The quantity and difference of these Equations, as the sign signifies, is increased or diminished in proportion to the mean horary motion of the Moon, which is 32′. 56″, to the horary motion of the Moon in her proper orbit.

SECT. XI. *The method of finding the Longitude by the Eclipses of Jupiter's Satellites; the amazing Velocity of Light demonstrated by these Eclipses; and of Cometary Eclipses.*

IN the former section, having explained at great length how eclipses of the sun and moon happen at certain times, it must be evident, that similar eclipses will be observed by the inhabitants of Jupiter and Saturn, which are attended by so many moons. These eclipses indeed very frequently happen to the satellites of Jupiter; and as they are of the greatest service in determining the longitude of places on this earth, astronomers have been at great pains to calculate tables for the eclipses of these satellites by their primary, for the satellites themselves have never been observed to eclipse one another. The construction of such tables is indeed much easier for these satellites than of any other celestial bodies, as their motions are much more regular.

482 Frequency of these eclipses.

The English tables are calculated for the meridian of Greenwich, and by these it is very easy to find how many degrees of longitude any place is distant either east or west from Greenwich; for, let an observer, who has these tables, with a good telescope and a well-regulated clock at any other place of the earth, observe the beginning or ending of an eclipse of one of Jupiter's satellites, and note the precise moment of time that he saw the satellite either immerge into, or emerge out of the shadow, and compare that time with the time shown by the tables for Greenwich; then 15 degrees difference of longitude being allowed for every hour's difference of time, will give the longitude of that place from Greenwich; and if there be any odd minutes of time, for every minute a quarter of a degree, east or west, must be allowed, as the time of observation is later or earlier than the time shown by the tables. Such eclipses are very convenient for this purpose at land, because they happen almost every day; but are of no use at sea, because the rollings of the ship hinders all nice telescopical observations.

Fig. 177.

To explain this by a figure, let J be Jupiter, K, L, M, N his four satellites in their respective orbits, 1, 2, 3, 4; and let the earth be at F (suppose in November, although that month is no otherwise material than to find the earth readily in this scheme, where it is shown in eight different parts of the orbit). Let Q be a place on the meridian of Greenwich, and R a place on some other meridian eastward from Greenwich. Let a person at R observe the instantaneous vanishing of the first satellite K into Jupiter's shadow, suppose at three o'clock in the morning; but by the tables he finds the immersion of that satellite to be at midnight at Greenwich; he then can immediately determine, that as there are three hours difference of time between Q and K, and that R is three hours forwarder in reckoning than Q, it must be 45 degrees of east longitude from the meridian of Q. Were this method as practicable at sea as at land, any sailor might almost as easily, and with equal certainty, find the longitude as the latitude.

483 When the immersions or emersions are to be observed.

Whilst the earth is going from C to F in its orbit, only the immersions of Jupiter's satellites into his shadow are generally seen; and their emersions out of it while the earth goes from G to B. Indeed, both these appearances may be seen of the second, third, and fourth satellite when eclipsed, whilst the earth is between D and E, or between G and A; but never of the first satellite, on account of the smallness of its orbit and the bulk of Jupiter, except only when Jupiter is directly opposite to the sun, that is, when the earth is at G; and even then, strictly speaking, we cannot see either the immersions or emersions of any of his satellites, because his body being directly between us and his conical shadow, his satellites are hid by his body a few moments before they touch his shadow; and are quite emerged from thence before we can see them, as it were just dropping from him. And when the earth is at C, the sun, being between it and Jupiter, hides both him and his moons from us.

In this diagram, the orbits of Jupiter's moons are drawn in true proportion to his diameter; but in proportion to the earth's orbit, they are drawn vastly too large.

In whatever month of the year Jupiter is in conjunction with the sun, or in opposition to him, in the next year it will be a month later at least. For whilst the earth goes once round the sun, Jupiter describes a twelfth part of his orbit. And therefore, when the earth has finished its annual period, from being in a line with the sun and Jupiter, it must go as much forwarder as Jupiter has moved in that time, to overtake him again; just like the minute-hand of a watch, which must, from any conjunction with the hour-hand, go once round the dial-plate and somewhat above a twelfth part more, to overtake the hour-hand again.

484 Velocity of light.

It is found by observation, that when the earth is between the sun and Jupiter, as at G, his satellites are eclipsed about 8 minutes sooner than they should be according to the tables; and when the earth is at B or C, these eclipses happen about 8 minutes later than the tables predict them. Hence it is undeniably certain, that the motion of light is not instantaneous, since it takes about $16\frac{1}{2}$ minutes of time to go through a space equal to the diameter of the earth's orbit, which is 180,000,000 of miles in length; and consequently the particles of light fly almost 200,000 miles every second of time, which is above a milion of times swifter than the motion of a cannon bullet. And as light is $16\frac{1}{2}$ minutes in travelling across the earth's orbit, it must be $8\frac{1}{4}$ minutes in coming from the sun to us: therefore if the sun were annihilated, we should see him for $8\frac{1}{4}$ minutes after; and if he were again created, he would be $8\frac{1}{4}$ minutes old before we could see him.

Fig. 178.

To illustrate this progressive motion of light, let A and B be the earth in two different parts of its orbit, whose distance from each other is 95,000,000 of miles, equal to the earth's distance from the sun S. It is plain, that if the motion of light were instantaneous, the satellite 1 would appear to enter into Jupiter's shadow FF at the same moment of time to a spectator in A, as to another in B. But by many years observations it has been found, that the immersion of the satellite into the shadow is seen $8\frac{1}{4}$ minutes sooner when the earth is at B than when it is at A. And so, as Mr Romeur first discovered, the motion of light is thereby proved to be progressive, and not instanta-

neous,

Eclipses of Jupiter's Satellites.

neous, as was formerly believed. It is easy to compute in what time the earth moves from A to B; for the chord of 60 degrees of any circle is equal to the semidiameter of that circle: and as the earth goes through all the 360 degrees of its orbit in a year, it goes through 60 of those degrees in about 61 days. Therefore, if on any given day, suppose the first of June, the earth is at A, on the first of August it will be at B; the chord, or straight line AB, being equal to DS the radius of the earth's orbit, the same with AS its distance from the sun.

As the earth moves from D to C, thro' the side AB of its orbit, it is constantly meeting the light of Jupiter's satellites sooner, which occasions an apparent acceleration of their eclipses; and as it moves through the other half H of its orbit, from C to D, it is receding from their light, which occasions an apparent retardation of their eclipses, because their light is then longer before it overtakes the earth.

485 Acceleration of these eclipses not owing to any inequality in the motions of the satellites.

That these accelerations of the immersions of Jupiter's satellites into his shadow, as the earth approaches towards Jupiter, and the retardations of their emersions out of his shadow, as the earth is going from him, are not occasioned by any inequality arising from the motions of the satellites in eccentric orbits, is plain, because it affects them all alike, in whatever parts of their orbits they are eclipsed. Besides, they go often round their orbits every year, and their motions are no way commensurate to the earth's. Therefore, a phenomenon not to be accounted for from the real motions of the satellites, but so easily deducible from the earth's motion, and so answerable thereto, must be allowed to result from it. This affords one very good proof of the earth's annual motion.

486 Eclipses by comets.

From what we have said in general concerning eclipses, it is plain that secondary planets are not the only bodies that may occasion them. The primary planets would eclipse one another, were it not for their great distances; but as the comets are not subject to the same laws with the planets, it is possible they may sometimes approach so near to the primary planets, as to cause an eclipse of the sun to those planets; and as the body of a comet bears a much larger proportion to the bulk of a primary planet than any secondary, it is plain that a cometary eclipse would both be of much longer continuance, and attended with much greater darkness, than that occasioned by a secondary planet. This behoved to be the case at any rate: but if we suppose the primary planet and comet to be moving both the same way, the duration of such an eclipse would be prodigiously lengthened; and thus, instead of four minutes, the sun might be totally darkened to the inhabitants of certain places for as many hours. Hence we may account for that prodigious darkness which we sometimes read of in history at times when no eclipse of the sun by the moon could possibly happen. It is remarkable, however, that no comet hath ever been observed passing over the disk of the sun like a spot, as Venus and Mercury are; yet this must certainly happen, when the comet is in its perihelion, and the earth on the same side of its annual orbit. Such a phenomenon well deserves the watchful attention of astronomers, as it would be a greater confirmation of the planetary nature of comets than any thing hitherto observed.

Astronomical Machinery.

SECT. XII. *A Description of the Astronomical Machinery serving to explain and illustrate the foregoing part of this Treatise.*

The machine represented by fig. 207. is the GRAND ORRERY, first made in this kingdom by Mr Rowley for King George I. The frame of it, which contains the wheel-work, &c. and regulates the whole machine, is made of ebony, and about four feet in diameter; the outside thereof is adorned with 12 pilastres. Between these the 12 signs of the zodiac are neatly painted with gilded frames. Above the frame is a broad ring supported with 12 pillars. This ring represents the plane of the ecliptic; upon which are two circles of degrees, and between these the names and characters of the 12 signs. Near the outside is a circle of months and days, exactly corresponding to the sun's place at noon each day throughout the year. Above the ecliptic stand some of the principal circles of the sphere, agreeable to their respective situations in the heavens: viz. N° 10. are the two colures, divided into degrees and half degrees; N° 11. is one-half of the equinoctial circle, making an angle of $23\frac{1}{2}$ degrees. The tropic of cancer and the arctic circle are each fixed parallel at their proper distance from the equinoctial. On the northern half of the ecliptic is a brass semicircle, moveable upon two points fixed in ♈ and ♎. This semicircle serves as a moveable horizon to be put to any degree of latitude upon the north part of the meridian, and the whole machine may be set to any latitude without disturbing any of the internal motions, by two strong hinges (N° 13.) fixed to the bottom-frame upon which the instrument moves, and a strong brass arch, having holes at every degree, through which a strong pin is put at every elevation. This arch and the two hinges support the whole machine when it is lifted up according to any latitude; and the arch at other times lies conveniently under the bottom-frame. When the machine is set to any latitude (which is easily done by two men, each taking hold of two handles conveniently fixed for the purpose), set the moveable horizon to the same degree upon the meridian, and hence you may form an idea of the respective altitude or depression of the planets both primary and secondary. The sun (N° 1.) stands in the middle of the whole system upon a wire, making an angle with the ecliptic of about 82 degrees. Next the sun is a small ball (2.), representing Mercury. Next to Mercury is Venus (3.), represented by a larger ball. The earth is represented (N° 4.) by an ivory ball, having some circles and a map sketched upon it. The wire which supports the earth makes an angle with the ecliptic of $66\frac{1}{2}$ degrees, the inclination of the earth's axis to the ecliptic. Near the bottom of the earth's axis is a dial-plate (N° 9.), having an index pointing to the hours of the day as the earth turns round its axis. Round the earth is a ring supported by two small pillars, representing the orbit of the moon; and the divisions upon it answer to the moon's latitude. The motion of this ring represents the motion of the moon's orbit according to that of the nodes. Within this ring is the moon (N° 5.), having a black cap or case, by which its motion represents the phases of the moon according to her age. Without the orbits of the

Astronomical Machinery.

the earth and moon is Mars (N° 6.) The next in order to Mars is Jupiter and his four moons (N° 7.) Each of these moons is supported by a wire fixed in a socket which turns about the pillar supporting Jupiter. These satellites may be turned by the hand to any position, and yet when the machine is put into motion they will all move in their proper times. The outermost of all is Saturn, his five moons, and his ring (N° 8.). These moons are supported and contrived similar to those of Jupiter. The machine is put into motion by turning a small winch (N° 14,); and the whole system is also moved by this winch, and by pulling out and pushing in a small cylindrical pin above the handle. When it is pushed in, all the planets, both primary and secondary, will move according to their respective periods by turning the handle. When it is drawn out, the motions of the satellites of Jupiter and Saturn will be stopped while all the rest move without interruption. There is also a brass lamp having two convex glasses to be put in room of the sun; and also a smaller earth and moon, made somewhat in proportion to their distance from each other, which may be put on at pleasure. The lamp turns round at the same time with the earth, and the glasses of it cast a strong light upon her. And when the smaller earth and moon are placed on, it will be easy to show when either of them will be eclipsed. When this machine is intended to be used, the planets must be duly placed by means of an ephemeris hereafter described; and you may place a small black patch or bit of wafer upon the middle of the sun. Right against the first degree of ♈, you may also place patches upon Venus, Mars, and Jupiter, right against some noted point in the ecliptic. Put in the handle, and push in the pin which is above it. One turn of this handle answers to a revolution of the ball which represents the earth about its axis; and consequently to 24 hours of time, as shown by the hour-index (9.), which is marked and placed at the foot of the wire on which the ball of the earth is fixed. Again, when the index has moved the space of ten hours, Jupiter makes one revolution round its axis, and so of the rest. By these means the revolutions of the planets, and their motions round their own axes, will be represented to the eye. By observing the motions of the spots upon the surface of the sun and of the planets in the heavens, their diurnal motion was first discovered, after the same manner as we in this machine observe the motions of their representatives by that of the marks placed upon them.

488 The Orrery (fig. 208.) is a machine contrived by the late ingenious Mr James Ferguson. It shows the motions of the sun, Mercury, Venus, earth, and moon; and occasionally the superior planets, Mars, Jupiter, and Saturn, may be put on. Jupiter's four satellites are moved round him in their proper times by a small winch; and Saturn has his five satellites, and his ring which keeps its parallelism round the sun; and by a lamp put in the sun's place, the ring shows all its various phases already described.

In the centre, N° 1. represents the sun, supported by its axis, inclining almost 8 degrees from the axis of the ecliptic, and turning round in $25\frac{1}{4}$ days on its axis, of which the north pole inclines toward the eighth degree of Pisces in the great ecliptic (N° 11.), whereon the months and days are engraven over the signs and degrees in which the sun appears, as seen from the earth, on the different days of the year.

The nearest planet (N° 2.) to the sun is Mercury, which goes round him in 87 days 23 hours, or $87\frac{23}{24}$ diurnal rotations of the earth; but has no motion round its axis in the machine, because the time of its diurnal motion in the heavens is not known to us.

The next planet in order is Venus (N° 3.), which performs her annual course in 224 days 17 hours, and turns round her axis in 24 days 8 hours, or in $24\frac{1}{3}$ diurnal rotations of the earth. Her axis inclines 75 degrees from the axis of the ecliptic, and her north pole inclines towards the 20th degree of Aquarius, according to the observations of Bianchini. She shows all the phenomena described in Sect. ii.

Next, without the orbit of Venus, is the earth (N° 4.), which turns round its axis, to any fixed point at a great distance, in 23 hours 56 minutes 4 seconds of mean solar time; but from the sun to the sun again, in 24 hours of the same time. N° 6. is a sidereal dial-plate under the earth, and N° 7. a solar dial-plate on the cover of the machine. The index of the former shows sidereal, and of the latter, solar time; and hence the former index gains one entire revolution on the latter every year, as 365 solar or natural days contain 366 sidereal days, or apparent revolutions of the stars. In the time that the earth makes $365\frac{1}{4}$ diurnal rotations on its axis, it goes once round the sun in the plane of the ecliptic; and always keeps opposite to a moving index (N° 10.) which shows the sun's daily change of place, and also the days of the months.

The earth is half covered with a black cap, for dividing the apparently enlightened half next the sun from the other half, which, when turned away from him, is in the dark. The edge of the cap represents the circle bounding light and darkness, and shows at what time the sun rises and sets to all places throughout the year. The earth's axis inclines $23\frac{1}{2}$ degrees from the axis of the ecliptic: the north pole inclines toward the beginning of Cancer, and keeps its parallelism throughout its annual course; so that in summer the northern parts of the earth incline towards the sun, and in winter from him: by which means, the different length of days and nights, and the cause of the various seasons, are demonstrated to sight.

There is a broad horizon, to the upper side of which is fixed a meridian semicircle in the north and south points, graduated on both sides from the horizon to 90° in the zenith or vertical point. The edge of the horizon is graduated from the east and west to the south and north points, and within these divisions are the points of the compass. From the lower side of this thin horizontal plate stand out four small wires, to which is fixed a twilight-circle 18 degrees from the graduated side of the horizon all round. This horizon may be put upon the earth (when the cap is taken away), and rectified to the latitude of any place; and then by a small wire called the *solar ray*, which may be put on so as to proceed directly from the sun's centre towards the earth's, but to come no farther than almost to touch the horizon. The beginnnig of twilight, time of sun-rising, with his amplitude, meridian altitude, time of setting, amplitude then, and end of twilight, are shown for every day of the year, at that place to which the horizon is rectified.

The

Astronomical Machinery.

The moon (N° 5.) goes round the earth, from between it and any fixed point at a great diſtance, in 27 days 7 hours 43 minutes, or through all the ſigns and degrees of her orbit, which is called her *periodical revolution;* but ſhe goes round from the ſun to the ſun again, or from change to change, in 29 days 12 hours 35 minutes, which is her *ſynodical revolution;* and in that time ſhe exhibits all the phaſes already deſcribed.

When the abovementioned horizon is rectified to the latitude of any given place, the times of the moon's riſing and ſetting, together with her amplitude, are ſhown to that place as well as the ſun's; and all the various phenomena of the harveſt-moon are made obvious to ſight.

The moon's orbit (N° 9.) is inclined to the ecliptic (N° 11.), one-half being above and the other below it. The nodes, or points at ☊ and ☋, lie in the plane of the ecliptic, as before deſcribed, and ſhift backward through all its ſines and degrees in 18⅔ years. The degrees of the moon's latitude to the higheſt at NL (north latitude) and loweſt at SL (ſouth latitude), are engraven both ways from her nodes at ☊ and ☋, and as the moon riſes and falls in her orbit according to its inclination, her latitude and diſtance from her nodes are ſhown for every day, having firſt rectified her orbit ſo as to ſet the nodes to their proper places in the ecliptic; and then as they come about at different and almoſt oppoſite times of the year, and then point towards the ſun, all the eclipſes may be ſhown for hundreds of years (without any new rectification), by turning the machinery backward for time paſt, or forward for time to come. At 17 degrees diſtance from each node, on both ſides, is ingraved a ſmall ſun; and at 12 degrees diſtance, a ſmall moon, which ſhow the limits of ſolar and lunar eclipſes; and when, at any change, the moon falls between either of theſe ſuns and the node, the ſun will be eclipſed on the day pointed to by the annual index (N° 10.); and as the moon has then north or ſouth latitude, one may eaſily judge whether that eclipſe will be viſible in the northern or ſouthern hemiſphere: eſpecially as the earth's axis inclines toward the ſun or from him at that time. And when at any full the moon falls between either of the little moon's and node, ſhe will be eclipſed, and the annual-index ſhows the day of that eclipſe. There is a circle of 29½ equal parts (N° 8.) on the cover of the machine, on which an index ſhows the days of the moon's age.

There are two ſemicircles (fig. 216.) fixed to an elliptical ring, which being put like a cap upon the earth, and the forked part F upon the moon, ſhows the tides as the earth turns round within them, and they are led round it by the moon. When the different places come to the ſemicircle A*a*E*b*B, they have tides of flood; and when they come to the ſemicircle CED, they have tides of ebb; the index on the hour-circle (fig. 208.) ſhowing the times of theſe phenomena.

There is a jointed wire, of which one end being put into a hole in the upright ſtem that holds the earth's cap, and the wire laid into a ſmall forked piece which may be occaſionally put upon Venus or Mercury, ſhows the direct and retrograde motions of theſe two planets, with their ſtationary times and places, as ſeen from the earth.

The whole machinery is turned by a winch or handle (N° 12.); and is ſo eaſily moved, that a clock might turn it without any danger of ſtopping.

To give a plate of the wheel-work of this machine would anſwer no purpoſe, becauſe many of the wheels lie ſo behind others as to hide them from ſight in any view whatever.

489 The Planetarium (fig. 209.) is an inſtrument contrived by Mr William Jones of Holburn, London, mathematical inſtrument maker, who has paid conſiderable attention to thoſe ſort of machines, in order to reduce them to their greateſt degree of ſimplicity and perfection. It repreſents, in a general manner, by various parts of its machinery, all the motions and phenomena of the planetary ſyſtem. This machine conſiſts of, the Sun (in the centre), with the planets, Mercury, Venus, the Earth and Moon, Mars, Jupiter and his four moons, Saturn and his five moons; and to it is occaſionally applied an extra long arm for the Georgian planet and his two moons. To the earth and moon is applied a frame CD, containing only four wheels and two pinions, which ſerve to preſerve the earth's axis in its proper paralleliſm in its motion round the ſun, and to give the moon her due revolution about the earth at the ſame time. Theſe wheels are connected with the wheel-work in the round box below, and the whole is ſet in motion by the winch H. The arm M that carries round the moon, points out on the plate C her age and phaſes for any ſituation in her orbit, and which accordingly are engraved thereon. In the ſame manner the arm points out her place in the ecliptic B, in ſigns and degrees, called her geocentric place; that is, as ſeen from the earth. The moon's orbit is repreſented by the flat rim A; the two joints of which, and upon which it turns, denoting her nodes. This orbit is made to incline to any deſired angle. The earth of this inſtrument is uſually made of a three inch or 1½ globe, papered, &c. for the purpoſe; and by means of the terminating wire that goes over it, points out the changes of the ſeaſons, and the different lengths of days and nights more conſpicuouſly. This machine is alſo made to repreſent the Ptolemaic Syſtem, or ſuch as is vulgarly received; which places the earth in the centre, and the planets and ſun revolving about it. (It is done by an auxiliary ſmall ſun and an earth, which change their places in the inſtrument.) At the ſame time, it affords a moſt manifeſt confutation of it: for it is plainly obſerved by this conſtruction, (1.) That the planets Mercury and Venus being both within the orbit of the ſun, cannot at any time be ſeen to go behind it; whereas in nature we obſerve them as often to go behind as before the ſun in the heavens. (2.) It ſhows, that as the planets move in circular orbits about the central earth, they ought at all times to be of the ſame apparent magnitude; whereas, on the contrary, we obſerve their apparent magnitude in the heavens to be very variable, and ſo far different, that, for inſtance, Mars will ſometimes appear as big as Jupiter nearly, and at other times you will ſcarcely know him from a fixed ſtar. (3.) It ſhows that any of the planets might be ſeen at all diſtances from the ſun in the heavens; or, in other words, that when the ſun is ſetting, Mercury or Venus may be ſeen not only in the ſouth but even in the eaſt; which circumſtances were never yet obſerved. (4.) You

Fig. 207 The GRAND ORRERY by Rowley

Astronomical Machinery.

You see by this planetarium that the motions of the planets should always be regular and uniformly the same; whereas on the contrary, we observe them always to move with a variable velocity, sometimes faster, then slower, and sometimes not at all, as will be presently shown. (5.) By the machine you see the planets move all the same way, viz. from west to east continually: but in the heavens we see them move sometimes direct from west to east, sometimes retrograde from east to west, and at other times to be stationary. All which phenomena plainly prove this system to be a false and absurd hypothesis.

The truth of the Copernican or Solar System of the world is hereby most clearly represented. For taking the earth from the *centre*, and placing thereon the usual large brass ball for the sun, and restoring the earth to its proper situation among the planets, then every thing will be right and agree exactly with celestial observations. For turning the winch H, (1.) You will see the planets Mercury and Venus go both before and behind the sun, or have two conjunctions. (2.) You will observe Mercury never to be more than a certain angular distance, 21°, and Venus 47°, from the sun. (3.) That the planets, especially Mars, will be sometimes much nearer to the earth than at others, and therefore must appear larger at one time than at another. (4.) You will see that the planets cannot appear at the earth to move with an uniform velocity; for when nearest they appear to move faster, and slower when most remote. (5.) You will observe the planets will appear at the earth to move sometimes directly from west to east, and then to become retrograde from east to west, and between both to be stationary or without any apparent motion at all. Which particulars all correspond exactly with observations, and fully prove the truth of this excellent system. Fig. 211. represents an apparatus to show these latter particulars more evidently. An hollow wire, with a slit at top, is placed over the arm of the planet Mercury or Venus at E. The arm DG represents a ray of light coming from the planet at D to the earth, and is put over the centre which carries the earth at F. The planets being then put in motion, the planet D, as seen in the heavens from the earth at F, will undergo the several changes of position as above described. The wire prop that is over Mercury at E, may be placed over the other superior planets, Mars, &c. and the same phenomena may be exhibited.

By this machine you at *once* see all the planets in motion about the sun, with the same respective velocities and periods of revolution which they have in the heavens; the wheel-work being calculated to a minute of time, from the latest discoveries.

You will see here a demonstration of the earth's motion about the sun, as well as those of the rest of the planets: for if the earth were to be at rest in the heavens, then the time between any two conjunctions of the same kind, or oppositions, would be the same with the periodical time of the planets, viz. 88 days in Mercury, 225 in Venus, &c.: whereas you here observe this time, instead of being 225 days, is no less than 583 days in Venus, occasioned by the earth's moving in the mean time about the sun the same way with the planet. And this space of 583 days always passes between two like conjunctions of Venus in the heavens. Hence the most important point of astronomy is satisfactorily demonstrated.

The diurnal rotation of the earth about its axis, and a demonstration of the cause of the different seasons of the year, and the different lengths of days and nights, are here answered completely: for as the earth is placed on an axis inclining to that of the ecliptic in an angle of 23½ degrees, and is set in motion by the wheel-work, there will be evidently seen the different inclination of the sun's rays on the earth, the different quantity thereof which falls on a given space, the different quantity of the atmosphere they pass through, and the different continuance of the sun above the horizon at the same place in different times of the year; which particulars constitute the difference betwixt heat and cold in the summer and winter seasons.

As the globe of the earth is moveable about its inclined axis, so by having the horizon of London drawn upon the surface of it, and by means of the terminating wire going over it, by which is denoted, that on that side of the wire next the sun is the enlightened half of the earth, and the opposite side the darkened half, you will here see very naturally represented the cause of the different lengths of day and night, by observing the unequal portions of the circle which the island of Great-Britain, or the city of London, or any other place, describes in the light and dark hemispheres at different times of the year, by turning the earth on its axis with the hand. But in some of the better orreries on this principle, the earth revolves about its axis by wheel-work.

As to the eclipses of the sun and moon, the true causes of them are here very clearly seen: for by placing the lamp (fig. 212,) upon the centre, in room of the brass ball denoting the sun, and turning the winch until the moon comes into a right line betwen the centers of the lamp (or sun) and earth, the shadow of the moon will fall upon the earth, and all who live on that part over which the shadow passes will see the sun eclipsed more or less. On the other side, the moon passes (in the aforesaid case) through the shadow of the earth, and is by that means eclipsed. And the orbit A (fig. 210.) is so moveable on the two joints called nodes, that any person may easily represent the due position of the modes and intermediate spaces of the moon's orbit; and thence show when there will or will not be an eclipse of either luminary, and what the quantity of each will be.

While the moon is continuing to move round the earth, the lamp on the centre will so illumine the moon, that you will easily see all the phases, as new, dichotomized, gibbous, full, waining, &c. just as they appear in the heavens. You will moreover observe all the same phases of the earth as they appear at the moon.

The satellites of Jupiter and Saturn are moveable only by the hand; yet may all their phenomena be easily represented, excepting the true relative motions and distances. Thus, if that gilt globe which before represented the sun be made now to denote Jupiter, and four of the primary planets only be retained, then will the Jovian system be represented; and by candle light only you will see (the machine being in motion) the immersions and emersions of the satellites into and out of Jupiter's shadow. You will see plainly the manner in which they transit his body, and their occultations

Aſtronomical Machinery.

cultations behind it. You will obſerve the various ways in which one or more of theſe moons may at times diſappear. And if the machine be ſet by a white wall, &c. then by the projection of their ſhadows will be ſeen the reaſons why thoſe moons always appear on each ſide of Jupiter in a right line, why thoſe which are moſt remote may appear neareſt, and *è contrario*. And the ſame may be done for Saturn's five moons and his ring.

490 *The Method of Rectifying the Orrery, and the proper Manner of placing the Planets in their true Situations.*

Having dwelled thus much on the deſcription of orreries, it may be uſeful to young readers, to point out the method by which the orrery ſhould be firſt rectified, previous to the exhibition or uſing of it: and the following is extracted from Mr William Jones's deſcription of his new *Portable Orrery*, " The method of ſhowing the places, and relative aſpects of the planets on any day of the year in the planetarium, muſt be done by the aſſiſtance of an *ephemeris* or *almanac*, which among other almanacs is publiſhed annually by the Stationer's Company.

" This ephemeris contains a diary or daily account of the planets places in the heavens, in ſigns, degrees, and minutes, both as they appear to the eye ſuppoſed to be at the ſun, and at the earth, throughout the year. The firſt of theſe poſitions is called the *heliocentric place*, and the latter, the *geocentric place*. The heliocentric place is that made uſe of in orreries; the geocentric place, that in globes. As an example for finding their places, and ſetting them right in the orrery, we will ſuppoſe the ephemeris (by *White*, which for this purpoſe is conſidered the beſt) at hand, wherein at the bottom of the *left-hand* page for every month is the heliocentric longitudes (or places) of all the planets to every ſix days of the month; which is near enough for common uſe: a copy of one of theſe tables for March 1784 is here inſerted for the information of the tyro.

Days	Day increaſ.	Helioc. long. ♄	Helioc. long. ♃	Helioc. long. ♂	Helioc. long. ⊖	Helioc. long. ♀	Helioc. long. ☿
1	3 11	16 ♑ 45	17 ♒ 11	1 ♋ 30	11 ♍ 37	0 ♐ 35	7 ♏ 58
7	3 35	16 56	17 43	4 23	17 37	10 7	25 23
13	3 59	17 7	18 15	7 15	23 36	19 38	11 ♐ 59
19	4 23	17 17	18 47	10 6	29 33	29 8	28 33
25	4 47	17 28	19 19	12 55	5 ♎ 30	8 ♑ 38	15 ♑ 49

Now, as an example, we will ſuppoſe, that in order to ſet the planets of the orrery, we want their heliocentric places for the 21ſt of this month. Looking into the table, we take the 19th day, which is the neareſt to the day wanted: then, accordingly we find the place of Saturn (♄) is in 17° 17′, or 17 degrees (rejecting the minutes, being in this caſe uſeleſs); of Capricornus (♑), of Jupiter (♃), in 18° of Aquarius (♒), Mars (♀) in 10° of Cancer (♋), the earth (⊖), in 29° of Virgo (♍), Venus (♀), in 29° of Sagittarius (♐), Mercury (☿) in 28° of the ſame ſign; and in the ſame manner for any other day therein ſpecified. Upon even this circumſtance depends a very pleaſing aſtronomical praxis, by which the young tyro may at any time be able to entertain himſelf in a moſt rational and agreeable manner, viz. he may in a minute or two repreſent the true appearance of the planetary ſyſtem juſt as it really is in the heavens, and for any day he pleaſes, by aſſigning to each planet its proper place in its orbit; as in the following manner: For the 19th of March, as before, the place of Saturn is in 17° of Capricornus (♑); now, laying hold of the arm of Saturn in the orrery, you place it over or againſt the 17° of Capricorn on the ecliptic circle, conſtantly placed on or ſurrounding the inſtrument: thus doing the ſame for the other planets, they will have their proper heliocentric places for that day.

" Now in this ſituation of the planets, we obſerve, that if a perſon was placed on the earth, he would ſee Venus and Jupiter in the ſame line and place of the ecliptic, conſequently in the heavens they would appear together, or in conjunction; Mercury a little to the left or eaſtward of them, and nearer to the ſun; Saturn to the right, or the weſtward, farther from the Sun; Mars directly oppoſite to Saturn; ſo that when Saturn appears in the weſt, Mars appears in the eaſt, and *vice verſa*. Several other curious and entertaining particulars as depending on the above, may be eaſily repreſented and ſhown by the learner, particularly the foregoing when the winch is turned, and all the planets ſet into their reſpective motions."

We cannot cloſe this detail on orreries more agreeably than by the following account of an inſtrument 491
of that ſort invented by Mr. James Ferguſon, to which he gives the name of a *Mechanical Paradox*, and which is actuated by means of what many, as he obſerves, even good mechanics, would be ready to pronounce impoſſible, viz. That the teeth of one wheel taking equally deep into the teeth of three others, ſhould affect them in ſuch a manner, that in turning it any way round its axis, it ſhould turn one of them the *ſame way*, another the *contrary way*, and the third *no way at all*.

The ſolution of the paradox is given under the article Mechanics; after which, our author proceeds to give the following account of its uſes. " This machine is ſo much of an orrery, as is ſufficient to ſhow the different lengths of days and nights, the viciſſitudes of the ſeaſons, the retrograde motion of the nodes of the moon's orbit, the direct motion of the apogeal point of her orbit, and the months in which the ſun and moon muſt be eclipſed.

" On the great immoveable plate A (ſee fig. 213.) are the months and days of the year, and the ſigns and degrees of the zodiac ſo placed, that when the annual index *h* is brought to any given day of the year, it will point to the degree of the ſign in which the ſun is on that day. This index is fixed to the moveable frame BC,

Astronomical Machinery.

BC, and is carried round the immoveable plate with it, by means of the knob *n*. The carrying this frame and index round the immoveable plate, answers to the earth's annual motion round the sun, and to the sun's apparent motion round the ecliptic in a year.

"The central wheel D (being fixt on the axis *a*, which is fixt in the centre of the immoveable plate) turns the thick wheel E round its own axis by the motion of the frame: and the teeth of the wheel E take into the teeth of the three wheels F, G, H, whose axes turn within one another, like the axes of the hour, minute, and second hands of a clock or watch, where the seconds are shown from the centre of the dial-plate.

"On the upper ends of these axes, are the round plates I, K, L; the plate I being on the axis of the wheel F, K on the axis of G, and L on the axis of H. So that which ever way these wheels are affected, their respective plates, and what they support, must be affected in the same manner; each wheel and plate being independent of the others.

"The two upright wires M and N, are fixed into the plate I; and they support the small ecliptic OP, on which, in the machine, the signs and degrees of the ecliptic are marked. This plate also supports the small terrestrial globe *e* on its inclining axis *f*, which is fixed into the plate near the foot of the wire N. This axis inclines $23\frac{1}{2}$ degrees from a right line, supposed to be perpendicular to the surface of the plate I, and also to the plane of the small ecliptic OP which is parallel to that plate.

"On the earth *e* is the crescent *g*, which goes more than half way round the earth, and stands perpendicular to the plane of the small ecliptic OP, directly facing the sun Z: Its use is to divide the enlightened half of the earth next the sun from the other half which is then in the dark; so that it represents the boundary of light and darkness, and therefore ought to go quite round the earth; but cannot in a machine, because in some positions the earth's axis would fall upon it. The earth may be freely turned round on its axis by hand, within the crescent, which is supported by the crooked wire *w*, fixt to it, and into the upper plate of the moveable frame BC.

