time be years and quarters, find the amount for the whole years, as above ; then find the amount of 1 l. for the given quarters ; by which multiply the amount for the whole years ; and to the product add ſuch a part of the annuity as the given quarters are of a year.

If the given annuity be payable half yearly, or quarterly, find the amount of 1 l. for half a year or a quarter ; by which find the amount for the ſeveral half-years or quarters, in the ſame manner as the amount for the ſeveral years is found above.

Prob. 2. Annuity, rate, and time given, to find the preſent worth, or ſum of money that will purchaſe the annuity.

Rule. Find the amount of the given annuity by the former problem ; and then, by compound intereſt, find the preſent worth of this amount, as a ſum due at the end of the given time.

Examp. What is the preſent worth of an annuity of 40l. to continue 5 years, diſcounting at 5 *per cent.* compound intereſt ?

By the former problem, the amount of the given annuity for 5 years, at 5 *per cent.* is 221.02525 ; and by compound intereſt, the amount of 1 l. for 5 years, at 5 *per cent.* is 1.2762815625.

And, 1.2762815625) 221.02525000(173.179 = 173l. 3s. 7d. the preſent worth ſought.

The preſent worth may be alſo found thus : By compound intereſt, find the preſent worth of each year by itſelf, and the ſum of theſe is the preſent worth ſought. The former example done in this way follows.

1.2762815625) 40.000000000	(31.3410
1.21550625) 40.0000000	(32.9080
1.157625) 40.00000	(34.5535
1.1025) 40.000	(36.2811
1.05) 40.0	(38.0952
Preſent worth,	173.1788

If the annuity to be purchaſed be in reverſion, find firſt the preſent worth of the annuity, as commencing immediately, by any of the methods taught above ; and then, by compound intereſt, find the preſent worth of that preſent worth, rebating for the time in reverſion ; and this laſt preſent worth is the anſwer.

Examp. What is the preſent worth of a yearly penſion or rent of 75 l. to continue 4 years, but not to commence till 3 years hence, diſcounting at 5 *per cent?*

.05 : 1 :: 75 : 1500
1.05×1.05×1.05×1.05 = 1.21550625
1.21550625)1500.00000(1234.05371
1500
1234.05371

265.94629, preſent worth of the annuity, if it was to commence immediately.

1.05×1.05×1.05 = 1.157625 *L. s. d.*
1.157625)265.94629(229.7344 = 229 14 8¼

Prob. 3. Preſent worth, rate and time given, to find the annuity.

Rule. By the preceding problem, find the preſent worth of 1 l. annuity for the rate and time given ; and then ſay, As the preſent worth thus found to 1 l. annuity, ſo the preſent worth given to its annuity ; that is, divide the given preſent worth by that of 1 l. annuity.

Examp. What annuity, to continue 5 years, will 173l. 3s. 7d. purchaſe, allowing compound intereſt at 5 *per cent.*

.05 : 1 :: 1 : 20l.
1.05×1.05×1.05×1.05×1.05 = 1.2762815625
1.2762815625)20.0000000(15.6705.
20
15.6705.

4.3295 preſent worth of 1 l. annuity
4.329)173.179(40l. annuity. *Anſ.*

II. *Annuities for ever, or freehold Eſtates.*

In freehold eſtates, commonly called *annuities in fee-ſimple,* the things chiefly to be conſidered are, 1. The annuity or yearly rent. 2. The price or preſent worth. 3. The rate of intereſt. The queſtions that uſually occur on this head will fall under one or other of the following problems.

Prob. 1. Annuity and rate of intereſt given to find the price.

As the rate of 1 l. to 1 l. ſo the rent to the price.

Examp. The yearly rent of a ſmall eſtate is 40l : What is it worth in ready money, computing intereſt 3½ *per cent?*

As .035 : 1 :: 40 : 1142.857142 = *L.* 1142 17 1½.

Prob. 2. Price and rate of intereſt given, to find the rent or annuity.

As 1 l. to its rate, ſo the price to the rent.

Examp. A gentleman purchaſes an eſtate for 4000l. and has 4½ *per cent.* for his money : Required the rent ?

As 1 : .045 :: 4000 : 1 : 180l. rent ſought.

Prob. 3. Price and rent given, to find the rate of intereſt.

As the price to the rent, ſo 1 to the rate.

Examp. An eſtate of 180l. yearly rent is bought for 4000l. : What rate of intereſt has the purchaſer for his money ?

As 4000 : 180 :: 1 :.045 rate ſought.

Prob.

PROB. 4. The rate of interest given, to find how many years purchase an estate is worth.

Divide 1 by the rate, and the quot is the number of years purchase the estate is worth.

EXAMP. A gentleman is willing to purchase an estate, provided he can have $2\frac{1}{2}$ *per cent.* for his money: How many years purchase may he offer?

.025)1.000(40 years purchase. *Ans.*

PROB. 5. The number of years purchase, at which an estate is bought or sold, given, to find the rate of interest.

Divide 1 by the number of years purchase, and the quot is the rate of interest.

EXAMP. A gentleman gives 40 years purchase for an estate: What interest has he for his money?

40)1.000(.025 rate sought.

The computations hitherto are all performed by a single division or multiplication, and it will scarcely be perceived that the operations are conducted by the rules of compound interest; but when a reversion occurs, recourse must be had to tables of annuities on compound interest.

PROB. 6. The rate of interest, and the rent of a freehold estate in reversion, given, to find the present worth or value of the reversion.

By Prob 1. find the price or present worth of the estate, as if possession was to commence presently; and then, by the Tables, find the present value of the given annuity, or rent, for the years prior to the commencement; subtract this value from the former value, and the remainder is the value of the reversion.

EXAMP. A has the possession of an estate of 130l. *per annum*, to continue 20 years; B has the reversion of the same estate from that time for ever: What is the value of the estate, what the value of the 20 years possession, and what the value of the reversion, reckoning compound interest at 6 *per cent*?

By Prob. 1. .06)130.00($2166.\dot{6}666$ value of the estate.
By Tables, 1491.0896 val. of the possession.

675.5770 value of the reversion.

PROB. 7. The price or value of a reversion, the time prior to the commencement, and rate of interest, given, to find the annuity or rent.

By the Tables, find the amount of the price of the reversion for the years prior to the commencement; and then by Prob. 3. find the annuity which that amount will purchase.

EXAMP. The reversion of a freehold estate, to commence 20 years hence, is bought for 675.577l. compound interest being allowed at 6 *per cent.*: Required the annuity or rent?

By the Tables the amount of 675.577l. for 20 years, at 6 *per cent* is } *L.* $2166.\dot{6}$

By Prob. 2. $2166.\dot{6}\times.06 = 130.0$ rent sought.

III. *Life Annuities.*

THE value of annuities for life is determined from observations made on the bills of mortality. Dr Halley, Mr Simpson, and Monf. de Moivre, are gentlemen of distinguished merit in calculations of this kind.

Dr Halley had recourse to the bills of mortality at Breslaw, the capital of Silesia, as a proper standard for the other parts of Europe, being a place pretty central, at a distance from the sea, and not much crowded with traffickers or foreigners. He pitches upon 1000 persons all born in one year, and observes how many of these were alive every year, from their birth to the extinction of the last, and consequently how many died each year, as in the first of the following tables; which is well adapted to Europe in general. But in the city of London, there is observed to be a greater disparity in the births and burials than in any other place, owing probably to the vast resort of people thither, in the way of commerce, from all parts of the known world. Mr Simpson, therefore, in order to have a table particularly suited to this populous city, pitches upon 1280 persons all born in the same year, and records the number remaining alive each year till none were in life.

It may not be improper, however, to observe, that however perfect tables of this sort may be in themselves, and however well adapted to any particular climate, yet the conclusions deduced from them must always be uncertain, being nothing more than probabilities, or conjectures drawn from the usual period of human life. And the practice of buying and selling annuities on lives, by rules founded on such principles, may be justly considered as a sort of lottery or chance-work, in which the parties concerned must often be deceived. But as estimates and computations of this kind are now become fashionable, we shall subjoin some brief account of such as appear most material.

Dr Halley's Table on the bills of mortality at Breslaw.

22	448	46	237	70	69	94	1
23	441	47	228	71	64	95	0

From the preceding tables the probability of the continuance or extinction of human life is estimated as follows.

1. The probability that a person of a given age shall live a certain number of years, is measured by the proportion which the number of persons living at the proposed age has to the difference betweeen the said number and the number of persons living at the given age.

Thus, if it be demanded, what chance a person of 40 years has to live seven years longer? from 445, the number of persons living at 40 years of age in Dr Halley's table, subtract 377, the number of persons living at 47 years of age, and the remainder 68, is the number of persons that died during these 7 years; and the probability or chance that the person in the question shall live these 7 years is as 377 to 68, or nearly as $5\frac{1}{2}$ to 1. But, by Mr Simpson's table, the chance is something less than that of 4 to 1.

2. If the year to which a person of a given age has an equal chance of arriving before he dies, be required, it may be found thus: Find half the number of persons living at the given age in the tables, and in the column of age you have the year required.

Thus, if the question be put with respect to a person of 30 years of age, the number of that age in Dr Halley's table is 531, the half whereof is 265, which is found in the table between 57 and 58 years; so that a person of 30 years has an equal chance of living between 27 and 28 years longer.

3. By the tables, the premium of insurance upon lives may in some measure be regulated.

Thus, the chance that a person of 25 years has to live another year, is, by Dr Halley's table, as 80 to 1; but the chance that a person of 50 years has to live a year longer is only 30 to 1. And, consequently, the premium for insuring the former ought to be to the premium for insuring the later for one year, as 30 to 80, or as 3 to 8.

Annuity.

Prob. I. To find the value of an annuity of 1 l. for the life of a single person of any given age.

Monf. de Moivre, by observing the decrease of the probabilities of life, as exhibited in the table, composed an algebraic theorem or canon, for computing the value of an annuity for life; which canon we here lay down by way of

Rule. Find the complement of life; and, by the tables, find the value of 1 l. annuity for the years denoted by the said complement; multiply this value by the amount of 1 l. for a year, and divide the product by the complement of life; then subtract the quot from 1; divide the remainder by the interest of 1 l. for a year; and this last quot will be the value of the annuity sought, or, in other words, the number of years purchase the annuity is worth.

Examp. What is the value of an annuity of 1 l. for an age of 50 years, interest at 5 *per cent.*?

86
50 are given.

36 complement of life.

By the tables, the value is, 16.5468
Amount of 1 l. for a year, 1.05

827340
165468

Complement of life, 36)17.374140(.482615
From unity, viz. 1.000000
Subtract .482615

Interest of 1 l. .05).517385(10.3477 value sought.

By the preceding problem is constructed the following table.

The

The value of 1 l. annuity for a single life.

Age.	3 *per c.*	$3\frac{1}{2}$ *per c.*	4 *per c.*	$4\frac{1}{2}$ *per c.*	5 *per c.*	6 *per c.*

The above table shows the value of an annuity of one pound for a single life, at all the current rates of interest; and is esteemed the best table of this kind extant, and preferable to any other of a different construction. But yet those who sell annuities have generally one and a half or two years more value, than specified in the table, from purchasers whose age is 20 years or upwards.

Annuities of this sort are commonly bought or sold at so many years purchase; and the value assigned in the table may be so reckoned. Thus the value of an annuity of one pound for an age of 50 years, at 3 *per cent.* interest is 12.51; that is 12l. 10s. or twelve and a half years purchase. The marginal figures on the left of the column of age serve to shorten the table, and signify, that the value of an annuity for the age denoted by them, is the same with the value of an annuity for the age denoted by the numbers before which they stand. Thus the value of an annuity for the age of 9 and 10 years is the same; and the value of an annuity for the age of 6 and 14, for the age of 3 and 24, &c. is the same. The further use of the table will appear in the questions and problems following.

QUEST. 1. A person of 50 years would purchase an annuity for life of 200l.: What ready money ought he to pay, reckoning interest at $4\frac{1}{2}$ *per cent.*?

L.

By the table the value of 1 l. is 10.8
Multiply by 200

Value to be paid in ready money 2164.00 *Ans.*

QUEST. 2. A young merchant marries a widow lady of 40 years of age, with a jointure of 300l. a-year, and wants to dispose of the jointure for ready money: What sum ought he to receive, reckoning interest at $3\frac{1}{2}$ *per cent.*?

By

Annuity.

	L.
By the table the value of 1 l. is	13.98
	300
Value to be received in ready money	4194:00 *Anſ.*

PROB. 2. To find the value of an annuity for the joint continuance of two lives, one life failing, the annuity to ceaſe.

Here there are two caſes, according as the ages of the two perſons are equal or unequal.

1. If the two perſons be of the ſame age, work by the following

RULE. Take the value of any one of the lives from the table; multiply this value by the intereſt of 1 l. for a year; ſubtract the product from 2; divide the foreſaid value by the remainder; and the quot will be the value of 1 l. annuity, or the number of years purchaſe ſought.

EXAMP. What is the value of 100l. annuity for the joint lives of two perſons, of the age of 30 years each, reckoning intereſt at 4 *per cent?*

By the table, one life of 30 years is	14.68
Multiply by	.04
Subtract the product	5872
From	2.0000
Remains	1.4128

And 1.4128) 14.68 (10.39 value of 1l. annuity.

And 10.39×100=1039 the value ſought.

2. If the two perſons are of different ages, work as directed in the following

RULE. Take the values of the two lives from the table; multiply them into one another, calling the reſult the firſt product; then multiply the ſaid firſt product by the intereſt of 1 l. for a year, calling the reſult the ſecond product; add the values of the two lives, and from their ſum ſubtract the ſecond product; divide the firſt product by the remainder, and the quot will be the value of 1 l. annuity, or the number of years-purchaſe ſought.

EXAMP. What is the value of 70l. annuity for the joint lives of two perſons, whereof one is 40 and the other 50 years of age, reckoning intereſt at 5 *per cent?*

By the table the value of 40 years is	11.83
And the value of 50 years is	10.35
Firſt product,	122.4405
Multiply by	.05
Second product,	6.122025
Sum of the two lives,	22.180000
Second product deduct,	6.122025
Remainder,	16.057975

And 16.057975) 122.4405 (7.62 value of 1 l. annuity.
70

533.40 value ſought.

PROB. 3. To find the value of an annuity upon the longeſt of two lives; that is, to continue ſo long as either of the perſons is in life.

RULE. From the ſum of the values of the ſingle lives ſubtract the value of the joint lives, and the remainder will be the value ſought.

EXAMP. What is the value of an annuity of 1 l. upon the longeſt of two lives, the one perſon being 30, and the other 40 years of age, intereſt at 4 *per cent?*

By the table, 30 years is	14.68
40 years is	13.20
	27.88
Value of their joint lives, by Prob. 2. Caſe 2. is,	9.62
Value ſought,	18.26

If the annuity be any other than 1 l. multiply the anſwer found as above by the given annuity.

If the two perſons be of equal age, find the value of their joint lives by Caſe 1. of Prob. 2.

PROB. 4. To find the value of the next preſentation to a living.

RULE. From the value of the ſucceſſor's life ſubtract the joint value of his and the incumbent's life, and the remainder will be the value of 1 l. annuity; which multiplied by the yearly income, will give the ſum to be paid for the next preſentation.

EXAMP. A enjoys a living of 100l. *per annum*, and B would purchaſe the ſaid living for his life after A's death: The queſtion is, What he ought to pay for it, reckoning intereſt at 5 *per cent*. A being 60, and B 25 years of age?

	L.
By the table, B's life is	13.46
Joint value of both lives, by Prob. 2. is	6.97
The value of 1 l. annuity,	6.49
Multiply by	100
Value of next preſentation,	649.00

The value of a direct preſentation is the ſame as that of any other annuity for life, and is found for 1 l. by the table; which being multiplied by the yearly income, gives the value ſought.

PROB. 5. To find the value of a reverſion for ever, after two ſucceſſive lives; or to find the value of a living after the death of the preſent incumbent and his ſucceſſor.

RULE. By Prob 3. find the value of the longeſt of the two lives, and ſubtract that value from the value of the perpetuity, and the remainder will be the value ſought.

EXAMP. A, aged 50, enjoys an eſtate or living of 100l. *per annum;* B, aged 30, is entitled to his lifetime of the ſame eſtate after A's death; and it is propoſed to ſell the eſtate juſt now with the burden of A and B's lives on it: What is the reverſion worth, reckoning intereſt at 4 *per cent?*

	L.
By the table, A's life of 50 is	11.34
B's life of 30 is	14.68
Sum,	26.02
Value of their joint lives, found by Prob. 2. Caſe 2. is	8.60
Value of the longeſt life,	17.42ſub.
From the value of the perpetuity,	25.00
Remains the value of 1 l. reverſion,	7.58
Multiply by	100
Value of the reverſion,	758.00

PROB.

Prob. 6. To find the value of the joint continuance of three lives, one life failing, the annuity to ceaſe.

Rule. Find the ſingle values of the three lives from the table; multiply theſe ſingle values continually, calling the reſult the product of the three lives; multiply that product by the intereſt of 1 l. and that product again by 2, calling the reſult the double product; then, from the ſum of the ſeveral products of the lives, taken two and two, ſubtract the double product; divide the product of the three lives by the remainder, and the quot will be the value of the three joint lives.

Examp. A is 18 years of age; B 34, and C 56: What is the value of their joint lives, reckoning intereſt at 4 *per cent.*?

By the table, the value of A's life is 16.1, of B's 14.12, and of C's 10.01.

$16.1 \times 14.12 \times 10.01 = 2275.6$, product of the three lives,
.04

91.024
2

182.048, double product.

Product of A and B,	$16.1 \times 14.12 \times$	227.33
A and C,	$16.1 \times 10.01 =$	161.16
B and C,	$14.12 \times 10.00 =$	141.34
Sum of all, two and two,	-	529.83
Double product ſubtract	- -	182.048
Remainder	-	347.782

And 347.782)2275.600(6.54 value ſought.

Prob. 7. To find the value of an annuity upon the longeſt of three lives.

Rule. From the ſum of the values of the three ſingle lives taken from the table, ſubtract the ſum of all the joint lives, taken two and two, as found by Prob. 2. and to the remainder add the value of the three joint lives, as found by Prob 6. and that ſum will be the value of the longeſt life ſought.

Examp. A is 18 years of age, B 34, and C 56: What is the value of the longeſt of theſe three lives, intereſt at 4 *per cent*?

By the table, the ſingle value of A's life is	16.1
ſingle value of B's life is	14.12
ſingle value of C's life is	10.01
Sum of the ſingle values,	40.23
By Prob. 2. the joint value of A and B is	10.76
joint value of A and C is	8.19
joint value of B and C is	7.65
Sum of the joint lives,	26.60
Remainder, -	13.63
By Prob. 6. the value of the 3 joint lives is	6.54
Value of the longeſt of the 3 lives,	20.17

Other problems might be added, but theſe adduced are ſufficient for moſt purpoſes. The reader probably may wiſh that the reaſon of the rules, which, it muſt be owned, are intricate, had been aſſigned; but this could not be done without entering deeper into the ſubject than was practicable in this place. See Chances.

Annuities (Borrowing upon); one of the methods employed by government for raiſing ſupplies.

Of this there are two methods; that of borrowing upon annuities for terms of years, and that of borrowing upon annuities for lives.

During the reigns of king William and queen Anne, large ſums were frequently borrowed upon annuities for terms of years, which were ſometimes longer and ſometimes ſhorter. In 1693, an act was paſſed for borrowing one million upon an annuity of 14 *per cent*. or of 140,000*l*. a year for 16 years. In 1691, an act was paſſed for borrowing a million upon annuities for lives, upon terms which in the preſent times would appear very advantageous. But the ſubſcription was not filled up. In the following year the deficiency was made good by borrowing upon annuities for lives at 14 *per cent*., or at little more than ſeven years purchaſe. In 1695, the perſons who had purchaſed thoſe annuities were allowed to exchange them for others of 96 years, upon paying into the exchequer 63 pounds in the hundred; that is, the difference between 14 *per cent*. for life, and 14 *per cent*. for 96 years, was ſold for 63 pounds, or for four and a half years purchaſe. Such was the ſuppoſed inſtability of government, that even theſe terms procured few purchaſers. In the reign of queen Anne, money was upon different occaſions borrowed both upon annuities for lives and upon annuities for terms of 32, of 89, of 98, and of 99 years. In 1719, the proprietors of the annuities for 32 years were induced to accept in lieu of them South Sea ſtock to the amount of eleven and a half years purchaſe of the annuities, together with an additional quantity of ſtock equal to the arrears which happened then to be due upon them. In 1720, the greater part of the other annuities for terms of years both long and ſhort were ſubſcribed into the ſame fund. The long annuities at that time amounted to 666,821*l*. 8*s*. $3\frac{1}{2}$*d*. a year. On the 5th of January, 1775, the remainder of them, or what was not ſubſcribed at that time, amounted only to 136,453*l*. 12*s*. 8*d*.

During the two wars which begun in 1739 and in 1755, little money was borrowed either upon annuities for terms of years, or upon thoſe for lives. An annuity for 98 or 99 years, however, is worth nearly as much money as a perpetuity, and ſhould, therefore, one might think, be a fund for borrowing nearly as much. But thoſe who, in order to make family ſettlements, and to provide for remote futurity, buy into the public ſtocks, would not care to purchaſe into one of which the value was continually diminiſhing; and ſuch people make a very conſiderable proportion both of the proprietors and purchaſers of ſtock. An annuity for a long term of years, therefore, though its intrinſic value may be very nearly the ſame with that of a perpetual annuity, will not find nearly the ſame number of purchaſers. The ſubſcribers to a new loan, who mean generally to ſell their ſubſcription as ſoon as poſſible, prefer greatly a perpetual annuity redeemable by parliament, to an irredeemable annuity for a long term of years of only equal amount. The value of the former may be ſuppoſed always the ſame, or very nearly the ſame; and it makes, therefore, a more convenient transferable ſtock than the latter.

During the two laſt mentioned wars, annuities, either for terms of years or for lives, were ſeldom granted but as premiums to the subscribers to a new loan, over and above the redeemable annuity or interest upon the credit of which the loan was supposed to be made. They were granted, not as the proper fund upon which the money was borrowed; but as an additional encouragement to the lender.

Annuities for lives have occasionally been granted in two different ways; either upon separate lives, or upon lots of lives, which in French are called *Tontines*, from the name of their inventor. When annuities are granted upon separate lives, the death of every individual annuitant disburthens the public revenue so far as it was affected by his annuity. When annuities are granted upon tontines, the liberation of the public revenue does not commence till the death of all the annuitants comprehended in one lot, which may sometimes consist of twenty or thirty persons, of whom the survivors succeed to the annuities of all those who die before them; the last survivor succeeding to the annuities of the whole lot. Upon the same revenue more money can always be raised by tontines than by annuities for separate lives. An annuity, with a right of survivorship, is really worth more than an equal annuity for a separate life, and from the confidence which every man naturally has in his own good fortune, the principle upon which is founded the success of all lotteries, such an annuity generally sells for something more than it is worth. In countries where it is usual for government to raise money by granting annuities, tontines are upon this account generally preferred to annuities for separate lives. The expedient which will raise most money, is almost always preferred to that which is likely to bring about in the speediest manner the liberation of the public revenue.

In France a much greater proportion of the public debts consists in annuities for lives than in England. According to a memoir presented by the parliament of Bourdeaux to the king in 1764, the whole public debt of France is estimated at twenty-four hundred millions of livres; of which the capital for which annuities for lives had been granted, is supposed to amount to three hundred millions, the eighth-part of the whole public debt. The annuities themselves are computed to amount to thirty millions a-year, the fourth part of one hundred and twenty millions, the supposed interest of that whole debt. It is not the different degrees of anxiety in the two governments of France and England for the liberation of the public revenue, which occasions this difference in their respective modes of borrowing; it arises altogether from the different views and interests of the lenders.

In Britain, the seat of government being in the greatest mercantile city in the world, the merchants are generally the people who advance money to government. By advancing it they do not mean to diminish; but, on the contrary, to increase their mercantile capitals; and unless they expected to sell with some profit their share in the subscription for a new loan, they never would subscribe. But if by advancing their money they were to purchase, instead of perpetual annuities, annuities for lives only, whether their own or those of other people, they would not always be so likely to sell them with a profit. Annuities upon their own lives they would always sell with loss; because no man will give for an annuity upon the life of another whose age and state are nearly the same with their own, the same price which he would give for one upon his own. An annuity upon the life of a third person, indeed, is, no doubt, of equal value to the buyer and the seller; but its real value begins to diminish from the moment it is granted, and continues to do so more and more as long as it subsists. It can never, therefore, make so convenient a transferable stock as a perpetual annuity, of which the real value may be supposed always the same, or very nearly the same.

In France, the seat of government not being in a great mercantile city, merchants do not make so great a proportion of the people who advance money to government. The people concerned in the finances, the farmers-general, the receivers of the taxes which are not in farm, the court-bankers, &c. make the greater part of those who advance their money in all public exigencies. Such people are commonly men of mean birth, but of great wealth, and frequently of great pride. They are too proud to marry their equals, and women of quality disdain to marry them. They frequently resolve, therefore, to live bachelors; and having neither any families of their own, nor much regard for those of their relations, whom they are not always very fond of acknowledging, they desire only to live in splendour during their own time, and are not unwilling that their fortune should end with themselves. The number of rich people, besides, who are either averse to marry, or whose condition of life renders it either improper or inconvenient for them to do so, is much greater in France than in England. To such people, who have little or no care for posterity, nothing can be more convenient than to exchange their capital for a revenue, which is to last just as long, and no longer than they wish it to do.

ANNUITY of Tiends, in Scots law, a certain proportion of the tiends of erected benefices formerly payable to the crown, but now gone into disuse.

ANNULAR, in a general sense, something in the form of, or resembling, a ring. It is also a peculiar denomination of the fourth finger, commonly called the *ring-finger*.

ANNULET, in architecture, a small square member in the Doric capital, under the quarter-round.

Annulet is also a narrow flat moulding, which is common to divers places of the columns, as in the bases, capitals, &c. It is the same member which Vitruvius calls a *fillet*; Palladio, a *listil* or *cincture*; Scamozzi, and Mr Brown, a *supercilium*, *list*, *timea*, *eye-brow*, *square rabbit*. See Architecture.

Annulet, a little circle, borne as a charge in coats-of-arms, as also added to them as a *difference*. Among the Romans it represented liberty and nobility. It also denotes strength and eternity, by reason of its circular form.

When this figure is added as a difference, some authors assert, that it serves to remind the bearer to atchieve great actions.

ANNULLING, a term sometimes used for cancelling or making void a deed, sentence, or the like.

ANNUNCIADA, Annuntiada, or Annuntiata, an order of knighthood in Savoy, first instituted by Amadeus I. in the year 1409: their collar was of 15 links, interwoven one with another, in form of a true-lover's knot; and the motto, F. E. R. T. signifying, *Fortitudo ejus Rhodum tenuit.* Amadeus VIII. gave the name *Annunciada* to this order, which was formerly known by that of *the knot of love;* changing at the same time the image of St Maurice patron of Savoy, which hung at the collar, for that of the Virgin Mary; and, instead of the motto above-mentioned, substituting the words of the angel's salutation.

ANNUNCIADA is also the title of several religious orders, instituted at different times, and at different places, in honour of the annunciation. See the next article.

ANNUNCIATION, the tidings brought by the angel Gabriel to the Virgin Mary of the incarnation of Christ.

ANNUNCIATION is also a festival kept by the church on the 25th of March, in commemoration of these tidings. This festival appears to be of very great antiquity. There is mention made of it in a sermon which goes under the name of *Athanasius*. Others carry it up to the time of Gregory Thaumaturgus, because there is a sermon likewise attributed to him upon the same subject. But the best critics reject both these writings as spurious. However, it is certain this festival was observed before the time of the council of Trullo, in which there is a canon forbidding the celebration of all festivals in lent, excepting the Lord's day, and the feast of the annunciation: so that we may date its original from the seventh century.

In the Romish church, on this feast, the pope performs the ceremony of marrying or cloystering a certain number of maidens, who are presented to him in the church, clothed in white serge, and muffled up from head to foot: An officer stands by, with purses containing notes of fifty crowns for those who make choice of marriage, and notes of a hundred for those who choose to veil.

ANNUNCIATION is likewise a title given by the Jews to part of the ceremony of the passover.

ANNUNCIATOR, the name of an officer in the church of Constantinople. It was his business to inform the people of the festivals that were to be celebrated.

ANODYNE (from α privative, and οδυνω, *doleo;* or α neg. and ωδυνη, *pain);* a term applied to medicines which ease pain, and procure sleep. They are divided into three sorts, *viz.* 1. Paregorics, or such as assuage pain. 2. Hypnotics, or such as relieve by procuring sleep. 3. Narcotics, or such as ease the patient by stupifying him.

Opiates and Narcotics destroy sensation. Some hypnotics annd paregorics, as nitre, camphor, &c. procure ease and sleep by removing the offending cause. Camphor is said to be the best anodyne in nervous cases and at the decline of fevers. The doses of these medicines are generally regulated by the pulse.

ANNOINTERS, a religious sect in some parts of England, so called from the ceremony they used of anointing all persons before they admitted them into their church. They founded their opinion of anointing upon the fifth of James, verses 14 and 15.

ANOLYMPIADES, in antiquity, a name given by the Elians to those Olympic games which had been celebrated under the direction of the Pisæans and Arcadians. The Elians claimed the sole right of managing the Olympic games, in which they sometimes met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Elians were at that time reduced very low: this, as well as those managed by the inhabitants of Pisa, they called ανολυμπιαδας, that is, "unlawful Olympiads; and left them out of their annals, wherein the names of their victors and other occurrences were registered.

ANOMALISTICAL YEAR, in astronomy, the time that the earth takes to pass through her orbit: it is also called the *Periodical Year*. The space of time belonging to this year is greater than the tropical year, on account of the procession of the equinoxes. See ASTRONOMY.

ANOMALOUS, a term applied to whatever is irregular, or deviates from the rule observed by other things of the like nature.

ANOMALOUS *Verbs*, in grammar, such as are not conjugated conformably to the paradigm of their conjugation. They are found in all languages. In Latin, the verb *lego* is the paradigm of the third conjugation; and runs thus, *lego, legis, legit:* By the same rule it should be *fero, feris, ferit;* but we say *fero, fers, fert: fero*, then, is an anomalous verb. In English the irregularity relates often to the preter tense and passive participle: for example, *give*, were it formed according to rule, would make *gived* in the preter tense and passive participle: whereas in the former, it makes *gave*, and in the latter *given*.

ANOMALY, in astronomy, an irregularity in the motion of the planets, whereby they deviate from the aphelion or apogee.

ANOMIA, in zoology, a genus of insects belonging to the order of vermes testacea. The shell is bivalve, and the valves are unequal. One valve is perforated near the hinge; affixed by that perforation to some other body. There are 25 species of the anomia; of which only two are natives of the British seas, *viz.* 1. The ephippium, with the habit of an oyster; the one side convex, the other flat; perforated; adherent to other bodies, often to oyster-shells, by a strong tendinous ligature; colour of the inside perlaceous. Size near two inches diameter. 2. The squammula, with shells resembling the scales of fish; very delicate, and silvery; much flatted; perforated; very small. Adheres to oysters, crabs, lobsters, and shells. The species of this genus are commonly called *Beaked cockles*. No name has been given to the fish that inhabit it; for the recent shells of this kind are so very rare, that there is scarcely one to be found perfect. They are perhaps, as well as that which has given its form to the *cornu amonis*, inhabitants of the deepest parts of the ocean; consequently it must be some extraordinary agitation of that great body of water that can bring them at all to our knowledge in their recent state.

The fossile species of the *Anomia* genus are uncommonly numerous in this island, in our chalk-pits and limestone quarries; and, in Gloucestershire, they are as common on the ploughed land as pebbles in other places.

ANOMOEANS, in ecclesiastical history, the name by which the pure Arians were called in the fourth century, in contradistinction to the Semi-Arians. The word is formed from the Greek, ανομοιος, *different, dissimilar:* For the pure Arians asserted, that the Son was of a nature different from, and in nothing like that of the Father: whereas the Semi-Arians acknowledged a likeness of nature in the Son; at the same time that they denied, with the pure Arians, the consubstantiality of the World.—The Semi-Arians condemned the Anomœans in the council of Seleucia; and the Anomœans in their turn condemned the Semi-Arians in the councils of Constantinople and Antioch, erasing the word ὁμοιος, *like*, out of the Formula of Rimini and that of Constantinople.

ANOMORHOMBOIDIA, in natural history, the name of a genus of spars; the word is derived from the Greek ανωμαλης *irregular*, and ρομβοειδης a *rhomboidal* figure. The bodies of this genus are pellucid crystalline spars of no determinate or regular external form, but always breaking into regularly rhomboidal masses; easily fissile, and composed of plates running both horizontally and perpendicularly thro' the masses, but cleaving more readily and evenly in an horizontal, than in a perpendicular direction: the plates being ever composed of irregular arrangements of rhomboidal concretions. Of this genus there are five known species. 1. A white, bright, and shattery one; found in great quantities in the lead-mines of Derbyshire, Yorkshire, and Wales. 2. A milk-white, opake, and shattery one, found in some parts of France, and very plentifully in Germany, and sometimes in Wales and Scotland, and in the hills of Yorkshire. 3. A hard, dull, and snow-white one, found in some of the mines in Derbyshire, and in many of the northern countries. 4. A hard, grey and pellucid one, found in the lead-mines of Yorkshire, and very common in Germany. And, 5. A pellucid and colourless one; this is found in the lead mines of Derbyshire and Yorkshire. All these in some degree have their double refraction of the island crystal. See *Island-Crystal*.

ANONIS, in botany. See Ononis.

ANONYMOUS, something that is nameless, or of which the name is concealed. It is a term usually applied to books that do not express the author's name, or to authors whose names are unknown.

Anonymous, in Commerce.——Partnerships in trade in France are styled anonymous, when they are not carried on under any particular name, but wherein each of the partners trades visibly on his own account, and in his own name; after which all the partners give one another an account of their profit or loss in trade. These sorts of partnerships are concealed, and known only to the parties themselves.

Anonymous Partnerships in Trade, are also in France such, wherein persons of fortune and quality deposit sums of money, in order to share of the profits and loss. To this end those who furnish the capital have no trouble in carrying on the trade, nor do their names appear to be any way interested therein.

Anonymous, in law. The sending anonymous letters demanding money, &c. is felony by the Black Act, 9. Geo. I. cap. 22.

ANOREXIA, anorexy, (from α neg. and ορεξις, *appetite*); a want of appetite, or a loathing of food. The disorder is either original or symptomatic. When it is original, its causes are, bad diet, too free drinking, voraciousness, &c.: In which cases, a vomit or two of ipecacuanha may be taken; and temperance, a light but cordial nourishing diet, and daily exercise, persisted in, will generally effect a recovery. But it is more frequently a symptom of some other disorder; and then the cure depends on the removal of the original one.

ANOSSI, a province of the island of Madagascar, lying between Lat. 23° 18 and 26° S. It is watered by many rivers, most of which run into the *Franchere*, *Ramevatte*, or *Immour*, the spring of which is in a mountain called *Manghage*, and discharges itself into the sea in Lat. 25. 18 S. The mouth of this river is often stopped, and the course to the sea interrupted, unless kept open by the overflowings of great rains and high tides. The water runs salt one league above the mouth, particularly in a free communication with the sea. A lake, called *Ambou*, is formed at the mouth, half a league wide, with depth sufficient for any ship if the mouth of the river was kept open. Next in bigness to the Franchere is the Manghasia, which springs from a mountain called *Siliva*, and empties itself into the sea, where large ships may ride at anchor. Crocodiles breed in these and all the other rivers of the island.

Between the two rivers above mentioned lies Cape St Romain, half a mile distant from the mouth of the Franchere, and which runs from the north-west six or seven leagues into the sea. When the Cape is passed, the coast forms a great bay, in the shape of a cross, which extends to the mouth of a river called *Dian Panouge*, or *Pitorah*. In the middle of this bay the land runs out, and almost forms a peninsula called *Tholangare*. Fort Dauphin lies to the north of this peninsula, and Port Dauphin over against it. This province has several other peninsulas and small islands belonging to it. The country is beautiful; abounds in fruit-trees; is fertile in pasture for cattle; and, if carefully cultivated, would produce all the necessaries of life. It is surrounded by high mountains, which are covered with woods and shrubs; but, about four miles distant from Fort Dauphin, the adjacent hills are quite destitute of verdure. The French often dug in this neighbourhood, expecting to meet with mines of gold and silver, particularly in one mountain where several springs flow near each other and empty themselves into a neighbouring river. In this river they found several stones and heaps intermixed with yellow clay, with a great quantity of black and white spangles shining like silver, which they carefully pounded and washed, but without effect. About 60 yards above these springs the grass, and every sort of vegetable, appears half dried and yellow, from a metalline sulphur, which gives that aspect; but the top of the mountain is covered with a fresh and beautiful verdure. It is said that the Portuguese found gold at the foot of this mountain on the north side, but that the place they had dug was filled up by the chiefs of the country after the Portuguese had been driven out.

The province of Anossi is inhabited by three different sorts of whites, and four sorts of negroes. The whites are distinguished by the names of *Rohandrians Anacandrians*, and *Ondzatsi*. The whites are distinguished from the negroes by the general name of *Zaferamini*, or *Rahimini*; and the Rohandrians are distinguished above the other whites. When they proceed to an election of a sovereign, whom they call *Ompiandrian*, or *Dian Bahouache*; he is chosen from the Rohandrian race. Next to him the others hold the rank of princes, and are honoured as such by all the rest of the subjects. The Anacandrians are descendants of the chiefs, but who have degenerated, and are accounted the bastards of princes, or those who are descended from a Rohandrian and any inferior white or black woman. These are likewise called by the name of *Ontempassemaca*, or people from the sandy parts of Mecca, from whence, they say, came the Rohandrians. Both the Rohandrians and Anacandrians wear long hair, which hangs down in curls; and enjoy the privilege of killing beasts. The Ondzatsi, or lowest class of whites, are descended from the bastards of the Anacandrians. These are all fishermen, and are allowed to kill no land-animal except a chicken.

The four classes of negroes are named *Voadziri Lohavohits*, *Ontsoa*, and *Ondeves*. The Voadziri, the most powerful and the richest, are masters of several vilages, and descended from the original lords of the country. They enjoy the privilege of killing beasts, when at a distance from the whites, and no Rohandrian or Anacandrian in the village. The Lohavohits are descendants from the Voadziri, and also lords; but with this difference, that the one commands a whole district, and the jurisdiction of the others extends only to their own village and family. They are also permitted to kill those beasts they intend to eat, when at a distance from the whites. The Ontsoa are next to the Lohavohits, and are their near relations. The Ondeves are the lowest of all, being originally slaves by father and mother. The Voadziri, Lohavohits, and Ontsoa, enjoy the privilege of submitting themselves, on the death of their lord or king, to any chief they please. In return for such homage the new lord makes them a present, in consequence of which he becomes heir to all their possessions. Hence the lower classes both of whites and blacks, when death approaches, are under the greatest concern and anguish of mind, well knowing that their lords will not fail to deprive their children of every thing they possess. The Ondeves have not the same liberty with the others: but, in times of famine, the chiefs are obliged to supply them with necessaries; which if they fail to do, they have the liberty of submitting themselves to new masters. The inhabitants of this province have no temples, and very little appearance of religion; only they keep up a custom of immolating beasts upon particular occasions, as in sickness, planting yams or rice, on assemblies, &c. They offer the first-born beast to the devil and to God, naming the devil first, in this manner, *Dianbilis Aminhanhabare*, or "Lord Devil and God."—There are several towns on the river Franchere; and near this river the Portuguese had a fort built upon a steep rock, and several buildings below, with inclosures, which furnished all sorts of necessaries for their subsistence; but they were all massacred by the natives.

This province seems originally to have been inhabited by negroes. The whites or Zaferamini settled in it about 200 years ago, and conquered the negroes. But they themselves were conquered by the French, though under the government of a king whom they honoured as a god. In 1642, Captain Rivault obtained a permission to establish a colony in this part of the island; and accordingly he took possession of it in the name of the king of France, in the month of September, that same year. The French landed 200 men well armed and provided with store of ammunition and other necessaries for building a fort, which they immediately set about; but no sooner did the natives observe their intention, than they used their utmost art to prevent their design from taking effect. This created a war, in which the French were victors; and, the natives becoming in time much better reconciled to them, they intermarried, and lived up and down in several towns at some distance from one another, not above five or six in a place. This tranquillity lasted for some years; but at last the natives, growing jealous, resolved to free themselves from a foreign yoke, and accordingly formed a conspiracy to cut off all the French in one day; which they soon after effected, not leaving a single person alive. In 1644 the above-mentioned Fort Dauphin was erected in Lat. 25. 6. S. Many buildings were erected, behind the Fort, adjoining to the governor's house, with great inclosures that produced every sort of fruit and kitchen herb. In 1656 this fort was accidentally destroyed by fire; but was soon after repaired, and still continues, notwithstanding the catastrophe above mentioned, and its garrison carries on frequent wars with the natives.

ANOTTA, or ARNOTTA, in dyeing, an elegant red colour, formed from the pellicles or pulp of the seeds of the BIXA, a tree common in South America. It is also called *Terra Orleana*, and *Roucou*.

The manner of making anotta is as follows: The red seeds cleared from the pods, are steeped in water for seven or eight days or longer, till the liquor begins to ferment; then strongly stirred, stamped with wooden paddles and beaters, to promote the separation of the red skins: this process is repeated several times till the seeds are left white. The liquor, passed through close cane-sieves, is pretty thick, of a deep red colour, and a very ill smell; in boiling, it throws up its colouring matter to the surface in form of scum, which is afterwards boiled down by itself to a due consistence, and made up while soft into balls. The anotta commonly met with among us, is moderately hard and dry, of a brown colour on the outside, and a dull red within. It is difficultly acted upon by water, and tinges the liquor only of a pale brownish-yellow colour. In rectified spirit of wine, it very readily dissolves, and communicates a high orange or yellowish red. Hence it is used as an ingredient in varnishes, for giving more or less of an orange-cast to the simple yellows. Alkaline salts render it perfectly soluble in boiling water, without altering its colour. Wool or silk boiled in the solution acquire a deep, but not a very durable, orange-dye. Its colour is not changed by alum or by acids, any more than by alkalis: but when imbibed in cloth, it is discharged by soap, and destroyed by exposure to the air. It is said to be an antidote to the poisonous juice of manioc or cassava.—Labat informs us, that the Indians prepare an anotta greatly superior to that which is brought to us, of a bright shining red colour, almost equal to carmine: that, for this purpose, instead of steeping and fermenting the seeds in water, they rub them with the hands, previously dipt in oil, till the pellicles came off, and are reduced into a clear paste; which is scraped off from the hands with a knife, and laid on a clean leaf in the shade to dry. De Laet, in his notes on Margrave's natural history of Brazil, mentions also two kinds of anotta; one of a permanent crimson colour, used as a fucus or paint for the face; and another which gives a colour inclining

more

more to that of saffron. This last, which is our anotta, he supposes to be a mixture of the first sort with certain resinous matters, and with the juice of the root of the tree. The wax or pulp in which the seeds are inclosed is a cool agreeable rich cordial, and has been long in use among the Indians and Spaniards in America, who still mix it with their chocolate, both to heighten the flavour and raise the colour. It is said to be a successful remedy in bloody-fluxes. The roots have much the same properties with the wax; but these are observed to work more powerfully by the urinary passages: they are used by some people in their broths, and seem to answer all the purposes of the pulp, but in a more faint degree. See Bixa.

ANOUT, a small island in the Schagerrack, or that part of the sea of Denmark which has Norway on the north, Jutland on the west, and the isle of Zealand on the south; it lies in 13° E. Long. and 56° 36′ N. Lat.

ANSÆ, in astronomy, implies the parts of Saturn's ring projecting beyond the disk of the planet.—The word is Latin, and properly signifies *handles*; these parts of the ring appearing like handles to the body of the planet.

ANSARIANS, a people of Syria, so called in the country, but styled in Delisle's maps *Ensarians*, and those of Danville, *Nassaris*. The territory occupied by these Ansaria is that chain of mountains which extends from Antakia to the rivulet called *Nahr-el-Kahir*, or the Great River. The history of their origin, though little known, is yet instructive. The following account is from the *Bibliotheque Orientale* of Assemani, a writer who has drawn his materials from the best authorities.

"In the year of the Greeks 1202 (A. D. 891), there lived at the village of Nasar, in the environs of Koufa, an old man, who, from his fastings, his continual prayers, and his poverty, passed for a saint: several of the common people declaring themselves his partizans, he selected from among them twelve disciples to propagate his doctrine. But the commandant of the place, alarmed at his proceedings, seized the old man, and confined him in prison. In this reverse of fortune, his situation excited the pity of a girl who was slave to the goaler, and she determined to give him his liberty: an opportunity soon offered to effect her design. One day when the goaler was gone to bed intoxicated, and in a profound sleep, she gently took the keys from under his pillow, and after opening the door to the old man, returned them to their place unperceived by her master: the next day when the goaler went to visit his prisoner, he was extremely astonished at finding he had made his escape, and the more so since he could perceive no marks of violence. He therefore judiciously concluded he had been delivered by an angel, and eagerly spread the report, to avoid the reprehension he merited; the old man, on the other hand, asserted the same thing to his disciples, and preached his doctrines with more earnestness than ever. He even wrote a book, in which, among other things, he says, 'I, such a one, of the village of Nasar, have seen Christ who is the word of God, who is Ahmad, son of Mohammad, son of Hanafa, of the race of Ali; who also is Gabriel: and he said to me, Thou art he who readeth (with understanding); thou art the man who speaketh truth; thou art the camel which preserveth the faithful from wrath; thou art the beast which carrieth their burden; thou art the (Holy) Spirit, and John, the son of Zachary. Go, and preach to men that they make four genuflections in praying; two before the rising of the sun, and two before his setting, turning their faces towards Jerusalem: and let them say, three times, God Almighty! God Most High! God Most Great! Let them observe only the second and third festival; let them fast but two days annually; let them not wash the prepuce, nor drink beer, but as much wine as they think proper; and lastly, let them abstain from the flesh of carnivorous animals.' This old man passing into Syria, propagated his opinions among the lower orders of the country people, numbers of whom believed in him: And after a few years he went away, and nobody ever knew what became of him."

Such was the origin of these Ansarians, who are, for the most part, inhabitants of the mountains before mentioned.

The Ansaria are divided into several tribes or sects; among which are distinguished the Shamsia, or adorers of the sun; the Kelbia, or worshippers of the dog; and the Kadmousia, who are said to pay a particular homage to that part in women which corresponds to the priapus.

Many of the Ansaria believe in the metempsychosis; others reject the immortality of the soul; and in general, in that civil and religious anarchy, that ignorance and rudeness which prevail among them, these peasants adopt what opinions they think proper, following the sect they like best, and frequently attaching themselves to none.

Their country is divided into three principal districts farmed by the chiefs called *Mokaddamim*. Their tribute is paid to the Pacha of Tripoli, from whom they annually receive their title. Their mountains are in general not so steep as those of Lebanon, and consequently are better adapted to cultivation; but they are also more exposed to the Turks, and hence doubtless, it happens, that with great plenty of corn, tobacco, wines, and olives, they are more thinly inhabited than those of their neighbours the Maronites and the Druzes.

ANSE, an ancient town of France, in the Lyonois, ten miles north of Lyons, Long. 6. 55. N. Lat. 45. 55.

ANSELM, archbishop of Canterbury, in the reigns of William Rufus and Henry I. He was born in the year 1033, at Aost, a town in Savoy at the foot of the Alps. He became a monk in the abbey of Bec in Normandy; of which he was afterwards chosen prior, and then abbot. In the year 1092, he was invited over to England by Hugh Earl of Chester; and in the year following was prevailed on, as we are told, with great difficulty, to accept the archbishopric of Canterbury. He enjoined celibacy on the clergy; for which he was banished by king Rufus, but recalled by Henry at his coming to the crown. He refused to consecrate such bishops as were invested by the king, according to pope Urban's decree; flatly denying it to be the king's prerogative: for this he was outed again; till, the pope and king agreeing, he was recalled in 1107. In short, from the day of his consecration to that of his death, he was continually employed in fighting the prerogative of the church against that of the crown; and for that purpose spent much of his time in travelling backwards and forwards between England and Rome, for the advice and direction of his Holiness. At the council of Bari, in the kingdom of Naples, the pope being puzzled by the arguments of the Greeks against the Holy Ghost's proceeding from the Father, he called upon Anselm, who was present, and he discussed their objections with great applause. Priests call him a resolute saint; to other people he appears to have been an obstinate and insolent priest. He wrought many miracles, if we believe the author of his life, both before and after his death, which happened at Canterbury, in the 76th year of his age, anno 1109. He was canonised in the reign of Henry VII. Anselm, though we may disregard him as a saint, deserves to be remembered as one of the principal revivers of literature, after three centuries of profound ignorance.

His works have been printed in different years, and at different places, viz. Nuremb. 1491. Paris 1544 and 1549. Venice 1549. Cologn 1573 and 1612. Lyons 1630. But the best is that of father Gerberon, printed at Paris 1675. It is divided into three parts; the first contains dogmatical tracts, and is intitled *Monologia;* the second contains practical and devotional tracts; the third part consists of letters, in four books.

ANSER, in ornithology, the trival name of a species of anas. See Anas.

Anser, in astronomy, a small star, of the fifth or sixth magnitude, in the milky way, between the swan and eagle, first brought into order by Hevelius.

ANSERES, the name which Linnæus gives to his third order of birds. See Zoology, n° 8.

ANSIBARII, or Ansivarii, an ancient people of Germany, situated somewhere in the neighbourhood of the Chauci. All we know of their history is, that in the reign of the Emperor Nero, they were driven from their own pessessions by the Chauci. Being then in a forlorn condition, they took possession of some uninhabited lands, which had been used as pasture for the horses of the Roman soldiers. They were led by one Boiocalus, a man of great valour, and of known fidelity to the Romans. He remonstrated to the Romans, who objected to their taking possession of these lands, That the territory in dispute was large; and requested, that it might be allowed to an unhappy people, driven from their own habitations: that, at the same time, wide tracts might be retained for the horses and cattle of the soldiers to graze in: that it was inconsistent with humanity to famish men in order to feed beasts. &c. and at last, lifting up his eyes to heaven, he asked the celestial luminaries how they could behold a desolate soil, and if they would not more justly let loose the sea to swallow up usurpers, who had engrossed the whole earth? To this the Roman commander, Avitus, replied, that the weakest must submit to the strongest; and that since the gods, to whom they had appealed, had left the sovereign judgment to the Romans, they were resolved to suffer no other judges than themselves. To Boiocalus himself, however, he privately offered lands as a reward for his long attachment to the Romans: but this offer the brave German rejected, as a price for betraying his people; adding, "A place to live in we may want, but a place to die in we cannot." The Ansibarii now invited the neighbouring nations to join them against the Romans; but they, dreading the power of that nation, refused to give them any assistance: upon which they applied to the neighbouring nations, begging leave to settle in their territories; but being every where driven out as enemies and intruders, these unhappy people were reduced to wander up and down till every one of them perished.

ANSIKO, a kingdom of Africa, bounded on the west by the river Umbre which runs into the Zaire, the kingdom of Wangua, and the Amboes who border on Loango; on the north, by some desarts of Nubia; and on the south, by Songo and Sonda, provinces of Congo. Here are great numbers of wild beasts, as lions, rhinoceroses, &c. and many copper mines. The king of Ansiko, or the great Macoco, commands 13 kingdoms, and is esteemed the most powerful monarch in Africa. The inhabitants of Angola have a tradition, that this is the proper country of the Giagas, who came originally from Sierra Leona, and over-ran like a torrent the whole coast as far as Benguela; that, being weakened by numerous battles, and unable to force the defiles in order to return to Sierra Leona, they arrived on the borders of Monomotapa, where being defeated, they were forced to remain in the provinces of Ansiko. Be this as it will, the Ansikans yield not in the least to the Giagas in fierceness and barbarity. They are so accustomed to the eating of human flesh, that it is asserted they have markets where it is publicly sold, and that there are no other graves for the dead than the bellies of the living. They try the courage of their prisoners of war by shooting at them as at marks, directing their arrows above or around their heads; and whoever discovers the least signs of fear, is immediately devoured without remedy. Those who appear intrepid and resolute, have their noses and ears bored, and two fore-teeth of the upper jaw drawn. They are then improved in barbarity, by accustoming them to the most horrid cruelties.

The Ansikans are neat, well-proportioned, and strong; wandering about from place to place, without either sowing or reaping. They are dreaded for their extreme brutality, and never traded with by the Europeans. Their language is barbarious, and difficult to be learned, even by the inhabitants of Congo. The most distinguished among them wear red and black caps of Portuguese velvet: the lower ranks go naked from the waist upwards; and, to preserve their health, anoint their bodies with a composition of pounded white sandal-wood and palm-oil. Their arms are battle-axes, and small but very strong bows adorned with serpents skins. Their strings are made of supple and tender shoots of trees, that will not break, and their arrows of hard and light wood. These people, who kill birds flying, shoot with such surprising swiftness, that they can discharge 28 arrows from the bow before the first falls to the ground. With equal dexterity they manage their battle-axes; one end of which is sharpened and cuts like a wedge, and the other flattened like a mallet, with a handle set between, about half the length of the iron, rounded at the end like an apple, and covered with the skin of a serpent.—The current money in this country is the zimbis or shell, which is fished for, and passes among several African nations.—they worship the sun as their chief deity; whom they represent by the figure of a man, and the moon by that of a woman. They have also an infinite number of inferior deities, each individual having a particular idol whom he addresses on certain occasions.

ANSLO, a sea-port town of Norway, in the province of Aggerhuys, with a bishop's see. The supreme court of justice is held here for Norway. It is seated on a bay of the same name. E. Long. 10. 14. N. Lat. 50. 24.

ANSON (George), a gentleman whose merit and good fortune, as a naval commander, exalted him to the rank of Nobility. He was the son of William Anson, Esq; of Huckborough, in Staffordshire; and showing an early inclination for the sea, received a suitable education. The first command he enjoyed was that of the Weazle sloop in 1722; but the most memorable action of his life, and the foundation of his future good fortune, took place on his receiving the command of five ships, a sloop, and two victuallers, equipped to annoy the Spaniards in the South Seas, and to co-operate with admiral Vernon across the isthmus of Darien: an expedition, the principal object of which failed by the unaccountable delay in fitting him out. He sailed, however, in Sept. 1740; doubled Cape Horn in a dangerous season; lost most of his men by the scurvy; and with one only remaining ship, the Centurion, crossed the great Pacific Ocean. If no considerable national advantage resulted from this voyage, Commodore Anson made his own fortune, and enriched his surviving companions, by the capture of a rich galleon on her passage from Acapulco to Manilla; with which he returned home round the Cape of Good Hope. If he was lucky in meeting this galleon, he was no less fortunate in escaping a French fleet then cruising in the Channel, by sailing through it during a fog. He arrived at Spithead in June 1744. In a short time after his return, he was appointed rear-admiral of the blue, and one of the lords of the admiralty. In April 1745, he was made rear-admiral of the white, and the following year, vice-admiral of the blue; at which time he was chosen to represent the borough of Heydon in parliament. In 1747, being on board the Prince George of 90 guns, in company with Admiral Warren, and 12 other ships, he intercepted off Cape Finisterre, a powerful fleet, bound from France to the East and West Indies; when, by his valour and conduct he again enriched himself and his officers, and at the same time strengthened the British navy, by taking six men of war and four East-Indiamen, not one of them escaping. The French admiral, M. Jonquiere, on presenting his sword to the conqueror, said, *Monsieur, vous avez vaincu l'Invincible, et la Glorie vous suit:* "Sir, you have conquered the Invincible, and Glory follows you; pointing to the ships named the *Invincible* and the *Glory*, he had taken. For his signal services, King George the IId. created him Baron of Soberton in Hants. The same year he was appointed vice-admiral of the red; and, on the death of Sir John Norris, was made vice-admiral of England. In 1748 he was made admiral of the blue: he was afterwards appointed first lord of the admiralty, and was at length made admiral and commander in chief, in which rank he continued, with a very short interval, until his death; and the last service he performed was to convoy Queen Charlotte to England. He died in June 1762. No performance ever met with a more favourable reception, than the account of Anson's voyage round the world. Though it is printed under the name of his chaplain, it was composed under his lordship's own inspection, and from the the materials he himself furnished, by the ingenious Mr Benjamin Robins.

ANSPACH (the marquisate of), a small territory of Franconia, in Germany; bounded on the north by the bishoprics of Wartsburg and Bamberg, which last likewise lies to the west; by the earldoms of Holach and Oeting, with the bishopric of Aichstet, on the south; and the palatinate of Bavaria and the territory of Nuremberg on the east. The country is fruitful, and interspersed with woods, which render it agreeable for hunting. Besides the city Anspach, which is the capital, the chief towns are Kreglin, Swasbach, Kreilsheim, Rot, and Wasser-Truding.

Anspach is a small but pretty town, very well built, and has several churches. It is walled round, but has no other fortifications. In the palace there is a remarkable cabinet of curiosities. It is seated on a river of the same name, and belongs to the house of Brandenburg. E. Long. 10. 42. N. Lat. 49. 14.

ANSPESSADES, in the French armies, a kind of inferior officers in the foot, below the corporals, but above the common centinels. There are usually four or five of them in a company.

ANSTRUTHER *Easter* and *Wester*, two royal boroughs of Scotland, situated on the south-east coast of the county of Fife, in W. Long. 2. 25. N. Lat. 56. 20.

ANT, in zoology. See Formica and Termes.

Ant-Bear, or *Ant-eater*, in zoology. See Myrmecophaga.

Ant-Eggs, a name popularly given to a kind of little white balls found in the banks or nests of ants ordinarily supposed to be the ova of this insect.

Late naturalists have observed, that these are not properly the ants eggs, but the young brood themselves in their first state; they are so many little vermiculi wrapped up in a film, or skin, composed of a sort of silk, which they spin out of themselves as silk-worms and caterpillars do. At first they are hardly observed to stir: but, after a few days continuance they exhibit a feeble motion of flexion and extension; and begin to look yellowish and hairy, shaped like small maggots, in which shape they grow up, till they are almost as large as ants. When they pass their metamorphosis, and appear in their proper shape, they have a small black speck on them close to the anus of the included ant, which M. Liewenhoeck probably enough imagines to be the feces voided by it. Dr Ed. King opened several of these vulgarly reputed eggs; in some of which he found only a maggot in the circumstances as above described; while in another the maggot had begun to put on the shape of an ant about the head, having two little yellow specks, where the eyes were to be. In others, a further progress was observed, the included maggots being furnished with every thing to complete the shape of an ant, but wholly transparent, the eyes only excepted, which were as black as bugles. Lastly, in others, he took out every way perfect and complete ants, which immediately crept about among the rest. These supposed ants eggs are brought up every morning in summer, near the top of the bank, where they are lodged all the warm part of the day, within reach of the ſun's influence. At night, or if it be cool, or like to rain, they carry them down to a greater depth; ſo that you may dig a foot depth e'er you come at them. The true ants eggs are the white ſubſtance which, upon opening their banks, appears to the eye like the ſcatterings of fine white ſugar, or ſalt, but very ſoft and tender. Examined by a microſcope, it is found to conſiſt of ſeveral pure, white appearances, in diſtinct membranes, all figured like the leſſer ſort of birds eggs; and as clear as a fiſhes bladder. The ſame ſubſtance is found in the bodies of the ants themſelves. On this ſpawn, when emitted, they lie in multitudes to brood, till in ſome time it is turned into little vermicles as ſmall as mites, commonly called *ants-eggs*.

Ant-Hills, are little hillocks of earth, which the ants throw up for their habitation and the breeding of their young. They are a very great miſchief to dry paſtures, not only by waſting ſo much land as they cover, but by hindering the ſcythe in mowing the graſs, and yielding a poor hungry food pernicious to cattle. The manner of deſtroying them is to cut them into four parts from the top, and then dig into them ſo deeep as to take out the core below, ſo that, when the turf is laid down again, it may lie ſomewhat lower than the level of the reſt of the land: by this means it will be wetter than the reſt of the land: and this will prevent the ants from returning to the ſame place, which otherwiſe they would certainly do. The earth that is taken out muſt be ſcattered to as great a diſtance every way as may be, otherwiſe they will collect it together and make another hill juſt by. The proper time for doing this is winter; and if the places be left open, the froſt and rains of that time of the year will deſtroy the reſt: but in this caſe care muſt be taken that they are covered up early enough in the ſpring, otherwiſe they will be leſs fertile in graſs than the other places. In Hertfordſhire they uſe a particular kind of ſpade for this purpoſe. It is very ſharp, and formed at the top into the ſhape of a creſcent, ſo that the whole edge makes up more than three-fourths of a circle; this cuts in every part, and does the buſineſs very quickly and effectually. Others uſe the ſame inſtruments that they do for mole-hills. Human dung is a better remedy than all theſe, as is proved by experiment; for it will kill great numbers of them and drive all the reſt away, if only a ſmall quantity of it be put into their hills.

Acid of Ants, and acid produced by diſtilling millions of theſe inſects, either without addition, or with water. It reſembles vinegar in many reſpects; but differs from it in forming cryſtals with magneſia, iron, and zinc. Its attractions are not yet determined, but are ſuppoſed to coincide with thoſe of vinegar.

ANTA, in the ancient architecture, a ſquare pilaſter, placed at the corners of buildings.

Anta, or *Ante*, a ſmall kingdom on the gold-coaſt of Africa, extending about ten leagues in length.—The country is covered with large trees, among which ſtand a number of fine villages. The ſoil is exceedingly rich, and the face of the country beautiful. The air is alſo much more ſalubrious than in other places of the gold-coaſt; it being obſerved by all writers, that the number of deaths here bears no proportion to that on any other part on the coaſts of Guinea. This country contains the following villages, which deſerve a particular deſcription on account of the commerce they drive; viz. *Bourtrey*, *Tokorari*, *Sukoada*, and *Sama*; for which, ſee thoſe articles.—Formerly Anta was potent and populous, inhabited by a bold and rapacious people, who greatly annoyed the Europeans by their frequent incurſions; but by continual wars with their neighbours they are now greatly enfeebled, and the country in a manner depopulated. The ſpirit of the few remaining inhabitants is fled: they are deſponding, diſpirited, and abject, ſeeking protection from the Dutch and other Europeans who have forts on this coaſt, and looking upon them as their beſt friends.

ANTACIDS, in pharmacy, an appellation given to all medicines proper to correct acid or ſour humours.

Under the claſs of antacids come, 1. Abſorbents; as chalk, coral, ſea-ſhells, hæmatites, and ſteel-filings. 2. Obtundents; as oils and fats. 3. Immutants; as lixivious ſalts, and ſoaps.

ANTÆUS, in fabulous hiſtory, a giant of Libya, ſon of Neptune and Terra. Deſigning to build a temple to his father, of men's ſculls, he ſlew all he met; but Hercules fighting him, and perceiving the aſſiſtance he received from his mother (for by a touch of the earth he refreſhed himſelf when weary), lifted him up from the ground, and ſqueezed him to death.

Antæus was king of Mauritania; and from ſeveral circumſtances, with which we are ſupplied by various authors, it appears extremely probable that he was the ſame perſon with Atlas; they were both of them the ſons of Neptune, who reigned over Mauritania, Numidia, and a great part of Libya; as may be naturally inferred from his having ſuch particular marks of diſtinction conferred upon him by the inhabitants of thoſe regions. They both ruled with abſolute power over a great part of Africa, particularly Tingitania. Hercules defeated and ſlew Antæus in the ſame war wherein he took the Libyan world from Atlas: both Atlas and Antæus invaded Egypt, and contended with Hercules in the wars with the gods, and were both vanquiſhed by him. Antæus, as well as Atlas, was famed for his knowledge in the celeſtial ſciences: from whence we may fairly conclude them to have been the ſame king of Mauritania.

Antæus, in his wars with Hercules, who commanded an army of Egyptians and Ethiopians, behaved with great bravery and reſolution. Receiving large reinforcements of Libyan troops, he cut off vaſt numbers of Hercules's men: but that celebrated commander having at laſt intercepted a ſtrong body of Mauritanian or Libyan forces ſent to the relief of Antæus, gave him a total overthrow, wherein both he and the beſt part of his forces were put to the ſword. This deciſive action put Hercules in poſſeſſion of Libya and Mauritania, and conſequently of all the riches in thoſe kingdoms: hence aroſe the fable, that Hercules finding Antæus, a giant of an enormous ſize, with whom he was engaged in ſingle combat, to receive freſh ſtrength as often as he touched his mother earth when thrown upon her, at laſt lifted him up in the air and ſqueezed him to death. Hence likewiſe may be deduced the fable, intimating, that Hercules took Atlas's globe upon his own ſhoulders, overcame the dragon that guarded the orchards of the Heſperides, and made himſelf maſter of all the golden fruit. The golden apples, ſo frequently mentioned by the old mythologiſts, were the treaſures that fell into Hercules's hands

hands upon Antæus's defeat, the Greeks giving the Oriental word מאל, *riches*, the ſignification affixed to their own term, μηλα, *apples*. After the moſt diligent and impartial examination of all the different hypotheſes of hiſtorians and chronologers, relating to Atlas and Antæus, we find none ſo little clogged with difficulties as that of Sir Iſaac Newton. According to that illuſtrious author, Ammon, the father of Seſac, was the firſt king of Libya, or that vaſt tract extending from the borders of Egypt to the Atlantic ocean; the conqueſt of which country was effected by Seſac in his father's life-time. Neptune afterwards excited the Libyans to a rebellion againſt Seſac; ſlew him; and then invaded Egypt under the command of Atlas or Antæus, the ſon of Neptune, Seſac's brother and admiral. Not long after, Hercules, the general of Thebais and Ethiopia for the gods or great men of Egypt, reduced a ſecond time the whole continent of Libya, having overthrown and ſlain Antæus near a town in Thebais, from that event called Antæa or Antæopolis: this, we ſay, is the notion advanced by Sir Iſaac Newton, who endeavours to prove, that the firſt reduction of Libya by Seſac happened a little above a thouſand years before the birth of Chriſt, as the laſt by Hercules did ſome few years after.

ANTAGONIST, denotes an adverſary, eſpecially in ſpeaking of combats and games.

Antagonist muſcles, in anatomy, thoſe which have oppoſite functions; as flexors and extenſors, abductors and adductors, &c.

ANTANACLASIS, in rhetoric, a figure which repeats the ſame word, but in a different ſenſe; as, *dum vivimus, vivamus*.

ANTAGOGE, in rhetoric, a figure by which, when the accuſation of the adverſary is unanſwerable, we load him with the ſame or other crimes.

ANTANDROS, (anc. geog.) a town of Myſia, on the ſea-coaſt, at the foot of mount Alexandrea, a part of mount Ida. (Strabo, Ptolemy): it was a town of the Leleges, (Strabo); anciently called *Edonis*, then *Cimmeris*, (Pliny, Stephanus.) It takes its name from Antandros, a general of the Aeolians: it is now called *S. Dimitri*.

ANTAPHRODISIACS, in pharmacy, medicines proper to diminiſh the ſemen, and conſequently extinguiſh or leſſen all deſires of venery.

ANTARCTIC, in a general ſenſe, denotes ſomething oppoſite to the arctic or northern pole. Hence antarctic circle is one of the leſſer circles of the ſpheres, and diſtant only 23° 30′ from the ſouth pole, which is likewiſe called antarctic for the ſame reaſon.

ANTARES, in aſtronomy, the name of a ſtar of the firſt magnitude, called alſo the ſcorpion's heart. Its longitude is 60° 13′ 14″ of Sagittarius; and its latitude 4° 31′ 26″ S.

ANTAVARE, a province of the iſland of Madagaſcar, lying about 21° 30′ S. Lat. and bounded by the province and cape of Manouſi. The greateſt part of it is watered by the river Mananzari, whoſe ſource is in the red mountains of Ambohitſmene.

ANTE′, in heraldry, denotes that the pieces are let into one another in ſuch form as there is expreſſed; for inſtance, by dove-tails, rounds, ſwallow-tails, or the like.

ANTEAMBULONES, in Roman antiquity, ſervants who went before perſons of diſtinction to clear the way before them. They uſed this formula, *Date locum domino meo*, i. e. Make room or way for my maſter.

ANTECEDENT, in general, ſomething that goes before another, either in order of time or place.

Antecedent, in grammar, the words to which a relative refers.

Antecedent, in logic, is the firſt of the two propoſitions in an enthymeme.

Antecedent, in mathematics, is the firſt of two terms of a ratio, or that which is compared with the other.

ANTECEDENCE, in aſtronomy, an apparent motion of a planet towards the weſt, or contrary to the order of the ſigns.

ANTECESSOR, one that goes before. It was an appellation given to thoſe who excelled in any ſcience. Juſtinian applied it particularly to profeſſors of civil law; and, in the univerſities of France, the teachers of law take the title *anteceſſors* in all their theſes.

ANTECURSORES, in the Roman armies, a party of horſe detached before, partly to get intelligence, proviſions, &c. and partly to chooſe a proper place to encamp in. Theſe were otherwiſe called *anteceſſores*, and by the Greeks *prodromi*.

ANTEDATE, among lawyers, a ſpurious or falſe date prior to the true date of a bond, bill, or the like.

ANTEDILUVIAN, in a general ſenſe, implies ſomething that exiſted before the flood.

Antediluvian-World; the earth as it exiſted before the flood. See Earth.

ANTEDILUVIANS, a general name for all mankind who lived before the flood, and ſo includes the whole of the human race from Adam to Noah and his family.

Chronology of the firſt ages.

As Moſes had not ſet down the particular time of any tranſaction before the flood, except only the years of the fathers age wherein the ſeveral deſcendants of Adam in the line of Seth were begotten, and the length of their ſeveral lives; it has been the buſineſs of chronologers to endeavour to fix the years of the lives and deaths of thoſe patriarchs, and the diſtance of time from the creation to the deluge. In this there could be little difficulty were there no varieties in the ſeveral copies we now have of Moſes's writings; which are, the Hebrew, the Samaritan, and the Greek verſions of the Septuagint: but as theſe differ very conſiderably from one another, learned men are much divided in their opinions concerning the chronology of the firſt ages of the world; ſome preferring one copy and ſome another.

That the reader may the better judge of the variations in the three copies in this period, they are exhibited in the following table, with the addition of thoſe of Joſephus as corrected by Dr Wells and Mr Whiſton.

A TABLE of the Years of the Antediluvian Patriarchs.

	Their ages at their ſons birth.				Years they lived after their ſons birth.			Length of their lives.		
	Heb.	Sam.	Sept.	Joſ.	Heb.	Sam.	Sept.	Heb.	Sam.	Sept.
Adam, -	130	130	230	130	800	800	700	930	930	930
Seth, -	105	105	205	105	807	807	707	912	912	912
Enos, -	90	90	190	90	815	815	715	905	905	905
Cainan, -	70	70	170	70	840	840	740	910	910	910
Mahalaleel, -	65	65	165	65	830	830	730	895	895	895
Jared, -	162	62	162	62	800	785	800	962	847	962
Enoch, -	65	65	165	65	300	300	200	365	365	365
Methuſelah, -	187	67	167	187	782	653	802	969	720	969
Lamech, -	182	53	188	182	595	600	565	777	653	753
Noah was aged at the Flood,	600	600	600	600						
To the Flood,	1656	1307	2262	1556						

To this table it will be neceſſary, in order to explain the conſequences of theſe variations, to add ſeparate chronological tables, ſhowing in what year of his contemporaries the birth and death of each patriarch happened, according to the computation of each of the ſaid three copies.

A Chronological TABLE of the Years of the Patriarchs according to the Computation of the Hebrew.

	Years of the world.	Years of Seth.	Years of Enos.	Years of Cainan.	Years of Mahalaleel.	Years of Jared.	Years of Enoch.	Years of Methuſelah.	Years of Lamech.	Years of Noah.
Adam created,	1									
Seth born, -	130									
Enos born, -	235	105								
Cainan born, -	325	195	90

Jared, Methufelah, and Lamech, die,	1307		The Flood,			847		720	653	600

To the varieties exhibited in the two laft tables, others might be added, by admitting the various readings of fome numbers in the Samaritan and Septuagint: for as to the Hebrew copies, there is here a conftant agreement among them.

The manufcript from which the Samaritan Pentateuch was publifhed, agrees exactly with the Samaritan numbers given by Eufebius. But St Jerom tells us, that, in his time, there were fome Samaritan copies which make Methufelah 187 years old at the birth of Lamech, and Lamech 182 at the birth of Noah, juft as the Hebrew does. Now if thefe numbers be approved as the true original numbers, the interval from the creation to the flood will be 1556 years; differing from

Antediluvians.

from the Hebrew computation but 100 years in the age of Jared at the birth of Enoch: and if this last be allowed to be a mistake of the transcriber, by his dropping a number, and writing 62 instead of 162, as has been suspected, the Samaritan will be perfectly reconciled with the Hebrew, and all difference between them vanish.

Scaliger, on the authority of an old Samaritan chronicle, having at the end a table of the years of the patriarchs to the time of Moses, would correct two of the Samaritan numbers in Eusebius; viz. instead of 65 the age of Mahalaleel when he begat Jared, he thinks it should be 75; and instead of 67, the age of Methuselah when he begat Lamech, he would have it 77. By which alterations he reckons 20 years more to the flood than Eusebius and the manuscript; that is, 1327. But as he acknowledges the table, whereon he grounds these corrections, contains some great absurdities, it seems unreasonable to oppose it to the joint authority of Eusebius and the Samaritan manuscript.

As to the Septuagint, in the common editions of that version, the age of Methuselah at the birth of Lamech is 167; and consequently the sum of this period, according to them, is no more than 2242. But in this case Methuselah will outlive the flood 14 years; and we may well wonder, with Eusebius, where he was preserved. To obviate this objection, we are told, that, in some copies, Methuselah is said to have lived but 782 (not 802) years after the birth of Lamech, and no more than 949 in all. But the Alexandrian manuscrip entirely takes away the the difficulty, by giving the same number in this place with the Hebrew.

Pezron is of opinion, that the age of Lamech at the birth of Noah should be but 182, as it is both in the Hebrew and in Josephus, supposing, with St Austin, that the present number is the error of the scribe who first copied the original Septuagint manuscript in Ptolemy's library. So that he computes 2256 years to the flood. And, if this correction be admitted, and one more mentioned also by St Austin, viz. that Lamech lived 595 years after the birth of Noah, and not 161, as in the present copies, there will then remain no other difference between the Septuagint and the Hebrew than 600 years added to the ages of the six patriarchs when they begat their sons, and Methusaleh will, conformably to the Hebrew and Samaritan, die in the year of the flood.

Having premised this chronological view, we shall proceed to the history of the antediluvian patriarchs.

2 Of Adam in Paradise.

Of the great progenitor we are told, that "the Lord God took the man and put him into the garden." These words plainly indicate, that Adam was not created within the precincts of Paradise; and it is afterwards said, upon his being turned out of the garden, "He was sent to till the ground whence he was taken."—As to the situation of this garden, concerning which there has been so much learned but uncertain enquiry, see the article PARADISE.

Adam was doubtless created in the prime of his life, with all his powers and faculties in the highest degree of strength and vigour. His body would be graceful, and well proportioned; while his countenance was comely, and glowed with all the lustre of youthful innocence. The poet thus describes our first parents:

Adam the goodliest man, of men since born
His sons; the fairest of her daughters Eve.
——— for in their looks divine
The image of their glorious Maker shone. *Milton.*

Many have entertained an opinion (as mentioned under the article ADAM), that our first parent was created an adept in knowledge and in science, a consummate philosopher, and an accomplished divine. But the very reverse of this must be true, providing we give credit to the account which Moses gives of him. If Adam was created with intuitive knowledge, for what end was he endowed with the senses of a man, through which ideas might be conveyed to his mind, and make him capable of such improvements as arise from experience and observation? And if he originally possessed such a fund of valuable knowledge, why had he such an ardent thirst for an unwarrantable portion of more, and for the sake of this additional pittance forfeited his happiness and life? Besides, if Adam was at first all light and knowledge, and was soon after reduced to a state of ignorance and error, this transition would make a retrograde in the system of nature, quite dissimilar to that uniformity which obtains throughout the whole of the divine government and œconomy. Moses introduces our first parents into life in the most natural manner, as having capacities to acquire knowledge, senses to receive impressions from objects around them, and a sufficient degree of reason to form a judgment of the things perceived: yet all these faculties can only be considered as so many instruments, by the exercise of which they might be enabled to discharge the duties of their future life.

Smellie's Translation, vol. iii. p. 50. *&c.* (the passage here abridged).

The following portrait of our first progenitor when he first came into life, drawn by the inimitable pencil of Buffon, is extremely beautiful, while it is dissonant from no part of the Mosaic history. "Let us suppose a man in the same situation with him who first received existence; a man whose organs were perfectly formed, but who was equally new to himself, and to every object which surrounded him. Were he to give a history of his thoughts, and of the manner in which he received impressions, he might give some such information at this. I remember the moment when my existence commenced. It was a moment replete with joy, with amazement and anxiety. I neither knew what I was, where I was, nor whence I came. I opened my eyes. But what an amazing increase of sensation! The light, the celestial vault, the verdure of the earth, the transparency of the waters, gave animation to my spirits, and conveyed pleasures which exceed the powers of expression. At first I believed that all these objects existed within me, and formed a part of myself. When, turning mine eyes to the sun, his splendor overpowered me. I voluntarily shut out the light, and felt a small degree of pain. During this moment of darkness, I imagined that I had lost the greatest part of my being. I was then roused with a variety of sounds. The singing of birds and the murmuring breezes formed a concert, which excited the most sweet and enchanting emotions. I listened, and was convinced that these harmonious sounds existed within me.—I made a step forwards; and afterwards renewing my motion, I walked with my face turned towards

Antediluvians.

towards the Heavens, till I ſtruck againſt a palm tree, and felt ſome degree of pain. Seized with terror, I ventured to lay my hand upon the object, and perceived it to be a being deſtinct from myſelf, becauſe it did not, like touching my own body, give me a double ſenſation. I reſolved then to feel every object I ſaw, and had a ſtrong deſire to touch the ſun; but ſtretching out my hands to embrace the Heavens, they met without any intermediate object. All objects appeared to me equally near, and it was not till after many trials that I learned to uſe my eyes as a guide to my hand. At laſt the train of my ideas was interrupted, and I loſt the conſciouſneſs of my exiſtence. My ſleep was profound; but having no mode of meaſuring time, I knew nothing of its duration. When I awakened, I was aſtoniſhed to find by my ſide another form, perfectly ſimilar to my own. I conceived it to be another ſelf; and inſtead of loſing by my ſleep, I imagined myſelf to be doubled. I ventured to lay my hand upon this new being. With rapture and aſtoniſhment, I perceived that it was not myſelf, but ſomething much more glorious and deſirable."

This philoſophical detail coincides with the opinion, that excepting what portions of knowledge Adam might acquire by the exerciſe of his ſenſes, his Maker taught him every thing that was neceſſary for his comfort and ſubſiſtence. But before the Almighty gave any inſtructions to our firſt parents, we muſt ſuppoſe he inſpired them with the knowledge of the meaning of every word which they heard him ſpeak; otherwiſe it would have been impoſſible that he could have had any ſuch communication with them. The words which they heard, and were made to underſtand, being imprinted upon their memories, would ſerve as the foundation of a language, which they would afterwards increaſe and enlarge as new objects began to multiply, and hence give riſe to new terms and definitions.

One of the firſt leſſons taught to Adam by his infallible Director, would be the neceſſity of food for the ſupport of his life. Accordingly Moſes informs us, that for this purpoſe a grant was made him to eat of every tree of the garden excepting one. At the ſame time it was made known to him, in what manner he was to repair the decays of nature; namely, by eating of *the tree of life*. Then, in order to qualify him for ſocial intercourſe, he was ordered to exerciſe his faculty of ſpeech, by giving names to different creatures. The author of the book of Eccleſiaſticus ſays of our firſt parents, "They received the uſe of the five operations of the Lord; and in the ſixth, he imparted to them underſtanding; and in the ſeventh, ſpeech to interprete the cogitations thereof." The meaning cannot be, that he gave them every word they were to pronounce, more than every idea which their ſenſes were to convey to their underſtanding. Our talents, and the exerciſe of them, may be both ſaid to be given us of God; but whatever capacities we receive from him, it is ſuppoſed that we ourſelves muſt improve them, before we can attain to any acquirements whatever. Although Adam had heard and underſtood the words of God, yet Moſes does not give the leaſt hint that he ever attempted to ſpeak before this time. For if he had, as ſome imagine, innate knowledge and proper terms for every thing preſented to him, what occaſion was there to bring animals before him to ſee what names he would impoſe upon them? Some writers have endeavoured to turn into ridicule the whole of this tranſaction, and have aſked, how could all creatures upon earth appear at one time before Adam? not only one, but many days would have elapſed before he could give each a name. But this objection ariſes from not underſtanding the words of Moſes. What our tranſlators render to ſee what he would call THEM, is in the original to ſee what name he would call IT. "And whatſoever Adam called IT (viz. the living creature), that was the name of IT." The meaning ſeems to be no more than this: God brought a few creatures to Adam, to make him try to name them; and whatever he called any of them, that continued to be its name. And no doubt he would denominate every animal before him, from its external appearances, from its ſize, its colour, or its voice: And in proceſs of time, he would give names to all thoſe creatures which providence brought within his view, or with which he became afterwards acquainted.

The next thing in which God inſtructed Adam, tho' probably in a trance or viſion, was his near relation to Eve, as being part of his own body. This piece of knowledge was imparted to him, in order to cement the greater love and affection between the two during the remaining period of their lives.

Theſe, according to Moſes, are all the tranſactions in which our firſt parents were intereſted during their abode in Paradiſe, till they loſt their innocence, and forfeited the enjoyments of their happy ſituation. And nothing can be more evident, than that the inſtructions which they received, beſpoke the infantile ſtate of their minds; tho' there is no doubt but further and higher diſpenſations of knowledge would have been communicated to them, as they became able to bear them, and had their minds matured by experience and reflection.

3

How long our firſt parents retained their innocence.

How long our firſt parents retained their innocence, we are no where told. Many aſſert that they fell on the very firſt day of their creation. But Moſes mentions ſo many tranſactions on that day, as muſt have ingroſſed the whole of their attention, and prevented them from falling into ſuch temptations as ariſe from indolence and want of reflection. Beſides, if in ſuch circumſtances as they were placed, they could not refrain from an open violation of the Divine law for the ſpace of one day, it would beſpeak a deceitfulneſs of heart in them greater than in moſt of their poſterity. It is ſomewhat ſingular, that many of the great trials recorded in ſacred writing were limited to 40 days; which in prophetic ſtyle is ſometimes equivalent to 40 years. This appears from the hiſtory of Moſes, of Elijah, of Nineveh, and of the Jewiſh nation after the death of Chriſt. And what is very remarkable, he, of whom Adam was a type, was tempted 40 days in the wilderneſs. Agreeable to this part of the Divine œconomy, perhaps the trial of our firſt parents laſted ſo long. However, that they remained for a conſiderable time in the garden, appears highly probable from this conſideration, that their indulgent Creator, who had manifeſted his tender concern for them while innocent, and extended his mercy to them when fallen, would never have turned them out of paradiſe, and ſent

Antediluvians.

sent them into an uncultivated world, before they had acquired the arts of living, and were capable of providing against the vicissitudes of their future lot. The particulars of this memorable transaction are considered under the article FALL.

Moses gives us no further account of Adam's life after leaving the garden, but that he begat some children, and died at such an age. Yet we have no reason to doubt, but the venerable patriarch ever after led a life of penitence and of the strictest piety. The various communications which he had enjoyed with his Maker in paradise, and which were probably renewed to him after his fall, could not fail to make the deepest impressions upon his mind. The gracious respite he had met with, from the execution of the sentence denounced against him, would make him cautious of offending for the time to come; lest the next violation of the Divine authority should put an end to his existence. The *cherubim and flaming sword*, or the devouring flame, on the *east of Eden* (which might continue burning all his life), would be to him what the vestiges of the ark were to Noah and his sons, an awful memorial of the danger of incurring the Divine displeasure. Besides, his worldly comforts being in a great measure withdrawn, his mind would be naturally disposed for relishing those pleasures which flow from piety and religion.

Antediluvians.

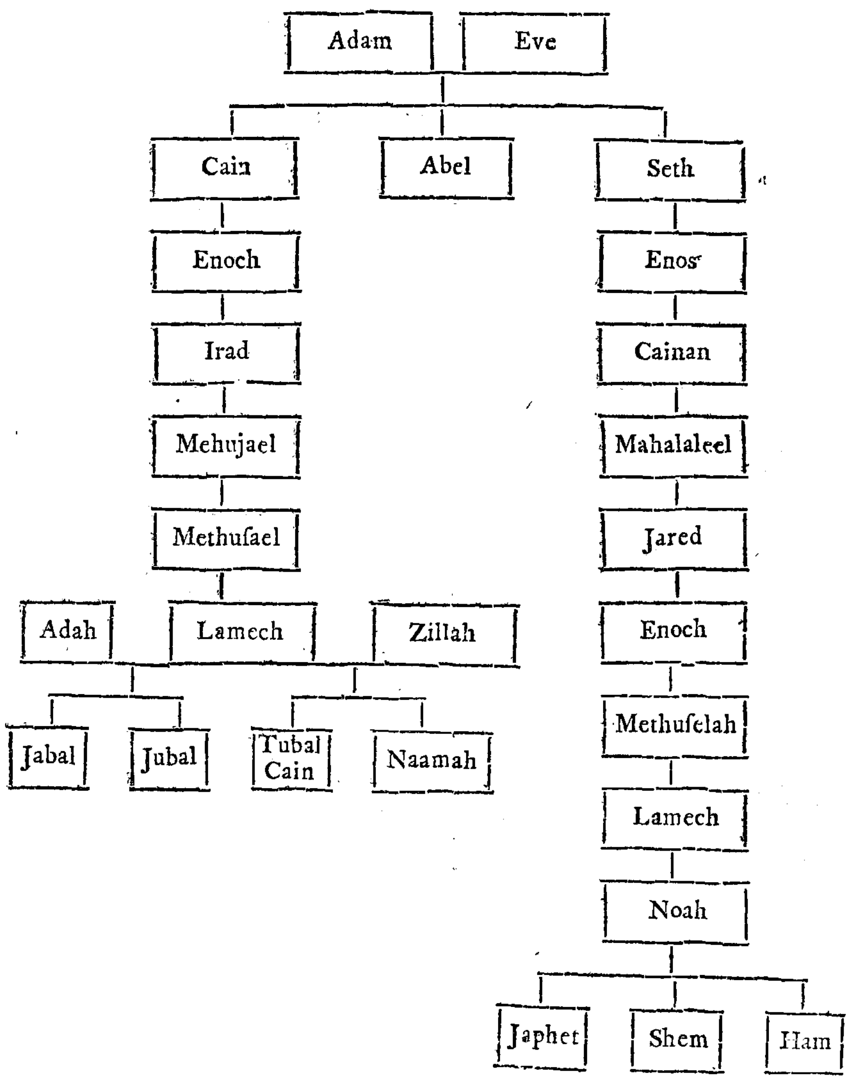
4 Of their progeny.

The first thing which we hear of Adam in his new situation was, that *he knew Eve his wife, and she conceived and bare Cain.* Afterwards, we are told, she bare Abel. When the brothers were grown up, they betook themselves to distinct employments; the former to husbandry, and the latter to the keeping of sheep. Their inward dispositions were still more different; Cain being wicked and avaricious, but Abel just and virtuous.

In process of time they brought their respective offerings to God. Cain of the fruit of the ground, and Abel of the firstlings of his flock; but they met with very different success: for God accepted the offering of Abel, but Cain's he did not accept; the consequences of which are related under the articles ABEL and CAIN.

Soon after the murder of Abel, his loss was made up to his parents in another son they had, whom Eve named *Seth*, that is, "appointed;" because he was appointed instead of Abel, whom Cain slew.

As the whole progeny of Adam, of whom we have any mention in Scripture, were the descendants of Cain and Seth, it may be proper to give the following genealogical table of the Antediluvians.



The

Antediluvians.

5 Of the line of Cain.

The sacred historian, confining himself chiefly to the line of Seth, from whence Noah was descended, has acquainted us with very few particulars relating to that of Cain: nor can we thus form any conjectures how long he or any of his descendents lived. All we know is, that Lamech, the fifth in descent from him, married two wives, Adah and Zillah, the first known instance of polygamy: that by the former he had two sons, Jabal, who was the first that dwelt in tents, and fed cattle; and Jubal, the inventor of music; and by the other, a son named Tubal-Cain, who found out the art of forging and working metals. Zillah likewise brought him a daughter named Naamah, supposed to have invented spinning and weaving: and we are told that, on some occasion or other, Lamech made a speech to his wives, the explication of which has greatly puzzled the interpreters. See LAMECH.

6 The line of Seth.

Miln's Physico-theolog. Lectures, p. 242, &c.

Moses proceeds to tell us, that Seth had a son born to him called *Enos*, and that *then began men to call upon the name of the Lord*. Commentators give us three different senses of these words. Some think the words should be rendered, *Then men profaned in calling on the name of the Lord;* and that even Enos arrogated to himself a power, as if he had been a god. But this sense seems harsh and unnatural. There is nothing more unlikely, than that Adam's grandchildren, who lived under his own eye, would so soon shake off parental authority, and apostatise from the belief and worship of the one true God. Others think, that though men had hitherto worshipped God in private, yet they now instituted public assemblies, met in larger societies for solemn and social worship, and introduced liturgies and forms for more effectually paying their homage to the Almighty. This indeed is a very natural comment from those who place religion in modes and set forms of worship. But it is scarcely credible, that Adam and his family had never met together to worship God till now, when we are told that Cain and Abel, and probably both their families along with them, brought their offerings to the Lord: this they no doubt did every sabbath-day. Others, therefore, put a more consistent interpretation upon the words, namely, that *men now called themselves by the name of the Lord*. The meaning of which is, that about this period, the family of Seth, who adhered to God and his worship, began to give themselves a denomination, expressive of their relation and regards to him. They distinguished themselves from the irreligious family of Cain, and assumed the title of the *sons* or *children* of God; which designation was afterwards applied to them by Moses; it was even used after the flood, and adopted by the writers of the New Testament.

Of the three next descendents of Seth, Cainan, Mahalaleel, and Jared, and of Methuselah and Lamech, the grandfather and father of Noah, Moses has recorded no more than their several ages. The oriental authors commend them, as they do Seth and Enos, for their piety, and the salutary injunctions they left behind them, forbidding their children all intercourse with the race of cursed Cain.

Enoch, the son of Jared and father of Methuselah, was a person of most extraordinary piety, *walking with God*, as the Scripture expresses it, for at least the last three hundred years of his life: as a reward for which exemplary behaviour in so corrupt an age, he was taken up by God into heaven, without tasting death. See ENOCH.

Antediluvians.

7 Corruption of the human race.

Moses afterwards informs us, *When men began to multiply*, i. e. when the earth was filled with inhabitants, and tribes formerly living remote, began to approach nearer to one another, *Daughters were born unto them;* meaning, in greater abundance than formerly: which seems to hint, that at this period there were considerably more females than males born into the world. Some think that Moses, being now about to mention the wickedness of the Antediluvians, introduces the posterity of Cain as being the chief cause of their corruption; and that he styles them *men* and *daughters of men*, because they were sensual and earthly; in which sense the word *men* is sometimes used in the scriptures.

The sons of God saw the daughters of men that they were fair; and they took them wives of all that they chose. These words have given rise to many absurd and ridiculous comments both of Jews and Christians. There are two meanings affixed to them, which may be mentioned as the most probable. Whenever the name of God is added to any thing, it not only denotes God's being the efficient cause, but it heightens and increases its usual meaning. For which reason any thing that is excellent in its kind, or uncommonly lofty and magnificent, was by the Jews said to be of God, or of the Lord. Thus the angels are called the *sons of God*. And Adam being created with a nobler image than any other creature, is said to be made in the *image of God*. The cedars of Lebanon are called the *cedars of the Lord;* and great mountains, the *mountains of God*. Therefore by the *sons of God* in this place are meant men of great opulence, power, and authority. And by way of contrast, the historian introduces those of poor and mean circumstances in life, and calls them the *daughters of men*. The words thus explained are not an unlikely description of that dissolute age. The great and mighty in this world are commonly most addicted to sensual gratifications, because they have so many incentives to inflame their passions, and so few restraints to curb them; and, instead of using their power to punish and discountenance vice, are too often the greatest examples and promoters of lasciviousness and debauchery. Thus, these *sons of God*, these great men, when they happened to meet with the daughters of their inferiors, gazed upon them as fit objects to gratify their lust; and from among these they *took to themselves*, in a forcible manner *wives*, or (as it may be rendered) *concubines*, *of all that they chose*, whether married or unmarried, without ever asking their consent. No wonder then that the earth should be *filled with violence*, when the highest rank of men were above the restraint of law, of reason and religion, and not only oppressed the poor, but with impunity treated them and their children in such a base and cruel manner.

But there are other writers who cannot relish the above opinion; because they think it a harsh and unnatural construction, to call great and powerful persons the *sons of God*, and all mean and plebeian women the *daughters of men*. Besides, the text does not say, that the *sons of God* offered any violence to these inferior women;

Antediluvians. women; but that they saw that they were *fair*, and made choice of them for wives. And wherein is the heinousness of the offence, if men of a superior rank marry their inferiors, especially when an excess of beauty apologises for their choice? Or why should a few unequal matches be reckoned among the causes of bringing upon the world an universal destruction? For these reasons many are of opinion, that the descendants of Seth, who were styled the *sons of God* on account of their near relation to him, saw the *daughters of men*, i. e. the impious progeny of Cain, and by intermarriages became associated with them; and surrendering to those inchantresses their hearts and their freedom, they surrendered at the same time their virtue and their religion. From this union proceeded effects similar to what has happened ever since. When a pure society mixes with a profane, the better principles of the one become soon tainted by the evil practices of the other; which verifies the old adage, *Evil communication corrupts good manners.* Thus it appears, that the great source of universal degeneracy, was owing to the posterity of Seth mingling with the progeny of Cain, in opposition to what their pious fathers had strictly charged them.

Miln. p. 265.

It is afterwards said, *There were giants in the earth in those days: and also after that, when the sons of God came in unto the daughters of men, and they bare children to them, the same became mighty men, which were of old, men of renown.* Translators are not agreed about the meaning of the word *giants*. Some render the word, *violent and cruel men;* others, men who *fall upon* and *rush forward*, as a robber does upon his prey: the meaning then is, that they were not more remarkable for their strength and stature than for their violence and cruelty. It is generally agreed, that in the first ages of the world, men were of a gigantic stature; though Moses does not mention them as giants till after the union of the families of Seth and Cain, when men used their superiority in bodily strength for the purposes of gratifying their unhallowed passions.

At this period of the world, and long after, political power and bodily strength went hand in hand together. Whoever was able to encounter and kill a fierce and dangerous wild beast and clear the country of noxious animals, or who was able in the day of battle to destroy most of his enemies, was looked up to by the rest of his companions as the fittest to be their leader and commander. Thus, Nimrod, from being a *mighty hunter*, became a great king, and grasping at power, was never satisfied till every obstacle to his ambition was removed. And it appears from history, that all his successors have pretty nearly trodden in the same path. These *giants* then, or *sons of God*, might be the chief warriors, who formed themselves into chosen bands, and living among a cowardly and effeminate people had no curb to their cruelty and lust. From them might spring an illegitimate race, resembling their fathers in body and mind, who, when they grew up, having no inheritance, would be turned loose upon the world, and follow no other employment but theft, rapine, and plunder. Thus they became *mighty men* and *men of renown, and procured themselves a name:* but this was owing to the mischief they did, and the feats of savage cruelty which they performed.

8 God's forbearance.

Mankind running thus headlong into all manner of vice, were admonished to repent; and God, out of his great mercy was pleased to grant them a convenient time for that purpose; no less than 120 years, during which space, but no longer, he declared his Spirit should "strive with man," or endeavour to awaken and reclaim them from their wicked course of life.

Amidst this general corruption, one man, however, was found to be just and perfect in his generation, walking with God. This extraordinary person was Noah, the son of Lamech; who, not thinking it sufficient to be righteous himself unless he did his utmost to turn others likewise to righteousness by admonition as well as example, became a preacher to the abandoned race among which he lived, employing both his counsel and authority to bring them to a reformation of their manners, and to restore the true religion among them. But all he could do was to no purpose; for they continued incorrigibly obstinate: so that at length (as Josephus tells us), finding himself and family in imminent danger of some violence in return for his good-will, he departed from among them, with his wife and children.

9 Preaching of Noah.

10 Mankind incorrigible.

On his departure, it is probable they fell into greater disorders than before; having now none to control or even to trouble them with unwelcome advice. Moses assures us, "that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was continually evil;" and that "the earth was corrupt and filled with violence, all flesh having corrupted his way upon the earth." These words leave no room to inquire into the particular crimes of the antediluvian world, which seems to have been over-run with a complication of all manner of debauchery and wickedness, and above all with violence and injustice towards one another.

11 The whole world destroyed by a flood, except Noah and his family.

Things being in this state, God, as the sacred historian pathetically expresses it, "repented that he had made man on earth, and it grieved him at his heart." And the time of forbearance being elapsed, he passed the sentence of their utter destruction by a flood of waters; a sentence which likewise included the beasts of the earth and every creeping thing, and the fowls of the air. But "Noah found grace in the eyes of the Lord;" who had before acquainted him with his design of bringing a deluge on the earth, and directed him to make an ark, or vessel, of a certain form and size, capable of containing not only himself and family, but such numbers of animals of all sorts as would be sufficient to preserve the several species and again replenish the earth, together with all necessary provisions for them. All these injunctions Noah performed; and, by God's peculiar favour and providence, he and those that were with him survived this tremendous calamity. See the article DELUGE.

12 Traditional history of the Antediluvians

As to any further transactions before the flood, we are left entirely in the dark by the sacred historian. The Jews and eastern nations, however, have made ample amends for the silence of Moses, by the abundance of their traditions. The only part of these, which can be connected in any thing like history, is what follows.———After the death of Adam, Seth with his family separated themselves from the profligate race of Cain, and chose for their habitation the mountain where Adam was buried, the Cainites remaining below in the plain where Abel was killed; and, according to our historians, this mountain was so high,

that

Antediluvians. that the inhabitants could hear the angels singing the praises of God, and even join them in that service. Here they lived in great purity and sanctity of manners. Their constant employment was praising God, from which they had few or no avocations; for their only food was the fruits of the trees which grew on the mountain, so that they had no occasion to undergo any servile labours, nor the trouble of sowing and gathering their harvest. They were utter strangers to envy, injustice, or deceit. Their only oath was, "By the blood of Abel; and they every day went up to the top of the mountain to worship God, and to visit the body of Adam, as a mean of procuring the Divine blessing. Here, by contemplation of the heavenly bodies, they laid the foundations of the science of astronomy; and lest their inventions should be forgotten, or lost before they were publicly known, understanding, from a prediction of Adams, that there would be a general destruction of all things, once by fire, and once by water, they built two pillars, one of brick, and the other of stone, that if the brick one happened to be overthrown by the flood or otherwise destroyed, that of stone might remain. This last, Josephus says, was to be seen in his time in the land of Siriad, (thought to be in Upper Egypt).

The descendants of Seth continued in the practice of virtue till the 40th year of Jared, when an hundred of them hearing the noise of the music and the riotous mirth of the Cainites, agreed to go down to them from the holy mountain. On their arrival in the plain, they were immediately captivated by the beauty of the women; who were naked, and with whom they defiled themselves; and this is what is meant by the intermarriage of the sons of God with the daughters of men, mentioned by Moses. The example of these apostate sons of Seth was soon followed by others; and from time to time great numbers continued to descend from the mountain, who, in like manner, took wives from the abandoned race of Cain. From these marriages sprung the giants (who, however, according to Moses existed before); and, these being as remarkable for their impiety as for their strength of body, tyrannized in a cruel manner, and polluted the earth with wickedness of every kind. This defection became at last so universal, that none were left in the holy mountain, except Noah, his wife, his three sons and their wives.

13 Profane history. *Berosus's Babylonian Antiquities.* Berosus, a Chaldæan historian, who flourished in the time of Alexander the Great, enumerates ten kings who reigned in Chaldea before the flood; of whom the first, called *Alorus*, is supposed to be Adam, and Xisuthrus, the last, to be Noah.—This Alorus, declared that he held his kingdom by divine right, and that God himself had appointed him to be the pastor of the people. According to our historian, in the first year of the world, there appeared out of the Red Sea, at a place near the confines of Babylonia, a certain *irrational* animal called *Oannes*. He had his whole body like that of a fish; but beneath his fish's head grew another of a different sort, (probably a human one). He had also feet like a man, which proceeded from his fish's tail, and a human voice, the picture of him being preserved ever after. This animal conversed with mankind in the day-time, without eating any thing: he delivered to them the knowledge of letters, sciences, and various arts: he taught them to dwell together in cities, to erect temples, to introduce laws, and instructed them in geometry; he likewise showed them how to gather seeds and fruits, and imparted to them whatever was necessary for a convenient and civilized life; but after this time there was nothing excellent invented. When the sun set, Oannes retired into the sea, and continued there all night. He not only delivered his instructions by word of mouth, but, as our author assures us, wrote of the origin of things, and of political œconomy. This, or a similar animal, is also mentioned by other authors.

Of Alasporus, the second king, nothing remarkable is related. His successor, Amelon, or Amillarus, was of a city called *Pantabibla*. In his time another animal resembling the former appeared 260 years after the beginning of this monarchy. Amelon was succeeded by Metalarus; and he by Doanus, all of whom were of the same city. In the time of the latter, four animals of a double form, half man and half fish, made their appearance. Their names were *Euedocus, Eneugamus, Encubulus*, and *Anementus*. Under the next prince, who was likewise of Pantabibla, appeared another animal of the same kind, whose name was *Odacon*. All these explained more particularly what had been concisely delivered by Oannes.

In the reign of the tenth king, Xisuthrus, happened the great deluge, of which our author gives the following account: Cronus, or Saturn, appeared to Xisuthrus in a dream, and warned him, that on the fifteenth of the month Dæsius mankind would be destroyed by a flood; and therefore commanded him to write down the original, intermediate state, and end of all things, and bury the writings under ground in Sippara, the city of the sun; that he should also build a ship, and go into it with his relations and dearest friends, having first furnished it with provisions, and taken into it fowls and four-footed beasts; and that, when he had provided every thing, and was asked whither he was sailing, he should answer, *To the gods, to pray for happiness to mankind.* Xisuthrus did not disobey; but built a vessel, whose length was five furlongs, and breadth two furlongs. He put on board all he was directed; and went into it with his wife, children, and friends. The flood being come, and soon ceasing, Xisuthrus let out certain birds, which finding no food, nor place to rest upon, returned again to the ship. Xisuthrus, after some days, let out the birds again; but they returned to the ship, having their feet daubed with mud: but when they were let go the third time, they came no more to the ship, whereby Xisuthrus understood that the earth appeared again; and thereupon he made an opening between the planks of the ship, and seeing that it rested on a certain mountain, he came out with his wife, and his daughter, and his pilot; and having worshipped the earth, and raised an altar, and sacrificed to the gods, he and those who went out with him disappeared. They who were left behind in the ship, finding that Xisuthrus and the persons that accompanied him did not return, went out themselves to seek for him, calling him aloud by his name; but Xisuthrus was no more seen by them: only a voice came out of the air, which enjoined them, as their duty was, to be religious; and informed them, that on account of his own piety he was gone to dwell with the gods, and that

Antediluvians.

that his wife and daughter and pilot, were partakers of the ſame honour. It alſo directed them to return to Babylon, and that, as the fates had ordained, they ſhould take the writings from Sippara, and communicate them to mankind; and told them, that the place where they were was the country of Armenia. When they had heard this, they offered ſacrifice to the gods, and unanimouſly went to Babylon; and when they came thither, they dug up the writings at Sippara, built many cities raiſed temples, and rebuilt Babylon.

14 Antediluvian kings of Egypt.

The Egyptians who would give place to no nation in point of antiquity, have alſo a ſeries of kings, who, as is pretended, reigned in Egypt before the flood; and to be even with the Chaldeans, began their account the very ſame year that theirs does according to Beroſus.

There was an ancient chronicle extant among the Egyptians, not many centuries ago, which contained 30 dynaſties of princes who ruled in that country, by a ſeries of 113 generations, through an immenſe ſpace of 36,525 years, during which Egypt was ſucceſſively governed by three different races; of whom the firſt were the Auritæ, the ſecond the Meſtræi, and the third the Egyptians.

But this extravagant number of years Manetho (to whoſe remains we muſt chiefly have recourſe for the ancient Egyptian hiſtory) has not adopted, however, in other reſpects he is ſuppoſed to have been led into errors in chronology by this old chronicle, which yet ſeems to have been a compoſition ſince Manetho's time.

15 Sanchoniatho's Phœnician hiſtory.

The account given by Beroſus is manifeſtly taken from the writings of Moſes; but we have another account of the firſt ages of mankind, in which no mention is made of the flood at all. This is contained in ſome fragments of a Phœnician author called *Sanchoniatho*, who is by ſome ſaid to have been cotemporary with Gideon, by others to have lived in the days of king David; while ſome boldly aſſert there never was ſuch a perſon, and that the whole is a fiction of Philo-Biblius, in oppoſition to the books of Joſephus written againſt Apion. To gratify the reader's curioſity, however, we have ſubjoined an account of the firſt ten generations mentioned by him, which are ſuppoſed by the compilers of the Univerſal Hiſtory to correſpond to the generations mentioned by Moſes before the flood.

Sanchoniatho having delivered his coſmogony, or generation of the other parts of the world, begins his hiſtory of mankind with the production of the firſt pair of mortals, whom Philo, his tranſlator, calls *Protogonus* and *Æon;* the latter of whom found out the food which was gathered from trees.

Their iſſue were called *Genus* and *Genea*, and dwelt in Phœnicia: but when the great droughts came, they ſtretched forth their hands to heaven towards the ſun; for him they thought the only God and Lord of heaven, calling him *Beelſamen*, which in Phœnician is *Lord of heaven*, and in Greek *Zeus.*

Afterwards from Genus, the ſon of Protogonus and Æon, other mortal iſſue was begotten, whoſe names were *Phos, Pur, and Phlox;* that is, *Light, Fire,* and *Flame.* Theſe found out the way of generating fire, by the rubbing of pieces of wood againſt each other, and taught men the uſe thereof. They begat ſons of vaſt bulk and height, whoſe names were given to the mountains on which they ſeized: ſo from them were named mount *Caſſius Libanus, Antilibanus*, and *Brathys.*

Of theſe laſt were begotten Memrumus, and Hypſuranius; but they were ſo named by their mothers, the women of thoſe times, who without ſhame lay with any man they could light upon. Hypſuranius inhabited Tyre, and he invented the making of huts of reeds and ruſhes, and the papyrus. He alſo fell into enmity with his brother Uſous, who firſt invented a covering for his body out of the ſkins of the wild beaſts which he could catch. And when violent tempeſts of winds and rains came, the boughs in Tyre being rubbed againſt each other, took fire, and burnt the wood there. And Uſous, having taken a tree, and broke off its boughs, was ſo bold as to venture upon it into the ſea. He alſo conſecrated two rude ſtones, or pillars, to fire and wind; and he worſhipped them, and poured out to them the blood of ſuch wild beaſts as had been caught in hunting. But when theſe were dead, thoſe that remained conſecrated to them ſtumps of wood and pillars, worſhipping them, and kept anniverſary feaſts unto them.

Many years after this generation came Agreus and Halicus, the inventors of the arts of hunting and fiſhing, from whom huntſmen and fiſhermen are named.

Of theſe were begotten two brothers, the inventors of iron and of the forging thereof: one of theſe, called *Chryſor*, the ſame with Hepheſtus or Vulcan, exerciſed himſelf in words and charms and divinations; found out the hook, bait, and fiſhing-line, and boats ſlightly built; and was the firſt of all men that ſailed. Wherefore he alſo was worſhipped after his death for a god; and they called him *Zeus Michius*, or Jupiter the engineer; and ſome ſay his brothers invented the way of making walls of brick.

Afterwards from this generation came two brothers; one of whom was called *Technites*, or the Artiſt; the other, *Geinus, Autochthon*, [the home-born man of the earth.] Theſe found out to mingle ſtubble, or ſmall twigs, with the brick earth, and to dry them in the ſun, and ſo made tyling.

By theſe were begotten others; of which one was called *Agrus* [Field]; and the other *Agrouerus*, or *Agrotes*, [Huſbandmen], who had a ſtatue much worſhipped, and a temple carried about by one or more yoke of oxen, in Phœnicia, and among thoſe of Byblus he is eminently called the *greateſt of the gods.* Theſe found out how to make courts about mens houſes, and fences and caves, or cellars. Huſbandmen, and ſuch as uſe dogs in hunting, derive from theſe; and they are alſo called *Aletæ* and *Titans.*

Of theſe were begotten Amynus and Magus, who ſhowed men to conſtitute villages and flocks.

In theſe mens age there was one Eliun, which imports in Greek *Hypſiſtus* [the moſt high], and his wife was named *Beruth*, who dwelt about Byblus: and by him was begot one Epigerus, or Autochton, whom they afterwards called *Uranus* [heaven]; ſo that from him that element which is over us, by reaſon of its excellent beauty, is called *heaven:* and he had a ſiſter of the ſame parents called *Ge*, [the earth]; and by reaſon of her beauty, the earth had her name given to it.

Hypſiſtus, the father of theſe, dying in fight with wild beaſts, was conſecrated, and his children offered ſacrifices and libations to him.—But Uranus taking the kingdom

Antediluvians. kingdom of his father, married his sister Ge, and had by her four sons; Ilus, who is called *Cronus* [or Saturn]; Betylus; Dagon, who is Siton or the god of corn; and Atlas: but by other wives Uranus had much issue.

As to the customs, policy, and other general circumstances of the Antediluvians, we can only form conjectures.

The only thing we know as to their religious rites is, that they offered sacrifices, and that very early, both of the fruits of the earth, and of animals; but whether the blood and flesh of the animals, or only their milk and wool, were offered, is a disputed point.—

16 Arts, &c. of the Antediluvians.

Of their arts and sciences, we have not much more to say. The antediluvians seem to have spent their time rather in luxury and wantonness, to which the abundant fertility of the first earth invited them, than in discoveries or improvements, which probably they stood much less in need of than their successors. The art of working metals was found out by the last generation of Cain's line; and music, which they might be supposed to practice for their pleasure, was not brought to any perfection, if invented, before the same generation. Some authors have supposed astronomy to have been cultivated by the Antediluvians, though this is probably owing to a mistake of Josephus; but it is to be presumed, the progress they made therein, or in any other science, was not extraordinary; it being even very doubtful whether letters were so much as known before the flood. See ALPHABET, n° 13.

As to their politics and civil constitutions, we have not so much as any circumstances whereon to build conjecture. It is probable, the patriarchal form of government, which certainly was the first, was set aside when tyranny and oppression began to take place, and much sooner among the race of Cain than that of Seth. It seems also, that their communities were but few, and consisted of vastly larger numbers of people than any form since the flood: or rather, it is a question, whether, after the union of the two great families of Seth and Cain, there were any distinction of civil societies, or diversity of regular governments, at all. It is more likely, that all mankind then made but one great nation, though living in a kind of anarchy, divided into several disorderly associations; which, as it was almost the natural consequence of their having, in all probability, but one common language, so it was a circumstance which greatly contributed to that general corruption, which otherwise perhaps could not have so universally overspread the Antediluvian world. And for this reason chiefly, as it seems, so soon as the posterity of Noah were sufficiently increased, a plurality of tongues was miraculously introduced, in order to divide them into distinct societies, and thereby prevent any such total depravation for the future. See *CONFUSION of Tongues*.

Of the condition of the Antediluvians, Mr Whitehurst, in his *Inquiry into the original state and formation of the earth*,* has given us the following picture: "Under a mild and serene sky, and when the spontaneous productions of the earth were more than sufficient for the calls of nature without art or labour, mankind had no need of any other protection from the inclemency of the seasons, nor of barns for winter's store, than the benevolent Author of nature had plentifully provided for them. Consequently, in a state of nature like this, there was no temptation to acts of violence, injustice, fraud, &c. every one having plenty and enough, each equally partook of the numerous blessings thus amply provided for him. Power and property being equally diffused, men lived together in perfect peace and harmony, without law, and without fear; therefore it may be truly said of the Antediluvians, that they slept away their time in sweet repose on the ever verdant turf. Such apparently was the state of nature in the first ages of the world, or from the creation to the first convulsion in nature, whereby the world was not only universally deluged, but reduced to a heap of ruins." But our ingenious author, whose *Inquiry* is not professedly repugnant to revelation, seems here to have lost himself in a pleasing reverie. At least he has forgot to inform us, For what purpose, under such circumstances, he supposes the deluge to have been sent upon the earth: and, How we are to understand the account given by Moses, who represents the Antediluvians, not as an innocent race, quietly reposing on the ever-verdant turf; but as a corrupt generation, by whom "the earth was filled with violence."

* P. 282, 283.

17 Of the longevity of the Antediluvians.

One of the most extraordinary circumstances, which occurs in the antediluvian history, is the vast length of human lives in those first ages, in comparison with our own. Few persons now arrive to eighty or an hundred years; whereas, before the flood, they frequently lived to near a thousand: a disproportion almost incredible, though supported by the joint testimonies of sacred and prophane writers. Some, to reconcile the matter with probability, have imagined that the ages of those first men might possibly be computed, not by solar years, but months; an expedient which reduces the length of their lives rather to a shorter period than our own. But for this there is not the least foundation; besides the many absurdities that would thence follow, such as their begetting children at about six years of age, as some of them in that case must have done, and the contraction of the whole interval between the creation and the deluge to considerably less than two hundred years, even according to the larger computation of the Septuagint.

Again: Josephus the Jewish historian, and some Christian divines, are of opinion, that before the flood, and some time after, mankind in general did not live to such a remarkable age, but only a few beloved of God, such as the patriarchs mentioned by Moses. They reason in this manner: Though the historian records the names of some men whose longevity was singular, yet that is no proof that the rest of mankind attained to the same period of life, more than that every man was then of a gigantic stature, because he says *in those days there were giants upon the earth*. Besides, had the whole of the Antediluvians lived so very long, and increased in numbers in proportion to their age, before the flood of Noah, the earth could not have contained its inhabitants, even suppposing no part of it had been sea. And had animals lived as long, and multiplied in the same manner as they have done afterwards, they would have consumed the whole produce of the globe, and the stronger would have extinguished many species of the weaker. Hence they conclude, that, for wise and good ends, God extended only the lives of the patriarchs, and a few beside, to such an extraordinary length.

But most writers maintain the longevity of mankind in general in the early world, not only upon the authority

Antediluvians. authority of sacred, but likewise of profane history. And for such a constitution, the moral reasons are abundantly obvious.

18 Moral reasons for this longevity. When the earth was wholly unpeopled, except by one pair, it was necessary to endow men with a stronger frame, and to allow them a longer continuance upon earth for peopling it with inhabitants. In the infant state of every mechanical art, relating to tillage, building, clothing, &c. it would require many years experience to invent proper tools and instruments to ease men of their labour, and by multiplied essays and experiments to bring their inventions to any degree of maturity and perfection. Every part of their work must have been exceedingly arduous from such a penury and coarseness of tools, and must have required longer time and more strength of body than afterwards, when mechanical knowledge was introduced into the world. If parents at this period had not continued long with their children, to have taught them the arts of providing for themselves, and have defended them from the attacks of wild beasts, and from other injuries to which they were exposed, many families would have been totally extinguished. But one of the best and most valuable ends which longevity would answer was, the transmitting of knowledge, particularly of religious knowledge, to mankind. And thus, before writing was invented, or any such easy and durable mode of conveyance was found out, a very few men served for many generations to instruct their posterity, who would not be at a loss to consult living and authentic records.

19 Natural causes of it. The natural causes of this longevity are variously assigned. Some have imputed it to the sobriety of the Antediluvians, and the simplicity of their diet; alleging that they had none of those provocations to gluttony, which wit and vice have since invented. Temperance might undoubtedly have some effect, but not possibly to such a degree. There have been many temperate and abstemious persons in later ages, who yet seldom have exceeded the usual period.—Others have thought, that the long lives of those inhabitants of the old world proceeded from the strength of their stamina, or first principles of their bodily constitutions: which might, indeed, be a concurrent, but not the sole and adequate cause of their longevity; for Shem, who was born before the deluge, and had all the virtue of the antediluvian constitution, fell three hundred years short of the age of his forefathers, because the greatest part of his life was passed after the flood.—Others have imputed the longevity of the Antediluvians to the excellency of these fruits, and some peculiar virtue in the herbs and plants of those days. But to this supposition it has been objected, that as the earth was cursed immediately after the fall, its productions we may suppose gradually decreased in their virtue and goodness till the flood; and yet we do not see the length of mens lives decreased considerably, if at all, during that interval. Waving this objection, as the import of the curse is variously interpreted, it appears certain that the productions of the earth were at first, and probably continued till after the deluge, of a different nature from what they were in future times. Buffon supposes this difference may have continued gradually to diminish for many ages subsequent to that catastrophe. The surface of the globe (according to his theory) was in the first ages of the world less solid and compact; because, gravity having acted only for a short time, terrestrial bodies had not acquired their present density and consistence. The produce of the earth, therefore, must have been analogous to its condition. The surface being more loose and moist, its productions would of course be more ductile and capable of extension: Their growth, therefore, and even that of the human body, would require a longer time of being completed. The softness and ductility of the bones, muscles, &c. would probably remain for a longer period, because every species of food was more soft and succulent. Hence, the full expansion of the human body, or when it was capable of generating, must have required 120 or 130 years; and the duration of life would be in proportion to the time of growth, as is uniformly the case at present: For if we suppose the age of puberty, among the first races of men, to have been 130 years, as they now arrive at that age in 14 years, the age of the Antediluvians will be in exact proportion to that of the present race; since by multiplying these two numbers by seven, for example, the age of the present race will be 90, and that of the Antediluvians will be 910. The period of man's existence, therefore, may have gradually diminished in proportion as the surface of the earth acquired more solidity by the constant action of gravity: and it is probable, that the period from the creation, to the days of David, was sufficient to give the earth all the density it was capable of receiving from the influence of gravitation; and consequently that the surface of the earth has ever since remained in the same state, and that the terms of growth in the productions of the earth, as well as the duration of life, have been invariably fixed from that period.

It has been further supposed, that a principal cause of the longevity under consideration was the wholesome constitution of the Antediluvian air, which, after the deluge, became corrupted and unwholesome, breaking, by degrees, the pristine crasis of the body, and shortening men's lives, in a very few ages, to near the present standard.

The temperature of the air and seasons before that catastrophe are, upon very probable grounds, supposed to have been constantly uniform and mild: the burning heats of summer and the severities of winter's cold were not then come forth, but spring and autumn reigned perpetually together: And indeed, the circumstances above all others most conducive to the prolongation of human life in the postdiluvian world appears to be an equal and benign temperature of climate (see the article LONGEVITY); whence it seems reasonable to infer, that the same cause might have produced the same effect in the Antediluvian world.

Whether flesh was permitted to be eaten before the deluge, is a question which has been much debated. By the permission expressly given to Noah for that purpose, after the flood, and God's assigning vegetables only for food to man, as well as beast, at the creation, one would imagine it was not lawful before: yet others have supposed, that it was included in the general grant of power and dominion given to Adam by God over the animal creation; and the distinction of beasts into clean and unclean, which was well known before the flood, is insisted on as a strong argument on this side. 20 Whether any flesh might be eaten before the flood.

But in answer to this it has been observed, that if so,

Antediluvians.

so, it doth not appear what occasion there was to renew this grant after the flood, and to add, "Every moving thing that liveth shall be meat for you, even as the green herb have I given you all things." This surely implies that the green herb and fruits of the trees were all that was granted to man at first; but now, over and above that, was added the grant of animal food: for in a deed or gift, all is specified that is given or granted, and whatever is not expressly mentioned is excluded or not given. Here man's food is appointed and specified, what is not expressly mentioned is therefore reserved and not granted. Besides, this grant or appointment of man's food respected, not Adam only, but all his posterity, till an additional grant was made.

To the animals no further grant was made than at first; but to man another was made immediately after his fall and expulsion from Paradise, implied in these words; "In the sweat of thy face shalt thou eat bread, till thou return unto the ground." This was in truth a punishment for his transgression, as well as a grant of other food, but yet what was now become necessary to him. Paradise was no doubt planted with the most excellent fruits, sufficient to have sustained his life in health and vigour in his innocent state: but after his transgression, being thrust out from that happy abode, and having then only the fruits of the common earth to feed on, which were not so nutritious as those of Paradise, he stood in need of something else to sustain life; and therefore bread produced by culture and other preparations for his food was now added, which before was not necessary, and thence called *the staff of life*. This seems a plain reason why bread was added after he came to live on the common earth; though perhaps another reason also for that addition may be given from the change that happened in man's body after his fall. Bread being now become the staff of life, Cain, the first man born, became a tiller of the ground, or an husbandman; as the next in birth, Abel, became a keeper or feeder of sheep.

As to the distinction between clean and unclean, this solely respected animals offered in sacrifice in the Antediluvian world: as is evident from hence, that Noah, upon his coming out of the ark, "took of every clean beast and of every clean fowl, and offered burnt-offerings unto the Lord;" and that upon the grant of animal food to him and his posterity, which was posterior in time to the sacrifice, there is not the least mention of any distinction between clean and unclean with respect to food, but the very contrary, since the grant runneth, "Every moving thing that liveth shall be meat for you, even as the green herb have I given you all things." That distinction of clean and unclean as to food, came in with the law of Moses, and was different from that of sacrifices, there being several creatures clean for food which were not to be offered in sacrifice.

But another objection here occurs. What occasion was there for keeping sheep, when none of them could be eaten? In answer to this, it has been observed, that sheep and other animals might at this period be of great use to men besides yielding them food. Their flocks, no doubt, consisted of such creatures as were of the domestic kind, and such as by the divine law were pronounced clean and fit for being offered in sacrifice; therefore numbers would be kept for this very purpose. Their skins, besides serving men as garments; might answer many other valuable intentions. Vestments of hair and wool soon succeeded the ruder covering of skins; consequently great profit would be derived from such animals as could be shorn, especially in countries where the inhabitants led a pastoral life and dwelt in tents. And we afterwards find that Abel's sacrifice was of this kind. They might use several of these animals, as they still do in some parts of the world, for bearing of burdens and drawing of carriages: for we may take for granted that the first inventions for easing men of labour, would be of the simplest kind, and such as came easiest to hand. But keeping flocks of sheep, goats, and such like, would be of great utility, by affording quantities of milk, which is found to be the most nourishing diet both to the young and the old; and their carcases, though not used as food, might answer some useful purposes, perhaps in manuring the soil.

21 Increase of mankind before the flood.

The Antediluvian world was, in all probability, stocked with a much greater number of inhabitants than the present earth either actually does, or perhaps is capable of containing or supplying. This seems naturally to follow from the great length of their lives, which exceeding the present standard of life in the proportion, at least, of ten to one, the Antediluvians must accordingly in any long space of time double themselves, at least in about the tenth part of the time in which mankind do now double themselves. It has been supposed that they began to beget children as early, and left off as late, in proportion, as men do now; and that the several children of the same father succeeded as quickly one after another as they usually do at this day; and as many generations, which are but successive with us, were contemporary before the flood, the number of people living on the earth at once would be by that means sufficiently increased to answer any defect which might arise from other circumstances not considered. So that, if we make a computation on these principles, we shall find, that there was a considerable number of people in the world at the death of Abel though their father Adam was not then 130 years old; and that the number of mankind before the deluge would easily amount to above one hundred thousand millions (even according to the Samaritan chronology), that is, to twenty times as many as our present earth has, in all probability, now upon it, or can well be supposed capable of maintaining in its present constitution.

The following table, made upon the abovementioned principles by Mr Whiston, shows at least what number of people might have been in the Antediluvian world.

Number of mankind.	Year of the world.	Year of doubling.	Series.

* Cockburn upon the Deluge.

But according to a later* writer upon the subject, the above table, though the numbers there may be thought sufficient for the peopling of the earth, we could by no means depend upon, for several reasons; particularly,

22
Objections to Mr Whiston's table.

1. It is laid down there as a foundation, that the Antediluvians would double themselves every 40 years; as indeed they would, and in less time, after there came to be 100 marriages. Now, had the author observed this regular progression in his computation, by adding 40 years to every former period of the age of the world, the amount, instead of two millions of millions, &c. would have been above five millions of millions at the year 1656, the age of the world at the deluge, according to the Hebrew numbers which he contends for. What would the sum then have been, had we carried on the computation for 600 years more according to the Septuagint?

2. He supposes the period of doubling must have been much shorter in the earliest ages, and much longer in the later, contrary to reason and fact. For mankind being sprung from one pair only, the increase at first must have been very slow, but come on very fast when a considerable number were married. His table therefore is made not regularly, but according to fancy, by unequal starts or chasms, at great intervals in the later part, where it should have been most regular; it would seem with no other view than to raise such a number, upon the whole, as might be thought sufficient to people the earth,

3. In that calculation the two material points, the time of nursing and the age of puberty, are quite overlooked, by which all computations of the numbers in the antediluvian world must be regulated. What unavoidable mistakes this omission must occasion, will be seen by examining the first ten numbers of the said table.

Years of the world and intervals of doubling.	Nember of increase according to the intervals.	
1	2	Adam and Eve.
2	4	Cain and Abel.
6	8	
12	16	
20	32	
30	64	
42	128	
56	256	
72	512	
90	1024	
110	2048	

On this table it may be observed, 1. That though there were but two persons created at first, this computation makes four persons in the second year of the world. This could not possibly be, except Cain had been born within 12 months after the creation, which is highly improbable, and Abel in the second year, yet far more improbable; for in that case Eve could not have suckled Cain.

Cockburn, p. 108.

2. In the sixth year of the world we have eight persons, that is, six children of Eve's in six years. "But (our author adds) what shall Eve do with six infants in six years? Where could she find so many wet nurses for them? Or would the mother of all living deny her children that nourishment which the Creator had appointed for their first food, the milk in her breasts? Do they consider that there was but one women in the world to do for herself, her husband and her children, what belongs to women to do? We should surely have more respect and compassion for the mother of all mankind, than to lay such an intolerable burden upon her, whose sorrow for her own deception, and thereby ruining both herself and her husband, must have been very great for many years. In punishment of which, though God had said *he would greatly multiply her sorrow and conception*, the meaning was not, that she should have a child every year, which could not be, because the nature of that food and nourishment appointed by himself for her children would not permit it. Nor yet when he commanded them to *increase and multiply and replenish the earth*, could the command be obeyed in such a manner as was contrary to the order of nature and providence. But the method intended to answer the design of the command was to prolong their lives to above 800 and 900 years, and their prolific powers for 340 or 360 years of that term of life, that by slow and sure and long continuance of increase they might people the earth in due time."

3. The same exception lies to all the following periods of doubling, where the number far exceeds what it could possibly be in fact; but we shall pass them over, and come to the last of them in the year 110, in which the nember of mankind is made 2048. Now in the year 110 not one of Adam's children were mar-

Antediluvians.

ried, because not yet come to the age of puberty. In that year of the world there could be no more than 18 or 20 persons, at single births, besides Adam and Eve. It is a great mistake therefore to imagine, that the periods of doubling were much shorter in the earlier times than in the latter; the contrary of which is evident to reason.

Id. p. 81. According to our author, two errors have been fallen into in treating of this point; namely, 1. That in the first ages of the world, both before and after the Flood, men began to propagate their kind as early as they commonly do at present. 2. That the children of the same father succeeded one after another as fast as they do now, that is, that the women brought forth children every year. The first of these errors he confutes, by showing that the several periods or stages of man's life bear a just proportion to one another, and to the whole term of life; and that the period of puberty or maturity has not been the same at all times, but is according to the length or brevity of life in the different ages of the world, according to that remark of St Augustine, *Tanto serior fuit proportione pubertas, quanto vitæ totius major annositas.* Moses, he observes, gives the age of the world from the creation to the deluge, and from that period to his own time chiefly by generations. A generation is the interval of years between the births of father and son. This the Latins call *ætas*, and the Greeks γενεα. Now, a generation, or the interval of years between father and son, has not been, neither possibly could be, the same in all ages from the beginning, as Vossius justly observes; but has varied greatly according to the length or brevity of man's life in the several periods of the world. Since the ordinary term of man's life has been reduced to 70 and 80 years, the time of puberty is in proportion to this brevity of life, and reckoned at 20 or 21, which is the fourth-part of a life of fourscore. The several stages of human life are infancy, childhood, youth, manhood, full age, declension, old or decrepit age; all which commonly bear a proportion to the whole term of life. Now the bounds and limits of these several stages cannot be precisely the same in all, but vary in respect of the disposition of men's bodies, their course of life, and also the places and ages in which they live. In the Antediluvian world then, when men lived to upwards of 800 and 900 years, can it be thought that they passed through the several stages of life in as short a time as men do now, who seldom exceed 80, and not one in ten arrives at that age? But if the Antediluvians arrived at puberty or manhood as soon as men do now, then would the several stages of human life have been lost or confounded, and men would have started from childhood to manhood at once, without any due or regular intervals, contrary to the order of nature: But if, according to the present œconomy of nature, man is but a youth at 20, which is a fourth part of our term of life, we may reasonably conclude, there would be a suitable proportion of years in a much longer term of life, since nature is constant and uniform in her operations. And though in so long a life as the Antediluvians enjoyed, the time of puberty might be a fifth or a sixth part of their term of life, yet would they be but youths at 150 or 160; which bears much the same proportion to the whole of their life as 20 is to that of ours.

23 Of the ages of puberty among the Antediluvians.

The other is an error, he thinks, which could never have been fallen into, had it been considered, that every mother suckled her own children in those early days; and indeed where could she have found another to have done it for her?

Taking it for granted, then, that it was an universal custom for women to suckle their children as well before as after the food, the next question is, for how long time they continued nurses? He shews various instances, that when man's life was reduced to 130 or 140 years, the ordinary time of nursing was two years: he thence infers, that for three or four generations after the flood, when men lived to above 400 years, the time would be so much longer in proportion, and would not be less than three or four years; and consequently, that before the flood, when life was protracted to 800 or 900 years, it would be still longer in proportion to their longevity; so that five years might be the ordinary time of nursing in the Old World; and therefore that we cannot reckon less than six years between the births. For man's life being prolonged to so many hundred years at first for the more speedy peopling of the earth, he came by slow degrees to mature age, there being a long time required to rear up a body that was to last near 1000 years. The intervals therefore of infancy, childhood, youth, and mature age, were so much longer in proportion to ours as the difference is between our term of life and theirs; and 150 or 160 years, with respect to their longivity, was no more in proportion than 20 is to the brevity of our life. As the Antediluvians therefore were so very long in growing up to mature age, he concludes that the time of nursing could not be shorter than five years, and that the distance between the births in a regular way must be set at six years.

24 Of the time allotted for nursing in those early days.

25 Distance between the births.

Upon the whole, he thinks it evident that there could be no such speedy increase of mankind at the beginning as is imagined; that the time of nursing above specified was no more than necessary for that strength of constitution which was to last for 800 and 900 years; and that women who were to continue bearing children for 340 or 360 years of their life, should have them but slowly, and at the distance of several years, that their strength might hold out, and that they might not be overburthened with too many cares at once; and therefore, when Eve's first child was six years old, it was time enough for her to have another, and so on, though possibly sometimes twins.

These points being discussed, he proceeds, 1. To compute what number upon the whole might be born into the world from the creation to near the time of the deluge; and then, 2. To state the needful deductions for deaths and other deficiencies.

25 Cockburn's calculation of the increase of mankind.

I. 1. How long the parents of mankind continued in paradise, we know not; though longer perhaps than is commonly imagined. We shall even suppose two or three years, in which time there was no child born, nor any attempt towards it. We shall allow them two or three years more to lament their fall, and the miserable estate their want of faith and disobedience had brought them to, from a most happy condition; and suppose Cain to be born six years after the creation (in which supposition few, probably, will be apt to think us too hasty), and Abel again six years after him, and so every sixth year Eve to have had a child, the first

seven

Antediluvians.

seven, eight or nine whereof were probably all males (the males being longer in coming to maturity than the females); and this distance between the births will also be thought a sufficient allowance. At this rate of increase Adam would have in 100 years 16 children, in 200 years 32, and in 400 years 64 children; when we will suppose Eve to have left off child-bearing. Nor need this number of Adam's children be thought too great, when there are instances in these later ages, and this short period of man's life, of those who have had 40 children at single births by two successive wives, and of many others who have had 20, 25, and 30, by one wife; though in such cases it is not to be supposed that the women suckled their children.

2. Though it is reasonable to think that the Antediluvians, notwithstanding their longevity, came to mature age at 150; yet as we are not sure that they all married so soon as they were ripe for marriage, and that the earliest in the genealogies is born in the 162d year of his father, who might probably be a first-born, our author does not suppose Cain, Abel, or any of the succeeding children or grandchildren of Adam to have married till they were 160, but to have had children from 161 or 162 till they were of the age of 500, at the fore-named distance or interval between the births; though Noah we know had three sons after he was 500, at the due intervals. And to all the Antediluvians we may allow, without fear of exceeding, 50 or 54 children in general, according to the course of nature, and the longevity of those first ages of the world.

3. Let us next inquire in what number of years the men of that world might double themselves, notwithstanding the long interval between the births. The increase indeed will be found very small for the first 300 or 400 years, as they were late in coming to maturity; but the succeeding ages will swell the account exceedingly. Let us suppose at present (what shall be proved afterwards) that in the year of the world 500, there were 200 persons only, male and female, of full age to marry, the men at 160, the women at 120 or thereabout. The first or second year after the marriage will probably produce 100 births from 100 couple, and every sixth year after 100 more. At this slow progression the 200 married persons will, in 19 or 20 years, be increased to 600: so that the number of mankind would be trebled in 20 years, after there came 100 pair to be married. And in this manner they would increase and multiply every 20 years, or in that space treble themselves.

It may perhaps be objected, that though it appears that such an increase might be at first from the first 100 marriages, yet they could not continue thus to multiply at such periods; because, according to the rule we have laid down, none of the issue of these 100 first marriages could increase the number of mankind till the men had attained the age of 160. It is true they could not: but then it must be remembred, that the first 100 pair are still adding every sixth year 100 more to the number of mankind, even till after the 400 born in the first 20 years are married, and begin a new stock for increase; so that when there came to be some hundred couples married, the increase and multiplication would come on very fast, and in 1000 years mankind would be prodigiously increased.

But though there be nothing in this supposition contrary to reason, viz. That after the year of the World 500, they might treble themselves in 20 years; yet we will not reckon upon so short an interval, but will allow a much longer time even to their doubling themselves, and shall exhibit two tables of doubling; the first at the interval of 50 years (much too long indeed), the other at the interval of 40 years, and both beginning at the year 500, when there could not be fewer (whatever more there might be) than 100 married or marriageable persons descended from Adam and Eve.

Years of the World.	Number of Mankind.
500	200
550	400
600	800
650	1,600
700	3,200
750	6,400
800	12,800
850	25,600
900	51,200
950	102,400
1,000	204,800
1,050	409,600
1,100	819,200
1,150	1,638,400
1,200	3,276,800
1,250	6,553,600
1,300	13,107,200
1,350	26,214,400
1,400	52,428,800
1,450	104,857,600
1,500	209,715,200
1,550	419,430,400
1,600	838,860,800
1,650	1,677,721,600
1,700	3,355,443,200
1,750	6,710,886,400
1,800	13,421,772,800
1,850	26,843,545,600
1,900	53,687,091,200
1,950	107,374,182,400
2,000	214,748,364,800
2,050	429,496,729,600

This table is calculated at the long interval of 50 years, that it may appear that even by under-rating the number of mankind, there would be so many millions born into the world before the deluge came, that they would be obliged to spread themselves over the face of the earth, though but one half of the sum total of 429,496 millions had been alive at the time of the deluge; but as the interval here allowed may appear to be too long for the time of doubling, the second is calculated at the interval of 40 years, which comes nearer to the truth of the case, though even this may exceed the time of doubling.

1,860	3,435,973,836,800
1,900	6,871,947,673,600
1,940	13,743,895,347,200
1,980	27,487,790,694,400
2,020	54,975,581,388,800

The first table is brought down no lower than to the year 2050, and the second to the year 2020, though there remain by the first 206, and by the second 236 years to the flood: the reason is, that in those last 200 years of the world, mankind would not increase in any measure equal to what they had done in the preceeding years (though regularly the increase should have been much greater): because that violence was then great in the earth, and thousands, yea, millions, might have been cut off by untimely deaths; for which cause the worlds destruction was determined 120 years before the flood came.

27 Objection answered. II. But now against this immense number of mankind that might in a regular and ordinary way have been born in the world between the creation and the deluge in 2056 years, it will no doubt be objected by some (as it has been done to far less numbers,) that all such calculations are mere guess-work, the product of fruitful imaginations.

But it should be considered, that in calculations of this nature some regular order or method must be observed: and though, according to the course of nature, such an increase and multiplication of mankind there might have been periodically, especially at the beginning, when the command was *to increase and multiply and replenish the earth;* yet we will not suppose that all things went on thus regularly, without difference or interruption. We do not know what extraordinary obstructions or interruptions there might be to such a regular increase. Though every married pair might by the course of nature have had such a number of children as has been mentioned, yet the Divine Providence might order it otherwise in manifold instances, and it might possibly be in the Old World as it has been since the flood, viz. that some marriages have produced many children, others few, and some none at all. Allowing therefore for all such obstructions and deficiencies, and likewise for all casualties and accidents (to which men might be liable in that world as well as in the present), in as ample a manner as can be desired, let the former number be reduced to one half, viz. to 27,487,790,694,400, that is, 27 billions, or millions of millions, four hundred and eighty-seven thousand seven hundred and ninety millions, six hundred and ninety-four thousand and four hundred. And this we shall now suppose to be the whole number of those who were born into the world before the deluge. But from this sum is to be subtracted the number of those who died before that time.

Of those in the genealogies from Adam by Seth, Enoch was translated at the age of 365, and Lamech the father of Noah died just before the flood at 753, Mahalaleel at 895. Adam and the other five patriarchs lived to above 900. Before the year 900 therefore, we may suppose there were no deaths except that of Abel, who was slain, a young man, but that all born within that period were alive together. But in the tenth century death began to reign, and Adam and Eve we may presume were the first over whom death had power in a natural way, as their disobedience was the cause of it. The children also born of them in the first hundred years would also die in this 10th century, those born in the second hundred would die in the 11th, those born in the third century would die in the 12th, and so on. But though we are far from thinking that after the beginning of the 10th century (till which time few or none died), the deaths would be equal to the births; yet as we have made large concessions all along, we shall do the same in this case, and suppose them upon the whole to have been equal, especially since we cannot precisely say how soon that violence or blood-shed, which was their crying sin, came to prevail; and therefore will reduce the last sum mentioned to one half again, to allow for the deaths and prevailing violence, and suppose the total number of mankind alive upon earth at the time of the deluge to have been no more than 13,743,895,347,200, that is, 13 billions, or millions of millions, seven hundred and forty-three thousand eight hundred and ninety-five millions, three hundred and forty-seven thousand and two hundred; a number vastly exceeding that of the present inhabitants of the whole earth.

28 Probability of the above calculation. Notwithstanding the very large allowances and abatements made to reduce the number of mankind, yet even the last reduction to 13 billions, or millions of millions, &c. seems so vastly great, that it will hardly be thought possible that such a number of men could ever be at one time upon the earth. Now, though we pretend to no certainty in this point (which made it the more requisite to allow largely for deaths and deficiencies), yet the calculation we have given must appear highly probable, since it is founded on grounds certain and undeniable: for instance,

1. It

1. It cannot be denied but that the Antediluvians were come to the age of puberty and marriage at 160 years, when we find a son born in 162. Nor,

2. Can it be said, that they could not have children at the age of 500, when we have an instance of one that had three sons at due distances after that age. Neither,

3. Can it be alleged that we have not allowed a due distance or interval between the births, viz. six years, when most will be opinion that it could not be so long. Nor yet,

4. Can it be judged that we have made the period of doubling far too short, when we had before showed that after 100 marriages consummated, they would treble themselves in half the time we have taken for their doubling. Nor,

5. Will any one make a doubt, but that there might be 200 persons of mature age for marriage in the year of the world 500, the men at 160, the women younger. Nevertheless, as this is the foundation of our calculation, we shall now show that there was at least such a number of persons marriageable at that age of the world.

It may be observed, that as we take 160 for the year of maturity and marriage, according to that period all married or marriageable in the year 500 must have been born in or before the year 340; the males at least, though the females coming sooner to maturity, might some of them be born later or after the year 380. Now, according to this stated period of marriage,

1. In or before the year 340, Adam might have had 54 children, males and females, or 27 pair married or fit for marriage.

2. Cain, whom we suppose to be but six years younger than Adam (which by the by is more than others allow), and to have married in the year 166, might have in the year 340, 28 children, or 14 pair fit for marriage; which added to the former, makes 41 pair.

3. Abel married six years later, that is, in the year 172. and whom we shall suppose slain in the year 225 or 226, could in that case have no more than eight or nine children, or four pair, which with the former make 45 pair.

4. Adam's third son married in the year 178, will afford us in the year 340, 26 children, or 13 pair, which increase the number of marriageable persons to 58 pair.

5. A fourth son of Adam's married in the year 184, will give us in the year 340, 25 children, or 12 pair; which makes the number of pairs 70.

6. A fifth son of Adam's married in the year 190, might in the year 340 have 24 children, or 12 pair again, which increase the former number to 82 pair.

7. A sixth son of Adam's married in the year 196, would have in the year 340, 22 children, or 11 pair; which added to the former make up 93 pair.

8. A seventh son of Adam's married in the year 202, will, in the year 340, give us 20 children, or 10 pair; which makes in the whole 103 pair, already three pair more than we reckoned upon. I need therefore go no farther on to the eighth or ninth son; but the following eight or nine births I may reasonably take to have been daughters, and married to the brothers that preceded them.

Here are now no more than 14 children of Adam's married, who have given us the 100 pair we have reckoned upon, and three over. We might yet have 13 pair to bring into the account, all born before the year 340, and marriageable in the year 500, which would very much increase the number of mankind. And by this the reader may perceive that we have been far from building on uncertain or precarious foundations, since we have omitted 13 pair more, which we might have taken into the account. And if it be considered that the command given to Adam was to increase and multiply and replenish the earth, no doubt can be made, but that his own and his childrens marriages were fruitful in the procreation of children that the earth might be inhabited.

ANTEGO. See Antigua.

ANTEJURAMENTUM, by our ancestors called *juramentum calumniæ*, an oath which anciently both accuser and accused were to take before any trial or purgation.—The accuser was to swear that he would prosecute the criminal; and the accused to make oath, on the day he was to undergo the ordeal, that he was innocent of the crime charged against him.

ANTELOPE, in zoology. See Capra.

ANTELUCAN, in ecclesiastical writers, is applied to things done in the night or before day. We find frequent mention of the antelucan assemblies *(Cœtus antelucani)* of the ancient Christians in times of persecution for religious worship.

ANTEMURALE, in the ancient military art, denotes much the same with what the moderns call an *out-work*.

ANTENATI, in modern English history, is chiefly understood of the subjects of Scotland, born before king James the Frist's accession to the English crown, and alive after it. In relation to these, those who were born after the accession were denominated *Postnati*. The antenati were considered as aliens in England, whereas the postnati claimed the privilege of natural subjects.

ANTENCLEMA, in oratory, is where the whole defence of the person accused turns on criminating the accuser. Such is the defence of Orestes, or the oration for Milo: *Occisus est, sed latro. Exsectus, sed raptor.*

ANTENICENE, in ecclesiastical writers, denotes a thing or person prior to the first council of Nice. We say the Antenicene faith, Antenicene creeds, Antenicene fathers.

ANTENNÆ, in the history of insects, slender bodies with which nature has furnished the heads of these creatures, being the same with what in English are called *horns* or *feelers*. See Entomology.

ANTENOR, a Trojan prince, came into Italy, expelled the Enganians on the river Po, and built the city of Padua, where his tomb is said to be still extant.

ANTEPAGMENTA, in the ancient architecture, the jams of a door. They are also ornaments, or garnishings, in carved work, of men, animals, &c. made either of wood or stone, and set on the architrave.

ANTEPENULTIMA, in grammar, the third syllable of a word from the end, or the last syllable but two.

ANTEPILANI, in the Roman armies, a name given to the hastati and principes, because they marched next before the triarii, who were called *pilani*.

ANTEPILEPTICS, among physicians, medicines esteemed good in the epilepsy.

ANTEPOSITION, a grammatical figure, whereby a word, which by the ordinary rules of syntax ought to follow another, comes before it. As when, in the Latin, the adjective is put before the substantive, the verb before the nominative case, &c.

ANTEPREDICAMENTS, among logicians, certain preliminary questions which illustrate the doctrine of predicaments and categories.

ANTEQUIERA, a handsome town of Spain, in the kingdom of Granada, divided into two parts, the upper and the lower. The upper is seated on a hill, and has a castle: the lower stands in a fertile plain, and is watered with a great number of brooks. There is a large quantity of salt in the mountain; and five miles from the town, a spring famous for the cure of the gravel. W. Long. 4. 40. N. Lat. 36. 51.

ANTERIOR, denotes something placed before another, either with respect to time or place.

ANTEROS, in mythology, one of the two Cupids who were the chief of the number. They are placed at the foot of the Venus of Medici; this is represented with a heavy and sullen look, agreeably to the poetical description of him, as the cause of love's ceasing. The other was called Eros.

ANTESIGNANI, in the Roman armies, soldiers placed before the standards, in order to defend them, according to Limpsius; but Cæsar and Livy mention the antesignani as the first line, or first body, of heavy armed troops. The velites, who used to skirmish before the army, were likewise called *antesignani*.

ANTESTATURE, in fortification, a small retrenchment made of palisadoes, or sacs of earth, with a view to dispute with an enemy the remainder of a piece of ground.

ANTESTARI, in Roman antiquity, signifies to bear witness against any one who refused to make his appearance in the Roman courts of judicature, on the day appointed, and according to the tenor of his bail. The plaintiff, finding the defendant after such a breach of his engagement, was allowed to carry him into court by force, having first asked any of the persons present to bear witness. The person asked to bear witness in this case, expressed his consent by turning his right ear, which was instantly taken hold of by the plaintiff, and this was to answer the end of a subpœna. The ear was touched upon this occasion, says Pliny, as being the seat of memory, and therefore the ceremony was a sort of caution to the party to remember his engagement.

ANTEVIRGILIAN HUSBANDRY, an appellation given to Mr. Tull's new method of horse-hoeing husbandry. See AGRICULTURE.

ANTHELION, See CORONA and PARHELION.

ANTHELIX, in anatomy, the inward protuberance of the external ear, being a semicircle within, and almost parallel to the helix. See ANATOMY.

ANTHELMINTICS, among physicians, medicines proper to destroy worms.

ANTHEM, a church-song, performed in cathedral-service by choristers, who sung aternately. It was used to denote both psalms and hymns, when performed in this manner. But at present, anthem is used in a more confined sense, being applied to certain passages taken out of the scriptures, and adapted to a particular solemnity. Anthems were first introduced in the reformed service of the English church, in the beginning of the reign of Queen Elizabeth.

ANTHEMIS, CAMOMILE: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ discoides*. The essential characters are these: The receptaculum is chaffy; there is no pappus; the calyx is hemispheric and subequal; and the florets of the ray are more than five. Of this genus Linnæus enumerates 17.

Species; of which the most remarkable are the following. 1. The nobilis, or common camomile, grows in plenty upon commons, and other waste land. It is a trailing perennial plant, which puts out roots from the branches, by which it spreads and multiplies greatly. Of this kind there is a variety with double leaves.—Formerly this plant was used for planting of walks; which, when mowed and rolled, looked well for some time; but as it was subject to decay in large patches, the walks became unsightly, and it was therefore disused. 2. The pyrethrum, or pellitory of Spain, is a perennial plant, which grows naturally in Spain and Portugal, from whence the roots are brought to Britain. The branches trail upon the ground, and spread a foot or more each way; these are garnished with fine winged leaves like those of the common camomile. At the extremity of each branch is produced one large single flower, like a camomile, but much larger; the rays of which are of a pure white within, but purple on the outside. After the flowers are past, the receptacle swells to a large scaly cone, having the seeds lodged between its scales; but unless the season is dry, the seeds will not come to perfection in Britain. 3. The tinctoria, with sawed winged leaves, is a perennial plant, which flowers from June to November, and makes a very pretty appearance, some of the flowers being of a white, others of a sulphur, and some of a bright yellow colour. 4. The Arabica, with a branching empalement. The seeds of this species were brought from Africa by the late Dr Shaw, and distributed to many curious botanists in Britain and other countries of Europe. It grows neat two feet high, with an upright stem, having a single flower at the top, from whose empalement there are two or three footstalks put out horizontally, about two inches long, each having a single flower smaller than the first, like the childing marigold, or hen-and-chicken daisy.

Culture. The first sort may be very easily propagated by procuring a few slips in the spring, and planting them about a foot distant from one another, where they will soon cover the ground. The other sorts may be propagated from seeds sown in the spring, and will require no other care than to be kept free from weeds: only the third sort must be transplanted when come up from the seeds into borders near shrubs, where they may have room to grow; for they spread very wide, and therefore require to be placed three feet distant from other plants.

Medicinal Uses. The first and second sorts are used in medicine. The first have a strong, not ungrateful, aromatic smell, and a very bitter nauseous taste. They are accounted carminative, aperient, emollient, and in some measure anodyne; and stand recommended in flatulent

tulent colics, for promoting the uterine purgations in spasmodic pains, and the pains of child-bed-women: sometimes they have been employed in intermittent fevers, and the nephritis. These flowers are frequently also used externally in discutient and antiseptic fomentations, and in emollient glysters. They enter the *decoctum pro enemate* and *decoctum pro fomento* of our pharmacopoeias. An essential oil was formerly directed to be prepared from them, but it is now omitted. A simple watery infusion of them taken in a tepid state, is at present frequently employed to promote the operation of emetics. The root of the pyrethrum is the only part endowed with medical virtue. It has no sensible smell; its taste is very hot and acrid, but less so than that of arum or dracunculus: the juice expressed from it has scarce any acrimony, nor is the root itself so pungent when fresh as after it has been dried. Water, assisted by heat, extracts some share of its taste, rectified spirit the whole; neither of them elevate any thing in distillation. The principal use of pyrethrum in the present practice is as a masticatory, for promoting the salival flux, and evacuating viscid humours from the head and neighbouring parts; by this means it often relieves the tooth-ach, some kinds of pains of the head, and lethargic complaints.

ANTHERA, among botanists, that part of the stamen which is fixed on the top of the filamentum, within the corolla: it contains the pollen or fine dust, which, when mature, it emits for the impregnation of the plant, according to Linnæus. The APEX of Ray, Tournef. & Rivin.; *Capsula staminis*, of Malpighi.

ANTHERICUM, SPIDER-WORT: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method, ranking under the 10th order, *Coronariæ*. The characters are: There is no *calyx*: The *corolla* consists of six oblong petals, which are expanding: The *stamina* consist of six subulated erect filaments; the antheræ are small and furrowed: The *pistillum* has a three-cornered germen, a simple stylus, and obtuse stigma: The *pericarpium* is an ovate trisulcated capsule, with three cells and three valves: The *seeds* are numerous and angular. Of this genus Linnæus reckons up nine.

Species. But only the three following seem to deserve notice. 1. The ramosum, with a branching stalk. 2. The iliago. These are perennial plants, which are natives of Spain, Portugal, and other warm countries. They were formerly pretty common in the English gardens; but the severe winter of 1740 killed most of their roots. They flower in June and July, and the seeds are ripe in September. 3. The frutescens, with a shrubby stalk, was formerly known among the gardeners near London by the name of *onion-leaved aloe*. It produces many ligneous branches from the root, each supporting a plant with long taper leaves, in shape like those of an onion, and full of a yellow pulp very juicy. These plants send out roots, which run down and fasten themselves into the earth, by which they multiply greatly. The flowers are produced on long loose spikes, are yellow, and appear at different times, so that the plants are never long destitute of flowers. This species is a native of the Cape of Good Hope.

Culture. The two first are propagated by seeds, which should be sown in the autumn, in a warm situation, on a bed of light sandy earth. When the plants come up they must be kept clear of weeds during the summer; and in autumn, when the leaves decay, they should be carefully taken up and transplanted into a bed of light earth, at a foot distance from one another. If the winter prove severe, they should be covered with straw, pease-haulm, or old tan. The third likewise requires shelter in winter; though some of them will live in the open air, if planted close to the warm wall.

ANTHESPHORIA, in antiquity, a Sicilian festival instituted in honour of Proserpine. The word is derived from the Greek ανθος, *flower*, and φερω, *I carry*; because that goddess was carried away by Pluto when she was gathering flowers in the fields. Yet Festus does not ascribe the feast to Proserpine; but says it was thus called by reason ears of corn were carried on this day to the temples.—Anthesphoria seems to be the same thing with the *florisertum* of the Latins, and answers to the harvest-home among us.

ANTHESTERIA, in antiquity, was a feast celebrated by the Athenians in honour of Bacchus. The most natural derivation of the word is from the Greek ανθος (*flos*), a flower, it being the custom at this feast to offer garlands of flowers to Bacchus.

The Anthesteria lasted three days, the 11th, 12th, and 13th of the month; each of which had a name suited to the proper office of the day. The first day of the feast was called πιθοιγια, i. e. *opening of the vessels*: because on this day they tapped the vessels, and tasted the wine. The second day they called χοες, *congii*, the name of a measure containing the weight of 10 pounds; on this they drank the wine prepared the day before. The third day they called χυτροι, *kettles*: on this day they boiled all sorts of pulse in kettles; which however they were not allowed to taste, as being offered to Mercury.

ANTHESTERION, in ancient chronology, the sixth month of the Athenian year. It contained 29 days; and answered to the latter part of our November and beginning of December. The Macedonians called it *dæsion* or *desion*. It had its name from the festival antheresteria kept in it.

ANTHISTIRIA, in botany: A genus of the trigynia order, belonging to the triandria class of plants; and, in the natural method, ranking under the 4th order, *Gramina*. The characters are: The *calyx* is a four-valved glume equally cleft to the base: The *corolla* is a two-valved glume: The *stamina* consist of three short slender filaments, the antheræ oblong and erect: The *pistillum* has an oblong germen; the styli are two; and the stigmata are clavated and and hairy: There is no *pericarpium*, except a closed calyx: The *seed* is oblong and furrowed. There is only one species of this grass, the ciliata or fringed anthistiria, a native of India.

ANTHOCEROS, or HORN-FLOWER: A genus of the order of algæ, belongingingto the cryptogamia class of plants; and, in the natural method, ranking under the 57th order, *Algæ*. The essential characters are: The calyx of the *male* is sessile, cylindric, and entire; the antheræ (one) is subulated, very long, and two-valved: The calyx of the *female* is monophyllous, divided into six parts, and expanding: The seeds are about three, naked and roundish.—There are only three species of the anthoceros, viz. the punctatus or spotted anthoceros, a native of Britain; the lævis, a native of Europe

Europe and America; and the multifides, a native of Germany. It is found in moist shady places, and on heaths.

ANTHOLOGION, the title of the service-book used in the Greek church. It is divided into 12 months, containing the offices sung throughout the year, on the festivals of our Saviour, the Virgin, and other remarkable saints.

ANTHOLOGY, a discourse of flowers, or of beautiful passages from any authors.—It is also the name given to a collection of epigrams taken from several Greek poets.

ANTHOLYZA, MAD-FLOWER: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the 6th order, *Ensatæ*. The essential characters are these: The calyx is tubular, irregular, and bent back; and the capsule is beneath the flower.

Species. 1. The ringens, whose flower-slips spread asunder. This hath red, round, bulbous roots, from which arise several rough furrowed leaves, near a foot long, and half an inch broad: between these comes out the flower-stalk immediately from the root, which rises two feet high, is hairy, and hath several red flowers coming out on each side. These appear in June, and the seeds ripen in September. 2. The spicata, with narrow furrowed leaves, is in shape and size like the vernal crocus, but the outer skin is thin and white; from this arise five or six long narrow leaves, which are deeply furrowed. Between these arise the flower-stem, which is a foot and a half high, bending on one side towards the top, where the flowers come out on one side, standing erect. They are of a white colour, appear in May, and the seeds ripen in August. Both these species are natives of Africa, from whence their seeds were first obtained, and raised in the Dutch gardens.

Culture. The antholyza may be propagated by offsets, which it sends off in pretty great plenty; or by seeds, which are sometimes perfected in Europe. These should be sown soon after they are ripe, in pots of light earth; which, if plunged in old beds of tan which has lost its heat, and shaded in the middle of the day in hot weather, they will come up the following winter: therefore they must be kept covered with glasses to screen them from cold, otherwise the young plants will be destroyed. They may remain in the pots two years, if the plants are not too close, when they will have acquired strength enough to bear transplanting; the proper time for which is in July and August, when their leaves are decayed. In summer the pots may be placed in the open air, but in winter they must be placed under a hot-bed frame; or in the green-house, where they are a great ornament when in flower.

ANTHONY (St), was born in Egypt in 251, and inherited a large fortune, which he distributed among his neighbours and the poor, retired into solitude, founded a religious order, built many monasteries, and died *anno* 356. Many ridiculous stories are told of his conflicts with the devil and of his miracles. There are seven epistles extant attributed to him.

St Anthony is sometimes represented with a fire by his side, signifying that he relieves persons from the inflammation called after his name; but always accompanied by a hog, on account of his having been a swine-herd, and curing all disorders in that animal. To do him the greater honour, the Romanists in several places keep at common charges a hog denominated *St Antony's hog*, for which they have great veneration. Some will have St Antony's picture on the walls of their houses, hoping by that to be preserved from the plague; and the Italians, who do not know the true signification of the fire painted at the side of their saint, concluding that he preserves houses from being burnt, invoke him on such occasions. Both painters and poets have made very free with this saint and his followers: the former by the many ludicrous pictures of his temptation; and the latter, by divers epigrams on his disciples or friars; one of which is the following, printed in Stephens's World of Wonders:

Once fedd'st thou, Anthony, an herd of swine,
  And now an herd of monks thou feedest still.
For wit and gut alike both charges bin;
  Both loven filth alike; both like to fill
Their greedy paunch alike: nor was that kind
More beastly, sottish, swinish, than this last.
All else agrees: one fault I only find,
  Thou feedest not thy monks with oaken mast.

ANTHONY, or *Knights of St ANTHONY*, a military order, instituted by Albert Duke of Bavaria, Holland, and Zealand, when he designed to make war against the Turks in 1382. The knights wore a collar of gold made in form of a hermit's girdle, from which hung a stick cut like a crutch, with a little bell, as they are represented in St Antony's pictures.

St ANTHONY also gives the denomination to an order of religious founded in France about the year 1095, to take care of those afflicted with St Anthony's fire, (see the next article.)—It is said, that, in some places, these monks assume to themselves a power of giving, as well as removing, the *ignis sacer*, or erysipelas; a power which stands them in great stead for keeping the poor people in subjection, and extorting alms. To avoid the menaces of these monks, the country people present them every year with a fat hog a-piece. Some prelates endeavoured to persuade Pope Paul III. to abolish the order; *quæstuarios istos sancti Anthonii, qui decipiunt rusticos et simplices, eosque innumeris superstitionibus implicent, de medio tollendos esse.* But they subsist notwithstanding, to this day in several places.

St ANTHONY's Fire, a name popularly given to the erysipelas. Apparently it took this denomination, as those afflicted with it made their peculiar application to St Anthony of Padua for a cure. It is known, that anciently particular diseases had their peculiar saints: thus, in the ophthalmia, persons had recourse to St Lucia; in the tooth-ach, to St Apollonia; in the hydrophobia, to St Hubert, &c.

ANTHORA, in botany, the trivial name of a species of Aconitum. See ACONITUM.

ANTHORISMUS, in rhetoric, denotes a contrary description or definition of a thing from that given by the adverse party.—Thus, if the plaintiff urge, that to take any think away from another without his knowledge or consent, is a thief; this is called ὁρος, or definition. If the defendant reply, that to take a thing away from another without his knowledge or consent, provided it be done with design to return it to him again, is not theft; this is an Ανθορισμος.

Anthospermum ‖ Anthropolatria.

ANTHOSPERMUM, the AMBER-TREE: A genus of the diœcia order, belonging to the polygamia class of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The essential characters are: The calyx of the hermaphrodite flower is divided into four parts; there is no corolla; the stamina are four, and the pistilli two; the germen is beneath the flower. Male and female on the same and separate plants.

Species. Of this genus Linnæus mentions three; the Æthiopica, ciliare, and herbacea; but the first is most generally known in the gardens of the curious. Its beauty consists in its small evergreen leaves, which grow as close as heath. These being bruised between the fingers, emit a very fragrant odour; whence the name amber-tree.

Culture. This plant is easily propagated by cuttings during any of the summer-months, in a border of light earth; where they will take root in six weeks time, provided they are watered or shaded as the season may require; or if they are planted in pots plunged in a moderate hot-bed, they will take root the sooner, and there will be a greater certainty of their growing. They must be frequently renewed by cuttings, as the old plants are very subject to decay, and seldom last above three or four years.

ANTHOXANTHUM, or VERNAL-GRASS: A genus of the digynia order, belonging to the diandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The essential characters are: The calyx is a bivalved gluma, with one flower; the corolla is bivalved, obtuse, and without any awn.

There are three species of anthoxanthum; viz. the odoratum, or spring-grass, a native of Britain; the indicum, a native of India; and the paniculatum, a native of the southern parts of Europe. The odoratum is one of the earliest spring grasses, and is extremely common in our fertile pastures. The delightful smell of new-mown hay is chiefly from this plant. Cows, horses, sheep, and goats eat it.

ANTHRACIS, ANTHRACIAS, or ANTHRACITIS, names promiscuously used by ancient naturalists for very different fossils; viz. the carbuncle, hæmatites, and a kind of asteria. See CARBUNCLE, &c.

ANTHRACOSIS, in medicine, a corrosive scaly ulcer either in the bulb of the eye or the eye-lids.

ANTHRAX, a Greek term, literally signifying a burning coal, used by the ancients to denote a gem, as well as a disease, more generally known by the name of *carbuncle*.

ANTHRAX is sometimes also used for lithanthrax or pitcoal. See LITHRANTHRAX.

ANTHROPOGLOTTUS, among zoologists, an appellation given to such animals as have tongues resembling that of mankind, particularly to the parrot kind.

ANTHROPOGRAPHY, denotes the description of the human body, its parts, structure, &c. See ANATOMY.

ANTHROPOLATRÆ, in church-history, an appellation given to the Nestorians, on account of their worshipping Christ, notwithstanding that they believed him to be a mere man.

ANTHROPOLATRIA, the paying divine honours to a man; supposed to be the most ancient kind of idolatry.

Anthropolites.

ANTHROPOLITES, a term denoting petrifactions of the human body, as those of quadrupeds are called *zoolites*.

It has been doubted whether any real human petrifactions ever occur, and whether those which have been supposed such were not mere *lusus naturæ*. But the generality of naturalists best versed in this branch assures us of real anthropolites being sometimes found. And indeed, as it is universally admitted that the zoolites are frequently seen, what negative argument therefore can be brought against the existence of the others? Are not the component parts of the human body nearly similar to those of the brute creation? Consequently, correspondent matter may be subject to, and acquire, the like accidental changes, wherever the same power or causes concur to act upon either object. If the former are not so common, it may be accounted for, in some measure, by reflecting that human bodies are generally deposited in select and appropriated places; whereas the bones of animals are dispersed every where, and falling into various beds of earth, at a greater or less depth, there is more probability of their encountering the petrifying agent. Could we credit some authors who have treated on this subject, they will tell us of entire bodies and skeletons that were found petrified. One in particular, discovered at Aix in Provence *anno* 1583, in a rocky cliff, the cerebrum whereof, when struck against a piece of steel, produced sparks, the bones being at the same time friable. The reports of Happel and Kircher are too absurd for belief. Van Helmont's strange relations, together with those of a Jean a Costa, must also be rejected as fabulous. Scheuhzer has published an engraved figure, which he calls the *Antediluvian man*: how far it is authentic, it would be rash to say. It is, however, asserted by many respectable writers on natural history, that whole skeletons petrified have been brought to light from certain old mines, which remained closed up and disused for several centuries. These indeed are acknowledged to be very rare. Yet it is a known fact, that detached parts, osteolithi, are sometimes found, especially in situations where either the water, the soil, or both, have been observed to possess a strong putrescent quality. The human vertebræ, fragments or portions of the tibia, and even the whole cranium itself, have been seen in an absolute state of petrification. Some of these are said to appear vitriolated or mineralized. As to the petrified bones of pretended giants, they are more probably real zoolites, the bones of the larger animals. All these bones are found in various states, and under different appearances. Some are only indurated; others calcined, vitriolated, or mineralized; some, again, are simply incrusted; whilst others have been proved completely petrified. Notwithstanding what is here advanced, it may be granted that a positive *lusus naturæ*, in some hands, is repeatedly mistaken for a real petrification. They are, however, distinguishable at all times by an experienced naturalist; particularly by the following rules: First, We may determine that fossil a *lusus naturæ* which, on a strict examination, is observed to deviate in any material degree from the true *res analogica existens*. Secondly, By the same parity of reasoning, those fossil shells are to be esteemed certain petrifications, and genuine Antediluvian *reliquiæ*, in which, on a compari-

son

fon with their *analogues* collected from the fea, there appears an exact conformity in fize and figure. This comparative obfervation will hold good for all foffils; that is, fuch as prefent themfelves either under the animal or vegetable form. It is neverthelefs worthy of notice, that all teftaceous foffils are not petrified; fince fome kinds of them have been found in beds of fand, which retained their original perfect fhape and quality, but at the fame time they proved very brittle, indeed fcarcely bearing the moft gentle touch. Shells of this defcription are always diffoluble by acids, in contradiftinction to the petrified or calcareous foffil fhells whofe property it is to refift the action of fuch like *menftrua*. See further the article PETRIFACTION.

ANTHROPOLOGY, a difcourfe upon human nature.

ANTHROPOLOGY, among divines, denotes that manner of expreffion by which the infpired writers attribute human parts and paffions to God.

ANTHROPOMANCY, a fpecies of divination, performed by infpecting the intrails of a human creature.

ANTHROPOMORPHA, a term formerly given to the primates of that clafs of animals which have the greateft refemblance to the human kind.

ANTHROPOMORPHISM, among ecclefiaftical writers, denotes the herefy or error of the Anthropomorphites. See the next article.

ANTHROPOMORPHITES, in church-hiftory, a fect of ancient heretics, who taking every thing fpoken of God in Scripture in a literal fenfe, particularly that paffage of Genefis in which it is faid *God made man after his own image*, maintained that God had a human fhape. They are likewife called *Audens*, from Audeus their leader.

ANTHROPOMORPHOUS, fomething that bears the figure of refemblance of a man. Naturalifts give inftances of anthropomorphous plants, anthropomorphous minerals, &c. Thefe generally come under the clafs of what they call *lufus naturæ*, or monfters.

ANTHROPOPATHY, a figure or expreffion by which fome paffion is afcribed to God, which properly belongs only to man.

ANTHROPOPHAGI, (of ανθρωπος a *man*, and φαγω to *eat*), MEN-EATERS. That there have been, in almoft all ages of the world, nations who have followed this barbarious practice, we have a bundance of teftimonies.

The Cyclops, the Leftrygons, and Scylla, are all reprefented in Homer as *anthropophagi*, or man-eaters; and the female phantoms, Circe and the Syrens, firft bewitched with a fhew of pleafure, and then deftroyed. This, like the other parts of Homer's poetry, had a foundation in the manner of the times preceding his own. It was ftill, in many places, the age fpoken of by Orpheus,

> When men devour'd each other like the beafts,
> Gorging on human flefh.——

According to Herodotus, among the Effedonian Scythians, when a man's father died, the neighbours brought feveral beafts, which they killed, mixed up their flefh with that of the deceafed, and made a feaft. Among the Maffagetæ, when any perfon grew old, they killed him and eat his flefh; but if he died of ficknefs, they buried him, efteeming him unhappy. The fame author alfo affures us, that feveral nations in the Indies killed all their old people and the fick, to feed on their flefh: he adds, that perfons in health were fometimes accufed of being fick, to afford a pretence for devouring them. According to Sextus Empiricus, the firft laws that were made, were for the prevention of this barbarious practice, which the Greek writers reprefent as univerfal before the time of Orpheus.

Of the practice of anthropophagy in latter times, we have the teftimonies of all the Romifh miffionaries who have vifited the internal parts of Africa, and even fome parts of Afia. Herrera fpeaks of great markets in China, furnifhed wholly with human flefh, for the better fort of people Marcus Paulus fpeaks of the like in his time, in the kingdom of Concha towards Quinfay, and the ifland of Zapengit; others, of the great Java; Barbofa, of the kingdom of Siam and ifland of Sumatra; others, of the iflands in the Gulf of Bengal, of the country of the Samogitians, &c.

The philofophers Diogenes, Chryfippus, and Zeno, followed by the whole fect of Stoics, affirmed that there was nothing unnatural in the eating of human flefh; and that it was very reafonable to ufe dead bodies for food, rather than to give them a prey to worms and putrefaction. In order to make the trial, however, whether there was any real repugnancy in nature to the feeding of an animal with the flefh of its own fpecies, Leonardus Floroventius fed a hog with hog's flefh, and a dog with dog's flefh; upon which he found the briftes of the hog to fall off, and the dog to become full of ulcers.

When America was difcovered, this practice was found to be almoft univerfal, infomuch that feveral authors have fuppofed it to be occafioned through a want of other food, or through the indolence of the people to feek for it; though others afcribe its origin to a fpirit of revenge.

It appears pretty certain from Dr Hawkefworth's Account of the Voyages to the South Seas, that the inhabitants of the ifland of New Zealand, a country unfurnifhed with the neceffaries of life, eat the bodies of their enemies. It appears alfo to be very probable, that both the wars and anthropophagy of thefe favages take their rife and owe their continuance to irrefiftible neceffity, and the dreadful alternative of deftroying each other by violence or of perifhing by hunger. See vol. iii. p. 447, & feq. and vol. ii. p. 389, &c.

Mr Marfden alfo informs us that this horrible cuftom is practifed by the Battas, a people in the ifland of Sumatra. "They do not eat human flefh (fays he) as a means of fatisfying the cravings of nature, owing to a deficiency of other food; nor is it fought after as a glutonous delicacy, as it would feem among the New Zealanders. The Battas eat it as a fpecies of ceremony; as a mode of fhowing their deteftation of crimes, by an ignominous punifhment; and as a horrid indication of revenge and infult to their unfortunate enemies. The objects of this barbarious repaft are the prifoners taken in war, and offenders convicted and condemned for capital crimes. Perfons of the former defcription may be ranfomed or exchanged, for which they often wait a confiderable time; and the latter fuffer only when their friends cannot redeem them by the cuftomary fine of twenty beenchangs, or eighty dollars.

dollars. These are tried by the people of the tribe where the fact was committee, but cannot be executed till their own particular raja or chief has been acquainted with the sentence; who, when he acknowledges the justice of the intended punishment, sends a cloth to cover the delinquent's head, together with a large dish of salt and lemons. The unhappy object, whether prisoner of war or malefactor, is then tied to a stake: the people assembled throw their lances at him from a certain distance; and when mortally wounded, they run up to him, as if in a transport of passion; cut pieces from the body with their knives; dip them in a dish of salt and lemon juice; slightly broil them over a fire prepared for the purpose; and swallow the morsels with a degree of savage enthusiasm. Sometimes (I presume according to the degree of their animosity and resentment) the whole is devoured; and instances have been known, where, with barbarity still aggravated, they tear the flesh from the carcase with their mouths. To such a depth of depravity may man be plunged, when neither religion nor philosophy enlighten his steps! All that can be said in extenuation of the horror of this diabolical ceremony is, that no view appears to be entertained of torturing the sufferers; of increasing or lengthening out the pangs of death; the whole fury is directed against the corse; warm indeed with the remans of life, but past the sensation of pain. I have found a difference of opinion in regard to their eating the bodies of their enemies slain in battle. Some persons long resident there, and acquainted with their proceeding, assert that it is not customary; but as one or two particular instances have been given by other people, it is just to conclude, that it sometimes takes place, though not generally. It was supposed to be with this intent that raja Neabin maintained a long conflict for the body of Mr Nairne, a most respectable gentleman and valuable servant of the India Company, who fell in an attack upon the campong of that chief, in the year 1775."

It may be said, that whether the dead body of an enemy be eaten or buried, is a matter perfectly indifferent. But whatever the practice of eating human flesh may be in itself, it certainly is relatively, and in its consequences, most pernicious. It manifestly tends to eradicate a principle, which is the chief security of human life, and more frequently restrains the hand of the murderer, than the sense of duty or the dread of punishment. If even this horrid practice originates from hunger, still it must be perpetuated from revenge. Death must lose much of its horror among those who are accustomed to eat the dead; and where there is little horror at the sight of death, there must be less repugnance to murder. See some further observations on this subjects equally just and ingenious, by Dr Hawkesworth, *ut supra*

ANTHROPOPHAGIA, the act or habit of eating human flesh. This is pretended by some to be the effect of a disease, which leads people affected with it to eat every thing alike. Some choose only to consider it as a species of PICA. The annals of Milan furnish an extraordinary instance of anthropophagy. A Milanese woman, named Elizabeth, from a depraved appetite, like what women with child, and those whose menses are obstructed, frequently experience, had an invincible inclination to human flesh, of which she made provision by enticing children into her house, where she killed and salted them; a discovery of which having been made, she was broken on the wheel and burnt in 1519.

ANTHROPOSCOPIA, from ανθρωπος, and σκοπεω, *I consider*, the art of judging or discovering a man's character, disposition, passions, and inclinations, from the lineaments of his body. In which sense, anthroposcopia seems of somewhat greater extent than physiognomy or metoposcopy. Otto has published an Anthroposcopia, *sive judicium hominis de homine ex lineamentis externis*.

ANTHROPOTHYSIA, the inhuman practice of offering human sacrifices. See SACRIFICE.

ANTHUS, in ornithology, a synonime of a species of loxia. See LOXIA.

ANTHYLLIS, KIDNEY-VETCH, or *Lady's-finger*: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The essential characters are: The calyx is ventricose, and the legumen is roundish and covered.

Species. Linnæus enumerates nine species; of which the following seem to be most worthy of attention. 1. The vulneraria, with unequal winged leaves, is a native of Spain and Portugal, as likewise of Wales. It is a biennial plant, having single leaves at bottom, which are oval and hairy; but those which grow out of the stalks are winged, each being composed of two or three pair of lobes terminated by an odd one. The flowers grow collected into heads at the top of the stalks, are of a bright scarlet colour, and make a pretty appearance. It flowers in June and July, and the seeds ripen in October. 2. The montana or herbaceous woundwort, with winged leaves, grows naturally in the mountains in the south of France, and in Italy. It is garnished with winged leaves, which have an equal number of hairy lobes at the extremity of the branches. The flowers are produced in heads, and are of a purple colour and globular form. They appear in June and July, and the seeds ripen in October. 3. The barba jovis, or silver-bush, has its name from the whiteness of its leaves. This is a shrub which often grows to the height of ten or twelve feet, dividing into many lateral branches, garnished with winged leaves composed of an equal number of narrow lobes, which are very white and hairy: the flowers are produced at the extremities of the branches, collected into small heads; these are of a bright yellow colour, and appear in June; sometimes they are succeeded by short woolly pods, containing two or three kidney-shaped seeds: but unless the season proves warm, they do not ripen in this country. 4. The cytisoides, or shrubby woundwort, has long been known in the English gardens. It is a low shrub, seldom rising above two feet high, but sends out many slender branches, garnished with hoary leaves, which are sometimes single, but generally have three oval lobes, the middle being longer than the other two: the flowers are yellow, and come out from the sides of the branches, three or four joined together, having woolly impalements; but these are rarely succeeded by seeds in England.