"In the plate K are fixed the two upright wires Q and R: they support the moon's inclined orbit ST in its nodes, which are the two opposite points of the moon's orbit where it intersects the ecliptic OP. The ascending node is marked ☊, to which the descending node is opposite below *e*, but hid from view by the globe *e*. The half ☊ T *e* of this orbit is on the north-side of the ecliptic OP, and the other half *e* S ☊ is on the south side of the ecliptic. The moon is not in this machine; but when she is in either of the nodes of her orbit in the heavens, she is then in the plane of the ecliptic: when she is in T in her orbit, she is in her greatest north latitude; and when she is at S, she is in her greatest south latitude.

"In the plate L is fixed the crooked wire UU, which points downward to the small ecliptic OP, and shows the motion of the moon's apogee therein, and its place at any given time.

"The ball Z represents the sun, which is supported by the crooked wire XY, fixt into the upper plate of the frame at X. A straight wire W proceeds from the sun Z, and points always toward the centre of the earth *e*; but toward different points of its surface at different times of the year, on account of the obliquity of its axis, which keeps its parallelism during the earth's annual course round the sun Z; and therefore must incline sometimes toward the sun, at other times from him, and twice in the year neither toward nor from the sun, but sidewise to him. The wire W is called *the solar ray*.

"As the annual-index *h* shows the sun's place in the ecliptic for every day of the year, by turning the frame round the axis of the immoveable plate A, according to the order of the months and signs, the solar ray does the same in the small ecliptic OP: for as this ecliptic has no motion on its axis, its signs and degrees still keep parallel to those on the immoveable plate. At the same time, the nodes of the moon's orbit ST (or points where it intersects the ecliptic OP) are moved backward, or contrary to the order of signs, at the rate of $19\frac{1}{3}$ degrees every Julian year; and the moon's apogeal wire UU is moved forward, or according to the order of the signs of the ecliptic, nearly at the rate of 41 degrees every Julian year; the year being denoted by a revolution of the earth *e* round the sun Z; in which time the annual-index *h* goes round the circles of months and signs on the immoveable plate A.

"Take hold of the knob *n*, and turn the frame round thereby; and in doing this, you will perceive that the north pole of the earth *e* is constantly before the crescent *g*, in the enlightened part of the earth toward the sun, from the 20th of March to the 23d of September; and the south pole all that time behind the crescent in the dark; and from the 23d of September to the 20th of March, the north pole is constantly in the dark behind the crescent, and the south pole in the light before it; which shows, that there is but one day and one night at each pole, in the whole year; and that when it is day at either pole, it is night at the other.

"From the 20th of March to the 23d of September, the days are longer than the nights in all those places of the northern hemisphere of the earth which revolve through the light and dark, and shorter in those of the southern hemisphere. From the 23d of September to the 20th of March the reverse.

"There are 24 meridian semicircles drawn on the globe, all meeting in its poles; and as one rotation or turn of the earth on its axis is performed in 24 hours, each of these meridians is an hour distant from the other, in every parallel of latitude. Therefore, if you bring the annual-index *h* to any given day of the year, on the immoveable plate, you may see how long the day then is at any place of the earth, by counting how many of these meridians are in the light, or before the crescent, in the parallel of latitude of that place; and this number being subtracted from 24 hours, will leave remaining the length of the night. And if you turn the earth round its axis, all those places will pass directly under the point of the solar ray, which the sun passes vertically over on that day, because they are just as many degrees north or south of the equator as the sun's declination is then from the equinoctial.

"At the two equinoxes, viz. on the 20th of March and 23d of September, the sun is in the equinoctial, and

Astronomical Machinery.

and consequently has no declination. On these days, the solar ray points directly toward the equator, the earth's poles lie under the inner edge of the crescent, or boundary of light and darkness; and in every parallel of latitude there are 12 of the meridians or hour circles before the crescent, and 12 behind it; which shows that the days and nights then are each 12 hours long at all places of the earth. And if the earth be turned round its axis, you will see that all places on it go equally through the light and the dark hemispheres.

"On the 21st of of June, the whole space within the north polar circle is enlightened, which is $23\frac{1}{2}$ degrees from the pole, all around; because the earth's axis then inclines $23\frac{1}{2}$ degrees toward the sun: but the whole space within the south polar circle is in the dark; and the solar ray points toward the tropic of Cancer on the earth, which is $23\frac{1}{2}$ degrees north from the equator. On the 20th of December the reverse happens, and the solar ray points toward the tropic of Capricorn, which is $23\frac{1}{2}$ degrees south from the equator.

"If you bring the annual-index *h* to the beginning of January, and turn the moon's orbit ST by its supporting wires Q and R till the ascending node (marked ☊) comes to its place in the ecliptic OP, as found by an ephemeris, or by astronomical tables, for the beginning of any given year; and then move the annual-index by means of the knob *n*, till the index comes to any given day of the year afterward, the nodes will stand against their places in the ecliptic on that day; and if you move on the index till either of the nodes comes directly against the point of the solar ray, the index will then be at the day of the year on which the sun is in the conjunction with that node. At the times of those new moons which happen within seventeen days of the conjunction of the sun with either of the nodes, the sun will be eclipsed: and at the times of those full moons, which happen within twelve days of either of these conjunctions, the moon will be eclipsed. Without these limits there can be no eclipses either of the sun or moon; because, in nature, the moon's latitude or declination from the ecliptic is too great for the moon's shadow to fall on any part of the earth, or for the earth's shadow to touch the moon.

"Bring the annual-index to the beginning of January, and set the moon's apogeal wire UU to its place in the ecliptic for that time, as found by astronomical tables; then move the index forward to any given day of the year, and the wire will point on the small ecliptic to the place of the moon's apogee for that time.

"The earth's axis *f* inclines always toward the beginning of the sign Cancer on the small ecliptic OP. And if you set either of the moon's nodes, and her apogeal wire to the beginning of that sign, and turn the plate A about, until the earth's axis inclines toward any side of the room (suppose the north side), and then move the annual-index round and round the immoveable plate A, according to the order of the months and signs upon it, you will see that the earth's axis and beginning of Cancer will still keep toward the same side of the room, without the least deviation from it; but the nodes of the moon's orbit ST will turn progressively towards all the sides of the room, contrary to the order of signs in the small ecliptic OP, or from east, by south, to west, and so on; and the apogeal wire UU, will turn the contrary way to the motion of the nodes, or according to the order of the signs in the small ecliptic, from west, by south, to east, and so on quite round. A clear proof that the wheel F, which governs the earth's axis and the small ecliptic, does not turn any way round its own centre; that the wheel G, which governs the moon's orbit OP, turns round its own centre backward, or contrary both to the motion of the frame BC and thick wheel E; and that the wheel H, which governs the moon's apogeal wire UU, turns round its own centre forward, or in direction both of the motion of the frame and of the thick wheel E, by which the three wheels F, G, and H, are affected.

The wheels D, E, and F, have each 39 teeth in the machine; the wheel G has 37, and H 44.

"The parallelism of the earth's axis is perfect in this machine; the motion of the apogee very nearly so; the motion of the nodes not quite so near the truth, though they will not vary sensibly therefrom in one year. But they cannot be brought nearer, unless larger wheels, with higher numbers of teeth, are used.

In nature, the moon's apogee goes quite round the ecliptic in eight years and 312 days, in direction of the earth's annual motion; and the nodes go round the ecliptic, in a contrary direction, in 18 years and 225 days. In the machine, the apogee goes round the ecliptic OP in eight years and four-fifths of a year, and the nodes in eighteen years and a half."

The Cometarium, (fig. 216.) This curious machine shows the motion of a comet or eccentric body moving round the sun, describing equal areas in equal times, and may be so contrived as to show such a motion for any degree of eccentricity. It was invented by the late Dr Desaguliers. 402

The dark elliptical groove round the letters *a b c d e f g h i k l m* is the orbit of the comet Y; this comet is carried round in the groove according to the order of letters, by the wire W fixed in the sun S, and slides on the wire as it approaches nearer to or recedes farther from the sun, being nearest of all in the perihelion *a*, and farthest in the aphelion *g*. The areas, *a* S *b*, *b* S *c*, *c* S *d*, &c. or contents of these several triangles, are all equal; and in every turn of the winch N, the comet Y is carried over one of these areas; consequently, in as much time as it moves from *f* to *g*, or from *g* to *h*, it moves from *m* to *a*, or from *a* to *b*; and so of the rest, being quickest of all at *a*, and slowest at *g*. Thus the comet's velocity in its orbit continually decreases from the perihelion *a* to the aphelion *g*; and increases in the same proportion from *g* to *a*.

The elliptic orbit is divided into 12 equal parts or signs, with their respective degrees, and so is the circle *n o p q r s t u*, which represents a great circle in the heavens, and to which the comet's motion is referred by a small knob on the point of the wire W. Whilst the comet moves from *f* to *g* in its orbit, it appears to move only about five degrees in this circle, as is shown by the small knob on the end of the wire W; but in as short time as the comet moves from *m* to *a*, or from *a* to *b*, it appears to describe the large space *t n* or *n o* in the heavens, either of which spaces contains

Astronomical Machinery.

tains 120 degrees, or four signs. Were the eccentricity of its orbit greater, the greater still would be the difference of its motion, and *vice versa*.

ABCDEFGHIKLM is a circular orbit for showing the equable motion of a body round the sun S, describing equal areas ASB, BSC, &c. in equal times with those of the body Y in its elliptical orbit abovementioned; but with this difference, that the circular motion describes the equal arcs AB, BC, &c. in the same equal times that the elliptical motion describes the unequal arcs, *a b*, *bc*, &c.

Now, suppose the two bodies Y and 1 to start from the points *a* and A at the same moment of time, and, each having gone round its respective orbit, to arrive at these points again at the same instant, the body Y will be forwarder in its orbit than the body 1 all the way from *a* to *g*, and from A to G: but 1 will be forwarder than Y through all the other half of the orbit; and the difference is equal to the equation of the body Y in its orbit. At the points *a* A, and *g* G, that is, that in the perihelion and aphelion they will be equal; and then the equation vanishes. This shows why the equation of a body moving in an elliptic orbit, is added to the mean or supposed circular motion from the perihelion to the aphelion, and subtracted from the aphelion to the perihelion, in bodies moving round the sun, or from the perigee to the apogee, and from the apogee to the perigee in the moon's motion round the earth.

This motion is performed in the following manner by the machine, fig. 217. ABC is a wooden bar (in the box containing the wheel-work), above which are the wheels D and E, and below it the elliptic plates FF and GG; each plate being fixed on an axis in one of its focuses, at E and K: and the wheel E is fixed on the same axis with the plate FF. These plates have grooves round their edges precisely of equal diameters to one another, and in these grooves is the cat-gut string *g g*, *g g* crossing between the plates at *h*. On H, the axis of the handle or winch N in fig. 216, is an endless screw in fig. 217. working in the wheels D and E, whose numbers of teeth being equal, and should be equal to the number of lines *a* S, *b* S, *c* S, &c. in fig. 216, they turn round their axes in equal times to one another, and to the motion of the elliptic plates. For, the wheels D and E having equal numbers of teeth, the plate FF being fixed on the same axis with the wheel E, and turning the equally big plate GG by a cat-gut string round them both, they must all go round their axes in as many turns of the handle N as either of the wheels has teeth.

It is easy to see, that the end of *h* of the elliptical plate FF being farther from its axis E than the opposite end I is, must describe a circle so much the larger in proportion, and therefore move through so much more space in the same time; and for that reason the end *h* moves so much faster than the end I, although it goes no sooner round the centre E. But then the quick-moving end *h* of the plate FF leads about the short end *h* K of the plate GG with the same velocity; and the slow-moving end I of the plate FF coming half round as to B, must then lead the long end *k* of the plate GG as slowly about: so that the elliptical plate FF and its axis E move uniformly and equally quick in every part of its revolution; but the elliptical plate GG, together with its axis K, must move very unequally in different parts of its revolution; the difference being always inversely as the distance of any point of the circumference of GG from its axis at K: or in other words, to instance in two points, if the distance K *k* be four, five, or six times as great as the distance K *h*, the point *h* will move in that position, four, five, or six times as fast as the point *k* does, when the plate GG has gone half round; and so on for any other eccentricity or difference of the distances K *k* and K *h*. The tooth I on the plate FF falls in between the two teeth at *k* on the plate GG; by which means the revolution of the latter is so adjusted to that of the former, that they can never vary from one another.

On the top of the axis of the equally moving-wheel D in fig. 217. is the sun S in fig. 216.; which sun, by the wire fixed to it, carries the ball 1 round the circle ABCD, &c. with an equable motion, according to the order of the letters: and on the top of the axis K of the unequally-moving ellipsis GG, in fig. 217. is the sun S in fig. 216. carrying the ball Y unequally round in the elliptical groove *a b c d*, &c. *N. B.* This elliptical groove must be precisely equal and similar to the verge of the plate GG, which is also equal to that of FF.

In this manner machines may be made to show the true motion of the moon about the earth, or of any planet about the sun, by making the elliptical plates of the same eccentricities, in proportion to the radius, as the orbits of the planets are, whose motions they represent; and so their different equations in different parts of their orbits may be made plain to sight, and clearer ideas of these motions and equations acquired in half an hour, than could be gained from reading half a day about such motions and equations.

The Improved Celestial Globe, fig. 187. On the north pole of the axis, above the hour-circle, is fixed an arch MKH of $23\frac{1}{2}$ degrees; and at the end H is fixed an upright pin HG, which stands directly over the north pole of the ecliptic, and perpendicular to that part of the surface of the globe. On this pin are two moveable collets at D and H, to which are fixed the quadrantile wires N and O, having two little balls on their ends for the sun and moon, as in the figure. The collet D is fixed to the circular plate F, whereon the $29\frac{1}{2}$ days of the moon's age are engraven, beginning just under the sun's wire N; and as this wire is moved round the globe, the plate F turns round with it. These wires are easily turned, if the screw G be slackened: and when they are set to their proper places, the screw serves to fix them there, so as in turning the ball of the globe, the wires with the sun and moon go round with it; and these two little balls rise and set at the same times, and on the same points of the horizon, for the day to which they are rectified, as the soon and moon do in the heavens. 493

Because the moon keeps not her course in the ecliptic (as the sun appears to do), but has a declination of $5\frac{1}{3}$ degrees on each side from it in every lunation, her ball may be screwed as many degrees to either side of the ecliptic as her latitude or declination from the ecliptic amounts to at any given time.

The horizon is supported by two semicircular arches, because pillars would stop the progress of the balls

Astronomical Machinery.

balls when they go below the horizon in an oblique sphere.

To rectify this globe. Elevate the pole to the latitude of the place; then bring the sun's place in the ecliptic for the given day to the brazen meridian, and set the hour-index to 12 at noon, that is, to the upper 12 on the hour-circle; keeping the globe in that situation, slacken the screw G, and set the sun directly over his place on the meridian; which done set the moon's wire under the number that expresses her age for that day on the plate F, and she will then stand over her place in the ecliptic, and show what constellation she is in. Lastly, fasten the screw G, and adjust the moon to her latitude, and the globe will be rectified.

Having thus rectified the globe, turn it round, and observe on what points of the horizon the sun and moon balls rise and set, for these agree with the points of the compass on which the sun and moon rise and set in the heavens on the given day: and the hour-index shows the times of their rising and setting; and likewise the time of the moon's passing over the meridian.

This simple apparatus shows all the varieties that can happen in the rising and setting of the sun and moon: and makes the forementioned phenomena of the harvest moon plain to the eye. It is also very useful in reading lectures on the globes, because a large company can see this sun and moon go round, rising above and setting below the horizon at different times, according to the seasons of the year; and making their appulses to different fixed stars. But in the usual way, where there is only the places of the sun and moon in the ecliptic to keep the eye upon, they are easily lost sight of, unless they be covered with patches.

494 The Trajectorium Lunare, fig. 208. This machine is for delineating the paths of the earth and moon, showing what sort of curves they make in the etherial regions. S is the sun, and E the earth, whose centres are 95 inches distant from each other; every inch answering to 1,000,000 of miles. M is the moon, whose centre is $\frac{24}{100}$ parts of an inch from the earth's in this machine, this being in just proportion to the moon's distance from the earth. AA is a bar of wood, to be moved by hand round the axis g which is fixed in the wheel Y. The circumference of this wheel is to the circumference of the small wheel L (below the other end of the bar) as 365¼ days is to 29½, or as a year is to a lunation. The wheels are grooved round their edges, and in the grooves is the cat-gut string GG crossing between the wheels at X. On the axis of the wheel L is the index F, in which is fixed the moon's axis M for carrying her round the earth E (fixed on the axis of the wheel L in the time that the index goes round a circle of 29½ equal parts, which are the days of the moon's age. The wheel Y has the months and days of the year all round its limb; and in the bar AA is fixed the index l, which points out the days of the months answering to the days of the moon's age, shown by the index F, in the circle of 29½ equal parts at the other end of the bar. On the axis of the wheel L is put the piece D, below the cock C, in which this axis turns round; and in D are put the pencils e and m directly under the earth E and moon M; so that m is carried round e as M is round E

Lay the machine on an even floor, pressing gently on the wheel Y, to cause its spiked feet (of which two appear at P and P, the third being supposed to be hid from sight by the wheel) enter a little into the floor to secure the wheel from turning. Then lay a paper about four feet long under the pencils e and m, crosswise to the bar; which done, move the bar slowly round the axis g of the wheel Y; and as the earth E goes round the sun S, the moon M will go round the earth with a duly proportioned velocity; and the friction wheel W running on the floor, will keep the bar from bearing too heavily on the pencils e and m, which will delineate the paths of the earth and moon. As the index I points out the days of the months, the index F shows the moon's age on these days, in the circle of 29½ equal parts. And as this last index points to the different days in its circle, the like numeral figures may be set to those parts of the curves of the earth's path and moon's, where the pencils e and m are at those times respectively, to show the places of the earth and moon. If the pencil e be pushed a very little off, as if from the pencil m, to about $\frac{1}{40}$ part of their distance, and the pencil m pushed as much towards e, to bring them to the same distances again, though not to the same points of space; then, as m goes round e, e will go as it were round the centre of gravity between the earth e and moon m; but this motion will not sensibly alter the figure of the earth's path or the moon's.

If a pin, as p, be put through the pencil m, with its head, towards that of the pin q in the pencil e, its head will always keep thereto as m goes round e, or as the same side of the moon is still obverted to the earth. But the pin p, which may be considered as an equatorial diameter of the moon, will turn quite round the point m, making all possible angles with the line of its progress, or line of the moon's path. This is an occular proof of the moon's turning round her axis.

Sect. XIII. *A Description of the principal astronomical Instruments by which Astronomers make their most accurate Observations.*

By practical astronomy is implied the knowledge of observing the celestial bodies with respect to their position and time of the year, and of deducing from those observations certain conclusions useful in calculating the time when any proposed position of these bodies shall happen. 495

For this purpose, it is necessary to have a room or place conveniently situated, suitably contrived, and furnished with proper astronomical instruments. It should have an uninterrupted view from the zenith down to (or even below) the horizon, at least towards its cardinal points: and for this purpose, that part of the roof which lies in the direction of the meridian in particular, should have moveable covers, which may easily be moved and put on again; by which means an instrument may be directed to any point of the heavens between the horizon and the zenith, as well to the northward as southward.

This place, called an Observatory, should contain some, if not all, of the following instruments.

I. A Pendulum Clock, for showing equal time. 496 This

This should show time in hours, minutes, and seconds; and with which the observer, by hearing the beats of the pendulum, may count them by his ear, while his eye is employed on the motion of the celestial object he is observing. Just before the object arrives at the position described, the observer should look on the clock and remark the time, suppose it 9 hours 15 minutes 25 seconds; then saying, 25, 26, 27, 28, &c. responsive to the beat of the pendulum, till he sees through the instrument the object arrived at the position expected; which suppose to happen when he says 38, he then writes down 9 h. 15 min. 38 sec. for the time of observation, annexing the year and the day of the month. If two persons are concerned in making the observation, one may read the time audibly while the other observes through the instrument, the observer repeating the last second read when the desired position happens.

II. An Achromatic Refracting Telescope, or a Reflecting one, of two feet at least in length, for observing particular phenomena. These instruments are particularly described under Optics.

III. A Micrometer, for measuring small angular distances. See Micrometer.

IV. Astronomical Quadrants, both mural and portable, for observing meridian and other altitudes of the celestial bodies.

497 1. The *Mural Quadrant* is in the form of a quarter of a circle, contained under two radii at right angles to one another, and an arch equal to one-fourth part of the circumference of the circle. It is the most useful and valuable of all the astronomical instruments; and as it is sometimes fixed to the side of a stone or brick wall, and the plane of it erected exactly in the plane of the meridian, it in this case receives the name of *mural quadrant or arch*.

Tycho Brache was the first person who contrived this mural arch, viz. who first applied it to a wall; and Mr Flamstead, the first in England who with indefatigable pains fixed one up in the royal observatory at Greenwich.

These instruments have usually been made from five to eight feet radius, and executed by those late celebrated artists, Sisson, Graham, Bird, and other eminent mathematical instrument makers now in London. The construction of them being generally the same in all the sizes, we shall here describe one made by the late Jon. Sisson, under the direction of the late M. Graham. Fig. 214. represents the instrument as already fixed to the wall. It is of copper, and of about 5 feet radius. The frame is formed of flat bars, and strengthened by edge bars affixed underneath perpendicularly to them. The radii HB, HA, being divided each into four equal parts, serve to find out the points D and E, by which the quadrant is freely suspended on its props or iron supports that are fastened securely in the wall.

One of the supports E is represented separately in *e* on one side of the quadrant. It is moveable by means of a long slender rod EF or *ef*, which goes into a hollow screw in order to restore the instrument to its situation when it is discovered to be a little deranged. This may be known by the very fine perpendicular thread HA, which ought always to coincide with the same point A of the limb, and carefully examined to be so by a small magnifying telescope at every observation. In order to prevent the unsteadiness of so great a machine, there should be placed behind the limb four copper ears with double cocks I, K, I, K. There are others along the radii HA and HB. Each of these cocks contains two screws, into which is fastened the ears that are fixed behind the quadrant.

Over the wall or stone which supports the instrument, and at the same height as the centre is placed horizontally the axis PO, which is perpendicular to the plane of the instrument, and which would pass through the centre if it was continued. This axis turns on two pivots P. On this axis is fixed at right angles another branch ON, loaded at its extremity with a weight N capable of equipoising with its weight that of the telescope LM; whilst the axis, by its extremity nearest the quadrant, carries the wooden frame PRM, which is fastened to the telescope in M. The counterpoise takes off from the observer the weight of the telescope when he raises it, and hinders him from either forcing or straining the instrument.

The lower extremity (V) of the telescope is furnished with two small wheels, which take the limb of the quadrant on its two sides. The telescope hardly bears any more upon the limb than the small friction of these two wheels; which renders its motion so extremely easy and pleasant, that by giving it with the hand only a small motion, the telescope will run of itself over a great part of the limb, balanced by the counterpoise N.

When the telescope is to be stopped at a certain position, the copper hand T is to be made use of, which embraces the limb and springs at the bottom. It is fixed by setting a screw, which fastens it to the limb. Then, in turning the regulating screw, the telescope will be advanced; which is continued until the star or other object whose altitude is observing to be on the horizontal fine thread in the telescope. Then on the plate X supporting the telescope, and carrying a vernier or nonius, will be seen the number of degrees and minutes, and even quarter of minutes, that the angular height of the object observed is equal to. The remainder is easily estimated within two or three seconds nearly.

There are several methods of subdividing the divisions of a mural quadrant, which are usually from five to ten minutes each; but that which is most commonly adopted is by the vernier or nonius, the contrivance of Peter Vernier a Frenchman. This vernier consists of a piece of copper or brass, CDAB (fig. 215.), which is a small portion of X (fig. 214.), represented separately. The length CD is divided into 20 equal parts, and placed contiguously on a portion of the division of the limb of the quadrant containing 21 divisions, and thereby dividing this length into 20 equal parts. Thus the first division of the vernier piece marked 15, beginning at the point D, is a little matter backward, or to the left of the first division of the limb, equal to 15″. The second division of the vernier is to the left of the second division of the limb double of the first difference, or 30″; and so on unto the twentieth and last division on the left of the vernier piece; where the 20 differences being accumulated each of the twentieth part of the division of the limb, this last division will

 be

be found to agree exactly with the 21st division on the limb of the quadrant.

The index must be pushed the 20th part of a division, or 15″, to the right; for to make the second division on the vernier coincide with one of the divisions of the limb, in like manner is moving two-twentieths, or 30″, we must look at the second division of the index, and there will be a coincidence with a division of the limb. Thus may be conceived that the beginning D of the Vernier, which is always the line of reckoning, has advanced two divisions, or 30″, to the right, when the second division, marked 30 on the vernier, is seen to correspond exactly with one of the lines of the quadrant.

By means of this vernier may be readily distinguished the exactitude of 15″ of the limb of a quadrant five feet radius, and simply divided into 5′. By an estimation by the eye, afterwards the accuracy of two or three seconds may be easily judged. On the side of the quadrant is placed the plate of copper which carries the telescope. This plate carries two verniers. The outer line CD divides five minutes into 20 parts, or 15″ each. The interior line AB answers to the parts of another division not having 90°, but 96 parts of the quadrant. It is usually adopted by English astronomers on account of the facility of its subdivisions. Each of the 96 portions of the quadrant is equivalent to 56′ 15″ of the usual divisions. It is divided on the limb into 16 parts, and the arch of the vernier AB contains 25 of these divisions; and being divided itself into 24, immediately gives parts, the value of each of which is 8″ 47½‴. From this mode a table of reduction may easily be constructed, which will serve to find the value of this second mode of dividing in degrees, minutes, and seconds, reckoning in the usual manner, and to have even the advantage of two different modes; which makes an excellent verification of the divisions on the limb of the quadrant and observed heights by the vernier.

498 2. *The Portable Astronomical Quadrant*, is that instrument of all others which astronomers make the greatest use of, and have the most esteem for. They are generally made from 12 to 23 inches. Fig. 219. is a representation of the improved modern one as made by the late Mr Sisson and by the present mathematical instrument makers. This is capable of being carried to any part of the world, and put up for observation in an easy and accurate manner. It is made of brass, and strongly framed together by crossed perpendicular bars. The arch AC, and the telescope EF, are divided and constructed in a similar manner to the mural quadrant, but generally without the division of 96 parts. The counterpoise to the telescope T is represented at P, and also another counterpoise to the quadrant itself at P. The quadrant is fixed to a long axis, which goes into the pillar KR. Upon this axis is fixed an index, which points to, and subdivides by a vernier the divisions of the azimuth circle K. This azimuth circle is extremely useful for taking the azimuth of a celestial body at the same time its altitude is observed. The upper end of the axis is firmly connected with the adjusting frame GH; and the pillar is supported on the crossed feet at the bottom of the pillar KR with the adjusting screws *a*, *b*, *c*, *d*.

When this instrument is set up for use or observation, it is necessary that two adjustments be very accurately made: One, that the plane or surface of the instrument be truly perpendicular to the horizon; the other that the line supposed to be drawn from the centre to the first line of the limb, be truly on a level or parallel with the horizon. The first of these particulars is done by means of the thread and plummet *p*; the thread of which is usually of very fine silver wire, and it is placed opposite to a mark made upon the end of the limb of the instrument. The four screws at the foot, *a*, *b*, *c*, *d*, are to be turned until a perfect coincidence is observed of the thread upon the mark, which is accurately observed by means of a small telescope T, that fits on the limb. The other adjustment is effected by means of the spirit-level L, which applies on the frame GH, and the small screws turned as before until the bubble of air in the level settles in the middle of the tube. The dotted tube EB is a kind of prover to the instrument; for by observing at what mark the centre of it appears against, or by putting up a mark against it, it will at any time discover if the instrument has been displaced. The screw S at the index, is the regulating or adjusting screw, to move the telescope and index, during the observation, with the utmost nicety.

V. ASTRONOMICAL *or* EQUATORIAL SECTOR. 499
This is an instrument for finding the difference in right ascension and declination between two objects, the distance of which is too great to be observed by the micrometer. It was the invention of the late ingenious Mr George Graham, F. R. S. and is constructed from the following particulars. Let AB (fig. 32.) represent an arch of a circle containing 10 or 12 degrees well divided, having a strong plate CD for its radius, fixed to the middle of the arch at D: let this radius be applied to the side of an axis H F I, and be moveable about a joint fixed to it at F, so that the plane of the sector may be always parallel to the axis HI; which being parallel to the axis of the earth, the plane of the sector will always be parallel to the plane of some hour-circle. Let a telescope CE be moveable about the centre C of the arch AB, from one end of it to the other, by turning a screw at G; and let the line of sight be parallel to the plane of the sector. Now, by turning the whole instrument about the axis HI, till the plane of it be successively directed, first to one of the stars and then to another, it is easy to move the sector about the joint F, into such a position, that the arch AB, when fixed, shall take in both the stars in their passage, by the plane of it, provided the difference of the declinations does not exceed the arch AB. Then, having fixed the plane of the sector a little to the westward of both the stars, move the telescope CE by the screw G; and observe by a clock the time of each transit over the cross hairs, and also the degrees and minutes upon the arch AB, cut by the index at each transit; then in the difference of the arches the difference of the declinations, and by the difference of the times, we have the difference of the right ascensions of the stars.

The dimensions of this instrument are these: The length of the telescope, or the radius of the sector, is 2½ feet; the breadth of the radius, near the end C, is 1¼ inch; and at the end D two inches. The breadth of the limb AB is 1½ inch; and its length six

Thackara & Vallance sculp.

six inches, containing ten degrees divided into quarters and numbered from either end to the other. The telescope carries a nonius or subdividing plate, whose length, being equal to sixteen quarters of a degree, is divided into fifteen equal parts; which, in effect, divides the limb into minutes, and, by estimation, into smaller parts. The length of the square axis HIF is eighteen inches, and of the part HI twelve inches; and its thickness is about a quarter of an inch: the diameters of the circles are each five inches: the thickness of the plates, and the other measures, may be taken at the direction of a workman.

This instrument may be rectified, for making observations, in this manner: By placing the intersection of the cross hairs at the same distance from the plane of the sector, as the centre of the object-glass, the plane described by the line of sight during the circular motion of the telescope upon the limb, will be sufficiently true, or free from conical curvity; which may be examined by suspending a long plumb-line at a convenient distance from the instrument; and by fixing the plane of the sector in a vertical position, and then by observing, while the telescope is moved by the screw along the limb, whether the cross hairs appear to move along the plumb-line.

The axis *hfo* may be elevated nearly parallel to the axis of the earth, by means of a small common quadrant; and its error may be corrected, by making the line of sight follow the circular motion of any of the circumpolar stars, while the whole instrument is moved about its axis *hfo*, the telescope being fixed to the limb: for this purpose, let the telescope *kl* be directed to the star *a*, when it passes over the highest point of its diurnal circle, and let the division cut by the nonius be then noted; then, after twelve hours, when the star comes to the lowest point of its circle, having turned the instrument half round its axis, to bring the telescope into the position *mn*; if the cross hairs cover the same star supposed at *b*, the elevation of the axis *hfo* is exactly right; but if it be necessary to move the telescope into the position *uv*, in order to point to this star at *c*, the arch *mu*, which measures the angle *mfu*, or *bfc*, will be known; and then the axis *hfo* must be depressed half the quantity of this given angle if the star passed below *b*, or must be raised so much higher if above it; and then the trial must be repeated till the true elevation of the axis be obtained. By making the like observations upon the same star on each side the pole, in the six-o'clock-hour-circle, the error of the axis, toward the east or west may also be found and corrected, till the cross hairs follow the star quite round the pole: for supposing *aopbc* to be an arch of the meridian (or in the second practice of the six-o'clock-hour-circle), make the angle *afp* equal to half the angle *afc*, and the line *fp* will point to the pole; and the angle *ofp*, which is the error of the axis, will be equal to half the angle *bfc* or *mfu*, found by the observation; because the difference of the two angles *afb*, *afc*, is double the difference of their halves *afo* and *afp*. Unless the star be very near the pole, allowance must be made by refractions.

VI. Transit and Equal Altitude Instruments.

500 1. *The Transit Instrument* is used for observing objects as they pass over the meridian. It consists of a telescope fixed at right angles to an horizontal axis; which axis must be supported that what is called the line of collimation, or line of sight of the telescope, may move in the plane of the meridian. This instrument was first made by the celebrated Mr Romeur in the year 1689, and has since received great improvements. It is made of various sizes, and of large dimensions in our great observatories; but the following is one of a size sufficiently large and accurate for all the useful purposes.

The axis AB (fig. 220.), to which the middle of the telescope is fixed, is about $2\frac{1}{2}$ feet long, tapering gradually towards its ends, which terminate in cylinders well turned and smoothed. The telescope CD which is about four feet long and $1\frac{1}{4}$ inch diameter, is connected with the axis by means of a strong cube or die G, and in which the two cones MQ, forming the axis are fixed. This cube or stock G serves as the principal part of the whole machine. It not only keeps together the two cones, but holds the two sockets KH, of 15 inches length, for the two telescopic tubes. Each of these sockets has a square base, and is fixed to the cube by four screws. These sockets are cut down in the sides about eight inches, to admit more easily the tube of the telescope; but when the tube is inserted, it is kept in firm by screwing up the tightening screws at the end of the sockets at K and H. These two sockets are very useful in keeping the telescope in its greatest possible degree of steadiness. They also afford a better opportunity of balancing the telescope and rectifying its vertical thread, than by any other means.

In order to direct the telescope to the given height that a star would be observed at, there is fixed a semicircle AN on one of the supporters, of about $8\frac{1}{2}$ inches diameter, and divided into degrees. The index is fixed on the axis, at the end of which is a vernier, which subdivides the degrees into 12 parts or five minutes. This index is moveable on the axis, and may be closely applied to the divisions by means of a tightening screw.

Two upright posts of wood or stone YY, firmly fixed at a proper distance, are to sustain the supporters of this instrument. These supporters are two thick brass plates RR, having well smoothed angular notches in their upper ends, to receive the cylindrical arms of the axis. Each of these notched plates is contrived to be moveable by a screw which slides them upon the surfaces of two other plates immoveably fixed upon the two upright pillars; one plate moving in an horizontal, and the other in a vertical, direction; or, which is more simple, these two modes are sometimes applied only on one side, as at V and P, the horizontal motion by the screw P, and the vertical by the screw V. These two motions serve to adjust the telescope to the planes of the horizon and meridian: to the plane of the horizon by the spirit-level EF, hung by DC on the axis MQ, in a parallel direction; and to the plane of the meridian in the following manner:

Observe by the clock when a circumpolar star seen through this instrument transits both above and below the pole; and if the times of describing the eastern and western parts of its circuit are equal, the telescope is then in the plane of the meridian: otherwise the screw P must be gently turned that it may move the telescope

ſcope ſo much that the time of the ſtar's revolution be biſected by both the upper and lower tranſits, taking care at the ſame time that the axis remains perfectly horizontal. When the teleſcope is thus adjuſted, a mark muſt be ſet at a conſiderable diſtance (the greater the better) in the horizontal direction of the interſection of the croſs wires, and in a place where it can be illuminated in the night-time by a lanthorn hanging near it; which mark being on a fixed object, will ſerve at all times afterwards to examine the poſition of the teleſcope by, the axis of the inſtrument being firſt adjuſted by means of the level.

501 *To adjuſt the Clock by the Sun's Tranſit over the Meridian.* Note the times by the clock when the preceding and following edges of the ſun's limb touch the croſs-wires. The difference between the middle time and 12 hours, ſhows how much the mean, or time by the clock, is faſter or ſlower than the apparent, or ſolar time, for that day; to which the equation of time being applied, will ſhow the time of mean noon for that day, by which the clock may be adjuſted.

502 2. *The Equal Altitude Inſtrument* is an inſtrument that is uſed to obſerve a celeſtial object when it has the ſame altitude on both the eaſt and weſt ſides of the meridian, or in the morning and afternoon. It principally conſiſts of a teleſcope about 30 inches long fixed to a ſextantal or ſemicircular divided arch; the centre of which is fixed to a long vertical axis; but the particulars of the inſtrument the reader will ſee explained in OPTICS, Part III.

503 3. *Compound Tranſit Inſtrument.* Some inſtruments have been contrived to anſwer both kinds of obſervations, viz. either a tranſit or equal altitudes. Fig. 222 repreſents ſuch an inſtrument, made firſt of all for Mr Le Monnier the French aſtronomer, by the late Mr Siſſon, under the direction of Mr Opaham, mounted and fixed up ready for obſervation.

AB is a teleſcope, which may be 3, 4, 5, or 6 feet long, whoſe cylindrical tube fits exactly into another hollow cylinder *a b*, perpendicular to the axis: theſe ſeveral pieces are of the beſt hammered plate braſs. The cylindrical extremity of this axis NN are of ſolid bell-metal, and wrought exquiſitely true, and exactly of the ſame ſize in a lathe; and it is on the perfection to which the cylinders or trunnions are turned that the juſtneſs of the inſtrument depends. In the common focus of the object-glaſs and eye-glaſs is placed a reticle (fig. 223.) conſiſting of three horizontal and parallel fine-ſtretched ſilver wires, fixed by pins or ſcrews to a braſs circle, the middle one paſſing through its centre, with a fourth vertical wire likewiſe paſſing through the centre, exactly perpendicular to the former three.

The horizontal axis MN (fig. 222.) is placed on a ſtrong braſs frame, into the middle of which a ſteel cylinder GH is fixed perpendicularly, being turned truly round, and terminating in a conical point at its lower extremity; where it is let into a ſmall hole drilled in the middle of the dove-tail ſlider; which ſlider is ſupported by a hollow cube fixed to the ſupporting piece IK, conſiſting of two ſtrong plates of braſs, joined together at right angles, to which are fixed two iron cramps LL, by which it is faſtened to the ſtone-wall of a ſouth window.

The upper part G of the ſteel ſpindle is embraced by a collar *d e f*, being in contact with the blunt extremity of three ſcrews, whoſe particular uſe will be explained by and by. O is another cylindrical collar cloſely embracing the ſteel ſpindle at about a third part of its length from the top; by the means of a ſmall ſcrew it may be looſened or pinched cloſe as occaſion requires. From the bottom of this collar proceeds an arm or lever acted upon by the two ſcrews *g h*, whereby the whole inſtrument, excepting the ſupporting piece, may be moved laterally, ſo that the teleſcope may be made to point at a diſtant mark fixed in the vertical of the meridian. *i k* is a graduated ſemicircle of thin braſs ſcrewed to the teleſcope, whereby it may be elevated ſo as to point to a known celeſtial object in the day-time. *l m* is a ſpirit-level parallel to the axis of rotation on the teleſcope, on which two trunnions hang by two hooks at M and N. Along the upper ſide of the glaſs tube of the level ſlides a pointer to be ſet to the end of the air-bubble; and when the poſition of the axis of rotation is ſo adjuſted by the ſcrews that the air-bubble keeps to the pointer for a whole revolution of the inſtrument, the ſpindle GH is certainly perpendicular to the horizon, and then the line of collimation of the teleſcope deſcribes a circle of equal altitude in the heavens. When the level is ſuſpended on the axis, raiſe or depreſs the tube of the level by twiſting the neb of the ſcrew *n* till you bring either end of the air-bubble to reſt at any point towards the middle of the tube, to which ſlide the index; then lift off the level, and, turning the ends of it contrary ways, hang it again on the trunnions; and if the air-bubble reſts exactly again the index as before, the axis of rotation is truly horizontal: If not, depreſs that end of the axis which lies on the ſame ſide of the pointer as the bubble does, by turning the neb of the ſcrew at N, till the bubble returns about halfway towards the pointer; then having moved the pointer to the place where it now reſts, invert the ends of the level again, and repeat the ſame practice till the bubble reſts exactly at the pointer in both poſitions of the level. If, after the teleſcope is turned upſide down, that is, after the trunnions are inverted end for end, you perceive that the ſame point of a remote fixed object is covered by the vertical wire in the focus of the teleſcope that was covered by it before the inverſion, it is certain that the line of ſight or collimation is perpendicular to the tranſverſe axis; but if the ſaid vertical wire covers any other point, the braſs circle that carries the hairs muſt be moved by a ſcrew-key introduced through the perforation in the ſide of the tube at X, till it appears to biſect the line joining theſe two points, as near as you can judge; then, by reverting the axis to its former poſition, you will find whether the wires be exactly adjuſted. *N. B.* The ball *o* is a counterpoiſe to the centre of gravity of the ſemicircle *i k*, without which the teleſcope would not reſt in an oblique elevation without being fixed by a ſcrew or ſome other contrivance.

The ſeveral beforementioned verifications being accompliſhed, if the teleſcope be elevated to any angle with the horizon and there ſtopped, all fixed ſtars which paſs over the three horizontal wires of the reticle on the eaſtern ſide of the meridian in aſcending, will have preciſely the ſame altitudes when in deſcending they again croſs the ſame reſpective wires on the weſt

west side, and the middle between the times of each respective equal altitude will be the exact moment of the star's culminating or passing the meridian. By the help of a good pendulum-clock, the hour of their true meridional transits will be known, and consequently the difference of right ascension of different stars. Now, since it will be sufficient to observe a star which has north declination two or three hours before and after its passing the meridian, in order to deduce the time of its arrival at that circle; it follows, that having once found the difference of right ascension of two stars about 60 degrees asunder, and you again observe the first of these stand at the same altitude both in the east and west side, you infer with certainty the moment by the clock at which the second star will be on the meridian that same night, and by this means the transit-instrument may be fixed in the true plane of the meridian till the next day; when, by depressing it to some distant land objects, a mark may be discovered whereby it may ever after be rectified very readily, so as to take the transits of any of the heavenly bodies to great exactness, whether by night or day.

When such a mark is thus found, the telescope being directed carefully to it, must be fixed in that position by pinching fast the end of the arm or lever between the two opposite screws *g h*; and if at any future time, whether from the effect of heat or cold on the wall to which the instrument is fixed, or by any settling of the wall itself, the mark appears no longer well bisected by the vertical wire, the telescope may easily be made to bisect it again, by giving a small motion to the pinching screws.

The transit-instrument is now considered as one of the most essential particulars of the apparatus of an astronomical observatory.

Besides the above may be mentioned,

The EQUATORIAL *or* PORTABLE OBSERVATORY; 504
an instrument designed to answer a number of useful purposes in practical astronomy, independent of any particular observatory. It may be made use of in any steady room or place, and performs most of the useful problems in the science. The following is a description of one lately invented by Mr Ramsden, from whom it has received the name of the *Universal Equatorial*.

The principal parts of this instrument (fig. 221.) are, 1. The azimuth or horizontal circle A, which represents the horizon of the place, and moves on a long axis B, called the *vertical axis*. 2. The equatorial or hour-circle C, representing the equator, placed at right angles to the polar axis D, or the axis of the earth, upon which it moves. 3. The semicircle of declination E, on which the telescope is placed, and moving on the axis of declination, or the axis of motion of the line of collimation F. These circles are measured and divided as in the following table:

Measures of the several circles and divisions on them.	Radius In. dec.	Limb divided to	Nonius of 30 gives seconds	Divided on limb into parts of inc.	Divided by Nonius into parts of inch.
Azimuth or horizontal circle	5 1	15′	30″	45th	1350th
Equatorial or hour circle	5 1	15′ 1′ in time	30″ 2″	45th	1350th
Vertical semicircle for declination or latitude	5 5	15′	30″	42d	1260th

4. The telescope, which is an achromatic refractor with a triple object-glass, whose focal distance is 17 inches, and aperture 2.45 inches, and furnished with six different eye-tubes; so that its magnifying powers extend from 44 to 168. The telescope in this equatorial may be brought parallel to the polar axis, as in the figure, so as to point to the pole-star in any part of its diurnal revolution; and thus it has been observed near noon, when the sun has shone very bright. 5. The apparatus for correcting the error in altitude occasioned by refraction, which is applied to the eye-end of the telescope, and consists of a slide G moving in a groove or dove-tail, and carrying the several eye-tubes of the telescope, on which slide there is an index corresponding to five small divisions engraved on the dove-tail; a very small circle, called the refraction circle H, moveable by a finger-screw at the extremity of the eye-end of the telescope; which circle is divided into half-minutes, one entire revolution of it being equal to 3′ 18″, and by its motion raises the centre of the cross-hairs on a circle of altitude; and likewise a quadrant I of 1¼ inch radius, with divisions on each side, one expressing the degree of altitude of the object viewed, and the other expressing the minutes and seconds of error occasioned by refraction, corresponding to that degree of altitude: to this quadrant is joined a small round level K, which is adjusted partly by the pinion that turns the whole of this apparatus, and partly by the index of the quadrant: for which purpose the refraction circle is set to the same minute, &c. which the index points to on the limb of the quadrant; and if the minute, &c. given by the quadrant exceed the 3′ 18″ contained in one entire revolution of the refraction circle, this must be set to the excess above one or more of its entire revolutions; then the centre of the cross-hairs will apppear to be raised on a circle of altitude to the additional height which the error of refraction will occasion at that altitude.

This instrument stands on three feet L distant from each other 14,4 inches; and when all the parts are horizontal is about 29 inches high: the weight of the equatorial and apparatus is only 59 lb. avoirdupoise, which are contained in a mahogany case weighing 58 lb.

The principal adjustment in this instrument is that of making the line of collimation to describe a portion of an hour-circle in the heavens; in order to which, the azimuth circle must be truly level, the line of collimation

limation or some corresponding line represented by the small brass rod M parallel to it, must be perpendicular to the axis of its own proper motion; and this last axis must be perpendicular to the polar axis: on the brass rod M there is occasionally placed a hanging level N, the use of which will appear in the following adjustments:

The azimuth circle may be made level by turning the instrument till one of the levels is parallel to an imaginary line joining two of the feet screws; then adjust that level with these two feet screws; turn the circle half round, *i. e.* 180°; and if the bubble be not then right, correct half the error by the screw belonging to the level, and the other half error by the two foot screws; repeat this till the bubble comes right; then turn the circle 90° from the two former positions, and set the bubble right, if it be wrong, by the foot screw at the end of the level; when this is done, adjust the other level by its own screw, and the azimuth circle will be truly level. The hanging level must then be fixed to the brass rod by two hooks of equal length, and made truly parallel to it: for this purpose make the polar axis perpendicular or nearly perpendicular to the horizon; then adjust the level by the pinion of the declination-semicircle; reverse the level, and if it be wrong, correct half the error by a small steel screw that lies under one end of the level, and the other half error by the pinion of the declination-semicircle; repeat this till the bubble be right in both positions. In order to make the brass rod on which the level is suspended at right angles to the axis of motion of the telescope or line of collimation, make the polar axis horizontal, or nearly so: set the declination-semicircle to 0°, turn the hour-circle till the bubble comes right; then turn the declination-circle to 90°; adjust the bubble by raising or depressing the polar axis (first by hand till it be nearly right, afterwards tighten with an ivory key the socket which runs on the arch with the polar axis, and then apply the same ivory key to the adjusting screw at the end of the said arch till the bubble comes quite right); then turn the declination-circle to the opposite 90; if the level be not then right, correct half the error by the aforesaid adjusting screw at the end of the arch, and the other half error by the two screws which raise or depress the end of the brass rod. The polar axis remaining nearly horizontal as before, and the declination-semicircle at 0°, adjust the bubble by the hour-circle; then turn the declination-semicircle to 90°, and adjust the bubble by raising or depressing the polar axis; then turn the hour-circle 12 hours; and if the bubble be wrong, correct half the error by the polar axis, and the other half error by the two pair of capstan screws at the feet of the two supports on one side of the axis of motion of the telescope; and thus this axis will be at right angles to the polar axis. The next adjustment is to make the centre of cross-hairs remain on the same object, while you turn the eye-tube quite round by the pinion of the refraction apparatus: for this adjustment, set the index on the slide to the first division on the dove-tail; and set the division marked 18″ on the refraction-circle to its index; then look through the telescope, and with the pinion turn the eye-tube quite round; and if the centre of the hairs does not remain on the same spot during that revolution, it must be corrected by the four small screws, two and two at a time (which you will find upon unscrewing the nearest end of the eye-tube that contains the first eye-glass); repeat this correction till the centre of the hairs remains on the spot you are looking at during an entire revolution. In order to make the line of collimation parallel to the brass rod on which the level hangs, set the polar axis horizontal, and the declination-circle to 90°, adjust the level by the polar axis; look through the telescope on some distant horizontal object, covered by the centre of the cross hairs; then invert the telescope, which is done by turning the hour-circle half round; and if the centre of the cross hairs does not cover the same object as before, correct half the error by the uppermost and lowermost of the four small screws at the eye-end of the large tube of the telescope; this correction will give a second object now covered by the centre of the hairs, which must be adopted instead of the first object: then invert the telescope as before; and if the second object be not covered by the centre of the hairs, correct half the error by the same two screws which were used before: this correction will give a third object, now covered by the centre of the hairs, which must be adopted instead of the second object; repeat this operation till no error remains; then set the hour-circle exactly to 12 hours (the declination-circle remaining at 90° as before); and if the centre of the cross hairs does not cover the last object fixed on, set it to that object by the two remaining small screws at the eye-end of the large tube, and then the line of collimation will be parallel to the brass rod. For rectifying the nonius of the declination and equatorial circles, lower the telescope as many degrees, minutes, and seconds, below 0° or Æ on the declination-semicircle as are equal to the complement of the latitude; then elevate the polar axis till the bubble be horizontal, and thus the equatorial circle will be elevated to the co-latitude of the place; set this circle to 6 hours; adjust the level by the pinion of the declination-circle; then turn the equatorial circle exactly 12 hours from the last position; and if the level be not right, correct one half of the error by the equatorial circle, and the other half by the declination-circle; then turn the equatorial circle back again exactly 12 hours from the last position; and if the level be still wrong, repeat the correction as before till it be right, when turned to either position; that being done, set the nonius of the equatorial circle exactly to 6 hours, and the nonius of the declination-circle exactly to 0°.

The principal uses of this equatorial are,

1. To find your meridian by one observation only: for this purpose, elevate the equatorial circle to the co-latitude of the place, and set the declination-semicircle to the sun's declination for the day and hour of the day required; then move the azimuth and hour-circles both at the same time, either in the same or contrary direction, till you bring the centre of the cross hairs in the telescope exactly to cover the centre of the sun; when that is done, the index of the hour-circle will give the apparent or solar time at the instant of observation; and thus the time is gained, though the sun be at a distance from the meridian; then turn the hour-circle till the index points precisely at 12 o'clock, and lower the telescope to the horizon, in order to observe some point there-

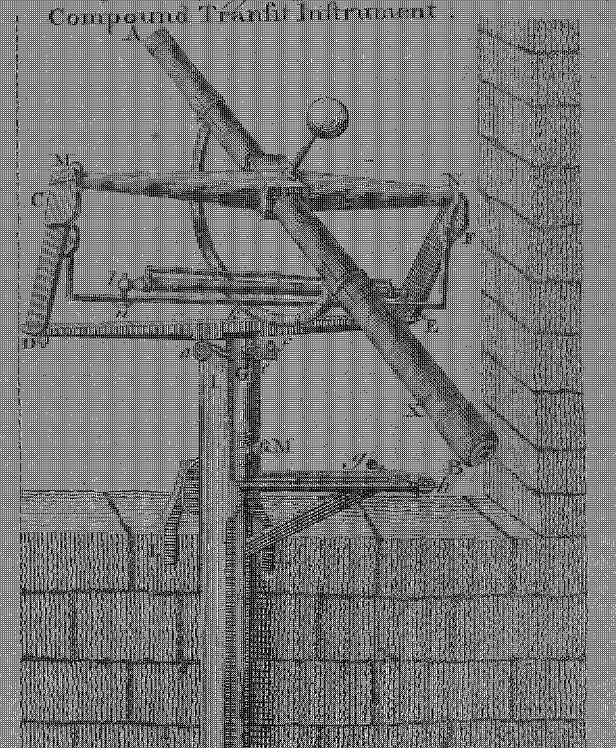
Compound Transit Instrument.



Thackara & Vallance sculp.

in the centre of your glass, and that point is your meridian mark found by one observation only; the best time for this operation is three hours before or three hours after 12 at noon.

2. To point the telescope on a star, though not on the meridian, in full day-light. Having elevated the equatorial circle to the co-latitude of the place, and set the declination-semicircle to the star's declination, move the index of the hour-circle till it shall point to the precise time at which the star is then distant from the meridian, found in tables of the right ascension of the stars, and the star will then appear in the glass. Besides these uses peculiar to this instrument, it is also applicable to all the purposes to which the principal astronomical instruments, viz. a transit, a quadrant, and an equal-altitude instrument, are applied.

INDEX.

A.

B.

Aſtrope-Wells ‖ Aſtruc.

ASTROPE-WELLS, near Banbury in Oxfordſhire, are recommended as excellent in female obſtructions, the gravel, hypochondriac, and ſimilar diſorders. The water is a briſk, ſpirituous, pleaſant-taſted chalybeate, and is alſo gently purgative. It ſhould be drank from three to five quarts in the forenoon.

ASTROSCOPE, a kind of aſtronomical inſtrument, compoſed of two cones, on whoſe ſurface the conſtellations, with their ſtars, are delineated, by means whereof the ſtars may eaſily be known. The aſtroſcope is the invention of William Schukhard, formerly profeſſor of mathematics at Tubingen, who publiſhed a treatiſe expreſsly on it in 1698.

ASTRUC (John), a celebrated phyſician, was born in the year 1684, at the little town of Savoy, in the province of Languedoc. His father, who was a proteſtant clergyman, beſtowed particular pains upon the earlieſt part of his education. After which he went to the univerſity of Montpelier, where he was created maſter of arts in the year 1700. He then began the ſtudy of medicine; and, in two years, obtained the degree of bachelor, having, upon that occaſion, written a diſſertation on the cauſe of fermentation, which he defended in a very ſpirited manner. On the 25th of January 1703 he was created doctor of phyſic; after which, before arriving at extenſive practice, he applied to the ſtudy of medical authors, both ancient and modern, with uncommon aſſiduity. The good effects of his ſtudy ſoon appeared; for, in the year 1710, he publiſhed a treatiſe concerning muſcular motion, from which he acquired very high reputation. In the year 1717, he was appointed to teach medicine at Montpelier; which he did with ſuch perſpicuity and eloquence, that it was univerſally ſaid he had been born to be a profeſſor. His fame ſoon roſe to ſuch a height, that the king aſſigned him an annual ſalary; and he was, at the ſame time, appointed to ſuperintend the mineral waters in the province of Languedoc. But as Montpelier did not afford ſufficient ſcope for his aſpiring genius, he went to Paris with a great ſtock of manuſcripts, which he intended to publiſh, after ſubjecting them to the examination of the learned. Soon after, however, he left it, having in the year 1729 accepted the office of firſt phyſician to the king of Poland, which was then offered to him. His ſtay in Poland, however, was but of ſhort duration, and he again returned to Paris. Upon the death of the celebrated Geoffroy, in the year 1731, he was appointed Regius Profeſſor of medicine at Paris. The duties of this office he diſcharged in ſuch a manner as to anſwer even the moſt ſanguine expectations. He taught the practice of phyſic with ſo great applauſe, as to draw from other univerſities to that of Paris a great concourſe of medical ſtudents, foreigners as well as natives of France. At the ſame time he was not more celebrated as a profeſſor than a practitioner. And, even at an advanced age, he perſiſted with unwearied aſſiduity in that intenſe ſtudy which firſt raiſed his reputation. Hence it is, that he has been enabled to tranſmit to poſterity ſo many valuable monuments of his medical erudition. He died, univerſally regretted, on the 15th of May 1766, in the 82d year of his age.

Aſturia.

ASTURIA, an ancient kingdom of Spain, ſubdued by Auguſtus emperor of Rome.—The inhabitants of this country, along with thoſe of Cantabria, aſſerted their liberty long after the reſt of Spain had received the Roman yoke. So great was their deſire of liberty, that, after being cloſely ſhut up by the Roman army, they endured the moſt terrible calamities of famine, even to the devouring of one another, rather than ſubmit to the enemy. At length, however, the Aſturians were for ſurrendering: but the Cantabrians oppoſed this meaſure, maintaining that they ought all to die ſword in hand like brave men. Upon this the two nations quarrelled, notwithſtanding their deſperate ſituation; and a battle enſuing, 10,000 of the Aſturians were driven to the intrenchments of the Romans, whom

whom they begged in the most moving manner to receive them on any terms they pleased. But Tiberius the emperor's son-in-law refusing to admit them into the camp, some of these unhappy people put an end to their lives by falling upon their own swords; others lighting great fires threw themselves into them, while some poisoned themselves by drinking the juice of a venomous herb.

The campaign being put an end to by winter, the next year the Asturians summoned all their strength and resolution against the Romans; but notwithstanding their utmost efforts of valour and despair, they were entirely defeated in a most bloody battle which lasted two days, and for that time entirely subdued. A few years afterwards they rebelled, in conjunction with the Cantabrians; but were soon reduced by the Romans, who massacred most of the young men that were capable of bearing arms. This did not prevent them from revolting anew in a short time afterwards; but without success, being obliged to submit to the Roman power, till the subversion of that empire by the Goths.

Asturias, anciently the kingdom of Asturia, is now a principality of modern Spain, bounded by Biscay on the east, Galicia on the west, Castile and Old Leon on the south, and the sea on the north. Its greatest length is about 110 miles, and its breadth 54. On the south it is separated from Castile and Old Leon by high mountains covered with woods. The province is tolerably fertile, but thinly inhabited. The inhabitants value themselves much on being descended from the ancient Goths. Even the poor peasants, who are fain to go to seek work in other provinces, call themselves *illustrious Goths* and *Mountaineers*, thinking it ignominious to marry even with great and rich families of another race. This pride is flattered by the respect paid them by the rest of the nation, and the privileges bestowed upon them by the government. The hereditary prince of Spain is styled *prince of the Asturias*. The most remarkable places in this principality are Oviedo, Gyon, Santillana, and St Andero.

ASTYAGES, son of Cyaxares, the last king of the Medes. He dreamed that from the womb of his daughter Mandane, married to Cambyses king of Persia, there sprung a vine that spread itself over all Asia. She being with child, he resolved to kill the infant as soon as born. Its name was Cyrus; and Harpagus, being sent to destroy it, preserved it: which Astyages after a long time hearing of, he caused Harpagus to eat his own son. Harpagus called in Cyrus, who dethroned his grandfather, and thereby ended the monarchy of the Medes. See Media and Persia.

ASTYANAX, the only son of Hector and Andromache. After the taking of Troy, he was thrown from the top of a tower by Ulysses's orders.

ASTYNOMI, in Grecian antiquity, magistrates in Athens, corresponding to the ædiles of the Romans; they were ten in number. See Ædile.

ASYLUM, a sanctuary, or place of refuge, where criminals shelter themselves from the hands of justice. The word is compounded of the primitive particle α, and συλαω, *I hurt*; because no person could be taken out of an asylum without sacrilege.

The asyla of altars and temples were very ancient; and likewise those of tombs, statues, and other monuments of considerable personages. Thus, the temple of Diana at Ephesus was a refuge for debtors, the tomb of Theseus for slaves. Among the Romans, a celebrated asylum was opened by Romulus between the mounts Palatine and Capitoline, in order to people Rome, for all sorts of persons indiscriminately, fugitive slaves, debtors, and criminals of every kind. The Jews had their asyla; the most remarkable of which were, the six cities of refuge, the temple, and the altar of burnt-offerings.

It was customary among the Heathens to allow refuge and impunity even to the vilest and most flagrant offenders: some out of superstition, and others for the sake of peopling their cities: and it was by this means, and with such inhabitants, that Thebes, Athens, and Rome, were first stocked. We even read of asylums at Lyons and Vienne among the ancient Gauls; and there are some cities in Germany which still preserve the ancient right of asylum. Hence on the medals of several ancient cities, particularly in Syria, we meet with the inscription ΑΣΥΛΟΙ, to which is added ΙΕΡΑΙ. This quality of asylum was given them, according to M. Spanheim, in regard to their temples, and to the gods revered by them.

The emperors Honorius and Theodosius granting the like immunities to churches, the bishops and monks laid hold of a certain tract or territory, without which they fixed the bounds of the secular jurisdiction: and so well did they manage their privileges, that convents in a little time became next akin to fortresses; where the most notorious villians were in safety, and braved the power of the magistrate.

These privileges at length were extended not only to the churches and church-yards, but also to the bishops houses; whence the criminal could not be removed without a legal assurance of life, and an entire remission of the crime. The reason of the extension was, that they might not be obliged to live altogether in the churches, &c. where several of the occasions of life could not be decently performed.

But at length these asyla or sanctuaries were also stripped of most of their immunities, because they served to make guilt and libertinage more bold and daring. In England, particularly, they were entirely abolished. See Sanctuary.

ASYMMETRY, the want of proportion between the parts of any thing; being the contrary of *symmetry*.

ASYMPTOTE, in geometry, a line which continually approaches nearer to another; but, though continued infinitely, will never meet with it: Of these are many kinds. In strictness, however, the term *asymptotes* is appropriated to right lines, which approach nearer and nearer to some curves of which they are said to be *asymptotes*; but if they and their curves are indefinitely continued, they will never meet. See Conic *Sections*.

ASYNDETON, in grammar, a figure which omits the conjunctions in a sentence. As in *veni, vidi, vici*, where et is left out: or in that of Cicero concerning Catiline, *abiit, excessit, evasit, erupit:* or in that verse of Virgil,

Ferte citi flammas, date vela, impellite remos.

Asyndeton stands opposed to polysyndeton, where the copulatives are multiplied.

ATABULUS, in physiology, a provincial wind in Apulia, of a dry pinching quality, and very noxious in its effects. The ancient naturalists speak of the Atabulus in terms of horror, on account of the ravage it made among the fruits of the earth, which it scorched or withered up.

ATABYRIS, a very high mountain in the island of Rhodes, on which, according to Strabo and Diodorus Siculus, there stood a temple of Jupiter Atabyrius, whose worship a colony of Rhodians carried into Sicily, where a temple was built to the same deity at Agrigentum.

ATALANTA, an island in the Euripus of Euboea, near the Locri Opuntii, said to have been originally a city of the Locri, but torn from the continent in the time of an earthquake, and during an irruption of mount Ætna. This happened in the fourth year of the 93d Olympiad, in the reign of Artaxerxes Mnemon (Pliny, Orosius).

ATALANTIS, ATLANTICA, or ATLANTIS. See ATLANTIS.

ATARAXY, a term used by the stoics and sceptics, to denote that calmness of mind which secures us from all emotions arising from vanity and self-conceit.

ATARGATIS FANUM, the temple of a goddess worshipped by the Syrians and Parthians, having the face of a woman and tail of a fish, and called *Derceto* by the Greeks. Her temple stood in the city Bambyce, called afterwards *Hierapolis*. It was extremely rich, insomuch that Crassus, in his march against the Parthians, spent several days in weighing the treasure. Vossius makes the name of this goddess Phoenician, from *Addir-dag*, "the great fish."

ATARNEA, an ancient town of Mysia, situated between Adramyttium and Pitane, remarkable for the marriage of Aristotle with the sister or concubine of the tyrant Hermias; also for the dottage of that philosopher.

ATAXY, in a general sense, the want of order: With physicians, it signifies irregularity of crises and paroxysms of fevers.

ATCHE, in commerce, a small silver coin used in Turkey, and worth only one-third of the English penny.

ATCHIEVEMENT, in heraldry, denotes the arms of a person or family, together with all the exterior ornaments of the shield; as helmet, mantle, crest, scrolls, and motto, together with such quarterings as may have been acquired by alliances, all marshalled in order.

ATCHIEVE. This term is derived from the French *achever*, i. e. to finish or make an end of; but signifies, in its ordinary acceptation, to perform great actions or exploits.

ATE, the goddess of mischief, in the Pagan theology. She was daughter of Jupiter, and cast down from heaven at the birth of Hercules. For Juno having deceived Jupiter, in causing Euristheus to be born before Hercules, Jupiter expressed his resentment on Ate, as the author of that mischief: and threw her headlong from heaven to earth, swearing she should never return thither again (*Homeri Il.* xix. 125.) The name of this goddess comes from *αταω*, *noceo*, to "hurt." Her being the daughter of Jupiter, means, according to mythologists, that no evil happens to us but by the permission of Providence; and her banishment to earth denotes the terrible effects of divine justice among men.

ATEGUA, or ATTEGUA, an ancient town of Spain, placed by some in the road from Antiquara, now Antequera, to Hispalis, or Seville; by others near Alcala Real; which last is the more probable situation, because the flumen salsum, now the Salado, was in its neighbourhood. Now *Tebala Vieja*, or *Teivela*.

ATELLA, an ancient town of Campania in Italy, between Capua and Neapolis. From this town the *Atellanæ fabulæ*, or *Atellani ludi*, took their name. These were also called *Osci*, from their inventor, in whose territory Atella lay. They were generally a species of farce, interlarded with much ribaldry and buffoonery; and sometimes were exordia or interludes presented between the acts of other plays. The actors in these farces were not reckoned among the common players, nor deemed infamous; but retained the rights of their tribe, and might be listed for soldiers, the privilege only of free men. The ruins of this town are still to be seen about 11 miles from the modern Aversa, which was built out of its materials.

ATEMPO GIUSTO, in music, signifies to sing or play in an equal, true, and just time.

ATERGATIS, in mythology, a goddess of the Syrians, supposed to be the mother of Semiramis. She was represented with the face and breasts of a woman, but the rest of her body resembled a fish. Vossius says the term signifies *without fish*, and conjectures that the votaries of this deity abstained from fish.

ATERNUM, a town of Lucania in Italy, now *Aterni*, (Cluverus): Also a town in the territory of the Piceni, now *Pescara*, a port-town of Naples, situated on the Adriatic, E. Long. 15. 25. N. Lat. 42. 30.

ATESTE, a town in the territory of Venice in Italy, now called *Este*. E. Long. 12. 6. N. Lat. 45. 25.

ATHAMADULET, the prime minister of the Persian empire, as the grand vizier is of the Turkish empire. He is great chancellor of the kingdom, president of the council, superintendant of the finances, and is charged with all foreign affairs.

ATHAMANTA, SPIGNEL: A genus of the dinynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The fruit is oblong and striated; and the petals are inflected and emarginated. Of this genus Linnæus enumerates nine species; but none of them merit particular notice, except the cretensis, otherwise called *daucus creticus*, which grows wild in the Levant and the warmer parts of Europe. The leaves are irregularly disposed, and formed like those of fennel. The flower-stalk rises about two feet high, sending out many branches, terminated at the top by compound umbels, composed of near 20 small ones. These have white flowers with five petals, which are succeeded by oblong, hairy, channelled fruit, divided into two parts, containing one oblong hairy seed. The seeds have a warm biting taste, with an agreeable aromatic smell. They are kept in the shops as a medicine, are carminative, and said to be diuretic; but are little used in practice. The plant may be propagated

gated from seeds, which should be sown on an open bed of light dry ground; the following autumn the plants should be taken up, and planted at about a foot distance in a bed of light sandy earth, where the roots will continue several years.

ATHANASIA, GOLDILOCKS: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ discoides*. The receptacle is chaffy; the pappus is chaffy, and very short; and the calyx is imbricated. There are 20 species, all tender plants except one; and none of them possessed of beauty, or any remarkable property.

ATHANASIAN CREED; a formulary, or confession of faith, long supposed to have been drawn up by Athanasius bishop of Alexandria, in the fourth century, to justify himself against the calumnies of his Arian enemies. But it is now generally allowed among the learned not to have been his. Dr Waterland ascribes it to Hilary bishop of Arles, for the following among other reasons: 1. Because Honoratus of Marseilles, the writer of his life, tells us, that he composed an *Exposition of the Creed*: a properer title for the *Athanasian*, than that of *Creed* simply which it now bears. 2. Hilary was a great admirer and follower of St Austin; and the whole composition of this creed is in a manner upon St Austin's plan, both with respect to the Trinity and incarnation. 3. It is agreeable to the style of Hilary, as far as we can judge from the little that is left of his works. Upon the whole, he concludes, that Hilary bishop of Arles, about the year 430, composed *The Exposition of Faith*, which now bears the name of the *Athanasian Creed*, for the use of the Gallican clergy, and particularly those of the diocese of Arles: That, about the year 570, it became famous enough to be commented upon; but that all this while, and for several years lower, it had not yet acquired the name of *Athanasian*, but was simply styled *The Catholic Faith*: That, before 670, Athanasius's admired name came in to recommend and adorn it, being in itself an excellent system of the Athanasian principles of the Trinity and incarcation, in opposition chiefly to the Arians, Macedonians, and Apollinarians. This is the hypothesis of the learned author of the *Critical History of the Athanasian Creed*.

As to the reception of this creed in the Christian churches, we find, that it obtained in France in the time of Hincmar, or about 850; that it was received in Spain about 100 years later than in France, and in Germany much about the same time. As to our own country, we have clear and positive proofs of this creed being sung alternately in our churches in the tenth century. It was in common use in some parts of Italy, particularly in the diocese of Verona, about the year 960, and was received at Rome about the year 1014. As to the Greek and oriental churches, it has been questioned whether any of them ever received this creed at all; though some very considerable writers are of a contrary persuasion. It appears then, that the reception of this creed has been both general and ancient; and may vie with any, in that respect, except the Nicene, or Constantinopolitan, the only general creed common to all the churches.