Culture. The first and second sorts require no particular management further than being kept free from weeds. The third and fourth may be propagated by

Anthypophora || Antichrist.

cuttings planted during any of the summer months; observing to shade and water them till they have taken good root; when they are to be transplanted into pots, and must always be housed in winter.

ANTHYPOPHORA, in rethoric, a figure of speech; being the counter-part of an hypophora. See HYPOPHORA.

ANTI, a Greek preposition, which enters into the composition of several words, both Latin, French, and English, in different senses. Sometimes it signifies *before*, as in anti-chamber; and sometimes *opposite* or *contrary*, as in the names of these medicines, anti-scorbutic, anti-venereal.

ANTI, in matters of literature, is a title given to divers pieces written by way of answer to others, whose names are usually annexed to the anti. See the *Anti* of M. Baillet; and the *Anti-Baillet* of M. Menage: there are also *Anti-Menagiani*, &c. Cæsar the dictator wrote two books by way of answer to what had been objected to him by Cato, which he callled *Anti-Catones;* these are mentioned by Juvenal, Cicero, &c. Vives assures us, he had seen Cæsar's *Anti-Catones* in an ancient library.

ANTIBACCHIUS, in ancient poetry, a foot consisting of three syllables, the two first long, and the last one short: such is the word āmbīrĕ.

ANTIBES, a sea-port town of Provence in France, with a strong castle. Its territory produces excellent fruit; and the town stands opposite to Nice, in the Mediterranean. E. Long. 7. 5. N. Lat. 43. 35.

ANTICHAMBER, an outer chamber for strangers to wait in, till the person to be spoken with is at leisure.

ANTICHORUS, in botany: a genus of the monogynia order, belonging to the octandria class; of which the essential characters are: The calyx is a four-leav'd perianthium: The corolla consists of four expanding petals: The pericarpium is a capsule, above, subulated, with four cells and four valves: The seeds are very numerous. There is but one species, the depressus, a native of Arabia.

ANTICHRIST, among ecclesiastical writers, denotes a great adversary of Christianity, who is to appear upon the earth towards the end of the world.

We have demonstrations, disputations, and proofs, in great order and number, both that the pope is, and that he is not Antichrist.

F. Calmet is very large in describing the father and mother of Antichrist, his tribe and pedigree, his wars and conquests, his atchievements against Gog, Magog, &c.

Some place his capital at Constantinople, others at Jerusalem, others at Moscow, and some few at London; but the generality at Rome, though these last are divided. Grotius and some others suppose Rome Pagan to have been the seat of Antichrist: most of the Lutheran and reformed doctors contend earnestly for Rome Christian under the papal hierarchy. In fact, the point having been maturely debated at the council of Gap, held in 1603, a resolution was taken thereupon, to insert an article in the confession of faith, whereby the pope is formally declared to be Antichrist.—Pope Clement VIII. was stung to the quick with this decision; and even king Kenry IV. of France was not a little mortified, to be thus declared, as he said, an imp of Antichrist.

Antichrist.

M. le Clerc holds, that the rebel Jews and their leader Simon, whose history is given by Josephus, are to be reputed as the true Antichrist. Lightfoot and Vanderhart rather apply this character to the Jewish Sanhedrim. Hippolitus and others held that the devil himself was the true Antichrist; that he was to be incarnate, and make his appearance in human shape before the consummation of all things. Others among the ancients held that Antichrist was to be born of a virgin, by some prolific power imparted to her by the devil. A modern writer* of the female sex, whom many hold for a saint, has improved on this sentiment; maintaining that Antichrist is to be begotten by the devil on the body of a witch, by means of the semen of a man caught in the commission of a certain crime, and conveyed, &c.

* Bayle's Dictionary, voce *Bourignon*.

Hunnius and some authors, to secure Antichrist to the pope (notwithstanding that this latter seemed excluded by not being of the tribe of Dan), have broke in upon the unity of Antichrist, and assert there is to be both an eastern and a western Antichrist.

Father Malvenda, a Jesuit, hath published a large work intitled *Antichristo*, in which this subject is amply discussed. It consists of thirteen books. In the first he relates all the opinions of the Fathers with regard to Antichrist. In the second, he speaks of the times when he shall appear; and shows, that all the fathers who supposed Antichrist to be near at hand, judged the world was near its period. In the third, he discourses of his origin and nation; and shows that he is to be a Jew of the tribe of Dan: this he founds on the authority of the fathers; on the passage in Genesis xlix. 17. *Dan shall be a serpent by the way*, &c.; on that of Jeremy viii. 10. where it is said, *The armies of Dan shall devour the earth;* and on Rev. vii. where St. John enumerating all the tribes of Israel, makes no mention of that of Dan. In the fourth and fifth books, he treats of the signs of Antichrist. In the sixth, of his reign, and wars. In the seventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his persecutions: and in the rest of the coming of Enoch and Elias, the conversion of the Jews, the reign of Jesus Christ, and the death of Antichrist, after he has reigned three years and an half. See also *Lowman on the Revelation*.

How endless are conjectures! Some of the Jews, we are told, actually took Cromwell for the Christ: while some others have laboured to prove him Antichrist himself. Pfaffus assures us he saw a folio book in the Bodleian library, written on purpose to demonstrate this latter position.

Upon the whole, the Antichrist mentioned by the apostle John, 1. Ep. ii. 18. and more particularly described in the book of Revelation, seems evidently to be the same with the *Man of Sin*, &c. characterised by St Paul in his second Epistle to the Thessalonians, ch. ii. And the entire description literally applies to the excesses of papal power. Had the right of private judgment, says an excellent writer, been always adopted and maintained, Antichrist could never have been; and when the sacred right comes to be universally asserted,

serted, and men follow the voice of their own reason and consciences, Antichrist can be no more.

ANTICHRISTIANISM, a state or quality in persons or principles, which denominates them antichristian, or opposite to the kingdom of Christ.

M. Jurieu takes the idea of the unity of the church to have been the source of *Antichristianism*. Had not mankind been infatuated with this, they would never have stood in such awe of the anathemas of Rome. It is on this the popes erected their monarchial power.

ANTICHRISTIANS properly denote the followers or worshippers of Antichrist.

ANTICHRISTIANS are more particularly understood of those who set up or believe a false Christ, or Messiah.

ANTICHTHONES, in ancient geography, an appellation given to the inhabitants of opposite hemispheres.

ANTICOR, or ANTICOEUR, among farriers, an inflammation in a horse's throat, being the same with the quinzy in mankind. See FARRIERY, xxxvii. 2.

ANTICOSTE, a barren island lying in the mouth of the river St Laurence, in North America. W. Long. 64. 16. N. Lat. from 49 to 53.

ANTICYRA (anc. geog.), a town in Phocis, on the Corinthian bay, opposite to Cirrha, lying to the west on the same bay. The Phoceans seizing the temple of Apollo at Delphi, a war, called the *sacred*, commenced, and lasted ten years; when Philip, father of Alexander the great, avenged the god, by destroying many of the cities of the pillagers. Anticyra was one of the number. It was again taken and subverted by Atilius a Roman general in the war with the Macedonians. It afterwards became famous for its hellebore. That drug was the root of a plant, the chief produce of the rocky mountains above the city, and of two kinds; the black, which had a purgative quality; and the white, which was an emetic. Sick persons resorted to Anticyra to take the medicine, which was prepared there by a peculiar and very excellent recipe: Hence the adage, *Naviget Anticyram*, (Hor.) By the port in the second century was a temple of Neptune, not large, built with selected stones, and the inside white-washed; the statue of brass. The agora or market-place was adorned with images of the same metal; and above it was a well with a spring, sheltered from the sun by a roof supported by columns. A little higher was a monument formed with such stones as occurred, and designed, it is said, for the sons of Iphitus. One of these, Schedius, was killed by Hector, while fighting for the body of Patroclus, but his bones were transported to Anticyra; where his brother died after his return from Troy. About two stadia or a quarter of a mile distant was a high rock, a portion of the mountain, on which a temple of Diana stood, the image bigger than a large woman, and made by Praxiteles. The walls and other edifices at Anticyra were probably erected like the temple of Neptune, with stones or pebbles. The site is now called *Asprospitia*, or *The White Houses*; and some traces of the buildings from which it was so named remain. The port is land-locked, and frequented by vessels for corn. Some paces up from the sea is a fountain.

ANTIDESMA, in botany, a genus of the dioecia order, belonging to the pentandria class of plants. The *calyx* of the male is five-leav'd; there is no corolla; the *antheræ* are bifid: The female *calyx* is five-leav'd; the corolla is wanting; the *stigmata* are five; the *berry* is cylindric and one-seeded. There is but one species, the alexiteria, a native of India.

ANTIDICOMARIANITES, ancient heretics, who pretended that the holy virgin did not preserve a perpetual virginity, but that she had several children by Joseph after our Saviour's birth.—Their opinion was grounded on some expressions of our Saviour, wherein he mentions his brothers and his sisters; and of St Matthew, where he says, that Joseph knew not Mary till she brought forth her first-born son. The Antidicomarianites were the disciples of Helvidius and Jovinian, who appeared in Rome towards the close of the fourth century.

ANTIDORON, in ecclesiastical writers, a name given by the Greeks to the consecrated bread, out of which the middle part, marked with the cross, wherein the consecration resides, being taken away by the priest, the remainder is distributed after mass to the poor. On the sides of the antidoron are impressed the words *Jesus Christus vicit*. The word is formed from δωρον, *donum*, "a gift," as being given away *loco muneris*, or in charity. The antidoron is also called *panis præsanctificatus*. Some suppose the antidoron to be distributed in lieu of the sacrament, to such as were prevented from attending in person at the celebration; and thence derived the origin of the word, the eucharist being denominated *doron*, "gift," by way eminence.

ANTIDOSIS, in antiquity, denotes an exchange of estates, practised by the Greeks on certain occasions with peculiar ceremonies, and first instituted by Solon.

When a person was nominated to an office, the expence of which he was not able to support, he had recourse to the antidosis; that is, he was to seek some oother citizen of better substance than himself, who was free from this, and other offices; in which case the former was excused. In case the person thus substituted denied himself to be the richest, they were to exchange estates after this manner; the doors of their houses were close shut up and sealed, that nothing might be conveyed away; then both took an oath to make a faithful discovery of all their effects, except what lay in the silver-mines, which by the laws was excused from all imposts; accordingly, within three days, a full discovery and exchange of estates was made.

ANTIDOTE, among physicians, a remedy taken to prevent, or to cure, the effects of poison, &c.

ANTIENT. See ANCIENT.

ANTIGONEA, or ANTIGONIA (anc. geog.), a town of Bithynia, so called from Antigonus, the son of Philip, and afterwards called *Nicæa* (Strabo, Stephanus.) Another of Epirus, to the north of the Montes Ceraunii, opposite to the city of Oricum (Polybius Ptolemy.) A third of Arcadia, namely *Mantinea*, so called in honour of king Antigonus (Plutarch, Pausanias.) A fourth in Macedonia, in the territory of Mygdonia (Pliny, Ptolemy.) A fifth in the territory of Chalcidice, in Macedonia, on the east side of the Sinus Thermaicus (Livy.) A sixth of Syria, built by Antigonus, not far from Antioch, on the Orontes (Stephanus); but soon after destroyed by

Seleucus,

Seleucus, who removed the inhabitants to Seleucia, a town built by him (Diodorus Siculus.) A seventh of Troas, called Alexandrea in Pliny's time.

ANTIGONUS, one of Alexander's commanders, to whom Asia fell. He conquered Eumenes, and expelled Seleucus out of Syria; who flying to Ptolemy Lagus in Egypt, a bloody war commenced betwixt him, Cassander, and Antigonus, wherein, by the help of his son Demetrius, Antigonus prevailed, and built the city Antigonia, anno Romæ 448. Afterward Cassander, Seleucus, and Lysimachus, uniting against him, routed him, in league with king Pyrrhus, and slew him near Epirus, 301 years before Christ.

ANTIGONUS, king of the Jews, was the son of Aristobulus. He entered into an alliance with the king of the Parthians, and besieged Jerusalem. He cut off his uncle Hircanus's ears, to incapacitate him for the high-priesthood, and put Josephus, Herod's brother, to death. At length, Herod took him and sent him to M. Anthony; who, to gratify Herod, cut off his head, and thereby extinguished the Asmoneans, who had reigned 126 years. This happened 36 years before Christ.

ANTIGRAPHUS, in antiquity, an officer of Athens, who kept a counterpart of the apodecti, or chief treasurer's account, to prevent mistakes, and keep them from being falsified.

ANTIGRAPUS is also used, in middle-age writers, for a secretary or chancellor. He is thus called, according to the old glossarists, on account of his writing answers to the letters sent to his master. The antigraphus is sometimes also called *archigraphus*; and his dignity *antigraphia* or *archigraphia*.

ANTIGRAPHUS is also used in Isidorus for one of the notes of sentences, which is placed with a dot to denote a diversity of sense in translations.

ANTIGRAPHUS is also applied in ecclesiastical writers to an abbreviator of the papal letters. In which sense the word is used by pope Gregory the Great in his register. Of late days the office of antigraphus consists in making minutes of bulls from the petitions agreed to by his holiness, and renewing the bulls after engrossing.

ANTIGUA, one of the Antilles or Caribbee islands, situated 20 leagues east of St Christopher's, in W. Long. 62. 5. and N. Lat. 17. 30. It is about 50 miles in circumference, and is reckoned the largest of all the British leeward islands.

This island having no rivers, and but few springs, or such as are brackish, the inhabitants are obliged to preserve the rain-water in cisterns. The air here is not so wholesome as in the neighbouring islands, and it is more subject to hurricanes; but it has excellent harbours, particularly English Harbour, which is capable of receiving the largest man of war in the navy. Here is also a dock-yard, supplied with all stores and conveniences for repairing and careening ships. The principal trade, however, is carried on in the harbour of St John's, the capital, situated in the north-west part of the island, and which has water sufficiently deep for merchant vessels. The town of St John's was once in a very flourishing condition, as may be judged by the loss sustained at the late fire, which was computed at the amazing sum of L.400,000.

This island was first attempted to be settled by Sir Thomas Warner, about the same time with St Christopher's and Nevis: but no establishment then took place. It was afterwards granted by Charles II. to Lord Willoughby, then governor of Barbadoes, who settled a colony upon it in the space of a few years. In a short time, but by what means is not evident, it became again the public property. It raises at present about 16,000 hogsheads of sugar, which was at first of a very bad quality, unfit for the English market; but the planters have greatly improved their staple since, and it is now as good as in any of the other islands. It has continued unmolested in all the late wars with France. The number of white inhabitants is reckoned about 10,000. It is divided into five parishes; that of St John's-town, which is reckoned the capital of the north-west part, and consists of above 200 houses; those of Falmouth, Porham, and Bridgetown, on the south-side; and St Peters's, which is no town, but lies almost in the middle of the island.

ANTIGUGLER, is a crooked tube of metal, so bent, as easily to be introduced into the necks of bottles, and used in decanting liquors, without disturbing them. For this purpose the bottle should be a little inclined, and about half a spoonful of the liquor poured out, so as to admit an equal quantity of air; let one end of the bent tube be stopped with the finger, whilst the other is thrust into the body of the liquor near to the bubble of air already admitted. When the finger is taken off, the bottle will have vent, and the liquor will run out steadily and undisturbed.

ANTIHECTICS, in pharmacy, medicines good in hectical disorders.

ANTIHECTICUM POTERII, the name of a medicine formerly much celebrated, but now laid aside in common practice.

ANTILIBANUS (anc. geog.), a mountain of Cœlosyria, which bounds it on the south, running parallel with Libanus: they both begin a little above the sea, Libanus near Tripolis, Antilibanus at Sidon; and both terminate near the mountains of Arabia, which run to the north of Damascus, and the mountains of Traconitis, and there end in other mountains (Strabo.) The Scripture making no distinction between Libanus and Antilibanus, calls them by the common name *Lebanon*.

ANTILLES, the French name for the CARIBEE islands.

ANTILOGARITHM, the complement of the logarithm of a sine, tangent, or secant; or the difference of that logarithm from the logarithm of 90 degrees.

ANTILOGY, in matters of literature, an inconsistency between two or more passages of the same book.

ANTILOPE. See CAPRA.

ANTIMENSIUM, a kind of consecrated tablecloth, occasionally used in the Greek church, in places where there is no proper altar. F. Goar observes, that in regard the Greeks had but few consecrated churches, and that consecrated altars are not things easy to be removed; that church has, for many ages, made use of certain consecrated stuffs or linens, called *antimensia*, to serve the purposes thereof.

ANTIMENSIUM, in the Greek church, answers to the *altare portabile*, or portable altar, in the Latin church. They are both only of late invention, though

Habertus would have them as old as St Basil. But Durant and Bona do not pretend to find them in any author before the time of Bede and Charlemagne.

Antimensia is also applied to other tables, used in offices of religion, besides those whereon the eucharist is administered: such, *e. g.* are those whereon the host is exposed, &c. The origin of the Antimensia is described by Meursius; when the bishop had consecrated a church, the cloth which had been spread on the ground, and over the communion table, was torn in pieces, and distributed among the priests, who carried each a fragment away, to serve to cover the tables in their churches and chapels. Not that it was necessary that such cloths should be laid on all tables; but only on those which either were not consecrated, or at least whose consecration was doubted of.

ANTIMERIA, in grammar, a figure whereby one part of speech is used for another: e. g. *velle suam cuique est*, for *voluntas sua cuique est*; also, *populus late rex*, for *populus late regnans.*

Antimeria, in a more restrained sense, is a figure where the noun is repeated instead of the pronoun. The antimeria is frequent in the Hebrew, and is sometimes retained in our version of the Old Testament accordingly: e. g. *Hear my voice, ye wives of Lamech*, for *my wives*, Gen. iv. 23.

ANTIMETABOLE, in rhetoric, a figure which sets two things in opposition to each other. The word is Greek, compounded of αντι, *against*, and μεταϐολη from μεταϐαλλω, I *shift* or *transfer*; *i. e.* a shifting, or setting two things over-against each other. This figure is twice exemplified in an apophthegm of Musonius: which, on account of its excellence, is called *aureum monitum*, the golden maxim or precept.

Αν τι πραξης καλον μετα πονȣ, ὁ μεν πονος οιχεται, το δε καλον μενει.

Αν τι ποιησης αισχρον μετα ηδονης, το μεν ηδυ οιχεται, το δε αισχρον μενει.

In English thus:

"Allowing the performance of an honourable action to be attended with labour; the labour is soon over, but the honour immortal: whereas, should even pleasure wait on the commission of what is dishonourable, the pleasure is soon gone, but the dishonour eternal."

ANTIMETATHESIS, in rhetoric, is the inversion of the parts or members of an Antithesis. Such is that of Cicero, in Verrem, lib. iv. cap. 52. "Compare this peace with that war; the arrival of this governor with the victory of that general; his profligate troops with the invincible army ot the other; the luxury of the former with the temperance of the latter: you will say, that Syracuse was founded by him who took it; and taken by him, who held it when founded."

ATIMONARCHICAL, an appellation given to whatever opposes monarchical government.

ANTIMONIALS, in medicine, preparations of antimony. See Pharmacy.

ANTIMONY, a blackish mineral substance, staining the hands, full of long, shining, needle-like striæ, hard, brittle, and considerably heavy. It is found in different parts of Europe, as Bohemia, Saxony, Transylvania, Hungary, France, and England; commonly in mines by itself, intermixed with earth and stony matters. Sometimes it is blended with the richer ores of silver, and renders the extraction of that metal difficult by volatillizing a part of the silver, or, in the language of the miners, *robbing the ore*. See Metallurgy for the different operations.

Antimony is the *stibium* of the ancients; by the Greeks called στιμμι. The reason of its modern denomination, *antimony*, is usually referred to Basil Valentine, a German monk, who, as the tradition relates, having thrown some of it to the hogs, observed, that, after purging them violently, they immediately grew fat upon it. This made him think, that, by giving his fellow-monks a like dose, they would be the better for it. The experiment, however, succeeded so ill, that they all died of it; and the medicine thenceforwards was called *antimony*, q. d. *anti-monk*.

Uses. Antimony at first was of service only in the composition of paint. Scripture describes it to us as a sort of paint, with which the women blackened their eye-brows. Jezebel, understanding that Jehu was to enter Samaria, painted her eyes with antimony; or, according to the Hebrew, "put her eyes in antimony." As large black eyes were thought the finest, they of both sexes, who were careful of their beauty, rubbed their eyes, eye-lids, and round the eyes, with a needle dipped in a box of paint made of antimony, with a design of blackening them.—At this day, the women of Syria, Arabia, and Babylonia, anoint and blacken themselves about the eyes; and both men and women put black upon their eyes in the desert, to preserve them from the heat of the sun and the piercing of its rays. Mr Darvieux tells us, that the Arabian women border their eyes with a black colour made of tutty, which the Arabians call *rehel*. They draw a line of the kind of blacking without the corner of their eyes, to make them appear larger. Isaiah, in his enumeration of the several ornaments belonging to the daughters of Sion, has not forgot the needles which they made use of in painting their eyes and eyelids. Nor has this practice escaped the lash of Juvenal:

Ille supercilium madida fuligine tinctum
Obliqua producit acu, pingitque trementes
Attollens oculos.

Ezekiel, discovering the irregularities of the Jewish nation under the idea of a debauched woman, says, that she bathed and perfumed herself, and that she anointed her eyes with antimony. Job shows sufficiently how much antimony was in esteem, by calling one of his daughters a vessel of antimony, or a box to put paint in, *cornu stibii*. The author of the Book of Enoch says, that before the deluge the angel Azleel taught young women the art of painting themselves.

Tertullian and St Cyprian have declaimed very warmly against this custom of painting their eyes and eye-brows, which was much practised in Afric even by the men: *Inunge oculos tuos non stibio diaboli, sed collyrio Christi*, says St Cyprian. Pliny, speaking of the Roman ladies, says, that they painted their very eyes: *Tanta est decoris affectatio, ut tingantur oculi quoque.* Sardanapalus painted his eyes and eye-brows. Josephus reproaches the seditious with the same, who assumed the name of zealots, and made themselves masters of the temple of Jerusalem.

The modern uses of antimony are very numerous and important. It is a common ingredient in specula or burning concaves, serving to give the composition a finer texture. It makes a part in bell metal, and renders the sound more clear. It is mingled with tin, to make it more hard, white, and sounding; and with lead, in the casting of printers letters, to render them more smooth and firm. It is also a general help in the melting of metals, and especially in the casting of cannon balls. It is likewise made use of for purifying and heightening the colour of gold. See CHEMISTRY, GOLD, PURIFICATION, &c.

For a long time this mineral was esteemed poisonous. In 1566, its use was prohibited in France by an edict of parliament; and in 1609, one Besnier was expelled the faculty for having given it. The edict was repealed in 1650; antimony having a few years before been received into the number of purgatives. In 1668, a new edict came forth, forbidding its use by any but doctors of the faculty.—It is now universally allowed, that pure antimony in its crude state has no noxious quality; and that though many of its preparations are most virulently emetic and cathartic, yet, by a slight alteration or addition, they lose their virulence, and become mild in their operation. See CHEMISTRY and PHARMACY.

The virtues of antimony in the diseases of animals are greatly extolled. Pigs that have the measles are at all times recovered by it, which proves it a great purifier of the blood. Horses who have running heels that cannot be cured by the common methods used by the farriers, will generally be cured by this medicine in a little time. The manner of using it is this: Mix one dram with every feeding of oats which the horse has in a morning. It is best put together in one place, buried under a few oats; and the horse's head being with-held a little, and then let go just against that place, he will take it all in at a mouthful. Some horses do not dislike it; others obstinately refuse it, but to these it may easily be given in balls. The virtues of this drug in fattening of cattle has been thought imaginary, but experiment proves it to be a real truth. A horse that is lean and scabby, and not to be fatted by any other means, will become fat on taking a dose of antimony every morning for two months together. A boar fed for brawn, and having an ounce of antimony given him every morning, will become fat a fortnight sooner than others put into the stye at the same time, and fed in the same manner, but without the antimony.

ANTINOE. See ENFINE'.

ANTINOEIA, in antiquity, annual sacrifices, and quinquennial games, in memory of Antinous the Bithynian. They were instituted at the command of Adrian the Roman emperor, at Mantinea in Arcadia, where Antinous was honoured with a temple and divine worship.

ANTINOMIANS, in ecclesiastical history, certain heretics who maintain the law of no use or obligation under the gospel-dispensation, or who hold doctrines that clearly supercede the necessity of good works and a virtuous life. The Antinomians took their origin from John Agricola about the year 1538; who taught, that the law is no ways necessary under the gospel; that good works do not promote our salvation, nor ill ones hinder it; that repentance is not to be preached from the decalogue, but only from the gospel.

This sect sprung up in England during the protectorate of Oliver Cromwell, and extended their system of libertinism much farther than Agricola the disciple of Luther. Some of their teachers expressly maintained, that as the elect cannot fall from grace, nor forfeit the Divine favour, the wicked actions they commit are not really sinful, nor are to be considered as instances of their violation of the divine law; and that consequently they have no occasion either to confess their sins, or to break them off by repentance. According to them, it is one of the essential and distinctive characters of the elect, that they cannot do any thing which is either displeasing to God or prohibited by the law.—Luther, Rutherford, Schlusselburg, Sedgwick, Gataker, Witsius, Bull, Williams, &c. have written refutations; Crisp, Richardson, Saltmarsh, &c. defences, of the Antinomians; Wigandus, a comparison between ancient and modern Antinomians.

The doctrine of Agricola was in itself obscure, and perhaps represented worse than it really was by Luther, who wrote with acrimony against him, and first styled him and his followers *Antinomians*. Agricola stood on his own defence, and complained that opinions were imputed to him which he did not hold. Nicholas Amsdorf fell under the same odious name and imputation, and seems to have been treated more unfairly than even Agricola himself. It is rather hard to charge upon a man all the opinions that may be inferred from things that have hastily dropped from him, when he himself disavows such inferences.

ANTINOUS, the favourite of Adrian, was born at Bithynus in Bithynia His beauty engaged the heart of Adrian in such a manner, that there never was a more boundless and extravagant passion than that of this emperor toward this youth. After his death, the emperor ordered divine honours to be paid him; and he also erected a city of his name. See ENFINE'.

ANTIOCH, a city of Syria in Asia, situated on the river Orontes, in E. Long. 37. 5. N. Lat. 36. 20. It was built by Seleucus Nicator, founder of the Syro-Macedonian empire, who made it his capital. It stood on the above-mentioned river, about 20 miles from the place where it empties itself into the Mediterranean; being equally distant from Constantinople and Alexandria in Egypt, that is, about 700 miles from each. Seleucus called it *Antioch*, from his fathers name, according to some; or from that of his son, according to others. He built 16 other cities bearing the same name; of which one, situated in Pisidia, is probably that where the name of *Christians* was first given to the followers of Jesus Christ. But that situated on the Orontes, by far eclipsed, not only all the others of this name, but all the cities built by Seleucus. Antigonus, not long before, had founded a city in that neighbourhood, which from his own name he had called *Antigonia*, and designed it for the capital of his empire; but it was rased to the ground by Seleucus, who employed the materials in building his metropolis, and also transplanted the inhabitants thither.

The city of Antioch was afterwards known by the name of *Tetrapolis*, being divided as it were into four cities, each of them being surrounded with its proper wall.

Antioch. wall, besides a common one which inclosed them all. The first of these cities was built by Seleucus Nicator, as already mentioned; the second by those who flocked thither on its being made the capital of the Syro-Macedonian empire; the third by Seleucus Callinicus; and the fourth by Antiochus Epiphanes.—About four or five miles distant, stood a place called *Daphne*, which was nevertheless reckoned a suburb of Antioch. Here Seleucus planted a grove, and in the middle of it built a temple which he consecrated to Apollo and Diana, making the whole an asylum. To this place the inhabitants of Antioch resorted for their pleasures and diversions; whereby it became at last so infamous, that, "to live after the manner of Daphne" was used as a proverb to express the most voluptuous and dissolute way of living. Here Lucius Verus, the colleague of M. Aurelius, chose to take up his residence, instead of marching against the Parthians; while his general Cassius forbade by proclamation any of his soldiers to enter or even go near the place. In short, so remarkable was Daphne of old, that the metropolis itself was distinguished by it, and called *Antioch near Daphne*.

Though Antioch continued to be, as Pliny calls it, the queen of the East, for near 1600 years; yet scarce any city mentioned in history hath undergone such calamities, both from the attacks of its enemies, and its being naturally subjected to earthquakes.—The first disaster mentioned in history which befel the Antiochians happened about 145 years before Christ. Being at that time very much disaffected to the person and government of Demetrius their king, they were continually raising tumults and seditions; insomuch that he found himself at last obliged to solicit assistance from the Jews; and was furnished by Jonathan, one of the Maccabees, with 3000 men: by which reinforcement, believing himself sufficiently strong to reduce the mutineers by force, he ordered them immediately to deliver up their arms. This unexpected order caused a great uproar in the city. The inhabitants ran to arms, and invested the king's palace, to the number of 120,000, with a design to put him to death. All the Jews hastened to his relief, fell upon the rebels, killed 100,000 of them, and set fire to the city. On the destruction of the Syrian empire by the Romans, Antioch submitted to them as well as the other cities of that kingdom, and continued for a long time under their dominion. About the year 115, in the reign of the emperor Trajan, it was almost entirely ruined by one of the most dreadful earthquakes mentioned in history. Trajan himself happened to be there at that time, being returned from an expedition against the Parthians; so that the city was then full of troops, and strangers come from all quarters either out of curiosity or upon business and embassies: the calamity was by this means felt almost in every province of the Roman empire. The earthquake was preceded by violent claps of thunder, unusual winds, and a dreadful noise under ground. The shock was so terrible, that great numbers of houses were overturned, and others tossed to and fro like a ship at sea. Those who happened to be in their houses were for the most part buried under their ruins: those who were walking in the streets or in the squares, were, by the violence of the shock, dashed against each other, and most of them either killed of dangerously wounded.—This earthquake continued, with some small intermission, for many days and nights; so that vast numbers perished. The most violent shock, according to the Acts of St Ignatius, was on a Sunday, December 23. By this Trajan was much hurt, but escaped through a window. Dio Cassius pretends, that he was taken out of the window by one who exceded the human size in tallness. The same historian adds, that mount Lison, which stood at a small distance from the city, bowed with its head and threatened to fall down upon it; that other mountains fell; that new rivers appeared, and others that had flowed before forsook their course and vanished. When the earthquake ceased, a woman was heard crying under the ruins; which being immediately removed, she was found with a living child in her arms. Search was made for others; but none was found alive, except one child, which continued sucking its dead mother.

No doubt, Trajan, who was an eye-witness of this terrible calamity, would contribute largely towards the re-establishment of Antioch in its ancient splendor. Its good fortune, however, did not continue long; for in 155, it was almost entirely burnt by accidental fire; when it was again restored by Antoninus Pius. In 176 or 177, the inhabitants having sided with Cassius, the abovementioned Roman general, who had revolted from M. Aurelius, that emperor published a severe edict against them, deprived them of all their privileges, suppressed their public assemblies, and took from them the shows and spectacles to which they were greatly addicted: but his anger being soon appeased, he restored them to their former condition, and even condescended to visit their city. In 194, having sided with Niger against Severus, the latter deprived them of all their privileges, and subjected Antioch as a mere village to Laodicea; but, however, pardoned them the next year at the intreaties of his eldest son, then a child.

When the power of the Roman empire began to decline, Antioch became the bone of contention between them and the eastern nations; and accordingly, on the breaking out of a Persian war, it was almost always sure to suffer. In 242, it was taken and plundered by Sapor; and, though he was defeated by Gordian, it underwent the same misfortune in the time of Valerian, about 18 years after; and after the defeat and captivity of Valerian, being taken by the Persian monarch a third time, he not only plundered it, but levelled all the public buildings with the ground. The Persians, however, being soon driven out, this unfortunate city continued free from any remarkable calamity till about the time of the division of the Roman empire by Constantine in 331. It was then afflicted with so grievous a famine, that a bushel of wheat was sold for 400 pieces of silver. During this grievous distress, Constantine sent to the bishop 30,000 bushels of corn; besides an incredible quantity of all kinds of provisions, to be distributed among the ecclesiastics, widows, orphans, &c. In the year 347, Constantine II. caused an harbour to be made at Seleucia, for the convenience of Antioch. This was effected at an immense expence, the mouth of the Orontes, where the port was made, being full of sands and rocks. When the emperor Julian set out on his expedition against the Persians, he made a long stay at Antioch; during which time, many of the Roman provinces were afflicted with a famine, but which raged more violently at Antioch than in other places.

The

Antioch. The ecclesiastical writers of those times say, that this famine followed Julian from place to place; and as he continued longer at Antioch than any other city, it raged more violently there than any where else. To remedy this evil, Julian fixed the prices of corn; by which means the famine was greatly increased, the merchants conveying their corn privately to other places, so that this metropolis was reduced to a most deplorable situation. In 381, in the reign of Theodosius the Great, Antioch was again visited by a famine, accompanied by a grievous plague. The latter soon ceased: but, the famine still continuing, the bishop, Libanius, applied to Icarius, count of the East, requesting him by some means or other to relieve the poor, who had flocked from all parts to the metropolis, and were daily perishing in great numbers: but to this Icarius gave no other answer, than that they were abhorred and justly punished by the gods. This inhuman answer raised great disturbances; which, however, were terminated without bloodshed. In 387, Theodosius finding his exchequer quite drained, and being obliged to be at an extraordinary expence in celebrating the fifth year of the reign of his son Arcadius, and the tenth of his own, an extraordinary tax was laid upon all the people in the empire. Most of the cities submitted willingly to this; but the people of Antioch, complaining of it as an unreasonable oppression, crowded to the house of Flavianus their bishop, as soon as the edict was published, to implore his protection. Being unable to find him, they returned to the forum; and would have torn the governor in pieces, had not the officers who attended him kept back with great difficulty the enraged multitude, till he made his escape. Upon this, they broke some of the emperor's statues, and dragged others through the city, uttering the most injurious and abusive expressions against him and his whole family. They were however, dispersed by a body of archers, who, by wounding only two of the rabble, struck terror into all the rest. The governor proceeded against the offenders with the utmost cruelty; exposing some to wild beasts in the theatre, and burning others alive. He did not spare even the children, who had insulted the emperor's statues; and caused several persons to be executed, who had been only spectators of the disorder. In the mean time, a report was spread, that a body of troops was at hand, with orders to plunder the city, and put all to the sword, without distinction of sex or age; upon which the citizens abandoned their dwellings in the utmost terror and confusion, retiring to the neighbouring mountains with their wives and families. As the report proved groundless, some of them returned; but the greater part, dreading the cruelty of the governor, and the displeasure of the emperor, continued in their retreats. To those who returned, St Chrysostom preached some homilies, which have reached our times, and are greatly admired; and which are said by St Chrysostom himself, as well as some cotemporary writers, to have had a considerable effect in reforming the lives of this licentious and dissolute people. On hearing the news of this tumult, Theodosius was so much enraged, that he commanded the city to be destroyed, and its inhabitants to be put to the sword without distinction; but this order was revoked before it could be put into execution, and he contented himself with a punishment similar to that inflicted by Severus above-mentioned. He appointed judges to punish the offenders; who proceeded with such severity, and condemned such numbers, that the city was thrown into the utmost consternation. On this occasion, St Chrysostom and the hermits, who were very numerous in the neighbourhood, exerted all their eloquence in behalf of the unhappy people, and obtained a respite for those who had been condemned. They next proceeded to draw up a memorial to the emperor in favour of the citizens in general; and being joined by Flavianus, at last obtained a general pardon, and had the city restored to all its former privileges.

In the year 458, Antioch was almost entirely ruined by an earthquake, which happened on the 14th of September; scarce a single house being left standing in the most beautiful quarter of the city. The like misfortune it experienced in 525, during the reign of the emperor Justin; and 15 years after, being taken by Cosrhoes king of Persia, that insulting and haughty monarch gave it up to his soldiers, who put all they met to the sword. The king himself seized on all the gold and silver vessels belonging to the great church; and caused all the valuable statues, pictures, &c. to be taken down and conveyed to Persia, while his soldiers carried off every thing else. The city being thus completely plundered, Cosrhoes ordered his men to set fire to it; which was accordingly done so effectually, that none of the buildings even without the walls escaped. Such of the inhabitants as escaped slaughter were carried into Persia, and sold as slaves.

Notwithstanding so many and so great calamities, the city of Antioch soon recovered its wonted splendor; but in a short time underwent its usual fate, being almost entirely destroyed by an earthquake in 587, by which 30,000 persons lost their lives. In 634, it fell into the hands of the Saracens, who kept possession of it till the year 858, when it was surprised by one Burtzas, and again annexed to the Roman empire. The Romans continued masters of it for some time, till the civil dissentions in the empire gave the Turks an opportunity of seizing upon it as well as the whole kingdom of Syria. From them it was again taken by the Crusaders in 1098. In 1262, it was taken by Bibaris sultan of Egypt, who put a final period to its glory.

Antioch is now no more than a ruinous town, whose houses, built with mud and straw, and narrow and miry streets, exhibit every appearance of misery and wretchedness. These houses are situated on the southern bank of the Orontes, at the extremity of an old decayed bridge: they are covered to the south by a mountain; upon the slope of which is a wall, built by the Crusaders. The distance between the present town and this mountain may be about 400 yards, which space is occupied by gardens and heaps of rubbish, but presents nothing interesting.

Notwithstanding the unpolished manners of its inhabitants, Antioch was better calculated than Aleppo to be the emporium of the Europeans. By clearing the mouth of the Orontes, which is six leagues lower down, boats might have been towed up that river, though they could not have sailed up, as Pococke has asserted; its current is too rapid. The natives, who never knew the name Orontes, call it, on account of the swiftness of its stream, *El-aasi*, that is, the rebel. Its breadth, at Antioch, is about forty paces. Seven

 leagues

leagues above that town it passes by a lake abounding in fish, and especially in eels. A great quantity of these are salted every year, but not sufficient for the numerous fasts of the Greek Christians. It is to be remembered, we no longer hear at Antioch, either of the Grove, or Daphne, or of the voluptuous scenes of which it was the theatre.

The plain of Antioch, though the soil of it is excellent, is uncultivated, and abandoned to the Turcomans; but the hills on the side of the Orontes, particularly opposite Serkin, abound in plantations of figs and olives, vines, and mulberry trees, which, a thing uncommon in Turkey, are planted in quincunx, and exhibit a landscape worthy our finest provinces.

Seleucus Nicator, who founded Antioch, built also at the mouth of the Orontes, on the northern bank, a large and well fortified city, which bore his name, but of which at present not a single habitation remains: nothing is to be seen but heaps of rubbish, and works in the adjacent rock, which prove that this was once a place of very considerable importance. In the sea also may be perceived the traces of two piers, which are indications of an ancient port, now choaked up. The inhabitants of the country go thither to fish, and call the name of the place *Souaidia*.

ANTIOCHETTA, a town of Turkey, in Asia, in Carimania, with a bishop's see, over-against the island of Cyprus. E. Long. 32. 15. N. Lat. 36. 42.

ANTIOCHIA (anc. geog.), a town of Assyria, situated between the rivers Tigris and Tornadotus (Pliny).—Another of Caria, on the Meander; called also *Pythopolis*, *Athymbra*, and *Nyssa*, or *Nysa* (Stephanus): but Strabo says, that Nysa was near Tralles.—A third of Cilicia Trachea, on mount Cragus (Ptolemy).—A fourth, called *Epidaphnes*, the capital of Syria, distinguished from cities of the same name, either by its situation on the Orontes, by which it was divided, or by its proximity to Daphne (See ANTIOCH).—A fifth Antiochia, a town of Comagene, on the Euphrates (Pliny).—A sixth, of Lydia, *Tralles* so called (Pliny).—A seventh, of Margiana, (Strabo, Pliny, Ptolemy), on the river Margus, taking its name from Antiochus, son of Seleucus, who rebuilt it, and walled it round, being before called *Alexandria*, from Alexander the founder, and surnamed Syria; in compass seventy stadia: whither Orodes carried the Romans, after the defeat of Crassus (Pliny)—An eighth, in Mesopotamia, on the lake Calirrhoe, the old name of Edessa (Pliny).—A ninth Antiochia, on the river Mygdonius, in Mesopotamia, situate at the foot of mount Masius, and is the same with Nisibis (Strabo, Plutarch). It was the bulwark and frontier town of the Romans against the Parthians and Persians, till given up to the Persians, by Jovinian, by an ignominious peace [Ammian, Eutropius).—A tenth Antiochia, was that situate in the north of Pisidia (Luke, Ptolemy, Strabo): it was a Roman colony, with the appellation, *Cæsarea*. There is an Antiochia at mount Taurus, mentioned by Ptolemy, but by no other author.

ANTIOCHIAN SECT or *Academy*, a name given to the fifth academy, or branch of academies. It took the denomination from its being founded by Antiochus, a philosopher contemporary with Cicero.—The Antiochian academy succeeded the Philonian. As to point of doctrine, the philosophers of this sect appear to have restored that of the ancient academy, except that in the article of the criterion of truth. Antiochus was really a stoic, and only nominally an academic.

ANTIOCHIAN Epocha, a method of computing time from the proclamation of liberty granted the city of Antioch, about the time of the battle of Pharsalia.

ANTIOCHUS, the name of several kings of SYRIA. See that article.

ANTIOCHUS of *Ascalon*, a celebrated philosopher, the disciple of Philo of Larissa, the master of Cicero, and the friend of Lucullus and Brutus. He was founder of a fifth academy; but, instead of attacking other sects, he set himself down to reconcile them together, particularly the sect of the stoics with that of the ancient academy.

ANTIOPE, in fabulous history, the wife of Lycus, king of Thebes, who, being deflowered by Jupiter in the form of a satyr, brought for Amphion and Zethus.—Another Antiope was queen of the Amazons; and, with the assistance of the Scythians, invaded the Athenians; but was vanquished by Theseus.

ANTIPÆDOBAPTISTS, (derived from ἀντι *against*, παις, παιδος, *child*, and βαπτιζω, *baptize*, whence βαπτιστης), is a distinguishing denomination given to those who object to the baptism of infants; because they say, infants are incapable of being instructed, and of making that profession of faith which intitles them to this ordinance and an admission into church communion. See ANABAPTISTS and BAPTISTS.

ANTIPAROS, an island in the Archipelago, opposite to Paros, from which it is separated by a strait about seven miles over. It is the *Olearos*, or *Oliaros*, mentioned by Strabo, Pliny, Virgil, Ovid, &c.; and was, according to Heraclides Ponticus, as quoted by Stephanus, first peopled by a Phœnician colony from Sidon.—According to Mr Tournefort's account, it is about 16 miles in circumference, produces a little wine and cotton, with as much corn as is necessary for the maintenance of 60 or 70 families, who live together in a village at one end of the island, and are mostly Maltese and French corsairs.

This island is remarkable for a subterraneous cavern or grotto, accounted one of the greatest natural curiosities in the world. It was first discovered in the last century by one Magni an Italian traveller, who has given us the following account. "Having been informed (says he) by the natives of Paros, that in the little island of Antiparos, which lies about two miles from the former, of a gigantic statue that was to be seen at the mouth of a cavern in that place, it was resolved that we (the French consul and himself) should pay it a visit. In pursuance of this resolution, after we had landed on the island, and walked about four miles through the midst of beautiful plains and sloping woodlands, we at length came to a little hill, on the side of which yawned a most horrid cavern, that with its gloom at first struck us with terror, and almost repressed curiosity. Recovering the first surprise, however, we entered boldly; and had not proceeded above 20 paces, when the supposed statue of the giant presented itself to our view. We quickly perceived, that what the ignorant natives had been terrified at as a giant, was nothing more than a sparry concretion, formed by the water dropping from the roof of the cave, and by degrees

Antiparos. hardening into a figure which their fears had formed into a monſter. Incited by this extraordinary appearance, we were induced to proceed ſtill further, in queſt of new adventures in this ſubterranean abode. As we proceeded, new wonders offered themſelves: the ſpars, formed into trees and ſhrubs, preſented a kind of petrified grove; ſome white, ſome green; and all receding in due perſpective. They ſtruck us with the more amazement, as we knew them to be the mere productions of Nature, who, hitherto in ſolitude, had, in her playful moments, dreſſed the ſcene, as if for her own amuſement.

"But we had as yet ſeen but a few of the wonders of the place; and we were introduced as yet only into the portico of this amazing temple. In one corner of this half-illuminated receſs, there appeared an opening of about three feet wide, which ſeemed to lead to a place totally dark, and that, one of the natives aſſured us contained nothing more than a reſervoir of water. Upon this we tried, by throwing down ſome ſtones, which, rumbling along the ſides of the deſcent for ſome time, the ſound ſeemed at laſt quaſhed in a bed of water. In order, however, to be more certain, we ſent in a Levantine mariner, who, by the promiſe of a good reward, with a flambeau in his hand, ventured into this narrow aperture. After continuing within it for about a quarter of an hour, he returned, carrying ſome beautiful pieces of white ſpar in his hand, which art could neither imitate nor equal. Upon being informed by him that the place was full of theſe beautiful incruſtations, I venture in once more with him, for about 50 paces, anxiouſly and cautiouſly deſcending by a ſteep and dangerous way. Finding, however, that we came to a precipice which led into a ſpacious amphitheatre, if I may ſo call it, ſtill deeper than any other part, we returned, and being provided with a ladder, flambeaux, and other things to expedite our deſcent, our whole company, man by man, ventured into the ſame opening, and, deſcending one after another, we at laſt ſaw ourſelves all together in the moſt magnificent part of the cavern.

"Our candles being now all lighted up, and the whole place completely illuminated, never could the eye be preſented with a more glittering or a more magnificent ſcene. The roof all hung with ſolid icicles, tranſparent as glaſs, yet ſolid as marble. The eye could ſcarce reach the noble and lofty cieling; the ſides were regularly formed with ſpars; and the whole preſented the idea of a magnificent theatre, illuminated with an immenſe profuſion of lights. The floor conſiſted of ſolid marble; and in ſeveral places magnificent columns, thrones, altars, and other objects appeared as if nature had deſigned to mock the curioſities of art. Our voices, upon ſpeaking or ſinging, were redoubled to an aſtoniſhing loudneſs; and, upon the firing of a gun, the noiſe and reverberations were almoſt deafening. In the midſt of this grand amphitheatre, roſe a concretion of about 15 feet high, that, in ſome meaſure reſembled an altar; from which, taking the hint, we cauſed maſs to be celebrated there. The beautiful columns that ſhot up round the altar, appeared like candleſticks; and many other natual objects repreſented the cuſtomary ornaments of this ſacrament.

"Below even this ſpacious grotto, there ſeemed another cavern; down which I ventured with my former mariner, and deſcended about 50 paces by means of a rope. I at laſt arrived at a ſmall ſpot of level ground, where the bottom appeared different from that of the amphitheatre, being compoſed of ſoft clay, yielding to the preſſure, and in which I thruſt a ſtick to about ſix feet deep. In this, however, as above, numbers of the moſt beautiful cryſtals were formed; one of which, particularly, reſembled a table. Upon our egreſs from this amazing cavern, we perceived a Greek inſcription upon a rock at the mouth; but ſo obliterated by time, that we could not read it. It ſeemed to import, that one Antipater, at the time of Alexander, had come thither; but whether he penetrated into the depths of the cavern, he does not think fit to inform us."

From this account Mr Tournefort's differs conſiderably. Mr Magni mentions only one deſcent or precipice from the entry of the cave to the grotto, or moſt magnificent part: M. Tournefort ſays that there were many very dangerous precipices and rugged ways, thro' which they were obliged to paſs, ſometimes on their back, and ſometimes on their belly; but gives no particular account of his journey till he comes to the grand cavern. This indeed he deſcribes very pompouſly; but as by it he evidently wants to ſupport a favourite hypotheſis, namely, the vegetation of ſtones, perhaps the particulars are not altogether to be depended upon. He informs us, that, at the entry into the cavern, he met with a Greek inſcription almoſt defaced, containing a good number of proper names, and that there was a tradition among the inhabitants, that theſe were the names of ſome who had conſpired againſt Alexander the Great, and having miſſed their aim, had taken refuge in this grotto.

The moſt particular account, however, of this famous grotto that hath hitherto been publiſhed, appeared in the Britiſh magazine, in a letter ſigned *Charles Saunders*, and dated Feb. 24th, 1746-7; which, as it is very particular, and ſeems to bear ſufficient marks of authenticity, we ſhall here inſert. "Its entrance lies in the inſide of a rock, about two miles from the ſea-ſhore; and is a ſpacious and very large arch, formed of rough craggy rocks, overhung with brambles and a great many climbing plants, that give it a gloomineſs which is very awful and agreeable. Our ſurgeon, myſelf, and four paſſengers, attended by ſix guides with lighted torches entered this cavern about eight o'clock in the morning, in the middle of Auguſt laſt. We had not gone 20 yards in this cavity, when we loſt all ſight of day-light: but our guides going before us with lights, we entered into a low narrow kind of alley, ſurrounded every way with ſtones glittering like diamonds by the light of our torches; the whole being covered and lined throughout with ſmall cryſtals, which gave a thouſand various colours by their different reflections. This alley grows lower and narrower as one goes on, till at length one can ſcarce get along it. At the end of this paſſage we were each of us preſented with a rope to tie about our middles; which when we had done, our guides led us to the brink of a moſt horrible precipice. The deſcent into this was quite ſteep, and the place all dark and gloomy. We could ſee nothing, in ſhort, but ſome of our guides with torches in a miſerable dark place, at a vaſt diſtance below us. The dreadful depth of this place, and the horror of the deſcent thro' a miſerable darkneſs into it, made me look back to the lane of diamonds, if I may ſo call it, thro' which we had juſt paſſed, and I could not but think I was leaving heaven, to deſcend into the infernal regions. The hope of ſomething fine at my journey's end, tempted me, however, to truſt myſelf to the rope and my guides at the top, to let myſelf down. After about two minutes dangling in this poſture, not without much pain as well as terror, I found myſelf ſafe, however, at the bottom; and our friends all ſoon followed the example. When we had congratulated here with one another on our ſafe deſcent; I was inquiring where the grotto, as they called it, was. Our guides, ſhaking their heads, told us, we had a great way to that yet; and led us forward about 30 yards under a roof of ragged rocks in a ſcene of terrible darkneſs, and at a vaſt depth from the ſurface of the earth, to the brink of another precipice much deeper and more terrible than the former. Two of the guides went down here with their torches firſt; and by their light we could ſee, that this paſſage was not ſo perpendicular indeed as the other, but lay in a very ſteep ſlant, with a very ſlippery rock for the bottom; vaſt pieces of rough rugged rocks jutting out in many places on the right hand, in the deſcent, and forcing the guides ſometimes to climb over, ſometimes to creep under them, and ſometimes to round them; and on the left, a thouſand dark caverns, like ſo many monſtrous wells, ready, if a foot ſhould ſlip, to ſwallow them up for ever. We ſtood on the edge to ſee theſe people with their lights deſcend before us, and were amazed and terrified to ſee them continue deſcending till they ſeemed at a monſtrous and moſt frightful depth. When they were at the bottom, however, they hollowed to us; and we, trembling and quaking, began to deſcend after them. We had not got 30 feet down, when we came to the place where the rock was perfectly perpendicular; and a vaſt cavern ſeemed to open its mouth to ſwallow us up on one ſide, while a wall of rugged rock threatened to tear us to pieces on the other. I was quite diſheartened at this terrible proſpect, and declared I would go back: but our guides aſſured us there was no danger; and the reſt of the company reſolving to ſee the bottom now they were come ſo far, I would not leave them: ſo on we went to a corner where there was placed an old ſlippery and rotten ladder, which hung down cloſe to the rock; and down this, one after another, we at length all deſcended. When we had got to the bottom of this, we found ourſelves at the entrance of another paſſage, which was terrible enough indeed; but in this there was not wanting ſomething of beauty. This was a wide and gradual deſcent; at the entrance of which one of our guides ſeated himſelf on his breech, and began to ſlide down, telling us we muſt do the ſame. We could diſcover, by the light of his torch, that this paſſage was one of the nobleſt vaults in the world. It is about nine feet high, ſeven wide, and has for its bottom a fine green gloſſy marble. The walls and arch of the roof of this being as ſmooth and even in moſt places as if wrought by art, and made of a fine gliſtering red and white granite, ſupported here and there with columns of a deep blood-red ſhining porphyry, made, with the reflection of the lights, an appearance not to be conceived. This paſſage is at leaſt 40 yards long; and of ſo ſteep a deſcent, that one has enough to do, when ſeated on one's breech, not to deſcend too quickly. Our guides, that we kept with us, could here keep on each ſide of us: and, what with the prodigious grandeur and beauty of the place, our eaſy travelling through it, and the diverſion of our now and then running over one another whether we would or not; this was much the pleaſanteſt part of our journey. When we had entered this paſſage, I imagined we ſhould at the bottom join the two guides we had firſt ſet down; but alas! when we were got there, we found ourſelves only at the mouth of another precipice, down which we deſcended by a ſecond ladder not much better than the former. I could have admired this place alſo, would my terror have ſuffered me; but the dread of falling, kept all my thoughts employed during my deſcent. I could not but obſerve, however, as my companions were coming down after me, that the wall, if I may ſo call it, which the ladder hung by, was one maſs of blood-red marble, covered with white ſprigs of rock-cryſtal as long as my finger, and making, with the glow of the purple from behind, one continued immenſe ſheet of amethyſts. From the foot of this ladder we ſlided on our bellies through another ſhallow vault of poliſhed green and white marble, about 20 feet; and at the bottom of this joined our guides. Here we all got together once again, and drank ſome rum, to give us courage before we proceeded any farther. After this ſhort refreſhment, we proceeded by a ſtrait, but ſomewhat ſlanting paſſage, of a rough, hard, and ſomewhat coarſe ſtone, full of a thouſand ſtrange figures of ſnakes rolled round, and looking as if alive; but in reality as cold and hard as the reſt of the ſtone, and nothing but ſome of the ſtone itſelf in that ſhape. We walked pretty eaſily along this deſcent for near 200 yards; where we ſaw two pillars ſeemingly made to ſupport the roof from falling in: but in reality it was no ſuch thing; for they were very brittle, and made of a fine glittering yellow marble. When we had paſſed theſe about 200 yards, we found ourſelves at the brink of another very terrible precipice: but this our guides aſſured us was the laſt; and there being a very good ladder to go down by, we readily ventured. At the bottom of this ſteep wall, as I may call it, we found ourſelves for ſome way upon plain even ground; but, after about 40 yards walking, were preſented by our guides with ropes again; which we faſtened about our middles, though not to be ſwung down by, but only for fear of danger, as there are lakes and deep waters all the way from hence on the left hand. With this caution, however, we entered the laſt alley: and horrible work it was indeed to get through it. All was perfectly horrid and diſmal here. The ſides and roof of the paſſage were all of black ſtone; and the rocks in our way were in ſome places ſo ſteep, that we were forced to lie all along on our backs, and ſlide down; and ſo rough, that they cut our clothes, and bruiſed us miſerably in paſſing. Over out heads, there were nothing but ragged black rocks, ſome of them looking, as if they were every moment ready to fall in upon us; and, on our left hands, the light of our guides torches ſhowed us continually the ſurfaces of dirty and miſerably looking lakes of water. If I had heartily repented of my expedition often before, here I aſſure you I was all in a cold ſweat, and fairly gave myſelf over for loſt; heartily curſing all the travellers that had written of this place, that they had deſcribed it ſo as

Antiparos. to tempt people to see it, and never told us of the horrors that lay in the way. In the midst of all these reflections, and in the very dismallest part of all the cavern, on a sudden we had lost four of our six guides. What was my terror on this sight! This place was a thousand times darker and more terrible for want of their torches; and I expected no other but every moment to follow them into some of these lakes, into which I doubted not but they were fallen. The remaining two guides said all they could, indeed, to cheer us up; and told us we should see the other four again soon, and that we were near the end of our journey. I don't know what effect this might have upon the rest of my companions; but I assure you I believed no part of the speech but the last, which I expected every moment to find fulfilled in some pond or precipice. Our passage was by this time become very narrow, and we were obliged to crawl on all-fours over rugged rocks; when in an instant, and in the midst of these melancholy apprehensions, I heard a little hissing noise, and saw myself in utter, and not to be described, darkness. Our guides called indeed cheerfully to us, and told us that they had accidentally dropped their torches into a puddle of water, but we should soon come to the rest of them, and they would light them again; and told us there was no danger, and we had nothing to do but to crawl forward. I cannot but say I was amazed at the courage of these people; who were in a place where, I thought, four of them had already perished, and from whence we could none of us ever escape; and determined to lie down and die where I was. Words cannot describe the horror, or the extreme darkness, of the place. One of our guides, however, perceiving that I did not advance, came up to me, and clapping his hand firmly over my eyes, dragged me a few paces forward. While I was in this strange condition, expecting every moment death in a thousand shapes, and trembling to think what the guide meant by this rough proceeding, he lifted me at once over a great stone, set me down on my feet, and took his hand from before my eyes. What words can describe at that instant my astonishment and transport! Instead of darkness and despair, all was splendor and magnificence before me, our guides all appeared about us; the place was illuminated by 50 torches, and the guides all welcomed me into the grotto of Antiparos. The four that were first missing, I now found had only given us the slip, to get the torches lighted up before we came; and the other two had put out their lights on purpose, to make us enter out of utter darkness into this pavilion of splendor and glory. I am now come to the proper business of this letter; which was, to describe this grotto. But I must confess to you that words cannot do it. The amazing beauties of the place, the eye that sees them only can conceive. The best account I can give you, however, pray accept of.

"The people told us, the depth of this place was 485 yards. The grotto, in which we now were, is a cavern of 120 yards wide, and 113 long, and seems about 60 yards high in most places. These measures differ something from the accounts travellers in general give us; but you may depend upon them as exact, for I took them with my own hand. Imagine then with yourself, an immense arch like this, almost all over lined with fine and bright chrystallized white marble, and illuminated with 50 torches; and you will then have some faint idea of the place I had the pleasure to spend three hours in. This, however, is but a faint description of its beauties. The roof, which is a fine vaulted arch, is hung all over with icicles of white shining marble, some of them ten feet long, and as thick as one's middle at the root: and among these there hang 1000 festoons of leaves and flowers of the same substance; but so very glittering, that there is no bearing to look up at them. The sides of the arch are planted with seeming trees of the same white marble, rising in rows one above another, and often inclosing the points of the icicles. From these trees there are also hung festoons, tied as it were from one to another in vast quantities; and in some places among them there seem rivers of marble winding through them in a thousand meanders. All these things are only made, in a long course of years, from the dropping of water, but really look like trees and brooks turned to marble. The floor we trod upon was rough and uneven, with crystals of all colours growing irregularly out of it, red, blue, green, and some of a pale yellow. These were all shaped like pieces of saltpetre; but so hard, that they cut our shoes: among these, here and there, are placed icicles of the same white shining marble with those above, and seeming to have fallen down from the roof and fixed there; only the big end of these is to the floor. To all these our guides had tied torches, two or three to a pillar, and kept continually beating them to make them burn bright. You may guess what a glare of splendor and beauty must be the effect of this illumination, among such rocks and columns of marble. All round the lower part of the sides of the arch are a thousand white masses of marble, in the shape of oak-trees. Mr Tournefort compares them to cauliflowers, but I should as soon compare them to toad-stools. In short, they are large enough to inclose, in many places, a piece of ground big enough for a bed-chamber. One of these chambers has a fair white curtain, whiter than sattin, of the same marble, stretched all over the front of it. In this we all cut our names, and the date of the year, as a great many people have done before us. In a course of years afterwards, the stone blisters out like this white marble over the letters. Mr Tournefort thinks the rock grows like oaks or apple-trees for this reason; but I remember I saw some of the finest cockle and muscle shells, in the rock thereabouts, that ever I saw in my life. I wonder whether he thinks they grow there too. Besides, if this rock grows so fast, the cavern ought to be all grown up by this time; and yet, according to his measures and mine, the cavern seems on the other hand to be turned larger since. Indeed, all that I can gather from his account of this glorious place is, that he had drank a bottle or two too much before he went down into it."

ANTIPAS-HEROD, or HEROD-ANTIPAS, the son of HEROD the Great, by one of his wives called Cleopatra, a native of Jerusalem. Herod the Great, in his first will, appointed Antipas his successor in the kingdom; but afterwards, altering that will, he named his son Archelaus his successor, giving to Antipas the title only of Tetrach of Galilee and Peræa.

Antipas took a great deal of pains in adorning and fortifying the principal places of his dominions. He married the daughter of Aretas king of Arabia; whom he he divorced about the year of Christ 33, to marry his sister-in-law Herodias, wife to his brother Philip, who was still living. St John the Baptist exclaiming continually against this incest, was taken into custody by order of Antipas, and imprisoned in the castle of Machærus, (Mat. xiv. 3, 4. Mark i. 14. vi. 17, 18. Luke iii. 19, 20.) Josephus says, that Antipas caused St John to be laid hold of because he drew too great a concourse of people after him; and that he was afraid lest he should make use of the authority which he had acquired over the minds and affections of the people, to induce them to revolt. But the evangelists, who were better informed than Josephus, as being eye-witnesses of what passed, and acquainted in a particular manner with St John and his disciples, assures us that the true reason of imprisoning St John was, the aversion which Herod and Herodias had conceived against him for the liberty he had used in censuring their scandalous marriage. The virtue and holiness of St John were such, that even Herod feared and respected him; but his passion for Herodias had prevailed with him to have killed that prophet, had he not been restrained by his apprehensions of the people, who esteemed John the Baptist as a prophet. (Mat. xiv. 5, 6.) One day, however, while the king was celebrating the festival of his birth, with the principal persons of his court, the daughter of Herodias danced before him; and pleased him so well, that he promised with an oath to give her whatever she should ask of him. By her mother's advice she asked the head of John the Baptist; upon which the king commanded John to be beheaded in prison, and the head to be given her.—Aretas, king of Arabia, to revenge the affront which Herod had offered to his daughter, declared war against him, and overcame him in a very obstinate engagement. Herod being afterwards detected as a party in Sejanus's conspiracy, was banished by the emperor Caius into Lyons in Gaul; whither Herodias accompanied him.

This Antipas is the Herod who, being at Jerusalem at the time of our Saviour's passion, (Luke xxiii. 11.) ridiculed him, by dressing him in a white robe, and directing him to be conducted back to Pilate, as a mock king, whose ambition gave him no umbrage. The time when Antipas died is not known: however, it is certain he died in exile, as well as Herodias. Josephus says, that he died in Spain, whither Caius upon his coming to Gaul, the first year of his banishment, might order him to be sent.

ANTIPATER, the disciple of Aristotle, and one of Alexander the Great's generals, was a man of great abilities, and a lover of the sciences; but was accused of poisoning Alexander. He subdued the revolted Thracians, relieved Megalopolis, and overthrew the Spartans there. He died 321 years before the Christian æra.

ANTIPATER, an Idumæan of illustrious birth, and possessed of great riches and abilities, taking advantage of the confusion into which the two brothers Hyrcanus and Aristobulus plunged Judea by their contest for the office of high-priest, took such measures as to gain Hyrcanus that office, and under his government to obtain the absolute direction of all affairs; while his great abilities and application to business made him so considerable, that he was honoured as much as if he had been invested with the royal authority in form: but he was at last poisoned by a Jew, named Malachus, 43 years before the Christian æra. He left among his other children, the famous Herod king of the Jews.

ANTIPATER (Cælius), a Roman historian, who wrote a history of the Punic war, much valued by Cicero. The emperor Adrian preferred him to Salust.

ANTIPATER of Sydon, a stoic philosopher, and likewise a poet, commended by Cicero and Seneca: he flourished about the 171st Olympiad. We have several of his epigrams in the *Anthologia*.

ANTIPATHY, in physiology, is formed from the two Greek word, ἀντι *contrary*, and παθος *passion*. Literally taken, the word signifies *incompatibility*: but for the most part the term *antipathy* is not used to signify such incompatibilities as are merely physical; it is reserved to express the aversion which an animated or sensitive being feels at the real or ideal presence of particular objects. In this point of view, which is the light in which we at present consider the term, *antipathy*, in common language, signifies "a natural horror and detestation, an insuperable hatred, and involuntary aversion, which a sensitive being feels for some other object, whatever it is, though the person who feels this abhorrence is entirely ignorant of its cause, and can by no means account for it." Such is, they say, the natural and reciprocal hostility between the salamander and the tortoise; between the toad and the weasel; or between sheep and wolves. Such is the invincible aversion of particular persons against cats, mice, spiders, &c.: a prepossession which is sometimes so violent, as make them faint at the sight of these animals. Of these and a thousand other antipathies the ancient naturalists, the schoolmen, and the vulgar, form so many legends; and relate them as certain facts, that they may demand an explication of them from the philosophers. But these sages begin with investigating whether such antipathies actually exist or not.

To explore the matter without prejudice, we shall find it necessary to abstract from the subjects of this disquisition, 1. All such antipathies as are not ascertained; as that which is supposed to be felt by hens at the sound of an harp whose strings are made of a fox's bowels, between the salamander and tortoise, and between the weasel and the toad. Nothing is less confirmed, or rather nothing is more false, than these facts, with which vulgar credulity and astonishment are amused and actuated: and though some of these antipathies should be ascertained, this would be no proof that the animals which feel them are not acquainted with their causes, according to their mode and proportion of knowledge; in which case it will be no longer the antipathy which we have defined.

2. We must abstract those antipathies which can be extinguished or resumed at pleasure; those fictitious aversions, which certain persons feel, or pretend to feel, with affected airs, that they may appear more precise and finical, or singularly and prodigiously elegant; that they may seem to have qualities so exquisitely fine, as require to be treated with peculiar delicacy. One who bestows any attention on the subject, would be astonished to find how many of these chimerical aversions there are, which are pretended, and passed upon the world by those who affect them, as natural and unconquerable.

3. When we abstract those aversions the, causes of which

Antipathy. which are known and evident; we ſhall be ſurpriſed, after our deduction of theſe pretended antipathies from the general ſum, how ſmall, how inconſiderable, is the quantity of thoſe which are conformable to our definition. Will any one pretend to call by the name of *antipathy*, thoſe real, innate, and inconteſtable averſions which prevail between ſheep and wolves? Their cauſe is obvious: the wolf devours the ſheep, and ſubſiſts upon his victim; and every animal naturally flies with terror from pain or deſtruction: ſheep ought therefore to regard wolves with horror, which for their nutrition tear and mangle the unreſiſting prey. From principles ſimilar to this, ariſe that averſion which numbers of people feel againſt ſerpents; againſt ſmall animals, ſuch as reptiles in general, and the greateſt number of inſects. During the credulous and ſuſceptible period of infancy, pains have been taken to impreſs on our minds the frightful idea that they are venomous; that their bite is mortal; that their ſting is dangerous, productive of tormenting inflammations or tumours, and ſometimes fatal: they have been repreſented to us as ugly and ſordid; as being, for that reaſon, pernicious to thoſe who touch them; as poiſoning to thoſe who have the misfortune to ſwallow them. Theſe horrible prepoſſeſſions are induſtriouſly inculcated from our infancy; they are ſometimes attended and ſupported by diſmal tales, which are greedily imbibed, and indelibly engraven on our memories. It has been taught us both by precept and example, when others at their approach have aſſumed in our view the appearance of deteſtation and even of terror, that we ſhould fly from them, that we ſhould not touch them. Is it then wonderful (if our falſe impreſſions as to this ſubject have been corrected neither by future reflections nor experiments), that we ſhould entertain, during our whole lives, an averſion for theſe objects, even when we have forgot the admonitions, the converſations, and examples, which have taught us to believe and apprehend them as noxious beings? and in proportion to the ſenſibility of our frame, in proportion as our nerves are irritable, our emotions at the ſight of what we fear will be more violent, eſpecially if they anticipate our expectation, and ſeize us unprepared, thought our ideas of what we have to fear from them are the moſt confuſed and indiſtinct imaginable. To explain theſe facts, is it neceſſary to fly to the exploded ſubterfuge of occult qualities inherent in bodies, to latent relations productive of antipathies, of which no perſon could ever form an idea?

It is often ſufficient to influence a perſon who had formerly no averſion for an object, if he lives with ſome other aſſociate who gives himſelf up to ſuch capricious panics; the habit is inſenſibly contracted to be agitated with diſagreeable emtions at the preſence of an object which had been formerly beheld with indifference and cold blood. I was acquainted (ſays the author of the article *Antipathy* in the French Encyclopédie) with a perſon of a very ſound underſtanding, whom thunder and lightning by no means terrified; nay, to whom the ſpectacle appeared magnificent and the ſound majeſtic; yet to a mind thus ſeemingly fortified againſt the infectious of terror, no more was neceſſary than ſpending the ſummer with a friend in whom the appearance of lightning excited the ſtrongeſt emotions, and whom the remoteſt clap of thunder affected with extravagant paroxiſms, to become timid in exceſs at the approach of thunder; nor could he ever afterwards ſurmount the fear which it inſpired.—The frightful ſtories of dogs and cats, which have killed their maſters, or which have given them mortal wounds, are more than ſufficient to inſpire a timorous perſon with averſion againſt theſe animals; and if the olfactory nerves of ſuch a perſon be delicate, he will immediately diſcover the ſmell of them in a chamber: diſturbed by the apprehenſion which theſe effluvia excite in his mind, he gives himſelf up to the moſt violent uneaſineſs, which is tranquillized when he is aſſured that the animal is no longer in the room. If by chance, in the ſearch which is made to calm the uneaſineſs of this timorous perſon, one of theſe creatures ſhould at laſt be diſcovered, every one preſently exclaims, *A miracle!* and admits the reality of *antipathies* into his creed; whilſt all this is nothing but the effect of a childiſh fear, founded on certain confuſed and exaggerated ideas of the hazard which one may run with theſe animals. The *antipathy* which ſome people entertain againſt eels, though they are eaten by others with pleaſure, ariſe from nothing but the fear of ſerpents, to which theſe fiſhes are in ſome degree ſimilar. There are likewiſe other *antipathies* which do not originate in the imagination, but ariſe from ſome natural incongruity; ſuch as we often remark in children, for particular kinds of victuals, with which their taſte is not offended, but which their ſtomachs cannot digeſt, and which are therefore diſgorged as ſoon as ſwallowed.

To what then are thoſe *antipathies*, of which we have heard ſo much, reducible? Either to legendary tales; or to averſions againſt objects which we believe dangerous; or to a childiſh terror of imaginary perils; or to a diſreliſh, of which the cauſe is diſguiſed; or to a ridiculous affectation of delicacy; or to an infirmity of the ſtomach; in a word, to a real or pretended reluctance for things which are either inveſted, or ſuppoſed to be inveſted, with qualities hurtful to us. Too much care cannot be taken in preventing, or regulating, the *antipathies* of children; in familiariſing them with objects of every kind; in diſcovering to them, without emotion, ſuch as are dangerous; in teaching them the means of defence and ſecurity, or the methods of eſcaping their noxious influence; and, when the rational powers are matured by age, in reflecting on the nature of thoſe objects which we fear, in aſcertaining what has been told concerning their qualities, or in vigorouſly operating upon our own diſpoſitions to overcome thoſe vain repugnancies which we may feel. See Sympathy, which is the oppoſite of *Antipathy*.

Antipathy, in ethics, hatred, averſion, repugnancy. *Hatred* is entertained againſt perſons; *averſion*, and *antipathy*, indiſcriminately againſt perſons or things; and *repugnancy*, againſt actions alone.

Hatred is more voluntary than *averſion*, *antipathy*, or *repugnancy*. Theſe laſt have greater affinity with the animal conſtitution. The cauſes of antipathy are leſs known than thoſe of a *averſion*. *Repugnancy* is leſs permanent than either the one or the other.—We hate a vitious character, we feel *averſion* to its exertions: we are affected with antipathy for certain perſons at firſt ſight; there are ſome affairs which we tranſact with *repugnancy*—*Hatred* calumniates; *averſion* keeps us at a diſtance from certain perſons; antipathy makes us us deteſt them; *repugnancy* hinders us from imitating them.

ANTIPATRIS (Acts xxiii. 31.), a town of Paleſtine, anciently called *Caphar-Saba*, according to Joſephus, but named *Antipatris* by Herod the Great, in honour of his father Antipater. It was ſituated in a pleaſant valley, near the mountains, in the way from Jeruſalem to Cæſarea. Joſephus places it at about the diſtance of ſeventeen miles from Joppa.

ANTIPELARGIA, among the ancients, a law, whereby children are obliged to furniſh neceſſaries to their aged parents. The ciconia, or ſtork, is a bird famous for the care it takes of its parents when grown old. Hence, in ſome Latin writers, this is rendered *lex ciconiaria*, or the ſtorks law.

ANTIPHONARY, ANTIPHONARIUM, a ſervice-book which contained all the invitatories, reſponſories, collects, and whatever elſe was ſung or ſaid in the choir, except the leſſons. This is otherwiſe called *reſponſarium*, from the reſponces therein contained. The author of the Roman *antiphonary* was pope Gregory the Great. We alſo find mention of nocturnal and diurnal *antiphonaries*, for the uſe of the daily and nightly offices; ſummer and winter *antiphonaries*; alſo *antiphonaries* for country churches, &c. By the provincial conſtitutions of archbiſhop Winchelſey, made at Merton, A. D. 1305, it is required that one of theſe ſhould be found in every church within the province of Canterbury. The uſe of theſe, and many other popiſh books, were forbid by the 3d and 4th of Edward VI. c. 10.

ANTIPHONY, the anſwer made by one choir to another, when the pſalm or anthem is ſung between two.

ANTIPHONY, ſometimes denotes a ſpecies of pſalmody, wherein the congregation, being divided into two parts, repeat the pſalms, verſe for verſe, alternately. In this ſenſe, antiphony ſtands contradiſtinguiſhed from ſymphony, where the whole congregation ſings together.

Antiphony differs from reſponſorium, becauſe in this latter the verſe is only ſpoken by one perſon, whereas in the former, the verſes are ſung by the two choirs alternately. The original of Antiphonal ſinging in the weſtern churches is referred to the time of St Ambroſe, about the year 374. That father is ſaid to have firſt introduced it into the church of Milan, in imitation of the cuſtom of the eaſtern church, where it appears to be of greater antiquity, though as to the time of its inſtitution, authors are not agreed; it was moſt probably introduced at Antioch, between the year of Chriſt 347 and 356.

ANTIPHONY is alſo uſed to denote the words given out at the beginning of the pſalm, to which both the choirs are to accommodate their ſinging.

ANTIPHONY, in a more modern ſenſe, denotes a kind of compoſition made of ſeveral verſes extracted out of different pſalms, adapted to expreſs the myſtery ſolemnized on the occaſion.

ANTIPODES, in geography, a name given to thoſe inhabitants of the globe that live diametrically oppoſite to each other. The word is Greek, and compounded of αντι, *oppoſite*, and πος, *a foot*; becauſe their feet are oppoſite to each other.

The antipodes lie under oppoſite meridians and oppoſite parallels; in the ſame degree of latitude, but of oppoſite denominations, one being north and the other ſouth. They have nearly the ſame degree of heat and cold, days and nights of equal length, but in oppoſite ſeaſons. It is noon to one, when midnight to the other; and the longeſt day with the one, is the ſhorteſt with the other.

Plato is eſteemed the firſt who thought it poſſible that the antipodes ſubſiſted, and is looked upon as the inventor of the word. As this philoſopher apprehended the earth to be ſpherical, he had only one ſtep to make to conclude the exiſtence of the antipodes.

The ancients, in general, treated this opinion with the higheſt contempt; never being able to conceive how men and trees could ſubſiſt ſuſpended in the air with their feet upwards, for ſo they apprehended they muſt be in the other hemiſphere.

They never reflected that theſe terms *upwards* and *downwards* are merely relative; and ſignify only nearer to, or farther from, the centre of the earth, the common centre to which all heavy bodies gravitate; and that, therefore, our antipodes have not their feet upwards and head downwards any more than ourſelves; becauſe they, like us, have their feet nearer the centre of the earth, and their heads farther from it. To have the head downwards and feet upwards, is to place the body in a direction of gravity tending from the feet to the head: but this cannot be ſuppoſed with regard to the antipodes; for they, like us, tend toward the centre of the earth, in a direction from head to foot.

ANTIPOLIS (anc. geog.), now ANTIBES, on the coaſt of Provence, a colony of the Maſſilians, near the river Verus, in Gallia Narbonenſis (Livy), three leagues to the weſt of Nice. E. Long. 7° Lat. 43° 40′.

ANTIQUARE, among Roman lawers, properly denotes the rejecting of a new law, or refuſing to paſs it. In which ſenſe, *antiquating* differs from *abrogating*; as the latter imports the annulling an old law, the former the rejecting a new one.

ANTIQUARE is alſo uſed for a law's growing obſolete, or into diſuſe, either by age or non-obſervance.

ANTIQUARII, a name given to copies of old books. After the decline of learning amongſt the Romans, and when many religious houſes were erected, learning was chiefly in the hands of the clergy; the greateſt number of whom were regulars, and lived in monaſteries. In theſe houſes were many induſtrious men, who were continually employed in making new copies of old books, either for the uſe of the monaſtery or for their own emolument. Theſe writing monks were diſtinguiſhed by the name of *Antiquarii*. They deprived the poor librarii, or common ſcriptores, of great part of their buſineſs, ſo that theſe found it difficult to gain a ſubſiſtence for themſelves and families. This put them upon finding out more expeditious methods of tranſcribing books. They formed the letters ſmaller, and made uſe of more jugations and abbreviations than had been uſual. They proceeded in this manner till the letters became exceedingly ſmall; the abbreviations were very numerous, and extremely difficult to be read. This in ſome meaſure accounts for the great variety of hands in the ſpecies of writing called *Modern Gothic*. When a number of copies were to be made of the ſame work, it was uſual to employ ſeveral perſons at the ſame time in writing it; each perſon, except him who wrote the first skin, began where his fellow was to leave off.

ANTIQUARY, a person who studies and searches after monuments and remains of antiquity, as old medals, books, statues, sculptures, and inscriptions, and, in general all curious pieces that may afford any light into antiquity.

In the chief cities of Greece and Italy, there were persons of distinction called *antiquaries*, whose business it was to show strangers the antiquities of the place, to explain the ancient inscriptions, and to give them all the assistance they could in this way of learning.—Pausanias calls these antiquaries Εξηγηται. The Sicilians call them *mystogogi*.

There was an ancient college of antiquaries erected in Ireland by Ollamh Fodhla, 700 years before Christ, for composing a history of that country: And to this, say the Irish historians, it is owing that the history and antiquities of that kingdom may be traced back beyond those of most other nations.

There is a society of antiquaries in London, and another in Edinburgh, incorporated by the king's charter. See SOCIETY.

ANTIQUARY is also used by ancient writers for the keeper of the antiquarian or cabinet of antiquities. This officer is otherwise called *archæota*, or antiquary of a king, a prince, a state, or the like.

Henry VIII. gave John Leland the title of his *antiquary;* a title which, says the author of his life, no body ever enjoyed besides himself. But the restriction, we suppose, was only intended to be understood in respect of the kings of England. M. Schott, we find, had the title of *antiquary* to the king of Prussia; P. Pedruzzi, that of *antiquary* to the Duke of Parma; M. Galland resided some time in Turky under the title of *antiquary* of the king of France.—The university of Oxford have still their antiquary under the denomination of *custos archivorum*.—The kings of Sweden have been at great expences in order to illustrate the antiquity of their country, having established an academy of antiquaries with this single view.—The office of the ancient Irish antiquaries was to preserve the genealogies of the kings of Ireland, to correct the regal tables of succession, and deliver down the pedigree of every collateral branch of the royal family.

ANTIQUATED, something obsolete, out of date, or out of use.

ANTIQUE, in a general sense, something that is ancient: but the term is chiefly used by sculptors, painters, and architects, to denote such pieces of their different arts as were made by the ancient Greeks and Romans. Thus we say, an antique bust, an antique statue, &c.

ANTIQUE is sometimes contradistinguished from *ancient*, which signifies a less degree of antiquity. Thus, antique architecture is frequently distinguished from ancient architecture.

ANTIQUITIES, a term implying all testimonies, or authentic accounts, that have come down to us of ancient nations. Bacon calls antiquities *the wrecks of history*, or such particulars as industrious and learned persons have collected from genealogies, inscriptions, monuments, coins, names, etymologies, archives, instruments, fragments of history, &c.

Antiquities, from a very extensive science, including "an historical knowledge of the edifices, magistrates, offices, habiliments, manners, customs, ceremonies, worship, and other objects worthy of curiosity, of all the principal ancient nations of the earth."

This science is not a matter of mere curiosity, but is indispensible to the theologian; who ought to be thoroughly acquainted with the antiquities of the Jews, to enable him properly to explain numberless passages in the Old and New Testaments: to the lawyer, who, without the knowledge of the antiquities of Greece and Rome, can never well understand, and properly apply, the greatest part of the Roman laws: to the physician and the philosopher, that they may have a complete knowledge of the history and principles of the physic and philosophy of the ancients: to the critic, that he may be able to understand and interpret ancient authors: to the orator and poet, who will be thereby enabled to ornament their writings with numberless images, illusions, comparisons, &c.

Antiquities are divided into sacred and profane, into public and private, universal and particular, &c. It is true, that the antiquaries (especially such as are infected with a spirit of pedantry, and the number of these is great) frequently carry their inquiries too far, and employ themselves in laborious researches after learned trifles: but the abuse of a science ought never to make us neglect the applying it to rational and useful purposes.

Many antiquaries also restrain their learned labours to the ecclaircissement of the antiquities of Greece and Rome: but this field is far too confined, and by no means contains the whole of this science, seeing it properly includes the antiquities of the Jews, the Egyptians, Persians, Phœnicians, Carthaginians Hetruscans, Germans, and in general, all those principal nations mentioned in ancient history: so far as any accounts of them are come down to us.

If to the general subjects above mentioned we add the particular study of antiques, of the statues, bass-reliefs, and the precious relics of architecture, painting, camaieus, medals, &c. it is easy to conceive that antiquities form a science very extensive and very complicated, and with which only a very small acquaintance could have been attainable by any one man, if our predecessors had not prepared the way for us; if they had not left us such inestimable works as those of Gronovius, Grævius, Montfaucon, Count Caylus, Winckelman, the Hebraic antiquities of D. Iken of Bremen, the Grecian antiquities of Brunings, the Roman antiquities of Nieupoort, and especially that work which is intitled *Bibliographia Antiquaria Joh. Alberti Fabricii*, professor at Hamburg; &c. &c. Nor must we here forget that very valuable work, with which Mr Robert Wood has lately enriched this science, and which is so well known, and so justly esteemed by all true connoisseurs, under the title of the *Ruins of Palmyra* and those of *Balbeck*. It is by this work that we are fully convinced of the grandeur and magnificence, the taste and elegance, of the buildings of the ancients. We here see that the invention of these matters is not all owing to the Greeks, but that there were other nations who served them as models. For, though many of the edifices of Palmyra are to be attributed to the emperor Aurelian, and to Odenatus and his wife Zenobia, who reigned there about the year 264, 264, yet there are found, at the same place, ruins of buildings, that appear to be of far greater antiquity, and that are not less beautiful. The ancient Persepolis is sufficient to prove this assertion. When we duly reflect on all these matters, and especially if we attempt to acquire any knowledge of this science, we shall soon be convinced that it but ill becomes a petit-maitre to laugh at a learned antiquary.

The knowledge of those monuments of the ancients, the works of sculpture, statuary, graving, painting, &c. which they call *antiques*, requires a strict attention, with regard to the matter itself on which the art has been exercised; as the wax, clay, wood, ivory, stones of every kind, marble, flint, bronze, and every sort of metal. We should begin by learning on what matter each ancient nation principally worked, and in which of the fine arts they excelled. For the matter itself, as the different sorts of marble, compositions of metals, and the species of precious stones, serve frequently to characterize the true antique, and to discover the counterfeit. The connoisseurs pretend also to know, by certain distinct characters in the design and execution of a work of art, the age and nation where it was made. They find, moreover, in the invention and execution, a degree of excellence, which modern artists are not able to imitate. Now, though we ought to allow, in general, the great merit of the ancients in the polite arts, we should not, however, suffer our admiration to lead us into a blind superstition. There are pieces of antiquity of every sort, which have come down to us; some that are perfectly excellent; and others so wretched, that the meanest among modern artists would not acknowledge them. The mixture of the good and bad has taken place in all subjects, at all times, and in all nations. The misfortune is, that most of our great antiquaries have been so little skilled in designing, as scarcely to know how to draw a circle with a pair of compasses. It is prejudice, therefore, which frequently directs them to give the palm to the ancients, rather than a judgment directed by a knowledge of the art. That character of expression, which they find so marvellous in the works of antiquity, is often nothing more than a mere chimera. They pretend that the artists of our days constantly exaggerate their expressions; that a modern Bacchus has the appearance of a man distracted with intoxication; that a Mercury seems to be animated with the spirit of a fury; and so of the rest. But let them not decide too hastily. Almost all the antique figures are totally void of all spirit of expression; we are forced to guess at their characters. Every artificial expression requires, moreover, to be somewhat exaggerated. A statue or portrait is an inanimate figure; and must therefore have a very different effect from one which, being endowed with life, has the muscles constantly in play, and where the continual change of the features, the motion of the eyes, and the looks, more or less lively, easily and clearly express the passions and sentiments. Whereas in a figure that is the produce of art, the delicate touches, that should express the passions, are lost to the eyes of the spectators: they must therefore be struck by strong, bold characters, which can affect them at the first glance of the eye. A very moderate artist is sensible, at the same time, that he is not to give his figures extravagant expressions, nor to place them in distorted attitudes.

ANTIQUITY signifies times or ages past long ago. Thus, we say, the heroes of antiquity, &c.

ANTIQUITY is also used to denote the works or monuments of antiquity. See ANTIQUITIES.

ANTIQUITY likewise expresses the great age of a thing; and in this sense we say the antiquity of a family, the antiquity of a kingdom.

ANTIRRHINUM, SNAP-DRAGON, or CALVES-SNOUT: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personatæ*. The essential characters are these: The calyx consists of five leaves; the basis of the corolla is bent backwards, and furnished with pectoria; the capsule is bilocular. There are 14 species of the antirrhinum, 10 of which are natives of Britain, viz. the cymbalaria, or ivy-leaved toad-grass; the elatine, or sharp-pointed fluellin; the spurium or round-leaved fluellin; the arvense, or corn-blue toad-flax; the repens, or creeping toad-flax; the monospermum, or sweet-smelling toad-flax; the linaria, ar common yellow-toad-flax; the minus, or less toad-flax: the majus, or greater snap-dragon; and the orontium, or least snap-dragon. The linaria is said to be cathartic and diuretic; but it is not used in the shops.

ANTIRRHIUM (anc. geog.), a promontory at the mouth of the Corinthian bay, where it is scarce a mile broad, and where it separates the Ætolians from the Peloponnesus; so called from its opposite situation to Rhium in Peloponnesus, (Pliny): both are now called the *Dardanelles* of *Lepanto*.

ANTISABBATARIANS, a modern religious sect, who oppose the observance of the Christian sabbath. The great principle of the Antisabbatarians is, that the Jewish sabbath was only of ceremonial, not moral obligation; and consequently is abolished by the coming of Christ.

ANTISAGOGE, in rhetoric, a figure differing little from that called *concession*. The following passage from Cicero is an instance of it: *Difficilis ratio belli gerendi; at plena Fidei, plena pietatis: & si dicas, magnus labor, multa pericula proponuntur; at gloria ex his immortalis est consecutura*. See CONCESSION.

ANTISCII, in geography, people who live on different sides of the equator, whose shadows at noon are projected opposite ways. Thus the people of the north are Antiscii to those of the south; the one projecting their shadows at noon towards the north pole, and the other toward the south pole.

ANTISCORBUTICS, medicines good in scorbutic cases.

ANTISEPTICS (from αντι and σηπτος *putrid*, of σηπω, *to putrify*), an appellation given to such substances as resist putrefaction.

We have some curious experiments in relation to antiseptic substances by Dr Pringle, who has ascertained their several virtues. Thus in order to settle the antiseptic virtue of salts, he compared it with that of common sea-salt; which being one of the weakest, he supposes equal to unity, and expresses the proportional strength of the rest by higher numbers, as in the following table.

Salts, their antiseptic virtue.

Sea-salt -	1	Saline mixture -	3
Sal gemma -	1+	Nitre - -	4+
Tartar vitriolated	2	Salt of hartshorn	4+
Spiritus Mindereri	2	Salt of wormwood	4+
Tartarus solubilis	2	*Borax* - -	12+
Sal diureticus -	2+	Salt of amber -	20+
Crude *sal ammoniac*	3	Alum - -	30+

In this table the proportions are marked in integral numbers: only to some there is added the sign +, to show, that those salts are possessed of a stronger antiseptic virtue than the number in the table expresses, by some fractions; unless in the three last, where the same sign imports, that the salt may be stronger by some units.

Some resinous and other substances even exceed the antiseptic virtues of the neutral salts; thus myrrh, asafætida, terra japonica, and aloes, are at least twelve times more antiseptic than sea-salt. Two grains of camphor is equivalent to sixty grains of that salt. An infusion of a few grains of Virginian snake-root, in powder, exceeds twelve times its weight of sea-salt. Comomile flowers have nearly the same extraordinary quality. The Jesuits bark has it also. Besides these, pepper, ginger, saffron, contrayerva-root, are twelve times more antiseptic than sea-salt. Dried sage, rhubarb, the root of the wild valerian, mint, angelica, ground ivy, senna, green tea, red roses, wormwood, mustard, and horse-radish, were likewise found more antiseptic than the standard.

To the class of antiseptic medicines may likewise be added fermented liquors, acids, spirits, and even those plants called *anti-acids*, and erroneously supposed hasteners of putrefaction, particularly horse-radish. Now vegetables, possessing this virtue, are the more valuable, in that being usually free of acrimony, they may be taken in much greater quantities than either spirits, acids, resins, or even the neutral salts.

Antiseptics are prescribed in all putrid, malignant, and pestilential cases. It is to be remarked, however, that different kinds of them are to be given in different diseases, and even in different stages of the same disease. Thus, the bark is a specific in a gangrene, when the vessels are relaxed, and the blood resolved or disposed to putrefaction; but will fail, if the vessel are too full, or the blood be too thick. With the same caution is the bark to be used in wounds, viz. chiefly in cases of absorbed matter, when it infects the humours, and brings on a hectic fever.

By the great antiseptic virtue of alum, the bark, and other astringents, it should seem, that astriction had no small share in the cure of putrid disorders; and, indeed, the very nature of putrefaction consists in a separation or disunion of the parts. But as astringents are improper to be administered in many cases, contrayerva-root, snake-root, camphor, &c. may supply their place; which, though, highly antiseptic, have very little, if any, of an astringent quality.

ANTISPASMODICS, are medicines proper for the cure of spasms and convulsions. Opium, balsam of Peru, and the essential oils of many vegetables, are the principal in this class of medicines. Opium excels, for its immediate effects. Peruvian balsam, in many instances, produces more lasting benefit than opium, and sometimes succeeds where opium fails. As antispasmodics, the essential oils differ in this from opium, that they act more on a particular part than on the system in general, and have no soporific effect. Some medicines remove spasms by immediate contact, as asses milk, cream, oil of almonds; others by repelling heat, as gas, sulphur, nitre, sal ammoniac, &c. And where the strictures are produced by inanition and a defect of vital heat, spasms are removed by those medicines that restore the *vis vitæ*, such as valerian, castor, musk, &c.

ANTISTASIS, in oratory, a defence of an action from the consideration that had it been omitted worse would have ensued. This is called by Latin writers *comparativum argumentum*; such, *e. gr.* would be the general's defence who had made an inglorious capitulation, That without it, the whole army must have perished.

ANTISTHENES, a Greek philosopher, and founder of the Cynics. He was born at Athens, and passed the former part of his life as a soldier. Having afterwards been an attendant at the lectures of Socrates, he was principally charmed with those exhortations of that great philosopher, which persuaded to frugality, to temperance, and to moderation: these Antisthenes was resolved to practise by carrying every precept to its utmost extent. Permitting therefore his beard to grow, he went about the streets in a thread-bare coat, scarcely to be distinguished from a common beggar. He prided himself upon the most rigid virtue, and thought himself obliged to attack the vicious wherever he found them. This gave him some reputation in the city; but it may be supposed, that, in a place so very luxurious as Athens, he had more enemies than disciples. His philosophy consisted rather in action than speculation: it was therefore his constant maxim, That to be virtuous was to be happy, and that all virtue consisted in action; that the wise man should live for himself, contented in all situations, and happy alone in the consciousness of his own virtue. He acknowledged nothing to be good but was was honourable; and asserted, that virtue might be acquired by practice. Laertius tells us there were 10 tomes of his works; and he has given us many of his apophthegms.

ANTISTOECHON, in grammar, the using one letter instead of another; as *olli* for *illi*.

ANTISTROPHE, in grammar, a figure by which two things mutually depending on one another, are reciprocally converted; as, *the servant of the master, the master of the servant.*

ANTISTROPHE, among lyric poets, that part of a song and dance in use among the ancients, which was performed before the altar, in returning from west to east in opposition to strophe. See STROPHE and ODE.

ANTITACTÆ, in church history, a branch of Gnostics, who held, that God was good and just, but that a creature had created evil; and consequently that it is our duty to oppose this author of evil, in order to avenge God of his adversary.

ANTITHENAR, in anotomy, a name given to the adductor incicis. See ANATOMY, *Table of the Muscles*.

ANTITHESIS, in rhetoric, a contrast or opposition of words or setiments. Such is that of Cicero, in the second Catilinarian: "On one side stands modesty, on the other impudence; on one fidelity, on the other deceit; here piety, there sacrilege; here continency, there lust, &c." Such also is that of Augustus to some seditious young men: *Audite, juvenes, senem, quem juvenem senes audivere*. Such again is that of Seneca; *Curæ leves loquuntur, ingentes stupent*. And that of Virgil:

Flectere si nequeo superos, Acheronta movebo.

St Augustine, Seneca, Salvian, and many other ancient writers, seem greatly to affect antithesis; but among the moderns they are generally decried. Desmaretz represents them as the favourites of young writers. The following is an example of modern antithesis:

——Though gentle, yet not dull;
Strong, without rage; without o'erflowing, full.

Antithesis is sometimes used for controversy. In this sense, we meet with *antithetic* method, *antithetic* discourses, &c. Marcion composed a volume of Antitheses, or contrarieties and oppositions between the law and the gospel.

ANTITRAGUS musculus, in anatomy, a muscle of the ear. See Anatomy, *Table of the Muscles*.

ANTITRINITARIANS, those who deny the Trinity, and teach that there are not three persons in the Godhead. Thus in the Samosatenians, who do not believe the distinction of persons in God; the Arians, who deny the divinity of the Word; and the Macedonians, who deny that of the Holy Spirit, are all properly Antitrinitarians. Among the moderns, Antitrinitarians are particularly understood of Socinians, called also Unitarians.

The *Bibliotheca Antitrinitariorum*, or *Antitrinitarian Library*, is a posthumous work of Christopher Sandius, an eminent Antitrinitarian; wherein he gives a list, digested in order of time, of all the Socinian or modern Antitrinitarian authors, with a brief account of their lives, and a catalogue of their works. See Unitarian.

ANTITYPE, a Greek word, properly signifying a type or figure correspondent to some other type.

The word antitype occurs twice in the New Testament; viz. in the Epistle to the Hebrews, ix. 24. and in St Peter, 1 Ep. iii. 21. where its genuine import has been much controverted. The former says, that "Christ is not entered into the holy places made with hands, which are *αντιτυπα*, the figures or antitypes of the true—now to appear in the presence of God for us." Now *τυπος*, signifies the pattern by which another thing is made; and as Moses was obliged to make the tabernacle, and all things in it, according to the pattern showed him in the mount; the tabernacle so formed was the antitype of what was shown to Moses: any thing, therefore, formed according to a model or pattern, is an antitype. In the latter passage, the Apostle, speaking of Noah's flood, and the deliverance only of eight persons in the ark from it, says, *Ω και ημας αντιτυπον νυν σωζει βαπτισμα*, *baptism, being an antitype to that, now saves us; not putting away the filth of the flesh, but the answer of a good conscience towards God, &c.* The meaning is, that righteousness, or the answer of a good conscience towards God, now saves us by means of the resurrection of Christ, as formerly righteousness saved those eight persons by means of the ark, during the flood. The word antitype, therefore, here signifies a general similitude of circumstances; and the particle *ω*, *whereunto*, refers, not to the immediate antecedent, *υδατος*, *water*, but to all that precedes.

Antitype, among the ancient Greek fathers, and in the Greek liturgy, is also applied to the symbols of bread and wine in the Sacrament. Hence it hath been argued, by many Protestants, that the Greeks do not really believe the doctrine of transubstantiation; because they call the bread and wine *antitypes*, *αντιτυπα*, q. d. figures, similitudes; and this even after the consecration.

ANTIUM, (anc. geog.) a city of the Volsci, (Livy); situated on the Tuscan sea, yet without a harbour, because they had a neighbouring hamlet, called *Ceno*, with a harbour, (Strabo). The Romans gained the first reputation in naval affairs against the Antiates; part of whose ships they conveyed into the arsenal of Rome, and part they burnt; and with their beaks or rostra adorned the pulpit erected in the Forum, thence called *Rostra*, (Livy, Florus). Here stood a famous temple of Fortune, (Horace). Addison says, there were two Fortunæ worshipped at Antium.—It is now extinct, but the name still remains in the *Capo de' Anzo*.

ANTIVARI, a strong town of Turky, in Europe, in Dalmatia, a Greek archbishop's see, and subject to the Turks. E. Lon. 29. 15. N. Lat. 43. 0.

ANTLER, among sportsmen, a start or branch of a deer's attire.

Brow-Antler, denotes the branch next the head; and,

Bes-Antler, the branch next above the brow-antler.

ANTLIA, an ancient machine, supposed to be the same with our pump. Hence the phrase, *in antliam condemnari*, according to the critics, denotes a kind of punishment, whereby criminals were condemned to drain ponds, ditches, or the like.

ANTOEICI, in geography, those inhabitants of the earth who live under the same meridian, and at the same distance from the equator; the one toward the north, and the other toward the south. Hence they have the same longitude; and their latitude is also the same, but of a different denomination. They are in the same semicircle of the meridian, but opposite in parallels. They have precisely the same hours of the day and night, but opposite seasons; and the night of the one is always equal to the day of the other.

ANTOINE, a town of France, in Dauphiny, in the diocese of Vienne, with a celebrated abbey. It is seated among the mountains, 13 miles east of Lyons. E. Lon. 5. 20. N. Lat. 45. 43.

ANTONA, (Tacitus); a river of Britain, which Camden supposes to be a faulty reading for Avuona or Aufona, (the Avon).

ANTONACUM, Antonnacum, or Antunnacum, a town of the Treveri; now *Andernach* below Coblentz. E. Lon. 7° 5′. Lat. 50° 25′.

ANTONIA, a citadel of Jerusalem, the origin of which we have in Josephus; who says, that Hyrcanus, the first high-priest of that name, built Baris near the temple, a house with turrets, where he generally resided fided. Herod afterwards made it ftronger, for the fecurity and defence of the temple; and in honour of Marc Anthony, who then commanded in the eaft, called it *Antonia*. It was very extenfive, and could accommodate a Roman legion: from it there was a full view of the temple.

ANTONIA (St), a town of France, in Rouergue, in the diocefe of Rhodez, whofe fortifications are demolifhed. It is feated on the river Aveirou. E. Lon. 0. 55. N. Lat. 44. 10.

ANTONIAN WATERS, medical waters of Germany, very pleafant to the tafte, and efteemed good in many chronic and hypochondriac cafes. See TONSTEIN.

ANTONIANO (Silvio), a man of great learning, who raifed himfelf from a low condition by his merit, was born at Rome in the year 1540. When he was but ten years old, he could make verfes upon any fubject propofed to him; and thefe fo excellent, though pronounced extempore, that even a man of genius could not compofe the like without a good deal of time and pains. The Duke de Ferrara coming to Rome, to congratulate Marcellus II. upon his being raifed to the pontificate, was fo charmed with the genius of Antoniano, that he carried him to Ferrara, where he provided able mafters to inftruct him in all the fciences. From thence he was fent for by Pius IV. who made him profeffor of the belles lettres in the college at Rome. Antoniano filled this place with fo much reputation, that, on the day when he began to explain the oration *pro Marco Marcello*, he had a vaft crowd of auditors, and among thefe no lefs than 25 cardinals. He was afterwards chofen rector of the college; and after the death of Pius IV. being feized with a fpirit of devotion, he joined himfelf to Philip Neri, and accepted the office of fecretary to the facred college, offered him by Pius V. which he executed for 25 years with the reputation of an honeft and able man. He refufed a bifhopric which Gregory XIV. would have given him; but he accepted the office of fecretary to the briefs, offered him by Clement VIII. who made him his chamberlain, and afterwards a cardinal. Antoniano killed himfelf by too great fatigue: for he fpent whole nights in writing letters; which brought on a ficknefs, whereof he died, in the 63d year of his age. He wrote with fuch eafe and fluency, that he never almoft made any blot or rafure; and it is faid of him, that he preferved the flower of his virginity during his whole life.

ANTONIDES VANDER GOES (John), an eminent Dutch poet, born at Goes in Zealand, the 3d of April 1647. His parents were Anabaptifts, people of good character, but of low circumftances. They went to live at Amfterdam when Antonides was about four years old; and, in the ninth year of his age, he began his ftudies, under the direction of Hadrian Junius and James Cocceius. Antonides took great pleafure in reading the Latin poets, and carefully compared them with Grotius, Heinfius, &c. By this means he acquired a tafte for poetry, and enriched his mind with noble ideas. He firft attempted to tranflate fome pieces of Ovid, Horace, and other ancients; and, having formed his tafte on thefe excellent models, he at length undertook one of the moft difficult tafks in poetry, to write a tragedy: this was intitled *Trazil*, or *The invafion of China*. Antonides, however, was fo modeft, as not to permit it to be publifhed. Vondel, who was then engaged in a dramatic piece, which was taken alfo from fome event that happened in China, read Antonides's tragedy; and was fo well pleafed with it, that he declared, if the author would not print it, he fhould take fome paffages out of it, and make ufe of them in his own tragedy. He accordingly did fo; and it was reckoned much to the honour of Antonides, to have written what might be adopted by fo great a poet as Vondel was acknowledged to be by all good judges. Upon the conclufion of the peace between Great Britain and Holland, in the year 1697, Antonides wrote a piece intitled *Bellona aan band*, i. e. "Bellona chained; a very elegant poem, confifting of feveral hundred verfes. He next wrote an ingenious heroic poem, which he intitled, *The River Y*. (the river on which Amfterdam is built).

Antonides's parents had bred him up an apothecary: but his remarkable genius for poetry foon gained him the efteem and friendfhip of feveral perfons of diftinction; and particularly of Mr Buifero, one of the lords of the admiralty at Amfterdam, and a great lover of poetry, who fent him at his expence to purfue his ftudies at Leyden, where he remained till he took his degree of doctor of phyfic, and then his patron gave him a place in the admiralty. In 1678, Antonides married Sufanna Bermans, a minifter's daughter, who had alfo a talent for poetry. His marriage was celebrated by feveral eminent poets, particularly by the famous Peter Francius, profeffor of eloquence, who compofed fome Latin verfes on the occafion. After marriage, he did not much indulge his poetic genius; and within a few years he fell into a confumption, of which he died on the 18th September 1684, being then but thirty-feven years and a few months old. He is efteemed the moft eminent Dutch poet after Vondel. His works have been printed feveral times, having been collected by father Anthony Tanfz. The laft edition was printed by Nicholas Ten Hoom, at Amfterdam, in the year 1714, in 4to, under the direction of David Van Hoogftraaten, one of the mafters of the Latin fchool of that city, who added to it alfo the life of the poet.

ANTONINUS PIUS, the Roman emperor, was born at Lanuvium in Italy, A. C. 86, of a family originally from Nifmes in Languedoc. His character was in all refpects one of the nobleft that can be imagined; and he had the title of *Pius* given him by the fenate. We have no regular account of the tranfactions of his reign, fince Capitolinus has written in a very confufed manner; and we have only an abridgment of Dion Caffius's hiftory by Xiphilin now remaining. He managed the public revenues with great frugality, yet was extremely generous; was fond of peace, and in war preferred the reputation of juftice to all the advantages which might be gained by victory. He was more intent upon preferving the bounds of his empire than extending them; and he often made ufe of Scipio's expreffion, That he chofe rather to fave one citizen than kill a thoufand enemies. By this conduct he made himfelf univerfally efteemed and revered in that age, and admired by pofterity. This great and good emperor died in 161, aged 75 years, having reigned 23.

ANTONINUS PHILOSOPHUS (Marcus Aurelius), the Roman emperor, born at Rome, the 26th of April, in the 121ft year of the Chriftian æra. He was called by feveral names till he was admitted into the Aurelian

lian family, when he took that of Marcus Aurelius Antoninus. Hadrian, upon the death of Cejonius Commodus, turned his eyes upon Marcus Aurelius; but, as he was not then 18 years of age, and consequently too young for so important a station, he fixed upon Antoninus Pius, whom he adopted, upon condition that he should likewise adopt Marcus Aurelius. The year after this adoption, Hadrian appointed him quæstor, though he had not yet attained the age prescribed by the laws. After the death of Hadrian, Aurelius married Faustina, the daughter of Antoninus Pius, by whom he had several children. In the year 139, he was invested with new honours by the emperor Pius, in which he behaved in such a manner as endeared him to that prince and the whole people.

Upon the death of Pius, which happened in the year 161, he was obliged by the senate to take upon him the government; in the management of which he took Lucius Verus as his colleague. Dion Cassius says, that the reason of doing this was, that he might have leisure to pursue his studies, and on account of his ill state of health; Lucius being of a strong vigorous constitution, and consequently more fit for the fatigues of war. The same day he took upon him the name of Antoninus, which he gave likewise to Verus his colleague, and betrothed his daughter Lucilla to him. The two emperors went afterwards to the camp; where, after having performed the funeral rites of Pius, they pronounced each of them a panegyric to his memory. They discharged the government in a very amicable manner. It is said that, soon after Antoninus had performed the apotheosis of Pius, petitions were presented to him by the pagan priests, philosophers, and governors of provinces, in order to excite him to persecute the Christians; which he rejected with indignation, and interposed his authority for their protection, by writing a letter to the common assembly of Asia, then held at Ephesus (A). The happiness which the empire began to enjoy under these two emperors was interrupted, in the year 162, by a dreadful inundation of the Tiber, which destroyed a vast number of cattle, and occasioned a famine at Rome. This calamity was followed by the Parthian war; and at the same time the Catti ravaged Germany and Rhætia. Lucius Verus went in person to oppose the Parthians; and Antoninus continued at Rome, where his presence was necessary.

During this war with the Parthians, about the year 163 or 164, Antoninus sent his daughter Lucilla to Verus, she having been betrothed to him in marriage, and attended her as far as Brundusium: he intended to have conducted her to Syria; but it having been insinuated by some persons, that his design of going into the east was to claim the honour of having finished the Parthian war, he returned to Rome. The Romans having gained a victory over the Parthians, who were obliged to abandon Mesopotamia, the two emperors triumphed over them at Rome in the year 166; and were honoured with the title of *Fathers of their country*. This year was fatal, on account of a terrible pestilence which spread itself over the whole world, and a famine under which Rome laboured: it was likewise in this year that the Marcomanni, and many other people of Germany, took up arms against the Romans; but the two emperors havidg marched in person against them, obliged the Germans to sue for peace. The war, however, was renewed the year following, and the two emperors marched again in person; but Lucius Verus was seized with an apoplectic fit, and died at Altinum. The Romans were now defeated with great slaughter; and the emperor, not choosing to burden his subjects with new taxes, exposed to public sale the furniture of the palace, the gold and silver plate belonging to the crown, and his wife's rich garments embroidered with gold, and a curious collection of pearls, which Adrian had purchased during his long progress thro' the provinces of the empire, and was called *Adrian's cabinet*.

In the year 170, Antoninus made vast preparations against the Germans, and carried on the war with great vigour. During this war, in 174, a very extraordinary event is said to have happened, which, according to Dion Cassius, was as follows: Antoninus's army being blocked up by the Quadi, in a very disadvantageous place, where there was no possibility of procuring water; in this situation, being worn out with fatigue and wounds, oppressed with heat and thirst, and incapable of retiring or engaging the enemy, in an instant the sky was covered with clouds, and there fell a vast quantity of rain: the Roman army were about to quench their thirst, when the enemy came upon them with such fury, that they must certainly have been defeated, had it not been for a shower of hail, accompanied with a storm of thunder and lightning, which fell upon the enemy, without the least annoyance to the Romans, who by this means gained the victory (B). In 175, Antoninus made a treaty with several nations of Germany. Soon after, Avidius Cassius, governor of Syria, revolted from the emperor: this insurrection, however, was put an end to by the death of Cassius, who was killed by a centurion named *Anthony*. Antoninus behaved with great lenity towards those who had been engaged in Cassius's party:

(A) Eusebius has preserved this letter, Hist. Eccles. lib. iv. cap. 13. but he falsely ascribes it to Antoninus Pius, whereas it was wrote by Marcus Antoninus, as Valerius makes it appear in his annotations on Eusebius.

(B) The pagans as well as Christians, according to Mr. Tillemont (p. 621. art. xvi.), have acknowledged the truth of this prodigy, but have greatly differed as to the cause of such a miraculous event; the former ascribing it, some to one magician and some to another: In Antoninus's Pillar, the glory is ascribed to Jupiter the god of rain and thunder. But the Christians affirmed, that God granted this favour at the prayer of the Christian soldiers in the Roman army, who are said to have composed the twelfth or Melitene legion; and, as a mark of distinction, we are told that they received the title of the *Thundering Legion*, from Antoninus (Euseb. Eccles. Hist. lib. v. cap. 5). Mr Moyle, in the letters published in the second volume of his works, has endeavoured to explode this story of the Thundering Legion; which occasioned Mr Whiston to publish an answer, in 1726, intitled, *Of the Thundering Legion; or, Of the miraculous deliverance of Marcus Antoninus, and his army, upon the prayers of the Christians.*

 ty: he would not put to death, nor imprison, nor even sit in judgment himself upon any of the senators engaged in this revolt; but he referred them to the senate, fixing a day for their appearance, as if it had been only a civil affair. He wrote also to the senate, desiring them to act with indulgence rather than severity; not to shed the blood of any senator or person of quality, or of any other person whatsoever, but to allow this honour to his reign, that, even under the misfortune of a rebellion, none had lost their lives, except in the first heat of the tumult. In 176, Antoninus visited Syria and Egypt: the kings of those countries, and ambassadors also from Parthia, came to visit him. He staid several days at Smyrna; and, after he had settled the affairs of the east, went to Athens, on which city he conferred several honours, and appointed public professors there. From thence he returned to Rome with his son Commodus, whom he chose consul for the year following, though he was then but 16 years of age, having obtained a dispensation for that purpose. On the 27th of September, the same year, he gave him the title of *Imperator;* and on the 23d of December, he entered Rome in triumph, with Commodus, on account of the victories gained over the Germans. Dion Cassius tells us, that he remitted all the debts which were due to himself and the public treasury during 46 years, from the time that Hadrian had granted the same favour, and burnt all the writings relating to those debts. He applied himself likewise to correct many enormities, and introduced several excellent regulations. In the year 179, he left Rome with his son Commodus, in order to go against the Marcomanni, and other barbarous nations; and the year following gained a considerable victory over them, and would, in all probability, have entirely subdued them in a very short time, had he not been taken with an illness, which carried him off on the 17th of March 180, in the 59th year of his age, and 19th of his reign. The whole empire regretted the loss of so valuable a prince, and paid the greatest regard to his memory: he was ranked amongst the gods, and almost every person had a statue of him in their houses. His book of Meditations has been much admired by the best judges.

ANTONINE's Column. See COLUMN.

ANTONINUS's Wall, the name of the third rampart or defence that had been built or repaired by the Romans against the incursions of the North Britons. It is called by the people in the neighbourhood, *Graham's Dyke;* from the notion that one Graham, or Grimus, first made a breach in it after the retreat of the Romans out of Britain. The first barrier erected by the Romans was the chain of forts made by Agricola* from the frith of Forth to that of Clyde, in the year 81, to protect his conquests from the inroads of the Caledonians. The second was the vallum, or dyke, flung up by Adrian † in the year 121. It terminated on the western side of the kingdom, at *Axelodunum,* or *Brugh,* on the Solway sands; and was supposed to have reached no further than *Pons Ælii,* or *Newcastle,* on the eastern. But from an inscription lately discovered, it appears to have extended as far as the wall of Severus.‡ This rampart of Adrian's was situated much further south than Agricola's chain; the country to the north having been either, according to some authors, recovered by the native Britons after the departure of Agricola; or, according to others, voluntarily slighted by Adrian. However, this work of Adrian's did not long continue to be the extreme boundary of the Roman territories to the north in Britain. For Antoninus Pius, the adopted son and immediate successor of Adrian, having, by his lieutenant Lollius Urbicus, recovered the country once conquered by Agricola, commanded another rampart to be erected between the friths of Forth and Clyde, in the tract where Agricola had formerly built his chain of forts. The great number of inscriptions which have been found in or near the ruins of this wall, or rampart to the honour of Antoninus Pius, leave us no room to doubt its having been built by his direction and command. If the fragment of a Roman pillar with an inscription, now in the college library of Edinburgh, belonged to this work, as it is generally supposed to have done, it fixes the date of its execution to the third consulship of Antoninus, which was A. D. 140, only 20 years after that of Adrian, of which this seems to have been an imitation. This wall or rampart, as some imagine, reached from Caer-ridden on the frith of Forth to Old Kirkpatrick on the Clyde; or, as others think, from Kinniel on the east to Dunglass on the west. These different suppositions hardly make a mile of difference in the length of this work, which, from several actual mensurations, appears to have been 37 English or 40 Roman miles. Capitolinus, in his life of Antoninus Pius, directly affirms, that the wall which that emperor built in Britain was of turf. This in the main is unquestionably true; though it is evident (from the vestiges of it still remaining, which not very many years ago were dug up and examined for near a mile together) that the foundation was of stone. Mr Camden also tells us, from the papers of one Mr Anthony Pont, that the principal rampart was faced with square stone, to prevent the earth from falling into the ditch. The chief parts of this work were as follows: 1. A broad and deep ditch, whose dimensions cannot now be discovered with certainty and exactness, tho' Mr Pont says it was 12 feet wide. 2. The principal wall or rampart was about 12 feet thick at the foundation, but its original height cannot now be determined. This wall was situated on the south brink of the ditch. 3. A military way on the south side of the principal wall, well paved, and raised a little above the level of the ground. This work, as well as that of Adrian, was defended by garrisons placed in forts and stations along the line of it. The number of these forts or stations, whose vestiges were visible in Mr Pont's time, were 18, situated at about the distance of two miles from each other. In the intervals between the forts, there were turrets or watch-towers. But the number of these, and their distance from each other, cannot now be discovered.

* See *Agricola.*

† See *Adrian.*

‡ See *Severus.*

It is not a little surprising, that though it is now more than 1600 years since this work was finished, and more than 1300 since it was slighted, we can yet discover, from authentic monuments, which are still remaining, by what particular bodies of Roman troops almost every part of it was executed. This discovery is made from inscriptions upon stones, which were originally built into the face of the wall, and have been found in or near its ruins, and are carefully preserved. The number of stones with inscriptions of this kind now extant, is 11: of which six may be seen at one view in in the college of Glaſgow, one in the college of Aberdeen, one in the college of Edinburgh, one in the collection of Baron Clerk, one at Cochnoch-houſe, and one at Calder-houſe. From theſe inſcriptions it appears in general, that this great work was executed by the ſecond legion, the vexillations of the ſixth legion and of the twentieth legion, and one cohort of auxiliaries. If theſe corps were all complete, they would make in all a body of 7800 men. Some of theſe inſcriptions have ſuffered greatly by the injuries of time and other accidents; ſo that we cannot diſcover from them with abſolute certainty, how many paces of this work were executed by each of theſe bodies of troops. The ſum of the certain and probable information contained in theſe inſcriptions, as it is collected by the learned and illuſtrious Mr Horſley, ſtands thus:

	Paces.
The ſecond legion built - -	11,603
The vexillation of the ſixth legion -	7,411
The vexillation of the twentieth legion -	7,801
All certain - -	26,815
The vexillation of the twentieth legion, the monuments certain, and the number probable	3,411
The ſame vexillation, on a plain monument, no number viſible, ſuppoſed - -	3,500
The ſixth legion, a monument, but no number, ſuppoſed - - -	3,000
Cohors prima Cugernorum - -	3,000
Total	39,726

or 39 miles 726 paces, nearly the whole length of the wall. It would have been both uſeful and agreeable to have known how long time theſe troops were employed in the execution of this great work. But of this we have no information. Neither do we know what particular bodies of troops were in garriſon in the ſeveral forts and ſtations along the line of this wall, becauſe theſe garriſons were withdrawn before the *Notitia Imperii* was written.

Though we cannot diſcover exactly how many years this wall of the emperor Antoninus continued to be the boundary of the Roman territories in Britain, yet we know with certainty that it was not very long. For we are told by an author of undoubted credit, that, in the reign of Commodus, A. D. 180, "he had wars with ſeveral foreign nations, but none ſo dangerous as that of Britain. For the people of the iſland, having paſſed the wall which divided them from the Romans, attacked them, and cut them in pieces."

Dio. l. 72. p. 820.

ANTONIO (Nicholas), knight of the order of St James and canon of Seville, did great honour to the Spaniſh nation by his Bibliotheque of their writers. He was born at Seville in 1617, being the ſon of a gentleman whom king Philip IV. made preſident of the admiralty eſtabliſhed in that city in 1626. After having gone through a courſe of philoſophy and divinity in his own country, he went to ſtudy law at Salamanca; where he cloſely attended the lectures of Franciſco Ramos del Manzano, afterwards counſellor to the king and preceptor to Charles II. Upon his return to Seville, after he had finiſhed his law-ſtudies at Salamanca, he ſhut himſelf up in the royal monaſtery of Benedictines, where he employed himſelf ſeveral years in writing his *Bibliotheca Hiſpanica*, having the uſe of the books of Bennet de la Sana abbot of that monaſtery and dean of the faculty of divinity at Salamanca. In the year 1659, he was ſent to Rome by king Philip IV. in the character of agent-general from this prince: he had alſo particular commiſſions from the inquiſition of Spain, the viceroys of Naples and Sicily, and the governor of Milan, to negociate their affairs at Rome. The cardinal of Arragon procured him, from Pope Alexander VII. a canonry in the church of Seville, the income whereof he employed in charity and purchaſing of books: he had above 30,000 volumes in his library. By this help, joined to continual labour and indefatigable application, he was at laſt enabled to finiſh his Bibliotheca Hiſpanica, in four volumes in folio, two of which he publiſhed at Rome in the year 1672. The work conſiſts of two parts; the one containing the Spaniſh writers who flouriſhed before the 15th century, and the other thoſe ſince the end of that century. After the publication of theſe two volumes, he was recalled to Madrid by king Charles II. to take upon him the office of counſellor to the cruſade; which he diſcharged with great integrity till his death, which happened in 1684. He left nothing at his death but his vaſt library, which he had brought from Rome to Madrid; and his two brothers and nephews being unable to publiſh the remaining volumes of his Bibliotheca, ſent them to Cardinal d'Aguiſne, who paid the charge of the impreſſion, and committed the care thereof to Monſieur Marti, his librarian, who added notes to them in the name of the Cardinal.

Antonio (St), one of the Cape de Verd iſlands, lying in E. Long. 0. 26. N. Lat. 18. 10. It is ſeparated from St Vincent's by a clear navigable channel two leagues in breadth. On the north ſide, it has a good road for ſhipping, with a collection of freſh water riſing from ſprings, which, however, ſcarcely merits the name of a pond. The iſland ſtretches from north-eaſt to ſouth-weſt, and is filled with mountains; one of which is of ſo extraordinary a height, as to be compared with the Peak of Teneriffe: Its top is conſtantly covered with ſnow, and, notwithſtanding the clearneſs of the ſky, is generally hid in clouds. Here are produced a variety of fruits; oranges, lemons, palms, melons, &c. and ſome ſugar-canes. The potatoes and melons are particularly excellent, and are much ſought after by mariners. But, notwithſtanding all this plenty, the inhabitants live in the moſt wretched poverty. They are in number about 500, chiefly negroes, under the protection of the Portugueſe, whoſe language they ſpeak, and imitate their manners. To the north-weſt ſtands a village, containing about 20 huts, and at leaſt 50 families, under the direction of a governor, or, as they call him, a *captain*, a prieſt, and a ſchoolmaſter.

Antonio (St), a Dutch fort in Axim, on the gold coaſt of Africa. It ſtands on a high rock, which projects into the ſea in form of a peninſula; and is ſo environed by rocks and dangerous ſhoals, as to be inacceſſible to an enemy but by land, where it is fortified by a parapet, draw-bridge, and two batteries of heavy canon. Beſides this it has a battery towards the ſea. The three batteries conſiſt of 24 canon. Its form is triangular; the building is neat, ſtrong, and commodious for the extent, that being but ſmall, on account of the narrowneſs of the rock on which it is built. The garriſon is uſually compoſed of 25 white men, and an equal number of negroes, under the command of a ſerjeant.

Antonius. jeant. It is maintained at the expence of the Weſt-India Company; and, when well ſtored with proviſions, is capable of making a long defence againſt any number of negroes. It is, however, as well as all other forts on this coaſt, liable to inconveniences from the heavy and continual rains, which damage the walls, and render frequent reparations neceſſary. This obliges the Dutch always to keep ready a quantity of lime or cement made of calcined oyſter-ſhells, of which the coaſt produces great numbers.—This ſettlement was firſt founded by the Portugueſe during the reign of Emanual. They fixed at firſt upon a ſmall point; where, finding themſelves inſecure, they built the fort where it now ſtands. They were driven out by the Dutch in 1642; and, upon the concluſion of a peace with the States-general, the fort remained by treaty in the hands of the Dutch Weſt-India Company, who have kept poſſeſſion of it ever ſince.

ANTONIUS (Marcus), a famous Roman orator. While he filled the office of prætor, Sicily fell to his lot, and he cleared the ſeas of the pirates which infeſted that coaſt. He was made conſul with A. Poſthumius Albinus, in the year of Rome 653; when he oppoſed the turbulent deſigns of Sextus Titus, tribune of the people, with great reſolution and ſucceſs. Some time after, he was made governor of Cilicia, in quality of proconſul; where he performed ſo many great exploits, that he obtained the honour of a triumph. We cannot omit obſerving, that, in order to improve his great talent for eloquence, he became a ſcholar to the greateſt men at Rhodes and Athens, in his way to Cilicia, and when on his return to Rome. Soon after he was appointed cenſor; which office he diſcharged with great reputation, having carried his cauſe before the people, againſt Marcus Duronius, who had preferred an accuſation of bribery againſt him, in revenge for Antonius's having eraſed his name out of the liſt of ſenators, which this wiſe cenſor had done, becauſe Duronious, when tribune of the people, had abrogated a law which reſtrained immoderate expence in feaſts. He was one of the greateſt orators ever known at Rome; and it was owing to him, according to the teſtimony of Cicero, that Rome might boaſt herſelf a rival even to Greece itſelf in the art of eloquence. He defended, amongſt many others, Marcus Aquilius; and moved the judges in ſo ſenſible a manner, by the tears he ſhed, and the ſcars he ſhowed upon the breaſt of his client, that he carried his cauſe. He never would publiſh any of his pleadings, that he might not, as he ſaid, be proved to ſay in one cauſe, what might be contrary to what he ſhould advance in another. He affected to be a man of no learning. His modeſty, and many other qualifications, rendered him no leſs dear to many perſons of diſtinction, than his eloquence made him univerſally admired. He was unfortunately killed during thoſe bloody confuſions raiſed at Rome by Marius and Cinna. He was diſcovered in the place where he hid himſelf, and ſoldiers were ſent to diſpatch him; but his manner of addreſſig them had ſuch an effect, that none but he who commanded them, and had not heard his diſcourſe, had the cruelty to kill him. His head was expoſed before the roſtra, a place which he had adorned with his triumphal ſpoils. This happened 90 years before the Chriſtian æra.

Antonius (Marcus) the triumvir, grandſon to the former, was very handſome in his youth; for which reaſon he was greatly beloved by Curio a ſenator, who, by carrying him about in all his debaucheries, made him contract ſuch heavy debts, that his own father forbad him his houſe. Curio, however, was ſo generous as to bail him for 250 talents. When the civil war broke out, Curio took Cæſar's party, and prevailed with Antonius to do the ſame; for which he was made a tribune of the people, and in that office did Cæſar great ſervice. Cæſar, having made himſelf maſter of Rome, gave Antonius the government of Italy: at the battle of Pharſalia, Cæſar confided ſo much in him, that he gave him the command of the left wing of his army, whilſt he himſelf led the right. After Cæſar was made dictator, he made Antonius general of the horſe, though he had never been prætor; in which command he exerted his power with the utmoſt violence. He was made conſul, when Cæſar enjoyed that honour for the fifth time, the laſt year of that uſurper's life. On Cæſar's death he harrangued the populace with great art, and raiſed their fury againſt his murderers; flattering himſelf that he ſhould eaſily get into the place which Cæſar had filled: but his haughty behaviour made him loſe all the advantages his affected concern for Cæſar had gained him. His ill treatment of Octavius, and quarrel with him, produced another civil war; which ended in an accommodation between him, Octavius, and Lepidus, fatal to the peace of Rome. They agreed to ſhare the ſupreme power among them; and many of the moſt illuſtrious Romans were ſacrificed by proſcription to cement this bloody league, which is known by the name of the *Second Triumvirate*. But the triumvirs were too ambitious, and hated one another too much, to be long united. Antonius went into Aſia to raiſe money for his ſoldiers: during his abſence, Fulvia his wife quarrelled with Octavius. When Antonius was in Aſia, indulging himſelf in all manner of luxury, the famous Cleopatra inſpired him with the moſt violent paſſion. Hearing of the quarrel between Fulvia and Octavius, and finding Octavius was become publicly his enemy, Antonius entered into a confederacy with Sextus Pompeius, who was ſtill maſter of Sicily. He then went into Italy, in order to fight Octavius; but Fulvia, who had been the author and promoter of this war, dying, Octavius and Antonius came to an agreement. One of the conditions of this new peace was, that they ſhould together attack Pompey, though the former had lately made an alliance with him. Antonius then married Octavia, ſiſter to Octavius, as a pledge of their renewed friendſhip; but returned ſoon after to his beloved Cleopatra, and again lived with her in Alexandria. Octavius took hold of this pretence to inveigh againſt him, and begin the war again. At laſt they engaged in a ſea-fight at Actium, in which Octavius gained a complete victory; which was followed by the deaths both of Antonius and Cleopatra. The infatuated Antonius fell upon his own ſword; and Cleopatra ſtung herſelf to death with an aſp, as was ſuppoſed, to avoid gracing the victor's triumph at Rome.

Antonius. Antonomaſia.

ANTONOMASIA, a form of ſpeech, in which, for a proper name, is put the name of ſome dignity, office, profeſſion, ſcience, or trade; or when a proper name is put in the room of an appellative. Thus a king is called his *majeſty*; a nobleman, his *lordſhip*. We ſay the *philoſopher* inſtead of Ariſtotle, and the *ora-*

tor for Cicero: Thus a man is called by the name of his country, a *German*, an *Italian*; and a grave man is called a *Cato*, and a wise man a *Solomon*.

ANTOSIANDRIANS, a sect of rigid Lutherans, who oppose the doctrine of Osiander relating to justification. These are otherwise denominated *Osiandromastiges*.—The Antosiandrians deny that man is made just, with that justice wherewith God himself is just; that is, they assert, that he is not made essentially, but only imputatively, just; or, that he is not really made just, but only pronounced so.

ANTRIM, the most northerly county of Ireland. It is bounded by that of Down on the south-east, that of Londonderry on the west, from which it is separated by the river Bann, part of Armagh on the south, St George's channel on the east, and the Deucaledonian ocean on the north. Its greatest length is about 46 miles, its greatest breadth about 27; and the number of acres it contains, plantation-measure, are computed at 383,000. Though the country is much incumbered with bogs and marshes, yet it enjoys a pretty good air, and is well peopled, chiefly with protestants. Where it is free from bogs the soil is fruitful. It sends two members for the shire, and two for each of the following towns, viz. Lisburn, Belfast, Antrim, and Randalstown.

Certain narrow valleys, called *glyns*, beginning here, and running a great way along the coast, belonged formerly to the Bissets, noblemen of Scotland, who having been obliged to quit that country for having assassinated Patrick earl of Athol upon a private quarrel, came hither, and had a great estate bestowed upon them by Henry III. of England; of which, in the reign of Edward II. a part was forfeited by the rebellion of Hugh, then chief of the family. Another tract near this, called the *Rowte*, belonged anciently to the Macguillers, but now to the M'Donnels earls of Antrim.

Upon the coast of this country are the promontories called by Ptolemy, *Robogdium*, *Vennicinium*, and *Boræum*, now *Fair Foreland*, *Ramshead*, and *St Helen's-head*. The river also, styled by the same author *Vidua*, and now *Crodagh*, runs through this county.—Here also is the remarkable natural curiosity called the GIANT's-*Causeway*; for a particular description of which see that article.

ANTRIM, the capital town of the county of Antrim, in Ireland, seated at the north end of the lake Lough-Neagh, about six miles from the mouth of the bay, having a good road before it, with a pier near the place, within which vessels lie dry at low water. It was anciently a borough of great consequence, as appears from the mayor's being admiral of a considerable extent of coast, as well in Down as in this county; the corporation enjoying the customs paid by all vessels within those bounds, the creeks of Bangor and Belfast only excepted. This grant, however, the crown repurchased, and thereupon transferred the custom-house to Belfast, to which town it is now much inferior as well in size as in trade. It is, however, still a place of note, and sends two members to the house of commons. It gives the title of *earl* to the noble family of M'Donnell.—At Antrim is a seat, with noble demesnes, and beautiful and highly cultivated lands, of the Earl of Massareene.—It is but a poor place, 13 miles west of Carrickfergus. W. Long. 6. 26. N. Lat. 54. 45. It sends two members to parliament.

ANTRUM, among anatomists, a term used to denote several cavities of the body: as the *antrum highmorianum*, or that in the maxillary or jaw bone; *antrum pylori*, or that at the bottom of the pylorus, &c.

ANTWERP, a city of the duchy of Brabant, in the Austrian Netherlands, capital of the marquisate of Antwerp, otherwise called the *marquisate of the holy Roman empire*, situated in E. Long. 4. 15. N. Lat. 51. 12. It lies in a low marshy ground on the Scheld. 24 miles from Brussels to the north. It is the third city in rank in Brabant, large and well built, containing 22 squares, and above 200 streets, all straight and broad, especially that called the *Mere*, in which six coaches can go abreast. Most of the houses are of free-stone, and have an air of antiquity, being high, with courts before and gardens behind. At the head of the Mere is a crucifix of brass thirty-three feet high. The cathedral dedicated to the Virgin Mary, the stadt-house, and the exchange, are magnificent structures: the latter is the first building of that kind in Europe, and on its model the exchanges of London and Amsterdam are built. Its pillars are all of blue marble, and carved, but all in a different manner. The exchange cost the city 300,000 crowns. Antwerp, towards the end of the fifteenth century, was one of the most celebrated towns that ever existed. The Scheld, on which it stands, being 20 feet at low water, and rising 20 feet more at flood, ships of the greatest burden came up to the keys, as in the river Thames at London; but when the United Provinces formed themselves into a free state, after having shaken off the yoke of Spain, they got the entire command of the navigation of the Scheld; which ruined the trade of Antwerp, and transferred it to Amsterdam. This made the inhabitants turn their heads to painting, jewelling, and banking, which they have continued to this day with great success and reputation: for at Antwerp bills of exchange may be negociated for any sum to any part of Europe; and in the time of Queen Anne's wars, two brothers of the name of De Koning, paid the one the army of France, and the other that of the confederates. Besides, here is a fine manufacture of tapestry and lace; and, for the promoting of trade, an insurance-company has been erected. This city is the see of a bishop, who, as abbot of St Bernard, is the second prelate in Brabant. The bishopric is of great extent, and the cathedral a most noble pile, with one of the finest steeples in the world. The emperor Charles V. when he made his entry into Antwerp, said it ought to be put in a case, and showed only once a-year for a rarity. The house of the hanse-towns, built when the city was in its flourishing condition, is a stately building, with magazines above for dry goods, and cellars below for wet, and in the middle story were 300 lodging-rooms for merchants; but now it is turned to a horse-barrack. There is a market here called the *Friday's market*, because it is held every Friday, where all sorts of household goods, pictures, and jewels, are sold by auction. No city in the Netherlands has so many and so fine churches as this. Many of them, particularly the cathedral and Jesuits church, are adorned with paintings, by Sir Peter Paul Rubens, who was a native

Antwerp.

tive of this city; and by Quintin Masseys, who is said to have been a blacksmith; but having fallen in love with a painter's daughter, and been told by her father, when he asked her of him in marriage, that he would have none but a painter for his son-in-law, he went to Italy to study painting, and, in a few years, returned so eminent in his new profession, that he found no difficulty in obtaining the father's consent. He is interred at the entry of the cathedral, where his effigy is put up, with an inscription, signifying, that conjugal love made an Apelles of a blacksmith. The abovementioned Jesuits church is extremely magnificent, and the chapel of the Virgin, joining to it, still more so. Among the cloisters the most remarkable are, the noble and rich abbey of St Michael, on the banks of the Scheld, the apartments of which are truly royal, and in which all sovereign princes that pass this way actually lodge; and the English nunnery, of the order of St Teresa, the nuns of which never wear linen, nor eat flesh, and lie upon straw: the grates of the convent are so dismal, that it looks like a prison. As to the fortifications of the city, it is environed with a fine wall, planted with rows of trees on each side, with walks between broad enough for two coaches to go abreast, being also defended by a very strong, large, regular citadel, in form of a pentagon, erected by the Duke of Alva in 1568, which commands the town and the neighbouring country. The magistracy of this city is chosen only out of the seven patrician families; and consists of two burgomasters and 18 echevins, besides inferior magistrates. Among the privileges granted to it by its princes, there is one by which every person born in it is a citizen, though both his father and mother were foreigners.

In 1585, Antwerp underwent a remarkable siege by the Duke of Parma. It was then the most wealthy city in the Netherlands, and had long been the object of his designs; but the difficulties attending the enterprize obliged him to postpone it for a considerable time. In order to succeed, it was necessary to cut off the communication of the city with Holland, Ghent, and all places above and below Antwerp on the Scheld. To effect this, he laid siege to Liskenshouk and Tillo, places of the utmost consequence to the security and commerce of the city: both were obstinately defended; and the siege of the latter was raised, after it had been carried on for three months: however, the Duke gained several other posts on the river, where he built forts, and greatly annoyed the shipping and trade of the city. He next laid siege to Dendermonde, in order to cut off the communication with Ghent, in which he succeeded by the reduction of the town. His next attempt was on Vilvorde: this place he took by assault, and thereby cut off the communication with Brussels. Finding, however, this method of hemming in the city tedious, and ineffectual while an opening to the mouth of the river remained, he formed a design of building a bridge across the Scheld, the extremities of which were to be defended by strong forts and out-works. He began with collecting great quantities of wood at Callo and fort St Philip, where he intended the bridge should be built; but his project was for some time retarded by the Antwerpers, who broke down the dykes, overflowed the whole country, and carried of his magazines by the inundation. Not discouraged by this loss, he applied himself diligently to repair it, and with incredible expedition cut a canal from Steken to Callo, by which he carried off the waters. He then set to work upon the bridge, and finished it in seven months, without any interruption from the Zealanders. During the building of this bridge, Aldegonde, governor of Antwerp, proposed to build a fort on Couvensteyn dyke, in order to secure that important post, and then breaking down the dyke when the bridge was near finished: but he was violently opposed by certain citizens, who apprehended that their lands and villas would be destroyed by the inundation. This unseasonable opposition, with the negligence of the magistrates, who, because the markets were high, had not laid in a sufficient stock of corn, occasioned the loss of the city. However, in despite of all the Duke of Parma's precautions, the Zealanders found means to throw in a convoy of corn; but the citizens, knowing they would not run the risk of carrying it back again, so cheapened the price, that these bold traders refused ever to bring their goods again to so bad a market. The Antwerpers, having thus through avarice brought on their ruin, began in a short time to suffer by famine; they then pressed the Zealanders to attempt something for their relief, but it was now too late. While the magistrates were deliberating on some means for destroying the bridge, which they might have prevented from being ever completed, one Ginebelli, a Mantuan engineer, offered his services, undertaking at a certain expence to blow it into the air. Even in this extremity the expence was grudged: but necessity at last overcame this obstacle; Ginebelli was furnished with two large vessels, a number of small boats, and every thing necessary. He formed the two large vessels into fire-ships, which he set adrift with the stream, deceiving the enemy by means of false fires lighted up in the fleet of small boats. The train of one of the fire-ships was expended before the time expected, and she blew up with a terrible explosion, but with little damage to the bridge. The other was more successful, carrying off all the outworks, setting fire to the whole bridge, and burying above 500 soldiers in the ruins it made. The fire, however, was soon extinguished, and the bridge repaired by the Duke of Parma, while the Antwerpers were prevented by avarice from repeating the experiment; so that they were soon reduced to the greatest straits, and obliged to surrender. It is said that the city of Amsterdam had obstructed every measure for the relief of Antwerp, hoping to profit by its destruction. It was not doubted but the Protestants would forsake it as soon as it fell into the hands of an arbitrary Catholic prince; and this conjecture was soon fulfilled by the removal of many families with their effects to Amsterdam.—After the battle of Ramillies, the city of Antwerp surrendered to the Duke of Marlborough. It was taken by the French in 1746, but restored to the house of Austria at the treaty of Aix-la-Chapelle.

Anubis.

ANUBIS, a symbolical deity of the Egyptians, was regarded as the faithful companion of Osiris and of Isis. Temples and priests were consecrated to him, and his image was borne in all religious cerimonies.

Cynopolis, the present Minieh, situated in the lower Thebais, was built in honour of Anubis. The temple wherein he was worshipped no longer subsists. The priests celebrated his festivals there with great pomp, and conſecrated the dog to him as his living repreſentation. "Anubis (ſays Strabo) is the city of dogs, the captal of the Cynopolitan prefecture. Theſe animals are fed there on ſacred aliments, and religion has decreed them a worſhip." An event, however, related by Plutarch, brought them into conſiderable diſcredit with the people. Cambyſes having ſlain the god Apis, and thrown his body into a field, all animals reſpected it except the dogs, which alone eat of his fleſh. This impiety diminiſhed the popular veneration for them.

Cynopolis was not the only city which burned incenſe on the altars of Anubis. He had chapels in almoſt all the temples. On ſolemnities, his image always accompanied thoſe of Iſis and Oſiris. Rome having adopted the ceremonies of Egypt, the emperor Commodus, to celebrate the Iſiac feaſts, ſhaved his head, and himſelf carried the god Anubis. The ſtatue of this god was either of maſſive gold or gilt, as well as the attributes that accompanied them. Anubis ſignifies *gilded*. The denomination was myſterious; and the Egyptian prieſts, it would ſeem, had not given it without reaſon.

The ſignification of this emblematical deity is thus explained by Plutarch: "The circle which touches and ſeparates the two hemiſpheres, and which is the cauſe of this diviſion, receiving the name of *horizon*, is called *Anubis*. He is repreſented under the form of a dog, becauſe that animal watches day and night." St Clemens of Alexandria, who was well informed in the myſtic theology of the Egyptians, favours this explication. The two dogs, ſays he, (the two Anubis) are the ſymbols of two hemiſpheres which environ the terreſtial globe. He adds in another place: Others pretend that theſe animals, the faithful guardians of men, indicate the tropics, which guard the ſun on the ſouth and on the north like porters.

According to the former of theſe interpretations, the prieſts, regarding Anubis as the horizon, gilded his ſtatue; to mark, that this circle, receiving the firſt rays of the ſun, appears ſparkling with brightneſs on his riſing, and that at his ſetting he reflects his laſt rays upon the earth. They ſaid in their ſacred fables, that Anubis was the ſon of Oſiris, but illegitimate. In fact, he only gives to the earth a borrowed light; and cannot be eſteemed, like Horus, as the father of the day, or as the legitimate offspring of Oſiris. It may be added that the viſible horizon turning with the ſun, is his inſeparable companion.

In the latter of theſe explications, where Anubis repreſents the tropics, he is alſo the faithful guardian of Iſis and Oſiris. In fact, the courſe of the ſun and of the moon is contained between the circles wherein the ſolſtices are performed. They neither deviate to the right nor left. Theſe limits aſſigned by the Author of nature might therefore, in hieroglyphic language, be repreſented by a divinity with the head of a dog, who ſeemed to oppoſe their paſſage on the ſide of the two poles The other opinion, notwithſtanding, ſeems more natural, and to be more analogous to the ideas of the prieſts.

Upon the whole, it is reaſonable to imagine, that Anubis at firſt was only a ſymbolical image, invented by aſtronomers to give a ſenſible expreſſion of their diſcoveries; that afterwards, the people, accuſtomed to ſee it in their temples, which were the depoſitaries of ſcience, adored it as a deity; and that the prieſts favoured their ignorance by connecting it with their religion. The worſhip of Anubis introduced, that of the dog became his emblem. Almoſt all the gods of the Gentiles have originated in this manner.

ANUS, in anatomy, the lower extremity of the inteſtinum rectum, or orifice of the fundament.

ANVIL, a ſmith's utenſil, ſerving to place the work on to be hammered or forged. The face or uppermoſt ſurface of the anvil, muſt be very flat, and ſmooth, without flaws, and ſo hard that a file will not touch it. At one end there is ſometimes a pike, bickern, or beak-iron, for the rounding of hollow work. The whole is uſually mounted on a firm wooden block. Forged anvils are better than thoſe of caſt work, and the beſt have the upper part made of ſteel. Lockſmiths have a ſmaller kind of anvil called the *ſtake*, which is moveable, and placed ordinarily on their work-bench. Its uſe is for ſetting ſmall cold work ſtraight, or to cut or punch on with the cold chiſſel or cold punch.

ANXUR, (anc. geog.), a city of the Volſci, in Latium; called *Tarracina*, by the Greeks and Latins; Now *Terracina;* ſituated on an eminence (Livy, Horace, Sil. Italicus). *Anxuras*, a citizen of Anxur (Livy). And the epithet *Anxurus*, a name of Jupiter, worſhipped without a beard at Anxur (Virgil). Though others read *Axurus*, or *Axyrus*, without a razor. E. Long. 14. 5. Lat. 41. 18.

AONIDES, in mythology, one of the many appellations of the muſes; ſo called from Aonia, a part of ancient Bœotia.

AORASIA, in antiquity, the inviſibility of the gods. The word is Greek, *αορασια*, and derived from *α*, priv. and *οραω*, to ſee. The opinion of the ancients with regard to the appearance of the gods to men, was, that they never ſhowed themſelves face to face, but were known from their backs as they withdrew. Neptune aſſumed the form of Calchas to ſpeak to the two Ajaxes; but they knew him not till he turned his back to leave them, and diſcovered the god by his majeſtic ſtep as he went from them. Venus appeared to Æneas in the character of a huntreſs: but her ſon knew her not, till ſhe departed from him; her divinity was then betrayed by her radiant head, her flowing robe, and her majeſtic pace.

AORIST, among grammarians, a tenſe peculiar to the Greek language, comprehending all the tenſes; or rather, expreſſing an action in an indeterminate manner, without any regard to paſt, preſent, or future.

AORISTIA, in the ſceptic philoſophy, denotes that ſtate of the mind wherein we neither aſſert nor deny any thing poſitively, but only ſpeak of things as ſeeming or appearing to us in ſuch a manner. The aoriſtia is one of the great points or terms of ſcepticiſm, to which the philoſophers of that denomination had continual recourſe by way of explication, or ſubterfuge. Their adverſaries, the Dogmatiſts, charged them with dogmatizing, and aſſerting the principles and poſitions of their ſect to be true and certain.

AORNUS, a very high rock of India, having its name from its extraordinary height, as being above the flight of a bird. Its circuit was about 25 miles, its height 11 furlongs, and the way leading up to the top artificial and narrow. At the bottom, on one ſide, ran the river Indus: on the top was a fine plain, part of which was covered with a thick wood; the reſt arable land, with a fountain furniſhing abundance of excellent water. This rock was taken by Alexander the Great, in whoſe time there was a report that Hercules had attempted it in vain; however, according to Arrian, this report was without foundation. It is probable indeed, that it was raiſed after the place was taken, in order to magnify Alexander's exploit. While the Macedonian monarch was preparing all things neceſſary for the ſiege, an old man with his two ſons, who had long lived in a cave near the ſummit, came and offered to ſhow him a private way of aſcending. This being readily accepted, Ptolemy, with a conſiderable body of light-armed troops, was diſpatched with them, with orders in caſe they ſucceeded, to entrench themſelves ſtrongly upon the rock, in the wood to which the old man was to direct them, before they ventured to attack the Indians. Ptolemy exactly executed his orders; and gave notice, by a lighted torch ſet upon a pole, that he had got ſafely up. Upon this, Alexander gave immediate orders for a body of troops to attempt the paſſage by which the rock was commonly aſcended; but they were repulſed with great ſlaughter. He then ſent an Indian with letters to Ptolemy, deſiring him, the next time an attack was made by the common way, to fall upon the enemy behind. But in the mean time, thoſe who defended the rock attacked Ptolemy with great vigour; but were at laſt repulſed, though with much difficulty: but the next day, when Alexander renewed the attack, though Ptolemy attacked the Indians in the rear, the Macedonians were repulſed on both ſides. At laſt the king, perceiving that the ſtrength of the Indians lay in the ſtraitneſs and declivity of the way by which they were attacked, cauſed a great quantity of trees to be felled, and with them filled the cavities between the plain on which the Indians were encamped and the higheſt of his own advanced poſts. The Indians at firſt derided his undertaking; but at length perceiving the ardour with which the work was carried on, and having felt the effects of the miſſile weapons of the Macedonians, they ſent deputies to propoſe terms of capitulation. Alexander, ſuſpecting that their deſign was only to amuſe him till they made their eſcape, withdrew his guards from the avenues. As ſoon as he knew the Indians were deſcended, he, with 700 of Ptolemy's light-armed foot, took poſſeſſion of the deſerted rock, and then made a ſignal for his forces to fall upon the flying Indians. They ſetting up a loud ſhout, ſo terrified the fugitives, that numbers of them fell from the rocks and precipices, and were daſhed to pieces, while the greateſt part of the remainder were cut off in the roads.

AORTA, in anatomy, the great artery which riſes immediately from the left ventricle of the heart, and is from thence diſtributed to all parts of the body. It is divided into two grand trunks, diſtinguiſhed by the epithets *aſcending* and *deſcendiug*. See Anatomy.

AOUSTA, or Aost, a town of Italy, in Piedmont, and capital of the duchy of the ſame name, a biſhop's ſee, and ſubject to the king of Sardinia. It is remarkable for ſeveral monuments of the Romans, and for the birth of Anſelm archbiſhop of Canterbury. It is ſeated at the foot of the Alps, on the river Doria. E. Long. 7. 33. N. Lat. 45. 38.

Aousta, a territory of Piedmont, with the title of a duchy. It is a valley 30 miles in length, and extends from the paſs of St. Martin's, near the frontiers of Yvree, to St. Bernard. It abounds in paſtures, and all ſorts of fruits; the capital is of the ſame name.

AOUTA, the name of the paper-mulberry tree at Otaheite, in the South Sea, from which a cloth is manufactured, that is worn by the principal inhabitants. See the article Bark.

APACHES, a people of New Mexico, in North America. They are brave, reſolute, and warlike, fond of liberty, and the inveterate enemies of tyranny and oppreſſion. Of this diſpoſition the Spaniards had fatal experience towards the end of the laſt century, when they revolted againſt the Catholic king, maſſacred ſeveral of his officers, and committed the greateſt devaſtations. Ever ſince they have remained the allies, not the ſubjects, of the Spaniards; and the viceroy of Mexico has been obliged to maintain a more formidable garriſon, and a greater number of troops.

APÆDUSIA, denotes ignorance or unſkilfulneſs in what relates to learning and the ſciences. Hence alſo perſons uninſtructed and illiterate are called *Apædeutæ*. The term *Apædeutæ* was particularly uſed among the French in the time of Huet; when the men of wit at Paris were divded into two factions, one called by way of reproach *apædeutæ*, and the other *eruditi*. The *apædeutæ* are repreſented by Huet, as perſons who, finding themſelves either incapable or unwilling to undergo a ſevere courſe of ſtudy in order to become truly learned, conſpired to decry learning, and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity. The *apædeutæ* in effect were the men of pleaſure; the *eruditi* the men of ſtudy. The *apædeutæ* in every thing preferred the modern writers to the ancient, to ſuperſede the neceſſity of ſtudying the latter. The *eruditi* derided the moderns, and valued themſelves wholly on their acquaintance with the ancients.

APAGOGE, in logic. See Abduction.

Apagoge, in the Athenian law, the carrying a criminal taken in the fact to the magiſtrate. If the accuſer was not able to bring him to the magiſtrate, it was uſual to take the magiſtrate along with him to the houſe where the criminal lay concealed, or defended himſelf.

Apagoge, in mathematics, is ſometimes uſed to denote a progreſs or paſſage from one propoſition to another; when the firſt having been once demonſtrated, is afterwards employed in the proving of others.

APAGOGICAL demonstration, an indirect way of proof, by ſhowing the abſurdity of the contrary.

APALACHIAN Mountains, more properly called the *Allegany Mountains*, have their ſouthern beginning near the bay of Mexico, in the latitude of 30°, extending northerly in many broken ridges, running nearly parallel to the ſea to Hudſon's river, in the latitude of about 40° North. A great part of theſe mountains is covered with rocks, ſome of which are of a ſtupendous height and bulk; the ſoil between them is generally black and ſandy, but in ſome places differently coloured, compoſed of pieces of broken rock and ſpar, of a glittering appearance, which ſeem to be indications of minerals and ores if proper ſearch was made for them. Cheſnuts and ſmall oaks are the trees that principally grow on theſe mountains, with ſome *Chinkapin** and other ſmall ſhrubs. The graſs is thin, mixed with vetch and ſmall peaſe; and in ſome places there is very little vegetable appearance.

*Fagus pumila. See *Fagus*.

The rocks of the Apalachian mountains ſeem to engroſs one-half of the ſurface. They are moſtly of a light grey colour: ſome are of a coarſe-grained marble like alabaſter; others, of a metallic luſtre: ſome pieces are in the form of ſlate, and brittle; others in lumps, and hard: and ſome appear with ſpangles, or covered over with innumerable ſmall ſhining ſpecks, like ſilver. Theſe frequently appear at the roots of trees when blown down. The different ſpars are found moſt on the higheſt and ſteepeſt parts of the hills, where there is little graſs and few trees; but the greateſt part of the ſoil between the rocks is generally a dark ſandy-coloured kind of mould, and ſhallow; yet fertile, and productive of good corn, which encourages the Tallipooſes, a clan of the Cherokee Indians, to ſettle among them in latitude 34°' and they are the only Indian nation that has a conſtant reſidence on theſe mountains.

APAMEA, or Apamia, the name of ſeveral ancient cities.

1. One of Bithynia, formerly called *Myrlea*, from Myrlus, general of the Colophonians: deſtroyed by Philip, father of Perſeus; and given to his ally Pruſius, who rebuilt it, and called it *Apamea*, from the name of his queen Apama (Strabo). Stephanus ſays, that Nicomedus Epiphanes, ſon of Pruſius, called it after his mother; and that it had its ancient name from Myrlea, an Amazon. The Romans led a colony thither (Strabo); called *Colonea Apamena* (Pliny, Appian). The gentilitious name is *Apamæus*, and *Apamenus* (Trajan in a letter to Pliny).

2. Another *Apamea*, called *Cibotos*, of Phrygia, at ſome diſtance from the Meander (Agathodæmon); but by a coin of Tiberius on the Meander. The name is from Apame, mother of Antiochus Soter, the founder, and the daughter of Artabazus (Strabo). The riſe, or at leaſt the increaſe, of Apamea, was owing to the ruins of Celenæ. The inhabitants were called *Apamienſis*, and, though inland, were worſhippers of Neptune. The reaſon, it has been conjectured, was, that they had ſuffered often from earthquakes, of which he was ſuppoſed the author. Mithridites gave an hundred talents towards the reſtoration of the city, which, it is ſaid, had likewiſe been overthrown in the time of Alexander. Their tribute money was remitted to them for five years on the ſame account under the Emperor Tiberius. The ſubterraneous paſſage of the Lycus and the other ſtreams ſhowed that the ground had many cavities; and theſe, it has been ſurmiſed, rendered the region very liable to be ſhaken.

3. A third, on the confines of Parthia and Media, ſurnamed *Raphane* (Strabo, Pliny).

4. A fourth, *Apamea*, a town in Meſene, an iſland in the Tigris (Pliny, Ammian); where a branch of the Euphrates, called the *Royal river*, falls into the Tigris (Ptolemy).

5. A fifth in Meſopotamia, on the other ſide the Euphrates, oppoſite to Zeugma on this ſide, both founded by Seleucus, and joined by a bridge, from which the latter takes its name (Pliny, Iſidor, Characenus).

6. Another *Apamea*, near *Famia*, alſo in Syria, below the confluence of the Orontes and Marſyas; a ſtrong city, and ſituated in a peninſula, formed by the Orontes and a lake. "It was here (ſays Strabo) that the Seleucidæ had eſtabliſhed the ſchool and nurſery of their cavalry." The ſoil of the neighbourhood, abounding in paſturage, fed no leſs than thirty thouſand mares, three hundred ſtalions, and five hundred elephants; inſtead of which the marſhes of Famia at preſent ſcarcely afford a few buffaloes and ſheep. To the veteran ſoldiers of Alexander, who here repoſed after their victories, have ſucceeded wretched peaſants, who live in perpetual dread of the oppreſſions of the Turks and the inroads of the Arabs.

Apamea was alſo the ancient name of *Pella*, in the Decapolis.

APANAGE, or Appennage, in the French cuſtoms, lands aſſigned by a ſovereign for the ſubſiſtence of his younger ſons, which revert to the crown upon the failure of male iſſue in that branch to which the lands are granted.

APANOMIA, a town of Santorin, an iſland in the Mediterranean ſea, called in this part, by ſome, the *Sea of Candia*: it has a ſpacious harbour, in the form of a half-moon; but the bottom is ſo deep, that ſhips cannot anchor there, E. Long. 25. 59. N. Lat. 36. 18.

APANTHROPY, in medicine, denotes a love of ſolitude, and averſion for the company of mankind. Apanthropy is by ſome reckoned among the ſymptoms, by others among the ſpecies or degrees, of melancholy; and alſo paſſes for an ill indication in leucophlegmatic caſes.

APARINE, in botany, a ſynonime of the utricularia and ſeveral other plants.

APARITHMESIS, in rhetoric, denotes the anſwer to the protaſis or propoſition itſelf. Thus, if the protaſis be, *Appellandi tempus non erat*, —the aparithmeſis is, *At tecum anno plus vixi*.

APARTISMENUS, in the ancient poetry, an appellation given to a verſe, which comprehended an entire ſenſe or ſentence in itſelf. This is ſometimes alſo written, *appartemenus*, i. e. ſuſpended, as not needing any following verſe.

APATHY, among the ancient philoſophers, implied an utter privation of paſſion, and an inſenſibility of pain. The word is compounded of α priv. and πάθος, affection. The Stoics affected an entire apathy: they conſidered it as the higheſt wiſdom to enjoy a perfect calmneſs or tranquillity of mind, incapable of being ruffled by either pleaſure or pain. In the firſt ages of the church, the Chriſtians adopted the term *apathy* to expreſs a contempt of all earthly concerns; a ſtate of mortification, ſuch as the goſpel preſcribes. Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking hereby to draw the philoſophers to Chriſtianity, who aſpired after ſuch a ſublime pitch of virtue. Quietiſm is only apathy diſguiſed under the appearance of devotion.

APATURIA, in antiquity, a ſolemn feaſt celebrated by the Athenians in honour of Bacchus. The word is uſually derived from ἀπάτη, *fraud*. It is ſaid to have been inſtituted in memory of a fraudulent victory obtained by Melanthus, King of Athens, over Xanthus king

king of Bœotia, in a single combat, which they agreed upon, to put an end to a debate between them relating to the frontiers of their countries. Hence Budæus calls it *festum deceptionis*, "the feast of deceit."

Other authors give a different etymology of this feast: They tell us, that the young Athenians were not admitted into the tribes on the third day of the apaturia, till their fathers had first sworn, that they were their own children; and that, till that time, they were supposed, in some measure, to be without fathers, *απατορες*; whence the feast, say they, took its name. Xenophon, on the other hand, informs us, that the relations and friends met on this occasion, and joined with the fathers of the young people who were to be received into the tribes; and that from this assembly the feast took its name: that in *απατερια*, the *α*, far from being a privative, being here a conjunctive, signifies the same thing with *ομυ*, *together*. This feast lasted four days: the first day, those of the same tribe made merry together; and this they called *δορπια*. The second day, which they called *αναρρυσις*, they sacrificed to Jupiter and Minerva. The third day, which they called *κυρεωτις*, such of their young men and maids as were of age were admitted into their tribes. The fourth day they called *επιβδης*.

APAULIA, in antiquity, the third day of a marriage solemnity. It was thus called, because the bride, returning to her father's house, did *απαυλιζεσθαι τυ νυμφιω*, lodge apart from the bridegroom. Some will have the apaulia to have been the second day of the marriage, viz. that whereon the chief ceremony was performed; thus called by way of contradistinction from the first day, which was called *προαυλια*. On the day called *απαυλια* (whenever that was), the bride presented her bridegroom with a garment called *απαυλητηρια*.

APE, in zoology, the general English name of a very numerous race of animals, the natural history of which is given at large under the article SIMIA: comprehending *Apes* properly so called, or such as want tails; and *Monkeys* and *Baboons*, or such as have tails, the former *long*, and the other *short*, ones. See SIMIA.

Sea-APE, a name given by Steller to a marine animal which he saw on the coast of America, and is thus described*. "The head appeared like that of a dog, with sharp and upright ears, large eyes, and with both lips bearded: the body round and conoid; the thickest part near the head: the tail forked; the upper lobe the longest: the body covered with thick hair, grey on the back, reddish on the belly. It seemed destitute of feet. It was extremely wanton, and played a multitude of monkey-tricks. It sometimes swam on one side, sometimes on the other side of the ship, and gazed at it with great admiration. It made so near an approach to the vessel, as almost to be touched with a pole; but if any body moved, it instantly retired. It would often stand erect for a considerable space, with one-third of its body above water; then dart beneath the ship, and appear on the other side; and repeat the same thirty times together. It would frequently arise with a sea-plant, not unlike the bottle-gourd, toss it up, and catch it in its mouth, playing with it numberless fantastic tricks.

* *Hist. of Kamtschatka*, p. 136.

APELYTES, Christian heretics in the second century, who affirmed that Christ received a body from the four elements, which at his death he rendered back to the world, and so ascended into heaven without a body.

APELLA, among physicians, a name given to those whose prepuce is either wanting or shrunk, so that it can no longer cover the glans. Many authors have supposed this sense of the word *Apella* warranted from the passage in Horace, *credat Judæus Apella, non ego*. But, according to Salmasius and others, *Apella* is the proper name of a certain Jew, and not an adjective signifying *circumcised*.

APELLIS, one of the most celebrated painters of antiquity. He was born in the isle of Cos, and flourished in the time of Alexander the Great, with whom he was in high favour. He executed a picture of this prince, holding a thunderbolt in his hand: a piece, finished with so much skill and dexterity, that it used to be said there were two Alexanders; one invincible, the son of Philip; the other inimitable, the production of Apelles. Alexander gave him a remarkable proof of his regard: for when he employed Apelles to draw Campaspe, one of his mistresses, having found that he had conceived an affection for her, he resigned her to him; and it was from her that Apelles is said to have drawn his Venus Anadyomene.

One of Apelles's chief excellencies was his making his pictures so exactly resemble the persons represented; insomuch that the physiognomists are said to have been able to form a judgment of the persons destiny as readily from his portraits as if they had seen the originals. But what is called *grace* was the characteristic of this artist. His pencil was so famous for drawing fine lines, that Protogenes discovered by a single line that Apelles had been at his house. Protogenes lived at Rhodes: Apelles sailed thither, and went to his house with great eagerness, to see the works of an artist who was known to him only by name. Protogenes was gone from home: but an old woman was left watching a large piece of canvas, which was fitted in a frame for painting. She told Apelles that Protogenes was gone out; and asked him his name, that she might inform her master who had inquired for him. "Tell him (says Apelles) he was enquired for by this person;"—at the same time taking up a pencil, he drew on the canvass a line of great delicacy. When Protogenes returned, the old woman acquainted him with what had happened. That artist, upon contemplating the fine stroke of the line, immediately pronounced that Apelles had been there; for so finished a work could be produced by no other person. Protogenes, however, himself drew a finer line of another colour; and, as he was going away, ordered the old woman to show that line to Apelles if he came again; and to say, "This is the person for whom you are enquiring." Apelles returned, and saw the line: he would not for shame be overcome; and therefore, in a colour different from either of the former, he drew some lines so exquisitely delicate, that it was utterly impossible for finer strokes to be made. Protogenes now confessed the superiority of Apelles, flew to the harbour in search of him, and resolved to leave the canvass with the lines on it for the astonishment of future artists.

Apelles showed great liberality of mind towards Protogenes. With ideas enlarged by education and literature, he was incapable of harbouring little jealousies of noble competitors; on the contrary, he was the first who made the works of Protogenes to be valued as they deserved among the Rhodians. He acknowledged that Protogenes was in some respects superior to himself; but that in one particular himself excelled, viz. in knowing when to take his hand from the Picture; an art which Protogenes had not yet learned, and therefore over-worked his pieces. Apelles equally disapproved of too elaborate diligence, or too hasty negligence, in execution. A studied work of Protogenes he esteemed less on the one account; and on the other, when a silly painter once brought him a picture, and said, "This I painted in a hurry,"—he replied, "Though you had not told me so, I perceive it was painted in haste: but I wonder you could not execute more such pieces in the same time.

There are two stories related of Apelles, which show him to be at once an artist of modesty in amending even trifling improprieties, when pointed out to him by competent judges; and yet of self-confidence sufficient to make him know the perfection and value of his own paintings. It was customary with Apelles to expose to public view the works which he had finished, and to hide himself behind the picture, in order to hear the remarks passed on it by persons who chanced to view it. He once overheard himself blamed by a shoemaker for a fault in the slippers of some picture: he corrected the fault which the man had noticed: but on the day following the shoemaker began to animadvert on the leg; upon which Apelles with some anger looked out from behind the canvass, and bade him keep to his own province, "Ne sutor ultra crepidam." It is well known that Alexander forbade any one besides Apelles to paint his portrait. We are not, however, to conclude from this, that Alexander was a more skilful judge of painting than he was of poetry. Like Augustus, he cherished the fine arts more from vanity than taste. A remarkable proof is given of this prince's inability to discern merit, and of the painter's freedom in expressing the mortification he felt, when a work of his was not sufficiently commended. "Alexander (says Ælian, lib. ii. c. 3. Var. Hist.) having viewed the picture of himself which was at Ephesus, did not praise it as it deserved. But when a horse was brought in, and neighed at seeing the figure of a horse in the picture, as though it had been a real horse; *O king!* (said Apelles) *this horse seems to be by far a better judge of painting than you.*" It happened more than once that the horses drawn by him were mistaken for real ones, by living horses which saw and neighed at the pictures. In his finishing a drawing of this animal, a remarkable circumstance is related of him. He had painted a horse returning from battle, and had succeeded to his wishes in describing every other mark that could indicate a mettlesome steed, impatient of restraint; there was wanting nothing but a foam of a bloody hue issuing from the mouth. He again and again endeavoured to express this, but his attempts were unsuccessful. At last, with vexation, he threw against the reins of the horse a sponge which had in it many colours; a mixture of which coming out of the sponge, and tinging the reins, produced the very effect desired by the painter.

The works of Apelles were all admired; but the most celebrated were the picture of Alexander in the temple of Diana at Ephesus, and that of Venus emerging from the sea. Alexander was drawn with thunder in his hand; and such relief was produced by the chiaroscuro in this piece, that the fingers seemed to shoot forward, and the thunder-bolt to be out of the picture. His Venus Αναδυομενη was esteemed the most exquisite figure which the pencil could create: it is therefore extolled by the Roman poets Propertius and Ovid; and the poet of Sidon, Antipater, has left us the following Greek epigram on it:

Ταν αναδυομεναν απο ματερος αρτι θαλαττας
  Κυπριν, Απελλειυ μοχθον ορα γραφιδος,
Ως χερι συμμαρψασα διαβροχον υδατι καιταν
  Εκθλιβει νοτερων αφρον απο πλοκαμων.
Αυται νυν ερευσιν Αθηναιη τε και Ηρη
  "Ουκ ετι σοι μορφας εις εριν ερχομεθα."

Anth. iv. 12.

Graceful as from her natal sea she springs,
  Venus, the labour of Apelles, view:
With pressing hand her humid locks she wrings,
  While from her tresses drips the frothy dew:
Ev'n Juno and Minerva now declare,
  "No longer we contend whose form's most fair."

APENE, in antiquity, a kind of chariot wherein the images of the gods were carried in procession on certain days, attended with a solemn pomp, songs, hymns, dancing, &c. It was very rich, made sometimes of ivory, or of silver itself, and variously decorated.

APPENNINUS, now the *Appennine*; a mountain, or ridge of mountains, running through the middle of Italy, from north-west to the south-west for 700 miles, in the form of a crescent, (Pliny); beginning at the Alps in Liguria, or the Rivierra di Genoa; and terminating at the strait of Messana, or at Reggio, and the promontory Leucopetra; and separating, as by a back or ridge, the Adriatic from the Tuscan sea, (Pliny, Strabo, Ptolemy, Polybius, Vitruvius). This mountain, though high, is greatly short of the height of the Alps. Its name is Celtic, signifying a *high mountain*.

APENRADE, a town of Denmark, in the duchy of Sleswick, seated at the bottom of a gulph in the Baltic sea, between Flensbourg and Hadaschleben. It is 25 miles north from Sleswick. E. Long. 9. 28, N. Lat. 55. 4.

APENZEL, a town of Switzerland, in the canton of the same name, seated on the river Chuz, E. Long. 9. 1. N. Lat. 47. 31. The canton itself, which was allied to the others in 1513, consists only of three or four valleys; having the town and abbey of St Gall on the north; the county of Toggenburg on the west; the lordship of Sax in the canton of Zurich, and that of Gambs in the canton of Shweiz, on the south; and the Rheinthall, or Rhine-valley, on the east. Its greatest length is about 30 miles, and its breadth about 20. It yields good pasturage, and consequently is not destitute of cattle, milk, butter, or cheese. Considerable quantities also of wheat, rye, barley, oats beans, pease, flax, and wine, are produced in it; besides a great deal of fruit, wood, and turf; with mineral waters, and warm baths. There are many mountains in the canton, the highest of which it that called the *Hohesantis*, or the *Hohe-Mesmer*, which commands a prospect of a prodigious extent. There are also several lakes and rivers. The inhabitants, who are partly Protestants,

testants, and partly Roman-catholis, subsist chiefly by their manufactures of linen, crape, fustian, and thread, or by bleaching, and the sale of their cattle, butter, cheese, horses, wood, and coal. Of the twenty-three parishes in the canton, four are Popish, and nineteen protestant. Before the Reformation, the inhabitants were subject to the abbot of St. Gall; but they then shook off his yoke, and united themselves with the other cantons: after that, however, there were violent animosities between the Papists and Protestants, the former continually persecuting the latter, till at last, in 1587, by the mediation of the other cantons, the two parties came to an accommodation, by which certain districts were assigned to each party, whereas before they lived promiscuously together; and though these two divisions now constitute but one canton, yet each forms a distinct community or free state, sending its particular representatives to the diets of the confederacy, and having its separate councils and officers. In spirituals the Papists are subject to the bishop of Constance, but the Protestants to their own consistory. The militia of the former does not exceed 3000, whereas those of the latter amount to 10,000.

APEPSIA, (from α neg. and πεπτω, to *digest*.) Indigestion.

Abstemiousness and excess are alike causes of indigestion. An over-distension of the stomach may in some measure injure its proper tone; and long fasting, by inducing a bad quality in the juices secerned into the stomach, renders it feeble, and generates wind. Hard drinking, and any of the causes of an anorexy, also injure digestion.

The columbo root is said to be particularly useful when the stomach is languid, the appetite defective, digestion with difficulty carried on, or when a nausea with flatulency attends. It is prescribed in substance with any grateful aromatic, or infused in Madeira wine, now and then interposing gentle doses of the tincture of rhubarb.

A mixture of mustard-seed with the columbo root is of admirable utility in complaints of this kind; particularly where acidity and flatulence prevail much in the primæ viæ.

APER, in zoology, a synonime of the sus scrofa. See Sus.

APERIENTS, in the materia medica, an appellation given to such medicines as facilitate the circulation of the humours by removing obstructions.—The five aperient roots of the shops are smallage, fennel, asparagus, parsley, and butcher's broom.

APERTURE, the opening of any thing, or a hole or cleft in any continuous subject.

Aperture, in geometry, the space between two right lines which meet in a point and form an angle.

Aperture, in optics, a round hole in a turned bit of wood or plate of tin, placed within the side of a telescope or microscope, near to the object-glass, by means of which more rays are admitted, and a more distinct appearance of the object is obtained.

Apertures, or *Apertions*, in architecture, are used to signify doors, windows, chimnies, &c.

APETALOSE, or Apetalous, among botanists, an appellation given to such plants as have no flower-leaves.

APEX, the vertex or summit of any thing.

Apex, in antiquity, the crest of a helmet, but more especially a kind of cap worn by the flamens.

Apex, among grammarians, denotes the mark of a long syllable, falsely called a *long accent*.

APHACA, (anc. geog.) the name of a place in Syria, situated between Heliopolis and Byblus, near Lebanon; infamous for a temple of Venus, called *Aphacitis*, near which was a lake, round which fire usually burst forth, and its waters were so heavy, that bodies floated on them. The temple was destroyed by Constantine, as being a school of incontinence, (Eusebius). The name is of Syriac origin, signifying *embraces*.

APHÆRESIS, in grammar, a figure by which a letter or syllable is cut off from the beginning of a word. Thus *ciconio*, by aphæresis, is written *conia; contemnere, temnere; omittere, mittere*, &c.

A like retrenchment at the end of a word is called Apocope.

Aphæresis, in medicine, denotes a necessary taking away or removal of something that is noxious.—In surgery, it signifies an operation whereby something superfluous is taken away.

APHANES: a genus of the monogynia order, belonging to the tetrandia class of plants; and in the natural method ranking under the 35th order, *Senticosæ*. The essential characters are these: The calyx is divided into eight parts; there is no corolla; the seeds are two, and naked. There is only one species, the arvensis or pensley-piert, a native of Britain. It is extremely common in corn-fields. The stalks rise five or six together; they are three inches long, round, hairy, and procumbent: the leaves stand very thick upon them, and are roundish, but divided, as it were, into three parts, and those deeply serrated at their edges. The flower comes out in a double series, arranged all along the branches, and are of a greenish white, and the whole plant is of a greyish or whitish-green colour.

APHASIA, (from α, and φημι. "I speak,") in the sceptic philosophy, denotes a state of doubt, wherein a person not knowing what to determine on, it is best for him to be silent. In this sense, *Aphasia* stands opposed to *phasis*, under which are included both assertion and negation.

APHEK, the name of several cities mentioned in scripture. 1. Aphek in the tribe of Judah, where the Philistines encamped, when the ark was brought from Shiloh, which was taken by them in battle, 1 Sam. iv. 1, 2. &c. It is thought to be the same with Aphekah mentioned in Josh. xv. 53. 2. Aphek in the valley of Jezreel, where the Philistines encamped while Saul and his army were near Jezreel, upon the mountains of Gilboa, 1 Sam. xxix. 1, &c. 3. APHEK a city belonging to the tribe of Asher, near the country of the Sidonians; (Josh. xix. 30, and xiii. 4.) 4. Aphek a city of Syria, one of the principal in Benhadad's kingdom, near which the battle was fought between Ahab and Benhadad, wherein the Syrians were worsted; and whereof, as they retreated with precipitation into the city, the walls fell upon them, and crushed in pieces 27,000, (1 Kings xx. 26, *et seq.*) This city lay between Heliopolis and Biblos.

APHELIUM, or Aphelion, in astronomy, is that point in any planet's orbit, in which it is farthest diſtant from the ſun, being that end of the greater axis of the elliptical orbit of the planet moſt remote from the focus where the ſun is.

APHIOM KARAHISSART, a town of Natolia, in Aſiatic Turkey; it is named *Aphiom*, becauſe it produces a great deal of opium, called *aphiom* by the Turks. E. Long. 32. 18. N. Lat. 38. 35.

APHIS, in zoology, the PUCERON, VINE-FRETTER, or PLANT-LOUSE; a genus of inſects belonging to the order of inſecta hemiptera. The roſtrum or beak of the aphis is inflected; the antennæ or feelers are longer than the thorax; the wings are four, and erect, or they are wanting; the feet are of the ambulatory kind; and the belly often ends in two horns, from which is ejected that moſt delicate juice called *Honey-dew*. HONEY-DEW.

Linnæus enumerates 33 ſpecies of the aphis, all of them inhabitants of particular plants, from which their trivial names are taken; as, aphis *ribis*, *ulmi*, *roſæ*, &c.: And he adds, that there ſeem to be a greater variety of plants producing aphides than there are different ſorts of this inſect. But ſome late obſervers have been able to diſtinguiſh more than double the above number of ſpecies; and it is probable that many more remain ſtill to be added, as many of the ſame kind of plants are found to ſupport two or three quite different ſorts of aphides. Thus the plum-tree has two ſorts very diſtinct from each other: one of a yellowiſh green, with a round ſhort body; the other of a bluiſh green, as it were enamelled with white, and the ſhape more oblong. On the gooſe-berry buſh and currant the ſame aphides may be found; but each of theſe is inhabited by two very different ſpecies: one being of a duſky green, with a ſhort plump body; the other of a paler green, the body more taper, and tranſverſely wrinkled. The roſe-tree, again, ſupports not leſs than three diſtinct ſpecies: the largeſt is of a deep green, having long legs of a browniſh caſt, with the joints of a very dark brown, as are alſo the horns and antennæ; a ſecond ſort is of a paler green, has much ſhorter legs, and a more flat body; the third ſort is of a pale red, its body traſverſely wrinkled, and is moſt frequently on the ſweet-briar.

The extraordinary nature of theſe inſects have for ſome time paſt juſtly excited the wonder and attention of naturaliſts. They were long ranked among the animals which had been claſſed with the true androgynes ſpoken of by Mr Breynius: for having never been catched copulating, it was haſtily concluded that they multiplied without copulation. This, however, was but a doubt, or at beſt a mere ſurmiſe: but this ſurmiſe was believed and adopted by Mr Reaumur; and though he ſupported it by ſome obſervations peculiar to himſelf, the queſtion remained ſtill undecided, till Mr Bonnet ſeemed to have cleared it up in the affirmative, by taking and ſhutting up a young aphis at the inſtant of its birth, in the moſt perfect ſolitude, which yet brought forth in his ſight 95 young ones. The ſame experiment being made on one of the individuals of this family, that had been tried with its chief, the new hermit ſoon multiplied like its parent; and one of this third generation, in like manner brought up in ſolitude, proved no leſs fruitful than the former. Repeated experiments, in this reſpect, as far as the fifth or ſixth generation, all uniformly preſenting the obſerver with *fecund virgins*, were communicated to the Royal Academy of Sciences; when an unforeſeen and very ſtrange ſuſpicion, imparted by Mr Trembley to Mr Bonnet, engaged him anew in a ſeries of ſtill more painful experiments than the foregoing. In a letter which that celebrated obſerver wrote to him from the Hague, the 27th January, 1741, he thus expreſſes himſelf: "I formed ſince the month of November, the deſign of rearing ſeveral generations of ſolitary pucerons, in order to ſee if they would all equally bring forth young. In caſes ſo remote from uſual circumſtances, it is allowed to try all ſorts of means; and I argued with myſelf, Who knows, that but one copulation might ſerve for ſeveral generations? This "*who knows*," to be ſure, was next to avouching nothing; but as it came from Mr. Trembley, it was ſufficient to perſuade Mr Bonnet that he had not gone far enough in his inveſtigation. If the fecundity of aphides was owing to the ſecret copulation ſuggeſted by Mr Trembley; this copulation ſerved at leaſt five or more ſucceſſive generations. Mr Bonnet therefore reared to the amount of the tenth generation of ſolitary aphides, and had the patience to keep an account of the days and hours of the birth of each generation. In ſhort, it was diſcovered, That they are really diſtinguiſhed by ſexes: That there are males and females among them, whoſe amours are the leaſt equivocal of any in the world: that the males are produced only in the tenth generation, and are but few in number: that theſe, ſoon arriving at their full growth, copulate with the females: that the virtue of this copulation ſerves for ten generations: that all theſe generations, except the firſt (from the fecundated eggs), are produced viviparous; and all the individuals are females, except thoſe of the laſt generations, among whom, as we have already obſerved, ſome males make their appearance, to lay the foundations of a freſh ſeries.—Theſe circumſtances have been confirmed by other naturaliſts. In particular, we have a curious and accurate detail of them by Dr Richardſon of Rippon, in the Philoſophical Tranſactions, Vol. xi. art. 22. an extract of which we ſhall here inſert, in order to give the reader as full an inſight into the nature of theſe ſingular inſects, as can be done by a mere detail of facts in themſelves utterly unaccountable.

"The great variety of ſpecies which occur in the inſects now under conſideration, may make an inquiry into their particular nature ſeem not a little perplexed; having them, however, ſkilfully reduced under their proper genus, the difficulty is by this means conſiderably diminiſhed. All the inſects comprehended under any diſtinct genus, we may reaſonably ſuppoſe to partake of one general nature; and, by diligently examining any of the particular ſpecies, may thence gain ſome inſight into the nature of all the reſt. With this view I have choſen, out of the various ſorts of aphides, the largeſt of thoſe found on the roſe-tree; not only as its ſize makes it the more conſpicuous, but as there are few others of ſo long a duration. This ſort, appearing early in the ſpring, continues late in the autumn; while ſeveral are limited to a much ſhorter term, in conformity to the different trees and plants from whence they drew their nouriſhment.

1. "If at the beginning of February the weather happens to be ſo warm as to make the buds of the roſe-tree ſwell and appear green; ſmall aphides are frequently to be found upon them, not larger than the young

Aphis. young ones in summer when first produced. But there being no old ones to be found at this time of the year, which in summer I had observed to be viviparous, I was formerly not a little perplexed by such appearances, and almost induced to give credit to the old doctrine of equivocal generation. That the same kind of animal should at one time of the year be viviparous, and at another time oviparous, was an opinion I could then by no means entertain. This, however, frequent observation has at last convinced me to be fact; having found those aphides which appear early in the spring, to proceed from small black oval eggs which were deposited on the last year's shoots in autumn: though, when it happens that the insects make too early an appearance, I have observed the greatest part to suffer from the sharp weather that usually succeeds, by which means the rose-trees are some years in a manner freed from them.

"Those which withstand the severity of the weather seldom come to their full growth before the month of April; at which time they usually begin to breed, after twice casting off their exuviæ or outward covering. It appears then that they are all females, which produce each of them a very numerous progeny, and that without having intercourse with any male insect. As I observed before, they are viviparous; and what is equally uncommon, the young ones all come into the world backwards. When they first come from the parent, they are enveloped by a thin membrane, having in this situation the appearance of an oval egg; which, I apprehend, must have induced Reaumur to suspect that the eggs discovered by Bonnet were nothing more than mere abortions. These egg-like appearances adhere by one extremity to the mother; while the young ones contained in them extend the other; by that means gradually drawing the ruptured membrane over the head and body to the hind feet. During this operation, and for some time after, by means of something glutinous, the fore part of the head adheres to the vent of the parent. Being thus suspended in the air, it soon frees itself from the membrane in which it was confined, and, after its limbs are a little strengthened, is set down on some tender shoot, and then left to provide for itself.

2. "In the spring months, there appear on the rose-trees but two generations of aphides, including those which immediately proceed from the last year's eggs; the warmth of the summer adds so much to their fertility, that no less than five generations succeed one another in the interval. One is produced in May, which casts off its covering; while the months of June and July each supply two more, which cast off their coverings three or four times, according to the different warmth of the season. This frequent change of the outward covering is the more extraordinary, as it is the oftenest repeated when the insects come the soonest to their growth; which I have sometimes observed to happen in ten days, where warmth and plenty of nourishment have mutually conspired. From which considerations I am thoroughly convinced that these various coverings are not connate with the insect; but that they are, like the scarf-skin, successively produced.

"Early in the month of June, some of the third generation which were produced about the middle of May, after casting off their last covering, discover four erect wings, much longer than their bodies: and the same is observable in all the succeeding generations, which are produced during the summer months; without, however, distinguishing any diversity of sex, as is usual in several other kinds of insects. For some time before the aphides come to their full growth, it is easy to discover which of them will have wings, by a remarkable fullness of the breast, which, in the others, is hardly to be distinguished from the body. When the last covering is rejected, the wings, which were before folded up in a very narrow compass, gradually extend themselves in a most surprising manner, till their dimensions were at last very considerable. But these winged ones have the peculiarity, that the number of them does not seem so much to depend on their original structure, as on the quantity or quality of the nourishment with which they are supplied: it being frequently observed, that those on a succulent shoot have few or none with wings among them, while others of the same generation, on a less tender branch, are most of them winged; as if only the first rudiments of wings were composed in the former, while nature thought proper to expand them in the latter, that they might be more at liberty to supply their wants.

"The increase of these insects in the summer-time is so very great, that, by wounding and exhausting the tender shoots, they would frequently suppress all vegetation, had they not many enemies which restrain them. To enumerate the variety of other insects that in their worm and fly state are constantly destroying them, would exceed the bounds of the present design: there is one, however, so singular in the manner of executing its purpose, that I cannot pass by it without some further notice. This is a very small black ichneumon fly, with a slender body and very long antennæ, which darts its pointed tail into the bodies of the aphides, at the same time depositing an egg in each. This egg produces a worm, which feeds upon the containing insect till it attains its full growth; when it is usually changed to that kind of fly from whence it came. In this, however, it is sometimes prevented by another sort of small black fly, which wounds this worm through its pear-like habitation; and by laying one of its eggs therein, instead of the former fly, produces its own likeness. I must, however, further observe, notwithstanding these insects have many enemies, they are not without friends; if we may consider those as such who were very officious in their attendance, for the good things they expect to reap thereby. The ant and the bee are both of this kind, collecting the honey in which the aphides abound; but with this difference, that the ants are constant visitors, the bee only when flowers are scarce. To which let me also add, that the ants will suck in the delicious nectar while the aphides are in the act of discharging it from the anus; but the bees only collect it from the leaves on which this honey-dew has fallen.

3. "In the autumn I find three more generations of aphides to be produced; two of which make their appearance in the month of August, and the third usually appear before the middle of September. As the two first differ in no respect from those which we meet with in summer, it would be wasting time to dwell any longer upon them; but the third, differing greatly from all the rest, demands our giving it a more

Aphis.

serious attention. Though all the aphides which have hitherto appeared were females, in this tenth generation are found several male insects; not that they are by any means so numerous as the females, being only produced by a small number of the former generation. To which I must further add, that I have observed those which produce males, previously to have produced a number of females; which in all respects resembling those already described, I shall decline taking into any further consideration.

"The females have at first altogether the same appearance with those of the former generations; but, in a few days their colour changes from a green to a yellow, which is gradually converted into an orange colour before they come to their full growth. They differ likewise in another respect, at least from those which occur in the summer, that all those yellow females are without wings. The male insects are, however, still more remarkable, their outward appearance readily distinguishing them from the females of this and of all other generations. When first produced, they are not of a green colour like the rest, but of a reddish brown; and have afterwards, when they begin to thicken about the breast, a dark line along the middle of the back. These male insects come to their full growth in about three weeks time, and then cast off their last covering; the whole insect being, after this operation, of a bright yellow colour, the wings only excepted. But after this they soon change to a darker yellow, and in a few hours to a very dark brown; if we except the body, which is something lighter coloured, and has a reddish cast. They are all of the winged sort; and the wings, which are white at first, soon become transparent, and at length appear like very fine black guaze.

"The males no sooner come to maturity than they copulate with the females; in which act they are readily discovered, as they remain in conjunction for a considerable time, and are not easily disturbed. The commerce between them continues the whole month of October, and may be observed at all times of the day, though I have found it most frequent about noon; especially when the weather is moderately warm, and the sun overcast. The females, in a day or two after their intercourse with the males, I have observed to lay their eggs; which they usually do near the buds, when they are left to their own choice. Where there are a number crowded together, they of course interfere with each other; in which case they will frequently deposite their eggs on other parts of the branches, or even on the spines with which they are beset."

These insects are found in great numbers not only on the stems and leaves, but even upon roots of many trees and plants. Those trees that are most loaded with the insects, as already observed, suffer greatly from them. The plant-lice thrust their sharp-pointed rostrum into the substance of the leaf to draw out their sustenance, which warps the stem and leaves, and occasions in the latter cavities underneath, and swellings above; nay, even in some, a kind of hollow gall filled with insects, as is often seen on elm-leaves.

See plate I. (vol. i.)

It appears astonishing that the slight puncture of so small an animal should so greatly disfigure a plant: but it must be remembered, that plant-lice always live in numerous associations, which increase visibly by the prodigious fruitfulness of those insects; so that although each puncture be slight, yet the number of them is so great, so reiterated, that it is no longer a wonder the leaves should be disfigured. Lovers of gardening and plants are extremely anxious to free and cleanse their trees from this vermin; but their care often proves unavailing, the insect is so fruitful that it soon produces a fresh colony. The best and surest method of extirpating it, is to put on the trees infested with them some larvæ of the plant-louse lion, or aphidivorous flies*; for those voracious larvæ destroy every day a great number of the insects, and that with so much the more facility, as the latter remain quiet and motionless in the neighbourhood of these dangerous enemies, who range over heaps of plant-lice, which they gradually waste and diminish.

* See *Coccinella*, *Ichnemon*, *Hemerobius*, &c.

Aphlastum ‖ Aphrodita.

APHLASTUM, in the ancient navigation, a wooden ornament, shaped like a plume of feathers, fastened on the goose's or swan's neck used by the ancient Greeks in the heads of their ships. The aphlastum had much the same office and effect in a ship than the crest had on the helmet. It seems also to have had this further use, viz. by the waving of a party-coloured ribband fastened to it, to indicate from what quarter the wind blew.

APHONIA, among physicians, signifies a suppression or total loss of voice. It is never a primary disease; but a consequence of many different disorders. The cure is to be effected by removing the disorder from whence the aphonia proceeds.

APHORISM, a maxim or principle of a science; or a sentence which comprehends a great deal in a few words. The word comes from αφοριζω, *I separate*; q. d. a choice or select sentence.—The term is chiefly used in medicine and law. We say, the aphorisms of Hippocrates, of Sanctorius, of Boerhaave, &c. aphorisms of the civil law, &c.

APHRACTI, in the ancient military art, denotes open vessels, without decks or hatches, furnished only at head and stern, with cross planks, whereon the men stood to fight.

APHRODISIA, in antiquity, festivals kept in honour of Venus, the most remarkable of which was that celebrated by the Cyprians. At this solemnity several mysterious rites were practised: all who were initated to them offered a piece of money to Venus as an harlot, and received as a token of the goddess's favour a measure of salt, and a φαλλος; the former, because salt is a concretion of sea-water, to which Venus was thought to owe her birth; the latter, because she was the goddess of wantonness.

APHRODISIACS, among physicians, medicines which increase the quantity of semen, and create an inclination to venery.

APHRODITA, in zoology, an insect of the order of vermes mollusca. The body of the aphrodita is oval, with many small tentacula or protuberances on each side, which serve as so many feet: The mouth is cylindrical at one end of the body, and capable of being retracted, with two bristly tentacula. There are four species of this insect; viz. 1. The aculeata, by some called the *sea-mouse*, with 32 tentacula or feet, an inhabitant of the European seas, and often found in the belly of the cod-fish. It feeds upon shell-fish. See Plate XVII. fig. 4. 2. The scabra, of an oblong shape, scabrous

scabrous on the back, with 20 tentacula. It inhabits the Belgic sea. It is sometimes taken off Brighthelmstone, an inch long. 3. The squamata, with 24 feet, and scaly on the back. The mouth is wrapt up in an aperture, and the tail is terminated by a few very short bristles. It inhabits the European ocean. 4. The imbricata, is very like the former, only its scales are more glabrous. It inhabits the northern ocean.

APHRODITE, in mythology, a name of Venus, derived from αφρος, *froth*; because, according to the poets, Venus is supposed to have been produced from the froth or foam of the sea.

APHRONITRE, in natural history, a name given by the ancients to a particular kind of natrum.

APHTHÆ, in medicine, small, round, and superficial ulcers arising in the mouth. See MEDICINE-*Index*.

APHTHARTODOCETÆ, a sect sworn enemies of the council of Chalcedon. The word is derived from αφθαρτος, *incorruptible*, and δοκεω, *I imagine*; and was given them, because they imagined the body of Jesus Christ was incorruptible and impassible, and not capable of death. They arose among the Eutychians, and made their first appearance in the year 535.

APHYLLANTHES, LEAFLESS FLOWER, or BLUE MONTPELLIER PINK: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 5th order, *Tetrapetaloidæ*. In character it differs not from the JUNCUS or rush, but in having a calyx of six petals, whereas the juncus has no calyx. There is only one species, the Monspelienses, a native of France. The root consists of a number of slender, hard, woody, long and contorted fibres: the radical leaves are very numerous, two inches long, extremely narrow, and wither very quickly. The stalk is round, smooth, without a joint or knot, naked, and tolerably firm; at its top stands a single and very beautiful blue flower, arising from a kind of compound imbricated cup.

APIARY, a place where bees are kept. See the article BEE.

APIASTER, in ornithology, the trivial name of a species of the merops. See MEROPS.

APICES, in botany, the same with ANTHERÆ.

APICIUS. There were at Rome three of that name, famous for their gluttony: the second is the most celebrated of the three. He lived under Tiberius, spent immense sums on his belly, and invented divers sorts of cakes which bore his name. He kept as it were a school of gluttony at Rome. After having spent two millions and a half in entertainments, finding himself very much in debt, he examined into the state of his affairs; and seeing that he had but 250,000 livers remaining, he poisoned himself, out of apprehension of starving with such a sum. He had prostituted himself when very young to Sejanus.

APINA, or *Apinæ*, a town of Apulia, built by Diomedes, as was also Tricæ, (Pliny). *Apinæ* and *Tricæ* is a very proverbial saying for things trifling and of no value, (Martial); and *Apinarii* was the appellation for triflers or buffoons, (Trebellius Pollio.)

APION, a famous grammarian, born in Egypt, was a professor at Rome in the reign of Tiberius. He had all the arrogance of a mere pedant, and amused himself with difficult and insignificant inquiries. One of his principal works was his Antiquities of Egypt.

APIS, in mythology, a divinity worshipped by the ancient Egyptians at Memphis. It was an ox, having certain exterior marks; in which animal the soul of the great Osiris was supposed to subsist. This animal had the preference to all others, as being the symbol of agriculture, the improvement of which that prince had so much at heart.

According to several learned writers on the Egyptian religion, Apis was only a symbolical deity. "Amongst the animals consecrated to ancient rites (says Ammianus Marcellinus), Mnevis and Apis are the most celebrated: the first is an emblem of the sun, the second of the moon." Prophyry tells us, that Apis bore the characteristic signs of the two stars; and Macrobius, who confirms this opinion, adds, that he was equally consecrated to them both.

This bull, become the object of public adoration, it may be supposed, could not be born like other animals; accordingly the priests published that his origin was celestial. "An Apis is seldom born, says Pomponius Mela. He is not produced by the ordinary laws of generation. The Egyptians say he owes his birth to celestial fire." Plutarch explains this passage: "The priests pretend that the moon diffuses a generative influence, and as soon as a cow who takes the bull is struck by it, she conceive an Apis. Accordingly we discover in him the signs of that star."

Such were the fables industriously spread by those who presided over the divine institutions. The vulgar, to whom this emblematical deity presaged abundance, received them eagerly, and implicitly believed them. Pliny has described the characters which distinguished this sacred bull: "A white spot, resembling a crescent, on the right side, and a lump under the tongue, were the distinguishing marks of Apis." When a cow, therefore, which was thought to be struck with the rays of the moon, produced a calf, the sacred guides went to examine it, and if they found it conformable to this description, they announced to the people the birth of Apis, and fecundity.

"Immediately (says Ælian), they built a temple to the new god, facing the rising sun, according to the precepts of Mercury, where they nourished him with milk for four months. This term expired, the priests repaired in pomp to his habitation, and saluted him by the name of Apis. They then placed him in a vessel magnificently decorated, covered with rich tapestry, and resplendent with gold, and conducted him to Nilopolis, singing hymns, and burning perfumes. There they kept him for forty days. During this space of time, women alone had permission to see him, and saluted him in a particular manner. After the inauguration of the god in this city, he was conveyed to Memphis with the same retinue, followed by an innumerable quantity of boats, sumptuously decked out. There they completed the ceremonies of his inauguration, and he became sacred to all the world. Apis was superbly lodged, and the place where he lay was mystically called *the bed*. Strabo having visited his palace, thus describes it: "The edifice where Apis is kept, is situated near the temple of Vulcan. He is fed in a sacred apartment, before which is a large court. The house in which they keep the cow that produced him,

him, occupies one of its sides. Sometimes, to satisfy the curiosity of strangers, they make him go out into this court. One may see him at all times through a window; but the priests produce him also to public view." Once a year (says Solinus) they present a heifer to him, and the same day they kill her.

A bull, born in so marvellous a manner, must be possessed of supernatural knowledge. Accordingly the priests published, that he predicted future events by gestures, by motions, and other ways, which they construed according to their fancy. "Apis (says Pliny) has two temples called *Beds*, which serve as an augury for the people. When they come to consult him, if he enters into a particular one, it is a favourable presage, and fatal if he passes into the other. He gives answers to individuals by taking food from their hands. He refused that offered him by Germanicus, who died soon after." It would be unjust to conclude, that this respectable writer gave credit to such arguries. He relates the opinion of the Egyptians, and contents himself with citing facts without offering his judgment.

Such was the installation of Apis. His anniversary was always celebrated for seven days. The people assembled to offer sacrifices to him, and what is extraordinary oxen were immolated on the occasion. This solemnity did not pass without prodigies. Ammianus Marcellinus, who has collected the testimonies of the ancients, relates them in these words: "During the seven days in which the priests of Memphis celebrate the birth of Apis, the crocodiles forget their natural ferocity, become gentle, and do no harm to any body."

This bull, however, so honoured, must not exceed a mysterious term fixed for his life. "Apis (says Pliny) cannot live beyond a certain number of years. When he has attained that period, they drown him in the fountain of the priests; for it is not permitted, adds Ammianus Marcellinus, to let him prolong his life beyond the period prescribed for him by the sacred books." When this event happened, he was embalmed, and privately let down into the subterraneous places destined for that purpose. In this circumstance, the priests announced that Apis had disappeared; but when he died a natural death, before this period arrived, they proclaimed his death, and solemnly conveyed his body to the temple of Serapis.

"At Memphis was an ancient temple of Serapis, which strangers were forbidden to approach, and where the priests themselves only entered when Apis was interred. It was then (says Plutarch) that they opened the gates called *Lethes* and *Cocythe* (of oblivion and lamentation), which made a harsh and piercing sound."

Ammianus Marcellinus, and Solinus, paint with great energy the general despair of the Egyptians, who with cries and lamentations demanded another Apis from heaven.

According to Plutarch, the term prescribed for the life of Apis was 25 years; which number marked a period of the sun and of the moon, and the bull was consecrated to those two bodies. Syncellius, in his Chronography, when he comes down to the 32d Pharaoh, called *Aseth*, says, "Before Aseth, the solar year consisted of 360 days. This prince added five to complete its course. In his reign a calf was placed amongst the gods, and named *Apis*." And in the Bibliotheca of Fabricius we have the following passage: "It was customary to inaugurate the kings of Egypt at Memphis, in the temple of Apis. They were here first initiated in the mysteries, and were religiously invested; after which, they were permitted to bear the yoke of God, through a town to a place called the *Sanctuary*, the entrance of which was prohibited to the profane. There they will be obliged to swear that they would neither insert months nor days in the year, and that it should remain composed of 365 days, as had been established by the ancients."—From these facts Mr Savary, in his letters on Egypt, infers, that Apis was the tutelary divinity of the new form given to the solar year, and of the cycle of 25 years, discovered at the same time. This deity, besides, had a marked relation of the swelling of the Nile, as is testified by a great number of historians. The new moon which followed the summer solstice, was the æra of this phenomenon, on which the eyes of every body were fixed: And Pliny speaks as follows on this subject: "Apis had on his right side a white mark, representing the crescent: this mark (continues Ælian) indicated the commencement of the inundation." If Apis possessed the characteristic signs which proved his divine origin, he promised fertility and abundance of the fruits of the earth. It seems demonstrated therefore, Mr Savary adds, that this sacred bull, the guardian of the solar year of 365 days, was also regarded as the genius who presided over the overflowing of the river. The priests, by fixing the course of his life to 25 years, and by making the installation of a new Apis, concur with the renewal of the period above mentioned, had probably perceived, as the result of long meteorological observations, that this revolution always brought about abundant seasons, Nothing was better calculated to procure a favourable reception of this emblematical deity from the people, since his birth was a presage to them of a happy inundation, and of all the treasures of teeming nature.

The solemnity of his inauguration was called *Apparition*. That which was renewed every year towards the 12th or 13th of the month *Payn*, which corresponds with the 17th or 18th of June, was called *the birth of Apis*. It was a time of rejoicing, which Ælian describes in the following manner: "What festivals! what sacrifices take place in Egypt at the commencement of the inundation! It is then that all the people celebrate the birth of Apis. It would be tedious to describe the dances, the rejoicings, the shews, the banquets, to which the Egyptians abandon themselves on this occasion, and impossible to express the intoxication of joy which breaks forth in all the towns of the kingdom."

These observations Mr Savary thinks further confirmed by the name of this respectable bull; *Api*, in the Egyptian tongue, signifying number, measure. This epithet perfectly charactarizes an animal established as the guardian of the solar year, the type of the cycle of 25 years, and the presage of a favourable inundation.

Monsieur Huet, Bishop of Avranche, has endeavoured to prove that Apis was a symbolical image of the Patriarch Joseph, and has supported his opinion with

Apis. with all his erudition. Dr Bryant apprehends that the name of *Apis* was an Egyptian term for a father; that it referred to the Patriarch Noah; and that the crescent which was usually marked on the side of the animal, was a representation of the ark.

APIS, or BEE, in zoology, a genus of insects belonging to the order of insecta hymenoptera. The mouth is furnished with two jaws, and a proboscis infolded in a double sheath; the wings are four in number, the two foremost covering those behind when at rest: in the anus or tail of the females and working bees there is a hidden sting.

These insects are distinguished into several species, each of which has its peculiar genius, talents, manners, and disposition. Variety prevails in the order of their architecture, and in the nature of their materials. Some live in society, and share the toils; such are the common bee and the drone. Others dwell and work in solitude, building the cradles of their families; as the leaf-cutter bee does with the rose-tree leaf; the upholsterer with the gaudy tapestry of the corn-rose; the mason-bee with a plaster, the wood-piercer with sawdust. All are employed in their little hermitage, with the care of providing for the wants of their posterity. —The species enumerated by Linnæus are no fewer than 55; of which the following are the most remarkable:—

1. The florisomnis, or black bee with a cylindrical incurvated belly, having two tooth-like protuberances at the anus, and a kind of prickles on the hind-legs. This bee sleeps in flowers. 2. The dentata, or shining green bee, with black wings, and a kind of teeth on the hind thighs. The tongue of this bee is almost as long as its body. 3. The variegata: the breast and belly are variegated with white and black spots; the legs are of an iron colour. It is a native of Europe. This species sleeps in the geraneum phæum, or spotted crane's-bill. 4. The rostrata is distinguished by the upper lip being inflected and of a conical shape, and by the belly being invested with bluish belts. They build their nests in high sandy grounds, and there is but one young in each nest. 5. The ferruginea, or smooth black bee, with the feelers, mouth, belly, and feet, of an iron colour. This is a small bee, and supposed to be of an intermediate kind between the bee and wasp. It is a native of Europe. 6. The cariosa is a yellowish hairy bee; and the feet and front are of a bright yellow colour. It builds in the rotten trees of Europe. 7. The brasilianorum, or pale-red, hairy bee, with the basis of the thighs black. This is a very large bee, every where covered with a testaceous skin. It is a native of America. 8. The lapidaria, or red hairy bee, with a yellow anus, builds in holes of rocks. 9. The terrestris is black and hairy, with a white belt round the breast, and a white anus: it builds its nest very deep in the earth. 10. The violacea is a red bee, and very hairy, with bluish wings. It is a native of Europe. The violacea is said to perforate trees, and hollow them out in a longitudinal direction; they begin to build their cells at the bottom of these holes, and deposit an egg in each cell, which is composed of the farina of plants and honey or a kind of gluten. 11. The muscorum, or yellow hairy bee with a white belly, builds in mossy grounds. The skill displayed by these builders is admirable. In order to enjoy the pleasure of seeing their operations, let a nest be taken to pieces, and the moss conveyed to a distance. The bees will be seen to form themselves into a chain, from their nest to the place where the moss has been laid. The foremost lays hold of some with her teeth, clears it bit by bit with her feet (which circumstance has also gotten them the name of carding-bees), then, by the help of her feet, she drives the unravelled moss under her belly; the second, in like manner, pushes it on to the third. Thus there is formed an uninterrupted chain of moss, which is wrought and interwoven with the greatest dexterity by those that abide by the nest; and to the end, their nest may not be the sport of the winds, and may shelter them from rain, they throw an arch over it, which they compose with a kind of wax, tenaceous, though thin in substance, which is neither the unwrought bees-wax nor the real wax. Dissolved in oil of turpentine, it may be used in taking off impressions. 12. The centuncularis, leaf-cutter, or black bee, having its belly covered with yellow down. The nests of this species are made of leaves curiously plaited in the form of a matt or quilt. There are several varieties of the leaf-cutting bees, all equally industrious. They dig into the ground, and build their nests, of which some have the form and size of thimbles inserted one within another, others the shape and size of goose-quills. These nests are composed of pieces of leaves. Each sort of bees cut into its own materials; some the rose-leaf tree, others the horse chesnut. A careful observer may discover rose-tree leaves cut as it were with a pinking iron; and there he may procure himself the pleasure of seeing with what dexterity a bee, destitute of any mathematical instrument, cuts out a circular piece, fit to be either the bottom or the lid of one of those nests; others it cuts out into ovals and semi-ovals, which form the sides of the nest, into each of which it deposits one egg with ready prepared victuals. 13. The mellifica, or domestic honey-bee. But the particulars concerning this valuable species are so numerous and interesting as to require a separate article for their detail; which the reader will therefore find at due length under the English or popular name BEE.

In the Philosophical Transactions, N° 172*, we have an account of a species of honey-bee found in some parts of America, very different in form and manners from the common bee of Europe. Their combs are composed of a series of small bottles or bladders of wax, of a dusky brown or blackish colour: and each of these is much of the size and shape of a Spanish olive. They hang together in clusters, almost like a bunch of grapes, and are so contrived, that each of them has its aperture, while the bees are at work upon it; but as soon as it is filled with honey, this aperture is closed, and the bees leave it, and go to work upon another vessel. Their lodgings are usually taken up in the hollow of an old tree, or in some cavity of a rock by the sea-side. They are sagacious in choosing the most secure retreats, because their honey is so delicious a bait, that they are hunted after by many animals; and they have no power of defending themselves, having no stings as our bees have. The combs are brittle; and the honey is clear and liquid like rock-water. It is used by the natives rather as a drink with their food than as honey. They use it also in medicine as a purge, drinking half a pint of it in the morning fasting.

*Vol I. 68.

Pl. LVIII.

The

The Abbé Clavigero, in his History of Mexico, mentions a species similar in every respect to ours, but without the sting. This is the bee of Yucatan and Chiapa, which makes the fine clear honey of *Estabentun*, of an aromatic flavour, superior to that of all the other kinds of honey with which we are acquainted. The honey is taken from them six times a-year, that is, once in every other month; but the best is that which is got in November, being made from a fragrant white flower like jessamine, which blows in September, called in that country *Estabentun*, from which the honey has derived its name. This honey is said to be in high estimation with the Europeans who touch at the ports of Yucatan. According to our author, the French of Guarico buy it sometimes for the purpose of sending it as a present to the king. Another species described by the same author, resembles in its form the winged ants, but is smaller than the common bee and without a sting. This insect, which is peculiar to warm and temperate climates, forms nests in size and shape resembling sugar-loaves, and even sometimes greatly exceeding these in size, which are suspended from rocks, or from trees, and particularly from the oak. The populousness of these hives are much greater than those of the common bee. The nymphs of this bee, which are eatable, are white and round, like a pearl. The honey is of a greyish colour, but of a fine flavour.

APIUM, PARSLEY: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural menthod ranking under the 45th order, *Umbellatæ*. The fruit is of an oval shape, and streaked; the involucrum consists of one leaf; and the petals are inflected. There are only two species of apium; the petroselinum, or common parsley, a native of Sardinia; and the graveolens, or smallage, a native of Britain: the culture of both which are well known.

Medicinal Uses, &c. The roots and seeds of the *petroselinum* are used in medicine. The root of parsley is one of the five aperient roots, and in this intention is sometimes made an ingredient in apozems and diet-drinks: If liberally used, it is apt to occasion flatulencies; and thus, by distending the viscera, produces a contrary effect to that intended by it: the taste of this root is somewhat sweetish, with a light degree of warmth and aromatic flavour. The seeds are an ingredient in the electuary of bay-berries.—The roots of *smallage* are also in the number of aperient roots, and have been sometimes prescribed as an ingredient in aperient apozems and diet-drinks, but are at present disregarded. The seeds of the plant are moderately aromatic, and were formerly used as carminatives; in which intention they are, doubtless, capable of doing service, though the other warm seeds, which the shops are furnished with, render these unnecessary; and accordingly the Edinburgh college, which retains the roots, has expunged the seeds.

Besides its medicinal virtues above mentioned, the common parsley is reckoned an effectual cure for the rot in sheep, provided they are fed with it twice a-week for two or three hours each time: but hares and rabbits are so fond of this herb, that they will come from a great distance to feed upon it; and in the countries where these animals abound, they will destroy it if not very securely fenced against them; so that whoever has a mind to have plenty of hares in their fields, may draw them from all parts of the country by cultivating parsley.

APIVORUS, in ornithology, a synonime of a species of falco. See FALCO.

APLUDA: A genus of the monœcia order, belonging to the polygamia class of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is a bivalved gluma; the floscules of the female are sessile, and the male floscules are furnished with pedunculi; the female has no calyx; the corolla has a double valve; there is but one stylus, and one covered seed. The male has three stamina. There are three species of apluda, viz. the mutica, aristata, and zengites, all natives of the Indies.

APOBATANA, the metropolis of Media, and where the kings kept their treasure (Isidorus Characenus); supposed to be the same wiih *Ecbatana*.

APOBATERION, in antiquity, a valedictory speech, or poem made by a person on departing out of his own country, and addressed to his friends or relations.

APOBATHRA, a place near Sestos (Strabo); the landing place where Xerxes ships were frozen and stuck in the ice (Eustathius).

APOCALYPSE, REVELATION, the name of one of the sacred books of the New Testament, containing revelations concerning several important doctrines of Christianity. The word is Greek, and derived from αποκαλυπτω, to *reveal*, or *discover*.

This book, according to Irenæus, was written about the year 96 of Christ, in the island of Patmos, whither St. John had been banished by the emperor Domitian. But Sir Isaac Newton places the writing of it earlier, viz. in the time of Nero. Some attribute this book to the arch-heretic Cerinthus: but the ancients unanimously ascribed it to John, the son of Zebedee, and brother to James; whom the Greek father call the *Divine*, by way of eminence, to distinguish him from the other Evangelists. This book has not, at all times, been esteemed canonical. There were many churches in Greece, as St Jerome informs us, which did not receive it; neither is it in the catalogue of canonical books prepared by the council of Laodicea, nor in that of St Cyril of Jerusalem; but Justin, Irenæus, Origin, Cyprian, Clemens of Alexandria, Tertullian, and all the fathers of the fourth, fifth, and the following centuries, quote the Revelations as a book then acknowledged to be canonical. The Alogians, Marcionites, Cerdonians, and Luther himself, rejected this book: but the Protestants have forsaken Luther in this particular; and Beza has strongly maintained against his objections, that the Apocalypse is authentic and canonical.

The Apocalypse consists of twenty-two chapters. The three first are an instruction to the bishops of the seven churches of Asia Minor. The fifteen following chapters contain the persecutions which the church was to suffer from the Jews, heretics, and Roman emperors. Next, St. John prophesies of the vengeance of God, which he will exercise against those persecutors, against the Roman empire, and the city of Rome; which, as the Protestants suppose, he describes under the name of Babylon, the great whore, seated upon seven

seven hills. In the last place, the 19th, 20th, 21st, and 22d chapters, describe the triumph of the church over its enemies, the marriage of the Lamb, and the happiness of the church triumphant.

"It is a part of this prophecy (says Sir Isaac Newton), that it should not be understood before the last age of the world; and therefore it makes for the credit of the prophecy, that it is not yet understood. The folly of interpreters has been to foretel times and things by this prophecy, as if God designed to make them prophets. By this rashness they have not only exposed themselves, but brought the prophecy also into contempt. The design of God was much otherwise: He gave this and the prophecies of the Old Testament, not to gratify mens curiosities, by enabling them to foreknow things: but that, after they were fulfilled, they might be interpreted by the events; and his own providence, not the interpreters, be then manifested thereby to the world. And there is already so much of the prophecy fulfilled, that as many as will take pains in this study, may see sufficient instances of God's providence."

There have been several other works published under the title of *Apocalypses*. Sozomen mentions a book used in the churches of Palestine, called the *Apocalypse*, or *Revelation of St Peter*. He also mentions an Apocalypse of St Paul; which the Cophtæ retain to this day. Eusebius also speaks of both these Apocalypses. St Epiphanius mentions an Apocalypse of Adam; Nicephorus, an Apocalypse of Esdras; Gratian and Cedrenus, an Apocalypse of Moses, another of St Thomas, and another of St Stephen; St Jerom, an Apocalypse of Elias. Porphyry, in his life of Plotin, makes mention of the Apocalypse or Revelations of Zoroaster, Zostrian, Nicothæus, Allogenes, &c.

APOCOPE, among grammarians, a figure which cuts off a letter or syllable from the end of the word; as *ingenî for ingenii*.

APOCRISARIUS, in ecclesiastical antiquity, a sort of resident in an imperial city, in the name of a foreign church or bishop, whose office was to negociate, as proctor, at the emperor's court, in all ecclesiastical causes in which his principals might be concerned. The institution of the office seems to have been in the time of Constantine, or not long after, when, the emperors being become Christians, foreign churches had more occasions to promote their suits at court than formerly. However, we find it established by law in the time of Justinian. In imitation of this officer, almost every monastery had its Apocrisarius, or resident, in the imperial city.

The title and quality of Apocrisary became at length appropriated to the Pope's agent, or *Nuncio*, as he is now called; who resided at Constantinople, to receive the Pope's dispatches, and the emperor's answers. The word is formed from Αποκρινειν, *to answer*.

APOCRUSTICS, in medicine, the same with repellents. See REPELLENTS.

APOCRYPHA, or APOCRYPHAL BOOKS, such books as are not admitted into the canon of scripture, being either not acknowledged as divine, or considered as spurious. The word is Greek; and derived from απο, and κρυπτω to *hide* or *conceal*.

When the Jews published their sacred books, they gave the appellations of *canonical* and *divine* only to such as they then made public: such as were still retained in their archives they called *apocryphal*, for no other reason but because they were not public; so that they might be really sacred and divine, though not promulged as such.

Thus, in respect of the Bible, all books were called *apocryphal* which were not inserted in the Jewish canon of scripture. Vossius observes, that, with regard to the sacred books, none are to be accounted apocryphal, except such as had neither been admitted into the synagogue nor the church, so as to be added to the canon, and read in public.

The protestants do not only reckon those books to be apocryphal which are esteemed such in the church of Rome, as the prayer of Manasseth king of Judah, the third and fourth books of Esdras, St Barnabas's epistle, the book of Hermos, the addition at the end of Job, and the 151st psalm; but also Tobit, Judith, Esther, the book of Wisdom, Jesus the son of Sirach, Baruch the prophet, the Song of the Three Children, the history of Susannah, the history of Bell and the Dragon, and the first and second books of Maccabees.

It is now pretended that these books were not received by the Jews, or so much as known to them. None of the writers of the New Testament cite or mention them: neither Philo nor Josephus speak of them. The Christian church was for some ages an utter stranger to these books. Origen, Athanasius, Hilary, Cyril of Jerusalem, and all the orthodox writers, who have given catalogues of the canonical books of scripture, unanimously concur in rejecting these out of the canon. And for the New Testament, they are divided in their opinions, whether the epistle to the Hebrews, the epistle of St James, and the second epistle of St Peter, the second and third epistles of John, the epistle of St Jude, and the Revelations, are to be acknowledged as canonical or not.

The Protestants acknowledge such books of scripture only to be canonical as were so esteemed to be in the first ages of the church; such as are cited by the earliest writers among the Christians as of divine authority, and after the most diligent enquiry were received and so judged to be by the council of Laodicea. The several epistles abovementioned, and the book of Revelations, whatever the sentiments of some particular persons are or may have been of them, are allowed by all the reformed churches to be parts of the canon of the New Testament.

The apocryphal books, however, according to the sixth article of the church of England, are to be read for example of life and instruction of manners; but it doth not apply them to establish any doctrine.

APOCYNUM, (Αποκυνον, of απο and κυων *a dog*, because the ancients believed this plant would kill dogs), DOGSBANE: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 30th order *Contortæ*. The essential characters are: The corolla is bell-shaped; and the filaments are five, alternate with the stamina.

Species. Of this genus botanical writers enumerate 11 species; of which the following are the most remarkable: 1. The venetum, with an upright herbaceous stalk, grows on a small island in the sea near Venice, but is supposed to have been originally brought from

from some other country. There are two varieties of this; one with a purple, and the other with a white flower. The roots creep very much, and by them only it is propagated; for it seldom produces any seeds either in the gardens where it is cultivated, or in those places where it grows naturally. Mr Miller tells us, that he had been assured by a very curious botanist, who resided many years at Venice, and constantly went to the spot several times in the season to procure the seeds, had any been produced, that he never could find any pods formed on the plants. The stalks rise about two feet high, and are garnished with smooth oval leaves placed opposite; the flowers grow at the top of the stalks, in small umbels, and make a very pretty appearance. The flowers appear in July and August. 2. The speciossimum, with large flowers, is a native of Jamaica in the savannahs, whence it has the name of *Savannah-flower*, by which it is generally known in that island. This sort rises three or four feet high, having woody stalks which send out a few lateral branches, garnished with smooth oval leaves placed by pairs opposite, of a shining green colour on their upper sides, but pale and veined underneath. The flowers are produced from the sides of the branches, upon long footstalks: there are commonly four or five buds at the end of each; but there is seldom more than one of them which comes to the flower. The flower is very large, having a long tube which spreads open wide at the top, of a bright yellow, and makes a fine appearance, especially in those places where the plants grow, naturally, being most part of the year in flower. 3. Cordatum with a climbing stalk. 4. The villosum, with hairy flowers and a climbing stalk. These were discovered at La Vera Cruz in New Spain, by Dr William Houston, who sent their seeds to England. They are both climbers and mount to the tops of the tallest trees. In England they have climbed over plants in the stoves, and risen to upwards of 20 feet high. The third sort has produced flowers several times: but the fourth never showed an appearance of any.

Culture. The first sort is hardy enough to live in England in the open air, provided it is planted in a warm situation and dry soil. It is propagated, as we have already observed, by its creeping roots; the best time for removing and planting which is in the spring, just before they begin to push out new stalks. The other sorts are propagated by seeds, but are so tender as to require being kept constantly in a stove.

Properties. All the species of this plant abound with a milky juice, which flows out from any part of their stalks and leaves when they are broken: this is generally supposed to be hurtful if taken inwardly, but doth not blister the skin when applied to it as the juice of spurge and other acrid plants. The pods of all the sorts are filled with seeds, which are for the most part compressed and lie over one another *imbricatim*, like the tiles of a house; these have each a long plume of a cottony down fastened to their crowns, by which, when the pods are ripe and open, the seeds are wafted by the wind to a considerable distance, so that the plants become very troublesome weeds. This down is in great esteem in France, for stuffing of easy chairs, making quilts, &c. for it is exceedingly light and elastic. It is called by the French *delawad*; and might probably become a vendible commodity in England, were people attentive to the collecting of it in Jamaica where the plants are found in plenty.

APODECTÆ, in antiquity, a denomination given to ten general receivers appointed by the Athenians to receive the public revenues, taxes, debts, and the like. The apodectæ had also a power to decide controversies arising in relation to money and taxes, all but those of the most difficult nature and highest concern, which were reserved to the courts of judicature.

APODECTÆI, in the Athenian government, officers appointed to see that the measures of corn were just.

APODES, in a general sense, denotes things without feet. Zoologists apply the name to a fabulous sort of birds, said to be found in some of the islands of the New World, which, being entirely without feet, support themselves on the branches of trees by their crooked bills.

APODES in the Linnæan system, the name of the *first order* of fishes, or those which have no belly-fins. See ZOOLOGY.

APODICTICAL, among philosophers, a term importing a demonstrative proof, or systematical method of teaching.

APODOSIS, in rhetoric, makes the third part of a complete exordium, being properly the application, or restriction of the *protasis*. The apodosis is the same with what is otherwise called *axiosis*; and stands opposed to *protasis*: e. gr. *protasis*, all branches of history are necessary for a student; *catesceue*, so that, without these, he can never make any considerable figure; *apodosis*, but literary history is of a more especial use, which recommends it, &c.

APODYTERIUM, in the ancient baths, the apartments where persons dressed and undressed.

APOGEE, in ASTRONOMY, that point in the orbit of a planet, which is at the greatest distance from the earth. The apogee of the sun is that part of the earth's orbit which is at the greatest distance from the sun; and consequently the sun's apogee, and the earth's aphelion, are one and the same point.

APOLIDES, in antiquity, those condemned for life to the public works, or exiled into some island, and thus divested of the privileges of Roman citizens.

APOLLINARIAN GAMES, in Roman antiquity, were instituted in the year of Rome 542. The occasion was a kind of oracle delivered by the prophet Marcus after the fatal battle at Cannæ, declaring, that to expel the enemy, and cure the people of an infectious disease which then prevailed, sacred games were to be annually performed in honour of Apollo; the prætor to have the direction of them, and the decemviri to offer sacrifices after the Grecian rite. The senate ordered that this oracle should be observed the rather, because another of the same Marcus, wherein he had foretold the overthrow at Cannæ, had come true; for this reason they gave the prætor 12,000 ases out of the public cash to defray the solemnity. There were sacrificed an ox to Apollo, as also two white goats, and a cow to Latona; all with their horns gilt. Apollo had also a collection made for him, besides what the people who were spectators gave voluntarily. The first prætor by whom they were held was P. Cornelius Sylla. For some time they were moveable or indictive; but at length were fixed, under P. Licinius Varus, to the fifth of July, and made perpetual. The men, who were spectators at these games, wore garlands on their heads;

Apollinarians, Apollinaris.

the women performed their devotions in the temples at the ſame time, at laſt they carouſed together in the veſtibles of their houſes, the doors ſtanding open. The Apollinarian games were merely ſcenical; and at firſt only obſerved with ſinging, piping, and other ſorts of muſic; but afterwards there were alſo introduced all manner of mountebank-tricks, dances, and the like; yet ſo as that they ſtill remained ſcenical, no chariot races, wreſtling, or the like laborious exerciſes of the body, being ever practiſed at them.

APOLLINARIANS, Apollinarists, called alſo by Epiphanius *Dimaritæ*, ancient hereticks, who denied the proper humanity of Chriſt, and maintained that the body which he aſſumed was endowed with a ſenſitive, and not a rational, ſoul, but that the Divine Nature ſupplied the place of the intellectual principle in man. This ſect derived its name from Apollinaris, biſhop of Laodicea, in the fourth century.

The Apollinarians have been charged with other opinions, ſuch as, the Millenarian and Sabellian, the pre-exiſtence of the body of Chriſt, and the paſſion of his Deity: but eccleſiaſtical writers are not agreed with reſpect to theſe and other particulars. Their doctrine was firſt condemned by a council of Alexandria in the year 362, and afterwards in a more formal manner by a council at Rome in 375; and by another council in 378, which depoſed Apollinaris from his biſhopric. Notwithſtanding all, his doctrine ſpread through moſt of the churches of the eaſt; and his followers were ſubdivided into various ſects. In 388, the emperor Theodoſius enacted a law, forbidding them to hold aſſemblies, to have any eccleſiaſtics or biſhops, or to dwell in cities. The rigorous execution of this law, in concurrence with the decrees of different councils, reduced them to a very ſmall number, and their doctrine had no long duration.

APOLLINARIS (Caius Sulpicius), a very learned grammarian, born at Carthage, lived in the 2d century, under the Antonines; he is ſuppoſed to be the author of the verſes which are prefixed to the comedies of Terence, and contain the arguments of them. He had for his ſucceſſor in the profeſſion of grammar Helvius Pertinax, who had been his ſcholar, and was at laſt emperor.

Apollinaris Sidonius (Caius Lollius), an eminent Chriſtian writer and biſhop in the 5th century, was born of a noble family in France. He was educated under the beſt maſters, and made a prodigious progreſs in the ſeveral arts and ſciences, but particularly in poetry and polite literature. After he had left the ſchools, he applied himſelf to the profeſſion of war. He married Papianilla, the daughter of Avitus, who was conſul, and aftewards emperor, by whom he had three children. But Majorianus in the year 457 having deprived Avitus of the empire, and taken the city of Lyons, in which our author reſided, Apollinaris fell into the hands of the enemy. However, the reputation of his learning ſoftened Majorianus's reſentments, ſo that he treated him with the utmoſt civility, in return for which Apollinaris compoſed a panegyric to his honour; which was ſo highly applauded, that he had a ſtatue erected to him at Rome, and was honoured with the title of *Count*. In the year 467 the emperor Anthemius rewarded him for the panegyric, which he had written in honour of him, by raiſing him to the poſt of governor of Rome, and afterwards to the dignity of a patrician and ſenator, and erecting a ſtatue to him. But he ſoon quitted theſe ſecular employments for the ſervice of the church. The biſhopric of Clermont being vacant in 472 by the death of Eparchus, Apollinaris, who was then only a layman, was choſen to ſucceed him without any intereſt or ſolicitation on his part, in which ſee he acted with the greateſt integrity. Clermont being beſieged by the Goths, he animated the people to the defence of that city, and would never conſent to the ſurrender of it; ſo that, when it was taken about the year 480, he was obliged to retire; but he was ſoon reſtored by Evariges king of the Goths, and continued to govern the church as he had done before. He died in peace the 21ſt of Auguſt 487; and his feſtival is ſtill obſerved in the church of Clermont, where his memory is had in great veneration. He is eſteemed the moſt elegant writer of his age, both in proſe and verſe. He wrote a great many little pieces; but preſerved none but thoſe which he thought were worthy of being continued down to poſterity. He collected himſelf the nine books which we have remaining of his letters. His chief pieces in poetry are the three panegyrics upon the emperors Avitus, Majorianus, and Anthemius. The reſt of them are a collection of poems addreſſed to his friends upon particular ſubjects. His letters contain a variety of particulars relating to polite literature and profane hiſtory.

Apollinarius, Apollo.

APOLLINARIUS (Claudius), a learned biſhop of Hierapolis, who, about the year 170, preſented to Marcus Aurelius an excellent Apology for the Chriſtians.

Apollinarius the Younger, thus called to diſtinguiſh him from his father, called *Apollinarius the Elder*, was at firſt lector or reader of Laodicea, and afterwards biſhop of that city. He was univerſally eſteemed the greateſt man of his age, both for learning and piety, and a moſt accurate and nervous defender of the faith againſt all it enemies: but notwithſtanding this on his advancing ſome opinions that were not approved, he was anathematized as an heretic by the ſecond general council of Conſtantinople in 381.

APOLLO, in mythology, a Pagan deity worſhipped by the Greeks and Romans. Cicero mentions four of his name: the moſt ancient of whom was the ſon of Vulcan; the ſecond a ſon of Corybas, and born in Crete; the third an Arcadian, called *Nomian*, from his being a great legiſlator; and the laſt, to whom the greateſt honour is aſcribed, the ſon of Jupiter and Latona.

Apollo had a variety of other names, either derived from his principal attributes, or the chief places where he was worſhipped. He was called the *Healer* from his enlivening warmth and cheering influence; *Pæan*, from the peſtilential heats: to ſignify the former, the antients placed the graces in his right hand; and for the latter, a bow and arrows in his left: *Nomius*, or the ſhepherd, from his fertilizing the earth, and thence ſuſtaining the animal creation: *Delius*, from his rendering all things manifeſt: *Pythius*, from his victory over Python; *Lycias*, *Phœbus*, and *Phaneta*, from his purity and ſplendor. As Apollo is almoſt always confounded by the Greeks with the ſun, it is no wonder that he ſhould be dignified with ſo many attributes. It was natural for the moſt glorious object in nature, whoſe influence is felt by all creation, and ſeen by eve-

Apollo. ry animated part of it, to be adored as the fountain of light, heat, and life. The power of healing diseases being chiefly given by the ancients to medicinal plants and vegetable productions, it was natural to exalt into a divinity the visible cause of their growth. Hence he was also styled the *God of Physic*; and that external heat which cheers and invigorates all nature, being transferred from the human body to the mind, gave rise to the idea of all mental effervescence coming from this god; hence, likewise, poets, prophets, and musicians are said to be *numine afflati*, inspired by Apollo.

Whether Apollo was ever a real personage, or only the great luminary, many have doubted. Indeed, Vossius has taken great pains to prove this god to be only a metaphorical being, and that there never was any other Apollo than the sun. "He was styled the *Son of Jupiter* (says this author), because that god was reckoned by the ancients the author of the world. His mother was called *Latona*, a name which signifies *hidden*; because, before the sun was created, all things were wrapped up in the obscurity of chaos. He is always represented as beardless and youthful, because the sun never grows old or decays. And what else can his bow and arrows imply, but his piercing beams?" And adds, "that all the ceremonies which were performed to his honour, had a manifest relation to the great source of light which he represented. Whence (he concludes) it is vain to seek for any other divinity than the sun, which was adored under the name of Apollo." However, though this be in general true, yet it does appear, from many passages in ancient authors, that there was some illustrious personage named *Apollo*, who, after his apotheosis, was taken for the sun; as Osiris and Orus in Egypt, whose existence cannot be called in question, were, after their death, confounded with the sun, of which they became the symbols, either from the glory and splendor of their reigns, or from a belief that their souls had taken up their residence in that luminary.

Of the four Apollos mentioned by Cicero, it appears that the three last were Greeks, and the first an Egyptian; who according to Herodotus, was the son of Osiris and Isis, and called *Orus*. Pausanias is of the same opinion as Herodotus, and ranks Apollo among the Egyptian divinities. The testimony of Diodorus Siculus is still more express; for in speaking of Isis, after saying that she had invented the practice of medicine, he adds, that she taught this art to her son Orus, named *Apollo*, who was the last of the gods that reigned in Egypt.

It is easy to trace almost all the Grecian fables and mythologies from Egypt. If the Apollo of the Greeks was said to be the son of Jupiter, it was because Orus the Apollo of the Egyptians had Osiris for his father, whom the Greeks confounded with Jupiter. If the Greek Apollo was reckoned the god of eloquence, music, medicine, and poetry, the reason was, that Osiris, who was the symbol of the sun among the Egyptians, as well as his son Orus, had there taught those liberal arts. If the Greek Apollo was the god and conductor of the muses, it was because Osiris carried with him in his expedition to the Indies singing women and musicians. This parallel might be carried on still further; but enough has been said to prove that the true Apollo was that of Egypt. Apollo.

To the other perfections of this divinity the poets have added beauty, grace, and the art of captivating the ear and the heart, no less by the sweetness of his eloquence, than by the melodious sounds of his lyre. However, with all these accomplishments, he had not the talent of captivating the fair, with whose charms he was enamoured. But the amours and other adventures related of this god during his residence on earth, are too numerous, and too well known, to be inserted here. His musical contests, however, being more connected with the nature of this work, must not be wholly unnoticed.

To begin, therefore, with the dispute which he had with Pan, that was left to the arbitration of Midas.

Pan, who thought he excelled in playing the flute, offered to prove that it was an instrument superior to the lyre of Apollo. The challenge was accepted; and Midas, who was appointed the umpire in this contest, deciding in favour of Pan, was rewarded by Apollo, according to the poets, with the ears of an ass, for his stupidity.—This fiction seems founded upon history. Midas, according to Pausanias, was the son of Gordias and Cybele; and reigned in the Greater Phrygia, as we learn from Strabo. He was possessed of such great riches, and such an inordinate desire of increasing them by the most contemptible parsimony, that, according to the poets, he converted whatever he touched into gold. However, his talent for accumulation did not extend to the acquirement of taste and knowledge in the fine arts; and, perhaps, his dulness and inattention to these provoked some musical poets to invent the fable of his decision in favour of Pan against Apollo. The scholiast upon Aristophanes, to explain the fiction of his long ears, says, that it was designed to intimate that he kept spies in all parts of his dominions.

Marsyas, another player on the flute, was still more unfortunate than either Pan, or his admirer Midas. This Marsyas, having engaged in a musical dispute with Apollo, chose the people of Nysa for judges. Apollo played at first a simple air upon his instrument; but Marsyas, taking up his pipe, struck the audience so much by the novelty of its tone, and the art of his performance, that he seemed to be heard with more pleasure than his rival. Having agreed upon a second trial of skill, it is said that the performance of Apollo, by accompanying the lyre with his voice, was allowed greatly to excel that of Marsyas upon the flute alone. Marsyas, with indignation, protested against the decision of his judges; urging that he had not been fairly vanquished according to the rules stipulated, because the dispute was concerning the excellence of their several instruments, not their voices; and that it was wholly unjust to employ two arts against one.

Apollo denied that he had taken any unfair advantages of his antagonist, since Marsyas had employed both his mouth and fingers in performing upon his instrument; so that, if he was denied the use of his mouth, he would be still more disqualified for the contention. The judges approved of Apollo's reasoning, and ordered a third trial. Marsyas was again vanquished; and Apollo, inflamed by the violence of the dispute, flea'd him alive for his presumption. See Marsyas.

Pan-

Apollo.

Pausanias relates a circumstance concerning this contest, that had been omitted by Diodorus, which is, that Apollo accepted the challenge from Marsyas, upon condition that the victor should use the vanquished as he pleased.

Diodorus informs us, that Apollo, soon repenting of the cruelty with which he had treated Marsyas, broke the strings of the lyre, and by that means put a stop, for a time, to any farther progress in the practice of that new instrument.

The next incident to be mentioned in the history of Apollo is his defeat of the serpent Python.

The waters of Deucalion's deluge, says Ovid, which had overflowed the earth, left a slime, from whence sprung innumerable monsters; and among others the serpent Python, which made great havoc in the country about Parnassus. Apollo, armed with his darts, put him to death; which, physically explained, implies, that the heat of the sun having dissipated the noxious steams, those monsters soon disappeared: or, if this fable be referred to history, the serpent was a robber, who haunting the country about Delphos, and very much infesting those who came thither to sacrifice; a prince, who bore the name of Apollo, or one of the priests of that god put him to death.

This event gave rise to the institution of the Pythian games, so frequently mentioned in the Grecian history; and it was from the legend of Apollo's victory over the Python that the god himself acquired the name of *Pythius*, and his priestess that of PYTHIA. The city of Delphos, where the famous oracles were so long delivered, was frequently styled *Pytho*.

As Apollo was the god of the fine arts, those who cultivated them were called *his sons*. Of this number was Philammon of Delphos, whom the poets and mythologists make the twin-brother of Autolychus, by the nymph Chione, and Apollo and Mercury. It is pretended that both these divinities were favoured by the nymph on the same day, and that their sires were known from their different talents. Philammon, a great poet and musician, was reported to be the offspring of the god who presides over those arts; and Autolychus, from the craftiness and subtility of his disposition, was said to have sprung from Mercury, god of theft and fraud. Philammon is one of the first, after Apollo, upon fabulous record, as a vocal performer, who accompanied himself with the sound of the lyre: his son was the celebrated Thamyris. See THAMYRIS.

There can be no doubt but that Apollo was more generally revered in the Pagan world than any other deity; having, in almost every region of it, temples, oracles, and festivals, as innumerable as his attributes: the wolf and hawk were consecrated to him, as symbols of his piercing eyes; the crow and the raven, because these birds were supposed to have by instinct the faculty of prediction; the laurel, from a persuasion that those who slept with some branches of that tree under their heads received certain vapours, which enabled them to prophesy. The cock was consecrated to him, because by his crowing he announces the rising of the sun; and the grasshopper on account of his singing faculty, which was supposed to do honour to the god of music. Most of the ancient poets have celebrated this tuneful insect, but none better than Anacreon, Ode 43.

Plato says that the grasshopper sings all summer without food, like those men who, dedicating themselves to the muses, forget the common concerns of life.

Apollo.

The swan was regarded by the ancients as a bird sacred to Apollo in two capacities; first, as being, like the crow and raven, gifted with the spirit of prediction; and, secondly, for his extraordinary vocal powers. The sweetness of his song, especially at the approach of death, was not only extolled by all the poets of antiquity, but by historians, philosophers, and sages; and to call a great writer the *swan* of his age and nation, was a full acknowledgment of his sovereignty*. Thus Horace calls Pindar *the Theban swan*.

* See the article *Anas*

Plutarch, who was himself a priest of Apollo, impressed with the highest respect and veneration for him and for music, in his dialogue upon that art, makes one of his interlocutors say, that an invention so useful and charming could never have been the work of man, but must have originated from some god, such as Apollo, the inventor of the flute and lyre, improperly attributed to Hyagnis. Marsyas, Olympus, and others; and the proofs he urges in support of this assertion, show, if not its truth, at least that it was the common and received opinion.

All dances and sacrifices, says he, used in honour of Apollo, are performed to the sound of flutes: the statue of this god at Delos, erected in the time of Hercules, had in its right-hand a bow; and on the left stood the three graces, who were furnished with three kinds of instruments; the lyre, the flute, and the syrinx. The youth also, who carries the laurel of Tempe to Delphos, is accompanied by one playing on the flute; and the sacred presents formerly sent to Delos by the Hyperboreans, were conducted thither to the sound of lyres, flutes, and shepherds pipes. He supports these facts by the testimonies of the poets Alcæus, Alcmon, and Corinna.

It seems as if the account of Apollo could not be concluded by any thing that is left to offer on the subject, so properly, as by part of the celebrated hymn of Callimachus, which during many ages was performed and heard by the most polished people on the globe, with the utmost religious zeal, at the festivals instituted to this god.

Ha! how the laurel, great APOLLO's tree,
And all the cavern, shakes! Far off, far off,
The man that is unhallow'd: for the god
Approaches. Hark! he knocks: the gates
Feel the glad impulse; and the sever'd bars
Submissive clink against their brazen portals.
Why do the Delian palms incline their boughs,
Self-mov'd; and hov'ring swans, their throats releas'd
From native silence, carol sounds harmonious?
  Begin, young men, the hymn: let all your harps
Break their inglorious silence; and the dance,
In mystic numbers trod, explain the music.
But first by ardent pray'r, and clear lustration,
Purge the contagious spots of human weakness:
Impure no mortal can behold Apollo.
So may you flourish, favour'd by the god,
In youth with happy nuptials, and in age
With silver hairs, and fair descent of children;
So lay foundations for aspiring cities,
And bless your spreading colonies' increase.
  Pay sacred rev'rence to Apollo's song;
Lest watchful the far-shouting god emit
His fatal arrows. Silent, Nature stands;
And seas subside, obedient to the sound
Of Io! Io Pæan! nor dares Thetis
Longer bewail her lov'd Achilles' death;

For Phœbus was his foe. Nor must sad Niobe
In fruitless sorrow persevere, or weep
Even thro' the Phrygian marble. Hapless mother!
Whose fondness could compare her mortal offspring
To those which fair Latona bore to Jove.
Io! again repeat ye, Io Pæan!

Recite Apollo's praise till night draws on,
The ditty still unfinish'd; and the day
Unequal to the godhead's attributes
Various, and matter copious of your songs.
Sublime at Jove's right-hand Apollo sits,
And thence distributes honour, gracious king,
And theme of verse perpetual. From his robe
Flows light ineffable! his harp, his quiver,
And Lactian bow, are gold: with golden sandals
His feet are shod. How rich! how beautiful!
Beneath his steps the yellow min'ral rises;
And earth reveals her treasures. Youth and beauty
Eternal deck his cheek: from his fair head
Perfumes distil their sweets; and cheerful Health,
His duteous hand-maid, through the air improv'd
With lavish hand diffuses scent ambrosial.
The spearman's arm by thee, great god, directed,
Sends forth a certain wound. The laurel'd bard,
Inspir'd by thee, composes verse immortal.
Taught by thy art divine, the sage physician
Eludes the urn, and chains or exiles death.

Perpetual fires shine hallow'd on thy altars,
When annual the Carnean feast is held:
The warlike Libyans, clad in armour, lead
The dance; with clanging swords and shields they beat
The dreadful measure: In the chorus join
Their women; brown, but beautiful: such rites
To thee well pleasing ————————
———————— The monstrous Python
Durst tempt thy wrath in vain; for dead he fell,
To thy great strength and golden arms unequal.
Io! while thy unerring hand elanc'd
Another and another dart, the people
Joyfully repeated *Io! Io Pæan!*
Elance the dart, Apollo; for the safety
And health of man, gracious thy mother bore thee!

PRIOR.

Apollo-Belvidere, one in the first class of the ancient statues. The excellence of this statue consists in the expression of something divine, whereas the rest excel only in things that are common to men. This statue may perhaps justly enough claim the preference, even in the superior and distinguished class of the best remains of all antiquity. There are about twenty ancient statues which the moderns have discovered that are referred to the first class, and considered each as the chief beauty in its kind.

APOLLODORUS, born at Damascus, a famous architect under Trajan and Hadrian. He had the direction of the bridge of stone which Trajan ordered to be built over the Danube in the year 104, which was esteemed the most magnificent of all the works of that emperor. Hadrian, one day as Trajan was discoursing with this architect upon the buildings he had raised at Rome, would needs give his judgment, and showed he understood nothing of the matter. Apollodorus turned upon him bluntly, and said to him, Go paint citruls, for you are very ignorant of the subject we are talking upon. Hadrian at this time boasted of his painting citruls well. This insult cost Apollodorus his life.

APOLLODORUS, a celebrated painter of Athens, about 408 years before the birth of Christ, was the first who invented the art of mingling the colours, and of expressing the lights and shades. He was admired also for his judicious choice of subjects, and for the beauty and strength of colouring surpassed all the masters that went before him. He excelled likewise in statuary.

APOLLODORUS the Athenian, a famous grammarian, the son of Asclepiades and disciple of Aristarchus. He wrote many works not now extant; but his most famous production was his Bibliotheca, concerning the origin of the gods. This work consisted of 24 books, but only three are now in being. Several other pieces of his are to be found in Fabricius's *Bibliotheca Græca*. There were various other persons of this name. Scipio Testi, a Neapolitan, has written a treatise of the Apollodoruses, which was printed at Rome in 1555; and Dr Thomas Gale published a work of the same kind in 1675.

APOLLONIA, the name of several ancient cities, particularly of a colony of the Milesians in Thrace, from which Lucullus took away a colossus of Apollo, and placed in the capitol. The greatest part of the town was situated in a small island on the Euxine, in which was a temple of Apollo (Strabo). Pliny says the colossus was 30 cubits high, and cost 500 talents. There was also an Apollonia at mount Parnassus, near Delphi. (Stephanus). Troezen was formerly called *Apollonia*.

APOLLONIA, feasts sacred to Apollo, instituted upon the following occasion. Apollo, having vanquished Python, went with his sister Diana to Ægialea; but, being driven from thence, he removed to the island Crete. The Ægialeans were soon after visited with a plague; upon which, consulting the soothsayers, they were ordered to send seven young men and as many virgins, to appease those deities and bring them back into their country. Apollo and Diana being thus appeased, returned to Ægialea: in memory of which, they dedicated a temple to Pitho, the *goddess of persuasion;* whence a custom arose of choosing every year seven young men, and as many virgins, to go as it were in search of Apollo and Diana.

APOLLONIA, in geography, a promontory of Africa, upon the coast of Guinea, near the mouth of the river Mancu.

APOLLONIUS, the author of the *Argonautics*, and surnamed *The Rhodian*, from the place of his residence, is supposed to have been a native of Alexandria, where he is said to have recited some portion of his poem while he was yet a youth. Finding it ill received by his countrymen, he retired to Rhodes; where he is conjectured to have polished and completed his work, supporting himself by the profession of rhetoric, and receiving from the Rhodians the freedom of their city. He at length returned, with considerable honour, to the place of his birth; succeeding Eratosthenes in the care of the Alexandrian library in the reign of Ptolemy Euergetes, who ascended the throne of Egypt the year before Christ 246. That prince had been educated by the famous Aristarchus, and rivalled the preceding sovoreigns of his liberal family in the munificent encouragement of learning. Apollonius was a disciple of the poet Callimachus; but their connection ended in the most violent enmity, which was probably owing to some degree of contempt expressed by Apollonius for the light compositions of his master. The learned have vainly endeavoured to discover the particulars of their quarrel.—The only work of Apollonius which has descended to modern times is his poem above-mentioned, in four books, on the Argonautic expedition.

Apollonius, Apollos.

expedition. Both Longinus and Quintilian have assigned to this work the mortifying character of mediocrity: "But (says Mr Hayley) there lies an appeal from the sentence of the most candid and enlightened critics to the voice of Nature; and the merit of Apollonius has little to apprehend from the decision of this ultimate judge. His poems abound in animated description, and in passages of the most tender and pathetic beauty. How finely painted is the first setting forth of the Argo! and how beautifully is the wife of Chiron introduced, holding up the little Achilles in her arms, and showing him to his father Peleus as he sailed along the shore! But the chief excellence in our poet, is the spirit and delicacy with which he has delineated the passion of love in his Medea. That Virgil thought very highly of his merit in this particular, is sufficiently evident from the minute exactness with which he has copied many tender touches of the Grecian poet. Those who compare the third book of Apollonius with the fourth of Virgil, may, I think, perceive not only that Dido has some features of Medea, but that the two bards, however different in their reputation, resembled each other in their genius; and they both excel in delicacy and pathos."—The ancient scholia upon his *Argonautics*, still extant, are extremely useful, and full of learning.

Apollonius of Perga, a city of Pamphylia, was a great geometrician, under the reign of Ptolemy Euergetes, which reaches from the 2d year of the 133d Olympiad to the 3d year of the 139th. He studied a long time at Alexandria, under the disciples of Euclid; and composed several works, of which that only of the Conics remains.

Apollonius, a Pythagorean philosopher, born at Tyana in Cappadocia, about the begining of the first century. At 16 years of age he became a strict observer of Pythagoras's rules, renouncing wine, women and all sorts of flesh; not wearing shoes, letting his hair grow, and wearing nothing but linen. He soon after set up for a reformer of mankind, and chose his habitation in a temple of Æsculapius, where he is said to have performed many wonderful cures. Philostratus has wrote the life of Apollonius, in which there are numberless fabulous stories recounted of him. We are told that he went five years without speaking; and yet during this time, that he stopped many seditions in Cicilia and Pamphylia: that he travelled, and set up for a legislator; and that he gave out he understood all languages, without having ever learned them: that he could tell the thoughts of men, and understood the oracles which birds gave by their singing. The Heathens were fond of opposing the pretended miracles of this man to those of our Saviour; and by a treatise which Eusebius wrote against one Hierocles, we find that the drift of the latter, in the treatise which Eusebius refutes, seems to have been to draw a parallel betwixt Jesus Christ and Apollonius, in which he gives the preference to this philosopher. Mr Du Pin has wrote a confutation of Philostratus's life of Apollonius.

Apollonius wrote some works; viz. four books of Judicial astrology; a treatise upon the sacrifices, showing what was proper to be offered to each diety; and a great number of letters; all of which are now lost.

APOLLOS, in Scripture-history, a Jew of Alexandria, who came to Ephesus during the absence of St Paul, who was gone to Jerusalem (Acts xviii. 24.) Apollos was an eloquent man, and well versed in the Scriptures; and as he spoke with zeal and fervour, he taught diligently the things of God: but knowing only the baptism of John, he was no more than a catechumen, or one of the lowest order of Christians, and did not as yet distinctly know the mysteries of the Christian doctrine. However, he knew that Jesus Christ was the Messiah, and declared himself openly to be his disciple. When therefore he was come to Ephesus, he began to speak boldly in the synagogue, and to show that Jesus was the Christ. Aquila and Priscilla having heard him, took him home with them; instructed him more fully in the ways of God; and baptized him, probably in the name of Jesus Christ.

Apollyon, Apologetic.

Some time after this he had a mind to go into Achaia; and the brethren having exhorted him to undertake this journey, they wrote to the disciples, desiring them to receive him. He arrived at Corinth; and was there very useful in convincing the Jews out of the Scriptures, and demonstrated to them that Jesus was the Christ. Thus he watered what St Paul had planted in this city (1 Cor. iii. 6.): but the great fondness which his disciples had for his person had like to have produced a schism; some "saying, I am of Paul; others, I am of Apollos, I am of Cephas." However, this division, which St Paul speaks of in the chapter last quoted, did not prevent that apostle and Apollos from being closely united by the bands of charity. Apollos hearing that the Apostle was at Ephesus, went to meet him, and was there when St Paul wrote the first epistle to the Corinthians; wherein he testifies, that he had earnestly entreated Apollos to return to Corinth, but hitherto had not been able to prevail with him; that, neverthelefs, he gave him room to hope that he would go when he had an opportunity. St Jerom says, that Apollos was so dissatisfied with the division which had happened upon his account at Corinth; that he retired into Crete with Zena, a doctor of the law; and that this disturbance having been appeased by the letter which St Paul wrote to the Corinthians, Apollos returned to this city, and was bishop thereof. The Greeks make him bishop of Duras; others say, he was bishop of Iconium in Phrygia; and others, that he was bishop of Cæsarea.

APOLLYON, a Greek word that signifies *the destroyer*, and answers to the Hebrew *Abaddon*. St John in the Revelations (ix. 11.) says, that an angel having opened the bottomless pit, a thick smoke issued out of it; and with this smoke locusts, like horses, prepared for battle, and commanded by the angel of the bottomless pit, called in Hebrew *Abaddon*, but in the Greek *Apollyon*.

APOLOGETIC, Apologetical, something said or written, by way of excuse or apology, for any action or person.

The Apologetic of Tertullian is a work full of strength and spirit. He there vindicates the Christians from all that had been objected to them; particularly from the abominable crimes said to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this last accusation was, their refusing to take the accustomed oaths, and swear by the tutelary gods of the empire.—Tertullian addresses

dresses

dreſſes his Apologetic to the magiſtrates of Rome, the emperor Severus being then abſent.

APOLOGUE, in matters of literature, an ingenious method of conveying inſtruction by means of a feigned relation called a *moral fable*.

The only difference between a parable and an apologue is, that the former, being drawn from what paſſes among mankind, requires probability in the narration; whereas the apologue, being taken from the ſuppoſed actions of brutes, or even of things inanimate, is not tied down to the ſtrict rules of proprobability. Æſop's fables are a model of this kind of writing.

APOLOGY, a Greek term, literally importing an excuſe or defence of ſome perſon or action.

APOMELI, among ancient phyſicians, a decoction of honey and vinegar, much uſed as a detergent, promoter of ſtool, urine, &c.

APOMYOS DEUS, (ἀπὸ, and μυῖα *fly*,) in the Heathen mythology, a name under which Jupiter was worſhipped at Elis, and Hercules as well as Jupiter at the Olympic games. Theſe deities were ſupplicated under this name, to deſtroy or drive away the vaſt number of flies which always attended at the great ſacrifices; and in thoſe which accompanied the Olympic games, the firſt was always to the Apomyos, or Myiagrus, Deus, that he might drive away the flies from the reſt. The uſual ſacrifice was a bull.

APONEUROSIS, among phyſicians, a term ſometimes uſed to denote the expanſion of a nerve or tendon in the manner of a membrane; ſometimes for the cutting off a nerve; and, finally, for the tendon itſelf.

APONO (Peter d'), one of the moſt famous philoſophers and phyſicians of his age, born in the year 1250, in a village about four miles from Padua. He ſtudied ſome time at Paris, and was there promoted to the degree of doctor in philoſophy and phyſic. When he came to practiſe as a phyſician, he is ſaid to have inſiſted on very large ſums for his viſits: we are not told what he demanded for the viſits he made in the place of his reſidence; but it is affirmed, that he would not attend the ſick in any other place under 150 florins a-day; and when he was ſent for by Pope Honorius IV. he demanded 400 ducat's for each day's attendance. He was ſuſpected of magic, and proſecuted by the Inquiſition on that account. "The common opinion of almoſt all authors (ſays Naude) is, that he was the greateſt magician of his age; that he had acquired the knowledge of the ſeven liberal arts, by means of the ſeven familiar ſpirits, which he kept incloſed in a cryſtal; and that he had the dexterity to make the money he had ſpent come back into his purſe." The ſame author adds, that he died before the proceſs againſt him was finiſhed, being then in the 80th year of his age; and that, after his death, they ordered him to be burnt in effigy, in the public place of the city of Padua: deſigning thereby to ſtrike a fear into others of incurring the like puniſhment; and to ſuppreſs the reading three books which he had wrote; the firſt being the Heptameron, which is printed at the end of the firſt volume of Agrippa's work; the ſecond, that which is called by Trithemius, *Elucidarium necromanticum Petri de Albano*; and the laſt, that which is intitled by the ſame author, *Liber experimentorum mirabilium de annulis ſecundum xxviii. manſiones lunæ*. His body being ſecretly taken up by his friends, eſcaped the vigilance of the inquiſitors, who would have burnt it. It was removed ſeveral times, and was at laſt placed in the church of St Auguſtin, without an epitaph or any mark of honour. The moſt remarkable book which Apono wrote, was that which procured him the ſirname of *Conciliator*; he wrote alſo a piece intitled *De medicina omnimoda*. There is a ſtory told of him, that, having no well in his houſe, he cauſed his neighbour's to be carried into the ſtreet by devils, when he heard they had forbidden his maid fetching water there. He had much better (ſays Mr Bayle) have employed the devils to make a well in his own houſe, and have ſtopped up his neighbour's; or, at leaſt, tranſported it into his houſe, rather than into the ſtreet.

APONOGETON: A genus of the digynia order, belonging to the heptandria claſs of plants, which has no Engliſh name. The calyx is an oblong omentum; there is no corolla; and the capſulæ are three-ſeeded. There are two ſpecies, natives of the Indies.

APONUS, a hamlet near Patavium, with warm baths. It was the birth-place of Livy, (Martial); and is now called *Albano*. E. Long. 10. N. Lat. 45. 15.

APOPEMPTIC, in the ancient poetry, a hymn addreſſed to a ſtranger on his departure from a place to his own country. The ancients had certain holidays, wherein they took leave of the gods with *apopemptic* ſongs, as ſuppoſing them returning each to his own country. The deities having the patronage of divers places, it was but juſt to divide their preſence, and allow ſome time to each. Hence it was, that among the Delians and Mileſians we find feaſts of Apollo, and among the Argians feaſts of Diana, called *Epidemiæ*, as ſuppoſing theſe deities then more peculiarly reſident among them. On the laſt day of the feaſt they diſmiſſed them, following them to the altars with *apopemptic* hymns.

APOPHASIS, a figure in rhetoric, by which the orator, ſpeaking ironically, ſeems to wave what he would plainly inſinuate: as, *Neither will I mention thoſe things, which, if I ſhould, you notwithſtanding could neither confute nor ſpeak againſt them.*

APOPHLEGMATIZANTS, in pharmacy, medicines proper to clear the head from ſuperfluous phlegm, whether by ſpitting or by the noſe.

APOPHTHEGM, a ſhort, ſententious, and inſtructive remark, pronounced by a perſon of diſtinguiſhed character. Such is that of Cyrus: *He is unworthy to be a magiſtrate, who is not better than his ſubjects.* Or this: *He that will not take care of his own buſineſs, will be forced to take care of that of others.* Or that of Artaxerxes Mnemon, when reduced to hunger by the loſs of his baggage: *How much pleaſure have I hitherto lived a ſtranger to?* Or that of Cato, *Homines nihil agendo diſcunt male agere.* Or, finally, that of Auguſtus, *Feſtina lente.* The apophthegms of Plutarch are well known.

APOPHYGE, in architecture, a concave part or ring of a column, lying above or below the flat member. The French call it *le conge d'en bas*, or *d'en haut*: the Italians, *cavo di baſſo*, or *di ſopra*; and alſo *il vivo di baſſo*. The apophyge originally was no more than

the

the ring or ferril, at first fixed on the extremities of wooden pillars, to keep them from splitting; which afterwards was imitated in stone.

APOPHYSIS, in anatomy, a process or protuberance of a bone. See ANATOMY.

APOPLEXY, a distemper in which the patient is suddenly deprived of all his senses, and of voluntary motion. See MEDICINE-*Index*.

APORIA, is a figure in rhetoric, by which the speaker shows, that he doubts where to begin for the multitude of matter, or what to say in some strange and ambiguous thing; and doth, as it were, argue the case with himself. Thus Cicero says, *Whether he took them from his fellows more impudently, gave them to a harlot more lasciviously, removed them from the Roman people more wickedly, or altered them more presumptuously, I cannot well declare.*

APORON, or APORIME, a problem difficult to resolve, and which has never been resolved, though it be not, in itself, impossible.

The word is derived from απορος, which signifies something very difficult, and impracticable; being formed from the privative α and πορος, *passage*. Such we conceive the quadrature of the circle; the duplicature of the cube; the trisection of an angle, &c. When a question was proposed to any of the Greek philosophers, especially of the sect of Academists; if he could not give a solution, his answer was, Απορεω, *I cannot see through it*.—This word is also used by some law writers for an inexplicable speech or discourse.

APOSIOPESIS, in rhetoric, otherwise called *reticency*, and *suppression*; a figure, by which a person really speaks of a thing, at the same time that he makes a show as if he would say nothing of it. The word comes from αποσιωπαω, *I am silent*.—It is commonly used to denote the same with ELLIPSIS. Jul. Scaliger distinguishes them. The latter, according to him, being only the suppression of a word; as, *me, me; adsum qui feci:* the former: the omitting to relate some part of the action; as,

> *Dixerat, atque illam media inter talia ferro*
> *Collapsam adspiciunt*————————

where the poet does not mention how Dido killed herself.—This figure is of use to keep up the grandeur and sublimity of a discourse.

APOSPHRAGISMA, (from απο σφραγιζω, *I seal*,) in antiquity, the figure and impression of a seal.—It was forbid among the ancients to have the figure or image of God on their rings and seals. To this purpose the precept of Pythagoras, Εν δακτυλιω εικονα Θεȣ μη περιφερειν! But in process of time, this was little regarded; it was usual enough to have the figures of Egyptian and other deities, as well as of heroes, monsters, friends, ancestors, and even brutes, on their *dactyli*, or ring-seals. Thus Cæsar had the image of Venus, Pollio of Alexander, Augustus of the *sphinx*, Pompey of a frog, Lentulus of his grandfather, &c.

APOSTACY, the abandoning the true religion. The primitive Christian church distinguished several kinds of apostacy. The first, of those who went over entirely from Christianity to Judaism; the second, of those who mingled Judaism and Christianity together; and the third, of those who complied so far with the Jews as to communicate with them in many of their unlawful practices, without making a formal profession of their religion. But the fourth sort was of those who, after having been some time Christians, voluntarily relapsed into Paganism.

The perversion of a Christian to Judaism, Paganism or other false religions, was punished by the emperors Constantius and Julian with confiscation of goods, to which the emperors Theodosius and Valentinian added capital punishment, in case the apostate endeavoured to pervert others to the same iniquity. A punishment too severe for any temporal laws to inflict; and yet the zeal of our ancestors imported it into this country; for we find by Bracton, that in his time apostates were to be burnt to death. Doubtless the preservation of Christianity, as a national religion, is, abstracted from its own intrinsic truth, of the utmost consequence to the civil state: which a single instance will sufficiently demonstrate. The belief of a future state of rewards and punishments, the entertaining just ideas of the moral attributes of the supreme Being, and a firm persuasion that he superintends and will finally compensate every action in human life (all which are clearly revealed in the doctrines and forcibly inculcated by the precepts, of our saviour Christ), these are the grand foundation of all judicial oaths; which call God to witness the truth of those facts, which perhaps may be only known to him and the party attesting: all moral evidence therefore, all confidence in human veracity, must be weakened by apostacy, and overthrown by total infidelity. Wherefore all affronts to Christianity, or endeavours to depreciate its efficacy, in those who have once professed it, are highly deserving of censure. But yet the loss of life is a heavier penalty than the offence, taken in a civil light, deserves; and, taken in a spiritual light, our laws have no jurisdiction over it. This punishment, therefore, has long ago become obsolete; and the offence of apostacy was for a long time the object only of the ecclesiastical courts, which corrected the offender *pro salute animæ*. But about the close of the last century, the civil liberties to which we were then restored being used as a cloke of maliciousness, and the most horrid doctrine subversive of all religion being publicly avowed both in discourse and writings, it was thought necessary again for the civil power to interpose, by not admitting those miscreants to the privileges of society, who maintained such principles as destroyed all moral obligation. To this end it was enacted by statute 9 and 10 W. III. c. 32. That if any person educated in, or having made profession of, the Christian religion, shall by writing, printing teaching, or advised speaking, deny the Christian religion to be true, or the holy Scriptures to be of divine authority, he shall upon the first offence be rendered incapable to hold any office or place of trust; and, for the second, be rendered incapable of bringing any action, or of being guardian, executor, legatee, or purchaser of lands, and shall suffer three years imprisonment without bail. To give room however for repentance, if, within four months after the first conviction, the delinquent will in open court publicly renounce his error, he is discharged for that once from all disabilities.

APOSTASIS, in medicine, the same with abscess.

APOSTATE, one who deserts his religion. Among the

the Romanists, it signifies a man who, without a legal dispensation, forsakes a religious order of which he had made profession. Hence,

APOSTATA CAPIENDO, in the English law, a writ that formerly lay against a person who, having entered into some order of religion, broke out again, and wandered up and down the country.

A POSTERIORI, or demonstration *à posteriori*. See DEMONSTRATION.

APOSTIL, in matters of literature, the same with a marginal note.

APOSTLE properly signifies a messenger or person sent by another upon some business; and hence, by way of eminence, denotes one of the disciples commissioned by Jesus Christ to preach the gospel.

Our blessed Lord selected twelve out of the number of his disciples to be invested with the apostleship. Their names were Simon Peter, Andrew, James the greater, John, Philip, Bartholomew, Thomas, Matthew, James the less, Jude sirnamed Lebbeus or Thaddeus, Simon the Canaanite, and Judas Iscariot. Of these Simon, Andrew, James the greater, and John, were fishermen; and Matthew a publican, or receiver of the public revenues: of what profession the rest were, we are not told in scripture; though it is probable they were fishermen.

There are various conjectures as to the reason of our Saviour's making choice of *twelve* apostles. The most probable is, that it might be an allusion to the twelve patriarchs, as the founders of their several tribes; or to the twelve chief heads or rulers of those tribes, of which the body of the Jewish nation consisted. This opinion seems to be countenanced by what our Saviour tells his apostles, that "when the Son of man shall sit in the throne of his glory, *they* also shall sit upon twelve thrones judging the twelve tribes of Israel."

Our Lord's first commission to his apostles was in the third year of his public ministry, about eight months after their solemn election; at which time he sent them out by two and two. They were to make no provision of money for their subsistence in their journey, but to expect it from those to whom they preached. They were to declare, that the kingdom of heaven, or the Messiah, was at hand; and to confirm their doctrine by miracles. They were to avoid going either to the Gentiles or to the Samaritans, and to confine their preaching to the people of Israel. In obedience to their Master, the apostles went into all the parts of Palestine inhabited by the Jews, preaching the gospel, and working miracles. The evangelical history is silent as to the particular circumstances attending this first preaching of the apostles; and only informs us, that they returned, and told their Master of all that they had done.

Their second commission, just before our Lord's ascension into heaven, was of a more extensive and particular nature. They were now not to confine their preaching to the Jews, but to "go and teach ALL nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost." Accordingly they began publicly, after our Lord's ascension, to exercise the office of their ministry, working miracles daily in proof of their mission, and making great numbers of coverts to the Christian faith. This alarmed the Jewish Sanhedrim; whereupon the apostles were apprehended, and, being examined before the high priest and elders, were commanded not to preach any more in the name of Christ. But this injunction did not terrify them from persisting in the duty of their calling; for they continued daily, in the temple, and in private houses, teaching and preaching the gospel.

After the apostles had exercised their ministry for twelve years in Palestine, they resolved to disperse themselves in different parts of the world, and agreed to determine by lot what parts each should take. According to this division, St Peter went into Pontus, Galatia, and those other provinces of the Lesser Asia. St Andrew had the vast northern countries of Scythia and Sogdiana allotted to his portion. St John's was partly the same with Peter's, namely, the Lesser Asia. St Philip had the Upper Asia assigned to him, with some parts of Scythia and Colchis. Arabia Felix fell to St Bartholomew's share. St Matthew preached in Chaldæa, Persia, and Parthia. St Thomas peached likewise in Parthia; as also to the Hyrcanians, Bactrians, and Indians. St James the less continued in Jerusalem, of which church he was bishop. St Simon had for his portion Egypt, Cyrene, Libya, and Mauritania; St Jude Syria and Mesopotamia; and St Matthias, who was chosen in the room of the traitor Judas, Cappadocia and Colchis. Thus, by the dispersion of the apostles, Christianity was very early planted in a great many parts of the world. We have but very short and imperfect accounts of their travels and actions.

In order to qualify the apostles for the arduous task of converting the world to the Christian religion, they were in the first place, miraculously enabled to speak the languages of the several nations to whom they were to preach: and, in the second place, were endowed with the power of working miracles, in confirmation of the doctrines they taught; gifts which were unnecessary, and therefore ceased, in the after ages of the church, when Christianity came to be established by the civil power.

St Paul is frequently called the *apostle*, by way of eminence; and the *apostle of the Gentiles*, because his ministry was chiefly made use of for the conversion of the Gentile world, as that of St Peter was for the Jews, who is therefore stiled the *apostle of the circumcision*. The several apostles are usually represented with their respective badges or attributes; St Peter with the keys; St Paul with a sword; St Andrew with a cross or saltier; St James minor with a fuller's pole; St John with a cup, and winged serpent flying from it; St Bartholomew with a knife; St Philip with a long staff, whose upper end is formed into a cross; St Thomas with a lance; St Matthew with a hatchet; St Matthias with a battle-ax; St James major with a pilgrim's staff and a gourd-bottle; St Simon with a saw; and St Jude with a club.

This appellation was also given to the ordinary travelling ministers of the church.—Thus St Paul, in the epistle to the Romans, xvi. 7. says, "Salute Andronicus and Junia, my kinsmen and fellow prisoners, who are of note among the apostles." It was likewise a title given to those sent by the churches to carry their alms to the poor of other churches. This usage they borrowed from the synagogues, who called those whom they sent on this message by the same name; and the

function

function or office itself αποστολη, *apostole*, q. d. *mission*. Thus St. Paul, writing to the Philippians, tells them, that Epaphroditus their apostle had ministered to his wants, ch. ii. 25.

The appellation is given in like manner to those persons who first planted the Christian faith in any place. Thus Dionysius of Corinth is called the *apostle of France*; Xavier, the *apostle of the Indies*, &c. In the East Indies the Jesuit missionaries are also called *apostles*.

Apostle is also used among the Jews for a kind of officer anciently sent into the several parts and provinces in their jurisdiction, by way of visitor or commissary, to see that the laws were duly observed, and to receive the monies collected for the reparation of the temple, and the tribute payable to the Romans. The Theodosian code, lib. xiv. *De Judæis*, calls those *apostoli, qui ad exigendum aurum atque argentum a patriarcha certo tempore diriguntur*. Julian the apostate remitted the Jews the *apostole*, αποστολη; that is, as he himself explains it, the tribute they had been accustomed to send him. These apostles were a degree below the officers of the synagogues called *patriarchs*, and received their commissions from them. Some authors observe, that St Paul had borne this office; and that it is this he alludes to in the beginning of the epistle to the Galatians: as if he had said, Paul, no longer an apostle of the synagogue, nor sent thereby to maintain the law of Moses, but now an apostle and envoy of Jesus Christ, &c. St Jerom, though he does not believe that St Paul had been an apostle of this kind, yet imagines that he alludes to it in the passage just cited.

Apostle, in the Greek liturgy, is particularly used for a book containing the epistles of St Paul, printed in the order wherein they are to be read in churches, through the course of the year. Another book of the like kind, containing the Gospels, is called Ευαγγελιον, *Gospel*.—The apostle, of late days, has also contained the other canonical epistles, the Acts of the Apostles, and the Revelations. Hence it is also called *Acts of the Apostles*, Πραξαποστολος; that being the first book in it.

Apostle is also thought by many to have been the original name for bishops, before the denomination *bishop* was appropriated to their order. Thus Theodoret says expressly, the same persons were anciently called promiscuously both bishops and presbyters, whilst those who are now called bishops were called *apostles*. In the arsenal of Bremen, there are twelve pieces of cannon called the *Twelve Apostles*, on a supposition that the whole world must be convinced, and acquiesce in the preaching of such apostles.

Apostles' Creed: A *formula*, or summary, of the Christian faith, drawn up, according to Ruffinus, by the apostles themselves; who, during their stay at Jerusalem, soon after our Lord's ascension, agreed upon this *creed*, as a rule of faith, and as a *word of distinction* by which they were to know friends from foes. Baronius, and some other authors, conjecture, that they did not compose it till the second year of the reign of Claudius, a little before their dispersion. As to their manner of composing it, some fancy, that each apostle pronounced his article, which is the reason of its being called *symbolum apostolicum* it, being made up of sentences jointly contributed, after the manner of persons paying each their club (*symbolum*) or share of a reckoning.

But there are reasons which may induce us to question whether the apostles composed any such creed as this. For, first, neither St Luke in the Acts, nor any other ecclesiastical writer before the 5th century, make any mention of an assembly of the apostles in order to the composing of a creed. Secondly, the fathers of the three first centuries, in disputing against heretics, endeavour to prove that the doctrine contained in this creed was the same which the apostles taught; but they never pretend that the apostles composed it. Thirdly, if the apostles had made this creed, it would have been the same in all churches, and in all ages; and all authors would have cited it after the same manner. But the case is quite otherwise. In the second and third ages of the church, there were as many creeds as authors, and one and the same author sets down the creed after a different manner in several places of his works; which is an evidence that there was not at that time any creed which was reputed to be the apostles'. In the 4th century, Ruffinus compares together the three ancient creeds of the churches of Aquileia, Rome, and the East, which differ very considerably in the terms. Besides, these creeds differed not only in the terms and expressions, but even in the articles, some of which were omitted in one or other of them; such as those of the *descent into hell*, the *communion of the saints*, and the *life everlasting*. From these reasons it may be gathered, that tho' this creed may be said to be that of the apostles in regard to the doctrines contained therein, yet it is not to be referred to them as the authors and first composers of it. Who was the true author of it, is not so easy to determine; though its great antiquity may be inferred from hence, that the whole form, as it now stands in the English liturgy, is to be found in the works of St Ambrose and Ruffinus, the former of whom flourished in the 3d century, and the latter in the 4th century.

The primitive Christians, in regard they always concealed this and their other mysteries, did not publicly recite the creed, except at the times of baptism; which, unless in cases of necessity, were only at Easter and Whitsuntide. The constant repeating it was not introduced into the church till the end of the 5th century; about which time Petrus Gnapheus, bishop of Antioch, prescribed the recital of it every time divine service was performed.

APOSTOLARE, Apostolicare, *apostolizing*, in some middle-age writers, denotes the being preferred to the dignity of pope.

APOSTOLATE, in a general sense, is used for mission. In this sense, Olearius has a discourse concerning the apostolate of Christ.

Apostolate more properly denotes the dignity or office of an apostle of Christ; but it is also used, in ancient writers, for the office of a bishop. In this sense we meet with several letters, petitions, requests, &c. directed to bishops under the title of your *apostolate*, or *apostalatus vester*. But as the title *apostolicus* had been appropriated to the pope, so that of *apostolate* became at length restrained to the sole dignity of the popedom. Every bishop's see was anciently dignified with the title of *sedes apostolica*, an apostolical fee, which is now the peculiar denomination of the fee of Rome.

APOSTOLI, in a law, denote those letters missive which are demanded in cases of appeal.

APOSTOLIC, APOSTOLICAL, something that relates to the apostles, or descends from them. Thus we say, the *apostolical* age, *apostolical* doctrine, *apostolical* character, constitutions, traditions, &c.

APOSTOLIC, in the primitive church, was an appellation given to all such churches as were founded by the apostles; and even to the bishops of those churches, as being the reputed successors of the apostles. These were confined to four, viz. Rome, Alexandria, Antioch, and Jerusalem. In after-times, other churches assumed the same quality, on account, principally, of the conformity of their doctrine with that of the churches which were apostolical by foundation, and because all bishops held themselves successors of the apostles, or acted in their dioceses with the authority of apostles.

The first time the term *apostolical* is attributed to bishops, as such, is in a letter of Clovis to the council of Orleans, held in 511, though that king does not there expressly denominate them *apostolical*, but (*apostolica sede dignissimi*) highly worthy of the apostolical see. In 581, Guntram calls the bishops, met at the council of Mason, *apostolical* pontiffs, *apostolici pontifices*.

In progress of time, the bishop of Rome growing in power above the rest, and the three patriarchates of Alexandria, Antioch, and Jerusalem, falling into the hands of the Saracens, the title *apostolical* was restrained to the pope and his church alone. Though some of the popes, and St Gregory the Great, not contented to hold the title by this tenure, began, at length, to insist, that it belonged to them by another peculiar right, as being the successors of St Peter. The country of Rheims in 1049, declared that the pope was the sole apostolical primate of the universal church. And hence a great number of apostolicals; *apostolical* see, *apostolical* nuncio, *apostolical* notary, *apostolical* brief, *apostolical* chamber, *apostolical* vicar, &c.

APOSTOLICAL Constitutions. See CONSTITUTION.

APOSTOLICAL Traditions. See TRADITION.

APOSTOLICAL Fathers is an appellation usually given to the writers of the first century who employed their pens in the cause of Christianity. Of these writers, Cotelerius, and after him Le Clerc, have published a collection in two volumes, accompanied both with their own annotations and the remarks of other learned men.

APOSTOLIANS, a sect of the Mennonites, which first sprung up in the year 1664, and derived its name from Apostool, one of the Mennonite ministers at Amsterdam. They concurred with them in doctrine, and admitted to their communion those only who professed to believe all the sentiments which are contained in their public confession of faith.

APOSTOLICI, or APOSTOLICS, was a name assumed by three different sects, on account of their pretending to imitate the manner and practice of the apostles. The first apostolici, otherwise called *Apotactitæ* and *Apotactici*, rose out of the Encratitæ, and Cathari, in the third century. They made profession of abstaining from marriage, and the use of wine, flesh, money, &c.

Gerhard Sagarelli was the founder of the second sect; he obliged his followers to go from place to place as the apostles did, to wander about cloathed in white, with long beards, dishevelled hair, and bare heads, accompanied with women, whom they called their spiritual sisters. They likewise renounced all kinds of property and possessions, inveighed against the growing corruption of the church of Rome, predicted its overthrow, and the establishment of a purer church on its ruins. Sagarelli was burnt alive at Parma in the year 1300, and was afterwards succeeded by Dulcinus, who added to the character of an apostle those of a prophet and a general, and carried on a bloody and dreadful war for the space of more than two years against Raynerius, bishop of Vercelli; he was at length defeated, and put to death in a barbarous manner in the year 1307. Nevertheless, this sect subsisted in France, Germany, and in other countries, till the beginning of the fifteenth century, when it was totally extirpated under the pontificate of Boniface IX.

The other branch of apostolici were of the twelfth century. These also condemned marriage, preferring celibacy, and calling themselves the chaste brethren and sisters; though each was allowed a spiritual sister, with whom he lived in a domestic relation; and on this account they have been charged with concubinage: they held it unlawful to take an oath; they set aside the use of baptism; and in many things imitated the Manichees. Bernard wrote against this sect of apostolici.

APOSTOLICUM is a peculiar name given to a kind of song or hymn, anciently used in churches. The apostilicum is mentioned by Greg. Thaumaturgus as used in his time. Vossius understands it as spoken of the apostles creed: Suicer thinks this impossible, for that this creed was then unknown in the churches of the east.

APOSTROPHE, in rhetoric, a figure by which a person who is either absent or dead is addressed as if he were present, and attentive to us. This figure is, in boldness, a degree lower than the address to personified objects (see PERSONIFICATION); since it requires a less effort of imagination to suppose persons present who are dead or absent, than to animate insensible beings and direct our discourse to them. The poems of Ossian abound with the most beautiful instances of this figure. "Weep on the rocks of roaring winds, O maid of Inistore! Bend thy fair head over the waves, thou fairer than the ghost of the hills when it moves in a sun-beam at noon over the silence of Morven! He is fallen! Thy youth is low; pale beneath the sword of Cuchullin!"

APOSTROPHE, in grammar, the contraction of a word by the use of a comma: as *call'd* for *called*, *tho'* for *though*.

APOTACTITÆ, or APOTACTICI, an ancient sect, who affecting to follow the evangelical counsels of poverty, and the examples of the apostles and primitive Christians, renounced all their effects and possessions. It does not appear that they gave into any errors during their first state; some ecclesiastical writers assure us they had divers holy virgins and martyrs under the persecution of Dioclesian, in the fourth century; but they afterwards fell into the opinions of the Encratitæ, and taught that the renouncing of all riches was not

only

only a matter of counsel and advice, but of precept and necessity. And hence the sixth law in the Theodosian code joins the Apotactitæ with the Eunomians and Arians.

APOTEICHISMUS, in the ancient military art, a kind of line of circumvallation drawn round a place in order to besiege it. This was also called *periteichismus*. The first thing the ancients went about, when they designed to lay close siege to a place, was the Apoteichismus; which sometimes consisted of a double wall or rampart, raised of earth; the innermost to prevent sudden sallies from the town, the outermost to keep off foreign enemies from coming to the relief of the besieged. This answered to what are called *lines of contravallation* and *circumvallation* among the moderns.

APOTHECARY, one who practises the art of pharmacy. In London, the apothecaries are one of the city-companies. They were incorporated by a charter from king James. I. procured at the solicitation of Dr Mayerne and Dr Aitkens: till that time they only made a part of the grocer's company; plums, sugar, spice, Venice treacle, mithridate, &c. were sold in the same shop and by the same person. The reason of separating them was, that medicines might be be better prepared, and in opposition to divers persons who imposed unwholesome remedies on the people. By an act which was made perpetual in the ninth year of George I. they are exempted from serving upon juries, or in ward and parish offices. They are obliged to make up their medicines according to the formulas prescribed in the college dispensatory; and are liable to have their shops visited by the censors of the college, who are empowered to destroy such medicines as they think not good.

They have a hall in Black Friars, where there are two fine elaboratories, out of which all the surgeons chests are supplied with medicines for the royal British navy.

To his majesty belong two apothecaries: the salary to the first, 320l. to the second, 275l.—To the household belong also two.

The charitable dispensation of medicines by the Chinese is well deserving notice. They have a stone, which is ten cubits high, erected in the public squares of their cities: on this stone are engraved the names of all sorts of medicines with the price of each; and when the poor stand in need of any relief from physic, they go to the treasury, where they receive the price each medicine is rated at.

Apothecary, *Apothecarius*, in writers of the middle age, denotes a shop-keeper, or ware-house keeper.

Apothecarius is also used to denote a store-keeper, or officer appointed to have the direction of a magazine, granary, &c. in which sense *apothecarii* is sometimes rendered by *horearii* and *rationarii*.

APOTHEOSIS, in antiquity, an heathen ceremony, whereby their emperors and great men were placed among the gods. The word is derived from απο, and Θεος, *God*.

After the apotheosis, which the also called *deification* and *consecration*, temples, altars, and images were erected to the new deity; sacrifices, &c. were offered, and colleges of priests instituted.

It was one of the doctrines of Pythagoras which he had borrowed from the Chaldees, that virtuous persons after their death were raised into the order of the gods.

And hence the ancients deified all the inventors of things useful to mankind; and those who had done any important service to the commonwealth.—Tiberius proposed to the Roman senate the apotheosis of Jesus Christ, as is related by Eusebius, Tertullian, and Chrysostom.

Juvenal rallying the frequent apotheoses, introduces poor Atlas, complaining that he was ready to sink under the burden of so many new gods as were every day added to the heavens. Seneca ridiculed the apotheosis of Claudius with admirable humour.

The ceremony, according to Herodian's description, was as follows: after the body of the deceased had been burnt with the usual solemnities, an image of wax, exactly resembling him, was placed on an ivory couch, where it lay for seven days, attended by the senate and ladies of the highest quality in mourning; and then the young senators and knights bore the bed of state through the via sacra to the old forum, and from thence to the campus martius, where it was deposited upon an edifice built in form of a pyramid. The bed being thus placed amidst a quantity of spices and other combustibles, and the knights having made a solemn procession round the pile, the new emperor, with a torch in his hand, set fire to it, whilst an eagle, let fly from the top of the building, and mounting in the air with a firebrand, was supposed to convey the soul of the deceased to heaven; and thenceforward he was ranked among the gods.

We often meet with the consecration or apotheosis of emperors represented on medals; where we see the pyramids of several stories, each growing less and less; we see also the eagles flying away with the souls of the deceased emperors. A gem in the musæam of Brandenburg, represents the apotheosis of Julius Cæsar, mounted upon the celestial globe, and holding an helm in his hand, as if he were now the governor of heaven, as before of the earth. See Deification.

APOTHERAPIA, (from αποθεραπευω, *I cure*), in physic, properly denotes a complete or finished cure.

Apotherapia is also used, in the gymnastic art, for the last part of all regular exercise, viz. friction or unction with oil, before as well as after bathing. The design of this was partly to cleanse the skin from any filth or dust it might have contracted during the exercise, and partly to remove weariness.

APOTOME, in geometry, the difference between two incomensurable lines.

Apotome, in music, the difference between a greater and lesser semi-tone; expressed by the ratio, 128 ; 125.

APOTROPÆA, (from αποτρεπω, *I avert*), in the ancient poetry, verses composed for averting the wrath of incensed deities; and the deities invoked for averting any threatened misfortune were called *Apotrepeans*: they were also called *Alexicaci*, from αλεξω, *I drive away*; and *Averrunci* from *averrunco*, which denotes the same.

APOZEM, in medicine, the same with decoction. See Decoction.

APPARATUS, a term used to denote a complete set of instruments, or other utensils, belonging to any artist or machine.

Apparatus is frequently used for the operation of cutting for the stone. For this there are three sorts of apparatus, viz. the small, great, and high apparatus. See Surgery.

Apparatus is also used as a title of several books composed in form of catalogues, bibliothecas, dictionaries, &c. for the ease and convenience of study. The apparatus to Cicero is a kind of concordance, or collection of Ciceronian phrases, &c. The apparatus sacer of Possevin, is a collection of all kinds of ecclesiastical authors printed in 1611, in three volumes.—Glossaries, comments, &c. are also frequently called *Apparatuses*.

APPARENT, in a general sense, something that is visible to the eyes, or obvious to the understanding.

Apparent, among mathematicians and astronomers, denotes things as they appear to us, in contradistinction from real or true; thus we say, the apparent diameter, distance, magnitude, place, figure, &c. of bodies.

Apparent Heir, in law. No inheritance can vest, nor can any person be the actual complete heir of another, till the ancestor is previously dead. *Nemo est hæres viventis*. Before that time the person who is next in the line of succession is called an *heir apparent*, or *heir presumptive*. Heirs *apparent* are such, whose right of inheritance is indefeasible, provided they outlive the ancestor; as the eldest son or his issue, who must by the course of the common law be heirs to the father whenever he happens to die. Heirs *presumptive* are such, who, if the ancestor should die immediately, would in the present circumstances of things be his heirs: but whose right of inheritance may be defeated by the contingency of some nearer heir being born; as a brother or nephew, whose presumptive succession may be destroyed by the birth of a child; or daughter, whose present hopes may be hereafter cut off by the birth of a son. Nay, even if the estate hath descended, by the death of the owner, to such a brother, or nephew, or daughter; in the former cases, the estate shall be divested and taken away by the birth of a posthumous child; and, in the latter, it shall be also totally divested by the birth of a posthumous son.

APPARITION, in a general sense, denotes simply the appearance of a thing. In a more limited sense, it is used for spectre or ghost.—Several instances of apparitions occur in the Bible; that of Samuel, raised by the witch of Endor, has occasioned great disputes. We find great controversies among authors, in relation to the reality, the existence or non-existence, the possibility or impossibility, of apparitions. The Chaldeans, the Jews, and other nations, have been the steady asserters of the belief of apparitions. The denial of spirits and apparitions is by some made one of the marks of infidelity, if not of atheism. Many of the apparitions we are told of in writers, are doubtless mere delusions of the sense; many others are fictitious, contrived merely to amuse, or answer some purpose. Apparitions, it is certain, are machines that on occasion have been of good service both to generals, to ministers of state, to priests and others.

Partial darkness, or obscurity, are the most powerful means by which the sight is deceived: night is therefore the proper season for apparitions. Indeed the state of the mind, at that time, prepares it for the admission of these delusions of the imagination. The fear and caution which must be observed in the night; the opportunity it affords for ambuscades and assassinations; depriving us of society, and cutting off many pleasing trains of ideas, which objects in the light never fail to introduce, are all circumstances of terror: and perhaps, on the whole, so much of our happiness depends upon our senses, that the deprivation of any one may be attended with proportionable horror and uneasiness. The notions entertained by the ancients respecting the soul, may receive some illustration from these principles. In dark or twilight, the imagination frequently transforms an inanimate body into a human figure; on approaching, the same appearance is not to be found: hence they sometimes fancied they saw their ancestors; but not finding the reality, distinguished these illusions by the name of *shades*.

Many of these fabulous narrations might originate from dreams. There are times of slumber when we are not sensible of being asleep. On this principle, Hobbes has ingeniously accounted for the spectre which is said to have appeared to Brutus. "We read," says he, "of M. Brutus, that at Philippi, the night before he gave battle to Augustus Cæsar, he saw a fearful apparition, which is commonly related by historians as a vision; but, considering the circumstances, one may easily judge it to have been but a short dream. For sitting in his tent, pensive and troubled with the horror of his rash act, it was not hard for him, slumbering in the cold, to dream of that which most affrighted him; which fear, as by degrees it made him wake, so it must needs make the apparition by degrees to vanish: and having no assurance that he slept, he could have no cause to think it a dream, or any thing but a vision."—The well-known story told by Clarendon, of the apparition of the Duke of Buckingham's father, will admit of a similar solution. There was no man in the kingdom so much the subject of conversation as the duke; and from the corruptness of his character, he was very likely to fall a sacrifice to the enthusiasm of the times. Sir George Villiers is said to have appeared to the man at midnight: therefore there is the greatest probability that the man was asleep; and the dream affrighting him, made a strong impression, and was likely to be repeated.

APPARITOR, among the Romans, a general term to comprehend all attendants of judges and magistrates appointed to receive and execute their orders. *Apparitor*, in England, is a messenger that serves the process of a spiritual court, or a beadle in an university who carries the mace.

APPAUMEE, in heraldry, denotes one hand extended, with the full palm appearing, and the thumb and fingers at full length.

APPEAL, in law, the removal of a cause from an inferior to a superior court, or judge, when a person thinks himself aggrieved by the sentence of the inferior judge. Appeals lie from all the ordinary courts of justice to the House of Lords. In ecclesiastical cases, if an appeal is brought before a bishop, it may be removed to the archbishop; if before an archdeacon, to the court of arches, and thence to the archbishop; and from the archbishop's court to the king in chancery.

Appeal, in common law, denotes an accusation by a private subject against another, for some heinous crime; demanding punishment on account of the particular injury suffered, rather than for the offence against the public.

This private process, for the punishment of public crimes, had probably its original in those times, when a private pecuniary satisfaction, called a *weregild*, was

Appeal. constantly paid to the party injured, or his relations, to expiate enormous offences. This was a custom derived to the English, in common with other northern nations, from their ancestors the ancient Germans; among whom, according to Tacitus, *luitur homicidium certo armentorum ac pecorum numero; recipitque satisfactionem universa domus*. In the same manner, by the Irish Brehon law, in case of murder, the brehon or judge was used to compound between the murderer and the friends of the deceased who prosecuted him, by causing the malefactor to give unto them, or to the child or wife of him that was slain, a recompence which they called an *eriach*. And this we find in the Anglo-Saxon laws (particularly those of king Athelstan) the several weregilds for homicide established in progressive order, from the death of the ceorl or peasant, up to that of the king himself. And in the laws of Henry I. we have an account of what other offences were redeemable by weregild, and what were not so. As therefore, during the continuance of this custom, a process was certainly given, for recovering the weregild by the party to whom it was due; it seems that, when these offences by degrees grew no longer redeemable, the private process was still continued, in order to insure the infliction of punishment upon the offender, though the party injured was allowed no pecuniary compensation for the offence.

But though appeals were thus, in the nature of prosecutions for some attrocious injury, committed more immediately against an individual, yet it also was anciently permitted, that any subject might appeal another subject of high-treason, either in the courts of common law, or in parliament, or (for treasons committed beyond the seas) in the court of the high constable and marshal. The cognizance of appeals in the latter still continues in force; and so late as 1631, there was a trial by battle awarded in the court of chivalry, on such an appeal of treason; but that in the first was *virtually* abolished by the statutes 5 Edw. III. c. 9. and 2 Edw. III. c. 24. and in the second *expressly* by statute 1 Hen. IV. c. 14. So that the only appeals now in force, for things done within the realm, are appeals of felony and mayhem.

An appeal of felony may be brought for crimes committed either against the parties themselves or their relations. The crimes against the parties themselves are *larceny*, *rape*, and *arson*. And for these, as well as for mayhem, the persons robbed, ravished, maimed, or whose houses are burnt, may institute this private process. The only crime against one's relation, for which an appeal can be brought, is that of *killing* him, by either murder or manslaughter. But this cannot be brought by every relation; but only by the wife for the death of her husband, or by the heir-male for the death of his ancestor; which heirship was also confined by an ordinance of Henry I. to the four nearest degrees of blood. It is given to the wife, on account of the loss of her husband: therefore, if she marries again, before or pending her appeal, it is lost and gone; or, if she marries after judgment, she shall not demand execution. The heir, as was said, must also be heir-male, and such a one as was the next heir by the course of the common law at the time of the killing of the ancestor. But this rule has three exceptions: 1. If the person killed leaves an innocent wife, she only, and not the heir, shall have the appeal: 2. If there be no wife, and the heir be accused of the murder, the person, who next to him would have been heir-male, shall bring the appeal: 3. If the wife kills her husband, the heir may appeal her of the death. And, by the statute of Gloucester, 6 Ed. I. c. 9. all appeals of death must be sued within a year and a day after the completion of the felony by the death of the party: which seems to be only declaratory of the old common law; for in the Gothic constitutions we find the same "*prescriptio annalis, quæ currit adversus actorem, si de homicida ei non constat intra annum a cæde facta, nec quenquam interea arguat et accuset.*"

These appeals may be brought previous to any indictment; and, if the appellee be acquitted thereon, he cannot be afterwards indicted for the same offence. In like manner as by the old Gothic constitution, if any offender gained a verdict in his favour, when prosecuted by the party injured, he was also understood to be acquitted of any crown-prosecution for the same offence: but, on the contrary, if he made his peace with the king, still he might be prosecuted at the suit of the party. And so, in England, if a man be acquitted on an indictment of murder, or found guilty, and pardoned by the king, still he ought not (in strictness) to go at large, but be imprisoned or let to bail till the year and day be past, by virtue of the statute 3 Hen. VIII. c. 1. in order to be forthcoming to answer any appeal for the same felony, not having as yet been punished for it: though, if he hath been found guilty of manslaughter on an indictment, and hath had the benefit of clergy, and suffered the judgment of the law, he cannot afterwards be appealed; for it is a maxim in law, "that *nemo bis punitur pro eodem delicto*." Before this statute was made, it was not usual to indict a man for homicide within the time limited for appeals, which produced very great inconvenience.

If the appellee be acquitted, the appellor (by virtue of the statute of Westm. 2. 13 Edw. I. c. 12.) shall suffer one year's imprisonment, and pay a fine to the king, besides restitution of damages to the party for the imprisonment and infamy which he has sustained: and, if the appellor be incapable to make restitution, his abettors shall do it for him, and also be liable to imprisonment. This provision, as was foreseen by the author of Fleta, proved a great discouragement to appeals; so that thenceforward they ceased to be in common use.

If the apellee be found guilty, he shall suffer the same judgment, as if he had been convicted by indictment: but with this remarkable difference, than on an indicment, which is at the suit of the king, the king may pardon and remit the execution; on an appeal, which is at the suit of a private subject, to make an atonement for the private wrong, the king can no more pardon it, than he can remit the damages recovered on an action of battery. In like manner as, while the weregild continued to be paid as a fine for homicide, it could not be remitted by the king's authority. And the ancient usage was, so late as Henry IV.'s time, that all the relations of the slain should drag the appellee to the place of execution: a custom, founded upon that savage spirit of family-resentment which prevailed universally through Europe after the irruption of the northern nations, and is peculiarly attended to in their several codes of law; and which prevails even now among the

the wild and untutored inhabitants of America: as if the finger of nature had pointed it out to mankind, in their rude and uncultivated state. However, the punishment of the offender may be remitted and discharged by the concurrence of all parties interested; and as the king by his pardon may frustrate an indictment, so the appellant by his release may discharge an appeal: "*nam quilibet potest renunciare juri pro se introducto.*"

APPEARANCE, in a general sense, the exterior surface of a thing, or that which immediately strikes the senses.

APPEARANCE, in law, signifies a defendant's filing a common or special bail, on any process issued out of a court of judicature.

APPELLANT, in a general sense, one who appeals. See APPEAL.

APPELLANTS, in church history, an appellation given to such of the catholic clergy as appeal from the constitution unigenitus to a general council.

APPELLATION, the name by which any thing is known or distinguished when spoken of. See NAME.

Nothing can be more foreign to the original meaning of many words and proper names, than their present appellations, frequently owing to the history of those things being forgotten, or an ignorance of the language in which they were expressed. Who, for example, when the crier of a court bawls out, "O yes, O yes," would dream that it was a proclamation commanding the talkers to become hearers, being the French word *Oyez*, "listen," retained in our courts ever since the pleadings were held in law French? Or would any person suppose that the head-land on the French coast, near Calais, called by our seamen Blackness, could be so titled from its French name of *Blanc Nez*, or, the *White Head-land*?

King Henry the Eighth having taken the town of Bullogne in France, the gates of which he brought to Hardes in Kent, where they are still remaining, the flatterers of that reign highly magnified this action, which, Porto Bello like, became a popular subject for signs; and the port or harbour of Bullogne, called *Bullogne mouth*, was accordingly set up at a noted inn in Holburn; the name of the inn long out-living the sign and fame of the conquest, an ignorant painter employed by a no less ignorant landlord, to paint a new one, represented it by a bull and a large gaping human mouth (answering to the vulgar pronunciation of *Bull and mouth*). The same piece of history gave being to the *bull and gate*, originally meant for Bullogne gate, and represented by an embattled gate or entrance into a fortified town.

The *barber's pole* has been the subject of many conjectures; some conceiving it to have originated from the world *poll*, or head, with several other conceits as far-fetched and as unmeaning: but the true intention of that party-coloured staff was to show that the master of the shop practised surgery, and could breathe a vein as well as mow a beard; such a staff being to this day, by every village-practitioner, put into the hand of a patient undergoing the operation of phlebotomy. The white band which encompasses the staff, was meant to represent the fillet, thus elegantly twined about it.

Nor were the *Chequers* (at this time a common sign of a public-house) less expressive, being the representation of a kind of draught-board called *tables*, and showed that there that game might be played. From their colour which was red, and the similiarity to a lattice, it was corruptly called the *red lettuce*, which word is frequently used by ancient writers to signify an alehouse.

The Spectator has explained the sign of the *bell savage inn* plausibly enough, in supposing it to have been originally the figure of a beautiful female found in the woods, called in French *la belle sauvage*. But another reason has since been assigned for that appellation, namely, that the inn was once the property of Lady Arabelle savage, and familiarly called Bell Savage's inn, probably represented, as at present, by a bell and a savage or wild man, which was a rebus for her name; rebusses being much in fashion in the 16th century, of which the bolt and tun is an instance.

The *three blue balls* prefixed to the doors and windows of pawn-brokers shops, by the vulgar humorously enough said to indicate that it is two to one that the things pledged are ever redeemed, was in reality the arms of a set of merchants from Lombardy, who were the first that publicly lent money on pledges. They dwelt together in a street, from them named Lombard-street, in London, and also gave their name to another at Paris. The appellation of Lombard was formerly all over Europe considered as synonimous to that of usurer.

At the institution of yeomen of the guards, they used to wait at table on all great solemnities, and were ranged near the buffets; this procured them the name of *buffetiers*, not very unlike in sound to the jocular appellation of *beef-eaters*, now given them; though probably it was rather the voluntary misnomer of some wicked wit, than an accidental corruption arising from ignorance of the French language.

The opprobious title of *bum-bayliffe*, so constantly bestowed on the sheriffs officers, is, according to Judge Blackstone, only the corruption of *bound bayliffe*, every sheriff's officer being obliged to enter into bonds and to give security for his good behaviour, previous to his appointment.

A *cordwainer* seems to have no relation to the occugation it is meant to express, which is that of a shoemaker. But *cordonier*, originally spelt *cordaunier*, is the French word for that trade; the best leather used for shoes coming originally from Cordua in Spain. Spanish-leather shoes were once famous in England.

APPELLATIVE NAMES, in grammar, in contradistinction to proper names, are such as stand for universal ideas, or a whole rank of beings, whether general or special. Thus fish, bird, man, city, river, are common or appellative names; and so are trout, eel, lobster; for they all agree to many individuals, and some to many species. See NAME.

APPELLEE, among lawyers, the person against whom an appeal is brought. See APPEAL.

APPENDIX, in literature, a treatise or supplement added at the end of a work, to render it more complete.

APPERCEPTION, or ADPERCEPTION, a term used by Leibnitz and his followers for consciousness.

APPETITE, in a general sense, the desire of enjoying some object, supposed to be conducive to our happiness. When this inclination is guided by reason, and proportioned to the intrinsic value of the object, it is called *rational appetite*; as, on the other hand, it is denominated

denominated *sensitive appetite*, when we have only a blind propensity to a thing, without determinate ideas of the good qualities for which we desire it.

Appetites are passions directed to general objects, in contradistinction to passions directed to particular objects, which retain their proper name. Thus we say, an *appetite* for fame, for glory, for conquest, for riches; but we say the *passion* of love, of gratitude, of envy, &c. Appetite may be also distinguished from passion, since the latter has no existence till a proper object be presented; whereas the former exists first, and then is directed to an object.

Appetite, in medicine, a certain painful or uneasy sensation, always accompanied with a desire to eat or drink.—An excessive appetite is called by physicians *bulimy* or *fames canina*; a defect or loss of it, *anorexy*; and that after things improper for food, *pica*.

APPIA via, a way reaching from Rome through Capua to Brundusium, between 330 and 350 miles long. Appius Claudius, surnamed *Cæcus*, in the year of the city 441, carried it from the Porta Capena to Capua (Livy, Frontinus). It was afterwards carried on to Brundusium; but by whom, or when, is uncertain. It was laid with very hard stone, brought from a great distance, large and squared (Diodorus); and it was so wide, that several waggons could go abreast. Statius calls it *the queen of roads*. Its course is described by Horace, Strabo, and Antonine.

APPIAN, an eminent writer of the Roman history in Greek, under the reign of Trajan and Hadrian. He was of a good family in Alexandria in Egypt; whence he went to Rome, and there distinguished himself so well as an advocate, that he was chosen one of the procurators of the empire, and the government of a province was committed to him. He did not complete the Roman history in a continued series; but wrote distinct histories of all nations that had been conquered by the Romans, in which he placed every thing relating to those nations in the proper order of time. His style is plain and simple: in the opinion of Phocius, he has shown the greatest knowledge of military affairs, and the happiest talent at describing them, of any of the historians; for while we read him, we in a manner see the battles which he describes. Of all this voluminous work there remains only what treats of the Punic, Syrian, Parthian, Mithridatic, and Spanish wars, with those against Hannibal, the civil wars, and the wars in Illyricum, and some fragments of the Celtic or Gallic wars.

APPIUS Claudius, a Sabine by birth, one of the principal inhabitants of Regillum: his shining merit having drawn the envy of his fellow-citizens upon him, he retired to Rome with all his family. Appius was admitted into the senate, and was made consul, with Publius Servilius Priscus, in 258 from the building of Rome: but he was hated by the Plebeians, being an austere opposer of their clamours and seditions. The Claudian family continued long one of the most illustrious of the patrician families in Rome; and several in succession of the name of Appius supported the same stern character that distinguished their first founder.

APPLAUSE, an approbation of something, signified by clapping the hands, still practised in theatres.—Applause, in antiquity, differed from ACCLAMATION, as the latter was articulate and performed with the voice, the former with the hands. Among the Romans, applause was an artificial musical kind of noise, made by the audience or spectators to express their satisfaction. There were three species of applause, denominated from the different noises made in them, viz. *Bombus*, *Imbrices*, and *Testæ*; the first a confused din, made either by the hands or the mouth; the second and third, by beating on a sort of sounding vessels placed in the theatres for this purpose. Persons were instructed to give applause with skill; and there were even masters who professed to teach the art. The proficients in this way let themselves out for hire to the vain-glorious among the poets, actors, &c. and were properly disposed to support a loud applause. These they called *Laudicæni*, and Σοφοκλεις. At the end of the play, a loud peal of applause was expected, and even asked of the audience, either by the chorus or the person who spoke last. The formula was, *Spectatores plaudite*, or *Valete et plaudite*. The *plausores*, or applauders, were divided into chori, and disposed in theatres opposite to each other like the choristers in cathedrals, so that there was a kind of concert of applauses.

APPLE, the fruit of the pyrus malus. See Pyrus.

Apple of the eye, a name not unfrequently given to the pupil. See Anatomy.

Apples of Love. See Lycopersicon.

Mad Apples. See Melongena.

APPLEBY, the county-town of Westmoreland, where the assizes are held, is seated on the banks of the river Eden, which almost surrounds it. It was formerly a very considerable town, and had great privileges; but it is long ago gone to decay, and now only consists of mean houses in one broad street, which runs with an easy ascent from north to south; at the head of which is the castle, almost entirely surrounded by the river. It has two churches; a town hall, in which the assizes are held: a county jail; and an hospital for a governess and twelve widows, founded in 1651 by a daughter of lord Clifford. It is governed by a mayor, twelve aldermen, a common council, and two sergeants at mace, &c. Here is said to be the best corn-market in these northern parts. It sends two members to parliament. W. Long. 3. 52. N. Lat. 54. 30.

APPLICATION, in a general sense, is the laying two things together, in order to discover their agreement or disagreement.

Application, in geometry, is used either for division, for applying one quantity to another, whose areas, but not figures, shall be the same; or, for transferring a given line into a circle, or other figure, so that its ends shall be in the perimeter of the figure.

Application, in theology, is particularly used, by some divines, for the act whereby our Saviour transfers, or makes over to us, what he had earned or purchased by his holy life and death. Accordingly it is by this application of the merits of Christ that we are to be justified, and entitled to grace and glory. The sacraments are the ordinary means or instruments whereby this application is effected.

APPOGIATURA, in music, a small note inserted by the practical musician, between two others, at some distance.

APPOINTEE, a foot-soldier in the French army, &c. who for his long service and bravery receives pay above private sentinels. These have been suppressed in France,

France, except in the regiment of French guards, where forty appointees are ſtill retained to each company of 150 men.

Till the year 1670, they had alſo captains and lieutenants under the appellation of *appointees*, who, without reſiding in the regiment, received their pay.

APPOINTEE, in heraldry, the ſame as *aguiſée:* Thus we ſay, a croſs appointée, to ſignify that with two angels at the end cut off, ſo as to terminate in points.

APPOINTMENT, in a general ſenſe, the ſame as ASSIGNATION.

APPOINTMENT, in a particular ſenſe, denotes a penſion or ſalary given by great lords and princes to perſons of worth and parts, in order to retain them in their ſervice. The term is chiefly uſed among the French. The king of France gives large appointments to ſeveral of the officers in his ſervice. Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treaſurers; whereas appointments are annual gratifications granted by *brevet* for a time uncertain, and are paid out of the privy purſe.

APPOSER ſignifies an examiner. In the court of exchequer, there is an officer called the *foreign appoſer*. In the office of confirmation, in the firſt liturgy of Edward VI. the rubric directs the biſhop, or ſuch as he ſhall appoint, to appoſe a child; and a biſhop's examining chaplain was anciently called his *poſer*.

APPOSITION, in grammar, the placing two or more ſubſtantives together in the ſame caſe, without any copulative conjunction between them; as, *Ardebat Alexim, delicias domini.*

APPRAISER (from *ad*, "to," and *pretium*, "value") one who rates or ſets a value upon gooods, &c. He muſt be a ſkilful and honeſt perſon. It is not a buſineſs of itſelf, but is practiſed by brokers of houſehold-furniture; to which ſet of men the word is chiefly applied: Yet upholſterers and other brokers are employed, or even any perſon or perſons who are ſuppoſed to be ſkilled in the commodities to be appraiſed or valued. They are employed in caſes of death, executions brought in upon goods, or of ſtock to be turned over from one perſon to another, or divided between copartners; and are called *ſworn appraiſers*, from their taking an oath to do juſtice between party and party. They ſometimes appraiſe on behalf of both ſides, each party agreeing to have the ſame appraiſer or appraiſers; ſometimes in oppoſition, each party chooſing one or more of a ſide; and ſometimes by commiſſion or deputation of truſtees, maſters in chancery, &c.

APPRAISING, the act of rating, valuing, or ſetting a price on goods, by a perſon who is a competent judge, and is authoriſed thereto. See APPRAISER.

APPREHENSION, in logic, denotes the ſimple attention of the mind to an object preſented either to our ſenſe or our imagination, without paſſing a judgement or making any inference.

APPREHENSION is likewiſe uſed to expreſs an inadequate and imperfect idea: and thus it is applied to our knowledge of God, in contradiſtinction to comprehenſion.

APPREHENSION, in law, ſignifies the ſeizing a criminal, in order to bring him to juſtice.

APPRENTICE, (from *apprendre*, "to learn,") one who is bound by covenant to ſerve a tradeſman or artificer a certain time, upon condition of the maſter's inſtructing him in his art or myſtery.

Apprentices may likewiſe be bound to huſbandmen, or even to gentlemen; and they, as well as tradeſmen, in England, are compellable to take the children of the poor, whom the overſeers, with the conſent of two juſtices, may bind till the age of twenty-four years. Apprentices may be diſcharged on reaſonable cauſe; but if any, whoſe premium has been leſs than ten pounds, run away from their maſters, they are compellable to ſerve out the time of abſence, or give ſatisfaction for it, at any period within ſeven years after expiration of the original contract. Apprentices gain a ſettlement in that pariſh where they laſt ſerved forty days; and by the 5th of Elizabeth, c. 4. they have an excluſive right to exerciſe the trade in which they have been inſtructed, in any part of England. However, the reſolutions of the courts have in general rather confined than extended the reſtriction of this ſtatute. See Blackſtone's Com. Vol. I. p. 426, &c.

In France, the ſons of tradeſmen, living in their father's houſe till ſeventeen years of age, are reputed to have ſerved an apprenticeſhip. In that country, the times of ſerving are different in the differet profeſſions, from three years to eight. After ſerving out an apprenticeſhip, the perſon becomes what they call an *aſpirant*, or candidate for maſterſhip, and is to be examined by proper officers as to his ſkill and proficiency, and alſo to exhibit a *chef d'oeuvre* or maſterpiece in the art he has been bred to, before he be ſuffered to ſet up to practiſe for himſelf. And the cuſtom of France in regard to apprentices, is not unworthy the imitation of other nations.

Anciently, benchers in the inns of court were called *apprentices of the law*, in Latin *apprenticii juris nobiliores;* as appears by Mr Selden's note on Forteſcue: and ſo the learned Plowden ſtyles himſelf. Sir Henry Finch, in in his *Nomotechnia*, writes himſelf, *apprentice de ley:* Sir Edward Coke in his *Inſt.* ſays, *Apprenticii legis*, in pleading, are called *homines conſiliarii et in lege periti;* and in another place, *apprentices* and other counſellors of law.

Apprentices indentures and articles of clerkſhip, pay of duty ſix ſhillings. Pariſh indentures are excepted, and pay ſixpence only, by 5 W. 3. c. 21. For fees given with apprentices, clerks, or ſervants, bound or articled by indentures, from 1 l. to 50 l. maſters pay for every pound ſixpence; and for fees above 50 l. one ſhilling in the pound. 8 Ann. c. 9.

APPRENTICESHIP, the ſervitude of an apprentice, or the duration of his indenture.

Seven years ſeem anciently to have been, all over Europe, the uſual term eſtabliſhed for the duration of apprenticeſhips in the greater part of incorporated trades. All ſuch incorporations were anciently called *univerſities;* which, indeed, is the proper Latin name for any incorporation whatever. The univerſity of ſmiths, the univerſity of taylors, &c. are expreſſions which we commonly meet with in the old charters of ancient towns. When thoſe particular incorporations which are now peculiarly called *univerſities* were firſt eſtabliſhed, the term of years which it was neceſſary to ſtudy, in order to obtain the degree of maſter of arts, appears evidently to have been copied from the term of apprenticeſhip in common trades, of which the incorporations

Apprenticeship. porations were much more ancient. As to have wrought ſeven years under a maſter properly qualified was neceſſary in order to intitle any perſon to become a maſter, and to have himſelf apprentices in a common trade; ſo to have ſtudied ſeven years under a maſter properly qualified was neceſſary to intitle him to become a maſter, teacher, or doctor (words anciently ſynonimous), in the liberal arts, and to have ſcholars or apprentices (words likewiſe originally ſynonimous) to ſtudy under him.

By the 5th of Elizabeth, commonly called the *ſtatute of apprenticeſhip*, it was enacted, that no perſon ſhould for the future exerciſe any trade, craft or myſtery, at that time exerciſed in England, unleſs he had previouſly ſerved to it an apprenticeſhip of ſeven years at leaſt; and what before had been the bye-law of many particular corporations, became in England the general and public law of all trades carried on in market-towns. For though the words of the ſtatute are very general, and ſeem plainly to include the whole kingdom, by interpretation its operation has been limited to market-towns; it having been held, that in country villages a perſon may exerciſe ſeveral different trades, though he has not ſerved a ſeven years apprenticeſhip to each, they being neceſſary for the conveniency of the inhabitants, and the number of people frequently not being ſufficient to ſupply each with a particular ſet of hands.

By a ſtrict interpretation of the words, too, the operation of this ſtatute has been limited to thoſe trades which were eſtabliſhed in England before the 5th of Elizabeth, and has never been extended to ſuch as have been introduced ſince that time. This limitation has given occaſion to ſeveral diſtinctions which, conſidered as rules of police, appear as fooliſh as can well be imagined. It has been adjudged, for example, that a coachmaker can neither himſelf make, nor employ journeymen to make, his coach-wheels, but muſt buy them of a maſter wheel-wright; this latter trade having been exerciſed in England before the 5th of Elizabeth. But a wheelwright, though he has never ſerved an apprenticeſhip to a coachmaker, may either himſelf make, or employ journeymen to make, coaches; the trade of a coachmaker not being within the ſtatute, becauſe not exerciſed in England at the time when it was made. The manufactures of Mancheſter, Birmingham, and Wolverhampton, are many of them upon this account not within the ſtatute; not having been exerciſed in England before the fifth of Elizabeth.

In France, the duration of apprenticeſhips is different in different towns and in different trades. In Paris, five years is the term required in a great number; but before any perſon can be qualified to exerciſe the trade as a maſter, he muſt in many of them, ſerve five years more as a journeyman. During this latter term he is called the *companion* of his maſter, and the term itſelf is called his *companionſhip*.

In Scotland there is no general law which regulates univerſally the duration of apprenticeſhips. The term is different in different corporations. Where it is long, a part of it may generally be redeemed by paying a ſmall fine. In moſt towns, too, a very ſmall fine is ſufficient to purchaſe the freedom of any corporation. The weavers of linen and hempen cloth, the principal manufactures of the country, as well as all other artificers ſubſervient to them, wheelmakers, reelmakers, &c. may exerciſe their trades in any town corporate, without paying any fine. In all towns corporate, all perſons are free to ſell butcher's meat upon any lawful day of the week. Three years is in Scotland a common term of apprenticeſhip, even in ſome very nice trades; and in general there is no country in Europe in which corporation laws are ſo little oppreſſive.

Apprenticeſhip, Appriſing.

Apprenticeſhips were altogether unknown to the ancients. The reciprocal duties of maſter and apprentice make a conſiderable article in every modern code. The Roman law is perfectly ſilent with regard to them. There is no Greek or Latin word which expreſſes the idea we now annex to the word apprentice; a ſervant bound to work at a particular trade for the benefit of a maſter during a term of years, upon condition that the maſter ſhall teach him that trade.

Long apprenticeſhips Dr Smith conſiders as altogether unneceſſary. The arts, which are much ſuperior to common trades, ſuch as thoſe of making clocks and watches, contain no ſuch myſtery as to require a long courſe of inſtruction. The firſt invention of ſuch beautiful machines, indeed, and even that of ſome of the inſtruments employed in making them, muſt, no doubt, have been the work of deep thought and long time, and may juſtly be conſidered as among the happieſt efforts of human ingenuity: But when both have been fairly invented and are well underſtood; to explain to any young man, in the compleateſt manner, how to apply the inſtruments and how to conſtruct the machines, cannot well require more than the leſſons of a few weeks; perhaps thoſe of a few days might be ſufficient. In the common mechanic trades, thoſe of a few days might certainly be ſufficient. The dexterity of hand, indeed, even in common trades cannot be acquired without much practice and experience. But a young man would practiſe with much more diligence and attention, if from the beginning he wrought as a journeyman, being paid in proportion to the little work which he could execute, and paying in his turn for the materials which he might ſometimes ſpoil though aukwardneſs and inexperience. His education in this way generally would be more effectual, and always leſs tedious and expenſive. The maſter, indeed, would be a loſer; he would loſe all the wages of the apprentice, which he now ſaves, for ſeven years together. In the end, perhaps, the apprentice himſelf would be a loſer. In a trade ſo eaſily learnt he would have more competitors: and his wages, when he came to be a complete workman, would be much leſs than at preſent. The ſame increaſe of competition would reduce the profits of the maſters as well as the wages of the workmen. The trades, the crafts, the myſteries, would be all loſers: but the public would be a gainer; the work of all artificers coming in this way much cheaper to market.

Wealth of Nations, Vol. i. p. 162 Philad. Edition.

APPRISING, in Scots law, the name of that action by which a creditor formerly carried off the eſtate of his debtor for payment. It is now aboliſhed, and adjudications are appointed in place of it.—Adjudications, charter, reſignation, clare conſtat, cognition of heirs, heritable right, confirmation, novodamus, principal and original inſtrument of ſurrender, retour, ſeiſin, and ſervice, in Scotland, pay by different acts 4s. 9d. duty.

APPROACH, or APPROACHING, in a general sense, the acceding or coming together of two or more things.

APPROACHES, in fortification, the works thrown up by the besiegers, in order to get nearer a fortress, without being exposed to the enemy's cannon.

APPROACHING, in fowling, a term used to express such devices as are contrived for the getting within shot of shy birds. It is principally used in marshy low places. The best method of approaching is by means of three hoops tied together at proper distances, according to the height of the man that is to use it, and having boughs of trees tied all round it, with cords to hang it over his shoulders; a man getting into this, conceals himself, and approaches by degrees towards his game in the form of a moving bush. Geese, ducks, and teal, quit the waters in the evening, and pass the night in the fields; but at the approach of morning they return to the water again, and even when on the water they will retire to great distances, on the approach even of a horse or cow, so that the business of the stalking-horse is of little use; but this device of approaching by the moving bush succeeds tolerably well with them.

APROACHING, in gardening, the inoculating or ingrafting the sprig of one tree into another, without cutting it off the parent tree.

APPROBATION, a state or disposition of the mind, wherein we put a value upon, or become pleased with, some person or thing. Moralists are divided on the principle of approbation or the motive which determines us to approve and disapprove. The Epicureans will have it to be only self-interest: according to them, that which determines any agent to approve his own action, is its apparent tendency to his private happiness; and even the approbation of another's action flows from no other cause but an opinion of its tendency to the happiness of the approver, either immediately or remotely. Others resolve approbation into a moral sense, or a principle of benevolence by which we are determined to approve every kind affection either in ourselves or others, and all publicly useful actions, which we imagine to flow from such affection, without any view therein to our own private happiness.

APPROBATION, is more particularly used, in speaking of recommendations of books, given by persons qualified or authorised to judge of them. Those appointed to grant licences and imprimatures, frequently express their approbations of books. Books were formerly subjected to a licenser in England (see 13th Car. II. c. 33), which act is long since expired; and being incompatible with the noble principles of the Revolution, has never since been, and it is hoped never will be, revived.

APPROPRIATION, in the canon law, a severing of a benefice ecclesiastical to the proper and perpetual use of some religious house. See the article PARSON.

The contrivance of appropriations seems to have sprung from the policy of the monastic orders, who have never been deficient in subtile inventions for the increase of their own power and emoluments. At the first establishment of parochial clergy, the tithes of the parish were distributed in a fourfold division; one for the use of the bishop, another for maintaining the fabric of the church, a third for the poor, and the fourth to provide for the incumbent. When the fees of the bishops became otherwise amply endowed, they were prohibited from demanding their usual share of these tithes, and the division was into three parts only. And hence it was inferred by the monasteries, that a small part was sufficient for the officiating priest; and that the remainder might well be applied to the use of their own fraternities (the endowment of which was construed to be a work of the most exalted piety), subject to the burden of repairing the church and providing for its constant supply. And therefore they begged and bought, for masses and obits, and sometimes even for money, all the advowsons within their reach, and then appropriated the benefices to the use of their own corporation. But, in order to complete such approbriation effectually, the king's licence, and consent of the bishop, must first be obtained; because both the king and the bishop may some time or other have an interest by lapse, in the presentation to the benefice; which can never happen if it be appropriated to the use of a corporation, which never dies: and also because the law reposes a confidence in them, that they will not consent to any thing that shall be to the prejudice of the church. The consent of the patron also is necessarily implied, because the appropriation can be originally made to none but to such spiritual corporation as is also the patron of the church; the whole being indeed nothing else but an allowance for the patrons to retain the tithes and glebe in their own hands, without presenting any clerk, they themselves undertaking to provide for the service of the church. When the appropriation is thus made, the appropriators and their successors are perpetual parions of the church; and must sue and be sued, in all matters concerning the rights of the church, by the name of *parsons*.

This appropriation may be severed, and the church become disappropriate, two ways; as, first, if the patron or appropriator presents a clerk, who is instituted and inducted to the parsonage: for the incumbent so instituted and inducted is to all intents and purposes complete parson; and the appropriation being once severed, can never be reunited again, unless by a repetition of the same solemnities. And, when the clerk so presented is distinct from the vicar, the rectory thus vested in him becomes what is called a *sine-cure;* because he hath no cure of souls, having a vicar under him to whom that cure is committed. Also, if the corporation which has the appropriation is dissolved, the parsonage becomes disappropriate at common law: because the perpetuity of person is gone, which is necessary to support the appropriation.

In this manner, and subject to these conditions, may appropriations be made at this day: and thus were most if not all of the appropriations at present existing originally made; being annexed to bishopricks, prebends, religious houses, nay, even to nunneries, and certain military orders, all of which were spiritual corporations. At the dissolution of monasteries, by statutes 27 Hen. VIII. c. 28. and 31 Hen. VIII. c. 13. the appropriations of several parsonages, which belonged to those respective religious houses, (amounting to more than one third of all the parishes of England), would have been by the rules of common law disappropriated; had not a clause in those statutes intervened, to give them to the king in as ample a manner as the abbots, &c. formerly held the same at the time of their dissolution. This, though perhaps scarcely defensible, was not without example: for the same was done in former reigns, when the alien priores (that is, such as were filled by foreigners only) were dissolved and given to the crown. And from these two roots have sprung all the lay-appropriations or secular parsonages which we now see in the kingdom; they having been afterwards granted out from time to time by the crown. See the article *Parson and Vicar*.

APPROVER, in law, one who, confessing felony in himself, appealeth or impeacheth another or more of his accomplices. He is so called from the French *approuver, comprobare*, because he must prove what he hath alleged in his appeal. This proof was anciently either by battle, or by the country, at the choice of the appellee: and the form of this accusation may be found in Crompt. Just. 250.

Approvers of the king, are those who have the letting of the king's demesnes in small manors, &c. In the statute of the 1st of Ed. 3. c. 8. sheriffs are called the king's *approvers*.

It being in the discretion of the court to suffer one to be an approver, this method of late hath seldom been practised. But we have in cases of burglary and robbery on the highway, what seems to amount to the same by statute; it being ordained, that where persons charged with such crimes out of prison, discover two others concerned in the crime, they shall have a pardon, &c. Stat. 5th Anne, c. 31.

Approver is particularly used in ancient law writers, for a baliff or land-steward, appointed to have the care of a manor, franchise, or the like, and improve and make the most of it for the benefit of his master. In this sense, the word is also written *appruare*.

APPROXIMATION, in arithmetic and algebra, the coming nearer and nearer to a root, or other quantity sought, without expecting to be ever able to find it exactly.

APPUI, in the manege, (*q. d.* rest or stay upon the hand), is the reciprocal effort between the horse's mouth and the bridle-hand, or the sense of the action of the bridle on the hand of the horseman.

A just appui of the hand, is the nice bearing up or stay of the bridle, so that the horse, being awed by the sensibility and tenderness of his mouth, dares not rest too much upon the bit-mouth, nor check or beat upon the hand to withstand it. A horse is said to have no appui, when he is too apprehensive of the hand, and cannot bear the bit. He is said to have too much appui, when he rests or throws himself too much upon the bit. Horses designed for the army ought to have a full appui upon the hand. To give a horse a good appui, he should be galloped, and put often back.

APPULSE, in astronomy, the approach of any planet to a conjunction with the sun, or a star. It is a step towards a transit, occultation, conjunction, eclipse, &c. M. Flamsted, M. de la Hire, and others, have given observations of the moon's appulses to the pleiades. *Phils. Trans.* N° 76. p. 361. *M. Acad. Science. an.* 1708.

APRICOT, in botany. See Prunus.

APRIES, son of Psammis, king of Egypt; the same with Pharaoh Hophrah in Jeremiah and Ezekiel. He ruined Sidon, and some say he put Jeremiah to death. He thought neither God nor man could dethrone him; which yet was easily done by Amasis, and he himself was strangled by the Egyptians.

APRIL, the fourth month of the year, according to the common computation, but the second, according to that of the astronomers. It contains 30 days.—The word is derived from *aprilis*, of *aperio*, "I open;" because the earth, in this month, begins to open her bosom for the production of vegetables. In this month the sun travels through the sign Taurus.

A PRIORI, a kind of demonstration. See Demonstration.

APRON, in naval architecture, is a piece of curved timber fixed behind the lower part of the stern, immediately above the foremost end of the keel.

Apron is also a name given to a platform or flooring of plank, raised at the entrance of a dock, against which the dock-gates are shut.

Apron, in gunnery, a piece of lead which caps or covers the vent or touch-hole of a great gun.

APSIS or absis, signifies the bowed or arched roof of a house, room, or oven, &c. as also the ring or compass of a wheel.

Apsis in ecclesiastical writers, denotes an inner part in the ancient churches, wherein the clergy sat, and where the altar was placed. It is supposed to have been thus called, because covered with an arch or vault of its own, by the Greeks called αψις, by the Latins *absis*. Apsis, in this sense, amounts to the same with what is otherwise called *choir, concha, camera*, and *presbyterium*; and stands opposite to the *nave* or body of the church.

Apsis is more particularly used for the bishop's seat, or throne, in ancient churches. This was peculiarly called *apsis gradata*, because raised on steps above the ordinary stalls.—It was also denominated *exedra*, and in latter times *tribune*.

Apsis is also used for a reliquary, or case, wherein the relics of saints were anciently kept. It took the name *apsis*, from its being round, or arched at the top; or perhaps from the place where it was kept. The *apsis* was commonly placed on the altar: it was usually of wood, sometimes also of gold and silver, with sculptures, &c.

Apsis, in astronomy, a term used indifferently for either of the two points of a planet's orbit, where it is at greatest or least distance from the sun or earth; and hence the line connecting those points is called the line of the *apsides*. The word is Greek, and derived from απτω, to *connect*. The apsis at the greatest distance from the sun is called the *aphelion*, and at the greatest distance from the earth the *apogee*; while that at the least distance from the sun is termed the *perihelion*, and at the least distance from the earth the *perigee*.

APSIRTIDES. See Absorus.

APTA, or Apta Julia, (Pliny); now *Apte*, in Provence, on the river Calavon, seven leagues to the north of Aix, and nine to the north of Avignon. In the Notitiæ it is called *Civitas Aptensium*: Pliny reckons it among the Latin towns. That it was a colony, appears from an inscription on a stone found at Arles, (Sirmond). E. Long. 5. 56. Lat. 43. 23.

APTERA, (Strabo, Stephanus); APTERON, (Pliny); APTERIA, (Ptolemy): An inland town of Crete, whose port was Cisamus, on the west side of the island, (Strabo); 12 miles to the south of Sydonia towards the Montes Leuci, and as many from the Sinus Amphimales. So called from the Sirens, who, being there vanquished in song by the Muses, stript themselves of their wings, and out of grief leaped into the sea, (Stephanus). There was a town of Lycia of the same name. E. Long. 25. N. Lat. 35. 50.

APTERA, a term used by Linnæus for his seventh order of insects, comprehending such as have no wings.

APTHANE, a title anciently given to the higher degrees of nobility in Scotland. See THANE.

APTITUDE, (from *aptus* "fit"), the natural disposition any thing hath to serve for such or such a purpose.—Thus, oil hath an *aptitude* to burn, and water to extinguish fire.

APTITUDE, or APTNESS, is often used, in speaking of the talents of the mind, for a promptitude, or disposition to learn things with ease and expedition. In which sense *aptness* amounts to the same with what the Greeks call ευμαθια, *bona indoles*, and we sometimes *docility*. Charlton divides *aptness* into these parts, viz. *acuteness*, *sagacity* and *memory*.

APTOTE, among grammarians, an undeclinable noun, or one which has no variation of cases.

APULEIUS (Lucius), a Platonic philosopher, universally known by his performance of the Golden Ass. He lived in the second century, under the Antonines; and was born at Madaura, a Roman colony in Africa. He studied first at Carthage, then at Athens, and afterwards at Rome, where he learned the Latin tongue without the help of a master. He was a man of a curious and inquisitive disposition, especially in religious matters: this prompted him to take several journies, and to enter into several societies of religion. He spent his whole fortune almost in travelling; so that, at his return to Rome, when he was about to dedicate himself to the service of Osiris, he had not money enough to defray the expence attending the ceremonies of the reception, and was obliged to pawn his clothes to raise the necessary sum. He supported himself afterwards by pleading causes; and as he was a great master of eloquence, and of a subtile genius, many considerable causes were trusted to him. But he availed himself more by a good marriage than by his pleadings: a widow, named *Pudentilla*, who was neither young nor handsome, but wanted a husband and was very rich, took a great fancy to him. This marriage drew upon him a troublesome law-suit. The lady's relations, pretending he made use of sorcery to gain her heart and money, accused him of being a magician before Claudius Maximus proconsul of Africa. Apuleius was under no great difficulty of making his defence. As Pudentillo was determined from considerations of health, to enter upon a second marriage, even before she had seen this pretended magician, the youth, deportment, pleasing conversation, vivacity, and other agreeable qualities of Apuleius, were charms sufficient to engage her heart. He had the most favourable opportunities too of gaining her friendship, for he lodged some time at her house: Pudentilla's eldest son having a great friendship for him, was likewise desirous of the match, and solicited him in favour of Pudentilla. "Do you make a wonder (said Apuleius, in his defence) that a woman should marry again, after having lived a widow 13 years? it is much more wonderful that she did not marry again sooner. You think that magic must have been employed to prevail with a widow of her age, to marry a young man; on the contrary, this very circumstance shows how little occasion there was for magic." He offered to prove by his marriage-contract, that he got nothing of Pudentilla but a promise of a very moderate sum, in case he survived her and had children by her. He was also obliged to make such confessions in court as Pudentilla would gladly have excused. He said she was neither handsome nor young, nor such as could any ways tempt him to have recourse to enchantments; moreover, he added, that Pontianus her son proposed the marrying his mother to him only as a burden, and the action of a friend and philosopher. He also took notice of many inconveniences which attend the marrying of widows, and spoke highly of the advantages of a maid above a widow: "A handsome virgin (said he, let her be ever so poor, is abundantly portioned; she brings to her husband a heart quite new, together with the flower and first-fruits of her beauty. It is with great reason that all husbands set so great a value upon the flower of virginity: all the other goods which a woman brings her husband are of such a nature, that he may return them again, if he has a mind to be under no obligation her; that alone cannot be restored, it remains in the possession of the first husband. If you marry a widow, and she leaves you, she carries away all that she brought you." Upon which passage Mr Bayle makes a very coarse remark, *viz.* "That this good which is never taken back out of the hands of a husband, is very chimerical; and that there is never a baker nor a butcher, who would lend sixpence upon this unperishable possession." The apology is still extant, and is reckoned a very fine piece. Apuleius was extremely indefatigable in his studies; and composed several books, some in verse, and others in prose; but most of them have been lost. He took great pleasure in declaiming, and was heard generally with great applause: When he declaimed at Oeca, the audience cried out with one voice, that they ought to confer upon him the honour of citizen. The citizens of Carthage heard him with great satisfaction, and erected a statue to him; and several other cities did him the same honour. Several critics have published notes on Apuleius's Golden Ass, and there have been translations of it into different languages.

APULIA, now PUGLIA, a territory of Italy, bordering on the Adriatic, and extending from the river Frento to Tarentum in length, and from the Adriatic to the Lucani in breadth. *Apuli* the people, (Horace); divided into the *Apulia Daunia*, now called *Puglia Pinna*, or the *Capitanata*; and into the *Apulia Peucetia*, now *Terra di Barri*, (Pliny, Ptolemy.) Apulia abounded in sheep, which yielded the finest wool, (Martial). It is now the east side of the kingdom of Naples.

APUS, *Avis Indica*, in astronomy, a constellation of the southern hemisphere placed near the pole, between the triangulum australe and the chameleon, supposed to represent the bird of paradise.

APYCNI SUONI, in music, sounds distant one or more octaves, and yet concord.

APYCNOS, in music, is said of the diatonic genus, on account of its having spacious intervals, in comparison of the chromatic and enharmonic.

APYREXY, among physicians, denotes the intermission of a fever.

APYROUS, a word applied to denote that property of some bodies, by which they resist the most violent fire without any sensible alteration. Apyrous bodies ought to be distinguished from those which are refractory. Refractory substances are those which cannot by violent heat be fused, whatever other alteration they may sustain. But a body, properly speaking, apyrous, can neither be fused by heat, nor can undergo any other change. Diamonds were long thought to be possessed of this property. But some late experiments have shown, that diamonds may be entirely dissipated or evaporated by heat, and are therefore not intitled to be ranked among apyrous substances. Perhaps there is no body in nature essentially and rigorously apyrous. But it is sufficient that there be bodies apyrous relatively to the degree of fire which art can produce, to intitle them to that name.

AQUA, a term frequently met with in the writings of physicians, chemists, &c. for certain medicines, or menstruums, in a liquid form, distinguished from each other by peculiar epithets, as *Aqua Alexiteria*, *Aqua Aluminosa*, *Aqua Mirabilis*, *&c.* for which see PHARMACY.

Aqua Extincta, or *Extinguished Water*, is aquafortis into which some river-water has been poured, in order to qualify it, and render it less corrosive. Its use is to get the silver from the aquafortis that served to part gold from it.

Aqua Fortis, a name given by artists to nitrous acid of a certain strength, from its dissolving power: that which is concentrated and smoking, is called *spirit of nitre*. The aquafortis used by dyers, brass-founders, &c. is not only weaker than spirit of nitre, but contains a portion of vitriolic acid. It may be made by distilling crude nitre with calcined vitriol, equal parts. The nitrous acid, expelled by the vitriolic, will rise in red fumes, and pass into the receiver. The vitriolic acid, uniting with the alkaline basis of the nitre, forms vitriolated tartar; but, there being more vitriolic acid than is requisite to saturate the alkali, the surplus rises with the nitrous acid: aquafortis, therefore, is a mixture of these two acids. It may also be made by distilling crude nitre with somewhat more than half its weight of oil of vitriol; or by mixing one part of oil of vitriol with nine parts pure spirit of nitre. See CHEMISTRY-*Index*.

Aqua Marina, a name by which the jewellers call the beryl, on account of its sea-green colour. See BERYL.

Aqua Regia, a compound of nitrous and marine acid, in different proportions according to the purpose for which it is intended. It is usually made by dissolving, in nitrous acid, sal ammoniac, or common salt, both which are combinations of marine acid with alkali. When made with sal ammoniac, the common proportion is one part of this salt to four parts of nitrous acid; but to dissolve platina, equal parts are requisite. A purer aqua regia may be made by simply mixing the two acids.

Aqua regia is particularly used as a menstruum for gold; it likewise dissolves all other metals, except silver. The gold dissolved in aqua regia is, in fact, dissolved in the dephlogisticated marine acid only, which, being deprived of its phlogiston by the nitrous acid, recovers it from the gold, and thus renders gold soluble; for metals are not soluble in acids until they lose a part of their phlogiston. See CHEMISTRY-*Index*.

Aqua Secunda, aquafortis diluted with much pure water. It is employed in several arts, to clean the surface of metals and certain stones, and for various other purposes.

Aqua Vitæ, is commonly understood of what is otherwise called *brandy*, or spirit of wine, either simple, or prepared with aromatics. Some, however, distinguish between them; appropriating the term *brandy* to what is drawn from wine, or the grape; and *aqua vitæ* to that drawn after the same manner, from malt, &c.

Aquæ Augustæ, (Ptolemy); *Aquæ Tarbellicæ*, (Antonine); *Aquensis Civitas*, in the Notitia. Now *Acqs*, or *Dax*, a town in Gascony, on the river Adour, famous for its baths. W. Long. 1. 40. N. Lat. 43. 56.

Aquæ Bilbilitanæ, (Antonine); baths 24 miles to the west of Bilbilis. Now *Banos de Alhama*, in Arragon.

Aquæ Calidæ, (Ptolemy); *Aquæ Solis*, (Antonine); a place of the Belgæ in Britain, famous for its hot waters. Now *Bath*, in Somerset-shire. W. Long. 1. 5. Lat. 51. 20.

Aquæ Calidæ, (Ptolemy); *Aquicaldensis*, (Pliny); formerly in great repute, and a public bath; whose ruins still remain testimonies of the Roman grandeur. Now *Orense*, in Gallicia, still famous for its baths; on the river Minho, 54 miles south-east of Compostella. W. Long. 8. 30. Lat. 42. 30. Also a place in the bay of Carthage, (Strabo). Other *Aquicaldenses*, to the north of Gerundia in Catalonia, (Ptolemy).

Aquæ Calidæ, a colony between the rivers Serbetes and Savus, in Mauritania Cæsariensis, (Ptolemy).

Aquæ Celeniæ, (Ptolemy); or *Cilinæ*, (Antonine). Now *Caldas*, a hamlet on the Minho, in Gallicia.

Aquæ Convenarum, a hamlet of Gaul, in Aquitaine, (Antonine), and on the borders of the Convenae, or le Cominge, at the foot of the Pyrenees, near the source of the Garonne. Now Bagneres. W. Long. 3. 39. Lat. 42. 20.

Aquæ Cutiliæ, a lake of the Sabines, in the territory of Reate (Pliny); *Lacus Cutiliensis*, (Varro); with a moveable island in it, (Seneca, Pliny); supposed to be the centre of Italy, (Varro). The waters were medicinal, and extremely cold, good for a weak stomach and in weak nerves; they seemed to act by a kind of suction, which approached to a bite, (Pliny). Vespasian used them every summer; and there he died, (Sueton, Xiphilin from Dio). Now *Lago di Contigliano*.

Aquæ Flaviæ, a town on the confines of Gallicia and Portugal, so called from Vespasian and Titus. The inhabitants are called *Aquiflavienses*, coins. Now called *Chiavas*, a mean hamlet: but the ruins of its bridge testify its former grander. W. Long. 6. 6. Lat. 41. 40.

Aquæ Helvetiæ, described by Tacitus as a municipal town, and much frequented for its excellent water; and though he does not mention its name, Cluverius sup-

supposes it to be Baden, in Switserland, on the rivulet Limat, which soon after falls into the Aar. It is called the Upper, to distinguish it from another called the Lower Baden in Alsace. E. Long. 8. 49. Lat. 47. 55.

Aquæ Merom (Joshua), famous for the defeat of Jabin; supposed to be the lake called *Samachonitis*, or *Semechonitis*, by Josephus; into which the river Jordon falls, before it comes to the sea of Genesereth, or Galilee.

Aquæ Pannoniæ, famous baths of Austria, now called *Baden*, 28 miles to the south of Vienna.

Aquæ Patavinæ, are baths in the territory of Venice near Padua, (Pliny); called *Fontus Aponi* (Livy, Martial). Now *Bagni d'Abano*. E. Long. 31. 48. Lat. 45. 15.

Aquæ Quintianæ, put by Ptolemy in room of the *Aquæ Cilinæ* of Antonine. Now supposed to be *Sarria*, a town of Gallicia, on a rivulet of the same name, three leagues to the south of Lugo.

Aquæ Sextiæ, a colony to the north of Marseilles, so called, both from the founder Sextius Calvinus, and from its quantity of water, and number of cold and hot springs; built after the defeat of the Salyes, or Salvii, whose territory in the south of Provence reached from the Rhone to the borders of Italy, (Livy, Velleius, Strabo, Ptolemy). By an inscription the colony appears to have been either increased or renewed by Augustus. In the Notitia it is called *Civitas Aquensis*. Now *Aix*. Here the Teutones and Cimbri were defeated with a great slaughter by Marius. E. Long. 6. 4. Lat. 48. 4.

Aquæ Statiellæ or *Statiellorum*, (Pliny), a town in Liguria, on the river Bormia. Now *Acquic*, a town of Montferrat. E. Long. 8. 40. Lat. 44. 45.

Aquæ Tauri, hot waters or baths in Tuscany, at the distance of three miles from the sea, said to be discovered by a bull, hence the appellation. There are still to be seen the ruins of these baths. Now *Acquapendente*, in Orvieto. E. Long. 12. 40. Lat. 42. 40.

AQUÆDUCT, in hydraulics and architecture, a structure formed for conveying water from one place to another, over grounds that are unequal. The word is compounded of the Latin substantive *aqua* water, and *ductus* a channel by which that water may be conducted.

Architects distinguish two kinds of aquæducts, the *visible*, and the *subterraneous*.—The *visible* are constructed in valleys or marshes, and protracted in longitude or latitude as the situation requires. They are composed of adminicula for supporting the arches and confining the stream, and of arcades.—The *subterraneous* are formed, by piercing the mountains, and conducting them below the surface of the earth. They are built of stone, hewn or rough; and covered above with vaults, or with flat stones, which may be termed *flags*: these flags shelter the waters from the heat of the sun.

They divide them still into *double* and *triple* aquæducts; that is to say, such as are supported either by two or by three ranges of arcades. Such was the aqæduct which Procopius records to have been built by Cosroës king of the Persians, for the city of Petra in Mingrelia: It had three conduits upon the same line, each elevated above the other.

Frequently aquæducts are paved. Sometimes the waters flow through a natural channel of clay. Frequently they are conveyed by pipes of lead into reservoirs of the same metal, or into troughs of hewn stone. The channels are cut with an imperceptible descent, that the current may be accelerated by its own weight. Parallel to its course, on each side, is cut a narrow foot path, where people may walk when necessary. By conduits, or grooves, the waters are conveyed into large cisterns, but not forced above their original level. To make them rise and issue from their apertures with force, they must be confined in tubes of a small diameter, and abruptly fall from a considerable declivity.

Aquæducts of every kind were long ago the wonders of Rome; the vast quantity of them which they had; the prodigious expence employed in conducting waters over arcades from one place to another, at the distance of 30, 40, 60, and even 100 miles, which were either continued or supplied by other labours, as by cutting mountains and piercing rocks; all this ought to surprise us; nothing like this is undertaken in our times: we dare not even think of purchasing public conveniency at so dear a rate. Appias the censor advised and constructed the first aquæduct. His example gave the public luxury a hint to cultivate these objects; and the force of prodigious and indefatigable labour diverted the course of rivers and floods to Rome. Agrippa, in that year when he was ædile, put the last hand to the magnificence of these works. It is chiefly in this respect that the modern so much resembles the ancient city of Rome. For this advantage, she is peculiarly indebted to Sextus V. and to Paul V. who for grandeur and magnificence emulated the masters of the universe*. There are still to be seen, in different places contiguous to Rome, striking remains of these aquæducts; arches continued thro' a long space, over which were extended the canals which carried the water to the city. The arches are sometimes low, sometimes raised to a vast height, to humour the tumidities or depressions of the ground. There are some which have two arcades, one constructed above the other; and this precaution was observed, lest the height of a single arcade, if extended as far as the situation required, might render the structure less firm and permanent. They are commonly of bricks; which by their cement cohere so strongly, that the parts are not separated without the utmost difficulty—When the elevations of the ground were enormous, it became necessary to form *subterraneous* aquæducts. These carried the waters to such aquæducts as were raised above ground, in the declivity or at the foot of mountains. If the artificial channel of the water was not susceptible of a downward bias but by passing through a rock, through this they cut a passage at the same height with the superior aquæduct: such an one may be seen above the city of Tivoli, and at the place called *Vicavaro*. The canal which formed the course of the aquæduct is hewn out of the rock to the extent of more than a mile, about five feet in height and four in breadth.

* See *New Memoirs of Italy*, vol. i.

There is one thing, however, which deserves to be remarked. It is, that the aquæducts, which might have been directed in a straight line to the city, did not arrive at it but by frequent and winding mazes. Some have said that this oblique tract was pursued to avoid the expence which must attend the building of arcades to an extraordinary height: others, that it was their intention to diminish the impetuosity of the current; which,

which rolling in a straight line through an immense space, must always have increased its velocity, must have worn the canals by perpetual and forcible attrition, and of consequence afforded an impure and unwholesome draught to the inhabitants. But since there was so great a descent between the cascade of Tivoli and Rome, it is demanded why they should go to draw water from the same river at the distance of more than 20 miles higher; nay, of more that 30 miles, if we reckon the curvatures of its direction through that mountainous country? It is replied, the motive of obtaining the water more salubrious, and more limpid, was sufficient to make the Romans think their labour necessary, and their expence properly bestowed; and to those who reflect that the waters of this river were impregnated with mineral particles, and by no means wholesome, the answer will appear satisfactory.

Vol. IV. If any one will cast his eyes upon plate 128th of the Antiquities of Father Montfaucon, he will see with how much care these immense works were constructed. From distance to distance spiramenta were left, that, if the water should happen to be stopped by any accident, it might gradually disemboge, till they could clear its ordinary passage. There were likewise, even in the very canals which conveyed the water, cavities considerably deeper than its internal surface, into which the stream was precipitated, and where it remained stagnant till it was refined from mud and feculence; and ponds, where it might expand itself till it was purified.

The aquæduct of the *aqua Marcia* had an arch of 16 feet in diameter. The whole was composed of three different kinds of stone; one of them reddish, another brown, and a third of an earth colour. Above, there appeared two canals; of which the highest was fed by the new waters of the Tiverone, and the lower by what they call the *Claudian* river. The entire edifice is 70 Roman feet high. Near this aquæduct, we have in Father Montfaucon the plan of another with three canals; the highest supplied by the water called *Julia*, that in the middle from Tepula, and the lowest from the aqua Marcia.

The arch of the aquæduct of the aqua Claudia is of hewn stone, very beautiful; that of the aquæduct of the aqua Neronia is of bricks: they are each of them 72 Roman feet in height.

The canal of the aquæduct which was called the *aqua Appia*, deserves to be mentioned for a singularity which is observed in it; for it is not, like the others plain, nor gradual in its descent; but much narrower at the lower than the higher end.

The consul Frontinus, who superintended the aquæducts under the emperor Nerva, mentions nine of them which had each 13,594 pipes of an inch in diameter. Vigerus observes, that, in the space 24 hours, Rome received 500,000 hogsheads of water.

We might likewise have mentioned the aquæduct of Drusus, and that of Riminius: but we shall satisfy ourselves with observing here, that Augustus caused all the aquæducts to be repaired; and afterwards pass to other monuments of the same kind, and still more important, which give the most striking ideas of Roman magnificence.

One of these monuments is the aquæduct of Metz, of which a great number of arcades still remain. These arcades crossed the Moselle, a river which is broad and vast at that place. The copious sources of Gorze furnished water for the representation of a sea-fight. This water was collected in a reservoir: from thence it was conducted by subterraneous canals formed of hewn stone, and so spacious that a man could walk erect in them: it traversed the Moselle upon its superb and lofty arcades, which may still be seen at the distance of two leagues from Metz; so nicely wrought and so firmly cemented, that, except those parts in the middle which have been carried away by the ice, they have resisted, and will still resist, the severest shocks of the most violent seasons. From these arcades, other aquæducts conveyed the waters to the baths, and to the place where the naval engagement was mimicked.

If we may trust Colmenarus, the aquæduct of Segovia may be compared with the most admired labours of antiquity. There still remain 159 arcades, wholly consisting of stones enormously large, and joined without mortar. These arcades, with what remains of the edifice, are 102 feet high; there are two ranges of arcades, one above another. The *aquæduct* flows thro' the city, and runs beneath the greatest number of houses which are at the lower end.

After these exorbitant structures, we may be in some degree believed when we speak of the *aquæduct* which Lewis XIV. caused to be built near Maintenon, for carrying water from the river Bucq to Versailles: it is perhaps the greatest aquæduct which now subsists in the world; it is 7000 fathoms in length, above 2560 in height, and contains 242 arcades.

AQUAMBOE, one of the greatest monarchies on the coast of Guinea in Africa, stretching 20 miles in breadth, and ten times that space in length from east to west. According to Bosman, the coast is divided into a great number of petty royalties, but all of them subject to the king of Aquamboe, who indiscrimately uses an unlimited authority over them and the meanest of his subjects. His despotism gave rise to a proverbial saying, that "there are only two ranks of men at Aquamboe; the royal family, and slaves." The natives of this country are haughty, turbulent, and warlike; and their power is formidable to all the neighbouring nations. They grievously infest such nations as are tributaries to the king of Aquamboe, entering their territories by troops, and carrying off from the inhabitants whatever they think proper; nor do they ever meet with any opposition from the inhabitants, as they are sensible the king would not fail to resent this as an indignity offered to him.

AQUARIANS, Christians in the primitive church who consecrated water in the eucharist instead of wine. This they did under pretence of abstinence and temperance; or, because they thought it universally unlawful to eat flesh or drink wine. Epiphanius calls them *Encratites*, from their abstinence; St Austin, *Aquarians*, from their use of water; and Theodoret, who says they sprang from Tatian, *Hydroporastatæ*, because they offered water instead of wine.

Besides these, there was another sort of Aquarians, who did not reject the use of wine as unlawful; for they administered the eucharist in wine at evening service: but, in their morning assemblies, they used water, for fear the smell of wine should discover them to the heathens.

AQUARIUS, the WATER-CARRIER, in astronomy, the

Aquartia || Aquatinta.

the 11th sign is the zodiac, reckoning from Aries; from which also the 11th part of the ecliptic takes its name.—The sun moves through Aquarius in the month of January; it is marked thus, ♒.

The poets feign, that Aquarius was Ganymede, whom Jupiter ravished under the shape of an eagle, and carried away into heaven, to serve as a cup-bearer, in the room of Hebe and Vulcan; whence the name.—Others hold, that the sign was thus called, because, when it appears in the horizon, the weather usually proves rainy.

The stars in the constellation Aquarius, in Ptolemy's catalogue, are 45; in Tycho's 41; in Hevelius's 47; in Flamstead's 108.

AQUARTIA, in botany, a genus of the tetrandria monogynia class. The calyx is campanulated; the corolla is rotated, with linear divisions; and the berry is four-seeded. There is but one species, the *aculeata*, a native of America.

AQUATIC, in natural history, an appellation given to such things as live or grow in the water.

AQUATINTA, a method of etching on copper, lately invented, by which a soft and beautiful effect is produced, resembling a fine drawing in water-colours or Indian ink.

Previous to the operation upon the plate, the following powder must be prepared.—Take of asphaltum and fine transparent rosin, equal parts, suppose two ounces of each, and pound them separately. Through a muslin sieve (which may be formed with part of a chip-box of three or four inches diameter) sift upon a sheet of paper a thin stratum of the asphaltum, above which sift a similar layer of the rosin, and upon this another layer of asphaltum, continuing these alternate layers till both of the powders are exhausted: then pass the mixture through the same sieve upon the paper once or twice, or till both appear to be sufficiently incorporated; when the powder is ready for use. Some, instead of the above mixture, use gum sandarach pounded.

The main process is as follows.—A copper-plate being polished in the usual way, lay the etching ground upon it, and etch the outlines of your design in the manner directed under the article ETCHING: The ground is then to be softened with a little grease, and wiped off with a piece of rag; leaving, however, as much grease upon the plate as just to dim the copper. You now sift your powder upon the surface of the plate; after which, strike the other side of it pretty smartly against the edge of the table, in order to discharge it of the loose powder: This done, with a hand-vice hold the back of the plate over a chaffing-dish of charcoal fire, till it become so hot as to give pain upon being touched with the back of the hand; and the powder which adhered to the grease will now be fixed to the plate. The plate being then suffered to cool, take turpentine varnish, mixed with ivory black; and with a hair-pencil dipt in it, cover all the lights or places where there is no work or shades. A rim or border of bees-wax is now to be raised round the plate: Then having reduced the aquafortis to a proper strength by vinegar or water, you pour it on, and let it stand five minutes for the first or lightest shade: after which, pour it off; and having washed the plate with water, set it on edge to dry: Then with the varnish stop up your light shades, pour on the aquafortis for the second tint, and let it stand five minutes more; proceeding in the same manner for every tint till you produce the darkest shades. If a bold open ground is wanted in any part, this requires an after-operation: The ground must be laid as the other, by sifting on the powder; only this powder is much coarser, and the plate must be much more heated in order that the particles of the powder may spread, and form small circles: even good clean rosin will do by itself.

Aquatinta || Aquila.

In etching landskips, the sky and distant objects are also performed by a second operation, and the powder is sifted upon the plate with a finer sieve. If the trees or any part of the fore-ground require to be higher finished, the plate must be entirely cleansed from grease with bread, and a ground laid in the common way of etching; when you may finish as highly and neatly as you please with the needle or point, by stippling with dots, and biting up those parts, or by a rolling-wheel.

The preceding is the method for prints of one single tint. But if different colours are to be expressed, there will be requied as many different plates, each plate having only the part etched upon it which is designed to be charged with its proper colour: unless (as many happen in particular subjects) some of the colours are so distant from each other as to allow the printer room to fill them in with his rubber without blending them; in which case, two or more different colours may be printed from the same plate at once.—Where different plates are necessary, a separate one, having a pin in each corner, must be provided as a sole or bottom to the aquatinta plates; and these again must be exactly fitted, having each a small hole in their corners for passing over the pins of the sole: the said pins serving the double purpose of retaining the plates successively in their due position, and of directing the printer in placing the paper exactly on each plate so as not to shift: by which means each tint or colour will be exactly received on its proper place.—This is the method practised at Paris. A landscape or similar subject, however may be printed off at once in the different proper colours, by painting these upon the plate. In this case, the colours must be pretty thick in their consistence; and the plate must be carefully wiped in the usual way after the laying on of each tint, as well as receive a general wipe upon its being charged with all the tints.

This art is kept as secret as possible by those who practise it; and it is believed that no particular explanation or directions, before the present, have been communicated to the public. In order to succeed, however, great care and judgment are requisite; and much depends upon a certain nicety of management, which is only attainable by practice.

AQUAVIVA, a town of the kingdom of Naples, and province of Barri.

AQUEDUCT. See AQUÆDUCT.

AQUEOUS, in a general sense, something partaking of the nature of water, or that abounds with it.

Aqueous Humour. See ANATOMY, p. 767.

AQUILA, in ornithology, a synonime of the eagle. See FALCO.

AQUILA, the EAGLE, in astronomy, a constellation of the northern hemisphere; usually joined with Antinous.

The

Aquilegia. The stars in the constellation Aquila and Antinous, in Ptolemy's catalogue, are 15; in Tycho's, 19; in Hevelius's, 42; in the Britannic catalogue, 71.

AQUILA, a fine large city of Italy, and the capital of Abruzzo, seated on a hill, on the banks of the river Pescara, near its source. It has an ancient castle, and is a bishop's see immediately under the pope. The land about it produces great plenty of saffron. It was very near being all destroyed by an earthquake, in February 1703. The first shock was so terrible, that the inhabitants abandoned the city; but returning to vespers, it being Candlemas-day, the shocks followed one another with such violence, that 24,000 people perished, and great numbers were wounded; 800 were killed in one single church: many other churches, monasteries, noble buildings, and the town-house, were either swallowed up or overturned, together with the greater part of the city and its walls. Aquila stands 30 miles from the sea, and about 16 from the confines of the pope's dominions. E. Long. 14. 20. N. Lat. 42. 20.