As to the matter of this creed, it is given as a summary of the true orthodox faith, and a condemnation of all heresies ancient and modern. Unhappily, however, it has proved a fruitful source of unprofitable controversy and unchristian animosity even down to the present time.

ATHANASIUS (St), bishop of Alexandria, and one of the greatest defenders of the faith against the Arians, was born in Egypt. He followed St Alexander to the council of Nice, in 325, where he disputed against Arius, and the following year was made bishop of Alexandria; but, in 335, was deposed by the council of Tyre: when, having recourse to the emperor Constantine, the Arian deputies accused him of having hindered the exportation of corn from Alexandria to Constantinople; on which the emperor, without suffering him to make his defence, banished him to Treves. The emperor, two years after, gave orders that he should be restored to his bishopric: but, on his return to Alexandria, his enemies brought fresh accusations against him, and chose Gregory of Cappadocia to his see; which obliged Athanasius to go to Rome to reclaim it of Pope Julius. He was there declared innocent, in a council held in 342, and in that of Sardica in 347, and two years after was restored to his see by order of the emperor Constans; but after the death of that prince, he was again banished by the emperor Constantius, which obliged him to retire into the deserts. The Arians then elected one George in his room; who being killed in a popular sedition under Julian in 360, St Athanasius returned to Alexandria, but was again banished under Julian, and restored to his see under Jovian. He addressed to that emperor a letter, in which he proposed that the Nicene creed should be the standard of the orthodox faith, and condemned those who denied the divinity of the Holy Ghost. He was also banished by Valens in 367, and afterwards recalled. St Athanasius died on the 2d of May 373.

His works principally contain a defence of the mystery of the Trinity, and of the incarnation and divinity of the Word and Holy Spirit. There are three editions of his works which are esteemed; that of Commelin, printed in 1600; that of Peter Nannius, in 1627; and that of father Montfaucon. As to the creed which bears his name, see the preceding article.

ATHANATI, in Persian antiquity, a body of cavalry, consisting of 10,000 men, always complete. They were called *athanati* (a word originally Greek, and signifying *immortal*), because, when one of them happened to die, another was immediately appointed to succeed him.

ATHANOR. Chemists have distinguished by this name a furnace so constructed that it can always maintain an equal heat, and which shall last a long time without addition of fresh fuel.

The body of the athanor has nothing in it particular, and is constructed like ordinary furnaces. But at one of its sides, or its middle, there is an upright hollow tower, which communicates with the fire-place by one or more sloping openings. This tower ought to have a lid which exactly closes its upper opening.

When the athanor is to be used, as much lighted coal is put in the fire-place as is judged necessary, and the tower is filled to the top with unlighted fuel. The tower is then to be exactly closed with its lid. As fast as the coal in the fire-place is consumed, that in the tower falls down and supplies its place. As the coal contained in the tower has no free communication with the external air, it cannot burn till it falls into the fire-place.

The athanor being much celebrated and used by ancient chemists, it has been particularly described by many authors, and was formerly found in all laboratories. At present this furnace is much less employed, and is even neglected. The reason of this is, that all the ancient chemists were in search of the art of making gold; and being excited by this powerful desire, and confidence of success, they spared no trouble nor expence to accomplish this design. They undertook, without hesitation, operations which required great length of time and unremitted heat. Whereas now, these alluring hopes having vanished, the cultivators of chemistry have no other view than to extend and perfect the theory of this essential part of natural philosophy. This motive, although undoubtedly much nobler than the former, seems, however, to be less powerful over most men. For now, all long and laborious operations whence chemistry might receive great advantages, are neglected, as being tiresome and disgustful. There is, in fact, a considerable difference betwixt the hope of explaining a philosophical phenomenon, and that of obtaining an ingot of gold capable of producing many others. Hence the instruments employed in long operations, and particularly the athanor, are now much neglected; and also because the fuel in the tower is apt to stick there or fall down at once in too great quantity. The lamp-furnace, which is a true athanor, may be successfully employed in operations which do not require much heat.

ATHAROTH, or Atroth, (anc. geog.) the name of several towns. Two appear to have been in Samaria, in the tribe of Ephraim; the one four miles to the north of Sebaste, or the city of Samaria; the other in the confines of Benjamin and Ephraim, yet so as to be of the resort of Ephraim rather than of Benjamin (Joshua). This is the *Atroth-Addar* mentioned Joshua xvi. 5. from which to Upper Beth-horon extends the greatest breadth of the tribe of Ephraim.

ATHEISM, the disbelief of a Deity. See Atheist.

ATHEIST, a person who does not believe the existence of a Deity. Many people, both ancient and modern, have pretended to atheism, or have been reckoned atheists by the world; but it is justly questioned whether any man seriously adopted such a principle. These pretensions, therefore, must be founded on pride or affectation.

Atheism, as absurd and unreasonable as it is, has had its martyrs. Lucilio Vanini, an Italian, native of Naples, publicly taught atheism in France, about the beginning of the 16th century; and, being convicted of it at Tolouse, was condemned to death. Being pressed to make public acknowledgement of his crime, and to ask pardon of God, the king, and justice, he answered, he did not believe there was a God; that he never offended the king; and, as for justice, he wished it to the devil. He confessed that he was one of twelve, who parted in company from Naples to spread their doctrine in all parts of Europe. His tongue was first cut out, and then his body burnt, April 9. 1619.

Cicero represents it as a probable opinion, that they who apply themselves to the study of philosophy believe there are no gods. This must, doubtless, be meant of the academic philosophy, to which Cicero himself was attached, and which doubted of every thing. On the contrary, the Newtonian philosophers are continually recurring to a Deity, whom they always find at the end of their chain of natural causes. Some foreigners have even charged them with making too much use of the notion of a God in philosophy, contrary to the rule of Horace:

Nec Deus intersit, nisi dignus vindici nodus.

Among us, the philosophers have been the principal advocates for the existence of a Deity. Witness the writings of Sir Isaac Newton, Boyle, Ray, Cheyne, Nieuwentyt, &c. To which may be added many others, who, though of the clergy (as was also Ray), yet have distinguished themselves by their philosophical pieces in behalf of the existence of a God; *e. gr.* Derham, Bentley, Whiston, Samuel and John Clarke, Fenelon, &c. So true is that saying of Lord Bacon, that though a smattering of philosophy may lead a man into atheism, a deep draught will certainly bring him back again to the belief of a God and Providence.

ATHELING, Adeling, Edling, Ethling, or Etheling, among the Anglo-Saxons, was a title of honour, properly belonging to the heir-apparent, or presumptive, to the crown. This honourable appellation was first conferred by king Edward the Confessor on Edgar, to whom he was great uncle, when, being without any issue of his own, he intended to make him his heir.

ATHELSTAN, a Saxon king of England, natural son of Edward the elder, and grandson of the great Alfred. He succeeded to the crown in 925, and reigned 16 years. There was a remarkable law passed by this prince, which shows his just sentiments of the advantages of commerce, as well as the early attention to it in this country: it declared, that any merchant who made three voyages on his own account beyond the British channel or narrow seas, should be intitled to the privilege of a thane, or gentleman.

ATHENÆA, in antiquity, a feast celebrated by the ancient Greeks in honour of Minerva, who was called *Athene*.

ATHENÆUM, in antiquity, a public place wherein the professors of the liberal arts held their assemblies, the rhetoricians declaimed, and the poets rehearsed their performances. These places, of which there were a great number at Athens, were built in the manner of amphitheatres, encompassed with seats, called *cunei*. The three most celebrated Athenæa were those at Athens, at Rome, and at Lyons, the second of which was built by the emperor Adrian.

ATHENÆUS, a physician, born in Cilicia, cotemporary with Pliny, and founder of the pneumatic sect. He taught that the fire, air, water, and earth, are not the true elements, but that their qualities are, viz. heat, cold, moisture, and dryness; and to these he added a fifth element, which he called *spirit*, whence his sect had its name.

Athenæus, a Greek grammarian, born at Naucratis

cratis in Egypt in the 3d century, one of the most learned men of his time. Of all his works we have none extant but his Deipnosophis, *i. e.* the sophists at table; there is an infinity of facts and quotations in this work which render it very agreeable to admirers of antiquity.

There was also a mathematician of this name, who wrote a treatise on mechanics, which is inserted in the works of the ancient mathematicians, printed at Paris in 1693, in folio, in Greek and Latin.

ATHENAGORAS, an Athenian philosopher, flourished about the middle of the 2d century; and was remarkable for his zeal for Christianity, and his great learning, as appears from the apology which he addressed to the emperors Marcus Aurelius Antoninus and Lucius Commodus.

ATHENODORUS, a famous stoic philosopher, born at Tarsus, went to the court of Augustus, and was made by him tutor to Tiberius. Augustus had a great esteem for him, and found him by experience a man of virtue and probity. He used to speak very freely to the emperor. He, before he left the court to return home, warned the emperor not to give himself up to anger, but, whenever he should be in a passion, to rehearse the 24 letters of the alphabet before he resolved to say or do any thing. He did not live to see his bad success in the education of Tiberius.

ATHENOPOLIS, a town of the Massilienses, an ancient nation of Gaul. It is conjectured by Harduin to be the same with *Telo Martius*, now *Toulon*; by others to be the same with *Antipolis* or *Antibes*.

ATHENREE, a town of Ireland in the county of Galway, and province of Connaught. W. Long. 8.5. N. Lat. 53. 14. It is governed by a portrieve, and hath a barrack for three companies of foot. It hath been a place of considerable strength; but, like the numerous churches and castles which surround it, has felt the resistless force of time. Some of the walls and towers, however, are still remaining, as monuments of its former grandeur.

ATHENS, a celebrated city of Greece, and capital of the ancient kingdom of Attica, situated in E. Long. 53. N. Lat. 38.5. See ATTICA.

1 By whom founded.

In early times, that which was afterwards called the *citadel* was the whole city; and went under the name of *Cecropia*, from its founder Cecrops, whom the Athenians in after times affirmed to have been the first builder of cities, and called this therefore by way of eminence *Polis*, i. e. the city. In the reign of Erichthonius it lost the name of *Cecropia*, and acquired that of *Athens*, on what account is not certain; the most probable is, that it was so named in respect to the goddess Minerva, whom the Greeks call *Athene*, who was also esteemed its protectress. This old city was seated on the top of a rock in the midst of a large and pleasant plain, which, as the number of inhabitants increased, became full of buildings, which induced the distinction of Acro and Catapolis, *i. e.* of the upper and lower city. The extent of the citadel was 60 stadia; it was surrounded by olive trees, and fortified, as some say, with a strong palisade; in succeeding times it was encompassed with a strong wall, in which there were nine gates, one very large one, and the rest small. The inside of the citadel was adorned with innumerable edifices. The most remarkable of which were, 1. The magnificent temple of Minerva, styled *parthenion*, because that goddess was a virgin. The Persians destroyed it; but it was rebuilt with still greater splendor by the famous Pericles, all of the finest marble, with such skill and strength, that, in spite of the rage of time and barbarous nations, it remains perhaps the first antiquity in the world, and stands a witness to the truth of what ancient writers have recorded of the prodigious magnificence of Athens in her flourishing state. 2. The temple of Neptune and of Minerva; for it was divided into two parts: one sacred to the god, in which was the salt fountain said to have sprung upon the stroke of his trident; the other to the goddess protectress of Athens, wherein was the sacred olive which she produced, and her image which fell down from heaven in the reign of Erichthonius. At the back of Minerva's temple was the public treasury, which was burnt to the ground through the knavery of the treasurers, who, having misapplied the revenues of the state, took this short method of making up accounts.

2 Remarkable buildings,

The lower city comprehended all the buildings surrounding the citadel, the fort Munychia, and the havens Phalerum and Piræus, the latter of which was joined to the city by walls five miles in length; that on the north was built by Pericles, but that on the south by Themistocles; but by degrees the turrets which were at first erected on those walls were turned into dwelling-houses for the accommodation of the Athenians, whose large city was now become too small for them. The city, or rather the lower city, had 13 great gates, with the names of which it is not necessary to trouble the reader. Among the principal edifices which adorned it, we may reckon, 1. The temple of Theseus, erected by Conon, near its centre. Adjacent thereto, the young people performed their exercises. It was also a sanctuary for distressed persons, slaves or free. 2. The Olympian temple erected in honour of Jupiter, the honour of Athens, and of all Greece. The foundation of it was laid by Pisistratus: it was carried on but slowly in succeeding times, 700 years elapsing before it was finished, which happened under the reign of Adrian, who was particularly kind to Athens: this was the first building in which the Athenians beheld pillars. 3. The pantheon, dedicated to all the gods; a most noble structure, supported by 120 marble pillars, and having over its great gate two horses carved by Praxiteles: it is yet remaining, as we shall have occasion to show hereafter when we come to speak of the present state of this famous city. In several parts of it were *staoi* or porticos, wherein people walked in rainy weather, and from whence a sect of philosophers were denominated *stoics*, because their master Zeno taught in those porticos.

3 Ceramicus.

There were at Athens two places called *Ceramicus*, from Ceramus the son of Bacchus and Ariadne; one within the city, containing a multitude of buildings of all sorts; the other in the suburbs, in which was the academy and other edifices. The Gymnasia of Athens were many; but the most remarkable were the Lyceum, Academia, and Cynosarges. The Lyceum stood on the banks of Ilissus; some say it was built by Pisistratus, others by Pericles, others by Lycurgus. Here Aristotle taught philosophy, instructing such as came

Athens. to hear him as they walked, whence his disciples are generally thought to derive the name of *peripatetics*. The ceramicus without the city was the distance of six stadia from its walls. The academy made part thereof; as to the name of which there is some dispute. Some affirm that it was so called from Academus, an ancient hero, who, when Helen was stolen by Theseus, discovered the place where she lay hid to Castor and Pollux: for which reason the Lacedemonians, when they invaded Attica always spared this place. Dicæarchus writes, that Castor and Pollux had two Arcadians in their army, the one named *Echedemus*, the other *Marothus;* from the former of these he says this place took its name, and that the borough of Marathon was so called from the other. It was a marshy unwholesome place, till Cimon was at great pains to have it drained; and then it became extremely pleasant and delightful, being adorned with shady walks, where Plato read his lectures, and from thence his scholars were styled *academics*.

4 Cynosarges. The Cynosarges was a place in the suburbs not far from the Lyceum: it was famous on many accounts; but particularly for a noble gymnasium erected there, appointed for the special use of such as were Athenians only by one side. In after times Themistocles derived to himself ill-will, by carrying many of the nobility to exercise with him here, because, being but of the half blood, he could exercise no where else but in this gymnasium. Anthisthenes instituted a sect of philosophers, who from the name of this district, as many think, were styled *Cynics*.

5 Havens. The havens of Athens were three. First the Pyræus, which was distant about 35 or 40 stadia from the city, till joined thereto by the long walls beforementioned, after which it became the principal harbour of the city, It had three docks; Cantharos, Aphrodisium, and Zea: the first was so called from an ancient hero, the second from the goddess Venus who had there two temples, and the third from bread-corn. There were in this port five porticos, which joining together formed one great one called from thence *Macra Stoa*, or the grand portico. There were likewise two great markets or fora; one near the long portico, the other near the city. The second port was Munichia, a promontory not far distant from Pyræus; a place very strong by nature, and afterwards rendered far stronger by art. It was of this that Epimenides said, if the Athenians foresaw what mischief it would one day produce to them, they would eat it away with their teeth. The third was Phalerum, distant from the city, according to Thucydides 35 stadia, but according to Pausanias only 20. This was the most ancient harbour of Athens, as Pyræus was the most capacious.

6 Present state. Of this city, as it stands at present, we have the following account by Dr Chandler. "It is now called *Athini*; and is not inconsiderable, either in extent or the number of inhabitants. It enjoys a fine temperature, and serene sky. The air is clear and wholesome, though not so delicately soft as in Ionia. The town stands beneath the Archopolis or citadel; not encompassing the rock as formerly, but spreading into the plain, chiefly on the west and north-west. Corsairs infesting it, the avenues were secured, and in 1676 the gates were regularly shut after sunset. It is now open again; but several of the gateways remain, and a guard of Turks patrols at midnight. Some masses of brick work, standing separate, without the town, belonged perhaps to the ancient wall, of which other traces also appear. The houses are mostly mean and straggling; many with large areas or courts before them. In the lanes, the high walls on each side, which are commonly whitewashed, reflect strongly the heat of the sun. The streets are very irregular; and anciently were neither uniform nor handsome. They have water conveyed in channels from mount Hymettus, and in the bazar or market-place is a large fountain. The Turks have several mosques and public baths. The Greeks have convents for men and women; with many churches, in which service is regularly performed; and besides these, they have numerous oratories or chapels, some in ruins or consisting of bare walls, frequented only on the anniversaries of the saints to whom they are dedicated. A portrait of the owner on a board is placed in them on that occasion, and removed when the solemnity of the day is over.

7 Citadel, or city of Cecrops. "The city of Cecrops is now a fortress with a thick irregular wall, standing on the brink of precipices, and inclosing a large area about twice as long as broad. Some portions of the ancient wall may be discovered on the outside, particularly at the two extreme angles; and in many places it is patched with pieces of columns, and with marbles taken from the ruins. A considerable sum had been recently expended on the side next Hymettus, which was finished before we arrived. The scaffolding had been removed to the end toward Pentele; but money was wanting, and the workmen were withdrawn. The garrison consists of a few Turks, who reside there with their families, and are called by the Greeks *Castriani*, or the soldiers of the castle. The rock is lofty, abrupt, and inaccessible, except the front, which is towards the Piræus; and on that quarter is a mountainous ridge, within cannon-shot. It is destitute of water fit for drinking; and supplies are daily carried up in earthen jars, on horses and asses, from one of the conduits in the town.

"The acropolis furnished a very ample field to the ancient virtuosi. It was filled with monuments of Athenian glory, and exhibited an amazing display of beauty, of opulence, and of art; each contending as it were for the superiority. It appeared as one entire offering to the Deity, surpassing in excellence and astonishing in richness. Heliodorus, named Periegetes *the guide*, had employed on it 15 books. The curiosities of various kinds, with the pictures, statues, and pieces of sculpture, were so many and so remarkable, as to supply Polemo Periegetes with matter for four volumes; and Strabo affirms, that as many would be required in treating of other portions of Athens and of Attica. In particular, the number of statues was prodigious. Tiberius Nero, who was fond of images, plundered the acropolis as well as Delphi and Olympia; yet Athens, and each of these places, had not fewer than 3000 remaining in the time of Pliny. Even Pausanias seems here to be distressed by the multiplicity of his subject. But this banquet, as it were, of the senses has long been withdrawn; and is now become like the tale of a vision. The spectator views with concern the marble ruins intermixed with mean flat-roofed cottages, and extant amid rubbish; the sad memorials of a nobler people; which, however, as visible from the sea, should have introduced modern Athens

thens to more early notice. They who reported it was only a ſmall village, muſt, it has been ſurmiſed, have beheld the acropolis through the wrong end of their teleſcopes.

" The acropolis has now, as formerly, only one entrance, which fronts the Piræus. The aſcent is by traverſes and rude fortifications furniſhed with cannon, but without carriages, and neglected. By the ſecond gate is the ſtation of the guard, who ſits croſs-legged under cover, much at his eaſe, ſmoking his pipe, or drinking coffee, with his companions about him in like attitudes. Over this gate-way is an inſcription in large characters on a ſtone turned upſide down, and black from the fires made below. It records a preſent of a pair of gates.

8 Propyléa.

" Going farther up, you come to the ruins of the propyléa, an edifice which graced the entrance into the citadel. This was one of the ſtructures of Pericles, who began it when Euthymenes was archon, 435 years before Chriſt. It was completed in five years, at the expence of 2012 talents. It was of marble, of the Doric order, and had five doors to afford an eaſy paſſage to the mulitudes which reſorted on buſineſs or devotion to the acropolis.

" While this fabric was building, the architect Mneſicles, whoſe activity equalled his ſkill, was hurt by a fall, and the phyſicians deſpaired of his life; but Minerva, who was propitious to the undertaking, appeared, it was ſaid, to Pericles, and preſcribed a remedy, by which he was ſpeedily and eaſily cured. It was a plant or herb growing round about the acropolis, and called afterwards *parthenium*.

9 Temple of Victory.

" The right wing of the propyléa was a temple of Victory. They related that Ægeus had ſtood there, viewing the ſea, and anxious for the return of his ſon Theſeus, who was gone to Crete with the tributary children to be delivered to the Minotaur. The veſſel which carried them had black ſails ſuiting the occaſion of its voyage; and, it was agreed, that, if Theſeus overcame the enemy, their colour ſhould be changed to white. The neglect of this ſignal was fatal to Ægeus, who, on ſeeing the ſails unaltered, threw himſelf down headlong from the rock, and periſhed. The idol was named *Victory without wings;* it was ſaid, becauſe the news of the ſucceſs of Theſeus did not arrive but with the conqueror. It had a pomegranate in the right hand, and an helmet in the left. As the ſtatue was without pinions, it was hoped the goddeſs would remain forever on the ſpot.

" On the left wing of the propyléa, and fronting the temple of Victory, was a building decorated with paintings by Polygnotus, of which an account is given by Pauſanias. This edifice, as well as the temple, was of the Doric order, the columns fluted, and without baſes. Both contributed alike to the uniformity and grandeur of the deſign; and the whole fabric, when finiſhed, was deemed equally magnificent and ornamental. The interval between Pericles and Pauſanias conſiſts of ſeveral centuries. The propyléa remained entire in the time of this topographer; and, as will be ſhown, continued nearly ſo to a much later period. It had then a roof of white marble, which was unſurpaſſed either in the ſize of the ſtones or in the beauty of their arrangement; and before each wing was an equeſtrian ſtatue.

" The propyléa have ceaſed to be the entrance of the acropolis. The paſſage, which was between the columns in the centre, is walled up almoſt to their capitals, and above is a battery of cannon. The way now winds before the front of the ancient ſtructure; and turning to the left hand among rubbiſh and mean walls, you come to the back part, and to the five door-ways. The ſoil without is riſen higher than the top of the two ſmaller. There, under the vault and cannon, lies an heap of large ſtones, the ruin of the roof.

" The temple of Victory, ſtanding on an abrupt rock, has its back and one ſide encumbered with the modern ramparts. The columns in the front being walled up, you enter it by a breach in the ſide, within 10

Roof carried off by an exploſion.

the propyléa. It was uſed by the Turks as a magazine for powder, until about the year 1656, when a ſudden exploſion, occaſioned by lightning, carried away the roof, with a houſe erected on it, belonging to the officer who commanded in the acropolis, whoſe family, except a girl, periſhed. The women of the Aga continued to inhabit in this quarter, but it is now abandoned and in ruins.

" The cell of the temple of Victory, which is of white marble, very thick, and ſtrongly cemented, ſufficiently witneſſes the great violence it has undergone; the ſtones in many places being disjointed, as it were, and forced from their original poſition. Two of theſe making an acute angle, the exterior edges touching, without a crevice; and the light abroad being much ſtronger than in the room, which has a modern roof and is dark; the portion in contact becoming pellucid, had illumined the vacant ſpace with a dim colour reſembling that of amber. We were deſired to examine this extraordinary appearance, which the Greeks regarded as a ſtanding miracle, and which the Turks, who could not confute them, beheld with equal aſtoniſhment. We found in the gape ſome coals, which had been brought on a bit of earthen ware for the purpoſe of burning incenſe, as we ſuppoſed, and alſo a piece of wax-taper, which probably had been lighted in honour of the ſaint and author of the wonder; but our Swiſs unfortunately carrying his own candle too far in, the ſmoke blackened the marble, and deſtroyed the phenomenon.

" The building oppoſite to the temple has ſerved as a foundation for a ſquare lofty tower of ordinary maſonry. The columns of the front are walled up; and the entrance is by a low iron gate in the ſide. It is now uſed as a place of confinement for delinquents; but in 1676 was a powder magazine. In the wall of a rampart near it are ſome fragments of exquiſite ſculpture, repreſenting the Athenians fighting with the Amazons. Theſe belong to the freeze, which was then ſtanding. In the ſecond century, when Pauſanias lived, much of the painting was impaired by age, but ſome remained, and the ſubjects were chiefly taken from the Trojan ſtory. The traces are ſince vaniſhed.

" The pediment of the temple of Victory, with that of the oppoſite wing, is deſcribed as remaining in 1676, but on each building a ſquare tower had been erected. One of the ſteps in the front of the propyléa was entire, with the four columns, their entablature and the pediment. The portico, to which the five doorways belonged, conſiſted of a large ſquare room, roof-

ed

ed with ſlabs of marble, which were laid on two great marble beams, and ſuſtained by four beautiful columns. Theſe were Ionic, the proportions of this order beſt ſuiting that purpoſe, as taller than the Doric; the reaſon it was likewiſe preferred in the pronaos of the temple of Victory. The roof of the propyléa, after ſtanding above 2000 years, was probably deſtroyed, with all the pediments, by the Venetians in 1687, when they battered the caſtle in front, firing red-hot bullets, and took it, but were compelled to reſign it again to the Turks in the following year. The exterior walls, and in particular, a ſide of the temple of Victory, retain many marks of their hoſtilities.

11 Temple of Minerva.

"The chief ornament of the acropolis was the parthenion or great temple of Minerva, a moſt ſuperb and magnificent fabric. The Perſians had burned the edifice, which before occupied the ſite, and was called *hecatompedon*, from its being 100 feet ſquare. The zeal of Pericles and of all the Athenians was exerted in providing a far more ample and glorious reſidence for their favourite goddeſs. The architects were Callicrates and Ictinus; and a treatiſe on the building was written by the latter and Carpion. It was of white marble, of the Doric order, the columns fluted and without baſes, the number in front eight: and adorned with admirable ſculpture. The ſtory of the birth of Minerva was carved in the front pediment; and in the back, her conteſt with Neptune for the country. The beaſts of burden, which had conveyed up the materials, were regarded as ſacred, and recompenſed with paſtures; and one, which had voluntarily headed the train, was maintained during life, without labour, at the public expence.

12 Her ſtatue.

"The ſtatue of Minerva, made for this temple by Phidias, was of ivory, 26 cubits or 39 feet high. It was decked with pure gold to the amount of 44 talents, ſo diſpoſed by the advice of Pericles as to be taken off and weighed if required. The goddeſs was repreſented ſtanding, with her veſtment reaching to her feet. Her helmet had a ſphinx for the creſt, and on the ſides were griffins. The head of Meduſa was on her breaſt-plate. In one hand ſhe held her ſpear, and in the other ſupported an image of Victory about four cubits high. The battle of the Centaurs and Lapithæ was carved on her ſandals; and on her ſhield, which lay at her feet, the war of the gods and giants, and the battle of the Athenians and Amazons. By her ſpear was a ſerpent, in alluſion to the ſtory of Erichthonius; and on the pedeſtal, the birth of Pandora. The Sphinx, the Victory, and Serpent, were accounted eminently wonderful. This image was placed in the temple in the firſt year of the 87th Olympiad, in which the Peloponneſian war began. The gold was ſtripped off by the tyrant Lachares, when Demetrius Poliorcetes compelled him to fly. The ſame plunderer plucked down the golden ſhields in the acropolis, and carried away the golden Victories, with the precious veſſels and ornaments provided for the Panathenæan feſtival.

"The parthenion remained entire for many ages after it was deprived of the goddeſs. The Chriſtians converted it into a church, and the Mahometans into a moſque. It is mentioned in the letters of Cruſius, and miſcalled the *pantheon*, and the *temple of the unknown God*. The Venetians under Koningſmark, when they beſieged the acropolis in 1687, threw a bomb, which demoliſhed the roof, and ſetting fire to ſome powder, did much damage to the fabric. The floor, which is indented, ſtill witneſſes the place of its fall. This was the ſad forerunner of farther deſtruction; the Turks, breaking the ſtones, and applying them to the building of a new moſque, which ſtands within the ruin, or to the repairing of their houſes and the walls of the fortreſs. The vaſt pile of ponderous materials, which lay ready, is greatly diminiſhed; the whole ſtructure will gradually be conſumed and diſappear.

13 Temple converted into a moſque.

"The temple of Minerva in 1676 was, as Wheeler and Spon aſſert, the fineſt moſque in the world, without compariſon. The Greeks had adapted the fabric to their ceremonial by conſtructing at one end a ſemicircular receſs for the holy tables, with a window: for before it was enlightened only by the door, obſcurity being preferred under the heathen ritual, except on feſtivals, when it yielded to ſplendid illuminations; the reaſon, it has been ſurmiſed, why temples are commonly found ſimple and unadorned on the inſides. In the wall beneath the window were inſerted two pieces of the ſtone called *phengites*, a ſpecies of marble diſcovered in Cappadocia in the time of Nero; and ſo tranſparent that he erected with it a temple to Fortune, which was luminous within, when the door was ſhut. Theſe pieces were perforated, and the light which entered was tinged with a reddiſh or yellowiſh hue. The picture of the Panagia or Virgin Mary, in Moſaic, on the ceiling of the receſs, remained; with two jaſper columns belonging to the ſcreen, which had ſeparated that part from the nave; and within, a canopy ſupported by four pillars of porphyry, with Corinthian capitals of white marble, under which the table had been placed; and behind it, beneath the window, a marble chair for the archbiſhop; and alſo a pulpit, ſtanding on four ſmall pillars in the middle aile. The Turks had white-waſhed the walls to obliterate the portraits of ſaints, and the other paintings, with which the Greeks decorate their places of worſhip; and had erected a pulpit on the right hand for their iman or reader. The roof was diſpoſed in ſquare compartments; the ſtones maſſive: and ſome had fallen in. It had been ſuſtained in the pronaos by ſix columns; but the place of one was then ſupplied by a large pile of rude maſonry, the Turks not having been able to fill up the gap more worthily. The roof of the naos was ſupported by colonnades ranging with the door, and on each ſide; conſiſting of 22 pillars below, and of 23 above. The odd one was over the entrance, which by that diſpoſition was left wide and unembarraſſed. In the portico were ſuſpended a few lamps, to be uſed in the moſque at the ſeaſons when the muſſelmans aſſemble before day-break, or to be lighted up round the minaret, as is the cuſtom during their Ramazan or Lent.

14 Magnificent ruin.

"It is not eaſy to conceive a more ſtriking object than the parthenion, though now a mere ruin. The columns within the naos have all been removed: but on the floor may be ſeen the circles which directed the workmen in placing them; and at the farther end is a groove acroſs it, as for one of the partitions of the cell. The receſs erected by the Chriſtians is demoliſhed; and from the rubbiſh of the ceiling the Turkiſh boys

Athens. boys collect bits of the Moſaic, of different colours, which compoſed the picture. We are told at Smyrna, that this ſubſtance had taken a poliſh, and been ſet in buckles. This cell is about half demoliſhed; and in the columns which ſurround it, is a large gap near the middle. On the walls are ſome traces of the paintings. Before the portico is a reſervoir ſunk in the rock, to ſupply the Turks with water for the purifications cuſtomary on entering their moſques. In it, on the left hand, is the rubbiſh of the pile erected to ſupply the place of a column; and on the right, a ſtaircaſe, which leads out on the architrave, and has a marble or two with inſcriptions, but worn ſo as not to be legible. It belonged to the minaret, which has been deſtroyed.

15 Sculptures. "The travellers, to whom we are indebted for an account of the moſque, have likewiſe given a deſcription of the ſculpture then remaining in the front. In the middle of the pediment was ſeen a bearded Jupiter, with a majeſtic countenance, ſtanding, and naked; the right arm broken. The thunderbolt, it has been ſuppoſed, was placed in that hand, and the eagle between his feet. On his right was a figure, it is conjectured, of Victory, clothed to the mid-leg; the head and arms gone. This was leading on the horſes of a car, in which Minerva ſat, young and unarmed; her head-dreſs, inſtead of a helmet, reſembling that of a Venus. The generous ardour and lively ſpirit viſible in this pair of celeſtial ſteeds, was ſuch as beſpoke the hand of a maſter, bold and delicate, of a Phidias or Praxiteles. Behind Minerva was a female figure, without a head, ſitting, with an infant in her lap; and in this angle of the pediment was the emperor Hadrian with his arm round Sabina, both reclining, and ſeeming to regard Minerva with pleaſure. On the left ſide of Jupiter were five or ſix other trunks to complete the aſſembly of deities, into which he received her. Theſe figures were all wonderfully carved, and appeared as big as life. Hadrian and his conſort, it is likely, were complimented by the Athenians with places among the marble gods in the pediment, as benefactors. Both of them may be conſidered as intruders on the original company; and poſſibly their heads were placed on trunks, which before had other owners. They ſtill poſſeſs their corner, and are eaſy to be recogniſed, though not unimpaired. The reſt of the ſtatues are defaced, removed, or fallen. Moroſini was ambitious to enrich Vence with the ſpoils of Athens; and by an attempt to take down the principal group, haſtened their ruin. In the other pediment is a head or two of ſea-horſes finely executed, with ſome mutilated figures; and on the architrave beneath them are marks of the fixtures of votive offerings, perhaps of the golden ſhields, or of feſtoons ſuſpended on ſolemn occaſions, when the temple was dreſſed out to receive the votaries of the goddeſs.

16 Erectheum "Neptune and Minerva, once rival deities, were joint and amicable tenants of the Erecthéum, in which was an altar of Oblivion. The building was double, a partition-wall dividing it into two temples, which fronted different ways. One was the temple of Neptune Erectheus, the other of Minerva Polias. The latter was entered by a ſquare portico connected with a marble ſkreen, which fronts towards the propyléa. The door of the cell was on the left hand; and at the farther end of the paſſage was a door leading down into the Pandroſéum, which was contiguous.

17 Temple of Neptune Erectheus. "Before the temple of Neptune Erectheus was an altar of Jupiter *the ſupreme*, on which no living thing was ſacrificed, but they offered cakes without wine. Within it was the altar of Neptune and Erectheus; and two, belonging to Vulcan and a hero named *Butes*, who had tranſmitted the prieſthood to his poſterity, which were called *Butadæ*. On the walls were paintings of this illuſtrious family, from which the prieſteſs of Minerva Polias was alſo taken. It was aſſerted that Neptune had ordained the well of ſalt water, and the figure of a trident in the rock, to be memorials of his contending for the country. The former, Pauſanias remarks, was no great wonder, for other wells of a ſimilar nature were found inland; but this, when the ſouth wind blew, afforded the ſound of waves.