AQUILEGIA, COLUMBINE: A genius of the pentagynia order, belonging to the polyandria class of plants; and, in the natural method, ranking under the 26th order, *Multisiliquæ*. It has no calyx; the petals are five, with a horn-like nectarium inserted between each; and there are five separate capsules.

Species. 1. The vulgaris, or wild columbine, with blue flowers, is found growing wild in some woods of England. 2. The alpina, with long oval flowers, grows naturally near Ingleborough-hill in Yorkshire. The flowers are much larger than those of the garden columbine. 3. The inversa, or garden columbine. Of this there are great varieties, not only in the colour and fulness of their flowers, but also in their form. These are commonly called *rose-columbines*; the colours are chesnut, blue, red, and white, and some are finely variegated with two colours. There are others with sharp-pointed petals in form of a star, and of these there are single and double flowers of the same colours with the former. 4. The canadensis, or Canada columbine, flowers almost a month before the other sorts, and therefore is preserved in the gardens of the curious, though not at all remarkable for its beauty. There is a variety of this with taller flower-stems.

Culture. These plants are all propagated by sowing the seeds, or parting the old roots; but the former method is chiefly practised, for the old roots are very apt to degenerate. The seeds should be sown in a nursery-bed in August or September; for those which are kept till the spring seldom grow well, or at least remain in the ground a whole year. The spring following the plants will appear above ground, and should be kept clear of weeds; and if the season proves dry, they must be watered. In the middle or latter end of May they will be strong enough to transplant; for which purpose, some beds of good undunged earth should be prepared, planting them therein at eight or nine inches distance from each other. In the following autmn, by which time the plants will have acquired strength enough to flower the year following, the roots should be carefully taken up and planted in the borders of the flower-garden: but where their roots are designed to be preserved in perfection, all the flower-stalks must be cut off as soon as the flowers are past. In order to keep up a succession of good flowers, fresh seeds should be sown every year; and it will likewise be advantageous to exchange the seeds with some brought from a distant place.

Aquileia

Medicinal Uses. Columbine has been looked upon as aperient; and was formerly in great esteem among the common people for throwing out the small-pox and measles. A distilled water, medicated vinegar, and conserve, were prepared from the flowers; but they have long given place to medicines of greater efficacy.

AQUILEIA, a large city of the Carni, or Veneti, and a noble Roman colony, which was led thither between the first and second Macedonian wars, (Livy). It is washed by two rivers, the Natiso aud Turrus, (Pliny.) The reason of leading this colony was, in order to be a bulwark against the neighbouring barbarians. The colony was afterwards increased with 1500 families by a decree of the senate, (Livy); from which it became a very famous port-town, (Herodian). The emperor Julian ascribes the appellation to the augury of an eagle at the time of building it; but Isaac Vossius on Mela, to the great plenty of water, as if the town were called *Aquilegia*. The harbour, at the mouth of the Natiso, is distant 60 stadia from the city; so that ships of burden are towed up the river, (Strabo). In 452 it was besieged by Attila with an innumerable host of barbarians. The walls were assaulted by a formidable train of battering rams, moveable turrets, and engines, that threw stones, darts, and fire; and the monarch of the Huns employed the forcible impulse of hope, fear, emulation, and interest, to subvert the only barrier which delayed the conquest of Italy. Aquileia was at that period one of the richest, the most populous, and the strongest of the maritime cities of the Hadriatic coast. Three months were consumed without effect in the siege; till the want of provisions and the clamours of his army compelled Attila to relinquish the enterprise, and reluctantly to issue his orders that the troops should strike their tents the next morning and begin their retreat. But as he rode round the walls, pensive, angry, and disappointed, he observed a stork preparing to leave her nest in one of the towers, and to fly with her infant family towards the country. He seized, with the ready penetration of a statesman, this trifling incident which chance had offered to superstition; and exclaimed, in a loud and cheerful tone, that such a domestic bird, so constantly attached to human society, would never have abandoned her ancient seats, unless those towers had been devoted to impending ruin and solitude. The favourable omen inspired an assurance of victory; the siege was renewed and prosecuted with fresh vigour; a large breach was made in the part of the wall from whence the stork had taken her flight; the Huns mounted to the assault with irresistible fury; and the succeeding generation could scarcely discover the ruins of Aquileia. The place, however, which is still called Aquileia, there are several inscriptions and antiquities to be seen in it, which are worthy of a traveller's notice; and, though dwindled into a poor village, it gives a title to the patriarch of Aquileia. The patriarch is named by the Venetians, and resides at Udino, because the town of Aquileia belongs to the House of Austria. E. Long. 13. 30. Lat. 46. 20.

ACQUILICIUM, or Acquiliciana, in Roman antiquity, sacrifices performed in times of excessive drought, to obtain rain of the gods.

AQUILINE, something belonging to or resembling an eagle: Thus, an aquiline nose is one bent somewhat like an eagle's beak.

AQUILO, is used by Vitruvius for the north-east wind; or that which blows 45° from the north towards the east point of the horizon.—The poets gave the name *aquilo* to all stormy winds dreaded by the mariner.

AQUILUS, among the ancients, a dark or dusky colour approaching to black.—Hence some of the Heathen gods were called *dii aquili*, q. d. *nigri*.

AQUIMINARIUM, in antiquity, a kind of lustral vessel, wherein the Romans carried their holy water for expiation, and other religious offices.

AQUINAS (St Thomas), styled the *Angelical Doctor*, was of the ancient and noble family of the counts of Aquino, descended from the kings of Sicily and Arragon; and was born in the castle of Aquino, in the Terra di Lavora in Italy, in the year 1224 or 1225. He entered into the order of the Dominicans; and, after having taught school-divinity in most of the universities of Italy, at last settled at Naples: where he spent the rest of his life in study, in reading of lectures, and in acts of piety; and was so far from the views of ambition or profit, that he refused the archbishoprick of that city, when it was offered him by Pope Clement IV. He died in 1274, leaving an amazing number of writings, which were printed at Venice in 17 vols. folio, in the year 1490. He was canonized by Pope John XXII. in the year 1323; and Pius V. who was of the same order with him, gave him, in 1567, the title of the Fifth Doctor of the church, and appointed his festival to be kept with the same solemnity as those of the other four doctors. His authority has always been of great importance in the schools of the Roman Catholics. Lord Herbert, in his life of Henry VIII. tells us, that one of the principal reasons which induced that king to write against Luther was, that the latter had spoken contemptuously of Aquinas.

AQUINO (Philip d'), in Latin *Aquinas* or *Aquinius*, having turned from Judaism, had a pension from the clergy of France; and acquired much reputation by his knowledge of the Hebrew language, which he taught at Paris, in the reign of Lewis XIII. and by the books he published, among which is his *Dictionarium Hebræo-Chaldæo-Thalmudico-Rabbinicum*. His grandson, Anthony D'Aquin, was first physician to Lewis XIV.

Aquino, a town of Italy, in the kingdom of Naples, and Terra di Lavora; a bishop's see, but ruined by the emperor Conrade, and now consisting of about 35 houses. It was the birth-place of the poet Juvenal, and of Thomas Aquinas. E. Long. 14. 30. N. Lat. 41. 32.

AQUINUM, (anc. geog.) a large municipal town, and a Roman colony on the borders of the Samnites, washed by the river Melpha (Strabo). The birthplace of Juvenal, as he himself testifies. The inhabitants are called *Aquinates*; now *Aquino*, but almost in ruins, in the territory of Lavoro. E. Long. 17. 11. Lat. 41. 35.

AQUITANIA (anc. geog.), one of the three principal divisions of Gallia Comata (Cæsar); bounded by the Garonne, the Pyrenees, and the Ocean: this is the *Aquitania Cæsariana*, or *Vetus*. Augustus set different boundaries, viz. the Loire, the Cevennes, the Pyrenees, and the Ocean (Strabo). It was called *Gallia Aquitanica* (Pliny); and in the old Notitiæ, *Provincia Aquitanica*. The people are called *Aquitani* (Cæsar). Now comprising Guienne (which seems to be a corruption of Aquitania) and Gascony.

AR (anc. geog.), the metropolis of Moab, in Arabia Petræa (Moses); and the royal residence situate on the east side of the river Arnon. It was called also *Rabba* (Joshua;) and to distinguish it from Rabba of the Ammonites, *Rabbat Moab*, and on coins *Rabbath Moma* (Reland.) Eusebius says it was called *Areopolis* in his time, from *Ar* and *Polis*. The inhabitants are called *Areopolitæ*. St Jerom says that this city was entirely destroyed by an earthquake when he was a young man.

ARA thuribuli, the altar of incense, in astronomy, a southern constellation, not visible in our hemisphere, consisting, according to Ptolemy, of seven stars; and according to Sharp's catalogue, annexed to that of Mr Flamstead, of nine stars.

Ara, in astronomy, a southern constellation, containing eight stars.

ARAB, or Arabian horse. See Equus.

ARABESQUE, or Arabesk, something done after the manner of the Arabians. *Arabesque*, *Grotesque*, and *Moresque*, are terms applied to such paintings, ornaments of freezes, &c. wherein there are no human or animal figures but which consist wholly of imaginary foliages, plants, stalks, &c. The words take their rise from hence, that the Moors, Arabs, and other Mahometans, use these kinds of ornaments; their religion forbidding them to make any images or figures of men or other animals.

ARABIA, a country of Asia, famous from the remotest antiquity for the independency of its inhabitants during the vast conquests of the Assyrians, Persians, Greeks, and Romans, and, in latter times, for being the centre of an empire equal, if not superor, in extent to any that ever existed.

1 Whence named.

This country, or at least the greatest part of it, was in the earliest ages called *Arabah*. Concerning the etymology of which word there are various conjectures. It has most generally been derived from the Hebrew word ארב, signifying, *the west*, *mixture*, or *traffic*; but, according to M. Volney, *Arab*, in the ancient language of these countries, signifies a *solitude* or *desart*. In its largest extent, Arabia lies between the 12th and 35th degrees of N. Lat. and the 36th and 61st of E. Long. It greatest length from north to south is about 1430 miles, and its breadth from east to west is 1200. It is bounded on the west by Palestine, part of Syria, the isthmus of Suez, and the Red sea, called by the Arabs the sea *Al Kolzom*; on the east by the Euphrates, the Persian gulf, and bay of Ormos; on the north, by part of Syria, Diyar-Becr, Irak, and Khuzestan: and on the south by the straits of Babel-Mandel and the Indian ocean. It grows narrower as we approach the frontiers of Syria and Diyar-Becr; and, by reason of the proximity of the Euphrates to the Mediterranean, may be looked upon as a peninsula,

2 Boundaries &c.

ninſula, and that one of the largeſt in the whole world. —Arabia Proper, however, is much narrower, including little more than what was comprehended by the ancients under the name of Arabia Felix, which we ſhall preſently deſcribe; and here the Arabs have been ſettled almoſt ſince the flood.

3 Diviſion.

The firſt diviſion of the peninſula of Arabia was into *Arabah* and *Kedem*, as we learn from ſcripture; the firſt of which implied the weſt, and the other the eaſt, denoting the ſituation of the two countries.—Ptolemy was the firſt who divided the peninſula we ſpeak of into three parts, Arabia Petræa, Arabia Deſerta, and Arabia Felix, which diviſion has generally prevailed ſince his time.

Arabia Petræa, on the eaſt, was bounded by Syria and Arabia Deſerta; on the weſt, by Egypt, or rather the iſthmus of Suez which ſeparates Aſia from Africa, and the Heroopolitan gulph or weſtern arm of the Red Sea; on the north, by Paleſtine, the lake Aſphaltites, and Cœloſyria; and on the ſouth by Arabia Felix. This tract did not admit of much cultivation, the greateſt part being covered with dry ſands, or riſing into rocks, interſperſed here and there with ſome fruitful ſpots. Its metropolis was Petra, which by the Syrians was ſtiled *Rakam*, and in ſcripture *Joktheel*. Several other cities of Arabia Petræa are mentioned by Ptolemy; but as it is very improbable ſuch a barren country ſhould abound with large cities, we muſt look upon them as inconſiderable places.

Arabia Deſerta was bounded on the north by the Euphrates, which ſeparated it from Meſopotamia; on the weſt, by Syria, Judæi, and Arabia Petræa; on the eaſt by a ridge of mountains which ſeparated it from Babylonia and Chaldæa; on the ſouth, by Arabia Felix, from which it was likewiſe ſeparated by ſeveral ridges of hills. By far the greateſt part of this kingdom, as well as the former, was a loneſome deſart, diverſified only with plains covered with ſand, or mountains conſiſting of naked rocks and precipices; nor were they ever, unleſs ſometimes at the equinoxes, refreſhed with rain. The few vegetables which they produced were ſtinted by a perpetual drought, and the nouriſhment afforded them by the nocturnal dews was greatly impaired by the heat of the ſun in the day time. Throughout the deſarts were found huge mountains of ſand, formed by the violence of the winds that continually blew over them in the day-time, though they ceaſed in the night. Wells and fountains were for the moſt part exceedingly rare; however, notwithſtanding the ſterility of theſe countries, the vaſt plains of ſand juſt now mentioned were interſperſed with fruitful ſpots, which appeared here and there like ſo many iſlands in the midſt of the ocean. Theſe being rendered extremely delightful by their verdure, and the more ſo by the neighbourhood of thoſe frightful deſarts, the Arabs encamped upon them: and having conſumed every thing they found upon one, removed to another, as is the cuſtom of their deſcendants the Bedoweens at this day. Theſe fruitful ſpots were likewiſe frequent in Lybia, and by the Egyptians called *auaſes* or *abaſes*, as we learn from Strabo. The barren part of Arabia Felix bordering upon the Red Sea, was in like manner interſperſed with abaſes; which probably gave the name of *Abaſeni* to a nation ſettled there, and in the adjacent fertile region. A body of theſe, it is ſaid, croſſing the ſtraits of Babel-Mandel, paſſed into Ethiopia, which from them received the name of *Abaſſia*. From this account of Arabia Deſerta, we may reaſonably conclude, that the towns ſaid by Ptolemy to have been ſituated in it were places of very little conſequence.

Arabia Felix was bounded on the north by the two kingdoms juſt deſcribed; on the ſouth, by the Red Sea; on the eaſt and weſt, by part of that ſea, together with the Arabian and Perſian gulfs. In Strabo's time, it was divided into five provinces, by the oriental hiſtorians called *Yaman*, *Hejaz*, *Tehâma*, *Najd*, and *Yamana*. In this diſtrict ſtood ſeveral towns, particularly Nyſa, famous for being the birth-place of Bacchus; and Muſa, or Muza, a celebrated emporium or harbour, where the Arabian merchants reſorted with their frankincenſe, ſpices, and perfumes. Theſe two were ſituated in the province of Yaman. In that of Hejaz ſtood the ſtill more famous cities of Mecca and Medina; alſo Thaiſa or Taiſa, Gjudda or Jodda, Yanbo or Al Yanbo, and Madian, the Modiana of Ptolemy, and the Midion or Madian of Scripture.

4 When peopled.

At what time the abovementioned kingdoms were firſt peopled we have no certain accounts. The moſt conſiderable nations inhabiting Arabia Petræa, in the early ages, were the Iſhmaelites, the Nabatei or Nabatheans, the Cedræi or Kedareni, and the Agareni or Hagareni; and of theſe the Iſhmaelites were the moſt powerful, if they did not comprehend all the reſt; and if the Hagareni were not the ſame people with them, they muſt at leaſt have been nearly related. Kimſhi, an oriental hiſtorian, inſinuates, that they were originally the children of Hagar by an Arab, after ſhe had left Abraham. In after ages, the names of all the nations ſituated here were abſorbed in that of *Saracens*, by which the Iſhmaelites are diſtinguiſhed in the Jeruſalem Targum. A nation alſo is mentioned by Pliny, called *Arraceni*, and *Saraceni* by Ptolemy and Dioſcorides, which was probably no other than the Iſhmaelites above mentioned In Arabia Deſerta ſeveral tribes reſided, all of whom were very obſcure, except the Aiſitæ and Agræi. The former are ſuppoſed by Bochart to have been Job's countrymen, and the latter to have been the ſame with the Hagareni, Arraceni, or Saraceni, abovementioned. Arabia Felix was inhabited by many different tribes; the moſt remarkable of which were the Sabæi, Gerræi, Minæi or Minnæi, Atramitæ, Maranitæ, Catabani, Aſcitæ, Homeritæ, Sapphoritæ, Omanitæ, Saraceni, Nabathæi, Thamydeni, and Bnizomenæ; but neither their limits nor ſituation can now be determined with any manner of preciſion.

5 Diviſion of the Arabs.

According to the oriental hiſtorians, the Arabs are to be divided into two claſſes; *viz.* the *old loſt Arabians*, and the *preſent*. The moſt famous tribes among the former were thoſe of Ad, Thamud, Taſm, Jadês, Jorham, Amalek, Amtem, Haſbem, Abil, and Bâr. Concerning theſe, though now entirely loſt and ſwallowed up among other tribes, there are ſome remarkable traditions, of which the following may ſerve as a ſpecimen.

6 Tradition concernidg the tribe of Ad.

The tribe of Ad deduced their origin from Ad the ſon of Aws, or Uz, the ſon of Aram, the ſon of Shem, who, after the confuſion of tongues, ſettled in Al Abkaf, or the winding ſands in the province of Hadramant, on the confines of Yaman, where his poſterity greatly

Arabia.

greatly multiplied. Their first king was Sheddâd, the son of Ad, who built a stately palace and made a delightful garden in the desarts of Aden, which he designed as an imitation of the celestial paradise. This garden he called *Irem:* and when it was finished, he set out with a great retinue to take a view of it; but, having some thoughts of assuming divine honours, he was destroyed by a tempest from heaven, while yet a day's journey from his paradise. The garden and palace, however, were preserved, though invisible, as a monument of divine vengeance.

After the death of Sheddâd, the kingdom of Ad was governed by a long series of princes, concerning whom many fables are related by the eastern writers. The conclusion of their history, however, is as follows. "The Adites, in process of time falling from the worship of the true God, into idolatry, God sent the prophet Hûd, supposed to be the same with Heber, to preach to and reclaim them. But they refusing to acknowledge his mission or to obey him, God sent an hot and suffocating wind, which blew seven nights and eight days, and, entering at their nostrils, passed thro' their bodies, and destroyed them all, a very few only excepted, who had listened to Hûd, and retired with him to another place." Others relate, "that, before this terrible catastrophe, they had been previously chastised with a three years drought; and therefore sent Kail Ebn Ithar, and Morthed Ebn Sdaa, with 70 other principal men to Mecca, then in the hands of the tribe of Amalek, whose prince was Moawiyah Ebn Becr, to obtain of God some rain. Kail having begged of God that he would send rain to the people of Ad, three clouds appeared, a white, a red, and a black one; and a voice from heaven ordered him to choose which he would. Kail failed not to make choice of the last, thinking it would be laden with most rain; but when this cloud came over them, it proved to be fraught with the Divine vengeance, and a tempest broke forth from it which destroyed them all."

7 Arabs from whom descended.

The *present Arabs*, according to their own historians, are sprung from Kahtan, the same with Joktan, the son of Eber; and Adnan, descended in a direct line from Ishmael the son of Abraham. The former of these they call the *genuine* or *pure* Arabs, and the latter the *naturalized* or *insititious* Arabs.

Joktan the son of Eber had 13 sons, who some time after the confusion of languages settled in Arabia, extending themselves from Mesha to Sephar, a mountainous place in the south-eastern part of that peninsula. According to the Arabian historians, he had 31 sons, all of whom left Arabia and went into India, except two, viz. Yarab and Jorham; the former of whom, they say gave the name both to their country and language. Ishmael and his mother Hagar having been dismissed by Abraham, entered into the wilderness of Paran, as related in the book of Genesis. The sacred historian informs us, that during his residence in the wilderness he married an Egyptian; and the Arabian writers say that he also took to wife the daughter of Modad king Hejaz, lineally descended from Jorham the founder of that kingdom. By the Egyptian he was probably the father of the Scenite or wild Arabs; and having allied himself to the Jorhamites, he is considered by the Arabians as the father of the greatest part of their nation.

Arabia.

8 Joktan the first king.

Kahtan, or Joktan, is said to have first reigned, and worn a diadem in Yaman; but the particulars of his reign we no where learn. He was succeeded by Yarab already mentioned, he by Yashab, and Yashab by Abd Shems. He was successful in his expeditions against his enemies, carried off great spoils, and took many of them prisoners. He is said to have built the city of Saba or Mareb, and above it a stupendous mound or building which formed a vast reservoir, containing all the water that came down from the mountains. By means of this reservoir, the kings of Yaman not only supplied the inhabitants of Saba and their lands with water, but likewise kept the territories they had subdued in greater awe, as by cutting off their communication with it they could at any time greatly distress them.

9 Reservoir of Saba.

Abd Shems was succeeded by his son Hamyar, from whom the tribe of Hamyar is said to take its name; and he by a series of 17 Kings, concerning whom we have no remarkable particular, except that from one of them called *Africus* the continent of Africa took its name. The last of these was succeeded by a daughter surnamed *Balkis* or *Belkis*, whom some will have to be the queen of Sheba who paid a visit to Solomon. After Balkis came Malea, surnamed *Nasherolneam* on account of his magnificence and liberality. Having had bad success in an expedition, where his army was overwhelmed by torrents of sand, he caused a brasen statue to be erected with the following inscription in the old Hamyaritic character. "There is no passage behind me, no moving farther; the son of Sharhabil." He was succeeded by Shamar Yaraash, so called on account of his being affected with a constant tremor. To this prince the city of Sarmacand is said to owe its existence. After Shamar Yaraash we have a list of 15 kings, of whom nothing worth mentioning is recorded, except of one Abu Carb Asaad, who adorned the Caaba or temple of Mecca with tapestry, and first introduced Judaism among the Hamyarites. He was put to death by his subjects, probably on account of religion. The last of the 15 kings above mentioned was called *Abrahah*, who was succeeded by his son Sabban. He had that famous sword called *Samsannah*, which afterwards came into the hands of the khalif Al Rashid. This prince was succeed by Dhu Shanater, who had six fingers on each hand. He was abandoned to unnatural lust, and dethroned for abusing some of the noblest youths in the kingdom. To him succeeded Yusef, who lived about 70 years before Mahomet. He persecuted all those who would not turn Jews, putting them to death by various tortures, the most common of which was throwing them into a glowing pit of fire; whence he had the appellation of the *lord of the pit*. This persecution is taken notice of in the Koran. The last of the Hamyaritic monarchs was Dhu Jadan, according to Abulfeda, but, according to others, the Yusef just mentioned, who was surnamed *Dhu Nowas*, on account of his flowing curls, and was the last who reigned in an uninterrupted succession. He was a bigotted Jew, as already mentioned; and treated his subjects with such barbarity, that they were obliged to ask the assistance of Elesbaas or Elesbaan, king of Ethiopia, against him. Dhu Nowas, not being able to make head against the Ethiopians, was at last driven to such extremity, that he forced his horse into the sea, and lost both his life and crown together.

10 Balkis supposed to be the queen of Sheba.

11 Sarmacand by whom built.

12 Yusef, a bloody persecutor.

13 His subjects call in the king of Ethiopia, who dethrones Yusef.

The

14 Christian religion established in Arabia.

The king of Ethiopia, having thus become master of Yaman, established there the Christian religion, and fixed upon the throne one Abryat an Ethiopian. He was succeeded by Abraha-Ebn-Al-Sabah, surnamed the *slit-nosed*, from a wound he had formerly received in it. He was likewise styled *lord of the elephant*, from a story too ridiculous to deserve notice. He was succeeded by two other Ethiopian princes; but at last Seif Ebn Dhu Yazan, of the old royal family of Hamyar, having obtained assistance from the king of Persia, which had been denied him by the emperor Heraclius, recovered his throne, and drove out the Ethiopians; but was himself slain by some of them who were left behind. The succeeding princes were appointed by the Persians, till Yaman fell into the hands of Mahomet.

15 Ethiopians driven out.

16 Terrible inundation by the breaking down of the reservoir of Saba.

We have already taken notice of the vast mound or reservoir made by Abd Shems, from which he supplied the city of Saba with water. This building stood like a mountain above the city, and was by the Sabæans esteemed so strong, that they were under no fear of its ever failing. The water rose almost to the height of 20 fathoms; and was kept in on every side by a work so solid, that many of the inhabitants had their houses upon it. About the time of Alexander the Great, however, a terrible inundation happened. According to the Arabian historians, God being displeased at the pride and insolence of the inhabitants of this city, resolved to humble them; and for this purpose sent a mighty flood, which broke down the mound by night whilst the inhabitants were asleep, and carried away the whole city with the neighbouring towns and people. This inundation is styled in the Koran the *inundation of Al-Haram*; and occasioned so terrible a destruction that from thence it became a proverbial saying to express a total dispersion, "that they were gone and scattered like Saba".—By this accident no less than eight tribes were forced to remove their habitations; some of which gave rise to the kingdoms of Hira and Ghassan.

17 Origin, &c. of the kingdom of Hira.

The kingdom of Hira was founded by Malec, a descendant of Cahlan the brother of Hamyar; but after three descents, the throne came by marriage to the Lakhmians, who were descendants of Lakhm the son of Amru, the son of Abd Ems. These princes, whose general name was *Mondar*, preserved their dominion, notwithstanding some small interruption from the Persians, till the khalifat of Abubecr, when Al Mondar Maghrur, the last of them, lost his life and crown by the arms of Khaled-Ebn-Al-Walid. This kingdom continued 622 years and eight months, according to Ahmed Ebn Yusef. Its princes were under the protection of the kings of Persia, and were their lieutenants over the Arabs of Irak, as the kings of Ghassan were for the Roman emperors over those of Syria.

18 Of Ghassan.

The kingdom of Ghassan was founded by the tribe Azd, who, according to some, settling in Syria Damascena, near a water called *Ghassan*, from thence took their name; but others say they went under this appellation before they left Yaman. Having driven out the Dajaamian Arabs, who before possessed the country, they made themselves masters of a considerable territory. Here they maintained themselves, according to some 400, according to others 600, and according to Abulfeda 613 years, when the last of their kings submitted to the khalif Omar, and embraced the Mahometan religion; but receiving afterwards a disgust, soon returned to Christianity, and took refuge in Constantinople.

Arabia.

19 Of Hejaz.

The kindom of Hejaz was founded by Jorham the son of Kahtan, where princes of his line reigned till the time of Ishmael, who maried the daughter of Modad one of those princes. Some author's relate that Kider, one of Ishmael's sons, had the crown resigned to him by his uncles the Jorhamites: but, according to others, the descendants of Ishmael expelled that tribe; who, retiring to Johainah, were after various adventures destroyed by an inundation. After the expulsion of the Jorhamites, the government of Hejaz seems not to have continued long in the hands of one prince, but to have been divided among the heads of tribes, almost in the same manner as the Arabs of the desart are governed at this day. The tribe of Khozaab, after the above-mentioned inundation of Saba, fled into the kingdom of Hejaz, and settled themselves in a valley called *Marri* near Mecca. Here they founded an aristocracy, assuming to themselves both the government of the city of Mecca, and the custody of the Caaba or temple there. They continued masters of this city and territory, as well as presidents of the Caaba for many ages; till at length one Kosa, of the tribe of Koreish, circumvented Abu Gabshan, a weak and silly man, of whom, while in drunken humour, he bought the keys of the temple for a bottle of wine; but when Abu Gabshan grew cool, and reflected on his imprudence, he sufficiently repented of what he had done; whence the Arabian proverbs, "More vexed with late repentance than Abu Gabshan; more foolish than Abu Gabshan," &c. The tribe of Khozaab endeavoured afterwards to give some disturbance to the Koreish in the possession of the keys of the Caaba, which furnished the latter with a pretence for depriving them of the civil government of Mecca. After the Koreish had possessed themselves of this city, they kept up the same form of government which had prevailed there before. Besides these kingdoms, there were many others of lesser note, of which we find nothing remarkable.

20 Tribe of Khozaab assumes the government of Mecca.

21 Folly of Abu Gabshan

Thus we have briefly mentioned the most memorable events recorded by the Arabian historians previous to the time of Mahomet; but, before entering upon an account of that famous impostor and the kingdom founded by him, it will be proper to take notice of several circumstances in different parts of the world, which at that time concurred to facilitate his scheme, and without which, in all probability, he would never have been able to accomplish it.

22 Cause of Mahomet's success.

The first and great cause of Mahomet's success in his imposture, was the gross corruption and superstition with which the Christian religion was at that time obscured in all parts of the world. Had the pure doctrines of Christianity been then as publicly known as the ridiculous fopperies which deformed the Eastern and Western churches, Mahometanism could never have got a hearing. But along with the true religion, mankind seemed also to have lost the use of their rational faculties, so that they were capable of swallowing the grossest absurdities; such as it now appears almost incredible that any of the human race could receive as truths. Another cause was, the manner of government and way of life among the Arabs. Divided into small independent tribes, they never were capable of a firm union but by superstition; and had

Arabia.

Mahomet attempted their conquest in any other way, it was impossible he could have succeeded. As there were also among them Jews, Pagans, and Christians of all sorts, this impostor, by adopting something out of every religion then extant, cunningly recommended himself to the professors of every one of them. Add to all this, that, by allowing of polygamy, and setting forth his paradise as consisting in the enjoyment of women, he adapted himself to the corrupt dispositions of mankind in general.

If the distracted state of religion favoured the designs of Mahomet on the one hand, the weakness of the Grecian and Persian Monarchies assisted him no less powerfully on the other. Had those once formidable empires been in their vigour, either of them would have been sufficient to crush Mahometanism in its birth; but both of them were then strangely reduced. The Roman empire had continued to decline after the time of Constantine: the western parts of it were then entirely over-run by the Goths and other barbarous nations; and the eastern, or Greek empire, was so much reduced by the Huns on one hand, and the Persians on the other, as to be incapable of making any great effort. The Persian monarchy itself was in little better condition. It is true, they ravaged the dominions of the Greeks, and often overcame them in the field: but that was more owing to the weakness of the Grecian empire, than to the strength of the Persians; and so effectually did the intestine broils, which arose chiefly on account of religion, weaken the kingdom of Persia, that the most considerable part of it was annexed by the khalif Omar to his dominions.

As the Greeks and Persians were then in a languishing situation, so the Arabs were strong and flourishing. Their country had been peopled at the expence of the Grecian empire; whence the violent proceedings of the different religious sectaries forced many to take refuge in Arabia. The Arabs were not only a populous nation, but unacquainted with the luxuries and delicacies of the Greeks and Persians. They were inured to hardships of all kinds, and consequently much better fitted than their effeminate neighbours to endure the fatigues of war, as the event very fully verified.

23 Mahomet's birth, descent, &c.

Mahomet was born in the year of Christ 569. According to the Eastern historians, he was descended in a direct line from Ishmael. Kedar, or, as the Arabians call him, *Kidâr*, after his father Ishmael's death, communicated his name to the greatest part of Arabia Petræa. He was succeeded in his authority and possessions by his son Hamal; Hamal by Nabet, and Nabet by Salaman. After Salaman came Al Homeisa, then Al Yasa, whose son Odad was succeeded by Odd the father of Adnan. Counting ten generations forward in the same line, we come at last to Fehr, who seems to have distinguished himself by some glorious actions, as he was denominated *Koreish*, on account of his bravery. He is to be considered as the root of the politest and most celebrated tribe of the Arabs. He had three sons, Gâleb, Mohâreb, and Al Aâreth. From Mohâreb the Banu Mohâreb, denominated likewise *Sheibân*, took their origin; from Al Hâreth, the Banu Al Kholoj; and from Gâleb, in a direct line, the impostor Mahomet. Gâleb was the father of Lowa; and he of Caab, whose son Morrah had for his immediate descendant Kelâb the father of Kosa. It was this Kosa who aggrandized

24 Fehr head of the Koreish.

the tribe of the Koreish, by purchasing the keys of the Caaba from Abu Gabshan, as we have already related. By this he not only aggrandized his tribe, but became the prince of it himself. He was succeeded by his second son Abd Menâf, to whom the *prophetic light*, which is said to have manifested itself in his face, gave the right of primogeniture. Abd Menâf was succeeded by his son Amni, surnamed *Hâshem*, or "one that broke bread," on account of his singular generosity during a famine at Mecca. Having amassed great sums of money, he took a journey into Syria, where he purchased a vast quantity of meal, which he made into cakes and divided with his own hands amongst the people of Mecca. He likewise killed a prodigious number of camels, with which he fed them, and relieved them in the time of their distress: and finding that the soil about Mecca was so barren as to produce no fruits but what are common in the desarts, and consequently no corn or grain, which the Meccans are obliged to bring from other places, he appointed two caravans to set out yearly for that purpose, the one in summer, and the other in winter; by means of which, the city was amply supplied with provisions of all kinds. The provisions brought by them were distributed twice a-year; and Hâshem, by his prudent conduct, raised the glory of his people to the highest pitch; insomuch, that all the neighbouring great men and heads of tribes made their court to him. Nay, so great veneration is the memory of Hâshem held in by the Arabs, that from him the family of Mahomet among them are called *Hâshemites*; and he who presides over Mecca and Medina, who must always be of the race of Mahomet, has to this day the title of the "Chief or Prince of the Hâshemites."

25 Hashem's generosity.

Hâshem died at Gaza in Syria, and was succeeded by his son Abdal Motalleb or Mateleb. He is said to have been extremely affable and easy of access, as well as just and generous to a great degree; so that, in the beginning of the month *Ramadan*, he entertained the poor upon the flat roof of his house, and afterwards supplied the fowls of the air and wild beasts of the field with provisions of various kinds, which he ordered his servants to leave upon the summits of the neighbouring mountains. The well which God showed to Hagar in the wilderness is said to have been miraculously discovered to Abdal Motalleb, about 500 years after it had been filled up by Amru prince of the Jorhamites. This well is by the Arabs called *Zemzem*; which some derive from her calling to Ishmael, when she spied it, in the Egyptian tongue, *Zem, Zem*, i. e. Stay, Stay; though others ascribe it to a different origin. The water of this well which is on the east side of the Caaba, and covered with a small building and cupola, is highly reverenced; being not only drank with particular devotion by the pilgrims, but also sent in bottles as a great rarity to most parts of the Mahometan dominions.

26 Well Zemzem discovered by Abdal Motalleb.

Abdalla, the father of the Mahomet, was a younger son of Abdal Motalleb, and remarkable for his beauty. In his 24th or 25th year, he married Amina, the daughter of Wâheb, the son of Abdal Menâf. She is represented as the most beautiful, prudent, and virtuous lady of her tribe; and consequently the most worthy of such an extraordinary person as Abdalla. He died young, and, in his father's life-time, left his widow

Arabia.

an infant son in very mean circumstances; his whole substance consisting only of five camels and one female Ethiopian slave. Abdal Motalleb was, therefore, obliged to take care of his grandson Mahomet; which he not only did during his life, but at his death enjoined his eldest son Abu Taleb to provide for him for the future. Abu Taleb was extremely kind to his nephew, and instructed him in the business of merchandise; for which purpose he took him into Syria when he was but 13 years of age, recommending him to Khadijah, a noble and rich widow, for her factor; in whose service he behaved so well, that she married him, and thus raised him to an equality with the richest in Mecca.

27 Mahomet at first a merchant.

28 Begins to broach his doctrine.

Though Mahomet had probably formed a design of introducing his new religion pretty early, he did not think proper to avow it till the 40th year of his age. The grand article of his faith was, the unity of the divine nature, which he pretended was violated by the Jews and Christians no less than by the Pagans; for which reason, he resolved to make an attempt to rescue the world from the ignorance and superstition which prevailed at that time. This reformation he intended should begin in his own family; and therefore, having retired with his household to a cave in Mount Hara, near Mecca, he there opened the secret of his mission to Khadijah; acquainting her that the angel Gabriel had just appeared to him, and told him that he was appointed the Apostle of God. He also repeated to her a passage which he said had been revealed to him by the ministry of the angel, with an account of many prodigies which happened at his birth (See MAHOMET). This pretended revelation was received by Khadijah with the greatest joy; and in a kind of ecstasy she immediately communicated the good news to her cousin Waraka Ebn Nawfal, who, being a Christian, could write in the Hebrew character, and was pretty well versed in the Scriptures both of the Old and New Testament. He very readily came into her opinion, swore by God that what she said was true," and that "Mahomet was the great prophet foretold in the law by Moses the son of Amram."

29 Converts his wife and cousin, &c.

Mahomet finding his first step so successful, as Waraka was a very considerable person, began to entertain great hopes of accomplishing his design. He next converted his servant Zeid, to whom he gave his liberty on the occasion, which afterwards became a rule to his followers; and then Ali the son of Abu Taleb, though at that time only nine or ten years of age. This last, however, making no account of the other two, he used to call *the first of believers*. The next person he applied to was Abu Becr, a man of very considerable authority among the Koreish. He was easily gained over, and by his influence several others; so that Mahomet now made his mission no longer a secret. To Abu Becr he gave the name of *Al Saddik*, or *the faithful witness*; because he not only vouched for every thing he said, but also greatly increased the number of his followers. Mahomet likewise complimented him with the title of *Atik*, or *preserved*; intimating thereby that he was certainly saved from hell-fire.

Having given out that he was commanded from heaven to admonish his near relations, Mahomet directed Ali to prepare an entertainment, and invite to it the sons and descendants of Abdal Motalleb. He intended to open his mind to them; but Abu Laheb, one of Mahomet's uncles, making the company break up before the prophet had an opportunity of speaking to them, he was obliged to invite them again the next day. Having now proposed the matter, he asked which of them would become his wazir, prime minister, or vicegerent. This was accepted by Ali; upon which Mahomet said to him, "This is my brother, my deputy, and my *(khalif)* successor, or vicar; therefore show yourselves submissive and obedient to him." At this speech all the company fell a-laughing, telling Abu Taleb that he must now pay obedience and submission to his own son. Notwithstanding this repulse, however, Mahomet was so far from being discouraged, that he began to preach to the people in public. They heard him with some patience till he began to upbraid them with the idolatry, obstinacy, and perverseness of themselves and their fathers; which so highly provoked them, that they openly declared themselves his enemies, except some few who were converted. The prophet was now protected by the authority of his uncle Abu Taleb; who, however, was earnestly solicited to persuade his nephew to desist, and at last threatened with an open rupture in case he could not prevail on him so to do. This had such an effect upon Abu Taleb, that he advised his nephew not to push the matter any farther; representing the great danger he and his followers would otherwise run: but our prophet was not to be so intimidated; and told his uncle plainly, that "if they set against him the sun on his right hand, and the moon on his left, he would not abandon his enterprize." Abu Taleb, therefore, finding him so firmly resolved, used no further arguments, but promised to stand by him to the utmost of his power: so that notwithstanding the people of his tribe came to a determination to expel both Mahomet and his followers, he found a powerful support in his uncle against all their machinations.

Arabia.

30 Rejected by the Koreish.

31 His resolution.

Mahomet now entered upon his apostolic function with uncommon diligence and application; and soon gained over his uncle Hamza, and Omar Ebn Al Khattah, a person very much esteemed, and who before had been his violent opposer. Notwithstanding this success, however, the Koreish continued their opposition, and came to a resolution to proscribe all who had embraced Mahomet's doctrine. In consequence of this resolution, the *Moslems*, as his followers were called, were now treated with such severity, that they found it no longer safe to continue in Mecca; nay, several of them in the fifth year of his mission found themselves obliged to fly into Ethiopia, where they were kindly received by the Najashi or king of that country, who refused to deliver them up to those whom the Koreish sent to demand them. At this refusal they were so exasperated, that they came to a resolution to suppress effectually the new religion which had now made a considerable progress. In order to this, they entered into a solemn league or covenant against the Hashemites, and the family of Abdal Motalleb in particular, engaging themselves to contract no marriages with them, nor to have any manner of communication with them otherwise; and, to give this the greater weight, they reduced it into writing, and laid it up in the Caaba. Upon this the tribe became divided into two factions; and all the family of Hashem, both Mos-

32 His followers persecuted.

33 The Koreish enter into a league against him

lems and unbelievers, repaired to Abu Taleb as their head; except only Abdal Uzza, ſurnamed Abu Laheb, the ſon of Abdal Motalleb, who, out of hatred to his nephew and his doctrine, went over to the oppoſite party. After this the authority of Abu Taleb was ſcarce ſufficient to protect Mahomet from the fury of the Koreiſh; who, according to Al Jannabi, made frequent attempts upon him; ſometimes endeavouring to deſtroy him by force, at other times by ſecret wiles and machinations: nay, to compaſs their end, he tells us that they had recourſe to magic, inchantments, and diabolical illuſions. In ſhort, they gave him at laſt ſo much trouble, that he was obliged to change his habitation, and ſeek a new aſylum for himſelf and his companions. This he found in the houſe of one Orkam, which was advantageouſly ſituated on a hill called *Safa*. Here he converted Orkam's family, and the houſe was afterwards held in high eſtimation by the Moſlems.

34 Their writing deſtroyed by a worm.

The two factions into which the tribe of Koreiſh was divided ſubſiſted for five years, when they were put an end to by a very ſtrange accident. Mahomet told his uncle Abu Taleb, that God had manifeſtly ſhowed his diſapprobation of the covenant entered into againſt them, by ſending a worm to eat out every word of the inſtrument except the name of God. With this particular Abu Taleb immediately acquainted the Koreiſh; offering, in caſe it proved falſe, to deliver up his nephew to them; but if it ſhould prove true, he inſiſted that they ought to lay aſide their animoſity, and annul the league they had made againſt the Haſhemites. To this they acquieſced; and going to inſpect the writing, found it to be as Abu Taleb had told them; the words "In thy name, O God," being the only ones which remained. On ſo remarkable a proof of the divine diſpleaſure, the league was immediately annulled, and all acts of hoſtility between the two parties ceaſed.

After this memorable event Mahomet remained with his uncle Abu Taleb, who ſurvived the reconciliation only about eight months. The ſame year alſo died Khadijah, Mahomet's wife. Her death, as well as that of his uncle, proved a great detriment to his affairs;

35 Mahomet ſtill perſecuted by the Koreiſh.

for the Koreiſh, notwithſtanding the former reconciliation, began now to proſecute him with more violence than ever. He was therefore obliged to fly for ſhelter to Al Tayef; which he choſe on account of its being the reſidence of his uncle Al Abbas, whoſe protection he imagined he would be able to ſecure. In this, however, he found himſelf miſtaken; and though he ſtaid a month in the city, during which time he gained over a few, yet at laſt the lower ſort of people roſe againſt him and obliged him to return to Mecca. This refuſal, though it greatly diſcouraged the new converts, did not in the leaſt abate the zeal of Mahomet: on the contrary, he continued to preach boldly to the public aſſemblies at the pilgrimage to Mecca, exclaiming againſt idolatry, and particularly againſt the worſhip of two idols Allat and Al Uzza, to which the tribes, eſpecially the women of that of Thakif, were very much addicted. By this the prophet was often expoſed to great danger: however, he gained ſome converts, and amongſt them ſix of the inhabitants of Yathreb, of the Jewiſh tribe of Khazraj; who, on their return home, failed not to ſpeak much in commendation of their new religion, and exhorted their fellow-citizens immediately to embrace it. Theſe converts of the tribe of Khazraj are by the Arab writers called *Al Anſar*, *Al Anſarii*, or *Anſars*; that is, aſſiſtants, favourers, ſupporters, &c. because they aſſiſted and ſupported the prophet when he was purſued to the very brink of deſtruction.

36 Anſars, who.

They firſt met mahomet on a little hill called *Al Akabah*, where a temple ſtood, and where they firſt took an oath to exert themſelves in ſupport of their new apoſtle and his religion. An uninterrupted friendſhip and harmony reigned for a long time amongſt the members of the Jewiſh tribes of Khazraj, Koreidha, and Nadir, whoſe great progenitor, ſay the Arabs, was Aaron the ſon of Amran. Mahomet therefore inſinuating himſelf into the good graces of the Anſars, they readily embraced his religion, and proved of very conſiderable ſervice.

37 Mahomet's journey to heaven.

The next remarkable thing recorded of Mahomet is the invention of his night-journey to heaven. This he probably intended to ſupply the place of miracles. The abſurdities contained in that relation, however, are ſo great, that when he related it to his uncle Al Abbas, and Omm Hana the daughter of Abu Taleb, they endeavoured to diſſuade him from making it public. This advice he was ſo far from following, that he related the whole to Abu Jahl, one of his moſt inveterate enemies, who ridiculed him for it, and placed the ſtory in ſuch a ridiculous light to the Koreiſh, that they were on the point of inſulting him; ſeveral of his

38 Almoſt proves the ruin of his cauſe.

followers alſo left him; and the whole deſign had probably been ruined, had not Abu Becr vouched for his veracity, and declared, that, if Mahomet affirmed it to be true, he firmly belived the whole. This declaration not only retrieved the prophet's credit, but increaſed it to ſuch a degree, that he was ſure of making his diſciples ſwallow whatever he pleaſed; and on this occaſion it is ſaid by ſome that he gave Abu Becr the name of the *faithful witneſs*; as we have already related.

In the twelfth year of Mahomet's miſſion, twelve men of Yathreb, or Medina, of whom ten were of the tribe of Kharai, and two of that of Aws, came to Mecca, and took an oath of fidelity to the prophet at the hill Al Akaba. When they had ſolemnly engaged to do all required of them, Mahomet ſent one of his diſciples, named *Maſab Ebn Omair*, home with them, to inſtruct them more fully in the grounds of their new religion. Maſab being arrived at Medina, with the aſſiſtance of the new proſelytes, gained ſeveral others; and acquainting Mahomet with the ſucceſs of his miſſion, deſired leave to form a congregation of

39 Congregation of Moſlems formed at Medina.

Moſlems at Medina. This the prophet readily granted; in conſequence of which, the new Moſlems regularly aſſembled, to the number of forty perſons, in the houſe of Saad Ebn Khaithama. The next year Maſab returned to Mecca, accompained by ſeventy-three men and two women of Medina, who had profeſſed Mahometaniſm, beſides ſeveral others who were yet unbelievers. On their arrival they ſent immediately to Mahomet, and offered him their aſſiſtance, of which he now ſtood in the greateſt need; for his adverſaries were by this time grown ſo powerful in Mecca, that he could not ſtay there much longer without imminent danger. He therefore accepted their propoſal, and met them one night by appointment at the hill Al Akaba. At this interview he was attended by his uncle

Al Abbas; who, though then an unbeliever, wished his nephew well, and made a speech to the people of Medina; wherein he told them, that as Mahomet was obliged to quit his native city and seek an asylum elsewhere, and as they had offered him their protection, they would do well not to deceive him; and if they were not firmly resolved to defend, and not to betray him, they had better declare their minds, and let him seek for protection somewhere else. Upon their protesting their sincerity, Mahomet swore to be faithful to them, a part of the Koran being read to all present, on condition they should protect him against all insults, as heartily as they would do their own wives and families. They then asked him what recompence they were to expect if they should happen to be killed in his quarrel: he answered, Paradise; upon which they pledged their faith to him, after Mahomet had chosen twelve out of their number, who were to have the same authority under him that the twelve apostles had under Christ.

Finding now a confederacy formed in his favour, our prophet began to pull off the mask as to his true sentiments concerning the means of reformation. Hitherto he had propagated his religion by fair means only; and in several passages of the Koran, which he pretended were revealed before this time, he declared, that his business was only to preach and admonish; that he had no authority to compel any person; and that whether they believed or not, was none of his concern, but belonged solely to God. But no sooner did he find himself enabled, by the alliance abovementioned, to resist his enemies, than he gave out that God had allowed him and his followers to defend themselves; and at length, as his forces increased, he pretended not only to have leave to act on the defensive, but to attack the infidels, destroy idolatry, and set up the true religion by the power of the sword. To this he was excited by an apprehension that pacific measures would greatly retard, if not entirely overthrow, his designs; and therefore he determined to use the most violent methods to convert the Pagan Arabs, or rather to extend his own authority.

40
The Koreish resolve to put Mahomet to death.

The Koreish, in the mean time, finding that Mahomet had considerably extended his influence, and hearing of the league concluded with the Ansars, began to think it absolutely necessary that he should be prevented from escaping to Medina; and, in order to do this the more effectually, they resolved in a council, wherein it is said the devil assisted in person, to put an end to his life. To accomplish this with the greater safety, they agreed that a man should be chosen out of every tribe, and that each should have a blow at him; that so the guilt of his death might fall equally on all the tribes, and thus the Hashemites would be prevented from attempting to revenge the death of their kinsman, as they were much inferior in power to the rest of the tribes put together. Mahomet now directed his companions to repair to Medina, where, in consequence of the late treaty, they might be assured of protection. This they accordingly did: but he himself, with Abu Becr and Ali, remained behind; not having received, as he pretended, the divine permission to retire. Here he narrowly watched the motions of the Koreish, and was soon apprised of their machinations: for the abovementioned conspiracy was scarce formed, when by some means or other it came to Mahomet's knowledge; and he gave out that it was revealed to him by the angel Gabriel, who also commanded him to retire from Mecca. The conspirators were already assembled at the prophet's door; but he, to amuse them, ordered Ali to lie down in his place, and wrap himself in his green cloak: this Ali complied with, and Mahomet miraculously, according to the Arabs, escaped to the house of Abu Becr. The conspirators, in the mean time, perceiving through a crevice Ali wrapped up in the green cloak, took him for Mahomet himself, and watched there till morning, when Ali arose, and they found themselves deceived.

41
He outwits them and escapes.

42
In great danger at mount Thur.

The prophet next retired in company with Abu Becr to a cave in mount Thur, an hill a little south of Mecca. Here he had still a more narrow escape; concerning which we have the following account from an Arabic tradition. "The Koreish having detached a party from Mecca to reconnoitre the mouth of the cave, when they came there, found it covered by a spider's web, and a nest built at the entrance by two pigeons which they saw, and which had laid two eggs therein. On sight of this they reasoned with themselves in the following manner: "If any person had lately entered this cavern, "the eggs now before us would infallibly have been "broke, and the spider's webb demolished; there can "therefore be no body in it;" after which, they immediately retired. As the prophet, therefore, and his friend, were now saved so miraculously by means of the pigeon's eggs and the interposition of the spider's web, he afterwards enjoined his followers, in memory of so remarkable an event, to look upon pigeons as a kind of sacred animals, and never to kill a spider."

43
He is pursued and overtaken, but still escapes.

The prophet and Abu Becr having staid in this cave three days in order to recover a little from their consternation, set out for Medina; but the Koreish, being informed of the route they had taken, sent a party after them, under the command of Soraka Ebn Malec. These overtook them; and, as the Arab historians tell us, Soraka's horse fell down when he attempted to seize Mahomet. Upon this he recommended himself to the prophet's prayers, and remounted his horse without hurt: but, as he still continued the pursuit, his horse fell down with him a second time; upon which he returned to Mecca, without offering any farther violence: and Mahomet, thus happily delivered from the greatest dangers, arrived without farther molestation at Medina, where he was received with the greatest demonstrations of joy.—This flight of the prophet from Mecca to Medina was reckoned so remarkable by the Moslems, that they made it the æra from whence all their remarkable transactions were dated, called it the *Æra of the Hegira*, or *flight*. The beginning of the Hegira corresponded with the 16th of July, A. D. 622.

44
Æra of the Hegira.

On Mahomet's arrival at Medina, his first care was to build a mosque for his religious worship, and an house for himself. The city of Medina at that time was inhabited partly by Jews and partly by heretical Christians, that formed two factions which persecuted one another with great violence. This gave the impostor such an opportunity of propagating his new religion, that in a short time the city was entirely at his devotion. Here he strengthened himself by marrying Ayesha the daughter of Abu Becr, though then only seven years of age, and gave his own daughter Fatima in marriage to Ali,

 the

Arabia.

45 Union of the Ansars and Mohajerin.

the son of Abu Taleb. The next point he had in view was the union of the Mohajerin, or those who fled from Mecca on account of their religion, with the Ansars above mentioned. To facilitate this, after the mosque and house were finished, he established among the Moslems, a fraternity, the principal statute of which was, that they should not only treat one another like brethren, but likewise most cordially love, and mutually cherish, one another to the utmost of their power. But, lest even this should prove insufficient, he coupled the individuals of the two bodies of Ansars and Mohajerin; and this was the last transaction of the first year of the Hegira.

The next year was ushered in, according to Abulfeda, with a change of the *Kebla*, or place whither the Mahometans were to turn their faces in prayer. At first it had been declared to be perfectly indifferent where they turned their faces. Afterwards he directed them to pray with their faces towards the temple of Jerusalem, probably with a view to ingratiate himself with the Jews; and, now in order to gain the Pagan Arabs, he ordered his followers to pray with their faces towards the east. This inconstancy gave great offence, and occasioned the apostacy of many of his disciples. About this time Mahomet receiving advice that a rich caravan of the Koreish was on the road from Syria to Mecca, he detached his uncle Hamza, at the head of 30 horse, to seize upon it; who accordingly lay in wait for it in one of the woods of Yamama, thro' which it was to pass: here, however, he was informed that the caravan was guarded by 300 men, so that he returned without making any attempt; but the prophet made the proper dispositions for acting hereafter against the Koreish with success. This year also Mahomet sent out a party of 60 or 80 horse, all Mohajerin, except one who was an Ansar, to make reprisals on the the Koreish. They were met by a party of their enemies, and both sides immediately prepared for an engagement: however, they parted without bloodshed, except one of the Koreish, who was killed by an arrow shot by one of the Moslems.

46 Mahomet takes a caravan, and gains the battle of Bedr.

Mahomet, having now put himself into an offensive posture, began in earnest to make reprisals on the Koreish. His first exploit was the taking of a caravan attended by a small guard; and this being accomplished by a party consisting only of nine men, contributed greatly to encourage the Moslems. But what most established the impostor's affairs, and was indeed the true foundation of all his future greatness, was his gaining the battle of *Bedr;* of which we have the following account.——The prophet being informed that Abu Sofian Ebn Harb escorted a caravan of the Koreish with only 30 or 40 men, resolved to advance at the head of a small detachment of his troops to intercept it. To this he was excited by the riches of the caravan, which consisted of a large quantity of merchandize, consisting of the riches of Syria, carried on the backs of a thousand camels. He therefore sent out a party to reconnoitre it, with orders to wait in some convenient place, where they might remain undiscovered. But Abu Sofian having notice of Mahomet's motions, dispatched a courier to Mecca, requesting succours from his countrymen, that he might be able to defend the caravan. Upon this Mahomet drew together all his forces, which amounted to no more than 313, while his enemies consisted of very near 1000, Abu Sofian having been reinforced by the Meccans with 950 men. The two armies did not long remain in a state of inaction: but before the battle three champions from each party engaged each other in single combat. In this the Moslem champions were victorious, and the event greatly discouraged the Koreish. Mahomet, in the mean time, taking advantage of this lucky event, offered up his prayers to God with great fervency and vehemence; after which, feigning himself in a trance, he pretended that God had assured him of victory. Then throwing an handful of dust or gravel towards the enemy, he cried out, "May the faces of them be confounded;" and attacked the Koreish with such bravery, that they were soon put to flight, leaving 70 dead on the spot, and having as many taken prisoners. The loss on Mahomet's side was only 14 men, and among the prisoners was Al Abbas the prophet's uncle.

Though this action may seem of little consequence in itself, it was of very great advantage to Mahomet's affairs at that time. He was immediately treated with the highest respect by the Najashi, or King of Ethiopia, who received a particular account of the victory soon after it was gained; while the superstitious Moslems did not fail to look upon it as an evident declaration of heaven in their favour. Nay, notwithstanding the small number of enemies to be overcome, and who were only mortal men, these ignorant bigots did not hesitate to own the assistance of no less than 4000 angels, who, according to them, rode on black and white horses, having on their heads white and yellow sashes, that hung down between their shoulders!

Notwithstanding their disaster, however, Abu Sofian made a pretty good retreat, and conducted the greatest part of the caravan to Mecca. This chagrined the Moslems, though they found great spoil on the field of battle; the division of which had likely to have proved fatal to their cause, by the quarrels that it occasioned among them. So hot, indeed, were the disputes on this occasion, that the impostor was obliged to pretend an immediate revelation from heaven, empowering him to retain a fifth part for religious purposes, and to distribute the rest equally. This became a law for his successors; but, with regard to himself, the prophet often took the liberty of infringing it; for which, no doubt, a new revelation was always a ready and convenient salvo. As for those who were slain on Mahomet's part in this battle, they were all looked upon by the Moslems as martyrs; and the prophet perceiving among the prisoners two of his inveterate enemies, immediately caused their heads to be struck off.

47 His law concerning the division of spoils.

The Koreish, in order to be revenged on Mahomet for their late defeat at Bedr, sent Amru Ebn Al As, who afterwards conquered Egypt, with some other of their principal people, on an embassy to the king of Ethiopia, in order to interest him in their quarrel. To do this the more effectually, they accused Mahomet and his followers of speaking disrespectfully of JESUS and of his mother MARY; which accusation they hoped would likewise induce him to deliver up the Moslem refugees that were then at his court. But the bad success that had attended the arms of the Koreish hitherto, joined to the excuses made by the refugees, not only hindered the Najashi from delivering them up, but

but also prompted him to dismiss the ambassadors, and return the presents they had brought him. In the mean time, Abu Sofian, who had sworn never to use perfumes or enjoy women till he had another battle with Mahomet, set out from Mecca with a body of 200 horse. He advanced to a post within three miles of Medina; from whence he sent a detachment, who burnt a barn, together with a man in it that was winnowing wheat. Mahomet, being informed of this outrage, moved immediately towards him with a detachment of cavalry; but Abu Sofian was so intimidated by his approach, that he fled with precipitation, leaving behind him all the sacks of flour or meal that had been brought for the subsistence of his troops. Instead therefore of coming to an engagement with the impostor, as he had sworn, he contented himself with alarming the country, and pillaging such as he suspected of favouring Mahometanism. This year also Mahomet conquered the tribes called *Banu Solaim, Ghatfan*, and the *Banu Kainoka*; plundering likewise a rich caravan belonging to the Koreish, and acquiring from thence 25,000 dirhems for his own share of the plunder.

48 Abu Sofian's cowardice.

In the year of Christ 625, being the third of the Hegira, the Koreish assembled an army of 3000 men, among whom were 200 horse and 700 armed with coats of mail. The command of this army was given to Abu Sofian, who was attended by his wife Henda Bint Otba, and sat down at a village about six miles distant from Medina. Mahomet, being much inferior to the enemy, resolved at first to keep himself within the town, and receive them there; but afterwards, by the advice of his companions marched out against them at the head of 1000 according to some, 1050 according to others, or, as some say, only 900 men. Of these 200 were cuirassiers; but he had only one horse besides his own in the whole army. He distributed three standards among his troops; of which one was given to the tribe of Aws, another to that of Khazraj, and the third to Mohajerin. The grand standard was carried before the prophet by Mosaab Ebn Omair. With these forces Mahomet formed a camp in a village near Ohod, a mountain about four miles north of Medina, which he contrived to have on his back; and the better to secure his men from being surrounded, he placed 50 archers, the flower of his troops, in the rear, with strict orders not to quit their post. On the other hand, the army of the Koreish was drawn up in the form of a crescent, and made a very good appearance. The right wing was commanded by Khaled Ebn Al Walid, afterwards so terrible to the Greeks, the left by Acrema Ebn Abu Jahl; and the centre by Abu Sofian. The corps de reserve was headed by Abu Sofian's wife, accompanied by 15 other matrons, who performed the office of drummers, lamenting the fate of their countrymen slain at Bedr, in order to animate the troops who attended them. The attack was begun by the Moslems, who fell upon the enemy with such fury, that their centre immediately began to give away. Ali, or, according to Abulfeda, Hamza, slew Arta the enemy's great standard-bearer; which struck them with such terror, that they soon betook themselves to flight, falling foul upon their own corps de reserve. Victory had now been no longer doubtful, notwithstanding the vast inferiority of Mahomets troops, had not the 50 archers, contrary to the prophet's express command, quitted their post to pillage the enemy. Upon this Khaled, perceiving the Moslem army to be greatly exposed, attacked them in the rear with such bravery, that he turned the fortune of the day. Not content with putting the troops there in disorder, he cried out with all his might, "Mahomet is slain; and this had such an effect upon the Moslems, that they immediately took to their heels, nor could the utmost endeavours of the prophet himself afterwards rally them. He therefore found himself obliged to quit the field of battle; in doing which he was very near losing his life, being struck down by a shower of stones, and wounded in the face by two arrows, which occasioned the loss of two of his fore-teeth. He likewise received a contusion on his upper lip; and had even been killed on the spot, had not one of his companions, named *Telha*, Abu Becr's nephew, received a blow that was levelled at him. On this occasion Telha received a wound in his hand, which deprived him ever after of the use of some of his fingers. Of the Moslems 70 were slain; among whom were Hamza the prophet's uncle, and Mosaab the standard-bearer. Amongst the wounded were Abu Becr, Omar, and Othman; but as soon as they understood that the prophet was safe, they returned to the charge with a considerable body, and, after an obstinate dispute, carried him off. The good retreat made by these champions so discouraged the troops of Abu Sofian, that they did not pursue the flying enemy, but contented themselves with remaining masters of the field of battle; nor did that general, tho' he exulted not a little in his victory, make any farther use of it than to give Mahomet a challenge to meet him the next year at Bedr, which was accepted; and after his return to Mecca, he desired a truce with the Moslems, which was readily granted.

49 Battle of Ohod.

50 Mahomet defeated.

51 He apologizes for his defeat.

This defeat had like to have proved the total ruin of the impostor's affairs, and must inevitably have done so had the conquerors made the least use of their victory. Some of his followers now asserted, that had he been really a prophet sent from God, he could not have been thus defeated; and others were exasperated on account of the loss of their friends and relations who had been slain in the late engagement. To still the murmurs of the former, he laid the blame on the sins of those who had accompanied him; and, to pacify the latter, he pretended a revelation from heaven, wherein the period of all mens lives was said to be unalterably fixed without regard to their own actions, or to any external objects; so that those who were killed in battle behoved to have died, though they had remained at home in their own houses. By the assistance of this last doctrine he encouraged his followers to fight, without fear, for the propagation of their faith, as all their caution would not be sufficient to avert their destiny, or prolong their lives even for a single moment.

The next year, (A. D. 626), Mahomet, besides several other less considerable successes, reduced a fortress belonging to the Jewish tribe of Al Nadir, who had revolted on account of the defeat at Ohod: on this occasion, by an express revelation, as he pretended, he kept the whole booty to himself; and, about the same time, forbad his followers the use of wine, or to play at games of chance, on account of the disturbances and

quarrels

Arabia.

quarrels which were likely to be excited by that means among them. This year also he marched with a body of infantry to Bedr, to meet Abu Sofian, as he had promised the year before: but that general's heart failing him, he returned home without facing the prophet; and this piece of cowardice the Moslems did not fail to impute to a terror sent immediately from God. The year following, however, the Koreish, in conjunction with the tribe of Ghatfan, and the Jews of Al Nadir and Koreidha, assembled an army of 12,000 men, with which they formed the siege of Medina, thus threatening the impostor and all his followers with utter destruction at once. On the enemy's approach, Mahomet, by the advice of a Persian named *Salman*, ordered a deep ditch to be dug round the city, and went out to defend it with 3000 men. The Arabs having invested the town, both sides remained in a state of inactivity for some time; which was so well employed by the impostor, that he found means to corrupt some of the leading men in the enemy's camp. The good effects of this soon appeared; for a champion having advanced to the Moslem entrenchments, and challenged the best man in their army to fight him in single combat, the challenge was immediately accepted by Ali, who slew him and another that came to his assistance; after which, those who had been corrupted by Mahomet's agents so soured a considerable part of the forces, that they deserted their camp; upon which all the rest were obliged to raise the siege and return home.

52 Siege of Medina.

53 The siege raised.

The prophet, being now happily delivered from the most powerful combination that had ever been formed against him, was visited by the angel Gabriel; who asked him, whether he had suffered his men to lay down their arms, when the angels had not laid down theirs? ordering him at the same time to go immediately against the tribe of Koreidha, and assuring him that he himself would lead the way. Upon this Mahomet immediately set out for the fortress of the Koreidhites, and pushed on the siege with so much vigour, that, tho' it was deemed impregnable, he obliged the garrison to capitulate in twenty-five days. The Koreidhites, not daring to trust themselves to the impostor's mercy, surrendered at discretion to Saad Ebn Moadh, prince of the tribe of Aws, hoping that he, being one of their old friends and confederates, would have some regard for them. Here, however, they found themselves disappointed; for Saad, being highly provoked at them for assisting the Koreish while in league with Mahomet, ordered the men to put to the sword, the women and children made slaves, and their goods divided among the Moslems. This sentence was no sooner heard by Mahomet, than he cried out that Saad had pronounced the sentence of God; and, in consequence of this decision, ordered the men, to the number of 600 or 700, to be immediately massacred. The women and children were also carried into captivity. Their immoveable possessions were given to the Mohajerin, and the goods divided equally.

54 Khoreidhites massacred.

Mahomet now continued to be successful, gradually reducing the Arab tribes one after another. In 628, he sent an agent to Constantinople, desiring leave of the Greek emperor to trade with his subjects; which was immediately granted. The same year also he concluded a peace for ten years with the inhabitants of Mecca, and obtained liberty the next year to perform his devotions at the Caaba. What tended considerably to bring about this pacification was an account brought to the Koreish by one whom they had sent with an actual defiance to Mahomet, of the prodigious veneration which his followers had for him. This messenger acquainted them that he had been at the courts both of the Roman emperors and of the kings of Persia, but never saw any prince so highly respected as Mahomet was by his companions. Whenever he made the ablution in order to say his prayers, they ran and caught the water which he had used; whenever he spit, they licked it up, and gathered up every hair that fell from him, with great veneration. This intimated how desperately they would fight in his defence, and probably inclined his enemies to avoid hostilities. In 629, the impostor began to think of propagating his religion beyond the bounds of Arabia, and sent messengers to several neighbouring princes to invite them to embrace Mahometanism; but, before sending the letters, he caused a silver seal to be made, on which were engraved in three lines the following words, "MAHOMET THE APOSTLE OF GOD." This seal, he believed, would procure the letters to which it was affixed a more favourable reception at the courts of those princes whither they were directed. The first to whom he applied was Khosru Parviz the king of Persia; but he, finding that Mahomet had put his own name before his, tore the letter in pieces, and sent away the messenger very abruptly. He also sent a letter to the same purpose to Constantinople; but though the emperor Heraclius dismissed his messengers honourably, he refused to abandon the Christian faith. Besides these, he wrote five other letters, which he distributed among those who he thought would be most likely to acknowledge him for an apostle. However, we do not hear that by means of letters he ever introduced his religion into a foreign country.— But while our impostor was thus going on in the full career of success, and industriously propagating his infamous falsehoods by all the means he could think of, he was poisoned by a maid, who wanted, as she said, to make an experiment whether he was a prophet or not. This was done by communicating some poison to a shoulder of mutton, of which one of his companions named *Bashar Ebn Al Bara*, eating heartily, died upon the spot; and Mahomet himself, though he recovered a little, and lived three years after, yet never enjoyed perfect health. Notwithstanding this misfortune, however, he still continued his enterprizes. The year 630, proved remarkably fortunate. It was ushered in by the conversion of Khalid Ebn Al Walid, Amru Ebn Al As, and Othman Ebn Telha, three of the most considerable persons among the Koreish; and this soon enabled him to become master of the whole peninsula of Arabia. This year also the inhabitants of Mecca took it into their heads to violate the treaty concluded with Mahomet: for the tribe Becr, who were the confederates of the Koreish, attacking those of Khozaab, who were in alliance with Mahomet, massacred 20 of them, and afterwards retired; being supported in this action by a party of the Koreish themselves.— The consequence of this violation was soon apprehended; and Abu Sofian himself made a journey to Medina, in order to heal the breach and renew the truce: but in vain; for Mahomet, glad of this opportunity, refused to see him. Upon this he applied to Abu Becr, Ali, Omar,

Arabia.

55 Prodigious veneration for Mahomet.

56 He invites foreign princes to embrace his religion.

57 Is poisoned, but recovers.

58 Meccans violate the treaty with Mahomet.

Arabia. Omar, and Fatima, to intercede for their countrymen with the prophet; but some of these giving him rough answers, and others none at all, he was obliged to return to Mecca as he came. Mahomet immediately gave orders for the necessary preparations, that he might surprise the Meccans, who were by no means in a condition to receive him; but Hateb Ebn Abu Baltaa, hitherto a faithful Moslem, attempted to give them notice of their danger by a letter, though without effect. His letter was intercepted: and he alleged in his excuse, that the only reason he had for his conduct was to induce the Koreish to treat his family with kindness. This excuse the prophet accepted, as he had greatly distinguished himself at the battle of Bedr, but strictly forbade any such practices for the future; which having done, he immediately made the necessary dispositions for setting forward.

Mahomet's army, on this occasion, was composed of Mohajerin, Ansars, and other Arabs, who had lately become proselytes. As they drew near to Mecca, he set up his standards, and advanced in order of battle to Mar Al Dharan, a place about four parasangs from Mecca, where the whole army encamped. Here he ordered 10,000 fires to be lighted, and committed the defence of the camp to Omar, who cut off all communication with the town, so that the Meccans could receive no certain advice of their approach. Among others that came from Mecca to reconnoitre the Moslem camp, Abu Sofian Ebn Harb, Hakim Ebn Hezam, and Bodail Ebn Warka, fell into Omar's hands; and being conducted to Mahomet, were obliged to embrace Mahometanism in order to save their lives.

The first rumour of this expedition had not a little terrified the Koreish, though they were not apprized that the prophet had resolved upon a war: but perceiving now, upon the report of Abu Sofian, who had been sent back to them, that the enemy was at their gates, they were thrown into the utmost consternation. Of this Mahomet being informed, he resolved to take advantage of the confusion that then reigned among them. He therefore first dispatched Hakem and Bodail to the Meccans, inviting them to take an oath of allegiance to to him, and become converts to his new religion; after which, he made the following disposition of his forces. Al Zobier was ordered to advance with a detachment towards the town on the side of mount Cada. Saad Ebn Obad, prince of the tribe Khazraj, marched by his order with another detachment towards the height of Coda, which commands the plain of Mecca. Ali commanded the left wing of the army, consisting of Ansars and Mohajerin. The prophet put into his hands the great standard of Mahometanism, with orders to post himself upon mount Al Hajun, and to plant the standard there; strictly enjoining him, however, not to stir from thence till he himself arrived, and till a proper signal should be given him from Saad for that purpose. Khaled led the right wing, consisting of the Arabs lately converted, with which he was to possess himself of the plain of Mecca. Abu Obeidah commanded in the centre, which consisted entirely of infantry: the prophet himself remained in the rear, from whence he could most easily dispatch his orders to all the generals as occasion should require. He expressly prohibited Khaled and all his other officers to act offensively unless they were first attacked. Things being in this situation, the army upon a signal given put itself immediately in motion. The prophet mounted his camel with great alacrity, and was that day cloathed in red. Al Zobeir pursued the rout assigned him without opposition; nor did Saad discover the faintest traces of an enemy: Ali took possession of his post without the loss of a man; and in like manner Abu Obeidah seized on the suburbs. Khaled, however, in his march to the plain, was met by a large body of the Koreish and their confederates, whom he immediately attacked and defeated, putting 28 of them to the sword. Not content with this, he pursued them into the town, and 59 Mecca taken. massacred a great number of the inhabitants; which so terrified the rest, that some shut themselves up in their houses, while others fled different ways in order to avoid the fury of the merciless and impious tyrant, who was now become master of the city. Thus was Mecca reduced, with the loss only of two men on the side of the impostor.

Mahomet being now master of the city, made his public entry into it exactly at sun-rising. When the first tumult was over, he went in procession round the Caaba seven times, touching the corner of the black stone with the staff in his hand, as often as he passed it, with great devotion. Then he entered the Caaba; where observing several idols in the form of angels, and the statutes of Abraham and Ishmael with the arrows of divination in their hands, he caused them all to be destroyed. He also broke in pieces with his own hands a wooden pigeon, that had long been esteemed a deity by the idolatrous Koreish. Afterwards entering into the interior part of the Caaba, he repeated with a loud voice the form used at this day by the Mahometans, "Allah Akbar, God is great," &c. turning towards every part of the temple. Then he prayed between the two pillars there, with two inclinations, as well as without the Caaba; saying to those that attended him, "This is your Kebla, or the place towards which you are to turn your faces in prayer."

Having thus effectually subdued the Koreish, put an end to all commotions, and purged the Caaba of 360 idols, the prophet's next care was to ingratiate himself with the people. Sending therefore for some of the principal of them, he asked them what kind of treatment they expected from him, now he had conquered them? To this they replied, "None but what is favourable, O generous brother:" upon which he dismissed them, telling them they were from that moment a free people. After this, pretending a new revelation, he restored the keys of the Caaba to Othman Ebn Telha, who was in possession of them before; and who was now so much affected by this piece of justice, that he immediately became a proselyte. Next day the prophet declared Mecca an asylum, and publickly gave out that he would maintain to the utmost of his power the inviolable security of the place. He then was solemnly inaugurated; after which he proscribed, according to some, six men and four women, according to others, eleven men and one woman: but of these only three men and one woman were put to death; the rest being pardoned on their embracing Mahometanism, and one woman making her escape. The remainder of this year was spent in various expeditions against different tribes of the Arabs, which were in general attended with success.

Arabia. The ninth year of the Hegira, being that of Christ 631, is called by the Mahometans the year of *Embassies*; for the Arabs, who had hitherto been expecting the issue of the war between Mahomet and the Koreish, no sooner saw that which was the most considerable of the whole submit to him, than they began to come in to him in great numbers, and to send embassies to make their submissions to him, both while at Mecca and after his return to Medina, whither he had returned soon after the taking of Mecca: and this good fortune

60 Mahomet dies. continued without interruption to the year 632, when this famous impostor breathed his last, having just reduced under his subjection the whole peninsula of Arabia, and being ready to break into the neighbouring kingdoms in order to satisfy his ambition.

61 Great confusion on his death. The death of Mahomet occasioned such a consternation in Mecca, that the governor hid himself, fearing to be called to an account for his former conduct; and the inhabitants, upon the first arrival of this melancholy news, considered themselves as destitute of all manner of protection. After the first impressions of their fear, however, were over, they began to meditate a revolt; but were prevented by one Sohail Ebn Amru, a principal man of the Koreish. The tumults at Medina, however, were not so easily appeased. The news of this sad event was no sooner published there, than a number of people assembled before his door, crying out, "How can our apostle be dead? Our intercessor, our mediator, has not entirely left us! He is taken up into heaven, as was Isa (Jesus); therefore he shall not be buried." This was confirmed by Omar; who drew his sword and swore, that if any person affirmed Mahomet to be dead, he would cut off his hands and his feet. "The apostle of God (says he) is not dead: he is only gone for a season, as Moses the son of Amran was gone from the people of Israel for forty days, and then returned to them again." The populace therefore kept the body above ground, even after the belly began to swell; nor could the prophet's uncle Al Abbas, notwithstanding this, convince them to the contrary. Upon hearing of these transactions, Abu Becr immediately posted from Al Sonah, another quarter of the city, and expostulated with them in the following manner: "Do you worship Mahomet, or the god of Mahomet? If the latter, he is immortal, and liveth for ever; but if the former, you are in a manifest error, for he is certainly dead." The truth of this assertion he immediately evinced from several passages of the Koran, in so clear and conclusive a manner, that he not only satisfied Omar, but calmed the minds of all the people.

The prophet having left no directions concerning a successor, very warm disputes arose between the Mohajerin and the Ansars about the right of electing a khalif. The former insisted on having that right, because they had attended Mahomet in his flight to Medina; and the others, because they had supported him when expelled from his native city, &c. In short, the disputes became so hot, that an open rupture must have commenced, had not they been terminated by a proposal that each party should choose a khalif. This amused them a little for the present; but not proving perfectly agreeable to the Mohajerin, Abu Becr proposed two persons, Omar and Abu Obeidah, offering to swear allegiance to him on whom the suffrages of both parties should fall. But this producing no decision, Omar swore fealty to Abu Becr, and his example was followed by all the Moslems on the spot; upon which he was acknowledged both by the Mohajerin and Ansars to be the rightful successor of Mahomet. Arabia. 62 Abu Becr succeeds him.

These transactions, however, were not at all agreeable to Ali, who, as son-in-law to the prophet, had undoubtedly the best title to the succession. He expostulated with Abu Becr about the manner of his election, which had been effected without his knowledge; and received for answer, that the exigence of affairs would not admit of deliberation; and that, had not the election been so sudden, the opposite party would have wrested the power entirely out of their hands. Ali was in Fatima's apartment when Abu Becr had the good luck to be elected khalif; and, upon the arrival of the news, expressed great dissatisfaction. He found himself, however, soon obliged to change his note, when the new khalif sent Omar with orders to burn the house where he and his friends were assembled, in case he did not concur in supporting the election. But notwithstanding his forced compliance on this occasion, it is not to be doubted that he reckoned himself injured; and his pretensions were thought to be just by a great number of Moslems: which notion is entertained by a very considerable party of Mahometans even at this day; and these are called *Shiites* or *sectaries*. 63 Ali dissatisfied.

Soon after Abu Becr's accession, many of the Arabs refused to pay the tribute imposed upon them by Mahomet, and even attempted to shake off his yoke altogether. This so alarmed the khalif and his subjects at Medina, that, fearing a general revolt, they sent all not able to bear arms into the cavities of the rocks and mountains, and put themselves in as good a posture of defence as the short time would permit. In the mean time Khaled was dispatched with an army of 4500 men to reduce the rebels; and he soon coming up with them, gave them a total defeat, brought off a vast quantity of plunder, and made many of their children slaves. Nor was he content with this; for being sent by Abu Becr to Malek Ebn Noweirah, an eminent person among the Arabs, and famous for his skill in poetry as well as his horsemanship and bravery, to bring him over by fair means, he immediately ordered his head to be cut off. By this means, indeed, he extinguished all the remains of rebellion; but rendered himself exceedingly obnoxious to Abu Becr, who would have put him to death, had not Omar strongly interceded for him: for Khaled had greatly exceeded his commission, as Malek had returned to Mahometanism, and had offered to pay the money. This was not, however, the only piece of service Khaled performed at this time; he also defeated and killed Moseilama, who had set up for a prophet in the time of Mahomet, and even wanted to take the grand impostor himself into company with him. The same general likewise defeated and dispersed the troops of another prophet, called *Toleiah Ebn Khowailed*, obliging himself to remain concealed till after the death of Abu Becr. About the same time another body of rebels committed great disorders in the province of Bahrein. Against these Abu Becr dispatched Al Ola at the head of a considerable army, who soon obliged them to return to Mahometanism; having put great numbers of them to the sword, and plundered their country in a dreadful manner. 64 Rebellions extinguished by Khaled.

Abu Becr having now no enemy to contend with in 65 War with the Greeks.

Arabia.

Arabia, and being free from all apprehenſions of a competitor, reſolved next to turn his arms againſt the Greek emperor. Some ſkirmiſhes had happened, in the time of Mahomet, between the Moſlems and Greeks; in one of which Zeid, a Moſlem commander, had been killed. To revenge his death, his ſon Oſama was on the point of making an irruption into Syria at the time of Mahomet's deceaſe. This enterpriſe the khalif ordered him to go on with; and it was executed by Oſama with great ſucceſs. He entered Syria, and laid waſte the country; doing the Greeks a good deal of damage; after which he returned to Arabia without any conſiderable loſs.

66 Kingdom of Hira deſtroyed.

Soon after the khalif ſent Khaled at the head of a powerful army to invade Irak, and put an end to the kingdom of Hira. In this undertaking he was attended with his uſual ſucceſs. The king Al Mondar Al Maghrur loſt his life in defence of his dominions; and the kingdom was totally deſtroyed, after it had continued 622 years and eight months, as we have already hinted. The inhabitants became tributaries; and, according to Eutychius, the tribute collected on this occaſion amounted to 70,000 pieces of money. This, according to Al Makin, was the firſt tribute-money ever brought to Medina.

The exigence of the khalif's affairs in Syria, however, did not ſuffer Khaled long to remain in Irak. Before the departure of the army under his command, Abu Becr had come to a reſolution to invade Syria; and finding his deſign approved by the principal officers of his court, he ſent circular letters to the petty princes of Yaman, the chief men of Mecca, &c. informing them of his intention to take Syria out of the hands of the infidels; acquainting them, at the ſame time, that a war for the propagation of the true religion was an act of obedience to God. To theſe letters they paid a proper regard; and in a very ſhort time appeared at Medina at the head of their reſpective troops, and pitched their tents round the city. Here they ſtaid till the Moſlem army deſtined to act againſt the emperor was completely formed, and in a capacity to begin its march. The khalif having viewed the troops from the top of an hill, and prayed to God for ſucceſs, attended the generals a little way on foot. As the generals were on horſeback, they could not forbear expreſſing their uneaſineſs at the khalif's thus demeaning himſelf; but he told them, that it ſignified little whether they walked on foot or rode, as they had all the ſame views, viz. the ſervice of God, and the pro-

67 Abu Becr's directions to his general.

pagation of religion. At parting, he addreſſed Yezid Ebn Abu Sofian, whom he had inveſted with the ſupreme command, in the following manner; "Take care, Yezid Ebn Abu Sofian, to treat your men with tenderneſs and lenity. Conſult with your officers on all preſſing occaſions, and encourage them to face the enemy with bravery and reſolution. If you ſhall happen to be victorious, deſtroy neither old people, women, nor children. Cut down no palm-trees, nor burn any fields of corn. Spare all fruit-trees, and ſlay no cattle, but ſuch as you ſhall take for your own uſe. Adhere always inviolably to your engagements, and put none of the religious perſons you ſhall meet with in monaſteries to the ſword. Offer no violence to the places they ſerve God in. As for thoſe members of the ſynagogues of Satan *who ſhave their crowns*, cleave their ſkulls, and give them no quarter, except they embrace Iſlamiſm (Mahometaniſm), or pay tribute."

Arabia.

The Greek emperor was greatly alarmed at the approach of the Moſlem army; however, he made all neceſſary preparations for his defence, and ſent out a detachment to reconnoitre the enemy. Theſe having fallen in with the Arabs, a battle enſued, in which the Greeks were defeated with the loſs of 1200, while the Arabs loſt only 120 men. This was ſucceeded by a great many ſkirmiſhes, in which the Moſlems were generally victorious. The rich ſpoil taken on theſe occaſions was ſent as a preſent to the khalif; who having acquainted the inhabitants of Mecca with his good ſucceſs, they were thereby ſo elated, that they furniſhed him with a ſtrong reinforcement, which was immediately ordered into Syria. The Greek emperor, in the mean time, having ordered another body of his troops to advance towards the frontiers, they found an oppor-

68 The Moſlems defeated.

tunity of engaging the Moſlem army under Abu Obeidah, a perſon of great piety, but little experience in war. Him they totally defeated; and Abu Becr was ſo much provoked at his defeat, that he deprived him of the command, which was given to Khaled, who was for this purpoſe recalled from Irak. That general's firſt exploit was the reduction of Boſtra, a very rich and populous city of Syria Damaſcena; which, however, he accompliſhed by treachery rather than by force of arms. Having left a garriſon of 400 men in Boſtra, and being joined by Abu Obeidah's forces, he laid ſiege to

69 Damaſcus beſieged.

Damaſcus with an army of 45,000 men. This ſo alarmed the emperor, that he diſpatched an army of 100,000 men, commanded by one Werdan, to the relief of that city. Khaled, on hearing of the approach of this formidable army, was for marching immediately with all his forces, and giving them battle; but this was oppoſed by Abu Obeidah, as it would enable the inhabitants of Damaſcus to procure freſh ſupplies both of arms and proviſions, and conſequently render the reduction of the place more difficult. It was, therefore, at laſt agreed, that a body of troops ſhould be detached under Derar Ebn Al Wazar, an excellent officer, and an implacable enemy to the Chriſtians (as indeed were all the Moſlem generals except Abu Obeidah), to fight the enemy, whilſt the ſiege was carried on by the two generals.

70 The Greeks defeated with great ſlaughter.

Khaled, fearing leſt Derar's furious zeal and hatred to the Chriſtians ſhould prove fatal to his troops, told him before his departure, that though they were commanded to fight for the propagation of their religion, yet they were not allowed to throw away the lives of their men; and therefore ordered him to retire to the main body of the army, in caſe he found himſelf preſſed by a ſuperior force. But Derar, deaf to this ſalutary admonition, with his ſmall body of troops ruſhed upon the whole Chriſtian army; notwithſtanding the vaſt diſproportion of numbers. He charged them, however, with ſuch bravery, that he penetrated to the ſpot where the general gave his orders, killed the ſtandard-bearer, and carried off the ſtandard itſelf, in which was a croſs richly adorned with precious ſtones. Nay, he would in all probability have put Werdan's army to flight, had not the general's ſon, the commandant of Hems, arrived in the heat of the engagement with a body of 10,000 men; with which he attacked the Moſlems ſo briſkly in the rear, that he forced them to retire, and took

took Derar himſelf priſoner. This ſo diſcouraged them that they would have taken to their heels, had not Rafi Ebn Omeirah animated them with the following words. "What! do not you know, that whoever turns his back upon his enemies offends God and his prophet; and that the prophet declared the gates of paradiſe ſhould be open to none but ſuch as fought for religion? Come on! I will go before you. If your captain be dead, or taken priſoner, yet your God is alive, and ſees what you do." This exhortation had ſuch an effect upon his troops, that, returning to the charge, they maintained their ground with unparalleled bravery, till Khaled arrived with a conderable body of infantry and 1000 horſe. The arrival of this general ſoon turned the fortune of the day. A party of the imperial army went over to the Moſlems, and the reſt took to their heels. Derar alſo was retaken, and carried off in triumph. However, Werdan, having collected the ſhattered remains of his forces, and received a reinforcement from the emperor, found his army ſtill to amount to 70,000 men, with which he reſolved to make another attempt for the relief of Damaſcus. They were attended with ſtill worſe ſucceſs in this ſecond attempt than they had been before; being utterly defeated with the loſs of 50,000 men, ſo that they were no more in a condition to attempt any thing; and, in conſequence of this, the city was ſoon taken, notwithſtanding the utmoſt efforts of the beſieged.

71 The city taken.

72 Abu Becr dies, and is ſucceeded by Omar.

This diſaſtrous event happened in the year 634; and the very day that Damaſcus was taken, Abu Becr died of a conſumption in the 63d year of his age. He was ſucceeded by Omar, who was proclaimed khalif that very day; and the firſt title aſſigned him was, *The khalif of the khalif of the apoſtle of God.* But the Arabs conſidering, that by the additions to be continually made at the acceſſion of every new khalif, the title would become too long, they with one voice ſaluted him, *Emperor of the believers;* which illuſtrious title deſcended afterwards to his ſucceſſors by a kind of inconteſtable right.

The new khalif was no ſooner ſettled than he replaced Abu Obeidah in the command of the army in Syria, being greatly diſpleaſed with the cruel and bloodthirſty diſpoſition of Khaled. He alſo commanded Abu Obeidah to have an eye upon Paleſtine, and to invade it as ſoon as an opportunity offered. Khaled bore his diſgrace with great magnanimity; and ſwore, that though he had always had the greateſt regard for Abu Becr, and the utmoſt averſion to Omar, he would ſubmit to God's will, and obey the new khalif as the lawful ſucceſſor of Mahomet. The Moſlem forces in the mean time having made all proper diſpoſitions for improving the advantages they had gained, Abu Obeidah ſent a detachment of 500 horſe to a place called *Dair Abil Kodos*, about 30 miles from Damaſcus, to plunder the Chriſtians there. In this place their lived a prieſt ſo eminent for his ſanctity, that the neighbouring people of all ranks reſorted to him for his bleſſing and inſtruction. When any perſon of diſtinction married, he took with him his new ſpouſe, in order to receive this holy man's benediction. The fame of this prieſt's ſanctity drew ſuch numbers of people to that place every Eaſter, that a great fair was kept annually at his houſe, to which were brought vaſt quantities of the richeſt ſilks, plate, jewels, &c. When the Arabs drew near to this place, to which they were conducted by a Chriſtian, they were informed that the governor of Tripoli had married his daughter to a perſon of diſtinction, who had carried his lady to the above-mentioned prieſt. She was attended by a guard of 5000 men; beſides which, the Jews, Greeks, Copts, and Armenians, at that time aſſembled about the monaſtery, amounted to 10,000. Notwithſtanding this the Moſlem commander determined to cary off the lady; and having told his men, that they ſhould either enjoy the riches of the Chriſtians, or the pleaſures of paradiſe, he commanded them to fall on the enemy. The impetuoſity of theſe enthuſiaſts at firſt bore all down before them; but the Chriſtians perceiving they were but an handful of men, ſurrounded them on all ſides, and reſolved to make them pay dear for their temerity. But Abu Obeidah, being informed of their dangerous ſituation, immediately diſpatched Khaled with a ſtrong detachment to the relief of his diſtreſſed countrymen. The conſequence of this was, that the Chriſtians were entirely defeated, and the unhappy lady carried off, with 40 maids that waited upon her, as well as all the wealth brought to the above-mentioned fair; among which were many rich garments curiouſly wrought, and in particular one adorned with the effigies of our Saviour. All theſe were ſold for ten times their weight of gold to ſome of the opulent Arabs of Yaman. The young lady was given to Abdallah, who kept her to the reign of Yezid. Of this advantage Abu Obeidah ſent notice to the khalif by a letter, in which he alſo acquainted him that ſome of his men had drunk wine. Theſe delinquents, by the advice of Ali, had each of them 80 ſtripes beſtowed upon the ſoles of their feet; after which many others, who had never been ſuſpected of drinking this prohibited liquor, made a voluntary confeſſion, and received the ſame chaſtiſement.

73 Governor of Tripoli's daughter carried off.

74 Puniſhment of ſome ſoldiers who had drunk wine.

The Moſlem general next ſet about reducing the principal fortreſſes in Syria, and ſoon became maſter of Kinniſrin, Baalbec, Adeſtan, Shaizar, and Hems; on the news of which, the Greek emperor Heraclius, reſolving if poſſible to put a ſtop to the cruel and unprovoked ravages of theſe barbarians, ſent againſt them an army of 240,000 men, commanded by one Manuel, whom the Arabs call *Mahan*. But this vaſt multitude was utterly defeated by Khaled; upon whom Abu Obeidah conferred the ſupreme command, on account of his ſuperior ſkill in military affairs. This battle was fought near a village called *Yermouk*; and according to the Arabian hiſtorians, the Chriſtians had 150,000 men killed, and 40,000 taken priſoners, while the Moſlems loſt no more than 4030 men.

75 The Greeks utterly defeated at Yermouk.

76 Omar viſits Jeruſalem.

The defeat of Yermouk was immediately followed by the loſs of the whole province of Paleſtine. The reduction of Jeruſalem was one of its firſt conſequences; and Omar being appriſed of the ſucceſs of his arms, immediately ſet out to viſit that holy place, at the requeſt, it is ſaid, of the inhabitants. The khalif was attended in his journey by a numerous retinue, moſt of whom afterwards returned home. He rode upon a red camel, and carried with him two ſacks, one of which contained a ſort of proviſion conſiſting of barley, rice, or wheat, ſodden and unhuſked, and the other fruits. Before him he had a leather bottle, very neceſſary in theſe deſart countries to put water in; and behind him

a wooden platter. Before he left the place where he had rested the preceding night, he constantly said the morning prayer; after which he addressed himself to his attendants in a devout strain, always uttering before them some pious ejaculations. Then he communicated his provision to them; every one of his fellow-travellers eating with him out of the same platter, without the least distinction. His clothes were made of camels hair, and were in a very tattered condition; nor could any thing be more mean or sordid than the figure he made. On the road he distributed justice among his subjects: concerning which we have several
77 Anecdote of him. anecdotes; but that most to his honour is the following. Having observed some poor tributaries exposed to the heat of the sun, a very cruel punishment in those hot countries, for not being able to pay the sum demanded of them, he ordered them to be released; telling his attendants, that he once heard the apostle of God say, "Do not afflict men in this world; for those who do so, God shall punish in hell-fire at the day of judgement." His orders were immediately executed, to the great grief of the oppressors; and the khalif continued his route. On the confines of Syria he was met by Abu Obeidah attended by an escorte, who conducted him to the Moslem camp, where he was received with the utmost demonstrations of joy; and from thence to Jerusalem. The morning after his arrival, he said prayers and preached to the troops. In his sermon he repeated the following passage out of the koran, "Whomsoever God shall direct, he shall be rightly directed; and whomsoever he shall cause to err, thou shalt not find any to defend or to direct." Upon this a Christian rose up, and said aloud twice, "God causes no one to err." Omar made no answer to him, but commanded the Moslems near him to strike off the infidel's head if he repeated those words again; but the priest took care to give him no further interruption. After the conclusion of his sermon, he pitched his tent, made of hair, within sight of the city: then he signed the articles of capitulation; by which the inhabitants were intitled to the free exercise of their religion, the possession of their properties, and his protection.

The articles of capitulation being signed, Omar, in pursuance of his engagements, gave the inhabitants a schedule, by which they were secured in the full possession of all that had been agreed upon; after which the gates were opened to him, and he entered the town. He was waited upon by the patriarch Sophronius, with whom he conversed familiarly, and asked him many questions concerning the antiquities of the city. One of the first places they visited was the temple of the resurrection, in the midst of which Omar sat down; and when the hour of prayer was come, told the patriarch he had a mind to pray, and desired him to show him a place for that purpose. Sophronius told him he might do so where he was; but this he absolutely refused. Then the patriarch led him to St Constantine's church; but he likewise declined praying there. At last he said his prayers upon one of the steps of the east gate of the church; telling the patriarch afterwards, that had he prayed in any of the churches, the Moslems would infallibly have taken it from them, which he said they might attempt as it was, and therefore gave him a paper, wherein the Moslems were commanded not to pray on the steps of St Constantine's church in any numbers, but only one by one. After this he desired the patriarch to show him a place where he might erect a mosque; and was conducted to the place where Jacob's stone lay, on which he slept when he saw the vision of the ladder. This stone had been hitherto slighted, and no building suffered to be erected upon it, in order to fulfil our Saviour's prophecy, that the habitation of the Jews should be left unto them desolate, and that not one stone should be left upon another. In consequence of this neglect it was entirely covered with dirt, which the khalif immediately began to carry away in his vest; and the Moslems soon hastening to assist him, the stone was cleared in a very short time. We are told by Theophanes, that when Omar entered the temple of the resurrection, he was clad in such mean and dirty apparel, that the patriarch took great offence at his appearance, and with much difficulty at last prevailed upon him to put on some clean linen and clothes till his own could be washed. The same author relates, that when the patriarch first saw Omar in that place, he could not forbear crying out, "This is of a truth the abomination of desolation, spoken of by Daniel the prophet, standing in the holy place!" These words, as Mr Ockley imagines, being overheard by the Moslems, they trumped up a story of the patriarch's having owned that the conquest of Jerusalem by Omar was foretold by the prophet Daniel; and that an ancient prophecy was kept in Jerusalem concerning Omar, wherein his person was described, his name and religion specified, and he declared to be the only man that could reduce that city.

Before the khalif left Syria, he divided that country into two parts; one of which, that lay between Haûran or Aûran and Aleppo, which was not perfectly conquered, he committed to the care of Abu Obeidah, giving him the strictest orders to reduce it as soon as possible. Yezid Ebn Abu Sofian was commanded to take upon him the care of the other, which comprehended Palestine, and the sea-coast, and to make himself absolute master of it, having a body of troops assigned him for that purpose. He also directed Amru Ebn Al As to invade Egypt, then in a very languishing condition, with a body of Moslem forces. After having made these dispositions for extending his conquests, Omar set out for Medina, where he arrived in perfect health, to the great joy of the inhabitants, who apprehended, from his long stay at Jerusalem, that he had intended to fix his residence there. 78 He returns to Medina.

Soon after Omar's departure, Yezid advanced to Cæsarea; but found the place so strong, that he was obliged to continue some time in a state of inaction. Abu Obeidah, in the mean time, advanced towards Aleppo, the citadel of which was at that time the strongest in Syria. The citizens were struck with the utmost consternation at his approach. They had at that time two governors, who were brothers, and resided in the castle, which was situated at a little distance from the city. The names of these two governors, who were of very different dispositions, were Youkinna and John. Their father, by the emperor Heraclius's appointment, presided over all that tract which lay betwixt Aleppo and the Euphrates; and, after his death, the chief management of affairs devolved upon Youkinna, his brother John spending his time mostly in devotion and acts of charity.

charity. He would therefore gladly have prevailed on Youkinna to purchase a peace from the Arabs with money, rather than make his country a scene of blood and ravages; but this not suiting the martial genius of Youkinna, he armed a considerable number of the citizens, among whom were several Christian Arabs, and distributed money among them. He then told his men that he intended to act offensively against the Arabs, and even to engage them if possible before they drew too near. To inspire them with the greater resolution, he observed, that the Moslem army was divided into several bodies; one of which had orders to besiege Cæsarea, another to march to Damascus, and the third to invade Egypt. Having thus animated his troops, he put himself at the head of 12,000 of them, and march-
79 ed forwards to get intelligence of the enemy's motions. Abu Obeidah, in the mean time, had sent before him Caab Ebn Damarah, with 1000 men; giving him express orders not to fight till he had received information of the enemy. Youkinna's spies discovered Caab and his men resting themselves and watering their horses without the least apprehension of danger; of which the general being apprised, he posted one part of his troops in ambuscade, and with the other attacked the Moslems. The Arabs behaved with their usual valour; and at first repulsed the Christians, notwithstanding their superiority in numbers: but being attacked by the troops that lay in ambush, they were at last forced to retire; having 170 killed, and almost all the rest
80 wounded.

A Moslem detachment defeated by Youkinna.

Aleppo submits to Abu Obeidah.

After Youkinna's departure, the inhabitants of Aleppo, considering the calamities that awaited them if their city should be taken by storm, submitted without delay to Abu Obeidah, and were taken under the protection of the khalif. This disagreeable news being communicated to Youkinna, he posted home with all possible expedition, lest an attempt should be made on the castle in his absence. On his arrival at Aleppo, he was so highly incensed against the inhabitants, that he threatened them with death if they did not disannul
81 the treaty with the Arabs, and deliver up the authors of it into his hands. This demand not being immediately complied with, he fell upon the citizens with great fury, and killed 300 of them; among whom was his brother John, whose head he caused to be struck off, charging him with being the author and abettor of the late pernicious scheme. He would have made a much greater slaughter, had not the Moslem army at that instant arrived before the town; upon which Youkinna retired into the castle with a considerable body of troops: but before this could be effected, he was obliged to sustain an attack from the Arabs, in which he lost 3000 men. The action was no sooner ended than the inhabitants of Aleppo brought out forty of Youkinna's men, and as a proof of their fidelity delivered them into Abu Obeidah's hands. Of these, seven embraced Mahometanism, and the rest were beheaded.

Cruelty of Youkinna.

82 Immediately after Youkinna had shut himself up in the castle, a council of war was held in the Moslem camp, wherein it was deliberated what measures were to be pursued on the present occasion. Khaled gave it as his opinion, that the castle ought immediately to be attacked with all the Arab forces, before the emperor had time to send them any assistance. This advice was followed by Abu Obeidah, who caused the citadel to be immediately invested; and soon after he had surrounded it with all his forces, made a most vigorous assault. The besieged defended themselves with great bravery, and after a very warm dispute drove the enemy into their camp; and as they threw a great many stones out of their military engines, many of the Moslems were killed, and a much greater number wounded. This encouraged Youkinna to make a sally with a strong party of the garrison the following night. The fires being then out in the Moslem camp, and the besiegers not expecting such an unseasonable visit, 60 of them were killed on the spot, and 50 taken prisoners. Youkinna, however, being briskly attacked by Khaled, who soon drew together a body of troops to oppose him, lost about 100 men in his retreat. The next day, he caused the prisoners to be beheaded in the sight of the Moslem camp; and receiving advice that a strong party of Arabian cavalry was sent out to forage, he ordered a body of his horse to drive them to their camp; which they accordingly did, killed 130 of them, seized all their camels, horses, &c. and then retired to the mountains. Here they proposed to remain concealed till the following night, and then return to the castle; but Abu Obeidah, being informed of what had happened, detached Khaled and Derar with a body of troops to pursue the Greeks, and revenge the late affront. Khaled, being informed of the route the Christians had taken, possessed himself of the only pass by which they could return to the castle; and having posted there a body of his men whose courage he could depend upon, took 300 of the Greeks prisoners as they attempted to return, and put all the rest to the sword. The next morning, to retaliate Youkinna's cruelty, the prisoners were all brought out and beheaded in the sight of the garrison. 83

He is besieged in the citadel.

Notwithstanding this disaster, Youkinna made several sallies with good success, wherein he killed a great number of the enemy, and harrassed them to such a degree, that Abu Obeidah found himself obliged, for his greater security, to remove his camp to about a mile's distance from the castle; by which manœuvre he likewise hoped that Youkinna would be less upon his guard. Herein, however, he found himself mistaken: for the Greek commander, by the prudent measures he took, eluded all surprise; and tho' Abu Obeidah continued the siege for four months after the last-mentioned blow given to the garrison by Khaled, yet he had scarce any hopes of making himself master of it at last. Having nothing material to write to the khalif, he remained a long time silent; at which Omar being very much concerned, wrote to him, desiring an account of the affairs in Syria. Abu Obeidah acquainted him that the city of Aleppo had submitted to him; and that the citadel was the only place which held out in all that country, before which he had lost a great number of men, which he said, had induced him to think of raising the siege, and moving with his army in that track which lay between Antioch and Aleppo. This news was by no means agreeable to the khalif, who commanded his general to continue the siege at all events, and sent him a reinforcement of Arab troops, together with 70 camels, to assist the infantry in their march. 84

His vigorous defence.

Among the troops sent by Omar on this occasion, there was an Arab of a gigantic size, called *Dames*,

The citadel taken by stratagem.

Arabia.

who was a man of great courage and resolution. He observing the little progress made by the Moslems, bethought himself of a stratagem by which that fortress might be reduced, which seemed so difficult to be accomplished by force. He therefore desired that Abu Obeidah would assign him the command of a party consisting only of thirty men; which at Khaled's request was readily granted. Then he begged the general to raise the siege, and retire to about three miles distance from the castle, which was likewise immediately complied with. The following night Dames, who had posted himself with his party very near the citadel, found means to seize a Greek, from whom he learned that Youkinna, after the siege was raised, had exacted large sums of money from the citizens, on account of the treaty they had concluded with the Arabs; and that he was one of those who had endeavoured to make their escape from the oppression of such a tyrant, by leaping down from the wall. This man Dames took under his protection; but beheaded five or six others who fell into his hands, and could give no good account of themselves. He then covered his head and shoulders with a goat's skin, and took a dry crust in his hand, creeping on the ground till he got close to the foot of the wall. If he heard any noise or suspected any person to be near, he made such a noise with his crust as a dog does when he is gnawing a bone, his companions sometimes walking, and sometimes creeping after him in the same manner. He had before dispatched two of his men to Abu Obeidah, to desire that a detachment of horse might be sent him by break of day to support his small party, and facilitate the execution of the plan he had formed. At last Dames found an opportunity of raising seven men upon his shoulders, who stood one upon another's shoulders in such a manner that the highest reached the top of the wall. Here he soon placed himself, seized a watchman whom he found asleep, and threw him over the wall. Two others, whom he found in the same condition, he stabbed with his dagger, and threw them over likewise. Then he laid down his turban, and drew up the second of his brethren, as they two did the third, and by their help Dames himself and all the rest were enabled to mount the wall. He then privately stabbed the centry at each of the gates, and put his men in possession of every one of them. The soldiers of the garrison, however, were at last alarmed, and surrounded the Arabs, who were on the point of perishing, when Khaled appeared at the head of a detachment of cavalry. On sight of that general, who was now grown terrible to the Christians, the besieged

85 Youkinna's apostacy.

threw down their arms and surrendered at discretion. Youkinna and some of the principal officers turned Mahometans, in order to save their possessions; and the castle, being taken by storm, was pillaged by the Moslems. Dames acquired great glory by this exploit; and, out of complaisance to him, the army did not decamp from Aleppo till he and his men were perfectly cured of their wounds.

After the reduction of the citadel of Aleppo, Abu Obeidah intended to march to Antioch; but was diverted by Youkinna, who was now become a violent enemy to the Christians. He told the Moslem general, that his conquest of that part of the country would not be complete without the reduction of Azaz, a place of great importance, where Theodorus, Youkinna's cousin-german, was commandant. This fortress he proposed to become master of, by putting himself at the head of 100 Arab horse dressed in the Greek habit, who were to attend him to Azaz. Upon his arrival there, he was to assure Theodorus that he was still in reality a Christian, and had taken that opportunity to escape from the Moslem camp. But, to make his story more probable, Abu Obeidah was to send after him a detachment of 1000 horse, who were to pursue him as far Morah, a village in the neighbourhood of Azaz, with orders to post themselves there; from whence, if such a measure should be found necessary, they might easily advance to Azaz, to facilitate the conquest of that place. To this scheme Abu Obeidah agreed; but Youkinna with all his men were immediately taken prisoners by Theodorus, who had been informed of the whole affair by a spy in the Moslem camp, who had sent him a letter by a pigeon. The fortress, however, was soon reduced, and Youkinna re- 86

He is taken prisoner & brought before Heraclius.

gained his liberty; but was soon after taken prisoner a second time, and brought before his old master Heraclius, who then resided at Antioch. He told the emperor, that he had only pretended to embrace Mahometanism, in order to be able to do his Imperial Majesty the more essential service; and so far gained upon him, that he was soon after appointed governor of that city; the consequence of which was, that the Arabs were put in possession of it by his treachery. 87

Attempt to assassinate Omar miscarries.

The emperor being quite disheartened at his continual bad success, it was suggested to him by the king of Ghassan, who had fled to him for refuge, as we have already observed, that, however desperate his affairs might be, they would be perfectly restored by the assassination of the khalif. This piece of service he undertook to perform for the emperor; and dispatched one Wathek Ebn Mosafer, an Arab of his tribe, and a resolute young man, to Medina for that purpose. Wathek, some time after his arrival there, having observed the khalif to fall asleep under a tree, on which he had placed himself so as not to be observed by any one, drew his dagger, and was upon the point of stabbing him; but, as the Arab writers tell us, he was deterred by a lion, who walked round the khalif, and licked his feet till he awoke, after which he instantly went away. This struck Wathek with a profound reverence for Omar; he came down from his tree where he had been confined by the lion, confessed his design, and embraced the Mahometan religion. 88

The Greeks defeated.

Soon after the reduction of Antioch, Abu Obeidah sent an account of his success to Omar; and receiving an order to invade the mountainous parts of Syria, he asked his general officers which of them would command the body of troops destined for that purpose. One Meisarah Ebn Mesrouk having offered his service, the general gave him a black standard, with the following inscription upon it in white letters: "There is but one God; Mahomet is the Apostle of God." The body assigned him for this purpose consisted of 300 Arabs, and 1000 black slaves commanded by Dames. Meisarah, at the head of his troops, with some difficulty ascended the mountains, and, with much more, advanced to that part where the emperor's forces were posted. The cold was so intense on the summits of those mountains, that the Arabs, who had been

been accustomed to a warm climate, could hardly bear it. For some time they could not meet with a single person to give them intelligence of the enemy's motions; but at last they took a Greek prisoner, who informed them, that the imperial army, which consisted of 30,000 men, lay encamped on a spot not three leagues distant. The prisoner refusing to profess Mahometanism, they cut off his head, and then marched towards the imperial camp. The Greeks, hearing of their approach, advanced to meet them; and the Moslems being surrounded on all sides, were on the point of being all cut off, when Khaled appeared at the head of 3000 horse, and after him Ayab Ebn Ganem with 2000 more. At the approach of the horse under the command of the terrible Khaled, the Greeks retired, leaving all their tents, together with their rich furniture and effects, to the Arabs. In this engagement, one of Omar's chief favourites, named *Abdallah Ebn Hodasa*, was taken prisoner, and sent directly to Constantinople. The khalif was so much concerned at this, that he sent a letter to Heraclius, desiring his release; which the emperor not only complied with, but made him many valuable presents, sending at the same time a jewel of immense value as a present to the kha-

89 Omar's disinterestedness.

lif. This Omar offered to the jewellers of Medina, but they were ignorant of its value: the Moslems therefore begged him to keep it for his own use; but this he said he could not be answerable for to the public. It was therefore sold, and the money deposited in the public treasury.

About this time also, Khaled advanced with a body of troops as far as the Euphrates, and took Manbij, Beraa, Bales or Balis, exacting of the inhabitants 100,000 dinars for their present security, and imposing on them an annual tribute for the future. He also made himself master of Raaban, Dulouc, Korus, the Cyrus or Cyrrhus of the ancients, and several other fortified towns, nothing being now able to stand before him. Amru Ebn Al As now likewise prepared for the reducing some places in Palestine that still held out. While he remained in this province, he had a conference with Constantine the emperor's son, who endeavoured to persuade him to make peace with the Christians; but this he not agreeing to, unless they would consent to pay tribute, all hopes of an accommodation vanished and the generals on both sides prepared to enter upon action. In the mean time an officer came from the Christian camp, dressed in very rich apparel, who challenged the stoutest man among the Moslems to fight him in single combat. The challenge was accepted by a young Arab officer of Yaman; who being animoted by a notion, derived from the prophet himself, that "the spirits of the martyrs rest in the crops of green birds, that eat of the fruits and drink of the rivers of paradise," discovered an uncommon eagerness to encounter his enemy. But the Christian officer not only killed this youth, but two or three more of the Moslems who came to his assistance. He was then attacked by Serjabil Ebn Hosanah, one of the generals, but a man so weakened by fasting, that he could scarce

90 Account of Toleiha the false prophet.

stand before him, and would therefore have been undoubtedly killed, had not a Greek horseman very opportunely interposed, and with one blow of his scymitar cut off the Christian's head. Serjabil, greatly surprised at this deliverance, asked the horseman who he was, and from whence he came; to which he replied in the following terms: "I am the unfortunate Toleiha Ebn Khowaid, who set up for a prophet, and, lying against God, pretended to inspiration." In consequence of having saved his life, Serjabil introduced him to Amru; and writing a letter to Omar, wherein he acquainted him with the signal proof Toleiha had given of his repentance, he obtained his pardon from the khalif.

Though the two armies did not come to a general engagement, yet they had frequent skirmishes, in which the Arabs always got the better, and in some the Greeks suffered very considerably. This, together with the severity of the season, which was then uncommonly cold, so dejected the soldiery, that they began to desert in great numbers. Constantine therefore, finding his troops to diminish daily, and the Arabs to grow stronger and stronger, took the advantage of a tempestuous night to escape to Cæsarea, which Yazid had not been able to take, leaving his camp to be plundered by the enemy.

91 Youkinna takes Tripoli.

This city was soon after invested by Amru; and at the same time Youkinna, having made himself master of Tripoli by treachery, seized 50 ships from Cyprus and Crete, which carried a supply of arms and provisions for the emperor's troops, and had entered the port without knowing that the Arabs were masters of the town. With these ships he undertook an expedition against Tyre; and telling the inhabitants that he brought a supply of arms and provisions for Constantine's army, he was admitted into the town, and received with great kindness. Here, however, he had not been long before he was discovered by one of his own soldiers, and put under arrest, with 900 of his men. He was however set at liberty by those to whose care he was committed;

92 Tyre and Cæsarea reduced.

and then opened the gates of the town to Yezid, by whom it had been invested. Constantine having got intelligence at Cæsarea of the loss of Tripoli and Tyre, was so disheartened, that he set sail from that city with all his family and the greatest part of his wealth; and the citizens then thought proper to make the best terms they could with Amru. The surrender of this city was followed by that of all the other cities and fortresses in the province; and thus the Arabs drove the Greeks out of the whole country of Syria extending from the Mediterranean to the Euphrates. This conquest was completed in the 18th year of the Hegira, six years after it had been undertaken.

93 Violent storms, plague, &c.

This year there happened such violent storms of hail in the peninsula of the Arabs, that a considerable extent of territory was laid waste by them, and a great number of animals of various kinds destroyed. An epidemical distemper likewise raged at Medina, which spread itself all over the neighbouring territory, and swept away great numbers of people. Syria also was visited by a dreadful plague; so that the Moslems lost there 25,000 men, among whom were Abu Obeidah himself, Yezid Ebn Abu Sofian, Serjabil, and many other persons of distinction. In short, so great was the mortality, occasioned by the plague, both in Arabia and Syria, that the Arabs style the 18th year of the Hegira the *year of destruction*.

94 Egypt reduced.

Amru Ebn Al As having now executed the khalif's orders in Syria, set out on his expedition against Egypt. His first attempt was on Tarma, a town situated on the isthmus of Suez. This he reduced after a month's siege;

 fiege; and having narrowly viewed its fituation, he formed a defign of cutting through the ifthmus, and thus joining the Mediterranean and the Red fea: but this project was not well relifhed by the khalif, who apprehended that it would facilitate the entrance of the Chriftians into the peninfula of Arabia. From Tarma he marched to Mefr, the Memphis of the ancient geograpers; which, after a fiege of feven months, was delivered up to him by the treachery of Al Mokawkas the Governor. From Mefr, he continued his march towards Alexandria, and, having defeated the emperor's army, clofely invefted that city. While his army lay before this capital, Amru himfelf had the misfortune to be taken prifoner and carried into the town. Being brought before the governor, he afked him why he committed fuch ravages and depredations in the Chriftian territories? To this Amru refolutely anfwered, "We have come hither to oblige you either to profefs Mahometanifm, or pay an annual tribute to the khalif; to one of which conditions you muft fubmit, or be all of you put to the fword." A Greek who ftood by, hearing this, told the governor that Amru was certainly the Moflem general, and therefore defired him to cut off his head. Upon this Werdan, one of Amru's flaves, perceiving the extreme danger his mafter was in, gave him a box on the ear, exclaiming againft his impudence for talking in fuch a manner. The governor being impofed upon by this fhallow artifice, not only faved his life, but, to fhow his generofity, difmiffed him without ranfom. This was foon followed by the lofs of Alexandria, and that by the conqueft of the whole kingdom: after which, Amru difpatched Okba Ebn Nafe with a body of troops to penetrate farther into Africa; and that general made himfelf mafter of all the country lying between Barka and Zoweilah, reducing under his dominion alfo that part of the continent which now forms the piratical kingdom of Tripoli in Barbary.

95 Together with Barca and Tripoli.

Soon after the Moflems had made themfelves mafters of Alexandria, a grievous famine raged in Arabia, particularly at Medina, then the refidence of the khalif. This obliged Omar to write to Amru to fend him a fupply of corn, with which Egypt at that time abounded. In compliance with this order, Amru fent a train of camels laden with corn, in a continued line from Egypt to Medina; the firft of which were entering Medina when the laft were leaving Alexandria. But this method of conveying corn proving too tedious and expenfive, he ordered him to clear the Amnis Trajanus of Ptolemy, now the Khalis, which runs from one end of Cairo to the other, of the fand and gravel with which it was choaked. This he accordingly did, and by that means rendered the communication between Egypt and Arabia much more eafy than it had formerly been.

96 The Perfians defeated.

While the Arabs thus extended their conquefts in the weft, they were no lefs fuccefsful in the eaft. We have already taken notice of Khaled's having been fent into Irak to reduce the kingdom of Hira, and of his being recalled to affift in the conqueft of Syria. As the kings of Hira were under the protection of the Perfian monarchs, the deftruction of that kingdom neceffarily brought on a war with the Perfians. After the departure of Khaled, the command of the forces was left with Ebn Obeid Ebn Mafud, together with Al Mothanna Ebn Haretha, Amru Ebn Hafem, and Salit Ebn Kis. Abu Obeid having paffed a river contrary to the advice of the other generals, was killed, and his troops in great danger; however, Al Mothanna made an excellent retreat, and repaffed the river without any confiderable lofs. After this he fortified himfelf in his camp till he received a confiderable reinforcement from the khalif; when the Moflem army marched to Dir Hind, and thence continued to make frequent excurfions, ravaging that part of Irak that lay next to the Euphrates, a body of 12,000 chofen horfe was now difpatched againft thofe invaders, under the command of one Mahran. At firft the Perfians had the advantage, and obliged the Arabs to retire; but they were foon brought back by Al Mothanna, and the battle lafted from noon till fun-fet. At laft Al Mothanna, engaging Mahran in fingle combat, laid him dead at his feet; upon which the Perfians fled to Al Madayen, a town fituated on the Tigris, about a day's journey from Bagdad. After this a powerful army was difpatched by the Perfians under the command of one Ruftam; but he alfo was killed, and his troops were entirely difperfed. At the fame time Abu Mufa, another Moflem general, defeated a formidable body of troops under the command of Al Harzaman, a noble Perfian, at Ahwaz.

Not content with thofe victories, foon after the reduction of Damafcus, the khalif difpatched Saad Ebn Abu Wakkas, to diflodge the Perfians from fome diftricts they poffeffed in the neighbourhood of the Euphrates. Saad having drawn together a body of 12,000 men, advanced to Kadefia, a city bordering upon the defarts of Irak; where having utterly defeated an army of 120,000 Perfians, he made himfelf mafter of the opulent city of Al Madayen, and poffeffed himfelf of Yezdejerd's treafure; which was fo rich, if we may believe the Arabian writers, that Saad took out of it three thoufand millions of dinars, amounting to two thoufand and twenty-five millions of pounds fterling; an enormous and almoft incredible fum. From thence Saad went to that part of the palace where the king's plate was depofited, which he carried off, as well as an immenfe quantity of camphire with which another part of the palace was entirely filled. This laft the Arabs feem to have carried off merely for the fake of plundering, as they were fo much unacquainted with the nature of it, that they mixed it with their bread, which gave it a bitter and difagreeable tafte. Afterwards the Arab general carried off the crown and royal garments, adorned with gold and jewels of ineftimable value. He alfo plundered his armoury, which was well ftored with all forts of weapons; after which he caufed the roof of his porch to be opened, where he found another treafure equal in value to ten millions of crowns. He alfo found among the furniture of the palace a piece of filk tapeftry, 60 cubits fquare, which was adorned with a great variety of beautiful flowers, herbs, and plants, formed of gold, filver, and jewels, the moft valuable that could be procured. This being brought to Omar, he cut in pieces, and diftributed it among the Moflems; and that part of it which fell to Ali's fhare, and which was yet none of the beft, he fold for 20,000 crowns.

97 Incredible treafure taken from them.

In the twentieth or twenty-firft year of the Hegira, the Arabs, ftill unfated with conqueft, invaded Mefopotamia under Aiyad Ebn Ganem, where the city of Edeffa fubmitted on the firft fummons. From Edeffa

98 Mefopotamia reduced.

Arabia.

deſſa he marched to Conſtantia, or Conſtantina, ſuppoſed to be the Nicephorium of the ancients. This he took by ſtorm, as likewiſe Daras, where he maſſacred all the people he found in the place; and theſe repeated ſucceſſes ſo terrified the reſt of the fortified towns, that they all ſubmitted without reſiſtance. At the ſame time Al Mogheirah Ebn Shaabah, one of the khalif's commanders, made himſelf maſter of Shiz, a place famous for the birth of Zerduſht the Perſian philoſopher, and over-ran the whole province of Aderbijan. He alſo poſſeſſed himſelf of all the country of Armenia bordering on mount Taurus; nay, he in a manner obliged the whole region to own the authority of the khalif, and penetrated into Cappadocia. The ſame year alſo Saad made himſelf maſter of Ahwas, the capital of Khuzeſtan (the ancient Suſiana); in conſequence of which he became maſter of the greateſt part, if not of the whole, of that province; at the ſame time

99 that Al Nooman conquered the greateſt part of Khoraſan.

Omar murdered.

But while Omar's troops were thus irreſiſtibly over-running the fineſt conntries in the known world, a period was put to his conqueſts and his life, by a Perſian named *Abu Lulua*, who ſtabbed him thrice in the belly while he was performing his devotions at Medina. The reaſon of this was becauſe the khalif refuſed to remit him ſome part of the tribute, which according to the Mahometan cuſtom he was obliged to pay for the free exerciſe of his religion. The Arabs, perceiving that he had killed their ſovereign, immediately ruſhed upon him; but the aſſaſſin defended himſelf ſo deſperately, that he killed ſeven of them and wounded 13: but at laſt one the khalif's attendants threw his veſt over him, and ſeized him; upon which he ſtabbed himſelf, and ſoon after expired.

Omar having languiſhed three days after the wounds

100 given him by the Perſian, expired in the 10th, 11th, or 12th year of his reign, and after his death Othman Ebn Affan was choſen; though Ali had a better title, and ſeems indiſputably to have been the moſt virtuous, if not the only virtuous perſon, as well as the braveſt warrior among them. He was inaugurated in the 24th year of the Hegira, nearly coincident with the year of our Lord 645.

Succeeded by Othman.

Othman was no ſooner ſettled on the throne, than he commanded Al Mogheirah to complete the conqueſt of the territory of Hamadan; which he eaſily accompliſhed, and at the ſame time reduced Bira, a ſtrong caſtle in Meſopotamia, which either had never ſubmitted, or had revolted on the departure of the Moſlem troops out of that province. Another army, under Abdallah Ebn Amar, was alſo diſpatched into Perſia, to deprive Yezdejerd of the poor remains of his dominions; and this was done ſo effectually, that the unhappy monarch was obliged to fly to Sijeſtan and abandon Perſia altogether.

In the 27th year of the Hegira, the iſland of Cyprus was reduced by Moawiyah; who ſoon after conquered the iſland of Aradus, and took Ancyra; after

101 which he reduced the iſland of Rhodes, broke in pieces the famous Coloſſus, and ſold the metal of it to a Jew of Edeſſa.

Coloſſus of Rhodes deſtroyed.

In the mean time another of the Arab commanders entered Iſauria, where he committed dreadful depredations, plundering many towns and villages, putting a great number of people to the ſword, and carrying off 5000 priſoners. In the 31ſt year of the Hegira, one Habib having made an irruption into that part of Armenia which was ſtill unconquered, defeated a body of the Emperor's troops, purſuing them as far as mount Caucaſus, and laying waſte all the neighbouring territory. About the ſame time alſo, Abul Abar, who had been conſtituted admiral by Moawiyah, gave the emperor Conſtance a ſignal defeat by ſea, on the coaſt of Lycia, in which ſuch a number of Chriſtians were killed, that the neighbouring ſea was dyed with their blood.

Arabia.

But while Othman was thus carrying every thing irreſiſtibly before him abroad, he neglected to ſecure the affections of his ſubjects at home, which ſoon proved his ruin. 102

Inſurrections againſt the khalif.

Sedition was induſtriouſly propagated through all the provinces of the empire, and articles of accuſation brought againſt the khalif. The chief of theſe were, That he had recalled one who had been baniſhed by the prophet: that he had removed Saad, an officer of diſtinguiſhed bravery, and ſupplied his place by one who drank wine, and was otherwiſe of a ſcandalous life; that he had ſquandered away vaſt ſums among his favourites; that he had removed Amru from the government of Egypt, to which he had preferred his own foſter-brother; and, laſtly, that he had preſumed to ſit on the top of Mahomet's pulpit, whereas Abu Becr had always ſat on the higheſt ſtep and Omar on the loweſt. To this formidable accuſation the poor khalif pleaded guilty, and promiſed to make all the reparation in his power; but his condeſcenſion only ſerved to increaſe the inſolence of the rebels. They were however appeaſed by Ali; and public tranquillity had undoubtedly been reſtored, had it not been for Ayeſha, one of Mahomet's widows, who procured the deſtruction of the khalif by a ſcheme truly worthy of the wife of ſuch an huſband. That traitreſs, being deſirous of raiſing one of her favourites named Telha to the dignity of khalif, prevailed on Merwan the ſecretary of ſtate to write a letter to the prefect of Egypt, enjoining him to put to death Mahomet Ebn Abu Becr, with whom it was ſent, and who was to be his ſucceſſor. This letter Merwan took care ſhould be diſcovered: and Mahomet taking it for a genuine order of the khalif, publiſhed the ſuppoſed injury all over the neighbouring countries. He then marched with a body of rebels to Medina, where the innocent khalif was beſieged in his palace; and, notwithſtanding all his proteſtations, nothing leſs than his death could ſatisfy the enraged multitude. In this deplorable ſituation Othman ſent to Ali for aſſiſtance; who commanded his two ſons Haſan and Hoſein to defend the palace gates. This they did for ſome time with fidelity enough, till finding the khalif reduced to great ſtraits for want of water, they abandoned their poſts; upon which the rebels eaſily made themſelves maſters of the palace, and cruelly 103

murdered the khalif in the 82d year of his age, after

He is murdered.

he had reigned 12 years. His body remained three days unburied; and was at laſt thrown into a hole made for it, and without the uſual ablution, or the leaſt funeral ſolemnity.

The arms of the Moſlems had hitherto been ſo ſucceſsful, and their conqueſts ſo rapid, that they may ſeem not only to have vied with Alexander, but to have bid fairer for univerſal monarchy than any nation either before or ſince.—The ruin of mighty empires always originates from the impoſſibility of keeping them united

Arabia. united. Divisions arise; civil wars break out; and the kingdom being weakened by these intestine feuds, the common enemies take advantage of them to ruin the whole fabric.—If we consider Mahomet, as in truth he was, not as an enthusiast, but as a politician, and the founder of an empire; we shall find him in that capacity superior perhaps to any that ever existed. The empire of Alexander the Great, which arose with still more rapidity than that of the Arabs, had no support but from his own ambition and personal qualifications. While he lived, he was without a rival, because all were afraid of him; but when he died, the bands of union whereby his empire had been held together, were immediately dissolved. His captains were not inspired with the same veneration for his son, who was unborn at the time of his death, that they had for his father; and therefore they fought not to conquer for him, but for themselves; and the consequence was, that the kingdom fell to pieces the moment that he died. The same thing happened to the empires of Jenghiz Khan, Tamerlane, and others, who made vast conquests in a short time. They erected mighty empires indeed; but their duration, we may say, was but momentary. The empire of the Romans was founded on a kind of enthusiastic desire of aggrandizing the city of Rome: patriotism became fashionable; and as the city never ceased to exist, those who conquered always had the same end in view, namely to exalt the republic more and more. This empire, therefore, was not only very extensive, but very durable; though, as it was impossible that mankind could always continue to venerate a city, the same divisions that ruined other empires at last brought this to an end.—The foundation of Mahomet's empire seemed to be still more firm. He was not only the king, but, we may say, the god of his people. Whatever enthusiasm people may show in defending their country, nay even their nearest relations, experience has taught us, that it is greatly inferior to what is shown by those who fight in defence of religion. This enthusiasm Mahomet had taken care not only to bring over to his side, but to exalt to its highest pitch, by inculcating upon his followers, that their rewards in the next world should be proportionable to the fury with which they fought in this. To live at peace, except with those who submitted to his will, did not at all enter into his plan; and he who made no conquests, or at least did not strive to make them, was no true believer. By this means, let his empire be ever so much extended, the temptation to making fresh conquests was still equally strong; and not only the commanders of armies, but every private person, had the most powerful motives to urge him towards the conquest of the whole world, had that been possible.—The only thing Mahomet seems to have failed in was, the appointment of the succession to the apostleship; and why he was deficient in this is inconceivable. From this one source proceeded the divisions which ruined his empire when it was scarce erected, and of which we are now to give the history.

104 Causes of the decline of the Moslem empire

Tho' the prophet had been so deficient in providing for the safety of his kingdom as not to name a successor at his death; yet his son-in-law Ali was always of opinion that the succession belonged of right to him; and that it ought to be, like that of other kingdoms, hereditary. This disposition to render the apostleship hereditary in his family, was, in all probability, what disgusted the Moslems with Ali; against whom they could otherwise have no objection: for he was endowed with every amiable quality; a firm believer in Mahomet; and of such unparalleled strength and courage, that he never declined a combat to which he was challenged, nor ever failed to come off victorious; for which reason he was styled by his countrymen, "the Lion of God."

105 Character of Ali.

On the death of Othman, however, notwithstanding the prejudices against Ali, as none could pretend so good a right to the khalifat as he, the Arabs immediately took the oath of allegiance to him, tho' with an intention to break it as soon as possible, as was fully evinced by the event. The disturbances which happened immediately on Ali's accession were owing partly to the machinations of Ayesha, who, having got Othman murdered on purpose to raise Telha to the dignity of khalif, and now finding Ali unanimously chosen, resolved to destroy him also. She therefore pretended great concern for the death of the late khalif, and accused Ali of being his murderer: but being reproved by one of the Moslems for endeavouring to blacken an innocent person, when she could not but know herself guilty; she replied, that Othman's infidelity had indeed made her his enemy, but that she had forgiven him upon his repentance. At the time of Ali's inauguration she was at Mecca, where she enjoyed a very considerable share of influence and authority. At her instigation, Telha Ebn Obeidallah, and Zobeir Ebn Al Awam, began to represent to Ali, that the murderers of Othman ought to be brought to condign punishment; offering themselves at the same time for that purpose. This they did purely to sow dissension, for they themselves had been deeply concerned in the murder; and Ali, sufficiently aware of their intention, told them it was impossible till the empire should be more settled. Finding themselves disappointed in this attempt, they next begged the government of Cufa and Basra, that they might with the greater facility extinguish any rebellion that should happen. Here again Ali was aware of their intention; and refused their request, under pretence that he stood in need of persons of their great capacity, as counsellors, about his person. Then they desired leave to perform a pilgrimage to Mecca, which the khalif could not refuse; and they were no sooner got there, than they set about raising an army against him without any provocation at all.

106 He is chosen khalif.

107 Disturbances raised by Ayesha

This, however, was not the only source of discord at present. Ali had been displeased with the governors of provinces appointed by Othman; and therefore dismissed them immediately upon his accession. This was very impolitic; but he was prompted to it by that rashness and want of prudence which is inseparable from, or rather is the very essence of, great courage. The consequence of this was, that Moawiyah, governor of Syria, was, immediately upon his dismission by Ali, proclaimed khalif by the troops under his command.—Thus the Moslems were divided into two factions; the one under Moawiyah and Ayesha, who adhered to the house of Ommiyah, to which Othman and Moawiyah belonged; and the other to Ali. The adherents of the house of Ommiyah were called *Motazalites*, or *separatists*.

108 And Moawiyah.

Ali finding how matters were situated, and that a very strong party was formed against him, endeavoured to

109 Ali raises an army.

to ingratiate himſelf as much as poſſible with the Koreiſh; and to raiſe an army againſt Ayeſha, who had now taken the field, and even reduced the city of Baſra. He made a formal ſpeech to the people on hearing this bad news, and deſired their aſſiſtance. But though he was very much beloved on account of his perſonal merit, and the beſt orator of the age, he could not with all his eloquence for ſome time prevail on them to give a deciſive anſwer in his favor. At laſt Ziyad Ebn Hantelah ſtept to Ali of his own accord, and ſaid, "Whoſoever retreats, we will advance." Upon this two Anſars, doctors of the law, ſtood up, and pronounced Ali innocent of the death of Othman; which deciſion ſoon induced the Anſars and the body of the people to eſpouſe his quarrel. He then left Medina, with a body of 900 men, and advanced to Arrabah, where he was joined by ſeveral other parties. From this place he wrote to the people of Cufa and Medina, preſſing them to ſend him farther aſſiſtance, and to diſpoſe the Motazalites to an accommodation. From Medina he very ſoon obtained a large ſupply of horſes, arms, and other neceſſaries; and from Cufa he obtained with difficulty a reinforcement of 8000 men.

Being greatly animated by this ſeaſonable ſupply, Ali advanced towards Baſra, where the troops of Ayeſha were ready to receive him. Both parties ſeemed averſe to an engagement; and Ayeſha began to be very much intimidated at the ſight of Ali's army, which,
110 *He defeats and takes Ayeſha priſoner.*
however, was inferior to her own: but, by ſome means or other, a battle was at laſt brought about, in which, Ayeſha was defeated and taken priſoner. The only remarkable effort that was made by the troops of Ayeſha in this engagement, was in defence of her perſon. It is ſaid, that no fewer than 70 men who held her camel by the bridle, had their hands cut off ſucceſſively; and that the pavilion in which ſhe ſat was ſo full of darts and arrows, that it reſembled a porcupine. Ayeſha was treated very kindly by Ali, who at firſt ſet her at liberty, but afterwards confined her to her houſe at Medina, and commanded her to interfere no more with ſtate-affairs, though he ſtill allowed her to perform the pilgrimage to Mecca.

After this victory, Ali had no enemies to contend with either in Arabia, Irak, Egypt, Perſia, or Khoraſan. A ſtrong party, however, ſtill remained in Syria, headed by Moawiyah, who founded his claims to the khalifat on a pretended declaration of Othman that he ſhould be his ſucceſſor. In this defection he was joined by Amru Ebn Al As, who had obtained a promiſe of the government of Egypt, provided Moawiyah could be advanced to the dignity of khalif.

Ali, with his uſual good-nature, endeavoured to bring the rebels to a ſenſe of their duty, and often ſent propoſals of accommodation to Moawiyah; but he ſtill remained inflexible. Perceiving, therefore, that it would be neceſſary to invade Syria, he entered that country with an army of 70,000 men, while Moawiyah advanced to meet him with 80,000; and by repeated reinforcements Ali's army at laſt amounted to 90,000, and Moawiyah's to 120,000. The two armies came in ſight of each other towards the cloſe of the 36th year of the Hegira, when they ſeemed ready to enter upon action; but only ſome ſkirmiſhes happened between them, wherein neither party ſuſtained any conſiderable loſs. The firſt month of the 37th year was ſpent in fruitleſs negociations; but in the ſecond month they began to fight in different parties, without ever hazarding a general engagement. Theſe battles continued, according to ſome, for 40 days, and according to others, 110. Maowiyah's loſs amounted to 45,000 men, and Ali's to 25,000, among whom, were 26 who had been intimately acquainted with Mahomet himſelf, and were dignified with the title of *The Companions*. The moſt famous of theſe was Ammar Ebn Yaſer, Ali's general of horſe, who was upwards of 90 years of age, and was highly eſteemed by both parties. The loſs of this general ſo exaſperated Ali, that he charged the Syrians with a body of 12,000 men, 111
Moawiyah challenged to a ſingle combat by Ali.
broke them, and challenged Moawiyah to fight him in ſingle combat. This challenge Moawiyah declined, inſiſting that it was not a fair one, as Ali could not but be ſenſible of his ſuperiority in ſtrength. As the challenge was given in the hearing of both armies, Amru inſiſted that Moawiyah could not in honour refuſe it; but the coward made no other reply than that Amru aſpired to the khalifat himſelf, and wanted to enjoy it after his death. The battle being now renewed with great fury, Moawiyah's forces were puſhed to their camp; which had certainly been taken, had not 112
Amru's ſtratagem
Amru bethought himſelf of the following ſtratagem to retrieve Moawiyah's affairs, when he ſeemed on the very brink of deſtruction. He ordered ſome of his men to fix copies of the Koran to the points of their lances, and carry them to the front of the battle, crying out at the ſame time, "This is the book that ought to decide all differences between us; this is the book of God between us and you, that abſolutely prohibits the effuſion of the Moſlem blood."—This produced the deſired effect. The khalif's troops threw down their arms, and even threatened him with death if he did not ſound a retreat; which he therefore found himſelf obliged to do, and thus had a deciſive victory wreſted out of his hands.

According to this new mode of deciſion, the two parties were each to chooſe their arbitrator; but even this was not allowed to Ali, though Moawiyah had liberty to chooſe Amru Ebn Al As. The troops of Irak, not content with offering ſo groſs an affront to the khalif, inſiſted on naming for his arbitrator Abu Muſa Al Aſhavi; a very weak man, and one who had already betrayed him. The conſequence of this appointment 113
Ali depoſed.
was, that Ali was depoſed by both the arbitrators; and he accordingly dropt his title to the khalifat, but without laying down his arms, or putting himſelf in Moawiyah's power.

After this deciſion, Ali retired to Cufa, where he was no ſooner arrived, than 12,000 of theſe troops who had themſelves forced him to accept of the arbitration, pretending to be offended with the ſtep he had taken, revolted from him. Theſe were called *Kharejites*, that is, rebels or revolters: and *Mohakkemites*, or judiciarians, becauſe they affirmed that Ali had referred to the judgment of men what ought to have been only referred to the judgment of God; and, therefore, that inſtead of keeping the peace he had made with Moawiyah, he ought to purſue his enemies, who were likewiſe the enemies of God, without mercy. To this Ali replied, That as he had given his word, he ought to keep it: and, in ſo doing, he only followed what was preſcribed by the law of God. The Kharejites

rejites replied, That God was the only judge between him and Moawiyah, and that consequently he had committed an enormous sin, of which he ought sincerely to repent. This irritating Ali, he with some warmth replied, That if any sin had been committed on this occasion, it was by themselves, who had forced him to

114 He defeats the Kharejites.

take the steps of which they now complained. This answer not proving agreeable, they chose for their general Abdallah Ebn Waheb, who appointed for their rendezvous Naharwan, a town seated between Waset and Bagdat, about four miles to the eastward of the Tigris. Here they assembled an army of 25,000 men; and Ali, having tried gentle methods ineffectually, at last marched against them in person. Before he attacked them, however, he planted a standard without the camp, and made proclamation by sound of trumpet, that whoever would repair to it should have quarter, and whoever would retire to Cufa should find a sanctuary there. This had such an effect, that Abdallah's army was soon reduced to 4000 men, with whom he rushed upon the khalif's forces; but all of them were cut in pieces, except nine who escaped.

Had Ali marched against Moawiyah immediately after the defeat of the Kharejites, and while his troops were flushed with victory, he had probably reduced him entirely: but by allowing his troops to refresh themselves, they all deserted him, and Moawiyah's party had an opportunity of gathering still more strength; and though Moawiyah's troops often made incursions

115 They attempt to murder Ali, Amru, and Moawiyah.

into the territories of Ali, the latter seems afterwards to have acted only on the defensive. At last the Kharejites, imagining that it would be for the good of the Moslem affairs that Moawiyah, Ali, and Amru, were dead, dispatched assassins to murder all the three. Moawiyah was wounded, but recovered; Amru's secretary

116 Ali assassinated.

was killed by mistake; but Ali was wounded with a poisoned sword, which occasioned his death. The assassin was taken, and Ali would have pardoned him had he recovered, but ordered him to be put to death if he died, that he might, as he said, "have an immediate opportunity of accusing him before God." Even in this order he showed his usual clemency, as he ordered the assassin to be dispatched at one blow, and without torture of any kind.

Thus fell Ali, the most virtuous of all the Mahometan khalifs, after he had reigned near five years, and lived 63. He was pressed by those about him to nominate a successor before he died; but this he declined, saying, he would follow the example of the Apostle of God,

117 Succeeded by Hasan:

who had not named any: and, as his son Hasan inherited his father's piety, though not his courage, he was declared khalif without any scruple. Moawiyah, however, behaved in such a manner towards him, as showed his hostile intentions; and those about Hasan pressed him to declare war immediately. This Hasan, who was of an exceeding mild and peaceable disposition, could hardly be persuaded to do; and though he at last took the field, yet he immediately perceived his

118 Who resigns the khalifat to Moawiyah.

incapacity to dispute the empire with Moawiyah; and therefore resigned it, in spite of all the remonstrances of his friends, to a traitor, who caused him after some years to be poisoned by his wife.

Moawiyah being thus left sole master of the Moslem empire, found himself under a necessity of reducing the Kharejites, who were his enemies as well as Ali's, and had now gathered together a considerable army. Against these rebels the khalif would have dispatched Hasan, but that prince refused; upon which he sent the Syrian troops against them, who were defeated: however the Cufans, being at last persuaded to take up arms, soon extinguished the rebellion, and settled Moawiyah more firmly than ever on the Moslem throne.

119 Constantinople besieged without success.

In the 48th year of the Hegira, the khalif sent his son Yezid with a powerful army to besiege Constantinople. In this expedition he was attended by three or four of the *Companions*, who, notwithstanding their age, were prompted by zeal to undergo incredible fatigues. The Moslem forces too, though they suffered extremely, were animated to surmount all difficulties by a tradition, according to which the prophet in his lifetime declared, "That the sins of the first army that took the city of Cæsarea should be forgiven." Concerning the particulars of this expedition we are in the dark: only, in general, that it proved unsuccessful; and in it Abu Ayub, who had been with Mahomet at the battles of Bedr and Ohod, lost his life. His tomb is held in such veneration by the Moslems, that the Sultans of the Ottoman family gird their swords on at it on their accession to the throne. In the 54th year of the Hegira,

120 Turks defeated.

the Arabs made an irruption into Bukharia, and defeated a Turkish army that opposed them. The Turks lost a great number of men; and the queen, who commanded in person, with great difficulty made her escape. She had only time to put on one of her buskins; the other fell into the hands of the Arabs, who valued it at no less than 2000 dinars. About this time also, according to the Greek historians, a treaty was concluded between the emperor and the Moslems, whereby the latter were allowed to keep the territories they had seized; in consideration of which they were to pay 3000 pounds weight of gold, 50 slaves, and as many choice horses. To these dishonourable conditions they were obliged to submit, in consequence of their late unsuccessful expedition to Constantinople, and some other defeats they had received. This peace was to continue for 30 years. The next year, Moawiyah, having conferred the government of Khorasan upon Saad, Othman's grandson, that general, soon after his promotion, passed the Jihun, or Amu, the Oxus of the ancients, and advanced with a body of troops to Samarkand, which opened its gates to him on his approach; soon after which he defeated an army of Usbeck Tartars, and marced directly to Tarmud, or Tarmid, which also surrendered without opposition. The 57th year of the Hegira was remarkable for nothing but vast swarms of locusts, which did incredible damage in Syria and Mesopotamia; and great discontents on account of the khalif's having nominated for his successor his son Yezid, a person of scandalous life, and no way worthy of the throne. The 58th year of the Hegira was rendered remarkable by the death of

121 Moawiyah dies.

Ayesha, Mahomet's widow; and the 60th by that of Moawiyah, after having reigned, from Hasan's resignation, nineteen years three months and five days; but concerning his age authors are not agreed. He was interred at Damascus, which was made the residence of the khalifs as long as the house of Ommiyah continued on the throne.

122 Succeeded by Yezid.

Yezid was proclaimed, in consequence of his nomination, the same day his father died. His inaugura-

tion

Arabia.

tion was performed on the new moon of the month Rajeb, corresponding to April 7th, 680. Immediately after his election, he wrote to Al Walid, governor of Medina, to seize Hosein, the remaining son of Ali, and Abdallah Ebn Zobeir, in case they refused to acknowledge his right. He accordingly tendered the oath of allegiance to Hosein, who returned an evasive answer, and found means to escape to his own house. As for Abdallah, he delayed waiting upon the governor, under various pretences, for 24 hours; after which he made his escape to Mecca: hither Hosein followed him; but received an invitation from the people of Cufa, who promised to assist him in vindicating the rights of his father Ali and himself. In the mean time, Yezid, being informed of Al Walid's negligence in suffering Abdallah and Hosein to escape, removed him from his employment, appointing in his room Amru Ebn Saad, at that time commandant of Mecca. The new governor immediately dispatched against Abdallah Amer Ebn Zobeir, Abdallah's, own brother, who mortally hated him: but Abdallah, having engaged Amer in the field, defeated and took him prisoner; which greatly raised his reputation at Medina, although Hosein's superior interest among them still rendered him incapable of aspiring to the khalifat by himself.

123
Hosein and Abdallah refuse to acknowledge him.

While Abdallah was thus strengthening himself at Mecca and Medina, Hosein was doing the same at Cufa. On the first notice of their inclinations, he had sent to them Moslem Ebn Okail, to whom, as representative of the son of Ali, they had taken an oath of allegiance, and were now very pressing on Hosein to honour their city with his presence. Besides this, Hosein was supported by the forces of Irak, who retained a great veneration for the memory of his father, and had all along considered the government of Moawiyah as a downright usurpation.

Notwithstanding all these steps taken at Cufa in favour of Hosein, the deliberations of the conspirators were carried on with such secrecy, that Al Nooman the governor continued a stranger to them, even after the Cufans had determined immediately to enter upon action with an army of 18,000 men. At last, however, he began to be roused from his lethargy; but Yezid being displeased with his conduct, removed him from his government, appointing for his successor Obeidallah Ebn Ziyad. This governor entered the city in the evening, and was received with all possible demonstrations of joy by the Cufans, who mistook him for Hosein, owing to a black turban which he had on his head, resembling that which Hosein usually wore. His first care was to extinguish the sedition that had been excited by Moslem. In order to this, he commanded a trusty servant to disguise himself, and personate a stranger come out of Syria to see the inauguration of Hosein; that he might get admission into Moslem's house, and penetrate all his councils. This commission was faithfully executed; and Obeidallah understanding that Moslem lodged in the house of one Sharik, who was then sick, sent a messenger to Sharik, letting him know that he intended to visit him on a certain day. Sharik immediately came to a resolution to receive him, and appointed Moslem a place in the corner of the room whence he might rush out upon Obeidallah and kill him. The visit was accordingly made; but Moslem's heart failing him, the governor escaped: Hani, however, in whose house Moslem had first lodged, was imprisoned by Obeidallah. Upon the news of this, Moslem assembled about 4000 men, and besieged Obeidallah in the castle. The governor, however, not in the least dispirited, made a speech to Moslem's followers; which had such an effect upon them, that they all deserted him except about 30. By the favour of the night, Moslem escaped to a poor woman's cottage in the neighbourhood; but being betrayed by her son, Obeidallah sent a datachment of 80 horse to seize him. Moslem made a gallant resistance, and thrice cleared the house of them; but being at last overpowered with numbers, and grievously wounded, he was taken and brought to Cufa. While on the road, he endeavoured to send an account of his bad success to Hosein, then, as he supposed, on the road to Cufa; but without success. When arrived at the castle he begged a draught of water: but those who stood by told him he should have none till he drank the hamim, or boiling liquor, which the Mahometans pretend is drunk by the damned in hell; and soon after this, being brought before the governor, he was beheaded along with Hani, and both their heads sent as a present to Yezid.

Hosein, in the mean time, was preparing to set out for Cufa, having received the most favourable advices from Moslem, of whose fate he was ignorant, and who had sent him a list of 140,000 men that were ready to obey his orders. This the wisest of his friends represented as a desperate enterprize, and intreated him to drop it, or at least to defer his journey till he should be better assured of success: but Hosein was deaf to all salutary counsel; nay, he could not, by the most earnest intreaties, be prevailed upon to forbear taking his wives and children along with him. The consequences of this obstinacy may easily be imagined: Obeidallah dispatched first 1000, and then 5000 men against him; with orders, however, not to offer any violence to him, provided he submitted himself. To these terms the infatuated Hosein would not agree: he offered indeed to return home, if Obeidallah would permit; but that not being granted, he desperately engaged the troops of Obeidallah, and was after long resistance cut in pieces with all his men. His head was brought to Obeidallah, who struck it over the mouth with a stick, and treated it with great contempt. He was also inclined to have put his family to death; but probably feared an insurrection, as the people of Cufa expressed great resentment on account of Hosein's death; nor was it at all agreeable to the khalif Yezid, who treated the family of the unfortunate Hosein with the greatest kindness.

124
Hosein's obstinacy.

125
He is defeated and killed.

This year, the 61st of the Hegira, Yezid appointed Salem Ebn Ziyad governor of Khorasan; who, soon after entering upon the government, made an irruption into the Turkish territories. He took his wife along with him in this expedition, who was delivered of a child in the neighbourhood of Samarcand; on which occasion she is said to have borrowed some jewels from the prince of Sogd's lady, which she afterwards carried off with her. In the mean time Salem detached Mohalleb with a considerable body of troops to Khowarazm, the principal city of the Turks or Tartars in those parts, from which he extorted the immense sum of 50,000,000 pieces of money; from whence advancing

to

to Samarcand, he forced the inhabitants of that city alſo to pay him an immenſe ſum; and then retired, with little loſs, into the province he governed.

In the mean time Abdallah Ebn Zobier, finding himſelf, by the death of Hoſein, at the head of the partizans of the houſe of Haſhem, who were greatly oppreſſed by Yezid, began in earneſt to aſpire to the khalifat. As he had therefore never owned the authority of Yezid, he now openly declared againſt him,

126 Abdallah proclaimed khalif.

and was proclaimed khalif at Medina ſoon after the arrival of Hoſein's family in that place. Soon after his inauguration, to render himſelf the more popular, he expatiated on the circumſtances of Hoſein's death, which indeed were very tragical, and repreſented the Cufans as the moſt abandoned and perfidious villains upon earth. This went ſo well down with the citizens of Mecca and Medina, that they flocked to him in great numbers, ſo that he ſoon found himſelf at the head of a conſiderable force. The khalif Yezid being informed of his progreſs, ſwore he would have him in chains; and accordingly ſent a ſilver collar for him to Merwan, then governor of Medina: but the intereſt of Abdallah was now ſo ſtrong, that he laughed at the menaces both of the khalif and Merwan. Nay, the governor of Mecca, though he ſecretly hated him, thought it good policy, as matters then ſtood, to keep up a good underſtanding with Abdallah: but this coming to the ears of Yezid, he depoſed the governor; appointing in his place Walid Ebn Otbah, a man of known fidelity, and a bitter enemy of Abdallah. The new governor, therefore, immediately on his acceſſion, uſed all his art and ſkill to circumvent Abdallah; but to no purpoſe, as the latter was always on his guard. This conduct, however, giving him great diſguſt, as well as terrible apprehenſions, he wrote to the khalif, informing him that all the diſturbances were owing to the untractable diſpoſition of Walid; and that, if he would ſend a perſon of a different character, peace would ſoon be reſtored. This letter the khalif very injudiciouſly gave ear to, and diſmiſſed his faithful governor, appointing in his room one who was totally unqualified for that poſt. The people of Medina, now

127 Yezid formally depoſed.

having freſh intelligence of Yezid's diſſolute manner of life, renounced their allegiance to him, and formally depoſed him in a very ſingular manner. After they had aſſembled in the moſque, about the pulpit there, one of them ſaid, "I lay aſide Yezid as I do this turbant," and immediately threw his turbant on the ground. Another ſaid, "I put away Yezid as I do this ſhoe," caſting away his ſhoe at the ſame time. Theſe examples being followed by others, there was a large heap of ſhoes and turbants almoſt inſtantly formed upon the ſpot. They then diſmiſſed Yezid's governor, and baniſhed from the city all the friends and dependents of the houſe of Ommiyah. Theſe, to the number of about 1000, took refuge in the houſe of Merwan Ebn Al Hakem, where they were ſo cloſely beſieged by Abdallah's party, that they found themſelves obliged to ſend to Yezid for immediate aſſiſtance; acquainting him, that if they were not ſuccoured, they muſt all inevitably periſh. The khalif, though he wondered that ſuch a number of men ſhould ſuffer themſelves to be ſo cooped up without making the leaſt reſiſtance, diſpatched Moſlem Ebn Okba to Medina, with a conſiderable body of troops, to quell the diſturbances. He ordered him to ſpare Ali the ſon of Hoſein and his family, as they had no hand at all in the diſturbances: then he was to ſummon the town of Medina to ſurrender for three days ſucceſſively; which if they refuſed, he was to take it by ſtorm, and give it up to be plundered by the ſoldiers for three whole days.

The inhabitants of Medina being now ſenſible of their danger, ſuffered the friends of the houſe of Ommiyah to withdraw quietly out of the city; though, before they departed, a promiſe was extorted from them not to appear in arms againſt the reigning faction. Moſlem, in the mean time, advanced towards the city at the head of 5000 foot and 12,000 horſe; and having ſummoned it according to his inſtructions, upon its refuſal made the neceſſary preparations for an attack. The garriſon, however, for a conſiderable time, made a vigorous defence; but at laſt, moſt of the Anſars and principal officers being killed, the Arabs propoſed a capitulation. Moſlem, however, would hearken to no terms, and inſiſted on their ſurrendering at diſcretion; which being refuſed, he entered the city after a faint reſiſtance. Ali was treated with great reſpect; but all the men that had carried arms were put to the ſword, and Moſlem ſuffered his troops to raviſh 1000 women, and to pillage the city for three days ſucceſſively. Thoſe that eſcaped the ſlaughter he forced to acknowledge themſelves the ſlaves and vaſſals of Yezid. For this extreme ſeverity he was ſurnamed by the Arabs *Al Muſrif*, or *The Extravagant*, and ever after conſidered as an impious perſon, eſpecially as the prophet had declared that the wrath of God ſhould moſt certainly remain upon thoſe who ſacked or plundered the city of Medina.

128 Medina taken and plundered by the khaliff's forces.

After the reduction of Medina, Moſlem directed his courſe to Mecca, where Abdallah then reſided; but he died by the way, and the command of the troops devolved upon Hoſein Ebn Thamir Al Selwi. This general advanced to Mecca, which he beſieged for 40 days, battering the town with ſuch fury, that he beat down a great part of the famous temple there, and burnt the reſt; nor would the city itſelf have eſcaped the ſame fate, had not an end been put to the war by the arrival of certain accounts of the death of Yezid, who departed this life in the 64th year of the Hegira, anſwering to the year 684 of the Chriſtian æra, having lived 39, and reigned three years and ſix or eight months. On the news of his death, Hoſein offered to take the oath of allegiance to Abdallah; but the latter at that time durſt not truſt him, of which he had afterwards ſufficient reaſon to repent.

129 Yezid dies.

Yezid was ſucceeded by his ſon Moawiyah II. who was proclaimed khalif at Damaſcus the ſame day that his father died; but being of a weakly conſtitution, and unable to bear the fatigues of government; reſigned the crown ſix weeks after his inauguration, and died ſoon after without naming a ſucceſſor.

130 Moawiyah II. proclaimed khalif and reſigns.

This abdication having left the Moſlem empire abſolutely without a maſter, great commotions enſued. On the death of Yezid, Obeidallah Ebn Ziyad, governor of Baſrah, repreſented to the citizens that they ought to chooſe a protector till a new khalif ſhould be choſen; and if the perſon ſo choſen ſhould be diſagreeable

able to them, they might then remain in a state of independency under the protector whom they had chosen. The inhabitants, perceiving the drift of this speech, complimented him with that honour; which he accepted with seeming difficulty; but sending a deputy to Cufa, the inhabitants of that city not only refused to acknowledge his authority, but threw dust and gravel at his messenger. This coming to the ears of the people of Basrah, they not only deprived Obeidallah of the dignity they had newly conferred upon him, but even expelled him the city. Nor could he prevail upon the Najari, a tribe of Ansars, to espouse his quarrel, nor even upon his own relations, though he distributed among them great part of the sixteen millions of pieces of money which he had found in the treasury of Basrah, and kept the remainder to himself. Nay, so odious had he rendered himself to all ranks, an account of his cruelties, particularly the death of Hosein the son of Ali, that his brother Abdallah was unable to protect him from the fury of the populace, though he kept him concealed in womens clothes, and distributed among the mob 200,000 pieces of money. He was therefore at last constrained to leave the city, attended by a guard of 100 men. Immediately after his departure, the mob plundered his house, and pursued him, so that he was obliged to exchange his camel for an ass, and thus with the utmost difficulty escaped into Syria.

131 Obeidallah forced to fly into Syria.

In the mean time, Hosein Ebn Thamir, being returned into Syria with the forces under his command, gave a faithful account of the situation of affairs in Arabia to Merwan Ebn Al Hakem. He also acquainted him of the offer he had made to Abdallah of the oath of allegiance, which the latter had refused, or at least would not come to Damascus in order to be invested with the supreme authority there. On this account he advised Merwan to take care of himself and the rest of the house of Ommiyah, who had fled to Damascus after their expulsion from Medina. On this discourse Merwan was inclined to submit to Abdallah; but was diverted from it by Obeidallah, who insisted that no superior ought to be acknowledged by Merwan, who was at the head of the Koreish. The people of Damascus had constituted Dahak Ebn Kais their protector, who inclined to Abdallah The Basrans were at this juncture entirely in tumult and confusion, not being able to agree about a protector after the expulsion of Obeidallah; so that at last they wrote to Abdallah, offering him the government of their territory. This he accepted, but could not be prevailed upon to stir from Mecca: nor could Merwan be persuaded to suffer any of the Syrians to perform the pilgrimage to Mecca, lest they should join Abdallah, and thereby contribute to his exclusion from the throne.

132 Merwan proclaimed khalif at Damascus.

In the midst of this confusion Abdallah might have easily secured the khalifat to himself, had he not with the utmost imprudence as well as inhumanity given orders for the extermination of the house of Ommiyah. This ruined his affairs; for they being now obliged to provide for their own safety, Merwan was proclaimed khalif at Damascus; and thus the whole Moslem empire was rent into two potent factions, the one under Merwan, and the other under Abdallah.

We have already observed, that Dahak Ebn Kais inclined to favour Abdallah. This he continued to do after Merwan was proclaimed khalif, insomuch that a battle soon ensued between his followers and those of Merwan, in which Dahak was defeated and killed; and thus Merwan became master of all the province of Syria. Soon after this victory, Merwan advanced with a considerable body of troops towards Egypt; but sent before him Amru Ebn Saad with a detachment, in order to facilitate his passage. That general having defeated Abdalrahman, Abdallah's lieutenant, in several brisk actions, he at last surrendered the whole country to Merwan for a sum of money, and retired with the Arabs under his command to Hejaz. The Syrian troops, therefore, immediately took possession of that country, and obliged the inhabitants to take an oath of allegiance to Merwan; who having appointed his son Abdalazziz to preside over Egypt, returned with the greatest part of his forces to Damascus. Here he was informed that Abdallah had dispatched against him his brother Musab with a considerable army. Against him Merwan dispatched Amru Ebn Saad; who having soon come up with him, gave him a total defeat, and dispersed his troops in such a manner that Musab found it impossible to rally them again.

133 Abdallah's forces defeated by Merwan.

134 The Cufans revolt.

In the 65th year of the Hegira, the inhabitants of Cufa, pretending to be seized with remorse of conscience for their treachery to Hosein the son of Ali, raised an insurrection against both the khalifs, and therefore assembled a body of 16,000 men, under the command of one Soliman, who was to revenge the death of Hosein upon Obeidallah Ebn Ziyad and his adherents. But while Soliman and his troops remained yet inactive, Al Mockhtar, who had served under Abdallah, and was disgusted at not having been promoted as he expected, arrived at Cufa, and representing the incapacity of Soliman, who indeed appears to have been totally unfit for such an enterprize, offered to take the command upon himself. This, however, was refused; and as Al Mockhtar had no opinion of Soliman's military capacity, he found means to draw off 2000 of his troops; while 10,000 more chose rather to violate the oaths they had taken, that run the risk of being cut to pieces by a superior enemy. Soliman, however, put a good face upon the matter; and, telling his troops that they were to fight for another world and not this, set forward to invade Syria with the 4000 who remained with him: but being advanced as far as Eksas upon the Euphrates, he found that he had lost 1000 men by desertion; nor was he joined by the Separatists of Basrah and Al Madayen, though they had promised him a reinforcement. Firmly persuaded, however, that his cause was the cause of heaven, Soliman continued his march all night, and next day arrived at the tomb of Hosein, where his men performed their devotions with such enthusiasm of penitence, that one present swore he never saw such crowding about the black stone in the temple of Mecca itself.—Continuing still to advance, he received a friendly letter from Abdallah Ebn Yezid, the governor of Cufa, advising him to return, and representing to him the folly of engaging so powerful an army as would be sent against him, with an handful of men: but Soliman, imagining that he was only recalled in order to support Abdallah Ebn Zobeir in his pretensions to the khalfat, persisted in

135 Joined by Al Mockhtar.

136 Soliman's folly and enthusiasm.

Arabia. in his resolution of penetrating into Syria. He told his troops, that they would never be nearer the two Hoseins (Hosein, and his brother Hasan, to whom also the Shiites give that name) than they were at present; and that should they at this time meet with death, they would be in a state of repentance, and consequently could never die in a more proper time; and after

137 He is cut in pieces with all his men. this speech, continuing still to advance, he was at last met by Obeidallah at the head of 20,000 horse, who, after an obstinate engagement, cut to pieces Soliman and all his troops.

138 Merwin dies. Soon after this decisive action died the khalif Merwan, after he had reigned eleven months. He is said by some authors to have been poisoned by his wife Zeinab, Moawiyah's widow. Her he had married, with a promise that her son Khaled should succeed him; but afterwards altering the succession in favour of his own son Abdalmalec, young Khaled reproached him with his breach of promise: upon this Merwan calling him *bastard*, the child complained to his mother, who, to be revenged for this affront, is said to have poisoned him, or smothered him in a pillow.

In the beginning of the khalifat of Abdalmalec, Al Mokhtar, who had been imprisoned by the governor of Cufa, was released at the intercession of Abdallah Ebn Omar, who had married his sister. The year following, having put himself at the head of the Shiite sectaries, he sent proposals of alliance to Abdallah Ebn Zobeir; but he, justly suspecting his sincerity, by a stratagem cut off near 3000 of his men. Upon this disaster, Al Mokhtar, fearing the house of Ali might be intimidated, sent a letter to Mahomet Ebn Hanifyah,

139 Narrow escape of the family of Ali. one of that family, in which he offered his assistance with a powerful army. This offer Mahomet declined, declaring himself only for pacific measures; but though he and all the rest of Ali's family behaved in the most peaceable manner, Abdallah did not think himself safe till they owned his authority. He therefore imprisoned them, together with 17 of the principal citizens of Cufa, whom he threatened to put to death, and afterwards burn their bodies, if they did not within a limited time take an oath of allegiance to him. Al Mokhtar being informed of the distressed situation they were in, sent a body of 750 horse to Mecca, under Abu Abdallah, to release them. That general not only executed his orders with great bravery, but took Abdallah himself prisoner, whom he would have cut to pieces on the spot, had he not been released at the intercession of Mahomet, who for the present adjusted the differences to the mutual satisfaction of all parties. After this reconciliation, Abu Abdallah, or rather Mahomet himself, distributed among 4000 of Ali's friends a sum of money brought for that purpose, in order to indemnify them for the losses they had sustained. Thus the friends of Ali were happily delivered, when only two days of time granted them by Abdallah remained, and a sufficient quantity of wood and other combustibles was collected, in order to consume their bodies. Notwithstanding the reconciliation, however, that had lately taken place, Mahomet Ebn Hanifyah thought proper to post himself on a mountain near Mecca with a body of 4000 men.

The Cufans having received advice before Merwan's death, that he had sent Obeidallah with a powerful army towards their city, and even given him permission to plunder it in case it should be taken, appointed Yezid Ebn Ares, a man of undaunted courage, to oppose him; but Merwan dying before Obeidallah could execute his commission, an end was put for the present to this expedition. The memory of it, however, still remained; and Al Mokhtar, to whom Obeidallah was personally obnoxious, assembled a body of troops to act offensively against him, and even against the Syrian 140

khalif himself, in case he would support Obeidallah. Among other preparations for their enterprize, Al Mokhtar caused a kind of portable throne to be made, telling his troops, that "it would be of the same use to them that the ark was to the children of Israel." It was therefore carried on a mule before the troops that were to march against Obeidallah, and the following prayer said before it: "O God! grant that we may live long in thy obedience; help us; and do not forget us, but protect us." This expedient was so well adapted to the hot-headed enthusiasts who composed 141 Impiety of Al Mokhtar.

Al Mokhtar's army, that they attacked Obeidallah's camp, defeated him, and gained a complete victory. Obeidallah himself was killed in the action, his head sent to Al Mockhtar, and his body reduced to ashes.— By this victory the sectaries were rendered so formidable, that Nisibin or Nisibis, and several other cities, surrendered to them without opposition. They now began to entertain thoughts of deposing both the khalifs, and placing on the Moslem throne one of the family of Ali; but all their towering hopes were soon frustrated by the defeat and death of Al Mokhtar by 142 Obeidallah defeated and killed.

Musab brother to Abdallah Ebn Zobeir. Al Mokhtar, after being defeated in a general engagement by Musab, fled to the castle of Cufa, where he defended himself with great bravery for some time; but being at last killed, his men, to the number of 7000, surrendered at discretion, and were all of them put to the sword on account of the outrages they had committed. Al Mokhtar defeated and killed by Musab.

The next year, the 68th of the Hegira, the Azarakites, so denominated from Nafe Ebn Al Azarak, the author of their sect, having assembled a considerable force, made an irruption into Irak. They advanced 143

almost to the gates of Cufa, and penetrated to Al Madayen. Being sworn enemies of the house of Ommiyah, and acknowledging no government spiritual or temporal, they committed terrible ravages in every part of the Moslem territories through which they passed. Horrid cruelties committed by the Azarakites.

They carried their excesses to such a height as to murder all the people they met with, to rip open women with child, and commit every species of cruelty that could be invented upon the inhabitants without distinction. The governor of Mawsel and Mesopotamia, being informed of these unparalleled outrages, marched against them with a body of troops, and carried on a brisk war with them for eight months. During this period their leader Nafe Ebn Al Azarak died; and was succeeded by Katri Ebn Al Fojat, under whose conduct they continued their depredations. Musab not being pleased with his lieutenant's management of the war, recalled him, and sent in his place one Omar Ebn 144

Abdallah Temimi, who gave the Azarakites a great overthrow at Naisabur in Khorasan, put many of them to the sword, and pursued the rest as far as Ispahan and the province of Kerman. Here having received a reinforcement, they returned into the province of Ahwaz, and did incredible damage to the country through They are defeated and dispersed.

Arabia. through which they passed. But Omar advancing against them a second time, they retired at his approach to Al Madayen, ravaging the district belonging to the city in a dreadful manner. However, Omar pursuing them thither also, they fled into the province of Kerman, and thence gradually dispersed themselves. This year there was a grievous famine in Syria, which suspended all military operations.

The next year, being the 69th of the Hegira, Abdalmalec left Damascus to march against Musab. In his absence he left Amru Ebn Saad governor of the city; but he immediately seized upon it for himself, which obliged the khalif to return. After several skirmishes had happened between some detachments of the khalif's troops with those of Amru, a pacification was

145 Barbarity of Abdalmalec.

concluded at the intercession of the women: but Abdalmalec barbarously put Amru to death with his own hand, notwithstanding his promise; and was immediately seized with such a tremor, that he lost the use of almost all his faculties, and was obliged to be laid in bed. In the mean time the palace was attacked by Yahyah, Amru's brother, at the head of 1000 slaves. After a warm dispute, they forced open the gates, killed several of the guards, and were upon the point of entering the palace, when the people within threw Amru's head among them. This so cooled their ardour, that they desisted from the attempt; and some money having been afterwards distributed among them, they retired. So great, however, was Abdalmalec's avarice, that after the tumult was appeased, he recalled all the money which had been distributed, and commanded it to be deposited in the public treasury.

146 Disgraceful treaty with the Greeks.

In the 70th year of the Hegira, the Greeks made an irruption into Syria; and Abdalmalec having occasion for all his forces to act against Abdallah Ebn Zobeir, was obliged to pay a tribute of 1000 dinars per day, according to Theophanes, and send every year 365 slaves and as many horses to Constantinople. In this treaty it was also stipulated, that the revenues of Cyprus, Armenia, and Heria, should be equally divided between the khalif and the Greek emperor.

147 Musab defeated and killed by Abdalmalec.

Abdalmalec being now at leisure to pursue his intended expedition against Musab, marched against him in person; and having arrived at Masken, a small town on the frontiers of Mesopotamia, where he was waited for by Musab, the latter was defeated through the treachery of the troops, and himself killed. After the battle, Abdalmalec repaired to Cufa, where he was received with the utmost submission; and people of all ranks came in crowds to take the oath of allegiance to him. He then ordered vast sums of money to be distributed among them, and gave a splendid entertainment to his new subjects, to which even the meanest of them were not refused admittance. During this entertainment, the unfortunate Musab's head was presented to the khalif; upon which one of the company took occasion to say to him, "I saw Hosein's head in this same castle presented to Obeidallah; Obeidallah's to Al Mokhtar; Al Mokhtar's to Musab; and now at last Musab's to yourself." This observation so affected the khalif, that, either to avert the ill omen, or from some other motive, he ordered the castle to be immediately demolished. Abdallah Ebn Zobeir, in the mean time, having received the melancholy news of the defeat and death of his brother, assembled the people of Mecca, and from the pulpit made a speech suitable to the occasion. He also did his utmost to put Mecca in a proper posture of defence, expecting a speedy visit from his formidable competitor, who now gave law to Irak, Syria, and Egypt, without controul.

Soon after Abdalmalec's return to Damascus, he appointed his brother Bashar governor of Cufa; and Khaled Ebn Abdallah governor of Basra. The latter had no sooner entered upon his office, than he indiscreetly removed from the command of the army Al Mohalleb, one of the greatest generals of the age; appointing in his room Abdalaziz, who was greatly his inferior in military skill. Of this dismission the Azarakites being informed, they immediately attacked Abdalaziz, entirely defeated him, and took his wife prisoner. A dispute arising among the victors about the price of that lady, one of them, to end it immediately cut off her head. Upon this disaster, Khaled was commanded to replace Al Mohalleb, which he did; and having in conjunction with him attacked the Azarakites, forced their camp, and entirely defeated them.

148 Azarakites defeated.

In the 72d year of the Hegira, Abdalmalec having no enemy to contend with but Abdallah Ebn Zobeir, made great preparations for an invasion of Hejaz, giving the command of the army to be employed on this occasion to Al Hejaj, one of his most warlike and eloquent captains. Before that general had put his army in march for Mecca, he offered his protection to all the Arabs there that would accept of it. Abdallah being informed of the enemy's approach, sent out several parties of horse to reconnoitre, and give him intelligence of their motions. Between these and some of Al Hejaj's advanced guards several skirmishes happened, in which Abdallah's men had generally the worst. This encouraged Al Hejaj to send to the khalif for a reinforcement, his troops amounting to no more than 2000 men, who were insufficient for reducing Mecca. He assured him at the same time, that Abdallah's fierceness was very much abated, and that his men deserted to him daily. The khalif, upon this, ordered a reinforcement of 5000 men under the command of Tharik Ebn

149 Mecca besieged by Al Hejaj.

Amer; but notwithstanding this additional strength, he made but little progress in the siege for some time. While he battered the temple of Mecca with his machines, it thundered and lightened so dreadfully, that the Syrians were struck with terror, and refused to play any longer upon that edifice. Upon this Al Hejaj stuck the corner of his vest into his girdle, and putting into it one of the stones that was to be discharged out of the catapults, slang it into the town, and this occasioned the recommencement of the operations. The next morning the Syrians were annoyed by fresh storms, which killed 12 men, and quite dispirited them. Al Hejaj, however, animated them, by observing that he was a son of Tehama; that this was the storm of Tehama, and that their adversaries suffered as much as they. The day following some of Abdallah's men were killed by a very violent storm, which gave Al Hejaj a farther opportunity of animating his troops. At last, Abdallah having been deserted by most of his friends, 10,000 of the inhabitants of Mecca, and even by his own sons Hamza and Khobeib, desired to know his mother's sentiments as to what course he was to take. He represented to her, that he was almost entirely abandoned by his subjects and relations; that the few who

Arabia.

who perſiſted in their fidelity to him could ſcarce enable him to defend the city any longer; and that the Syrian khalif would grant him any terms he ſhould think fit to demand. His mother, however, being of an inflexible reſolution, and not able to bear the thoughts of ſeeing her ſon reduced to the rank of a private perſon, being herſelf the daughter of Abu Becr the firſt khalif, adviſed him by no means to ſurvive the ſovereignty, of which he was on the point of being deprived. This advice being agreeable to his own ſentiments, he reſolved to die in defence of the place. In purſuance of this reſolution, he defended the city, to the amazement of the beſiegers, for ten days, though deſtitute of arms, troops, and fortifications. At laſt, having taken a final leave of his mother, and being animated by deſpair, he made a ſally upon the enemy, deſtroyed a great number of them with his own hand, and was at length killed fighting valiantly upon the ſpot. At the laſt interview he had with his mother, ſhe is ſaid to have deſired him to put off a coat of mail he had on for his defence; and, in order to inſpire him with the greater fortitude, ſhe gave him a draught in which a whole pound of muſk had been infuſed. Al Hejaj ordered his head to be cut off, and his body to be affixed to a croſs; and by reaſon of the muſk he had drank, the body emitted a grateful odour for ſeveral days.

150 Abdallah killed.

By the reduction of Mecca, and the death of Abdalla Ebn Zobeir, Abdalmalec remained ſole maſter of the Moſlem empire; but he ſuſtained a great loſs next year, in having an army of 100,000 men totally cut off by the Khazarians in Armenia. The governor, however, having marched in perſon againſt them at the head of only 40,000 men, but all choſen troops, penetrated into the heart of Armenia, defeated and diſperſed a large body of the Khazarians, drove them into their temples, and reduced them to aſhes. One of his generals alſo defeated an army of 80,000 Khazarians at the Iron or Caſpian gates, and deſtroyed a great number of them, obliging the reſt to embrace the Mahometan religion.

151 Khazarians reduced.

152 Cruelty of Al Hejaj.

Al Hejaj, in conſequence of his ſervices, was made governor, firſt of Medina, and then of Irak, Khoraſan, and Sijiſtan; in all which places he behaved with the greateſt cruelty. Having entered the city of Cufa muffled up in his turbant, he was ſurrounded by crowds of people who preſſed forward to ſee him. He told them their curioſity would ſoon be gratified; which he effectually did, by aſcending the pulpit, and treating them in a very coarſe manner; ſwearing that he would make the wicked bear his own burden, and fit him with his own ſhoe; and telling them, among other things, that "he imagined he ſaw the *heads* of men ripe and ready to be gathered, and turbants and beards beſprinkled with blood." At Baſra he made a ſpeech much to the ſame purpoſe; and, to give the inhabitants a taſte of his diſcipline, cauſed one of them who had been informed againſt as a rebel to be beheaded on the ſpot without any trial. So great indeed was the abhorrence in which he was held by thoſe over whom he preſided, that having once recommended himſelf to the prayers of a religious Moſlem, the latter inſtantly prayed, that it would pleaſe God to kill Al Hejaj quickly; "for nothing, ſaid he, could be more advantageous for himſelf or the people." In conſequence of theſe cruelties, rebellions were ſoon raiſed againſt him; but they were eaſily ſuppreſſed, and Al Hejaj continued in the full enjoyment of all his employments till he died.

Arabia.

153 Saleh and Shebib rebel.

In the 76th year of the Hegira, one Saleh Ebn Marj, a hot-headed enthuſiaſt, and Shebib Ebn Zeid, a Kharejite, took up arms againſt the khalif. They had conſpired againſt him the year before when on a pilgrimage to Mecca; and Al Hejaj had been ordered to ſeize them: but at that time they found means to make their eſcape; and having now aſſembled about 120 men, Saleh was proclaimed emperor of the faithful at Daras in Meſopotamia. The governor ſoon received intelligence of their motions; and ordered a body of 500 men, under the command of one Adi, to march againſt them: but that general, being afraid to attack them notwithſtanding his ſuperiority in numbers, demanded a reinforcement. He therefore was ſupplied with 500 more troops, with which he advanced to Daras: but being ſtill afraid of the rebels, he entered into negociations with them; during which they attacked him, entirely defeated his army, and made themſelves maſters of his camp. Upon this the governor ſent a detachment of 1500 horſe againſt them; but the rebels, notwithſtanding the ſmallneſs of their number, defended themſelves in ſuch a manner, that the khalif's troops were forced to diſmount and fight on foot. The engagement continued till night; when the rebels, finding themſelves unable to contend with ſuch numbers, retired to Mawſel. After this, Al Hejaj being informed that they had taken poſt at Daſcara, ſent againſt them an army of 5000 men. The rebels, hearing of this formidable army, abandoned their camp; but were ſo cloſely purſued, that they found themſelves obliged to ſtand an engagement at Modbaj, a ſmall village on the Tigris. Saleh's forces, conſiſting only of three companies of 30 men each, were ſoon thrown into diſorder, and himſelf killed: but Shebib made an excellent retreat to a neighbouring caſtle; from whence he ſallied out at midnight on the khalif's forces, penetrated to the very heart of the camp, where he wounded the general himſelf, and diſperſed the greateſt part of his army.

154 Their bravery.

155 Saleh killed.

156 Al Hejaj defeated by Shebib.

After this victory, the rebels became terrible even to Al Hejaj himſelf, whom they afterwards defeated in ſeveral engagements; and taking advantage of his being at Baſra, made themſelves maſters of Cufa with little oppoſition. Al Hejaj was now conſtrained to write to the khalif for a ſtrong detachment of the Syrian troops, with which he advanced againſt Shebib; whoſe army bearing no proportion to that of Al Hejaj, the former was totally defeated, had his wife's brother killed in the action, and was obliged to fly into Kerman. Having refreſhed his men in this province, he again advanced to Ahwaz, where he was met by one of Al Hejaj's generals at the head of the Syrian army. Shebib defended himſelf with incredible valour, and ſeveral times repulſed the khalif's forces; but being overpowered by numbers, as his army conſiſted of no more than 600 men, he was at laſt put to flight, and in paſſing a bridge, was thrown off by his horſe and drowned. His body was drawn up by a net, and the head ſent to Al Hejaj, who was not a little pleaſed at the ſight. After his death, the rebels quarrelled among themſelves, ſo that the khalif's troops cut off the greateſt part of them. The remainder, under Katri Ebn Fojat, fled to Tabreſtan. Here they were kind-

157 Shebib's valour and death.

Arabia.

ly received by Afhid the king, who had affigned them part of his territories for their habitation. But they had not been long fettled before they infifted upon Afhid's either embracing Mahometanifm, or paying them an annual tribute; which he refufing, they drove him into Irak, where he implored the khalif's protection. Afhid afterwards conducted a body of Moflem troops into Tabreftan; where they fell upon the rebels with fuch fury, that they killed Katri himfelf, cut a great number of his men to pieces, and took all the reft prifoners.

158 Ingratitude of the rebels.

159 They are all deftroyed.

This year alfo (the 76th of the Hegira) money was firft coined in Arabia. Before this time, the dinars, or gold coins, had Greek infcriptions; and the dirhems, or filver ones, Perfic infcriptions. The firft erection of a mint in Arabia was occafioned by the following accident. Abdalmalec added to the letters he wrote to the Greek emperor this fhort paffage of the Koran, "Say God is one;" or "Say, there is one God;" and then inferted the year of the Hegira, with the name of the prophet, in fuch a manner as gave the emperor great offence. Upon this he wrote to Abdalmalec, defiring him to alter that manner of writing, or he would fend him fome coins in which the name of Mahomet fhould be mentioned in fuch a manner as would not prove very agreeable. Abdalmalec now refolved to coin money of his own; and accordingly fome dirhems were this year ftamped by Al Hejaj, with the infcription *Alla Samad*, "God is eternal;" which gave great offence to the fuperftitious Moflems, as they imagined that the name of God would be thereby profaned by the touch of unclean perfons.

160 Money firft coined in Arabia.

In the 77th year of the Hegira, the Arabs made an incurfion into the imperial territories, and had Lazica and Bernucium betrayed to them; and the next year they made themfelves mafters of Africa Propria, demolifhing the city of Carthage fo effectually, that fcarce a veftige of it was left. They were foon driven out, however, by John the Patrician, a man of great valour and experience in war; but returning with a fuperior force, they obliged John in his turn to fly to Conftantinople.

161 Carthage demolifhed

The 79th year of the Hegira is remarkable for nothing but the rebellion of Abdalrahman in Perfia; who drove the Khakan, or emperor of the Turks, Tartars, or Moguls, out of that country: but the following year, one of the Greek generals named *Heraclius* penetrated into Syria as far as Samofata, and deftroyed 200,000 Arabs, ravaging the country in a terrible manner; and Abdalrahman was defeated and killed by Al Hejaj, after a great number of engagements, fome fay 81, and others 100. In the 83d year of the Hegira, the nobility of Armenia revolting, drove the Arabs out of that province; but Mahomet, one of the khalif's generals, entering the country with a powerful army, got the authors of the revolt into his hands, and caufed them all to be burnt alive. Encouraged by this fuccefs, the Moflems invaded Cilicia under one Azar; but were, to the number of 10,000, cut in pieces by Heraclius; and the next year, having again entered that country, 12,000 of them were deftroyed by the fame general, and the reft forced to fly into their own country.

162 200,000 Arabs deftroyed by Heraclius.

In the 86th year of the Hegira died the khalif Abdalmalec, after a reign of 21 years. He is faid to have had fuch a ftinking breath, that the flies which accidentally fettled on his lips were almoft inftantly ftruck dead by it. He was fucceeded by Al Walid, who greatly extended the Moflem dominions. The firft year of his reign, one of his generals having paffed the Oxus (now the Jihum), defeated a numerous army of Turks and Tartars. He then over-ran and entirely reduced the countries of Sogd or Sogdiana, Bagrafs, Shafh, Targana, and the whole immenfe tract going under the name of Mawaralnahr, or Great Buckharia. He alfo conquered the khan of Khowarazm, obliging him to pay an annual tribute of two millions of dinars. About the fame time another general called *Mahomet* made an irruption into India, and fubdued a confiderable part of that country. He alfo entirely fubdued the kingdom of Al Sind, lying between Perfia and India. In this expedition, Derar king of Al Sind was defeated and killed, and had his head cut off by Mahomet.

163 Abdalmalec dies.

164 Prodigious conquefts of the Moflems.

In the 90th year of the Hegira, the Moflems made an irruption into Capadocia, defeated the emperor's army who oppofed them, and took the city of Tyana. The next year they made another incurfion into the imperial territories, whence they carried off vaft numbers of flaves; and the year following one Othman penetrated into the heart of Cilicia, where he made himfelf mafter of feveral cities, but does not appear to have long kept his conquefts.

In the 93d year of the Hegira, anfwering to that of Chrift 712, Tarek Ebn Zarka made a defcent into Spain, defeated Roderic the laft king of the Goths, reduced the city of Toledo, and over-ran a confiderable part of the kingdom. Being afterwards joined by Mufa, commander of the African Moflems, the two generals made themfelves mafters of moft of the fortreffes, fubjugating in a manner the whole country, and obliging it to pay tribute to the khalif. In thefe expeditions the Moflems acquired fpoils of immenfe value; and, amongft other things, an exceeding rich table, called by the Arab writers "the table of Solomon the fon of David." According to thefe writers, this table confifted entirely of gold and filver, and was adorned with three borders of pearls; but Roderic of Toledo, a Spanifh hiftorian, fays it confifted of one entire ftone, of a green colour, and of an immenfe fize, being no lefs than 365 feet. He adds, that it was found in a certain village or town, near the mountain called in his days *Jibal Soliman*, or "the mountain of Solomon."

165 They make a defcent on Spain.

166 And over-run the whole country.

After Mufa and Tarik had committed dreadful depredations in Spain, they were both recalled by the khalif; but the next year, Tarik having undertaken another expedition into the fame country, landed a body of 12,000 men at Gibraltar, with which he plundered the whole province of Bætica, and over-ran the greateft part of Lufitania. Roderic hearing of thefe depredations, fent againft him an army of raw undifciplined troops, who were eafily defeated, and moft of them left dead on the fpot; which fo animated the Arab commander, that he refolved not to lay down his arms till he had made an abfolute conqueft of Spain. About the fame time that Tarif made fuch progrefs in Spain, another Moflem general entered Pifidia with a powerful army, took the city of Antioch, and, after having ravaged the country, retired into the khalif's territories with very little lofs.

In

167 Al Hejaj dies.

In the 95th year of the Hegira died Al Hejaj governor of Irak, &c. after he had preſided over that country 20 years. He exerciſed ſuch cruelties upon thoſe who were in ſubjection to him, that he is ſaid to have killed 120,000 men, and to have ſuffered 50,000 men and 30,000 women to periſh in priſon. To excuſe this cruelty, he uſed frequently to ſay, That a ſevere, or even violent government, is better than one too weak and indulgent; as the firſt only hurts particular perſons, but the latter the whole community. This year alſo the Arabs gained a complete victory in Spain over Roderic king of the Goths, who periſhed in the action. In this campaign, Tarif poſſeſſed himſelf of immenſe treaſures; by which means he was enabled to reward not only his officers, but common ſoldiers alſo. In the eaſtern parts of the world alſo, the Arabs were this year very formidable; Moſlema, an Arab general, having entered the imperial territories, ravaged the whole province of Galatia, carrying off with him many rich ſpoils, and a vaſt number of priſoners. The Greek emperor, hearing that Al-Walid deſigned to attack him both by ſea and land, ſent ſome of his nobles to treat of a peace; and, among other things, deſired them to bring him a particular account of the force with which the khalif deſigned to invade the Greek empire. This they repreſented as ſo terrible, that it would be next to impoſſible to oppoſe it. The emperor therefore cauſed a great number of light ſhips to be built, the walls to be repaired, and ordered ſuch of the citizens as had not laid up proviſions for three years to depart the city. Al Walid, in the mean time, continued his warlike preparations with the utmoſt vigour, being determined to make himſelf maſter of Conſtantinople in a ſingle campaign.

168 Al Walid dies, and is ſucceeded by Soliman.

In the 96th year of the Hegira died the khalif Al Walid, and was ſucceeded by his brother Soliman. This year the Moſlem conqueſts on the eaſt ſide were increaſed by the reduction of Tabreſtan and Jurgan or Georgiana. In Spain, alſo, the city of Toledo which had revolted was reduced, and Cæſar-Auguſta, now Saragoſſa, as well as ſeveral others. The next year

169 Conſtantinople unſucceſsfully beſieged.

Moſlema ſet out for Conſtantinople, which he beſieged without ſucceſs till the 99th year of the Hegira; at which time he was obliged to return, after having loſt before it 120,000 men. The ſoldiers were reduced to the greateſt extremities of hunger, being forced to live upon hides, the roots and bark of trees, the moſt noiſome animals, and even the dead bodies of their com-

170 Death of Soliman.

panions. This year alſo (the 99th of the Hegira) is remarkable for the death of the khalif Soliman. According to ſome, he was poiſoned by Yezid his brother, governor of Perſia, who was diſpleaſed with his having appointed his couſin-german, Omar Ebn Abdalaziz as his ſucceſſor, to the excluſion of himſelf. According to others, he died of an indigeſtion; which is not greatly to be wondered at, if, as thoſe authors ſay, he uſed to devour 100 pounds weight of meat every day, and dine very heartily after eating three lambs roaſted for breakfaſt. In the latter part of his reign, the Moſlems were by no means ſucceſsful in Spain; the kingdom of Navarre being founded at this time by Pelagius, or Pelayo, whom the Arabs were never able to reduce.

The new khalif Omar Ebn Abdalaziz was by no means of a martial character; but is ſaid to have been very pious, and poſſeſſed of very amiable qualities. He ſuppreſſed the uſual malediction, which was ſolemnly pronounced by the khalifs of the houſe of Ommiyah againſt the houſe of Ali; and always ſhowed great kind-

171 New khalif poiſoned.

neſs to the latter. He was poiſoned by Yezid, after a ſhort reign of two years and five months. It is related, as an inſtance of this khalif's humility, that when Moſlema viſited him in his laſt ſickneſs occaſioned by the poiſon, he lay upon a bed of palm-tree leaves, ſupported by a pillow formed of beaſts ſkins, and covered with an ordinary garment. He had alſo on a dirty ſhirt; for which Moſlema blamed his ſiſter Fatima, Omar's wife; but ſhe excuſed herſelf by telling him, that the emperor of the faithful had not another ſhirt to put on.

Concerning Yezid the ſucceſſor of Omar, we find very little worth mentioning. He did not long enjoy the dignity he had ſo iniquitouſly purchaſed, dying after a reign of little more than four years. He died of grief for a favourite concubine named *Hababah*, who was accidentally choked by a large grape which ſtuck in her throat.

Yezid was ſucceeded by his brother Heſham, who aſcended the throne in the 105th year of the Hegira. In the ſecond and third year of his reign, ſeveral incurſions were made into the imperial territories, but generally without ſucceſs. In the 109th year of the He-

172 The Turks defeated.

gira, Moſlema drove the Turks out of Armenia and Aderbijan, and again confined them within the Caſpian gates. The next year he obliged them to take an oath that they would keep their own country; but this they ſoon violated, and were again driven back by Moſlema.

173 France invaded by the Arabs.

About this time alſo the Arabs, having paſſed the Pyrenees, invaded France to the number of 400,000, including women and ſlaves, under the command of one Abdalrahman. Having advanced to Arles upon the Rhone, they defeated a large body of French that oppoſed them; and having alſo defeated Count Eudo, they purſued him through ſeveral provinces, waſted the whole country with fire and ſword, making themſelves maſters of the city of Tours, moſt of which they redu-

174 They are utterly defeated by Charles Martel.

ced to aſhes. Here, however, a ſtop was put to their devaſtations by Charles Martel; who, coming up with them near the above-mentioned city, engaged them for ſeven days together, and at laſt gave them a total overthrow. The French general made himſelf maſter of all their baggage and riches; and Abdalrahman, with the ſhattered remains of his army, reached the frontiers of Spain with the utmoſt difficulty. The following year alſo, according to ſome hiſtorians, the Arabs were overthrown at Illiberis, ſcarce any of them making their eſcape. To make amends for this bad fortune, however, the khalif's arms were ſucceſsful againſt the Turks, who had again invaded ſome of the eaſtern provinces.

In the 125th year of the Hegira died the khalif Heſham, after a reign of 19 years ſeven months and eleven days. He was ſucceeded by Al Walid II. who is repreſented as a man of a moſt diſſolute life, and was aſſaſſinated the following year, on account of his profeſſing *Zendiciſm*, a ſpecies of infidelity nearly reſembling Sadduciſm. He was ſucceeded by Yezid the ſon of Al Walid I. who died of the plague after a reign of ſix months; and was ſucceeded by Ibrahim Ebn Al Walid, an imprudent and ſtupid prince. He was deposed in the 127th year of the Hegira by Merwan Ebn Mahomet, the governor of Mesopotamia;

175 Reign of Merwan.

who gave out as an excuse for his revolt, that he intended to revenge the murder of the khalif Al Walid II. He was no sooner seated on the throne, than the people of Hems rebelled against him. Against them the khalif marched with a powerful army; and asking them what could excite them to this rebellion, summoned them to surrender. They assured him that they were disposed to admit him into their city; and, accordingly, one of the gates being opened, Merwan entered with about 300 of his troops. The men that entered with him were immediately put to the sword; and the khalif himself escaped with great difficulty. However, he afterwards defeated them in a pitched battle, put a great number of them to the sword, dismantled the city, and crucified 600 of the principal authors of the revolt.

This, however, was far from quieting the commotions in different parts of the empire. The inhabitants of Damascus soon followed the example of those of Hems, and deposed the khalif's governor; but Merwan, immediately after the extinction of the former rebellion, marched to Damascus with great celerity, entered the city by force, and brought to condign punishment the authors of the revolt. Peace, however, was no sooner established at Damascus, than Soliman Ebn Hesham set up for himself at Basra, where he was proclaimed khalif by the inhabitants. Here he assembled an army of 10,000 men, with whom he marched to Kinnissin, where he was joined by vast numbers of Syrians who flocked to him from all parts. Merwan, receiving advice of Soliman's rapid progress, marched against him with all the forces he could assemble, and entirely defeated him. In this engagement Soliman lost 30,000 men, so that he was obliged to fly to Hems, where 900 men took an oath to stand by him to the last. Having ventured, however, to attack the khalif's forces a second time, he was defeated, and again forced to fly to Hems. But being closely pursued by Merwan, he constituted his brother Saad governor of the city, leaving with him the shattered remains of his troops, and himself fled to Tadmor. Soon after his departure Merwan appeared before the town, which he besieged for seven months; during which time he battered it incessantly with 80 catapults. The citizens being reduced to the last extremity, surrendered, and delivered Saad into the khalif's hands. In consideration of this submission, Merwan pardoned the rebels, and took them all under his protection. About the same time, another pretender to the khalifat appeared at Cufa; but Merwan took his measures so well, that he extinguished this rebellion before it could come to any height.

176 A party formed against him in Khorasan.

Notwithstanding the success, however, that had hitherto attended Merwan, a strong party was formed against him in Khorasan by the house of Al Abbas. The first of that house that made any considerable figure was named *Mahomet*, who flourished in the reign of Omar Ebn Abdalaziz. He was appointed chief of the house of Al Abbas, about the 100th year of the Hegira; and is said to have prophesied, that after his death, one of his sons named *Ibrahim* should preside over them till he was killed, and that his other son Abdallah surnamed *Abul Abbas Al Saffah*, should be khalif, and exterminate the house of Ommiyah. Upon this Al Saffah was introduced as the future sovereign, and those present kissed his hands and feet.

After the decease of Mahomet, his son Ibrahim nominated as his representative in Khorasan one Abu Moslem, a youth of 19 years of age; who beginning to raise forces in that province, Merwan dispatched against him a body of horse under the command of Nasr Ebn Sayer: but that general was entirely defeated by Abu Moslem, and the greatest part of his men killed.

177 Merwan's forces defeated.

The next year (the 128th of the Hegira) Merwan made vast preparations to oppose Abu Moslem, who after the late victory began to grow formidable to several parts of the empire. According to some authors, Merwan gained two victories over some of Ibrahim's generals: but the year following, Abu Moslem brought such a formidable army into the field, that the khalif's troops could not make head against them; his officers in Khorasan therefore were obliged either to take an oath of allegiance to Ibrahim, or to quit the province within a limited time.

In the 130th year of the Hegira, the khalif's general Nasr having drawn together another army, was again defeated by Kahtaba another of Ibrahim's generals, and forced to fly to Raya, a town of Dylam, according to some, or of Khorasan, according to others.

178 Ibrahim put to death.

The next year Ibrahim, having foolishly taken it into his head to go on a pilgrimage to Mecca, attended by a numerous retinue splendidly accoutred, was seized and put to death by Merwan; and the year following Abul Abbas was proclaimed khalif at Cufa. As soon as the ceremony was ended, he sent his uncle Abdallah with a powerful army to attack Merwan's forces that were encamped near Tubar, at a small distance from Mosul, where that khalif was then waiting for an account of the success of his troops under Yezid governor of Irak against Khatahba, one of Al Saffah's generals. Khatahba receiving advice of Yezid's approach, immediately advanced against him, and entirely defeated him; but in crossing the Euphrates, the waters of which were greatly swelled, he was carried away by the current and drowned. The pursuit, however, was continued by his son Hamid, who dispersed the fugitives in such a manner that they could never afterwards be rallied.

179 Merwan himself defeated,

At the news of this disaster, Merwan was at first greatly dispirited; but soon recovering himself, he advanced to meet Abdallah. In the beginning of the battle, the khalif happened to dismount; and his troops perceiving their sovereign's horse without his rider, concluded that he was killed, and therefore immediately fled; nor was it in the power of the khalif himself to rally them again, so that he was forced to fly to Damascus: but the inhabitants of that city, seeing his condition desperate, shut their gates against him,

180 And killed.

Upon this he fled to Egypt, where he maintained himself for some time; but was at last attacked and killed by Saleh, Abdallah's brother, in a town of Thebair, called *Busir Kurides*. The citizens of Damascus, tho' they had shamefully deserted Merwan, refused to open their gates to the victors; upon which Saleh entered the city by force, and gave it up to be plundered for three days by his soldiers.

By the total defeat and death of Merwan, Al Saffah remained sole master of the Moslem throne; but we hear of no very remarkable events that happened during

his

Arabia. his reign: only that he massacred great numbers of the partizans of the house of Ommiyah; and that Constantine Copronymus, taking advantage of the intestine divisions among the Moslems, ravaged Syria. The khalif died of the small-pox in the 136th year of the Hegira, in the 33d year of his age; and was succeeded by his brother Al Mansur. In the beginning of Al

181 Reign of Al Mansur. Mansur's reign, hostilities continued against the house of Ommiyah, who still made resistance, but were always defeated. Abdallah, however, the khalif's uncle, caused himself to be proclaimed khalif at Damascus; and having assembled a powerful army in Arabia, Syria, and Mesopotamia, advanced with great expedition to the banks of the Masius near Nisibus, where he encamped. Al Mansur, being informed of this rebellion, dispatched Abu Moslem against Abdallah. This general, having harassed him for five months together, at last brought him to a general action; and having entirely defeated him, forced him to fly to Basra. Not-

182 He murders Abu Moslem. withstanding all his services, however, Abu Moslem was soon after ungratefully and barbarously murdered by Al Mansur, on some ridiculous pretences of being deficient in respect towards him.

After the death of Abu Moslem, one Sinan a Magian, or adorer of fire, having made himself master of that general's treasures, revolted against the khalif; but he was soon defeated by Jamhur Ebn Morad, who had been sent against him with a powerful army. In this expedition Jamhur having acquired immense riches, the covetous disposition of the khalif prompted him to send a person express to the army to seize upon all the wealth. This so provoked Jamhur, that he immediately turned his arms against his master; but was soon defeated, and entirely reduced. The following year (the

183 Abdalrahman proclaimed khalif in Spain. 139th of the Hegira), one Abdalrahman, of the house of Ommiyah, after the entire ruin of that family in Asia, arrived in Spain, where he was acknowledged khalif; nor did he or his descendants ever afterwards own subjection to the Arabian khalifs.

184 Attempt to assassinate the khalif. The 140th year of the Hegira is remarkable for an attempt to assassinate the khalif. This attempt was made by the Rawandians; an impious sect, who held the doctrine of metempsychosis or transmigration.—They first offered Al Mansur divine honours, by going in procession round his palace, as the Moslems were wont to do round the Caab; but the khalif, highly incensed at this impiety, ordered 100 of the principal of them to be imprisoned. These however were soon released by their companions; who then went in a body to the palace with an intention to murder their sovereign: but he being a person of uncommon bravery, though he was surprised with very few attendants, mounted a mule, and advanced towards the mutineers with an intention to sell his life as dear as possible. In the mean time, Maan Ebn Zaidat, one of the chiefs of the Ommiyan faction, who had concealed himself in order to avoid the khalif's resentment, sallied out of his retreat, and putting himself at the head of Al Mansur's attendants, charged the rebels with such fury, that he entirely defeated them. This generosity of Maan was so remarkable, that it afterwards passed into a proverb. On this occasion 6000 of the Rawandians were killed on the spot, and the khalif delivered from instant death: he was, however, so much disgusted with the Arabs on account of this attempt, that he resolved to remove the capital of his empire out of their peninsula; and accordingly founded a new city on the banks of the Tigris, which from that time to this has been known by the name of *Bagdad*. The foundations of it were laid in the 145th year of the Hegira, and finished four years after. Arabia. 185 He removes the seat of empire to Bagdad.

On the removal of the seat of government to Bagdad, the peninsula of the Arabs seems all at once to have lost its consequence, and in a short time the inhabitants seem even to have detached themselves from the jurisdiction of the khalifs: for in the 156th year of the Hegira, while Al Mansur was yet living, they made irruptions into Syria and Mesopotamia, as if they had designed to conquer these countries over again for themselves; and though the Arabs, properly so called, continued nominally subject to the khalifs of Bagdad till the abolition of the khalifat by Hulaku the Tartar, yet they did not become subject to him when he became master of that city. There is even the strongest reason to believe that the Arabs (i. e. the inhabitants of the peninsula properly called *Arabia*) have remained independent, not only of Hulaku, but of every other conqueror that the world hath yet produced.

The perpetual independence of the Arabs, indeed, "has been the theme of praise among strangers and natives. The kingdom of Yemen it is true, has been successively subdued by the Abyssinians, the Persians, the sultans of Egypt, and the Turks; the holy cities of Mecca and Medina have repeatedly bowed under a Scythian tyrant; and the Roman province of Arabia embraced the peculiar wilderness in which Ismael and his sons must have pitched their tents in the face of their brethren. Yet these exceptions are temporary or local; the body of the nation has escaped the yoke of the most powerful monarchies: the arms of Sesostris and Cyrus, of Pompey and Trajan, could never achieve the conquest of Arabia; the present sovereign of the Turks may exercise a shadow of jurisdiction, but his pride is reduced to solicit the friendship of a people whom it is dangerous to provoke and fruitless to attack. The obvious causes of their freedom are inscribed on the character and country of the Arabs. Many ages before Mahomet, their intrepid valour had been severely felt by their neighbours in offensive and defensive war. The patient and active virtues of a soldier are insensibly nursed in the habits and discipline of a pastoral life. The care of the sheep and camels is abandoned to the women of the tribe; but the martial youth, under the banner of the emir, is ever on horseback, and in the field, to practice the exercise of the bow, the javelin, and the scymetar. The long memory of their independence is the firmest pledge of its perpetuity; and succeeding generations are animated to prove their descent and to maintain their inheritance. Their domestic feuds are suspended on the approach of a common enemy; and in their last hostilities against the Turks, the caravan of Mecca was attacked and pillaged by fourscore thousand of the confederates. When they advance to battle, the hope of victory is in the front; and in the rear, the assurance of a retreat. Their horses and camels, who in eight or ten days can perform a march of four or five hundred miles, disappear before the conqueror; the secret waters of the desart elude his search; and his victorious troops are consumed with thirst, hunger and fatigue, in

Gibbon's *Hist.* vol. v. p. 178.

186 National independence of the Arabs.

Arabia. in the purſuit of an invſible foe, who ſcorns his efforts, and ſafely repoſes in the heart of the burning ſolitude. The arms and deſarts of the Bedoweens are not only the ſafeguards of their own freedom, but the barriers alſo of the Happy Arabia, whoſe inhabitants, remote from war, are enervated by the luxury of the ſoil and climate. The legions of Auguſtus melted away in diſeaſe and laſſitude; and it is only by a naval power that the reduction of Yemen has been ſucceſsfully attempted. When Mahomet erected his holy ſtandard, that kingdom was a province of the Perſian empire; yet ſeven princes of the Homerites ſtill reigned in the mountains; and the vicegerent of Choſroes was tempted to forget his diſtant country and his unfortunate maſter. The hiſtorians of the age of Juſtinian repreſent the ſtate of the independent Arabs, who were divided by intereſt or affection in the long quarrel of the Eaſt: the tribe of Gaſſan was allowed to encamp on the Syrian territory: the princes of Hira were permitted to form a city about forty miles to the ſouthward of the ruins of Babylon. Their ſervice in the field was ſpeedy and vigorous; but their friendſhip was venal, their faith inconſtant, their enmity capricious: it was an eaſier taſk to excite than to diſarm theſe roving barbarians; and, in the familiar intercourſe of war, they learned to ſee, and to deſpiſe, the ſplendid weakneſs both of Rome and Perſia. From Mecca to the Euphrates, the Arabian tribes were confounded by the Greeks and Latins, under the general appellation of Saracens; a name which every Chriſtian mouth has been taught to pronounce with terror and abhorrence.

187 Their domeſtic freedom and character.

"The ſlaves of domeſtic tyranny may vainly exult in their national independence; but the Arab is perſonally free; and he enjoys, in ſome degree, the benefits of ſociety, without forfeiting the prerogatives of nature. In every tribe ſuperſtition, or gratitude, or fortune, has exalted a particular family above the heads of their equals. The dignities of ſheich and emir invariably deſcend in this choſen race; but the order of ſucceſſion is looſe and precarious; and the moſt worthy or aged of the noble kinſmen are preferred to the ſimple, though important, office of compoſing diſputes by their advice, and guiding valour by their example. The momentary junction of ſeveral tribes produces an army: their more laſting union conſtitutes a nation; and the ſupreme chief, the emir of emirs, whoſe banner is diſplayed at their head, may deſerve, in the eyes of ſtrangers, the honours of the kingly name. If the Arabian princes abuſe their power, they are quickly puniſhed by the deſertion of their ſubjects, who had been accuſtomed to a mild and parental juriſdiction. Their ſpirit is free, their ſteps are unconfined, the deſart is open, and the tribes and families are held together by a mutual and voluntary compact. The ſofter natives of Yemen ſupported the pomp and majeſty of a monarch; but if he could not leave his palace without endangering his life, the active powers of government muſt have been devolved on his nobles and magiſtrates. The cities of Mecca and Medina preſent, in the heart of Aſia, the form or rather the ſubſtance of a commonwealth. The grandfather of Mahomet, and his lineal anceſtors, appear in foreign and domeſtic tranſactions as the princes of their country; but they reigned like Pericles at Athens, or the Medici at Florence, by the opinion of their wiſdom and integrity; their influence was divided with their patrimony; and the ſceptre was transferred from the uncles of the prophet to a younger branch of the tribe of Koreiſh. On ſolemn occaſions they convened the aſſembly of the people; and, ſince mankind muſt be either compelled or perſuaded to obey, the uſe and reputation of oratory among the ancient Arabs is the cleareſt evidence of public freedom. But their ſimple freedom was of a very different caſt from the nice and artificial machinery of the Greek and Roman republics, in which each member poſſeſſed an undivided ſhare of the civil and political rights of the community. In the more ſimple ſtate of the Arabs, the nation is free, becauſe each of her ſons diſdains a baſe ſubmiſſion to the will of a maſter. His breaſt is fortified with the auſtere virtues of courage, patience, and ſobriety: the love of independence prompts him to exerciſe the habits of ſelf-command; and the fear of diſhonour guards him from the meaner apprehenſion of pain, of danger, and of death. The gravity and firmneſs of the mind is conſpicuous in its outward demeanor: his ſpeech is ſlow, weighty, and conciſe; he is ſeldom provoked to laughter; his only geſture is that of ſtroaking his beard, the venerable ſymbol of manhood; and the ſenſe of his own importance teaches him to accoſt his equals without levity, and his ſuperiors without awe. The liberty of the Saracens ſurvived their conqueſts: the firſt khalifs indulged the bold and familiar language of their ſubjects: they aſcended the pulpit to perſuade and edify the congregation; nor was it before the ſeat of empire was removed to the Tigris, that the Abbaſſides adopted the proud and pompous ceremonial of the Perſian and Byzantine courts.

188 Civil wars and private revenge.

"In the ſtudy of nations and men, we may obſerve the cauſes that render them hoſtile or friendly to each other, that tend to narrow or enlarge, to mollify or exaſperate, the ſocial character. The ſeparation of the Arabs from the reſt of mankind has accuſtomed them to confound the ideas of ſtranger and enemy; and the poverty of the land has introduced a maxim of juriſprudence, which they believe and practiſe to the preſent hour. They pretend, that in the diviſion of the earth the rich and fertile climates were aſſigned to the other branches of the human family; and that the poſterity of the outlaw Iſmael might recover, by fraud or force, the portion of inheritance of which he had been unjuſtly deprived. According to the remark of Pliny, the Arabian tribes are equally addicted to theft and merchandiſe: the caravans that traverſe the deſart are ranſomed or pillaged; and their neighbours, ſince the remote times of Job and Seſoſtris, have been the victims of their rapacious ſpirit. If a Bedoween diſcovers from afar a ſolitary traveller, he rides furiouſly againſt him, crying, with a loud voice, "Undreſs thyſelf, thy aunt (*my wife*) is without a garment." A ready ſubmiſſion intitles him to mercy; reſiſtance will provoke the aggreſſor, and his own blood muſt expiate the blood which he preſumes to ſhed in legitimate defence. A ſingle robber, or a few aſſociates, are branded with their genuine name; but the exploits of a numerous band aſſume the character of lawful and honourable war. The temper of a people, thus armed againſt mankind, was doubly inflamed by the domeſtic licence of rapine, murder, and revenge. In the conſtitution of Europe, the right of peace and war is now

now confined to a ſmall, and the actual exerciſe to a much ſmaller, liſt of reſpectable potentates; but each Arab, with impunity and renown, might point his javelin againſt the life of his countryman. The union of the nation conſiſted only in a vague reſemblance of language and manners; and in each community the juriſdiction of the magiſtrate was mute and impotent. Of the time of ignorance which preceded Mahomet, 1700 battles are recorded by tradition: hoſtility was embittered with the rancour of civil faction; and the recital, in proſe or verſe, of an obſolete feud was ſufficient to rekindle the ſame paſſions among the deſcendants of the hoſtile tribes. In private life, every man, at leaſt every family, was the judge and avenger of its own cauſe. The nice ſenſibility of honour, which weighs the inſult rather than the injury, ſheds its deadly venom on the quarrels of the Arabs: the honour of their women, and of their *beards*, is moſt eaſily wounded; an indecent action, a contemptuous word, can be expiated only by the blood of the offender; and ſuch is their patient inveteracy, that they expect whole months and years the opportunity of revenge. A fine or compenſation for murder is familiar to the barbarians of every age: but in Arabia the kinſmen of the dead are at liberty to accept the atonement, or, to exerciſe with their own hands the law of retaliation. The refined malice of the Arabs refuſes even the head of the murderer, ſubſtitutes an innocent to the guilty perſon, and transfers the penalty to the beſt and moſt conſiderable of the race by whom they have been injured. If he falls by their hands, they are expoſed in their turn to the danger of repriſals; the intereſt and principal of the bloody debt are accumulated; the individuals of either family lead a life of malice and ſuſpicion, and 50 years may ſometimes elapſe before the account of vengeance be finally ſettled. This ſanguinary ſpirit, ignorant of pity or forgiveneſs, has been moderated, however, by the maxims of honour, which require in every private encounter ſome decent equality of age and ſtrength, of numbers and weapons.

189
Annual truce.

An annual feſtival of two, perhaps of four months, was obſerved by the Arabs before the time of Mahomet; during which their ſwords were religiouſly ſheathed both in foreign and domeſtic hoſtility: and this partial truce is more ſtrongly expreſſive of the habits of anarchy and warfare.

190
Their ſocial qualifications and virtues.

"But the ſpirit of rapine and revenge was attempered by the milder influence of trade and literature. The ſolitary peninſula is encompaſſed by the moſt civilized nations of the ancient world: the merchant is the friend of mankind; and the annual caravans imported the firſt ſeeds of knowledge and politeneſs into the cities, and even the camps of the deſart. The arts of grammar, of metre, and of rhetoric, were unknown to the freeborn eloquence of the Arabian; but their penetration was ſharp, their fancy luxuriant, their wit ſtrong and ſententious, and their more elaborate compoſitions were

191
Love of poetry.

addreſſed with energy and effect to the minds of their hearers. The genius and merit of a riſing poet was celebrated by the applauſe of his own and the kindred tribes. A ſolemn banquet was prepared, and a chorus of women, ſtriking their tymbals, and diſplaying the pomp of their nuptials, ſung in the preſence of their ſons and huſbands the felicity of their native tribe; that a champion had now appeared to vindicate their rights; that a herald had raiſed his voice to immortaliſe their renown. The diſtant or hoſtile tribes reſorted to an annual fair, which was aboliſhed by the fanaticiſm of the firſt Moſlems; a national aſſembly that muſt have contributed to refine and harmoniſe the barbarians. Thirty days were employed in the exchange, not only of corn and wine, but of eloquence and poetry. The prize was diſputed by the generous emulation of the bards; the victorious performance was depoſited in the archives of princes and emirs; and we may read in our own language the ſeven original poems which were inſcribed in letters of gold and ſuſpended in the temple of Mecca. The Arabian poets were the hiſtorians and moraliſts of the age; and if they ſympathiſed with the prejudices, they inſpired and crowned the virtues, of their countrymen. The indiſſoluble union of generoſity and valour was the darling theme of their ſong; and when they pointed their keeneſt ſatyr againſt a deſpicable race, they affirmed, in the bitterneſs of reproach, that the men knew not how to give, nor the women to deny. The ſame hoſpitality which was practiſed by Abraham, and celebrated by Homer, is ſtill renewed in the camps of the Arabs. The ferocious Bedoweens, the terror of the deſart, embrace, without enquiry or heſitation, the ſtranger who dares to confide in their honour and to enter their tent. His treatment is kind and reſpectful: he ſhares the wealth or the poverty of his hoſt; and after a needful repoſe, he is diſmiſſed on his way, with thanks, with bleſſings, and perhaps with gifts.

192
Ancient idolatry.

"The religion of the Arabs, as well as of the Indians, conſiſted in the worſhip of the ſun, the moon, and the fixed ſtars; a primitive and ſpecious mode of ſuperſtition. The bright luminaries of the ſky diſplay the viſible image of a deity; their number and diſtance convey to a philoſophic, or even a vulgar eye, the idea of boundleſs ſpace: the character of eternity is marked on theſe ſolid globes, that ſeem incapable of corruption or decay: the regularity of their motions may be aſcribed to a principle of reaſon or inſtinct; and their real or imaginary influence encourages the vain belief that the earth and its inhabitants are the object of their peculiar care. The ſcience of aſtronomy was cultivated at Babylon; but the ſchool of the Arabs was a clear firmament and a naked plain. In their nocturnal marches, they ſteered by the guidance of the ſtars: their names, and order, and daily ſtation, were familiar to the curioſity and devotion of the Bedoween; and he was taught by experience to divide in 28 parts the zodiac of the moon, and to bleſs the conſtellations, who refreſhed, with ſalutary rains, the thirſt of the deſart. The reign of the heavenly orbs could not be extended beyond the viſible ſphere; and ſome metaphyſical powers were neceſſary to ſuſtain the tranſmigration of ſouls and the reſurrection of bodies: a camel was left to periſh on the grave, that he might ſerve his maſter in another life; and the invocation of departed ſouls implies that they were ſtill endowed with conſciouſneſs and power. Each tribe, each family, each independent warrior, created and changed the rites and the object of his fantaſtic worſhip; but the nation, in every age, has bowed to the religion, as

Arabia.

193 The Caaba or temple of Mecca. well as to the language of Mecca. The genuine antiquity of the Caaba extends beyond the Christian æra: in describing the coast of the Red Sea, the Greek historian Diodorus has remarked, between the Thamaudites and the Sabæans, a famous temple, whose superior sanctity was revered by *all* the Arabians: the linen or silken veil, which is annually renewed by the Turkish emperor, was first offered by a pious king of the Homerites, who reigned 700 years before the time of Mahomet. A tent or a cavern might suffice for the worship of the savages, but an edifice of stone and clay has been erected in its place; and the art and power of the monarchs of the East have been confined to the simplicity of the original model. A spacious portico incloses the quadrangle of the Caaba; a square chapel, 24 cubits long, 23 broad, and 27 high: a door and a window admit the light; the double roof is supported by three pillars of wood; a spout (now of gold) discharges the rain-water, and the well Zemzem is protected by a dome from accidental pollution. The tribe of Koreish, by fraud or force, had acquired the custody of the Caaba: the sacerdotal office devolved through four lineal descents to the grandfather of Mahomet; and the family of the Hashemites, from whence he sprung, was the most respectable and sacred in the eyes of their country. The precincts of Mecca enjoyed the rights of sanctuary; and, in the last month of each year, the city and the temple were crowded with a long train of pilgrims, who presented their vows and offerings in the house of God. The same rites which are now accomplished by the faithful Mussulman were invented and practised by the superstition of the idolaters. At an awful distance they cast away their garments: seven times, with hasty steps, they encircled the Caaba, and kissed the black stone: seven times they visited and adored the adjacent mountains; seven times they threw stones into the valley of Mina; and the pilgrimage was atchieved, as at the present hour, by a sacrifice of sheep and camels, and the burial of their hair and nails in the consecrated ground. Each tribe either found or introduced in the Caaba their domestic worship: the temple was adorned, or defiled, with 360 idols of men, eagles, lions, and antelopes; and most conspicuous was the statue of Hebal, of red agate, holding in his hand seven arrows, without heads or feathers, the instruments and symbols of profane divination. But this statue was a monument of Syrian arts: the devotion of the ruder ages was content with a pillar or a tablet; and the rocks of the desart were hewn into gods or altars, in imitation of the black stone of Mecca, which is deeply tainted with the reproach of an idolatrous origin. From Japan to Peru,

194 Sacrifices and rites. the use of sacrifice has universally prevailed; and the votary has expressed his gratitude or fear by destroying or consuming, in honour of the gods, the dearest and most precious of their gifts. The life of a man is the most precious oblation to deprecate a public calamity: the altars of Phœnicia and Egypt, of Rome and Carthage, have been polluted with human gore: the cruel practice was long preserved among the Arabs; in the third century, a boy was annually sacrificed by the tribe of the Dumatians; and a royal captive was piously slaughtered by the prince of the Saracens, the ally and soldier of the emperor Justinian. The father of Mahomet himself was devoted by a rash vow, and hardly ransomed for the equivalent of 100 camels. The Arabs, like the Jews and Egyptians, abstained from the taste of swine's flesh; and they circumcised their children at the age of puberty: the same customs, without the censure or the precept of the Koran, have been silently transmitted to their posterity and proselytes; and it has been sagaciously conjectured, that the artful legislator indulged the stubborn prejudices of his countrymen.

195 Introduction of the Sabians. "Arabia was free: From the adjacent kingdoms, which were shaken by the storms of conquest and tyranny, the persecuted sects fled to the happy land where they might profess what they thought, and practise what they professed; and the religions of the Sabians and Magians, of the Jews and Christians, were disseminated from the Persian Gulf to the Red Sea. In a remote period of antiquity, Sabianism was diffused over Asia by the science of the Chaldæans and the arms of the Assyrians. From the observations of 2000 years, the priests and astronomers of Babylon deduced the eternal laws of nature and providence. They adored the seven gods or angels who directed the course of the seven planets, and shed their irresistible influence on the earth. The attributes of the seven planets, with the twelve signs of the zodiac, and the twenty-four constellations of the northern and southern hemisphere, were represented by images and talismans; the seven days of the week were dedicated to their respective deities; the Sabians prayed thrice each day; and the temple of the moon at Haran was the term of their pilgrimage. But the flexible genius of their faith was always ready either to teach or to learn. The altars of Babylon were overturned by the Magians; but 196 The Magians.

the injuries of the Sabians were revenged by the sword of Alexander; Persia groaned above 500 years under a foreign yoke; and the purest disciples of Zoroaster escaped from the contagion of idolatry, and breathed with their adversaries the freedom of the desart. Seven hundred years before the death of Mahomet the 197 The Jews.

Jews were settled in Arabia: and a far greater multitude was expelled from the holy land in the wars of Titus and Hadrian. The industrious exiles aspired to liberty and power: they erected synagogues in the cities and castles in the wilderness; and their Gentile converts were confounded with the children of Israel, whom they resembled in the outward mark of circumcision. The Christian missionaries were still more ac- 197 The Christians.

tive and successful: the Catholics asserted their universal reign; the sects whom they oppressed successively retired beyond the limits of the Roman empire; the Marcionites and Manichæans dispersed their *fantastic* opinions and apocryphal gospels; the churches of Yemen, and the princes of Hira and Gassen, were instructed in a purer creed by the Jacobite and Nestorian bishops." Such was the state of religion in Arabia previous to the appearance of Mahomet. See n° 22. *supra*.

As the Arabs are one of the most ancient nations in the world, having inhabited the country they at present possess almost from the deluge, without intermixing with other nations, or being subjugated by any foreign power, their language must have been formed soon after, if not at, the confusion of Babel. The two principal

pal dialects of it were, that ſpoken by the Hamyarites and other genuine Arabs, and that of the Koreiſh, in which Mahomet wrote the Koran. The firſt is ſtyled by the Oriental writers the *Arabic* of *Hamyar*, and the other *the pure* or *defecated*. As Yarab, grandfather of Hamyar, is ſuppoſed by the Oriental writers to have been the firſt whoſe tongue deviated from the Syriac to the Arabic, the Hamyaritic dialect, according them, muſt have approached nearer to the purity of the Syriac; and conſequently have been more remote from the true genius of the Arabic than that of any other tribe. The dialect of the Koreiſh, termed by the Koran *the perſpicuous and clear Arabic*, is referred to Iſhmael as its author; who, ſay the above-mentioned writers, firſt ſpoke it; and, as Dr Pocock believes, after he had contracted an alliance with the family of Jorham by marriage, formed it of their language and the original Hebrew. As, therefore, the Hamyaritic dialect partook principally of the Syriac, ſo that of the Koreiſh was ſuppoſed to conſiſt chiefly of the Hebrew. But, according to Jallalo'ddin, the politeneſs and elegance of the dialect of the Koreiſh ought rather to be attributed to their having, from the remoteſt antiquity, the cuſtody of the Caaba, and dwelling in Mecca the centre of Arabia. The Arabs are full of the commendations of their language, which is very harmonious, expreſſive, and, as they ſay, ſo immenſely copious, that no man uninſpired can be a perfect maſter of it in its utmoſt extent. How much, in this laſt article, it is ſuperior to the Greek and Latin tongues, in ſome meaſure appears from hence, that ſometimes a bare enumeration of the Arabic names of one particular thing, and an explication of them, will make a conſiderable volume. Notwithſtanding this, the Arabs believe the greateſt part of their language to be loſt; which will not ſeem improbable, when we conſider how late the art of writing became generally practiſed among them. For though it was known to Job their countryman, to the Edomites, as well as the other Arabian nations bordering upon Egypt and Phœnicia, and to the Hamyarites many centuries before Mahomet, as appears from ſome ancient monuments ſaid to be remaining in their character; yet the other Arabs, and thoſe of Mecca in particular, unleſs ſuch of them as were either Jews or Chriſtians, were to the time of Moramer perfectly ignorant of it. It was the ancient Arabic language preceding the reign of Juſtinian, which ſo nearly reſembled the Ethiopic; for ſince that time, and eſpecially ſince the age of Mahomet, all the Arabic dialects have been not a little corrupted. This is now the learned language of the Mahometans, who ſtudy it as the European Chriſtians do the Hebrew, Greek, and Latin.

199 Letters. The character uſed by them, the moſt ancient of any peculiar to the Arabs, wherein the letters were not diſtinctly ſeparate, went by the appellation of *Al Moſnad*, from the mutual dependency of its letters or parts upon one another. This was neither publickly taught, nor ſuffered to be uſed, without permiſſion firſt obtained. Could we depend upon what Al Firauzabadius relates from Ebn Haſhem, this character muſt have been of a very high antiquity; ſince an inſcription in it, according to the laſt author, was found in Yaman, as old as the time of Joſeph. Be that as it will, Moramer Ebn Morra of Anbar, a city of Irak, who lived not many years before Mahomet, was the inventor of the preſent Arabic character, which Baſhar the Kendian, who married the ſiſter of Abu Sofian, is ſaid to have learned from the houſe of Anbar, and to have introduced at Mecca but a little time before the inſtitution of Mahometiſm. Moramer's alphabet the Oriental authors agree to have been very different from the ancient one of the Hamyarites, ſince they diſtinguiſh the Hamyaritic and Arabic pens. In Mahomet's time, the Morameric alphabet had made ſo ſmall a progreſs, that no one in Yaman could either write or read it; nay, Mahomet himſelf was incapable of doing either; for which reaſon he was called the *illiterate prophet*. The letters of this alphabet were very rude; being either the ſame with, or very much like, the Cufic; which character is ſtill found in inſcriptions and the titles of ancient books; nay, for many years it was the only one uſed by the Arabs, the Koran itſelf being at firſt written therein. In order to perpetuate the memory of Moramer's invention, ſome authors call the Arabic letters *al Moramer*, i. e. *the progeny of Moramer*. The moſt remarkable ſpecimens of the *Cufic* character (ſo denominated from Cufa, a city of Irak, where ſome of the firſt copies of the Koran were written) are the following: Part of that book in it on vellum, brought from Egypt by Mr Greaves; ſome other fragments of the ſame book in it publiſhed by Sir John Chardin; certain paſſages of a MS. in the Bodleian library the legends on ſeveral Saracenic coins dug up not many years ago on the coaſt of the Baltic, not far from Dantzick; and, according to Mr Profeſſor Hunt, thoſe noble remains of it that are, or were lately, to be ſeen in Mr Joſeph Ames's valuable collection of antique curioſities. As to the true origin of the ancient and modern Arabic alphabets, we muſt own ourſelves pretty much in the dark. See ALPHABET.

The Arabian learning may be divided into two periods, viz. *Ante-Mahometan* and *Mahometan*. 200 Learning, &c.

The Arab learning, in this firſt period, conſiſted, according to Abulpharagius, in the knowledge of their language, the propriety of diſcourſe, the compoſition of verſe, and the ſcience of the ſtars: but their chief attention ſeems to have been directed to oratory and poetry.

The ſecond period is more diſtinguiſhed, at leaſt from the time of Al-Mamon, the ſeventh caliph of the family of the Abaſſides, who flouriſhed about the year 820, and has the honour of being the founder of the modern Arabian learning. He ſent for all the beſt books out of Chaldea, Greece, Egypt, and Perſia, relating to phyſic, aſtronomy, coſmography, muſic, chronology, &c. and penſioned a number of learned men, ſkilled in the ſeveral languages and ſciences, to tranſlate them into Arabic. By this means, divers of the Greek authors, loſt in their own country and language, have been preſerved in Arabic. From that time Arabia became the chief ſeat of learning; and we find mention by Abulpharagius, Pococke, D'Herbelot, and Hottinger, of learned men, and books without number.

The revival of learning in the 10th century, by Gerbert, known after his elevation to the pontificate by the title of Silveſter II. and afterwards among the Europeans in general, may be aſcribed to the inſtructions and writings of the Arabian doctors and philoſophers, and

and to the ſchools which they founded in ſeveral parts of Spain and Italy. And in the 12th century, the inquiſitive of different countries frequented the ſchools of the Saracens in Spain, and diſſeminated the knowledge which they obtained there after their return. At this time, many of the learned productions of the Arabians were tranſlated into Latin, which facilitated the general progreſs of ſcience.

The philoſophy of the Arabians, before Mahomet, was Sabian, and included the ſyſtem and ceremonies of that ſect of idolaters. This it was that Mahomet ſet himſelf to decry; and he is even ſaid by ſome to have carried his oppoſition ſo far, as to prohibit, if not puniſh, all ſtudy of philoſophy. But his followers, by degrees, got over this reſtraint; the love of learning increaſed; till, under the memorable caliphate of Al-Mamon, Ariſtotle's philoſophy was introduced and eſtabliſhed among them; and from them propagated, with their conqueſts, through Egypt, Africa, Spain, and other parts. As they choſe Ariſtotle for their maſter, they chiefly applied themſelves to that part of philoſophy called *logic*, and thus became proficients in the knowledge of words rather than things. Whence they have been ſometimes denominated, *Maſters of the wiſdom of words;* ſometimes the *Talking ſect.* Their philoſophy was involved in quaint arbitrary terms and notions, and their demonſtrations drawn from thence as from certain principles, &c. *Walch Hiſt. Log.* lib. ii. ſec. 2. § 1.

Their phyſic ſucceeded the Grecian; and their phyſicians handed down the art to us, having made conſiderable improvements, chiefly in the pharmaceutical and chemical parts.

It is certain we owe to them moſt of our ſpices and aromatics, as nutmegs, cloves, mace, and other matters of the produce of India. We may add, that moſt of the gentle purgatives were unknown to the Greeks, and firſt introduced by the Arabs, as manna, ſenna, rhubarb, tamarinds, caſſia, &c. They likewiſe brought ſugar into uſe in phyſic, where, before, only honey was uſed. They alſo found the art of preparing waters and oils, of divers ſimples, by diſtillation and ſublimation. The firſt notice of the ſmall-pox and the meaſles is likewiſe owing to them. Laſtly, the reſtoration of phyſic in Europe took its riſe from their writings. M. Le Clerc has given a ſketch, and Dr Freind an ample hiſtory of the Arabian phyſic. We have alſo a *notitia* of all the Arabian phyſicians by Fabricius.

Their poetry may be divided into two ages. The ancient, according to Voſſius, was no other than rhiming; was a ſtranger to all meaſure and rule; the verſes looſe and irregular, confined to no feet, number of ſyllables, or any thing elſe, ſo that they rhimed at the end; oftentimes all the verſes in the poem ended with the ſame rhime. It is in ſuch verſe that the alcoran is ſaid to be written.

The modern Arabian poetry takes its date from the caliphate of Al Raſchid, who lived toward the cloſe of the eight century. Under him poetry became an art, and laws of proſody were laid down. Their compariſons, in which they abound, are taken, with little choice, from tents, camels, hunting, and the ancient manners of the Arabs.

201 Mechanical arts.

That ſome of the Arabs had a good degree of knowledge in ſeveral mechanical arts, appears from Strabo, who informs us, that the people of Tamna and the adjacent provinces had magnificent temples, and elegant houſes, built in the Egyptian taſte. The ſame author likewiſe relates, that in Arabia Felix, beſides the huſbandmen, there were many artificers; and, among others, thoſe which made palm-wine, which he intimates, was much uſed by the Arabs. As for the exerciſe of arms and horſemanſhip, they looked upon this as one of their principal accompliſhments, being obliged to practiſe and encourage it by reaſon of the independency of their tribes, whoſe frequent jarring made wars almoſt continual amongſt them, which for the moſt part ended in field-battles. Hence it became an uſual ſaying amongſt them, that God had beſtowed four peculiar things on the Arabs, viz. *turbans inſtead of diadems, tents inſtead of walls and houſes, ſwords inſtead of intrenchments, and poems inſtead of written laws.* The principal arms uſed by the ancient Arabs were bows and arrows, darts or javelins, and broad ſwords or ſcymitars. The bows and arrows were the moſt ancient of theſe; being uſed by Iſhmael himſelf, according to Scripture. It is probable alſo, that ſome of them were acquainted with every branch of the military art cultivated by their neighbours the Egyptians, Syrians, and Phœnicians.

202 Commerce.

Before the Portugueſe interrupted the navigation of the Red ſea, the Arabs were the factors of all the trade that paſſed thro' that channel. Aden, which is ſituated at the moſt ſouthern extremity of Arabia upon the Indian ocean, was the mart in theſe parts. The ſituation of its harbour, which opened an eaſy communication with Egypt, Ethiopia, India, and Perſia, had rendered it, for many ages, one of the moſt flouriſhing factories in Aſia. Fifteen years after it had repulſed the great Albuquerque, who attempted to demoliſh it in 1513, it ſubmitted to the Turks, who did not long remain maſters of it. The king of Yemen, who poſſeſſed the only diſtrict in Arabia that merits the title of *Happy*, drove them from thence, and removed the trade to Mocha, a place in his dominions which till then was only a village.

This trade was at firſt inconſiderable; conſiſting principally in myrrh, incenſe, aloes, balm of Mecca, ſome aromatics, and medicinal drugs. Theſe articles, the exportation of which is continually retarded by exorbitant impoſts, and does not exceed at preſent 30,625 l. were at that time more in repute than they have been ſince: but muſt have been always of little conſequence. Soon after a great change enſued from the introduction of coffee.

Though this article is generally uſed in the Arabian entertainments, none but the rich citizens have the pleaſure of taſting the berry itſelf. The generality are obliged to content themſelves with the ſhell and the huſk of this valuable production. Theſe remains, ſo much deſpiſed, make a liquor of a pretty clear colour, which has a taſte of coffee without its bitterneſs and ſtrength. Theſe articles may be had at a low price at Betelfagui, which is the general market for them. Here likewiſe is ſold all the coffee which comes out of the country by land. The reſt is carried to Mocha, which is 35 leagues diſtant, or to the nearer ports of Lohia or Hodeida, from whence it is tranſported in ſmall veſſels to Jodda. The Egyptians fetch it from the

Arabia. the last mentioned place, and all other nations from the former.

The quantity of coffee exported may be estimated at twelve millions five hundred and fifty thousand weight. The European companies take off a million and a half; the Persians three millions and a half; the fleet from Suez six millions and a half; Indostan, the Maldives, and the Arabian colonies on the coast of Africa, fifty thousand; and the caravans a million.

As the coffee which is bought up by the caravans and the Europeans is the best that can be procured, it costs about 8¼d. a pound. The Persians, who content themselves with that of an inferior quality, pay no more than about 6¼d. a pound. The Egyptians purchase it at the rate of about 8d. their cargoes being composed partly of good and partly of bad coffee. If we estimate coffee at about 7⅜d. a pound, which is the mean price, the profits accruing to Arabia from its annual exportation will amount to 384,343 l. 15 s. This money does not go into their coffers; but it enables them to purchase the commodities brought from the foreign markets to their ports of Jodda and Mocha.

Mocha receives from Abyssinia, sheep, elephants teeth, musk, and slaves. It is supplied from the eastern coast of Africa with gold, slaves, amber, and ivory; from the Persian Gulph, with dates, tobacco, and corn; from Surat, with a vast quantity of coarse, and a few fine linens; from Bombay and Pondicherry, with iron, lead, and copper, which are carried thither from Europe; from Malabar, with rice, ginger, pepper, Indian saffron, with coire, cardamom, and also with planks; from the Maldives, with gum, benzoin, aloes-wood, and pepper, which these islands take in exchange; from Coromandel, with 400 or 500 bales of cottons, chiefly blue. The greatest part of these commodities, which may fetch 262,500l. are consumed in the interior part of the country. The rest, particularly the cottons, are disposed of in Abyssinia, Socotora, and the eastern coast of Africa.

None of the branches of business which are managed at Mocha, as well as throughout all the country of Yaman, or even at Sanaa the capital, are in the hands of the natives. The extortions with which they are perpetually threatened by the government deter them from interfering in them. All the warehouses are occupied by the Banians of Surat or Guzaret, who make a point of returning to their own country as soon as they have made their fortunes. They then resign their settlements to merchants of their own nation, who retire in their turn, and are succeeded by others.

The European companies, who enjoy the exclusive privilege of trading beyond the Cape of Good Hope, formerly maintained agents at Mocha. Notwithstanding it was stipulated by a solemn capitulation, that the imposts demanded should be rated at two and a quarter *per cent.* they were subject to frequent extortions: the governor of the place insisting on their making him presents, which enabled him to purchase the favour of the courtiers, or even of the prince himself. However, the profits they obtained by the sale of European goods, particularly clothes, made them submit to these repeated humiliations. When these several articles were furnished by Grand Cairo, it was then impossible to withstand the competition, and the fixed settlements were therefore given up.

The trade was carried on by ships that failed from Europe with iron, lead, copper, and silver, sufficient to pay for the coffee they intended to buy. The supercargoes, who had the care of these transactions, settled the accounts every time they returned. These voyages, which at first were pretty numerous and advantageous, have been successively laid aside. The plantations of coffee, made by the European nations in their colonies, have equally lessened the consumption and the price of that which comes from Arabia. In process of time, these voyages did not yield a sufficient profit to answer the high charges of undertaking them on purpose. The companies of England and France then resolved, one of them to send ships from Bombay, and the other from Pondicherry, to Mocha, with the merchandise of Europe and India. They even frequently had recourse to a method that was less expensive. The English and French visit the Red sea every year. Tho' they dispose of their merchandise there to good advantage, they can never take in cargoes from thence for their return. They carry, for a moderate freight, the coffee belonging to the companies who lade the vessels with it, which they dispatch from Malabar and Coromandel to Europe. The Dutch company, who prohibit their servants from fitting out ships, and who send no vessels themselves, to the gulph of Arabia, are deprived of the share they might take in this branch of commerce. They have also given up a much more lucrative branch, that of Jodda.

Jodda is a port situated near the middle of the gulph of Arabia, 20 leagues from Mecca. The government there is of a mixed kind: the grand Signior and the Xeriff of Mecca share the authority and the revenue of the customs between them. These imposts are levied upon the Europeans at the rate of 8 *per cent.* and upon other nations at 13. They are always paid in merchandise, which the managers oblige the merchants of the country to buy at a very dear rate. The Turks, who have been driven from Aden, Mocha, and every part of the Yaman, would long ago have been expelled from Jodda, if there had not been room to apprehend that they might revenge themselves in such a manner as to put an end to their pilgrimages and commerce.

203 Coins. The coins, which are current at Mocha, the principal port of the Red Sea, are dollars of all kinds; but they abate five per cent. on the pillar dollars, because they are reckoned not to be the purest silver, and the dollar weight with them is 17 drams 14 grains. All their coins are taken by weight, and valued according to their pureness. The gold coins current here are ducats of Venice, Germany, Turkey, Egypt, &c. The comasses are a small coin, which are taken at such a price as the government sets on them; and they keep their accounts in an imaginary coin, called *cabeers*, of which 80 go to a dollar. For an account of the ancient coins called *dinars* and *dirhems*, see these two articles.

Gum ARABIC. See Gum.

Arabia ‖ Arabici

ARABICI, a sect who sprung up in Arabia; about the year 207, whose distinguishing tenet was, that the soul died with the body, and also rose again with it.

Eusebius, lib. vi. c. 38. relates, that a council was called to stop the progress of this rising sect; and that Origen assisted at it; and convinced them so thoroughly of their error that they abjured it.

ARABIS, BASTARD TOWER-MUSTARD: A genus of the siliquosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, *Siliquosæ*. The generic mark consists in 4 nectiferous glands which lie on the inside of each leaf of the calyx. There are 8 species; but none of them remarkable for their beauty or other properties. Only one of these, the thaliana or mouse-ear, is a native of Britain. It is a low plant, seldom rising more than four or five inches high, branching on every side, having small white flowers growing alternately, which have each four petals in form of a cross, that are succeeded by long slender pods filled with small round seeds. It grows naturally on sandy ground or old walls. Sheep are not fond of it, and swine refuse it.

ARABISM, ARABISMUS, an idiom or manner of speaking peculiar to the Arabs or the Arabic language.

ARABIST, a person curious of, and skilled in, the learning and languages of the Arabians: such were Erpenius and Golius. The surgeons of the 13th century are called *Arabists* by Severinus.

ARABLE LANDS, those which are fit for tillage, or which have been formerly tilled.

ARACAN, the capital of a small kingdom to the north-east of the Bay of Bengal, situated in E. Long. 93. 0. N. Lat. 20. 30. It has the conveniency of a spacious river, and a harbour large enough to hold all the ships in Europe. It is said by Schouten to be as large as Amsterdam; but the houses are slight, being made with palm-trees and bomboo-canes, and covered with leaves of trees. They are seldom above six feet high, but have many windows or air-holes. But the people of the highest rank are much better accommodated. They have no kitchens, chimneys, or cellars, which oblige the women to dress the victuals out of doors. Some of the streets are on the ridges of rocks, wherein are a great many shops. Their orchards and gardens contain all the fruit common to the Indies, and their trees are green all the year. Their common drink is toddy; which is the sap of the cocoa-tree, and when new will intoxicate like wine, but soon grows sour. Elephants and buffaloes are very numerous here, and are made use of instead of horses. They have plenty of provisions, and but little trade: for when Mr Channoch was here in 1686, with six large ships, there was nothing to be had in the way of commerce; and yet the country produces lead, tin, stick-lac, and elephants teeth. The Mogul's subjects come here to purchase these commodities; and sometimes meet with diamonds, rubies, and other precious stones. They were formerly governed by a king of their own, called the king of the *White Elephant;* but this country has been conquered by the king of Pegu. They pay little or no regard to the chastity of their women, and the common sailors take great liberties among them. Their religion is Paganism; and the idols, temples, and priests are very numerous. The dress of the better sort is very slight, for it consists chiefly of a piece of white cotton over their arms, breast, and belly, with an apron before. The complexion of the women is tolerable; they wear thin flowered guaze over their breast and shoulders, and a piece of cotton, which they roll three or four times round their waist, and let it hang as low as their feet. They curl their hair, and put glass rings in their ears, and stretch them of a monstrous length. On their arms and legs they have hoops of copper, ivory, silver, &c. The country produces great quantities of rice, and the water is good. Their flocks of sheep and herds of cattle are also numerous near Aracan; but what they say of the towns and villages, with which the country is pretended to be overspread, may be doubted. Captain Hamilton affirms, that there are but few places inhabited, on account of the great number of wild elephants and buffaloes, which would destroy the fruits of the ground; and that the tigers would destroy the tame animals. There are some islands near the sea, inhabited by a few miserable fishermen, who can just keep themselves from starving, tho' they are out of the reach of oppression. The rich burn the dead bodies; but the poor, who are not able to buy wood, throw them into the river.

ARACHIS, in botany: A genus of the diadelphia order, belonging to the decandria class of plants; and, in the natural method, ranking under the 32d order, *Papilionaceæ*. There is only one species, the hypogæa, an annual plant, and a native of Brasil and Peru. The stalks are long, trail upon the ground, and are furnished with winged leaves, composed of four hairy lobes each. The flowers are produced singly on long peduncuis; they are yellow, of the pea kind, and each contains ten awl-shaped stamina, nine of which are tied together, and the upper one stands off. In the centre is an awl-shaped stylus, crowned with a simple stigma. The germen is oblong, and becomes an oval oblong pod, containing two or three oblong blunt seeds.—This plant is cultivated in all the American settlements for the seeds, which make a considerable part of the food of the slaves. The manner of perfecting them is very singular: for as the flowers fall off, the young pods are forced into the ground by a natural motion of the stalks, and there they are entirely buried, and not to be discovered without digging for them; whence they have taken the name of *ground nuts*.

ARACHNE, in fabulous history, a young maid of Lydia, said to have been the inventress of spinning. She is fabled to have been so skilful in this art, as to challenge Minerva at it; who tore her work, and struck her; which disgrace driving her to despair, she hanged herself. Minerva, from compassion, brought her to life, and transformed her into a spider, which still employs itself in spinning.

ARACHNOIDES, in anatomy, an appellation given to several membranes; as the tunic of the crystalline humour of the eye, the external lamina of the pia mater, and one of the coverings of the spinal marrow.

ARACK, ARRACK, or RACK, a spirituous liquor imported from the East Indies, used by way of dram and in punch.

The word *arack*, according to Mr Lockyer, is an Indian name for strong waters of all kinds; for they call our spirits and brandy *English arack*. But what we understand by the name *arack*, he affirms is really no other than a spirit procured by distillation from a vegetable juice called *toddy*, which flows by incision out of the cocoa-nut tree, like the birch-juice procured among us. The toddy is a pleasant drink by itself, when new, and purges those who are not used to it; and, when stale, it is heady, and makes good vinegar.

The

Arack.

The English at Madrass use it as leaven to raise their bread with.

Others are of opinion, that the arack, or arrack, is a vinous spirit obtained by distillation, in the East Indies, from rice or sugar, fermented with the juice of cocoa-nuts.

The Goa arack is said to be made from the toddy, the Batavia arack from rice and sugar; and there is likewise a kind of shrub from which arack is made.

Goa and Batavia are the chief places for arack.—At Goa there are divers kinds; single, double, and treble distilled. The double distilled, which is that commonly sent abroad, is but a weak spirit in comparison with Batavia arack; yet, on account of its peculiar and agreeable flavour, is preferred to all the other aracks of India. This flavour is attributed to the earthen vessels which they use at Goa to draw the spirit; whereas at Batavia they use copper stills.

The Parier arack made at Madrass, and the Columbo and Quilone arack at the other places, being fiery hot spirits, are little valued by the Europeans, and therefore rarely imported; though highly prized among the natives. In the best Goa arack, the spirits of the cocoa-juice do not make above a sixth or eighth part.

The manner of making the Goa arack is this: The juice of the trees is not procured in the way of tapping, as we do; but the operator provides himself with a parcel of earthen pots, with bellies and necks like our ordinary bird-bottles: he makes fast a number of these to his girdle, and any way else that he commodiously can about him. Thus equipped, he climbs up the trunk of a cocoa tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the small knots or buttons, he applies the mouth of the bottle to the wound, fastening it to the bough with a bandage; in the same manner he cuts off other buttons, and fastens on his pots, till the whole number is used: this is done in the evening, and descending from the tree, he leaves them till the next morning; when he takes off the bottles, which are mostly filled, and empties the juice into the proper receptacle. This is repeated every night, till a sufficient quantity is produced; and the whole being then put together, is left to ferment, which it soon does. When the fermentation is over, and the liquor or wash is become a little tart, it is put into the still, and a fire being made, the still is suffered to work as long as that which comes over has any considerable taste of spirit.

The liquor thus procured is the low wine of arack; and this is so poor a liquor, that it will soon corrupt and spoil, if not distilled again, to separate some of its phlegm; they therefore immediately after pour back this low wine into the still, and rectify it to that very weak kind of proof-spirit, in which state we find it. The arack we meet with, notwithstanding its being of a proof-test, according to the way of judging by the crown of bubbles, holds but a sixth, and sometimes but an eighth, part of alcohol or pure spirit; whereas our other spirits, when they show that proof, are generally esteemed to hold one half pure spirit. *Shaw's Essay on Distilling.*

There is a paper of observations on arack, in the *Melanges d'Histoire Natur.* tome v. p. 302. By fermenting, distilling, and rectifying the juice of the American maple, which has much the same taste as that of the cocoa, the author says, he made arack not in the least inferior to any that comes from the East Indies; and he thinks the juice of the sycamore and of the birch trees would equally answer the end.

Arack, Arad.

Besides the common sorts of Goa and Batavia arack, there are two others less generally known; these are the bitter arack and the black arack.

By stat. 11th Geo. I. c. 30. arack on board a ship within the limits of any port of Great Britain, may be searched for and seized, together with the package; or if found unshipping or unshipped, before entry, may be seized by the officers of excise, in like manner as by the officers of the customs.—Upon an excise-officer's suspicion of the concealment of arack, and oath made of the grounds of such suspicion before the commissioners or a justice of peace, they may empower him to enter such suspected places, and seize the liquors, with the casks, &c. If the officers are obstructed, the penalty is 100l.

Arack is not to be sold but in warehouses, entered as directed in the 6th of Geo. I. c. 21. upon forfeiture, and the casks, &c. If permits are not returned which are granted for the removal of arack, or if the goods are not sent away within the time limited, the penalty is treble the value. If the permits are not returned, and the decrease is not found to be sufficient, the like quantity is forfeited. Permits are not to be taken out but by direction in writing of the proprietor of the stock, or his known servant, upon forfeiture of 50l. or three months imprisonment.

By stat. 9th Geo. II. c. 35. if arack is offered for sale without a permit, or by any hawker, pedlar, &c. with a permit, the person to whom it is offered may seize and carry it to the next warehouse belonging to the customs or excise, and bring the person offering the same before any justice of the peace, to be committed to prison, and prosecuted for the penalties incurred by such offence. The person seizing such goods may prosecute in his own name; and on recovery is entitled to one-third part of the gross produce of the sale: and the commissioners are, if desired, upon a certificate from the justice of the offender's being committed to prison, to advance to the seizer 15s. per gallon for the arack so seized.

Arack (except for the use of seamen, two gallons each) found in any ship or vessel arrived from foreign parts, at anchor, or hovering within the limits of any port, or within two leagues of the shore; and not proceeding on her voyage (unless in case of unavoidable necessity and distress of weather, notice whereof must be given to the collector or chief officer of the port upon the ship's arrival), is forfeited, with the boxes, casks, or other package, or the value thereof.

Arack is also the name of a spirituous liquor made by the Tartars of Tungusia, of mare's milk, left to sour, and afterwards distilled twice or thrice between two earthen pots closely stopped, whence the liquor runs through a small wooden pipe. It is more intoxicating than brandy.

ARAD (anc. geog.), a city lying to the south of Judah and the land of Canaan, in Arabia Petræa. The Israelites having advanced towards the land of Canaan (Numb. xxi. 1.), the king of Arad opposed their passage, defeated them, and took a great booty from them; but they destroyed his country as soon as they became

became masters of the land of Canaan (Numb. xxxiii.) Arad was rebuilt, and Eusebius places it in the neighbourhood of Kades, at the distance of 20 miles from Hebron. The Israelites, in their passage through the wilderness, having departed from Sepher, came to Arad, and from thence to Makkelath.

ARADUS (anc. geog.), an island between the borders of Phœnicia and Seleucis, at the distance of 20 stadia from a dangerous coast: all of it a rock surrounded by the sea, in compass seven stadia; and forming a very powerful city and republic. It is now called *Ronad;* but not a single wall is remaining of all that multitude of houses which, according to Strabo, were built with more stories than even those of Rome. The liberty enjoyed by the inhabitants had rendered it very populous; and it subsisted by a naval commerce, manufactures, and arts. As present the island is deserted; nor has tradition even retained the memory of a spring of fresh water in its environs, which the people of Aradus discovered at the bottom of the sea, and from which they drew water in time of war by means of a leaden bell and a leathern pipe fitted to its bottom.

ARÆ PHILÆNON, or PHILÆNORUM (Strabo); to the south of the Syrtis major; but in Peutinger; more westerly, to the south almost of the Syrtis Minor. In Strabo's time, the altars were not extant, but a village of the same name stood on the spot. On a dispute about limits, between the Cyrenians and Carthaginians, it was agreed that two of each people should set out on the same day, and that where they should happen to meet, there the limits of both should be fixed. The Philæni, two brothers, Carthaginians, undertook it for Carthage: these, after having advanced a great many miles into the territory of the Cyreneans, were met by their antagonists; who, enraged at their being beforehand with them so far, gave them the option of either returning back, or of being buried alive on the spot. Like zealous patriots, they chose the latter; and there the Carthaginians raised two altars in honour of the Philæni. (Sallust, Valerius Maximus.)

ARÆOMETER, an instrument wherewith to measure the density or gravity of fluids.

The aræometer, or water-poise, is usually made of glass; consisting of a round hollow ball, which terminates in a long slender neck hermetically sealed at top; there being first as much running mercury put into it as will serve to balance or keep it swimming in an erect position.

The stem is divided into degrees (as represented Plate XXXIV. fig. 23.); and by the depth of its descent into any liquor, the lightness of that liquor is concluded: for that fluid in which it sinks least must be heaviest; and that in which it sinks lowest, lightest.

M. Homberg has invented a new aræometer, described in Phil. Transact. N° 262. thus: *A* is a glass bottle or matrass, with so slender a neck that a drop of water takes up in it about five or six lines, or half of an inch. Near that neck is a small capillary tube *D*, about six inches long, and parallel to the neck.—To fill the vessel, the liquor is poured in at the mouth *B*, (which is widened to receive a tunnel), till it run out at *D*, that is, till it rise in the neck to the mark *C*, by which means you have always the same bulk or quantity of liquor; and consequently, by means of the balance, can easily tell, when different liquors fill it, which weighs most, or is most intensely heavy.

Some regard, however, is to be had in these trials to the season of the year and degree of heat and cold in the weather; because some liquors rarefy with heat and condense with cold more than others, and accordingly take up more or less room.

By means of this instrument, the ingenious author has made a table to show the different weights of the same bulk of the most considerable chemical liquors both in summer and winter, as follows:

The aræometer full of	Weighed in summer. *oz. dr. gr.*		in winter. *oz. dr. gr.*
Quicksilver, -	11 00 06	-	11 00 32
Oil of tartar, -	01 03 08	-	01 03 31
Spirit of urine, -	01 00 32	-	01 00 43
Oil of vitriol, -	01 03 58	-	01 04 03
Spirit of nitre, -	01 01 40	-	01 01 70
Spirit of salt, -	01 00 39	-	01 00 47
Aquafortis, -	01 01 38	-	01 01 55
Vinegar, -	00 07 55	-	00 07 60
Spirit of wine, -	00 06 47	-	00 06 61
River water, -	00 07 53	-	00 07 57
Distilled water, -	00 07 50	-	00 07 54

The instrument itself weighed, when empty, one dram twenty-eight grains. See HYDROMETER.

ARÆOPAGUS. See AREOPAGUS.

ARÆOSTYLE, in architecture, a term used by Virtruvius, to signify the greatest interval which can be made between columns.

ARÆOTICS, in medicine, remedies which rarefy the humours, and render them easy to be carried off by the pores of the skin.

ARAF, among the Mahometans. See ALARAF.

ARAFAH, the ninth day of the last month of the Arabic year, named *Dhoulhegiat;* on which the pilgrims of Mecca perform their devotions on a neighbouring mountain called *Arafat.* The Mahometans have a very great veneration for this mountain, because they believe that Adam and Eve, after they were banished out of Paradise, having been separated from each other during 120 years, met afterwards on this mountain.

ARAFAT, or GIBEL EL ORPHAT, *the mountain of knowledge,* a mountain in Arabia, near Mecca. The Mahometans say this was the place where Adam first met with and knew his wife Eve after their expulsion from Paradise. This mountain not being large enough to contain all the devotees that come annually in pilgrimage to Mecca, stones are set up all round it to show how far it reaches. The pilgrims are clad in robes of humility and mortification, with their heads uncovered. They seem to be very much affected; for the tears flow down their cheeks, and they sob and sigh most bitterly, begging earnestly for remission of sins, and promising to lead a new life. They continue here about four or five hours, and at half an hour after sunset they all decamp to perform a religious duty called *Asham nomas.* After this, they all receive the honourable title of *hadgees,* which is conferred upon them by the imam or priest. This being pronounced, the trumpet sounds, and they all return to Mecca.

ARAGON. See ARRAGON.

ARAL, a great lake in the kingdom of Khowarazm, Arahum, Aralia. razm, lying a little to the eastward of the Caspian sea. Its length from north to south is said to be near 150 miles, and its breadth from east to west about 70. The shore on the west side is high and rocky, and destitute of good water: yet there are abundance of wild horses, asses, antelopes, and wolves; as also a fierce creature called a *jolbart*, which the Tartars say is of such a prodigious strength as to carry off a horse. It is surprising that this lake should be quite unknown to geographers till within these few years. Several great rivers, which were supposed to run into the Caspian sea, are now known to fall into this lake, particularly the Sihun or Sirr, and the Gihun or Amo, so often mentioned by the Oriental historians. This lake, like the Caspian sea, has no visible outlet. Its water is also very salt; and for that reason is conveyed by the neighbouring inhabitants by small narrow canals into sandy pits, where the heat of the sun, by exhaling the water, leaves them a sufficient quantity of salt. The same kinds of fish are found in Aral that are found in the Caspian sea. The former is also called the *Lake of Eagles*.

ARAHUM, or HARAHUM, in ancient writers, denotes a place consecrated or set apart for holy purposes. Hence the phrase *in araho jurare*, or *conjurare*, "to make oath in the church;" because, by the Ripuarian laws, all oaths were to be taken in the church on the relics of the saints.

ARALIA, the ANGELICA TREE; A genus of the pentagynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 46th order, *Hederaceæ*. The essential characters are: The involucrum is an umbella; the calyx is quinquedentated, and above the fruit; the corolla consists of five petals; and the berry has five seeds.

Species. There are five species of aralia, all natives of the Indies. The principal are, 1. The nudicaulis, having a naked stalk. This grows three or four feet high; the leaves have two large trifoliate lobes, which are sawed on their edges. The flower-stalks arise between these, immediately from the root, and are terminated by round umbels of small four-leaved flowers of a whitish colour. The roots of this species were brought over from North America, and sold here for sarsaparilla, and it is still used as such by the inhabitants of Canada; though it is very different from the true sort. 2. The spinosa, with a prickly stem, is a very ornamental shrub, and a native of Virginia. The height to which this tree will grow, if the soil and situation wholly agree with it, is about twelve feet; and the stem, which is of a dark brown colour, is defended by sharp spines, which fall off; even the leaves, which are branching, and composed of many wings, and are of a pleasant green colour, have these defenders, which are both crooked and strong, and stand as guards to them till the leaves fall off in the autumn. The flowers are produced in large umbels from the ends of the branches: They are of a greenish yellow colour; and their general characters indicate their structure. They make their appearance the end of July or beginning of August; but are not succeeded by ripe seeds in our gardens.

Propagation and culture of the spinosa. This tree will what gardeners call *spawn*; i. e. after digging among the roots, young plants will arise, the broken roots sending forth fresh stems; nay, if the roots are planted in a warm border, and shaded in hot weather, they will grow; but if they are planted in pots, and assisted by a moderate warmth of dung, or tanner's bark, they will be pretty sure of success; so that the propagation of this tree is very easy. But the general method of propagating it, and by which the best plants may be had, is from seeds, which must be procured from America, for they do not ripen in Britain; and, after having obtained them, they must be managed in the following manner: The time that we generally receive them is in the spring; so that against their coming we must be furnished with a sufficient number of large pots. These, when the seeds are come, must be filled with fine mould, which, if taken from a rich border, will do very well. The seeds must be sown in these pots as soon as possible after their arrival, hardly half an inch deep, and then the pots should be plunged in a warm place their whole depth in the soil. Care must be taken to break the mould in the pots, and water them as often as it has a tendency to crust over; and if they are shaded in hot weather, the plants will frequently come up the first summer. But as this does not often happen, if the young plants do not appear by midsummer, the pots should be taken and plunged in a shady place; nay, if they should, there will be still more occasion for this being done; for they will flourish after that better in the shade; and the design of plunging them in a warm place at first was only with a view of setting the powers of vegetation at work, that, having natural heat, artificial shade also may be given them, and water likewise, the three grand necessaries for the purpose. The pots, whether the plants are come up in them or not, should be removed into shelter in October, either into a greenhouse, some room, or under an hotbed-frame; and in the spring, when all danger of frost is over, they should be plunged into the natural ground their own depth in a shady place. Those that were already come up will have shot strong by the autumn following; and if none of them have appeared, they will come up this spring; and whether they are young seedlings, or small plants of a former summer's growth, they must be constantly kept clean of weeds, and duly watered in the time of drought; and this care must be observed until the autumn. In October they must again be removed into shelter, either into a greenhouse, &c. as before, or fixed in a warm place, and hooped, that they may be covered with mats in frosty weather. In the latter end of March following, they should be planted in the nursery way, to gain strength before they are finally planted out. The ground for this purpose, besides the natural shelter, should have a reed hedge, or something of the like nature, the more effectually to prevent the piercing winds from destroying the young plants. In this snug place the plants may be set in rows: in each of which rows furze-bushes should be stuck the whole length; and all these together will ensure their safety. But here one caution is to be observed; not to stick the furze so thick, but that the plants may enjoy the free air in mild weather, and not to take them away too early in the spring, lest, being kept warm the whole winter, and being deprived of their protection, a cutting frost should happen, as it sometimes does even in April, and destroy them. Weeding and watering in dry weather must be their summer's care. They may be stuck again with furze-bushes in the winter; though it will not be necessary

Aralia.

neceſſary to do it in ſo cloſe a manner; and with this care, ſtill diminiſhing in proportion the number of furze-buſhes, they may continue for three or four years, when they may be planted out into the warmeſt parts of the plantation. With this management theſe plants will be inured to bear our winters in well-ſheltered places.

The ſpines which grow on the branches and the leaves admoniſh us, for our own ſafety, not to plant this tree too near the ſides of frequented walks; and the conſideration of the nature of the tree, which is rather tender at the beſt, directs us (if we have a mind to retain the ſort) to plant it in a warm and well-ſheltered ſituation; where the piercing froſts, come from what point they will, will loſe their edge: for without this, they will be too tender to ſtand the teſt of a ſevere winter; though it has often happened, that after the main ſtem of the plant has been deſtroyed, it has ſhot out again from the root, and the plant by that means been both increaſed and preſerved.

ARAM, or *Aramæa Regio*, (anc. geog.) the Hebrew name of Syria, ſo called from Aram the ſon of Shem, (Moſes, Joſephus.)

Aram Beth-Rehob, (anc. geog.) was that part of Syria lying to the north of Paleſtine; becauſe Rehob was its boundary towards that quarter, (Moſes); allotted to the tribe of Aſher, (Judges); where it joins Sidon, (Joſhua).

Aram-Dammeſek, or Syria Damaſcena, (anc. geog.) a principal part of Syria, and more powerful than the reſt, (2 Sam.) taking its name from Damaſcus, the principal city.

Aram-Maacha, (anc. geog.) a diſtrict of Syria, at the foot of mount Hermon, (2 Samuel, 1 Chronicles); on the borders of the half tribe of Manaſſeh, on the other ſide the Jordan, called the coaſt of *Maachathi*, (Moſes, Joſhua.)

Aram-Naharaim, (anc. geog.) i. e. Aram, or Syria of the Rivers, or Meſopotamia, ſituated between the Euphrates and Tigris; which is the reaſon of the name.

Aram-Soba, or *Zoba*, (anc. geog.) which David conquered, was a country near the Euphrates, where afterwards Palmyra ſtood: the Euphrates bounded it on the eaſt, as the land of Canaan and Syria Damaſcena did on the weſt, (2 Samuel.)

ARAMONT, a town of Languedoc in France, ſeated on the river Rhone. E. Long. 4. 52. N. Lat. 43. 54.

ARANEA, the SPIDER; a genus of inſects belonging to the order of aptera, or inſects without wings.

All the ſpecies of ſpiders have eight legs, with three joints in each, and terminating in three crooked claws; eight eyes, two before, two behind, and the reſt on the ſides of the head. In the fore-part of the head, at the mouth, there is a pair of ſharp crooked claws or forceps: theſe ſtand horizontally; and, when not exerted for uſe, are concealed in two caſes contrived for their reception, in which they fold like a claſp-knife, and there lie between two rows of teeth. A little below the point of each claw, there is a ſmall hole, through which Liewenhoeck ſuppoſes the ſpider emits a kind of poiſon (A.) Theſe claws are the weapons with which they kill flies, &c. for their food. The belly or hinder part is ſeparated from the head and breaſt by a ſmall thread-like tube. The ſkin or outer ſurface is a hard poliſhed cruſt.

Spiders have five tubercles or nipples at the extremity of the belly, whoſe apertures they can enlarge or contract at pleaſure. It is through theſe apertures that they ſpin a gluey ſubſtance with which their bellies are full. They fix the end of their threads by applying theſe nipples to any ſubſtance, and the thread lengthens in proportion as the animal recedes from it. They can ſtop the iſſuing of the threads by contracting the nipples, and re-aſcend by means of the claws on their feet, much in the ſame manner as ſome men warp up a rope. When the common houſe-ſpider begins her web, ſhe generally chooſes a place where there is a cavity, ſuch as the corner of a room, that ſhe may have a free paſſage on each ſide, to make her eſcape in caſe of danger. Then ſhe fixes one end of her thread to the wall, and paſſes on to the other ſide, dragging the thread along with her (or rather the thread follows her as ſhe proceeds), till ſhe arrives at the other ſide, and there fixes the other end of it. Thus ſhe paſſes and repaſſes, till ſhe has made as many parallel threads as ſhe thinks neceſſary for her purpoſe. After this, ſhe begins again and croſſes theſe by other parallel threads, which may be named the *woof*. Theſe are the toils or ſnares which ſhe prepares for entangling flies, and other ſmall inſects, which happen to light upon it. But, beſides this large web, ſhe generally weaves a ſmall cell for herſelf, where ſhe lies concealed watching for her prey. Betwixt this cell and the large web ſhe has a bridge of threads, which, by communicating with the threads of the large one, both give her early intelligence when any thing touches the web, and enables her to paſs quickly in order to lay hold of it. There are many other methods of weaving peculiar to different ſpecies of ſpiders; but as they are all intended

---

(A) Dr Mead, in his Eſſay on Poiſons, diſſents wholly from this opinion, having never been able, on repeated examinations, to diſcover any ſuch opening, not even in the claws of the largeſt foreign ſpiders; which being above fifty times bigger than any of the European ſpiders, would more eaſily have afforded a view of this opening, if nature had allotted any to this part of the animal. Beſides, repeated obſervations alſo convinced him that nothing dropped out of the claws, which were always dry while the ſpider bit any thing, but that a ſhort white proboſcis was at the ſame inſtant thruſt out of the mouth, which inſtilled a liquor into the wound. And the ſame author obſerves, that the quantity of liquor emitted by our common ſpiders when they kill their prey, is viſibly ſo great, and the wounding weapons ſo minute, that they ſhould contain but a very inconſiderable portion thereof, if it were to be diſcharged that way. Baker's Microſcope, p. 196. Spiders frequently caſt their ſkins, which may be found in the webs perfectly dry and tranſparent; and from ſuch ſkins the forceps, or claws, for they are always ſhed with the ſkins, may eaſier be ſeparated, and examined with much greater exactneſs, than in the common ſpider while living.

Aranea.

ed for the ſame purpoſe, it is needleſs to give particular deſcriptions of them.

That darting-out of long threads, however, which has been obſerved by naturaliſts, and by means of which ſome ſpecies can convey themſelves to great diſtances, deſerves particular notice.

Dr Liſter tells us, that attending cloſely to a ſpider weaving a net, he obſerved it ſuddenly to deſiſt in the mid-work: and turning its tail to the wind, it darted out a thread with the violence and ſtream we ſee water ſpout out of a jet: this thread, taken up by the wind, was immediately carried to ſome fathoms long; ſtill iſſuing out of the belly of the animal. By-and-by the ſpider leaped into the air, and the thread mounted her up ſwiftly. After this diſcovery, he made the like obſervation in near thirty different ſorts of ſpiders; and found the air filled with young and old, ſailing on their threads, and doubtleſs ſeizing gnats and other inſects in their paſſage, their being often manifeſt ſigns of ſlaughter, legs and wings of flies, &c. on theſe threads, as well as in their webs below. Dr Hulſe diſcovered the ſame thing about the ſame time.

Dr Liſter thinks there is a fair hint of the darting of ſpiders in Ariſtotle, Hiſt. An. lib. ix. cap. 39. and in Pliny, lib. x. cap. 74. But with regard to their ſailing, the ancients are ſilent, and he thinks it was firſt ſeen by him. He alſo obſerves of thoſe ſailing ſpiders, that they will often dart, not a ſingle thread only, but "a whole ſheaf at once, conſiſting of many filaments; yet all of one length, all divided each from the other, and diſtinct until ſome chance either ſnap them off or entangle them. But for the moſt part you may obſerve that the longer they grow, the more they ſpread, and appear to a diligent obſerver like the numerous rays in the tail of a blazing ſtar. As for that which carries them away in the air, ſo ſwift off-hand, it is (as I have already hinted) partly their ſudden leap; partly the length and number of the threads projected, the ſtream of the air and wind beating more forcibly upon them; and partly the poſture and management of their feet, which, at leaſt by ſome ſort of them, I have obſerved to have been uſed very like wings or oars, the ſeveral legs (like our fingers) being ſometimes cloſe joined, at other times opened, again bent, extended, &c. according to the ſeveral neceſſities and will of the ſailor. To fly they cannot be ſtrictly ſaid, they being carried into the air by external force; but they can, in caſe the wind ſuffer them, ſteer their courſe, and perhaps mount and deſcend at pleaſure: and to the purpoſe of rowing themſelves along the air, it is obſervable that they ever take their flight backwards; that is, their head looking a contrary way, like a ſculler upon the Thames. It is ſcarce credible to what height they will mount; which yet is preciſely true, and I think eaſily to be obſerved by one that ſhall fix his eye ſome time on any part of the heavens, the white webs, at a vaſt diſtance, very diſtinctly appearing from the azure ſky; but this is in autumn only, and that in very fair and calm weather." In a letter to Mr Ray, dated January 1670, ſpeaking of the height ſpiders are able to fly to, he ſays, "Laſt October, &c. I took notice, that the air was very full of webs; I forthwith mounted to the top of the higheſt ſteeple on the Minſter (in York), and could there diſcern them yet exceeding high above me."

He further obſerves, that they not only thus ſhoot their threads upward, and mount with it in a line almoſt perpendicular; they alſo project them in a line parallel to the horizon, as may be ſeen by their threads running from one wall to another in a houſe, or from one tree to another in the field, and even from wall to wall acroſs gardens of conſiderable extent.

The matter of which the ſpider's threads are formed, we have obſerved, is a viſcid juice, elaborated in the body of the animal, and emitted from papillæ ſituated at the extremity of the belly; which papillæ are furniſhed with numerous apertures that do the buſineſs of wire-drawers, as it were, in forming the threads. Of theſe apertures Mr. Reaumur obſerves, there are enough in the compaſs of the ſmalleſt pin's head to yield a prodigious quantity of diſtinct threads. The holes are perceived by their effects: take a large garden-ſpider ready to lay its eggs, and applying the finger on a part of its papillæ, as you withdraw that finger it will take with it an amazing number of different threads. M. Reaumur has often counted 70 or 80 with a microſcope, but has perceived that there were infinitely more than he could tell. In effect, if he ſhould ſay that each tip of a papillæ furniſhed a thouſand, he is perſuaded he would ſay much too little. The part is divided into an infinity of little prominences, like the eyes of a butterfly, &c. Each prominence no doubt makes its ſeveral threads; or rather between the ſeveral protuberances there are holes that give vent to threads; the uſe of the protuberances, in all probability, being to keep the threads at their firſt exit, before they are yet hardened by the air, aſunder. In ſome ſpiders thoſe protuberances are not ſo ſenſible; but in lieu thereof there are tufts of hair which may ſerve the ſame office, viz. to keep the threads a-part. Be this as it will, there may threads come out at above a thouſand different places in every papillæ; conſequently the ſpider, having five papillæ, has holes for above five thouſand threads.

Such is the tenuity of the threads in the larger ſort of ſpiders. But if we examine the young produced by thoſe, we ſhall find that they no ſooner quit their egg than they begin to ſpin. Indeed their threads can ſcarce be perceived, but the webs may: they are frequently as thick and cloſe as thoſe of houſe ſpiders; and no wonder, there being often four or five hundred little ſpiders concurring in the ſame work. How minute muſt their holes be! the imagination can ſcarce conceive that of their papillæ! The whole ſpider is perhaps leſs than a papilla of the parent which produced it. But there are even ſome kinds of ſpiders ſo ſmall at their birth, that they are not viſible without a microſcope. There are uſually found an infinity of theſe in a cluſter, and they only appear like a number of red points: And yet there are webs found under them, though well nigh imperceptible. What muſt be the tenuity of one of theſe threads? Mr Liewenhoek has computed that 100 of the ſingle threads of a full grown ſpider are not equal to the diameter of the hair of his beard; and conſequently, if the threads and hair be both round, ten thouſand ſuch threads are not bigger than ſuch a hair. He calculates further, that when young ſpiders firſt begin to ſpin, four hundred of them are not larger than one which is of a full growth; allowing which, four millions of a young ſpider's

Aranea. der's threads are not so big as the single hair of a man's beard.

Garden-spiders, particularly the short-legged species, yield a kind of silk, which has by some been judged scarce inferior to that of the silk-worm. Mr Bon of Languedoc, about 70 years ago, contrived to manufacture from it a pair of silk stockings and mittens, of a beautiful natural grey colour, which were almost as handsome and strong as those made with common silk: And he published a dissertation concerning the discovery. But M. Reaumur, being appointed by the Royal Academy to make a farther enquiry into this new silk-work, raised several objections and difficulties against it, which are found in the Memoirs of the Academy for the year 1710. The sum of what he has urged amounts to this. The natural fierceness of the spiders renders them unfit to be bred and be kept together. Four or five thousand being distributed into cells, fifty in some, one or two hundred in others, the big ones soon killed and eat the less, so that in a short time there were scarce left one or two in each cell; and to this inclination of mutually eating one another M. Reaumur ascribes the scarcity of spiders, considering the vast number of eggs they lay.

But this is not all: he even affirms that the spider's bag is inferior to that of the silk-worm both in lustre and strength, and that it produces less matter to be manufactured. The thread of the spider's web, he says, only bears a weight of two grains without breaking; and that of the bag bears thirty-six. The latter, therefore, in all probability, is eighteen times thicker than the former; yet it is weaker than that of the silk-worm, which bears a weight of two drams and a half. So that five threads of the spider's bag must be put together to equal one thread of the silk-worm's bag. Now it is impossible these should be applied so justly over one another as not to leave little vacant spaces between them, whence the light will not be reflected; and, of consequence, a thread thus compounded must fall short of the lustre of a solid thread. Add to this, that the spider's thread cannot be wound off as that of the silk worm may, but must of necessity be carded; by which means, being torn in pieces, its evenness, which contributes much to its lustre, is destroyed. In effect, this want of lustre was taken notice of by M. de la Hire, when the stockings were presented to the academy. Again, spiders furnish much less silk than the worms: the largest bags of these latter weigh four grains, the smaller three grains; so that 2304 worms produce a pound of silk. The spider-bags do not weigh above one grain; yet when cleared of their dust and filth, they lose two-thirds of their weight. The work of twelve spiders, therefore, only equals that of one silk-worm; and a pound of silk will require at least 27,648 spiders. But as the bags are wholly the work of the females, who spin them to deposit their eggs in, there must be kept 55,296 spiders to yield a pound of silk. Yet will this only hold of the best spiders; those large ones ordinarily seen in gardens, &c. scarce yielding a twelfth part of the silk of the others. Two hundred and eighty of these, he shows would not yield more than one silk-worm; 663,552 of them would scarce yield a pound.

The act of generation among spiders varies in different species. As these insects prey upon each other, except during the time of their amours, they dare not come within reach of one another but with the utmost caution. They may sometimes be seen stretching out their legs, shaking the webs, and tampering with each other by a slight touch with the extremity of their feet; then, in a fright, dropping hastily down their thread, and returning in a few moments to make fresh trial by feeling. When once both parties are well assured of the sex they have to deal with, the approaches of their feet, in order to feel, become more frequent, confidence takes place, and the instant of amorous dalliance ensues. "We cannot," says Lyonnet, "but admire how careful they are not to give themselves up blindly to a passion, or venture on an imprudent step, which might become fatal to them." A caveat this to the human kind. Lister and Lyonnet, two accurate observers, say, that the extremity of those arms, or claws, which the spider uses to grasp his prey with, suddenly opens, as it were by a spring, and lets out a white body, which the male applies beneath the abdomen of the female to fulfil the wish of nature. In the water-spider, the sexual organs are situated at the hinder parts of the male, are curve, and act as it were by a spring; those of the females are distinct. Nature by a thousand varied methods accomplishes her purpose.

Spiders frequently change their colour, which varies much, in respect to season, sex, age, &c. but they are in general more beautifully variegated in autumn, a season not only the most opportune and plentiful repecting their prey, but the time when they arrive at their greatest magnitude, and are in their height of vigour.

The species of aranea enumerated by naturalists amount to upwards of 50; of which it may here suffice to mention a few of the most remarkable.

1. The calycina, with a round pale yellow belly, and two hollow points. It lives in the cups of flowers, af- the flower-leaves have fallen off; and catches bees, and other flies, when they are in search of honey.

2. The avicularia, has a convex round breast, hollowed transversely in the middle. It is a native of America, and feeds upon small birds, insects, &c. The bite of this spider is as venomous as that of the serpent.

3. The ocellata, has three pair of eyes on its thighs. It is about the same size with the tarantula, of a pale colour, with a black ring round the belly, and two large black spots on the sides of the breast. It is a native of China.

4. The Saccata, has an oval belly, of a dusky iron colour. It lives in the ground, and carries a sack with its eggs where-ever it goes. This sack it glues to its belly, and will rather die than leave it behind.

5. Diadema is the largest spider which this country produces. The abdomen is of and oval form, downy, and of a ruddy yellow colour, which is very variable in different seasons; being sometimes paler, at others very dark coloured. The upper part is beautifully adorned with black and white circles and dots, having a longitudinal band in the middle, composed of oblong and oval-shaped pearl-coloured spots, so arranged as to resemble a fillet, similar to those worn by the eastern kings. The ground upon which this fillet, and the white dots are laid, when viewed with a glass, and the sun shining thereon, is beautiful and rich beyond all description. There are varieties in colour of this spider

Aranea.

der when young: some have their abdomen purple, ornamented with white dots, the legs yellow and annulated with a deeper colour: others have their abdomen of a fine red likewise ornamented with white, but the legs of a fine pale green colour: annulated with dark purple or black. It inhabits the birch-tree.

6. The cucurbitina, has a globular yellow belly, with a few black spots. It lives in the leaves of trees, and incloses its eggs in a soft net.

7. The labyrinthica, with a dusky oval belly, a whitish indented line, and a forked anus. The web of this species is horizontal, with a cylindrical well or tube in the middle.

8. The fimbriata, has a black oblong belly, with a white line on each side, and dusky-coloured legs. It lives in water, upon the surface of which it runs with great swiftness.

9. The holosericea, has an ovalish belly covered with a down-like velvet; at the base, or under part, it has two yellow spots. It is found in the folded leaves of plants.

10. The viatica, or wanderer, is generally of a yellow colour more or less deep. Sometimes it is whitish and even rather green. The abdomen is large, broad, almost square, with two bands of dark orange, which arising from the thorax descend obliquely on the sides towards the middle. Between the bands are a few small black dots forming a kind of triangle upon the middle of the abdomen. On the thorax are seen two longitudinal bands somewhat green, one on each side. The two foremost pair of legs are very long, and the hinder short; which makes it walk like a crab. It is found upon plants; and is a lively, active, indefatigable hunter. Without any motion of the head, which is furnished with immovable eyes, it perceives all the flies that hover round about, does not scare them, but stretches over them its arms furnished with feathers, which prove nets in which their wings intangle. It is said to sit on its eggs; which however it often carries about with it, wrapt up in a ball of white silk.

11. The aquatica, is of a livid colour, with an oval belly, and a transverse line, and two hollowed points. It frequents the fresh waters of Europe. But it is in some sort amphibious: for it can live on land as well as in the water, and comes often on shore for its food; yet it swims well in water, both on its belly and back; it is distinguishable by its brightness. In the water its belly appears covered with a silver varnish, which is only a bubble of air attached to the abdomen by means of the oily humours which transpire from its body, and prevent the immediate contact of the water. This bubble of air is made the substance of of its dwelling, which it constructs under water; for it fixes several threads of silk, or such fine matter, to the stalks of plants in the water; and then ascending to the surface, thrusts the hinder part of its body above water, drawing it back again with such rapidity, that it attaches underneath a bubble of air, which it has the art of detaining under water, by placing it underneath the threads abovementioned, and which it binds like a covering almost all around the air-bubble. Then it ascends again for another air-bubble; and thus proceeds until it has constructed a large aerial apartment under water, which it enters into or quits at pleasure. The male constructs for himself one near to the female; and when love invites, he breaks through the thread walls of the female's dwelling, and the two bubbles attached to the bellies of both unite into one, forming one large nuptial chamber. The female is sometimes laid for a whole day together stretched on her back, waiting for the arrival of the male, without motion, and seemingly as if dead. As soon as he enters and glides over her, she seems to be brought to life again, gets on her legs and runs after the male, who makes his escape with all possible speed. The female takes care of the young, and constructs similar apartments on purpose for them. The figure of this spider has nothing remarkable; and would be overlooked among a croud of curiosities, if the spectator be unacquainted with its singular art of constructing an aerial habitation under water, and thus uniting together the properties of both elements. It lodges during the winter in empty shells, which it dexterously shuts up with a web.

12. The fasciata, with yellow bands round the belly, and dusky rings on the legs, is a native of Barbary, and is as large as the thumb. It inhabits hedges and thickets: its webs have large meshes, and it resides in the centre. The snares are spread for large flies, wasps, drones, and even locusts: the lesser insects can escape through the meshes. The animal which it entangles is soon bound with strong threads; killed by the spider's jaws; and partly eat, if the spider is hungry: the rest is concealed under some neighbouring dry leaves, covered with a kind of web and a blackish glue in great abundance. Its larder is said to be often plentifully stored: —Its nest is of the size of a pigeon's egg, divided horizontally, and suspended by the threads of the insect, which are of a silvery white, and stronger than silk. The young ones live in amity; but when grown up, are mortal enemies. They never meet but they fight with violence, and their battle only ends with the death of the weakest. The dead body is carefully stored in the larder. Twelve of these spiders, by way of experiment, were shut up together; and, after a battle of eight days, the strongest only remained alive.

13. The tarantula, has the breast and belly of an ash-colour; the legs are likewise ash-coloured, with black- Plate XVII. ish rings on the under part; the fangs or nippers are (in Vol. I.) red on the inner side, the rest being blackish: Two of its eyes are larger than the other, red, and placed in the front; four other eyes are placed in a transverse direction towards the mouth; the other two are nearer the back: It has two antennæ or feelers. It is a native of Italy, Cyprus, Barbary, and the East Indies. It lives in bare fields, where the lands are fallow, but not very hard, and from its antipathy to damp and shade, chooses for its residence the rising part of the ground facing the east Its dwelling is about four inches deep, and half an inch wide; at the bottom it is curved, and there the insect sits in wet weather, and cuts its way out if water gains upon it. It weaves a net at the mouth of the hole. These spiders do not live quite a year. In July they shed their skin, and proceed to propagation; which, from a mutual distrust, as they frequently devour one another, is a work undertaken with great circumspection. They lay about seven hundred and thirty eggs, which hatch in the spring; but the parent does not live to see her progeny, having expired early in the winter. The Ichneumon fly is their most formidable enemy.

Aranea.

The bite of the tarantula is said to occasion an inflammation in the part, which in a few hours brings on sickness, difficulty of breathing, and universal faintness. The person afterwards is affected with a delirium, and sometimes is seized with a deep melancholy. The same symptoms return annually, in some cases for several years; and at last terminate in death. Music, it has been pretended, is the only cure. A musician is brought, who tries a variety of airs, till at last he hits upon one that urges him to dance; the violence of which exercise produces a proportionable agitation of the vital spirits, attended with a consequent degree of perspiration, the certain consequence of which is a cure. Such are the circumstances that have been generally related, and long credited, concerning the bite of this animal. Kircherus, in his *Musurgia*, gives a very particular account of the symptoms and cure, illustrated by histories of cases. Among these, he mentions a girl, who, being bitten by this insect, could be cured only by the music of a drum. He then proceeds to relate, that a certain Spaniard, trusting to the efficacy of music in the cure of the frenzy occasioned by the bite of the tarantula, submitted to be bitten on the hand by two of these creatures, of different colours, and possessed of different qualities. The venom was no sooner diffused about his body, than the symptoms of the disorder began to appear; upon which harpers, pipers, and other musicians, were sent for, who by various kinds of music endeavoured to rouse him from that stupor into which he was fallen: but here it was observed that the bites of the two insects had produced contrary effects; for by one he was incited to dance, and by the other he was restrained therefrom; and in this conflict of nature the patient expired. The same account is given in his *Phonurgia Nova*, with the addition of a cut respresenting the insect in two positions, the patient in the action of dancing, together with the musical notes of the tune or air by which in one instance the cure was affected.

In his *Musurgia*, this author, attempting mechanically to account for the cure of the bite of the tarantula by music, says of the poison, That it is sharp, gnawing and bilious; and that it is received and incorporated into the medullary substance of the fibres. With respect to the music, he says, That the sounds of chords have a power to rarefy the air to a certain harmonical pitch; and that the air thus rarefied, penetrating the pores of the patient's body, affects the muscles, arteries, and minute fibres, and incites him to dance; which exercise begets a perspiration, in which the poison evaporates.

Unsatisfactory as this theory appears, the belief of this strange phenomenon has prevailed among the ablest of modern physicians. Sir Thomas Brown, so far from disputing it, says, That since many attest the fact from experience, and that the learned Kircherus hath positively averred it, and set down the songs and tunes solemnly used for the cure of the disease, and since some also affirm that the tarantula itself will dance at the sound of music, he shall not at all question it*.

* *Inquiries into Vulgar Errors*, B. iii. c. 28.

Farther, that eminent Italian physician of the last century, Baglivi, a native of Apulia, the country where the tarantula is produced, has written a dissertation *De anatomia, morsu, et effectibus tarantulæ*. In this he describes the region of Apulia where the tarantula is produced, with the anatomy and figure of the insect and its eggs, illustrated by an engraving; he mentions particularly the symptoms that follow from the bite, and the cure of the disease by music, with a variety of histories of cures thus wrought, many of them communicated by persons who were eye-witnesses of the process.

Ludovicus Valetta, a Celestine monk of Apulia, published at Naples, in the year 1706, a treatise upon this spider, in which he not only answers the objections of those who deny the whole thing, but gives, from his own knowledge, several instances of persons who had suffered this way, some of whom were of great families, and so far from being dissemblers, that they would at any rate, to avoid shame, have concealed the misfortune which had befallen them.

The honourable Mr Robert Boyle, in his treatise of Languid and Unheeded Motions, speaking of the bite of the tarantula, and the cure of the disease which follows it by means of music, says, That, having himself had some doubts about the matter, he was, after strict inquiry, convinced that the relations in the main were true.

Lastly, Dr Mead, in his Mechanical Account of Poisons, has given an essay on the tarantula, containing the substance of the above relations, which he endeavours to confirm by his own reasoning thereon.

Notwithstanding the number and weight of these authorities, and the general acquiescence of learned and ingenious men in the opinion that the bite of the tarantula is poisonous, and that the cure of the disorder occasioned by it is effected by music, we have reason to apprehend that the whole is a mistake.

In the Philosophical Transactions for the year 1672, p. 406, is an extract of a letter from Dr Thomas Cornelio, a Neapolitan physician, to John Doddington, Esq; his majesty's resident at Venice, communicated by the latter, in which, speaking of his intention to send to Mr Doddington some tarantulas, he says, "Mean while I shall not omit to impart to you what was related to me a few days since by a judicious and unprejudicate person; which is, that being in the country of Otranto, where those insects are in great numbers, there was a man, who, thinking himself stung by a tarantula, showed in his neck a small speck, about which in a very short time there arose some pimples full of a serous humour; and that in a few hours after, the poor man was sorely afflicted with very violent symptoms, as syncopes, very great agitations, giddiness of the head, and vomiting; but that, without any inclination at all to dance, and without a desire of having any musical instruments, he miserably died within two days. The same person affirmed to me, that all those that think themselves bitten by tarantulas, except such as for evil ends feign themselves to be so, are for the most part young wanton girls, whom the Italian writers call *Dolce di Sale*; who, by some particular indisposition falling into this melancholy madness, persuade themselves, according to the vulgar prejudice, to have been stung by a tarantula."

Dr Serao, an Italian physician, has written an ingenious book, in which he has effectually exploded this opinion as a popular error; and in the Philosophical Transactions, N° LX. for the year 1770, p. 236, is a letter from Dominico Cirillo, M. D. professor

feſſor of natural hiſtory in the univerſity of Naples, wherein, taking notice of Serao's book, he ſays, That having had an opportunity of examining the effects of this animal in the provine of Taranto, where it is found in great abundance, he finds that the ſurpriſing cure of the bite of the tarantula by muſic has not the leaſt truth in it; and that it is only an invention of the people, who want to get a little money by dancing when they ſay the tarantiſm begins. He adds, "I make no doubt but ſometimes the heat of the climate contributes very much to warm their imaginations, and throw them into a delirium, which may be in ſome meaſure cured by muſic; but ſeveral experiments have been tried with the tarantula, and neither men nor animals after the bite have had any other complaint than a very trifling inflammation upon the part, like that produced by the bite of a ſcorpion, which goes off by itſelf without any danger at all. In Sicily, where the ſummer is ſtill warmer than in any part of the kingdom of Naples, the tarantula is never dangerous; and muſic is never employed for the cure of the pretended tarantiſm."

Mr Swinburn, when in the country of the tarantula, was deſirous of inveſtigating minutely every particular relative to that inſect; but the ſeaſon was not far enough advanced, and no *tarantati* (perſons bitten, or pretending to be bitten, by the tarantula) had begun to ſtir. He prevailed, however, upon a woman who had formerly been bitten, to act the part, and dance the tarantata before him. A great many muſicians were ſummoned, and ſhe performed the dance, as all preſent aſſured him, to perfection. At firſt ſhe lolled ſtupidly on a chair, while the inſtruments were playing ſome dull muſic. They touched, at length, the chord ſuppoſed to vibrate to her heart; and up ſhe ſprang with a moſt hideous yell, ſtaggered about the room like a drunken perſon, holding a handkerchief in both hands, raiſing them alternately, and moving in very true time. As the muſic grew briſker, her motions quickened, and ſhe ſkipped about with great vigour and variety of ſteps, every now and then ſhrieking very loud. The ſcene was far from pleaſant; and, at his deſire, an end was put to it before the woman was tired. Wherever the tarantati are to dance, he informs us, a place is prepared for them, hung round with bunches of grapes and ribbons. The patients are dreſſed in white, with red, green, or yellow ribbons, for thoſe are their favourite colours; on their ſhoulders they caſt a white ſcarf, let their hair fall looſe about their ears, and throw their heads as far back as they can bear it. They are exact copies of the ancient prieſteſſes of Bacchus. The orgies of that god, whoſe worſhip, under various ſymbols, was more widely ſpread over the globe than that of any other divinity, were no doubt performed with energy and ethuſiaſm by the lively inhabitants of this warm climate. The introduction of Chriſtianity aboliſhed all public exhibitions of theſe heatheniſh rites, and the women durſt no longer act a frantic part in the character of Bacchantes. Unwilling to give up ſo darling an amuſement, they deviſed other pretences; and poſſeſſion by evil ſpirits may have furniſh them with one. Accident may alſo have led them to a diſcovery of the tarantula; and, upon the ſtrength of its poiſon, the Puglian dames ſtill enjoy their old dance, though time has effaced the memory of its ancient name and inſtitution: and this Mr Swinburn takes to be the origin of ſo ſtrange a practice. If at any time theſe dances are really and involuntarily affected, he ſuppoſes it can be nothing more than an attack upon their nerves, a ſpecies of St Vitus's dance: and he inclines the more to the idea, as there are numberleſs churches and places throughout theſe provinces dedicated to that ſaint.

Many ſenſible people of the country, however, differ in opinion from Dr Serao and other authors, who have ridiculed the pretended diſorder, and affirmed that the venom of this ſpecies of ſpider can produce no effects but ſuch as are common to all others. The Brindiſians ſay, that the tarantulas ſent to Naples for the experiment were not of the true ſort, but a much larger and more innocent one; and that the length of the journey, and want of food, had weakened their power ſo much, as to ſuffer the Doctor or others to put their arm into the bag where they were kept with impunity. They quote many examples of perſons bitten as they ſlept out in the fields during the hot months, who grew languid, ſtupid, deprived of all courage and elaſticity, till the ſound of ſome favourite tune rouſed them to dance, and throw off the poiſon. Theſe arguments of theirs, however, Mr Swinburn thinks of little weight: for they acknowledged that elderly perſons were more frequently infected than young ones; and that moſt of them were women, and thoſe unmarried. No perſon above the loweſt rank in life was ever ſeized with this malady, nor is there an inſtance of its cauſing death. The length of the dance, and the patient's powers of bearing ſuch exceſſive fatigue in the canicular ſeaſon, prove nothing; becauſe every day, at that time of the year, peaſants may be ſeen dancing with equal ſpirit and perſeverance, though they do not pretend to be ſeized with the tarantiſm. The illneſs may therefore be attributed to hyſterics, exceſſive heat, ſtoppage of perſpiration, and other effects of ſleeping out of doors in a hot ſummer air, which is always extremely dangerous, if not mortal, in moſt parts of Italy. Violent exerciſe may have been found to be a certain cure for this diſorder, and continued by tradition, though the date and circumſtances of this diſcovery have been long buried in oblivion; a natural paſſion for dancing, imitation, cuſtom of the country, and a deſire of raiſing contributions upon the ſpectators, are probably the real motives that inſpire the tarantati. Before Serao's experiments, the tarantula had been proved to be harmleſs, from trials made in 1693 by Clarizio, and in 1740 at Lucera by other naturaliſts.

ARANJUEZ, a town in the province of New Caſtile, where the king of Spain has a palace and gardens which are reckoned the moſt delightful in the world.

This place is 20 miles from Madrid, by a noble road, planted on each ſide with trees, lately made at the expence of 120,000l. Sterling. It is delightfully ſituated at the conflux of the rivers Tagus and Jarama; which run through the gardens, and add new beauty to this charming ſpot, where art and nature ſeem to go hand in hand with the moſt pleaſing and rural ſimplicity. On one ſide, fine avenues of ſtately oaks and lofty elms convey the trueſt ideas of magnificence, while they afford the moſt reviving ſhade; on the other, the ſudden tranſitions to lawns and wilderneſs, Aranjuez. nefs, the cafcades of water breaking through the thickets, the tuneful fongs of numberlefs birds fheltered in thefe cool receffes, the occafional appearance and paffage of the monarch attended by the grandees of his kingdom; all thefe objects united, and concentered in one point, fill the imagination with pleafing ideas, and imprefs the mind of a traveller with a thoufand agreeable fenfations.

The general fituation is in a very large plain furrounded with large hills, of a moft difagreeable afpect indeed, but feldom appearing, being well hidden by the noble rows of trees that extend acrofs the flat in every direction. The main body of the palace is an old building, to which have been lately added two new wings. The firft part of the building was erected by Philip II. who purchafed the eftate, planted many of the avenues, and, in order to extend his chafe, or to indulge his fplenetic difpofition, had all the vines that grew on the hills rooted up. By that means he drove away the inhabitants, and rendered the environs of his villa a perfect defart.—The apartments are good; but contain nothing very particular to take off from the enjoyment of fo many fine objects abroad. In one of the new wings is a play-houfe, and in the other a chapel. Part of the ceiling of the former was painted by Mengs, who was alfo fent to Rome to paint a holy family for the principal altar in the chapel. There are feven fine pictures of Luca Jordano in the apartment called El Cabinete Antiguo, and fix others in that De los Mayordomos. The portraits of the grand duke and duchefs of Tufcany, by Mengs, are in a new apartment called the *king's dreffing-room*. In the chapel, over the great altar, there is a fine picture of the Annunciation, by Titian, prefented to him by Charles V. and brought from the convent of Jufte, after the death of that emperor. The porcelain cabinet, where there are feveral large pieces of the king's own manufactory, is alfo an object of curiofity to a traveller.

As to the gardens, the whole of them may be thrown into three grand divifions, diftinguifhed by the names of La Huerta Valenciana, Los Deleites, and El Cortijo. In the Huerta Valenciana, agriculture and gardening are carried on in the fame manner as in that fruitful province, and they plough with horfes. In the Cortijo they ufe oxen, as in Andalufia; and in other places they fcratch up the ground with mules, as is ftill practifed in fome parts of Spain. Which ever way one looks round, a conftant variety pleafes the eye, and enraptures the mind. At one moment the fturdy buffalo moves before you, drawing his heavy burden; foon after, the flow camel, with his ponderous load; while the fwift zebra with his ftriped garment frifks over the plains. If you approach the farm, every object of convenience is confulted, and in the dairy every degree of neatnefs. The Dutch cow enjoys a luxuriant pafture, the brood mares greatly enliven the landfcape, and ftables are filled with the moft excellent horfes. And an immenfe nurfery furnifhes all manner of trees and plants. The fine avenue, which ferves alfo for a public walk, called Calle de Reyna, has nothing equal to it at Verfailles. It is three miles long, quite ftraight from the palace gate, croffing the Tagus twice before it lofes itfelf in the thickets, where fome noble fpreading elms and weeping poplars hang beautifully over the deep ftill pool. Near this road is a flower-garden for the fpring, laid out with great tafte by Mr Wall during his miniftry. The gay variety of flowers at this time of year is particularly pleafing to the eye; but its beauty foon fades on the approach of fummer. As the weather grows hot, the company that choofes to walk retires to a garden in an ifland of the Tagus, on the north fide of the palace. This is an heavenly place, cut into various walks and circular lawns, which in their primitive ftate may have been very ftiff and formal: but in the courfe of a century, Nature has obliterated the regular forms of art; the trees have fwelled out beyond the line traced for them, and deftroyed the enfilade by advancing into the walls or retiring from them. The fweet flowering-fhrubs, inftead of being clipped and kept down, have been allowed to fhoot up into trees, and hang over the ftatues and fountains they were originally meant to ferve as humble fences to. The jets-d'eau dafh up among the trees, and add frefh verdure to the leaves. The terraces and baluftrades built along the river, are now overgrown with rofes, and other luxuriant bufhes, hanging down into the ftream, which is darkened by the large trees growing on the oppofite banks. Many of the ftatues, groupes, and fountains, are handfome, fome mafterly, the works of Algardi: all are placed in charming points of view, either in open circular fpots, at a diftance from the trees, or elfe in gloomy arbours, and retired angles of the wood. The banks of this wood, called the Ila, are alfo enlivened by elegant yachts for the amufement of the royal family.

Aranjuez, Arar.

The town or village formerly confifted of the palace, its offices, and a few miferable huts, where the ambaffadors, and the attendants of the court, endeavoured to lodge themfelves as well as they could, but always very uncomfortable; many of the habitations were vaults half under ground. What determined the king to build a new town, and to embellifh the environs, was an accident that happened at the nuncio's; a coach broke through the cieling of his dining-room, and fell in upon the table. The court then began to apply very confiderable fums to the purpofe of errecting proper dwellings for the great number of perfons that flock to the place where the fovereign refides; near 10,000 are fuppofed to live here two or three months in fpring; the king keeps 115 fets of mules, which require a legion of men to to take care of them. Above a million Sterling has been laid out at Aranjuez fince the year 1763; and it muft be acknowledged, that wonders have been performed: feveral fine ftreets drawn in ftraight lines with broad pavements, a double row of trees before the houfes, and a very noble road in the middle; commodious hotels for the minifters and ambaffadors; great fquares, markets, churches, a theatre, and an amphitheatre for bull-feafts, have been raifed from the ground; befides the acceffion of two new wings to the palace. Neatnefs and convenience have been more ftudied and fought for than fhow in the architecture, but altogether the place has fomething truly magnificent in the coup d'œil.

ARAR, (Cæfar, Strabo); *Araris*, (Dio Caffius); *Saucona*, (Ammian): A river of Celtic Gaul, now the *Saone*; which rifes out of mount Vogefus on the confines of Lorrain, runs through the Franche Comte and Burgundy, and below Lyons falls into the Rhone. It is fo incredibly flow, that the eye cannot diftinguifh which

which way it moves, (Cæſar); and therefore Pliny calls it the *Sluggiſh river*. Its courſe is from north to ſouth. It is famous for a bridge of Cæſar, which was built by the ſoldiers in one day. It is navigable equally with the Rhone.

ARARAT, the name of the mountain on which Noah's ark reſted, after the abatement of the waters of the univerſal deluge. Concerning this mountain there are various conjectures; though it is almoſt univerſally allowed to be in Armenia Major. Some are of opinion that it is one of the mountains which divide Armenia on the ſouth from Meſopotamia and that part of Aſſyria inhabited by the *Curds;* from whom theſe mountains took the name of *Curdu* or *Cardu*; by the Greeks turned into *Gordyæi*, &c. Others, that it lies towards the middle of Armenia, near the river Araxes, above 280 miles diſtant from the abovementioned mountains, making it belong to mount Taurus; but the Armenians are poſitive that Noah's Ararat is no other than a mountain to which they now give the name of *Maſis*, which lies about 12 leagues to the eaſt of Erivan, and four leagues from the Aras. It is encompaſſed by ſeveral petty hills: on the tops of them are found many ruins, thought to have been the buildings of the firſt men, who were, for ſome time, afraid to deſcend into the plains. It ſtands by itſelf, in form of a ſugar-loaf, in the midſt of a very large plain, detached, as it were, from the other mountains of Armenia, which make a long chain. It conſiſts, properly ſpeaking, of two hills; the leſſer of which is the more ſharp and pointed: the higher, on which it is ſaid the ark reſted, lies to the north-weſt of it, and riſes far above the neighbouring mountains. It ſeems ſo high and big, that, when the air is clear, it may be ſeen four or five days journey off; yet travellers think the height is not extraordinary. Chardin is of opinion that he paſſed a part of mount Caucaſus which is higher; and Poullet thinks the height of mount Maſis, or Ararat, not above twice as great as that of mount Valerian near Paris. They therefore think that its being viſible at ſuch a great diſtance is owing to its lonely ſituation in a vaſt plain, and upon the moſt elevated part of the country, without any mountains before it to obſtruct the view. Nor is the ſnow with which it is always covered from the middle upwards any argument of its height; for, in this country, ice hath often been obſerved in the mornings of the middle of July. (See ARMENIA). Certain it is, however, that this mountain hath never yet been aſcended; which the Armenians pretend was owing to the interpoſition of angels, in order to diſappoint the curioſity of thoſe who wanted to advance to ſuch a ſacred place as that whereon the ark reſted: but the exceſs of cold may very reaſonably be ſuppoſed able to fruſtrate all ſuch attempts, without any ſupernatural interpoſition. The moſt diſtinct account we have of this mountain is that given by Mr Tournefort; which, however, being much ſwelled with immaterial circumſtances, it is needleſs to trouble our readers with at length. He tells us, that this mountain is one of the moſt diſagreeable ſights upon earth, without either houſes, convents, trees, or ſhrubs; and ſeems as if continually waſting and mouldering away. He divides it into three regions: The lowermoſt, he ſays, is the only one which contains any human creatures, and is occupied by a few miſerable ſhepherds that tend ſcabby flocks; and here are alſo found ſome partridges; the ſecond is inhabited by crows and tigers; and all the reſt is covered with ſnow, which half the year is involved in thick clouds. On the ſide of the mountain that looks towards Erivan is a prodigious precipice, from whence rocks of an immenſe ſize are continually tumbling down with a hideous noiſe. This precipice ſeems quite perpendicular; and the extremities are rough and blackiſh, as if ſmutted with ſmoke. The ſoil of the mountain is looſe, and on the ſandy parts it is impoſſible to take a firm ſtep; ſo that our traveller encountered great difficulties in his aſcent and deſcent of this mountain; being often obliged, in order to avoid the ſand, to betake himſelf to places where great rocks were heaped on one another, under which he paſſed as through caverns, or to places full of ſtones, where he was forced to leap from one ſtone to another. If we may believe Struys, a Dutch writer, however, all theſe difficulties may be ſurmounted. He aſſures us, he went five days journey up mount Ararat, to ſee a Romiſh hermit: that he paſſed through three regions of clouds; the firſt dark and thick, the next cold and full of ſnow, and the third colder ſtill: that he advanced five miles every day; and when he came to the place where the hermit had his cell, he breathed a very ſerene and temperate air: that the hermit told him, he had perceived neither wind nor rain all the 25 years he had dwelt there; and that on the top of the mountain there ſtill reigned a greater tranquility, whereby the ark was preſerved uncorrupted. He farther pretends, that the hermit gave him a croſs made out of the wood of the ark, together with a certificate; a formal copy of which the author has given in his ſham relation.

ARASSI, a maritime, populous, and trading town of Italy, in the territory of Genoa. E. Long. 7. 20. N. Lat. 44. 3.

ARATEIA, in antiquity, a yearly feſtival celebrated at Sicyon, on the birth-day of Aratus, wherein divers honours were paid by a prieſt conſecrated to this ſervice, who for diſtinction's ſake wore a ribband beſpangled with white and purple ſpots. The arateia were ſolemnized with much pomp of muſic, the choiriſters of Bacchus attending.

ARATUS, general of the Achæans, conquered Niocles tyrant of Sicyon. Two years after, he ſurpriſed the caſtle called *Acrocorinthus*, and drove out the king of Macedonia: he delivered Argos from its tyrants, and was poiſoned by Philip II. king of Macedonia, whom he had newly reſtored: he was about 62 when he died, the ſecond year of the 141ſt Olympiad. He was intered at Sicyon, and received the greateſt honours from his countrymen. His ſon, who had alſo been prætor, was poiſoned by king Philip. Polybius gives us ſo great a character of Aratus the father's Commentaries or Hiſtory, that the loſs of ſo valuable a work is highly to be regretted.

ARATUS, a Greek poet, born at Soli, or Solæ, a town in Cilicia, which afterwards changed its name, and was called *Pompeiopolis*, in honour Pompey the Great. He flouriſhed about the 124th, or, according to ſome, the 126th Olympiad, in the reign of Ptolemy Philadelphus king of Egypt. He diſcovered in his youth a remarkable poignancy of wit, and capacity for improvement; and having received his education

under

under Dionysius Heracleotes, a Stoic philosopher, he espoused the principles of that sect. Aratus was physician to Antigonus Gonatus, the son of Demetrius Poliorcetes, king of Macedon: this prince, being a great encourager of learned men, sent for him to court, admitted him to his intimacy, and encouraged him in his studies. The *phænomena* of Aratus, which is still extant, gives him a title to the character of an astronomer as well as a poet; in this piece he describes the nature and motion of the stars, and shows the particular influences of the heavenly bodies, with their various dispositions and relations. He wrote this poem in Greek verse: it was translated into Latin by Cicero; who tells us in his first book, *De oratore*, that the verses of Aratus are very noble. This piece was translated by others as well as Cicero; there being a translation by Germanicus Cæsar, and another into elegant verse by Festus Avienus. An edition of the *phænomena* was published by Grotius, at Leyden, in quarto, 1600, in Greek and Latin, with the fragments of Cicero's version, and the translation of Germanicus and Avienus, all which the editor has illustrated with curious notes. He was certainly much esteemed by the ancients, since we find so great a number of scholiasts and commentators upon him. There are several other works also ascribed to Aratus. Suidas mentions the following: Hymns to Pan; Astrology and Astrothesy; a composition of antidotes; an Επιθυτικον on Theopropus; an Ηθοποιια on Antigonus; an epigram on Phila, the daughter of Antipater, and wife of Antigonus; an Epicedium of Cleombrotus; a correction of the Odyssey; and some Epistles, in prose. Virgil, in his Georgics, has imitated or translated many passages from this author; and St. Paul has quoted a passage of Aratus. It is in his speech to the Athenians (Acts xvii. 28.) wherein he tells them, that some of their own poets have said, Τȣ γὰρ καὶ γένος ἐσμεν: "For we are also his offspring." These words are the beginning of the fifth line of the *phænomena* of Aratus.

ARAVA, a fortress of Upper Hungary, in a county and on a river of the same name. E. Long. 20. 0. N. Lat. 49. 20.

ARAUCO, a fortress and town of Chili, in South America; situated in a fine valley, on a river of the same name. The natives are so brave, that they drove the Spaniards out of their country, though they had no fire arms. W. Long. 71. 20. S. Lat. 42. 30.

ARAUSIO, or *Civitas Arausiensis*, or *Arausicorum* (Notitiæ); *Colonia Secundanorum* (Mela, Pliny, Coins); so called because the veterans of the second legion were there settled: The capital of the Cavares, in Gallia Narbonensis. Now *Orange*, in the west of Provence, on an arm of the river Egue, which soon after falls into the Rhone, from which it is distant a league to the east, at the foot of a mountain. Here is an ancient amphitheatre to be still seen. E. Long. 4. 46. Lat. 44. 10.

ARAW, a town of Swisserland, in Argow, seated on the river Aar. It is handsome, large, and remarkable for its church, its fountain, and the fertility of the soil. E. long. 18. 0. N. Lat. 47. 25.

ARAXES, now the ARAS, a river of Armenia Major, which takes its rise in a mountain called *Albos*, where the Euphrates also hath its origin. From this mountain it runs eastward with a serpentine course, discharging itself into the Caspian sea, after a run of upwards of 500 miles, during which it receives some considerable rivers. Some have imagined that it hath its rise in mount Ararat; but Tournefort assures us that it comes no nearer that mountain than 12 miles. The Araxes is a very rapid river, and is supposed to be the Gihon mentioned by Moses. Besides this extreme rapidity, it is very apt to overflow after rains; so that they have in vain endeavoured to build bridges over it; tho' some of them appear, from the few arches remaining, to have been built of the best materials, and in the strongest manner. Such is the vehemence of its current after the thawing of the adjacent snows, or some fierce rains, that neither banks nor dykes can resist it; so that nothing can be more terrible than the noise and violence of its waves at such times: but in winter, when its waters are low, it is fordable in some places on camels.

ARBA (anc. geog.), an island and city of Illyria. Now *Arbe*, in the gulph of Quarnaro. Of this island, which has been but slightly noticed by geographers, we have the following description by the Abbé Fortis.

In the Roman times, it is probable that there were no other cities in Arbe but that which bears the name of the island, in the neighbourhood of which ancient monuments are frequently dug up.

This city of Arbe, though the capital of a small island, not above thirty miles round, wholly uncultivated, and uninhabitable in the highest part that faces the channel of Morlacca, has always maintained itself with decorum. That it was inhabited by civilized people in the Roman times, is evident, by the inscriptions that have been frequently discovered there, and others still remain at Arbe. In the lower times it suffered all the calamities to which the neighbouring countries were subjected, but it always recovered itself with honour even after dissolution.

The archives of the community of Arbe contain some ancient papers that are truly valuable, and they are kept with great jealousy; by them it appears, that, in the eleventh century, gold and silk were not rare among the inhabitants. Arbe was subject to the kings of Hungary; afterwards it became dependent on Venetian feudatories; and at last was taken under the immediate dominion of the most serene republic, by which a governor is appointed who has the title of count and captain. The number of people on the island does not much exceed three thousand souls, distributed in a few parishes, which might be officiated by a small number of priests: yet, through a monstrous inconsistency that falls very heavy on the poor inhabitants, they have to maintain no less than three convents of friars, and as many of nuns, besides the considerable charge of near sixty priests, who have a very scanty provision.

The climate of Arbe is none of the happiest; the winter season is horrid, especially when agitated by the violent northerly winds, which sometimes transform the intermediate seasons into winter, and cause the summer itself to disappear. These furious winds do great damage to the island, particularly in the winter and spring. Two years ago, about twelve thousand sheep perished in one night, of cold, in the common pastures of the mountain; where, according to the cus-

Arba.

tom over all Dalmatia, they are left in the open air the whole year round. The ſalt fog raiſed by the dreadful commotion of the waves, which often roar, between the mountains of Arbe and the oppoſite Alps, in the narrow channel of Morlacca, conſumes all the buds of the plants and corn, if it happens to be driven upon the iſland by the wind; and it is followed by a cruel ſcarcity of every kind of produce. This calamity communicates its baneful influence even to the fleſh of the animals left on the paſtures, that becomes ill-taſted, in conſequence of the bitterneſs and bad nouriſhment of the food. Abſtracting from theſe irregularities, the air of Arbe is healthful; nor ought the conſtant ſummer fevers among the inhabitants to be attributed to its influence as they are, more probably, derived from unwholeſome food, and a way of life differing little from that of the Hottentots.

The appearance of the iſland is exceedingly pleaſant. On the eaſt it has a very high mountain, of the ſame ſubſtance as the Morlacca, of which it was at once a part. At the foot of this mountain, the reſt of the iſland is extended to the weſtward, and divided into beautiful and fruitful plains interſperſed with little hills fit to bear the richeſt products. At the extremity that looks to the north, a delightful promontory, called Loparo, ſtretches into the ſea; it is crowned with little hills, which almoſt quite incloſe a fine cultivated plain. Near this promontory are the two ſmall iſlands of S. Gregorio and Goli, very uſeful to ſhepherds and fiſhers. The coaſt of Arbe, that faces the Morlacca mountains, is quite ſteep and inacceſſible; and the channel between them is extremely dangerous, being expoſed to furious winds, and without a ſingle port on either ſide. The long and narrow iſland of Dolin, lying parallel to the iſland of Arbe, along the coaſt of Barbado, forms a channel leſs dangerous, though by no means ſo ſecure as it is beautiful to look at. There are ſeveral harbours in the neighbourhood of the city of Arbe, by which the trade of the beſt part of the iſland is facilitated.

The city ſtands on a riſing ground between two harbours, which form a peninſula; it contains about a thouſand inhabitants, among whom are many noble families, but few of them are rich. Among the moſt remarkable curioſities of the iſland, the Arbegiani are proud of many egregious reliques, and particularly of the head of S. Criſtofano their protector; but the lovers of ſacred antiquity will find ſomething much more ſingular in the three heads of Shadrach, Meſhech, and Abednego, which are venerated there with great devotion. Four of the principal gentlemen are keepers of the ſanctuary, and to their care the precious records of the city are alſo committed. Among theſe records there is a tranſaction of MXVIII. by which the city of Arbe promiſes to the Doge of Venice, Ottone Orſeolo, a tribute of ſome pounds *de ſeta ſerica*, "of wrought ſilk," and in caſe of contravention, pounds *de auro obrizo* "of pure gold."

In the laſt age there was a learned biſhop of Arbe, named Ottavio Spaderi, who would not permit the reliques of S. Criſtofano to be expoſed to the public veneration, on the ſolemnity of the ſaint's day, becauſe he doubted of their authenticity. The mob roſe, and was going to throw him down from the top of the hill on which the cathedral ſtands; nor did the tumult ceaſe after the day was paſt. The government ſent an armed veſſel to deliver the prelate from the danger he was in; and the pope thought proper to give him a more tractable ſpouſe in Italy.

Arba.

The nature of the ſoil of Arbe is not the ſame in every ſituation; nay it would be difficult to find a country where there is ſo great a variety in ſo little ſpace. There is a very great difference between the ground of the extremity of the mountain above the channel of Barbado, and the ſides of it on the one part towards the iſland, and on the other facing the ridge of Morlacca. Nor is the top of the mountain itſelf always of the ſame ſtructure: for in ſome parts it is extended in a fine level plain, partly woody and partly cultivable; in other places it is quite rocky, and compoſed of bare marble. The ground at the foot of the mountain, where it ſtretches towards the ſhore, oppoſite to Jablanaz, is nothing but marble; and, in the diſtrict of Barbado it is gravelly, and a good ſoil for vines. The wine of Barbado is of excellent quality, and in great eſtimation; hardly any other product is cultivated along that coaſt, as the vines ſucceed ſo well, notwithſtanding the negligent culture. Below the pretended ruins of Colento the land bears vines, olives, mulberry, and other fruit-trees, and alſo corn in the loweſt parts. All the lower part of the iſland is compoſed alternatively of little hills and valleys, and of a ſubſtance for the moſt part very different from that of the mountain and its adjacencies. As the organization of the mountain is wholly of marble, ſo that of the hills is generally arenaceous. The wheſtone forms a lage part, and frequently contains *oſtracites* and *lenticulares*; the exterior ſtratum is commonly friable. The valleys, which according to appearances ſhould be full of ſand, are provided with an excellent ſoil, with ſuch a mixture of very minute ſand as is requiſite to keep it light. Springs of freſh water are by nature well diſtributed over the iſland, and maintain a proper humidity when the ſummer is not exceſſively dry; ſo that the dark verdure of the hills covered with wood, the luxuriance of the vines, and freſhneſs of the corn-ground, form a ſpectacle extremely cheerful and agreeable.

The iſland of Arbe would have every thing requiſite for the ſubſiſtence of its ſmall population, if the land was cultivated by a people leſs ſtupid and lazy. It produces, however, fire-wood, of which many cargoes are annually ſent to Venice; corn, oil, excellent wine, brandy, and ſilk, ſince very ancient times; it alſo exports hides, wool, ſheep, hogs, and horſes of a good breed. There is alſo abundance of good ſalt made on the iſland; and the fiſhing of tunny and mackrel, notwithſtanding it is managed in a ſlovenly and aukward manner, makes no inconſiderable article of trade to the Arbegiani, who, like all their neighbours, find their account in ſelling this commodity to ſtrangers rather than to the Venetians. Yet, with all theſe natural products, the iſland is very far from being rich, or even in a tolerable flouriſhing ſtate; becauſe there is much land left uncultivated, and the peaſants are lazy.

ARBACES governed Media under Sardanapalus. Seeing him ſpinning among a company of his women, he ſtirred up his people to revolt, and dethroned Sardanapalus; who thereupon burnt himſelf in his palace. Arbaces being crowned, began the monarchy of the Medes, which laſted 317 years under nine kings, till

Astyages was expelled by Cyrus. Arbaces reigned 22 years, and died A. M. 3206. See MEDIA.

ARBALEST, or CROSS-BOW. See *CROSS-BOW*.

ARBELA, now IRBIL, a city of Assyria, lying in E. Long. 44. 5. N. Lat. 35. 15. It is famous for the last and decisive battle fought in its neighbourhood between Alexander the Great and Darius Codomannus. This battle was fought 331 years before Christ, and the event of it determined the fate of the Persian empire. Arrian relates, that Darius's army consisted of a million of foot and 40,000 horse; according to Diodorus, there were 200,000 horse, and 800,000 foot; Plutarch relates, that the horse and foot together made up a million; and Justin gives us exactly half Diodorus's number. The Macedonian army, according to Arrian, consisted of 40,000 foot and 7000 horse.

Upon receiving notice of the vast strength of the enemy, Alexander expressed neither surprise nor apprehension; but having "commanded a halt, he encamped four days, to give his men rest and refreshment. His camp being fortified by a good intrenchment, he left in it the sick and infirm, together with all the baggage; and on the evening of the fourth day, prepared to march against the enemy with the effective part of his army, which was said to consist of 40,000 infantry and 7000 horse, unincumbered with any thing but their provisions and armour. The march was undertaken at the second watch of the night, that the Macedonians, by joining battle in the morning, might enjoy the important advantage of having an entire day before them, to reap the full fruits of their expected victory. About half way between the hostile camps, some eminences intercepted the view of either army. Having ascended the rising ground, Alexander first beheld the Barbarians, drawn up in battle array, and perhaps more skilfully marshalled than he had reason to apprehend. Their appearance, at least, immediately determined him to change his first resolution. He again commanded a halt, summoned a council of war; and different measures being proposed, acceded to the single opinion of Parmenio, who advised that the foot should remain stationary until a detachment of horse had explored the field of battle, and carefully examined the disposition of the enemy. Alexander, whose conduct was equalled by his courage, and both surpassed by his activity, performed those important duties in person at the head of his light horse and royal cohort. Having returned with unexampled celerity, he again assembled his captains, and encouraged them by a short speech. Their ardour corresponded with his own; and the soldiers, confident of victory, were commanded to take rest and refreshment.

Gillies's Hist. of Greece.

"Meanwhile Darius, perceiving the enemy's approach, kept his men prepared for action. Notwithstanding the great length of the plain, he was obliged to contract his front, and form in two lines, each of which was extremely deep. According to the Persian custom, the king occupied the centre of the first line, surrounded by the princes of the blood and the great officers of his court, and defended by his horse and foot guards, amounting to 15,000 chosen men. These splendid troops, who seemed fitter for parade than battle, were flanked on either side by the Greek mercenaries and other war-like battalions, carefully selected from the whole army. The right wing consisted of the Medes, Parthians, Hyrcanians, and Sacæ; the left was chiefly occupied by the Bactrians, Persians, and Cardusians. The various nations composing this immense host were differently armed, with swords, spears, clubs, and hatchets; while the horse and foot of each division were promiscuously blended, rather from the result of accident than by the direction of design. The armed chariots fronted the first line, whose centre was farther defended by the elephants. Chosen squadrons of Scythian, Bactrian, and Cappadocian cavalry advanced before either wing, prepared to bring on the action, or after it began to attack the enemy in flank and rear. The unexpected approach of Alexander within sight of his tents prevented Darius from fortifying the wide extent of his camp; and, as he dreaded a nocturnal assault from enemies who often veiled their designs in darkness, he commanded his men to remain all night under arms. This unusual measure, the gloomy silence, the long and anxious expectation, together with the fatigue of a restless night, discouraged the whole army, but inspired double terror into those who had witnessed the miserable disasters on the banks of the Granicus and the Issus.

"At day-break Alexander disposed his troops in a manner suggested by the superior numbers and deep order of the enemy. His main body consisted in two heavy-armed phalanxes, each amounting to above 16,000 men. Of these the greater part formed into one line; behind which he placed the heavy-armed men, reinforced by his targeteers, with orders, that when the out-spreading wings of the enemy prepared to attack the flanks and rear of of his first line, the second should immediately wheel to receive them. The cavalry and light infantry were so disposed on the wings, that while one part resisted the shock of the Persians in front, another, by only facing to the right or left, might take them in flank. Skilful archers and darters were posted at proper intervals, as affording the best defence against the armed chariots, which (as Alexander well knew) must immediately become useless whenever their conductors or horses were wounded.

"Having thus arranged the several parts, Alexander with equal judgment led the whole in an oblique direction towards the enemy's left; a manœuvre which enabled the Macedonians to avoid contending at once with superior numbers. When his advanced battalions, notwithstanding their nearness to the enemy, still stretched towards the right, Darius also extended his left, till fearing that by continuing this movement his men should be drawn gradually off the plain, he commanded the Scythian squadrons to advance, and prevent the farther extension of the hostile line. Alexander immediately detached a body of horse to oppose them. An equestrian combat ensued, in which both parties were reinforced, and the barbarians finally repelled. The armed chariots then issued forth with impetuous violence; but their appearance only was formidable; for the precautions taken by Alexander rendered their assault harmless. Darius next moved his main body, but with so little order, that the horse, mixed with the infantry, advanced, and left a vacuity in the line, which his generals wanted time or vigilance to supply. Alexander seized the decisive moment, and penetrated into the void with a wedge of squadrons. He was followed by the nearest sections of the phalanx, who ruſhed forward with loud ſhouts, as if they had already purſued the enemy. In this part of the field, the victory was not long doubtful; after a feeble reſiſtance, the barbarians gave way; and the puſillanimous Darius was foremoſt in the flight.

"The battle, however, was not yet decided. The more remote diviſions of the phalanx, upon receiving intelligence that the left wing, commanded by Parmenio, was in danger, had not immediately followed Alexander. A vacant ſpace was thus left in the Macedonian line, through which ſome ſquadrons of Perſian and Indian horſe penetrated with celerity, and advanced to the hoſtile camp. It was then that Alexander derived ſignal and well-earned advantages from his judicious order of battle. The heavy-armed troops and targeteers, which he had ſkilfully poſted behind the phalanx, ſpeedily faced about, advanced with a rapid ſtep, and attacked the barbarian cavalry, already entangled among the baggage. The enemy, thus ſurpriſed, were deſtroyed or put to flight. Meanwhile, the danger of his left wing recalled Alexander from the purſuit of Darius. In advancing againſt the enemy's right, he was met by the Parthian, Indian, and Perſian horſe, who maintained a ſharp conflict. Sixty of the *Companions* fell: Hephæſtion, Cœnus, and Menidas, were wounded. Having at length diſſipated this cloud of cavalry, Alexander prepared to attack the foot in that wing. But the buſineſs was already effected, chiefly by the Theſſalian horſe; and nothing remained to be done, but to purſue the fugitives, and to render the victory as deciſive as poſſible.

"According to the leaſt extravagant accounts, with the loſs of 500 men he deſtroyed 40,000 of the barbarians, who never thenceforth aſſembled in ſufficient numbers to diſpute his dominion in the Eaſt. The invaluable provinces of Babylonia, Suſiana, and Perſis, with their reſpective capitals of Babylon, Suſa, and Perſepolis, formed the prize of his ſkill and valour. The gold and ſilver found in thoſe cities amounted to thirty millions Sterling; the jewels and other precious ſpoil, belonging to Darius, ſufficed, according to Plutarch, to load 20,000 mules and 5000 camels." The conſequence of this victory the reader will find narrated under the article Persia.

ARBERG, a town of Swiſſerland, in the canton of Bern, with a handſome caſtle, where the bailiff reſides. It is ſeated on the river Aar, in a kind of iſland. E. Long. 17. 15. N. Lat. 47. 0.

ARBITER, in the civil law, implies a judge nominated by the magiſtrate, or choſen voluntarily by the two contending parties, in order to decide their differences.

The civilians make a difference between *arbiter* and *arbitrator*, though both found their power on the compromiſe of the parties; the former being obliged to judge according to the cuſtoms of the law, whereas the latter is at liberty to uſe his own diſcretion, and accommodate the difference in the manner that appears to him moſt juſt and equitable.

ARBITRARY, that which is left to the choice or arbitration of men, or not fixed by any poſitive law or injunction.

Arbitrary Puniſhment, in law, denotes ſuch puniſhments as are by ſtatute left to the diſcretion of the judge. It is a general rule in arbitrary puniſhments, that the judge cannot inflict death. Hence all puniſhments that are not capital have acquired the name of *arbitrary puniſhments*, even although they be expreſsly pointed out by ſtatute.

ARBITRATION is where the parties, injuring and injured, ſubmit all matters in diſpute, concerning any perſonal chattels, or perſonal wrong, to the judgment of two or more arbiters or arbitrators; who are to decide the controverſy: and if they do not agree, it is uſual to add, that another perſon be called in as umpire, (*imperator* or *impar*), to whoſe ſole judgment it is then referred; or frequently there is only one arbitrator originally appointed. This deciſion, in any of theſe caſes, is called an *award*. And thereby the queſtion is as fully determined, and the right transferred or ſettled, as it could have been by the agreement of the parties or the judgment of a court of juſtice. See alſo Law, Part III. N° clxxxv. 15, &c.

ARBITRATOR, a private extraordinary judge, choſen by the mutual conſent of parties, to determine controverſies between them. See Arbiter and Arbitration.

ARBOIS, a ſmall populous town of France, in the Franche Compte, famous for its wines. E. Long. 5. 40. N. Lat. 46. 55.

ARBON, an ancient town in Swiſſerland, on the ſouth banks of the lake Conſtance, in Thurgaw. It has a caſtle built by the Romans, and is under the juriſdiction of the biſhop of Conſtance. In the time of war, the Swiſs have a right to put in a garriſon. The Popiſh and Proteſtant religions are equally tolerated in this town. E. Long. 9. 30. N. Lat. 4. 38.

ARBOR, in botany, a tree. Trees are by Linnæus claſſed in the ſeventh family of the vegetable kingdom, and are diſtinguiſhed from ſhrubs in that their ſtems come up with buds on them; but this diſtinction holds not univerſally, there being rarely any buds on the large trees in India.

Arbor, in mechanics, the principal part of a machine, which ſerves to ſuſtain the reſt; alſo the axis or ſpindle on which a machine turns, as the *arbor* of a crane, windmill, &c.

Arbor Dianæ. See Chemistry-*Index*.

Arbor Vitæ. See Thuya.

ARBORESCENT, an epithet applied to ſuch objects as reſemble trees.

Arborescent Star-fiſh, in zoology, a ſpecies of aſterias. See Asterias.

ARBORIBONZES, in modern hiſtory, prieſts of Japan, who live an erratic life, and ſubſiſt on alms. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

ARBORIST, a perſon ſkilled in that part of botany which treats of trees.

ARBOUR, in gardening, a kind of ſhady bower, formerly in great eſteem; but of late rejected on account of its being damp and unwholeſome.

Arbours are generally made of lattice-work, either of wood or iron; and covered with elms, limes, hornbeams; or with creepers, honeyſuckles, jaſmines, or paſſion-flowers; either of which will anſwer the purpoſe very well, if rightly managed.

ARBROATH, See Aberbrothic.

ARBURG, a town of Swiſſerland, in the canton of Bern, on the river Aar. It is ſmall, but very ſtrong, being seated on a rock, and defended by a good fortress cut out of the rock. E. Long. 17. 55. N. Lat. 47. 10.

ARBUSCULA is used by Bradley to denote a little or dwarf tree, above the rank of shrubs but below that of trees; such e. gr. as the elder.

ARBUSTUM implies a number or multitude of trees planted for the fruit sake.

The word was more peculiarly applied to a place planted with trees for fastening vines to, which are hence called by Columella *arbustivæ*.

ARBUSTUM is sometimes also used to denote an orchard, or field wherein trees are planted at such distance that there is room for ploughing and growing corn between.

ARBUTHNOT (Alexander), principal of the university of Aberdeen in the reign of James VI. of Scotland, was born in the year 1538. He studied first at Aberdeen; and was afterwards sent over to France, where, under the famous Cujacius, he applied himself to the study of the civil law. In the year 1563, he returned to Scotland, and took orders. Whether he was ordained by a bishop or by presbyters, is a matter of uncertainty. In 1568, he was appointed minister of Arbuthnot and Logy-Buchan; and in the following year, Mr Alexander Anderson being deprived, our author was made principal of the king's college at Aberdeen in his room. In the general assembly which met at Edinburgh in the years 1573 and 1577, he was chosen moderator; and to the end of his life was an active supporter of the reformed religion. He died in 1583, in the 45th year of his age; and was buried in the college church of Aberdeen. We are told in the Biographia, that he was eminent as a poet, a philosopher, a mathematician, a lawyer, a divine, and a physician. He wrote *Orationes de origine & dignitate juris*, printed at Edinburgh, 1572, 4to. His cotemporary Thomas Maitland wrote a copy of Latin verses on the publication of this book: they are printed in the *Delic. Poetar. Scot.* He published Buchanan's history of Scotland in the year 1582.

ARBUTHNOT (Dr John), was born in Kincardinshire, near Montrose, and was educated at Aberdeen, where he received his degree in physic. The difficulties in which his family was involved on account of their political principles, making it necessary that he should court preferment in another country than his own, he went to London. The first character in which he acted there was a teacher of the mathematics; and while he was employed in this manner, he had occasion to publish his *Examination of Dr Woodward's account of the deluge*. This tract, which abounded with learning and good sense, served to make him known. He published soon after his *Essay on the usefulness of mathematics*. In the profession of physic he advanced by slow but sure degrees; and his reputation in it was at length fully established, by a successful cure which he performed on Prince George of Denmark. Queen Anne, in consequence of it, appointed him one of her physicians in ordinary in 1709; and, some years before this, his extensive knowledge had procured his admission into the Royal Society. His talents and worth were the strongest recommendations of him to the men of wit and learning of his day; and he entered into particular connection with Pope and Swift, with whom he joined in publishing several volumes of miscellanies; among which are the well-known *Memoirs of Martinus Scriblerus*, a satire of infinite humour on the abuses of human learning. In 1715, he assisted Pope and Gay in the *Three hours after marriage*; a dramatic performance, which was brought upon the stage without success. In 1727, he published *Tables of ancient coins, weights, and measures*; a work of great use, and real erudition. In 1732, his valuable tract concerning *The nature and choice of aliments* appeared; which, the year after, was followed by his remarks on *The effects of air on human bodies*. A constitutional asthma had distressed him at different periods of his life, and proved fatal to him in 1734.—Dr Arbuthnot appears to have been in all respects a most accomplished and amiable person. He has showed himself equal to any of his cotemporaries in wit and learning, and he was superior to most men in the moral duties of life, in acts of humanity and benevolence. His letter to Mr Pope, written as it were upon his death-bed, and which no one can read without the tenderest emotion, discovers such a noble fortitude of mind at the approach of his dissolution, as could be inspired only by a clear conscience, and the calm retrospect of an uninterrupted course of virtue. In 1751, came out in two vols. 8vo. printed at Glasgow, *The miscellaneous works of the late Dr Arbuthnot*; which are said to comprehend, with what is inserted in Swift's miscellanies, all the pieces of wit and humour of this admirable author.

ARBUTUS, the STRAWBERRY TREE: a genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 18th order, *Bicornes*. The calyx is divided into five parts; the corolla is ovated; and the fruit is a berry with five cells.

Species. 1. The unedo, or common strawberry-tree, is a native of Italy, Spain, and also of Ireland; and is now very common in the British gardens. Of this species there are four varieties, viz. The oblong-fruited, the round-fruited, the red-flowered, and the double-blossomed. One description is nearly common to them all; and their inconsiderable variation is almost sufficiently shewn in their respective appellations.

The oblong-fruited sort will grow to be a middling-sized tree in some countries; for we read of the large uses its wood has been applied to; such as, *arbutæ crates*, &c. Arbutean harrows, &c. With us it may be kept down to any size. The main stems are covered with a light-brown bark, rough, and falling. The younger branches are of a kind of purple colour, whilst the last year's shoots are of a fine red, and a little hairy. The leaves grow alternately on the branches, and are of an oblong oval figure. They stand on short footstalks, and the oldest leaves make a contrast with the younger by having their footstalk and mid-rib of a fine scarlet colour. They are smooth, and beautifully serrated. Their upper surface (as in most trees) is of a stronger green than their under; and the young twigs are garnished with them in plenty. These are beauties in common to most trees, in some degree or other; but every thing else almost of this tree that presents itself to consideration is singular: the time of its flowering will be in November and December; when it is rather singular to see a tree in the open ground in full blow; and the fruit ripens by that time twelvemonth after. The manner and nature of the fruit, Arbutus. fruit, which look like very large red ſtrawberries, give it alſo a ſingular and delightful look; and this is heightened as they appear all over the tree among the flowers; for that is the time of its being ripe, when the flowers for the ſucceeding crop are fully out. The flowers themſelves make no great figure; they are of a kind of whitiſh-yellow colour; and are ſucceeded by the abovementioned ſtrawberry-fruit, which will require a revolution of twelve months before they perfectly arrive at their maturity and colour. The flowers of the firſt ſort are larger than thoſe of the ſecond; and the fruit is oval, and much larger than our common ſcarlet ſtrawberry.

The round-fruited ſort has its pitcher-ſhaped flowers, which are ſucceeded by round ſcarlet fruit, as wide as they are long; and this is all the difference between theſe ſorts.

The red-flowered ſort differs in no reſpect from the common ſort, only the flowers are red, and theſe conſtitute a variety from the other ſorts of flowers; but the contraſt is not ſo great between their fruit and them as of the other ſorts, their colour approaching too near to a ſameneſs.

The double-bloſſomed ſort differs in no reſpect, only that the flowers are double; but this difference is ſo inconſiderable, that it will not be ſeen without looking into the flower; and even then the doubleneſs will appear ſo trifling as ſcarcely to merit notice; ſo that a plant or two, to have it ſaid that the collection is not without it, will be ſufficient. Neither ought any more to be admitted; for they will not produce the ſame plenty of fruit, which conſtitutes the greateſt beauty of theſe trees, as the ſingle ſorts.

The above ſorts thrive beſt in a wet ſoil, and are ſeldom hurt by hard winters, though the young and tender branches are often deſtroyed by froſt; but, however dead the trees may appear, they ought always to be ſuffered to remain till the following ſummer ſhows what are living and what are dead.

The method of propagating the varieties of the unedo is by layers and cuttings: the ſpecies itſelf may be raiſed from ſeed.—1. *Propagation by layers.* The operation muſt be performed on the youngeſt twigs; and in ſome ſoils they will ſtrike root pretty freely, whilſt in others they can hardly be made to grow at all: But before they have lain two ſummers, you may ſcarcely venture to look for any. When the roots are ſtruck, the layers ſhould be carefully taken off in the ſpring, and planted in ſeparate pots; and after well watering them, they ſhould be plunged up to the rims in an hotbed, and this will ſet them forward; for without this aſſiſtance many of the layers will be loſt; ſince they are difficult plants to make grow. After the hotbed has forced the ſeeds into a ſtate of vegetation, the pots may be taken out, and plunged up to the rims in ſome natural mould, to keep them cool and moiſt; and here they may ſtand for two or three years, or longer, if the pots are large enough, without ever removing or ſheltering in winter; for they are hardy enough to reſiſt our ſevereſt cold. When they are to be finally ſet out, all the mould may be turned out of the pots hanging to the roots; and having proper holes made ready, they may be planted in them, and the plant will be ignorant of its new ſituation.

2. *By cuttings.* Theſe muſt be planted in pots, and have the benefit of a good bark-bed; in which being conſtantly ſhaded and duly watered, many of them will grow. As the plants raiſed this way will be rather tender by being forced in the bark-bed, it will be neceſſary to remove them into the greenhouſe, or to place them under a hotbed-frame during the firſt winter: and after that, the pots may be ſet up to the rims in the ground, and, like the layers, the plants may be turned out at a convenient time into the places where they are to remain. Arbutus.

1. *Raiſing from ſeeds.* Let theſe be taken from the oblong or round-fruited ſort. The ſeeds, which will be ripe ſome time in November or the beginning of December, for they will not be ripe at the ſame time in all places, muſt be then gathered; and as they ſhould not be ſowed until the ſpring, it will be proper to put them into a pot or jar, mixing with them a quantity of drift-ſand; and this will preſerve them ſound and good. The beginning of March is the beſt time for ſowing the ſeeds; and the beſt ſoil for them is maiden earth, taken from a rich paſture at leaſt a year before, with the ſward; and this, by conſtant turning, being well rotted and mixed, will be ready to receive them. Having filled a different quantity of pots with this fine mould, let the ſeeds be ſown, and but juſt covered, ſcarcely a quarter of an inch deep. A dry day ſhould be choſen for the buſineſs; and no watering by the hand ſhould be given them, as it will endanger the ſetting the mould hard in the pots. Leave them abroad until ſome rain falls, which at that time may be hourly expected; and after that, having an hotbed ready, plunge the pots therein. In leſs than ſix weeks you may expect your plants to appear; when much air ſhould be afforded them, and frequent waterings, in ſmall quantities, gently ſprinkled over them. After this, they may be hardened to the air by degrees, and the pots ſet up to the rims in the natural mould, in a ſhady place. In October they ſhould be removed into the greenhouſe, or ſome ſhelter, in froſty weather; though they ſhould always be ſet abroad in mild open weather. In the ſpring they may be taken out, and planted in ſeparate pots; and they ſhould have the advantage alſo of a hotbed to ſet them a-growing: their future management may be the ſame as was directed for the layers. When theſe trees are to be planted out, very little regard need be paid to the ſoil or ſituation; for they will grow almoſt any where, and reſiſt our ſevereſt northern blaſts. One thing, however, the gardener muſt conſtantly obſerve, in order to continue his trees in their beauty, viz. As often as a heavy ſnow falls, ſo conſtantly ſhould he go and ſhake the boughs; for it will lodge amongſt the leaves and branches in ſuch great quantity as to weigh down and ſplit the largeſt branches; the deformity of which afterwards may be eaſily conceived. Beſides, many years muſt expire before the tree will, if ever it ſhould, grow to its former beauty; to preſerve this, therefore, makes the narrowly watching theſe trees in ſnowy weather highly neceſſary.

2. The andrachne will grow to a larger ſize than the arbutus. The leaves are ſmooth, and nearly of the ſame figure as the preceding ſort; though they are larger, and have their edges undivided. The flowers grow like the other ſorts; are of the ſame colour; and they

they are succeeded by large, oval, scarlet fruit. It is called the *Oriental Strawberry-tree*, because this sort grows plentifully in many parts of the East, and is useful to the inhabitants for many purposes in life.

The andrachne may be propagated in the same manner as the arbutus: But the plants must be preserved in pots for three or four years till they have obtained strength; and may be then planted in a warm situation and on a dry soil, for this species will not thrive on wet ground.

Besides the above, there are three other species of arbutus, viz. The acadiensis, a native of Acadia; the alpina, or mountain strawberry-tree, a native of Britain; and the uva ursi, a plant lately discovered in the Highlands of Scotland, and which formerly was thought not to be a native of Britain.

ARCADE, in architecture, is used to denote any opening in the wall of a building formed by an arch.

ARCADI, or ARCADIANS, the name of a learned society at Rome. See the article ACADEMY.

ARCADIA, an inland district in the heart of Peloponnesus (Strabo). It is mountainous, and fitter for pasture than corn; and therefore chiefly celebrated by bucolic or pastoral poets, who feign Pan, the god of shepherds, to be the guardian of it (Virgil.) It has to the north Achaia, to the east Argos and Laconia, Messenia to the south, and Elis to the west. According to Pliny, the wine of this country cured barenness in women, and inspired the men with rage; and the berries of the yew gathered there were so strong a poison, that whoever slept or took refreshment under that tree were sure to die. In Strabo's time there were few cities remaining in it, most of them being destroyed in the Grecian wars. Eustathias says, that the country was anciently called *Pelasgia*, from Pelasgos, who brought the people, from roots, herbs, and leaves of trees, to feed on acorns, especially beech-mast; as Artemidorus observes, that the Arcadians usually lived on acorns. It was also called *Lycaonia*, *Gigantis*, and *Parrhasia* (Stephanus). The Arcadians are greatly commended for their love of, and skill in, music (Virgil, Polybius). To imitate the Arcadians, is to labour and toil for the benefit of others, never conquering their own, but the enemies of others (Hesychius). This probably took its rise from the ancient Arcadians being accustomed to hire themselves out as mercenaries to foreign nations. Homer commends their martial prowess, their pastures, their sheep, and their country well-watered. The gentilitious name is *Arcades;* who boasted of their great antiquity, and that they were older than the sun and moon (Apollonius Rhodius, Nonnius, Plutarch, Ovid, Statius). They were the first who had a year of three months, and therefore called *Proceleni*, because their year was prior to that adjusted in Greece to the course of the moon (Censorinus).

ARCANGIS, in the Turkish armies, an inferior kind of infantry, which serve as *enfans perdus*, and to harrass and pillage the enemy's frontiers. The Arcangis are an order inferior to the Janisaries; and when any of them distinguish themselves, are usually preferred into the Janisaries order. They have no pay, but are to subsist on their plunder.

ARCANUM, among physicians, any remedy, the preparation of which is industriously concealed, in order to enhance its value.

ARCANUM (anc. geog.), a villa of Q. Cicero, Tully's brother, in Latinum, (Cicero). Now Arce, in the Terra di Lavoro, in the kingdom of Naples, on the borders of the Campagnia di Roma, on the river Melpis, between Arpinum and Aquinum.

ARCBOUTANT, in building, an arched buttress. See BUTTRESS.

ARCESILAUS, a celebrated Greek philosopher, about 300 years before the Christian æra, was born at Pitane, in Eolis. He founded the second academy, which is called the *second school*. He was a man of great erudition, and well versed in the writings of the ancients. He was remarkable for the severity of his criticisms; but nevertheless he knew how to accommodate himself to the age, and pursue the allurements of pleasure. He had a great number of disciples. His doctrines were different in several respects from those of the ancient school: and perhaps he was led into this diversity of opinions by many capital errors in the ancient school, such as the incredible arrogance of the dogmatists, who pretended to assign causes for all things; the mysterious air they had thrown upon the doctrine of ideas; the entirely discarding the testimony of the senses; the objections of the Pyrrhonists, who now began to broach their opinions; the powerful opposition of the Stoics and Peripatetics, who discovered the feeble parts of the academic philosophy. These might have given cause to reform the ancient school, and to found a new one. The middle school, therefore, laid it down as a principle, that we could know nothing, nor even assure ourselves of the certainty of this position; from whence they inferred, that we would affirm nothing, but always suspend our judgment. They advanced, that a philosopher was able to dispute upon every subject, and bring conviction with him, even upon contrary sides of the same question; for there are always reasons of equal force both in the affirmative and negative of every argument. According to this doctrine, neither our senses, nor even our reason, are to have any credit; and therefore, in common affairs, we are to conform ourselves to received opinions. Arcesilaus was succeeded by his disciple Lacydes.

ARCH, in geometry, any part of the circumference of a circle or curved line, lying from one point to another, by which the quantity of the whole circle or line, or some other thing sought after, may be gathered.

ARCH, a concave or hollowed piece of building, constructed in such a manner that the several stones of which it is composed keep one another in their places. The terms *arch* and *vault* properly differ only in this, that the arch expresses a narrower, and the vault a broader, piece of the same kind. The principal difference in the form of arches is, that some are circular, and others elliptical; the former having a larger or smaller part of a circle, the other of an ellipsis. What are called *strait arches*, are those frequently used over doors and windows, the upper and under edges of which are strait and parallel, and the ends and joints all pointing toward a centre. The space between two piers of a bridge is called an *arch*, because usually arched over.

Triumphal ARCHES are magnificent entries into cities, erected to adorn a triumph, and perpetuate the memory of the action. The arches of Titus and Constantine ftantine make at this time a great figure among the ruins of old Rome.

Arch, in compofition, fignifies *chief*, or of the *firft* clafs; as archangel, archbifhop, &c.

ARCHÆUS, or Archeus. See Archeus.

ARCHANGEL, an angel occupying the eighth rank in the celeftial hierarchy. See Angel and Hierarchy.

Archangel, a city of Ruffia, in the province of Dwina, fituated on the eaft fide of the river Dwina, about fix miles from the White Sea, in E. Long. 40. 21. N. Lat. 64. 30. The city extends about three miles in length and one in breadth. It is rich, populous, built in the modern tafte, and is a metropolitan fee. It rofe from a caftle built on the fpot by Bafilowitz II. to protect the increafing trade brought there by the difcovery of the White Sea by the Englifh, and took its name from a monaftery built in honour of the archangel Michael. Before this period the commercial intercourfe between Ruffia and the northern parts of Europe had been long carried on by the Hanfeatic towns; which ufually failed to Revel or Narva, and from thence paffed through Dorpt to Plefcof and Novogorod, where their factories were eftablifhed. The accidental difcovery of archangel, in 1553, deprived the Hanfeatic towns of a great part of this lucrative commerce, and transferred it to the Englifh. On the 11th of May, in the abovementioned year, three fhips failed from Deptford, in order to explore the northern feas, under the command of Sir Hugh Willoughby. Two of thefe veffels penetrated as high as the 72d degree of latitude, to the coaft of Spitzbergen; and being afterwards forced by ftrefs of weather into the bay of the river Arzina in Ruffian Lapland, both their crews were frozen to death. Richard Chancellor, who commanded the other fhip, called the Bonaventure, difcovering the country bordering upon the White Sea, landed near the mouth of the Dwina, in a bay, which he denominated the *Bay of St Nicholas*, from a convent of that name, near the prefent port of Archangel. The czar Iwan Bafilowitz, being informed of his arrival, invited him to his court, where he was hofpitably entertained; and the czar indulged the Englifh with a free trade in his dominions: in confequence of this permiffion, a company of merchants was incorporated in London; and being encouraged by particular privileges from the czar, fet on foot a confiderable commerce, to the mutual advantage of both nations. This traffic the Englifh for fome time enjoyed without competition. The Dutch, however, and other nations, gradually infinuated themfelves into this commerce; which they carried on to a very great difadvantage, as not being favoured with thofe privileges which the czar had granted to the Englifh company. Thefe were at laft fuddenly annihilated by Alexis Michaelovitch; who in 1648 banifhed the Englifh merchants from all his dominions. The caufe of this expulfion is generally imputed to the refentment which the czar conceived againft the Englifh for the execution of Charles I. with whom he was clofely connected by leagues of amity and alliance: but in effect he abolifhed the company's privileges in the year before that event; and his indignation againft the Englifh for their rebellion, Mr Coxe affirms, was only a political pretext; the real motive being derived from the offers made by the Dutch to pay duties of export and import, to the amount of 15 *per cent.* if they were indulged with the liberty of carrying on as free a trade as the Englifh throughout his dominions. For not long afterwards, the czar fuffered William Prideaux, Cromwell's agent, to refide at Archangel; and permitted the Englifh to renew their commerce in that port upon the fame footing with other foreigners. And upon this footing alone our merchants ever after continued to trade.

The commodities chiefly imported into Archangel, were gold and filver ftuffs and laces, gold wire, cochineal, indigo, and other drugs for dyeing; wine, brandy, and other diftilled fpirits. The cuftoms arifing to the czar were computed at 200,000 rubles a-year, and the number of foreign fhips at 400 annually. But upon the building of Peterfburg, Peter the Great abolifhed the immunities of Archangel, and removed the commerce of the White Sea to the havens of the Baltic. Still, however, its exports of tar were confiderable; in 1730, to the amount of 40,000 lafts, of 11 barrels each. It fends, during winter, great quantities of the rawaga, a fmall fpecies of three-finned cod, to Peterf burg frozen.

In 1752 Elizabeth again reftored the ancient immunities of Archangel; and its prefent trade is not inconfiderable. It fupplies the government of Archangel, part of thofe of Nifhnei-Novogorod and Cafan, with European commodities; and draws in exchange from thofe parts corn, flax, hemp, coarfe linen, cordage, fails, mafts, and tallow, which are moftly conveyed by the Dwina: it forms alfo a principal communication with the northern and weftern parts of Siberia, from whence the merchants procure furs, fkins, and iron.

The houfes of Archangel are generally of wood, but well contrived; and every chamber is provided with a ftove, as a fence againft the cold, which is here exceffive in the winter. The ftreets are paved with broken pieces of timber and rubbifh, difpofed fo unfkilfully, that one cannot walk over it without running the rifk of falling, except when the ftreets are rendered fmooth and equal by the fnow that falls and freezes in the winter. Notwithftanding the feverity of the cold in this place, there is always plenty of good provifions; butcher's meat, poultry, wild fowl, and fifh, in great variety, are fold furprifingly cheap.

The moft remarkable edifice in Archangel is a large town-houfe, built of fquare ftones in the Italian manner, and divided into three parts. One of thefe confifts of large commodious apartments, for the accommodation of merchants, ftrangers as well as natives: here they are permitted to refide with their merchandife till the month of October, when all the foreign fhips fet fail for the refpective countries to which they belong. Then the traders are obliged to remove their quarters from the town-houfe or palace, which hath a fpacious court, that reaches down to the river.

ARCHBISHOP, the name of a church dignitary of the firft clafs. Archbifhops were not known in the eaft till about the year 320; and though there were fome foon after this who had the title, yet that was only a perfonal honour, by which the bifhops of confiderable cities were diftinguifhed. It was not till of late that archbifhops became metropolitans, and had fuffragans under them. Athanafius appears to be the firft who ufed the title *Archbifhop*, which he gave occafionlly casionally to his predecessor; Gregory Nazianzen, in like manner, gave it to Athanasius; not that either of them were intitled to any jurisdiction, or even any precedence in virtue of it. Among the Latins, Isidore Hispalensis is the first that speaks of archbishops. He distinguishes four orders or degrees in the ecclesiastial hierarchy, viz. patriarchs, archbishops, metropolitans, and bishops.

The archbishop, beside the inspection of the bishops and inferior clergy in the province over which he presides, exercises episcopal jurisdiction in his own diocese. He is guardian of the spiritualites of any vacant see in his province, as the king is of the temporalities; and exercises ecclesiastical jurisdiction in it. He is intitled to present by lapse to all the ecclesiastical livings in the disposal of his diocesan bishop, if not filled within six months. He has likewise a customary prerogative, upon consecrating a bishop, to name a clerk or chaplain to be provided for by such bishop; in lieu of which it is now usual to accept an option. He is said to be enthroned when vested in the archbishopric; whereas bishops are said to be installed.

The ecclesiastical government of England is divided into two provinces, viz. Canterbury and York. Canterbury hath the following suffragan bishoprics appertaining to it, St Asaph, Bangor, Bath and Wells, Bristol, Chichester, Litchfield and Coventry, St David's, Ely, Exeter, Gloucester, Hereford, Landaff, Lincoln, London, Norwich, Oxford, Peterborough, Rochester, Salisbury, Winchester, and Worcester. To York appertaineth the bishoprics of Carlisle, Chester, and Durham; to which may be added the bishopric of Sodor and Man, whose bishop is not a Lord of Parliament. See CANTERBURY and YORK.

The archbishop of Canterbury had anciently, viz. till the year 1152, jurisdiction over Ireland as well as England, and was styled a *patriarch*, and sometimes *alterius orbis papa*, and *orbis Britannici pontifex*. Matters were done and recorded in his name thus, *Anno pontificatus nostri primo*, &c. The first archbishop of Canterbury was Austin, appointed by king Ethelbert, on his conversion to Christianity, about the year 598. He was also *legatus natus*. He even enjoyed some special marks of royalty; as, to be patron of a bishopric, which he was of Rochester; and to make knights, coin moneys, &c. He is still the first peer of England, and the next to the royal family; having precedence of all dukes and all great officers of the crown. It is his privilege, by custom, to crown the kings and queens of that kingdom. He may retain and qualify eight chaplains; whereas a duke is by statute allowed only six. He has, by common law, the power of probate of wills and testaments, and granting letters of administration. He has also a power to grant licences and dispensations in all cases formerly sued for in the court of Rome, and not repugnant to the law of God. He accordingly issues special licences to marry, to hold two livings, &c. and he exercises the right of conferring degrees. He also holds several courts of judicature; as, court of arches, court of audience, prerogative court, and court of peculiars.

The archbishop of York has the like rights in his province as the archbishop of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of state, except the lord high chancellor. He has also the rights of a count palatine over Hexamshire. The first archbishop of York was Paulinus, appointed by Pope Gregory about the year 622. He had formerly jurisdiction over all the bishops of Scotland; but in the year 1470, pope Sextus IV. created the bishop of St Andrew's archbishop and metropolitan of all Scotland.

Scotland, whilst episcopacy prevailed in that country, had two *archbishops*, of St Andrew's and Glasgow; of which the former was accounted the metropolitan; and, even before it arrived at the dignity of an archbishopric, resisted with great spirit all the attempts of the archbishops of York in England to become the metropolitans of Scotland. The sees of Argyle, Galloway, and the Isles, were suffragans to Glasgow; all the others in the kingdom, to St Andrew's.

Ireland has four archbishops; of Armagh, Dublin, Cassil, and Tuam; of whom the former is primate of all Ireland.

ARCHBISHOPRIC, in ecclesiastical geography, a province subject to the jurisdiction of an archbishop.