18 Of Minerva Polias. "The temple of Minerva Polias was dedicated by all Attica, and poſſeſſed the moſt ancient ſtatue of the goddeſs. The demi or towns had other deities, but their zeal for her ſuffered no diminution. The image, which they placed in the acropolis, then the city, was in after ages not only reputed conſummately holy, but believed to have fallen down from heaven in the reign of Erichthonius. It was guarded by a large ſerpent, which was regularly ſerved with offerings of honied cakes for his food. This divine reptile was of great ſagacity, and attained to an extraordinary age. He wiſely withdrew from the temple, when in danger from the Medes; and, it is ſaid, was living in the ſecond century. Before this ſtatue was an owl; and a golden lamp. This continued burning day and night. It was contrived by a curious artiſt, named *Callimachus*, and did not require to be repleniſhed with oil oftener than once a-year. A brazen palm-tree, reaching to the roof, received its ſmoke. Ariſtion had let the holy flame expire while Sylla beſieged him, and was abhorred for his impiety. The original olive-tree, ſaid to have been produced by Minerva, was kept in this temple. When the Medes ſet fire to the acropolis, it was conſumed; but, they aſſerted, on the following day, was found to have ſhot up again as much as a cubit. It grew low and crooked, but was eſteemed very holy. The prieſteſs of Minerva was not allowed to eat of the new cheeſe of Attica; and, among her perquiſites, was a meaſure of wheat, and one of barley, for every birth and burial. This temple was again burned when Callias was archon, 24 years after the death of Pericles. Near it was the tomb of Cecrops, and within it Erectheus was buried.

"The ruin of the Erecthéum is of white marble; the architectural ornaments of very exquiſite workmanſhip, and uncommonly curious. The columns of the front of the temple of Neptune are ſtanding with the architrave; and alſo the ſkreen and portico of Minerva Polias, with a portion of the cell retaining traces of the partition-wall. The order is Ionic. An edifice revered by ancient Attica, as holy in the higheſt degree, was in 1676 the dwelling of a Turkiſh family, and is now deſerted and neglected; but many ponderous ſtones and much rubbiſh muſt be removed before the well and trident would appear. The former, at leaſt, might probably be diſcovered. The portico is uſed as a powder-magazine; but we obtained permiſ-

Athens.

fion to dig and to examine the outfide. The door-way of the veftibule is walled up, and the foil rifen nearly to the top of the door-way of the Pandroféum. By the portico is a battery commanding the town, from which afcends an amufing hum. The Turks fire from it, to give notice of the commencement of Ramazan or of their Lent, and of bairam or the holy-days, and on other public occafions.

"The pandroféum is a fmall, but very particular building, of which no fatisfactory idea can be communicated by defcription. The entablature is fupported by women called *Caryatides*. Their ftory is thus related. The Greeks, victorious in the Perfian war, jointly deftroyed Carya, a city of the Peloponnefus, which had favoured the common enemy. They cut off the males, and carried into captivity the women, whom they compelled to retain their former drefs and ornaments, though in a ftate of fervitude. The architects of thofe times, to perpetuate the memory of their punifhment, reprefented them, as in this inftance, each with a burden on her head, one hand uplifted to it; and the other hanging down by her fide. The images were in number fix, all looking toward the parthenion. The four in front, with that next to the propyléa, remain, but mutilated, and their faces befmeared with paint. The foil is rifen almoft to the top of the bafement on which they are placed. This temple was open or latticed between the ftatues; and in it alfo was a ftunted olive-tree, with an altar of Jupiter Hercéus ftanding under it. The propyléa are nearly in a line with the fpace dividing it from the parthenion; which difpofition, befides its other effects, occafioned the front and flank of the latter edifice to be feen at once by thofe who approached it from the entrance of the acropolis.

19
Of Jupiter Olympius.

"The ruin of the temple of Jupiter Olympius confifts of prodigious columns, tall and beautiful, of the Corinthian order, fluted; fome fingle, fome fupporting their architraves; with a few maffive marbles beneath; the remnant of a vaft heap, which only many ages could have confumed and reduced into fo fcanty a compafs. The columns are of very extraordinary dimenfions, being about fix feet in diameter, and near 60 in height. The number without the cell was 116 or 120. Seventeen were ftanding in 1676: but a few years before we arrived, one was overturned with much difficulty, and applied to the building a new mofque in the bazar or market-place. This violence was avenged by the bafhaw of Negropont, who made it a pretext for extorting from the vaiwode or governor 15 purfes; the pillar being, he alleged, the property of their mafter the Grand Signior. It was an angular column, and of confequence in determining the dimenfions of the fabric. We regretted that the fall of this mighty mafs had not been poftponed until we came, as it would have afforded an opportunity of infpecting and meafuring fome members which we found far too lofty to be attempted. On a piece of the architrave, fupported by a couple of columns, are two parallel walls, of modern mafonry, arched about the middle, and again near the top. You are told it has been the habitation of a hermit, doubtlefs of a Stylites; but of whatever building it has been part, and for whatever purpofe defigned, it muft have been erected thus high in air, while the immenfe ruin of this huge ftructure was yet fcarcely diminifhed, and the heap inclined fo as to render it acceffible. It was remarked that two ftones of a ftep in the front had coalefced at the extremity, fo that no juncture could be perceived; and the like was difcovered alfo in a ftep of the parthenion. In both inftances it may be attributed to a concretory fluid, which pervades the marble in the quarry. Some portion remaining in the pieces, when taken green as it were, and placed in mutual contact, it exfuded and united them by a procefs fimilar to that in a bone of an animal when broken and properly fet.

Athens, Atherina.

20
Detached pieces of antique fculpture, &c.

"Befides the more ftable antiquities, many detached pieces are found in the town, by the fountains, in the ftreets, the walls, the houfes, and churches. Among thefe are fragments of fculpture; a marble chair or two, which probably belonged to the Gymnafia or theatres: a fun-dial at the catholicon or cathedral, infcribed with the name of the maker; and, at the archiepifcopal houfe clofe by, a very curious veffel of marble, ufed as a ciftern to receive water, but once ferving, it is likely, as a public ftandard or meafure. Many columns occur; with fome maimed ftatues, and pedeftals, feveral with infcriptions, and almoft buried in earth. A cuftom has prevailed, as at Chios, of fixing in the wall, over the gate-ways and doors of the houfes, carved ftones, moft of which exhibit the funeral fupper. In the courts of the houfes lie many round ftelæ, or pillars, once placed on the graves of the Athenians; and a great number are ftill to be feen applied to the fame ufe in the Turkifh burying grounds before the acropolis. Thefe generally have concife infcriptions containing the name of the perfon, and of the town and tribe to which the deceafed belonged. Demetrius the Phalerian, who endeavoured to reftrain fepulchral luxury, enacted, that no perfon fhould have more than one, and that the height fhould not exceed three cubits. Another fpecies, which refembles our modern head-ftones, is fometimes adorned with fculpture, and has an epitaph in verfe. We faw a few mutilated Hermæ. Thefe were bufts on long quadrangular bafes, the heads frequently of brafs, invented by the Athenians. At firft they were made to reprefent only Hermes or Mercury, and defigned as guardians of the fepulchres in which they were lodged; but afterwards the houfes, ftreets, and porticos of Athens, were adorned with them, and rendered venerable by a multitude of portraits of illuftrious men and women, of heroes, and of gods: and, it is related, Hipparchus, fon of Pififtratus, erected them in the demi or borough-towns, and by the road-fide, infcribed with moral apophthegms in elegiac verfe; thus making them vehicles of inftruction."

ATHERINA, in ichthyology, a genus of fifhes of the order of abdominales. The characters of this genus are thefe: The upper jaw is plain: the rays of the branchioftege membrane are fix; and the fide-belt or line fhines like filver. The fpecies are two, viz. 1. The hepfetus, with about 12 rays in the fin next the anus. It is found in the Mediterranean. It is alfo very common in the fea near Southampton, England, where, it is called a *fmelt*. The higheft feafon is from March to the latter end of May, or beginning of June; in which month it fpawns. It never deferts the place; and is conftantly taken except in hard froft. It is alfo found on other coafts of that ifland. The length is above

bove $4\frac{1}{2}$ inches, and the tail is much forked. The fish is semipellucid, covered with scales; the colour silvery, tinged with yellow: beneath the side-line is a row of small black spots. 2. The menidea, with 24 rays in the fin next the anus. This is a very small pellucid fish, with many black points interspersed; it has many teeth in the lips, but none in the tongue or jaws. It is found in the fresh waters of Carolina, and spawns in April.

ATHEROMA, in surgery, a tumor without pain or discoloration of the skin, containing, in a membranous bag, matter resembling pap, intermixed with hard and stony particles. These tumors are easily cured by incision.

ATHERTON, or ATHERSTON, a town of Warwickshire in England, situated on the river Stour, in W. Long. 1. 30. N. Lat. 52. 40. It is a considerable town, and had formerly a monastery; but now is best known by its fair, which is the greatest in England for cheese.

ATHESIS (anc. geog.), a river of the Cisalpine Gaul, which, rising in the Rhetian Alps, in Mount Brenna, in the county of Tirol, runs southwards and washes Tridentum and Verona, which last it divides; and after passing this, bends its course eastwards, in a parallel direction with the Po, and falls into the Adriatic between Fossa Claudia and Philistina: it separated the Euganei, an ancient people, from the Veneti. The people dwelling on it are called *Athesini* (Pliny). Its modern name is the *Adige*.

ATHLETÆ, in antiquity, persons of strength and agility, disciplined to perform in the public games. The word is originally Greek, αθλητης; formed from αθλος, *certamen*, "combat;" whence also αθλον, the prize or reward adjudged the victor.—Under Athletæ were comprehended wrestlers, boxers, runners, leapers, throwers of the disk, and those practised in other exercises exhibited in the Olympic, Pythian, and other solemn sports; for the conquerors wherein there were established prizes.

ATHLETIC HABIT, denotes a strong hale constitution of body. Anciently it signified a full fleshy corpulent state, such as the athletæ endeavoured to arrive at. The athletic habit is esteemed the highest pitch of health: yet is it dangerous, and the next door to disease; since, when the body is no longer capable of being improved, the next alteration must be for the worse. The chief object of the athletic diet, was to obtain a firm, bulky, weighty body; by force of which, more than art and agility, they frequently overpowered their antagonist: hence they fed altogether on dry solid, and viscuous meats. In the earlier days, their chief food was dry figs and cheese, which was called *arida saginatio* ξηρα τροφη, and Αςκησις διαξηρων ισχαδων. Oribasius, or, as others say, Pythagoras, first brought this in disuse, and substituted flesh in lieu thereof. They had a peculiar bread called κολλητια: They exercised, eat, and drank, without ceasing: they were not allowed to leave off eating when satiated, but were obliged to cram on till they could hold no more; by which means they at length acquired a degree of voracity which to us seems incredible, and a strength proportional. Witness what Pausanias relates of the four celebrated athletæ, Polydamus the Thessalian, Milo the Crotonian, Theagenes the Thasian, and Euthymus the Locrian: The second is said to have carried a bull on his back a considerable way, then to have knocked him down with a blow of his fist, and lastly, as some add, devoured him at a meal.

ATHLONE, a town of Westmeath, in Ireland, lying in W. Long. 8. 0. N. Lat. 53. 20. It is situated on both sides of the Shannon, and both parts are united by a strong, high-raised, and well-built bridge, in the middle of which stands a monument, with some figures cut in marble, together with Queen Elizabeth's arms, and some inscriptions declaring the time and the founders of the building. The castle was founded by King John on some land belonging to St Peter's abbey, for which he granted a compensation. It is built on a high-raised round hill, resembling one of the Danish raths or forts. Here were formerly two convents or monasteries. Athlone was formerly strongly fortified, and considered as of very great importance. In the year 1691, a part of the English army under General Ginckle, in the very face of the Irish, who were strongly entrenched on the opposite shore, fording the river, formed, and took possession of the town, not losing more than 50 men in the attack; which is esteemed as bold and successful an enterprise as any recorded in history. There are generally two troops of horse and four companies of foot quartered at Athlone. This town gives the title of *earl* to the family of Ginckle, as a reward for the noble services performed by the General.

ATHOL, the most northern district of Perthshire in Scotland, extending in length 43 miles, and in breadth 30. It is bordered on the north by Badenoch, on the west by Lochaber, on the east and south-east by Mar and Gowrie, on the south by Stratherne and Perth Proper, and on the south-west by Braidalbane. The country is very rough and mountainous, and contains part of the ancient Caledonian forest; but these mountains are interspersed with fruitful vallies. Here are several villages, but no towns of any consideration. The most noted place is Blair Castle, seated on the river Tilt, near its influx into the Gurrey, a pleasant limpid stream that falls into the Tay. This castle belongs to the Duke of Athol, who derives his title from this district, and lives here with great magnificence. In the same neighbourhood we see the pass of Gillicranky, rendered memorable by the battle fought here in the beginning of King William's reign, between that monarch's general M'Kay, and the Highlanders adhering to king James. See GILLICRANKY.

ATHOS, a celebrated mountain of Chalcidia in Macedonia, situated E. Long. 26. 20. N. Lat. 40. 10. The ancients entertained extravagant notions concerning its height. Mela affirmed it to be so high as to reach above the clouds; and Martianus Capellinus, that it was six miles high. It was a received opinion, that the summit of mount Athos was above the middle region of the air, and that it never rained there; because the ashes left on the altars erected near its summit were always found as they were left, dry and unscattered. But if on many accounts it was famous among the ancients, it is no less so among the moderns. The Greeks, struck with its singular situation and the venerable appearance of its towering ascent, erected so many churches, monasteries, hermitages, &c. upon it, that it became in a manner inhabited by devotees, and from thence received the name of the *Holy Mountain*; which name it still retains, though many of those consecrated works are now decayed. According to the accounts of modern travellers, this mountain advances into the Archipelago, being joined to the continent by an isthmus about half a league in breadth. It is about 30 miles in circumference, and two in perpendicular height. It may be tavelled over in about three days, and may be seen 90 miles off. There is a fine prospect from the top; but, like all other high mountains, the cold on its summit is excessive. It abounds with many different kinds of plants and trees, particularly the pine and fir. In the valleys grows a plant called *elegia*, whose branches serve to make pens for writing. In short, this mountain is said to be adorned with variety of herbage and evergreens, a multitude of springs and streams, and woods growing near the shore, so as to be one of the most agreeable places in the world.

It is now inhabited by Caloyers, a sort of Greek monks, of the order of St Basil, who never marry, though others of that church do. They abstain from flesh, and fare very hardly, their ordinary meal being olives pickled when they are ripe. They are about 6000 in all, and inhabit several parts of the mountain, on which are 24 large old monasteries, surrounded with high walls for a defence against banditti. They are so respected, that the Turks themselves will often send them alms. These monks are not idle like others; but labour with the ax, spade, and sickle, dressing themselves like hermits. Formerly they had fine Greek manuscripts; but are now become so illiterate, that they can scarce read or write.

Through this mountain, or rather through the isthmus behind it, Xerxes king of Persia is said to have cut a passage for his fleet when about to invade Greece. In this work he spent three whole years, and employed in it all the forces on board the fleet. He is also said, before the work was begun, to have written the following insolent and ridiculous letter to the mountain: "Athos, thou proud and aspiring mountain, that liftest up thy head to the very skies, I advise thee not to be so audacious as to put rocks and stones that cannot be cut in the way of my workmen. If thou makest that opposition, I will cut thee entirely down, and throw thee headlong into the sea." The directors of this enterprise are said to have been Bubaris the son of Megabyzus, and Artacheus the son of Arbeus, both Persians; but as no traces of such a great work remain, the truth of the whole relation has justly been called in question.

ATHWART, in navigation, is synonimous with across the line of the course.

Athwart the Fore-foot, is a phrase that denotes the flight of a cannon-ball from one ship across the course of another, to intercept the latter, and oblige her to shorten sail, that the former may come near enough to examine her.

Athwart-Hause, expresses the situation of a ship, when she is driven by wind or tide, or any other accident, across the fore-part of another.

Athwart-Ships, reaching across ships from one side to the other.

ATHY, a town of Ireland in the county of Kildare, not far from the borders of Queen's county. W. Long. 7. 0. N. Lat. 53. 0. It is situated on the river Barrow; is governed by a sovereign, two bailiffs, and a recorder, and is, alternately with Naas, the assizes town.

ATIBAR, the name by which the inhabitants of the kingdom of Gago in Africa call gold-dust; from which word Europeans, and especially the French, have composed the word *tibir*, which also signifies gold-dust among those who trade in that commodity.

ATIGNY, an ancient town of Champagne in France, where several of the kings of France had their residence. It is seated on the river Arsne, in E. Long. 4. 47. N. Lat. 49. 30.

ATKINS (Sir Robert), lord chief baron of the exchequer, was born in 1621, and educated at the university of Oxford, from whence he removed to the inns of court, and became eminent in the law. He was made knight of the Bath, with many other persons of the first distinction, at the coronation of King Charles II. In 1672, he was appointed one of the judges of Common Pleas; in which honourable station he continued till 1679, when, foreseeing the troubles that soon after ensued, he thought fit to resign, and retire into the country. In 1689, he was made by King William lord chief baron of the exchequer; and about the same time executed the office of speaker to the house of lords, which had been previously refused by the Marquis of Halifax. He distinguished himself by an unshaken zeal for the laws and liberties of his country. He wrote several pieces, which have been collected into one volume 8vo, under the title of *Parliamentary and Political Tracts*. The authors of the Biographia Britannica remark, that whoever inclines to be thoroughly informed of the true constitution of his country, of the grounds and reasons of the revolution, and of the danger of suffering prerogative to jostle law, cannot read a better or plainer book than those tracts of Sir Robert Atkins. He died in 1709, aged 88.

ATKINS (Sir Robert), son of the preceding, was born in 1646, and was eminent for all the virtues that could adorn an English gentleman. He wrote The Ancient and Present State of Gloucestershire, in one large volume in folio; and died October 29, 1711.

ATKYNS (Richard), was descended from a good family, and was born at Tuffleigh in Gloucestershire, in the year 1615. He was educated at Oxford, from whence he removed to Lincoln's Inn, and afterwards distinguished himself by his loyalty to King Charles I. for whom he raised a troop of horse at his own expence. At the Restoration he was made one of the deputy lieutenants of Gloucestershire, and distinguished himself by his attachment to the government. But at length being committed prisoner to the Marshalsea in Southwark for debt, he died there on the 14th of September 1677. He wrote several pieces, particularly A Treatise on the Original and Growth of Printing.

ATLANTIC OCEAN, that bounded by Europe and Africa on the east, and by America on the west.

ATLANTICA. See ATLANTIS.

ATLANTIDES, in astronomy, a denomination given to the Pleiades, or seven stars, sometimes also called *Vergilliæ*. They are thus called, as being suppo-

sed

sed by the poets to have been the daughters either of Atlas or his brother Hesperus, who were translated into heaven.

ATLANTIS, Atalantis, or Atlantica, an island mentioned by Plato and some others of the ancients, concerning the real existence of which many disputes have been raised. Homer, Horace, and the other poets, make two Atlanticas, calling them *Hesperides* and *Elysian Fields*, making them the habitations of the blessed. The most distinct account of this island we have in Plato's Timæus, of which Mr Chambers gives the following abridgment. "The Atlantis was a large island in the western ocean, situated before or opposite to the straits of Gades. Out of this island there was an easy passage into some others, which lay near a large continent exceeding in bigness all Europe and Asia. Neptune settled in this island (from whose son Atlas its name was derived), and divided it among his ten sons. To the youngest fell the extremity of the island, called *Gadir*, which in the language of the country signifies *fertile*, or *abundant in sheep*. The descendants of Neptune reigned here from father to son for a great number of generations in the order of primogeniture, during the space of 9000 years. They also possessed several other islands; and, passing into Europe and Africa, subdued all Lybia as far as Egypt, and all Europe to Asia Minor. At length the island sunk under water, and for a long time afterwards the sea thereabouts was full of rocks and shelves."

Many of the moderns also are of opinion, that the existence of the Atlantis is not to be looked upon as entirely fabulous. Some take it to have been America; and from thence, as well as from a passage in Seneca's Medea, and some other obscure hints, they imagine that the new world was not unknown to the ancients. But allowing this to be the case, the abovementioned continent which was said to lie beyond Atlantis would seem rather to have been the continent of America than Atlantis itself. The learned Rudbeck, professor in the university of Upsal, in a work intitled *Atlantica sive Manheim*, endeavours to prove that Sweden and Norway are the Atlantis of the ancients; but this its situation will by no means allow us to believe. By Kircher it is supposed to have been an island extending from the Canaries quite to the Azores; that it was really swallowed up by the ocean as Plato asserts: and that these small islands are the shattered remains of it which were left standing.

Atlantis (New), is the name of a fictitious philosophical commonwealth, of which a description has been given by Lord Bacon.—The new Atlantis is supposed to be an island in the South Sea, to which the author was driven in a voyage from Peru to Japan. The composition is an ingenious fable, formed after the manner of the Utopia of Sir Thomas More, or Campanella's City of the Sun. Its chief design is to exhibit a model or description of a college, instituted for the interpretation of nature and the production of great and marvellous works, for the benefit of men, under the name of *Solomon's House*, or "the college of the six day's work." Thus much, at least, is finished; and with great beauty and magnificence. The author proposed also a frame of laws, or of the best state or mould of a commonwealth. But this part is not executed.

ATLAS, king of Mauritania, a great astronomer, contemporary with Moses. From his taking observations of the stars from a mountain, the poets feigned him to have been turned into a mountain, and to sustain the heavens on his shoulders. Being an excellent astronomer, and the first who taught the doctrine of the sphere, they tell us that his daughters were turned into stars; seven of them forming the Pleiades, and other seven the Hyades.

Atlas, a chain of mountains in Africa, lying between the 20th and 25th degree of north latitude, and supposed almost to divide the continent from east to west. They are said to have derived their name from Atlas king of Mauritania, who was a great astronomer. They are greatly celebrated by the ancients on account of their height, insomuch that the abovementioned king, who is said to have been transformed into a mountain, was feigned to bear up the heavens on his shoulders. We are assured, however, by Dr Shaw, that the part of this chain of mountains which fell under his observation could not stand in competition either with the Alps or Apennines. He tells us, that if we conceive a number of hills, usually of the perpendicular height of 400, 500, or 600 yards, with an easy ascent, and several groves of fruit or forest trees, rising up in a succession of ranges above one another; and that if to this prospect we add now and then a rocky precipice, and on the summit of each imagine a miserable mud-walled village; we shall then have a just idea of the mountains of Atlas.

According to M. Chenier*, this mountain is formed by an endless chain of lofty eminences, divided into different countries, inhabited by a multitude of tribes, whose ferocity permits no stranger to approach. "I have not been able (continues he) to obtain a sufficient knowledge of these mountains to describe them accurately: What Leo Africanus has said of them is very vague; and his account is the less to be regarded at present, as it is now about three centuries since he wrote, and the face of the country has been in that time totally changed. Nothing perhaps would be more interesting to the curiosity of the philosopher, or conduce more to the improvement of our knowledge in natural history, than a journey over mount Atlas. The climate, though extremely cold in winter, is very healthy and pleasant; the valleys are well cultivated, abound in fruits, and are diversified by forests and plentiful springs, the streams of which uniting at a little distance, form great rivers, and lose themselves in the ocean. According to the reports of the Moors, there are many quarries of marble, granite, and other valuable stone, in these mountains: It is probable there are also mines, but the inhabitants have no idea of these riches; they consider their liberty, which their situation enables them to defend, as the most inestimable of all treasures."

* *Hist. of Morocco*, l. 13.

Atlas, in matters of literature, denotes a book of universal geography, containing maps of all the known parts of the world.

Atlas, in commerce, a silk-sattin, manufactured in the East-Indies. There are some plain, some striped, and some flowered, the flowers of which are either gold or only silk. There are atlasses of all colours; but most of them false, especially the red and the crimson. The manufacture of them is admirable; the gold and

Atmosphere.

and silk being worked together after such a manner as no workmen in Europe can imitate; yet they are very far from having that fine gloss and lustre which the French know how to give to their silk stuffs. In the Chinese manufactures of this sort, they gild paper on one side with leaf-gold; then cut it in long slips, and weave it into their silks; which makes them with very little cost, look very rich and fine. The same long slips are twisted or turned about silk threads, so artificially, as to look finer than gold thread, though it be of no great value.

ATMOSPHERE, a word generally used to signify the whole mass of fluid consisting of air, aqueous and other vapours, electric fluid, &c. surrounding the earth to a considerable height.

1 Atmosphere composed of two different fluids.

The composition of that part of our atmosphere properly called *air*, was till lately very much unknown. In former times it was supposed to be a simple, homogeneous, and elementary fluid. The experiments of Dr Priestly discovered, that the purest kind of air, which he called *dephlogisticated*, was in reality a compound, and might be artificially produced in various ways. His first conjectures concerning its component parts were, that it consisted of earth, nitrous acid, and phlogiston. Subsequent experiments rendered these conjectures dubious; and at last it was supposed that dephlogisticated air is a pure elementary substance, the vivifying principle to animals, and the acidifying principle throughout all nature. This dephlogisticated air, however, is but a small part of the composition of our atmosphere. According to the most accurate computations, the air we usually breathe is composed of only one-fourth of this dephlogisticated air, or perhaps less; the other three or four parts consisting of what Dr Priestley calls *phlogisticated*, and M. Lavoisier *mephitic air*. This by itself is absolutely noxious, and exceedingly poisonous to animals: though it seems only to be negatively so; for when mixed in a certain proportion with dephlogisticated air, it may be breathed with safety, which could not be if it contained any ingredient absolutely unfriendly to the human constitution. The other part, viz. the pure dephlogisticated air, seems to stand much in the same relation to plants that phlogisticated air does to animals; that is, it would prove poisonous, and destroy them if they were to depend upon it entirely for their subsistence; but as they derive their nourishment partly from the air and partly from the soil, it thence happens, that the plants which are set to grow in dephlogisticated air do not die instantly, as animals do in the phlogisticated kind, but remain for some time weak and sickly.

2 Phlogisticated air poisonous to animals, and dephlogisticated air to vegetables.

3 A great quantity of electric fluid contained in the atmosphere

The other component parts of our atmosphere are so various, and of such heterogeneous natures, that they do not admit of any kind of definition or analysis, one only excepted, namely, the *electric fluid*. This we know pervades the whole, but appears to be much more copious in the upper than in the lower atmospherical regions. See Electricity. To measure the absolute quantity of this fluid, either in the atmosphere or any other substance, is impossible. All that we can know on this subject is, that the electric fluid pervades the atmosphere; that it appears to be more abundant in the superior than the inferior regions; that it seems to be the immediate bond of connection between the atmosphere and the water which is suspended in it; and that by its various operations, the phenomena of hail, rain, snow, lightning, and various other kinds of meteors, are occasioned. See Rain, Hail, Snow, &c.

4 Calculations of the height of the atmosphere.

Various attempts have been made to ascertain the height to which the atmosphere is extended all round the earth. These commenced soon after it was discovered, by means of the Torricellian tube, that air is a gravitating substance. Thus it also became known, that a column of air, whose base is a square inch, and the height that of the whole atmosphere, weighs 15 pounds; and that the weight of air is to that of mercury as 1 to 10,800: whence it follows, that if the weight of the atmosphere be sufficient to raise a column of mercury to the height of 30 inches, the height of the aerial column must be 10,800 times as much, and consequently a little more than five miles high.

It was not, however, at any time supposed, that this calculation could be just: for as the air is an elastic fluid, the upper parts must expand to an immense bulk, and thus render the calculation above related exceedingly erroneous. By experiments made in different countries, it has been found, that the spaces which any portion of air takes up, are reciprocally proportional to the weights with which it is compressed. Allowances were therefore to be made in calculating the height of the atmosphere. If we suppose the height of the whole divided into innumerable equal parts, the density of each of which is as its quantity; and the weight of the whole incumbent atmosphere being also as its quantity; it is evident, that the weight of the incumbent air is every where as the quantity contained in the subjacent part; which makes a difference between the weights of each two contiguous parts of air. By a theorem in geometry, where the differences of magnitudes are geometrically proportional to the magnitudes themselves, these magnitudes are in continual arithmetical proportion; therefore, if, according to the supposition, the altitude of the air, by the addition of new parts into which it is divided, do continually increase in arithmetical proportion, its density will be diminished, or (which is the same thing, its gravity decreased) in continual geometrical proportion.

It is now easy, from such a series, by making two or three barometrical observations, and determining the density of the atmosphere at two or three different stations, to determine its absolute height, or its rarity at any assignable height. Calculations accordingly were made upon this plan; but it having been found that the barometrical observations by no means corresponded with the density which, by other experiments, the air ought to have had, it was suspected that the upper part of the atmospherical regions were not subject to the same laws with the lower ones. Philosophers therefore had recourse to another method for determining the altitude of the atmosphere, viz. by a calculation of the height from which the light of the sun is refracted, so as to become visible to us before he himself is seen in the heavens. By this method it was determined, that at the height of 45 miles the atmosphere had no power of refraction; and consequently beyond that distance was either a mere vacuum, or the next thing to it, and not to be regarded.

5 Height of it determined from the beginning and end of twilight.

This theory soon became very generally received and the height of the atmosphere was spoken of as familiarly

Atmosphere.

6 Objection from the appearance of meteors.

miliarly as the height of a mountain, and reckoned to be as well ascertained, if not more so, than the heights of most mountains are. Very great objections, however, which have never yet been removed, arise from the appearances of some *meteors*, like large globes of fire, not unfrequently to be seen at vast heights above the earth (see METEOR). A very remarkable one of this kind was observed by Dr Halley in the month of March 1719, whose altitude he computed to have been between 69 and 73¼ English miles; its diameter 2800 yards, or upwards of a mile and an half; and its velocity about 350 miles in a minute. Others, apparently of the same kind, but whose altitude and velocity were still greater, have been observed: particularly that very remarkable one, August 18th 1781, whose distance from the earth could not be less than 90 miles, and its diameter not less than the former; at the same time that its velocity was certainly not less than 1000 miles in a minute. Fire-balls, in appearance similar to these, though vastly inferior in size, have been sometimes observed at the surface of the earth. Of this kind Dr Priestley mentions one seen on board the Montague, 4th November 1749, which appeared as big as a large millstone, and broke with a violent explosion.

From analogical reasoning, it seems very probable, that the meteors which appear at such great heights in the air are not essentially different from those which, like the fire-ball just mentioned, are met with on the surface of the earth. The perplexing circumstances with regard to the former are, that at the great heights abovementioned, the atmosphere ought not to have any density sufficient to support flame, or to propagate sound; yet these meteors are commonly succeeded by one or more explosions, nay are sometimes said to be accompanied with a hissing noise as they pass over our heads. The meteor of 1719 was not only very bright, insomuch that for a short space it turned night into day, but was attended with an explosion heard over all the island of Britain, occasioning a violent concussion in the atmosphere, and seeming to shake the earth itself. That of 1783 also, though much higher than the former, was succeeded by explosions; and, according to the testimony of several people, a hissing noise was heard as it passed. Dr Halley acknowledged that he was unable to reconcile these circumstances with the received theory of the height of the atmosphere; as, in the regions in which this meteor moved, the air ought to have been 300,000 times more rare than what we breathe, and the next thing to a perfect vacuum.

In the meteor of 1783, the difficulty is still greater, as it appears to have been 20 miles farther up in the air. Dr Halley offers a conjecture, indeed, that the vast magnitude of such bodies might compensate for the thinness of the medium in which they moved. Whether or not this was the case, cannot indeed be ascertained, as we have so few data to go upon; but the greatest difficulty is to account for the brightness of the light. Appearances of this kind are indeed with great probability attributed to electricity, but the difficulty is not thus removed. Though the electrical fire pervades with great ease the vacuum of a common air-pump, yet it does not in that case appear in bright well defined sparks, as in the open air, but rather in long streams resembling the aurora borealis. From some late experiments indeed, Mr Morgan concludes, that the electrical fluid cannot penetrate a perfect vacuum*. If this is the case, it shows that the regions we speak of are not such a perfect vacuum as can be artificially made; but whether it is or not, the extreme brightness of the light shows that a fluid was present in those regions, capable of confining and condensing the electric matter as much as the air does at the surface of the ground; for the brightness of these meteors, considering their distance, cannot be supposed inferior to that of the brightest flashes of lightning.

* See *Electricity*-Index.

7 Density of the air does not always keep pace with its gravity.

This being the case, it appears reasonable to conclude that what is called the *density* of the air does not altogether keep pace with its gravity. The latter indeed must in a great measure be affected by the vapours, but above all by the quantity of the basis of fixed or dephlogisticated air contained in it: for Mr Kirwan has discovered that the basis of fixed air, when deprived of its elastic principle, is not greatly inferior to gold in specific gravity; and we cannot suppose that of dephlogisticated air to be much less. It is possible, therefore, that pure air, could it be deprived of all the water it contains, might have very little gravity; and as there is great reason to believe that the basis of dephlogisticated air is only one of the constituent parts of water †, we see an evident reason why the air ought to become lighter, and likewise less fit for respiration, the higher up we go, though there is a possibility that its density, or power of supporting flame, may continue unaltered.

† See *Dephlogisticated air*, and *Water*.

There are not yet, however, a sufficient number of facts to enable us to determine this question; though such as have been discovered seem rather to favour the above conjecture. Dr Boerhaave was of opinion that the gravity of the air depended entirely on the water it contained; and, by means of alkaline salts, he was enabled to extract as much water from a quantity of air as was very nearly equivalent to its weight. By the calcination of metals we may extract as much of the basis of dephlogisticated air from a quantity of atmospherical air as is equivalent to the weight of air lost. Were it possible, therefore, to extract the whole of this, as well as all other vapours, and to preserve only the elastic principle, it is highly probable that its gravity would entirely cease. It has been found by those who have ascended with aerostatic machines, or to the tops of high mountains, that the deplogisticated air is found to be contained in smaller quantities in the atmosphere of these elevated regions than on the lower grounds. It is also found, that in such situations the air is much drier, and parts with water with much more difficulty, than on the ordinary surface. Salt of tartar, for instance, which at the foot of a mountain will very soon run into a liquid, remains for a long time exposed to the air on the top of it, without showing the least tendency to deliquesce. Nevertheless, it hath never been observed that fires did not burn as intensely on the tops of the highest monntains as on the plains. The matter indeed was put to the trial in the great eruption of Vesuvius in 1779, where, though the lava spouted up to the height of three miles above the level of the sea, the uppermost parts all the while were to appearance as much inflamed as the lowest.

The

Atmosphere.