ARCHBUTLER, one of the great officers of the German empire, who presents the cup to the emperor on solemn occasions. This office belongs to the king of Bohemia.

ARCHCHAMBERLAIN, an officer of the empire, much the same with the great chamberlain in England. The elector of Brandenburg was appointed by the golden bull archchamberlain of the empire.

ARCHCHANCELLOR, an high officer who, in ancient times, presided over the secretaries of the court. Under the two first races of the kings of France, when their territories were divided into Germany, Italy, and Arles, there were three archchancellors: and hence the three archchancellors still subsisting in Germany; the archbishop of Mentz being archchancellor of Germany, the archbishop of Cologn, and the archbishop of Treves.

ARCHCHANTOR, the president of the chantors of the church.

ARCHCOUNT, a title formerly given to the earl of Flanders, on account of his great power and riches.

ARCHDEACON, an ecclesiastical dignitary or officer next to a bishop, whose jurisdiction extends either over the whole diocese or only part of it. He is usually appointed by the bishop himself; and hath a kind of episcopal authority, originally derived from the bishop, but now independent and distinct from his. He therefore visits the clergy; and has his separate court for punishment of offenders by spiritual censures, and for hearing all other causes of ecclesiastical cognizance. There are 60 archdeacons in England.

ARCHDEACON's Court, is the most inferior court in the whole ecclesiastical polity. It is held, in the archdeacon's absence, before a judge appointed by himself, and called his *official*; and its jurisdiction is sometimes in concurrence with, sometimes in exclusion of, the bishop's court of the diocese. From hence, however, by statute 24 Hen. VIII. c. 12. there lies an apeal to that of the bishop.

ARCHDRUID, the chief or pontiff of the ancient druids of a nation. See DRUID.

ARCHDUKE, a title peculiar to the House of Austria; all the sons of which are archdukes, and daughters archduchesses. See DUKE.

ARCHELAUS, a celebrated Greek philosopher, the

the disciple of Anaxagoras, flourished about 440 years before Christ. He read lectures at Athens, and did not depart much from the opinions of his master. He taught that there was a double principle of all things, namely, the *expansion* and *condensation* of the air, which he regarded as infinite. Heat, according to him, was in continual motion. Cold was ever at rest. The earth, which was placed in the midst of the universe, had no motion. It originally resembled a wet marsh, but was afterwards dried up; and its figure, he said, resembled that of an egg. Animals were produced from the heat of the earth, and even men were formed in the same manner. All animals have a soul, which was born with them; but the capacities of which vary according to the structure of the organs of the body in which it resides.—Socrates, the most illustrious of his disciples, was his successor.

Archelaus, the son of Herod the Great, was declared king of Judea the second year after the birth of Christ. He put to death 3000 persons before he went to Rome to be confirmed by Augustus. However, that emperor gave him half of what had been possessed by his father; but at length, on fresh complaints exhibited against him by the Jews, he banished him to Vienne in Gaul, A. D. 6, where he died.

Archelaus, the son of Apollonius, one of the greatest sculptors of antiquity, was a native of Ionia, and is thought to have lived in the time of the emperor Claudius. He executed, in marble, the apotheosis of Homer. This masterpiece in sculpture was found in 1568, in a place named *Fratocchia*, belonging to the princes of Colonna, where, it is said, the emperor Claudius had a pleasure-house. Father Kircher, Cupert, Spanheim, and several other learned antiquaries, have given a description and explication of the work.

ARCHERS, a kind of militia or soldiery armed with bows and arrows. The word is formed of *arcus* "a bow;" whence *arcuarius*, and even *arquis*, and *arquites*, as they are also denominated in the corrupt state of the Latin tongue.

Archers were much employed in former times: but they are now laid aside, excepting in Turkey and some of the eastern countries; where there are companies of archers still subsisting in their armies, and with which they did terrible execution at the battle of Lepanto.—As an exercise, the practice of archery is still kept up in many places. See the article Archery.

In France, the officers who attend the lieutenants de police and provosts to make captures, seizures, arrests, &c. are called *archers*; though their arms be only halberds or carabines.—In this sense they say, the *archers* of the *grand prevot de l'hotel*; of the *prevot des marchands*; the city *archers*; the *archers du guet*, or of the watch, &c.—Small parties of *archers*, called also *gens de marechaussee*, are continually patrolling on the great roads, to secure them against robbers.—The carriages of Lyons, &c. are always escorted by a party of archers. To the diligence of these archers, or marshal's-men, it is partly owing, that persons now travel in all parts of France in the utmost security; there being fewer robbers on the highway in that whole kingdom in a year than about London in a week.

ARCHERY, the art or exercise of shooting with a bow and arrow.

In most nations the bow was anciently the principal implement of war, and by the expertness of the archers alone was often decided the fate of battles and of empires.—In England archery was greatly encouraged in former times, and many statutes were made for the regulation thereof; whence it was that the English archers in particular became the best in Europe, and procured them many signal victories.

The *Artillery company* of London, though they have long disused the weapon, are the remains of the ancient fraternity of bowmen or archers. Artillery (*artillérie*) is a French term signifying *archery*; as the *king's bowyer* is in that language styled *artillier du roy*: And from that nation the English seem to have learnt at least the cross-bow archery. We therefore find that William the Conqueror had a considerable number of bowmen in his army at the battle of Hastings, when no mention is made of such troops on the side of Harold: And it is supposed that these Norman archers shot with the arbalest (or cross-bow), in which formerly the arrow was placed in a groove, being termed in French a *quadrel*, and in English a *bolt*. *Archæologia* vol. vii.

Of the time when shooting with the long bow first began among the English, at which exercise they afterwards became so expert, there appear no certain accounts. Their chroniclers do not mention the use of archery as expresly applied to the cross-bow, or the long-bow, till the death of Richard I. who was killed by an arrow at the siege of Limoges in Guienne, which Hemmingford mentions to have issued from a cross-bow.—After this, which happened in 1196, there appear not upon record any notices of archery for nearly 150 years, when an order was issued by Edward III. in the 15th year of his reign, to the sherives of most of the English counties for providing 500 white bows and 500 bundles of arrows, for the then intended war against France. Similar orders are repeated in the following years; with this difference only, that the sheriff of Gloucestershire is directed to furnish 500 painted bows as well as the same number of white. The famous battle of Cressy was fought four years afterwards, in which the English chroniclers state that they had 2000 archers, who were opposed to about the same number of the French, together with a circumstance which seems to prove, that by this time they used the long-bow, whilst the French archers shot with the arbalest. The circumstance alluded to is as follows: Previously to the engagement there fell a very heavy rain, which is said to have much damaged the bows of the French, or perhaps rather the strings of them. Now the long-bow (when unstrung) may be most conveniently covered, so as to prevent the rain's injuring it; nor is there scarcely any addition to the weight from such a cause; whereas the arbalest is of a most inconvenient form to be sheltered from the weather. As therefore, in the year 1342, orders issued to the sherives of each county to provide 500 bows, with a proper porportion of arrows, it seems probable that these were long-bows, and not the arbalest.

At the above-mentioned battle, the English ascribed their victory chiefly to the archers.—The battle of Poicters was fought A. D. 1356, and gained by the same means.

Sometimes the archers gained great victories without even the least assistance from the men-at-arms; as, parti-

Archery.

particularly, the decisive victory over the Scots at Homildon, A. D. 1402. In that bloody battle, the men-at-arms did not strike a stroke, but were mere spectators of the valour and victory of the archers. The Earl of Douglas, who commanded the Scotch army in that action, enraged to see his men falling thick around him by showers of arrows, and trusting to the goodness of his armour (which had been three years in making) accompanied by about eighty lords, knights, and gentlemen, in complete armour, rushed forward, and attacked the English archers sword in hand. But he soon had reason to repent his rashness. The English arrows were so sharp and strong, and discharged with so much force, that no armour could repell them. The Earl of Douglas, after receiving five wounds, was made prisoner; and all his brave companions were either killed or taken. Philip de Comines acknowledges, what the English writers assert, that their archers excelled those of every other nation; and Sir John Fortescue says again and again,—"that the might of the realme of England standyth upon archers." The superior dexterity of their archers gave the English a great advantage over their capital enemies the French and Scots. The French depended chiefly on their men-at-arms, and the Scots on their pikemen; but the ranks of both were often thinned and thrown into disorder by flights of arrows before they could reach their enemies.

Henry's Hist. vol. v. p. 463.

James I. of Scotland, who had seen and admired the dexterity of the English archers, and who was himself an excellent archer, endeavoured to revive the exercise of archery among his own subjects, by whom it had been too much neglected. With this view, he ridiculed their awkward manner of handling their bows, in his humorous poem of Christ's Kirk on the Green; and procured the following law to be made in his first parliament, A. D. 1424, immediately after his return to Scotland: "That all men might busk thame to be archares fra the be 12 years of age; and that at ilk ten punds worth of land thair be made bow markes, and speciallie near paroche kirks, quhairn upon halie dayis men may cum, and at the leist schuite thryse about, and have usage of archarie: and whasa usis not archarie, the laird of the land sall rais of him a wedder; and giff the laird raisis not the said pane, the king's sherif or his ministers sall rais it to the king." But the untimely death of that excellent prince prevented the effectual execution of this law.

There is not found any act of Parliament of Henry V. in relation to archery, and all the orders in Rymer till the battle of Agincourt relate to great guns, from which he seems at first to have expected more considerable advantage than from the training of bowmen. It should seem, however, that this sort of artillery, from its unwieldiness, bad and narrow roads, together with other defects, was as yet but of little use in military operations. In the year 1417 this king therefore ascribes his victory at Agincourt to the archers, and directs the sherives of many counties to pluck from every goose six wing-feathers for the purpose of improving arrows, which are to be paid for by the king.

Archaeologia

In 1421, though the French had been defeated both at Cressy, Poicters, and Agincourt, by the English archers, yet they still continued the use of the cross-bow; for which reason, Henry V. as duke of Normandy, confirms the charters and privileges of the balistarii, which had been long established as a fraternity in his city of Rouen.

In the fifth year of Edward IV. an act passed, that every Englishman, and Irishman dwelling with Englishmen, shall have an English bow of his own height, which is directed to be made of yew, wych, hazel, ash, or awburne, or any other reasonable tree according to their power. The next chapter also directs that butts shall be made in every township, which the inhabitants are obliged to shoot up and down every feast-day, under the penalty of a halfpenny when they shall omit this exercise.

In the 14th year, however, of this same king, it appears by Rymer's Fœdera, that 1000 archers were to be sent to the duke of Burgundy, whose pay is settled at six pence a-day, which is more than a common soldier receives clear in the present times, when provisions are so much dearer, and the value of money so much decreased. This circumstance seems to prove, very strongly, the great estimation in which archers were still held. In the same year, Edward preparing for a war with France, directs the sherives to procure bows and arrows, "as most specially requisite and necessary."

On the war taking place with Scotland, eight years after this, Edward provides both ordnance and archers; so that though the use of *artillery* (as we now term it) was then gaining ground, yet that of the bow and arrow was not neglected.

Richard III. by his attention to archery, was able to send 1000 bowmen to the duke of Bretagne, and he availed himself of the same troops at the battle of Bosworth.

During the reign of Henry VII. however, there appears no order relative to gun-powder or artillery; whilst, on the other hand, in 1488, he directs a large levy of archers to be sent to Britanny, and that they shall be reviewed before they embark. In the 19th year of his reign, this same king forbids the use of the cross-bow, because "the long-bow had been much used in this realm, whereby honour and victory had been gotten against outward enemies, the realm greatly defended, and much more the dread of all Christian princes by reason of the same."

During the reign of Henry VIII. several statutes were made for the promotion of archery. The 8th Eliz. c. 10. regulates the price of bows, and the 13th Eliz. c. 14. enacts, that bow-staves shall be brought into the realm from the Hanse-towns and the Eastward; so that archery still continued to be an object of attention in the legislature.

In Rymer's *Fœdera* there is neither statute nor proclamation of James I. on this head; but it appears by Dr Birch's Life of his son (prince Henry), that at eight years of age, he learned to shoot both with the bow and gun, whilst at the same time this prince had in his establishment an officer who was styled *bow-bearer*. The king granted a second charter to the artillery company, by which the powers they had received from Henry VIII. were considerably extended.

Charles I. appears from the dedication of a treatise

tise intitled, *The Bowman's Glory*, to have been himself an archer; and in the eighth year of his reign he issued a commission to the chancellor, lord-mayor, and several of the privy council, to prevent the fields near London being so inclosed as "to interrupt the necessary and profitable exercise of shooting," as also to lower the mounds where they prevented the view from one mark to another.

Catharine of Portugal (queen to Charles II.) seems to have been much pleased with the sight at least of this exercise; for in 1676, by the contributions of Sir Edward Hungerford and others, a silver badge for the marshal of the fraternity was made, weighing 25 ounces, and representing an archer drawing the long-bow (in the proper manner) to his ear, with the following inscription: *Reginæ Catherinæ Sagittarii.* The supporters are two bowmen, with the arms of England and Portugal. In 1682 there was a most magnificent cavalcade and entertainment given by the Finsbury archers, when they bestowed the titles of "duke of Shoreditch," "marquis of Islington," &c. upon the most deserving. Charles II. was present upon this occasion; but the day being rainy, he was obliged soon to leave the field.

So lately as the year 1753 targets were erected in the Finsbury fields, during the Easter and Whitsun holidays; when the best shooter was styled Captain for the ensuing year, and the second Lieutenant.

Why this military weapon was so decisive in the battles of former days, the following reasons may be suggested.

Before the introduction of fire-arms, the enemy could only be struck at a distance by slings, the bow used by the ancients, or the cross-bow; to all which the English long-bow was infinitely superior. As for slings, they never have been used in the more northern parts of Europe by armies in the field; nor does their use indeed seem to have been at all convenient or extensively practicable, for two principal reasons; In the first place, slingers cannot advance in a compact body, on account of the space to be occupied by this weapon in its rotatory motion; in the next place, the weight of the stones to be carried must necessarily impede the slingers greatly in their movements. The bow of the ancients, again, as represented in all their reliefs, was a mere toy compared with that of our ancestors; it was therefore chiefly used by the Parthians, whose attacks (like those of the present Arabs) were desultory. As for the cross-bow, it is of a most inconvenient form for carriage, even with the modern improvements; and, in case of rain, could not be easily secured from the weather. After the first shot, moreover, it could not be recharged under a considerable time, whilst the bolts were also heavy and cumbersome. The English long-bow, on the other hand, together with the quiver of arrows, was easily carried by the archer, as easily secured from rain, and recharged almost instantaneously. It is not therefore extraordinary, that troops, who solely used this most effectual weapon, should generally obtain the victory, even when opposed to much more numerous armies.

It may be urged, that these losses having been experienced by our enemies, must have induced them to practise the same mode of warfare.—But it is thought that the long bow was not commonly used even in England till the time of Edward III. when the victory at Cressy sufficiently proclaimed the superiority of that weapon. It required, however, so much training before the archer could be expert, that we must not be surprised if soon afterwards this military exercise was much neglected, as appears by the preambles of several ancient statutes. Whilst the military tenures subsisted, the sovereign could only call upon his tenants during war, who therefore attended with the weapons they had been used to, and which required no previous practice. On the other hand, the English archers were obliged by acts of parliament, even in time of peace, to erect butts in every parish, and to shoot on every Sunday and holiday, after repairing perhaps to these butts from a considerable distance, whilst the expence of at least a yew-bow is represented as being a charge which they were scarcely equal to. The king and parliaments of this country having thus compelled the inhabitants to such training, the English armies had (it should seem) the same advantage over their enemies as the exclusive use of fire-arms would give at present.

It appears also by what hath been already stated, that the long-bow continued to be in estimation for more than two centuries after gunpowder was introduced, which probably arose from muskets being very cumbersome and unwieldy. It is well known that rapid movements are generally decisive of the campaign; and for such the archers were particularly adapted, because, as they could not be annoyed at the same distance by the weapons of the enemy, they had scarcely any occasion for armour. The flower of ancient armies likewise was the cavalry, against which the long-bow never failed to prevail, as man and horse were too large objects to be missed: and hence the great number of French nobility who were prisoners at Cressy, Poicters, and Agincourt; for being dismounted (if not wounded) whilst they were also clad in heavy armour, they could not make their escape. The same reason accounts for the English obtaining these signal victories with so inferior numbers; for the nobility and gentry thus becoming prisoners, the other parts of the French army made little or no resistance. No wonder, therefore, that in England the greatest anxiety was shewn to promote the exercise of this most important weapon, and that so many statutes were made for that purpose.

In Scotland, also, little less attention, though apparently not with equal success, was shewn to the encouragement of the art. In both kingdoms, it was provided, that the importers of merchandise should be obliged, along with their articles of commerce, to import a certain proportion of bows, bow-staves, and shafts for arrows. In both, every person was enjoined to hold himself provided in bows and arrows, and was prescribed the frequent use of archery. In both, a restraint was imposed upon the exercise of other games and sports, lest they should interfere with the use of the bow; for it was intended, that the people should be made expert in the use of it as a military weapon, by habituating them to the familiar exercise of it as an instrument of amusement. As there was no material difference between the activity and bodily strength of the

the two people, it might be ſuppoſed that the Engliſh and Scots wielded the bow with no unequal vigour and dexterity; but from undoubted hiſtorical monuments it appears that the former had the ſuperiority; of which one inſtance has already been narrated. By the regulations preſcribed in their ſtatute-book for the practice of archery, we find that the Engliſh ſhot a very long bow, thoſe who were arrived at their full growth and maturity being prohibited from ſhooting at any mark that was not diſtant upwards of 220 yards.

In the uſe of the bow, great dexterity as well as ſtrength ſeems to have been requiſite. Though we hear of arrows at Cheviot Chaſe which were a yard long, yet it is by no means to be ſuppoſed that the whole band made uſe of ſuch, or could draw them to the head. The regulation of the Iriſh ſtatute of Edward IV. viz. that the bow ſhall not exceed the height of the man, is allowed by archers to have been well conſidered; and as the arrow ſhould be half the length of the bow, this would give an arrow of a yard in length to thoſe only who were ſix feet high. A ſtrong man of this ſize in the preſent time cannot eaſily draw above 27 inches if the bow is of a proper ſtrength to do execution at a conſiderable diſtance. At the ſame time it muſt be admitted, that as our anceſtors were obliged by ſome of the old ſtatutes to begin ſhooting with the long-bow at the age of ſeven, they might have acquired a greater ſlight in this exerciſe than their deſcendants, though the latter ſhould be allowed to be of equal ſtrength.

As the ſhooting of the long-bow was firſt introduced in England, and practiſed almoſt excluſively for nearly two centuries, ſo it hath occaſioned a peculiar method of drawing the arrow to the ear and not to the breaſt. That this is contrary to the uſage of the ancients is very clear from their reliefs, and from the tradition of the Amazons cutting off one of their paps, as it occaſioned an impediment to their ſhooting. The Finſbury archer is therefore repreſented in this attitude of drawing to the ear, both in the *Bowman's Glory*, and in the ſilver badge given by Catharine to the Artillery company. Not many years ago there was a man named Topham, who exhibited ſurpriſing feats of ſtrength, and who happened to be at a public-houſe near Iſlington, to which the Finſbury archers reſorted after their exerciſe. Topham conſidered the long bow as a play-thing, only fit for a child; upon which one of the archers laid him a bowl of punch, that he could not draw the arrow two-thirds of its length. Topham accepted this bet with the greateſt confidence of winning: but bringing the arrow to his breaſt inſtead of his ear, he was greatly mortified by paying the wager, after many fruitleſs efforts.

As to the diſtance to which an arrow can be ſhot from a long-bow with the beſt elevation of forty-five degrees, that muſt neceſſarily depend much both upon the ſtrength and ſlight of the archer; but in general the diſtance was reckoned from eleven to twelve ſcore yards. The butts for exerciſe, as above-noticed, were directed to be diſtant upwards of 220 yards. There is indeed a tradition, that an attorney of Wigan in Lancaſhire (named Leigh) ſhot a mile in three flights; but the ſame tradition ſtates, that he placed himſelf in a very particular attitude, which cannot be uſed commonly in this exerciſe. According to Neade, an archer might ſhoot ſix arrows in the time of charging and diſcharging one muſket.

The archers conſider an arrow of from 20 to 24 drop weight to be the beſt for flight or hitting a mark at a conſiderable diſtance, and that yew is the beſt material of which they can be made. As to the feathers, that of a gooſe is preferred; it is alſo wiſhed, that the bird ſhould be two or three years old, and that the feather may drop of itſelf. Two out of three feathers in an arrow are commonly white, being plucked from the gander; but the third is generally brown or grey, being taken from the gooſe; and, from this difference in point of colour, informs the archer when the arrow is properly placed. From this moſt diſtinguiſhed part therefore the whole arrow ſometimes receives its name: And this, by-the-by, affords an explanation of the grey gooſe wing in the ballad of Cheviot Chaſe. Arrows were armed anciently with flint or metal heads, latterly with heads of iron; of theſe there were various forms and denominations. By an act of parliament, made the 7th of Henry IV. it was enacted, that for the future all the heads for arrows and quarrels ſhould be well boiled or braſed, and hardened at the points with ſteel; and that every arrow-head or quarrel ſhould have the mark of the maker: workmen diſobeying this order, were to be fined and impriſoned at the king's will, and the arrow-heads or quarrels to be forfeited to the crown.

Groſe on Ancient Armour.

Arrows were reckoned by ſheaves, a ſheaf conſiſting of 24 arrows. They were carried in a quiver, called alſo an *arrow-caſe*, which ſerved for the magazine; arrows for immediate uſe were worn in the girdle. In ancient times phials of quicklime, or other combuſtible matter, for burning houſes or ſhips, was fixed on the heads of arrows, and ſhot from long-bows. This has been alſo practiſed ſince the uſe of gunpowder. Neade ſays, he has known by experience, that an archer may ſhoot an ounce of fire-work upon an arrow twelve ſcore yards. Arrows with wild-fire, and arrows for fire-works, are mentioned among the ſtores at Newhaven and Berwick, in the 1ſt of Edward VI.

The force with which an arrow ſtrikes an object at a moderate diſtance, may be conceived from the account given by king Edward VI. in his journal, wherein he ſays, that 100 archers of his guard ſhot before him two arrows each, and afterwards all together; and that they ſhot at an inch board, which ſome pierced quite thro', and ſtruck into the other board; divers pierced it quite through with the heads of their arrows, the boards being well-ſeaſoned timber: their diſtance from the mark is not mentioned.

To protect our archers from the attacks of the enemy's horſe, they carried long ſtakes pointed at both ends: theſe they planted in the earth, ſloping before them. In the 1ſt of Edward VI. 350 of theſe were in the ſtores of the town of Berwick, under the article of archer's ſtakes; there were alſo at the ſame time eight bundles of archer's ſtakes in Pontefract caſtle.

To prevent the bow-ſtring from ſtriking the left arm, the arm is covered with a piece of ſmooth leather, faſtened

Archery. fastened on the outside of the arm: this is called a *bracer*; and to guard the fingers from being cut by the bow-string, archers wore shooting gloves. Chaucer in his prologue to the Canterbury tales, thus describes an archer of his day:

And he was clad in cote and hode of grene,
A shefe of peacock arwes bright and keen,
Under his belt he bare ful thriftily;
Wel coude he dresse his takel yewmanly,
His arwes drouped not with fetheres lowe,
And in his hand he bare a mighty bowe,
A not-hed hadde he, with broune visage,
Of wood crafte coude he wel all the usage;
Upon his arms he had a gai bracer,
And by his side a swerd and a bokeler,
And on the other side a gaie daggere
Harneised wel, and sharp as pointe of spere:
A cristofre on his breast of silver shene,
An horn he bare, the baudrik was of grene,
A forester was he sothely as I gesse.

Though archery continued to be encouraged by the king and legislature for more than two centuries after the first knowledge of the effects of gunpowder, yet by the latter end of the reign of Henry VIII. it seems to have been partly considered as a pastime. Arthur, the elder brother of Henry, is said to have been fond of this exercise, in so much that a good shooter was styled Prince Arthur. We are also informed, that he pitched his tent at Mile End in order to be present at this recreation, and that Henry his brother also attended. When the latter afterwards became king, he gave a prize at Windsor to those who should excel in this exercise; and a capital shot having been made, Henry said to Barlow (one of his guards), "If you still win, you shall be duke over all archers." Barlow therefore having succeeded, and living in Shoreditch, was created duke thereof. Upon another occasion, Henry and the queen were met by 200 archers on Shooter's hill, which probably took its name from their assembling near it to shoot at marks. This king likewise gave the first charter to the Artillery Company in the 29th year of his reign, by which they are permitted to wear dresses of any colour except purple and scarlet, to shoot not only at marks but birds, if not pheasants or herons, and within two miles of the royal palaces. They are also enjoined by the same charter not to wear furs of a greater price than those of the martin. The most material privilege, however, is, that of indemnification from murder, if any person passing between the shooter and the mark is killed, provided the archers have first called out *fast*.

The following description of an archer, his bow and accoutrements, is given in a MS. written in the time of Queen Elizabeth. "Captains and officers should be skilful of that most noble weapon, and to see that their soldiers according to their draught and strength have good bows, well nocked, well strynged, everie strynge whippe in their nocke, and in the myddes rubbed with wax, braser and shuting glove, some spare strynges trymed as aforesaid, every man one shefe of arrows, with a case of leather defensible against the rayne, and in the same fower and twentie arrowes, whereof eight of them should be lighter than the residue, to gall or astoyne the enemye with the hailshot of light arrows, before they shall come within the danger of their harquebuss shot. Let every man have a brigandine, or a little cote of plate, a skull or hufkyn, a mawle of leade of five foot in lengthe, and a pike, and the same hanging by his girdle, with hook and a dagger; being thus furnished, teach them by musters to march, shoote, and retire, keeping their faces upon the enemy's. Sumtyme put them into great nowmbers, as to battell apparteyneth, and thus use them often times practised, till they be perfecte; ffor those men in battell ne skirmish can not be spared. None other weapon maye compare with the same noble weapon."

The long-bow, as already observed, maintained its place in the armies long after the invention of fire-arms. Nor have there been wanting experienced soldiers who were advocates for its continuance, and who in many cases even preferred it to the harquebuss or musket. King Charles I. twice granted special commissions under the great seal for enforcing the use of the long bow. The first was in the 4th year of his reign: but this was revoked by proclamation four years afterwards, on account of divers extortions and abuses committed under sanction thereof. The second, anno 1633, in the 9th year of his reign, to William Neade and his son, also named William, wherein the former is styled an ancient archer, who had presented to the king a warlike invention for uniting the use of the pike and bow, seen and approved by him and his council of war: wherefore his Majesty had granted them a commission to teach and exercise his loving subjects in the said invention, which he particularly recommended the chief officers of his trained bands to learn and practise; and the justices and other chief magistrates throughout England, are therein enjoined to use every means in their power to assist Neade, his son, and all persons authorised by them in the furtherance, propagation, and practice of this useful invention. Both the commissions and proclamation are printed at large in Rymer. At the breaking out of the civil war, the Earl of Essex issued a precept, dated in November 1643, for stirring up all well-affected people by benevolence, towards the raising a company of archers for the service of the king and parliament.

Archery with the long-bow continues to be used as a manly exercise by the inhabitants of Geneva, and in many parts of Flanders; nor is it totally neglected in Great Britain. There are several societies of archers in England; the chief of which are, *Woodmen of Arden*, and the *Toxophilite*. But the most noted society of this kind, now existing, is

The *Royal Company of Archers* in Scotland.—The ancient records of this company having been destroyed by fire about the beginning of the present century, no authentic traces of their institution now remain. It is said that they owe their origin to the commissioners appointed in the reign of James I. of Scotland for enforcing and overseeing the exercise of archery in different counties. Those commissioners, who were in general men of rank and power, picking out amongst the better sort of people under their cognisance the most expert archers, formed them into a company, and upon perilous

rilous occaſions made a preſent of their ſervices to the king as his chief body-guards; in which ſituation they often diſtinguiſhed themſelves for their loyalty, their courage, and ſkill in archery. This rank of the king's principal body-guards the Royal Company ſtill claim within ſeven miles of the metropolis of Scotland.

Certain it is, that by an act of the privy-council of Scotland in the 1677, this Company was recogniſed under the name and title of "His Majeſty's Company of Archers:" And by the ſame act a piece of plate of the value of L. 20 Sterling was ordered to be given to be ſhot for by them at their annual parades called *WEAPON-ſhawings*, and to be called *The King's Prize*.

At this period the Royal Company conſiſted, as it does at preſent, of the principal nobility and gentry of Scotland. But their unfortunate attachment to anti-revolution principles, upon that event's taking place, put almoſt a period to their exiſtence: Their public parades or marches were diſcontinued, and the royal prize was with-held.

Upon the acceſſion of Queen Anne, their former ſplendor was revived; and in the year 1703 they obtained a royal charter, confirming in general terms all their former rights and privileges, and conferring others upon them. But their partiality to the family of Stuart was at various after periods the cauſe of a temporary proſperity and decline.

Theſe unhappy differences of opinion having totally ſubſided, the Royal Company are now more numerous and flouriſhing than ever, and perhaps even more dexterous archers. His preſent Majeſty, as a mark of his royal patronage and approbation, has been pleaſed to revive the royal prize, which for the firſt time was ſhot for upon the 28th of July 1788 by a numerous and reſpectable meeting.

The Woodmen of Arden and the Toxophilite have lately been pleaſed to admit the members of the Royal Company to the freedom of their ſocieties: theſe grants have been followed by reciprocal diplomas from the Royal Company; ſo that the three chief ſocieties of archers in Britain may be ſaid to be now incorporated into one.

The prizes belonging to this Company, and which are annually ſhot for, are, 1. A ſilver arrow, given by the town of Muſſelburgh, which appears to have been ſhot for as early as the year 1603. The victor in this, as in the other prizes, except the king's prize, has the cuſtody of it for a year, then returns it with a medal appended, on which are engraved any motto and device which the gainer's fancy dictates. 2. A ſilver arrow given by the town of Peebles A. D. 1626. 3. A ſilver arrow given by the city of Edinburgh A. D. 1709. 4. A ſilver punch-bowl of about the value of L. 50, made of Scottiſh ſilver at the expence of the Company, A. D. 1720. And, 5. The king's prize above mentioned, which becomes the abſolute property of the winner. All theſe prizes are ſhot for at what is termed *rovers*, the marks being placed at the diſtance of 185 yards.

Beſides theſe, there is another prize annually contended for at butt or point-blank diſtance, called the *Gooſe*. The ancient manner of ſhooting for this prize was, a living gooſe was built in a turf-butt, having the head only expoſed to view; and the archer who firſt hit the gooſe's head was intitled to the gooſe as his reward. But this cuſtom, on account of its barbarity, has been long ago laid aſide; and in place of the gooſe-head, a mark of about an inch diameter is affixed upon each butt, and the archer who firſt hits this mark is captain of the butt-ſhooters for a year.

The affairs of the Company are managed by a preſes and ſix counſellers, who are choſen annually by the whole members. The council are veſted with the power of receiving or rejecting candidates for admiſſion, and of appointing the company's officers civil and military.

The Royal Company now conſiſts of above 1000 members, among whom are moſt of the Scottiſh nobility of the firſt diſtinction. A number of the Company meet weekly during the ſummer-ſeaſon in Edinburgh, in the Meadows, where they exerciſe themſelves in ſhooting at butts or rovers: And in the adjoining ground they have a handſome building, erected within theſe 12 years, whith ſuitable offices, whither they adjourn after their exerciſe, and where they hold their elections and other meetings relative to the buſineſs of the ſociety.

The uniform of the Royal Company of Archers is tartan, lined with white, and trimmed with green and white fringes; a white ſaſh, with green toſſels; and a blue bonnet, with a St Andrew's croſs and feathers. The Company have two ſtandards. The firſt of theſe bears on one ſide Mars and Cupid encircled in a wreath of thiſtles; with this motto, "*In peace* and war." On the other, a yew tree, with two men dreſſed and equipped as archers, encircled as the former; motto, *Dat gloria vires*. The other ſtandard diſplays, on one ſide, a lion rampant gules, on a field or, encircled with a wreath; on the top, a thiſtle and crown; motto, *Nemo me impune laceſſet*. On the other, St Andrew on the croſs on a field argent; at the top, a crown; motto, *Dulce pro patria periculum*.

ARCHES-COURT, in Engliſh eccleſiaſtical polity, is a court of appeal, belonging to the archbiſhop of each province; whereof the judge is called the *dean of the arches*, becauſe he anciently held his court in the church of St Mary *le bow* (*Sancta Maria de arcubus*), though all the principal ſpiritual courts are now holden at Doctors Commons. His proper juriſdiction is only over the 13 peculiar pariſhes belonging to the archbiſhop in London; but the office of dean of the arches having been for a long time united with that of the archbiſhop's principal office, he now, in right of the laſt-mentioned office, receives and determines appeals from the ſentences of all inferior eccleſiaſtical courts within the province. And from him there lies an appeal to the king in chancery (that is, to a court of delegates appointed under the king's great ſeal), by ſtatute 25 Hen. VIII. c. 19. as ſupreme head of the Engliſh church, in the place of the biſhop of Rome, who formerly exerciſed this juriſdiction; which circumſtance alone will furniſh the reaſon why the Popiſh clergy were ſo anxious to ſeparate the ſpiritual court from the temporal.

ARCHETYPE, the firſt model of a work, which is copied after to make another like it.—Among minters, it is uſed for the ſtandard weight by which the o-

thers

thers are adjuſted.—The archetypal world, among Platoniſts, means the world as it exiſted in the idea of God before the viſible creation.

ARCHEUS, (from αρχη, the principal, chief, or firſt mover); a ſort of primum mobile ſet up by Helmont, to ſuperintend the animal œconomy, and preſerve it. It is akin to Plato's *anima mundi*—Hippocrates uſes the word αρχαιη φυσις, to ſignify the former healthy ſtate before the attack of the diſeaſe.

ARCHIACOLYTHUS (from αρχος, *chief*, and ακολουθος, *miniſter*), an ancient dignity in cathedral churches: the miniſters whereof were divided into four orders or degrees, viz. prieſts, deacons, ſubdeacons, and acolythi; each of which had their chiefs. The chief of the acolythi was called *archiacolythus*.

ARCHIATER, Archiatrus, properly denotes chief phyſician of a prince who retains ſeveral. The word is formed of αρχη, *principium*, "chief;" and ιατρος, *medicus*, a "phyſician."

ARCHIDAPIFER, (from αρχος, and *dapifer*, "ſewer,") or chief ſewer, is a great officer of the empire. The elector of Bavaria is archidapifer. The palatine of the Rhine, at one time pretended this office was annexed to his palatinate; but he has ſince deſiſted.

ARCHIEROSYNES, in the Grecian antiquity, a high prieſt veſted with authority over the reſt of the prieſts, and appointed to execute the more ſacred and myſterious rites of religion.

ARCHIGALLUS, in antiquity, the high-prieſt of Cybele, or the chief of the eunuch-prieſts of that goddeſs, called *Galli*.

ARCHIGERONTES (from αρχος, and γερων *old*), in antiquity, the chiefs or maſters of the ſeveral companies of artificers at Alexandria. Some have miſtaken the archigerontes for the arch-prieſts appointed to take the confeſſions of thoſe who were condemned to the mines.

ARCHIGUBERNUS, Archiguberneta, or Archigubernites, in antiquity, the commander of the imperial ſhip, or that which the emperor was aboard of. Some have confounded the office of archigubernus with that of *præfectus claſſis*, or admiral, but the former was under the command of the latter. Potter takes the proper office of the archiguberneta to have been, to manage the marine affairs, to provide commodious harbours, and order all things relating to the ſailing of the fleet, except what related to war.

ARCHIL, Archilla, Rocella, Orsielle, is a whitiſh moſs which grows upon rocks, in the Canary and Cape Verd iſlands, and yields a rich purple tincture, fugitive indeed, but extremely beautiful. This weed is imported to us as it is gathered. Thoſe who prepare it for the uſe of the dyer, grind it betwixt ſtones, ſo as to thoroughly bruiſe, but not to reduce it into powder; and then moiſten it occaſionally with a ſtrong ſpirit of urine, or urine itſelf mixed with quicklime: in a few days it acquires a purpliſh red, and at length a blue colour. In the firſt ſtate it is called *Archil;* in the latter, *Lacmus* or *Litmaſe*.

The dyers rarely employ this drug by itſelf, on account of its dearneſs and the periſhableneſs of its beauty. The chief uſe they make of it is, for giving a bloom to other colours, as pinks, &c. This is effected by paſſing the dyed cloth or ſilk through hot water lightly impregnated with the archil. The bloom thus communicated ſoon decays upon expoſure to the air. Mr Hellet informs us, that by the addition of a little ſolution of tin, this drug gives a durable dye; that its colour is at the ſame time changed towards a ſcarlet; and that it is the more permanent in proportion as it recedes the more from its natural colour.

Prepared archil very readily gives out its colour to water, to volatile ſpirits, and to ſpirit of wine; it is the ſubſtance principally made uſe of for colouring the ſpirits of thermometers. As expoſure to the air deſtroys its colour upon cloth, the excluſion of the air produces a like effect in theſe hermetically ſealed tubes, the ſpirits of large thermometers becoming in the compaſs of a few years colourleſs. M. l'Abbe Nollet obſerves (in the French Memoirs for the year 1742), that the colourleſs ſpirit, upon breaking the tube, ſoon reſumes its colour, and this for a number of times ſucceſſively; that a watery tincture of archil, included in the tubes or thermometers, loſt its colour in three days; and that, in an open deep veſſel, it became colourleſs at the bottom, while the upper part retained its colour. See *Colour-Making*, nº 38.

A ſolution of archil in water, applied on cold marble, ſtains it of a beautiful violet, or purpliſh blue colour, far more durable than the colour which it communicates to other bodies. Mr du Fay ſays he has ſeen pieces of marble ſtained with it, which in two years had ſuffered no ſenſible change. It ſinks deep into the marble, ſometimes above an inch; and at the ſame time ſpreads upon the ſurfaee, unleſs the edges be bounded by wax or other like ſubſtances. It ſeems to make the marble ſomewhat more brittle.

Linnæus informs us, in the Swediſh Tranſactions for the year 1742, that the true archil moſs is to be found on the weſtern coaſts of England. It has been for a conſiderable time paſt prepared by Meſſrs Gordons at Leith from a ſpecies found in the Highlands of Scotland.

ARCHILOCHIAN, a term in poetry, applied to a ſort of verſes, of which Archilochus was the inventor, conſiſting of ſeven feet; the four firſt whereof are ordinarily dactyls, though ſometimes ſpondees; the three laſt trochees, as in Horace,

Solvitur acris hyems, grata vice veris & Favoni.

ARCHILOCHUS, a famous Greek poet and muſician, was, according to Herodotus, contemporary with Candaules and Gyges, kings of Lydia, who flouriſhed about the 14th Olympiad, 724 years before Chriſt. But he is placed much later by modern chronologiſts; viz, by Blair, 686, and by Prieſtley 660 years, before Chriſt.

He was born at Paros, one of the Cyclades. His father Teleſicles was of ſo high a rank, that he was choſen by his countrymen to conſult the oracle at Delphos concerning the ſending a colony to Thaſos: a proof that he was of one of the moſt diſtinguiſhed families upon the iſland. However, he is ſaid to have ſullied his birth by an ignoble marriage with a ſlave called *Enipo*, of which alliance our poet-muſician was the fruit.

Though Archilochus ſhowed an early genius and attachment to poetry and muſic, theſe arts did not prevent

vent his going into the army, like other young men of his birth; but in the first engagement at which he was present, the young poet, like Horace, and like our own Suckling, lost his buckler, though he saved his life by the help of his heels. *It is much easier*, said he, *to get a new buckler than a new existence.* This pleasantry, however, did not save his reputation: nor could his poetry or prayers prevail upon Lycambes, the father of his mistress, to let him marry his daughter, though she had been long promised to him. After these mortifications, his life seems to have been one continued tissue of disgrace and resentment,

Archilochum proprio rabies armavit iambo.
HOR. Art. Poet. 79.

Archilochus, with fierce resentment warm'd,
Was with his own severe iambics arm'd. FRANCIS.

The *rage of Archilochus* was proverbial in antiquity; which compared the provoking this satirist to the treading upon a serpent: A comparison not very severe, if it be true that Lycambes, and, as some say, his three daughters, were so mortified by his satire, as to be driven to the consolation of a halter.

In this piece, many adventures are mentioned, full of defamation, and out of the knowledge of the public. There were likewise many loose passages in it; and it is said to have been on account of this satire that the Lacedemonians laid a prohibition on his verses*.

* Val. Max. lib. 6. c. 3.

However, according to Plutarch, there is no bard of antiquity by whom the two arts of poetry and music have been so much advanced as by Archilochus. To him is attributed particularly the sudden transition from one rhythm to another of a different kind, and the manner of accompanying those irregular measures upon the lyre. Heroic poetry, in hexameter verse, seems to have been solely in use among the more ancient poets and musicians; and the transition from one rhythm to another, which lyric poetry required, was unknown to them; so that if Archilochus was the first author of this mixture, he might with propriety be styled the *Inventor of Lyric Poetry*, which, after his time, became a species of versification wholly distinct from heroic.— To him is likewise ascribed the invention of *Epodes.* See EPODE.

Our poet-musician is generally ranked among the first victors of the Pythic games: and we learn from Pindar, that his muse was not always a termagant; for though no mortal escaped her rage, yet she was at times sufficiently tranquil and pious to dictate hymns in praise of the gods and heroes. One in particular, written in honour of Hercules, acquired him the acclamations of all Greece; for he sung it in full assembly at the Olympic games, and had the satisfaction of receiving from the judges the crown of victory consecrated to real merit. This hymn, or ode, was afterwards sung in honour of every victor at Olympia, who had no poet to celebrate his particular exploits.

Archilochus was at last slain by one Callondax Corax, of the island of Naxos; who, though he did it in fight, according to the laws of war, was driven out of the temple of Delphi, by command of the oracle, for having deprived of life a man consecrated to the Muses.

The names of Homer and Archilochus were equally revered and celebrated in Greece, as the two most excellent poets which the nation had ever produced. This appears from an epigram in the Anthologia; and from Cicero, who ranks him with poets of the first class, and in his Epistles tells us, that the grammarian Aristophanes, the most rigid and scrupulous critic of his time, used to say, that the longest poem of Archilochus always appeared to him the most excellent.

ARCHIMAGUS, the high-priest of the Persian Magi or worshippers of fire. He resided in the highest fire-temple; which was had in the same veneration with them as the temple of Mecca among the Mahometans. Zoroastres first settled it at Balch; but after the Mahometans had over-run Persia in the 7th century, the Archimagus was forced to remove from thence into Kerman, a province of Persia, lying on the southern ocean, where it hath continued to this day. Darius Hystaspes took upon himself the dignity of Archimagus: for Porphyry tells us, he ordered before his death, that, among the other titles, it should be engraven on his monument, that he had been *Master of the Magi;* which plainly implies that he had borne this office among them, for none but the Archimagus was master of the whole sect. From hence it seems to have proceeded, that the kings of Persia were ever after looked on to be of the sacerdotal tribe, and were always initiated into the sacred order of the Magi, before they took on them the crown, and were inaugurated in the the kingdom.

ARCHIMANDRITE, in ecclesiastical history, was a name given by the ancient Christians to what we now call an *abbot*. Father Simon observes, that the word *mandrite* is Syriac, and signifies a solitary monk.

ARCHIMIDES, a celebrated geometrician, born at Syracuse in the island of Sicily, and related to Hiero king of Syracuse. He was remarkable for his extraordinary application to mathematical studies; in which he used to be so much engaged, that his servants were often obliged to take him from thence by force. He had such a surprising invention in mechanics, that he affirmed to Hiero, if he had another earth, whereon to plant his machines, he could move this which we inhabit. He is said to have formed a glass sphere, of a most surprising workmanship, wherein the motions of the heavenly bodies were represented. He discovered the exact quantity of the silver which a goldsmith had mixed with the gold in a crown he had made for the king; he had the hint of this discovery from his perceiving the water rise up the sides of the bath as he went into it, and was filled with such joy, that he ran naked out of the bath, crying, "I have found it! I have found it!" By the invention of machines, he, for a long time, defended Syracuse on its being besieged by Marcellus (See SYRACUSE). On the city's being taken, that general commanded his soldiers to have a particular regard to the safety of this truly great man; but his care was ineffectual. "What gave Marcellus the greatest concern (says Plutarch), was the unhappy Archimedes, who was at that time in his musæum, and his mind, as well as his eyes, so fixed and intent upon some geometrical figures, that he neither heard the noise and hurry of the Romans, nor perceived the city was taken. In this depth of study and contemplation, a soldier came suddenly upon him, and commanded him to follow him to Marcellus; which he refuſing to do till he had finiſhed his problem, the ſoldier, in a rage, drew his ſword, and ran him through the body." Others have related the circumſtances of his death in a ſomewhat different manner. It however happened 208 years before the Chriſtian æra. Cicero, when he was quæſtor in Italy, diſcovered his tomb, on which was carved a cylinder and ſphere†. Some of the works of this great mathematician are loſt, but others are preſerved. His pieces which remain are, 1. Two books of the Sphere and Cylinder. 2. The Dimenſions of a Circle. 3. Of Centers of Gravity, or Æquiponderants. 4. Of Spheroids and Conoids. 5. Of Spiral Lines. 6. The Quadrature of a Parabola. 7. Of the Number of the Sand. 8. Of Bodies that float on Fluids. The beſt edition is theſe is that publiſhed at London, in 1675, 4to. Among the works of Archimedes which are loſt, we may reckon the deſcriptions of the following inventions, which we may gather from himſelf and other ancient authors. 1. Περι της στεφανης, or his account of the method which he uſed to diſcover the mixture of gold and ſilver in the crown. 2. His deſcription of the Κοχλια, or Κοχλιον, an engine to draw water out of places where it is ſtagnated. Athenæus, ſpeaking of the prodigious ſhip built by the order of Hiero, tells us, that Archimedes invented the cochlion, by means of which the hold, notwithſtanding its depth, could be drained by one man. (Δειπνοσοφιςων, lib. b.) Diodorus Siculus informs us (lib. v.) that he contrived this machine to drain Egypt, and that by a wonderful mechaniſm it would empty the water from any depth. 3. The Ελιξ, by means of which (according to Athenæus, Δειπνοσ, lib. v.) he launched Hiero's great ſhip. 4. The Τρισπαστον, of the power of which Tzetzes gives a hyperbolical relation, Chil. ii. hiſt. 35. 5. The machines he uſed in the defence of Syracuſe againſt Marcellus

† *Tuſcul. Quæſt.* l. iv.

Of theſe we have an account in Polybius, Livy, and Plutarch. 6. His burning-glaſſes, with which he is ſaid to have ſet fire to the Roman galleys. Galen, Περι κρασεων, lib. iii. 7. His pneumatic and hydraulic engines, concerning which he wrote books, according to Tzetzes, Chil. ii. hiſt. 35.

ARCHIPELAGO, in geography, a general term ſignifying a ſea interrupted with iſlands; it is however more eſpecially applied to that lying between Europe and Aſia, which contains the iſlands anciently called *Cyclades* and *Sporades*. See theſe two words.

ARCHIPHERACITÆ, miniſters in the Jewiſh ſynagogues appointed to read and interpret the Perakim, or titles and heads of the law and the prophets.

ARCHPRESBYTER, ARCH-PRIEST, a prieſt eſtabliſhed in ſome dioceſes with a ſuperiority over the reſt. He was anciently choſen out of the college of preſbyters at the pleaſure of the biſhop. Theſe archpreſbyters were much of the ſame nature with deans in the cathedral churches, as the college of preſbyters anſwers to the chapter. See PRESBYTER.

ARCHISYNAGOGUS, the chief of the ſynagogue; the title of an officer among the Jews, who preſided in their ſynagogues and aſſemblies. The number of theſe officers was not fixed, nor the ſame in all places: there being 70 in ſome, and in others only one. They are ſometimes called *princes* of the ſynagogue, and had a power of excommunicating ſuch as deſerved that puniſhment.

ARCHITECT, a perſon ſkilled in architecture, or the art of building; who forms plans and deſigns for edifices, conducts the work, and directs the ſeveral artificers employed in it. The word is derived from αρχος, *princeps*, and τεκτων, *faber*, "workman; q. d. the principal workman.

A R C H I T E C T U R E,

IN the utmoſt latitude of the word, ſignifies the art of building in general; but the term is moſt frequently applied only to the conſtruction of ſuch buildings as are neceſſary for the purpoſes of civil life, ſuch as houſes, churches, halls, bridges, porticoes, *&c.*

Hiſtory of Architecture.

THE origin of this art, like that of moſt others, is totally unknown. We are aſſured, however, that it is as old as Cain: for Moſes tells us that he built a city; tho' what were the materials, or how the buildings were conſtructed, we are entirely ignorant. It is commonly ſaid, that the firſt materials employed in building were branches and twigs of trees, wherewith men conſtructed huts, ſuch as the *wigwams* in uſe among the American Indians at preſent. This, however, appears diſputable. The natural ſhelter afforded by hollows in the ſides of mountains or rocks, it may be ſuppoſed, would much more readily ſuggeſt the idea of uſing ſtones and earth as materials for building houſes. Indeed, conſidering that tents were not invented before the days of Jabal, Tubal-Cain's brother, it is very probable that ſuch temporary houſes as the Indian wigwams were not originally known; otherwiſe the method of covering poles with the ſkins of beaſts, inſtead of ſmall branches or twigs, muſt very ſoon have taken place. Theſe temporary houſes ſeem to have come into uſe only when men began to lead an idle wandering life, like the Tartars, and could not be at the trouble of conſtructing durable habitations in every place where they were obliged to wander with their cattle; and Jabal perhaps from them took the hint of making portable houſes or tents. Accordingly we ſee, that no nations, except thoſe who are in a perpetually unſettled ſtate, make uſe of ſuch wretched materials. Even in America, where the human race has appeared in the rudeſt form, they were no ſooner collected into great bodies under the emperors of Mexico and Peru, than ſtone-buildings began to be erected.

1 Materials firſt uſed in building.

We are not, therefore, to look for the origin of architecture in any ſingle nation; but in every nation, when the inhabitants began to leave off their ſavage way of life, and to become civilized; and if there is any nation to be found which hath been always in a civilized ſtate, we may be aſſured that architecture hath always had an exiſtence there. But whatever may be in this, the origin of regular buildings hath been deduced

duced from the construction of the meanest huts in a very natural and plausible manner by several authors. "Anciently (says Vitruvius) men lived in woods, and inhabited caves; but in time, taking perhaps example from birds, who with great industry build their nests, they made themselves huts. At first they made these huts, very probably, of a conic figure; because that is a figure of the simplest structure; and, like the birds, whom they imitated, composed them of branches of trees, spreading them wide at the bottom, and joining them in a point at the top; covering the whole with reeds, leaves, and clay, to screen them from tempests and rain.

2 Primitive huts Plate XXXVI. fig. 1.

3 Their improvement.

"But finding the conic figure inconvenient on account of its inclined sides, they changed both the form and construction of their huts, giving them a cubical figure, and building them in the following manner: Having marked out the space to be occupied by the hut, they fixed in the ground several upright trunks of trees to form the sides, filling the interval between them with branches closely interwoven and covered with clay. The sides being thus completed, four large beams were placed on the upright trunks; which, being well joined at the angles, kept the sides firm, and likewise served to support the covering or roof of the building, composed of many joists, on which were laid several beds of reeds, leaves, and clay.

Plate XXXVI. fig. 2.

"Insensibly mankind improved in the art of building, and invented methods to make their huts lasting and handsome, as well as convenient. They took off the bark, and other unevennesses, from the trunks of trees that formed the sides; raised them, probably, above the dirt and humidity, on stones; and covered each of them with a flat stone or slate, to keep off the rain. The spaces between the ends of the joists were closed with clay, wax, or some other substance; and the ends of the joists covered with thin boards cut in the manner of triglyphs. The position of the roof was likewise altered: for being, on account of its flatness, unfit to throw off the rains that fell in great abundance during the winter season, they raised it in the middle; giving it the form of a gable roof, by placing rafters on the joists, to support the earth and other materials that composed the covering.

Fig. 3.

"From this simple construction the orders of architecture took their rise. For when buildings of wood were set aside, and men began to erect solid and stately edifices of stone, they imitated the parts which necessity had introduced into the primitive huts; in so much that the upright trees, with the stones at each end of them, were the origin of columns, bases, and capitals; and the beams, joists, rafters, and strata of materials that formed the covering, gave birth to architraves, frizes, triglyphs, and cornices, with the corona, the mutules, the modillions, and the dentils.

"The first buildings were in all likelihood rough and uncouth; as the men of those times had neither experience nor tools: but when by long experience and reasoning upon it, the artists had established certain rules, had invented many instruments, and by great practice had acquired a facility in executing their ideas, they made quick advances towards perfection, and at length discovered certain manners of building, which succeeding ages have regarded with the highest veneration."

4 State of architecture among the Egyptians.

Among the ancient Egyptians, Assyrians, and Persians, this art was carried to an incredible length. The pyramids of Egypt are such structures as would exceed the power of the most potent monarch on earth to raise at this day. The largest of these, according to the account of M. Goguet, is near 500 feet high, and contains 313,590 solid fathoms. It is composed of stones enormously large; many of them being 30 feet long, four feet high, and three in breadth; and all this huge mass of building was coated over with square flags of marble—The structure called the *labyrinth*, in the same country, according to Herodotus, who saw it, excelled every thing which he could have conceived from the imagination either of himself or others. Within the same circuit of walls they had inclosed 3000 halls, 12 of which were of a singular form and beauty; and of these, half were above, and half below ground; and the whole was terminated by a pyramid 40 fathoms high. All this prodigious mass of building was composed of white marble, and the walls were adorned with engravings.—The obelisks were not less astonishing; the largest of them being entire pieces of granite, no less than 180 feet high.—Near Andera, in Upper Egypt, are the ruins of a palace of gray granite, the cielings of which are supported by columns of such thickness, that four men can scarcely fathom them. The cielings themselves are composed of stones of the same kind, six or seven feet in breadth and 18 feet in length. The grand hall is 112 feet long, 60 high, and 58 broad. The roof of the whole edifice is a terrace, on which the Arabs formerly built a very large village, the ruins of which are still visible.

5 Among the Babylonians and Persians.

Among the Babylonians and Persians, too, such immense piles of building have been raised, as appear utterly inconceivable, and incredible to many modern authors where their former grandeur is not demonstrable by ruins visible at this day. The ruins of Persepolis, the ancient capital of Persia, were so stupendous in the time of Avicenna the Arab physician, that his countrymen could not believe such structures possible to be erected but by evil spirits. Of their extraordinary magnificence, indeed, we may have some idea from the account of the stair-cases belonging to the palace. The remains, some time ago, consisted of 95 steps of white marble, so broad and flat, that 12 horses might conveniently go up abreast.

6 Their buildings more remarkable for greatness than elegance.

In these vast structures, however, the nations of whom we speak seem to have regarded the greatness, rather than the elegance or usefulness of their works. In the pyramids and obelisks of Egypt this is exceedingly conspicuous; but whether it was so in the labyrinth or in the palace of Thebes above mentioned, it is impossible to determine, unless the buildings were entire, and we knew for what purpose they had been designed. If the kings who built the pyramids designed to immortalize their memories by building, they certainly could not have fallen upon any thing more proper for this purpose; though even in this they have some how or other failed, the names of those who erected them not being certainly known even in the time of Herodotus.—It is certain, however, that neither the ancient Assyrians nor Babylonians knew the method of constructing arches. The roofs of all their halls were flat, and covered with prodigiously large stones, some of them so big as to cover a whole room singly. Their manner of

7 Ignorant of the use of arches.

of building was also quite destitute of what is now called *taste*; the columns were ill-proportioned, and their capitals executed in the poorest manner imaginable. This was observed by the Greeks, who improved upon the proportions formerly used, and were the inventors of three of the five orders of architecture, viz. the Doric, Ionic, and Corinthian.

8
And of proportioning columns.

"Anciently (says Vitruvius) they were ignorant of the art of proportioning the various parts of a building: they used columns; but they cut them at hazard, without rules, without principles, and without having any attention to the proportions which they ought to give them: they placed them likewise without any regard to the other parts of the edifice.

Origin of the Doric order.

Dorus, son of Helen and grandson of Deucalion, having caused a temple to be built at Argos in honour of Juno, that edifice was found by chance to be constructed according to the taste and proportions of the order which afterwards they called *Doric*. The form of this building having appeared agreeable, they conformed to it for the construction of edifices which they afterwards had to build.

"About the same time, the Athenians sent into Asia a colony under the conduct of Ion, nephew of Dorus: this undertaking had very good success. Ion seized on Caria, and there founded many cities: these new inhabitants thought to build temples. They proposed for a model that of Juno at Argos; but, ignorant of the proportion which they ought to give to the columns, and in general to the whole edifice, they sought for rules capable of regulating their operation. These people wanted, in making their columns sufficiently strong to support the whole edifice, to render them at the same time agreeable to the sight. For this purpose, they thought to have given it the same proportion that they found between the foot of a man and the rest of his body. According to their ideas, the foot made a sixth part of the human height: in consequence, they gave at first to a Doric column, taking in its chapiter, six of its diameters; that is to say, they made it six times as high as it was thick: afterwards they added to it a seventh diameter.

10
Of the Ionic

"This new order of architecture was not long in giving birth to a second: they would immediately go beyond their first invention. The Ionians tried to throw still more delicacy and elegance into their edifices. They employed the same method which they had before put in practice for the composition of the Doric order: but instead of taking for a model the body of a man, the Ionians were regulated by that of a woman. With a view to make the columns of this new order more agreeable and more pleasing, they gave them eight times as much height as they had diameter. They also made channelings all along the trunk to imitate the folds of the robes of women: the volutes of the chapiter represented that part of the hair which hung in curls on each side of the face. The Ionians added, lastly, to these colums a base, which was not in use in the Doric order." According to Vitruvius, these bases were made in the manner of twisted cords, as a kind of case for the columns. This order of architecture was called *Ionic*, from the name of the people who had invented it.

Such is the account given by Vitruvius of the origin of improvements in the proportion of columns. Had these improvements, however, existed in such early times, Homer, who was greatly posterior to them, would certainly have made mention of something of that kind; but in all his writings he gives us no account of any thing like columns of stone, but uses a word which would rather incline us to think that his columns were nothing more than bare posts.

11
Hints of improvement probably taken from Solomon's temple.

It is remarkable, that improvements in architecture did not take place in any nation till after, or about, the time that Jerusalem was taken by Nebuchadnezzar. The grandest buildings erected among the Assyrians seem to have owed their existence to this monarch; and it can scarce be imagined that he would not endeavour to imitate the architecture of Solomon's temple, to which, by his conquest of Jerusalem, he had full access.—It is also remarkable, that the dimensions of the two pillars, Jachin and Boaz, set up by Solomon, very nearly correspond with those of the Doric order, first invented by the Greeks, and which originally came from their colonies settled in Asia Minor. The height of Solomon's pillars, without the chapiter, was 18 cubits; that of the chapiter itself was five cubits; the circumference was 12 cubits; from whence, according to the scripture language, we may reckon the diameter to have been exactly four cubits. Had they been a single cubit higher, they would have been precisely of the same height with columns of the original Doric order. We do not indeed mean to assert, that this famous temple gave a model of architecture to the whole world; although it is scarce conceivable but imitations of it, as far as could be known, must have taken place among many nations.

12
Egyptian banqueting room described.

Notwithstanding all their defects, however, the Egyptian buildings undoubtedly have an air of vast grandeur and magnificence, if we may credit the description given of one of their banqueting-rooms by Vitruvius. The usual size of one of these rooms was from 100 to 150 feet in length, and its breadth somewhat more than half its length. At the upper end, and along the two sides, they placed rows of pillars tolerably well proportioned to one another, though not of any regular order; and at the lower part they made a magnificent and spacious entrance; this, with its ornaments, seems to have taken up one end of the building entire. We are not told that there were any pillars there; tho' perhaps they placed two or more towards the angles on each side, for uniformity, the central space being enough for an enrance in the grandest and most august manner. These rows of columns were set at a distance from the wall, forming a noble portico along the two sides and upper end of the building. Upon the pillars was laid an architrave; and from this was carried up a continued wall with three quarter columns, answering directly to those below, and in proportion one-fourth smaller in all their parts. Between these three quarter columns were placed the windows for enlightening the building. From the tops of the lower pillars to the wall was laid a floor: this covered the portico overhead within, and made on the outside a platform, which was surrounded by a corrider with rails and ballusters. This was terraced, and served as a plain for people to walk on; and from this they could look through the windows down into the room. To this terrace there was no covering required, as the Egyptians were in no fear of rain. The Egyptians decorated this sort of building with ſtatues; and no kind of ornament could anſwer it ſo well, as the light cannot fall upon ſtatues to ſuch advantage in any direction, as when it comes from above, in ſuch a regular, proportioned, and uninterrupted manner.

13 Ancient architecture ſuperior in grandeur to the modern.

We have already taken notice, that among the ancient Egyptians, Perſians, and Babylonians, the vaſt ſtrength and extent of their buildings ſeems to have been what they chiefly valued; and in this they certainly as much excelled the Greeks and modern nations, as the latter excel them in the beautiful proportion and elegance of their ſtructures. There are not wanting, however, ſome modern authors, who endeavour to deprive the ancients of what is juſtly their due, and will have every thing to be exaggerated which ſeems beyond the power of modern princes to accompliſh. In this way M. Goguet remarkably diſtinguiſhes himſelf; and that without giving any reaſon at all, but merely that he takes it into his head. Speaking of the wonders of ancient Babylon, "All theſe works (ſays he), ſo marvellous in the judgment of antiquity, appear to me to have been extremely exaggerated by the authors who have ſpoken of them. How can we conceive, in effect, that the walls of Babylon could have been 318 feet high and 81 in thickneſs, in a compaſs of near ten leagues?" To this we may eaſily reply, that the pyramids of Egypt, and the immenſe wall which divides China from Tartary, ſhow us, that even ſuch a work as the wall of ancient Babylon is ſaid to have been is not altogether incredible. The loweſt computation of the dimenſion of the Chineſe wall is, that it extends in length 1200 miles, is eighteen feet high at a medium, and as many thick; according to which computation, it muſt contain 9,504,000 ſolid fathoms; and yet, if we may credit the Chineſe hiſtorians, this immenſe maſs of building was finiſhed in five years. If therefore we can ſuppoſe Nebuchadnezzar, or whoever fortified the city of Babylon, to have been capable of employing as many men for 10 years as were employed in raiſing the Chineſe wall, we may ſuppoſe him able to have fortified the city of Babylon as ſtrongly as it is ſaid to have been; for the maſs of building is not quite double that of the Chineſe wall, though nearly ſo, amounting to 18,189,600 ſolid fathoms. When our author afterwards gaſconades about the works of the French king, it is difficult to avoid laughter at hearing him declare, that "infinitely more money has been expended, and much more genius required, as well as more power, taſte, and time, to finiſh Verſailles, with all its defects, than to conſtruct a pyramid, or erect an obeliſk." The genius, taſte, and time, we ſhall not diſpute; but as the ſame author confeſſes that 100,000 men were employed for 30 years together in the conſtruction of the largeſt pyramid, we think the power may juſtly be doubted. This doubt will appear ſtill the more reaſonable, when we conſider what time the abovementioned number of men would have taken to accompliſh ſome of the works of which M. Goguet boaſts ſo much. The canal of Languedoc, he tells us, extends in length upwards of 70 leagues, and required the removal of two millions of cubic fathoms of earth. This was no doubt a great work; but had 100,000 men been employed upon it at once, they muſt have removed this quantity of earth in three weeks, ſuppoſing each to have removed only a ſingle fathom a day. Nor can we imagine, that any modern work will at all ſtand in competition with the works of the ancients as to greatneſs, whatever they may do in other reſpects.

14 Architecture improved by the Greeks.

As to the improvements in architecture, the Greeks were undoubtedly the firſt European nation who began to diſtinguiſh themſelves in this way. Whence they took the firſt hint of improvement, we have no means of knowing: though, as we have already hinted, it is ſcarce credible but that Solomon's temple muſt have ſomewhat contributed thereto; eſpecially as we learn from Scripture, that the capitals of the columns there were ornamented in the richeſt manner. The origin of the Doric and Ionic orders we have already given an account of from Vitruvius; to which we may add, that the volutes, which are the peculiar ornament of the Ionic capital, are by ſome ſaid to repreſent the natural curling down of a piece of bark from the top of a beam, which is ſuppoſed to have been the firſt kind of column.—

15 Origin of the Corinthian order.

The Corinthian order was not invented till long after the others, and is ſaid to have taken its riſe from the following accident: A baſket had been ſet upon the ground, and covered with a ſquare tile; there grew near it a plant of acanthus or bears-breech; the leaves ſhot up and covered the outer ſurface of the baſket; and as the ſtalks roſe up among them, they ſoon reached the tile which overhung the edges of the baſket at the top; this ſtopping their courſe upwards, they curled and twiſted themſelves into a kind of volutes. In this ſituation a ſculptor, Callimachus, ſaw it; the twiſted part of the ſtalk repreſented to him the volutes of the Ionic capital, which, as they were here ſmaller, and more numerous, appeared in a new form: he ſaw the beauty of raiſing them among leaves, and was ſtruck with the repreſentation of a noble and lofty capital; which being afterwards put into execution, has been univerſally admired.

16 Private houſes of the Greeks.

In their private houſes the Greeks had greater convenience, but much leſs magnificence, than the Romans, as the former reſerved the uſe of their grandeſt architecture for their temples and public buildings. The entrance to their private houſes, however large they were, was always ſmall, narrow, and plain. The whole edifice uſually conſiſted of two courts, and ſeveral ranges of building. The porter's lodge, if ſuch a phraſe may be allowed, was uſually on the right hand of this narrow entrance, and oppoſite to this were the ſtables. From this entrance one came into the firſt or ſmaller court. This had piazzas on three ſides; and on the fourth, which was uſually the ſouth ſide, there were butments of pilaſters, which ſupported the more inward parts of the ceiling.—A ſpace being thus left between the one and the other, they had places for the lodgings of men and maid ſervants, and ſuch as had the principal care of the houſe. Upon the ſame floor with theſe butments they had ſeveral regular apartments, conſiſting of an antichamber, a chamber, and cloſets; and about the piazzas, rooms for eating, and other common purpoſes.—Oppoſite to the entrance was a lobby or veſtibule, through which lay the paſſage into the ſeveral rooms; and through this, in front, one entered a large paſſage, which led into the larger or principal ſquare. Round this they had four piazzas, which, in the common way of building, were all of one height; but, in more magnificent houſes, they made that which faced

faced the great entrance loftier, and every way nobler, than the other three. A nobleman of Rhodes added this to the common method of building; and it was thence called the *Rhodian* manner. In this more noble part of the building were the apartments of the family. Theſe were adorned with lofty galleries, and here were the beſt rooms: they were called the *mens apartments;* for, in rude times, the Greeks lodged their wives and female relations in the beſt rooms of the firſt court, where they had alſo their ſeparate and detached place. The two ſides of this larger court were kept for the reception of viſitors; and ſervants were appointed to wait upon them. The maſter of the houſe entertained his gueſts the firſt day in his own apartments; but after this, how long ſoever they ſtaid, they lived without reſtraint in one of thoſe ſeparate piazzas, and joined the family only when they choſe it. Thus was the upper end and two ſides of the great court diſpoſed of; and its lower end, being the ſame range of building that was the upper end of the firſt court, held the lady of the houſe and her female friends.

17 Of the Romans.

The Romans borrowed their architecture from the Greeks, but did not imitate them in the modeſty of their private dwellings. They placed the principal front of their houſe towards the ſouth, and on this they beſtowed all the decoration of expenſive ornament. They had here lofty galleries and ſpacious rooms, and every thing carried an air of greatneſs and ſhow. In their country houſes they preſerved the ſame ſituation and the ſame front, but the inner diſtribution was different. At the entrance they placed the meaner and more offenſive offices, after the manner of the Greeks. The firſt gallery, which received the ſtranger at his entrance, had on one ſide a paſſage to the kitchen, and on the other to the ſtalls where they kept cattle, that their noiſe or ſmell might not be offenſive within, while yet they were in readineſs for all ſervices. Theſe ſtalls were placed to the left, as in the Greek houſes; on the right was the kitchen, which had its light from above, and its chimney in the middle. Farther within the building were placed on one ſide bathing-rooms, and on the other family-conveniences, in the manner of our butteries and ſtore-rooms: the bathing-rooms were on the left, and the others on the right. Backwards, and full to the north, they placed their cellars, for fear of the ſun, and over theſe were other ſtore-rooms. From this part of the ſtructure one came into the court; for in theſe there generally was only one court: this was taken up by ſervants, and thoſe who had the care of the cattle; and on each ſide there were ſtalls for the cattle. In front from the entrance, but very far from all theſe annoyances, ſtood the nobler apartments for the maſter of the family.

18 Decline of the art among the Romans.

How magnificent the Romans were in their temples and public buildings, is yet to be ſeen in what remains of them, and which are not only models for all modern architects, but have never been ſurpaſſed or even equalled to this day. But though the art of architecture continued almoſt at its higheſt pitch among the Romans for two centuries, it declined exceedingly as the empire began to fail. Tacitus relates, that after the battle of Actium no men of genius appeared; and after the reign of Alexander Severus, a manner of building altogether confuſed and irregular was introduced, wherein nothing of the true graces and majeſty of the former was preſerved.

19 Gothic manner of building.

When the empire was entirely over-run by the Goths, the conquerors naturally introduced their own method of building. Like the ancient Egyptians, the Goths ſeem to have been more ſtudious to amaze people with the greatneſs of their buildings than to pleaſe the eye with the regularity of their ſtructure, or the propriety of their ornaments. They corrected themſelves, however, a little by the models of the Roman edifices which they ſaw before them: but theſe models themſelves were faulty; and the Goths being totally deſtitute of genius, neither architecture nor any other art could be improved by them.

Moſt writers who mention the ancient buildings in Britain, particularly the religious ones, notwithſtanding the ſtriking difference in the ſtyles of their conſtruction, claſs them all under the common denomination of *Gothic;* a general appellation by them applied to buildings not exactly conformable to ſome one of the five orders of architecture. Our modern antiquaries, more accurately, divide them into Saxon,—Norman,—and Saracenic, or that ſpecies vulgarly tho' improperly called *modern Gothic.*

20 Of the Saxon and Norman ſtyles.

It has been maintained by ſome, that the Saxon churches, after they began to be built with ſtone, conſiſted only of upright walls, without pillars or arches, the conſtruction of which it is alleged they were entirely ignorant of. But this opinion is not only contradicted by the teſtimony of ſeveral contemporary or very ancient writers, who expreſsly mention them both, but alſo by the remains of ſome edifices univerſally allowed to be of Saxon workmanſhip, one of them the ancient conventual church at Ely. Indeed, it is highly improbable that the Saxons could be ignorant of ſo uſeful a contrivance as the arch. Many of them, built by the Romans, they muſt have had before their eyes; ſome of which have reached our days: two particularly are now remaining in Canterbury only; one in the caſtle-yard, the other at Riding-gate. And it is not to be believed, that once knowing them and their convenience, they would neglect to make uſe of them; or having uſed, would relinquiſh them. Beſides, as it appears from undoubted authorities they procured workmen from the Continent to conſtruct their capital buildings, "according to the Roman manner," this alone would be ſufficient to confute that ill-grounded opinion; and at the ſame time proves, that what we commonly call *Saxon,* is in reality Roman architecture.

This was the ſtyle of building practiſed all over Europe; and it continued to be uſed by the Normans, after their arrival here, till the introduction of what is called the *modern Gothic,* which was not till about the end of the reign of Henry II. ſo that there ſeems to be little or no grounds for a diſtinction between the Saxon and Norman architecture. Indeed it is ſaid, the buildings of the latter were of larger dimenſions both in height and area; and they were conſtructed with a ſtone brought from Caen in Normandy, of which their workmen were peculiarly fond: but this was ſimply an alteration in the ſcale and materials, and not in the manner of the building. The ancient parts of moſt of our cathedrals are of this early Norman work.—The characteriſtic marks of this ſtyle are theſe: The walls are very thick, generally without buttreſſes; the arches, both within and without, as well as thoſe over the doors and windows, ſemicircular, and ſupported by very

very solid, or rather clumsy, columns, with a kind of regular base and capital: in short, plainness and solidity constitute the striking features of this method of building. Nevertheless, the architects of those days sometimes deviated from this rule: their capitals were adorned with carvings of foliage, and even animals; and their massive columns decorated with small half columns united to them, and their surfaces ornamented with spirals, squares, lozenge net-work, and other figures, either engraved or in relievo. Various instances of these may be seen in the cathedral of Canterbury, particularly the under-croft, the monastery at Lindisfarn or Holy island, the cathedral at Durham, and the ruined Choir at Orford in Suffolk. The columns 1, 1, 1, 1, (Plate XXXV.), are at the monastery of Lindisfarn or Holy island. Those 2, 2, 2, belong to the ruined chancel at Orford in Suffolk. N° 3 is at Christ-church, Canterbury. N° 4, a column with two remarkable projections like claws, in the south aisle of Romsey-church, Hampshire.

21
Of the modern Gothic or Saracenic style.

To what country or people the *modern Gothic*, or the style of building with pointed arches so called, owes its origin, seems by no means satisfactorily determined. Some have imagined it may possibly have taken its rise from those arcades we see in the early Norman or Saxon buildings or walls, where the wide semicircular arches cross and intersect each other, and form at their intersection a narrow and sharp-pointed arch: But it is more generally conjectured to be of Arabian extraction, and to have been introduced into Europe by some persons returning from the Crusades in the Holy Land. Sir Christopher Wren was of that opinion, and it has been subscribed to by most writers who have treated on this subject.

"Modern Gothic, as it is called (Says Rious), is distinguished by the lightness of its work, by the excessive boldness of its elevations and of its sections; by the delicacy, profusion, and extravagant fancy of its ornaments. The pillars of this kind are as slender as those of the ancient Gothic are massive; such productions, so airy, cannot admit the heavy Goths for their author. How can be attributed to them a style of architecture, which was only introduced in the tenth century of our æra, several years after the destruction of all those kingdoms, which the Goths had raised upon the ruins of the Roman empire, and at a time when the very name of Goth was entirely forgotten? From all the marks of the new architecture, it can only be attributed to the Moors; or, what is the same thing, to the Arabians or Saracens, who have expressed, in their architecture, the same taste as in their poetry; both the one and the other falsely delicate, crowded with superfluous ornaments, and often very unnatural: the imagination is highly worked up in both; but it is an extravagant imagination; and this has rendered the edifices of the Arabians (we may include the other orientals) as extraordinary as their thoughts. If any one doubts of this assertion, let us appeal to any one who has seen the mosques and palaces of Fez, or some of the cathedrals in Spain built by the Moors: one model of this sort is the church at Burgos; and even in Britain there are not wanting several examples of the same; such buildings have been vulgarly called modern Gothic, but their true appellation is Arabic, Saracenic, or Moresque.—This manner was introduced into Europe through Spain. Learning flourished among the Arabians all the time that their dominion was in full power; they studied philosophy, mathematics, physic, and poetry. The love of learning was at once excited; in all places that were not at too great a distance from Spain, these authors were read; and such of the Greek authors as they had translated into Arabic, were from thence turned into Latin. The physic and philosophy of the Arabians spread themselves in Europe, and with these their architecture: many churches were built after the Saracenic mode; and others with a mixture of heavy and light proportions, the alteration that the difference of the climate might require, was little, if at all considered. In most southern parts of Europe, and in Africa, the windows (before the use of glass), made with narrow apertures, and placed very high in the walls of the building, occasioned a shade and darkness within side, and were all contrived to guard against the fierce rays of the sun; yet were ill suited to latitudes, where that glorious luminary sheds its feebler influences, and is rarely seen but through a watery cloud."

Mr Grose, however, thinks the above opinion is not sufficiently favoured by the observations of several learned travellers who have accurately surveyed the ancient mode of building in those parts of the world. Thus Cornelius le Brun, an indefatigable and inquisitive traveller, has published many views of eastern buildings, particularly about the Holy Land: in all these, only one Gothic ruin, the church near Acre, and a few pointed arches, occur; and those built by the Christians when in possession of the country. Near Ispahan, in Persia, he gives several buildings with pointed arches: but these are bridges and caravanseras, whose age cannot be ascertained; consequently are as likely to have been built after as before the introduction of this style into Europe. At Isaphan itself, the meydoen, or grand market-place, is surrounded by divers magnificent Gothic buildings; particularly the royal mosque, and the Talael Ali-kapie, or theatre. The magnificent bridge of Alla-werdie-chan, over the river Zenderoet, 540 paces long and 17 broad, having 33 pointed arches, is also a Gothic structure; but no mention is made when or by whom these are built. The Chiaer Baeg, a royal garden, is decorated with Gothic buildings; but these were, it is said, built only in the reign of Scha Abbas, who died anno 1629. One building indeed, Mr Grose admits, seems at first as if it would corroborate this assertion, and that the time when it was erected might be in some degree fixed; it is the tomb of Abdalla, one of the apostles of Mahomet, probably him surnamed Abu Becr. "If this tomb (says he) is supposed to have been built soon after his death, estimating that even to have happened according to the common course of nature, it will place its erection about the middle of the seventh century: but this is by far too conjectural to be much depended on. It also seems as if this was not the common style of building at that time, from the temple of Mecca; where, if any credit is to be given to the print of it in Sale's Koran, the arches are semicircular. The tomb here mentioned has one evidence to prove its antiquity; that of being damaged by the injuries of time and weather. Its general appearance much resembles the east end of the chapel belonging

to Ely House, London, except that which is filled up there by the great window: in the tomb is an open pointed arch, where also the columns or pinnacles on each side are higher in proportion."

As to the supposition that this kind of architecture was brought into Spain by the Moors (who possessed themselves of a great part of that country the beginning of the eighth century, which they held till the latter end of the fifteenth), and that from thence, by way of France, it was introduced into Britain this at first seems plausible: though, accoding to Mr Grose, the only instance which seems to corroborate this hypothesis, or at least the only one proved by authentic drawings, is the mosque at Cordua in Spain; where, if we may judge from the views published by Mr Swinburn, although most of the arches are circular or horse-shoe fashion, there are some pointed arches formed by the intersection of two segments of a circle. This mosque was, as it is there said, begun by Abdoulrahman I. who laid the foundation two years before his death, and was finished by his son Hissem or Iscan about the year 800. If these arches were part of the original structure, it would be much in favour of the supposition; but as it is also said that edifice has been more than once altered and enlarged by the Mahometans, before any well-grounded conclusion can be drawn, it is necessary to ascertain the date of the present building.

There are also several pointed arches in the Moorish palace at Grenada, called the Alhambra; but as that was not built till the year 1273, long after the introduction of pointed arches into Europe, they are as likely to be borrowed by the Moors from the Christians, as by the Christians from the Moors. The greatest peculiarity in the Moorish architecture is the horse-shoe arch, which containing more than a semicircle, contracts towards its base, by which it is rendered unfit to bear any considerable weight, being solely calculated for ornament. In Romsey church, Hampshire, there are several arches somewhat of that form.

The drawings of the Moorish buildings given in *Les Delices de l'Espagne*, said to be faithful representations, there are no traces of the style called Gothic architecture: there, as well as in the Moorish castle at Gibraltar, the arches are all represented circular. Perhaps a more general knowledge of these buildings would throw some light on the subject: possibly the Moors may, like us, at different periods have used different manners of building.

The marks which constitute the character of Gothic, or Saracenical architecture, are its numerous and prominent buttresses, its lofty spires and pinnacles, its large and ramified windows, its ornamental niches or canopies, its sculptured saints, the delicate lace-work of its fretted roofs, and the profusion of ornaments lavished indiscriminately over the whole building: but its peculiar distinguishing characteristics are, the small clustered pillars and pointed arches formed by the segments of two intersecting circles; which arches, though last brought into use, are evidently of more simple and obvious construction that the semicircular ones; two flat stones, with their tops inclined to each other, and touching, form its rudiments; a number of boughs stuck into the ground opposite each other, and tied together at the top, in order to form a bower, exactly describe it: whereas a semicircular arch appears the result of deeper contrivance, as consisting of more parts; and it seems less probable chance, from whence all these inventions were first derived, should throw several wedge-like stones between two set perpendicular, so as exactly to fit and fill up the interval.

Bishop Warburton, in his notes on Pope's Epistles, in the octavo edition, has the following ingenious observations on this subject:—"Our Gothic ancestors had juster and manlier notions of magnificence, on Greek and Roman ideas, than these mimics of taste, who profess to study only classic elegance; and because the thing does honour to the genius of those barbarians, I shall endeavour to explain it. All our ancient churches are called without distinction Gothic, but erroneously. They are of two sorts; the one built in the Saxon times, the other in the Norman. Several cathedral and collegiate churches of the first sort are yet remaining, either in whole or in part; of which this was the original: When the Saxon kings became Christians, their piety (which was the piety of the times) consisted chiefly in building churches at home, and performing pilgrimages abroad, especially to the Holy Land; and these spiritual exercises assisted and supported one another; for the most venerable as well as most elegant models of religious edifices were then in Palestine. From these the Saxon builders took the whole of their ideas, as may be seen by comparing the drawings which travellers have given us of the churches yet standing in that country, with the Saxon remains of what we find at home; and particularly in that sameness of style in the latter religious edifices of the knights temporals (professedly built upon the model of the church of the Holy Sepulchre at Jerusalem), with the earlier remains of our Saxon edifices. Now the architecture of the Holy Land was Grecian, but greatly fallen from its ancient elegance. Our Saxon performance was indeed a bad copy of it, and as much inferior to the works of St Helene and Justinian, as theirs were to the Grecian models they had followed: yet still the footsteps of ancient art appeared in the circular arches, the entire columns, the division of the entablature into a sort of architrave, frize, and corniche, and a solidity equally diffused over the whole mass. This by way of distinction, I would call the Saxon architecture. But our Norman works had a very different original. When the Goths had conquered Spain, and the genial warmth of the climate and the religion of the old inhabitants had ripened their wits and inflamed their mistaken piety, both kept in exercise by the neighbourhood of the Saracens, through emulation of their service, and aversion to their superstition, they struck out a new species of architecture, unknown to Greece and Rome, upon original principles, and ideas much nobler than what had given birth even to classical magnificence. For this northern people having been accustomed, during the gloom of paganism, to worship the deity in groves (a practice common to all nations); when their new religion required covered edifices, they ingeniously projected to make them resemble groves, as nearly as the distance of architecture would permit; at once indulging their old prejudices, and providing for their present convenience, niences, by a cool receptacle in a sultry climate: and with what skill and success they executed the project by the assistance of Saracen architects, whose exotic style of building very luckily suited their purpose, appears from hence, that no attentive observer ever viewed a regular avenue of well grown trees intermixing their branches overhead, but it presently put him in mind of the long visto through the Gothic cathedral; or even entered one of the larger and more elegant edifices of this kind, but it presented to his imagination an avenue of trees; and this alone is what can be truly called the Gothic style of building. Under this idea of so extraordinary a species of architecture, all the irregular transgressions against art, all the monstrous offences against nature, disappear; every thing has its reason, every thing is in order, and an harmonious whole arises from the studious application of means proper and proportionate to the end. For could the arches be otherwise than pointed, when the workmen were to imitate that curve which branches of two opposite trees make by their insertion with one another? or could the columns be otherwise than split into distinct shafts, when they were to represent the stems of a clump of trees growing close together? On the same principles they formed the spreading ramification of the stone-work in the windows, and the stained glass in the interstices; the one to represent the branches, and the other the leaves of an opening grove, and both concurred to preserve that gloomy light which inspires religious reverence and dread. Lastly, we see the reason of their studied aversion to apparent solidity in these stupendous masses, deemed so absurd by men accustomed to the apparent as well as real strength of Grecian architecture. Had it been only a wanton exercise of the artist's skill, to show he could give real strength without the appearance of any, we might indeed admire his superior science, but we must needs condemn his ill judgment. But when one considers, that this surprising lightness was necessary to complete the execution of his idea of a sylvan place of worship, one cannot sufficiently admire the ingenuity of the contrivance. This too will account for the contrary qualities in what I call the Saxon architecture. These artists copied, as has been said, from the churches in the Holy Land, which were built on the models of the Grecian architecture, but corrupted by prevailing barbarism; and still farther depraved by a religious idea. The first places of Christian worship were sepulchres and subterraneous caverns, low and heavy from necessity. When Christianity became the religion of the state, and sumptuous temples began to be erected, they yet, in regard to the first pious ages, preserved the massive style, made still more venerable by the church of the Holy Sepulchre; where this style was, on a double account, followed and aggravated."

22
Rise and progress of architecture in Britain.

In Britain, before the Roman invasion, the natives appear to have had no better lodgings than thickets, dens, and caves. Some of these caves, which were their winter-habitations, and places of retreat in time of war, were formed and rendered secure and warm by art, like those of the ancient Germans, which are thus described by Tacitus: "They are used to dig deep caves in the ground and cover them with earth, where they lay up their provisions, and dwell in winter for the sake of warmth. Into those they retire also from their enemies, who plunder the open country, but cannot discover these subterranean recesses." Some of the subterraneous, or *earth-houses*, as they are called, are still remaining in the western isles of Scotland and in Cornwal. The summer habitations of the most ancient Britons were very slight; and, like those of the Finnians, consisted only of a few stakes driven into the ground, interwoven with wattles, and covered over with the boughs of trees.

When Julius Cæsar invaded Britain, the inhabitants of Cantium (Kent), and of some other parts in the south, had learned to build houses a little more substantial and convenient. "The country (says Cæsar) abounds in houses, which very much resemble those of Gaul." The first step towards this improvement seems to have been that of daubing the wattled walls of their houses with clay, to fill up the chinks and make them warmer. "The Germans used for this purpose a kind of pure resplendent earth of different colours, which had an appearance of painting at a distance;" but the Gauls and Britains chose rather to whitewash the clay after it was dry with chalk. Instead of the boughs of trees, they thatched these houses with straw, as a much better security against the weather. They next proceeded to form the walls of large beams of wood, instead of stakes and wattles. This seems to have been the mode of building in Britain, when it was first invaded by the Romans. "The Britons (says Diodorus Siculus, who was cotemporary with Cæsar) dwell in wretched cottages, which are constructed of wood, covered with straw." These wooden houses of the ancient Gauls and Britons were not square but circular, with high tapering roofs, at the top or centre of which was an aperture for the admission of light and emission of smoke. Those of Gaul are thus described by Strabo: "They build their houses of wood, in the form of a circle, with lofty tapering roofs." The foundations of some of the most magnificent of these circular houses were of stone, of which there are some vestiges still remaining in Anglesey and other places. It was probably in imitation of these wooden houses, that the most ancient stone edifices, of which there are still some remains in the western islands of Scotland, were built circular, and have a large aperture at the top.

When the Britons were invaded by the Romans, they had nothing among them answering to our ideas of a city or town, consisting of a great number of contiguous houses, disposed into regular streets, lanes, and courts. Their dwellings, like those of the ancient Germans, were scattered about the country, and generally situated on the brink of some rivulet for the sake of water, and on the skirt of some wood or forest for the conveniency of hunting and pasture for their cattle. As these inviting circumstances were more conspicuous in some part of the country than others, the princes and chiefs made choice of these places for their residence; and a number of their friends and followers, for various reasons, built their houses as near to them as they could with conveniency. This naturally produced an ancient British town, which is described by Cæsar and Strabo in the following manner: "From the Cassi he learnt that the town of Cassivelaun was at no great distance; a place defended by woods and marshes, in which very great numbers of men and cattle were collected. For what the Britons call a town, is is a tract of a woody country, surrounded by a mound and ditch, for the security of themselves and their cattle against the incursions of their enemies." "The forests of the Britons are their cities: for when they have inclosed a very large circuit with felled trees, they build within it houses for themselves, and hovels for their cattle. These buildings are very slight, and not designed for long duration." The palaces of the British princes were probably built of the same materials, and on the same plan, with the houses of their subjects, and differed from them only in solidity and magnitude.

Though the communication between Britain and the continent was more free and open after the first Roman invasion than it had been before, and some of the British princes and chieftans even visited Rome, then in its greatest glory; it doth not appear that the people of Britain made any considerable improvements in their manner of building for at least a hundred years after that invasion. For when the renowned Caractacus was carried prisoner to Rome, A. D. 52, and observed the beauty and magnificence of the buildings in that proud metropolis of the world, he is said to have expressed great surprise, "That the Romans, who had such magnificent palaces of their own, should envy the wretched cabbins of the Britons."

It must appear very surprising that the ancient Britons, when they were so ignorant of architecture, were capable of erecting (if indeed it was erected by them) so stupendous a fabric as that of Stonehenge on Salisbury plain: A fabric which hath been the admiration of all succeeding ages, and hath outlasted all the solid and noble structures which were erected by the Romans in that island. See the article STONEHENGE.

Of another very extraordinary species of building several remains are found in the Highlands of Scotland. They consist of ruins; the walls of which, instead of being cemented with lime or some other similar substance, or of being raised with dry stones, as was the method before cement came into use, are described as having been vitrefied, or the stones run and compacted together by the force of fire. Concerning the origin, use, &c. of these buildings, different opinions have been formed; and even the reality of them as works of contrivance has been called in question: of all which particulars the reader will find an account under the article *FORTS (Vitrefied)*.

But for whatever purposes, or by whatever means, the above and other similar structures of a peculiar nature were erected, we have sufficient evidence that the people of Britain, before they were subdued and instructed by the Romans, had but a rude knowledge of architecture, and were very meanly lodged. As soon, however, as the Romans began to form settlements and plant colonies in that island, a sudden and surprising change ensued in the state of architecture. For that wonderful people were as industrious as they were brave, and made haste to adorn every country that they conquered. The first Roman colony was planted at Camelodunum, A. D. 50; and when it was destroyed by the Britons in their great revolt under Boadicia, only eleven years after, it appears to have been a large and well built town, adorned with statutes, temples, theatres, and other public edifices.

The Romans not only built a prodigious number of solid, convenient, and magnificent structures for their own accommodation, but they exhorted, encouraged, and instructed the Britons to imitate their example. This was one of the arts which Agricola, the most excellent of the Roman governors, employed to civilize the Britons, and reconcile them to the Roman government. "The following winter (says Tacitus) was spent by Agricola in very salutary measures. That the Britons, who led a roaming and unsettled life, and were easily instigated to war, might contract a love to peace and tranquillity, by being accustomed to a more pleasant way of living, he exhorted and assisted them to build houses, temples, courts, and market-places. By praising the diligent and reproaching the indolent, he excited so great an emulation among the Britons, that after they had erected all those necessary edifices in their towns, they proceeded to build others merely for ornament and pleasure, as porticoes, galleries, baths, banqueting-houses, &c." From this time, which was A. D. 80, to the middle of the fourth century, architecture and all the arts immediately connected with it greatly flourished in that island; and the same taste for erecting solid, convenient, and beautiful buildings, which had long prevailed in Italy, was introduced into Britain. Every Roman colony and free city (of which there was a great number in that country) was a little Rome, encompassed with strong walls, adorned with temples, palaces, courts, halls, basilisks, baths, markets, aqueducts, and many other fine buildings, both for use and ornament. The country every where abounded with well-built villages, towns, forts, and stations; and the whole was defended by that high and strong wall, with its many towers and castles, which reached from the mouth of the river Tine on the east to the Solway Firth on the west. This spirit of building, which was introduced and encouraged by the Romans, so much improved the taste and increased the number of the British builders, that in the third century that island was famous for the great number and excellence of its architects and artificers. When the Emperor Constantius, father of Constantine the Great, rebuilt the city of Autun, in Gaul, A. D. 296, he was chiefly furnished with workmen from Britain, "which (says Eumenius) very much abounded with the best artificers."

Not very long after this period, architecture and all the arts connected with it began to decline very sensibly in Britain, and in all the provinces of the western empire. This was partly owing to the building of Constantinople, which drew many of the most famous architects and other artificers into the east, and partly to the irruptions and depredations of the barbarous nations.

The final departure of the Romans was followed by the almost total destruction of architecture in that island. For the unhappy and unwarlike people whom they left behind, having neither skill nor courage to defend the numerous towns, forts, and cities which they possessed, they were seized by their ferocious invaders, who first plundered and then destroyed them. By this means, the many noble structures with which Provincial Britain had been adorned by the art and industry of the Romans, were ruined or defaced in a very little time; and the unfortunate Britons were quite incapable of repairing them, or of building others in their room. That long succession of miseries in which they were involved

volved by the Scots, Picts, and Saxons, deprived them of the many useful arts which they had learned from their former masters, and lodged them once more in forests, dens, and caves, like their savage anceſtors.

The most wanton and extenſive devaſtations were thoſe committed by the Anglo-Saxons; among whom it ſeems to have been a maxim to deſtroy all the towns and caſtles which they took from their enemies, inſtead of preſerving them from their own uſe.

It cannot be ſuppoſed, that a people who wantonly demoliſhed ſo many beautiful and uſeful ſtructures had any taſte for the arts by which they had been erected. The truth is, that the Anglo-Saxons at their arrival in this iſland were almoſt totally ignorant of theſe arts; and, like all the other nations of Germany, had been accuſtomed to live in wretched hovels, built of wood or earth, and covered with ſtraw or the branches of trees: nor did they much improve in the knowledge of architecture for 200 years after their arrival. During that period, maſonry was quite unknown and unpractiſed in this iſland: and the walls even of cathedral churches were built of wood. "There was a time (ſays Venerable Bede) when there was not a ſtone church in all the land; but the cuſtom was to build them all of wood. Finan, the ſecond biſhop of Lindisfarne, or Holy iſland, built a church in that iſland, A. D. 652, for a cathedral, which yet was not of ſtone, but of wood, and covered with reeds; and ſo it continued till Eadbert, the ſucceſſor of St Cuthbert, and ſeventh biſhop of Lindisfarne, took away the reeds, and covered it all over, both roof and walls, with ſheets of lead." The firſt cathedral of York was built of the ſame materials; and a church of ſtone was eſteemed a kind of prodigy in thoſe times that merited a place in hiſtory. "Paulinus, the firſt biſhop of York, built a church of ſtone in the city of Lincoln, whoſe walls (ſays Bede) are ſtill ſtanding, though the roof is fallen down; and ſome healing miracles are wrought in it every year, for the benefit of thoſe who have the faith to ſeek them."

There does not ſeem to have been ſo much as one church of ſtone, nor any artiſts who could build one, in all Scotland, at the beginning of the eighth century. For Naitan king of the Picts, in his famous letter to Ceolfred abbot of Weremouth, A. D. 710, earneſtly intreats him to ſend him ſome maſons to build a church of ſtone in his kingdom, in imitation of the Romans; which he promiſes to dedicate to the honour of the apoſtle Peter, to whom the abbey of Weremouth was dedicated: and we are told by Bede, who was then living in that abbey, that the reverend abbot Ceolfred granted this pious requeſt, and ſent maſons according to his deſire.

Maſonry was reſtored, and ſome other arts connected with it introduced into England, towards the end of the ſeventh century, by two clergymen, who were great travellers, and had often viſited Rome, where they had acquired ſome taſte for theſe arts. Theſe were, the famous Wilfrid biſhop of York, and afterwards of Hexham, and Benedict Biſcop, founder of the Abbey of Weremouth. Wilfrid, who was one of the moſt ingenious, active, and magnificent prelates of the ſeventh century, was a great builder, and erected ſeveral ſtructures at York, Rippon, and Hexham, which were the admiration of the age in which he flouriſhed. The cathedral of Hexham, which was one of theſe ſtructures, is thus deſcribed by his biographer: "Having obtained a piece of ground at Hexham from Qeen Etheldreda, he there founded a moſt magnificent church, which he dedicated to the bleſſed apoſtle St Andrew. As the plan of this ſacred ſtructure ſeems to have been inſpired by the Spirit of God, it would require a genius much ſuperior to mine to deſcribe it properly. How large and ſtrong were the ſubterraneous buildings conſtructed of the fineſt poliſhed ſtones! How magnificent the ſuperſtructure, with its lofty roof, ſupported by many pillars, its long and high walls, its ſublime towers, and winding ſtairs! In one word, there is no church on this ſide of the Alps ſo great and beautiful." This admired edifice, of which ſome veſtiges are ſtill remaining, was built by maſons and other artificers brought from Rome by the munificence of its generous founder. Benedict Biſcop was the cotemporary and companion of Wilfrid in ſome of his journeys, and had the ſame taſte for the arts. He made no fewer than ſix journeys to Rome, chiefly with a view of collecting books, pictures, ſtatues, and other curioſities, and of perſuading artificers of various kinds to come from Italy and France and ſettle in England. Having obtained a grant of a conſiderable eſtate from Egfrid king of Northumberland, near the mouth of the river Were, he there founded a monaſtery, A. D. 647. "About a year after the foundations of this monaſtery were laid, Benedict croſſed the ſea into France, where he collected a number of maſons, and brought them over with him, in order to build the church of his monaſtery of ſtone after the Roman manner, of which he was a great admirer. His love to the apoſtle Peter, to whom he deſigned to dedicate his church, made him urge theſe workmen to labour ſo hard, that maſs was celebrated in it about a year after it was founded. When the work was far advanced, he ſent agents into France to procure if poſſible ſome glaſs-makers, a kind of artificers quite unknown in England, and to bring them over to glaze the windows of his church and monaſtery. Theſe agents were ſucceſsful, and brought ſeveral glaſs-makers with them; who not only performed the work required by Benedict, but inſtructed the Engliſh in the art of making glaſs for windows, lamps, drinking-veſſels, and other uſes."

Eddii Vita Wilfridi, c. 22.

Bedæ Hiſt. Abbat.

But though theſe arts of building edifices of ſtone, with windows of glaſs and other ornaments, were thus introduced by theſe two prelates in the latter part of the ſeventh century, they do not ſeem to have flouriſhed much for ſeveral centuries. It appears from many incidental hints in our ancient hiſtorians, that ſtone-buildings were ſtill very rare in the eighth and ninth ages; and that when any ſuch buildings were erected, they were the objects of much admiration. When Alfred the Great, towards the end of the ninth century, formed the deſign of rebuilding his ruined cities, churches, and monaſteries, and of adorning his dominions with more magnificent ſtructures, he was obliged to bring many of his artificers from foreign countries. "Of theſe (as we are told by his friend and companion Aſſerius) he had an almoſt innumerable multitude, collected from different nations; many of them the moſt excellent in their ſeveral arts."

In the other parts of the iſland architecture was, as might

might naturally be imagined, in a still less flourishing state. It appears indeed to have been almost entirely lost among the posterity of the ancient Britons after they retired to the mountains of Wales. The chief palace of the kings of Wales, where the nobility and wise men assembled for making laws, was called the *white palace*, because the walls of it were woven with white wands which had the bark peeled off. By the laws of Wales, whoever burnt or destroyed the king's hall or palace was obliged to pay one pound and eighty pence, besides one hundred and twenty pence for each of the adjacent buildings, which were eight in number; viz. the dormitory, the kitchen, the chapel, the granary, the bake-house, the store-house, the stable, and the dog-house. From hence it appears, that a royal residence in Wales, with all its offices, when these laws were made, was valued at five pounds and eighty pence of the money of that age, equal in quantity of silver to sixteen pounds Sterling, and in efficacy to one hundred and sixty. This is certainly a sufficient proof of the meanness of those buildings which were only of wood. Even the castles in Wales, in this period, that were built for the security of the country, appear to have been constructed of the same materials; for the laws required the king's vassals to come to the building of these castles with no other tools but an axe.

The arts of building do not seem to have been much better understood by the Scots and Picts than by the ancient Britons in the former part of this period. When Finan, the second bishop of Lindisfarne, built a church of wood in that island, A. D. 652, he is said to have done it *more Scotorum*, after the manner of his countrymen the Scots; and it hath been already observed, that Naitan king of the Picts was obliged to bring masons from Northumberland when he resolved to build a church of stone in his dominions, A. D. 710. After this last period, it is probable that the Picts, and perhaps the Scots, began to learn and practise the art of masonry; because there are still some stone buildings of a very singular construction, and great antiquity, to be seen in Scotland. These buildings are all circular; though of two kinds so different from each other, that they seem to be the works of different ages and of different nations. The largest of these structures are in a very extraordinary taste of architecture; and are thus described by a modern antiquary, who viewed them with no little attention: "Having arrived at the barrack of Glenelg, I was conducted to the remains of those stupendous fabrics, seated about two miles from thence, in a valley called *Glenbeg*, in which four of them anciently stood. Two of these are now almost quite demolished, the third is half fallen down, the fourth is almost entire. The first I met with lies towards the north side of the valley, and is called *Castle Chalamine*, or *Malcom's Castle*. It stands upon a considerable eminence, and affords us a fine prospect of the island of Sky, and a good part of the sea-coast. The foundation of this only appears; as also of that other, on the east end of the valley, called *Castle Chonnel*. About a quarter of a mile further, upon the bank of a rivulet which passes through the middle of the glen, stands the third fabric, called *Castle Tellve*. I found it composed of stones without cement; not laid in regular courses, after the manner of elegant buildings, but rudely and without order. Those toward the base were pretty large, but ascending higher they were thin and flat, some of them scarce exceeding the thickness of an ordinary brick. I was surprised to find no windows on the outside, nor any manner of entrance into the fabric, except a hole towards the west, at the base, so very low and narrow, that I was forced to creep in upon hands and knees, and found that it carried me down four or five steps below the surface of the ground. When I was got within, I was environed betwixt two walls, having a cavity or void space which led me round the whole building. Opposite to the little entry on the outside was a pretty large door in the second or inner wall, which let me into the area or inner court. When I was there, I perceived that one half of the building was fallen down, and thereby had the opportunity of seeing a complete section thereof. The two walls join together at the top, round about, and have formed a large void space or area in the middle. But to give a more complete idea of these buildings, I shall describe the fourth, called *Castle Troddan*, which is by far the most entire of any in that country, and from whence I had a very clear notion how these fabrics were originally contrived. On the outside were no windows, nor were the materials of this castle any wise different from those of the other already described, only the entry on the outside was somewhat larger; but this might be occasioned by the falling of the stones from above. The area of this makes a complete circle; and there are four doors in the inner wall, which face the four cardinal points of the compass. These doors are each eight feet and a half high, and five feet wide, and lead from the area into the cavity between the two walls, which runs round the whole building. The perpendicular height of this fabric is exactly 33 feet; the thickness of both walls, including the cavity between, no more than 12 feet; and the cavity itself is hardly wide enough for two men to walk abreast: the external circumference is 178 feet. The whole height of the fabric is divided into four parts or stories, separated from each other by thin floorings of flat stones, which knit the two walls together, and run quite round the building; and there have been winding stairs of the same flat stones ascending betwixt wall and wall up to the top. The undermost partition is somewhat below the surface of the ground, and is the widest; the others grow narrower by degrees till the wall closes at the top. Over each door are nine square windows, in a direct line above each other, for the admission of light; and between every row of windows are three others in the uppermost story, rising above a cornice which projects out from the inner wall and runs round the fabric." From this description of these singular edifices, it plainly appears, that they were designed both for lodging and defence; and considering the state of the times in which they were built, they were certainly very well contrived for answering both these purposes.

Gordon's Itinerarium Septentrionale, p. 166.

The stone edifices of the other kind which were probably erected in this period, and of which some few are still to be seen in Scotland, are not so large as the former, but more artificial. They are slender, lofty, circular towers, of cut stone, laid in regular rows, between 40 and 50 feet in external circumference, and from 70 to 100 feet high, with one door some feet from the ground. They are exactly similar to the round

round tower of Ardmore, and several others in Ireland; and therefore were probably built about the same time, which was in the tenth century, and for the same purposes; which are believed by some to have been for the confinement of penitents while they were performing penance. On this account these towers are always found in the neighbourhood of churches both in Scotland and Ireland; and are said to have been used in this manner: "The penitents were placed in the uppermost story of the tower (which commonly consisted of five or six stories); where having made probation, or done penance, such a limited time, according to the heinousness of their crimes, they then were permitted to descend to the next floor, and so on by degrees, until they came to the door, which always faced the entrance of the church, where they stood to receive absolution from the clergy, and the blessings of the people." A tedious process, to which few penitents in the present age would willingly submit. Other writers are of opinion, that the design of these circular towers (of which one is still remaining at Abernethy, and another at Brechin) was to be places from whence the people were called to public worship by the sound of a horn or trumpet, before the introduction of bells.

Archæologia vol. i. p. 307.

This art received very great improvements in the 12th century; which indeed may be called *the age of architecture*; when the rage for building was more violent in England than at any other time. The great and general improvements that were made in the fabrics of houses and churches in the first years of this century, are thus described by a cotemporary writer. "The new cathedrals and innumerable churches that were built in all parts, together with the many magnificent cloisters and monasteries, and other apartments of monks, that were then erected, afford a sufficient proof of the great felicity of England in the reign of Henry I. The religious of every order, enjoying peace and prosperity, displayed the most astonishing ardour in every thing that might increase the splendor of divine worship. The fervent zeal of the faithful prompted them to pull down houses and churches every where, and rebuild them in a better manner. By this means the ancient edifices that had been raised in the days of Edgar, Edward, and other Christian kings, were demolished, and others of greater magnitude and magnificence, and of more elegant workmanship, were erected in their room, to the glory of God."

Oraeric. Vital. Hist. Eccles. p. 788.

As the prodigious power of religious zeal, whatever turn it happens to take, when it is thoroughly heated, is well known, it may not be improper to give one example of the arts employed by the clergy and monks of this period, to inflame the pious ardour of the kings, nobles, and people, for building and adorning churches. When Joffred Abbot of Croyland resolved to rebuild the church of his monastery in a most magnificent manner, A. D. 1106, he obtained from the Archbishops of Canterbury and York, a bull dispensing with the third part of all penances for sin to those who contributed any thing towards the building of that church. This bull was directed not only to the king and people of England, but to the kings of France and Scotland, and to all other kings, earls, barons, archbishops, bishops, abbots, priors, rectors, presbyters, and clerks, and to all true believers in Christ, rich and poor, in all Christian kingdoms. To make the best use of this bull, he sent two of his most eloquent monks to proclaim it over all France and Flanders, two other monks into Scotland, two into Denmark and Norway, two into Wales, Cornwall, and Ireland, and others into different parts of England. "By this means (says the historian) the wonderful benefits granted to all the contributors to the building of this church were published to the very ends of the earth; and great heaps of treasure and masses of yellow metal flowed in from all countries upon the venerable Abbot Joffred, and encouraged him to lay the foundations of his church." Having spent about four years in collecting mountains of different kinds of marble from quarries both at home and abroad, together with great quantities of lime, iron, brass, and other materials for building, he fixed a day for the great ceremony of laying the foundation, which he contrived to make a very effectual mean of raising the superstructure: For on the long-expected day, the feast of the Holy Virgins Felicitas and Perpetua, an immense multitude of earls, barons, and knights, with their ladies and families, of abbots, priors, monks, nuns, clerks, and persons of all ranks, arrived at Croyland, to assist at this ceremony. The pious Abbot Joffred began by saying certain prayers, and shedding a flood of tears on the foundation. Then each of the earls, barons, knights, with their ladies, sons, and daughters, the abbots, clerks, and others, laid a stone, and upon it deposited a sum of money, a grant of lands, tithes, or patronages, or a promise of stone, lime, wood, labour, or carriages for building the church. After this the abbot entertained the whole company, amounting to 5000 persons, at dinner. To this entertainment they were all intitled; for the money, and grants of different kinds, which they had deposited on the foundation-stones, were alone sufficient to have raised a very noble fabric. By such arts as these the clergy inspired kings, nobles, and people of all ranks, with so ardent a spirit for these pious works, that in the course of this period almost all the sacred edifices in England were rebuilt, and many hundreds of new ones raised from the foundation. Nor was this spirit confined to England, but prevailed as much in Scotland in proportion to its extent and riches. King David I. alone, besides several cathedrals and other churches, built no fewer than thirteen abbeys and priories, some of which were very magnificent structures.

The sacred architecture of the Anglo-Normans in the beginning of this period did not differ much in its style and manner from that of the Anglo-Saxons; their churches being in general plain, low, strong, and dark; the arches both of the doors and windows semicircular, with few or no ornaments. By degrees, through much practice, our architects, who were all monks or clergymen, improved in their taste and skill, and ventured to form plans of more noble, light, and elevated structures, with a great variety of ornaments; which led to that bold magnificent style of building, commonly, though perhaps not very properly, called *the later Gothic*. It is not improbable that our monkish architects were assisted in attaining this style of building by models from foreign countries, or by instructions from such of their own number as had visited Italy, France, Spain, or the East. But the origin

of

of this style of architecture has been already considered, and the characters by which it is distinguished from the ancient Gothic have also been described: (See n° 21. *supra*.) Its first appearance in England was towards the latter end of the reign of King Henry II. But it was not at once thoroughly adopted; some short solid columns and semicircular arches being retained and mixed with the pointed ones; as for example, in the west end of the Old Temple Church; and at York, where under the choir there remains much of the ancient work, the arches of which are but just pointed and rise on short round pillars. In the reign of Henry III. however, this manner of building seems to have gained a complete footing; the circular giving place to the pointed arch, and the massive column yielding to the slender pillar. Indeed, like all novelties, when once admitted, the rage of fashion made it become so prevalent, that many of the ancient and solid buildings, erected in former ages, were taken down in order to be re-edified in the new taste, or had additions patched to them, of this mode of architecture. The present cathedral church of Salisbury was begun early in this reign, and finished in the year 1258. It is entirely in the Saracenic style; and, according to Sir Christopher Wren, may be justly accounted one of the best paterns of architecture of the age in which it was built. Its excellency is undoubtedly in a great measure owing to its being constructed on one plan; whence arises that symmetry and agreement of parts, not to be met with in many of our other cathedral churches; which have mostly been built at different times, and in a variety of styles. From this time till the reign of Henry VIII. the fashionable pillars in churches were of Purbic marble, very slender and round, encompassed with marble shafts a little detached, having each a capital adorned with foliage, which joining, formed one elegant capital for the whole pillar. The windows were long and narrow, with pointed arches and painted glass, which was introduced about that time, or at least became more common. In this century also they began to delight in lofty steeples, with spires and pinnacles. In the fourteenth century, the pillars consisted of an assemblage of shafts not detached, but united, forming one solid and elegant column; the windows, especially those in the east and west ends, were greatly enlarged, divided into several lights by stone mullions running into ramifications above, and forming numerous compartments in various fanciful shapes. Those windows, filled with stained glass of the most lively colours, representing kings, saints, and martyrs, and their histories, made a most solemn and glorious appearance. There were several other variations, especially in the taste of the carvings and other ornaments, which are too minute for general history.

As to the state of civil architecture during the same period: The houses of the common people in the country, and of the lower burgesses in towns and cities, were very little improved in their structure, that most numerous and useful order of men being much depressed in the times we are now delineating. Even in the capital city of London, all the houses of mechanics and common burgesses were built of wood, and covered with straw or reeds, towards the end of the twelfth century. But the palaces, or rather castles, of the Anglo-Norman kings, barons, and prelates, were very different from the residences of persones of the same rank in the Anglo-Saxon times. For this we have the testimony of a person of undoubted credit, who was well acquainted with them both. "The Anglo-Saxon nobles (says William of Malmsbury) squandered away their ample revenues in low and mean houses; but the French and Norman barons are very different from them, living at less expence, but in great and magnificent palaces." The truth is, that the rage of building fortified castles, was no less violent among the Norman princes, prelates, and barons, than that of building churches. To this they were prompted, not only by the custom of their native country, but also by their dangerous situation in that island. Surrounded by multitudes, whom they had depressed and plundered, and by whom they were abhorred, they could not think themselves safe without the protection of deep ditches and strong walls. The conqueror himself was sensible, that the want of fortified places in England had greatly facilitated his conquest, and might facilitate his expulsion; and therefore he made all possible haste to remedy this defect, by building very magnificent and strong castles in all the towns within the royal demesnes. "William (says Matthew Paris) excelled all his predecessors in building castles, and greatly harassed his subjects and vassals with these works." All his earls, barons, and even prelates, imitated his example; and it was the first care of every one who received the grant of an estate from the crown, to build a castle upon it for his defence and residence. The disputes about the succession in the following reigns, kept up this spirit for building great and strong castles. William Rufus was still a greater builder than his father. "This William (says Henry Knyghton) was much addicted to building royal castles and palaces, as the castles of Dover, Windsor, Norwich, Exeter, the palace of Westminster, and many others, testify; nor was there any king of England before him that erected so many and such noble edifices." Henry I. was also a great builder both of castles and monasteries. But this rage for building never prevailed so much in any period of the English history as in the turbulent reign of king Stephen, from A. D. 1135 to A. D. 1154. "In this reign (as we are told by the author of the Saxon Chronicle) every one who was able built a castle; so that the poor people were worn out with the toil of these buildings, and the whole kingdom was covered with castles." This last expression will hardly appear too strong, when we are informed, that besides all the castles before that time in England, no fewer than 1115 were raised from the foundation in the short space of 19 years. See the article CASTLE.

The castles, monasteries, and greater churches of this period, were generally covered with lead, the windows glazed; and when the walls were not of Ashler, they were neatly plastered, and whitewashed on both sides. The doors, floors, and roof, were commonly made of oak planks and beams, exactly smoothed and jointed, and frequently carved. It is hardly necessary to observe, that the building one of these great and magnificent castles, monasteries, or churches, of which there were many in England, must have been a work of prodigious expence and labour; and that the architects and artificers, by whom that work was planned and executed, must have attained considerable dexterity

dexterity in their respective arts. Several of these architects have obtained a place in history, and are highly celebrated for their superior skill. William of Sens, architect to Archbishop Lanfranc in building his cathedral, is said, by Gervase of Canterbury, to have been a most exquisite artist both in stone and wood. He made not only a model of the whole cathedral, but of every particular piece of sculpture and carving, for the direction of the workmen; and invented many curious machines for loading and unloading ships, and conveying heavy weights by land, because all the stones were brought from Normandy. Matthew Paris speaks even in a higher strain of Walter of Coventry, who flourished towards the end of this period, when he says, that "so excellent an architect had never yet appeared, and probably never would appear, in the world." This encomium was undoubtedly too high; but it is impossible to view the remains of many magnificent fabrics, both sacred and civil, that were erected in this period, without admiring the genius of the architects by whom they were planned, and the dexterity of the workmen by whom they were executed.

In the beginning of the reign of Henry VIII. or rather towards the latter end of that of Henry VII. when brick building became common, a new kind of low pointed arch grew much in use: it was described from four centres, was very round at the haunches, and the angle at the top was very obtuse. This sort of arch is to be found in every one of Cardinal Wolsey's buildings; also at West Sheen; an ancient brick gate at Mile End, called *King John's Gate;* and in the great gate of the palace of Lambeth. From this time Gothic architecture began to decline; and was soon after supplanted by a mixed style, if one may venture to call it one; wherein the Grecian and Gothic, however discordant and irreconcileable, are jumbled together. Concerning this mode of building, Mr Warton, in his observations on Spencer's Fairy Queen, has the following anecdotes and remarks.

"Although the Roman or Grecian architecture did not begin to prevail in England till the time of Inigo Jones, yet our communication with the Italians, and our imitation of their manners, produced some specimens of that style much earlier. Perhaps the earliest was Somerset House in the Strand, built about the year 1549, by the Duke of Somerset, uncle to Edward VI. The monument of Bishop Gardiner, in Winchester cathedral, made in the reign of Mary, about 1555, is decorated with Ionic pillars. These verses of Spencer,

> ——————————Did rise
> On stately pillars, fram'd after the Doric guise.

bear an allusion to some of the fashionable improvements in building, which at this time were growing more and more into esteem. Thus also Bishop Hall, who wrote about the same time, viz 1598:

> There findest thou some stately Doricke frame,
> Or neat Ionicke work.————

But these ornaments were often absurdly introduced into the old Gothic style: as in the magnificent portico of the schools at Oxford, erected about the year 1613; where the builder, in a Gothic edifice, has affectedly displayed his universal skill in the modern architecture, by giving us all the five orders together. However, most of the great buildings of Queen Elizabeth's reign have a style peculiar to themselves both in form and finishing; where, though much of the old Gothic is retained, and great part of the new taste is adopted, yet neither predominates; while both, thus distinctly blended, compose a fantastic species, hardly reducible to any class or name. One of its Characteristics is the affectation of large and lofty windows; where, says Bacon, "you shall have sometimes fair houses so full of glass, that one cannot tell where to come to be out of the sun."

To return now to our general history, and to conclude: In the 15th and 16th centuries, when learning of all kinds began to revive, the chaste architecture of the Greeks and Romans seemed as it were to be recalled into life. The first improvements in it began in Italy, and owed their existence to the many ruins of the ancient Roman structures that were to be found in that country, from whence an improved method of building was gradually brought into the other countries of Europe: and though the Italians for a long time retained the superiority as architects over the other European nations; yet, as men of genius travelled from all quarters into Italy, where they had an opportunity of seeing the originals from whence the Italians copied, architects have risen in other nations equal, if not superior, to any that ever appeared in Italy. Of this we have a recent instance in Mr Mylne, who lately gained the prize in architecture at Rome, where it would no doubt be disputed by such natives of Italy as were best skilled in that art.

PART. I. PRINCIPLES OF ARCHITECTURE.

MANY ages must have elapsed before architecture came to be considered as a fine art. Utility was its original destination, and still continues to be its principal end. Experience, however, has taught us, that architecture is capable of exciting a variety of agreeable feelings. Of these, utility, grandeur, regularity, order, and proportion, are the chief.

23 Distinction of buildings.

Architecture being an useful as well as a fine art, leads us to distinguish buildings, and parts of buildings, into three kinds, viz. what are intended for use solely, what for ornament solely, and what for both. Buildings intended for utility solely, ought in every part to correspond precisely to that intention: the least deviation from use, though contributing to ornament, will be disagreeable; for every work of use being considered as a mean to an end, its perfection as a mean is the capital circumstance, and every other beauty in opposition is neglected as improper. On the other hand, in such things as are intended solely for ornament, as columns, obelisks, triumphal arches, &c. beauty alone ought to be regarded. The principal difficulty in architecture lies in combining use and ornament. In order to accomplish these ends, different and even opposite means must be employed; which is the reason why they are so seldom united in perfection; and hence, in buildings of this kind, the only practicable method is, to prefer utility to ornament according to the character of the building: in palaces, and ſuch buildings as admit of a variety of uſeful contrivance, regularity ought to be preferred; but in dwelling-houſes that are too ſmall for a variety of contrivance, utility ought to prevail, neglecting regularity as far as it ſtands in oppoſition to convenience.

24 Intrinſic and relative beauty.

In conſidering attentively the beauty of viſible objects, we diſcover two kinds. The firſt may be termed *intrinſic* beauty, becauſe it is diſcovered in a ſingle object, without relation to any other. The ſecond may be termed *relative* beauty, being founded on a combination of relative objects. Architecture admits of both kinds. We ſhall firſt give a few examples of *relative* beauty.

The proportions of a door are determined by the uſe to which it is deſtined. The door of a dwelling-houſe, which ought to correſpond to the human ſize, is confined to ſeven or eight feet in height and three or four in breadth. The proportions proper for a ſtable or coach-houſe are different. The door of a church ought to be wide, in order to afford an eaſy paſſage for a multitude; and its height muſt be regulated by its wideneſs, that the proportion may pleaſe the eye. The ſize of the windows ought always to be proportioned to that of the room they are deſtined to illuminate; for if the apertures be not large enough to convey light to every corner, the room muſt be unequally lighted, which is a great deformity. Steps of ſtairs ſhould likewiſe be accommodated to the human figure, without regarding any other proportion; they are accordingly the ſame in large and in ſmall buildings, becauſe both are inhabited by men of the ſame ſize.

We ſhall next conſider *intrinſic* beauty, blended with that which is *relative*. A cube itſelf is more agreeable than a parallelopipedon; this conſtantly holds in ſmall figures: but a large building in the form of a cube is lumpiſh and heavy; while a parallelopipedon, ſet on its ſmaller baſe, is more agreeable on account of its elevation: Hence the beauty of Gothic towers. But if this figure were to be uſed in a dwelling-houſe, to make way for relative beauty, we would immediately perceive that utility ought chiefly to be regarded; and this figure, inconvenient by its height, ought to be ſet on its larger baſe: the loftineſs in this caſe would be loſt; but that loſs will be more than ſufficiently compenſated by the additional convenience. Hence the form of buildings ſpread more upon the ground than raiſed in height, is always preferred for a dwelling houſe.

25 Internal diviſions of houſes.

With regard to the internal diviſions, utility requires that the rooms be rectangular, to avoid uſeleſs ſpaces. An hexagonal figure leaves no void ſpaces; but it determines the rooms to be all of one ſize, which is both inconvenient and diſagreeable for want of variety. Though a cube be the moſt agreeable figure, and may anſwer for a room of a moderate ſize; yet, in a very large room, utility requires a different figure. Unconfined motion is the chief convenience of a great room; to obtain this the greateſt length that can be had is neceſſary. But a ſquare room of large ſize is inconvenient. It removes chairs, tables, &c. at too great a diſtance from the hand, which, when unemployed, muſt be ranged along the ſides of the room. Utility, therefore, requires a large room to be a parallelogram. This figure is likewiſe beſt calculated for the admiſſion of light; becauſe, to avoid croſs-lights, all the windows ought to be in one wall; and if the oppoſite wall be at ſuch a diſtance as not to be fully lighted, the room muſt be obſcure. The height of a room exceeding nine or ten feet has little relation to utility; therefore proportion is the only rule for determining the height when above that number of feet.

26 Utility and beauty often incompatible.

Artiſts who deal in the beautiful, love to entertain the eye; palaces and ſumptuous buildings, in which intrinſic beauty may be fully diſplayed, give them an opportunity of exerting their taſte. But ſuch a propenſity is peculiarly unhappy with regard to private dwelling-houſes; becauſe, in theſe, relative beauty cannot be diſplayed to perfection without hurting intrinſic beauty. There is no opportunity for great variety of form in a ſmall houſe; and in edifices of this kind, internal convenience has not hitherto been happily adjuſted to external regularity. Perhaps an accurate coincidence in this reſpect is beyond the reach of art. Architects, however, conſtantly ſplit upon this rock; for they never can be perſuaded to give over attempting to reconcile theſe two incompatibles: how otherwiſe ſhould it happen, that of the endleſs variety of private dwelling-houſes, there ſhould not be one found that is generally agreed upon as a good pattern? the unwearied propenſity to make a houſe regular as well as convenient obliges the architect, in ſome articles, to ſacrifice convenience to regularity; and, in others, regularity to convenience; and accordingly the houſe which turns out neither regular nor convenient, never fails to diſpleaſe.

Nothing can be more evident, than that the form of a dwelling-houſe ought to be ſuited to the climate; yet no error is more common than to copy in Britain the form of Italian houſes, not forgetting even thoſe parts that are purpoſely contrived for collecting air, and for excluding the ſun: witneſs our colonnades and logios, deſigned by the Italians to gather cool air, and exclude the beams of the ſun, conveniences which the climate of Britain does not require.

27 Architecture conſidered as a fine art.

We ſhall next view architecture as one of the fine arts; which will lead us to the examination of ſuch buildings, and parts of buildings, as are calculated ſolely to pleaſe the eye. Variety prevails in the works of nature; but art requires to be guided by rule and compaſs. Hence it is, that in ſuch works of art as imitate nature, the great art is, to hide every appearance of art; which is done by avoiding regularity and indulging variety. But in works of art that are original and not imitative, ſuch as architecture, ſtrict regularity and uniformity ought to be ſtudied, ſo far as conſiſtent with utility.

28 Difference between proportions of number and quantity.

Proportion is not leſs agreeable than regularity and uniformity; and therefore, in buildings intended to pleaſe the eye, they are all equally eſſential. It is taken for granted by many writers, that in all the parts of a building there are certain ſtrict proportions which pleaſe the eye, in the ſame manner as in ſound there are certain ſtrict proportions which pleaſe the ear; and that, in both, the ſlighteſt deviations is equally diſagreeable. Others ſeem to reliſh more a compariſon between proportion in numbers and proportion in quantity; and maintain, that the ſame proportions are agreeable in both. The proportions, for example, of the num-

bers

Principles.

bers 16, 24, and 36, are agreeable; and so, say they, are the proportions of a room, whose height is 16 feet, the breadth 24, and the length 36. But it ought to be considered, that there is no resemblance or relation between the objects of different senses. What pleases the ear in harmony, is not the proportion of the strings of the instrument, but of the sound which these strings produce. In architecture, on the contrary, it is the proportion of different quantities that pleases the eye, without the least relation to sound. The same thing may be said of numbers. Quantity is a real quality of every body; number is not a real quality, but merely an idea that arises upon viewing a plurality of things in succession. An arithmetical proportion is agreeable in numbers: but have we from this any reason to conclude, that it must also be agreeable in quantity? At this rate, a geometrical proportion, and many others, ought also to be agreeable in both. A certain proportion may coincide in quantity and number; and amongst an endless variety of proportions, it would be wonderful if there never should be a conicidence. One example is given of this coincidence in the numbers 16, 24, and 36; but, to be convinced that it is merely accidental, we need but reflect, that the same proportions are not applicable to the external figure of a house, and far less to a column.

It is ludicrous to observe writers acknowledging the necessity of accurate proportions, and yet differing widely about them. Laying aside reasoning and philosophy, one fact universally agreed on ought to have undeceived them, that the same proportions which please in a model are not agreeable in a large building: a room 48 feet in length, and 24 in breadth and height, is well proportioned: but a room 12 feet wide and high, and 24 long, approaches to a gallery.

29 Beauty arising from proportion.

Perrault, in his comparison of the ancients and moderns, goes to the opposite extreme; maintaining, that the different proportions assigned to each order of columns are arbitrary, and that the beauty of these proportions is entirely the effect of custom. But he should have considered, that if these proportions had not originally been agreeable, they could never have been established by custom.

For illustrating this point, we shall add a few examples of the agreeableness of different proportions. In a sumptuous edifice, the capital rooms ought to be large, otherwise they will not be proportioned to the size of the building; for the same reason, a very large room is improper in a small house. But in things thus related, the mind requires not a precise or single proportion, rejecting all others; on the contrary, many different proportions are equally agreeable. It is only when a proportion becomes loose and distant, that the agreeableness abates, and at last vanishes. Accordingly, in building, rooms of different proportions are found to be equally agreeable, even where the proportion is not influenced by utility. With regard to the proportion the height of a room should bear to the length and breadth, it must be extremely arbitrary, considering the uncertainty of the eye as to the height of a room when it exceeds 16 or 17 feet. In columns, again, every architect must confess that the proportion of height and thickness varies betwixt 8 diameters and 10, and that every proportion between these two extremes is agreeable. Besides, there must certainly be a further variation of proportion, depending on the size of the column. A row of columns 10 feet high, and a row twice that height, require different proportions: The intercolumniations must also differ in proportion according to the height of the row.

Proportion of parts is not only itself a beauty, but is inseparably connected with a beauty of the highest relish, that of concord and harmony: which will be plain from what follows: A room, the parts of which are all finely adjusted to each other, strikes us not only with the beauty of proportion, but with a pleasure far superior. The length, the breadth, the height, the windows, raise each of them a separate emotion: These emotions are similar; and, though faint when separately felt, they produce in conjunction the emotion of concord or harmony, which is very pleasant. On the other hand, where the length of a room far exceeds the breadth, the mind, comparing together parts so intimately connected, immediately perceives a disagreement or disproportion which disgusts. Hence a long gallery, however convenient for exercise, is not an agreeable figure of a room.

30 Form of structures to be suited to the purposes for which they are intended.

In buildings destined chiefly or solely to please the eye, regularity and proportion are essentially necessary, because they are the means of producing intrinsic beauty. But a skilful artist will not confine his view to regularity and proportion; he will also study congruity, which is perceived when the form and ornaments of a structure are suited to the purpose for which it is appointed. Hence every building ought to have an expression suited to its destination. A palace ought to be sumptuous and grand; a private dwelling, neat and modest; a play-house, gay and splendid; and a monument, gloomy and melancholy. A heathen temple has a double destination: It is considered as a house dedicated to some divinity; therefore it ought to be grand, elevated, and magnificent: It is also considered as a place of worship; and therefore ought to be somewhat dark and gloomy, because dimness or obscurity produces that tone of mind which is favourable to humility and devotion. Columns, besides their chief destination of being supports, contribute to that peculiar expression which the destination of a building requires. Columns of different proportions serve to express loftiness, lightness, &c. as well as strength. Situation may also contribute to expression: Conveniency regulates the situation of a private dwelling-house; and the situation of a palace ought to be lofty. This leads to a question. Whether the situation, where there happens to be no choice, ought, in any measure, to regulate the form of the edifice? The connection between a great house and a neighbouring field, though not extremely intimate, demands however some congruity. It would, for example, displease us to find an elegant building thrown away upon a wild uncultivated country: congruity requires a polished field for such a building. The old Gothic form of building was well suited to the rough uncultivated regions where it was invented; but was very ill adapted to the fine plains of France and Italy.

31 Internal division of houses.

The external structure of a house leads naturally to its internal structure. A large and spacious room, which is the first that commonly receives us, is a bad contrivance in several respects. In the first place, when immediately from the open air we step into such

a

a room, its ſize in appearance is diminiſhed by contraſt; it looks little, compared with the great canopy of the ſky. In the next place, when it recovers its grandeur, as it ſoon doth, it gives a diminutive appearance to the reſt of the houſe; paſſing from it, every apartment looks little. In the third place, by its ſituation it ſerves only for a waiting-room, and a paſſage to the principal apartments. Rejecting therefore this form, a hint may be taken from the climax in writing for another that appears more ſuitable: A handſome portico, proportioned to the ſize and faſhion of the front, leads into a waiting-room of a larger ſize, and this to the great room, all by a progreſſion of ſmall to great.

Grandeur is the principal emotion that architecture is capable of raiſing in the mind: it might therefore be the chief ſtudy of the artiſt, in great buildings deſtined to pleaſe the eye. But as grandeur depends partly on ſize, it is unlucky for architecture that it is governed by regularity and proportion, which never deceive the eye by making objects appear larger than they are in reality. But though regularity and proportion contribute nothing to grandeur, ſo far as that emotion depends on ſize; yet they contribute greatly to it by confining the ſize within ſuch bounds that it can be taken in and examined at one view; for when objects are ſo large as not to be comprehended but in parts, they tend rather to diſtract than ſatisfy the mind.

We ſhall next paſs to ſuch ornaments as contribute to give buildings a peculiar expreſſion. It has been doubted, whether a building can regularly admit any ornament but what is uſeful, or at leaſt has that appearance. But, conſidering the double aim of architecture as a fine, as well as an uſeful art, there is no reaſon why ornaments may not be added to pleaſe the eye, without any relation to utility. A private dwelling-houſe, it is true, and other edifices, where uſe is the chief aim, admit not regularly any ornament but what has at leaſt the appearance of uſe; but temples, triumphal arches, and other buildings intended chiefly or ſolely for ſhow, may be highly ornamented.

32 Different kinds of ornaments.

This ſuggeſts a diviſion of ornaments into three kinds, *viz.* 1. Ornaments that are beautiful without relation to uſe; ſuch as ſtatues, vaſes, baſſo or alto relievo: 2. Things in themſelves not beautiful, but poſſeſſing the beauty of utility, by impoſing on the ſpectator, and appearing to be uſeful; ſuch as blind windows: 3. Where things are beautiful in themſelves, and at the ſame time take on the appearance of uſe; ſuch as pilaſters.

With regard to the *firſt*, we naturally require that a ſtatue be ſo placed, as to be ſeen in every direction, and examined at different diſtances. Statues, therefore, are properly introduced to adorn the great ſtair that leads to the principal door of a palace, or to leſſen the void between pillars. But a niche in the external front is an improper place for a ſtatue. There is an additional reaſon againſt placing them upon the roof or top of the walls: their tickliſh ſituation gives pain, as they have the appearance of being in danger of tumbling down; beſides, we are inclined to feel from their being too much expoſed to the inclemencies of the weather. To adorn the top of the wall with a row of vaſes, is an unhappy conceit, by placing a thing, whoſe natural deſtination is utility, where it cannot have even the appearance of uſe. As to carvings upon the external ſurface of a building, termed *baſſo relievo* when flat, and *alto relievo* when prominent, all contradictory expreſſions ought be be avoided. Now, firmneſs and ſolidity being the proper expreſſions of a pedeſtal, and, on the contrary, lightneſs and delicacy of carved work, the pedeſtal, whether of a column or of a ſtatue, ought to be ſparingly ornamented. The ancients never ventured any bolder ornament than the baſſo relievo.

With reſpect to ornaments of the *ſecond* kind, it is a great blunder to contrive them ſo as to make them appear uſeleſs. A blind window, therefore, when neceſſary for regularity, ought to be ſo diſguiſed as to appear a real window: when it appears without diſguiſe, it is diſguſtful, as a vain attempt to ſupply the want of invention; it ſhows the irregularity in a ſtronger light, by ſignifying that a window ought to be there in point of regularity, but that the architect had not ſkill ſufficient to connect external regularity with internal convenience.

As to the *third*, it is an error to ſink pilaſters ſo far into the wall, as to remove totally, or moſtly, the appearance of uſe. They ſhould always project ſo much from the wall, as to have the appearance of ſupporting the entablature over them.

33 Columns.

From ornaments in general, we deſcend to a pillar, the chief ornament in great buildings. The deſtination of a pillar is to ſupport, really, or in appearance, another part termed the *entablature*. With regard to the form of a pillar, it muſt be obſerved, that a circle is a more agreeable figure than a ſquare, a globe than a cube, and a cylinder than parallelopipedon. This laſt, in the language of architecture, is ſaying, that a column is a more agreeable figure than a pilaſter; and for that reaſon it ought be preferred, when all other circumſtances are equal. Another reaſon concurs, that a column annexed to a wall, which is a plain ſurface, makes a greater variety than a pilaſter. Beſides, pilaſters at a diſtance are apt to be miſtaken for pillars; and the ſpectator is diſappointed, when, on a nearer approach, he diſcovers them to be only pilaſters.

As to the parts of a column, a bare uniform cylinder, without a capital, appears naked; and without a baſe, appears too tickliſhly placed to ſtand firm; it ought therefore to have ſome finiſhing at the top and bottom: Hence the three chief parts of a column, the ſhaft, the baſe, and the capital. Nature undoubtedly requires proportion among theſe parts, but it admits of variety of proportion. Vitruvius and ſome of the elder writers ſeem to think, that the proportions of columns were derived from the human figure, the capital repreſenting the head, the baſe the feet, and the ſhaft the body. The Tuſcan has been accordingly denominated the *Gigantic;* the Doric, the *Herculean;* the Ionic, the *Matronal;* and the Corinthian, the *Virginal;*—The Compoſite is a mixture of the Corinthian and Ionic. As to the baſe, the principle of utility interpoſes to vary it from the human figure, and to proportion it ſo to the whole, as to give the column the appearance of ſtability.

34 Whether new orders can be invented.

Among the Greeks, we find only three orders of columns, the Doric, the Ionic, and the Corinthian, diſtinguiſhed

Principles. ſtinguiſhed from each other by their deſtination as well as by their ornaments. It has been diſputed, whether any new order can be added to theſe: ſome hold the affirmative, and give for inſtances the Tuſcan and Compoſite; others maintain, that theſe properly are not diſtinct orders, but only the original orders with ſome ſlight variation. The only circumſtances that can ſerve to diſtinguiſh one order from another, are the form of the column, and its deſtination. To make the firſt a diſtinguiſhing mark, without regard to the other, would multiply orders without end. Deſtination is more limited, and it leads us to diſtinguiſh three kinds of orders; one plain and ſtrong, for the purpoſe of ſupporting plain and maſſy buildings; one delicate and graceful, for ſupporting buildings of that character; and between theſe, a third, for ſupporting buildings of a mixed nature. So that, if deſtination alone is to be regarded, the Tuſcan is of the ſame order with the Doric, and the Compoſite with the Corinthian.

The ornaments of theſe three orders ought to be ſuited to the purpoſes for which they are intended. Plain and ruſtic ornaments would not be a little diſcordant with the elegance of the Corinthian order, and ſweet and delicate ornaments not leſs with the ſtrength of the Doric.

35 Rules regarding building in general.

With reſpect to buildings of every kind, one rule, dictated by utility, is, that they be firm and ſtable. Another, dictated by beauty, is, that they alſo appear ſo to the eye: for every thing that appears tottering, and in hazard of tumbling down, produceth in the ſpectator the painful emotion of fear, inſtead of the pleaſing emotion of beauty; and accordingly it ſhould be the great care of the artiſt, that every part of his edifice appear to be well ſupported. Some have introduced a kind of conceit in architecture, by giving parts of buildings the appearance of falling; of this kind is the church of St Sophia in Conſtantinople; the round towers in the uppermoſt ſtories of Gothic buildings is in the ſame falſe taſte.

The moſt conſiderable ornaments uſed in architecture are the five orders of columns, pediments, arches, balluſters, *&c.* of which in the following chapters.

Chap. I. *Of the Orders of Architecture.*

An **Order** conſiſts of two principal members, the **Column** and the **Entablature**; each of which is compoſed of three principal parts. Thoſe of the Column are, the *Baſe*, the *Shaft*, and the *Capital*; and thoſe of the Entablature are, the *Architrave*, the *Frize*, and the *Cornice*. All theſe are ſubdivided into many leſſer parts, whoſe number, form, and dimenſions, characteriſe each order, and expreſs the degree of ſtrength, delicacy, richneſs, or ſimplicity peculiar to it.

36 Parts of an order divided into two claſſes.

The parts that compoſe an order may be diſtributed into two different claſſes. In the *firſt* may be ranged all that have any analogy to the primitive huts, and repreſent ſome part that was neceſſary in their conſtruction. Such are the ſhaft of the column, with the plinth of its baſe, and the abacus of its capital; likewiſe the architrave and triglyphs, the mutules, modilions, or dentils, which all of them repreſent the rafters, or ſome other pieces of timber uſed to ſupport the covering; and the corona, repreſenting the beds of materials that compoſed the covering. All theſe may properly be diſtinguiſhed by the name of *eſſential members*. The ſubſervient parts, contrived for the uſe or ornaments of the former, and commonly called *mouldings*, may conſtitute the *ſecond* claſs.

There are eight regular mouldings in ornamenting columns: the fillet, liſtel, or ſquare; the aſtragal, or bead; the torus, or tore; the ſcotia, mouth, or caſement; the echinus, ovolo, or quarter-round; the inverted cyma, talon, or ogee; the cyma, cyma recta, or cymation; the cavetto, or hollow. The names of theſe allude to their forms, and their forms are adapted to the purpoſes for which they are intended. See Plate XL.

The ovolo and talon, as they are ſtrong at the extremities, are fit for ſupporters; the cyma and cavetto, though improper for ſupports, ſerve for coverings to ſhelter other members; the torus and aſtragal, being ſhaped like ropes, are intended to bind and fortify the parts with which they are connected: But the uſe of the ſcotia and fillet is only to ſeparate and diſtinguiſh the other mouldings, to give a graceful turn to the profile, and to prevent the confuſion which would ariſe from joining ſeveral curved members together.

There are various methods of deſcribing the contours of mouldings; but the ſimpleſt and beſt is to form them of quadrants of circles.

37 Profile, what.

An aſſemblage of what are called eſſential parts and mouldings is termed a *profile*. The moſt perfect profiles are ſuch as are compoſed of few mouldings, varied in form and ſize; and ſo diſpoſed, that the ſtraight and curved ones ſucceed each other alternately. When ornaments are employed in mouldings, ſome of them ſhould be left plain, in order to give a proper repoſe: For when all are ornamented, the figure of the profile is loſt.

38 Diminution of columns.

Columns, in imitation of trees, from which they drew their origin, are tapered in their ſhafts. In the antiques the diminution is variouſly performed; beginning ſometimes from the foot of the ſhaft, and at others from one-quarter, or one-third of its height; the lower part being perfectly cylindrical. The former of theſe was moſt in uſe amongſt the ancients, and, being the moſt natural and graceful, ought to have the preference, though the latter hath been more univerſally practiſed by modern artiſts.

The firſt architects, ſays Mr Auzoult, probably made their columns in ſtraight lines, in imitation of trees; ſo that their ſhaft was a fruſtum of a cone: but finding this form abrupt and diſagreeable, they made uſe of ſome curve, which, ſpringing from the extremities of the ſuperior and inferior diameters of the column, ſwelled beyond the ſides of the cone, and by that means gave a more pleaſing figure to the contour.

Vitruvius, in the ſecond chapter of his third book, mentions this practice, but in ſo obſcure and curſory a manner, that his meaning hath not been underſtood; and ſeveral of the modern architects, intending to conform themſelves to the doctrine have made the diameters of their columns greater in the middle than at the foot of the ſhaft. Leon Baptiſta, Alberti, and others of the Florentine and Roman architects, have carried this to a very great exceſs; for which they have

The TUSCAN ORDER

have been juſtly blamed, as it is neither natural, reaſonable, nor beautiful.

Monſieur Auzoult obſerves, that a column, ſuppoſing its ſhafts to be the fruſtum of a cone, may have an additional thickneſs in the middle, without being ſwelled there beyond the bulk of its inferior parts; and ſuppoſes the addition mentioned by Vitruvius to ſignify nothing but the increaſe towards the middle of the column, occaſioned by changing the ſtraight line, which at firſt was in uſe, for a curve.

This ſuppoſition is extremely juſt, and founded on what is obſerved in the works of antiquity; where there is no inſtance of columns thicker in the middle than at the bottom, though all have the ſwelling hinted at by Vitruvius, all of them being terminated by curves; ſome granite columns excepted, which are bounded by ſtraight lines; a proof, perhaps, of their antiquity, or of their having been wrought in the quarries of Egypt by bungling and unſkilful workmen.

Monſieur Blondel, in his book, entitled, *Reſolution des quatre principaux problemes d' Architecture*, teaches various manners of diminiſhing columns; the beſt and ſimpleſt of which is by means of the inſtrument which Nicomedes invented to deſcribe the the firſt conchoid: for this, being applied at the bottom of the ſhaft, performs at one ſweep both the ſwelling and the diminution; giving ſuch a graceful form to the column, that it is univerſally allowed to be the moſt perfect practice hitherto diſcovered. The columns in the Pantheon, accounted the moſt beautiful among the antiques, are made in this manner; as appears by the exact meaſures of one of them to be found in Deſgodet's antiquities of Rome.

36 Vignola's method.

To give an accurate idea of the operation, it will be neceſſary firſt to deſcribe Vignola's method of diminution, on which it is grounded. "As to this ſecond method, ſays Vignola, it is a diſcovery of my own; and although it be leſs known than the former, it will be eaſily comprehended by the figure.

Pl.XXXVI Having therefore determined the meaſures of your column, (that is to ſay, the height of the ſhaft, and its inferior and ſuperior diameters), draw a line indefinitely from C through D, perpendicular to the axis of the column: this done, ſet off the diſtance C D, which is the inferior ſemi-diameter, from A, the extreme point of the ſuperior ſemi-diameter, to B, a point in the axis; then from A, through B, draw the line A B E, which will cut the indefinite line C D in E; and, from this point of interſection E, draw thro' the axis of the column any number of rays as E b a, on each of which, from the axis towards the circumference, ſetting off the interval C D, you may find any number of points, a, a, a, through which if a curve be drawn, it will deſcribe the ſwelling and diminution of the column."

40 Nicomedes'sinſtrument.

Though this method be ſufficiently accurate for practice, eſpecially if a conſiderable number of points be found, yet, ſtrictly ſpeaking, it is defective; as the curve muſt either be drawn by hand, or by applying a flexible ruler to all the points; both of which are liable to variations. Blondel therefore, to obviate this objection, (after having proved the curve paſſing from A to C through the points a a, to be of the ſame nature with the firſt conchoid of the ancients), employed the inſtrument of Nicomedes to deſcribe it; the conſtruction of which is as follows:

Having determined, as above, the length of the ſhaft, with the inferior and ſuperior diameters of the column, and having likewiſe found the length of the line C D E, take three rulers, either of wood or metal, as F G, I D, and A H; of which let F G and I D be faſtened together at right angles in G. Cut a dove-tail groove in the middle of F G, from top to bottom; and at the point E on the ruler I D (whoſe diſtance, from the middle of the groove in F G, is the ſame as that of the point of interſection from the axis of the column) fix a pin; then on the ruler A H ſet off the diſtance A B, equal to C D the inferior ſemidiameter of the column, and at the point B fix a button, whoſe head muſt be exactly fitted to the groove made in F G, in which it is to ſlide; and, at the other extremity of the ruler A H, cut a ſlit or canal from H to K, whoſe length muſt not be leſs than the difference of length between E B and E D, and whoſe breadth muſt be ſufficient to admit the pin fixed at E, which muſt paſs through the ſlit, that the ruler may ſlide thereon.

The inſtrument being thus completed, if the middle of the groove, in the ruler F G, be placed exactly over the axis of the column, it is evident that the ruler A H, in moving along the groove, will with the extremity A deſcribe the curve A a a C; which curve is the ſame as that produced by Vignola's method of diminution, ſuppoſing it done with the utmoſt accuracy; for the interval A B, a b, is always the ſame; and the point E is the origin of an infinity of lines, of which the parts B A, ba, ba, extending from the axis to the circumference, are equal to each other and to D C. And if the rulers be of an indefinite ſize, and the pins at E and B be made to move along their reſpective rulers, ſo that the intervals A B and D E may be augmented or diminiſhed at pleaſure, it is likewiſe evident that the ſame inſtrument may be thus applied to columns of any ſize.

In the remains of antiquity the quantity of the diminution is various; but ſeldom leſs than one-eighth of the inferior diameter of the column, nor more than one-ſixth of it. The laſt of theſe is by Vitruvius eſteemed the moſt perfect. 41 Quantity of diminution

Of the Tuscan Order.

This is the moſt ſolid and ſimple of all the orders. It is compoſed of few parts, devoid of ornaments, and ſo maſſy, that it ſeems capable of ſupporting the heavieſt burden. There are no remains of a regular Tuſcan order among the antiques: the doctrine of Vitruvius concerning it is obſcure; and the profiles of Palladio, Scamozzi, Serlio, de l'Orme, and Vignola, are all imperfect. 42 Plate XXXVII.

The height of the Tuſcan column is 14 modules, or ſemi-diameters, each conſiſting of 30 minutes; and that of the whole entablature $3\frac{1}{2}$ modules; which being divided into 10 equal parts, three of them are for the height of the architrave, three for the frize, and the remaining four for the cornice: The capital is one module; the baſe, including the lower cincture of the shaft, is likewise one module; and the shaft, with its upper cincture and astragal, 12 modules.

These are the general dimensions of the order; the particular dimensions may be learned by inspection of the plates.

In the remains of antiquity, the quantity of diminution at the top of the Tuscan column is various; but seldom less than one-eighth, nor more than one-sixth, of the inferior diameter of the column. The last of these is generally preferred; and Chalmers and others make the same diminution in all columns, without regard to their order.

Of the Doric Order.

43 Plate XXXVIII.

This order is next in strength to the Tuscan; and, being of a grave, robust, and masculine aspect, is by Scamozzi called the *Herculean*. As it is the most ancient of all the orders, it retains more of the structure of the primitive huts than any of the rest; the triglyphs in its frize representing the ends of the joists, and the mutules in its cornice representing the rafters.

The height of the Doric column, including its capital and base, is 16 modules, and the height of the entablature four; the latter of which being divided into eight parts, two of them are for the architrave, three for the frize, and three for the cornice.

In most of the antiques, the Doric column is executed without a base. Vitruvius likewise makes it without one; the base, according to him, having been first employed in the Ionic order, in imitation of the sandal of a woman's foot. Scamozzi blames this practice, and most of the modern architects are of his opinion.

44 Ornaments of the frize.

In the profile of the theatre of Marcellus, the frize is enriched with husks and roses; the architrave consists only of one fascia and a fillet; the drops are conical; the metope is enriched with a bull's skull, adorned with a garland of beads, in imitation of those on the temple of Jupiter Tonans, at the foot of the Capitol. In some antique fragments, and in a great many modern buildings, the metopes are alternately adorned with ox-skulls and pateras. But they may be filled with any other ornaments, according to the destination of the building.

The Ionic Order

45 Plate XXXIX.

Is of a more slender make than the Doric or Tuscan; its appearance is simple, yet graceful and majestic; its ornaments are few; so that it has been compared to a sedate matron, in decent, rather than magnificent, attire.

Among the ancients, the form of the Ionic profile appears to have been more positively determined than that of any other order; for, in all the antiques at Rome (the temple of Concord excepted), it is exactly the same.

The modern artists have likewise been unanimous in their opinions; all of them, excepting Palladio and his imitators, having employed the dentil, cornice, and the other parts of the profile, nearly as they are found in the Collifeum, the temple of Fortune, and the theatre of Marcellus.

The height of the Ionic column is 18 modules, and that of the entablature $4\frac{1}{2}$, or one quarter of the height of the column, as in the other orders, which is a trifle less than in any of the antique Ionics. In all the antiques, the base is Attic; and the shaft of the column may either be plain, or fluted with 24 flutings, or 20 only, as in the temple of Fortune. The plan of the flutings may be a trifle more than a semicircle, as in the forum of Nerva, because they then appear more distinct. The fillets, or intervals between them, must not be broader than one-third of the breadth of the fluting, nor narrower than one-fourth. The ornaments of the capital must correspond with the flutings of the shaft; and there must be an ove above the middle of each fluting. The volutes ought to be traced according to Mr Goldman's method, which is as follows:

46 Method of drawing volutes.

Plate XL. fig. 9. Draw the cathetus F C, whose length must be 15 minutes, or one-fourth of a module; and, from the point C, describe the eye of the volute A E B D, of which the diameter is to be $6\frac{2}{3}$ minutes; divide it into four equal sectors by the diameters A B, D E. Bisect the radii C A, C B, in 1 and 4; and on the line 1, 4, construct a square 1, 2, 3, 4. From the centre C, to the angles 2, 3, draw the diagonals C 2, C 3, and divide the side of the square 1, 4, into 6 equal parts, at 5, 9, C, 12, 8. Then through the points 5, 9, 12, 8, draw the lines 5, 6, 9, 10, 12, 11, 8, 7, parallel to the diameter E D, which will cut the diagonals in 6, 7, 10, 11; and the points 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, will be the centres of the volute. From the first centre 1, with the distance 1 F, describe the quadrant F G; from the second centre 2, with the distance 2 G, describe the quadrant G H; and, continuing the same operation from all the 12 centres, the contour of the volute will be completed.

Fig. 10. The centres for describing the fillet are found in this manner. Construct a triangle, of which the side A F is equal to the part of the cathetus contained between A F and the side F V, equal to C 1; place the distance F S from F towards A, equal to F S the breadth of the fillet, and through the point S draw the line S T, which will be to C 1 in the same proportion as A S is to A F; place this line on the diameter of the eye A B; divide it into three equal parts; and, through the points of division, draw lines parallel to the diameter E D, which will cut the diagonals C 2, C 3, and you will have twelve new centres, from whence the interior contour of the fillet may be described, in the same manner as the exterior one was from the first centres.

Of the Corinthian Order.

47 Plate XLI.

The proportions of this order are extremely delicate. It is divided into a great variety of members, and enriched with a profusion of ornaments. Scamozzi calls it the *virginal order*; and indeed it has all the delicacy in its make, and all the delicacy in its dress, peculiar to young girls.

The most perfect model of the Corinthian order is generally allowed to be in the three columns in the Campo Vaccino at Rome, the remains, as it is thought, of the temple of Jupiter Stator.

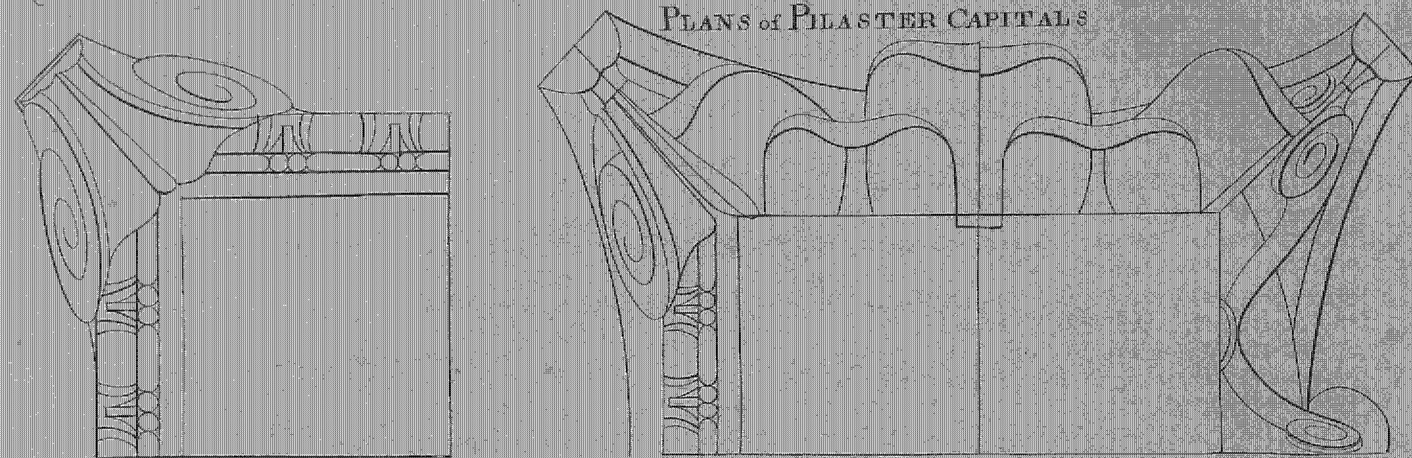
The Composite Order

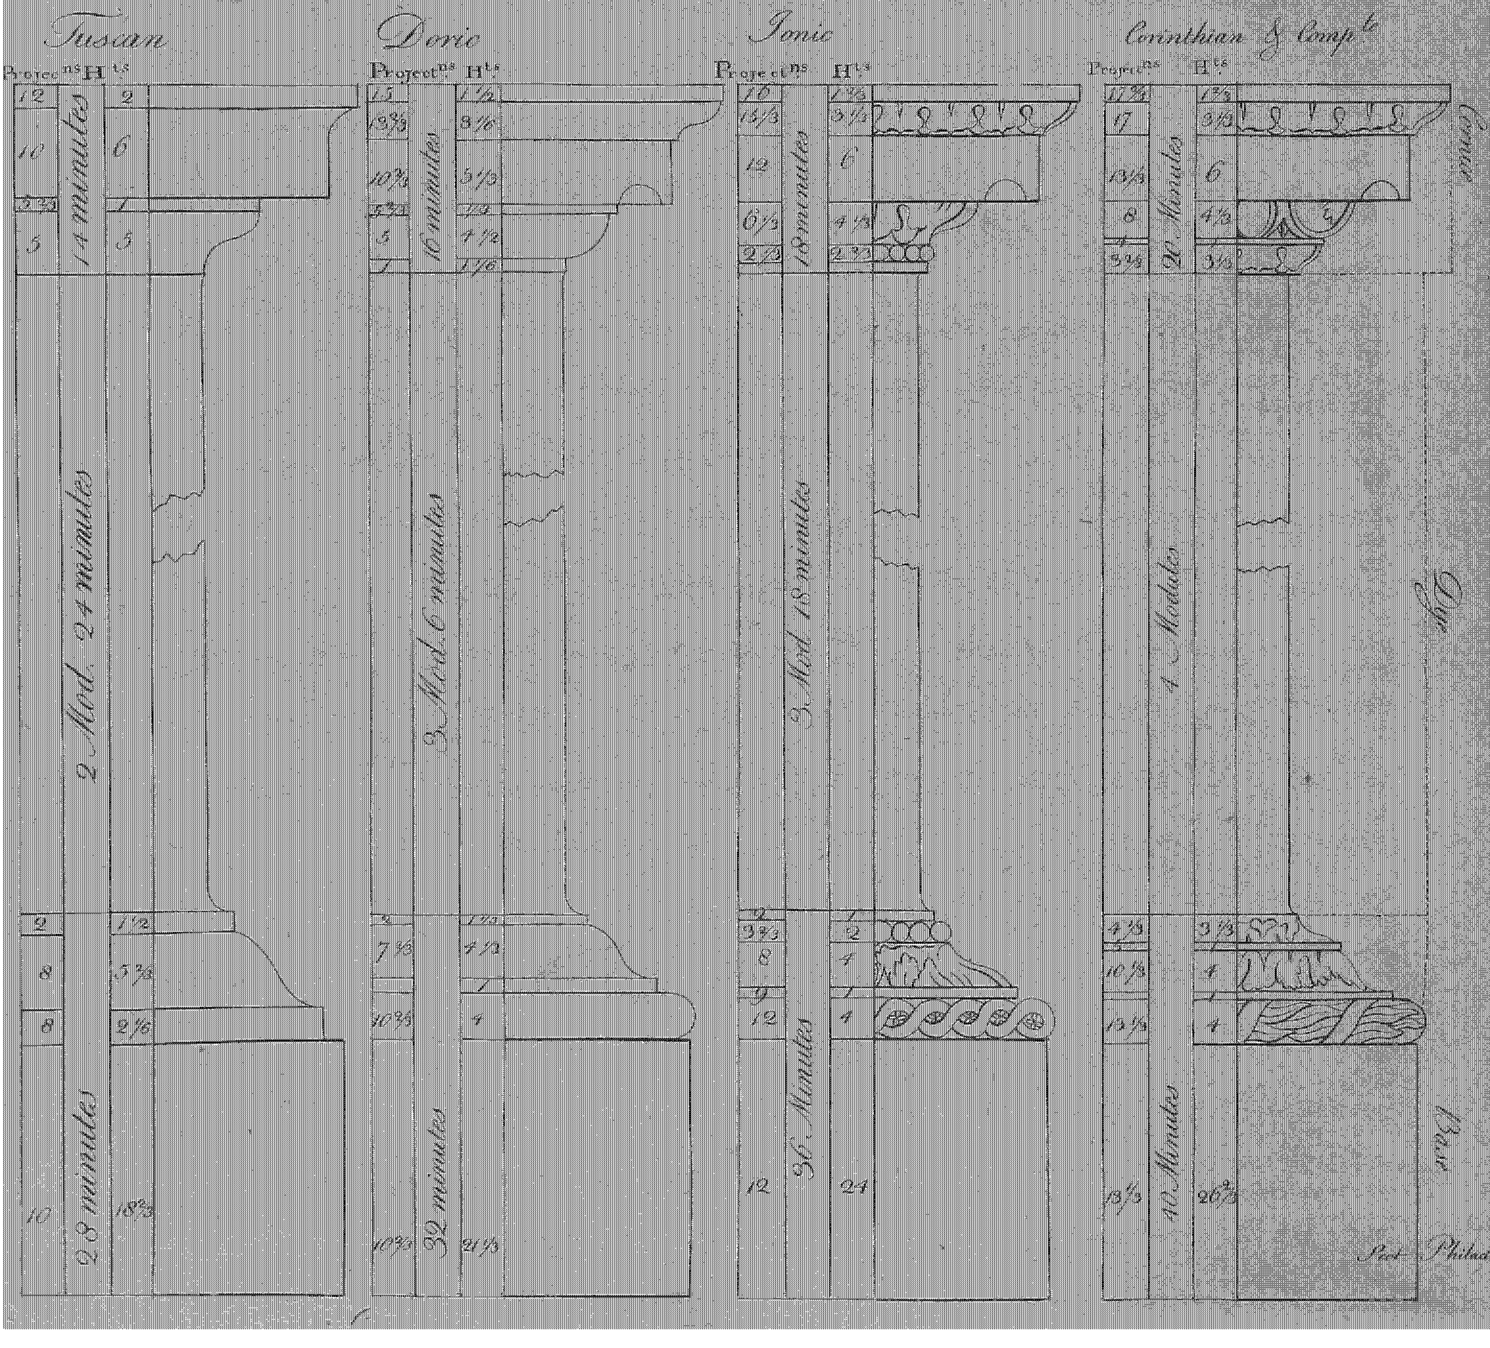
ARCHITECTURE

Plate XLIII

PLANS of PILASTER CAPITALS



PEDESTALS



Principles. The Corinthian column ſhould be 20 modules high, and the entablature 5; which proportions are a medium between thoſe of the Pantheon and the three columns. The baſe of the column may be either Attic or Corinthian: They are both beautiful. If the entablature be enriched, the ſhaft may be fluted. The fluting may be filled, to one-third of their height, with cabblings, as in the inſide of the Pantheon; which will ſtrengthen the lower part of the column, and make it leſs liable to injury.

In moſt of the antiques at Rome, the capital of this order is enriched with olive-trees; the acanthus being ſeldom employed but in the Compoſite. De Cordemoy, however, prefers the acanthus.

The divſions of the entablature bear the ſame proportions to each other, as the Tuſcan, Ionic, and Compoſite orders.

48 Pl. XLII.

The Composite

Is, ſtrictly ſpeaking, only a ſpecies of the Corinthian; and therefore retains, in a great meaſure, the ſame character.

49 Different kinds of ornaments.

It does not appear, that the ancients affected any particular form of entablature to this order. Sometimes the cornice is entirely plain, as in the temple of Bacchus; at others, as in the arch of Septimius Severus, it is enriched with dentils differing very little from the Ionic; and in the arch of Titus, there are both dentils and modilions; the whole form of the profile being the ſame with the Corinthian, as executed in the antiques at Rome.

The modern architects have varied more in this than in any other order, each following the bent of his own fancy.

The height of the Compoſite column, and parts of the entablature, is the ſame with that of the Corinthian. The foot of the leaves of the capital ought not to project beyond the upper part of the ſhaft. The different bunches of leaves ſhould be ſtrongly marked; the ſprigs which ariſe between the upper ones ſhould be kept flat upon the vaſe; and the ornaments of the volutes muſt not project beyond the fillets that incloſe them.

50

Chap. II. *Of Pilaſters.*

These differ from columns only in their plan; which is a ſquare, as that of columns is round. Their baſes, capitals, and entablatures, have the ſame parts, with the ſame heights and projections, as thoſe of columns: they are alſo diſtinguiſhed in the ſame manner, by the names of Tuſcan, Doric, Ionic, Corinthian, and Compoſite.

The column is undoubtedly more perfect than the the pilaſtre. However, they may be employed with great propriety on many occaſions. Some authors declaim againſt pilaſters, becauſe, according to them, they do not admit of diminution. But this is a miſtake; there are many inſtances, in the remains of antiquity, of their being diminiſhed. Scamozzi always gave his pilaſters the ſame diminution as his columns: Palladio and Inigo Jones have likewiſe diminiſhed them in many of their buildings.

51 Pilaſters where uſeful.

Pilaſters are employed in churches, galleries, halls, and other interior decorations, to ſave room; for, as they ſeldom project beyond the ſolid wall above one quarter of their diameter, they do not occupy near ſo much ſpace as columns. They are likewiſe uſed in exterior decorations; ſometimes alone, inſtead of columns on account of their being leſs expenſive; and ſometimes they accompany columns, being placed behind them to ſupport the architraves, where they enter the building, as in the Pantheon at Rome; or, in the ſame line with them, to fortify the angles, as in the portico of Septimius. Principles.

When pilaſters are uſed alone, they ſhould project one-quarter of their diameter beyond the walls. When placed behind columns, eſpecially if they be very near them, they need not project above one-eighth of their diameter. But, when placed on a line with columns, their projection muſt be regulated by that of the columns; and, conſequently it can never be leſs than a ſemidiameter, even when the columns are engaged as much as poſſible.

52 How ornamented.

The ſhafts of pilaſters are frequently adorned with flutings, in the ſame manner as thoſe of columns; the plan of which may be a trifle more than a ſemicircle: their number muſt be ſeven on each face, which make them nearly of the ſame ſize with thoſe of columns. The intervals, or fillets, muſt either be one-third or one-fourth of the fluting in breadth.

The capitals of pilaſters are profiled nearly in the ſame manner as thoſe of columns. Pl. XLIII.

Chap. III. *Of Attics.* 53

These very properly follow the pilaſters; being nothing more than ſquare pillars with their cornices. They had their origin in Athens, where it was for many ages a rule in building to conceal the roof. For this purpoſe, nothing ſerved ſo well as a kind of low or little order ranged in a continued line, ſingly, or with the interruption of balluſters; which riſing above the reſt of the work and before the roof, hid it perfectly, and placed ſomething agreeable in view. The place of Atties, therefore, is at the uppermoſt extremity of a building, to which they ſerve as a crown, or very properly make a finiſhing for the other orders when they have been uſed in the ſtructure. They muſt never ſtand under any thing except ſuch ornaments as are placed at the very top. Theſe Attics ſhould never exceed in height one-third of the height of the order on which they are placed, nor be leſs than one-quarter of it. The baſe, dye, and cornice, of which they are compoſed, may bear the ſame proportions to each other as thoſe of pedeſtals do; and the baſe and cornice may be compoſed of the ſame mouldings as thoſe pedeſtals. Sometimes the Attic is continued throughout; at others, it projects, and forms a pilaſter over each column of the order. The breadth of this pilaſter is ſeldom made narrower than the upper diameter of the column below it, and never broader. Its projection may be equal to one-quarter of its breadth.

Chap. IV. *Of Perſians, Caryatides, and Termini.* 54

Besides columns and pilaſters, it is ſometimes cuſtomary to employ repreſentations of the human figure, to ſupport entablatures in buildings. The male figures are called *Perſians;* and the female, *Carians,* or *Caryatides.*

The

Principles.

55 Origin of Persians.

The *Persians* are so called from a victory gained over the Persians by Pausanias, who having brought home spoils and trophies to the Athenians, they fixed upon Persian figures for those which should support entablatures, and thus kept in mind that there were once Persian slaves in Athens. To represent these conquered people in the lowest state possible, they loaded them with the heaviest entablature, *viz.* that of the Doric order. In process of time, however, other figures besides that of Persians were introduced, and other entablatures put over them; but the name was still retained.

56 Of Caryatides.

The proper Caryatides are women dressed in long robes, after the Asiatic manner; and the origin of the device was as follows.—The Carians had been long at war with the Athenians; but being at length totally vanquished, their wives were led away captives; and, to perpetuate the memory of this event, trophies were erected, in which figures of women dressed in the Caryatic manner, were used to support entablatures like the Persians; and though other female figures were afterwards used in the same manner, the name of *Caryatides* was always retained.

The ancients made frequent use of Persians and Caryatides, and delighted in diversifying them a thousand ways. The modern artists have followed their example; and there is a great variety of compositions of this kind to be met with in different parts of Europe.

Indecent attitudes, distorted features, and all monstrous productions, ought to be avoided, of which there are many examples in Gothic buildings. On the contrary, the attitudes should be simple and graceful, the countenance always pleasing, though varied and strongly marked agreeable to the nature of the object represented.

57 Their proportions, &c.

The Caryatides, or female figures, should never much exceed the human size. But the Persians, or male figures, may be of any size; and the larger the better, as they will strike the beholder with the greater awe and astonishment. Persians may be used with propriety in arsenals, galleries of armour, &c. under the figures of captives, heroic virtues, &c. Their entablature ought to be Doric, and bear the same proportion to them as to columns of the same height. The entablature for Caryatides ought to be either Ionic or Corinthian, according as the character of the figures is more or less delicate.

58 Termini.

Termini are sometimes employed, instead of Persians or Caryatides, to support the entablatures of monuments, chimney-pieces, and such like compositions. These figures owe their origin to the stones used by the ancients to mark the limits of particular possessions. Numa Pompilius, to render these inviolable, consecrated the terminus into a deity, and instituted festivals and sacrifices to his honour. In a short time, what was formerly only large upright stones, were represented in human shape; and afterwards introduced as ornaments to temples and other buildings. The termini are now principally used as ornaments for gardens and fields.

59

Chap. V. *Of Pedestals.*

Most writers consider the *Pedestal* as a necessary part of the order, without which it is not complete. It is indeed a matter of little importance whether it be considered in that light, or as a distinct composition; we shall therefore treat of a pedestal as a distinct body, having no more connection with the order than an attic, a basement, or any other part with which it may on some occasions be associated.

A pedestal consists of three principal parts; the base, the dye, and the cornice. The dye is always nearly of the same figure; being constantly either a cube or a parallelopipedon: but the base and cornice are varied and adorned with more or fewer mouldings, according to the simplicity or richness of the composition in which the pedestal is employed. Hence pedestals are, like columns, distinguished by the names of *Tuscan*, *Doric*, *Ionic*, *Corinthian*, and *Composite*.

60 Pedestals where proper.

Some authors are averse to pedestals, and compare a column raised on a pedestal to a man mounted on stilts; imagining that they were introduced merely from necessity, and for want of columns of a sufficient length. It is indeed true, that the ancients often made use of artifices to lengthen their columns; as appears by some that are in the Baptistery of Constantine at Rome; the shafts of which, being too short for the building, were lengthened and joined to their bases by an undulated sweep, adorned with acanthus leaves. Nevertheless, there are many occasions where pedestals are evidently necessary; and some in which the order, were it not so raised, would lose much of its beautiful appearance. Thus, in the inside of churches, if the columns that support the vault were immediately placed on the ground, the seats would hide their bases and a good part of their shafts; and in the theatres of the ancients, if the columns of the scene had been placed immediately on the stage, the actors would have hid a part of them from the audience. In anterior decorations, a pedestal diminishes the parts of the order, which otherwise might perhaps appear too clumsy, and hath the advantage of placing the column in a more favourable view, by raising its base near the level of the spectator's eye. In a second order of arcades, there is no avoiding pedestals; as without them it is impossible to give the arches any tolerable proportion.

61 Their proportions.

With regard to the proportion that pedestals ought to bear to that of the columns they support, it is by no means fixed. Both the ancients and moderns vary greatly on this head. Vignola's proportions are generally reckoned the best. He makes his pedestals in all the orders of the same height, *viz.* one-third of the column; and as their breadth of course increases or diminishes in the same degree as the diameters of their respective columns do, the character of the order is always preserved, which, according to any other method, is impossible.

As to the divisions of the pedestals; if the whole height be divided into nine parts, one of them may be given to the height of the cornice, two to the base, and the six remaining to the dye. The breadth of the dye is always made equal to that of the plinth of the column. The projection of the cornice may be made equal to its height; and the base being divided into three parts, two of them will be for the height of the plinth, and one for the mouldings, whose projection must be less than that of the cornice. These measures

Principles. meafures are common to all pedeftals. See Plate XLIII.

62 Chap. VI. *Of Intercolumniations.*

Columns are either engaged, or infulated; and, when infulated, are either very near the wall, or at a confiderable diftance from it. Engaged columns, or fuch as are near the walls of a building, are not limited in their intercolumniations, as thefe depend on the breadths of the arches, windows, niches, or other decorations placed between the columns. But columns that are entirely detached, and perform alone the office of fupporting the entablature, as in periftyles, porches and galleries, muft be near each other for the fake both of real and apparent folidity.

63 Different intercolumniations ufed by the ancients.

The intercolumniations among the ancients were various. Thofe ufed in the Ionic and Corinthian orders were the pycnoftyle, of which the interval was equal to one diameter and a half of the column; the fyftyle, whofe interval was equal to two diameters; the euftyle, to two and a quarter; the diaftyle to three, and the aræoftyle to four. In the Doric order, they ufed other intercolumniations, regulating them by the triglyphs, one of which was always placed directly over the middle of each column; fo that they were either fyftyle, monotryglyph, of one diameter and a half; diaftyle, of two diameters and three quarters; or aræoftyle, of four diameters; and the Tufcan intervals were very wide, fome of them being above feven diameters, which was very practicable, as the architraves were of wood.

Among thefe different intercolumniations, the pycnoftyle and fyftyle are too narrow; for although the ancients made frequent ufe of them, that ought rather to be afcribed to neceffity than choice. For, as the architraves were compofed of fingle ftones, extending from the middle of one column to the middle of another, it would have been difficult, efpecially in large buildings, to find blocks of a fufficient length for diaftyle intervals. With regard to the aræoftyle and Tufcan intercolumniations, they are by much too wide, and can only be ufed in ruftic buildings, where the architraves are of wood: neither is the diaftyle fufficiently folid in large compofitions. The euftyle is a medium between the narrow and broad intervals; and being at the fame time both fpacious and folid, hath been preferred to any of the reft by the ancients as well as the moderns.

64 Ufed by Vignola.

Vignola obferved nearly the fame proportion in all his intercolumniations; which practice, though condemned by feveral writers, is certainly preferable to any other; as it preferves the character of each order, and maintains in all of them an equal degree of real folidity. Setting afide therefore the pycnoftyle and fyftyle difpofitions on account of their want of fpace, and the aræoftyle for its deficiency in point of ftrength, it may be eftablifhed, that the diaftyle and euftyle intercolumniations (the latter of which, on moft occafions, ought to have the preference) may be employed in all the orders without diftinction, excepting the Doric; in which the moft perfect interval is ditriglyph; neither the monotriglyph, nor the aræoftyle, being to be fuffered but in cafes of neceffity.

Sometimes, on account of the windows, doors, niches, and other decorations, which correfpond with the intercolumniations of the periftyle, or gallery, it is not poffible to make the intervals fo narrow as euftyle, or even as diaftyle: wherefore the moderns, authorifed by fome few examples of the ancients, where grouped columns are employed, have invented a manner of difpofing them, called by Perrault *aræoftyle*, which admits of a larger interval, without any detriment to the apparent folidity of the building. This kind of difpofition is compofed of two fyftyle intercolumniations; the column that feparates them being approached towards one of thofe at the extremities, fufficient room only being left between them for the projection of the capitals; fo that the great fpace is three diameters and a half wide, and the little one half a diameter.

In periftyles, galleries, or porticoes, all the intercolumniations muft be equal; but in a logio, or porch, the middle interval may be broader than the others, by a triglyph or modilion, or three or four dentils; unlefs the columns at the angles be coupled, or grouped with pilafters; in which cafe, all the intervals fhould be of the fame dimenfions.

When buildings are very fmall, as is frequently the cafe in temples and other inventions ufed for ornamenting gardens, the intercolumniations may be broader, in proportion to the diameter of the columns, than ufual; becaufe, when they are nearer each other than three feet, there is hardly room for a bulky perfon to pafs between them.

Chap. VII. *Of Arches.*

65 Arches where proper.

Arches are not fo magnificent as colonnades; but they are more folid and lefs expenfive. They are proper for triumphal entrances, gates of cities, of palaces, of gardens, and of parks, and in general for all openings that require an extraordinary breadth.

66 How adorned.

There are various manners of adorning arches. Sometimes their piers are rufticated; fometimes they are adorned with pilafters, termini, or caryatides; and fometimes they are made fufficiently broad to admit nitches or windows. The circular part of the arch is either furrounded with ruftic key-ftones, or with an archivolt enriched with mouldings; which, in the middle, is fometimes interrupted by a confole, a mafk, ferving at the fame time as a key to the arch, and as a fupport to the architrave of the order. The archivolt is fometimes fupported by an impoft, at the head of the pier; and at others by columns placed on each fide of it, with a regular entablature, or architrave and cornice. There are likewife inftances of arcades without piers, the arches being turned on fingle columns, as in the temple of Faunus at Rome, &c. This practice, however, ought to be feldom imitated, as it is neither folid nor handfome.

When arches are large, the key-ftone fhould never be omitted, but cut in the form of a confole, and carried clofe under the foffit of the architrave, which, on account of its extraordinary length, requires a fupport in the middle. The impofts of arches fhould never be omitted; at leaft, if they be, a platform ought to fupply their place. If columns are employed without pedeftals in arcades, they fhould always be raifed on a plinth. In all arches, the circular part ought not to fpring immediately from the impoft, but

take

Principles.

take its rise at such a distance above it as is necessary in order to have the whole curve seen at the proper point of view.