8 Gravity of the upper regions of the atmosphere perhaps diminished by electricity.

The high degree of electricity, always existing in the upper regions of the atmosphere, must of necessity have a very considerable influence on the gravity of any heterogeneous particles floating in it. When we consider the effects of the electric fluid upon light bodies at the surface of the earth, it will readily be admitted, that in those regions where this fluid is very abundant, the gravity of the atmosphere may be much diminished without affecting its density. We know that it is the nature of any electrified substance to attract light bodies; and that, by proper management, they may even be suspended in the air, without either moving up or down for a considerable time. If this is the case with light terrestrial bodies it cannot be thought very improbable that the aerial particles themselves, *i. e.* those which we call the basis of dephlogisticated air, and of aqueous or other vapour diffused among them, should be thus affected in the regions where electricity is so abundant. From this cause, therefore, also the gravity of the atmosphere may be affected without any alteration at all being made in its density; and hence may arise anomalies in the barometer hitherto not taken notice of.

9 Absolute height of the atmosphere undetermined

It appears, therefore, that the absolute height of the atmosphere is not yet determined. The beginning and ending of twilight indeed show, that the height at which the atmosphere begins to refract the sun's light is about 44 or 45 English miles. But this may not improbably be only the height to which the aqueous vapours are carried: for it cannot be thought any unreasonable supposition, that light is refracted only by means of the aqueous vapour contained in the atmosphere; and that where this ceases, it is still capable of supporting the *electric* fire at least, as bright and strong as at the surface. That it does extend much higher, is evident from the meteors already mentioned: for all these are undoubtedly carried along with the atmosphere; otherwise that of 1783, which was seen for about a minute, must have been left 1000 miles to the westward, by the earth flying out below it in its annual course round the sun.

10 Of the pressure of the atmosphere

It has already been mentioned, that the pressure of the atmosphere, when in its mean state, is equivalent to a weight of 15 pounds on every square inch. Hence Dr Cotes computed, that the pressure of the whole ambient fluid upon the earth's surface is equivalent to that of a globe of lead 60 miles in diameter. Hence also it appears, that the pressure upon a human body must be very considerable; for as every square inch of surface sustains a pressure of 15 pounds, every square foot, as containing 144 inches, must sustain a pressure of 2160; and if we suppose a man's body to contain 15 square feet of surface, which is pretty near the truth, he must sustain a weight of 32,400 pounds, or 16 tun, for his ordinary load. By this enormous pressure we should undoubtedly be crushed in a moment, were not all parts of our bodies filled either with air or some other elastic fluid, the spring of which is just sufficient to counterbalance the weight of the atmosphere. But whatever this fluid may be, we are sure that it is just able to counteract the atmospherical gravity and no more; for if any considerable pressure be superadded to that of the air, as by going into deep water, or the like, it is always severely felt, let it be ever so equable. If the pressure of the atmosphere is taken off from any part of the human body, the hand, for instance, when put in an open receiver from whence the air is afterwards extracted, the weight of the atmosphere then discovers itself, and we imagine the hand strongly sucked down into the glass. See PNEUMATICS.

11 Variation of the pressure, and its effects.

In countries at some distance from the equator, the pressure of the atmosphere varies considerably, and thus produces considerable changes on many terrestrial bodies. On the human body the quantity of pressure sometimes varies near a whole tun; and when it is thus so much diminished, most people find something of a listlessness and inactivity about them. It is surprising, however, that the spring of the internal fluid, already mentioned, which acts as a counterpoise to the atmospherical gravity, should in all cases seem to keep pace with it when the pressure is naturally diminished, and even when it is artificially augmented, though not when the pressure is artificially diminished. Thus in that kind of weather when the pressure of the air is least, we never perceive our veins to swell, or are sensible of any inward expansion in our bodies. On the contrary, the circulation is languid, and we seem rather to be oppressed by a weight.

12 Of difficulty of respiration on the tops of mountains.

Even in going up to the tops of mountains, where the pressure in the atmosphere is diminished more than three times what it usually is on the plain, no such appearances are observed. Some travellers indeed have affirmed, that, on the tops of very high mountains, the air is so light as to occasion a great difficulty of respiration, and even violent retching and vomiting of blood. It does not appear, however, that these assertions are well founded. Mr Brydone found no inconvenience of this kind on the top of mount Ætna; nor is any such thing mentioned by Mr Houel, who also ascended this mountain. Sir William Hamilton indeed says, that he did feel a difficulty of respiration, independent of any sulphureous stream. But, on the top of a volcano, the respiration may be affected by so many different causes, that it is perhaps impossible to assign the true one. The French mathematicians, when on the top of a very high peak of the Andes, did not make any complaint of this kind, though they lived there for some time. On the contrary, they found the wind so extremely violent, that they were scarce able to withstand its force; which seems an argument for at least equal *density* of the atmosphere in the superior as in the inferior regions. Dr Heberden, who ascended to the top of Teneriffe, a higher mountain than Ætna, makes no mention of any difficulty of respiration.

13 Mr Saussure's symptoms on the top of Mount Blanc accounted for

M. Saussure, however, in his journey to the top of Mount Blanc, the highest of the Alps, felt very great uneasiness in the way. His respiration was not only extremely difficult, but his pulse became quick, and he was seized with all the symptoms of a fever. His strength was also exhausted to such a degree, that he seemed to require four times as long a space to perform some experiments on the top of the mountain as he would have done at the foot of it. It must be observed, however, that these symptoms did not begin to appear till he had ascended two miles and a half perpendicular above the level of the sea. The mountain is only about a quarter of a mile higher; and in this short space he was reduced to the situation just mentioned. But it is improbable that so small a difference, even at the end of of his journey, ſhould have produced ſuch violent effects, had not ſome other cauſe concurred. A cauſe of this kind he himſelf mentions, viz. that the atmoſphere at the top of the mountain was ſo much impregnated with fixed air, that lime-water, expoſed to it, quickly became covered with a pellicle occaſioned by the abſorption of that fluid. Now it is known, that fixed air is extremely pernicious to animals, and would bring on ſymptoms ſimilar to thoſe abovementioned. There is no reaſon, therefore, to have recourſe to the rarity of the atmoſphere for ſolving a phenomenon which may more naturally be accounted for otherwiſe.

When the preſſure of the atmoſphere is augmented, by deſcending, in the diving-bell, to conſiderable depths in the ſea, it does not appear that any inconvenience follows from its increaſe. Thoſe who ſit in the diving-bell are not ſenſible of any preſſure as long as they remain in the air, though they feel it very ſenſibly in going into the water: yet it is certain, that the preſſure in both caſes is the ſame; for the whole preſſure of the atmoſphere, as well as of the water, is ſuſtained by the air in the diving-bell, and conſequently communicated to thoſe who ſit in it.

But though artificial compreſſion of the air, as well as natural rarefaction, can thus be borne, it is otherwiſe with artificial rarefaction. Animals in an air-pump ſhow uneaſineſs from the very firſt, and cannot live for any time in an atmoſphere rarefied artificially even as much as it appeared to be from the barometer on the top of Mount Blanc.

14
Variation of the atmoſpherical preſſure accounted for.

It is not eaſy to aſſign the true reaſon of the variations of gravity in the atmoſphere. Certain it is, however, that they take place only in a very ſmall degree within the tropics; and ſeem there to depend on the heat of the ſun, as the barometer conſtantly ſinks near half an inch every day, and riſes again to its former ſtation in the night-time. In the temperate zones the barometer ranges from 28 to near 31 inches, by its various altitudes ſhowing the changes that are about to take place in the weather. If we could know, therefore, the latent cauſes by which the weather is influenced, we ſhould likewiſe certainly know thoſe by which the gravity of the atmoſphere is affected. Theſe are particularly explained under the articles Rain, Hail, Snow, Winds, &c. but in general they may be reduced to two, viz. an emiſſion of latent heat from the vapour contained in the atmoſphere, or of electric fluid from the ſame, or from the earth. To one or both of theſe cauſes, therefore, may we aſcribe the variations of the gravity of the atmoſphere: and we ſee that they both tend to produce the ſame effect with the ſolar heat in the tropical climates, viz. to rarefy the air, by mixing with it or ſetting looſe a non-gravitating fluid, which did not act in ſuch large proportion in any particular place before. No doubt, the action of the latent heat and electric fluid is the ſame in the torrid as in the temperate zones: but in the torrid zone the ſolar heat and exceſſive evaporation counteract them; ſo that whatever quantities may be diſcharged by the exceſſive deluges of rain, &c. which fall in thoſe countries, they are inſtantly abſorbed by the abundant fluid, and are quickly ready to be diſcharged again; while, in the temperate zones, the air becomes ſenſibly lighter, as well as warmer, by them for ſome time before they can be abſorbed again.

15
Variation of the heat and cold of the atmoſphere.

The variations of heat and cold to which the atmoſphere is ſubject, have been the ſubject of much ſpeculation. In general they ſeem to depend entirely upon the light of the ſun reflected into the atmoſphere from the earth; and where this reflection is deficient, even though the light ſhould be preſent ever ſo much, the moſt violent degrees of cold are found to take place. Hence, on the tops of mountains, the cold is generally exceſſive, though by reaſon of the clearneſs of the atmoſphere the light of the ſun falls upon them in greater quantity than it can do on an equal ſpace on the plain. In long winding paſſages alſo, ſuch as the caverns of Ætna and Veſuvius, where the air has room to circulate freely, without any acceſs of the ſun, the cold is ſcarce tolerable; whence the uſe of theſe for cooling liquors, preſerving meat, &c.

16
Lambert and De Luc's reaſons for the cold on the tops of mountains.

The coldneſs of the atmoſphere on the tops of mountains has been aſcribed by M. Lambert and De Luc, to the igneous fluid, or elementary fire, being more rare in thoſe elevated ſituations than on the plains. M. Lambert is of opinion that it is rarefied above by the action of the air, and that below it is condenſed by its own proper weight. He conſiders fire as a fluid in motion, the parts of which are ſeparable, and which is rarefied when its velocity is accelerated. He does not decide with regard to the identity of fire and light, though he ſeems inclined to believe it. M. de Luc compares elementary fire to a continuous fluid, whoſe parts are condenſed by being mutually compreſſed. He denies that fire and light are the ſame; and maintains that the latter is incapable, by itſelf, of ſetting fire to bodies, though it does ſo by putting in motion the igneous fluid they contain; and that it acts with more force near the earth than at a diſtance from its ſurface, by reaſon of this fluid, which he calls an *heavy* and *elaſtic* one, being more condenſed there than at a greater height.

17
Mr Sauſſure's account.

Mr Sauſſure, in treating of this ſubject in his account of the Alps, does not conſider fire as a fluid ſo free and detached as to be able either to aſcend with rapidity by its ſpecific levity, or to condenſe itſelf ſenſibly by its proper weight. He ſuppoſes it to be united to bodies by ſo ſtrict an affinity, that all its motions are determined, or at leaſt powerfully modified, by that affinity. As ſoon therefore as fire, diſengaged by combuſtion or by any other cauſe, endeavours to diffuſe itſelf, all the bodies that come within the ſphere of its activity endeavour to attract it; and they abſorb ſuch quantities of it as are in the direct ratio of their affinities with it, or in the inverſe ratio of what is neceſſary for their equilibrium with the ſurrounding bodies. Now it does not appear that in this diſtribution the ſituation of places, with regard to the horizon, has any other influence than what they receive from the different currents produced by the dilatation of the air, and by the levity which that dilatation produces. The aſcent of flame, ſmoke, &c. or of air heated in any way, perſuaded the ancients that fire is poſſeſſed of abſolute levity, by which it had a tendency to mount upwards. "But theſe effects (ſays he) are owing either to the levity of the fluid which conſtitutes flame, or to that of air dilated by heat; and not to the levity of the igne-

Atmosphere.

igneous fluid. I am, however, sufficiently convinced, that this fluid is incomparably lighter than air, though I do not believe that it possesses the power of ascending in our atmosphere by virtue of its levity alone.

18 Mr Bouguer's reasons for the cold on the top of the Andes.

"The celebrated Bouguer has demonstrated, by principles the most simple, and most universally adopted, that it is not necessary, in order to account for the diminution of heat on mountains, to have recourse to hypotheses that are at best doubtful. The following is his explanation of what was felt on the mountains of Peru.

"It was proper, in order to explain this subject, to insist on the short duration of the sun's rays, which cannot strike the different sides of mountains but for a few hours, and even this not always. A horizontal plain, when the sun is clear, is exposed at mid-day to the perpendicular and undiminished action of these rays, while they fall but obliquely on a plain not much inclined, or on the sides of a high pile of steep rocks. But let us conceive for a moment an insulated point, half the height of the atmosphere, at a distance from all mountains, as well as from the clouds which float in the air. The more a medium is transparent, the less heat it ought to receive by the immediate action of the sun. The free passage which a very transparent body allows to the rays of light, shows that its small particles are hardly touched by them. Indeed what impression could they make on it when they pass through almost without obstruction? Light, when it consists of parallel rays, does not by passing through a foot of free atmospheric air, near the earth, lose an hundred thousandth part of its force. From this we may judge how few rays are weakened, or can act on this fluid, in their passage through a stratum of the diameter not of an inch or a line, but of a particle. Yet the subtilty and transparency are still greater at great heights, as was obvious on the Cordilleras, when we looked at distant objects. Lastly, the grosser air is heated below by the contact or neighbourhood of bodies of greater density than itself, which it surrounds, and on which it rests; and the heat may be communicated by little and little to a certain distance. The inferior parts of the atmosphere by this means contract daily a very considerable degree of heat, and may receive it in proportion to its density or bulk. But it is evident, that the same thing cannot happen at the distance of a league and an half or two leagues above the surface of the earth, although the light there may be something more active. The air and the wind therefore must at this height be extremely cold, and colder in proportion to the elevation.

"Besides, the heat necessary to life is not merely that which we receive every instant from the sun. The momentary degree of this heat corresponds to a very small part of that which all the bodies around us have imbibed, and by which ours is chiefly regulated. The action of the sun only serves to maintain nearly in the same state the sum of the total heat, by repairing thro' the day the loss it sustains through the night, and at all times. If the addition be greater than the loss, the total heat will increase, as it happens in summer, and it will continue to accumulate in a certain degree; but for the reasons already given, this accumulation cannot be very great on the top of a mountain, where the summit which rises high, is never of great bulk. The lowest state of the thermometer in every place is always in proportion to the heat acquired by the soil; and that heat being very small on the top of a mountain, the quantity added to it by the sun during the day must be comparatively greater; and the accumulated heat will be more in a condition to receive increase in proportion to its distance from the degree which it cannot pass.

"Another particular observable on all the high places of the Cordilleras, and which depends on the same cause, is, that when we leave the shade, and expose ourselves to the sunshine, we feel a much greater difference than we do here in our fine days when the weather is temperate. Every thing contributes at Quito to make the sun exceedingly powerful: a single step from an exposed place to the shade gives the sensation of cold: this would not be the case if the quantity of heat acquired by the soil were more considerable. We now also see why the same thermometer, put first into the shade and then in the sun, does not undergo the same changes at all times and in all places. In the morning, upon Pinchincha, this instrument is generally a few degrees below the freezing point, which may be reckoned the natural temperature of the place; but when during the day we expose it to the sun, it is easy to imagine that the effect must be great, and much more than double in whatever way it is measured."

19 Burning glasses equally powerful on the tops of mountains as on plains.

This theory is adopted by M. Saussure, who adds the following fact to prove that the action of the sun's rays, considered abstractedly, and independent of any extrinsic source of cold, is as great on mountains as on plains; viz. that the power of burning lenses and mirrors is the same at all heights. To ascertain this fact, our author procured a burning-glass so weak that at Geneva it would just set fire to tinder. This he carried with some of the same tinder, to the top of the mountain Saleve (a height of 3000 feet); where it not only produced the same effect, but apparently with greater facility than on the plain. Being persuaded then, that the principal source of cold on the tops of high mountains is their being perpetually surrounded with an atmosphere which cannot be much heated either by the rays of the sun on account of its transparency, or by the reflection of them from the earth by reason of its distance, he wished to know, whether the direct solar rays on the top of a high mountain had the same power as on the plain, while the body on which they acted was placed in such a manner as to be unaffected by the surrounding air. For this purpose he instituted a set of experiments, from which he drew the following conclusions, viz. that a difference of 777 toises in height, diminishes the heat which the rays of the sun are able to communicate to a body exposed to the external air, 14° of the thermometer; that it diminishes the heat of a body partially exposed, only 6°; and that it augments by 1° the heat of a third body completely defended from the air.

20 Atmosphere every where counteracts the heat of the sun.

Hence it appears that the atmosphere, though so essentially necessary to the support of fire, is some how or other the greatest antagonist of heat, and most effectually counteracts the operation of the solar rays in producing it. This power it seems to exert at all distances, at the surface as well as in the higher regions. From some experiments made by M. Pictet, it appears, that

21 Is colder very near the surface of the ground than at some distance.

that even in places exposed to the rays of the sun, the heat, at five feet distance from the ground, is greater only by one or two degrees than at 50 feet above the surface, though the ground was at that time 15 or 20° warmer than the air immediately in contact with it. Inconsiderable as this difference is, however, it does not hold as we go higher up: for if it did, the cold on the top of the mountain of Saleve, which is 3000 feet above the level of the lake of Geneva, would be 60° greater than at the foot it; whereas in reality it is only 10°. In the night time the case is reversed; for the stratum of air, at five feet from the ground, was found by Mr Pictet to be colder than that at 50. Besides this, different strata of the atmosphere are found to possess very different and variable degrees of cold, without any regard to their situation high up or low down. In the year 1780, Dr Wilson of Glasgow found a very remarkable cold existing close to the surface of the ground; so that the thermometer, when laid on the surface of the snow, sunk many degrees lower than one suspended 24 feet above it. It has been likewise observed, that in clear weather, though the surface of the earth be then most liable to be heated by the sun, yet after that is set, and during the night, the air is coldest near the ground, and particularly in the valleys. Experiments on this subject were made for a whole year by Mr James Sex, who has given an account of them in the 78th volume of the Philosophical Transactions. He suspended thermometers (constructed in such a manner as to show the true maximum and minimum of heat that might take place in the observer's absence) in a shady northern aspect, and at different heights in the open air. One of these was placed at the height of 9 feet, and the other at that of 220 from the ground; and the observations were continued, with only a few days omission, from July 1784 to July 1785. The greatest variations of heat were in the months of October and June; in the former the thermometers generally differed most in the night, and in the latter mostly in the day. From the 25th to the 28th of October, the heat below, in the night time, exceeded in a small degree the heat above; at which time there was frequent rain mingled with hail. From the 11th to the 14th, and also on the 31st, there was no variation at all; during which time likewise the weather was rainy: all the rest of the month proving clear, the air below was found colder than that above, sometimes by nine or ten degrees. In the month of June, the greatest variations took place from the 11th to the 15th, and from the 25th to the 30th; and at both these times there appeared to be two currents of wind, the upper from the south-west and the lower from the north-east. Sometimes these were rendered visible by clouds, in different strata, moving in different directions, and sometimes by clouds moving in a contrary direction to a very sensible current of air below. On cloudy nights the lowest thermometer sometimes showed the heat to be a degree or two greater than the upper one; but in the day time the heat below constantly exceeded that above more than in the month of October.

22 Mr Sex's experiments on this subject.

To determine whether the nocturnal refrigeration was augmented by a nearer approach to the earth, two thermometers were placed in the midst of an open meadow, on the bank of the river near Canterbury. One was placed on the ground, and the other only six feet above it. The thermometer, at six feet distance from the ground, agreed nearly with the former at nine feet; but the nocturnal variations were found to correspond entirely with the clearness or the cloudiness of the sky: and though they did not always happen in proportion to their respective altitudes, yet when the thermometers differed in any respect, that on the ground always indicated the greatest degree of cold.

The difference betwixt these two thermometers, at the small distance of six feet from each other, being found no less than three degrees and an half, the number of thermometers in the meadow was augmented to four. One was sunk in the ground, another placed just upon it, and the third suspended at three feet above it. Three others were placed on a rising ground where the land was level with the cathedral tower, and about a mile distant from it. One of these was likewise sunk in the ground, another placed just upon it, and a third suspended six feet above it. With these seven thermometers, and the two first mentioned, which were placed in the city, he continued his observations for 20 days; but as the weather happened to be cloudy during the whole of that space, excepting for seven or eight days, no considerable variation happened excepting on these days. The result of the experiments was, that the cold was generally greater in the valley than on the hill; but the variations between the thermometers on the ground and those six feet above them, were often as great on the hill as in the valley.

Thus it was perceived that a difference of temperature took place at the distance of only three feet from the ground; but the length of the thermometers hitherto made use of rendered it impossible to make any experiment at a smaller distance. Two new ones, therefore, were formed by bending down the large tube, the body or bulb of the thermometer, to an horizontal position, while the stem remained in a vertical one; by which method the temperature might be observed to the distance of a single inch. Sometimes, in clear weather, these two horizontal thermometers were placed in the open air, one within an inch of the ground, and the other nine inches above it. When the variation among the other thermometers was considerable, a difference was likewise perceived between these; the lower one sometimes indicating more than two degrees less heat than the upper one, though placed so near each other.

From these experiments Mr Sex concludes, that a greater diminution of heat frequently takes place near the earth in the night-time than at any altitude in the atmosphere within the limits of his inquiry, that is, 220 feet from the ground; and at such times the greatest degrees of cold are always met with nearest the surface of the earth. 23 His conclusions from these experiments.

This is a constant and regular operation of nature, under certain circumstances and dispositions of the atmosphere, and takes place at all seasons of the year; and this difference never happens in any considerable degree but when the air is still, and the sky perfectly unclouded. The moistest vapour, as dews and fogs, did not at all impede, but rather promote, the refrigeration. In very severe frosts, when the air frequently deposites a quantity of frozen vapour, it is commonly found

Atmosphere.

found greatest; but the excess of heat which in the day-time was found at the lower station in summer, diminished in winter almost to nothing.

24 Mr Darwin's experiments on cold produced by the rarefaction of air.

It has been observed, that a thermometer, included in a receiver, always sinks when the air begins to be rarefied. This has been thought to arise, not from any degree of cold thus produced, but from the sudden expansion of the bulb of the thermometer in consequence of the removal of the atmospherical pressure: But from some late experiments related, Phil. Transf. vol. 78. by Mr Darwin, it appears that the atmosphere always becomes warm by compression, and cold by dilatation from a compressed state. These experiments were,

1. The blast from an air-gun was repeatedly thrown upon the bulb of a thermometer, and it uniformly sunk it about two degrees. In making this experiment the thermometer was firmly fixed against a wall, and the air-gun, after being charged, was left for an hour in its vicinity, that it might previously lose the heat it had acquired in the act of charging: the air was then discharged in a continued stream on the bulb of the thermometer, with the effect already menioned.

2. A thermometer was fixed in a wooden tube, and so applied to the receiver of an air-gun, that, on discharging the air by means of a screw pressing on the valve of the receiver, a continued stream of air, at the very time of its expansion, passed over the bulb of the thermometer. This experiment was four times repeated, and the thermometer uniformly sunk from five to seven degrees. During the time of condensation there was a great difference in the heat, as perceived by the hand, at the two ends of the condensing syringe: that next the air-globe was almost painful to the touch; and the globe itself became hotter than could have been expected from its contact with the syringe. "Add to this (says Mr Darwin), that in exploding an air-gun the stream of air always becomes visible, which is owing to the cold then produced precipitating the vapour it contained; and if this stream of air had been previously more condensed, or in greater quantity, so as not instantly to acquire heat from the common atmosphere in its vicinity, it would probably have fallen in snow."

3. A thermometer was placed in the receiver of an air-pump, and the air being hastily exhausted, it sunk two or three degrees; but after some minutes regained its former station. The experiment was repeated with a thermometer open at the top, so that the bulb could not be affected by any diminution of the external pressure; but the result was the same. Both during exhaustion and readmission of the air into the receiver, a steam was regularly observed to be condensed on the sides of the glass; which, in both cases, was in a few minutes reabsorbed, and which appeared to be precipitated by being deprived of its heat by the expanded air.

4. A hole, about the size of a crow-quill, was bored into a large air-vessel placed at the commencement of the principal pipe of the water-works of Derby. There are four pumps worked by a water-wheel, the water of which is first thrown into the lower part of this air-vessel, and rises from thence to a reservoir about 35 or 40 feet above the level; so that the water in this vessel is constantly in a state of compression. Two thermometers were previously suspended on the leaden air-vessel, that they might assume the temperature of it, and as soon as the hole above mentioned was opened, had their bulbs applied to the stream of air which issued out; the consequence of which was, that the mercury sunk four degrees in each. This sinking of the mercury could not be ascribed to any evaporation of moisture from their surfaces, as it was seen both in exhausting and admitting the air into the exhausted receiver mentioned in the last experiment, that the vapour which it previously contained was deposited during its expansion.

5. There is a curious phenomenon observed in the fountain of Hiero, constructed on a very large scale, in the Chemnicensian mines in Hungary. In this machine the air, in a large vessel, is compressed by a column of water 260 feet high; a stop-cock is then opened; and as the air issues with great vehemence, and in consequence of its previous condensation becomes immediately much expanded, the moisture it contains is not only precipitated, as in the exhausted receiver abovementioned, but falls down in a shower of snow, with isicles adhering to the nose of the cock. See Phil. Transf. vol. 52.

25 His conclusions with regard to cold on the tops of mountains.

From this phenomenon, as well as the four experiments above related, Mr Darwin thinks "there is good reason to conclude, that in all circumstances where air is mechanically expanded, it becomes capable of attracting the fluid matter of heat from other bodies in contact with it.

"Now, (continues he) as the vast region of air which surrounds our globe is perpetually moving along its surface, climbing up the sides of mountains, and descending into the valleys; as it passes along, it must be perpetually varying the degree of heat according to the elevation of the country it traverses: for, in rising to the summits of mountains, it becomes expanded, having so much of the pressure of the superincumbent atmosphere taken away; and when thus expanded, it attracts or absorbs heat from the mountains in contiguity with it; and, when it descends into the valleys, and is compressed into less compass, it again gives out the heat it has acquired to the bodies it comes in contact with. The same thing must happen to the higher regions of the atmosphere, which are regions of perpetual frost, as has lately been discovered by the aerial navigators. When large districts of air, from the lower parts of the atmosphere, are raised two or three miles high, they become so much expanded by the great diminution of the pressure over them, and thence become so cold, that hail or snow is produced by the precipitation of the vapour: and as there is, in these high regions of the atmosphere, nothing else for the expanded air to acquire heat from after it has parted with its vapour, the same degree of cold continues, till the air, on descending to the earth, acquires its former state of condensation and of warmth.

"The Andes, almost under the line, rests its base on burning sands; about its middle height is a most pleasant and temperate climate covering an extensive plain, on which is built the city of Quito; while its forehead is encircled with eternal snow, perhaps coeval with the mountain. Yet, according to the accounts of Don Ulloa, these three discordant climates seldom encroach

croach much on each other's territories. The hot winds below, if they afcend, become cooled by their expanfion; and hence they cannot affect the fnow upon the fummit; and the cold winds that fweep the fummit, become condenfed as they defcend, and of temperate warmth before they reach the fertile plains of Quito."

26 Difficulties ftill remain on the fubject.

Notwithftanding all thefe explanations, however, feveral very confiderable difficulties remain with regard to the heat and cold of the atmofphere. That warm air fhould always afcend; and thus, when the fource of heat is taken away by the abfence of the fun, that the ftratum of atmofphere lying immediately next to the earth fhould be fomewhat colder than that which lies a little farther up; is not at all to be wondered at. We have an example fomewhat fimilar to this in the potter's kiln; where, after the veffels have been intenfely heated for fome time, and the fire is then withdrawn, the cooling always begins at bottom, and thofe that ftand lowermoft will often be quite black, while all the upper part of the furnace and the veffels next to to it, are of a bright red. It doth not, however, appear, why fuch degrees of cold fhould take place at the furface of the earth as we fometimes meet with. It is, befides, no uncommon thing to meet with large ftrata in the upper regions of the atmofphere, remarkable for their cold, while others are warmer than thofe at the furface; as we have been affured of by the teftimony of feveral aerial navigators. It is alfo difficult to fee why the air which has once afcended, and become rarefied to any extreme degree, fhould afterwards defcend among a denfer fluid of fuperior gravity, though indeed the atmofpherical currents by which this fluid is continually agitated may have confiderable effect in this way. See the article WINDS. See alfo HEAT, COLD, CONGELATION, CONDENSATION, &c.

For the quantity of water contained in the atmofphere, fee the articles HYGROMETER, CLOUDS, VAPOUR, &c. For the caufe of the elafticity of the atmofphere, fee ELASTICITY; and for an explanation of its various operations, fee METEOROLOGY. See alfo HAIL, RAIN, SNOW, &c.

The ufes of the atmofphere are fo many and fo various that it is impoffible to enumerate them. One of the moft effential is its power of giving life to vegetables, and fupporting that of all animated beings. For the latter purpofe however, it is not in all places equally proper: we fhall therefore conclude this article with fome remarks on

27 Of the falubrity of the atmofphere.

The Salubrity of the ATMOSPHERE.——The air on the tops of mountains is generally more falubrious than that in pits. Denfe air indeed is always more proper for refpiration than fuch as is more rare; yet the air on mountains, though much more rare, is more free from phlogiftic vapours than that of pits. Hence it has been found, that people can live very well on the tops of mountains, where the barometer finks to 15 or 16 inches. M. de Sauffure, in his journey upon the Alps, having obferved the air at the foot, on the middle, and on the fummits of various mountains, obferves, that the air of the very low plains feems to be the lefs falubrious; that the air of very high mountains is neither very pure, nor, upon the whole, feems fo fit for the lives of men, as that of a certain height above the level of the fea, which he eftimates to be about 200 or 300 toifes, that is, about 430 or 650 yards.

Dr White, in the lxviiith vol. of the Phil. Tranf. giving an account of his experiments on air made at York, fays, that the atmofpherical air was in a very bad ftate, and indeed in the worft he had ever obferved it, the 13th of September 1777; when the barometer ftood at 30.30, the thermometer at 69°; the weather being calm, clear, and the air dry and fultry, no rain having fallen for above a fortnight. A flight fhock of an earthquake was perceived that day.

The air of a bed-room at various times, viz. at night, and in the morning after fleeping in it, has been examined by various perfons; and it has been generally found, that after fleeping in it the air is lefs pure than at any other time. The air of privies, even in calm weather has not been found to be fo much phlogifticated as might have been expected, notwithftanding its difagreeable fmell.

From this and other obfervations, it is thought that the exhalations of human excrements are very little if at all injurious, except when they become putrid, or proceed from a difeafed body; in which cafe they infect the air very quickly.

28 Dr Ingenhoufz's experiments.

Dr Ingenhoufz, foon after he left London, fent an account of his experiments made in the year 1779 upon the purity of the air at fea and other parts; which account was read at the Royal Society the 24th of April 1780, and is inferted in the lxxth vol. of the Phil. Tranf. His firft obfervations were made on board a veffel in the mouth of the Thames, between Sheernefs and Margate, where he found that the air was purer than any other fort of common air he had met with before. He found that the fea-air taken farther from the land, viz. between the Englifh coaft and Oftend, was not fo pure as that tried before; yet this inferior purity feems not to take place always. The Doctor's general obfervations, deduced from his numerous experiments, are, "That the air at fea, and clofe to it, is in general purer, and fitter for animal life, than the air on the land, though it feems to be fubject to fome inconfiftency in its degree of purity with that of the land: That probably the air will be found in general much purer far from the land than near the fhore, the former being never fubject to be mixed with land air."

The Doctor in the fame paper tranfcribes a journal of experiments, fhowing the degree of purity of the atmofphere in various places, and under different circumftances; which we fhall infert here in an abridged manner.

29 His Journal of the purity of the air in different places.

The method ufed in thofe experiments, was to introduce one meafure of common air into the eudiometer-tube, and then one meafure of nitrous air. The moment that thefe two forts of elaftic fluids came into contact, he agitated the tube in the water-trough, and then meafured the diminution, expreffing it by hundredth parts of a meafure; thus, when he fays that fuch air was found to be 130, it fignifies, that after mixing one meafure of it with one of nitrous air, the whole mixed and diminifhed quantity was 130 hundredths of a meafure, viz. one meafure and 30 hundredths of a meafure more.

"The different degrees of falubrity of the atmofphere, ſphere, as I found it in general in my country-houſe at Southal-Green, ten miles from London, from June to September, lay between 103 and 109. I was ſurpriſed when, upon my return to town to my former lodgings in Pall-Mall Court, I found the common air purer in general in October than I uſed to find it in the middle of ſummer in the country; for on the 22d of October, at nine o'clock in the morning, the weather being fair and froſty, I found that one meaſure of common air, and one of nitrous air, occupied 100 ſubdiviſions in the glaſs-tube, or exactly one meaſure. That very day, at two o'clock in the afternoon (it being then rainy weather), the air was ſomewhat altered for the worſe. It gave 102. October the 23d, it being rainy weather, the air gave 102. October the 24th, the weather being ſerene, the air at nine o'clock in the morning gave 100. October the 25th, the ſky being cloudy at 11 o'clock in the morning, the air gave 102. At 11 o'clock at night, from five different trials, it gave 105. October the 26th, the weather being very dark and rainy, the air gave 105, as before."

The air at Oſtend was found by the Doctor to be generally very good, giving between 94 and 98. At Bruges, the air taken at ſeven o'clock at night gave 103. November the 8th, the air at Ghent at three in the afternoon gave 03.

November the 12th, the air of Bruſſels at ſeven o'clock P. M. gave $105\frac{1}{2}$. The next day the air of the lower part of the ſame city gave 106; that of the higheſt appeared to be purer, as it gave 104; which agrees with the common popular obſervation. November the 14th, both the air of the higheſt and that of the loweſt part of the city appeared to be of the ſame goodneſs, giving 103. The weather was froſty.

November the 22d, the air of Antwerp in the evening gave $109\frac{1}{2}$; the weather being rainy, damp, and cold. November the 23d, the air of Breda gave 106. The next day about 11 o'clock the air gave 102; the weather being fair, cold, and inclining to froſt. At ſeven o'clock it gave 103. Next day, being the 25th, the air gave 104; the weather being cold and rainy. The 26th it gave 103; the weather being very rainy, cold, and ſtormy. November the 27th, the air at the Moordyke cloſe to the water gave $101\frac{1}{2}$; the weather being fair and cold, but not froſty. This ſpot is reckoned very healthy. November the 28th, the air of Rotterdam gave 103; the weather being rainy and cold. November the 29th, the air of Delft gave 103; the weather being ſtormy and rainy.

November the 30th, the air of the Hague gave 104; the weather being cold, and the wind northerly. The firſt of December the weather underwent a ſudden change; the wind becoming ſoutherly and ſtormy, and the atmoſphere becoming very hot. The day after, Fahrenheit's thermometer ſtood at 54°; and the common air being repeatedly and accurately tried gave 116; and that preſerved in a glaſs phial from the preceding day gave 117; and that gathered cloſe to the ſea gave 115.