67 Proportions.

The void or aperture of arches should never be higher nor much lower, than double their breadth; the breadth of the pier should seldom exceed two-thirds, nor be less than one-third, of the breadth of the arch; and the angular pier ought to be broader than the other, by one-half, one-third, or one-fourth; the impost should not be more than one-seventh, nor less than one-ninth of the aperture; and the archivolt must not be more than one-eighth, nor less than one-tenth of it. The breadth of the console must, at the bottom, be equal to that of the archivolt; and its sides must be drawn from the centre of the arch: the length of it must not be less than one and a half of its smallest breadth, nor more than double. The thickness of the pier depends on the breadth of the portico; for it must be strong enough to resist the pressure of its vault. But with regard to the beauty of the building, it should not be less than one-quarter of the breadth of the arch, nor more than one-third. These are the general dimensions of arches.

68

Chap. VIII. *Of Orders above Orders.*

When, in a building, two or more orders are employed, one above another, the laws of solidity require the strongest should be placed lowermost.—Hence the Tuscan must support the Doric, the Doric the Ionic, the Ionic the Composite or Corinthian, and the Composite the Corinthian.

This rule, however, is not always strictly adhered to. Most authors place the Composite above the Corinthian. There are likewise examples where the same order is repeated, as in the theatre of Statilus Taurus, and the Coliseum; and others, where an intermediate order is omitted, and the Ionic placed on the Tuscan, or the Corinthian on the Doric. But none of these practices ought to be imitated.

In placing columns above one another, the axis of all the columns ought to correspond, or be in the same perpendicular line, at least in front.

69 Proportions of columns placed above each other.

With regard to the proportions of columns placed above each other, Scamozzi's rule, That the lower diameter of the superior column should constantly be equal to the upper diameter of the inferior one, is universally esteemed the best, and gives all the columns the appearance of one long tapering tree, cut into several pieces. According to this rule, the Doric column will be to the Tuscan as $13\frac{1}{3}$ to 14; the Ionic to the Doric, as 15 to 16; the Composite or Corinthian to the Ionic, as $16\frac{2}{3}$ to 18; and the Corinthian to the Composite, as $16\frac{2}{3}$ to 20.

In Britain there are few examples of more than two stories of columns in the same aspect; and though in Italy, and other parts of Europe, we frequently meet with three, and sometimes more; yet it is a practice by no means to be imitated; for there is no possibility of avoiding many striking inconsistencies, or of preserving the character of each order in its intercolumnial decorations.

70

Chap. IX. *Of Basements.*

Instead of employing several orders one above the other in a composition, the ground-floor is sometimes made in the form of a *basement*, on which the order that decorates the principal story is placed. The proportion of these basements is not fixed, but depends on the nature of the rooms on the ground-floor. In the palace of the Porti in Vicenza, the height of the basement is equal to that of the order. In some buildings, its height exceeds two-thirds of that of the order; and, in others, only half the height of the order. It is not, however, advisable to make the basement higher than the order it supports; neither should it be lower than one half of the order.

71 Decorations, &c. of basements.

The usual method of decorating basements is with rustics of different kinds. The best, where neatness and finishing is aimed at, are such as have a smooth surface. Their height, including the joint, should never be less, nor much more, than half a module of the order placed on the basement. Their figure may be from a square to a sesquialtera; and their joints may be either squared or chamfered. The square ones should not be broader than one-eighth of the height of the rustic, nor narrower than one-tenth; and their depth must be equal to their breadth; those that are chamfered must form a rectangle; and the breadth of the whole joint may be from one-fourth to one-third of the height of the flat surface of the rustic.

Chap. X. *Of Pediments.* 72

Pediments, among the Romans, were used only as coverings to their sacred buildings, till Cæsar obtained leave to cover his house with a pointed roof, after the manner of temples. In the remains of antiquity we meet with two kinds of pediments, the triangular and the circular. The former of these are promiscuously applied to cover small or large bodies: But the latter, being of a heavier figure, are never used but as coverings to doors, niches, windows, or gates.

As a pediment represents the roof, it should never be employed but as a finishing to the whole composition.

The ancients introduced but few pediments into their buildings, usually contenting themselves with a single one to adorn the middle or principal part. But some of the moderns, and particularly the Italians, have been so immoderately fond of them, that their buildings frequently consist of almost nothing else.

The girder being a necessary part in the construction of a roof, it is an impropriety to intermit the horizontal entablature of a pediment, by which it is represented to make room for a niche, an arch, or a window.

73 Forms, &c. of pediments.

In regular architecture, no other form of pediments can be admitted, besides the triangular and circular. Both of them are beautiful; and when a considerable number of pediments are introduced, as when a range of windows are adorned with them, these two figures may be used alternately, as in the niches of the Pantheon, and in those of the temple of Diana at Nismes.

The proportion of pediments depend upon their size; for the same proportions will not do in all cases.

When the base of the pediment is short, its height must be increased; and when the pediment is long, the height must be diminished. The best proportion for

Principles. for the height is from one-fifth to one-fourth of the base, according to the extent of the pediment, and the character of the body it covers. The materials of the roof must also be attended to; for if it be covered with tiles, it will be necessary to raise it more than one-quarter of the base, as was the custom of the ancients in their Tuscan temples.

The tympan is always on a line with the front of the frize; and when large, admits of various ornaments.

74

Chap. XI. *Of Ballustrades.*

Ballustrades are sometimes of real use in buildings; and at other times they are only ornamental. Such as are intended for use, as when they are employed in stair-cases, before windows, or to inclose terrasses, &c. must always be nearly of the same height; never exceeding three feet and a half, nor ever less than three. But those that are principally designed for ornament, as when they finish a building, should be proportioned to the architecture they accompany: and their height ought never to exceed four-fifths of the height of the entablature on which they are placed; nor should it ever be less than two-thirds thereof, without counting the zocholo, or plinth, the height of which must be sufficient to leave the whole ballustrade exposed to view.

75 Proportion, &c. of ballusters.

The best proportion for ballustrades is to divide the whole given height into thirteen equal parts; eight of these for the height of the balluster, three for the base, and two for the cornice or rail; or into fourteen, (if it be required to make the balluster less), giving eight parts to the balluster, four to the base, and two to the rail. One of these parts may be called a *module;* and being divided into nine minutes, may serve to determine the dimensions of the particular members.

In ballustrades, the distance between two ballusters should not exceed half the diameter of the balluster measured in its thickest part, nor be less than one-third of it.

The breadth of the pedestals, when they are placed on columns or pilasters, is regulated by them; the dye never being made broader than the top of the shaft, nor much narrower; and when there are neither columns nor pilasters on the front, the dye should not be much lower than a square, and seldom higher. On stairs, or on any other inclined planes, the same proportions are to be observed as on horizontal ones.

Chap. XII. *Of Gates, Doors, and Piers.*

76 Doors and Gates.

There are two kinds of entrances, *viz.* doors and gates. The former serve only for the passage of persons on foot; but the latter likewise admit horsemen and carriages. Doors are used as entrances to churches and other public buildings, to common dwelling-houses, and apartments: And gates serve for inlets to cities, fortresses, parks, gardens, palaces, &c. The apertures of gates being always wide, they are generally made in the form of an arch, that figure being the strongest. But doors, which are generally of small dimensions, are commonly parrallelograms, and closed horizontally.

The general proportion for the apertures, both of gates and doors, whether arched or square, is, that the height be about double the breadth. Principles.

77 Piers.

The most common, and indeed almost the only ornaments for gates are the piers by which they are supported, and which were originally no more than bare posts into which the hinges of the gate were driven. Though this, however, is the only proper use of piers, it must be concealed as much as possible, and they must seem as if placed there only for ornament. As they are to be fixed to the wall before the house, so they must also be proportioned to it; and as they are to be seen in the same view with the front of the house, their correspondence with it is equally necessary. They are to be placed on a plinth, and something must be allowed by way of ornament and finishing at the top. All the luxuriance of fancy may be employed in the decoration of piers: but it will be proper to observe this general rule, that the pier being an inferior building, it must never be richer than the front of the house. If, for instance, the front of the house is ornamented with columns of the Doric order, the Ionic must not be used in the piers; and it will be found better to omit columns altogether, than to make use of the Tuscan order for piers in any case. If the Ionic or Corinthian orders are employed in the front of the house, the Doric or Ionic may be used with propriety in the piers. One piece of ornament is almost universal in piers, namely, a niche with its seat, made as if for the conveniency of weary travellers. On this account, it will be proper to raise the columns on pedestals, because the continued moulding from their cap will be a good ornament under the niche. The base of the columns ought always to be the Attic.

Inside-doors, however small the building may be, should never be narrower than two feet nine inches; nor should they ever, in private houses, exceed three feet six inches in breadth, which is more than sufficient to admit the bulkiest person. Their height should at least be six feet three or four inches; otherwise a tall person cannot pass without stooping. In churches, palaces, &c. where there is a constant ingress and egress of people, the apertures must be larger. The smallest breadth that can be given to a gate is $8\frac{1}{2}$ or 9 feet, which is but just sufficient for the passage of a coach.

Plate XLIV. fig. 1. Is a rustic door, composed by the celebrated Vignola, in which the aperture occupies two-thirds of the whole height, and one-half of the whole breadth; the figure of it being a double square. The rustics may be either smooth or hatched; their joints must form a rectangle, and the breadth of each joint may be one-third, or two-sevenths, of the vertical surface of a rustic. The joints of the claveaux, or key-stones, must be drawn to the summit of an equilateral triangle, whose base is the top of the aperture. The architrave surrounding the aperture may be composed either of a large ogee and fillet, or of a platband and fillet. Its whole breadth must be one-tenth of the breadth of the aperture; the remaining part of each pier being for the rustics. The entablature is Tuscan: the cornice is to be one-fifteenth of the whole height of the door; and what remains below it being divided into 21 equal parts, the two uppermost of them will be for the frize and architrave, and the remaining 19 for the rustics and plinth at the foot of the door.

Fig. 2. Is a disposition of Michael Angelo's. The windows of the Capitol at Rome are of this kind; and Sir Christopher Wren hath executed doors of the same kind under the semicircular porches in the flanks of St Paul's. The figure of the aperture may be a double square; the architrave one-sixth of the breadth of the aperture; and the whole entablature one-quarter of its height. The front of the pilasters or columns on each side, must be on a line with the fascia of the architrave; and their breadth must be a semidiameter.

Fig. 3. Is likewise a design of Vignola's. It is of the Corinthian order, and executed in the Cancellaria at Rome. The height is equal to double its breadth; and the whole ornament at the top is equal to one-third of the height of the aperture. The architrave is in breadth one-fifth of the breadth of the aperture; and the pilasters that support the consoles are half as broad as the architrave. The whole is well imagined, but rather heavy; and it will be best to reduce the architrave to one-sixth of the aperture, diminishing the entablature proportionally.

Fig. 4. Is a design of Serlio's. The aperture may be either twice as high as broad, or a trifle less. The diameter of the columns may be equal to one-quarter of the breadth of the aperture; and their height may be from eight diameters to eight and a half. The entablature must be somewhat less than one-quarter of the height of the columns; and the height of the pediment may be one-quarter of its base.

Fig. 5. Is a door in the salon of the Farnese at Rome, designed by Vignola. The aperture forms a double square. The entablature is equal to three-elevenths of its height, the architrave being one of these elevenths; and the whole ornaments on the sides, consisting of the architrave and pilasters, is equal to two-sevenths of the breadth of the aperture: the cornice is Composite, enriched with mutules and dentils; and the frize is adorned with a festoon of laurel.

Fig. 6. Is copied from a door at Florence, said to be a design of Cigoli's. The height of the aperture is a trifle more than twice its breadth. It is arched; and the impost is equal to half a diameter. The columns are Ionic, somewhat above nine diameters high; and their shafts are garnished each with five rustic cinctures. The entablature is less than one-quarter of the column; and the breadth of the tablet, in which there is an inscription, is equal to the breadth of the aperture.

Plate XLV. fig. 1. Is a pier invented by Mr Chambers. Its diameter may be one-quarter of its height, exclusive of the plinth and vase; and the height of both these may be equal to one diameter of the pier, or a trifle less. The rustics may either be plain, hatched, or vermiculated: the height of each course may be one-eleventh part of the height of the pier, counting to the top of the entablature; the entablature two-elevenths; and the base of the pier one-eleventh part.

Fig. 2. Is likewise a composition of Mr Chambers, imitated from M. Angelo Buonaroti's design for Cardinal Sermonetti. The height of the aperture is somewhat more than twice its breadth; which breadth occupies one-third of the breadth of the whole composition. The order is Composite; and the height of the entablature is equal to one-quarter of the height of the column. He has made a break in it over each column: but, unless the column project considerably, it will be as well to carry the entablature on in a straight line. The dimensions of the particular parts may be measured on the design.

Fig. 3. Is also a composition of Mr Chambers, executed at Goodwood, the seat of his grace the duke of Richmond, in Sussex. The diameter is one-quarter of the height, exclusive of the finishing, which is equal to one diameter: and the height of the pier, from the top of the entablature downwards, being divided into eleven and a half parts, one of these parts is given to the base, one to each rustic, and one and a half to the astragal, frize, and cornice.

Fig. 4. Is a composition of the late earl of Burlington's, that great architect and patron of the fine arts, which is executed at Chiswick, and at Bedford-house in Bloomsbury-square with some little difference.

Fig. 5. Is an invention of Mr Chambers.

Fig. 6. Is one of Inigo Jones's; of which kind he hath executed a couple at Aimsbury in Wiltshire, the seat of his grace the duke of Queensberry.

Chap. XIII. *Of Windows.*

78 Proportions of windows.

The first considerations with regard to windows is their size, which varies according to the climate, the destination of the building, &c. In Britain, the windows of the smallest private houses are commonly from 3 to $3\frac{1}{2}$ feet broad; and being generally twice their breadth in height, or somewhat more, in the principal apartments, they generally rise to within a foot or two of the ceilings of the rooms, which are frequently no higher than 10 feet, and at most 12 or 13. But, in more considerable houses, the apartments are from 15 to 20 feet high, and sometimes more; and in these the windows are from 4 to 5 and $5\frac{1}{2}$ feet broad, and high in proportion. These dimensions are sufficient for dwelling-houses of any size in that country; when they are larger, they admit too much of the cold air in winter. But churches, and other buildings of that kind, may have larger windows, proportioned to the size of the structures.

The proportions of the apertures of windows depend upon their situation. Their breadth in all the stories must be the same; but the different heights of the apartments make it necessary to vary the height of the windows likewise. In the principal floor, it may be from $2\frac{1}{8}$ of the breadth to $2\frac{1}{3}$, according as the rooms have more or less elevation. In the ground-story, where the apartments are lower, the apertures of the windows seldom exceed a double square; and, when they are in a rustic basement, they are frequently made much lower. The height of the windows of the second floor may be from $1\frac{1}{2}$ of their breadth to $1\frac{4}{5}$; and Attics and Mezzanines may be either a perfect square, or somewhat lower.

79 How ornamented.

The windows of the principal floor are generally most enriched. The simplest method of adorning them is, with an architrave surrounding the aperture, and

and crowned with a frize and cornice. The windows of the ground-floor are ſometimes left entirely plain, without any ornament; and at others they are ſurrounded with ruſtics, or a regular architrave with a frize and cornice. Thoſe of the ſecond floor have generally an architrave carried entirely round the aperture; and the ſame is the method of adorning Attic and Mezzanine windows: but the two laſt have ſeldom either frize or cornice; whereas the ſecond-floor windows are often crowned with both.

The breaſts of all the windows on the ſame floor ſhould be on the ſame level, and raiſed above the floor from two feet nine inches to three feet ſix inches at the very moſt. When the walls are thick, the breaſts ſhould be reduced under the apertures, for the conveniency of looking out. In France, the windows are frequently carried quite down to the floor. When the building is ſurrounded with gardens, or other beautiful objects, this method renders the rooms exceeding pleaſant.

The interval between the apertures of windows depends in a great meaſure on their enrichments. The breadth of the aperture is the leaſt diſtance that can be between them; and twice that breadth ſhould be the largeſt in dwelling-houſes; otherwiſe the rooms will not be ſufficiently lighted. The windows in all the ſtories of the ſame aſpect muſt be placed exactly above one another.

Plate XLVI. fig. 1. Is a deſign of P. Leſcot, abbot of Clagny, executed in the old Louvre at Paris. The apertures may be a double ſquare, or a trifle more; the architrave from one-ſixth to one-ſeventh of the breadth of the aperture: the pilaſter is equal to that beadth, when the architrave is narrow; or leſs, by one-quarter, or one-fifth, when it is broad. The whole entablature ſhould not exceed one-quarter of the height of the aperture, nor be much lower. The conſoles may be equal in length to half the breadth of the aperture at moſt, and to one-third of it at leaſt.

Fig. 2. Is a deſign of Palladio's, executed at the Chiericato in Vicenza: its proportions are not much different from the following. The plat-band that ſupports the window is equal to the breadth of the architrave.

Fig. 3. Is likewiſe a deſign of Palladio's, executed by him in many of his buildings. The aperture is a double ſquare. The breadth of the architrave is one-ſixth of the breadth of the aperture; and the frize and cornice together are double the height of the architrave. The breadth of the conſoles is two-thirds of the breadth of the architrave.

Fig. 4. Is a deſign of Ludovico da Cigoli; and executed in the ground-floor of the Ranunchini palace at Florence.

Fig. 5. Is a deſign of Inigo Jones, executed at the Banqueting-houſe. The aperture may be a double ſquare; the architrave may be one-ſixth of its breadth; the whole entablature one-quarter of its height; and the breadth of the conſoles two thirds of the breadth of the architrave.

Fig. 6. Is a deſign of M. Angelo Buonorati, executed at the Farneſe.

80 CHAP. XIV. *Of Niches and Statues.*

It hath been cuſtomary, in all ages, to enrich different parts of buildings with repreſentations of the human body. Thus the ancients adorned their temples, baths, theatres, &c. with ſtatues of their deities, heroes, and legiſlators. The moderns ſtill preſerve the ſame cuſtom, placing in their churches, palaces, &c. ſtatues of illuſtrious perſons, and even groups compoſed of various figures, repreſenting occurrences collected from hiſtory, fables, &c. Sometimes theſe ſtatues or groups are detached, raiſed on pedeſtals, and placed contiguous to the walls of a building, or in the middle of a room, court, or public ſquare. But they are moſt frequently placed in cavities made in the walls, called 81 *niches*. Of theſe there are two ſorts; the one formed like an arch in its elevation, and ſemicircular or ſemi-elliptical in its plan; the other is a parallelogram both in its plan and elevation.

Different kinds of niches.

The proportion of both theſe niches depends on the characters of the ſtatues, or the general form of the groups placed in them. The loweſt are at leaſt a double ſquare in height; and the higheſt never exceed $2\frac{1}{4}$ of their breadth. 82

How decorated.

With regard to the manner of decorating them, when they are alone in a compoſition, they are generally incloſed in a pannel, formed and proportioned like the aperture of a window, and adorned in the ſame manner. In this caſe, the niche is carried quite down to the bottom; but on the ſides and at the top, a ſmall ſpace is left between the niche and the architrave of the pannel. And when niches are intermixed with windows, they may be adorned in the ſame manner with the windows, provided the ornaments be of the ſame figure and dimenſions with thoſe of the windows. 83

Statues.

The ſize of the ſtatues depends on the dimenſions of the niches. They ſhould neither be ſo large as to have the appearance of being rammed into the niches, as in Santa Maria Majora at Rome; nor ſo narrow as to ſeem loſt in them, as in the Pantheon. The diſtance between the outline of the ſtatue and ſide of the niche ſhould never be leſs than one-third of a head nor more than one half, whether the niche be ſquare or arched; and when it is ſquare, the diſtance from the top of the head to the cieling of the niche ſhould not be greater than the diſtance on the ſides. Statutes are generally raiſed on a plinth, the height of which may be from one-third to one-half of a head; and ſometimes, where the niches are large, the ſtatues may be raiſed on ſmall pedeſtals.

The character of the ſtatue ſhould always correſpond with the character of the architecture with which it is ſurrounded. Thus, if the order be Doric, Hercules, Jupiter, Mars, Æſculapius, and all male ſtatues, repreſenting beings of a robuſt and grave nature, may be introduced; if Ionic, then Apollo, Bacchus, &c.; and if Corinthian, Venus, Flora, and others of a delicate nature, ſhould be employed.

CHAP. XV. *Of Chimney-pieces.*

AMONG the ancients, there are very few examples of chimney-pieces to be met with. Neither the Italians nor French have excelled in compoſitions of this kind. Britain, by being poſſeſſed of many able ſculptors at different times, has ſurpaſſed all other nations, both in taſte of deſign, and workmanſhip.

 The

Principles. 85 Proportions and [illegible] The size of the chimney must be regulated by the dimensions of the room where it is placed. In the smallest apartments, the breadth of the aperture should never be less than three feet, or three feet six inches. In rooms from 20 to 24 feet square, or of equal superficial dimensions, it may be from four to $4\frac{1}{2}$ feet broad; in those of 24 to 27, from $4\frac{1}{2}$ to 5; and, in such as exceed these dimensions, the aperture may even be extended to $5\frac{1}{2}$ or 6 feet.

The chimney should always be situated so as to be immediately seen by those who enter the room. The middle of the partition wall is the most proper place in halls, salons, and other rooms of passage; but in drawing-rooms, dressing-rooms, and the like, the middle of the back-wall is the best situation. In bed-rooms, the chimney is always in the middle of one of the partition-walls; and in closets, and other very small places, to save room, it is put in a corner. Wherever two chimneys are used in the same room, they should be placed either directly facing each other, if in different walls, or at equal distances from the centre of the wall in which they both are.

The proportion of the apertures of chimney-pieces of a moderate size is generally a perfect square; in small ones, it is a trifle higher; and in large ones, a trifle lower. Their ornaments consist in architraves, frizes, cornices, columns, pilasters, termini, caryatides, consoles, and all kinds of ornaments of sculpture, representing animals and vegetables, &c. likewise vases, chalices, trophies of arms, &c. In designing them, regard must be had to the nature of the place where they are to be employed. Such as are intended for halls, salons, guard-rooms, galleries, and other large places, must be composed of large parts, few in number, of distinct and simple forms, and having a bold relief; but chimney-pieces for drawing-rooms, dressing-rooms, &c. may be of a more delicate and complicated nature.

Chimney-pieces are composed of wood, stone, or marble; the last of which ought to be preferred, as figures or profiles are best represented in a pure white.

Plate XLVII. exhibits different designs for chimney-pieces by Palladio and Inigo Jones. Their proportion may be gathered from the designs, which are accurately executed.

86

Chap. XVI. *Of the Proportions of Rooms.*

The proportions of rooms depend in a great measure on their use, and actual dimensions: but, with regard to beauty, all figures, from a square to a sesquilateral, may be employed for the plan.

The height of rooms depends on their figure. Flat cieled ones may be lower than those that are coved. If their plan be a square, their height should not exceed five-sixths of the side, nor be less than four-fifths; and when it is oblong, their height may be equal to their breadth. But coved rooms, if square, must be as high as broad; and when oblong, they may have their height equal to their breadth, more one-fifth, one-quarter, or even one-third of the difference between the length and breadth: and galleries should at least be in height one and one-third of their breadth, and at most one and a half, or one and three-fifths.

The coldness of the British climate is a strong objection to high rooms; so that it is not uncommon to see the most magnificent apartments not above 15, 16, or at most 18 feet high; though the extent of the rooms would require a much more considerable elevation. But where beauty is aimed at, this practice ought not to be imitated. Principles. 87 High rooms improper in Britain.

When rooms are adorned with an entire order, the entablature should never exceed one-sixth of the whole height in flat-cieled rooms, and one-sixth of the upright part in coved ones; and when there are neither columns nor pilasters, but only an entablature, its height should not be above one-seventh of these heights. If the rooms be finished with a simple cornice, it should never exceed one-fourteenth, nor ever be less than one-fifteenth part of the above-mentioned height.

Chap. XVII. *Of Cielings.* 88

Cielings are either flat or coved, in different manners. The simplest of the flat kind are those adorned with large compartments, surrounded with one or several mouldings, either let into the cieling, or projecting beyond its surface: and when the mouldings that form the compartments are enriched, and some of the compartments adorned with well-executed ornaments, such cielings have a good effect, and are very proper for common dwelling-houses, and all low apartments. Their ornaments and mouldings do not require a bold relief; but, being near the eye, they must be finished with taste and neatness. For higher rooms, a flat cieling which has the appearance of being composed of various joists framed into each other, and forming compartments of various geometrical figures, should be employed. The sides of the joists forming the compartments are generally adorned with mouldings, and represent either a simple architrave, or an architrave cornice, according to the size of the compartments and the height of the room.

Coved cielings are more expensive; but they are likewise more beautiful. They are used promiscuously in large and small rooms, and occupy from one-fifth to one-third of the height of the room. If the room be low in proportion to its breadth, the cove must likewise be low; and when it is high, the cove must be so likewise: by which means the excess of the height will be rendered less perceptable. But, where the architect is at liberty to proportion the height of the room to its superficial dimensions, the most eligible proportion for the cove is one-fourth of the whole height. In parallelogram-figured rooms, the middle of the cieling is generally formed into a large flat pannel. This pannel, with the border that surrounds it, may occupy from one-half to three-fifths of the breadth of the room. The figure of the cove is commonly either a quadrant of a circle or of an ellipse, taking its rise a little above the cornice, and finishing at the border round the great pannel in the centre. The border projects somewhat beyond the coves on the outside; and, on the side towards the pannel, it is generally made of sufficient depth to admit the ornaments of an architrave, or architrave and cornice.

In Britain circular rooms are not much in use; but they

Principles. they are very beautiful. Their height must be the same with that of square rooms; their ceilings may be flat; but they are handsomer when coved, or of a concave form.

Arcs doublaux, or soffits of arches, when narrow, are ornamented with *guillochs*, or frets; but when broad, they may be adorned in a different manner.

When the profiles of the room are gilt, the ceilings ought likewise to be gilt. The usual method is to gild all the ornaments, and to leave the grounds white, pearl colour, light blue, or of any other tint proper to set off the gilding to advantage. Painted ceilings, so common in France and Italy, are but little used in Britain.

89 CHAP. XVIII. *Of Stairs and Stair-cases.*

THERE are many kinds of stair-cases; for, in some, the steps are made strait; in others, winding; in others, mixed of both. Of straight stairs, some fly directly forward, others are square, others triangular. Others are called *French flights*, or *winding-stairs*, (which in general are called *spiral*, or *cockle-stairs*); of which some are square, some circular or round, and some elliptical or oval; and these again are various, some winding about a solid, others about an open newel. Stairs mixed of straight and winding steps are also of various kinds; some are called *dog-legged*; some there are that wind about a solid newel, and others that fly about a square open newel.

90 Stair-cases where to be placed. Great care ought to be taken in placing of the stair-case in any building; and therefore stair-cases ought to be described and accounted for justly when the plan of a building is made. For want of this, sometimes unpardonable errors have been committed: such as having a little blind stair-case to a large house, or, on the other hand, a large spacious stair case to a little one.

Palladio says, in placing stair-cases, the utmost care ought to be taken; it being difficult to find a place convenient for them, that will not at the same time prejudice the rest of the building. But commonly the stairs are placed in the angle, wing or middle of the front.

To every stair-case are required three openings.

First, the door leading thereto.

Secondly, the window, or windows that give light to it;

And, thirdly, the landing.

First, the door leading to the stair-case should be so placed, that most of the building may be seen before you come at the stairs, and in such a manner that it may be easy for any person to find out.

Secondly, for the windows; if there be but one, it must be placed in the middle of the stair-case, that thereby the whole may be enlightened.

Thirdly, the landing of stairs should be large and spacious for the convenient entering into rooms: in a word, stair-cases should be spacious, light, and easy in ascent. The height of large steps must never be less than six inches, nor more than seven inches and a half.

The breadth of steps should never be less than 10 inches, or more than 18 inches; and the length of them not less than three feet, nor more than 12.

Plate XLVIII. fig. 1. A stair-case of two flights.—*A* shews the manner of drawing the *ramp*, which is to rise equal to the height of the first step of the next flight, and as much as its *kneeling*; as is shewn by the *ramp* intersecting the rail of the second flight. Principles. 91

Fig. 2. Shews the straight rail intersecting a circular cap.

Fig. 3. Section of two different hand rails.

Fig. 4. Shews the manner of dove-tailing the riser into the step.

Plate XLIX. fig. 1. represents a stair-case, with flights, and its landing rail. 92

Fig. 2. Shews the solid part of the step out of which the scroll is formed: where *a* represents the *oversail* of the step; *b*, The thickness of the bracket, with its *mitring* to the *riser*; and, *c*, The *string-board*.

Fig. 4. Shews the scale for drawing the scroll of fig. 3.—To perform which, take the distance from 1 to the centre, in fig. 3. and set it up from 1 to the centre in fig. 4.; divide that extent into three parts, then set 4 such parts on the upper side of the scale, and draw the line from 4 to one; set one foot of your compasses at 4, and strike the circular line; let that be divided into 12 equal parts, and then draw lines from 4 through those divisions to the upright line.

The scale being thus made, draw the scroll of fig. 3. by it in the following manner.

Set one foot of your compasses in 1, and describe a stroke at *c*; take the same distance, and with one foot in 2, cross the stroke at *c*; then from *c*, turn the part from 1 to 2, and proceed in the same manner; for if the distance were taken in the scale from 1 to the centre, it would strike the circle too flat; and if taken from 2, it would strike the circle too quick.

When this is well understood, there will be little difficulty in drawing the scroll below figure 2.; which throws itself out farther in proportion than that in fig. 3.; for this will always be the case when the upper line of the scale, which consists of four divisions in fig. 4. is made but with three divisions or less; whence it appears, that the upper line of the scale may be drawn at what length you please, according as you would bring in or keep out the scroll.

Plate L. Shews the manner of squaring twist-rails. 93

Fig. 2. Exhibits the pitch-board, to shew what part of the step the twisted part of the rail contains; the three dotted lines drawn from the rail to the pitch-board represent the width of the rail, which is to be kept level. The dotted lines *a* and *b* shew how much half the width of the rail turns up from its first beginning to 3.

Fig. 3. Shews the same pitch-board with the manner of the rail's turning up. If the sides of the twisted part of the rail be shaped by the rail-mould, so that they direct down to its ground plan, that is, the upper side of the rail being first struck by the mould, then apply the mould to the under side, as much back as the level of the pitch-board shews, by being struck on the side of the rail, and then fig. 3. being applied to the outside of the rail, from its first twisting part to 3, will show how much wood is to be taken off.

Fig. 5.

Practice.

Fig. 5. Exhibits the square of the rail, with the raking line of the pitch-board drawn through the middle on the upper side; then draw the depth of the side of the rail parallel to this, and the dotted lines from the diagonal of the rail; these lines shew what quantity of wood will be wanting on the upper and lower sides of the rail. Set your compasses at *c*, and draw the circular stroke from the raking part of the pitch-board to *b*; take the distance *a b* and transfer it from *a* to *b*, in fig. 7. The several distances thus found may be set at any number of places, ranging with the straight part of the rail; and it then forms the width of the mould for the twisting part of the rail.

Fig. 7. Shows the sweep of the rail. The rail cannot be fixed less than one-fourth part from the *nosing* or front of the step.

The remaining part of the pitch-board may be divided into any number of parts, as here into four; from these divisions draw lines across the pitch-board to the raking line; then take the distances from the ground line of the pitch-board to the plan of the rail and set them perpendicular from the raking line of the pitch-board; and these divisions when the rail is in its proper position, lie directly over the divisions on the ground plan.

In this figure, *l*, *m*, and *n*, rise as much above *o* as the dotted line in fig. 5. does above the width of the rail; and they sink as much below *o* as the other dotted line in fig. 5. falls below the width of the rail; the same thicknesses must be glued upon *o*, though the greatest part will come off in squaring. The reason of placing the letters *l*, *m*, and *n*, where they are, is, that they might not obstruct the small divisions of the rail-mould.

Fig. 4. Shews how to find the rail when it takes more than one step. The remaining part of the pitch-board is divided into four parts, as before in fig. 7. and it takes in two such parts of the next step. Draw lines from these divisions to the diagonal of the pitch-board as in fig. 7. then take the distance *a b*, and set it from *c* to *d*, and so proceed with the other divisions.

Another way to find the outside of the rail-mould is, to draw all the divisions across the plan of the rail; then take the distance from the ground line of the pitch-board to 4, transfer it from the diagonal of the pitch-board to 4 on the rail; and so proceeed with the other distances. Now, when the rail is put in its proper situation *c* will be perpendicular to *b*, and all the divisions, as 1, 2, 3, 4, *&c.* in the rail, will be perpendicular to 1, 2, 3, 4, *&c.* in the ground plan.

Practice.

Fig. 6. Shews the plan of a rail of five steps.

To find the rail.—Set five divisions, as from *e* to *h*, which is the height of the five steps; draw the diagonal *h* to the plan of the rail; then take the distance *e f*, and transfer in to *g h*, and proceed in the same manner with the other seven distances.

To find the width of the rail mould.—Draw the lines across the plan of the rail, as at *k*; set that distance from the diagonal to *i*; and so proceed with the rest, as was shewn in fig. 4.

Having formed the sides of the rail perpendicular to its ground plan, and having squared the lower end of the rail, then take a thin lath, and bend it with the rail, as is represented by *m*, fig. 1.

This is the readiest method of squaring a solid rail; but if the rail be bent in the thicknesses, the nosing of the steps must be drawn upon a cylinder, or some other solid body of a sufficient width to contain the width of the rail or string-board.

r represents the depth of the rail, touching the nose of each step. Take a sufficient number of thicknesses of this width, to make the thickness of your rail; glue them all together upon your cylinder or templet, confine them till they are dry, and the rail taken off is ready squared. Proceed in the same manner with the architrave, marked *a*.

Chap. XIX. *Of Roofs.* 94

Plate LI. Fig. 1. Shews the form of a trussed roof, with three ring-posts, that may carry seventy feet, or upwards.

Fig. 2. Exhibits an *M* roof, capable of carrying as great an extent as the former. Indeed both these designs are capable of carrying almost any extent.

Fig. 3. Represents two different sorts of trusses.

Fig. 4. Shews the manner of piecing timber. Sometimes the joint may be extended as far as *a*, with another bolt through it. To the right is shewn a different sort of joint.

Fig. 5. Shews the manner of trussing a girder. If the trusses are full long, with the pieces *b* and *c* you may make them as light as you please.

Fig. 6. Represents the manner of trussing partitions.

Part II. PRACTICE of ARCHITECTURE.

Having thus described and given rules for the most generally received proportions of the different parts of buildings, both of the useful and ornamental kind, we must next give an account of the method of erecting different kinds of edifices; and here the judgment of the architect must necessarily be very much employed, as no fixed rules have been laid down by which he can be directed in all cases. As a necessary preliminary, however, to the construction, we must first consider,

95 Chap. I. *The Situations of Houses.*

Though it must be, in many cases, impossible to chuse such a situation as might be agreeable either to the architect or the proprietor, yet where a choice can be made, there are certainly a great many circumstances that will determine one situation to be preferable to another. These circumstances depend entirely on the person who is to inhabit the house. A farmer, for instance, ough to dwell in the most centrical part of his farm; an independent gentleman must regard the healthiness, the neighbours with whom he can converse, the prospect from his house, and also the aspect of the ground near it. To answer these purposes of health and pleasure, an open elevated situation is the best, as the air is there pure, and the prospect extensive; but too elevated a situation is disagreeable, as being both difficult of access, and exposed to cold and bleak winds. To build in bottoms between hills is both unhealthful and unpleasant, the house being in a manner buried,

buried, and the ground near it generally marſhy from the rain-water which runs down from the hills, which renders the air unwholeſome. As a garden alſo is a very neceſſary article to a country habitation, the ſoil is by no means a matter of indifference; and therefore it may be concluded, that an elevated ſituation on a gravelly loam, near ſome running water, is the beſt ſituation for a country houſe.

Chap. II. *Of the conſtruction of Edifices in general.*

The proper ſituation of a houſe, or any other building, being choſen, according to its intended nature, the next thing to be conſidered is to lay the foundation in a proper manner. The only ſecurity of a houſe, or any other building whatever, is in having a good foundation, and no error is ſo dangerous as that which is committed here; as the ſhrinking of the foundation but the breadth of a ſtraw may cauſe a rent of five or ſix inches wide in the ſuperſtructure. To guard againſt errors of this kind, the qualities of the ground for a conſiderable depth muſt be carefully obſerved.

96 Qualities of the ground neceſſary to be examined.

The beſt foundation is that which conſiſts of gravel or ſtone; but, in order to know whether the inferior ſtrata are ſufficient for the ſupport of the building, it will be adviſable to ſink wells at ſome little diſtance. By attending to what is thrown up in digging theſe, the architect will be acquainted with what lies under the ſtony or gravelly bed which on the ſurface promiſes ſo much ſecurity, and will know what meaſures to take.

97 Rocky ground ſometimes dangerous.

But though a ſtony or gravelly bottom is undoubtedly the moſt ſure and firm, where all is found beneath, there is no kind of ground which may prove more fallacious, or occaſion ſuch terrible accidents. The reaſon of this is, that ſuch kind of ground often contains abſolute vacuities; nor is rock itſelf, though a foundation upon a rock is ſtrong even to a proverb, free from dangers of the ſame kind. Caverns are very frequent in rocky places; and ſhould an heavy building be erected over one of theſe, it might ſuddenly fall down altogether. To guard againſt accidents of this kind, Palladio adviſes the throwing down great weights forcibly on the ground, and obſerving whether it ſounds hollow, or ſhakes; and the beating of a drum upon it, by the ſound of which an accuſtomed ear will know whether the earth is hollow or not.

Where the foundation is gravel, it will be proper to examine the thickneſs of the ſtratum, and the qualities of thoſe that lie under it, as they have appeared in digging. If the bed of gravel is thick, and the under ſtrata of a ſound and firm kind, there needs no aſſiſtance; if otherwiſe, we muſt have recourſe to various methods in order to ſupply the defect.

98 Sandy or boggy ground how managed.

The other matters which may occur for a foundation are clay, ſand, common earth, or rotten boggy ground. Clay will often both raiſe and ſink a foundation; yet it has a ſolidity which, with proper management, is very uſeful. The marſhy, rotten, or boggy ground is of all others the worſt; yet even upon this great buildings may be raiſed with perfect ſafety, provided proper care be taken. In caſe of boggy earths, or unfirm ſand, piling is one of the moſt common methods of ſecuring a foundation; and, notwithſtanding the natural diſadvantage of the earth, piles, when properly executed, are one of the firmeſt and moſt ſecure foundations.

99 Foundations near waters dangerous.

In foundations near the edge of waters, we ſhould always be careful to ſound to the very bottom, as many terrible accidents have happened from the ground being undermined by rivers. The ſame method is to be followed when the ground on which we build has been dug or wrought before. It ought never to be truſted in the condition in which it is left; but we muſt dig through it into the ſolid and unmoved ground, and ſome way into that, according to the weight and bigneſs of the intended edifice. The church of St Peter's at Rome is an inſtance of the importance of this laſt obſervation. That church is in great part built upon the old circus of Nero; and the builders having neglected to dig through the old foundation, the ſtructure is conſequently ſo much the weaker. The walls were judged of ſtrength enough to bear two ſteeples upon the corners of the frontiſpiece; but the foundation was found too weak when it was impoſſible to remedy the defect perfectly.

100 Defect in St Peter's at Rome.

Before the architect, however, begins to lay the foundation of the building, it will be proper to conſtruct ſuch drains as may be neceſſary for carrying off the rain, or other refuſe water that would otherwiſe be collected and lodge about the houſe. In making of drains for carrying off this water, it will be neceſſary to make large allowances for the different quantities that may be collected at different times. It muſt alſo be conſidered, that water of this kind is always loaded with a vaſt quantity of ſediment, which by its continual falling to the bottom will be very apt to choak up the drain, eſpecially at thoſe places where there happen to be angles or corners in its courſe. The only method of preventing this is by means of certain cavities diſpoſed at proper diſtances from one another. Into theſe the ſediment will be collected, and they are for that reaſon called *ſeſpools*. With regard to theſe, the only directions neceſſary are, that they be placed at proper diſtances, be ſufficiently large, and placed ſo as to be eaſily cleaned. It is a good rule to make a ſeſpool at each place where the water enters the drain; as by this means a conſiderable quantity of ſediment will be prevented from entering the channel at all. Others are to be made at proper diſtances, eſpecially where there are any angles. They muſt be made ſufficiently large; the bigger, in moderation, the better; and they muſt alſo be covered in ſuch a manner as to be eaſily got at in order to be cleaned. But, as putrid water is exceedingly noxious, it will be neceſſary to carry up a brick funnel over every ſeſpool, in order to prevent the collection of the putrid effluvia, which would otherwiſe occaſion the death of the perſon who cleaned it.

101 Drains how made.

102 Seſpools.

103 Proprotions of drains.

All drains ought to be arched over at top, and may be moſt conveniently built of brick. According to their different ſizes, the following proportions of height and thickneſs may be obſerved. If the drain is 18 inches wide, the height of the walls may be one foot, and their thickneſs nine inches; the bottom may be paved with brick laid flatwiſe, and the arch turned four inches. If the drain is 22 inches wide, the ſide walls are then to be one foot three inches in height, and the reſt conſtructed as before. If it is 14 inches wide, the height of the walls may be 9 inches, and the ſweep of the arch four. A drain of a yard wide ſhould have the

Practice. same height, and the arch turned over it ought to be 9 inches thick. Upon the same principles and proportions may other drains of any size be constructed.

104 Foundation of buildings how laid.

The sewers and drains being constructed in a manner proportioned to the size of the intended building, the architect may next proceed to lay the foundation of the walls. Here the first care must be, that the floor of the foundation be perfectly smooth and level. The Italians begin with laying over it an even covering of strong oak plank; and upon that they lay, with the most exact care, the first course of the materials. Whether we take this method, or begin upon the naked floor, all must be laid with the most exact truth by rule and line. When the board plat is laid, a course of stone is the best first bed, and this is to be laid without mortar; for lime would make the wood decay, which otherwise, in a tolerably good soil, will last for ages. After this, all the courses should follow with the same perfect evenness and regularity. If the materials are brick, they should be laid on with an equal, and not too great quantity of mortar: if stone, they ought to be placed regularly, and in the same situation in which they lay in the quarry: for many stones, which will bear any weight flatwise, and in their natural position, are of such a grain, that they will split otherwise. The joinings of the under course must be covered by the solid of the next course all the way up; and the utmost care must be taken that there be no vacuity left in the wall, for the weight will most certainly crush it in. The less mortar there is in a foundation, the better. Its use is to cement the bricks and stones together; and the evener they are, the less will be required for the purpose. Where mortar is used to fill up the cavities, it becomes part of the wall; and not being of equal strength with the solid materials, it takes from the firmness of the building. For the same reason, nothing can be more absurd, than to fill up a foundation with loose stones or bricks thrown in at random; and where this is done, the ruin of the building is inevitable. Where the foundation of a principal wall is laid upon piles, it will be necessary also to pile the foundations of the partitions, though not so strongly.

105 Thickness and diminutions of walls, &c.

The thickness of foundation-walls in general ought to be double that of the walls which they are to support. The looser the ground, the thicker the foundation-wall ought to be; and it will require the same addition also in proportion to what is to be raised upon it. The plane of the ground must be perfectly level, that the weight may press equally every where: for when it inclines more to one side than another, the wall will split. The foundations must diminish as they rise, but the perpendicular is to be exactly kept in the upper and lower parts of the wall; and this caution ought to be observed all the way up with the same strictness. In some ground, the foundation may be arched; which will save materials and labour, at the same time that the superstructure has an equal security. This practice is peculiarly serviceable where the foundation is piled.

106 Diminution of the thickness of walls.

As the foundation-walls are to diminish in thickness, so are those which are built upon them. This is necessary in order to save expence, but is not absolutely so to strengthen the wall; for this would be no less strong though it was continued all the way to the top of an equal thickness, provided the perpendicular was exactly kept. In this the ancients were very expert; for we see, in the remains of their works, walls thus carried up to an exorbitant height. It is to be observed, however, that, besides perfect truth in their perpendiculars, they never grudged iron work, which contributed greatly to the strength of their buildings. The thickness and diminution of walls is in a great measure arbitrary. In common houses built of brick, the general diminution from the bottom to the top is one-half the thickness at the bottom; the beginning is two bricks, then a brick and a half, and lastly one brick, thickness. In larger edifices, the walls must be made proportionally thicker; but the diminution is preserved much in the same manner. Where stones are used, regard must be had to their nature, and the propriety of their figures for holding one another. Where the wall is to be composed of two materials, as stone and brick the heaviest ought always to be placed undermost.

107 Angles how fortified.

There is one farther particular regarding the strength of a plain wall, and that is, the fortifying its angles. This is best done with good stone on each side, which gives not only a great deal of strength, but a great deal of beauty. Pilasters properly applied are a great strengthening to walls. Their best distance is about every 20 foot, and they should rise five or six inches from the naked of the wall. A much slighter wall of brick with this assistance, is stronger than a heavier and massier one built plain. In brick walls of every kind, it is also a great addition to their strength to lay some chief courses of a larger and harder matter; for these serve like sinews to keep all the rest firmly together, and are of great use where a wall happens to sink more on one side than another.

108 Windows improper near the corners.

As the openings in a wall are all weakenings, and as the corners require to be the strongest parts, there should never be a window very near a corner. Properly, there should always be the breadth of the opening firm to the corner. In the most perfect way of forming the diminution of walls, the middle of the thinnest part being directly over the middle of the thickest, the whole is of a pyramidal form; but where one side of the wall must be perpendicular and plain, it ought to be the inner, for the sake of the floors and cross walls. The diminished side, in this case, may be covered with a fascia or cornice, which will at once be a strength and ornament.

109 Chimneys.

Along with the construction of walls, that of the chimneys must also considered; for errors in the construction of these will render the most elegant building extremely disagreeable. The common causes of smoaking are either that the wind is too much let in above at the mouth of the shaft, or the smoke is stifled below: and sometimes a higher building, or a great elevation of the ground behind, is the source of the mischief; or lastly, the room in which the chimney is, may be so small or close, that there is not a sufficient current of air to drive up the smoke. Almost all that can be done, while the walls are constructing, to prevent smoke, is, to make the chimney vent narrower at bottom than at top: yet this must not be carried to an extreme; because the smoke will then linger in the upper part, and all the force of the draught will not be able to send it up.—As for the methods of curing smoky chimneys in houses already built, see the article CHIMNEY.

Practice.

117 Roofs. After the walls are finished, the roof is the next consideration: but concerning it very little can be said; only that its weight must be proportioned to the strength of the walls. It must also be so contrived as to press equally upon the building; and the inner walls must bear their share of the load as well as the outer ones. A roof ought neither to be too massy nor too light; as being necessary for keeping the walls together by its pressure, which it is incapable of doing while too light; and if too heavy, it is in danger of throwing them down. Of these two extremes, however, the last is to be accounted the worst.

117 Floors. With regard to the floors, they are most commonly made of wood; in which case, it will be necessary that it should be well seasoned by being kept a considerable time before it is used. The floors of the same story should be all perfectly on a level; not even a threshold rising above the rest: and if in any part there is a room or closet whose floor is not perfectly level, it ought not to be left so, but raised to an equality with the rest; what is wanting of the true floor being supplied by a false one.

In mean houses, the floors may be made of clay, ox blood, and a moderate portion of sharp sand. These three ingredients, beaten thoroughly together and well spread, make a firm good floor, and of a beautiful colour. In elegant houses, the floors of this kind are made of plaster of Paris, beaten and sifted, and mixed with other ingredients. This may be coloured to any hue by the addition of proper substances; and, when well worked and laid, makes a very beautiful floor. Besides these, halls, and some other ground-rooms, are paved or floored with marble or stone; and this either plain or dotted, or of a variety of colours: but the universal practice of carpeting has in a great measure set aside the bestowing any ornamental workmanship upon floors. In country buildings, also, floors are frequently made of bricks and tiles. These, according to their shapes, may be laid in a variety of figures; and they are also capable of some variation in colour, according to the nature of the earth from which they were made. They may be laid at any time; but for those of earth or plaster, they are best made in the beginning of summer, for the sake of their drying.

Chap. III. *Of the Distribution of the Apartments of Houses, with other conveniences.*

As houses are built only for the sake of their inhabitants, the distribution of the apartments must of necessity be directed by the way of life in which the in-
118 Plan of a farm-house. habitants are engaged. In the country, this is commonly farming; and here, besides the house for the family, there is also necessary a barn for the reception of the produce of the ground, a stable for cattle, a cart-house for keeping the utensils under cover, and sheds for other uses.—To accomplish these purposes, let a piece of ground be taken of five times the extent of the front of the house, and inclosed in the least expensive manner. Back in the centre of this let the house be placed, and in the front of the ground the barn and the stable, with the adjoining sheds. These are to be set, one on each side, to the extreme measure of the inclosed ground: they will thus fill up a part of the entrance, and will leave all about the house some inclosed ground by way of yard. From the barn to the stable may be extended a fence with a gate in the middle, and this gate ought to front the door of the house.

This much being settled, the plan of the house and out-buildings may be made as follows. The door may open into a plain brick passage, at the end of which may be carried up a small stair-case. On one side of the passage may be a common kitchen; and on the other side a better or larger room, which will serve the family by way of parlour. Beyond this may stand on one side the pantry, and on the other the dairy room, the last being twice the size of the former. They are placed on the same side with the parlour, on account of the heat of the kitchen, which renders it improper to be near them. On the kitchen side, a brew-house may very conveniently be placed. More rooms may be added on the ground-floor as occasion requires; and the upper story is to be divided into bed-chambers for the family, with garrets over them for the servants.—A house of this kind is represented Plate LII. fig. 1.; and one of a somewhat better kind fig. 2. where a private gentleman who has a small family may find conveniency.

119 Of an elegant country seat. On Plate LIII. is represented a gentleman's country-seat, built on a more elegant plan. Here the front may extend 65 feet in length, the depth in the center being 40 feet, and in each of the wings 45. The offices may be disposed in wings; the kitchen in the one, and the stables in the other; both of which, however, may correspond in their front with the rest of the building, which they ought also to do with one another. These wings may have a projection of 13 feet from the dwelling-house, to which they ought to be connected, not by straight lines, but by curves, as represented fig. 2.

The best proportion of these offices to a house extending 65 feet in front, is 35 feet. If they are smaller, the house will look gigantic; if larger, they will lessen its aspect. To a front of 35 feet, a depth of 48 is a very good proportion. There ought also to be a covered communication between the dwelling-house and offices, which must not appear only to be a plain blank wall, but must be ornamented with gates, as in the figure. The arch by which the offices are joined to the dwelling-house must be proportioned to the extent of the buildings; and there cannot be a better proportion than five feet within the angles of the buildings. By this means the wings, which have only a projection of 13 feet, will appear to have one of 18, and the light will be agreeably broken.

With regard to the internal distribution of a house of this kind, the under story may be conveniently divided into three rooms. The hall, which is in the centre will occupy the whole of the projecting part, having a room on each side. The length of the hall must be 24 feet, and its breadth 12: the rooms on each side of it must be 16 feet long, and 11 wide. Of these two front rooms, that on the right hand may be conveniently made a waiting-room for persons of better rank, and that on the left hand a dressing-room for the master of the house. Behind the hall may run a passage of four feet and an half, leading to the apartments in the hinder part of the house and the stair-case. These may be disposed as follows. Directly behind the hall and this passage, the space may be occupied by a saloon, whose length is 24 feet and its breadth 17. On the left hand of the passage, behind the hall, is to be placed the grand stair-case; and as it will not fill the whole depth, a pleasant common parlour may terminate on that side of the house. On the other side, the passage is to lead to the door of the great dining parlour, which may occupy the whole space.

120 Another.

A plan of a house of the same kind, but somewhat different in the distribution, is represented below in the same plate. The front here extends 68 feet, and the wings project 28 feet; their depth is 48, and their breadth 36. The hall may be 26 feet long and 17 broad. On the left hand of the hall may be a waiting-room 16 feet long and 10 broad; behind which may be a handsome dining-room. The passage into this waiting-room should be at the lower end of the hall; and it must have another opening into the room behind it. On the right hand of the hall is the place of the great stair-case, for which a breadth of 16 feet three inches is to be allowed. In the centre of the building, behind the hall, may be a drawing-room 26 feet long and 16 broad; and behind the stair-case will be a room for a common parlour of 16 feet square. The passage of communication between the house and wings may be formed into colonnades in a cheap manner behind: a flight of steps, raised with a sweep, occupying the centre of each, and leading up to a door, and the covering being no more than a shed supported by the plainest and cheapest columns.

The two wings now remain to be disposed of. That on the right hand may contain the kitchen and offices belonging to it, and the other the stables. The front of the right-hand wing may by occupied by a kitchen entirely, which will then be 30 feet long and 16½ wide; or it may be made smaller, by setting off a small room to the right. Twenty-two feet by 16 will then be a good bigness. The other room will then have the same depth of 16 feet, and the width to the front may be 7½. Beyond the kitchen may stand the stair-case, for which 7½ feet will be a proper allowance; and to the right of this may be a scullery 12 feet 10 inches deep from the back front by 7 in breadth. To the left of the stair may be a servants hall 16 feet square, and behind that a larder 12 feet 10 by 14 feet 6. In the centre of the other wing may be a double coach-house: for which there should be allowed the whole breadth of the wing, with 10 feet 6 inches in the clear; and on each side of this may be the stables. The external decorations of the front and wings will be better understood from the figure than they can be by any description.

121 Of the Eral of Wemyss's house.

Plate LIV. shows the plan and elevation of the house of the Earl of Wemyss at Newmills. The proportions of the rooms are marked in the plan; and the front, being decorated with columns of the Ionic order, will sufficiently show in what manner any of the five orders may be induced with propriety and elegance.

Chap. IV. *Of Aquatic Buildings.*

1. Of Bridges.

122

These are constructed either of wood or stone; of which the last are evidently the strongest and most durable, and therefore in all cases to be preferred where the expence of erecting them can be borne. The proper situation for them is easily known, and requires no explanation; the only thing to be observed is, to make them cross the stream at right angles, for the sake of the boats that pass through the arches, with the current of the river; and to prevent the continual striking of the stream against the piers, which in a long course may endanger their being damaged and destroyed in the end.

Bridges built for a communication of high roads, ought to be so strong and substantial as to be proof against all accidents that may happen, to have a free entrance for carriages, afford an easy passage to the waters, and be properly adapted for navigation, if the river admits of it. Therefore the bridge ought to be at least as long as the river is wide in the time of its greatest flood: because the sloping of the waters above may cause too great a fall; which may prove dangerous to the vessels, and occasion the under graveling the foundation of the piers and abutments; or, by reducing the passage of the water too much in time of a great flood, it might break though the banks of the river, and overflow the adjacent country, which would cause very great damages; or if this should not happen, the water might rise above the arches, and endanger the bridge to be overset, as has happened in many places.

When the length of the bridge is equal to the breadth of the river, which is commonly the case, the current is lessened by the space taken up by the piers: for which reason this thickness should be no more than is necessary to support the arches; and it depends, as well as that of the abutments, on the width of the arches, their thickness, and the height of the piers.

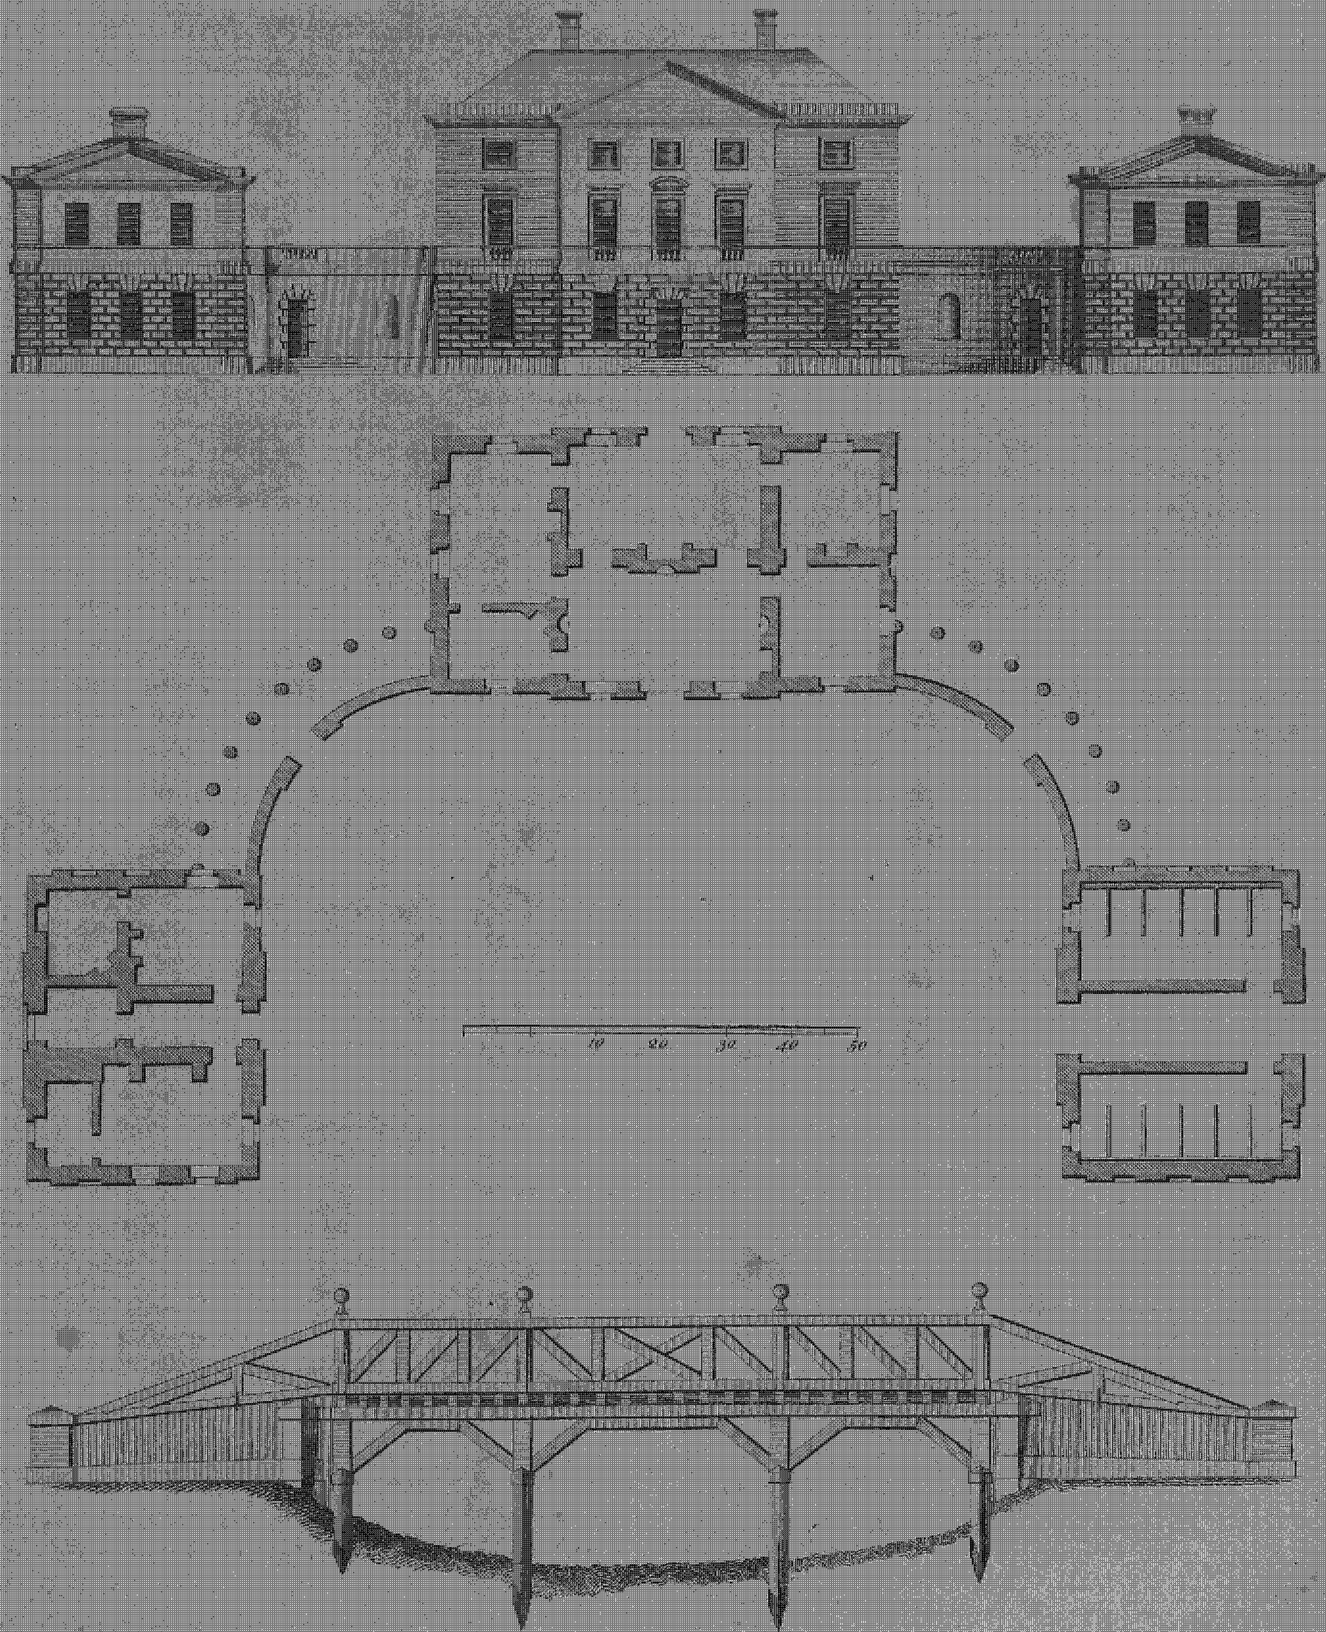
123 Proper form of arches.

The form of the arch is commonly semicircular; but when they are of any great width, they are made elliptical, because they would otherwise become too high. This has been done at the Pont Royal at Paris, where the middle arch is 75 feet, and its height would have been 37.5 feet, instead of which it is only 24 by being made elliptical.

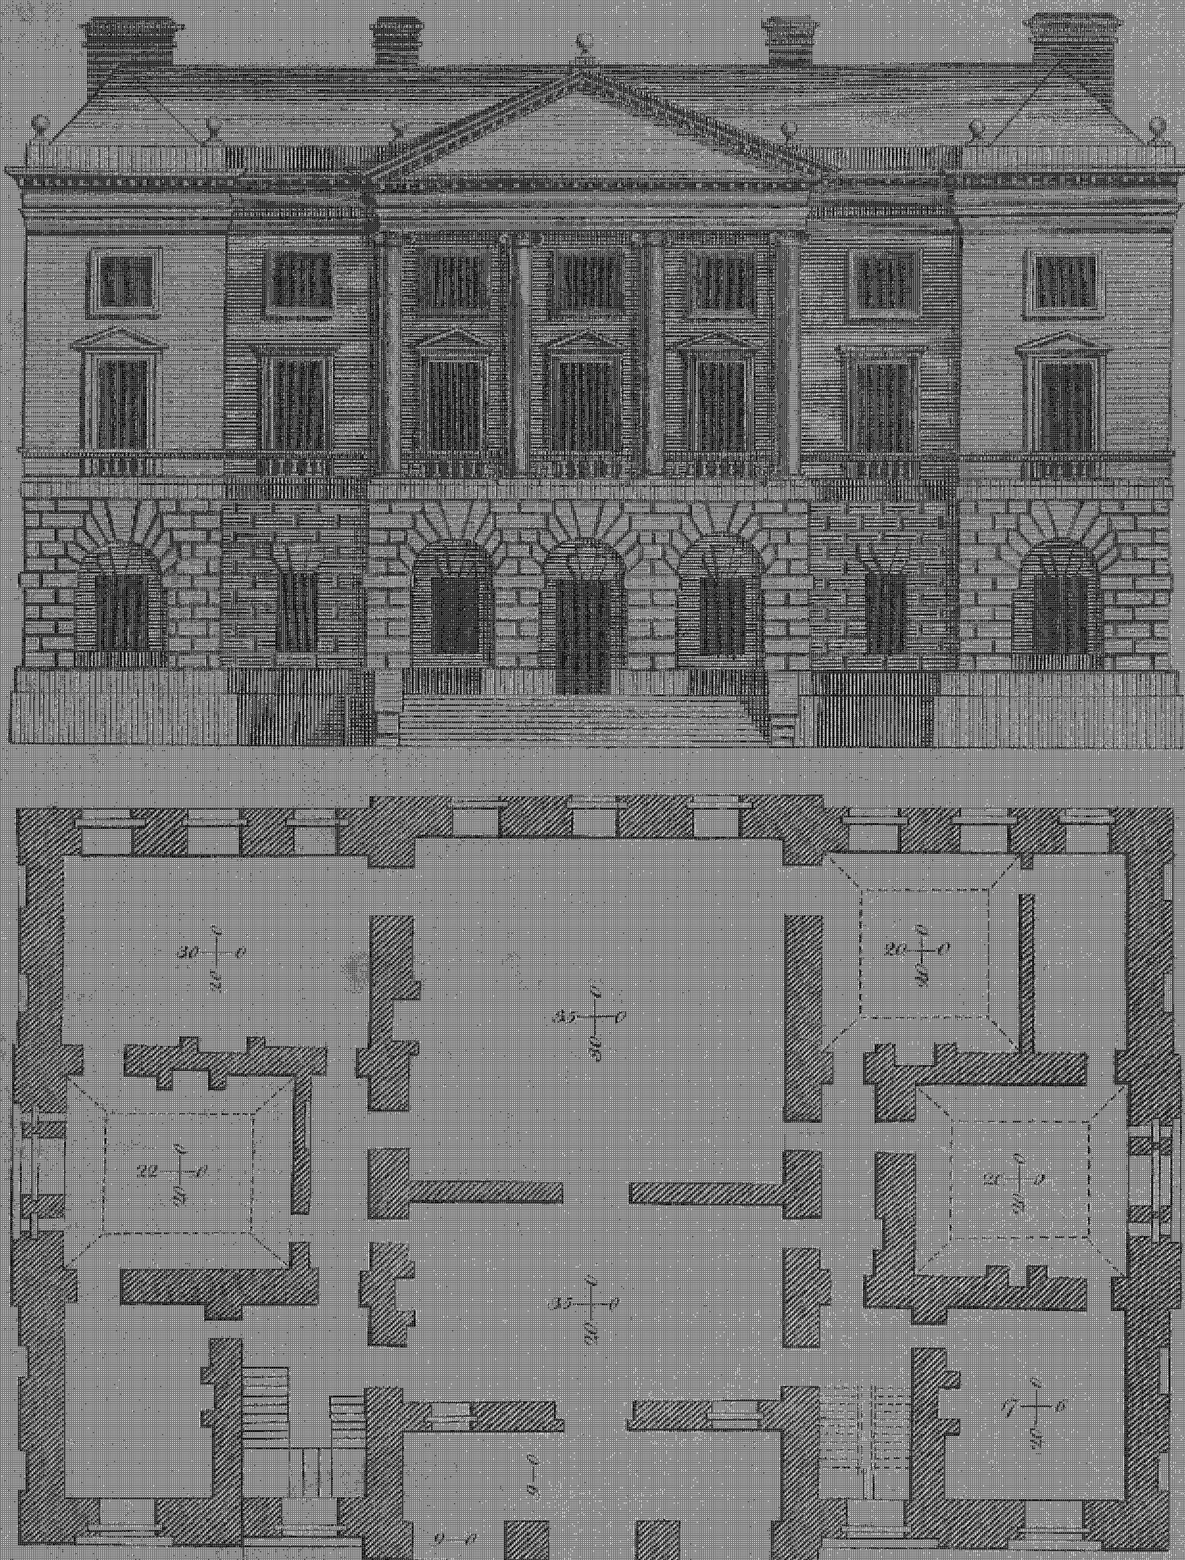
Another advantage of much more importance arises from the oval figure, which is, that the quantity of masonry of the arches is reduced in the same proportion as the radius of the arch is to its height. That is, if the radius is 36 feet, and the height of the arch 24, or three-fourths of the radius, the quantity of masonry of the arches is likewise reduced to three-fourths; which must lessen the expence of the bridge considerably. Notwithstanding these advantages, however, the latest experiments have determined segments of circles to be preferable to curves of any other kind; and of these the semicircle is undoubtedly the best, as pressing most perpendicularly on the piers.

When the height of the piers is about six feet, and the arches are circular, experience has shown, says Mr Belidor,

Architecture



R. Scot Sculp. Philad.a



Thackara & Vallance, Sculp.

 Belidor, that it is sufficient to make the thickness of the piers the sixth-part of the width of the arch, and two feet more; that is, the thickness of the piers of an arch of 36 feet, ought to be 8 feet; those of an arch of 48 feet, to be 10.

124 Thickness of the piers. When the arches are of a great width, the thickness of the piers may be reduced to the sixth-part of that width; but the depression of the two feet is not done at once; that is, in an arch above 48 feet, 3 inches are taken off for every 6 feet of increase of the width of the arch. For instance, the thickness of the piers supporting an arch of 72 feet wide, should be 14 feet, according to the preceding rule; but by taking off 3 inches for every six feet, above an arch of 48 wide, the thickness of the piers is reduced to 13 feet: consequently, by following the same rule, the thickness of the piers supporting an arch of 16 fathoms wide, will be 16 feet; all the others above that width are the sixth-part of the width.

After this, Mr Belidor gives a rule for finding the thickness of the piers which support elliptic arches, and makes them stronger than the former: the abutments he makes one-sixth part more than the piers of the largest arch. But it is plain that these rules are insufficient, being merely guess-work, determined from some works that have been executed.

125 Of the arch stones. The thickness of the arch-stones is not to be determined by theory, nor do those authors who have written on the subject agree amongst themselves. Mr Gautier, an experienced engineer, in his works, makes the length of the arch-stones, of an arch 24 feet wide, 2 feet; of an arch 45, 60, 75, 90 wide, to be 3, 4, 5, 6, feet long respectively, when they are hard and durable, and something longer when they are of a soft nature: on the contrary, Mr Belidor says, they ought to be always one twenty-fourth part of the width of the arch, whether the stone be hard or soft; because, if they are soft, they weigh not so much.

But that the length of the arch-stones should be but a foot in an arch of 24 feet wide, 2, 3, 4, in arches of 48, 72, 96 feet, seems incredible; because the great weight of the arches would crush them to pieces, by the pressure against one another; and therefore Mr Gautier's rule appears preferable: as he made the length of the arch-stones to increase in a slower proportion, from 10 to 45 feet wide, than in those above that width, we imagine that the latter will be sufficient for all widths, whether they are great or little: therefore we shall suppose the length of the arch-stones of 30 feet in width to be two feet, and to increase one foot in 15; that is, 3 feet in an arch of 45 feet; 4, 5, 6, in an arch of 60, 75, and 90 feet: and so the rest in the same proportion.

Table containing the thickness of piers of bridges.

	6	90	12	15	18	21	24
20	4.574	4.918	5.165	3.350	5.492	5.610	5.698
25	5.490	5.913	6.216	6.455	6.645	6.801	7.930
30	6.386	6.816	7.225	7.513	7.746	7.939	8.102
35	7.258	7.786	8.200	8.532	8.807	9.037	9.233
40	8.404	8.691	9.148	9.523	9.835	10.101	10.328
45	8.965	9.579	10.077	10.489	10.837	11.136	11.394
50	9.805	10.454	10.987	11.435	11.817	12.146	12.434
55	10.640	11.245	11.882	12.364	13.019	13.149	13.218
60	11.400	12.110	12.718	13.281	13.723	14.109	14.314
65	12.265	13.025	13.648	14.185	14.654	15.082	15.433
70	13.114	13.869	14.517	15.049	15.573	16.011	16.400
75	14.000	14.705	15.336	15.965	16.480	16.940	17.354
80	14.747	15.542	16.234	16.842	17.381	17.864	18.298
85	15.513	16.328	17.041	17.674	18.237	18.742	19.198
90	16.373	17.201	17.929	18.578	19.157	19.679	20.152
95	17.184	17.826	18.772	19.438	20.036	20.577	21.068
100	17.991	18.848	19.610	20.293	20.908	21.466	21.976

The first horizontal line expresses the height of the piers in feet, from 6 to 24 feet, each increasing by 3; the first vertical column, the width of arches from 20 to 100 feet, for every five feet. 125 Explanation of the table.

The other columns express the thickness of piers in feet and decimals, according to the respective height at the head of the column, and the width of the arch against it in the first column.

Thus, for example, let the width of the arch be 60 feet, and the height of the piers 12; then the number 12.718, under 12, and against 60, expresses the thickness of the piers, that is 12 feet and 8.6 inches: we must observe again, that the length of the key-stone is 2 feet in an arch of 30 feet wide 3, 4, 5, 6, in an arch of 45, 60, 75, 90; that of 20 feet wide, 1 foot four inches; and the length of any other width is found by adding 4 inches for every 5 feet in width.

As this table contains the thicknesses of piers in respect to arches that are commonly used in practice, we imagined, that to carry it farther would be needless; because the difference between the thickness of the piers of any contiguous arches being but small, those between any two marked here, may be made equal to half the sum of the next below and above it: thus the thickness of the piers of an arch 52 or 53 feet wide is nearly equal to 10.222, half the sum of the thicknesses 9.805 and 10.64 of the arches 50 and 55 feet wide, when the height of the piers is 6 feet.

127 Form of piers. Rectangular piers are seldom used but in bridges over small rivers. In all others, they project the bridge by a triangular prism, which presents an edge to the

 stream,

ſtream, in order to divide the water more eaſily, and to prevent the ice from ſheltering there, as well as veſſels from running foul againſt them: that edge is terminated by the adjacent ſurfaces at right angles to each other at Weſtminſter-bridge, and make an acute angle at the Pont Royal of about 60 degrees; but of late the French terminate this angle by two cylindric ſurfaces, whoſe baſes are arcs 60 degrees, in all their new
128 bridges.

Slope of the bridge on each ſide.

When the banks of the rivers are pretty high, the bridge is made quite level above, and all the arches of an equal width: but where they are low, or for the ſake of navigation a large arch is made in the middle of the ſtream, then the bridge is made higher in the middle than at the ends: in this caſe, the ſlope muſt be made eaſy and gradual on both ſides, ſo as to form above one continued curve line, otherwiſe it appears diſagreeable to the eye. Mr Belidor will have the deſcent of that ſlope to be one twenty-fourth part of the length: but this is undoubtedly too much, as one-fiftieth part
129 of the length is quite ſufficient for the deſcent.

Width, &c.

The width commonly allowed to ſmall bridges is 30 feet: but in large ones near great towns, theſe 30 feet are allowed clear for horſes and carriages, beſides a banquet at each ſide for foot paſſengers of 6 to 9 feet each, raiſed about a foot above the common road; the parapet-walls on each ſide are about 18 inches thick and 4 feet high · they generally project the bridge with a corniſh underneath; ſometimes balluſtrades of ſtone or iron are placed upon the parapet, as at Weſtminſter; but this is only practiſed where a bridge of a great length is made near the capital of a country.

The ends of bridges open from the middle of the two large arches with two wings, making an angle of 45 degrees with the reſt, in order to make their entrance more free and eaſy: theſe wings are ſupported by the ſame arches of the bridge next to them being continued in the manner of an arch, of which one pier is much longer than the other.

How the work is to be carried on.

130 Methods of laying the foundation

As the laying the foundation of the piers is the moſt difficult part of the whole work, it is neceſſary we ſhould begin with an eaſy caſe, that is, when the depth of the water does not exceed 6 or 8 feet; and then proceed
131 to thoſe which may happen in a greater depth of water.

By batardeaus.

One of the abutments with the adjacent piers is incloſed by a dyke called *batardeau* by the French, of a ſufficient width for the work, and room for the workmen. This batardeau is made by driving a double row of piles, whoſe diſtance is equal to the depth of water, and the piles in each row are 3 feet from each other; they are faſtened together on the outſide by bonds of 6 by 4 inches: this being done, frames of about 9 feet wide are placed on the inſide to receive the boards which are to form the incloſure: the two uprights of theſe frames are two boards of an inch and half thick, ſharpened below to be driven into the ground, and faſtened together by double bonds, one below and the other above, each ſeparated by the thickneſs of the uprights; theſe bonds ſerve to ſlide the boards between: after theſe frames have been driven into the ground as hard as can be, then the boards themſelves are likewiſe driven in till they reach the firm ground underneath.

Between every two piles tie-beams are faſtened to the bonds of the piles, to faſten the inſide wall to the outſide one; theſe tie-beams are let into the bonds and bolted to the adjacent piles: this being done, the bottom is cleared from the looſe ſand and gravel, by a machine like thoſe uſed by ballaſt-heavers; and then well prepared clay is rammed into this coffer very tight and firm, to prevent the water from oozing through.

Sometimes theſe incloſures are made with piles only driven cloſe to each other; at others, the piles are notched or dove-tailed one into the other; but the moſt uſual method is to drive piles with grooves in them, 5 or 6 feet diſtant from each other, and boards are let down between them.

This being done, pumps and other engines are uſed to draw the water out of the incloſures, ſo as to be quite dry; then the foundation is dug, and the ſtones are laid with the uſual precautions, obſerving to keep ſome of the engines always ſtanding, in order to draw out the water that may ooze through the batardeau.

The foundation being cleared, and every thing ready to begin the work, a courſe of ſtones is laid; the outſide all round with the largeſt ſtretchers and headers that can be had, and the inſide filled with aſhlers well jointed, the whole laid in terraſs mortar: the facings are crampt together, and ſet in lead; and ſome cramps are alſo uſed to faſten the facings with the inſide. The ſame manner is to be obſerved throughout all the courſes to the height of low-water mark; after which the facings alone are laid in terraſs mortar, and the inſide with the beſt of the common ſort. When the foundation is carried to the height of low-water mark, or to the height where the arches begin, then the ſhaft or middle wall is to be carried up nearly to the height of the arches, and there left ſtanding till all the piers are finiſhed, in order that the maſonry may be ſufficiently dry and ſettled before the arches are begun. 132

Proper form of the baſe.

As the piers end generally with an arch at each end, it is cuſtomary to lay the foundation in the ſame manner: which is not ſo well as to continue the baſe rectangular quite to the ends of the piers, and as high as low-water mark; both becauſe the foundation becomes then ſo much broader, and alſo becauſe the water will not be able to get under it: for when the current ſets againſt a flat ſurface, it drives the ſand and mud againſt it ſo as to cover it entirely; whereas if a ſharp edge be preſented to the ſtream, it carries every thing away, and expoſes the foundation to the continual action of the water, which in courſe of time muſt deſtroy it.

After the intervals between the arches are filled up with ſtones laid in a regular manner without mortar, and the gravel is laid over them; two drains or gutters are to be made lengthwiſe over the bridge, one on each ſide next to the foot-path, about 6 feet wide and a foot deep; which being filled with ſmall pebble ſtones, ſerve to carry off the rain-water that falls on the bridge, and to prevent its filtering through the joints of the arches, as often happens. 133

Method of building with coffers, as was practiſed at Weſtminſter bridge.

The former method of laying the foundation by means of batardeaus is very expenſive, and often meets with great difficulties: for when the depth of water is 8 feet or more, it is ſcarcely poſſible to make the batardeaus ſo tight as to prevent the water from oozing through them; and in that caſe the number of engines required, as well as the hands to work them, become very extenſive; and if part of the batardeau ſhould break

break by some extraordinary wind or tide, the workmen would be exposed to very great danger.

The next and best method therefore is to build with coffers, when it is practicable, such as were used at Westminster bridge. Here the height of water was 6 feet at a medium when lowest, and the tide rose about 10 feet at a medium also: so that the greatest depth of water was about 16 feet. At the place where one of the piers of the middle or great arch was to be, the workmen began to drive piles of about 13 or 14 inches square, and 34 feet long, shod with iron, so as to enter into the gravel with more ease, and hooped above to prevent their splitting in driving them: these piles were driven as deep as could be done, which was 13 or 14 feet below the surface of the bed of the river, and 7 feet distant from each other, parallel to the short ends of the pier, and at about 30 feet distant from them: the number of these piles was 34, and their intent to prevent any vessels or barges from approaching the work; and in order to hinder boats from passing between them, booms were placed so as to rise and fall with the water.

This being done, the ballast-men began to dig the foundation under the water, of about 6 feet deep, and 5 wider all round than the intended coffer was to be, with an easy slope to prevent the ground from falling in: in order to prevent the current from washing the sand into the pit, short grooved piles were driven before the two ends and part of the sides, not above 4 feet higher than low-water mark, and about 15 feet distant from the coffer: between these piles rows of boards were let into the groves down to the bed of the river, and fixed there.

The bottom of the coffer was made of a strong grate, consisting of two rows of large timbers, the one longwise, and the other crosswise, bolted together with wooden trunnels ten feet wider than the intended foundation. The sides of the coffer were made of fir timbers laid horizontally close one over another, pinned with oaken trunnels, and framed together at the corners, excepting at the two saliant angles, where they were secured with proper irons, so that the one-half might be loosened from the other if it should be thought necessary; these sides were lined on the inside as well as on the outside with three-inch planks placed vertically; the thickness of those sides was 18 inches at the bottom, reduced to 15 above, and they were 16 feet high; besides, knee timbers were bolted at the angles, in order to secure them in the strongest manner. The sides were fastened to the bottom by 28 pieces of timber on the outside, and 18 within, called *straps*, about 8 inches broad, and 3 or four inches thick, reaching and lapping over the ends of the sides: the lower part of these straps had one side cut dove-tail fashion, in order to fit the mortises made near the edge of the bottom to receive them, and were kept in their places by iron wedges, which being drawn out when the sides were to be taken away, gave liberty to clear the straps from the mortises.

Before the coffer was launched, the foundation was examined, in order to know whether it was level; for which purpose several gauges were made, each of which consisted of a stone of about 15 inches square and three thick, with a wooden pole in the middle of about 18 feet long. The foundation being levelled and the coffer fixed directly over the place with cables fastened to the adjacent piles, the masons laid the first course of the stones for the foundation within it; which being finished a sluice made in the side was opened near the time of low water; on which the coffer sunk to the bottom; and if it did not set level, the sluice was shut, and the water pumped out, so as to make it float till such time as the foundation was levelled: then the masons crampt the stones of the first course, and laid a second; which being likewise crampt, a third course was laid: then the sluice being opened again, proper care was taken that the coffer should settle in its due place. The stone-work being thus raised to within two feet of the common low-water mark, about two hours before low-water the sluice was shut, and the water pumped out so far as that the masons could lay the next course of stone, which they continued to do till the water was risen so high as to make it unsafe to proceed any farther: then they left off the work, and opened the sluice to let in the water. Thus they continued to work night and day at low-water, till they had carried their work some feet higher than the low-water mark: after this, the sides of the coffer were loosened from the bottom, which made them float; and then were carried ashore to be fixed to another bottom, in order to serve for the next pier.

It must be observed, that the coffer being no higher than 16 feet, which is equal to the greatest depth of water, and the foundation being 6 feet under the bed of the river; the coffer was therefore 6 feet under water when the tide was in; but being loaded with three courses of stones, and well secured with ropes fastened to the piles, it could not move from its place. By making it no higher, much labour and expence were saved: yet it answered the intent full as well as if it had been high enough to reach above the highest flood.

The pier being thus carried on above low-water mark, the masons finished the rest of it during the intervals of the tides in the usual way; and after all the piers and abutments were finished in a like manner, the arches were begun and completed as mentioned before: the whole bridge was built in about seven years, without any accidents happening either in the work or to the workmen, which is seldom the case in works of this nature.

134 Materials employed.

It may be observed, that all the piers were built with solid Portland stone, some of which weighed four tons. The arch-stones were likewise of the same sort: but the rest of the masonry was finished with Kentish *rag-stones*; and the paths for foot passengers were paved with *purbec*, which is the hardest stone to be had in England, excepting Plymouth marble.

135 This method sometimes impracticable.

This method of building bridges is certainly the easiest and cheapest that can be thought of, but cannot be used in many cases: when the foundation is so bad as not to be depended upon without being piled, or the depth of water is very great, with a stong current and no tide, it cannot then be practised. For if piles are to be used, it will be next to impossible to cut them off in the same level five or six feet below the bed of the river, notwithstanding that saws have been invented for that purpose: because if they are cut off separately, it will be a hard matter to do it so nicely that the one shall not exceed the other in height; and if this is not done, the grating or bottom of the coffer will not be equally sup-

Practice. supported, whereby the foundation becomes precarious: neither can they be cut off all together; for piles are to be driven as far as the bottom of the coffer extends, which at Westminster bridge was 27 feet; the saw must have 3 feet play, which makes the total length of the saw 30 feet; now if either the water is deeper than it is there, or the arches are wider, the saw must still be longer; so that this method is impracticable in any such cases.

In a great depth of water that has a strong current and no tide, the coffers must reach above the water, which makes them very expensive, and unwieldy to manage, as well as very difficult to be secured in their places, and kept steady: so that there is no probability of using them in such a case.

136 Russian method. In some cases, when there is a great depth of water, and the bed of the river is tolerably level, or where it can be made so by any contrivance, a very strong frame of timber about four times as large as the base of the piers may be let down with stones upon it round the edges to make it sink: after fixing it level, piles must be driven about it to keep it in its place; and then the foundation may be laid in coffers as before, which are to be kept steady by means of ropes tied to the piles.

This method has frequently been used in Russia; and though the bed of the river is not very solid, yet such a grate, when once well settled with the weight of the pier upon it, will be as firm as if piles had been driven under the foundation; but to prevent the water from gulling under the foundation, and to secure it against all accidents, a row of dove-tail piles must be driven quite round the grating: this precaution being taken, the foundation will be as secure as any that can be made.

137 French method. The French engineers make use of another method in raising the foundations of masonry under water; which is, to drive a row of piles round the intended place, nearer to, or farther from, each other, according as the water is more deep or shallow: these piles, being strongly bound together in several places with horizontal tie-beams, serve to support a row of dove-tail piles driven within them: when this is done, and all well secured according to the nature of the situation and circumstances, they dig the foundation by means of a machine with scoops, invented for that purpose, until they come to a solid bed of gravel or clay; or if the bed of the river is of a soft consistence to a great depth, it is dug only to about six feet, and a grate of timber is laid upon it, which is well secured with piles driven into the opposite corners of each square, not minding whether they exceed the upper surface of the grate much or little.

When the foundation is thus prepared, they make a kind of mortar called *beton*, which consists of twelve parts of pozolano or Dutch terrass, six of good sand, nine of unslacked lime, the best that can be had, thirteen of stone splinters not exceeding the bigness of an egg, and three parts of tile-dust, or cinders, or else scales of iron out of a forge: this being well worked together must be left standing for about 24 hours, or till it becomes so hard as not to be separated without a pick-ax.

This mortar being thus prepared, they throw into the coffer a bed of ruble-stone, not very large, and spread them all over the bottom as nearly level as they can; then they sink a box full of this hard mortar, broken into pieces, till it comes within a little of the bottom; the box is so contrived as to be overset or turned upside down at any depth; which being done, the pieces of mortar soften, and so fill up the vacant spaces between the stones; by these means they sink as much of it as will form a bed of about 12 inches deep all over; then they throw in another bed of stone, and continue alternately to throw one of mortar and one of stone till the work approaches near the surface of the water where it is levelled, and then the rest is finished with stones in the usual manner. Practice.

Mr Belidor says, in the second part of his Hydraulics, vol. ii. p. 188, that Mr Millet de Montville having filled a coffer containing 27 cubit feet, with masonry made of this mortar, and sunk it into the sea, it was there left standing for two months, and when it was taken out again it was harder than stone itself. 138 Impossibility of building bridges in some cases.

We have hitherto mentioned such situations only where the ground is of a soft nature: but where it is rocky and uneven, all the former methods prove ineffectual; nor indeed has their yet been any one proposed which can be always used upon such occasions, especially in a great depth of water. When the water is not so deep but that the unevenness of the rock can be perceived by the eye, piles strongly shod with iron may be raised and let fall down, by means of a machine, upon the higher parts, so as to break them off piece by piece, till the foundation is tolerably even, especially when the rock is not very hard; which being done, either this or any other way that can be thought of, a coffer is made without any bottom, which is let down and well secured, so as not to move from its place: to make it sink, heavy stones should be fixed on the outside; then strong mortar and stones must be thrown into it; and if the foundation is once brought to a level, large hewn stones may be let down so as to lie flat and even: by these means the work may be carried on quite up to the surface of the water. But when the water is so deep, or the rock so hard as not to be levelled, the foundation must be sounded, so as to get nearly the risings and fallings; then the lower part of the coffer must be cut nearly in the same manner, and the rest finished as before. It must however be observed, that we suppose a possibility of sinking a coffer; but where this cannot be done, no method that we know of will answer.

Among the aquatic buildings of the ancients none appears to have been more magnificent than Trajan's bridge. Dion Cassius gives the following account of it: "Trajan built a bridge over the Danube, which in truth one cannot sufficiently admire; for though all the works of Trajan are very magnificent, yet this far exceeds all the others: the piers were 20 in number, of square stones; each of them 150 feet high above the foundation, 60 feet in breadth, and distant from one another 170 feet. Though the expence of this work must have been exceeding great, yet it becomes more extraordinary by the rivers being very rapid, and its bottom of a soft nature: where the bridge was built, was the narrowest part of the river thereabout, for in most others it is double or treble this breadth; and although on this account it became so much the deeper and the more rigid, yet no other place was so suitable for this undertaking. The arches were afterwards 139 Trajan's bridge over the Danube described.

broken

broken down by Adrian; but the piers are ſtill remaining, which ſeem as it were to teſtify that there is nothing which human ingenuity is not able to effect." The whole length then of this bridge was 1590 yards; ſome authors add, that it was built in one ſummer, and that Apollodorus of Damaſcus was the architect, who left behind him a deſcription of this great work.

140 Wooden bridges.

Where ſtone bridges cannot be erected on account of the expence, very ſtrong and durable ones may be conſtructed of wood: in which caſe they ought to be ſo framed, as that all the parts may preſs upon one another like the arch of a ſtone bridge; and thus, inſtead of being weakened by great weights paſſing over them, they will become the ſtronger. How this is to be accompliſhed, will be better underſtood from the figure at bottom of Plate LIII. which repreſents a wooden bridge conſtructed after this manner, than it can be by any deſcription.

2. Of Harbours.

141 Situation proper for harbours.

In theſe, the firſt thing to be conſidered is the ſituation; which may be ſome large creek or baſon of water, in or near the place where the harbour is intended to be made, or at the entrance of a large river, or near the ſea: for a harbour ſhould never be dug entirely out of dry land, unleſs upon ſome extraordinary occaſions, where it is impoſſible to do otherwiſe, and yet a harbour is abſolutely neceſſary. When a proper place is found, before it is fixed upon, it muſt be conſidered whether ſhips can lie there ſafe in ſtormy weather, eſpecially when thoſe winds blow which are moſt dangerous upon that coaſt; whether there be any hills, riſing ground, or high buildings, that will cover it; in theſe caſes, the ſituation is very proper: but if there be nothing already that will cover the ſhips, it muſt be obſerved whether any covering can be made at a moderate expence, otherwiſe it would be uſeleſs to build a harbour there.

The next thing to be conſidered is, whether there be a ſufficient depth of water for large ſhips to enter with ſafety, and lie there without touching the ground; and if not, whether the entrance and inſide might not be made deeper at a moderate expence: or, in caſe a ſufficient depth of water is not to be had for large ſhips, whether the harbour would not be uſeful for ſmall merchantmen; for ſuch a one is often of great advantage, when ſituated upon a coaſt much frequented by ſmall coaſting veſſels.

The form of the harbour muſt be determined in ſuch a manner, that the ſhips which come in when it is ſtormy weather may lie ſafe, and ſo as there may be ſufficient room for as many as paſs that way: the depths of water where the piers are to be built muſt be taken at every 10, 15, or 20, feet diſtance, and marked upon piles driven here and there, in order that the workmen may be directed in laying the foundation.

142 Materials.

This being done, it muſt be conſidered what kind of materials are to be uſed, whether ſtone, brick, or wood. When ſtones are to be had at a moderate price, they ought to be preferred, becauſe the work will be much ſtronger, more laſting, and need fewer repairs, than if made with any other materials: but when ſtones are ſcarce, and the expence becomes greater than what is allowed for building the harbour, the foundation may be made of ſtone as high as low-water mark, and the reſt finiſhed with brick. If this manner of building ſhould ſtill be too expenſive, wood muſt be uſed; that is, piles are driven as cloſe as is thought neceſſary; which being faſtened together by croſs-bars, and covered with ſtrong oaken planks, form a kind of coffer, which is filled with all kinds of ſtones, chalk, and ſhingles.

143 French method of building.

The manner of laying the foundation in different depths of water, and in various ſoils, requires particular methods to be followed. When the water is very deep, the French throw in a great quantity of ſtones at random, ſo as to form a much larger baſe than would be required upon dry land; this they continue to within 3 or 4 feet of the ſurface of the water, where they lay the ſtones in a regular manner, till the foundation is raiſed above the water: they then lay a great weight of ſtones upon it, and let it ſtand during the winter, to ſettle; as likewiſe to ſee whether it is firm, and reſiſts the force of the waves and winds: after that, they finiſh the ſuperſtructure with large ſtones in the uſual manner.

144 A preferable one.

As this method requires a great quantity of ſtones, it can be practiſed only in places where ſtones are in plenty; and therefore the following one is much preferable. A coffer is made with dove-tail piles of above 30 yards long, and as wide as the thickneſs of the foundation is to be; then the ground is dug and levelled, and the wall is built with the beſt mortar.

As ſoon as the mortar is tolerably dry, thoſe piles at the end of the wall are drawn out, the ſide-rows are continued to about 30 yards farther, and the end incloſed; then the foundation is cleared, and the ſtones laid as before. But it muſt be obſerved, that the end of the foundation finiſhed is left rough, in order that the part next to it may incorporate with it in a proper manner: but if it is not very dry, it will incline that way of itſelf, and bind with the mortar that is thrown in next to it: this method is continued till the whole pier is entirely finiſhed.

It muſt likewiſe be obſerved, that the piers are not made of one continued ſolid wall; becauſe in deep water it would be too expenſive: for which reaſon, two walls are built parallel to each other, and the interval between them is filled up with ſhingles, chalk, and ſtone. As theſe walls are in danger of being thruſt out or overſet, by the corps in the middle, together with the great weight laid at times on the peir, they are tied or bound together by croſs-walls at every 30 or 40 yards diſtance, by which they ſupport each other in a firm and ſtrong manner.

In a country where there is a great plenty of ſtones, piles may be driven in as deep as they will go, at about two or three feet diſtance; and when the foundation is ſunk and levelled, large ſtones may be let down, which will bed themſelves: but care muſt be taken to lay them cloſe, and ſo as to have no two joints over each other; and when the wall is come within reach, the ſtones muſt be crampt together.

145 Another method with coffers

Another method practiſed, is to build in coffers much after the ſame manner as has been done in building the piers of Weſtminſter bridge; but as in this caſe the ends of the coffers are left in the wall, and prevent their joining ſo well as to be water-tight, the water that penetrates through and enters into the corps may occa-

ſion

Practice.

sion the wall to burst and to tumble down. Another inconveniency arising from this manner of building is, that as there are but few places without worms, which will destroy wood where-ever they cand find it; by their means the water is let into the pier, and consequently makes the work liable to the same accident as has been mentioned above.

149 Russian method.

To prevent these inconveniences, the best method is, to take the wood away, and joggle the ends of the walls together with large stones, pouring terrass-mortar into the joints; when this is done, the water between the two walls may be pumpt out, and the void space filled up with stone and shingle as usual: or if these joggles cannot be made water-tight, some dove-tail piles must be driven at each end as close to the wall as can be done, and strong sail-cloth put on the outside of them, which, when the water is pumpt out, will stick so close to the piles and wall, that no water can come in. This method is commonly used in Russia.

147 Thickness of piers.

The thickness of a pier depends on two considerations: it ought to be both such as may be able to resist the shock of the waves in stormy weather; and also to be of a sufficient breadth above, that ships may be laden or unladen whenever it is thought necessary. Now, because the specific gravity of sea-water is about one half that of brick, and as 2 to 5 in comparison of stone; and since the pressure of stagnated water against any surface is equal to the weight of the prism of water whose altitude is the length of that surface, and whose base is a right angled isosceles triangle, each of the equal sides being equal to the depth of the water; therefore a pier built with bricks, whose thickness is equal to the depth of the water, will weigh about four times as much as the pressure of the water against it; and one of stone of the same breadth, about six times and a quarter as much. Now this is not the force to be considered, since this pressure is the same within as without the pier: but it is that force with which the waves strike against the piers, and that depends on the weight and velocity of the waves, which can hardly be determined; because they vary according to the different depths of water, the distance from the shore, and according to the tides, winds, and other causes. Consequently the proper thickness of the piers cannot be determined by any other means than by experience.

Practitioners suppose, that if the thickness of a pier is equal to the depth of the water, it is sufficient; but for a greater security they allow 2, 3, or 4 feet more. This might probably do, if piers were built with solid stones crampt together; but as this is hardly ever the case, and on the contrary, as the inside is filled up with shingle, chalk, or other loose materials, their rule is not to be depended upon: besides it makes the space above too narrow for lading and unlading the ships, unless in a great depth of water; so that it does not appear that the method can be followed, excepting in a very few cases where the water has but very little motion.

When stone can be had, no other materials should be used, because they being of a larger bulk than brick, will better resist the waves by their own weight, till such time as the mortar is grown hard; for after this is effected, brick will resist better against the action of sea-water than soft stones.

The wall must be built with terrass mortar from the bottom to the height of low-water mark, and the rest finished with cinder or tile-dust mortar, which has been found sufficiently good in those places where the wall is wet and dry alternately. The upper part of the pier should be paved with flat hewn stones laid in strong mortar, in order to prevent any water from penetrating into it: iron rings ought also to be fixed here and there at proper distances, to fasten the ships, and prevent them from striking against the pier when agitated by the waves.

Wooden fenders or piles should be driven at the inside close to the wall, and crampt to it with iron, to prevent the ships from touching them, and from being worn by the continual motion. Where the sea breaks against the piers with great violence, breakers should be made at proper distances; that is, two rows of piles are driven nearly at right angles to the piers for the length of about 12 or 15 feet, and at about 8 or 10 feet distant from each other; and then another to join the two former: these piles being covered with planks, and the inside being filled with shingle and ruble-stones, then the top is paved with stones of about a foot in length, set long-wise to prevent the waves from tearing them up. This precaution is absolutely necessary where the water rushes in very strongly.

Military ARCHITECTURE, the same with what is otherwise called *fortification*. See FORTIFICATION.

Naval ARCHITECTURE, the art of building ships. See SHIP-*Building*.

ARCHITRAVE, in architecture, that part of a column which lies immediately upon the capital, being the lowest member of the entablature. See Plate XXXVII.

Over a chimney, this member is called the *mantle-piece*; and over doors or windows, the *hyperthyron*.

ARCHITRICLINUS, in antiquity, the master or director of a feast, charged with the order and œconomy of it, the covering and uncovering of the tables, the command of the servants, and the like.

The architriclinus was sometimes called *servus tricliniarcha*, and by the Greeks προγευστης, i. e. *prægustator*, or *fore-taster*. Potter also takes the architriclinus for the same with the symposiarcha.

ARCHIVAULT, in architecture, implies the inner contour of an arch, or a band adorned with mouldings, running over the faces of the arch-stones, and bearing upon the imposts. It has only a single face in the Tuscan order, two faces crowned in the Doric and Ionic, and the same mouldings as the architrave in the Corinthian and Composite.

ARCHIVE, or ARCHIVES, a chamber or apartment wherein the records, charters, and other papers and evidences, of a state, house, or community, are preserved, to be consulted occasionally.

We say, the *archives* of a college, of a monastery, &c.

&c. The archives of ancient Rome were in the temple of Saturn; the archives of the court of chancery are in the rolls office.

ARCHIVIST, Archivista, a keeper of an archive.

Under the emperors, the archivist was an officer of great dignity, held equal to the proconsuls, vested with the quality of a count, styled *clarissimus*, and exempted from all public offices and taxes. Among the ancient Greeks and Persians, the trust was committed to none but men of the first rank; among the Franks, the clergy being the only men of letters, kept the office among themselves.—Since the erection of the electoral college, the Archbishop of Mentz has had the direction of the archives of the empire.

ARCHMARSHAL, the grand marshal of the empire, a dignity belonging to the elector of Saxony.

ARCHONS, in Grecian antiquity, were magistrates appointed after the death of Codrus*. They were chosen from the most illustrious families till the time of Aristides, who got a law passed, by which it was enacted, that, in electing these magistrates, less regard should be paid to birth than to merit.

* See the article *Attica*

The tribunal of the archons was composed of nine officers. The first was properly the *archon;* by whose name the year of his administration was distinguished. The title of the second was *king;* that of the third, *polemarchus:* to these were added six *thesmothetæ*. These magistrates, elected by the scrutiny of beans, were obliged to prove, before their respective tribes, that they had sprung, both in their father's and their mother's side, for three descents, from citizens of Athens. They were likewise to prove that they were attached to the worship of Apollo, the tutelary god of their country; that they had in their house an altar consecrated to Apollo; and that they had been respectfully obedient to their parents; an important and sacred part of their character, which promised that they would be faithful servants to their country. They were likewise to prove, that they had served in a military capacity the number of years which the republic required of every citizen: and this qualification gave the state experienced officers; for they were not allowed to quit the army till they were 40 years old. Their fortune too, of which they were to inform those before whom they were examined, was a warrant for their fidelity.

After the commissioners, who were appointed to inquire into their character and other requisites, had made a report of them, they were then to swear that they would maintain the laws; which obligation if they neglected, they engaged to send to Delphi a statue of the weight of their bodies. According to a law of Solon, if an archon got drunk, he was condemned to pay a heavy fine, and sometimes even punished with death. Such magistrates as the Athenian archons were well intitled to respect. Hence it was eternal infamy to insult them; and hence Demosthenes observed, that to treat the thesmothetæ with disrespect, was to show disrespect to the republic.

Another qualification indispensibly required of the second officer of this tribunal, who was called the *king*, was, that he had married the daughter of an Athenian citizen, and that he had espoused her a virgin. This was exacted of him, says Demosthenes, because part of his duty was to sacrifice to the gods jointly with his wife, who, instead of appeasing, would have irritated them, if she had not possessed both those honours.

The inquiry into the private title of the nine archons was very severe; and this attention was the more necessary, as they had a right to take a seat in the Areopagus, after they had quitted their office, and given an account of their administration.

When any obscurity occurred in the laws relative to religion and the worship of the gods, the interpretation was submitted to the tribunal of the archons.

Aristotle observes, that Solon, whose aim was to make his people happy, and who found their government in his time aristocratical, by the election of the nine archons, who were annual magistrates, tempered their power, by establishing the privilege of appealing from them to the people, called by lot to give their suffrage, after having taken the oath of the Heliastæ, in a place near the Panathenæum, where Hissus had formerly calmed a sedition of the people, and bound them to peace by an oath.

The archons were the principal officers, not only in civil, but likewise in sacred matters, and especially in the mysteries of Bacchus. The archons, however, who were surnamed *eponymi*, were chiefly employed in civil affairs; yet they presided at the great feasts, and held the first rank there. Hence they are sometimes styled *priests*.

Archon is also applied by some authors to divers officers, both civil and religious, under the eastern or Greek empire. Thus bishops are sometimes called *archontes;* and the same may be said of the lords of the emperor's court. We also read of the *archon of the antimensia, archon of archons, grand archon, archon of churches, archon of the gospel, archon of the walls, &c.*

ARCHONTICI, in church-history, a branch of Valentinians, who maintained that the world was not created by God, but by angels called *Archontes*.

ARCHPRIEST, Archpresbyter, a priest or presbyter established in some dioceses, with a pre-eminence over the rest. Anciently the archpriest was the first person after the bishop: he was seated in the church next after the bishop; and even acted as his vicar, in his absence, as to all spiritual concerns. In the sixth century, there were found several archpriests in the same diocese; from which time some will have them to have been called *deans*. In the ninth century, they distinguished two kinds of cures or parishes: the smaller governed by simple priests; and the baptismal churches by archpriests; who, beside the immediate concern of the cure, had the inspection of the other inferior priests, and gave an account of them to the bishop, who governed the chief, or cathedral church, in person. There are archpresbyters still subsisting in the Greek church; vested with most of the functions and privileges of the chorepiscopi or rural deans.

ARCHTREASURER, the great treasurer of the German empire. This office was created with the eighth electorate, in favour of the elector Palatine, who had lost his former electorate, which was given to the duke of Bavaria, by the emperor Ferdinand II. who took it away from Frederic V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia. The dignity of archtreasurer was contested be-

tween

tween the elector of Brunſwick, who claimed it in virtue of his deſcent from the elector of Frederic and the elector Palatine.

ARCHILUTE, Arcileuto, a long and large lute, having its baſs ſtrings lengthened after the manner of the theorbo, and each row doubled, either with a little octave or an uniſon. It is uſed by the Italians for playing a thorough baſs.

ARCHYTAS of Tarentum, a philoſopher of the Pythagorean ſect, and famous for being the maſter of Plato, Eudoxas, and Philolaus, lived about 408 years before Chriſt. He was an excellent mathematician, particularly in that part of the ſcience which regards mechanics: he is ſaid to have made a wooden pigeon that could fly, and to be the firſt that brought down mathematics to common uſes. He is ſaid to be the inventor of the ten categories. He aſſerted, that God was the beginning, the ſupporter, and the end, of all things. There are two epiſtles preſerved in Diogenes Laertius, one from Archytas to Plato, and another from Plato to Archytas. He acquired great reputation in his legiſlative capacity. He likewiſe commanded the army ſeven times, and was never defeated; but was at laſt caſt away in the Adriatic Sea, and thrown upon the coaſt of Apulia.

ARCIS-SUR-AUBE, a ſmall handſome town of France, in Champaigne, ſeated on the river Aube. E. Long. 4. 15. N. Lat. 48. 40.

ARCO, a ſtrong town and caſtle in the Trentin, belonging to the houſe of Auſtria. It was taken by the French in 1703, and abandoned ſoon after. It ſtands on the river Sarca, near the north extremity of the lake Garda. E. Long. 9. 55. N. Lat. 45. 52.

ARCONA, a ſtrong town ſituated on the iſland of Rugen in the Baltic. It ſtood on a high promontory, with the eaſt, north, and ſouth ſides defended by ſteep and lofty precipices, and the weſt by a wall fifty feet high, proportionably thick, and ſecured by a deep and broad ditch. It was, however, taken and ruined, in 1168, by Valdemar king of Denmark. One of the conditions impoſed by the conqueror was, that the inhabitants ſhould deſtroy a temple they had erected to St Vitus, and deliver up the vaſt treaſure belonging to this tutelary ſaint. Another was, that they ſhould pay 40 ſilver yokes for oxen, by way of tribute, and enter as ſoldiers in the Daniſh ſervice when called upon.

ARCOS, a ſtrong city of Andaluſia, in Spain, ſeated on a high craggy rock, at the bottom of which runs the Gaudeleto. Its ſtrength lies not only in its ſituation, but in the works erected for its defence, and it is inacceſſible on every ſide but one. The governor reſides in an old caſtle, from whence there is a delightful proſpect, which extends very far into the neighbouring country. W. Long. 2. 10. N. Lat. 36. 40.

ARCTIC, in aſtronomy, an epithet given to the north pole, or the pole raiſed above our horizon. It is called the *arctic pole*, on occaſion of the conſtellation of the little bear, in Greek called αρκτος; the laſt ſtar in the tail whereof nearly points out the north pole.

Arctic Circle is a leſſer circle of the ſphere, parallel to the equator, and 23° 30′ diſtant from the north pole; from whence its name. This, and its oppoſite, the *antarctic*, are called the two *polar circles*; and may be conceived to be deſcribed by the motion of the poles of the ecliptic, round the poles of the equator, or of the world.

ARCTIUM, Burdock: A genus of the polygamia æqualis order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ-capitatæ:* The calyx is globular; with ſcales having hooks reflected at the tops.—The ſpecies are three, viz. the lappa or common burdock, the tomentoſum, and the perſonata. All theſe are troubleſome weeds, ſo require no direction for their culture. The tender ſtems of the common kind, deprived of the bark, may be boiled and eat like aſparagus. When raw, they are good with oil and vinegar. Boys catch bats by throwing the prickly heads of this ſpecies up into the air. Cows and goats eat this herb; ſheep and horſes refuſe it; ſwine are not fond of it. The ſeeds, which have a bitteriſh ſubacrid taſte, are recommended as very efficacious diuretics, given either in the form of emulſion, or in powder to the quantity of a dram. The roots, which taſte ſweetiſh, with a ſlight auſterity and bitteriſhneſs, are eſteemed aperient, diuretic, and ſudorific; and ſaid to act without irritation, ſo as to be ſafely ventured upon in acute diſorders.

ARCTOPHYLAX, (from αρκτος, *bear*, and φυλαττω, *I guard*,) in aſtronomy, a conſtellation, otherwiſe called *Bootes*.

ARCTOPUS, in botany: A genus of the polygamia diœcia claſs; and in the natural method ranking under the 45th order, *Umbellatæ*. The umbella of the male is compound; the involucrum conſiſts of five leaves; the corolla has five petals; the ſtamina are five; and two piſtilli: The umbella of the hermaphrodite is ſimple; the involucrum is divided into four parts, is ſpinous, large, and contains many male flowers in the diſk. There is but one ſpecies of arctopus, viz. the echinatus, a native of Ethiopia.

ARCTOTIS, in botany: A genus of the polygamia neceſſaria order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ-diſcoides*. The receptacle is briſtly; the corona of the pappus is pentaphyllous; and the calyx is imbricated with ſcales looſe at the top. It is commonly called *anemoſpermos*, from the reſemblance of its ſeeds to thoſe of the anemone. The ſpecies are 11; all of them natives of Ethiopia, or the Cape of Good Hope. Of theſe the anguſtifolia with ſpear-ſhaped leaves, and the aſpera with wing-ſhaped woolly leaves, are moſt remarkable for their beauty, having rays of a fine yellow or deep gold colour. They flower in May and June.

Culture. All the ſpecies of arctotis, may be propagated by cuttings; which ſhould be frequently renewed, as the old plants are ſubject to decay in winter. They may be planted in any of the ſummer months, in a bed of light freſh earth; obſerving to ſhade them from the ſun until they have taken root. They ſhould be expoſed to the open air until the latter end of October, or longer, if the weather is favourable, when they muſt be removed into the green-houſe.

ARCTURUS, in aſtronomy, a fixed ſtar, of the firſt magnitude, in the conſtellation of Arctophylax, or Bootes. The word is formed of αρκτος, *bear*, and ουρα, *tail*; q. d. *bear's tail*, as being very near it. This

Plate LVI.

Thackara & Vallance, Sculp.

ſtar was known to the ancients, as in the following verſe of Virgil:

Arcturum, Pluviaſque Hyades, geminoſque Triones.

See Alſo Job ix. 9. xxxviii. 32.

ARCUATION, in gardening, the method of raiſing trees by layers, which is done in the following manner:

Strong mother-plants or ſtools muſt be planted in a clear border, and in a ſtraight line, about ſix feet aſunder. When theſe have ſhot five or ſix main branches from the root, and as many collateral branches, the former muſt be bent to the ground, and there faſtened. The ſmall branches muſt be covered three inches deep upon the joints, and have a large baſon of earth made round them to hold the water.

About the middle of September they may be opened, and, if they have taken root, may be immediately removed into the nurſery; but if they have not ſufficiently extended their roots, they muſt be ſuffered to remain till the ſpring, and then tranſplanted.

ARCUCCIO, Arcutio, a machine made of a board, covered with pieces of hoops, like the tilt of a waggon; uſed in Italy to prevent children from being overlaid and ſmothered by nurſes or others. Every nurſe in Florence is obliged to lay her child in an arcutio, under pain of excommunication.

ARDAMON, or Ardama, in antiquity, a veſſel of water placed at the door of a perſon deceaſed, till the time of burial, as a token that the family was in mourning, and to ſerve to ſprinkle and purify perſons as they came out of the houſe.

ARDASSES, in commerce, the coarſeſt of all the ſilks of Perſia; and as it were the refuſe of each kind. In this ſenſe they ſay, the *legis*, the *houſets*, the *chouſs*, and the *payas ardaſſes*, to ſignify the worſt of thoſe four ſorts of Perſian ſilks.

ARDASSINES, in commerce, called in France *ablaques*; a very fine ſort of Perſian ſilks, little inferior in fineneſs to the ſourbaſtis, or rather cherbaſſis, and yet it is little uſed in the ſilk manufactures of Lyons and Tours, becauſe that kind of ſilk will not bear hot water in the winding.

ARDEA, in ornithology, a genus of the order of grallæ. The general characters of this order are theſe: The bill is ſtraight, ſharp, long, and ſomewhat compreſſed, with a furrow that runs from the noſtrils towards the point; the noſtrils are linear; and the feet have four toes. Under this genus Linnæus comprehends the grus or crane, the ciconia or ſtork, and the ardea or heron, of other authors. See Plates LV. LVI.

1. The firſt ſpecies is the pavonia, or crowned crane, which has an erect briſtly creſt, with the temples and two wattles naked. The head is black; the creſt is yellowiſh, and tipped with black at the top; the wings are white; and the feathers of the tail black, and of an equal length. It is a native of Africa, particularly the coaſt of Guinea, as far as Cape Verd; at this laſt place they are ſaid to be exceedingly tame, and will often come into the court-yards to feed with the poultry. Theſe birds are often kept in our menageries, and, with ſhelter of nights, live a good while. Their chief food is ſuppoſed to be worms, and ſuch other things as the heron tribe uſually feed on; alſo vegetables of all kinds. It often ſleeps on one leg; runs very faſt; and is ſaid not only to fly well, but to continue on the wing for a long time together. The fleſh is ſaid to be very tough.

2. The Virgo, with a ſtraight greeniſh bill and crimſon irides. The crown of the head is aſh-colour; the reſt of the head, the upper part of the neck behind, and all the under parts to the breaſt, black; the back, rump, and tail, and all the under part from the breaſt, are of a bluiſh aſh-colour: behind each eye ſprings a tuft of long white feathers, which decline downwards, and hang in an elegant manner: the quills and tail are black at the ends; the legs black. This ſpecies is found in many parts of Africa and Aſia, where they frequent marſhes and the neighbourhood of rivers, as their food is fiſh, like moſt of the heron genus. It is frequently kept in menageries, being endowed with great gentleneſs of manners, added to its being an elegant bird. At various times it puts itſelf into ſtrange and uncouth attitudes, eſpecially thoſe which imitate dancing; and Keyſler mentions one in the Great Duke's gallery at Florence, which had been taught to dance to a certain tune, when played or ſung to it. The name this bird is known by in the Eaſt is *kurki*, or *querky*. Sometimes it will breed in confinement: one is recorded to have lived 24 years at Verſailles, where it had been bred.

3. The leucogeranos of Pallas, or Siberian crane of Pennant, is four and a half feet when ſtanding erect. The bill is a red colour; the irides are white: the plumage as white as ſnow, except the 10 firſt greater quills, with the coverts of them, which are black: the legs are long and red. This ſpecies inhabits the vaſt marſhes and lakes in Siberia, eſpecially thoſe about the Iſchim, and along the rivers Ob and Irtiſh. It makes its neſt among the reeds, ſeldom acceſſible by man, upon riſing green graſſy tufts, made up of herbs and graſs heaped together; and lays two aſh-coloured eggs, ſpotted with brown. They are ſhy birds, and always upon their guard againſt an enemy; having a centinel to warn them of an approach; on the leaſt alarm they cry aloud, not unlike the ſwan, and fly off directly. The ſportſman finds, in courſe, much difficulty in approaching them within gunſhot; for, as they ſtand near five feet high from the ground, they are enabled to eſpy him at a greater diſtance. Sometimes indeed he approaches them under cover of a ſtalking-horſe, or other object; at other times a ſmall dog will divert their attention, as they will without fear attack the dog, while his maſter gets within reach. In breeding time, however, they are more bold, as they will defend their young even againſt men, ſo as to make it dangerous to come near their haunts. The male and female are ſaid to guard their neſt by turns.

4. The grus, or common crane of Engliſh authors, has a naked papillous crown; the prime feathers of the wings are black; the body is aſh-coloured; the prime feathers of the tail are ragged. This ſpecies is far ſpread, being met with in great flocks throughout Northern Europe and Aſia; in Sweden, Ruſſia throughout, and Siberia as far as the river Anadyr, migrating even to the arctic circle. In Kamtſchatka they are only ſeen on the ſouthern promontory: are migratory, returning

Ardea. northward to breed in the spring, and generally choosing the same places which had been occupied by them the season before. In the winter they inhabit the warmer regions, such as Egypt, Aleppo, India, &c.: they are also met with at the Cape of Good Hope, changing place with the season. In their migrations they frequently fly so high as not to be visible; their passing only being known by the noise they make, which is louder than any other bird. In France they are seen in spring and autumn; but for the most part are mere passengers.—This species seems to have been formerly a native of Britain; as we find in Willoughby, page 52. that there was a penalty of twenty pence for destroying an egg of this bird; and Mr. Ray informs us, that in his time they were found during the winter in large flocks in Lincolnshire and Cambridgeshire: but at present the inhabitants of those counties are scarcely acquainted with them; so that these birds seem now to have forsaken that island. We are told that they make their nest in the marshes, and lay two bluish eggs. The young birds are thought very good food. They feed on reptiles of all kinds, and in turn on green corn; of which last they are said to make so great havock, as to ruin the farmers where-ever the flocks of these depredators alight.

5. The Americana, or hooping crane of Edwards, is a native of America: The crown of the head and temples are naked and papillous; the forehead, nape of the neck, and prime wing-feathers, are black; but the body is white: The under part of the head, as far as the lower chap, is red; the beak is yellowish, and jagged at the point; the feet are red, and the prime tail-feathers white. This is an American species, often seen at the mouths of the Savanna, Alatamaha, and other rivers near St. Augustine: in spring going to the north to breed, like the common crane, and returning like that bird, to the south in autumn. In the summer they are found in Hudson's Bay, at which place they arrive in May, and retire in September; and are chiefly met with in unfrequented places, in the neighbourhood of lakes, where they breed. The nest is made on the ground, composed of grass and feathers. They lay two white eggs, like those of the swan, and sit 20 days; the young are at first yellow, changing to white by degrees. These birds have a loud long note, which may be heard at a great distance: their food is chiefly worms and insects, which it searches for at the bottom of ponds. The natives of Hudson's Bay call this species *Wapaw-uchechauk*.

6. The argil, or hurgil, of Ives, is a very large species; from tip to tip of the wings measuring 14 feet 10 inches; and from the tip of the bill to the claws seven feet and a half: the bill is 16 inches round at the base, of different colours, and nearly of a triangular shape; the feathers of the back and wings are very strong, and of an iron colour; those of the breast long: over the belly a great deal of down, of a dirty white: the legs and half the thighs are naked; the naked parts full three feet in length.

This monster, as Ives terms it, inhabits Bengal, and is also found at Calcutta; at the last place called *Hurgill*, or *Argill*. It majestically stalks along before one, and appears at first like a naked Indian. The common opinion is, that the souls of the Bramins possess these birds. On opening one of these, a terapin, or land tortoise, 10 inches long, was found in its craw, and a large male black cat was found entire in its stomach. In Sumatra there is said to be a great variety of the stork kind; some of a prodigious size, and otherwise curious; as the Boorong Cambing, and Booringoolar. Ardea.

The same species seems to have been remarked by Mr Smeathman in Africa, while resident there; an adult of one of which will often measure seven feet when standing erect. He describes the plumage much the same as in Mr Ive's bird; adding, that the gape is monstrously wide; the head is covered with white down, thinly dispersed, appearing not unlike a grey-headed man: on the middle of the neck before, a long conic membrane, like a bladder, sprinkled very thinly with short down, rising or falling as the animal moves the beak, and always appearing inflated. These birds are met with in companies. When seen at a distance, near the mouths of rivers, coming towards an observer, which they do with the wings extended, they may well be taken for canoes, upon the surface of a smooth sea: when on the sand-banks, for men and women picking up shell-fish or other things on the beach.

* *Latham's Synopsis*, vol. iii. part I.

One of these, a young bird, about five feet in height, was brought up tame, and presented to the chief of the Bananas, where Mr Smeathman lived; and being accustomed to be fed in the great hall, soon became familiar; duly attending that place at dinner-time, and placing itself behind its master's chair, frequently before any of the guests entered. The servants were obliged to watch it narrowly, and to defend the provisions with switches in their hands; but, notwithstanding this, it would frequently snatch off somewhat or other, and was known once to have purloined a whole boiled fowl, which it swallowed in an instant. Its courage is not equal to its voracity; for a child of eight or ten years old soon puts it to flight with a switch, though at first it seems to stand upon its defence, by threatening with its enormous bill widely extended, and crying out with a loud hoarse voice like a bear or tiger. It is an enemy to small quadrupeds, as well as birds and reptiles, and destroys fowls and chickens, though it dare not attack a hen with her young openly: it preys also on rats, young kittens, and the like: and has been known to swallow a cat whole: a bone of a shin of beef being broke asunder, serves it but for two morsels. The individual abovementioned used to fly about the island, and roost very high upon the silk-cotton trees; from whence, at two or three miles distance it could spy the dinner carrying across the yard; when, darting from its station, it would enter promiscuously with the women who carried in the dishes. When sitting, it was observed to rest itself on the whole length of the hind part of the legs. It sometimes stood near, for half an hour after dinner, with the head turning alternately, as if listening to the conversation; and during this time would every three or four minutes void the excrements, which were liquid and whitish; and took care always to do this on its legs, by wheeling the back parts round over one or the other, and this regularly on different legs; for if he had muted on the left leg last, he would be sure to do the same on the right the next time, never making any mistake.

7. The ciconia, or white stork of Ray, has naked eye-balls, and black prime wing-feathers. The skin be-

Ardea. low the feathers, as also the beak, feet, and claws, are of a blood colour. It is a native of Europe, Asia, and Africa; but is seldom or never to be met with in Italy. The ciconia feeds upon amphibious animals. It is such an enemy to serpents, that it is reckoned almost a crime to kill a stork. From this favourable treatment, they are seen in Holland and the Low Countries walking unconcerned in the middle of the streets. Storks are birds of passage; they spend the summer in Europe, and disappear all at once, and go off to Egypt, Ethiopia, &c. before winter, and do not return till about the middle of March.

8. The major, or common heron, has a black crest depending from the back part of the head, an ash-coloured body, and a black line and belt on the neck and breast. It is a native of Europe. This bird is remarkably light in proportion to its bulk, scarce weighing three pounds and an half: the length is three feet two inches; the breadth five feet four inches. The body is very small, and always lean; and the skin scarce thicker than what is called gold-beater's skin. It must be capable of bearing a long abstinence, as its food, which is fish and frogs, cannot be readily got at all times. It commits great devastation in ponds; but being unprovided with webs to swim, nature has furnished it with very long legs to wade after its prey. It perches and builds in trees, and sometimes in high cliffs over the sea, commonly in company with others, like rooks. It makes its nest of sticks, lines it with wool, and lays five or six large eggs of a pale green colour. During incubation, the male passes much of his time perched by the female. They desert their nests during the winter, excepting in February, when they resort to repair them. It was formerly in Britain a bird of game, heron-hawking being so favourite a diversion of the inhabitants, that laws were enacted for the preservation of the species, and the person who destroyed their eggs was liable to a penalty of twenty shillings for each offence. Not to know the hawk from the heron-shaw was an old proverb*, taken originally from this diversion; but in course of time served to express great ignorance in any science. This bird was formerly much esteemed as food; made a favourite dish at great tables, and was valued at the same rate as a pheasant. It is said to be very long-lived: by Mr Keysler's account it may exceed 60 years; and by a recent instance of one that was taken in Holland by a hawk belonging to the Stadtholder, its longevity is again confirmed, the bird having a silver plate fastened to one leg, with an inscription, importing it had been before struck by the elector of Cologne's hawks in 1735.—The cinerea of Linnæus is the female of this species.

* In aftertimes this proverb was absurdly corrupted to, He does not know a *hawk* from a *hand-saw*.

9. The grazetta, or egret, is crested behind; the body is white, the beak black, and the feet greenish. It is a most elegant bird. It weighs about one pound; and the length is 24 inches, to the end of the legs 32. It is a native of the east. But that formerly it was very frequent in Britain, appears by some of the old bills of fare: in the famous feast of Archbishop Neville, we find no less than a thousand asterides, egrets or egrittes, as it is differently spelt. Perhaps the esteem they were in as a delicacy during those days occasioned their extirpation in Britain; abroad they are still common, especially in the southern parts of Europe, where they appear in flocks. The scapulars and the crest were formerly much esteemed as ornaments for caps and head-pieces; so that aigrette and egret came to signify any ornament to a cap, though originally the word was derived from *aigre, a cause de l'aigreur de sa voix*.

10. The herodias, or cristata maxima of Catesby, is crested behind, has a dusky-coloured back, reddish thighs, and the breast speckled with oblong black spots. It is four feet and a half when erect; the bill is about eight inches from the angle of the mouth to the end of it; and the crest is made up of long, narrow, brown feathers, the longest being five inches in length, which it can erect and let fall at pleasure. It is a native of Virginia, and feeds not only upon fish and frogs, but on lizards, efts, &c.

11. The stellaris, or bittern, has a smooth head; it is variegated through the whole body with dark-coloured spots of different figures and sizes. It is a native of Europe, and inhabits chiefly the fen-countries. It is met with skulking among the reeds and sedges; and its usual posture is with the head and neck erect, and the beak pointed directly upwards. It will suffer persons to come very near it without rising; and has been known to strike at boys and at sportsmen, when wounded and unable to make its escape. It flies principally about the dusk of the evening, and then rises in a very singular manner, by a spiral ascent, till it is quite out of sight. It makes a very strange noise when it is among the reeds, and a different and a very singular one as it rises on the wing in the night. It builds its nest with the leaves of water plants on some dry clump among the reeds, and lays five or six eggs of a cinerous green colour. This bird and the heron are very apt to strike at the fowler's eyes when only maimed. The food of the bittern is chiefly frogs; not that it rejects fish, for small trouts have been met with in their stomachs. In the reign of Henry VIII. it was held in much esteem at British tables, and valued at one shilling. Its flesh has much the flavour of a hare, and nothing of the fishiness of that of the heron.

12. The violacea, or crested bittern of Catesby, has a white crest; the body is variegated with black and white, and bluish below. These birds are seen in Carolina in the rainy seasons: but in the Bahama Islands, they breed in bushes growing among the rocks in prodigious numbers, and are of great use to the inhabitants there; who, while these birds are young and unable to fly, employ themselves in taking them for the delicacy of their food. They are, in some of these rocky islands, so numerous, that in a few hours two men will load one of their *calapatches*, or little boats, taking them perching from off the rocks and bushes, they making no attempt to escape, though almost full grown. They are called by the Bahamians, *crab-catchers*, crabs being what they mostly subsist on; yet they are well-tasted, and free from any rank or fishy savour.

There are 67 other species enumerated by ornithologists.

Ardea (anc. geog.), a town of Latium, the royal residence of Turnus king of the Rutuli, (Livy); so called, either from the augury of the heron, (Hyginus); or from the excessive heat of the country, (Martial). It was a marshy, sickly situation, (Strabo, Seneca). It was built by Danaë, the mother of Perseus, (Virgil);

(Virgil); about five miles distant from the sea, and 20 from Rome: now a hamlet. It was a Roman colony, (Livy); the inhabitants called *Ardeates*. E. Long. 17. 49. Lat. 41. 30.

ARDEBIL, or ARDEVIL, a town of Persia, in the province of Aderbijan. It was taken and burnt by Jenghiz Khan in 1222, when most of the inhabitants were destroyed: but it has been since rebuilt; and is still ranked for dignity among the best cities of the kingdom, on account of its having been the residence and burying-place of some of the Persian kings; particularly the sepulchre of Sheik Sefi is at this place, to which the people resort in pilgrimage. He founded a place, which they call his kitchen, with a revenue sufficient to maintain 1000 poor people, and to feed them three times a-day. Three or four of the largest principal streets have shops, and are planted on each side with elms and linden trees, to keep off the excessive heat of the sun; but the houses are poorly built, with bricks dried in the sun: yet most of them, that are not in the bazars or market-places, have the pleasure and conveniency of a garden full of trees bearing fruit: and there are large spots in the out-parts of the town, where the houses are at a distance from each other, and the spaces between planted with trees, which render the city of a large extent. The meidan, or great square, is 300 paces long, and 150 broad, having shops all round; which, when this place was in a flourishing condition, were stored with all manner of valuable commodities.

Through the city there pass two branches of a rivulet, which have been sometimes enlarged by the melting of the snow on the mountains, that they have been forced to make canals to divert the stream. In the reign of Sha Abbas, it broke down the dykes, and carried away a great number of houses. The city is without walls, and is seated in the midst of a large plain encompassed with mountains, the highest of which lies westward, and is alway covered with snow. These render the air sometimes extremely hot, and at others intolerably cold, which occasion epidemical distempers, that carry off great numbers of people. The soil produces no fruit near the city but apples, pears, and peaches; and yet is good both for corn and pasture. The sheep are so numerous, that 100,000 have passed over the city-bridge in a day. There are here several sorts of mineral waters, which serve both for common bathing, and for the cure of various diseases; one of these is a sulphureous spring, whose exhalations render the circumambient air extremely disagreeable. There are three springs which produce as hot water as if it was boiling, and from which waters are conveyed to the public baths in the city. About half a league from the city, on the right hand of the public road, there is a pool of standing water, which is covered all over with salt like ice. E. Long. 47. 30. N. Lat. 37. 55.

ARDEN, the common name of forests among the Celtæ, from the wildly extensive one which ranged for 500 miles in length across the country of Gaul, or covered more than half the county of Warwick in Britain, and the sites of which still retain the appellation of *Arden*, to the much smaller one of the ancient Mancenion, that covered and surrounded the site of the present Manchester. Written *Arduen* by Cæsar and Tacitus in speaking of the forest in Gaul, and *Ardven* by Ossian in mentioning the woods of Caledonia, it cannot (says Mr Whitaker) be compounded of *ar* the prepositive article in Celtic, and the substantive *den*, as Baxter and Cambden assert it to be; but is formed of *ard* an adjective, and *ven* the same as *den*. The meaning of the name therefore is not, as Mr Baxter renders it, simply *the hills*, or even, as the ingenious translator of Ossian interprets it, the *high hill*. *Ard* signifies either *high* or *great*, and *ven* or *den* either an *hill* or *wood*. *Arduen*, *Ardven*, or *Arden*, then, means a considerable wood. Hence, only, the name became applicable to such very different sites, as the *plains* of Warwickshire and the *hills* of Scotland: and it was given not only to the most extensive forests, to that which was the greatest in Gaul, or so considerable in Britain; but to many that were important only within their own contracted districts, as the wood of Mancenion abovementioned, and others.

ARDENBURG, a town of the Netherlands, in Dutch Flanders, and formerly the most considerable in that country; but has been dismantled by the Dutch. E. Lon. 3. 30. N. Lat. 51. 16.

ARDENNE, a forest in France, formerly of vast extent; but the trees are in many places grubbed up, and where they stood are built cities, towns, and abbeys. At present it extends from Thionville, near the country of Leige, to Donchery and Sedan, on the confines of Champagne. The roads are so narrow in some places, that two waggons cannot pass each other; and therefore the waggoners are obliged to provide themselves with bells or horns to give one another notice to stop in time.

ARDENTES, in middle-age writers, an appellation given to those afflicted with the Ignis Sacer, or Erysipelas. They were thus called, as seeming to be scorched or burnt with the disease. Hence also the abbey of St Genevieve at Paris is called *Domus Ardentium*, by reason, as it is said, that great numbers were cured of that distemper at the shrine of this saint, in the reign of Lewis VI.

ARDES, a town of France, in Lower Auvergne, and the principal place of the duchy of Mercœur. It serves as a mart for the commodities and trade between Upper and Lower Auvergne. E. Long. 3. 10. N. Lat. 45. 22.

ARDFERT, a town of Ireland, was the ancient capital of Kerry, with an university, which was held in the highest esteem. It is a bishop's see, and borough by ancient prescription, and has been held *in commendam* with the bishopric of Limerick ever since the Restoration. The bishops were anciently called Bishops of Kerry. St Brandon, to whom the cathedral is dedicated, had his first education in this county, under Bishop Ert; but he finished his studies in Connaught, St Jarlath bishop of Tuam being his preceptor. The ruins here are very extensive. Near the Cathedral was an anchorite tower, the loftiest and finest in the kingdom, being 120 feet high: it fell suddenly in 1771. In the ruined churches there are several inscriptions round the mouldings of the tomb-stones: and over an arch, behind Lord Glandore's house, is an inscription in relief done in a masterly manner, but the characters unknown.

ARDRAH, a small territory or kingdom of Africa, in Guinea, properly so called. It lies at the bottom of the gulph of St Thomas, and has a town called *Ardres*, supposed to be the capital. The inhabitants are very licentious, and have neither temple nor any place for religious worship. However, they are very courageous; and their king was absolute till lately that the king of Dahomay made war upon this and the neighbouring territories, brought them under subjection, and burnt the towns, particularly Ardres. The air is very unwholesome to Europeans; yet the natives live to a great age; but the small-pox makes great destruction among them. This country is fertile in Indian corn, palm-wine, plants, and fruits, which last all the year; and they make a great deal of salt.

ARDRES, a small but strong town of France, in Lower Picardy. Here was an interview between Francis I. and Henry VIII. king of England in 1520. It is seated in the midst of a morass. E. Long. 2. 0. N. Lat. 50. 35.

ARDS, barony of, in the county of Down in Ireland: it is a narrow slip of land, in some places three, and in none above six, miles broad; but the soil is for the most part tolerably good. It lies between the lake of Strangford and the sea, and in the south part it is opposite to Lycale. Sir Thomas Smith obtained a patent for this barony from Queen Elizabeth, and sent his natural son with a colony to possess it; but he was intercepted and slain by an Irishman. After Sir Thomas's death, Ards was granted by James I. to some of the Scots nobility.

ARDUBA, an ancient city of the Pannonians. It was taken by Germanicus about the 7th year of the Christian æra; but its reduction was more owing to the disagreement that reigned among the inhabitants than to the valour of the Romans. The greater part of the citizens were for submitting; but the women, more fond of their ancient laws and liberties than the men, joined some Roman deserters, and falling upon their husbands, killed a great number of them: but being at last overcome by the men, who then submitted to the Romans, the women either threw themselves headlong from the tops of the walls, or, setting fire to their houses, burnt themselves and their children to death.

AREA, in general, denotes any plain surface, whereon we walk, &c. The word is Latin, importing more properly a threshing-floor; and is derived from *arere*, "to be dry."

Area, in architecture, denotes the space or site of ground on which an edifice stands. It is also used for inner courts, and those portions of ground.

Area, in geometry, denotes the superficial content of any figure. Thus, if a figure, *e. g.* a field, be in form of a square, and its side be 40 feet long, its area is said to be 1600 square feet; or it contains 1600 little squares, each a foot every way.

AREB, a kind of imaginary money used in the dominions of the great mogul. Four arebs are equal to one crou, or 100 lacs; one lac to 100,000 roupees.

AREBO, or Arebon, a town on the slave-coast of Guinea, in Africa, seated at the mouth of the river Formoso. The English had once a factory there, as the Dutch have still. It is a large oblong place, indifferently well peopled, and furnished with houses built of reeds and leaves. E. Long. 5. 5. N. Lat. 5. 0.

ARECA, the Fausel-nut, in botany, a genus of the order of palmæ pennatifoliæ. The male has no calyx, but three petals, and nine stamina; the female has no calyx; the corolla has three petals, and the calyx is imbricated. There are two species, viz.

1. The cathecu, a native of India. This has no branches, but its leaves are very beautiful: they form a round tuft at the top of the trunk, which is as straight as an arrow. It grows to the height of 25 or 35 feet, and is a great ornament in gardens. The shell which contains the fruit is smooth without, but rough and hairy within; in which it pretty much resembles the shell of the cocoa nut. Its size is equal to that of a pretty large walnut. Its kernel is as big as a nutmeg, to which it bears a great resemblance without, and has also the same whitish veins within when cut in two. In the centre of the fruit, when it is soft, is contained a greyish and almost liquid substance, which grows hard in proportion as it ripens. The extract of this nut has been supposed to be the terra japonica of the shops, at least that it is a very similar substance both in colour and taste: But according to later observations, the genuine drug seems to be obtained from the *Mimosa Catechu*. The fruit when ripe is astringent, but not unpalatable, and the shell is yellowish. Of this fruit there is a prodigious consumption in the East Indies, there being scarce any person, from the richest to the poorest, who does not make use of it; and the trade they drive in it is incredible. The chief use that is made of areca is to chew it with the leaves of betel, mixing with it lime made of sea-shells.* In order to chew it, they cut the areca into four quarters, and take one quarter of it, which they wrap up in a leaf of betel, over which they lay a little of the lime; afterwards they tie it, by twisting it round. This bit prepared for mastication is called *pinang*; which is a Malayan word used all over the East Indies. The pinang provokes spitting very much, whether it be made with dried or fresh areca; the spittle is red, which colour the areca gives it. This mastication cools the mouth, and fastens the teeth and gums. When they have done chewing the pinang, they spit out the gross substance that remains in the mouth. They are under a mistake who imagine that fresh areca melts entirely in the mouth. Nor is it a less mistake to think that the teeth which are tinged red during the time of chewing, always retain that colour. As soon as they have done chewing the pinang, they wash their mouth with fresh water, and then their teeth are white again. The Europeans who live at Batavia, or Malaca, and in the Sunda and Molucca islands, use pinang as much as the Indians do; and by washing their teeth they preserve them white. Some pretend that areca strengthens the stomach, when the juice of it is swallowed, as most of the Indians do. Another property ascribed to it is, its curing or carrying off all that might be unwholesome or corrupt in the gums. When eaten by itself, as is sometimes done by the Indians, it impoverishes the blood, and causes the jaundice; but is not attended with these inconveniences when mixed in the usual way with betel. The Saimese call it *plou* in their language. The best areca of the Indies comes from the island of Ceylon The Dutch East-India company send a great deal of it in their ships into the kingdom of Bengal. There grows in Malabar a sort of red areca, which is very proper for dyeing in that colour. The same company send some

* Cornelius le Brun asserts, that they rub the leaves of betel with a red drug of Siam, or with white chalk.

Areca. some of it from time to time to Surat and Amadabat, for the use of the dyers in the dominions of the Grand Mogul.

2. The oleracea, or true cabage-palm, is the most beautiful, and perhaps the tallest, of all trees. The trunk is perfectly straight, and marked with rings at the vestigiæ of the footstalks of the leaves. Near the ground it is about seven feet in circumference; but tapers as it ascends, and attains the height of 170 or 200 feet. The bark is of an ash colour till within 25 or 30 feet of the extremity of the tree; when it alters at once to a deep sea-green, which continues to the top. About five feet from the beginning of the green part upwards, the trunk is surrounded with its numerous branches in a circular manner; all the lowermost spreading horizontally with great regularity; and the extremities of many of the higher branches bend wavingly downwards, like so many plumes of feathers. These branches, when full grown, are 20 feet long, more or less; and are thickly set on the trunk alternately, rising gradually superior one to another: Their broad curved sockets so surround the trunk, that the sight of it, whilst among these, is lost, which again appears among the very uppermost branches, and is there inveloped in an upright green conic spire, which beautifully terminates its great height. The above-mentioned branches are somewhat round underneath, and slightly grooved on the upper side: They are likewise decorated with a very great number of green pennated leaves: Some of these are near three feet long, and an inch and an half broad, growing narrower towards their points, as well as gradually decreasing in length towards the extremities of the branches. As there are many thousand leaves upon one tree: every branch bearing many scores upon it, and every leaf being set at a small and equal distance from another, the beauty of such a regular lofty group of waving foliage, susceptible of motion by the most gentle gale of wind, is not to be described. The middle rib, in each leaf, is strong and prominent, supporting it on the under side, the upper appearing smooth and shining. The pithy part of the leaf being scraped off, the inside texture appears to be so many longitudinal thread-like filaments. These, being spun in the same manner as they do hemp, or flax, are used in making cordage of every kind, as well as fishing-nets, which are esteemed stronger than those usually made from any other material of the like nature.

Upon removing the large leaves, or branches, which surround the top of the trunk a little way above the beginning of the green bark just mentioned, what is called the *cabbage* is discovered lying in many thin, snow-white, brittle flakes, in taste resembling an almond, but sweeter. This substance, which cannot be procured without destroying the tree, is boiled, and eaten with mutton by the inhabitants of the West Indies, in the same manner as turnips and cabbage are with us; though it must appear the height of extravagancy and luxury to fell so stately a tree, which would be an ornament to the most magnificent palace in Europe, to gratify the taste of an epicure, especially as there is but a very small part of it eatable. What is called the *cabbage-flower*, grows from that part of the tree where the ash-coloured trunk joins the green part already described. Its first appearance is a green husky spatha, growing to above 20 inches long and about four broad; the inside being full of small white stringy filaments, full of alternate protuberant knobs, the smallest of these resembling a fringe of coarse white thread knotted: these are very numerous, and take their rise from larger footstalks: and these footstalks likewise are all united to different parts of the large parent-stalk of all. As this husky spatha is opened while thus young, the farinaceous yellow seed in embryo, resembling fine saw-dust, is very plentifully dispersed among these stringy filaments, which answer the use of apices in other more regular flowers: these filaments being cleared of this dust, are pickled, and esteemed among the best pickles either in the West Indies or in Europe. But if this spatha is not cut down and opened whilst thus young; if it be suffered to continue on the tree till it grows ripe and bursts; then the inclosed part, which whilst young and tender is fit for pickling, will by that time have acquired an additional hardness, become soon after ligneous, grow bushy, consisting of very many small leaves, and in time produce a great number of small oval thin-shelled nuts, about the bigness of unhusked coffee-berries: These being planted, produce young cabbage-trees.

The sockets or grooves, formed by the broad part of the footstalks of the branches, are used by the negroes as cradles for their children. On the inner side of the very young footstalks are tender pellicles, which when dried, it is said, make a writing paper The trunks serve as gutterings; the pith makes a sort of sago; and the nuts yield oil by decoction. In the pith also, after the trees are felled, there breeds a kind of worms, or grubs, which are eaten and esteemed a great delicacy by the French of Martinico, St Domingo, and the adjacent islands. These worms, says father Labat, are about two inches long, and of the thickness of one's finger; the head is black, and attached to the body without any distinction of neck. Their preparation for the table is as follows: They are strung on wooden skewers before a fire; and as soon as heated, are rubbed over with raspings of crust, salt, pepper, and nutmeg: this powder absorbs all the fat, which during the cookery would otherwise escape; when properly roasted, they are served up with orange or citron sauce. These worms being exposed for some time to the sun, are said to yield an oil which is of great efficacy in the piles. The oil in question, says Labat, is never to be heated before its application to the part affected; as repeated experiments have evinced that its spirit is totally dissipated by the fire.

Arelate. ARELATE, or ARELATUM, is a town of Gallia Narbonensis, situated on the Rhone, denoting a town on, or beyond, a marsh, according to the particular situation of the speaker; called *Arelate Sextanorum*, (Pliny, Mela, Coin), because it had a colony of the sixth legion. Writers of the lower age call it *Arelas, atis*, (Prudentius, Ausonius). There was a double Arelas, one on each side of the river and joined by a bridge, (Ausonius); that on the left side is thought to have been built by Constantine. Tiberius's fa her was sent by Julius Cæsar at the head of the colony, (Suetonius); and hence the appellation *Julia Paterna*, as appears from an inscription. It was the favou-

rite

rite place of the Romans, and greatly ornamented; and hence called *Gallula Roma*. (Ausonius). It is now called *Arles*. E. Long. 5. 5. Lat. 43. 40.

AREMBERG, a small town of Germany, in the circle of Westphalia, defended by a castle. It is the capital of a county of the same name, and was erected into a principality by the Emperor Maximilian II. in favour of John de Ligne, lord of Barbazon, who took the name of *Aremberg*. It is seated on the river Ayr. E. Long. 7. 3. N. Lat. 50. 27.

AREMORICA, or ARMORICA, a part of Gaul, between the Sequana and Ligeris, (Cæsar, Hirtius); denoting a country on, or beyond the sea, *ar moer*, or *are moer*, Celtic. Pliny indeed says, that *Aquitania* was formerly called *Aremorica*; but in this he stands alone. In the lower age, the term *Armorica* was confined to Bretagne in France.

ARENA, in Roman antiquity, a place where the gladiators fought; so called from its being always strewed with sand, to conceal from the view of the people the blood spilt in the combat. Nero is said to have strewed the Arena with gold dust.

ARENARIA, or SANDWORT, in botany: A genus of the decandria trigynia class; and in the natural method ranking under the 22d order, *Caryophyllæ*. The calyx has five open leaves; the petals are five, and entire; the capsule is unilocular, and contains many seeds. There are 17 species of arenaria, only seven of which are natives of Britain, viz. the peploides, or sea-sandwort; the trinervis, or plantain-leaved sandwort; the serpylli-folia, or least sandwort; the saxatilis, or mountain-sandwort; the laricifolia, or larchleaved sandwort; the tenuifolia, or fine-leaved sandwort; and the rubra, or purple-flowered sandwort.

ARENACUM, or ARENACUS, one of the four towns or larger villages in the island of the Batavi, (Tacitus). Now *Arnheim*, in Guelderland. E. Long. 5. 20. N. Lat. 52. 2.

ARENARII, in antiquity, gladiators who combated with beasts in the arena, or amphitheatre. The arenarii were slaves of the lowest rank; so that, tho' manumitted, they were not capable of being Roman citizens. They were the same with what were otherwise called *Bestiarii*.

ARENARIUM, in ecclesiastical writers, denotes a cemetery or burying-ground. The arenaria were properly a kind of pits, or holes under ground, wherein the ancient Christians not only buried their dead, but held their religious assemblies in times of persecution.

ARENSBERG, a small town of Germany, in the circle of Westphalia, upon the river Roer. E. Long. 8. 20. N. Lat. 51. 25.

ARENSBOURG, an episcopal and maritime town of Livonia in Sweden, seated in the isle of Osel, in the Baltic Sea. E. Long. 22. 40. N. Lat. 58. 15.

AREOLA, among anatomists, the coloured circle surrounding the nipple of the breast.

AREOPAGUS, a sovereign tribunal at Athens, famous for the justice and impartiality of its decrees, to which the gods themselves are said to have submitted their differences. It was in the town, on a rock or hill opposite to the citadel. The word signifies strictly, *rock of Mars*.

Plutarch attributes the establishment of the Areopagus to Solon. Other authors think differently: and with good reason; for it appears undeniable, that this tribunal was instituted before Solon. But the best authorities allow him the honour of its restoration. The city of Athens, governed till this time by tribunals of a circumscribed jurisdiction, which were multiplied by the most trifling accidents and circumstances, took no fixed political or civil form, however closely united the members of those tribunals were by their general views towards the public good, and by the common love of their country. As each of those tribunals could only act in proportion to the power delegated to it, it was impossible that so many different and unequal impressions should give to the great machine of the state that uniform and regular movement which, by an impulse always the same, would keep each part in the situation it should maintain with relation to the whole.

To effect this universal and harmonious power, it was necessary to unite the different channels of public authority, which, by being too much distributed, lost its force. This authority Solon collected, and placed it all in the court of Areopagus, which consequently became the main spring of the government. The judges of this court, who, under Draco, decided only in cases of murder, now took cognizance of crimes of every kind; and the same tribunal which inflicted capital punishment on murder, poisoning, burning of houses, theft, &c. struck at the roots of those crimes, by arraigning idleness, luxury, and debauchery. Equally attentive to stimulate the indolence of the young, and the languor of the old, these sage judges roused in the one the laudable ambition to serve the state, and restored to the others their former activity. Satisfied that extremes produce the same effects, they thought the republic had as much to fear from the excess of wealth as from the gripe of poverty. Hence they exacted a minute account of the effects of every individual. Hence their great severity to those idle citizens, who, instead of being useful members in a state, are its bane and its dishonour. Isocrates draws a most beautiful and striking picture of those venerable and astonishing men, and of the order and harmony which flourished in Athens by their wise administration.

The judges of the Areopagus, says that author, were more industrious to prevent crimes, by representing them in an odious light, than to establish modes of punishment. It was their opinion, that the enemies of the state were the instruments destined by the gods to punish the wicked; but that it was their province to correct and reform public and private manners. They were vigilantly attentive to the conduct of all the citizens, but particularly to that of the youth. They well knew that the impetuosity of juvenile passion gave the most violent shocks to health and growing virtue; that it was the duty of inspectors of education to soften the austerity of moral discipline with innocent pleasure; and that no recreations were more eligible than bodily exercises, which enable a young man to give a good education its full play, which improve health, give a pleasurable and agreeable vivacity, and even fortify the mind. The fortunes of the Athenians were too unequal to admit the same mode of education; and therefore the youth were trained in a manner suitable to the rank and circumstances of their respective fami-

 lies.

Areopagus. lies. Those of the inferior class were taught agriculture and commerce; from this principle, that idleness is followed by indigence, and that indigence excites to the most daring and attrocious crimes. Having thus endeavoured by wise precautions, to preclude the entrance of moral evil, they thought they had little to fear.

Exercises of the body, such as horsemanship and hunting, were objects of education to the youth of liberal fortune. In this sage distribution, their great aim was to prevent the poor from committing crimes, and to facilitate to the rich the acquisition of virtue. Not satisfied with having established good laws, they were extremely careful to see that they were observed. With this view, they had divided the city into quarters, and the country into cantons. Thus every thing passed under their eyes; nothing escaped them; they were acquainted with the private conduct of every citizen. Those who had been guilty of any irregularity were cited before the magistrates, and were reprehended, or punshed in proportion to their misdemeanour.

The same Areopagites obliged the rich to relieve the poor. They repressed the intemperance of the youth by a severe discipline. Corruption in magistrates was suppressed by the punishments denounced against it; and the old men, at the sight of the employments of the young, felt themselves animated with a degree of juvenile vigour and activity.

Religion came likewise under the cognizance of the Areopagites. Plato durst never, as we are told by Justin Martyr, divulge his private opinion concerning the Deity. He had learned from the Egyptians the docrine of Moses. It appeared to him the best, and he embraced it with ardour. But his dread of the Areopagites, who were attached to the prevailing system, would not permit him even to name the author of sentiments which opposed the common tradition.

The public edifices, the cleanness of the streets, the pay of the soldiers, the distribution of the public money; in a word, whatever interested the republic, was under the direction of the Areopagus. The people themselves, jealous as they were of their power, did nothing without consulting this assembly, and suffered it, without a murmur, to amend their precipitate decrees. Yet this authority, however great it may seem, was subject to the laws; by them rewards and punishments were determined; and those respectable judges gave an account of the exercise of their trust to public censors, who were placed betwixt them and the people, to prevent the aristocracy from growing too powerful.

The most important qualifications were required in those who entered into the Areopagus. Solon made a law, by which they who had not been archons for a year should not be admitted members of the Areopagus. To give more force to his law, he subjected himself to it, and was only admitted on that title. This was but the first step; those annual magistrates, after having given law to the republic, were interrogated on their administration. If their conduct was found irreproachable, they were admitted Areopagites with eulogiums; but the smallest misconduct excluded them from that honour for ever. What administration was not to be expected from a tribunal so well composed? what veneration was not due to men of such rare talents and virtue? Such respect was paid them, that people presumed not to laugh in their presence; and so well established was their reputation for equity, that those whom they condemned, or dismissed without granting their petition, never complained that they had been unjustly treated. Areopagus.

The edifice of the Areopagus was extremely simple; and its roof, which was at first of the most common materials, remained in that state till the time of Augustus. This we learn from Vitruvius. Orestes was the first who thought of embellishing it. He raised in it an altar to Minerva. He likewise adorned it with two seats of solid silver; on one of which the *accuser* sat, and the *accused* on the other. The one seat was consecrated to *Injury*, and the other to *Impudence*. This religious sketch was brought to perfection by Epimenides, who erected altars to those allegorical deities, and soon after a temple, which Cicero mentions in his second book of laws. This temple corresponded with that which Orestes had built to the Furies, who brought him to Athens, and procured him the protection of Minerva. Epimenides dedicated it a second time to the Furies, or *severe Godesses*, as they were termed by the Athenians. A man was thought lost without resource, and a victim to every human ill, if he enforced a perjury by invoking the sacred name of those tremendous divinities.

Those who employed their thoughts in solving the mysteries of Paganism, imagined that the Eumenides had their temple so near the court Areopagus, that they might enlighten the judges by their inspiration, and, by their continual assistance, prevent them from committing those errors to which human weakness is liable. To propitiate those terrible deities, and to procure their favour for the Areopagus, they were worshipped with great punctuality and devotion; and the senate itself appointed their priests. Demosthenes had been nominated to preside over their sacrifices; and he thought it very extraordinary, that he, to whom the republic had confided so important an office, should be publicly impeached.

It was natural to associate with the Eumenides the other deities who shared with them the sovereign empire over the dead. Epimenides placed in their temples the statues of Pluto, of Mercury, and of Tellus. They were all, according to Pausanias, of an agreeable form. Each of them was placed upon an altar, on which the citizens, or strangers, who had been acquitted by the Areopagus made their grateful offerings. But it was not to gratitude alone that these several deities owed all the incense that smoked upon their altars. They who had been accused before the senate, harassed with superstition, and uncertain how these deities would be affected towards them, were lavish of sacrifices to obtain their clemency, by which they hoped their judges would likewise be influenced.

The tomb of Oedipus was another of the ornaments of the Areopagus. It was in the outward court of the Areopagus, where a barge was likewise placed, which made part of the pomp at the public games.

Whatever homage and implicit obedience the court of Areopagus might derive from all this religious parade, the public good was always dearer to them than

Areopagus. than any lower advantages they might have drawn from the altars and temples with which they were surrounded.

The senate assembled in a hall built on the summit of a hill, which was ascended with difficuly by the old men bent with age. However, as for some time they only assembled on the three last days of each month, they bore with patience this inconvenient situation. But public affairs multiplied to such a degree, that they were obliged to add to the three former sittings a fourth, which was held on the seventh day of the month, and which was soon succeeded by an assembly every day. Their meetings were so regular, that they were not interrupted by the most solemn festivals, till Cephisodorus was archon, who, in the third year of the 105th Olympiad, made a decree, which obliged the Areopagites to celebrate, after the example of the other courts, the Apaturian feasts, which lasted five days.

This assiduous and painful exercise of their office made the Areopagites feel all the inconvenience of the situation of their tribunal, and determined them to remove it to a part of the city called the *Royal Portico*. It was a square exposed to all the inclemencies of the weather. When the judges, who assembled there in profound silence, had taken their places, they were inclosed by a thread, or rather a cord, drawn around them.

They held their assemblies in the night, that their attention to public affairs might not be diverted by external objects,—and (adds Lucian) that they might only be influenced by the arguments, and not by the presence and action, of the speakers. This circumstance explains a passage in Athenæus, who tells us, that none knew the numbers nor faces of the Areopagites. The custom of administering justice in the open air was not peculiar to them. It was followed by all the other tribunals when they tried for murder; for two reasons:—1st, That the judges, the sworn protectors of innocence, might not be hurt by being under cover with criminals, whose hands were polluted with blood. 2dly, that the accuser and the accused might not be under the same roof.

When all the members of the senate were convened, a heral enjoined silence, and ordered the people to retire. As soon as they had departed, the Assembly proceeded to business; and as they deemed the least preference a flagrant injustice, the causes which they were to determine were drawn by a kind of lottery; and the same chance which brought them up, distributed them to different numbers of judges, small or great, according to the importance of the several causes.

In early times, the parties themselves stated their cause in a simple manner. The eloquence of advocates was thought a dangerous talent, fit only to varnish crimes. But afterwards the Areopagus, on this point, relaxed from their severity;—at first the accused, and soon after the accusers, were permitted to engage those to make the attack and the defence, whose profession it was to exert the art of speaking, for others, with accuracy and elegance.

Sextus Empiricus seems not to have sufficiently distinguished times, where he says, that the court of Areopagus did not suffer those who are to be tried at their bar to avail themselves of the abilities of others. What undoubedly led him into that mistake, was an Areopagus. inviolable custom of that tribunal, which prohibited, in pleadings, all that warm and picturesque oratory which seduces the judgment and inflames the passions. When the suffrages were collected, each person gave his in silence. They voted with a small flint, which they held betwixt the thumb and the two next fingers, and which they put into one of the two urns that stood in a corner of the hall. One stood before the other. The first was called the *urn of death*; the second, the *urn of compassion*. That of death was of brass, and was termed *proper*; that of compassion was of wood, and was termed *improper*. The judges commonly brought their flint to the assembly, and put it into the urn; but, that all the suffrages might be collected, the herald took the two urns, and presented them, one after another, to every senator, commanding him, in the name of the republic, no longer to defer his acquittal or condemnation.

For this method of giving sentence, which was called κρυϐδὴν ψῆφος, because it kept the vote of each person undiscovered, the Thirty Tyrants, to make themselves masters of the decisions of the Areopagus, substituted another, by means of which they knew exactly the opinion of each of the judges; for they obliged them to bring their flints publicly, and lay them upon two tables placed before them, the situation of which was quite opposite to that of the urns; for the first of those tables was that of *life*, and the second that of *death*.

The first substances with which they gave their suffrages were not small pieces of the bones of a hog, as some authors assert, but sea-shells, for which pieces of brass of the same form, termed *spondyla*, were afterwards substituted. The substances with which they voted were distinguished by their form and colour. Those which condemned were black, and perforated in the middle; the others were white, and not perforated. The precaution of piercing the black ones tends to prove, what we have already observed, that the court of Areopagus sat in the night: for what end did it serve to pierce the black shells, or flints, if the judges could have seen them and the white ones, and consequently have distinguished their colours by the assistance of the light? But as they passed sentence in the dark, it is evident that a difference besides that of colour was necessary, to know the black ones from the white. The judges were likewise permitted to multiply at pleasure the distinctions between signs, which essentially distinguished the fates of men.

After the suffrages were collected, they were taken out of the two urns, and put into a third vase of brass. They were then counted; and as the number of white or of black flints was higher or inferior, one of the judges drew with his nail a shorter or a longer line on a tablet with a waxen surface, on which the result of each cause was marked. The short line expressed acquittal; the long, condemnation.

With regard to the emoluments of the judges, they were as moderate as those of the advocates. The length of the process did not enhance its expence; and when the decision of a cause was postponed till the next day, the committee were only paid an obolus on that day. Hence Mercury, in Lucian, is surprised that such sensible old men as the senators of Areopagus were ſhould ſell at ſo low a price the trouble of aſcending ſo high.

As to the number of the judges which compoſed the Areopagus, ſome authors, attentive only to a part of Solon's regulations, by which he enacted, that for the future, none but the nine archons ſhould be admitted members of the Areopagus, have imagined, that this tribunal was filled anew every year, and that it never conſiſted of more than nine magiſtrates. This opinion, and ſome others, are refuted by the circumſtantial account which Diogenes Laertius gives us of the condemnation of Socrates. This great man had wiſhed to ſubſtitute a rational hypotheſis for the fabulous and extravagant ſyſtem of religion which prevailed in his time. His project, however laudable, appeared impious in the eye of ſuperſtition. Information was laid againſt him before the Areopagus, and he had as many accuſers as fellow-citizens. After the charges and the anſwers were heard, they proceeded to ſuffrages. The opinions were divided, but not equally, for the number of thoſe who condemned him exceeded by 281 the number of thoſe who declared him innocent. He made an ironical reply to this iniquitous ſentence, by telling his judges, that he took it for granted, they would admit him to a maintenance in the Prytanæum. On this ſarcaſm, 80 of thoſe who had voted in his favour forſook him, went over to the oppoſite party, and condemned him to die. Here then we have 361 judges who condemn; to whom if we add thoſe who perſiſt in aquitting him, the number muſt be very conſiderable.

Of all the judgments of the Areopagus, the moſt famous one, excepting that of Mars, was the ſentence which they paſſed on Oreſtes. His trial, which happened under Demophon the 12th king of Athens, in 375 of the Attic æra, owed all its fame to a remarkable circumſtance, that gave riſe to a cuſtom which was obſerved ever afterwards. Oreſtes had killed his mother. He was accuſed before the Areopagus, and cited to appear in that court. He would have loſt his life in conſequence of the equal diviſion of the votes, had not Minerva, moved with his misfortunes, declared herſelf for thoſe who had abſolved him, and joined her ſuffrage to theirs. Thus Oreſtes was ſaved. In veneration to this miracle, the Areopagites, whenever the ſuffrages were equally divided, decided in favour of the accuſed, by granting him what they termed *the ſhell of Minerva*. Cephalus and Dædalus were condemned by the Areopagus long before the time of Oreſtes.

We find in ancient authors ſome deciſions of this tribunal, which bear the ſtrongeſt marks of juſtice, though their objects are not intereſting. We ſhall here quote an anecdote from Aulus Gellius, and Valerius Maximus, of a woman who was accuſed of having poiſoned her huſband and her ſon. She was taken and brought before Dolabella, who was then proconſul of Aſia. She was no ſooner in his preſence than ſhe owned the fact; and added, that ſhe had very good reaſons for putting her huſband and her ſon to death.—"I had (ſaid ſhe) to my firſt huſband, a ſon whom I tenderly loved, and whoſe virtues rendered him worthy of my affection. My ſecond huſband, and the ſon whom I bare to him, murdered my favourite child. I thought it would have been unjuſt to have ſuffered thoſe two monſters of barbarity to live. If you think, Sir, that I have committed a crime, it is your province to puniſh it: I certainly ſhall never repent of it." This affair embarraſſed Dolabella. She was afterwards ſent to the Areopagus; and that court, when they had examined her a long time, ordered her and her accuſer to appear before them again a hundred years after, from the firſt day of her trial.

We muſt not, however, ſuppoſe that the Areopagus always preſerved its old reputation; for ſuch is the conſtitution of human affairs, that perfection, with regard to them, is a violent, and conſequently a tranſitory, ſtate. Pericles, who lived about 100 years after Solon, to flatter the people and win them to his party, uſed his utmoſt efforts to weaken the authority of the Areopagus, which was then diſliked by the multitude. He took from it the cognizance of many affairs which had before come under its juriſdiction; and, to forward his deſign of humbling it, employed the eloquence of Ephialtes, whoſe talents were formidable, and who was an avowed enemy to the great men of Athens.

The Areopagus itſelf ſeemed to ſecond the endeavours of a man who projected its ruin, and by its miſconduct haſtened its fall. The old rules of the court, by which none were admitted its members but thoſe whoſe unexceptionable conduct would ſupport its majeſty, ſeemed too ſevere. They grew leſs delicate in their choice, and preſuming that the faults with which they diſpenſed, would ſoon be reformed in the ſociety of ſo many good examples, vice imperceptibly crept among them: corruption, at firſt ſecret and timid, grew inſenſibly open and daring, and made ſuch progreſs, that the moſt ſhameful crimes were ſoon exhibited on the ſtage; and they were not copied from the low and abandoned multitude, but from thoſe ſenators, once the venerable and auſtere cenſors of idleneſs and of vice. Demetrius, the comic poet, wrote a piece which he intitled *The Areopagite*, where he ſtrips the maſk off thoſe hypocritical legiſlators, who were now equally apt to be ſeduced by wealth and by beauty. So much had the Athenian ſenate degenerated in the days of Iſocrates, cir. 340 years before the Chriſtian æra.

Before this tribunal St Paul was called to give an account of his doctrine, and converted Dionyſius one of their number.

The end of this court of judicature is as obſcure as its origin, which was derived from very remote antiquity. It exiſted, with the other magiſtracies, in the time of Pauſanias, i. e. in the 2d century. The term of its ſubſequent duration is not aſcertained; but a writer, who lived under the emperors Theodoſius the Elder and Younger, in the 5th century, mentions it as extinct.

AREQUIBA, a city of Peru in South America, ſituated in W. Long. 73°. S. Lat. 17°. It is one of the moſt beautiful cities in all Peru, being delightfully ſituated in the valley of Quilca, 100 leagues from Lima, and 20 from the ſea, with which it communicates by a fine river. The entrance into the harbour is rather ſhallow for ſhips of great burden; but when once they are entered, they may ride ſecurely in 18 fathoms water. This city was founded in 1539, by order of Don Franciſco Pizarro, in a place known likewiſe by the name of *Arequiba;* but its ſituation being found diſadvantageous, the inhabitants obtained leave to remove

move to the place where the city now ſtands. The houſes are built with ſtone, and vaulted; and, contrary to what is uſual in warm countries, they are lofty, neatly furniſhed within, and finely decorated on the outſide. The inhabitants alſo are exempt from many diſeaſes common in other parts of Peru; which perhaps is owing to their keeping the ſtreets clean by means of canals which extend to the river. The temperature of the air is extremely good; and though ſometimes a ſlight froſt is perceivable, the cold is never exceſſive, nor the heat troubleſome, ſo that the ſurrounding fields are clothed with perpetual verdure. Theſe natural advantages however, are conſiderably allayed by its being very ſubject to earthquakes, by which it has already been five times laid in ruins; notwithſtanding, which, it is populous, and has amongſt its inhabitants ſome of the nobleſt families in America.

ARES, a word of Paracelſus's, by which he would expreſs that power of nature in the whole material world, by which ſpecies are divided into individuals.

ARETÆUS of Cappadocia, a Greek phyſician, of the ſect of the Pneumatiſts, lived in the reign of Auguſtus, according to ſome; according to others, under Trajan or Adrian. He wrote ſeveral treatiſes in the Ionian dialect, on acute diſeaſes, and other medicinal ſubjects; ſome of which are ſtill extant. The beſt edition of his works is that of Boerhaave, in Greek and Latin, with notes, printed in 1731; that of Wigan, printed at Oxford in 1723, in folio, is alſo much eſteemed.

ARETHUSA, in fabulous hiſtory, the daughter of Nereus and Coris, and the companion of Diana, who changed her into a fountain to deliver her from the purſuit of her lover Alpheus.

Arethusa, a celebrated fountain near the city of Syracuſe in Sicily, famous for the quantity of its waters, and the number of fiſhes it contained. Many fables were invented by the ancients concerning this fountain. They had alſo a notion that the river Alpheus run under or through the waters of the ſea, without mixing with them, from Peloponneſus to Sicily. Mr Brydone informs us, that it ſtill continues to ſend forth an immenſe quantity of water, riſing at once to the ſize of a river, but is entirely abandoned by the fiſhes it formerly contained in ſuch plenty. At ſome diſtance from Arethuſa is a fountain of freſh water which boils up very ſtrongly in the ſea, inſomuch that, after piercing the ſalt water, it may be ſometimes taken up very little affected by it. This fountain Mr Brydone thinks the ancients were ignorant of, or they would not have failed to uſe it as an argument for the ſubmarine journey of Alpheus.

Mr Swinburn deſcribes this once famous fountain as a large pool of water near the quay, defended from the ſea by a wall, and almoſt hidden by houſes on every other ſide. The water is not ſalt, but brackiſh, and fit for no purpoſe but waſhing linen. "This (ſays he) is the celebrated fountain of Arethuſa, whoſe ſoft poetical name is known to every reader. The fable of the nymph and her conſtant lover Alpheus, the excellence of the ſpring, and the charms of its ſituation, are themes on which ancient and modern poets have indulged their fancy, and exerciſed their pens. Alas, how altered! rubbiſh chokes up its wholeſome ſources; the waves have found a paſſage through the rocks, which repeated earthquakes have ſplit; and not a fiſh to be ſeen in it. Sometimes, after an earthquake, it has been left dry; and, at other times, the whole maſs of its waters have been tainted by ſubterraneous effluvia. Its fountain-head probably lies among the neighbouring hills."

Arethusa, in botany: A genus of the gynandria diandria claſs; and in the natural method ranking under the 7th order, *Orchideæ*. The generic character is taken from the nectarium, which is tubular, ſituated at the bottom of the corolla, and the inferior labium fixed to the ſtylus. There are four ſpecies; all natives of America except the carpenſis, which is only found at the Cape of Good Hope.

ARETIA, in botany: A genus of the pentandria monogynia claſs; and in the natural method ranking under the 21ſt order, *Pretiæ*. The corolla is divided into five parts; the tube of the corolla is ovated; and the capſule is globular, and conſiſts of but one cell. There is only one ſpecies, viz. the alphina.

ARETIN (Guido), famous for his muſical improvements, lived in the 13th century. He was a native of Arezzo, a city in Tuſcany; and having been taught the practice of muſic in his youth, and probably retained as a choriſter in the ſervice of the Benedictine monaſtery founded in that city, he became a monk profeſſed, and a brother of the order of St Benedict.

In this retirement he ſeems to have devoted himſelf to the ſtudy of muſic, particularly the ſyſtem of the ancients, and, above all, to reform their method of notation. The difficulties that attended the inſtruction of youth in the church-offices were ſo great, that as he himſelf ſays, ten years were generally conſumed barely in acquiring the knowledge of the plain-ſong; and this conſideration induced him to labour after ſome amendment, ſome method that might facilitate inſtruction, and enable thoſe employed in the choral office to perform the duties of it in a correct and decent manner. If we may credit thoſe legendary accounts that are extant in old monkiſh manuſcripts, we ſhould believe he was aſſiſted in his pious intention by immediate communications from heaven: ſome ſpeak of the invention of the ſyllables as the effect of inſpiration; and Guido himſelf ſeems to have been of the ſame opinion, by his ſaying it was revealed to him by the Lord; or, as ſome interpret his words, in a dream: but graver hiſtorians ſay, that being at veſpers in the chapel of his monaſtery, it happened that one of the offices appointed for that day was the hymn† to St John,

UT queant laxis	*REſonare fibris*
MIra geſtorum	*FAmuli tuorum*
SOLve pollutis	*LAbiis reatum,*
	Sancte Joannes.

† Compoſed by Paul, a deacon of the church of Aquileia, about the year 770.

During the performance of the hymn, he remarked the iteration of the words, and the frequent returns of ut, re, mi, fa, sol, la: he obſerved likewiſe a diſſimilarity between the cloſeneſs of the ſyllable mi and the broad open ſound of fa, which he thought could not fail to impreſs upon the mind a laſting idea of their congruity; and immediately conceived a thought of applying the ſix ſyllables to perfect an improvement either then actually made by him, or under conſideration, viz. that of converting the ancient tetrachords into hexachords.

Struck with the discovery, he retired to his study; and having perfected his system, began to introduce it into practice: the persons to whom he communicated it were the brethren of his own monastery, from whom it met with but a cold reception, which, in the epistle to his friend, he ascribes undoubtedly to its true cause, envy: however, his interest with the abbot, and his employment in the chapel, gave him an opportunity of trying the efficacy of his method on the boys who were training up for the choral service, and it exceeded the most sanguine expectation. "To the admiration of all (says cardinal Baronius), a boy thereby learnt, in a few months, what no man, though of great ingenuity, could before that attain in several years."

The fame of Guido's invention soon spread abroad, and his method of instruction was adopted by the clergy of other countries. We are told by Kircher, that Hermannus bishop of Hamburg, and Elviricus bishop of Osnaburg, made use of it; and by the authors of the *Histoire Litteraire de la France*, that it was received in that country, and taught in all the monasteries in the kingdom. It is certain that the reputation of his great skill in music had excited in the pope a desire to see and converse with him; of which, and of his going to Rome for that purpose, and the reception he met with from the pontiff, he himself has given a circumstantial account of in the epistle hereafter mentioned.

The particulars of this relation are very curious; and as we have his own authority, there is no room to doubt the truth of it. It seems that John XX. or, as some writers compute, the 19th pope of that name, having heard of the fame of Guido's school, and conceiving a desire to see him, sent three messengers to invite him to Rome; upon their arrival, it was resolved by the brethren of the monastery that he should go thither attended by Grimaldo the abbot, and Peter the chief of the canons of the church of Arezzo. Arriving at Rome, he was presented to the holy father, and by him received with great kindness. The pope had several conversations with him, in all which he interrogated him as to his knowledge in music; and upon sight of an antiphonary which Guido had brought with him, marked with the syllables agreeable to his new invention, the pope looked on it as a kind of prodigy; and ruminating on the doctrines delivered by Guido, would not stir from his seat till he had learned perfectly to sing off a verse: upon which he declared, that he could not have believed the efficacy of the method, if he had not been convinced by the experiment he had himself made of it. The pope would have detained him at Rome; but labouring under a bodily disorder, and fearing an injury to his health from the air of the place, and the heats of the summer, which was then approaching, Guido left that city upon a promise to revisit it, and explain to his holiness the principles of his new system. On his return homewards, he made a visit to the abbot of Pomposa, a town in the duchy of Ferrara, who was very earnest to have Guido settle in the monastery of that place: to which invitation it seems he yielded, being, as he says, desirous of rendering so great a monastery still more famous by his studies there.

Here it was that he composed a tract on music, intitled *Micrologus*, i. e. "a short discourse;" which he dedicated to Theodald bishop of Arezzo; and finished, as he himself at the end of it tells us, under the pontificate of John XX. and in the 34th year of his age. Vossius speaks also of another musical treatise written by him, and dedicated to the same person.

Most of the authors who have taken occasion to mention Guido, speak of the Micrologus as containing the sum of his doctrine: but it is in a small tract, intitled *Argumentum novi Cantus inveniendi*, that his declaration of his use of the syllables, with their several mutations, and in short his whole doctrine of solmisation, is to be found. This tract makes part of an epistle to a very dear and intimate friend of Guido, whom he addresses thus, "Beatissimo atque dulcissimo fratri Michaëli;" at whose request the tract itself seems to have been composed.

Whether Guido was the author of any other tracts, is not easy to determine. It no where appears that any of his works were ever printed, except that Baronius, in his *Annales Ecclesiastici*, tom. xi. p. 73, has given at length the epistle from him to his friend Michael of Pomposa, and that to Theodald bishop of Arezzo, prefixed to the Micrologus; and yet the writers on music speak of the Micrologus as of a book in the hands of every one. Martini cites several manuscrips of Guido; namely, two in the Ambrosian library at Milan, the one written about the 12th century, the other less ancient; another among the archives of the chapter of Pistoja, a city in Tuscany; and a third in the Mediceo-Laurenziano library at Florence, of the 15th century: these are clearly the Micrologus. Of the epistle to Michael of Pomposa, together with the *Argumentum novi Cantus inveniendi*, he mentions only one, which he says is somewhere at Ratisbon. Of the several tracts abovementioned, the last excepted, a manuscript is extant in the library of Baliol-college in Oxford. Several fragments of the two first, in one volume, are also among the Harleian manuscripts now in the British Museum, N° 3199; but so very much mutilated, that they afford but small satisfaction to a curious inquirer.

Aretin (Leonard), one of the most learned men of the 15th century, was secretary to the republic of Florence, and translated from the Greek into Latin some of the Lives of Plutarch, and Aristotle's Ethics: he also composed three books of the Punic war, that may serve as a supplement to those wanting in Livy; the history of the transactions in Italy during his time; that of ancient Greece; that of the Goths; that of the republic of Florence; and many other books. He died in 1443, aged 74.

Aretin (Francis), a man of great reading, and well acquainted with the Greek language. He translated into Latin the Commentaries of St Chrysostom upon St John, and about 20 Homilies of the same father: he also translated the Letters of Phalaris into Latin, and wrote a treatise *De balneis Puteolanis*. He studied at Sienna, about the year 1443; and afterwards taught law there with such reputation, that they called him the *Prince of Subtleties*, and his wit became a proverb. He displayed his talents chiefly in disputes, in which nobody could withstand him. He gave his opinions in law with so much confidence, as to assure those who consulted him that they should carry their cause: nor did experience contradict him; for it was a common saying at the bar, such a cause has been condemned

demned by Aretin, it must therefore be lost. He taught also in the university of Pisa, and in that of Ferrara. He was at Rome under the Pontificate of Sixtus IV. but did not stay here long; for he soon perceived that the great hopes which he had built upon his reputation would come to nothing. This pope, however, declared he would have given him a cardinal's hat, had he not thought he should have done a public injury by depriving the youth of such an excellent professor. When old age would not permit him to go through the duties of his office, they dispensed with his reading of lectures, and his salary was continued. He continued, however, sometimes to mount the chair; and although his lectures had now but little spirit in them, yet he had still many hearers on account of his reputation. One day when the students were gone to some public shows, there were but 40 persons in his auditory: which so mortified him, that he threw away his book; and crying out, "Aretin shall never explain law to a few persons," retired in a passion, and would teach no more. He was severe in his temper, and never kept a servant longer than a month or two; for it was a maxim of his, "that new hired servants always serve best." He was honoured with the title of *knight*, and spent all his life in celibacy; and his way of living was so parsimonious, that he was thereby enabled to amass a great deal of wealth. He had designed this wealth for the maintenance of a college; but he altered his resolution, and left it to his relations.

Aretin (Peter), a native of Arezzo, who lived in the 16th century. He was famous for his satirical writings: and was so bold as to carry his invectives even against sovereigns, and from thence got the title of the *Scourge of Princes*. Francis I. the emperor Charles V. most of the princes of Italy, several cardinals, and many noblemen courted his friendship by presents, either because they liked his compositions, or perhaps from an apprehension of falling under the lash of his satire. Aretin became thereupon so insolent, that he is said to have got a medal struck, on one side of which he is represented by these words, IL DIVINO ARETINO; and on the reverse, sitting upon a throne, receiving the presents of Princes, with these words, I PRINCIPI TRIBUTATI DA POPOLI, TRIBUTANO IL SERVIDOR LORO. Some imagine that he gave himself the title of *Divine*, signifying thereby that he performed the functions of a god upon earth, by the thunderbolts with which he struck the heads of the highest personages. He used to boast, that his lampoons did more service to the world than sermons; and it was said of him, that he had subjected more princes by his pen than the greatest had ever done by their arms. Aretin wrote many irreligious and obscene pieces; such are his dialogues, which were called *Ragionamenti*. There is likewise imputed to him another very obscene performance, *De omnibus Veneris schematibus*. "It was about the year 1525 (says Mr Chevillier*) that Julio Romano, the most famous painter of Italy, instigated by the enemy of the salvation of mankind, invented drawings to engrave 20 plates: the subjects are so immodest that I dare only name them. Peter Aretin composed sonnets for each figure. George Vasari, who relates this in his Lives of the Painters, says, he does not know which would be the greatest impurity, to cast one's eyes upon the drawings of Julio, or to dip into the verses of Aretin." Some say that Aretin changed his libertine principles; but however this may be, it is certain that he composed several pieces of devotion. He wrote a Paraphrase on the penitential Psalms, and another on Genesis; he wrote also the Life of the Virgin Mary, and that of St Catherine of Sienna, and of St Thomas Aquinas. He was author likewise of some comedies. He died in the year 1556, being about 65 years old.

* *Origin de l'imprimerie de Paris*, p. 224.

ARETOLOGI, in antiquity, a sort of philosophers, chiefly of the Cynic or Stoic tribe, who, having no school or disciples of their own, haunted the tables of great men, and entertained them in their banquets with disputations on virtue, vice, and other popular topics. These are sometimes also denominated *Circulatores Philosophi*. In this sense, the word is derived from the Greek αρετη, *virtue*, and λογος, *discourse*. Some authors choose to derive the word from αρετος, *gratus*, "agreeable;" and define Aretologi, by persons who strive to divert and entertain their audiences with jokes and pleasant tales; which latter seems the more natural explication.

AREZZO, a city of Italy, in Tuscany, seated in the territory of Florence, on the declivity of a hill that overlooks the neighbouring plain, between the Citta di Castelli and Florence. It is an ancient city, and a bishop's see; and was famous for a kind of earthen ware much esteemed by the Romans. It was greatly fallen to decay when Cosmo de Medicis took it under his protection; since which it has been recovering gradually. It is famed for being the birth-place of Mecænas. E. Long. 12. 2. N. Lat. 43. 27.

ARGEA, or Argei, in Roman antiquity, thirty human figures, made of rushes, thrown annually by the priests or vestals into the Tiber, on the day of the ides of May.—Plutarch in his Roman Questions, inquires why they were called *Argea*. There are two reasons assigned. The first, that the barbarous nation who first inhabited these parts cast all the Greeks they could meet with into the Tiber: for Argians was a common name for all Grecians: but that Hercules persuaded them to quit so inhuman a practice, and to purge themselves of the crime by instituting this solemnity. The second, that Evander, an Arcadian, and a sworn enemy of the Argians, to perpetuate that enmity to his posterity, ordered the figures of Argians to be thus cast into the river.

ARGEIA, or Argolis, a district of Peloponnesus, situated between Arcadia to the west, the Egean Sea to the east, Laconica and the Sinus Argolicus to the south, and to the north the territory of Corinth and the Sinus Saronicus (Livy, Ptolemy); so called from Argos, the capital: Now *Romania di Morea*.

By the Greeks the people were called *Argeii*, from *Argi* or *Argos*; by the Romans, *Argivi*, Argives They were a colony who migrated, it is said, from Egypt, under the command of Inachus. Polemon and Ptolemy Mendesius, ancient Greek writers, inform us, that Inachus was contemporary with Amosis, who demolished Avaris, and expelled the shepherds out of Egypt. If, with some learned chronologers, we suppose Inachus to have begun to reform the Argives B. C. 1856, and to have died B. C. 1808, he must have been coeval with Amosis who reigned in Upper Egypt 15 years before the

the expulſion of the ſhepherds, and 10 years after that event, which happened B. C. 1806. Inachus was ſtyled the *Son of the Ocean*, becauſe his origin was not known, or becauſe he had come by ſea into Greece. Before his arrival the inhabitants were rude and barbarous. Theſe he united and civilized, and inſtructed in various arts. His ſon Phoroneus inſtituted the laws of government; and, on that account, has been called the *firſt king in Argos*, the *firſt of men*, and the *father of mortals*. The family of Inachus, after having kept poſſeſſion of the throne 347 years, were expelled by Danaus, who arrived B. C. 1509 with a colony from Canaan. Acriſius, the laſt king of Argos, died B. C. 1313; and was ſucceeded by Perſeus, his grandſon, who transferred the ſeat of government to Mycenæ, 544 years from the firſt year of Inachus, in the reign of Cecrops II. king of Athens, and about the time when Pelops the ſon of Tantalus king of Phrygia, having been compelled by Ilus to leave his native country, came into Greece with great wealth, and acquired ſupreme power in the region afterwards called by his name. In the 37th year of Euryſtheus, grandſon of Perſeus, the Argonautic expedition happened, i. e. B. C. 1224. This unjuſt and tyrannical prince had aſſigned to Hercules his taſk; and, after the death of that hero, he baniſhed all his children. Theſe were the Heraclidæ who fled to Athens for protection, and who returned to Peloponneſus 40 years after the deſtruction of Troy. In the reign of Agamemnon, the Trojan war commenced; and it was carried on with vigour during the ſpace of ten years. In the year B. C. 1184, Troy was taken, and the war was concluded. Scarcely had the Grecians ſettled in their own country after their return from this dangerous expedition, when the poſterity of Hercules invaded Peloponneſus, took poſſeſſion of it, and divided it among themſelves. Here the kingdom of Mycenæ ended, and that of Sparta was eſtabliſhed on its ruins. See SPARTA.

ARGEMONE, PRICKLY POPPY: A genus of the monogynia order, belonging to the polyandria claſs of plants; and in the natural method ranking under the 27th order, *Rhœadeæ*. The corolla conſiſts of ſix petals; the calyx is triphyllous; and the capſule is ſemivalved. Of this genus there are three ſpecies, which are common in many parts of the Weſt-Indies, and called by the Spaniards the *devil's fig*; but they are of no uſe, and have very little beauty.

ARGENCES, a town of France, in Lower Normandy, on the river Meance. W. Long. 0. 10. N. Lat. 49. 15.

ARGENT, the common French word for *ſilver*, of which metal all white fields or charges are ſuppoſed to conſiſt. Argent of itſelf is uſed in heraldry to ſignify purity, innocence, beauty, and gentleneſs; and, according to G. Leigh, if it is compounded with

Gul.	it ſignifies	boldneſs;
Azu.		courteſy;
Ver.		virtue;
Pur.		favour;
Sab.		religion;

ARGENTAC, a town of France, in the Limoſin, on the river Dordogne. E. Long. 2. 3. N. Lat. 45. 5.

ARGENTAN, a town of France in Lower Normandy, and in the dioceſe of the Seez, with the title of marquiſate. It is ſeated on an eminence, in the middle of a fertile plain, on the banks of the river Orne, and carries on a conſiderable trade. E. Long. 0. 5. N. Lat. 48. 54.

ARGENTARIA, a town of ancient Gaul, thought to ſtand in the place where the city Colmar now ſtands. It is remarkable for a great victory gained by the emperor Gratian over the Lentienſes, in the month of May, A. D. 378. The Romans being but few in number, were at firſt overpowered, and obliged to give ground; but ſoon returning to the charge, they gained in the end a complete victory. Thirty thouſand of the barbarians, and among the reſt their king Triarius were killed on the ſpot; and all the reſt, except 5000, taken priſoners.

ARGENTARIA Creta, pure white earth, found in Pruſſia, and much eſteemed for cleaning plate.

ARGENTARIUS is frequently uſed in Roman writers, for a money changer or banker. The argentarii were monied people, who made a profit either by the changing, or lending money at intereſt. Theſe had their *tabernæ*, or offices, in the *forum Romanum*, built there as early as the reign of L. Tarquinius Priſcus. The argentarii and fœneratores were much hated on account of their covetouſneſs and extortion.

ARGENTATI MILITES, in antiquity. Livy, lib. vi. ſpeaks of *argentati milites*, as diſtinguiſhed from *aurati*. Aquinas ſuppoſes theſe to have been ſimilar to the argyraſpides and chryſaſpides; but the deſcriptions do not quadrate. Livy only repreſents the argentati as cloathed in white linen coats.

ARGNTEUIL, a town of the Iſle of France, ſeated on the river Seine, five miles north-weſt of Paris. It is a very beautiful place, with fine vineyards. In the environs are quarries of ſtucco. In the Benedictine priory they pretended to have the ſeamleſs coat of Chriſt. E. Lon. 2. 28. N. Lat. 48. 52.

ARGENTIERE, a ſmall iſland in the Archipelago, near Milo. It is about 18 miles in compaſs; and is full of barren mountains, producing nothing but barley, cotton, and a few grapes fit only for eating. The barley and cotton are ſown round the only village there is in the iſland. The ladies are handſome enough, have no other employment but making cotton ſtockings, and take up with the ſailors who put into the port. The men all uſe the ſea, and in time become good pilots. They have very little religion, are very ignorant, and of very bad morals. Juſtice is adminiſtered by an itinerant cadi, who is ſometimes the only muſſulman in the whole iſland. The only article relating to natural hiſtory is the Terra Cimolia ſo highly eſteemed by the ancients; it is a kind of white chalk, which is very heavy without taſte, and crumbles eaſily: they uſe it in waſhing linen. E. Long. 23. 10. N. Lat. 36. 50.

ARGENTINA, in ichthyology, a genus of fiſhes belonging to the order of abdominales. The generic characters are theſe: The teeth are in the tongue as well as the jaws; the branchioſtege membrane has eight radii or rays; the anus is near the tail; and the belly-fins conſiſt of many rays. There are two ſpecies of argentina, viz. The ſphyræna has 15 rays in the fin at the anus; the air-bladder of this ſpecies is conical on both ſides, and ſhines like ſilver: according to Mr Ray, falſe pearls are ſometimes made of it. 2. The carolina has likewiſe 15 rays in the fin near the anus; the

Argentinus ‖ Argo. the tail is forked, and the lateral lines are straight. It inhabits the fresh waters of Carolina.

ARGENTINUS, a deity worshipped by the ancients, as the god of silver coin; as Æsculanus, whom they made his father, was the god of brass money, which was in use before silver.

ARGENTON, a town and county of France, in the duchy of Berry, divided into two by the river Creuse. Here was formerly a castle; but it was demolished by Lewis XIV. E. Long. 1. 38. N. Lat. 40. 30.

ARGENTORA, *Argentina*, (Notitiæ); *Argentoratum*, (Ptolemy); *Argentoratus*, (Ammian); a city of the Tribocci; one of the fifty forts built by Drusus on the Rhine, (Florus): an appellation formed by the Romans from the German, *Argen Strassen*, or *Straten*, "unsafe roads for travellers," from the maroding parties of the garrisons that infested the roads. Now *Strasburg*†, in the lower Alsace, on the rivulet Ill, near the Rhine. E. Long. 7. 35, Lat 48. 38.

† See *Strasburg*.

ARGENTUM. See SILVER.

ARGENTUM Album, in our old customs, silver coin, or pieces of bullion that anciently passed for money. By Doomsday tenure, some rents to the king were paid in *argento albo*, common silver pieces of money; other rents in *libris ursis et pensatis*, in metal of full weight and purity: in the next age, that rent which was paid in money, was called *blanch fearm*, and afterwards *white rent*; and what was paid in provisions, was termed *black mail*.

ARGENTUM Dei, God's penny, anciently signified earnest-money, or money given to bind a bargain; in some places called *erles*, or *arles*, and by the civilians and canonists, *arrhæ*. *Et cepit de prædicto Henrico tres denarios de argenti Dei præ manibus.*

ARGENTUM Musivum is a mass consisting of silver-like flakes, used for the colouring of plaster-figures, and for other purposes, as pigment. It consists of an amalgam of equal parts of tin, bismuth, and mercury. It is to be mixed with white of eggs, or spirit varnish, and then applied to the intended work, which is afterwards to be burnished.

ARGENTUM Vivum, Mercury or *Quicksilver*. See MERCURY and CHEMISTRY-*Index*.

ARGESTES, is used by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the south, and westward. Ricciolus uses the term to denote the wind which blows at 22° 30′, from the west towards the north, coinciding with that which is otherwise called *west-north-west*.

ARGIL, in ornithology, a species of ardea. See ARDEA.

ARGILLA, clay in natural history. See CLAY.

ARGIVI, or ARGEII, the people of Argeia or Argolis. See ARGEIA.

ARGO, in antiquity, a ship or vessel celebrated among the poets; being that wherein the Argonauts, of whom Jason was the chief, made their expedition in quest of the golden fleece. Jason having happily accomplished his enterprise, consecrated the ship Argo to Neptune; or, as others say, to Minerva, in the Isthmus of Corinth; where, they add, it did not remain long before it was translated into heaven, and made a constellation. The generality of authors represent the ship Argo as of a long make, resembling the modern galleys; and furnished with thirty benches of rowers.

Argo ‖ Argonautic. It could not, however, be of any great bulk, since the Argonauts were able to carry it on their backs from the Danube to the Adriatic sea.

ARGO Navis, the *Ship Argo*, in astronomy, is a constellation in the southern hemisphere, whose stars, in Ptolemy's catalogue, are 45; in Tycho's, 11; in the Britannic catalogue, and Sharp's appendix, 64.

ARGOB, (anc. geog.), a canton lying beyond Jordan, in the half tribe of Manasseh, and in the country of Bashan, one of the most fruitful on the other side of Jordan. In the region of Argob there were sixty cities, called *Bashan-havoth-jair*, which had very high walls and strong gates, without reckoning many villages and hamlets which were not inclosed, Deut. iii. 4. 14, and 1 Kings iv. 13. But Argob was more particularly the name of the capital city of the region of Argob, which Eusebius says was fifteen miles west from Gerasa.

ARGONAUTA, the name of a genus of shell-fish belonging to the order of vermes testacea. The shell consists of one spiral involuted valve. There are two species of argonauta, viz. The argo, with a subdented carina, which is found in the Mediterranean and Indian oceans. This is the famous nautilus of authors. The shell seems no thicker nor stronger than a piece of paper; and the fish that inhabits it is a sepia. It has been imagined that men first learned the method of sailing in vessels from what they saw practised by this creature. When it is to sail, it extends two of its arms on high; and between these supports a membrane, which it throws out on this occasion: this serves for its sail; and the two other arms it hangs out of the shell, to serve occasionally either as oars or as a steerage; but this last office is generally served by the tail. When the sea is calm, it is common to see numbers of these creatures diverting themselves with sailing about in this manner; but as soon as a storm rises, or any thing gives them disturbance, they draw in their legs, and take in as much water as makes them somewhat heavier than the sea-water in which they swim, and they then sink to the bottom. The manner of their voiding this abundant water, when they would rise again, is by a number of holes, of which their legs are full. 2. The cymbium, with a blunt plaited carina. This species is very small, and is found in the Mediterranean.

See Plate LVIII.

ARGONAUTIC, something belonging to the Argonauts.

The argonautic expedition is one of the greatest epochas or periods of history which Sir Isaac Newton endeavours to settle, and from thence to rectify the ancient chronology. This he shows, by several authorities, to have been one generation or about thirty years earlier than the taking of Troy, and 43 years later than the death of Solomon. See CHRONOLOGY.

Dr Bryant, however, rejects the history of the Argonautic expedition as a Grecian fable, founded indeed on a tradition derived from Egypt, and ultimately referring to Noah's preservation, &c. in the ark. But although we are not to believe all the romantic stories which poets, and even some grave historians, have told us of those famous adventurers, yet it seems unreasonable to discredit enterely the Argonautic expedition. See ARGONAUTS.

ARGONAUTICA, in literary history, denotes poems on the subject and expeditions of the Argonauts. We have the *Argonautics* of Orpheus in epic verse, published by H. Stephens; the *Argonauticon* of Valerius Flaccus, in eight books of Latin heroics, in imitation of Apollonius, with respect to which Burman observes that the imitator has often surpassed the original; the *Argonautics* of Apollonius Rhodius, an heroic poem, consisting of four books, *opus*, as Quintilian calls it, *non contemnendum*.

ARGONAUTS, in antiquity, a company of illustrious Greeks, who embarked along with Jason, in the ship Argo, from Colchis, with a design to obtain the golden fleece.

The occasion of this expedition is thus represented by Greek writers. Phryxus, flying with his sister Helle from the rage of their step-mother Ino, the daughter of Cadmus, went on board a ship, whose ensign was a golden ram and sailed to Colchis (now Mingrelia, part of Georgia). Helle was drowned by the way, in that sea which from her was called the *Hellespont*, now the *Dardanelles*. This, according to some, was the ground of the poetical fable, that a ram with a golden fleece swam away with them to Colchis; and that the Argonauts undertook their famed expedition, in order to find that fleece. But Strabo and Arrian inform us, that it was a practice of the Colchians to collect gold on mount Caucassus by extending fleeces across the beds of the torrents; and as the water passed, the metallic particles remained entangled in the wool: hence, according to those historians, the adventure was named the *expedition of the golden fleece*. Sir Isaac Newtown thinks that this expedition was really an embassy sent by the Greeks, during the intestine divisions of Egypt in the reign of Amenophis, to persuade the nations upon the coast of the Euxine and Mediterranean seas, to take that opportunity of shaking off the yoke of Egypt, which Sesostris had laid upon them; and that fetching the golden fleece, was only a pretence to cover their true design.

But the most judicious and satisfactory account of the Argonautic expedition seems to be that given by Dr Gillies in his history of Greece. "The northern districts of Thessaly being peculiarly exposed to the dangerous fury of invaders, the petty princes of that province entered into a confederacy for their mutual defence. They assembled in spring and autumn at Thermopylæ, a place afterwards so illustrious, and then governed by Amphictyon, a descendant of Deucalion, whose name is immortalized in the Amphictyonic council. The advantages which the confederates derived from this measure, were soon perceived by their neighbours. The central states gradually acceded to their alliance; and about the middle of the fourteenth century before Christ, Acrisius king of Argos, and other princes of the Peloponnesus, were allowed to share the benefits and security of this useful association. See AMPHICTYONS.

"After this event, the Amphictyons appear to have long confined themselves to the original purpose of their institution. The states, whose measures were directed by this assembly, found sufficient occupation in defending their own territories; and near a century elapsed, before they undertook, by common consent, any distant expedition. But it was not to be expected that their restless activity could be always exhausted in defensive war. The establishment of the Amphictyons brought together the chiefs most distinguished by birth and bravery. Glory and emulation prompted them to arms, and revenge directed those arms against the barbarians. Jason, Admetus, and other chieftans of Thessaly, having equipped a small fleet in the neighbouring harbour of Ioleus, and particularly the ship Argo, of superior size and construction to any before known, were animated with a desire to visit foreign lands, to plant colonies in those parts of them that appeared most delightful, and to retort on their inhabitants the injuries which Greece had suffered from strangers. The princes of the north having proclaimed this spirited design over the central and southern provinces, the standard of enterprize and glory was speedily surrounded by the flower of the Grecian youth, who eagerly embraced this honourable opportunity to signalize their manly valour. Peleus, Tydeus, Telamon, and in general the fathers of those heroic chiefs who in the succeeding age shone with distinguished lustre in the plains of Troy, are numbered among the leaders of the Argonauts. They were accompanied by the chosen warriors, and by the venerable prophets, of their respective tribes; by an Esculapius, the admired father of the healing art; and by the divine Orpheus, whose sublime genius was worthy to celebrate the amazing series of their adventures.

"These adventures, however, have been too much adorned by the graces of poetry, to be the proper subjects of historical composition. The designs of the Argonauts are vieled under the allegorical, or at least doubtful, phrase, *of carrying off the golden fleece*; which, though easily explained, if we admit the report that the inhabitants of the eastern banks of the Euxine extended fleeces of wool, in order to collect the golden particles which were carried down by the torrents from Mount Caucasus, is yet described in such various language by ancient writers, that almost every modern who examines the subject, thinks himself intitled to offer, by way of explanation, some new conjecture of his own. But in opposition to the most approved of these conjectures, we may venture to affirm, that the voyage to Colchis was not undertaken with a view to establish extensive plans of commerce, or to search for mines of gold, far less to learn the imaginary art of converting other substances into that precious metal; all such motives supposing a degree of speculation and refinement unknown in that age to the gallant but uninstructed youth of Thessaly. The real object of the expedition may be discovered by its consequences. The Argonauts fought, conquered, and plundered; they settled a colony on the shores of the Euxine; and carried into Greece a daughter of the king of Colchis, the celebrated Medea, a princess of Egyptian extraction, whose crimes and enchantments are condemned to eternal infamy in the immortal lines of Euripides."

ARGONAUTS of St Nicholas, was the name of a military order instituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as some say, merely for preserving amity among the nobles. They wore a collar of shells, inclosed in a silver crescent, whence hung a ship with this device, *Non credo tempori*, "I do not trust time." Hence these Argonaut

Argonaut knights came to be called *knights of the shell*. They received the order of St Basil, archbishop of Naples; and held their assemblies in the church of St Nicholas, their patron.

ARGOPHYLLUM, White-leaf *(Forst. Nov. Gen.)*: A genus of the monogynia order, belonging to the pentandria class of plants. The capsule is trilocular; the nectarium is pyramidal, pentagonous, and the length of the corolla. There is but one species, the netidum or glossy, a native of New Caledonia. This genus has great affinity with the ivy; but differs in the nectarium, and perhaps in the fruit.

ARGOS. an ancient name of Peloponnesus; from Argos, one of the kings, (Homer, Strabo).

Argos, the capital, and an inland town, of Argolis or Argeia. It had different surnames; as *Achaicum*, from the country, or an ancient people, (Homer); *Hippium*, from its breed of horses; and *Inachium*, from the river Inachus, which runs by, or from Inachus the founder of the kingdom, whose name was also given to the river. The Argives related, that this was one of the river-gods who adjudged the country to Juno, when she contended for it with Neptune, which deity in return made their water to vanish; the reason why the Inachus flowed only after rain, and was dry in summer. The source was a spring, not copious, on a mountain in Arcadia, and the river served there as a boundary between the Argives and Mantineans.

Ancient Argos stood chiefly on a flat. The springs were near the surface; and it abounded in wells, which were said to have been invented by the daughters of Danaus. This early personage lived in the acropolis or citadel, which was named *Larissa*, and accounted moderately strong. On the ascent was a temple of Apollo on the ridge, which in the second century continued the seat of an oracle. The woman who prophesied was debarred from commerce with the male sex. A lamb was sacrificed in the night, monthly; when, on tasting of the blood, she became possessed with the divinity. Farther on was a stadium, where the Argives celebrated games in honour of Neméan Jupiter and of Juno. On the top was a temple of Jupiter, without a roof, the statue off the pedestal. In the temple of Minerva there, among other curious articles, was a wooden Jupiter, with an eye more than common, having one in the forehead. This statue, it was said, was once placed in a court of the palace of Priam, who fled as a suppliant to the altar before it, when Troy was sacked. In this city was also the brazen tower in which Danäe, being confined there by her father, was deflowered by Jupiter.

Argos retains its original name and situation, standing near the mountains which are the boundary of the plain, with Napoli and the sea in view of it. The shining houses are whitened with lime or plaster. Churches, mud-built cottages and walls, with gardens and open areas, are interspersed, and the town is of considerable extent. Above the other buildings towers a very handsome mosque shaded with solemn cypresses; and behind is a lofty hill, brown and naked, of a conical form, the summit crowned with a neglected castle. The devastations of time and war have effaced the old city. We look in vain (says Mr Chandler) for vestiges of its numerous edifices, the theatre, the gymnasium, the temples, and monuments, which it once boasted, contending even with Athens in antiquity and in favours conferred by the gods.

Argos Amphilochicum, (Thucydides, a city of Acarnania, (Scylax, Pliny); its territory Amphilochia: situate on the east side of the Sinus Ambracius, (Thucydides); distant one hundred and eighty stadia to the south-east of Ambracia, (Polybius). Also called *Argia Amphilochis*, (Mela); *Amphiloci*, and *Amphilochici*, the people, (Stephanus). The name is from Amphilochus, son of Amphiaraus; and from Argos, the name of his country, in Peloponnesus, (Thucydides).

Argos Hippium. See Argos in Peloponnesus, *supra*.

Argos Hippium, the ancient name of Arpi; but Lampe is a still more ancient; afterwards called *Argyrippa*, and *Argippa*; built by, and the residence of, Diomedes, on the Cerbalus, (Virgil); afterwards a large and populous city, (Livy): a town of Apulia; now in ruins, and the place called *Arpi*.

Argos Pelasgicum, (Homer); an appellation denoting Thessaly; so called from the Pelasgi.

Argos Portus, a port of Tuscany, (Strabo): now Porto Ferraro, in the north of the island of Elba. E. Long. 11. 30. Lat. 42. 35.

ARGUIM, an island on the coast of Africa, about sixteen miles distant from Cape Blanco, situated in W. Long. 16. 30. N. Lat. 20. 20. It is scarce two miles in length; notwithstanding which, it was a bone of contention for 87 years between the Portuguese, Dutch, English, and French; and, after a variety of fortune, has at last been totally abandoned.

This island was first discovered by the Portuguese in 1444, when a fleet bound to the East touched at Arguim, and from some little trade carried on with the natives, it was imagined that a settlement there might be of some advantage to Portugal. In consequence of this opinion, a fort was erected on the island, and the Portuguese enjoyed the peaceable possession of it till 1638. At this time the Dutch having received a minute account of the condition of the island, resolved to attack it; and accordingly landed without molestation from the garrison, which was too weak to oppose them. The Portuguese, however, defended themselves with great intrepidity, and at last surrendered upon honourable terms. The Dutch immediately set about repairing the fortifications, and securing it in the best manner they could: however, in 1665, the fort was reduced almost to an heap of rubbish by an English squadron; but as the fortifications were totally destroyed, and only a small garrison left there, it was easily retaken by the Dutch the next year. They now redoubled their diligence in strengthening the island, entering into alliance with Moorish chiefs, procuring a number of families to settle under protection of the fort, and giving extravagant prices for gums, in order to monopolize the gum-trade. By this means the gum-trade of the French Senegal company was almost entirely destroyed; upon which they fitted out a squadron, dispossessed the Dutch, and had the island finally ceded to them by the treaty of Nimeguen.

Though the Dutch now seemed to be totally expelled, they resolved not to part so easily with such a valuable settlement. Under pretence of being subjects of the Elector of Brandenburg, therefore, they erected one of the forts which had been demolished, and there maintained themselves in spite of the utmost endeavours of the French company to dispossess them. Numberless were the memorials, protests, rescripts, &c. which were published upon this occasion, till a new war in 1701 put an end to them. In 1717, however, the French company having found all their remonstrances ineffectual, fitted out a new squadron; but this armament did not arrive at Arguim before Feb. 26th, 1721. The Dutch defended themselves with such intrepidity and conduct as had almost baffled the utmost efforts of the French; but the latter having found means to draw off a Moorish chief from his allegiance, the Dutch were obliged to evacuate Arguim, and retire to Portendic, where they fortified themselves, determining to watch a favourable opportunity for recovering their settlement at Arguim. This was not long wanting, by means of the weakness of the garrison and the imprudence of Duval the French director; who having quarrelled with the Moors, was surprised, defeated, and killed by them; in consequence of which, the settlement fell again into the hands of the Dutch on the 11th of Jan. 1722. In 1723, the Dutch were attacked by another French squadron under the command of the Sieur Riguadiere. This gentleman boasted that the fort could not hold out one day; but though he prevailed so far as to get possession of the cisterns which contained the water of the besieged, he was at last shamefully repulsed, and forced to raise the siege with precipitation. The Dutch, however, did not long enjoy the possession which they had so bravely defended; for, in 1725, their fort was entirely demolished by the French under Du Casse, and has never since been rebuilt by any European nation.

ARGUMENT, in rhetoric and logic, an inference drawn from premises, the truth of which is indisputable, or at least highly probable. See LOGIC.

ARGUMENT, in matters of literature, denotes also the abridgment or heads of a book, history, comedy, chapter, &c. See SYLLABUS.

ARGUMENTATION, the act of inventing or framing arguments, of making inductions, and drawing conclusions. See INDUCTION, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument.—The matter of argumentation is propositions; the form, their due disposition, with regard to one another, so as a conclusion may be drawn from them. See ENTHYMEME, PROPOSITION, RATIOCINATION, SORITES, SYLLOGISM, &c.

ARGUS, in fabulous history, was the son of Aristor, and had 100 eyes, 50 of which were always open. Juno made choice of him to guard Io, whom Jupiter had transformed into a white heifer; but Jupiter, pitying Io for being so closely confined, sent Mercury, who, with his flute, charmed Argus to sleep, sealed up his eyes with his caduceus, and then cut off his head; when Juno, to reward his fidelity, turned him into a peacock, and placed his eyes in his tail.

Argus-Shell, a species of porcelain-shell, beautifully variegated with spots, resembling in some measure those in a peacock's tail.

ARGUTIÆ, witty and acute sayings, which commonly signify something further than what their mere words at first sight seem to import.—Writers on rhetoric speak of divers species of argutiæ, viz.

Argutiæ ab alieno, when something is said, which seems repugnant either to the nature and property of a thing, or to common custom, the laws, &c. which yet in reality is consistent therewith; or when something is given as a reason of another, which yet is not the reason of it. For instance, *Si Caius nihil didicisset, errasset minus*: again, *Aureum hoc sæculum est, quia plurimus jam auro honos venit*.

Argutiæ ab illusione, those wherein allusion is made to some history, fable, sentence, proverb, or the like; e. gr. *Multi umbram captant & carnem amittunt.*

Argutiæ a comparatis, when two things are compared together, which yet at first sight appear very different from each other, but so as to make a pretty kind of simile or dissimile; e. gr. *Par est pauper nil cupiens principi omnia habenti.*

Argutiæ a repugnantibus, when two things meet in a subject, which yet regularly cannot be therein; or when two things are opposed to each other, yet the epithet of the one is attributed to the other; e. gr. *Dum tacent clamant.*

ARGYLE (dukes of). See CAMPBELL.

ARGYLESHIRE, or ARGATHILIA, in Scotland; which together with Perthshire and the Western Islands, is said to have constituted the ancient kingdom of the Scots, while the rest of Caledonia was subject to the Picts and Romans, comprehends Kintyre, Knapdale, Argyle proper, Cowal, and Lorn. It is bounded on the south by the Irish sea and the Frith of Clyde; on the east, by Perthshire; on the north-east, by Lochaber; and on the north-west, by several Islands. The extent of it from south to north, between the Mull of Kintyre and the point of Ardnamurchan where it joins the shire of Invernefs, is about 114 miles; and the breadth in some places, including the isles, to 70. This country, like all other parts of the Highlands, affords a very wild and horrid prospect of hills, rocks, and huge mountains, piled upon each other in a stupendous and dreadful disorder; bare, bleak, and barren to the view; or at best covered with shagged heath, which appears black and dismal to the eye, except in the summer, when it is variegated with an agreeable bloom of a purple colour. The coast of Argyle is rocky: yet indented with bays and inlets, that afford good harbours for shipping. The country is well watered by rivers, brooks, and lakes, abounding with fish; the vales and flat parts of it are cultivated for corn; the mountains feed an innumerable quantity of black cattle, which run wild among the hills in winter as well as summer; the heath and woods, of which there is a considerable number, afford shelter to deer, roebucks, and all sorts of game in great plenty: the circumambient sea, with its locks, bays, and harbours, pours forth myriads of fish; but the innate wealth of the country is dug from the bowels of the mountains in iron, copper, lead, and other metals and minerals.

Argyle is the seat of a provincial synod, consisting of five presbyteries and 49 parishes; and gives the titles of *duke* and *earl* to the noble family of Campbell, the most powerful of all the Scottish nobility. The duke of Argyle is, by hereditary right, great master of the king's household in Scotland; admiral of the Western isles; general of Denoon castle; keeper of Dunstaffnage and Carrick: and, before the jurisdictions were abolished, enjoyed other hereditary offices, which rendered

dered him too powerful as the subject of a limited monarchy. He still possesses many royalties; his vassals, even of the name of *Campbell*, are so numerous, and his influence extends so far, that he could, on occasion, bring 3000 or 4000 fighting men into the field. Argyleshire is in general peopled by this clan; and affords a great number of castles and seats belonging to gentlemen who hold of the duke, and boast themselves descended from his family.

Argyle Proper is bounded by Knapdale and Cowal on the south; Lochaber on the north; Lennox and the Grampian hills on the east; and Lorne on the west. It lies between Lochfyn and Lochow; which last is a fresh-water lake, about a mile broad, but extending 24 in length, including 12 islands, on two of which there are the castles of Enconel and Glenurquhart. This lake which gives the title of *viscount* to the duke of Argyle, issues in the river Aw, which, after a course of six or seven miles, enters Loch Ettiff; and this falls into the west sea, opposite to the isle of Mull: all these abound with excellent trout and salmon. Argyleshire sends one member to parliament.

When the projected canal shall be completed, and some villages and harbours erected, the populous county of Argyle (Mr Knox affirms) will become one of the most valuable provinces in the British empire. It abounds in black cattle, sheep, and fish, though the latter are less numerous than those on the more northern shores. Washed on both sides by the sea, deeply indented by navigable lakes and bays; having an easy communication with the fishing grounds on the North Highlands; with Glasgow, and the trading towns on the Clyde; with Ireland, Wales, Whitehaven, Liverpool, Bristol, and other marts on the west coast of England, we may easily conceive, that the period is at no great distance, when Argyleshire will become a great commercial county. To corroborate this opinion, he observes, that after a vessel gets under sail from this coast, she enters at once into the Atlantic, where she meets with no interruption till she makes the coast of America or the West-Indies. The line, therefore, which nature points out for the inhabitants, is, that of salt-making, fishing, ship-building, freights or the carrying trade; soap and glass-making, by means of the kelp upon their shores, and sand found upon Gia island, which is adapted for the latter.

ARGYRASPIDES, or ARGYROASPIDES, in antiquity, persons armed with silver bucklers, or bucklers silvered.

The argyraspides, according to Quintus Curtius, made the second corps of Alexander's army; the first was the phalanx.—According to Justin's account, lib. xii. chap. 7. Alexander having penetrated into India, and extended his empire as far as the ocean; for a monument of his glory, ordered the armour of his soldiers, and the housings of his horses, to be adorned with silver. And hence commanded them to be called *argyraspides*, from the Greek αργυρος, *silver*, and ασπις, *buckler*.

By this author it should seem, that Alexander's whole army were called *argyraspides*.—After that prince's death, the agyraspides despised all other chiefs of the army, disdaining to obey any other, having borne arms under Alexander.

ARGYRIPÆ. See *ARGOS Hippium*.

ARGYRUNTUM, a maritime town of Illyria, (Ptolemy, Pliny). Now Novigrad, a town of Dalmatia. E. Long. 17. 30. Lat. 44. 30.

ARHUSEN, a diocese of North Jutland in Denmark, to the south of Wilburg, about 60 miles in length and 30 in breadth. It contains two capital cities, called *Arhusen* and *Rander*; besides several market-towns of less note, and upwards of 300 villages. Arhusen, one of the capitals, is advantageously situated on the coast of the Baltic Sea, at the mouth of the river Guda, which runs through it; and it is surrounded with forests full of game. E. Long. 10. 0. N. Lat. 56. 10.

ARIA, one of the ancient names of Thrace, (Stephanus); that is *martial*, from the character of the people, whose country Euripides calls the residence of Mars and Sophocles his place of nativity.

ARIA, and *Ariana* (anc. geog.) whether the same or distinct countries authors are not agreed. Ptolemy has only Aria, and knows nothing about Ariana. Pliny mentions only Ariana, and says nothing about Aria; but distinguishes between the Arii and Ariani: Parthia, he says, has the Arii to the east, Carmania and the Ariani to the south; from which it is conjectured, the Ariani extended farther than the Arii, and comprised the Gedrosii and the Drangae. Arrian has only Aria and Arii, and is silent about Ariana. But Strabo gives more extensive bounds to Ariana than to Aria, without particularly defining them: only in general he says, that Ariana begins from India, and quotes Eratosthenes; according to whom, Ariana is bounded by the Indus on the east; on the south, by the Great Sea; by Paropamisus on the north, and by the mountains, quite to Portæ Caspiæ; on the west, by the same boundaries by which Parthia is separated from Media, Carmania from Paraetacene and Persia: and thus Ariana is extremely extensive.—Aria has its limits thus described by Ptolemy: On the north, some parts of Margiana and Bactriana; on the east, the Paropamisidæ; on the south, the Drangiana: and Strabo says, the Arii adjoin to the the Paropamisidæ on the west.

ARIA, called *Ariapolis*, (Strabo): Now Herat, in Chorasan, set down in an ancient map as situated on the river Arias, which probably gave name to the country Aria. Arrian calls the river *Areios*; Pliny, *Arius*; Ammian, *Arias*; now Heri, which runs by Alexandria, also called *Alexandria Arion* or *Ariorum*.

ARIADNÆA, in Grecian antiquity, two festivals at Naxos, in honour of two women named *Ariadne*. One of them being the daughter of king Minos, they had, in the solemnity dedicated to her, a shew of sorrow and mourning; and, in memory of her being left by Theseus near the time of child-birth, it was usual for a young man to lie down and counterfeit all the agonies of a woman in labour. This festival is said to be first instituted by Theseus, to atone for his ingratitude to that princess.—The other Ariadne was thought to be of a gay and sprightly temper; and therefore her festival was observed with music and other expressions of mirth and joy.

ARIADNE, daughter of Minos king of Crete. Theseus being sent to destroy the Minotaur, Ariadne was so taken with him, that, as a testimony of her love, she gave Theseus a clue of thread to guide him out of the labyrinth. Theseus, having killed the Minotaur,

notaur, carried off the Athenians he had relieved, together with Ariadne; whom, however, he afterward forsook.

ARIADNIA, in antiquity. See ARIADNÆA.

ARIANA (anc. geog.), an extensive country, comprising Paropamisus, Arachosia, Drangiana, and Gedrosia, if we suppose it to reach the sea. See ARIA.

ARIANNA, a small village six miles N. E. from the city of Tunis. Here is a beautiful range of the ancient Carthaginian aqueduct, 74 feet high, supported by columns 16 feet square, and which still increased in grandeur the nearer it approached Carthage. The stones are all diamond-cut. Near this spot several ancient mattamones, or subterraneous magazines for corn, have been discovered within these few years, capable of containing 100 bushels, strongly arched with large square stones. The Moors have already begun to demolish them, it being their custom to do so with every thing beautiful as soon as it comes to light.

ARIANO, a town of Italy, in the kingdom of Naples, in the Ulterior Principality, with a bishop's see. Mr Swinburne describes it as an ugly city, built upon the uneven summit of a mountain, with an extensive look-out on all sides, but exposed to every blast that blows. It does not appear to be so old as the time of the Romans; therefore supposed to owe its rise to the demolition of some neighbouring town, and to the advantages its situation afforded for discovery and defence. It is but a poor place, without trade or manufactures; having declined ever since the desolation caused by an earthquake in 1456. It reckons about 14,000 inhabitants, and no less than 20 parishes and convents, besides an ill-endowed cathedral. The wine made here is pale, like red Champagne, which it also resembles in a certain tartness, exceedingly refreshing in hot weather. The soil lies upon a soft agrillaceous stone. At a small distance to the east is a bank consisting of layers of volcanical earths, interspersed with thick strata of oyster-shells.

Below the town is a convent of Dominicans, whose house, within these last hundred years, has been thrice rebuilt, having been as often thrown to the ground by earthquakes. The last and most destructive happened in 1732, fatal to all the country that lies along the eastern verge of the Appenine. In order to secure a retreat in case of future accidents, which from their situation they have every reason to expect, these fathers have constructed a small building of wood, the parts of which being joined together with strong iron chains, are contrived so as to have a proper play, and by yielding to the oscillatory motion of the earth, return easily to their equilibrium. E. Long. 15. 19. N. Lat. 41. 8.

ARIANS, followers of Arius, a presbyter of the church of Alexandria about the year 315; who maintained, that the Son of God was totally and essentially distinct from the Father; that he was the first and noblest of those beings whom God had created, the instrument by whose subordinate operation he formed the universe; and therefore inferior to the father both in nature and dignity: also, that the Holy Ghost was not God, but created by the power of the Son.

The Arians owned that the Son was the word, but denied that word to have been eternal. They held, that Christ had nothing of man in him but the flesh, to which the λογος or Word was joined, which was the same as the soul in us. See *Lardner's Credibility*, &c. Vol. IX. b. i. c. 69.

The Arians were first condemned and anathematized by a council at Alexandria in 320, under Alexander, bishop of that city; who accused Arius of impiety, and caused him to be expelled from the communion of the church: and afterwards by 380 fathers in the general council of Nice, assembled by Constantine in the year 325. But notwithstanding that, it was not extinguished; on the contrary, it became the reigning religion, especially in the East, where it obtained much more than in the West. Arius was recalled from banishment by the emperor Constantine in two or three years after the council of Nice, and the laws that had been enacted against him were repealed. In the year 335, Athanasius, his zealous opponent, was deposed and banished into Gaul, and Arius and his followers were reinstated in their privileges, and received into the communion of the church. In little more than a year after this, he fell a victim to the resentment of his enemies, and died a tragical death, occasioned probably by poison, or some other violence. The Arian party found a protector in Constantinus, who succeeded his father in the empire of the East; and the zeal with which he abetted them produced many animosities and tumults to the time of his death in the year 362. They underwent various revolutions, persecuting and oppressed, under succeeding emperors, according to the degree of interest they had in the civil power, till at length Theodosius the Great exerted every possible effort to suppress and disperse them.

The Arians were divided into various sects, of which ancient writers give an account under the names of *Semi-Arians*, *Eusebeans*, *Aetians*, *Eunomians*, *Acacians*, *Psathyrians*, and others. But they have been commonly distributed into three classes, viz. the *Genuine Arians*, *Semi-Arians*, and *Eunomians*.

Arianism was carried in the fifth century into Africa under the Vandals; and into Asia under the Goths: Italy, the Gauls, and Spain, were also deeply infected with it; and towards the commencement of the sixth century, it was triumphant in many parts of Asia, Africa, and Europe. But it sunk almost all at once, when the Vandals were driven out of Africa, and the Goths out of Italy, by the arms of Justinian. However, it revived again in Italy under the protection of the Lombards in the seventh century.

Erasmus seems to have aimed in some measure to restore Arianism at the beginning of the sixteenth century, in his Commentaries on the New Testament. Accordingly, he was reproached by his adversaries with Arian interpretations and glosses, Arian tenets, &c. To which he made little answer, save that there was no heresy more thoroughly extinct than that of the Arians: *Nulla heresis magis extincta quam Arianorum.* But the face of things was soon changed. Servetus, a Spaniard by nation, published in 1531 a little treatise against the Trinity, which once more revived the opinions of the Arians in the West. Indeed he rather showed himself a Photinian than an Arian; only that he made use of the same passages of Scripture, and the same arguments against the divinity of our Saviour, with the proper Arians.

It is true, Servetus had not, properly speaking, any difciples; but he gave occafion after his death to the forming of a new fyftem of Arianifm in Geneva, much more fubtle and artful than his own, and which did not a little perplex Calvin. From Geneva the new Arians removed to Poland, where they gained confiderable ground; but at length became Socinians.

The appellation *Arian* has been indifcriminately applied, in more modern times, to all thofe who confider Jefus Chrift as inferior and fubordinate to the Father; and whofe fentiments cannot be fuppofed to coincide exactly with thofe of the ancient Arians. Mr Whifton was one of the firft divines who revived this controverfy, in the beginning of the 16th century. He was followed by Dr. Clarke, who publifhed his famous book intitled *The Scripture Doctrine of the Trinity*, &c. In confequence of which he was reproached with the title of *Semi-Arian*. He was alfo threatened by the convocation, and combated by argument. Dr Waterland, who has been charged with verging towards Tritheifm, was one of his principal adverfaries. The hiftory of this controverfy during the prefent century may be found in a pamphlet, intitled *An account of all the confiderable books and Pamphlets that have been wrote on either fide, in the Controverfy concerning the Trinity, from the year* 1712; *in which is alfo contained an account of the Pamphlets written this laft Year, on each fide, by the Diffenters to the end of the Year* 1719. Publifhed at London, 1720.

ARICINA, in mythology, a furname of Diana; under which appellation fhe was honoured in the foreft Aricine, fo called from Aricia a princefs of the bloodroyal of Athens. Hippolytus, to whom this princefs was married, is faid to have erected a temple to Diana in this foreft, where he was concealed after his refurrection by Efculapius, and to have eftablifhed a prieft and feftivals.

ARIAS MONTANUS, a learned Spanifh divine, employed by Philip II. of Spain, to publifh another edition of the Bible, after that of Cardinal Ximenes; which he finifhed with applaufe, and died at Seville, in 1598.

ARICA, a port town of South-America, in the province of Los Charaes, in Peru. It was formerly a confiderable place: but the earthquakes, which are frequent here, have almoft entirely ruined it; for there are no more than 150 families, which are moft of them blacks, mulattoes, and Indians. Moft of the houfes are made with canes or reeds, fet upright, and bound together with cords or thongs; and as it never rains here, they are covered only with mats, which makes the place look at a diftance like a heap of ruins.

The vale of Arica is about a league wide, and fix leagues long, next the fea, and is all a barren country, except the fpot where the old town ftood, which is divided into little meadows of clover grafs and plots for fugar canes, with a few olive and cotton trees intermixt. This vale grows narrower as it runs eaftward: and a league up there is a village, where they begin to cultivate pimento or Jamaica pepper, which is planted throughout all the reft of the vale; and there are feveral farms, which produce nothing elfe, that bring in the value of 80,000 crowns yearly. The Spaniards of Peru are fo ufed to this pepper, that they drefs no provifion without it. W. Long. 70. 15. S. Lat. 18. 26.

ARICONIUM, a town of the Silures, (Antonine); now Hereford, (Camden). W. Long. 2. 42. Lat. 52. 6.

ARIDAS, a kind of taffety, manufactured in the Eaft Indies from a fhining thread which is got from certain herbs, whence they are ftyled *aridas of herbs*.

ARIDULLAM, in natural hiftory, a kind of zarnich found in the Eaft Indies. See ZARNICH.

ARIES, in zoology. See OVIS.

ARIES, the battering-ram. See *BATTERING-Ram*.

ARIES, in aftronomy, a conftellation of fixed ftars, drawn on the globe, in the figure of a ram. It is the firft of the twelve figns of the zodiac, from which a twelf part of the ecliptic takes its denomination.

ARILLUS, an improper term invented by Linnæus, and defined to be the proper exterior coat or covering of the feed, which falls off fpontaneoufly.

All feeds are not furnifhed with an arillus; in many, a dry covering, or fcarf-fkin, fupplies its place. In Jeffamy; hound's tongue, *cynogloffum*; cucumber; fraxinella, *dictamnus*; ftaff-tree, *celaftrus*; fpindletree, *euonymus*; African fpiræa, *diofma*; and the coffee-tree, *coffea*; it is very confpicuous.

In the genus hound's tongue, four of thefe arilli, or proper coats, each unfolding a fingle feed, are affixed to the ftylus; and in this circumftance, fays Linnæus, does the effence of the genus confift. In fraxinella, the arillus is common to two feeds. The ftaff-tree has its feeds only half involved with this cover.

The arillus is either *baccatus*, fucculent, and of the nature of a berry; as in the fpindle-tree, *euonymus*. *Cartilagineus*, cartilaginous, or griftly; as in the African fpiræa, *diofma*. *Coloratus*, coloured; as in the ftaff-tree. *Elafticus*, endued with elafticity, for difperfing the feeds; as is remarkable in the African fpiræa, *diofma*, and fraxinella. *Sebar*, rough and knotty; as in hound's tongue.

Although covered with an arillus or other dry coat, feeds are faid to be naked (*femina nuda*) when they are not inclofed in any fpecies of pericarpium or fruitveffel; as in the graffes, and the *labiati* or lipped flowers of Tournefort, which correfpond to the *didynamia gymnofpermia* of Linnæus. Seeds are faid to be covered (*feminu tecta*) when they are contained in a fruitveffel, whether capfule pod, or pulpy pericarpium, of the apple, berry, or cherry kind: See SEMEN). This exterior coat of the feed is, by fome former writers, ftyled *calyptra*. See CALYPTRA.

The different fkins or coverings of the feed, are adapted, fay naturalifts, for receiving the nutritive juices, and tranfmitting them within.

ARIMANIUS, the evil god of the ancient Perfians. The Perfian Magi held two principles: a good dæmon, or god, and an evil one: the firft the author of all good, and the other of all evil; the former they fuppofed to be reprefented by light, and the latter by darknefs, as their trueft fymbols. The good principle they named *Yezad* or *Yezdan*, and *Ormozd* or *Hormizda*, which the Greeks wrote *Oromafdes*; and the evil dæmon they called *Abriman*, and the Greeks *Arimanius*. Some of the Magians held both thefe principles to have been from all eternity; but this fect was reputed heterodox: the original doctrine being, that the good principle only was eternal, and the other created. —Plutarch (*De Ifide et Ofiride*, p. 369.) gives the

following

following account of the Magian traditions in relation to these gods and the introduction of evil into the world, viz. That Oromazes consisted of most pure light, and Arimanius of darkness; and that they were at war with each other: that Oromazes created six gods; the first, the author of benevolence: the second, of truth; the third, of justice, riches, and the pleasure which attends good actions; and that Arimanius made as many, who were the authors of the opposite evils or vices: that then Oromazes, triplicating himself, removed as far from the sun as the sun is from the earth, and adorned the heaven with stars, appointing the dog-star for their guardian and leader: that he also created 24 other gods, and inclosed them in an egg; but Arimanius having also made an equal number, these last perforated the egg, by which means evil and good became mixed together. However, the fatal time will come, when Arimanius, the introducer of plagues and famine, must be of necessity utterly destroyed by the former, and annihilated; then the earth being made plain and even, mankind shall live in a happy state, in the same manner, in the same political society, and using one and the same language. Theopompus writes, that, according to the Magians, the said two gods, during the space of 3000 years, alternately conquer, and are conquered; that for other 3000 years, they will wage mutual war, fight, and destroy the works of each other, till at last Hades (or the evil spirit) shall perish, and men become perfectly happy, their bodies needing no food, nor casting any shadow, i. e. being perfectly transparent.

ARIMASPI, (Pliny), a people of Sarmatia Europea, to the south of the Montes Riphæi, said by Mela to have but one eye; a fable broached by Aristeas Proconnesius, according to Herodotus.

ARIMATHEA, a town of Judea, (Evangelists); thought to be the same with *Ramatha*, 1 Sam. i. and thus in the tribe of Ephraim, (Wells).—This place is now called *Ramla*; and is in a very ruinous state, containing nothing but rubbish within its boundaries. The Aga of Gaza resides here in a Serai, the floors and walls of which are tumbling down. He maintains about one hundred horsemen, and as many Barbary soldiers, who (says Mr Volney) are lodged in an old Christian Church, the nave of which is used as a stable, and in an ancient kan, which is disputed with them by the scorpions. The adjacent country is planted with lofty olive trees, disposed in quincunces. The greatest part of them are as large as the walnut trees of France; but they are daily perishing through age, the ravages of contending factions, and even from secret mischief; for, in these countries, when a peasant would revenge himself of his enemy, he comes by night, and saws or cuts his trees close to the ground, and the wound, which he takes care to cover, draining of the sap like an issue, the olive tree languishes and dies. Amid these plantations, we meet, at every step, with dry wells, cisterns fallen in, and vast vaulted reservoirs, which prove that, in ancient times, this town must have been upwards of a league and a half in circumference. At present it scarcely contains two hundred families. The little land which is cultivated, by a few of them, belongs to the Mufti, and two or three persons related to him. The rest content themselves with spinning cotton, which is chiefly purchased by two French houses established there. The only remarkable antiquity at Ramla is the minoret of a ruined mosque on the road to Yafa, which is very lofty; and by an Arabic inscription appears to have been built by the sultan Saladin.

ARIMINUM, a town of Umbria, or Romagna, at the mouth of the Ariminus, on the Gulph of Venice. The seizing on it by Cæsar gave rise to the civil war. Now called *Rimini*, E. Long. 13. 30. Lat. 44. 8.

ARIOLI, in antiquity, a kind of prophets, or religious conjurers, who by abominable prayers, and horrible sacrifices at the altars of idols, procured answers to their questions concerning future events. *Isid. Orig.* lib. viii. cap. 9. These are also called *harioli*, and their operation *hariolation*. Sometimes they were denominated *aruspices* or *haruspices*. The *arioli* were distinguished by a slovenly dress, disorderly and matted beards, hair, &c.

ARION, an excellent musician and poet, inventor of dithyrambics. Periander entertained him at his court, where getting an estate, and returning to Corinth, the sailors, for lucre of his money, threw him into the sea; when, according to the poets, a dolphin, charmed with his music, took him on her back and carried him safe to shore.

ARION, an admirable horse, much more famous in poetic history than Bucephalus in that of Alexander. Authors speak variously of his origin, though they agree in giving him a divine one His production is most commonly ascribed to Neptune. This god, according to some, raised him out of the ground by a stroke of his trident: according to others, he begot him upon the body of the fury Erynnys; according to others, upon that of Ceres, whom he ravished in the form of a horse, she having previously assumed the form of a mare to elude his pursuit. This horse was nursed by the Nereids; and being sometimes yoked with the sea-horses of Neptune to the chariot of this god, he drew him with incredible swiftness through the sea. He had this singularity in him, that his right feet resembled those of a man. Neptune gave him to Capreus king of Haliartus. Capreus made a present of him to Hercules; who mounted him when he took the city of Elis, gained the prize with him in the race against Cygnus the son of Mars near Træcena, and at last made a present of him to Adrastus. It is under this last master that Arion has signalized himself the most: he won the prize for racing at the Memean games, which the princes who went to besiege Thebes instituted in the honour of Archemorus; and was the cause that Adrastus did not perish in this famous expedition, as all the other chiefs did.

ARIOSTO (Lodovico), the famous Italian poet, and author of Orlando Furioso, was born at the castle of Reggio in Lombardy in 1474. His father, who was major-domo to Duke Hercules, lived to the extent of his fortune, so left but little at his death. Ariosto, from his childhood shewed great marks of genius, especially in poetry; and wrote a comedy in verse on the story of Pyramus and Thisbe, which his brothers and sisters played. His father being utterly unlearned, and rather regarding profit than his son's inclination, compelled him to study the civil law in which having plodded some years to no purpose, he quitted it for more pleasing studies; yet often lamented, as Ovid

Ariosto. *See his Latin Poem. *Ad Patrem.*

and Petrarch did before him, and our own Milton since*, that his father banished him from the muses. At the age of 24, Ariosto lost his father, and found himself perplexed with family-affairs. However, in about six years he was, for his good parts, taken into the service of Don Hippolito, cardinal of Este. At this time he had written nothing but a few sonnets; but now he resolved to make a poem, and chose Bayardo's *Orlando Inamorato* for a ground-work. However, he was prevented writing for a great many years, and was chosen as a fit person to go on an embassy to Pope Julio II. where he gave such satisfaction, that he was sent again, underwent many dangers and difficulties, and at his return was highly favoured. Then, at his leisure, he again applied himself to his poem: but, soon after, he incurred the cardinal's displeasure for refusing to accompany him into Hungary; by which he was so discouraged, that he deferred writing for 14 years, even till the cardinal's death. After that, he finished by degrees, in great perfection, that which he began with great expectation. Duke Astolfo offered him great promotions if he would serve him; but, preferring liberty to grandeur, he refused this and other great offers from princes and cardinals, particularly from Leo X. from all whom he received notwithstanding great presents. The Duke of Ferrara delighted so much in his comedies, of which he wrote five, that he built a stage on purpose to have them played in his court, and enabled our poet to build himself a house in Ferrara, with a pleasant garden, where he used to compose his poems, which were highly esteemed by all the princes of Italy, who sent him many presents; but he said, "he would not sell his liberty for the best cardinal's hat in Rome." It was but a small, though convenient house: being asked, why he had not built it in a more magnificent manner, since he had given such noble descriptions of sumptuous palaces, beautiful porticos, and pleasant fountains, in his Orlando Furioso? He replied, That words were cheaper laid together than stones. Upon the door was the following inscription:

Parva sed apta mihi, sed nulli obnoxia, sed non
Sordida, parta meo sed tamen ære, domus.

Which Mr Harrington thus translates:

This house is small, but fit for me, but hurtful unto none;
But yet not sluttish, as you see, yet paid for with mine own.

In his diet he was temperate, and so careless of dainties, that he was fit to have lived in the world when they fed upon acorns. Whether he was ever married, is uncertain. He kept company with one Alexandria, to whom, it was reported, he was married privately, and a lady Genevera, whom he slily mentions in the 24th book of his Orlando, as poets are apt to intermix with their fictions some real amours of their own. He was urged to go ambassador to pope Clement, but would by no means accept this embassy. He translated the *Menecmi* of Plautus: and all his own comedies were so esteemed, that they were frequently acted by persons of the first quality; and when his Lena was first represented, Ferdinand of Este, afterwards Marquis of Massa, so far honoured the piece as to speak the prologue. He began one of his comedies in his father's lifetime, when the following incident shows the remarkable talent he had for poetry. His father one day rebuked him sharply, charging him with some great fault; but all the while he returned him no answer. Soon after, his brother began on the same subject; but he easily refuted him, and, with strong arguments, justified his own behaviour. "Why then (said his brother) did you not satisfy my father?" "In truth (said Ludovico), I was thinking of a part in my comedy; and methought my father's speech to me was so suited to the part of an old man's chiding his son, that I forgot I was concerned in it myself, and considered it only to make it a part of my play." It is also reported of Ariosto, that, coming by a potter's shop, he heard him singing a stave out of his Orlando, with so bad a grace, that, out of all patience, he broke with his stick several of his pots. The potter, in a pitiful tone, asking what he meant by wronging a poor man that had never injured him? "You rascal (he replied), I have not done thee half the wrong thou hast done me: for I have broken but two or three pots of thine, not worth so many halfpence; whereas thou hast broken and mangled a stanza of mine worth a mark of gold."

Ariosto was tall, of a melancholly complexion, and so absorbed in study and meditation, that he often forgot himself. His picture was drawn by Titian in a masterly manner. He was honoured with the laurel by the hands of the emperor Charles V. He was naturally affable, always assuming less than was his due, yet never putting up a known injury even from his superiors. He was so fearful on the water, that, whenever he went out of a ship, he would see others go before him; and, on land, he would alight from his horse on the least apprehension of danger. He was of an amorous disposition, and left two natural sons. He enjoyed the friendship of the most eminent men of learning of his time, most of whom he mentions with great respect in the last canto of his Orlando Furioso. His constitution was but weakly, so that he was obliged to have recourse to physicians the greatest part of his life. He bore his last sickness with great resolution and serenity; and died at Ferrara the 8th of July, 1533, according to Sir John Harrington, being then 59 years of age. He was interred in the church of the Benedictine monks, who, contrary to their custom, attended his funeral. He had a bust erected to him, and the following epitaph, written by himself, inscribed upon his tomb:

Ludovici Ariosti humantur ossa
Sub hoc marmore, seu sub hac humo, seu
Sub quidquid voluit benignus hæres,
Sive hærede benignior comes, seu
Opportunius incidens viator:
Nam scire haud potuit futura: sed nec
Tanti erat, vacuam sibi cadaver
Ut urnam cuperet parare.
Vivens ista tamen sibi paravit,
Quæ scribi voluit suo sepulchro,
Olim si quod haberet id sepulchrum:
Ne cum spiritus hoc brevi peracto
Præscripto spatio misellos artus,
Quos ægre ante reliquerat, reposcet,
Hac et hac cinerem huc et huc revellem
Dum noscat proprium, diu vagetur.

Ariosto, Aripo.

ARIPO, a strong town of Asia, on the western coast of the island of Ceylon, at the mouth of the river Sarunda. It belongs to the Dutch; and to the east of of it is a bank, where they fish for pearls. E. Long. 80. 25. N. Lat. 8. 42.

ARISBA (anc. geog.), a town of the island of Lesbos (Herodot.)—Another of Troas on the continent, in the territory and to the south-east of Abydos (Polyb.): the rendezvous of Alexander's army after the passage of the Hellespont (Arrian); a colony of the Mitylenians (Stephanus); taken and plundered by Achilles (Virgil). The residence of Axylus, celebrated by Homer, for his hospitality, which gained him the character of a friend to mankind.

ARISH, a Persian long measure, containing about 38 English inches.

ARISI, the Indian name for the plant which produces the rice. See ORYZA.

ARISTA, or AWN, among botanists, a long needle-like beard, which stands out from the husk of a grain of corn, grass, &c.

ARISTÆUS, son of Apollo and Cyrene, whom, for the many services he had rendered to mankind by his knowledge of all profitable arts, the gods placed amongst the stars; so that he is the Aquarius in the zodiac. The resemblance of his history to that of Moses has been curiously discussed by Huetius.

ARISTANDER, a famous soothsayer under Alexander the Great, over whom he gained a wonderful influence by the good success of his art. He had already had the same employment at the court of king Philip; and it was he who explained better than his brethren the dream that this Prince had after having married Olympias.

ARISTARCHUS, a Grecian Philosopher of Samos, one of the first that maintained that the earth turns upon its own centre. We are not sure of the age in which he lived; and have none of his works but a *Treatise of the greatness and distance of the Sun and Moon*, translated into Latin by Frederic Commandine, and published with Pappus's explanations in 1572.

ARISTARCHUS, a celebrated grammarian, much esteemed by Ptolemy Philometor, who committed to him the education of his son. He applied himself chiefly to criticism, and made a revisal of Homer's poems, but in too magisterial a way; for such verses as he did not like he treated as spurious. He commented on other poets; Cicero and Horace made use his name to express a very rigid critic.

ARISTIDA, in botany: A genus of the triandria digynia class; and, in the natural method, ranking under the 4th order, *Gramina*. The calyx has a double valve; the corolla has one valve, and three awns at the points. There are three species of Aristida, viz. the adscensionis, a native of the island of Ascension; the Americana, a native of Jamaica; and the plumosa, a native of America.

ARISTIDES, surnamed the *Just*, flourished at Athens at the same time with Themistocles, who triumphed over him by his boisterous eloquence, and got him banished, 483 years before Christ (See OSTRACISM): but Aristides being recalled a short time after, would never join with the enemies of Themistocles to get him banished; for nothing could make him deviate from the strictest rules of moderation and justice. Aristides brought the Greeks to unite against the Persians; distinguished himself at the famous battle of Marathon, and that of Salamine and Platea; and established an annual income of 460 talents for a fund to supply the expences of war. This great man died so poor, though he had the management of the revenues of Greece, that the state was obliged to pay his funeral expences, to give fortunes to his daughters in marriage, and a maintenance to his son Lysimachus.

ARISTIDES of Miletus, a famous Greek author, often cited by the ancients.

ARISTIDES, a very eloquent Athenian orator, who became a convert to the Christian religion, and about the year 124 presented to the emperor Adrian an apology for the Christians.

ARISTIDES (Ælius), a celebrated orator, born in Mysia, about 129 years before the Christian æra. The best edition of his works is that of Oxford, printed in Greek and Latin, in two volumes quarto.

ARISTIDES, a painter cotemporary with Apelles, flourished at Thebes about the 122d Olympiad. He was the first, according to Pliny, who expressed character and passion, the human mind, and its several emotions; but he was not remarkable for softness of colouring. "His most celebrated picture was of an infant (on the taking of a town) at the mother's breast, who is wounded and expiring. The sensations of the mother were clearly marked, and her fear lest the child, upon failure of the milk, should suck her blood." "Alexander the Great (continues the same author) took this picture with him to Pella."

Junius (in his Treatise *de Picturâ Veterum*(conjectures that the following beautiful epigram of Emilianus was written on this exquisite picture:

Ελκε, ταλαν παρα μητρος ον ουκ ετι μαζον αμελξεις
Ελκυσον υςατιον ναμα κατα φθιμενης.
Η δη γαρ ξιφεεσσι λιποπνοος αλλα τα μητρος
Φιλτρα και εν αιδη παιδοκομειν εμαθον

Elegantly translated thus;

Suck, little wretch, while yet thy mother lives,
Suck the last drop her fainting bosom gives!
She dies! her tenderness survives her breath,
And her fond love is provident in death..

Webb's Inquiry, dial. vii. p. 161.

ARISTIPPUS, the founder of the Cyrenaic sect of philosophy, was the son of Aretades, and born at Cyrene in Libya. He flourished about the 96th Olympiad. The great reputation of Socrates induced him to leave his own country, and remove to Athens, that he might have the satisfaction of hearing his discourses. He was chiefly delighted with those discourses of Socrates that related the most to pleasure: which he asserted to be the ultimate end in which all happiness consists. His manner of life was agreeable to his opinion; for he indulged himself extremely in all the luxuries of dress, wine, and women. Though he had a good estate, and three country seats, yet he was the only one of the disciples of Socrates who took money for teaching; which being observed by the philosopher, he asked Aristippus, How he came to have so much? Who in reply asked him, How he came to have so little? Upon his leaving Socrates, he went to Ægina, as Athenæus informs us, where he lived with more freedom and luxury than before. Socrates sent frequent exhortations to him, in order to reclaim him; but all in vain: and with the same view he published that discourse

course which we find in Xenophon. Here Aristippus became acquainted with Lais, the famous courtezan of Corinth; for whose sake he took a voyage to that city. He continued at Ægina till the death of Socrates, as appears from Plato's *Phædo*, and the epistle which he wrote upon that occasion. He returned at last into his own country Cyrene, where he professed philosophy, and instituted a sect, which, as we observed above, was called the *Cyrenaic*, from the place, and by some writers the *Hedonic* or voluptuous, from its doctrines. During the height of the grandeur of Dionysius the Sicilian tyrant, a great many philosophers resorted to him; and among the rest Aristippus, who was tempted thither by the magnificence of that court. Dionysius asking him the reason of his coming, he replied, "That it was in order to give what he had, and to receive what he had not:" or, as others represent it, "That when he wanted wisdom, he went to Socrates; but now as he wanted money, he was come to him." He very soon insinuated himself into the favour of Dionysius; for, being a man of a soft easy temper, he conformed himself exactly to every place, time, and person, and was a complete master of the most refined complaisance.

We have several remarkable passages concerning him during his residence at that court mentioned by Diogenes Laertius. Dionysius, at a feast, commanded that all should put on womens purple habits, and dance in them. But Plato refused, repeating these lines:

> I cannot in this gay effeminate dress
> Disgrace my manhood, or my sex betray.

But Aristippus readily submitted to the command, and made this reply immediately:

> ——At feasts, where mirth is free,
> A sober mind can never be corrupted.

At another time, interceding with Dionysius in behalf of a friend, but not prevailing, he cast himself at his feet; being reproved by one for that excess of humility, he replied, "That it was not he who was the cause of that submission; but Dionysius, whose ears were in his feet." Dionysius shewed him three beautiful courtezans, and ordered him to take his choice. Upon which he took them all three away with him, alleging that Paris was punished for preferring one to the other two: but when he had brought them to his door, he dismissed them, in order to shew that he could either enjoy or reject with the same indifference. Having desired money of Dionysius, the latter observed to him, that he had assured him a wise man wanted nothing. "Give me (says he) what I ask, and we will talk of that afterwards." When Dionysius had given it him, "Now (says he), you see I do not want." By this complaisance he gained so much upon Dionysius, that he had a greater regard for him than for all the rest of the philosophers, though he sometimes spoke with such freedom to that king, that he incurred his displeasure. When Dionysius asked, Why philosophers haunted the gates of rich men, but not rich men those of philosophers? he replied, "Because the latter know what they want, and the others not." Another time, Dionysius repeating (out of Sophocles, as Plutarch affirms, who ascribes this to Zeno) these verses:

> He that with tyrants seeks for bare support,
> Enslaves himself, though free he came to court;

he immediately answered,

> He is no slave if he be free to come.

Diocles, as Laertius informs us, related this in his *Lives of the Philosophers*; though others ascribe this saying to Plato. Aristippus had a contest with Antisthenes the Cynic philosopher; notwithstanding which, he was very ready to employ his interest at court for some friends of Antisthenes, to preserve them from death, as we find by a letter of his to that philosopher. Diogenes followed the example of his master Antisthenes in ridiculing Aristippus, and called him the *court-spaniel*.

We have many apohthegms of his preserved. Suidas observes, that he surpassed all the philosophers in the acuteness of his apohthegms. Being once railed at, he left the room; and the person who abused him, following him, and asking him why he went away, he answered, "Because it is in your power to rail, but it is not in my power not to hear you." A person observing, that the philosophers frequented the houses of rich men: "Why (says he), the physicians frequent the chambers of the sick, yet that is no reason why a man should rather choose to lie sick than be cured." To one who boasted of his great reading, he said, "That as they who feed and exercise most are not always more healthy than any who only eat and exercise to satisfy nature; so neither they who read much, but they who read no more than is useful, are truly learned." Among other instructions which he gave to his daughter Arete, he advised her particularly to despise superfluity. To one who asked him what his son would be the better for being a scholar? "If for nothing else (said he), yet for this alone, that when he comes into the theatre, one stone will not sit upon another." When a certain person recommended his son to him, he demanded 500 drachmas; and upon the father's replying, that he could buy a slave for that sum, "Do so (said he), and then you'll be master of a couple." Being reproached, because, having a suit of law depending, he fee'd a lawyer to plead for him, "Just so (said he), when I have a great supper to make, I always hire a cook." Being asked what was the difference between a wise man and a fool, he replied, "Send both of them together naked to those who are acquainted with neither of them, and then you'll know." Being reproved by a certain person (who, according to Mr Stanley, was Plato) for his costly and voluptuous feasts, "I warrant you (said he), that you would not have bestowed three farthings upon such a dinner;" which the other confessing, "Why, then (said he), I find myself less indulgent to my palate than you are to your covetous humour;" or, as it is otherwise represented, "I find, that I love my belly, and you love your money." When Simus, treasurer to Dionysius, shewed him his house magnificently furnished, and paved with costly marble, (for he was a Phrygian, and consequently profuse); Aristippus spit in his face: upon which the other growing angry, "Why, truly (said he), I could not find a fitter place." His servant carrying after him a great weight of money, and being ready to sink upon the road under his burden, he bid him throw away all that was too much for him to carry. Horace mentions this fact in his third satire of the second book:

> ——————Quid simile isti
> Græcus Aristippus? qui servos projicere aurum
> In media jussit Libya, quia tardius irent
> Propter onus segnes.

Being asked, what things were most proper for children to be instructed in? he answered, "Those which might prove of the greatest advantage to them when they came to be men." Being reproached for going from Socrates to Dionysius, he replied, "That he went to Socrates when he wanted serious instruction, and to Dionysius for diversion." Having received money of Dionysius at the same time that Plato accepted a book only, and being reproached for it, "The reason is plain (says he), I want money, and Plato wants books." Having lost a considerable farm, he said to one who seemed excessively to compassionate his loss, "You have but one field; I have three left: why should not I rather grieve for you?" Plutarch, who relates this in his book *De Tranquillitate Animi*, observes upon it, that it is very absurd to lament for what is lost, and not to rejoice for what is left. When a person told him, "That the land for his sake was lost," he replied, "That it was better so, than that he should be lost for the land." Being cast by shipwreck ashore on the island of Rhodes, and perceiving mathematical schemes and diagrams drawn upon the ground, he said, "Courage, friends; for I see the footsteps of men."

After he had lived a long time with Dionysius, his daughter Arete sent to him, to desire his presence at Cyrene, in order to take care of her affairs, since she was in danger of being oppressed by the magistrates. But he fell sick in his return home, and died at Lipara, an Æolian island. With regard to his principal opinions; like Socrates, he rejected the sciences as they were then taught, and pretended that logic alone was sufficient to teach truth and fix its bounds. He asserted, that pleasure and pain were the criterions by which we were to be determined; that these alone made up all our passions; that the first produced all the soft emotions, and the latter all the violent ones. The assemblage of all pleasure, he asserted, made true happiness, and that the best way to attain this was to enjoy the present moments. He wrote a great many books: particularly the history of Libya, dedicated to Dionysius; several Dialogues; and four books Of the Luxury of the Ancients. There are four epistles of his extant in the Socratic Collection published by Leo Allatius.

Besides Arete his daughter, whom he educated in philosophy. Aristippus had also a son, whom he disinherited for his stupidity. Arete had a son, who was named *Aristippus* from his grandfather, and had the surname of Μητροδιδακτος from his mother's instructing him in philosophy. Among his auditors, besides his daughter Arete, we have an account of Æthiops of Ptolemias, and Antipater of Cyrene. Arete communicated the philosophy which she received from her father to her son Aristippus, who transmitted it to Theodorus *the atheist*, who instituted the sect, called *Theodorean*. Antipater communicated the philosophy of Aristippus to Epitimedes his disciple; Epitimedes to Paræbates; Paræbates to Hegesias and Anniceris; and these two last, improving it by some additions of their own, obtained the honour each of them of giving a name to the *Hegesiac* and *Annicerian* sect.

Laertius mentions two other persons of the name of Aristippus; one, who wrote the History of Arcadia; the other, a philosopher of the New Academy.

ARISTO, a Stoic philosopher, the disciple of Zeno the chief of the Stoics, flourished about 290 years before the Christian æra. He differed but little from his master Zeno. He rejected logic as of no use, and natural philosophy as being above the reach of the human understanding. It is said, that being bald, the sun burnt his head; and that this caused his death.—There is a saying of his recorded, which might render the doctrine of Aristippus less odious than it ordinarily is; (see ARISTIPPUS). He used to say, "That a philosopher might do those of his hearers a prejudice who put a wrong interpretation upon good meanings; as for example, that the school of Aristippus might send out debauchees, and that of Zeno, Cynics:" which seems to imply, that the doctrine of this philosopher never produced this effect but when it was misunderstood. He should also have added, that every teacher is therefore obliged to forbear laying down ambiguous maxims, or to prevent false glosses being put upon them.

ARISTO (Titus), a Roman lawyer, perfect master of the public and civil law, of history and antiquity. The Pandects mention some books of his, as does Aulus Gellius.—He was cotemporary with Pliny the younger, who gives him a noble character, and had a most tender friendship for him. See *Plinii Epist.* lib. i. ep. 22.

ARISTOCRACY, a form of government where the supreme power is vested in the principal persons of the state. The word is derived from αριςος, *optimus*, and κρατεω, *impero*, "I govern." The ancient writers of politics prefer the aristocratical form of government to all others. The republic of Venice is an aristocracy. Aristocracy seems to coincide with oligarchy; which, however, is more ordinarily used to signify a corruption of an aristocratical state, where the administration is in the hands of too few, or where some one or two usurp the whole power.

ARISTOGITON, a famous Athenian, who, with Armodius, killed Hipparchus tyrant of Athens, about 513 years before the Christian æra. The Athenians erected a statue to him.

ARISTOLOCHIA, BIRTHWORT: A genus of the hexandria order, belonging the the gynandria class of plants; and in the natural method ranking under the 11th order *Sarmentaceæ*. It has no calyx; the corolla consists of one entire petal; and the capsule, which is below the flower, has six cells. The species are 21; but only the five following merit description. 1. The rotunda, is a native of the south of France, of Spain, and Italy, from whence the roots are brought for medicinal use. The roots are roundish, grow to the size of small turnips, being in shape and colour like the roots of cyclamens, which are frequently sold instead of them. This sort hath three or four weak trailing branches, which lie on the ground when they are not supported, and extend two feet in length; the leaves are heart-shaped and rounded at their extremity; the flowers

Aristolochia. flowers come out singly at every leaf, toward the upper part of the stalk. They are of a purplish black colour; and are frequently succeeded by oval seed-vessels having six cells full of flat seeds. 2. The longa, is a native of the same countries. This species hath long tap-roots like carrots; the branches are weak and trailing, extending little more than a foot; the flowers come out from the wings of the leaves like the other, are of a pale purple colour, and are frequently succeeded by seed-vessels like the other. 3. The serpentaria, is a native of Virginia and Carolina, from whence the *radix serpentariæ*, or snake-root, so much used in medicine, is brought over. The plant rises out of the ground in one, two, and sometimes three pliant stalks, which at every little distance are crooked or undulated. The leaves stand alternately, and are about three inches long, in form somewhat like the smilax aspera. The leaves grow close to the ground on footstalks an inch long, of a singular shape, and of a dark purple colour. A round canulated capsule succeeds the flower. It is filled with seeds, which are ripe in May. The usual price of the root when dried is 6d. per pound, both in Virginia and Carolina, which is money hardly earned; yet the negro slaves employ great part of the time allowed them by their masters in search for it, which is the reason that there are seldom found any but very small plants of this species. When they are planted in gardens in those countries where they are natives, the plants increase so much in two years time, that the hand can scarce grasp the stalks of a single one. This species delights in woods, and is usually found near the roots of great trees. 4. The indica, or contrayerva of Jamaica, is a native of that island, where its roots are used instead of the true contrayerva. It hath long trailing branches, which climb upon the neighbouring plants, and sometimes rise to a considerable height. The flowers are produced in small clusters towards the upper part of the stalks, which are of a dark purple colour. 5. The clematitis, with heart-shaped leaves, an upright stem, with the flowers crouded in the axillæ. The root is long and slender.

Culture. The first, second, and third sorts are propagated from seeds, which should be sown in the autumn, in pots filled with light fresh earth, and placed under a frame to preserve them from the frost. If they are plunged into a gentle hot-bed in the month of March, the plants will come up the sooner. In summer, and in autumn when the stalks begin to decay, they must be watered. In winter they must be again sheltered; and in March, before the roots begin to shoot, they must be transplanted into small separate pots filled with light earth, when they may be removed into the open air, and treated as before. The next spring they may be planted in the open air in a warm border; where, in the autumn, when their stalks decay, if the border is covered with old tanner's bark to keep out the frost, the roots will be secured; but where this care is not taken, they will frequently be killed by the frost. The fourth is tender: and therefore must be kept in a stove during the winter, or it will not live in England.

Medical Uses. The roots of the long and round sorts, on being first chewed, scarce discover any taste, but in a little time prove nauseously bitterish; the long somewhat the least so. The root of the clematitis is long and slender, rarely exceeding the thickness of a goose-quill: it instantly fills the mouth with an aromatic bitterness, which is not ungrateful. Their medical virtues are, to heat, stimulate, attenuate viscid phlegm, and promote the fluid secretions in general: they are principally celebrated in suppressions of female evacuations. The dose in substance is from a scruple to two drams. The long sort is recommended externally for cleansing and drying wounds and ulcers, and in cutaneous diseases.

Aristomenes. Aristophanes.

The root of the serpentaria is small, light, bushy, and consists of a number of strings or fibres, matted together, issuing from one common head; of a brownish colour on the outside, and paler or yellowish within. It has an aromatic smell, like that of valerian, but more agreeable: and a warm, bitterish, pungent taste. This root is a warm diaphoretic and diuretic; it has been greatly celebrated as an alexipharmic, and esteemed one of the principal remedies in malignant fevers and epidemic diseases. In these intentions, it is given in substance from 10 to 30 grains; and in infusion, to a dram or two. Both watery and spirituous menstrua extract its virtue by infusion, and elevate some share of its flavour in distillation; along with the water a small portion of essential oil arises.

None of these articles, however, are now in so much esteem as formerly; and while all of them are banished from the Pharmacopœia of the London college, the clematitis is alone retained in that of Edinburgh.

ARISTOMENES, a general of the Messenians, renowned for his valour and virtue. See MESSENIA.

ARISTOPHANES, a celebrated comic poet of Athens. He was cotemporary with Plato, Socrates, and Euripides; and most of his plays were written during the Peloponnesian war. His imagination was warm and lively, and his genius particularly turned to raillery. He had also great spirit and resolution; and was a declared enemy to slavery, and to all those who wanted to oppress their country. The Athenians suffered themselves in his time to be governed by men who had no other views than make themselves masters of the commonwealth. Aristophanes exposed the designs of these men, with great wit and severity, upon the stage. Cleo was the first whom he attacked, in his comedy of the *Equites*; and as there was not one of the comedians who would venture to personate a man of his great authority, Aristophanes played the character himself, and with so much success, that the Athenians obliged Cleo to pay a fine of five talents, which were given to the poet. He described the affairs of the Athenians in so exact a manner, that his comedies are a faithful history of that people. For this reason, when Dionysius king of Syracuse desired to learn the state and language of Athens, Plato sent him the comedies of Aristophanes, telling him, these were the best representations thereof. He wrote above 50 comedies; but there are only 11 extant which are perfect: these are, Plutus, the Clouds, the Frogs, Equites, the Acharnenses, the Wasps, Peace, the Birds, the Ecclesiazusæ or Female Orators, the Thesmophosiazusæ or Priestesses of Ceres, and Lysistrata. The Clouds, which he wrote in ridicule of Socrates*, is the most celebrated of all his comedies. Madam Dacier tells us, she was so much charmed with this performance, that after she had translated it, and read it over 200 times, it did not become the least tedious to her, which

* See the article *Socrates*.

which ſhe could not ſay of any other piece; and that the pleaſure which ſhe received from it was ſo exquiſite, that ſhe forgot all the contempt and indignation which Ariſtophanes deſerved for employing his wit to ruin a man, who was wiſdom itſelf, and the greateſt ornament of the city of Athens. Ariſtophanes having conceived ſome averſion to the poet Euripides, ſatirizes him in ſeveral of his plays, particularly in his Frogs and his Theſmophoſiazuſæ. He wrote his Peace in the 10th year of the Peloponneſian war, when a treaty for 50 years was concluded between the Athenians and the Lacedæmonians, though it continued but ſeven years. The Acharnenſes was written after the death of Pericles, and the loſs of the battle in Sicily, in order to diſſuade the people from intruſting the ſafety of the commonwealth to ſuch imprudent generals as Lamachus. Soon after, he repreſented his Aves or Birds; by which he admoniſhed the Athenians to fortify Decelæa, which he calls by a fictitious name *Nephelococcygia*. The Vaſpæ, or Waſps, was written after another loſs in Sicily, which the Athenians ſuffered from the miſconduct of Chares. He wrote the Lyſiſtrata when all Greece was involved in a war; in which comedy the women are introduced debating upon the affairs of the commonwealth; when they come to a reſolution, not to go to bed with their huſbands till a peace ſhould be concluded. His Plutus, and other comedies of that kind, were written after the magiſtrates had given orders that no perſon ſhould be expoſed by name upon the ſtage. He invented a peculiar kind of verſe, which was called by his name, and is mentioned by Cicero in his Brutus; and Suidas ſays, that he alſo was the inventor of the tetrameter and octameter verſe.

Ariſtophanes was greatly admired among the ancients, eſpecially for the true Attic elegance of his ſtyle. The time of his death is unknown; but it is certain he was living after the expulſion of the tyrants by Thraſybulus, whom he mentions in his Plutus and other comedies. There have been ſeveral editions and tranſlations of this poet. Nicodemus Friſchin, a German, famous for his claſſical knowledge, in the 16th century, tranſlated Plutus, the Clouds, the Frogs, the Equites, and the Acharnenſes, into Latin verſe. Quintus Septimus Florens rendered into Latin verſe the Waſps, the Peace, and Lyſiſtrata; but his tranſlation is full of obſolete words and phraſes. Madam Dacier publiſhed at Paris, in 1692, a French verſion of Plutus and the Clouds, with critical notes, and an examination of them according to the rules of the theatre. Mr Lewis Theobald likewiſe tranſlated theſe two comedies into Engliſh, and publiſhed them with remarks. The moſt noble edition of this author is that publiſhed by Ludolphus Kuſter, at Amſterdam, in folio, in 1710, and dedicated to Charles Montague Earl of Halifax.

ARISTOTELIA, in antiquity, annual feaſts celebrated by the citizens of Stagiris, in honour of Ariſtotle, who was born there; and in gratitude for his having procured from Alexander the rebuilding and repeopling of that city, which had been demoliſhed by king Philip.

ARISTOTELIAN, ſomething that relates to the philoſopher Ariſtotle.

Aristotelian Philoſophy, the philoſophy taught by Ariſtotle, and maintained by his followers. The Ariſtotelian is otherwiſe called the *Peripatetic philoſophy*. See Peripatetics.

ARISTOTELIANS, a ſect of philoſophers, otherwiſe called *Peripatetics*.

The Ariſtotelians and their dogmata prevailed for a long while in the ſchools and univerſities; even in ſpite of all the efforts of the Carteſians, Newtonians, and other corpuſcularians. But the ſyſtems of the latter, have at length gained the pre-eminence; and the Newtonian philoſophy in particular is now very generally received. The principles of Ariſtotle's philoſophy, the learned agree, are chiefly laid down in the four books *de Cœlo*; the eight books of *Phyſical Auſcultation*, φυσικης ακροασεως, belonging rather to logics, or metaphyſics, than to phyſics. Inſtead of the more ancient ſyſtems, he introduced matter, form, and privation, as the principles of all things; but he does not ſeem to have derived much benefit from them in natural philoſophy. His doctrines are, for the moſt part, ſo obſcurely expreſſed, that it has not yet been ſatisfactorily aſcertained what were his ſentiments on ſome of the moſt important ſubjects. He attempted to refute the Pythagoræan doctrine concerning the twofold motion of the earth; and pretended to demonſtrate, that the matter of the heavens is ungenerated, incorruptible, and ſubject to no alteration: and he ſuppoſed that the ſtars were carried round the earth in ſolid orbs. The reader will find a diſtinct account of the logical part of his philoſophy by Dr Reid profeſſor of moral philoſophy in the univerſity of Glaſgow, in the ſecond volume of Lord Kames's Sketches of the Hiſtory of Man; and Mr Harris has publiſhed a ſenſible commentary on his Categories, under the title of *Philoſophical Arrangements*.

ARISTOTLE, the chief of the Peripatetic philoſophers, born at Stagyra, a ſmall city in Macedon, in the 99th Olympiad, about 384 years before the birth of Chriſt. He was the ſon of Nicomachus, phyſician to Amyntas the grandfather of Alexander the Great. He loſt his parents in his infancy; and Proxenes, a friend of his father's, who had the care of his education, taking but little notice of him, he quitted his ſtudies, and gave himſelf up to the follies of youth. After he had ſpent moſt of his patrimony, he entered into the army; but not ſucceeding in this profeſſion, he went to Delphos to conſult the oracle what courſe of life he ſhould follow; when he was adviſed to go to Athens, and ſtudy philoſophy. He accordingly went thither about 18 years of age, and ſtudied under Plato till he was 37. By this time he had ſpent his whole fortune; and we are told that he got his living by ſelling powders, and ſome receipts in pharmacy. He followed his ſtudies with moſt extraordinary diligence, ſo that he ſoon ſurpaſſed all in Plato's ſchool. He eat little, and ſlept leſs; and, that he might not over-ſleep himſelf, Diogenes Laertius tells us, that he lay always with one hand out of the bed, having a ball of braſs in it, which, by its falling into a baſon of the ſame metal, awaked him. We are told, that Ariſtotle had ſeveral conferences with a learned Jew at Athens, and that by this means he inſtructed himſelf in the ſciences and religion of the Egyptians, and thereby ſaved himſelf the trouble of travelling into Egypt. When he had ſtudied about 15 years under Plato, he began

Aristotle.

to form different tenets from those of his master, who became highly picked at his behaviour. Upon the death of Plato, he quitted Athens; and retired to Atarnya, a little city in Mysia, where his old friend Hermias reigned. Here he married Pythias, the sister of this prince, whom he is said to have loved so passionately, that he offered sacrifice to her. Some time after, Hermias having been taken prisoner by Meranon the king of Persia's general, Aristotle went to Mitylene the capital of Lesbos, where he remained till Philip king of Macedon having heard of his great reputation, sent for him to be tutor to his son Alexander, then about 14 years of age: Aristotle accepted the offer; and in eight years taught him rhetoric, natural philosophy, ethics, politics, and a certain sort of philosophy, according to Plutarch, which he taught nobody else. Philip erected statues in honour of Aristotle; and for his sake rebuilt Stagyra, which had been almost ruined by the wars.

The last fourteen years of his life he spent mostly at Athens, surrounded with every assistance which men and books could afford him, for prosecuting his philosophical inquiries. The glory of Alexander's name, which then filled the world, insured tranquillity and respect to the man whom he distinguished as his friend: but after the premature death of that illustrious protector, the invidious jealousy of priests and sophists inflamed the malignant and superstitious fury of the Athenian populace; and the same odious passions which proved fatal to the offensive virtue of Socrates, fiercely assailed the fame and merit of Aristotle. To avoid the cruelty of persecution, he secretly withdrew himself to Chalcis, in Euboea. This measure was sufficiently justified by a prudent regard to his personal safety; but lest his conduct should appear unmanly, when contrasted with the firmness of Socrates in a similar situation, he condescended to apologize for his flight, by saying, that he was unwilling to afford the Athenians a second opportunity "to sin against philosophy." He seems to have survived his retreat from Athens only a few months, vexation and regret probably ended his days.

Besides his treatises on philosophy, he wrote also on poetry, rhetoric, law, &c. to the number of 400 treatises, according to Diogenes Laertius; or more, according to Francis Patricius of Venice. An account of such as are extant, and of those said to be lost, may be seen in Fabricius's *Bibliotheca Græca*. He left his writings with Theophrastus, his beloved disciple and successor in the Lycæum, and forbad that they should ever be published. Theophrastus, at his death, trusted them to Neleus, his good friend and disciple; whose heir buried them in the ground at Scepsis, a town of Troas, to secure them from the king of Pergamus, who made great search every where for books to adorn his library. Here they lay concealed 160 years, until, being almost spoiled, they were sold to one Apellicon, a rich citizen of Athens. Sylla found them at this man's house, and ordered them to be carried to Rome. They were some time after purchased by Tyrannion a grammarian; And Andronicus of Rhodes having bought them of his heirs, was in a manner the first restorer of the works of this great philosopher; for he not only repaired what had been decayed by time and ill-keeping, but also put them in a better order, and got them copied. There were many who followed the doctrine of Aristotle in the reigns of the 12 Cæsars, and their numbers increased much under Adrian and Antoninus: Alexander Aphrodinus was the first professor of the Peripatetic philosophy at Rome, being appointed by the emperors Marcus Aurelius and Lucius Verus; and in succeeding ages the doctrine of Aristotle prevailed among almost all men of letters, and many commentaries were written upon his works.

Aristotle, Aristoxenus.

The first doctors of the church disapproved of the doctrine of Aristotle, as allowing too much to reason and sense; but Anatolius bishop of Laodicea, Didymus of Alexandria, St Jerome, St Augustine, and several others, at length wrote and spoke in favour of it. In the sixth age, Boethius made him known in the west, and translated some of his pieces into Latin. But from the time of Boethius to the eighth age, Joannes Damascenus was the only man who made an abridgement of his philosophy, or wrote any thing concerning him. The Grecians, who took great pains to restore learning in the 11th and following ages, applied much to the works of this philosopher, and many learned men wrote commentaries on his writings: amongst these were Alfarabius, Algazel, Avicenna, and Averroes. They taught his doctrine in Africa, and afterwards at Cordova in Spain. The Spaniards introduced his doctrine into France, with the commentaries of Averroes and Avicenna; and it was taught in the university of Paris, until Amauri, having supported some particular tenets on the principles of this philosopher, was condemned of heresy, in a council held there in 1210, when all the works of Aristotle that could be found were burnt, and the reading of them forbidden under pain of excommunication. This prohibition was confirmed, as to the physics and metaphysics, in 1215, by the pope's legate; though at the same time he gave leave for his logic to be read, instead of St Augustine's used at that time in the university. In the year 1265, Simon, cardinal of St Cecil, and legate from the holy see, prohibited the reading of the physics and metaphysics of Aristotle. All these prohibitions, however, were taken off in 1366; for the cardinals of St Mark and St Martin, who were deputed by Pope Urban V. to reform the university of Paris, permitted the reading of those books which had been prohibited: and in the year 1448, Pope Stephen approved of all his works, and took care to have a new translation of them into Latin.

ARISTOXENUS, the most ancient musical writer, of whose works any tracts are come down to us. He was born at Tarentum, a city in that part of Italy called *Magna Græcia*, now Calabria. He was the son of a musician, whom some call *Mnesias*, others *Spintharus*. He had his first education at Mantinæa, a city of Arcadia, under his father, and Lamprus of Erythræ; he next studied under Xenophilus, the Pythagorean; and lastly under Aristotle, in company with Theophrastus. Suidas, from whom these particulars are transcribed, adds, that Aristoxenus, enraged at Aristotle having bequeathed his school to Theophrastus, traduced him ever after. But Aristocles the Peripatetic in Eusebius, exculpates Aristoxenus in this particular, and assures us that he always spoke with great respect of his master Aristotle. From the preceding account it appears that Aristoxenus lived under Alexander the Great and his first successors. His *Harmonics*

nics in three books, all that are come down to us, together with Ptolemy's Harmonic's, were first published by Gogavinus, but not very correctly, at Venice, 1562, in 4to, with a Latin version. John Meursius next translated the three books of Aristoxenus into Latin, from the MS. of Jos. Scaliger; but according to Meibomius, very negligently. With these he printed at Leyden, 1616, 4to. Nicomachus and Alypius, two other Greek writers on music. After this, Meibomius collected these musical writers together; to which he added Euclid, Bacchius senior, Aristides Quintilianus; and published the whole, with a Latin version, and notes, from the elegant press of Elzevir, Amst. 1652. The learned editor dedicates these ancient musical treatises to Christina queen of Sweden. Aristoxenus is said by Suidas to have written 452 different works, among which those on music were the most esteemed; yet his writings on other subjects are very frequently quoted by ancient authors, notwithstanding Cicero and some others say that he was a bad philosopher, and had nothing in his head but music. The titles of several of the lost works of Aristoxenus, quoted by Athenæus and others, have been collected by Meursius in his notes upon this author, by Tonsius and Menage, all which Fabricius has digested into alphabetical order.

ARITHMETIC

IS a science which explains the properties of numbers, and shows the method or art of computing by them.

History of Arithmetic.

AT what time this science was first introduced into the world we can by no means determine. That some part of it, however, was coeval with the human race was absolutely certain. We cannot conceive how any man endowed with reason can be without some knowledge of numbers. We are indeed told of nations in America who have no word in their language to express a greater number than three; and this they call *pœtarrarorincouroac:* but that such nations should have no idea of a greater number than this, is absolutely incredible. Perhaps they may compute by threes, as we compute by tens; and this may have occasioned the notion that they have no greater number than three.

But though we cannot suppose any nation, or indeed any single person, ever to have been without some knowledge of the difference between greater and smaller numbers, it is possible that mankind may have subsisted for a considerable time without bringing this science to any perfection, or computing by any regular scale, as 10, 60, &c. That this, however, was very early introduced in the world, even before the flood, we may gather from the following expression in Enoch's prophecy, as mentioned by the apostle Jude: "Behold the Lord cometh with *ten thousands* of his saints." This shows, that even at that time men had ideas of numbers as high as we have at this day, and computed them also in the same manner, namely by tens. The directions also given to Noah concerning the dimensions of the ark, leave us no room to doubt that he had a knowledge of numbers, and of measures likewise. When Rebekah was sent away to Isaac, Abraham's son, her relations wished she might be the mother of *thousands of millions*; and if they were totally unacquainted with the rule of multiplication, it is difficult to see how such a wish could have been formed.

It is probable, therefore, that the four fundamental rules of Arithmetic have always been known to some nation or other. No doubt, as some nations, like the Europeans formerly, and the Africans and Americans now, have been immersed in the most abject and deplorable state of ignorance, they might remain for some time unacquainted with numbers, except such as they had immediate occasion for; and, when they came afterwards to improve, either from their own industry, or hints given by others, might fancy that they themselves, or those from whom they got the hints, had invented what was known long before. The Greeks were the first European nation among whom arithmetic arrived at any degree of perfection. M. Goguet is of opinion, that they first used pebbles in their calculations: a proof of which he imagines is, that the word ψηφιζω, which comes from ψηφος, a little stone, or flint, among other things, signifies *to calculate*. The same, he thinks, is probable of the Romans; and derives the word *calculation* from the use of little stones (*calculi*) in their first arithmetical operations.

If this method, however, was at all made use of, it must have been but for a short time, since we find the Greeks very early made use of the letters of the alphabet to represent their numbers. The 24 letters of their alphabet, taken according to their order, at first denoted the numbers 1, 2, 3, 4, 5, 7, 8, 9, 10, 20, 30, 40, 50, 60, 70, 80, 100, 200, 300, 400, 500, 600, 700, and 800; to which they added the three following, ς, ϟ, ϡ, to represent 6, 90, 900. The difficulty of performing arithmetical operations by such marks as these may easily be imagined, and is very conspicuous from Archimedes's treatise concerning the dimensions of a circle.

The Romans followed a like method; and besides characters for each rank of classes, They introduced others for five, fifty, and five hundred. Their method is still used for distinguishing the chapters of books, and some other purposes. Their numeral letters and values are the following:

I	V	X	L	C	D	M
One,	five,	ten,	fifty,	one hundred,	five hundred,	one thousand.

Any number, however great, may be represented by repeating and combining these according to the following rules:

1st, When the same letter is repeated twice, or oftener, its value is represented as often. Thus II signifies two: XXX thirty, CC two hundred.

2d, When a numeral letter of lesser value is placed after one of greater, their values are added: thus XI signifies

signifies eleven, LXV sixty-five, MDCXXVIII one thousand six hundred and twenty-eight.

3d. When a numeral letter of lesser value is placed before one of greater, the value of the lesser is taken from that of the greater; thus IV signifies four, XL forty, XC ninety, CD four hundred.

Sometimes Iↄ is used instead of D for 500, and the value is increased ten times by annexing ↄ to the right hand.

Thus Iↄ signifies	500. Also CIↄ is used for		1000
Iↄↄ	5000	CCIↄↄ for	10000
Iↄↄↄ	50000	CCCIↄↄↄ for	100000

Sometimes thousands are represented by drawing a line over the top of the numeral, $\overline{\text{V}}$ being used for five thousand, $\overline{\text{L}}$ for fifty thousand, $\overline{\text{CC}}$ two hundred thousand.

4 Sexagesimal Arithmetic.

About the year of Christ 200, a new kind of arithmetic, called *sexagesimal*, was invented, as is supposed, by Claudius Ptolomæus. The design of it was to remedy the difficulties of the common method, especially with regard to fractions. In this kind of arithmetic, every unit was supposed to be divided into 60 parts, and each of these into 60 others, and so on: hence any number of such parts were called *sexagesimal fractions;* and to make the computation in whole numbers more easy, he made the progression in these also sexagesimal. Thus from one to 59 were marked in the common way: then 60 was called a *sexagesima prima*, or first sexagesimal integer, and had one single dash over it; so 60 was expressed thus I'; and so on to 59 times 60, or 3540, which was thus expressed LIX'. He now proceeded to 60 times 60, which he called a *sexagesima secunda*, and was thus expressed I''. In like manner, twice 60 times 60, or 7200, was expressed by II''; and so on till he came to 60 times 3600, which was a third sexagesimal, and expressed thus, I'''. If any number less than 60 was joined with these sexagesimals, it was added in its proper characters without any dash; thus $\mathrm{I}'\mathrm{XV}$ represented 60 and 15, or 75; $\mathrm{I}'\mathrm{VXXV}$ is four times 60 and 25, or 265; $\mathrm{X}''\mathrm{II}'\mathrm{XV}$, is ten times 3600, twice 60 and 15, or 36,135, &c. Sexagesimal fractions were marked by putting the dash at the foot, or on the left hand of the letter: thus $\mathrm{I}_{,}$ or $'\mathrm{I}$, denoted $\frac{1}{60}$; $\mathrm{I}_{,,}$ or $''\mathrm{I}$, $\frac{1}{3600}$, &c.

5 Indian Characters when brought into use.

The most perfect method of notation, which we now use, came into Europe from the Arabians, by the way of Spain. The Arabs however, do not pretend to be the inventors of them, but acknowledge that they received them from the Indians. Some there are indeed, who contend that neither the Arabs nor the Indians were the inventors, but that they were found out by the Greeks. But this is by no means probable; as Maximus Planudes, who lived towards the close of the 13th century, is the first Geek who makes use of them: and he is plainly not the inventor; for Dr Wallis mentions an inscription on a chimney in the parsonage-house of Helendon in Northamptonshire, where the date is expressed by M° 133, instead of 1133. Mr Luffkin furnishes a still clearer instance of their use, in the window of a house, part of which is a Roman wall, near the market-place in Colchester; where between two carved lions stands an escutcheon with the figures 1090. Dr Wallis is of opinion that these characters must have been used in England at least as long ago as the year 1050, if not in ordinary affairs, at least in mathematical ones, and in astronomical tables. How these characters came to be originally invented by the Indians we are entirely ignorant.

The introduction of the Arabian characters in notation did not immediately put an end to the sexagesimal arithmetic. As this had been used in all the astronomical tables, it was for their sakes retained for a considerable time. The sexagesimal integers went first out, but the fractions continued till the invention of decimals.

9 Treatises on Arithmetic.

The oldest treatises extant upon the theory of arithmetic are the seventh, eighth, and ninth books of Euclid's elements, where he treats of proportion and of prime and composite numbers; both of which have received improvements since his time, especially the former. The next of whom we know any thing is Nicomachus the Pythagorean, who wrote a treatise of the theory of arithmetic, consisting chiefly of the distinctions and divisions of numbers into classes, as plain, solid, triangular, quadrangular, and the rest of the figurate numbers as they are called, numbers odd and even, &c. with some of the more general properties of the several kinds. This author is, by some, said to have lived before the time of Euclid; by others, not long after. His arithmetic was published at Paris in 1538. The next remarkable writer on this subject is Boethius, who lived at Rome in the time of Theodoric the Goth. He is supposed to have copied most of his work from Nicomachus.

From this time no remarkable writer on arithmetic appeared till about the year 1200, when Jordanus of Namur wrote a treatise on this subject, which was published and demonstrated by Joannes Faber Stapulensis in the 15 century, soon after the invention of printing. The same author also wrote upon the new art of computation by the Arabic figures, and called this book *Algorismus Demonstratus*. Dr Wallis says this manuscript is in the Savillian library at Oxford, but it hath never yet been printed. As learning advanced in Europe, so did the knowledge of numbers; and the writers on arithmetic soon became innumerable. About the year 1464, Regiomontanus, in his triangular tables, divided the Radius into 10,000 parts instead of 60,000; and thus tacitly expelled the sexagesimal arithmetic. Part of it, however, still remains in the division of time, as of an hour into 60 minutes, a minute into 60 seconds, &c. Ramus in his arithmetic, written about the year 1550, and published by Lazarus Schonerus in 1586, uses decimal periods in carrying on the square and cube roots to fractions. The same had been done before by our countrymen Buckley and Record; but the first who published an express treatise on decimals was Simon Stevinius, about the year 1582. As to the circulating decimals, Dr Wallis is the first who took much notice of them. He is also the author of the *arithmetic of infinites*, which has been very usefully applied to geometry. The greatest improvement, however, which the art of computation ever received, is the invention of logarithms. The honour of this invention is unquestionably due to Lord Napier, baron of Merchiston in Scotland, about the end of the 16th or beginning

Notation and Numeration.

beginning of the 17th century. By theſe means arithmetic has advanced to a degree of perfection which the ancients could never have imagined poſſible, much leſs hoped to attain; and we believe it may now be reckoned one of thoſe few ſciences which have arrived at their utmoſt height, and which is in its nature capable of little further improvement.

7 Chap. I. NOTATION and NUMERATION.

The firſt elements of arithmetic are acquired during our infancy. The idea of one, though the ſimpleſt of any, and ſuggeſted by every ſingle object, is perhaps rather of the negative kind, and conſiſts partly in the excluſion of plurality, and is not attended to till that of a number be acquired. Two is formed by placing one object near another; three, four, and every higher number, by adding one continually to the former collection. As we thus advance from lower numbers to higher, we ſoon perceive that there is no limit to this increaſing operation; and that, whatever number of objects be collected together, more may be added, at leaſt in imagination; ſo that we can never reach the higheſt poſſible number, nor approach near it. As we are led to underſtand and add numbers by collecting objects, ſo we learn to diminiſh them by removing the objects collected; and if we remove them one by one, the number decreaſes through all the ſteps by which it advanced, till only one remain, or none at all. When a child gathers as many ſtones together as ſuits his fancy, and then throws them away, he acquires the firſt elements of the two capital operations in arithmetic. The idea of numbers, which is firſt acquired by the obſervation of ſenſible objects, is afterwards extended to meaſures of ſpace and time, affections of the mind, and other immaterial qualities.

Small numbers are moſt eaſily apprehended: a child ſoon knows what two and what three is; but has not any diſtinct notion of ſeventeen. Experience removes this difficulty in ſome degree; as we become accuſtomed to handle larger collections, we apprehend clearly the number of a dozen or a ſcore; but perhaps could hardly advance to an hundred without the aid of claſſical arrangement, which is the art of forming ſo many units into a claſs, and ſo many of theſe claſſes into one of a higher kind, and thus advancing through as many ranks of claſſes as occaſion requires. If a boy arrange an hundred ſtones in one row, he would be tired before he could reckon them; but if he place them in ten rows of ten ſtones each, he will reckon an hundred with eaſe; and if he collect ten ſuch parcels, he will reckon a thouſand. In this caſe, ten is the loweſt claſs, an hundred is a claſs of the ſecond rank, and a thouſand is a claſs of the third rank.

There does not ſeem to be any number naturally adapted for conſtituting a claſs of the loweſt, or any higher rank to the excluſion of others. However, as ten has been univerſally uſed for this purpoſe by the Hebrews, Greeks, Romans, and Arabians, and by all nations who have cultivated this ſcience, it is probably the moſt convenient for general uſe. Other ſcales, however, may be aſſumed, perhaps on ſome occaſions, with ſuperior advantage; and the principles of arithmetic will appear in their full extent, if the ſtudent can adapt them to any ſcale whatever: thus, if eight were the ſcale, 6 times 3 would be two claſſes and two units, and the number 18 would then be repreſented by 22. If 12 were the ſcale, 5 times 9 would be three claſſes and nine units, and 45 would be repreſented by 39, &c.

Numeration.

It is proper, whatever number of units conſtitutes a claſs of the lower rank, that the ſame number of each claſs ſhould make one of the next higher. This is obſerved in our arithmetic, ten being the univerſal ſcale: but is not regarded in the various kinds of monies, weights, and the like, which do not advance by any univerſal meaſure; and much of the difficulty in the practice of arithmetic ariſes from that irregularity.

As higher numbers are ſomewhat difficult to apprehend, we naturally fall on contrivances to fix them in our minds, and render them familiar: but notwithſtanding all the expedients we can fall upon, our ideas of high numbers are ſtill imperfect, and generally far ſhort of the reality; and though we can perform any computation with exactneſs, the anſwer we obtain is often incompletely apprehended.

It may not be amiſs to illuſtrate, by a few examples, the extent of numbers which are frequently named without being attended to. If a perſon employed in telling money reckon an hundred pieces in a minute, and continue at work ten hours each day, he will take ſeventeen days to reckon a million; a thouſand men would take 45 years to reckon a billion. If we ſuppoſe the whole earth to be as well peopled as Britain, and to have been ſo from the creation, and that the whole race of mankind had conſtantly ſpent their time in telling from a heap conſiſting of a quadrillion of pieces, they would hardly have yet reckoned the thouſandth part of that quantity.

All numbers are repreſented by the ten following characters.

1	2	3	4	5	6	7	8	9	0
One,	two,	three,	four,	five,	ſix,	ſeven,	eight,	nine,	cypher.

The nine firſt are called *ſignificant figures*, or *digits*; and ſometimes repreſent units, ſometimes tens, hundreds, or higher claſſes. When placed ſingly, they denote the ſimple numbers ſubjoined to the characters. When ſeveral are placed together, the firſt or right-hand figure only is to be taken for its ſimple value: the ſecond ſignifies ſo many tens, the third ſo many hundreds, and the others ſo many higher claſſes, according to the order they ſtand in. And as it may ſometimes be required to expreſs a number conſiſting of tens, hundreds, or higher claſſes, without any units or claſſes of a lower rank annexed; and as this can only be done by figures ſtanding in the ſecond, third, or higher place, while there are none to fill up the lower ones; therefore an additional character or cypher (0) is neceſſary, which has no ſignification when placed by itſelf, but ſerves to ſupply the vacant places, and bring the figures to their proper ſtation.

The following table ſhews the names and diviſions of the claſſes. 8.

8.	Trillions.
4	Hundred thousand of billions
3	Ten thousand of billions
7,	Thousand billions
9	Hundred billions
8	Ten billions
2.	Billions.
5	Hundred thousand of millions
6	Ten thousand of millions
4,	Thousand millions
7	Hundred millions
3	Ten millions
8.	Millions.
9	Hundred thousands
7	Ten thousands
2,	Thousands
6	Hundreds
4	Tens
5	Units

The first six figures from the right hand are called the *unit period*, the next six the *million period*, after which the *trillion*, *quadrillion*, *quintillion*, *sextillion*, *septillion*, *octillion*, and *nonillion* periods follow in their order.

It is proper to divide any number, before we reckon it into periods and half periods, by different marks. We then begin at the left hand, and read the figures in their order, with the names of their places, from the table. In writing any number, we must be careful to mark the figures in their proper places, and supply the vacant places with cyphers.

As there are no possible ways of changing numbers, except by enlarging or diminishing them according to some given rule, it follows, that the whole art of arithmetic is comprehended in two operations, *Addition* and *Subtraction*. However, as it is frequently required to add several equal numbers together, or to subtract several equal ones from a greater, till it be exhausted, proper methods have been invented for facilitating the operation in these cases, and distinguished by the names of *Multiplication* and *Division*; and these four rules are the foundation of all arithmetical operations whatever.

As the idea of number is acquired by observing several objects collected, so is that of fractions by observing an object divided into several parts. As we sometimes meet with objects broken into two, three, or more parts, we may consider any or all of these divisions promiscuously, which is done in the doctrine of vulgar fractions, for which a chapter will be allotted. However, since the practice of collecting units into parcels of tens has prevailed universally, it has been found convenient to follow a like method in the consideration of fractions, by dividing each unit into ten equal parts, and each of these into ten smaller parts; and so on. Numbers divided in this manner are called *Decimal Fractions*.

Chap. II. ADDITION.

Addition is that operation by which we find the amount of two or more numbers. The method of doing this in simple cases is obvious, as soon as the meaning of number is known, and admits of no illustration. A young learner will begin at one of the numbers, and reckon up as many units separately as there are in the other, and practice will enable him to do it at once. It is impossible strictly speaking, to add more than two numbers at a time. We must first find the sum of the first and second; then we add the third to that number; and so on. However, as the several sums obtained are easily retained in the memory, it is neither necessary nor usual to mark them down. When the numbers consist of more figures than one, we add the units together, the tens together, and so on. But if the sum of the units exceed ten, or contain ten several times, we add the number of tens it contains to the next column, and only set down the number of units that are over. In like manner we carry the tens of every column to the next higher. And the reason of this is obvious from the value of the places; since an unit, in any higher place, signifies the same thing as ten in the place immediately lower.

	Example.
Rule. "Write the numbers distinctly,	346863
" units under units, tens under tens; and	876734
" so on. Then reckon the amount of the	123467
" right-hand column. If it be under ten,	314213
" mark it down. If it exceed ten, mark	712316
" the units only, and carry the tens to the	438987
" next place. In like manner, carry the	279654
" tens of each column to the next, and mark	———
" down the full sum of the left hand co-	3092234
" lumn."	24433

As it is of great consequence in business to perform addition readily and exactly, the learner ought to practise it till it become quite familiar. If the learner can readily add any two digits, he will soon add a digit to a higher number with equal ease. It is only to add the unit place of that number to the digit; and, if it exceed ten, it raises the amount accordingly. Thus, because 8 and 6 is 14, 48 and 6 is 54. It will be proper to mark down under the sums of each column, in a small hand, the figure that is carried to the next column. This prevents the trouble of going over the whole operation again, in case of interruption or mistake. If you want to keep the account clean, mark down the sum and figure you carry on a separate paper, and, after revising them, transcribe the sum only. After some practice, we ought to acquire the habit of adding two or more figures at one glance. This is particularly useful when two figures which amount to 10, as 6 and 4, or 7 and 3, stand together in the column.

Every operation in arithmetic ought to be revised, to prevent mistakes; and as one is apt to fall into the same mistake, if he revise it in the same manner he performed it, it is proper either to alter the order, or else to trace back the steps by which the operation advanced, which will lead us at last to the number we began with. Every method of proving accounts may be referred to one or other of these heads.

1st, Addition may be proven by any of the following methods: repeat the operation, beginning at the top of the column, if you began at the foot when you wrought it.

2d, Divide the account into several parts; add these separately, and then add the sums together. If their amount correspond with the sum of the account, when added at once, it may be presumed right. This method is particularly proper when you want to know the sums of the parts, as well as that of the whole.

3d, Subtract the numbers successively from the sum; if the account be right, you will exhaust it exactly, and find no remainder.

When the given number consists of articles of different value, as pounds, shillings, and pence, or the like, which are called *different denominations*, the operations in arithmetic must be regulated by the value of the articles. We shall give here a few of the most useful tables for the learner's information.

I. *Sterling Money.*	II. *Averdupoise Weight.*
4 Farthings=1 penny, *marked* d.	16 Drams=1 ounce, oz.
12 Pence=1 Shilling, s.	16 Ounces=1 pound, lb.
20 Shillings=1 Pound, L.	28 Pound=1 quarter, qr.
Also, 6 s. 8 d.=1 noble	4 Quart=1 hun. wght, C.
10 s.=1 angel	20 Hun. weight=1 ton, T.
13 s. 4 d. or two-thirds of a pound=1 merk.	

Scots money is divided in the same manner as Sterling, and has one-twelfth of its value. A pound Scots is equal to 1 s. 8 d. Sterling, a shilling Scots to a penny Sterling, and a penny Scots to a twelfth-part of a penny Sterling; a mark Scots is two-thirds of a pound Scots, or $13\frac{1}{3}$ d. Sterling.

III. *Troy Weight.*	IV. *Apothecaries Weight.*
20 Mites=1 grain, gr.	20 Grains=1 scruple, ℈
24 Grain=1 pen. wt. dwt.	3 Scruples=1 dram, ʒ
20 Pen. wts.=1 ounce, oz.	8 Drams=1 ounce, ℥
12 Ounces=1 pound, lb.	12 Ounces=1 pound, ℔

V. *English Dry Measure.*	VI. *Scotch Dry Measure.*
2 Pints=1 quart	4 Lippies=1 peck
4 Quarts=1 gallon	4 Pecks=1 firlot
2 Gallons=1 peck	4 Firlots=1 boll
4 Pecks=1 bushel	16 Bolls=1 chalder
8 Bushels=1 quarter	

VII. *English Land Measure.*	VIII. *Scots Land Measure.*
$30\frac{1}{4}$ Square yards=1 pole or perch	36 Square ells=1 fall
40 Poles=1 rood	40 Falls=1 rood
4 Roods=1 acre	4 Roods=1 acre

IX. *Long Measure.*	X. *Time.*
12 Inches=1 foot	60 Seconds=1 minute
3 Feet=1 yard	60 Minutes=1 hour
$5\frac{1}{2}$ Yards=1 pole	24 Hours=1 day
40 Poles=1 furlong	7 Days=1 week
8 Furlongs=1 mile	365 Days=1 year
3 Miles=1 league.	52 Weeks & 1 day=1 year.

RULE *for compound Addition.* "Arrange like "quantities under like, and carry according to the "value of the higher place."

Note 1. When you add a denomination, which contains more columns than one, and from which you carry to the higher by 20, 30, or any even number of tens, first add the units of that column, and mark down their sum, carrying the tens to the next column; then add the tens, and carry to the higher denomination, by the number of tens that it contains of the lower. For example, in adding shillings, carry by ten from the units to the tens, and by two from the tens to the pounds.

Note 2. If you do not carry by an even number of tens, first find the complete sum of the lower denomination, then enquire how many of the higher that sum contains, and carry accordingly, and mark the remainder, if any, under the column. For example, if the sum of a column of pence by 43, which is three shillings and seven pence, mark 7 under the pence-column, and carry 3 to that of the shillings.

Note 3. Some add the lower denominations after the following method: when they have reckoned as many as amounts to one of the higher denomination, or upwards, they mark a dot, and begin again with the excess of the number reckoned above the value of the denomination. The number of dots shows how many are carried, and the last reckoned number is placed under the column.

Examples in Sterling Money.

L	145	6	8	L	16	9	$11\frac{1}{2}$
	215	3	9		169	16	10
	172	18	4		36	12	$9\frac{3}{4}$
	645	7	7		54	7	6
	737	2	3		30	—	$1\frac{1}{4}$
	35	3	9		7	19	6
	9	—	7		707	19	11
	1764	12	3		14	14	4
	780	—	—		84	18	$8\frac{3}{4}$
	99	9	9		125	3	7
	150	10	—		16	16	$8\frac{3}{4}$
	844	8	7		62	5	3

In Averdupoise Weight.

T.	*C.*	*qr.*	*lb.*	*T.*	*C.*	*qr.*	*lb.*
1	19	3	26	3	15	2	22
—	14	1	16	6	3	—	19
2	18	1	16	5	7	3	26
—	1	2	27	3	2	2	—
3	9	—	10	4	3	1	10
—	17	2	24	—	18	1	12
—	15	3	18	1	1	1	1
4	6	—	5	5	3	—	7
—	6	3	9	6	4	—	9
6	4	—	4	4	6	—	5
5	5	—	5	2	1	3	4

When one page will not contain the whole account, we add the articles it contains, and write against their sum, *Carried forward*; and we begin the next page with the sum of the foreging, writing against it, *Brought forward*.

When the articles fill several pages, and their whole sum is known, which is the case in transcribing accounts, it is best to proceed in the following manner: Add the pages, placing the sums on a separate paper; then add the sums, and if the amount of the whole be right, it only remains to find what numbers should be placed at the foot and top of the pages. For this purpose, repeat the sum of the first page on the same line; add the sums of the first and second, placing the amount in a line with the second; to this add the sum of the third, placing the amount in a line with the third. Proceed in like manner with the others; and if the last sum corresponds with the amount of the pages, it is right. These sums are transcribed at the foot of the respective pages, and tops of the following ones.

Subtraction.

Examples.

L			L			L			L		
134	6	8									
42	3	9	170	5	4	70	4	2	15	3	9
175	4	9	66	9	8	18	6	8	12	2	6
42	5	7	73	8	6	12	13	2	7	5	4
163	7	4	45	3	2	15	3	9	8	—	—
148	5	8	78	7	9	17	5	4	—	9	6
73	2	3	12	—	—	18	6	8	—	5	10
L			L			L			L		

1st Page,	L778	16	—	L	778	16	—
2d	445	14	5		1224	10	5
3d	151	19	9		1376	10	2
2th	43	6	11		1419	17	1
	L1419	17	1				

Then we transcribe L778, 16s. at the foot of the first and top of the second pages, L1224 : 10 : 5 at the foot of the second and top of the third ; and so on.

Chap. III. SUBTRACTION.

Subtraction is the operation by which we take a lesser number from a greater, and find their differences. It is exactly opposite to addition, and is performed by learners in a like manner, beginning at the greater and reckoning downwards the units of the lesser. The greater is called the *minuend*, and the lesser the *subtrahend*.

If any figure of the subtrahend be greater than the corresponding figure of the minuend, we add ten to that of the minuend, and, having found and marked the difference, we add one to the next place of the subtrahend. This is called *borrowing ten.* The reason will appear, if we consider that, when two numbers are equally increased by adding the same to both, their difference will not be altered. When we proceed as directed above, we add ten to the minuend, and we likewise add one to the higher place of the subtrahend, which is equal to ten of the lower place.

Rule. "Subtract units from units, tens from tens, "and so on. If any figure of the subtrahend be "greater than the corresponding one of the minuend, "borrow ten."

Example.			
	Minuend	173694	738641
	Subtrahend	21453	379235
	Remainder	152241	359406

To prove subtraction, add the subtrahend and remainder together ; if their sum be equal to the minuend, the account is right.

Or subtract the remainder from the minuend. If the difference be equal to the subtrahend, the account is right.

Rule *for compound subtraction.* "Place like deno- "minations under like, and borrow, when necessary, "according to the value of the higher place."

Examples.

			C.	*qr.*	*lb.*	*A.*	*R.*	*F.*	*E.*
L 146	3	3	12	3	19	15	2	24	18
58	7	6	4	3	24	12	2	36	7
L 87	15	9	7	3	23	2	3	28	11

Note 1. The reason for borrowing is the same as in simple subtraction. Thus, in subtracting pence, we add 12 pence when necessary to the minuend, and at the next step, we add one shilling to the subtrahend.

Note 2. When there are two places in the same denomination, if the next higher contain exactly so many tens, it is best to subtract the units first, borrowing ten when necessary; and then subtract the tens, borrowing, if there is occasion, according to the number of tens in the higher denomination.

Note 3. If the value of the higher denomination be not an even number of tens, subtract the units and tens at once, borrowing according to the value of the higher denomination.

Note 4. Some chuse to subtract the place in the subtrahend, when it exceeds that of the minuend, from the value of the higher denomination, and add the minued to the difference. This is only a different order of proceeding, and gives the same answer.

Note 5. As custom has established the method of placing the subtrahend under the minuend, we follow it when there is no reason for doing otherwise ; but the minuend may be placed under the subtrahend with equal propriety; and the learner should be able to work it either way, with equal readiness, as this last is sometimes more convenient; of which instances will occur afterwards.

Note 6. The learner should also acquire the habit, when two numbers are marked down, of placing such a number under the lesser, that, when added together, the sum may be equal to the greater. The operation is the same as subtraction, though conceived in a different manner, and is useful in balancing accounts, and on other occasions.

It is often necessary to place the sums in different columns, in order to exhibit a clear view of what is required. For instance, if the values of several parcels of goods are to be added, and each parcel consists of several articles, the particular articles should be placed in an inner column, and the sum of each parcel extended to the outer column, and the total added there.

If any person be owing an account, and has made some partial payments, the payments must be placed in an inner column, and their sum extended under that of the account in the outer column, and subtracted there.

An example or two will make this plain.

Multiplication.

Chap. IV. MULTIPLICATION.

In Multiplication, two numbers are given, and it is required to find how much the first amounts to, when reckoned as many times as there are units in the second. Thus, 8 multiplied by 5, or 5 times 8, is 40. The given numbers (8 and 5) are called *factors*; the first (8) the *multiplicand*; the second (5) the *multiplier*; and the amount (40) the *product*.

This operation is nothing else than addition of the same number several times repeated. If we mark 8 five times under each other, and add them, the sum is 40: But, as this kind of addition is of frequent and extensive use, in order to shorten the operation, we mark down the number only once, and conceive it to be repeated as often as there are units in the multiplier.

For this purpose, the learner must be thoroughly acquainted with the following multiplication-table, which is composed by adding each digit twelve times.

Twice		Thrice		Four times		Five times		Six times		Seven times	
1 is	2	1 is	3	1 is	4	1 is	5	1 is	6	1 is	7
2	4	2	6	2	8	2	10	2	12	2	14
3	6	3	9	3	12	3	15	3	18	3	21

12	96	12	108	12	120	12	132	12	144

If both factors be under 12, the table exhibits the product at once. If the multiplier only be under 12, we begin at the unit-place, and multiply the figures in their order, carrying the tens to the higher place, as in addition.

Ex. 76859 multiplied by 4, or 76859 added 4 times.

```
 76859        76859
     4        76859
 ------       76859
 307436       76859
              ------
              307436
```

If the multiplier be 10, we annex a cypher to the multiplicand. If the multiplier be 100, we annex two cyphers; and so on. The reason is obvious, from the use of cyphers in notation.

If the multiplier be any digit, with one or more cyphers on the right hand, we multiply by the figure, and annex an equal number of cyphers to the product. Thus, if it be required to multiply by 50, we first multiply by 5, and then annex a cypher. It is the same thing as to add the multiplicand fifty times; and this might be done by writing the account at large, dividing the column into 10 parts of 5 lines, finding the sum of each part, and adding these ten sums together.

If the multiplier consist of several significant figures, we multiply separately by each, and add the products. It is the same as if we divided a long account of addition into parts corresponding to the figures of the multiplier.

Example. To multiply 7329 by 365.

```
 7329     7329     7329        36645 =   5 times.
    5       60      300       439740 =  60 times.
 -----   ------   -------    2198700 = 300 times.
 36645   439740   2198700    -------   ---
                             2675085 = 365 times.
```

It is obvious that 5 times the multiplicand added to 60 times, and to 300 times, the same must amount to the product required. In practice, we place the products at once under each other; and, as the cyphers arising from the higher places of the multiplier, are lost in the addition, we omit them. Hence may be inferred the following

Rule. "Place the multiplier under the multiplicand, and multiply the latter successively by the significant figures of the former; placing the right-hand figure of each product under the figure of the multiplier from which it arises; then add the product."

```
Ex.   7329      42785      37846        93956
       365         91        235         8704
   -------    -------    -------      -------
     36645      42785     189230       375834
    43974     385065     113538      657692
   21987      -------    75692      751648
   -------    3893435    -------    ---------
   2675085               8893810    817793024
```

A number which cannot be produced by the multiplication of two others is called a *prime number*; as 3, 5, 7, 11, and many others.

A number which may be produced by the multiplication of two or more smaller ones, is called a *composite number*. For example, 27, which arises from the multiplication of 9 by 3; and these numbers (9 and 3) are called the *component parts* of 27.

Contractions and Varieties in Multiplication.

First, If the multiplier be a composite number, we may multiply successively by the component parts.

```
Ex. 7638 by 45 or 5 times 9   7638   1st,   5492 by  72
      45                         9   2d,   13759 by  56
    ------                  ------   3d,   56417 by 144
     38190                   68472   4th,  73048 by  84
     30552                       5   5th, 166549 by 125
    ------                  ------   6th, 378914 by  54
    343710                  343710   7th, 520813 by  63
```

Because the second product is equal to five times the first, and the first is equal to nine times the multiplicand,

plicand, it is obvious that the second product must be five times nine, or forty-five times as great as the multiplicand.

Secondly, If the multiplier be 5, which is the half of 10, we may annex a cypher and divide by 2. If it be 25, which is the fourth-part of an 100, we may annex two cyphers, and divide by 4. Other contractions of the like kind will readily occur to the learner.

Thirdly, To multiply by 9, which is one less than 10, we may annex a cypher, and subtract the multiplicand from the number it composes. To multiply by 99,999, or any number of 9's, annex as many cyphers, and subtract the multiplicand. The reason is obvious; and a like rule may be found, though the unit place be different from 9.

Fourthly, Sometimes a line of the product is more easily obtained from a former line of the same than from the multiplicand.

```
Ex. 1st.]   1372          2d.]   1348
              84                   36
            ----                 ----
            5488                 8088
           10976                 4044
          ------                -----
          115248                48528
```

In the first example, instead of multiplying by 5, we may multiply 5488 by 2: and, in the second, instead of multiplying by 3, we may divide 8088 by 2.

Fifthly, Sometimes the product of two or more figures may be obtained at once, from the product of a figure already found.

```
Ex. 1st.]  14356          2d.]   3462321
             648                   96484
          ------               ---------
          114848               13849284
          918784              166191408
         -------             332382816
         9302688             -------------
                             334058579364
```

In the second example, we multiply first by 4; then, because 12 times 4 is 48, we multiply the first line of the product by 12, instead of multiplying separately by 8 and 4; lastly because twice 48 is 96, we multiply the second line of the product by 2, instead of multiplying separately by 6 and 9.

When we follow this method, we must be careful to place the right-hand figure of each product under the right-hand figure of that part of the multiplier which it is derived from.

It would answer equally well in all cases, to begin the work at the highest place of the multiplier; and contractions are sometimes obtained by following that order.

```
Ex. 1st.] 3125      or     3125       2d.]  32452
           642              642              52575
         -----            -----         ----------
         18750            18750          162260
          12500            131250          811300
           6250           -------           2433900
         -------          2006250       ----------
         2006250                        1706163900
```

It is a matter of indifference which of the factors be used as the multiplier; for 4 multiplied by 3 gives the same product as 3 multiplied by 4; and the like holds universally true. To illustrate this, we may mark three rows of points, four in each row, placing the rows under each other; and we shall also have four rows containing three points each, if we reckon the rows downwards.

```
. . . .
. . . .
. . . .
```

Multiplication is proven by repeating the operation, using the multiplier for the multiplicand, and the multiplicand for the multiplier. It may also be proven by division, or by casting out the 9's; of which afterwards; and an account, wrought by any contraction, may be proven by performing the operation at large, or by a different contraction.

Compound Multiplication.

RULE I. "If the multiplier do not exceed 12, the "operation is performed at once, beginning at the "lowest place, and carrying according to the value "of the higher place."

```
Examples.]              Cwt. qr. lb.    A. R. P.    lb. oz. dwt.
L.  13  6  7             12   2   8     13  3 18     7   5   9
           9                      5             6            12
   ---------             ----------     --------    -----------
L. 119 19  3             62   3  12     83  — 28    89   5   8
```

RULE II. "If the multiplier be a composite number, whose component parts do not exceed 12, multiply first by one of these parts, then multiply the "product by the other. Proceed in the same manner if there be more than two."

```
Ex. 1st.]  L.   15  3  8 by 32=8×4
                       8
           ---------------
           L.  121  9  4=8 times.
                       4
           ---------------
           L.  485 17  4=32 times.

   2d.]    L.   17  3  8 by 75=5×5×3
                       3
           ---------------
           L.   51 11  —=3 times.
                       5
           ---------------
           L.  257 15  —=15 times.
                       5
           ---------------
           L. 1288 15  —=75 times.
```

Note 1. Although the component parts will answer in any order, it is best, when it can be done, to take them in such order as may clear off some of the lower places at the first multiplication, as is done in Ex. 2d.

Note 2. The operation may be proved, by taking the component parts in a different order, or dividing the multiplier in a different manner.

Rule III. "If the multiplier be a prime number, "multiply first by the composite number next lower, "then by the difference, and add the products."

L.

Multiplication.

L. 35 17 9	by 67=64+3		
8	64= 8+8		
L. 287 2 —	=8 times.		
8			
L. 2296 16 —	=64 times.		
107 13 3	= 3 times.		
L. 2404 9 3	=67 times.		

Here because 8 times 8 is 64, we multiply twice by 8, which gives L. 2296, 16 s. equal to 64 times the multiplicand; then we find the amount of 3 times the multiplicand, which is L. 107 : 13 : 3: and it is evident that these added, amount to 67, the multicand.

Rule IV. "If there be a composite number a little above the multiplier, we may multiply by that number, and by the difference, and subtract the second product from the first."

L. 17 4 5	by 106=108—2	
12	108= 9×12	
L. 206 13 —		
9		
L. 1859 17 —	=108 times.	
34 8 10	= 2 times.	
L. 1825 8 2	=106 times	

Here we multiply by 12 and 9, the component parts of 108, and obtain a product of L. 1860, 6 s. equal to 108 times the multiplicand; and, as this is twice oftener than was required, we subtract the multiplicand doubled, and the remainder is the number sought.

Example. L. 34 : 8 : 2½ by 3465.

Rule V. "If the multiplier be large, multiply by 10, and multiply the product again by 10; by which means you obtain an hundred times the given number. If the multiplier exceed 1000, multiply by 10 again; and continue it farther if the multiplier require it; then multiply the given number by the unit-place of the multiplier; the first product by the ten place, the second product by the hundred-place; and so on. Add the products thus obtained together."

L.	34 8 2½ by 5=	L. 172 1 ½=	5 times
	10		
10 times L.	344 2 1 by 6=	2064 12 6=	60 times
	10		
100 times L.	3441 — 10 by 4=	13764 3 4=	400 times
	10		
1000 times L.	34410 8 4 by 3=	103231 5 —=	3000 times.
		L. 119232 1 10½=	3465 times

The use of multiplication is to compute the amount of any number of equal articles, either in respect of measure, weight, value, or any other consideration. The multiplicand expresses how much is to be reckoned for each article; and the multiplier expresses how many times that is to be reckoned. As the multiplier points out the number of articles to be added, it is always an abstract number, and has no reference to any value or measure whatever. It is therefore quite improper to attempt the multiplication of shillings by shillings, or to consider the multiplier as expressive of any denomination. The most common instances in which the practice of this operation is required, are, to find the amount of any number of parcels, to find the value of any number of articles, to find the weight or measure of a number of articles, &c.

Division.

This computation, for changing any sum of money, weight, or measure, into a different kind, is called Reduction. When the quantity given is expressed in different denominations, we reduce the highest to the next lower, and add thereto the given number of that denomination; and proceed in like manner till we have reduced it to the lowest denomination.

Example. To reduce L. 46 : 13 : 8¾ to farthings.

L. 46	
20	Or thus:
920 shillings in L. 46	L 46 13 8¾
13	20
933 shillings in L. 46 13	933
12	12
11196 pence in L. 46 13	11204
8	4
11204 pence in L. 46 13 8	44819
4	
44816 farthings in L. 46 13 8	
3	
44819 farthings in L. 46 13 8¾	

It is easy to take in or add the higher denomination at the same time we multiply the lower,

Chap. V. DIVISION. 11

In division, two numbers are given; and it is required to find how often the former contains the latter. Thus, it may be asked how often 21 contains 7, and the answer is exactly 3 times. The former given number (21) is called the *Dividend*; the latter (7) the *Divisor*; and the number required (3) the *Quotient*. It frequently happens that the division cannot be completed exactly without fractions. Thus it may be asked, how often 8 is continued in 19? the answer is twice, and a remainder of 3.

This operation consists in subtracting the divisor from the dividend, and again from the remainder, as often as it can be done, and reckoning the number of subtractions; as,

21	19
7 first subtraction	8 first subtraction
14	11
7 second subtraction	8 second subtraction
7	3 remainder.
7 third subtraction.	
0	

As this operation, performed at large, would be very tedious, when the quotient is a high number, it is proper to shorten it by every convenient method; and, for this purpose, we may multiply the divisor by any number whose product is not greater than the dividend, and so subtract it twice or thrice, or oftener, at the same time. The best way is to multiply it by the greatest number, that does not raise the product too high, and that number is also the quotient. For example, to divide 45 by 7, we inquire what is the greatest multiplier for 7, that does not

Diviſion. not give a product above 45; and we ſhall find that it is 6; and 6 times 7 is 42, which, ſubtracted from 45, leaves a remainder of 3. Therefore 7 may be ſubtracted 6 times from 45; or, which is the ſame thing, 45, divided by 7, gives a quotient of 6, and a remainder of 3.

If the diviſor do not exceed 12, we readily find the higheſt multiplier that can be uſed from the multiplication table. If it exceed 12, we may try any multiplier that we think will anſwer. If the product be greater than the dividend, the multiplier is too great; and, if the remainder, after the product is ſubtracted from the dividend, be greater than the diviſor, the multiplier is too ſmall. In either of theſe caſes, we muſt try another. But the attentive learner, after ſome practice, will generally hit on the right multiplier at firſt.

If the diviſor be contained oftener than ten times in the dividend, the operation requires as many ſteps as there are figures in the quotient. For inſtance, if the quotient be greater than 100, but leſs than a 1000, it requires 3 ſteps. We firſt inquire how many hundred times the diviſor is contained in the dividend, and ſubtract the amount of theſe hundreds. Then we inquire how often it is contained ten times in the remainder, and ſubtract the amount of theſe tens. Laſtly, we inquire how many ſingle times it is contained in the remainder. The method of proceeding will appear from the following example:

To divide 5936 by 8.

From	5936	
Take	5600 =	700 times 8
Rem.	336	
From which take	320 =	40 times 8
Rem.	16	
From which take	16 =	2 times 8
	0	742 times 8 in all.

It is obvious, that as often as 8 is contained in 59, ſo many hundred times it will be contained in 5900, or in 5936; and, as often as it is contained in 33, ſo many times it will be contained in 330, or in 336; and thus the higher places of the quotient will be obtained with equal eaſe as the lower. The operation might be performed by ſubtracting 8 continually from the dividend, which will lead to the ſame concluſion by a very tedious proceſs. After 700 ſubtractions, the remainder would be 336; after 40 more, it would be 16; and after 2 more, the dividend would be entirely exhauſted. In practice, we omit the cyphers, and proceed by the following

Rule 1ſt, "Aſſume as many figures on the left "hand of the multiplier as contain the diviſor once "or oftener: find how many times they contain it, "and place the anſwer as the higheſt figure of the "quotient.

2d, "Multiply the diviſor by the figure you have "found, and place the product under the part of "the dividend from which it is obtained.

3d, "Subtract the product from the figures above it.

4th, "Bring down the next figure of the dividend "to the remainder, and divide the number it makes "up, as before."

Examples.] 1ſt. 8)5936(742 2d. 63)30114(478 Diviſion.

```
1st. 8)5936(742        2d. 63)30114(478
       56··                  252··

          365
          ---
Remainder  17
```

The numbers which we divide, as 59, 33, and 16, in the firſt example, are called *dividuals*.

It is uſual to mark a point under the figures of the dividend, as they are brought down, to prevent miſtakes.

If there be a remainder, the diviſion is completed by a vulgar fraction, whoſe numerator is the remainder, and its denominator the diviſor. Thus, in Ex. 3. the quotient is 2671, and remainder 17; and the quotient completed is 2671 $\frac{17}{365}$.

A number which divided another without a remainder is ſaid to meaſure it; and the ſeveral numbers which meaſure another, are called its *aliquot parts*. Thus, 2, 4, 6, 8, and 12, are aliquot parts of 24. As it is often uſeful to diſcover numbers which meaſure others, we may obſerve,

1ſt, Every number ending with an even figure, that is, with 2, 4, 6, 8, or 0, is meaſured by 2.

2d, Every number ending with 5, or 0, is meaſured by 5.

3d, Every number, whoſe figures, when added, amount to an even number, of 3's or 9's, is meaſured by 3 or 9, reſpectively.

Contractions and Varieties in Diviſion.

Firſt, When the diviſor does not exceed 12, the whole computation may be performed without ſetting down any figures except the quotient.

```
Ex. 7)35868(5124     or     7)35868
                              5124
```

Secondly, When the diviſor is a compoſite number, and one of the component parts alſo meaſures the dividend, we may divide ſucceſſively by the component parts.

```
Ex. 1st.] 30114 by 63.    2d.] 975 by 105=5×7×3
        9)30114                5)975
        7) 3346                3)195
  Quotient  478                7) 65
                        Quotient   9 2/7
```

This method might be alſo uſed, although the component parts of the diviſor do not meaſure the dividend; but the learner will not underſtand how to manage

manage the remainder till he be acquainted with the doctrine of vulgar fractions.

Thirdly, When there are cyphers annexed to the divisor, cut them off, and cut off an equal number of figures from the dividend; annex these figures to the remainder. *Ex.* To divide 378643 by 5200.

$52|00)3786|43(72\frac{4243}{5200}$

```
52|00)3786|43(72
      364·
      ----
       146
       104
       ----
       4243
```

The reason will appear by performing the operation at large, and comparing the steps.

To divide by 10, 100, 1000, or the like. Cut off as many figures on the right hand of the dividend as there are cyphers in the divisor. The figures which remain on the left hand compose the quotient, and the figures cut off compose the remainder.

Fourthly, When the divisor consists of several figures we may try them separately, by inquiring how often the first figure of the divisor is contained in the first figure of the dividend, and then considering whether the second and following figures of the divisor be contained as often in the corresponding ones of the dividend with the remainder (if any) prefixed. If not, we must begin again, and make trial of a lower number. When the remainder is nine, or upwards, we may be sure the division will hold through the lower places; and it is unnecessary to continue the trial farther.

Fifthly, We may make a table of the products of the divisor, multiplied by the nine digits, in order to discover more readily how often it is contained in each dividual. This is convenient when the dividend is very long, or when it is required to divide frequently by the same divisor.

```
73 by 2 = 146        73)538726949(737982
      3 = 219           511·····
      4 = 292           ---
      5 = 365            277
      6 = 438            219
      7 = 511            ---
      8 = 584             582
      9 = 657             511
                          ---
                           716
                           657
                           ---
                            599
                            584
                            ---
                             154
                             146
                             ---
                        Rem.   8
```

Sixthly, To divide by 9, 99, 999, or any number of 9's, transcribe under the dividend part of the same, shifting the highest figure as many places to the right, as there are 9's in the divisor. Transcribe it again, with the like change of place, as often as the length of the dividend admits; add these together, and cut off as many figures from the right hand of the sum as there are 9's in the divisor. The figures which remain on the left hand compose the quotient, and those cut off the remainder.

If there be any carriage to the unit-place of the quotient, add the number carried likewise to the remainder, as in Ex. 2,; and if the figures cut off be all 9's, add 1 to the quotient, and there is no remainder.

```
Examples. 1st.] 99)324123          2d.] 99)547825
                   3241                     5478

                    -------
                    476|999
                          1
                    -------
            Quotient 477
```

To explain the reason of this, we must recollect, that whatever number of hundreds any dividend contains, it contains an equal number of 99's, together with an equal number of units. In Ex. 1. the dividend contains 3241 hundreds, and a remainder of 23. It therefore contains 3241 times 99, and also 3241, besides the remainder already mentioned.—Again, 3241 contains 32 hundreds, and a remainder of 51: It therefore contains 32 99's, and also 32, besides the remainder of 41. Consequently the dividend contains 99, altogether, 3241 times, and 32 times, that is 3273 times, and the remainder consists of 23, 41, and 32, added, which makes 96.

As multiplication supplies the place of frequent additions, and division of frequent subtractions, they are only repetitions and contractions of the simple rules, and when compared together, their tendency is exactly opposite. As numbers, increased by addition are diminished and brought back to their original quantity by subtraction; in like manner, numbers compounded by multiplication are reduced by division to the parts from which they were compounded. The multiplier shows how many additions are necessary to produce the number; and the quotient shows how many subtractions are necessary to exhaust it. It follows, that the product, divided by the multiplicand, will quote the multiplier; and, because either factor may be assumed for the multiplicand, therefore the product divided by either factor quotes the other. It follows, also, that the dividend is equal to the product of the divisor and quotient multiplied together: and hence these operations mutually prove each other.

To prove multiplication. Divide the product by either factor. If the operation be right, the quotient is the other factor, and there is no remainder.

To prove division. Multiply the divisor and quotient together; to the product add the remainder, if any; and, if the operation be right, it makes up the dividend. Otherwise divide the dividend (after subtracting the remainder, if any) by the quotient. If the operation be right, it will quote the divisor. The reason of all these rules may be collected from the last paragraph.

Compound

Compound Division.

12 RULE I. "When the dividend only consists of "different denominations, divide the higher denomination, and reduce the remainder to the next "lower, taking in (p. 296. Rule V.) the given number of that denomination, and continue the division."

Examples.

Divide L. 465 : 12 : 8 by 72.

```
   L.  s. d.    L. s. d.
72) 465 12 8    (6 9 4

```

It is best not to reduce the terms lower than is necessary to render them equal. For instance, if each of them consists of an even number of sixpences, fourpences, or the like, we reduce them to sixpences, or fourpences, but not to pence.

The use of division is to find either of the factors by whose multiplication a given number is produced when the other factor is given; and therefore is of two kinds, since either the multiplier or the multiplicand may be given. If the former be given, it discovers what that number is which is contained so many times in another. If the latter be given, it discovers how many times one number is contained in another. Thus, it answers the questions of an opposite kind to those mentioned under Rule IV. p. 296. as, To find the quantity of a single parcel or share; to find the value, weight, or measure, of a single article; to find how much work is done, provisions consumed, interest incurred, or the like, in a single day, &c.

The last use of division is a kind of reduction exactly opposite to that described under Rule V. 296. The manner of conducting and arranging it, when there are several denominations in the question, will appear from the following examples.

1. To reduce 15783 pence to pounds, sh. and pence.

```
         20
12) 15783 (1315 (65
    12···   120·
    --     ---
    37     115
    36     100
    --     ---
    18      15
    12
    --
    63
    60
    --
     3
```

Answer, L. 65 : 15 : 3.

2. To reduce 174865 grs. to lbs. oz. and dwt. Troy.

```
              20    12
24) 174865 (7286 (364 (30
    168···   60··  36·
    ---      ---   ---
     68      128    04
     48      120
    ---      ---
    206       86
    192       80
    ---       --
     145       6
     144
     ---
       1
```

Ans. 30lb. 4oz. 6dwt. 1 gr.

In the first example, we reduce 15783 pence to shillings, by dividing by 12, and obtain 1315 shillings, and a remainder of 3 pence. Then we reduce 1315 shillings to pounds, by dividing by 20. and obtain 65 pounds and a remainder of 15 shillings. The divisions might have been contracted.

In the practice of arithmetic, questions often occur which require both multiplication and division to resolve. This happens in reduction, when the higher denomination does not contain an exact number of the lower.

RULE *for mixed reduction.* "Reduce the given denomination by multiplication to some lower one, "which is an aliquot part of both; then reduce that "by division to the denomination required."

Ex. Reduce L. 31742 to guineas.

```
   31742
      20
   ------
21)634840(30230
   63····
   ------
    048
     42
     --
      64
      63
      --
      10
```

Here we multiply by 20, which reduces the pounds to shillings; and divide the product by 21, which reduces the shillings to guineas.

Answer, 30230 guineas and 10 shill.

As

Division.

As Portuguese money frequently passes here in payments, we shall a give a table of the pieces, and their value.

A moidore	=L. 1	7	—
A half moidore	= —	13	6
A quarter moidore	= —	6	9
A double Joannes	= 3	12	—
A Joannes	= 1	16	—
A half ditto	= —	18	—
A quarter ditto	= —	9	—
An eighth ditto	= —	4	6

Note 1. Guineas may be reduced to pounds, by adding one-twentieth part of the number.

2. Pounds may be reduced to merks by adding one-half.

3. Merks may be reduced to pounds by subtracting one-third.

4. Four moidores are equal to three Joannes: wherefore moidores may be reduced to Joannes, by subtracting one-fourth; and Joannes to moidores, by adding one-third.

5. Five Joannes are equal to L. 9. Hence it is easy to reduce Portugueze money to Sterling.

Another case, which requires both multiplication and division, is, when the value, weight, measure, or duration of any quantity is given, and the value, &c. of a different quantity required, we first find the value, &c. of a single article by division, and then the value, &c. of the quantity required, by multiplication.

Ex. If 3 yards cost 15 s. 9 d. what will 7 yards cost, at the same rate?

```
        s.  d.
   3) 15   9 Price of 3 yards.
       5   3 Price of 1 yard by Rule IV. p. 296.
           7
   ———————————
L. 1 16   9 Price of 7 yards (by par. ult. p. 299. col. 1.
```

Many other instances might be adduced, where the operation and the reason of it are equally obvious. These are generally, though unnecessarily, referred to the rule of proportion.

We shall now offer a general observation on all the operations in Arithmetic. When a computation requires several steps, we obtain a just answer, whatever order we follow. Some arrangements may be preferable to others in point of ease, but all of them lead to the same conclusion. In addition, or subtraction, we may take the articles in any order, as is evident from the idea of number; or, we may collect them into several sums, and add and subtract these, either separately or together. When both the simple operations are required to be repeated, we may either complete one of them first, or may introduce them promiscuously; and the compound operations admit of the same variety. When several numbers are to be multiplied together, we may take the factors in any order, or we may arrange them into several classes, find the product of each class, and then multiply the products together. When a number is to be divided by several others, we may take the divisors in any order, or we may multiply them into each other, and divide by the product; or we may multiply them into several parcels, and divide by the products successively. Lastly, when multiplication and division are both required, we may begin with either; and when both are repeatedly necessary, we may collect the multipliers into one product, and the divisors into one another; or we may collect them into parcels, or use them singly, and that in any order. Still, we shall obtain the proper answer, if none of the terms be neglected.

When both multiplication and division are necessary to obtain the answer of a question, it is generally best to begin with the multiplication, as this order keeps the account as clear as possible from fraction. The example last given may be wrought accordingly as follows:

```
      s.  d.
     15   9
          7
   ————————
 3)5  10  3
   1  16  9
```

Some accountants prove the operations of arithmetic by a method which they call casting out the 9's, depending on the following principles:

First, If several numbers be divided by any divisor, (the remainders being always added to the next number), the sum of the quotients, and the last remainder, will be the same as those obtained when the sum of the numbers is divided by the same divisor. Thus, 19, 15, and 23, contain, together, as many 5's, as many 7's, &c. as their sum 57 does, and the remainders are the same; and, in this way, addition may be proven by division. It is from the correspondence of the remainders, that the proof, by casting out the 9's, is deduced.

Secondly, If any figure, with cyphers annexed, be divided by 9, the quotient consists entirely of that figure; and the remainder is also the same. Thus, 40, divided by 9, quotes 4, remainder 4; and 400 divided by 9, quotes 4, remainder 44. The same holds with all the digits; and the reason will be easily understood; every digit, with a cypher annexed, contains exactly so many tens; it must therefore contain an equal number of 9's, besides a remainder of an equal number of units.

Thirdly, If any number be divided by 9, the remainder is equal to the sum of the figures of the number, or to the remainder obtained, when that sum is divided by 9. For instance, 3765, divided by 9, leaves a remainder of 3, and the sum of 3, 7, 6, and 5, is 21; which divided by 9, leaves a remainder of 3. The reason of this will appear from the following illustration:

```
3000 divided by 9 quotes 333;   remainder 3
 700              quotes  77;   remainder 7
  60              quotes   6;   remainder 6
   5              quotes   0;   remainder 5
————                     ———             —
3765                     416 Sum of Rem. 21
Again. 21 divided by 9 quotes  2;  remainder 3
                         ———
```

Wherefore, 3765 divid. by 9 quotes 418; remainder 3; for the reason given. Hence we may collect the following rules for practice:

To cast the 9's out of an number, or to find what remainder will be left when any number is divided by 9: Add the figures; and when the sum exceeds 9, add the figures which would express it. Pass by the nines; and, when the sum comes exactly to 9, neglect it, and begin anew. For example, if it be required to cast the 9's out of 3573294, we reckon thus: 3 and 5 is

5 is 8, and 7 is 15; 1 and 5 is 6, and 3 is 9, which we neglect; 2 and (passing by 9) 4 is 6; which is the remainder or Result. If the article out of which the 9's are to be cast contains more denominations than one, we cast the 9's out of the higher, and multiply the result by the value of the lower, and carry on the product (casting out the 9's, if necessary), to the lower.

To prove addition, cast the 9's out of the several articles, carrying the results to the following articles; cast them also out of the sum. If the operation be right, the results will agree.

To prove subtraction, cast the 9's out of the minuend; cast them also out of the subtrahend and remainder together; and if you obtain the same result, the operation is presumed right.

To prove multiplication, cast the 9's out of the multiplicand, and also out of the multiplier, if above 9. Multiply the results together, and cast the 9's if necessary, out of their product. Then cast the 9's out of the product, and observe if this result correspond with the former.

Ex. 1st.] 9276 res. 6×8=48 res. 3.
8
———
74208 res. 3.

2d.] 7898 res. 5×3=15 res. 6.
48 res. 3.
———
63184
31592
———
379104 res. 6.

The reason of this will be evident, if we consider multiplication under the view of repeated addition. In the first example it is obviously the same. In the second, we may suppose the multiplicand repeated 48 times. If this be done, and the 9's cast out, the result, at the end of the 9th line, will be 0; for any number, repeated 9 times, and divided by 9, leaves no remainder. The same must happen at the end of the 18th, 27th 36th, and 45th lines; and the last result will be the same as if the multiplicand had only been repeated 3 times. This is the reason for casting out the 9's from the multiplier as well as the multiplicand.

To prove division, cast the 9's out of the divisor, and also out of the quotient; multiply the results, and cast the 9's out of the product. If there be any remainder, add to it the result, casting out the 9's, if necessary. If the account be right, the last result will agree with that obtained from the dividend.

Ex. 42) 2490 (59 res. 5×6=30 res. 3.
res. 6 210
———
390
378
———
Rem. 12 - - res. 3.

And the result of the dividend is 6.

This depends on the same reason as the last; for the dividend is equal to the product of the divisor and quotient added to the remainder.

We cannot recommend this method, as it lies under the following disadvantages:

First, If an error of 9, or any of its multiples, be committed, the results will nevertheless agree; and so the error will remain undiscovered. And this will always be the case, when a figure is placed or reckoned in a wrong column; which is one of the most frequent causes of error.

Secondly, When it appears by the disagreement of the results, that an error has been committed, the particular figure or figures in which the error lies are not pointed out; and consequently, it is not easily corrected.

Chap. VI. RULE of PROPORTION. 13

Sect. i. Simple Proportion.

Quantities are reckoned proportional to each other, when they are connected in such a manner, that if one of them be increased or diminished, the other increases or diminishes at the same time; and the degree of the alteration on each is a like part of its original measure; thus four numbers are in the same proportion, the first to the second as the third to the fourth, when the first contains the second, or any part of it, as often as the third contains the fourth, or the like part of it. In either of these cases, the quotient of the first, divided by the second, is equal to that of the third divided by the fourth; and this quotient may be called the *measure of the proportion*.

Proportionals are marked down in the following manner:

6 : 3 :: 8 : 4
12 : 36 :: 9 : 27
9 : 6 :: 24 : 18
16 : 24 :: 10 : 15

The rule of proportion directs us, when three numbers are given, how to find a fourth, to which the third may have the same proportion that the first has to the second. It is sometimes called the *Rule of Three*, from the three numbers given; and sometimes the *Golden Rule*, from its various and extensive utility.

Rule. "Multiply the second and third terms together, and divide the product by the first."

Ex. To find a fourth proportional to 18, 27, and 34.

18 : 27 :: 34 : 51

——
18
18
——
0

To explain the reason of this, we must observe, that if two or more numbers be multiplied or divided alike, the products or quotients will have the same proportion.

18 : 27
Multiplied by 34, 612 : 918
Divided by 18, 34 : 51

The

Proportion

The products 612, 918, and the quotients 34, 51, have therefore the same proportion to each other that 18 has to 27. In the course of this operation, the products of the first and third term is divided by the first; therefore the quotient is equal to the third.

The first and second terms must always be of the same kind; that is, either both monies, weights, measures, both abstract numbers, or the like. The fourth, or number sought, is of the same kind as the third.

When any of the terms is in more denominations than one, we may reduce them all to the lowest. But this is not always necessary. The first and second should not be reduced lower than directed p. 299, col. 1. par. *penult.*; and, when either the second or third is a simple number, the other, though in different denominations, may be multiplied without reduction.

			L.	s.	d.			
Ex. 5 :	7 ::		25	11	3			
					7			
						L.	s.	d.
		5)	178	18	9 (	35	19	9

The accountant must consider the nature of every question, and observe the circumstance which the proportion depends on; and common sense will direct him to this if the terms of the question be understood. It is evident that the value, weight and measure of any commodity is proportioned to its quantity; that the amount of work or consumption is proportioned to the time; that gain, loss or interest, when the rate and time are fixed, is proportioned to the capital sum from which it arises; and that the effect produced by any cause is proportioned to the extent of the cause. In these, and many other cases, the proportion is direct, and the number sought increases or diminishes along with the term from which it is derived.

In some questions, the number sought becomes less, when the circumstances from which it is derived become greater. Thus, when the price of goods increases, the quantity which may be bought for a given sum is smaller. When the number of men employed at work is increased, the time in which they may comple it becomes shorter; and, when the activity of any cause is increased, the quantity necessary to produce a given effect is diminished. In these, and the like, the proportion is said to be inverse.

General Rule *for stating all questions, whether direct or inverse.* "Place that number for the third "term which signifies the same kind of thing with "what is sought, and consider whether the number "sought will be greater or less. If greater, place the "least of the other terms for the first; but, if less, "place the greatest for the first."

Ex. 1st] If 30 horses plough 12 acres, how many will 42 plough in the same time?

H. H. A.
30 : 42 :: 12

Here, because the thing sought is a number of acres, we place 12, the given number of acres, for the third term; and, because 42 horses will plough more than 12, we make the lesser number 30, the first term, and the greater number, 42, the second term.

Ex. 2d.] If 40 horses be maintained for a certain sum on hay, at 5 d. per stone, how many will be maintained on the same sum when the price of hay rises to 8 d.

d. d. H.
8 : 5 :: 40

Here, because a number of horses is sought, we make the given number of horses, 40, the third term; and, because fewer will be maintained for the same money, when the price of hay is dearer, we make the greater price, 8 d. the first term; and the lesser price 5d. the second term.

The first of these examples is direct, the second inverse. Every question consists of a supposition and demand. In the first, the supposition is, that 30 *horses plough* 12 *acres*, and the demand, *how many* 42 *will plough?* and the first term of the proportion, 30, is found in the supposition, in this, and every other direct question. In the second, the supposition is, *that* 40 *horses are maintained on hay at 5d.* and the demand, *how many will be maintained on hay at 8d?* and the first term of the proportion, 8, is found in the demand, in this and every other inverse question.

When an account is stated, if the first and second term, or first and third, be measured by the same number, we may divide them by that measure, and use the quotients in their stead.

Ex. If 36 yards cost 42 shillings, what will 27 cost?

Y. Y. sh.
36 : 27 :: 42
4 : 3 :: 42
3
—— s. d.
4)126(31 6

Here 36 and 27 are both measured by 9, and we work with the quotients 4 and 3.

Sect. ii. Compound Proportion. 14

Sometimes the proportion depends upon several circumstances. Thus, it my be asked, if 18 men consume 6 bolls corn in 28 days, how much will 24 men consume in 56 days? Here the quantity required depends partly on the number of men, partly on the time, and the question may be resolved into the two following ones:

1st. If 18 men consume 6 bolls in a certain time, how many will 24 men consume in the same time?

M. M. B. B.
18 : 24 :: 6 : 8
6
——
18)144(8

Answer. 24 men will consume 8 bolls in the same time.

2d. If a certain number of men consume 8 bolls in 28 days, how many will they consume in 56 days?

D. D. B. B.
28 : 56 :: 8 : 16
8
——
18)448(16

Ans. The same number of men will consume 16 bolls in 56 days.

In the course of this operation, the original number of bolls, 6, is first multiplied into 24, then divided by 18, then multiplied into 8, then divided by 28. It would answer the same purpose to collect the mutipliers into one product, and the divisors into another; and then to multiply the given number of bolls by the former, and divide the product by the latter. p. 300. col. 1. par. *ult.*

The above question may therefore be stated and wrought as follows:

Men

Men 18 : 24 :: 6 bolls
Days 28 : 56

144 144
36 120

504 1344
6

504)8064(16

Here we multiply 18 into 28 for a divifor, and 6 into the product of 24 by 56, for a dividend.

" In general, ftate the feveral particulars on which " the queftion depends, as fo many fimple proportions, " attending to the fenfe of the queftion to difcover " whether the proportions fhould be ftated directly or " inverfely ; then multiply all the terms in the firft " rank together, and all thofe in the fecond rank to- " gether ; and work with the products as directed in " the fimple rule (Sect i. p. 301.)"

Example. If 100 men make 3 miles of road in 27 days, in how many days will 150 men make 5 miles ?

Men 150 : 100 :: 27 days
Miles 3 5

450 500
27

450)13500(30 days, anf.

Here the firft ftating is inverfe, becaufe more men will do it in fewer days; but the fecond is direct, becaufe more miles will require more days.

The following contraction is often ufeful. After ftating the proportion, if the fame number occurs in both ranks, dafh it out from both ; or, if any term in the firft rank, and another in the fecond rank are meafured by the fame numbers, dafh out the original terms, and ufe the quotients in their ftead.

Ex. If 18 men confume L. 30 value of corn in 9 months, when the price is 16 s. per boll, how many will confume L. 54 value in 6 months, when the price is 12 s. per boll ? In this queftion, the proportion depends upon three particulars, the value of corn, the time and the price. The firft of which is direct, becaufe the more the value of provifions is, the more time is required to confume them; but the fecond and third are inverfe, for the greater the time and price is, fewer men will confume an equal value.

Value 30 : 74 :: 18 men.
Months 6 : 9
Price 12 : 16
10 9
3 3
4

36
18

288
36

10)648(64 $\frac{9}{10}$

Here we obferve that 6 in the firft rank meafures 54 in the fecond : fo we dafh them out, and place the quotient 9 in the fecond rank. Next, becaufe 30 and 9 are both meafured by 3, we dafh them out, and place down the quotients 10 and 3; then, becaufe 12 and 16 are both meafured by 4, we dafh them out, and place down the quotients 3 and 4. Laftly, becaufe there is now 3 in both columns, we dafh them out, and work with the remaining terms, according to the rule.

The monies, weights and meafures, of different countries, may be reduced from the proportion which they bear to each other.

Ex. If 112 lb. averdupois make 104 lb. of Holland, and 100 lb. of Holland make 89 of Geneva, and 110 of Geneva make 117 of Seville, how many lbs. of Seville will make 100 lb. averdupois.

112 : 104 :: 100
100 : 89
110 : 117

If it be required, how many lb. averdupois will make 100 of Seville, the terms would have been placed in the different columns thus :

104 : 112 :: 100
89 : 100
117 : 110

Sect. iii. Distributive Proportion. 15

If it be required to divide a number into parts, which have the fame proportion to each other, that feveral other given numbers have, we add thefe numbers together, and ftate the following proportion : As the fum is to the particular numbers, fo is the number required to be divided to the feveral parts fought.

Ex. 1ft.] Four partners engage to trade in company ; A's ftock is L. 150, B's L. 320, C's L. 350, D's L. 500, and they gain L. 730 ; Required how much belongs to each, if the gain be divided among them in proportion to their ftocks ?

					Rem.
A's ftock L.	150	1320 : 150 :: 730 : L. 82	19	1 — 120	
B's	320	1320 : 320 :: 730 : 176	19	4 — 960	
C's	350	1320 : 350 :: 730 : 193	11	2 — 720	
D's	500	1320 : 500 :: 730 : 276	10	3 — 840	
Whole ftock	1320	Proof L. 730			

This account is proved by adding the gains of the partners ; the fum of which will be equal to the whole gain, if the operation be right ; but, if there be remainders, they muft be added, their fum divided by the common divifor, and the quotient carried to the loweft place.

Ex. 2d.] A bankrupt owes A L. 146, B L. 170, C L. 45, D L 480, and E L. 72 ; his whole effects are only L. 342 : 7 : 6. How much fhould each have ?

A's debt L.	146	913 : 146 ::	L. 342 7 6 :	L. 54 15		A's fhare.
B's	170	913 : 170 ::	342 7 6	63 15		B's
C's	45	913 : 45 ::	342 7 6	16 17	6	C's
D's	480	913 : 480 ::	342 7 6	180		D's
E's	72	913 : 72 ::	342 7 6	27		E's
	L. 913			L. 342 7	6	

This might alfo be calculated, by finding what compofition the bankrupt was able to pay per pound ; which is obtained by dividing the amount of his effects by the amount of his debts; and comes to 7 s. 6 d. and then finding by the rules of practice, how much each debt came to at that rate.

Chap. VII. RULES for PRACTICE. 16

The operations explained in the foregoing chapters comprehend the whole fyftem of arithmetic, and are fufficient for every computation. In many cafes, however, the work may be contracted, by adverting to the particular circumftances of the queftion. We fhall explain, in this chapter, the moft ufeful methods which practice has fuggefted for rendering mercantile computations eafy ; in which, the four elementary rules of arithmetic are fometimes jointly, fometimes feparately employed.

Sect. i. Computation of Prices.

The value of any number of articles, at a pound, a fhilling

Practice.

ſhillings, or a penny, is an equal number of pounds, ſhillings or pence; and theſe two laſt are eaſily reduced to pounds. The value, at any other rate, may be calculated by eaſy methods, depending on ſome contraction already explained, or on one or more of the following principles.

1ſt, If the rate be an aliquot part of a pound, a ſhilling, or a penny, then an exact number of articles may be bought for a pound, a ſhilling, or a penny; and the value is found by dividing the given number accordingly. Thus, to find the price of ſo many yards at 2s. 6d. which is the eighth-part of a pound, we divide the quantity by eight, becauſe every eight yards coſt L. 1.

2d, If the rate be equal to the ſum of two other rates which are eaſily calculated, the value may be found by computing theſe ſeparately, and adding the ſums obtained. Thus, the price of ſo many yards, at 9 d. is found, by adding their prices, at 6 d. and 3 d. together.

3d, If the rate be equal to the difference of two eaſy rates, they may be calculated ſeparately, and the leſſer ſubtracted from the greater. Thus, the value of ſo many articles at 11 d. is found, by ſubtracting their value at a penny from their value at a ſhilling. We may ſuppoſe that a ſhilling was paid for each article, and then a penny returned on each.

4th, If the rate be a compoſite number, the value may be found by calculating what it comes to at one of the component parts, and multiplying the ſame by the other.

Case I. "When the rate is an aliquot part of a "pound, divide the quantity by the number which may "be bought for a pound."

Table of the aliquot parts of L. 1.

10 ſhillings	= $\frac{1}{2}$ of L. 1.	1 ſhilling 4 d.	= $\frac{1}{15}$ of L. 1.
6 s. 8 d.	= $\frac{1}{3}$	1 s. 3 d.	= $\frac{1}{16}$
5 s.	= $\frac{1}{4}$	1 s.	= $\frac{1}{20}$
4 s.	= $\frac{1}{5}$	8 d.	= $\frac{1}{30}$
3 s. 4 d.	= $\frac{1}{6}$	6 d.	= $\frac{1}{40}$
2 s. 6 d.	= $\frac{1}{8}$	4 d.	= $\frac{1}{60}$
2 s.	= $\frac{1}{10}$	3 d.	= $\frac{1}{80}$
1 s. 8 d.	= $\frac{1}{12}$	2 d.	= $\frac{1}{120}$

Ex. 1ſt.] What is the value of 7463 yards, at 4 s?

5)7463
L. 1492 12 s.

2d.] What is the value of 1773 yards, at 3 d?

8|0)177|3
L. 22 3 3

In the firſt example we divide by 5, becauſe 4 s. is $\frac{1}{5}$ of a pound; the quotient 1492 ſhows how many pounds they amount to; beſides which there remains three yards at 4 s. and theſe come to 12 s. In the ſecond example, we divide by 80, as directed, and the quotient gives L. 22, and the remainder 13 yards, which at 3 d. comes to 3 s. and 3 d.

This method can only be uſed in calculating for the particular prices ſpecified in the table. The following 6 caſes comprehend all poſſible rates, and will therefore exhibit different methods of ſolving the foregoing queſtions.

Case II. "When the rate conſiſts of ſhillings only, "multiply the quantity by the number of ſhillings, "and divide the product by 20: Or, if the number "of ſhillings be even, multiply by half the number, "and divide the product by 10.

Ex. 1ſt.] 4573 at 13 s.
13
———
13719
4573
———
20)59449
L. 2972 9 s.

2d.] 7543 at 14 s.
7
———
10)52801
L. 5280 2 s.

The learner will eaſily perceive, that the method in which the ſecond example is wrought, muſt give the ſame anſwer as if the quantity had been multiplied by 14, and divided by 20; and, as the diviſion by 10 doubles the laſt figure for ſhillings, and continues all the reſt unchanged for pounds, we may obtain the anſwer at once, by doubling the right-hand figure of the product before we ſet it down.

If the rate be the ſum of two or more aliquot parts of a pound, we may calculate theſe as directed in Caſe I. and add them. If it be any odd number of ſhillings, we may calculate for the even number next lower, and add thereto the value at a ſhilling. If it be 19 s. we may ſubtract the value at a ſhilling, from the value at a pound.

Case III. "When the rate conſiſts of pence only."

Method 1. If the rate be an aliquot part of a ſhilling, divide the quantity accordingly, which gives the anſwer in ſhillings; if not, it may be divided into two or more aliquot parts: calculate theſe ſeparately, and add the values; reduce the anſwer to pounds.

1 penny is $\frac{1}{12}$ of a ſhilling.
2 d. $\frac{1}{6}$ of ditto.
3 d. $\frac{1}{4}$ of ditto.
4 d. $\frac{1}{3}$ of ditto.
6 d. $\frac{1}{2}$ of ditto.
5 d. is the ſum of 4 d. and 1 d. or of 2 d. and 3 d.
7 d. is the ſum of 4 d. and 3 d. or of 6 d. and 1 d.
8 d. is the ſum of 6 d. and 2 d. or the double of 4 d.
9 d. is the ſum of 6 d. and 3 d.
10 d. is the ſum of 6 d. and 4 d.
11 d. is the ſum of 6 d. 3 d. and 2 d.

Ex. 1ſt.] 7423 at 4 d.
———
3)7423
20)2474 4
L. 123 14 4

Here, becauſe 4 d. is one third of a ſhilling, we divide by 3, which gives the price in ſhills. and reduce theſe by diviſion to pounds.

2d.] 9786 at 9 d.
———
At 6 d. = $\frac{1}{2}$ of 1 s. 4893
At 3 d. = $\frac{1}{2}$ of 6 d. 2446 6
——— ——— ———
At 9 d. 7339 6
L. 366 19 6

Here we ſuppoſe, that firſt 6 d. and then 3 d. is paid for each article; half the quantity is the number of ſhillings which they would coſt at 6 d. each. Half of that is the coſt at 3 d. and theſe added and reduced give the anſwer.

3d.] 4856 at 11 d.
———
At 6d. = $\frac{1}{2}$ of 1s. 2428
At 3d. = $\frac{1}{2}$ of 6d. 1214
At 2d. = $\frac{1}{3}$ of 6d. 809 4
——— ———————
11 d. 4451 4
L. 222 11 4

Here we calculate what the articles would coſt at 6 d. at 3 d. and at 2 d. and add the values.

It is ſometimes eaſier to calculate at two rates, whoſe difference is the rate required, and ſubtract the leſſer value from the greater. Thus, the laſt example may be wrought by ſubtracting the value at a penny from the value at a ſhilling. The remainder muſt be the

Practice.

At $\frac{1}{4}$d. 18141 d.
12)54423 d.
4535 3
L. 226 15 3

We may also find the amount in twopences, threepences, fourpences, or sixpences, by one division, and reduce these as directed in Case I.

CASE V. "When the rate consists of pence and farthings, find the value of the pence, as directed in Case III. and that of the farthings from the proportion which they bear to the pounds. Add these together, and reduce."

Ex. 1st.] 3287 at 5$\frac{1}{4}$d.
At 4 d.=$\frac{1}{3}$ of 1s. 1095 8
At 1 d.=$\frac{1}{4}$ of 4d. 373 11
At 1 f.=$\frac{1}{4}$ of 1d. 68 5$\frac{3}{4}$
At 5$\frac{1}{4}$ 1438 $\frac{3}{4}$
L. 71 18 $\frac{3}{4}$

2d.] 4573 at 2$\frac{3}{4}$d.
At 2 d.=$\frac{1}{6}$ of 1s. 762 2
At $\frac{1}{2}$d.=$\frac{1}{4}$ of 2d. 190 6$\frac{1}{2}$
At $\frac{1}{4}$d.=$\frac{1}{2}$ of $\frac{1}{2}$d. 85 3$\frac{1}{4}$
At 2$\frac{3}{4}$ 1037 11$\frac{3}{4}$
L. 51 17 11$\frac{3}{4}$

3d.] 2842 at 3$\frac{3}{4}$d.
At 3 d.=$\frac{1}{4}$ of 1s. 710 6
At 3 f.=$\frac{1}{4}$ of 3d. 177 7$\frac{1}{2}$
At 3$\frac{3}{4}$d. 887 1$\frac{1}{2}$
L. 44 8 1$\frac{1}{2}$

4th.] 3572 at 7$\frac{1}{2}$d.
At 6 d.=$\frac{1}{2}$ of 1s. 1386
At 1$\frac{1}{2}$d.=$\frac{1}{4}$ of 6d. 346 6
At 7$\frac{1}{2}$d. 1732 6
L. 87 12 6

It is sometimes best to join some of the pence with the farthings in the calculation. Thus, in Ex. 4. we reckon the value at 6d. and at 3 halfpence, which makes 7$\frac{1}{2}$d.

Practice.

If the rate be 1$\frac{1}{2}$d. which is an eighth-part of a shilling, the value is found in shillings, by dividing the quantity by 8.

CASE VI. "When the rate consists of shillings and lower denominations."

Method 1. *Multiply the quantity by the shillings, and find the value of the pence and farthings, if any, from the proportion which they bear to the shillings. Add and reduce.*

Ex. 1st.] 4258 at 17s. 3d.
17
29806
4258
17 s. 72386

The learner should at first try every calculation more ways than one; which will not only serve the purpose of proving the operation, but will render him expert at discovering the best method of solving each question, and will lead him to invent other methods; for we have not exhausted the subject.

Thus, if the number of articles be 20, each shilling of the rate makes a pound of the amount. If it be 12, each penny of the rate makes a shilling of the amount. If 240, each penny of the rate makes a pound of the amount. If 480, each half-penny makes a pound. If 960, each farthing makes a pound. If the number of articles be a mutiple, or an aliquot part of any of these, the amount is easily calculated. And if it be near to any such number, we may calculate for that number, and add or subtract for the difference.

We have hitherto explained the various methods of computation, when the quantity is a whole number, and in one denomination. It remains to give the proper directions when the quantity contains a fraction, or is expressed in several denominations.

When the quantity contains a fraction, work for the integers by the preceding rules, and for the fraction take proportional parts.

When the quantity is expressed in several denominations and the rate given for the higher; calculate the higher, consider the lower ones as fractions, and work by the last rule.

When the rate is given for the lower denomination, reduce the higher denomination to the lower, and calculate accordingly.

Note 1st. 7 lb. 14 lb. and 21 lb. are aliquot parts of 1 qr.: and 16 lb. is $\frac{1}{7}$ of 1 cwt.; and are therefore easily calculated.

2d. If the price of a dozen be so many shillings, that of an article is as many pence; and if the price of a gross be so many shillings, that of a dozen is as many pence.

3d. If the price of a ton or score be so many pounds, that of 1 cwt. or a single article, is as many shillings.