December the 4th, the air of Amſterdam gave 103; the weather being rainy, windy, and cold. The day after the weather continuing nearly the ſame, the air gave 102. December the 10th, the air of Rotterdam gave 101; the weather being rainy. December the 12th, being in the middle of the water between Dort and the Moordyke, the air gave 109; the weather being remarkably dark, rainy, and windy. December the 13th, the air of Breda in the morning gave 109; the weather continuing as the day before. And in the afternoon, the air gave $106\frac{1}{2}$; the weather having cleared up. December the 16th, the air of the lower part of the city of Antwerp gave 105, that of the higher part 104; the weather being rainy and temperate. December the 17th, the air of Antwerp gave 107; the weather continuing nearly as in the preceding day. December the 19th, the air of Bruſſels gave 109; the weather being rainy, windy, and rather warm. December the 21ſt, the air of Bruſſels gave 106; the weather being dry and cold. The next day the air and weather continued the ſame. December the 23d, the air of Mons gave 104; the weather being rainy and cold. December the 24th, the air near Bouchain gave $104\frac{1}{2}$; the weather being cloudy and cold. December the 25th, the air of Peronne gave $102\frac{1}{2}$; the weather being froſty. December the 26th, the air of Cuvilli gave 103; the weather froſty. December the 27th, the air of Senlis gave $102\frac{1}{2}$; the weather froſty. December the 29th, the air of Paris gave 103; the weather froſty. 1780, January the 8th, the air of Paris gave 100; the weather froſty. January the 13th, the air of Paris gave 98; hard froſt. 30

Thus far with Dr Ingenhouſz's obſervations. His apparatus was a very portable one, made by Mr Martin, which in reality is the eudiometer-tube and meaſure as uſed by Mr Fontana before he made his laſt improvement. "The whole of this apparatus (ſays Dr Ingenhouſz) was packed up in a box about ten inches long, five broad, and three and a half high. The glaſs-tube or great meaſure, which was 16 inches long, and divided in two ſeparate pieces, lay in a ſmall compaſs, and could be put together by braſs ſcrews adapted to the divided extremities. Inſtead of a water-trough, ſuch as is uſed commonly, I made uſe of a ſmall round wooden tube, &c." 31

Apparatus with which his experiments were made.

The Abbé Fontana, who has made a great number of very accurate experiments upon this ſubject, gives his opinion in the following words: "I have not the leaſt heſitation in aſſerting, that the experiments made to aſcertain the ſalubrity of the atmoſpherical air in various places in different countries and ſituations, mentioned by ſeveral authors, are not to be depended upon; becauſe the method they uſed was far from being exact (A), the elements or ingredients for the experiment were unknown and uncertain, and the reſults very different from one another.

Fontana's opinions on the ſubject.

"When all the errors are corrected, it will be found that the difference between the air of one country and that of another, at different times, is much leſs than what is commonly believed; and that the great differences found by various obſervers are owing to the fallacious effects of uncertain methods. This I advance from experience; for I was in the ſame error. I found very

(A) It is plain that Dr Ingenhouſz's method is not implied in this remark: ſince the Doctor's experiments were made long after, and the method uſed by him was properly that of Mr Fontana.

very great differences between the results of the experiments of this nature which ought to have been similar; which diversities I attributed to myself, rather than to the method I then used. At Paris I examined the air of different places at the same time, and especially of those situations where it was most probable to meet with infected air, because those places abounded with putrid substances and impure exhalations; but the differences I observed were very small, and much less than what could have been suspected, for they hardly arrived to one-fiftieth of the air in the tube. Having taken the air of the hill called *Mount Valerian*, at the height of about 500 feet above the level of Paris, and compared it with the air of Paris taken at the same time, and treated alike, I found the former to be hardly one-thirtieth better than the latter.

"In London I have observed almost the same. The air of Islington and that of London suffered an equal diminution by the mixture of nitrous air; yet the air of Islington is esteemed to be much better. I have examined the air of London taken at different heights (for instance, in the street, at the second floor, and at the top of the adjoining houses), and have found it to be of the same quality. Having taken the air at the iron gallery of St Paul's cupola, at the height of 313 feet above the ground, and likewise the air of the stone gallery, which is 202 feet below the other; and having compared these two quantities of air with that of the street adjoining, I found that there was scarce any sensible difference between them, although taken at such different heights.

"In this experiment a circumstance is to be considered, which must have contributed to render the abovementioned differences more sensible: this is, the agitation of the air of the cupola; for there was felt a pretty brisk wind upon it, which I observed to be stronger and stronger the higher I ascended; whereas in the street, and indeed in all the streets I passed through, there was no sensible wind to be felt. This experiment was made at four in the afternoon, the weather being clear. The quicksilver in the barometer at that time was 28,6 inches high, and Fahrenheit's thermometer stood at 54°."

A few lines after, Mr Fontana proceeds thus:— "From this we clearly see, how little the experiments hitherto published about the differences of common air are to be depended upon. In general, I find that the air changes from one time to another; so that the differences between them are far greater than those of the airs of different countries or different heights. For instance, I have found that the air of London in the months of September, October, and November, 1778, when treated with the nitrous air, gave II,I, 1,90, and II,II, 2,25, which is a mean result of many experiments which differed very little from each other. The 26th day of November last, I found the air for the first time much better, for it gave II,I 1,80, and II,II, 2,20; but the 14th of February 1779, the air gave II,I, 1,69, and II,II, 2,21; from whence it appears, that the air of this 14th of February was better than it had been six months before. There can be no doubt of the accuracy of the experiments, because I compared the air taken at different times with that which I had first used in the month of September, and which I had preserved in dry glass-bottles accurately stopped."

This difference in the purity of the air at different times, Mr Fontana farther remarks, is much greater than the difference between the air of the different places observed by him: notwithstanding this great change, as he observed, and as he was informed by various persons, no particular change of health in the generality of people, or facility of breathing, was perceived.

Mr Fontana lastly concludes with observing, that "Nature is not so partial as we commonly believe. She has not only given us an air almost equally good every where at every time, but has allowed us a certain latitude, or a power of living and being in health in qualities of air which differ to a certain degree. By this I do not mean to deny the existence of certain kinds of noxious air in some particular places; but only say, that in general the air is good every where, and that the small differences are not to be feared so much as some people would make us believe. Nor do I mean to speak here of those vapours and other bodies which are accidentally joined to the common air in particular places, but do not change its nature and intrinsical property. This state of the air cannot be known by the test of nitrous air; and those vapours are to be considered in the same manner as we should consider so many particles of arsenic swimming in the atmosphere. In this case it is the arsenic, and not the degenerated air, that would kill the animals who ventured to breathe it."

ATOCK, The capital of a province of the same name in the dominions of the Great Mogul. It is seated on a point of land where two large rivers meet, and is one of the best fortresses the Mogul has; but formerly nobody was permitted to enter it without a passport from the Mogul himself. E. Long. 72. 10. N. Lat. 32. 20.

ATOM, in philosophy, a particle of matter, so minute, as to admit of no division. Atoms are the *minima naturæ*, and are conceived as the first principles or component parts of all physical magnitude.

ATOMICAL PHILOSOPHY, or the doctrine of atoms, a system which, from the hypothesis that atoms are endued with gravity and motion, accounted for the origin and formation of things. This philosophy was first broached by Moschus, some time before the Trojan war; but was much cultivated and improved by Epicurus; whence it is denominated the *Epicurean philosophy*. See EPICUREAN.

ATONEMENT. See EXPIATION.

ATONY, in medicine, a defect of tone or tension, or a laxity or debility of the solids of the body.

ATOOI, one of the Sandwich islands, situated in E. Long. 200. 20. N. Lat. 21. 57. Towards the north-east and north-west, the face of the country is ragged and broken; but to the southward it is more even. The hills rise from the sea-side with a gentle acclivity, and at a little distance back are covered with wood. Its produce is the same with that of the other islands of this cluster; but its inhabitants greatly excel the people of all the neighbouring islands in the management of their plantations. In the low grounds, contiguous to the bay wherein our navigators anchored, ed, these plantations were regularly divided by deep ditches; the fences were formed with a neatness approaching to elegance, and the roads through them were finished in such a manner as would have reflected credit even on an European engineer.

The island is about 300 miles in circumference. The road, or anchoring-place, which our vessels occupied, is on the south-west side of the island, about two leagues from the west end, before a village named Wymoa. As far as was sounded, the bank was free from rocks; except to the eastward of the village, where there projects a shoal on which are some rocks and breakers. This road is somewhat exposed to the trade-wind; notwithstanding which defect, it is far from being a bad station, and greatly superior to those which necessity continually obliges ships to use, in countries where the winds are not only more variable but more boisterous; as at Madeira, Teneriffe, the Azores, &c. The landing too is not so difficult as at most of those places; and, unless in very bad weather, is always practicable. The water in the neighbourhood is excellent, and may be conveyed with ease to the boats. But no wood can be cut at any convenient distance, unless the islanders could be prevailed upon to part with the few etooa trees (*cordia sebestina*) that grow about their villages, or a species called *dooe dooe*, which grows farther up the country. The ground, from the wooden part to the sea, is covered with an excellent kind of grass, about two feet in height, which sometimes grows in tufts, and appeared capable of being converted into abundant crops of fine hay. But on this extensive space not even a shrub grows naturally.

Besides taro, the sweet potatoe, and other similar vegetables used by our crews as refreshments, among which were at least five or six varieties of plantains, the island produces bread-fruit; which, however, seems to be scarce. There are also a few cocoa palms; some yams; the kappe of the Friendly islands, or Virginian arum; the etooa tree, and odoriferous gardenia or cape jasmine. Our people also met with several trees of the dooe dooe, that bear the oily nuts, which are stuck upon a kind of skewer and made use of as candles. There is a species of sida, or Indian mallow; also the morinda citrifolia, which is here called *none*; a species of convolvulus; the ava or intoxicating pepper, besides great quantities of gourds. These last grow to a very large size, and are of a remarkable variety of shapes, which are perhaps the effect of art.

The scarlet birds, which were brought for sale, were never met with alive; but one small one was seen, about the size of a canary bird, of a deep crimson colour; also a large owl, two brown hawks or kites, and a wild duck. Other birds were mentioned by the natives; among which were the otoo, or blueish heron, and the torata, a sort of of whimbrel. It is probable that the species of birds are numerous, if we may judge by the quantity of fine yellow, green, and small, velvet-like, blackish feathers used upon the cloaks and other ornaments worn by these people. Fish, and other productions of the sea, were to appearance not various. The only tame or domestic animals found here were hogs, dogs, and fowls, which were all of the same kind that had been met with at the islands of the South Pacific. There were also small lizards, and some rats.

The inhabitants of Atooi are of the middle size, and in general stoutly made. They are neither remarkable for a beautiful shape nor for striking features. Their visage, particularly that of the women, is sometimes round, but others have it long; nor can it justly be said, that they are distinguished as a nation by any general cast of countenance. Their complexion is nearly of a nut brown; but some individuals are of a darker hue. They are far from being ugly, and have, to all appearance, few natural deformities of any kind. Their skin is not very soft nor shining; but their eyes and teeth are, for the most part, pretty good. Their hair in general is straight; and though its natural colour is usually black, they stain it, as at the Friendly and other islands. They are active, vigorous, and most expert swimmers; leaving their canoes upon the most frivolous occasion, diving under them, and swimming to others, though at a considerable distance. Women with infants at the breast, when the surf was so high as to prevent their landing in the canoes, frequently leapt overboard, and swam to the shore, without endangering their little ones. They appeared to be of a frank, chearful disposition; and are equally free from the fickle levity which characterizes the inhabitants of Otaheite, and the sedate cast which is observable among many of those of Tongataboo. They seem to cultivate a sociable intercourse with each other; and, except the propensity of thieving, which is as it were innate in most of the people in those seas, they appeared extremely friendly. It was pleasing to observe with what affection the women managed their infants, and with what alacrity the men contributed their assistance in such a tender office; thus distinguishing themselves from those savages who consider a wife and a child as things rather necessary than desirable or worthy of their regard and esteem. From the numbers that were seen assembled at every village in coasting along, it was conjectured that the inhabitants of this island are pretty numerous. Including the straggling houses, it was computed there might perhaps be, in the whole island, sixty such villages as that near which our ships anchored; and allowing five persons to each house, there would be in every village five hundred, or thirty thousand upon the island. This number is by no means exaggerated; for there were sometimes three thousand people at least collected upon the beach, when it could not be supposed that above a tenth part of the natives were present.

ATRA BILIS, BLACK BILE, or MELANCHOLY. According to the ancients it hath a twofold origin: 1st, From the grosser parts of the blood, and this they called the *melancholy humour*. 2d, From yellow bile being highly concocted. Dr Percival, in his Essays Med. and Exp. suggests, that it is the gall rendered acrid by a stagnation in the gall-bladder, and rendered viscid by the absorption of its fluid parts. Bile in this state discharged into the duodenum, occasions universal disturbance and disorder until it is evacuated; it occasions violent vomiting, or purging, or both; and previous to this the pulse is quick, the head aches, a delirium comes on, a hiccough, intense thirst, inward heat, and a fetid breath. Some describe this kind of bile as being acid, harsh, corroding, and, when poured on the ground, bubbling up, and raising the earth after the manner of a ferment. Dr Percival says, that by the

the use of the *infus. senæ limoniet.* warmed with the *tinct. columb.* he had checked the vomitings occasioned by this matter.

Atra dies, in antiquity, denotes a *fatal day* whereon the Romans received some memorable defeat. The word literally imports *a black day;* a denomination taken from the colour, which is the emblem of death and mourning. Whence the Thracians had a custom of marking all their happy days with white stones or calculi, and their unhappy days with black ones: which they cast, at the close of each day, into an urn. At the person's death the stones were taken out; and from a comparison of the numbers of each complection, a judgment was made of the felicity or infelicity of his course of life. The *dies atræ* or *artri,* were afterwards denominated *nefasti,* and *posteri.* Such in particular was the day when the tribunes were defeated by the Gauls, at the river Allia, and lost the city; also that whereon the battle of Cannæ was fought; and several others marked in the Roman calendar as *atræ* or unfortunate.

ATRACTYLIS, distaff thistle: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ-capitatæ.* The corolla is radiated; and each of the little corollæ of the radius has five teeth.

Species. 1. The cancellata, or small cnicus, is an annual plant rising about eight or nine inches high, with a slender stem, garnished with hoary leaves, having spines on their edges. At the top of these branches are sent out two or three slender stalks, each terminated by a head of flowers like those of the thistle. The empalement is curiously netted over, and is narrow at the top, but swelling below; and contains many florets of a purplish colour. These are each succeeded by a single downy seed, which in cold years do not ripen in Britain. 2. The humilis, or purple prickly cnicus, rises about a foot high, with indented leaves, having small spines on their edges. The upper part of the stalk is divided into two or three slender branches, each supporting a head of purple flowers, having rays inclosed in a scaly empalement. The flowers appear in June; but unless the season is warm, the seeds will not ripen in Britain. 3. The gummifera, or prickly gum-bearing cnicus, known among physicians by the name of *carline thistle.* This sends out many narrow leaves, which are deeply serrated, and armed with spines on their edges. These lie close on the ground; and between them the flower is situated, without a stalk, and having many florets inclosed in a prickly empalement. Those on the border are white; but such as compose the disk are of a yellowish colour. It flowers in July, but never perfects seeds in Britain.

Culture. All these plants are natives of the warm parts of Europe, as Spain, Sicily, and the Archipelago islands, from whence their seeds must be procured. They must be sown upon an open bed of light earth, where the plants are to remain; and when the plants come up, they should be thinned, so as to leave them three or four inches asunder. The roots of the second will last two or three years, and the third is a perennial plant.

Medicinal Uses. The root of the third sort was formerly used as a warm diaphoretic and alexipharmic; but it never came much into use in Britain, and the present practice has entirely rejected it. The root is about an inch thick, externally of a pale rusty brown colour, corroded as it were in the surface; and perforated with numerous small holes, so as to appear worm-eaten when cut. It has a strong smell; and a subacid, bitterish, and weakly aromatic taste. Frederic Hoffman the elder relates, that he has observed a decoction of it in broth to occasion vomiting.

ATRÆTI, in medicine, infants having no perforation in the anus, or persons imperforated in the vagina or urethra.

ATRAGENE, in botany; A genus of the polyandria order belonging to the polygamia class of plants. The calyx has four leaves; the petals are 12; and the seeds are candated. There are three species, all natives of the east.

ATRAPHAXIS: A genus of the dygnia order, belonging to the hexandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ.* The calyx has two leaves; the petals are two, and sinuated; and there is but one seed. There are two species, both natives of warm countries, but meriting no particular description.

ATREBATII, a people of Britain, seated next to the Bibroci, in part of Berkshire and part of Oxfordshire. This was one of those Belgic colonies which had come out of Gaul into Britain, and there retained their ancient name. For the Atrebatii were a tribe of the Belgæ, who inhabited that country which is now called Artois. They are mentioned by Cæsar among the nations which composed the Belgic confederacy against him; and the quota of troops which they engaged to furnish on that occasion was 15,000. Comius of Arras was a king or chieftain among the Atrebatii in Gaul in Cæsar's time: and he seems to have possessed some authority, or at least some influence, over our Atrebatii in Britain; for he was sent by Cæsar to persuade them to submission. This circumstance makes it probable that this colony of the Atrebatii had not been settled in Britain very long before that time. The Atrebatii were among those British tribes which submitted to Cæsar; nor do we hear of any remarkable resistance they made against the Romans at their next invasion under Claudius. It is indeed probable, that before the time of this second invasion they had been subdued by some of the neighbouring states, perhaps by the powerful nation of the Cattivellauni, which may be the reason they are so little mentioned in history. Calliva Attrebatum, mentioned in the seventh, twelfth, thirteenth, and fourteenth itinera of Antoninus, and called by Ptolemy *Calcua,* seems to have been the capital of the Atrebatii; though our antiquaries differ in their sentiments about the situation of this ancient city, some of them placing it at Wallingford, and others at Ilchester.

ATREUS, in fabulous history, the son of Pelops and Hippodamia, and the father of Agamemnon and Menelaus, is supposed to have been king of Mycenæ and Argos about 1228 years before the Christian æra. He drove his brother Thyestes from court, for having a criminal commerce with Ærope his wife; but understanding that he had had two children by her, he sent for him again, and made him eat them; at which

which horrid action the sun, it is said, withdrew his light.

ATRI, a town of Italy, in the farther Abruzzo in the kingdom of Naples, with the title of a duchy; it is the see of a bishop, and is seated on a craggy mountain, four miles from the Adriatic Sea. E. Long. 13.8. N. Lat 42. 45.

ATRIENSES, in antiquity, a kind of servants or officers in the great families at Rome, who had the care and inspection of the atria and the things lodged therein.

These are otherwise called atriarii, though some make a distinction between *atrienses* and *atriarii*; suggesting that the latter were an inferior order of servants, perhaps assistants of the atrienses, and employed in the more servile offices of the atrium, as to attend at the door, sweep the area, &c.

The artienses are represented as servants of authority and command over the rest: they acted as procurators, or agents, of their master, in selling his goods, &c. To their care were committed the statues and images of the master's ancestors, &c. which were placed round the atrium; and which they carried in procession at funerals, &c.

In the villas, or country-houses, the atrienses had the care of the other furniture and utensils, particularly those of metal, which they were to keep bright from rust. Other things they were to hang from time to time in the sun, to keep them dry, &c. They were cloathed in a short white linen habit, to distinguish them, and prevent their loitering from home.

ATRIP, in nautical language, is applied either to the anchor or sails. The anchor is atrip, when it is drawn out of the ground in a perpendicular direction, either by the cable or buoy-rope. The top-sails are atrip, when they are hoisted up to the mast-head, or to their utmost extent.

ATRIPLEX, ORACH, or ARACH: A genus of the monœcia order, belonging to the polygamia class of plants; and, in the natural method, ranking under the 12th order, *Holoraceæ*. The calyx of the hermaphrodite flower has five leaves: there is no corolla; the stamina are five, and the stylus is bifid; the seed is one, and depressed.

Species. 1. The hortensis, or garden orach, was formerly cultivated in gardens, and used as a substitute for spinage, to which it is still preferred by some, tho' in general it is disliked by the English; however, it still maintains its credit in France, as also in the northern parts of England. There are three or four varieties of this plant, whose only difference is their colour; one is a deep green, another a dark purple, and a third with green leaves and purple borders. 2. The halimus, or broad-leaved orach, was formerly cultivated in gardens as a shrub, by some formed into hedges, and constantly sheared to keep them thick: but this is a purpose to which it is by no means adapted, as the shoots grow so vigorous, that it is impossible to keep the hedge in any tolerable order; and, what is worse, in severe winters the plants are often destroyed. 3. The petulacoides, or shrubby sea-orach, grows wild by the sea-side in many places of Britain. It is a low undershrub, seldom rising above two feet and an half, or at most three feet high; but becomes very bushy. This may have a place in gardens among other low shrubs, where it will make a pretty diversity. Besides these, nine other species are enumerated by botanical writers, but the abovementioned are the most remarkable.

Culture, &c. The first sort is annual, so must be propagated by seeds. These are to be sown at Michaelmas, soon after the seeds are ripe. The plants require no other culture than to be kept free from weeds, to hoe them when they are about an inch high, and to cut them down when they are too thick, so as to leave them about four inches asunder. When these plants are sown in a rich soil, and allowed a good distance from each other, the leaves will grow very large, and in this their goodness consists. This must be eaten whilst it is young; for when old, the leaves become tough, and are good for nothing. This species is an article of the materia medica; a decoction of the leaves is recommended in costiveness, where the patient is of a hot bilious disposition.—The second sort may be propagated by cuttings. These are to be planted in any of the summer months, in a shady border; where they will soon take root, and be fit against the following Michaelmas to transplant into those places where they are to remain.—The third sort requires very little culture. It may be also propagated from cuttings, and is to be planted in a poor gravelly soil.

ATRIUM, in ecclesiastical antiquity, denotes an open place or court before a church, making part of what was called the *narthex* or *antetemple*.

The atrium in the ancient churches was a large area or square plat of ground, surrounded with a portico or cloyster, situate between the porch or vestible of the church, and the body of the church.

Some have mistakenly confounded the atrium with the porch or vestible, from which it was distinct; others with the narthex, of which it was only a part.

The atrium was the mansion of those who were not suffered to enter farther into the church. More particularly, it was the place where the first class of penitents stood to beg the prayers of the faithful as they went into the church.

ATRIUM is also used, in the cannon law, for the cemetry or church-yard. In this sense we find a law prohibiting buildings to be raised in *atrio ecclesiæ*, except for the clergy; which the glossary explains thus, *id est in cæmeterio*, which includes the space of forty paces around a large church, or thirty round a little church or chapel.

ATROPA, DEADLY NIGHT-SHADE: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 25th order, *Luridæ*. The corolla is campanulated; the stamina are distant; the berry is globular, and consists of two cells. The species are five; of which the three following are the most remarkable: 1. The belladonna grows wild in many parts of Britain. It hath a perennial root, which sends out strong herbaceous stalks of a purplish colour, which rise to the height of four or five feet, garnished with entire oblong leaves, which towards autumn change to a purplish colour. The flowers are large, and come out singly between the leaves, upon long foot-stalks; bell-shaped, and of a dusky colour on the out-side, but purplish within. After the flower is past, the germen turns to a large round berry a little flatted at the top. It is first green; but when ripe, turns to a shining black,

black, sits close upon the empalement, and contains a purple juice of a nauseous sweet taste, and full of small kidney-shaped seeds. 2. The frutescens is a native of Spain, and rises with a shrubby stem to the height of six or eight feet; dividing into many branches garnished with round leaves, in shape like those of the storax tree: these are placed alternately on the branches. The flowers come out between the leaves on short foot-stalks, shaped like those of the former, but much less; of a dirty yellowish colour, with a few brown stripes: but these are never succeeded by berries in Britain. 3. The herbacea, with an herbaceous stalk, is a native of Campeachy. This hath a perennial root, which puts forth several channelled herbaceous stalks rising about two feet; and towards the top they divide into two or three small branches garnished with oval leaves four inches long and three broad, having several prominent transverse ribs on the under side. The flowers come out from between the leaves on short foot-stalks; they are white, and shaped like those of the common sort, but smaller. It flowers in July and August, but seldom ripens its fruit in Britain. 4. The mandragora, or mandrake, which has been distinguished into the male and female. The male mandrake has a very large, long, and thick root; it is largest at the top or head, and from thence gradually grows smaller. Sometimes it is single and undivided to the bottom; but more frequently it is divided into two or more parts. When only parted into two, it is pretended that it resembles the body and thighs of a man. From this root there arise a number of very long leaves, broadest in the middle, narrow towards the base, and obtusely pointed at the end; they are of a foot or more in length, and five inches or thereabouts in breadth; they are of a dusky and disagreeable green colour, and of a very fœtid smell. The female mandrake perfectly resembles the other in its manner of growth; but the leaves are longer and narrower, and of a darker colour, as are also the seeds and roots. It grows naturally in Spain, Portugal, Italy, and the Levant.

Culture. The first species, which is remarkable for its poisonous qualities, is very seldom admitted in gardens, nor should it ever be cultivated or allowed to grow in those places to which children have access. The other kinds are propagated by seeds, and placed in a stove, as is requisite for the more tender plants.

Qualities, &c. The first species, as we have already observed, is a strong poison. Mr Ray gives a good account of the symptoms that follow the taking of it inwardly, by what happened to a mendicant friar upon his drinking a glass of mallow wine in which the herb was infused. In a short time he became delirious, and soon after was seized with a grining laughter; then with several irregular motions, and at last with a real madness, and such a stupidity as those have who are sottishly drunk: but after all he was cured by a draught of vinegar. Buchannan also gives an account of the destruction of the army of Sweno the Dane, when he invaded Scotland, by mixing a quantity of the belladonna berries with the drink which the Scots were, according to a treaty of truce, to supply them with. This so intoxicated the Danes, that the Scots fell upon them in their sleep, and killed the greatest part of them, so that there were scarcely men enough left to carry off their king. There have also been many instances in Britain of children being killed by eating berries of a fine black colour, and about the size of a small cherry, which are no other than those of belladonna. When an accident of this kind is discovered in time, a glass of warm vinegar will prevent the bad effects.

The third species has been recommended in cases of barrenness, but without foundation. Its fresh root is a violent purge, the dose being from ten grains to twenty in substance, and from half a dram to a dram in infusion. It has been found to do service in hysteric complaints; but must be used with great caution, otherwise it will bring on convulsions, and many other mischievous symptoms. It has also a narcotic quality. At present only the fresh leaves are sometimes used in anodyne and emollient cataplasms and fomentations. It used to be an ingredient in one of the old officinal unguents; but both that and the plant itself are now rejected from our pharmacopœias. It still however retains a place in the foreign ones, and may perhaps be considered as deserving farther attention.

Naturalists tell strange stories of this plant: but setting aside its soporiferous virtue, the modern botanists will scarce warrant any of them, nor even that human figure ordinarily ascribed to its roots, especially since the discovery of the artifice of the Charletans in fashioning it, to surprise the credulity of the people. The figure given in Plate XCI. however, was taken from a genuine root.

Moses informs us, (Gen. xxx. 14.) that Reuben, the son of Leah, being in the field, happened to find mandrakes, which he brought home to his mother. Rachel had a mind to them, and obtained them from Leah, upon condition that she should consent that Jacob should be Leah's bedfellow the night following. The term דודאים *dudaim,* here made use of by Moses, is one of those words of which the Jews at this day do not understand the true signification. Some translate it *violets,* others *lillies,* or *jessamine.* Junius calls it *agreeable flowers;* Codurquus makes it *truffle,* or *mushroom;* and Calmet will have it to be the *citron.* Those that would support the translation of *mandrakes* plead, that Rachel being barren, and having a great desire to conceive, coveted Leah's mandrakes, it may be presumed, with a view to its prolific virtues. The ancients have given to mandrakes the name of the *apples of love,* and to Venus the name of *Mandragoritis;* and the Emperor Julian, in his epistle to Calixenes, says, that he drinks the juice of mandrakes to excite amorous inclinations.

ATROPHY, in medicine, a disease, wherein the body, or some of its parts, does not receive the necessary nutriment, but waste and decay incessantly. See MEDICINE-*Index.*

ATROPOS, in fabulous history, the name of the third of the Parcæ, or Fates, whose business it was to cut the thread of life.

ATTACHMENT, in the law of England, implies the taking or apprehending a person by virtue of a writ or precept. It is distinguished from an *arrest,* by proceeding out of a higher court by precept or writ; whereas the latter proceeds out of an inferior court by precept only. An arrest lies only to the body of

Attachment || Attainder.

of a man; whereas an attachment lies often on the goods only, and sometimes on the body and goods. An attachment by writ differs from *distress*, in not extending to lands, as the latter does; nor does a distress touch the body, as an attachment does.

Attachment out of the Chancery, is obtained upon an affidavit made, that the defendant was served with a subpœna, and made no appearance; or it issues upon not performing some order or decree. Upon the return of this attachment by the sheriff, *qod non est inventus in balliva sua*, another attachment, with a proclamation, issues; and if he still refuses to appear, a commission of rebellion.

Attachment of the Forest, is one of the three courts held in the forest. The lowest court is called the *court of attachment*, or *wood-mote court*; the mean, *swanmote*; and the highest, the *justice in eyre's seat*. The court of attachments has its name from the verdurers of the forest having no other authority in it, but to receive the attachments of offenders against vert and venison taken by the foresters, and to enroll them, that they may be presented or punished at the next justice in eyre's seat. This attachment is by three means: by goods and chattels; by body, pledges, or mainprize; or by the body only. This court is held every 40 days throughout the year; and is thence called *forty day's court.*

Foreign Attachment is an attachment of money or goods found within a liberty or city, to satisfy some creditor within such liberty or city. By the custom of London, and several other places, a man can attach money or goods in the hands of a stranger, to satisfy himself.

ATTACK, a violent attempt upon any person or thing, an assault, or the act of beginning a combat or dispute.

Attack, in the military art, is an effort made to force a post, break a body of troops, &c.

Attack of a Seige, is a furious assault made by the besiegers with trenches, covers, mines, &c. in order to make themselves masters of a fortress, by storming one of its sides. If there are two or three attacks made at the same time, there should be a communication betwixt them. See War.

ATTACOTTI, an ancient people of Britain, mentioned by Ammianus, Marcellinus and St Jerome, as well as in the *Notitia Imperii*. They are represented as allies and confederates of the Scots and Picts, and therefore, probably their neighbours: though their precise situation has not been determined by antiquaries.

ATTAINDER, in law. When sentence of death, the most terrible and highest judgment in our laws, is pronounced, the immediate inseparable consequence by the common law is attainder. For when it is now clear beyond all dispute, that the criminal is no longer fit to live upon the earth, but is to be exterminated as a monster and a bane to human society, the law sets a note of infamy upon him, puts him out of its protection, and takes no farther care of him than barely to see him executed. He is then called *attaint*, *attinctus*, *stained*, or *blackened*. He is no longer of any credit or reputation; he cannot be a witness in any court; neither is he capable of performing the functions of another man: for, by an anticipation of his punishment, he is already dead in law. This is after judgment: for there is great difference between a man *convicted*, and *attainted*; though they are frequently through inaccuracy counfounded together. After conviction only, a man is liable to none of these disabilities: for there is still in contemplation of law a possibility of his innocence. Something may be offered in arrest of judgment: the indictment may be erroneous, which will render his guilt uncertain, and thereupon the present conviction may be quashed: he may obtain a pardon, or be allowed the benefit of clergy; both which suppose some latent sparks of merit, which plead in extenuation of his fault. But when judgment is once pronounced, both law and fact conspire to prove him completely guilty; and there is not the remotest possibility left of any thing to be said in his favour. Upon judgment, therefore, of death, and not before, the attainder of a criminal commences: or upon such circumstances as are equivalent to judgment of death; as judgment of outlawry on a capital crime, pronounced for absconding or fleeing from justice, which tacitly confesses the guilt: And therefore, upon judgment either of outlawry, or of death, for treason or felony, a man shall be said to be attainted.

Attainder, Attaint.

A person attainted of high treason forfeits all his lands, tenements, and heriditaments; his blood is corrupted, and he and his posterity rendered base; and this corruption of blood cannot be taken off but by act of parliament.*

* See the articles *Forfeiture* and *Corruption* of Blood.

Attainders may be reversed or falsified, (i. e. proved to be false) by writ or error, or by plea. If by writ of error, it must be by the king's leave, &c.; and when by plea, it may be by denying the treason, pleading a pardon by act of parliament, &c.

Persons may be attainted by act of parliament.—Acts of attainder of criminals have been passed in several reigns, on the discovery of plots and rebellions, from the reign of king Charles II. when an act was made for the attainder of several persons guilty of the murder of king Charles I. Among acts of this nature, that for attainting Sir John Fenwick, for conspiring against king William, is the most remarkable; it being made to attaint and convict him of high treason on the oath of one witness, just after a law had been enacted, "That no person should be tried or attainted of high treason where corruption of blood is incurred, but by the oath of two lawful witnesses, unless the party confess, stand mute, &c." Stat. 7 and 8 W. III. cap. 3. But in the case of Sir John Fenwick, there was something extraordinary; for he was indicted of treason on the oaths of two witnesses, tho' but only one could be produced against him on his trial.

ATTAINT, is a writ that lies after judgment against a jury of twelve men that have given false verdict in any court of record, in an action real or personal, where the debt or damages amount to above 40s. Stat. 5 and 34 Ed. III. c. 7. It is called *attaint*, because the party that obtains it endeavours thereby to stain or taint the credit of the jury with perjury, by whose verdict he is grieved.

The jury who are to try this false verdict must be twenty-four, and are called *the grand jury*; for the law wills

wills not that the oath of one jury of twelve men ſhould be attainted or ſet aſide by an equal number, nor by leſs indeed than double the former. And he that brings the attaint can give no other evidence to the grand jury, than what was originally given to the petit. For as their verdict is now trying, and the queſtion is whether or no they did right upon the evidence that appeared to them, the law adjudged it the higheſt abſurdity to produce any ſubſequent proof upon ſuch trial, and to condemn the prior juriſdiction for not believing evidence which they never knew. But thoſe againſt whom it is brought are allowed, in the affirmance of the firſt verdict, to produce new matter: becauſe the petit jury may have formed their verdict upon evidence of their own knowledge, which never appeared in court; and becauſe very terrible was the judgment which the common law inflicted upon them, if the grand jury found their verdict a falſe one. The judgment was, 1. That they ſhould loſe their *liberam legem*, and become for ever infamous. 2. That they ſhould forfeit all their goods and chattels. 3. That their lands and tenements ſhould be ſeized into the king's hands. 4. That their wives and children ſhould be thrown out of doors. 5. That their houſes ſhould be raſed and thrown down. 6. That their trees ſhould be rooted up. 7. That their meadows ſhould be ploughed. 8. That their bodies ſhould be caſt into jail. 9. That the party ſhould be reſtored to all that he loſt by reaſon of the unjuſt verdict. But as the ſeverity of this puniſhment had its uſual effect, in preventing the law from being executed, therefore by the ſtatute 11 Hen. VII. c. 24. revived by 23 Hen. VIII. c. 3. and made perpetual by 13 Eliz. c. 25. it is allowed to be brought after the death of the party, and a more moderate puniſhment was inflicted upon attainted jurors; viz. perpetual infamy, and if the cauſe of action were above L.40 value, a forfeiture of L.20 a-piece by the jurors; or, if under L.40, then L.5 a-piece; to be divided between the king and the party injured. So that a man may now bring an attaint either upon the ſtatute or at common law, at his election; and in both of them may reverſe the former judgment. But the practice of ſetting aſide verdicts upon motion, and granting new trials, has ſo superſeded the uſe of both ſorts of attaints, that there is hardly any inſtance of an attaint later than the 16th century.

Attaint, among farriers, a knock or hurt in a horſe's leg, proceeding either from a blow with another horſe's foot, or from an over-reach in froſty weather, when a horſe, being rough-ſhod, or having ſhoes with long caulkers, ſtrikes his hinder feet againſt his fore-leg.

ATTAINTED, in law, is applied to a perſon's being under attainder. See Attainder.

ATTALICÆ vestes, in antiquity, garments made of a kind of cloth of gold. They took the denomination from Attalus, ſurnamed Philometer, a wealthy king of Pergamus, who was the firſt, according to Pliny, who procured gold to be woven into cloth.

ATTALUS, the name of ſeveral kings of Pergamus. See Pergamus.

ATTELABUS, in zoology, a genus of inſects belonging to the order of coleoptera or beetle-kind. It has four wings, of which the ſuperior are cruſtaceous, and ſerve as a ſheath or cover to the inferior, which are membranous. The head tapers behind, and is inclined; the feelers turn thicker towards the apex. The ſpecies are 13; vix. 1. The coryli is black, with red elytra or cruſtaceous wings. 2. The avellana is black, with the breaſt, feet, and elytra red. 3. The curculionoides is black, with red elytra and breaſt. The above three ſpecies frequent the leaves of the hazel and filbert nut-trees. 4. The ſurinamenſis has a double indentation (or two teeth) in the top of the elytra. It is a native of Surinam. 5. The penſilvanicus is black, with red elytra, a black belt round the middle, and another towards the apex of the elytra. It is a native of Philadelphia. 6. The melanurus is black, with teſtaceous elytra, black at the apex. It is a native of Sweden. 7. The betula has ſaltatory or ſpringy legs, and the whole body is of a dark-red colour. It frequents the leaves of the birch-tree. 8. The formicarius is black, with red elytra, and a double white belt towards the baſe. It is a native of Europe. 9. The ſipylus is green, with a hairy breaſt, and a double yellow belt upon the elytra. 10. The apiarius is bluiſh, with red elytra, and three black belts. It is a native of Germany. 11. The mollis is yellowiſh and hairy, with pale elytra, and three belts. It is a native of Europe. 12. The ceramboides is of a blackiſh red colour, and the elytra is furrowed. It frequents the ſpongy beletus, a ſpecies of muſhroom. 13. The bupreſtoides is of a dark-red colour, with a globular breaſt, and nervous elytra. It is a native of Europe.

ATTENTION, a due application of the ear, or the mind, to any thing ſaid or done, in order to acquire a knowledge thereof. The word is compounded of *ad*, "to," and *tendo*, "I ſtretch."

Attention of mind is not properly an act of the underſtanding; but rather of the will, by which it calls the underſtanding from the conſideration of other objects, and directs it to the thing in hand. Nevertheleſs, our attention is not always voluntary: an intereſting object ſeizes and fixes it beyond the power of controul.

Attention, in reſpect of hearing, is the ſtretching or ſtraining of the *membrana tympani*, ſo as to make it more ſuſceptible of ſounds, and better prepared to catch even a feeble agitation of the air. Or it is the adjuſting the tenſion of that membrance to the degree of loudneſs or lowneſs of the ſound to which we are attentive.

According to the degree of attention, objects make a ſtronger or weaker impreſſion (A). Attention is requiſite

(A) Bacon, in his natural hiſtory, makes the following obſervations. "Sounds are meliorated by the intenſion of the ſenſe, where the common ſenſe is collected moſt to the particular ſenſe of hearing, and the ſight ſuſpended. Therefore ſounds are ſweeter, as well as greater, in the night than in the day; and I ſuppoſe they are ſweeter to blind men than to others; and it is manifeſt, that between ſleeping and waking, when all the ſenſes are bound and ſuſpended, muſic is far ſweeter than when one is fully waking."

Attention, Attenuants quisite even to the simple act of seeing: the eye can take in a considerable field at one look; but no object in the field is seen distinctly but that singly which fixes the attention: in a profound reverie that totally occupies the attention, we scarce see what is directly before us. In a train of perceptions, no particular object makes such a figure as it would do singly and apart; for when the attention is divided among many objects, no particular object is intitled to a large share. Hence, the stillness of night contributes to terror, there being nothing to divert the attention:

Horror ubique animos, simul ipsa silentia terrent. *Æn.* ii.

Zara. Silence and solitude are ev'ry where!
Through all the gloomy ways and iron doors
That hither lead, nor human face nor vice
Is seen or heard. A dreadful din was wont
To grate the sense, when enter'd here, from groans
And howls of slaves condemn'd, from clink of chains,
And crash of rusty bars and creaking hinges;
And ever and anon the sight was dash'd
With frightful faces, and the meagre looks
Of grim and ghastly executioners.
Yet more this stillness terrifies my soul
Than did that scene of complicated horrors.
Mourning Bride, act 5. sc. 3.

In matters of slight importance, attention is mostly directed by will; and for that reason, it is our own fault if trifling objects make any deep impression. Had we power equally to with-hold our attention from matters of importance, we might be proof against any deep impression. But our power fails us here: an interesting object seizes and fixes the attention beyond the possibility of controul; and while our attention is thus forcibly attached to one object, others may solicit for admittance; but in vain, for they will not be regarded. Thus a small misfortune is scarce felt in presence of a greater:

Lear. Thus think'st 'tis much, that this contentious storm
Invades us to the skin: so 'tis to thee:
But where the greater malady is fix'd,
The lesser is scarce felt. Thou'dst shun a bear;
But if thy flight lay tow'rd the roaring sea,
Thou'dst meet the bear i' th' mouth. When the mind's free,
The body's delicate: the tempest in my mind
Doth from my senses take all feeling else,
Save what beats there. *King Lear, act 3. sc. 5.*

ATTENUANTS, or ATTENUATING *Medicines*, are such as subtilize and break the humours into finer parts; and thus dispose them for motion, circulation, excretion, &c.

Attenuating and inciding medicines are of very extensive use in physic, and come under different denominations, according to the different effects they produce. Thus, when tenacious and viscid juices not only stagnate in the cavities of the vessels, but obstruct the minute ducts of the viscera and emunctories, these medicines, by the inciding and attenuating quality, discharge the humours, and remove the obstructions; for which reason they are not improperly called *aperients*.

Attenuants produce so great a variety of effects, that it is proper we should be well acquainted with their several kinds, as appropriated to the several disorders, and know which will prove most serviceable in each. According to Hoffman, the dissolving and attenuating of viscid crudities in the stomach and *primæ viæ*, is well answered by the roots of arum, acorus, pepper, ginger, and the like; as also by sal ammoniac, vitriolated tartar, the fixed alkaline salts, and the simple or dulcified spirit of salt. When crude and unconcocted humours are to be evacuated by stool, this intention is very well answered by the neutral salts, as the salts of the purging waters, and the *sal polycrestum*, with a sufficient quantity of watery vehicle.

Attenuants ‖ Atterbury.

When viscid humours, occasioning disorders of the breast, are to be attenuated and expectorated, the intention is most effectually answered by elecampane and orice roots; and by gum ammoniacum, myrrh, or benjamin, and balsam of Peru: or by regenerated tartar, oxymel of squills, a solution of crabs eyes in distilled vinegar, and the syrups of tabacco, and the like.

When the mass of blood is tainted by thick and tenacious sordes, and the emunctories are by that means obstructed, and the humours contaminated by a saline sulphureous and scorbutic dyscracy, the most efficacious of the attenuants are the horse-radish, scurvy-grass, water and garden cresses, mustard, gum ammoniacum, benjamin, myrrh, the oil of fixed nitre, oil of tartar *per deliquium*, solutions of nitre, spirit of sal ammoniac, salt of wormwood with lemon juice, and the salts of the medicinal waters.

When grumous or coagulated blood, occasioned by contusions or blows, is to be attenuated, and again dissolved, the intention is sure to be answered by the roots of Solomon's seal, vinegar, and crabs eyes, the regenerated tartar, and nitre prepared with antimony.

And in cases where the lymph has acquired a preternatural thickness and viscidity, especially if from a venereal taint, the curative intention is most effectually answered by guaiacum, the acrid tincture of antimony, calomel æthiops mineral, and the like; which, when skilfully used, are of singular efficacy in dissolving and attenuating the viscid juices impacted in the glands of the liver.

ATTENUATION, the act of attenuating; that is, of making any fluid thinner, and less consistent, than it was before. The word is compounded of *ad* 'to,' and *tenuis* 'thin.' Attenuation is defined more generally by Chauvin, the dividing or separating of the minute parts of any body, which before, by their mutual *nexus* or implication, formed a more continuous mass. Accordingly, among alchemists, we sometimes find the word used for pulverization, or the act of reducing a body into an impalpable powder, by grinding, pounding, or the like.

ATTERBURY (Dr Francis), son of Dr Lewis Atterbury, was born at Milton in Buckinghamshire, 1662; educated at Westminster; and from thence elected to Christ-Church in Oxford, where he soon distinguished himself by his fine genius and turn for polite literature. The year he was made M. A. 1687, he exerted himself in the controversy with the Papists, vindicated Luther in the strongest manner, and showed an uncommon fund of learning, enlivened with great vivacity. In 1690 he married Miss Osborn, a distant rela-

Atterbury. relation of the Duke of Leeds; a lady of great beauty, but with little or no fortune, who lived at or in the neigbourhood of Oxford.

In Feb. 1690-1, we find him resolved "to bestir himself in his office in the house;" that of censor probably, an officer (peculiar to Christ-church) who presides over the classical exercises; he then also held the catechetical lecture founded by Dr Busby.

About this period it must have been that he took orders, and entered into another scene, and another sort of conversation; for in 1691 he was elected lecturer of St Bride's church in London, and preacher at Bridewell chapel. An academic life, indeed, must have been irksome and insipid to a person of his active and aspiring temper. It was hardly possible that a clergyman of his fine genius, improved by study, with a spirit to exert his talents, should remain long unnoticed; and we find that he was soon after appointed chaplain to King William and Queen Mary.

The share he took in the controversy against Bentley (about the genuineness of the Phalaris Epistles) is now very clearly ascertained. In one of the letters to his noble pupil, dated "Chelsea 1693, (he says), the matter had cost him some time and trouble. In laying the design of the book, in writing above half of it, in reviewing a good part of the rest, in transcribing the whole, and attending the press (he adds), half a year of my life went away."

In 1700, a still larger field of activity opened, in which Atterbury was engaged four years with Dr Wake (afterwards Archbishop of Canterbury) and others, concerning the Rights, Powers, and Privileges of Convocations;" in which, however, the truth of the question may be supposed to lie, he displayed so much learning and ingenuity, as well as zeal for the interests of his order, that the Lower House of Convocation returned him their thanks, and the university of Oxford complimented him with the degree of D. D. January 29, 1700, he was installed archdeacon of Totness, being promoted to that dignity by Sir Jonathan Trelawny, then Bishop of Exeter. The same year he was engaged, with some other learned divines, in revising an intended edition of the "Greek Testament," with Greek "Scholia," collected chiefly from the fathers, by Mr Archdeacon Gregory. At this period he was popular as preacher at the Rolls Chapel; an office which had been conferred on him by Sir John Trevor, a great discerner of abilities, in 1698, when he resigned Bridewell, which he had obtained in 1693. Upon the accession of Queen Anne in 1702, Dr Atterbury was appointed one of her Majesty's chaplains in ordinary; and, in October 1704, was advanced to the deanery of Carlisle. About two years after this, he was engaged in a dispute with Mr Hoadly, concerning the advantages of virtue with regard to the present life; occasioned by his sermon, preached August 30, 1706, at the funeral of Mr Thomas Bennet, a bookseller. In 1707, Sir Jonathan Trelawny, then bishop of Exeter, appointed him one of the canons residentiaries of that church. In 1709, he was engaged in a fresh dispute with Mr Hoadly, concerning "Passive Obedience;" occasioned by his Latin Sermon, intitled "Concio ad Clerum Londinensem, habita in Ecclesia S. Elphegi." In 1710, came on the famous trial of Dr Sacheverell, whose remarkable speech on that occasion was generally supposed to have been drawn up by our author, in conjunction with Dr Smalridge and Dr Freind. The same year Dr Atterbury was unanimously chosen prolocutor of the Lower House of Convocation, and had the chief management of affairs in that House. May 11, 1711, he was appointed by the Convocation, one of the committee, for comparing Mr Whiston's doctrines with those of the church of England; and in June following, he had the chief hand in drawing up "A Representation of the Present State of Religion." In 1712, Dr Atterbury was made dean of Christ-Church, notwithstanding the strong interest and warm applications of several great men in behalf of his competitor Dr Smalridge. The next year saw him at the top of his preferment, as well as of his reputation: for, in the beginning of June 1713, the Queen, at the recommendation of Lord Chancellor Harcourt, advanced him to the bishopric of Rochester, with the deanery of Westminster in commendam; he was confirmed July 4, and consecrated at Lambeth next day.

At the beginning of the succeeding reign, his tide of prosperity began to turn; and he received a sensible mortification presently after the coronation of King George I. when, upon his offering to present his Majesty (with a view, no doubt, of standing better in his favour) with the chair of State and royal canopy, his own perquisites as dean of Westminster, the offer was rejected, not without some evident marks of dislike to his person.

During the rebellion in Scotland, when the Pretender's declaration was dispersed, the archbishop of Canterbury, and the bishops in and near London, had published a *Declaration of their Abhorrence of the present Rebellion, and an Exhortation to the Clergy and People to be zealous in the discharge of their duties to his Majesty King George:* but the Bishop of Rochester refused to sign it; and engaged bishop Smalridge in the same refusal, on account of some reflections it contained against the high-church party. He appeared generally among the protestors against the measures of the ministry under the king, and drew up the reasons of the protests with his own hand.

In 1716, we find him advising Dean Swift in the management of a refractory chapter. April 26, 1722, he sustained a severe trial in the loss of his lady; by whom he had four children; Francis, who died an infant; Osborn, student of Christ-Church; Elizabeth, who died September 29, 1716. aged 17; and Mary, who had been then seven years married to Mr Morrice.

In this memorable year, on a suspicion of his being concerned in a plot in favour of the Pretender, he was apprehended, August 24, and committed prisoner to the tower.

Two officers, the under-secretary, and a messenger, went about two o'clock in the afternoon to the Bishop's house in Westminster, where he then was, with orders to bring him and his papers, before the council. He happened to be in his night-gown when they came in: and being made acquainted with their business, he desired time to dress himself. In the mean time his secretary came in; and the officers went to search for his papers; in the sealing of which the messenger brought a paper, which he pretended to have found

Atterbury. found in his close-stool, and desired it might be sealed up with the rest. His Lordship observing it, and believing it to be a forged one of his own, desired the officers not to do it, and to bear witness that the paper was not found with him. Nevertheless they did it; and though they behaved themselves with some respect to him, they suffered the messengers to treat him in a very rough manner, threatening him, if he did not make haste to dress himself, they would carry him away undressed as he was. Upon which he ordered his secretary to see his papers all sealed up, and went himself directly to the Cock-pit, where the council waited for him. The behaviour of the messengers, upon this occasion, seems to have been very unwarrantable, if what the author of "a Letter to the Clergy of the Church of England," &c. tell us be be true, that the persons, directed by order of the King and council, to seize his Lordship and his papers, received a strict command to treat him with great respect and reverence. However this was, when he came before the council, he behaved with a great deal of calmness, and they with much civility towards him. He had liberty to speak for himself as much as he pleased, and they listened to his defence with a great deal of attention; and, what is more unusual, after he was withdrawn, he had twice liberty to re-enter the council-chamber, to make for himself such representations and requests as he thought proper. It is said, that, while he was under examination, he made use of our Saviour's answer to the Jewish council, while he stood before them; "If I tell you, ye will not believe me; and if I also ask you you, ye will not answer me, nor let me go." After three quarters of an hour's stay at the Cock-pit, he was sent to the Tower, privately, in his own coach, without any manner of noise or observation.

This commitment of a bishop, upon a suspicion of high treason, as it was a thing rarely practised since the Reformation, so it occasioned various speculations among the people. Those who were the Bishop's friends, and pretended to the greatest intimacy with him, laid the whole odium of the matter on the ministry. They knew the Bishop so well, they said, his love to our constitution, and attachment to the Protestant succession, his professed abhorence of Popery and settled contempt of the Pretender, and his caution, prudence, and circumspection, to be such as would never allow him to engage in an attempt of subverting the government, so hazardous in itself, and so repugnant to his principles; and therefore they imputed all to the malice and management of a great minister of state or two, who were resolved to remove him, on account of some personal prejudices, as well as the constant molestation he gave them in parliament, and the particular influence and activity he had shown in the late election. The friends to the ministry, on the other hand, were strongly of opinion, that the Bishop was secretly a favourer of the Pretender's cause, and had formerly been tampering with things of that nature, even in the Queen's time, and while his party was excluded from power; but upon their re-admission, had relinquished that pursuit, and his confederates therein, and became a good subject again. They urged, that the influence which the late Duke of Ormond had over him, assisted by his own private ambition and revenge, might prompt him to many things contrary to his declared sentiments, and inconsistent with that cunning and caution which in other cases he was master of. And to obviate the difficulty, arising from the Bishop's aversion to Popery, and the Pretender's bigotry to that religion, they talked of a new-invented scheme of his, not to receive the Pretender, whose principles were not to be changed, but his son only, who was to be educated a Protestant in the church of England, and the bishop to be his guardian, and Lord Protector of the kingdom, during his minority. These, and many more speculations, amused the nation at that time; and men, as usual, judged of things by the measure of their own affections and prejudices.

March 23. 1722-3 a bill was brought into the House commons, for "inflicting certain pains and penalties on Francis Lord bishop of Rochester;" a copy of which was sent to him, with notice that he had liberty of council and solicitors for making his defence. Under these circumstances the Bishop applied, by petition, to the House of Lords, for their direction and advice, as to his conduct in this conjuncture; and April 4, he acquainted the Speaker of the House of Commons, by a letter, that he was determined to give that house no trouble, in relation to the bill depending therein; but should be ready to make his defence against it when it should be argued in another House, of which he had the honour to be a member. On the 9th the bill passed the House of Commons, and was the same day sent up to the House of Lords for their concurrence.

May 6th, being the day appointed by the Lords for the first reading of the bill, Bishop Atterbury was brought to Westminster to make his defence. The counsel for the Bishop were, Sir Constantine Phipps, and William Wynne; Esq. for the King, Mr Reeve, and Mr Wearg. The proceedings continued above a week: and on Saturday May 11th, the Bishop was permitted to plead for himself. This he did in a very eloquent speech; which he feelingly opens by complaining of the uncommon severity he had experienced in the Tower; which was carried to so great a length, that not even his son-in-law Mr Morrice was permitted to speak to him in any nearer mode than standing in an open area, while the Bishop looked out of a two-pair-of-stairs window. In the course of his defence he observes, "Here is a plot of a year or two standing, to subvert the government with an armed force; an invasion from abroad, an insurrection at home: just when ripe for execution, it is discovered; and twelve months after the contrivance of this scheme, no consultation appears, no men corresponding together, no provision made, no arm, no officers provided, not a man in arms; and yet the poor bishop has done all this. What could tempt me to step thus out of my way? Was it ambition, and a desire of climbing into a higher station in the church? There is not a man in my office farther removed from this than I am. Was money my aim? I always despised it too much, considering what occasion I am now like to have for it: for out of a poor bishopric of L. 500 *per annum*, I have laid out no less than L. 1000 towards the repairs of the church and episcopal palace; nor did I take one shilling for dilapidations. The rest of my little income has been

Atterbury. spent, as is necessary, as I am a bishop. Was I influenced by any dislike of the established religion, and secretly inclined towards a church of greater pomp and power? I have, my lords, ever since I knew what Popery was, opposed it; and the better I knew it, the more I opposed it. I began my study in divinity, when the Popish controversy grew hot, with that immortal book of Tillotson's, when he undertook the Protestant cause in general; and as such, I esteemed him above all. You will pardon me, my lords, if I mention one thing: Thirty years ago, I writ in defence of Martin Luther; and have preached, expressed, and wrote to that purpose from my infancy; and whatever happens to me, I will suffer any thing, and, by God's grace, burn at the stake, rather than depart from any material point of the Protestant religion as professed in the church of England. Once more: Can I be supposed to favour arbitrary power? The whole tenor of my life has been otherwise: I was always a friend to the liberty of the subject; and, to the best of my power, constantly maintained it. I may have been thought mistaken in the measures I took to support it; but it matters not by what party I was called, so my actions are uniform." Afterwards, speaking of the method of proceeding against him as unconstitutional, he says: "My ruin is not of that moment to any number of men, to make it worth their while to violate, or even to seem to violate, the constitution in any degree, which they ought to preserve against any attempts whatsoever. Though I am worthy of no regard, though whatsoever is done to me may for that reason be looked upon to be just; yet your lordships will have some regard to your own lasting interest and that of posterity. This is a proceeding with which the constitution is unacquainted; which, under the pretence of supporting it, will at last effectually destroy it. For God's sake, lay aside these extraordinary proceedings; set not up these new and dangerous precedents. I, for my part, will voluntarily and cheerfully go into perpetual banishment, and please myself that I am in some measure the occasion of putting a stop to such precedents, and doing some good to my country: I will live, wherever I am, praying for its prosperity; and do, in the words of Father Paul to the state of Venice, say, *Esto perpetua*. It is not my departing from it I am concerned for. Let me depart, and let my country be fixed upon the immoveable foundation of law and justice, and stand for ever."—After a solemn protestation of his innocence, and an appeal to the Searcher of Hearts for the truth of what he had said, he concludes thus: "If, on any account, there shall still be thought by your lordships to be any seeming strength in the proofs against me; if, by your lordships judgments, springing from unknown motives, I shall be thought to be guilty; if, for any reasons or necessity of state, of the wisdom and justice of which I am no competent judge, your lordships shall proceed to pass this bill against me; I shall dispose myself quietly and tacitly to submit to what you do; God's will be done: Naked came I out of my mother's womb, and naked shall I return; and whether he gives or takes away, blessed be the name of the Lord!"

On Monday the 13th he was carried for the last time from the Tower to hear the reply of the King's counsel to his defence. These were both men of great knowledge and sagacity in law, but of different talents in point of eloquence. Their speeches on this occasion were made public; and they seem to have formed their "Replies," designedly, in a different way. The former sticks close to the matter in evidence, and enforces the charge against the Bishop with great strength and perspicuity: The latter answers all his objections, and refutes the arguments brought in his defence, in an easy soft manner, and with great simplicity of reasoning. Mr. Reeve is wholly employed in facts, in comparing and uniting together circumstances, in order to corroborate the proofs of the Bishop's guilt: Mr Wearg is chiefly taken up in silencing the complaints of the Bishop and his counsel, and replying to every thing they advance, in order to invalidate the allegations of his innocence. The one, in short, possesses the minds of the Lords with strong convictions against the Bishop: The other dispossesses them of any favourable impression that might possibly be made upon them by the artifice of his defence. And accordingly Mr Reeve is strong, nervous, and enforcing; but Mr Wearg, smooth, easy, and insinuating, both in the manner of his expression and the turn of his periods. Mr Wearg pays the highest compliments to the Bishop's eloquence: but, at the same time, represents it as employed to impose upon the reason, and misguide the judgment of his hearers, in proportion as it affected their passions; and he endeavours to strip the Bishop's defence of all its ornaments and colours of rhetoric.

On the 15th the bill was read the third time; and, after a long and warm debate, passed on the 16th, by a majority of 83 to 43. On the 27th the King came to the House, and confirmed it by his royal assent. June 18. 1723, this eminent Prelate, having the day before taken leave of his friends, who, from the time of passing the bill against him to the day of his departure, had free access to him in the Tower (B), embarked on board the Aldborough man of war, and landed

(B) The following anecdote was first communicated to the public by the late Dr Maty, on the credit of Lord Chesterfield: "I went (said Lord Chesterfield) to Mr Pope, one morning, at Twickenham, and found a large folio Bible, with gilt clasps, lying before him upon his table; and, as I knew his way of thinking upon that book, I asked him, jocosely, if he was going to write an answer to it? It is a present, said he, or rather a legacy, from my old friend the Bishop of Rochester. I went to take my leave of him yesterday in the Tower, where I saw this Bible upon his table. After the first compliments, the Bishop said to me, 'My friend Pope, considering your infirmities, and my age and exile, it is not likely that we should ever meet again; and therefore I give you this legacy to remember me by it. Take it home with you; and let me advise you to abide by it.'—'Does your Lordship abide by it yourself?'—'I do.'—'If you do, my Lord, it is but lately. May I landed the Friday following at Calais. When he went on ſhore, having been informed that Lord Bolingbroke, who had after the riſing of the parliament, received the King's pardon, was arrived at the ſame place on his return to England, he ſaid, with an air of pleaſantry, "Then I am exchanged!" and it was, in the opinion of Mr Pope, on the ſame occaſion, "a ſign of the nation's being curſedly afraid of being over-run with too much politeneſs, when it could not regain one great man, but at the expence of another." But the ſeverity of his treatment did not ceaſe even with his baniſhment. The ſame vindictive ſpirit purſued him in foreign climes. No Britiſh ſubject was even permitted to viſit him without the king's ſign manual, which Mr Morice was always obliged to ſolicit, not only for himſelf, but for every one of his family whom he carried abroad with him, for which the fees of office were very high.

When biſhop Atterbury firſt entered upon his baniſhment, Bruſſels was the place deſtined for his reſidence; but, by the arts and inſtigations of the Britiſh miniſters, he was compelled to leave that place, and retire to Paris. There being ſolicited by the friends of the Pretender to enter into their negociations, he changed his abode for Montpelier in 1728; and, after reſiding there about two years, returned to Paris, where he died Feb. 15. 1731-2. The affliction which he ſuſtained by the death of his daughter in 1729, was thought to have haſtened his own diſſolution. The former event he hath himſelf related in a very affecting manner, in a letter to Mr. Pope: "The earneſt deſire of meeting one I dearly loved, called me abruptly to Montpelier; where, after continuing two months under the cruel torture of a ſad and fruitleſs expectation, I was forced at laſt to take a long journey to Toulouſe; and even there I had miſſed the perſon I ſought, had ſhe not, with great ſpirit and courage, ventured all night up the Garonne to ſee me, which ſhe above all things deſired to do before ſhe died. By that means ſhe was brought where I was, between ſeven and eight in

I beg to know what new light or arguments have prevailed with you now, to entertain an opinion ſo contrary to that which you entertained of that book all the former part of your life?'—The Biſhop replied, 'We have not time to talk of theſe things; but take home the book; I will abide by it, and I recommend you to do ſo too; and ſo God bleſs you.'

Theſe anecdotes Mr Nichols has inſerted in the "Epiſtolary Correſpondence," Vol. II. p. 79. with the profeſſed view of vindicating Atterbury, in the following words of an ingenius correſpondent:

"Dr Warton hath revived this ſtory, which he juſtly calls an 'uncommon' one, in his laſt 'Eſſay on the Genius and Writings of Pope.' It was indeed very uncommon; and I have my reaſons for thinking it equally groundleſs and invidious. Dr Warton, though he retails the ſtory from 'Maty's Memoirs,' yet candidly acknowledges, that it ought not to be implicitly relied on. That this caution was not unneceſſary, will, I apprehend, be ſufficiently obvious, from the following compariſon between the date of the ſtory itſelf and Mr Pope's letters to the Biſhop.

"According to Lord Cheſterfield's account, this remarkable piece of converſation took place but a few days before the Biſhop went into exile: and it is inſinuated that Mr Pope, till that period, had not even entertained the ſlighteſt ſuſpicion of his friend's reverence for the Bible: Nay, it is aſſerted, that the very recommendation of it from a quarter ſo unexpected, ſtaggered Mr Pope to ſuch a degree, that in a mingled vein of raillery and ſeriouſneſs, he was very eager to know the grounds and reaſons of the Biſhop's change of ſentiment.

"Unfortunately for the credit of Lord Cheſterfield and his ſtory, there is a letter on record, that was written nine months before this pretended dialogue took place, in which Mr Pope ſeriouſly acknowledged the Biſhop's piety and generoſity, in intereſting himſelf ſo zealouſly and affectionately in matters which immediately related to his improvement in the knowledge of the holy ſcriptures. The paſſage I refer to is a very remarkable one: and you will find it in a letter, dated July 27. 1722. It appears undeniably from this letter, that the Biſhop had earneſtly recommended to Mr Pope the ſtudy of the Bible; and had ſoftened his zeal with an unuſual urbanity and courteſy, in order to avoid the imputation of ill-breeding, and remove all occaſion of diſguſt from a mind ſo 'trembling alive' as Mr Pope's. I will tranſcribe the paſſage at large. 'I ought firſt to prepare my mind for a better knowledge even of good profane writers, eſpecially the moraliſts, &c. before I can be worthy of taſting the Supreme of books, and Sublime of all writings, in which, as in all the intermediate ones, you may (if your friendſhip and charity towards me continue ſo far) be the beſt guide to, Yours, A. Pope.'

"The laſt letter of Mr Pope to the Biſhop, previous to his going into exile, was written very early in June 1723. It muſt have been about this time that Pope paid his farewel viſit to the Biſhop in the Tower. But whether ſuch a converſation as that which hath been pretended actually took place, may be left to the determination of every man of common ſenſe, after comparing Lord Cheſterfield's anecdote with Mr. Pope's letter.

"There muſt have been a miſtake, or a wilful miſrepreſentation ſomewhere. To determine its origin, or to mark minutely the various degrees of its progreſs, till it iſſued forth into calumny and falſehood, is impoſſible. I have ſimply ſtated matters of fact as they are recorded; and leave it to your readers to ſettle other points not quite ſo obvious and indiſputable, as they may think fit. My motives in this very plain relation aroſe from an honeſt wiſh to remove unmerited obloquy from the dead. I ſhould ſincerely rejoice if the cloud which in other reſpects ſtill ſhades the character of this ingenious Prelate could be removed with equal facility and ſucceſs. I am, dear Sir, your faithful humble ſervant, Samuel Badcock."

Atterbury. in the morning, and lived 20 hours afterwards; which time was not loſt on either ſide, but paſſed in ſuch a manner as gave great ſatisfaction to both, and ſuch as, on her part, every way became her circumſtances and character: For ſhe had her ſenſes to the very laſt gaſp, and exerted them to give me, in thoſe few hours, greater marks of duty and love than ſhe had done in all her lifetime, though ſhe had never been wanting in either. The laſt words ſhe ſaid to me were the kindeſt of all; a reflection on the goodneſs of God, which had allowed us in this manner to meet once more, before we parted for ever. Not many minutes after that, ſhe laid herſelf on her pillow, in a ſleeping poſture.

Placidaque ibi demum morte quievit.

Judge you, Sir, what I felt, and ſtill feel on this occaſion, and ſpare me the trouble of deſcribing it. At my age, under my infirmities, among utter ſtrangers, how ſhall I find out proper reliefs and ſupports? I can have none, but thoſe with which reaſon and religion furniſh me; and thoſe I lay hold on, and graſp as faſt as I can. I hope that he who laid the burden upon me (for wiſe and good purpoſes no doubt) will enable me to bear it in like manner as I have borne others, with ſome degree of fortitude and firmneſs."

How far the Biſhop might have been attached in his inclinations to the Stuart family, to which he might be led by early prejudices of education, and the divided opinions of the times, it is not neceſſary here to enquire: But that he ſhould have been weak enough to engage in a plot ſo inconſiſtent with his ſtation, and ſo clumſily deviſed (to ſay the leaſt of it, and without entering into his ſolemn aſſeveration of innocence), is utterly inconſiſtent with that cunning which his enemies allowed him. The Duke of Wharton, it is well known, was violent againſt him, till convinced by his unanſwerable reaſoning.

It has been ſaid that Atterbury's wiſhes reached to the biſhopric of London, or even to York or Canterbury. But thoſe who were better acquainted with his views, knew that Wincheſter would have been much more deſirable to him than either of the others. And there are thoſe now living, who have been told from reſpectable authority, that that biſhopric was offered to him whenever it ſhould become vacant (and till that event ſhould happen a penſion of L.5000 a-year, beſides an ample proviſion for Mr Morice), if he would ceaſe to give the oppoſition he did to Sir Robert Walpole's adminiſtration, by his ſpeeches and proteſts in the Houſe of Lords. When that offer was rejected by the Biſhop, then the contrivance for his ruin was determined on.

In his ſpeech in the Houſe of Lords, the Biſhop mentions his being "engaged in a correſpondence with two learned men (Biſhop Potter and Dr Wall), on ſettling the times of writing the four goſpels." Part of this correſpondence is ſtill in being, and will ſoon be publiſhed. The ſame ſubject the Biſhop purſued during his exile, having conſulted the learned of all nations, and had nearly brought the whole to a concluſion when he died. Theſe laudable labours are an ample confutation of Biſhop Newton's aſſertion, that Atterbury "wrote little whilſt in exile but a few criticiſms on French authors."

His body was brought over to England, and interred on the 12th of May following in Weſtminſter abbey, in a vault which in the year 1722 had been prepared by his directions. There is no memorial over his grave: nor could there well be any, unleſs his friends would have conſented (which it is moſt probable they refuſed to do) that the words implying him to have died biſhop of Rocheſter ſhould have been omitted on his tomb. Atterbury.

Some time before his death, he publiſhed a vindication of himſelf, Biſhop Smalridge, and Dr Aldrich, from a charge brought againſt them by Mr Oldmixon, of having altered and interpolated the copy of Lord Clarendon's "Hiſtory of the Rebellion." Biſhop Atterbury's "Sermons" are extant in four volumes in octavo: thoſe contained in the two firſt were publiſhed by himſelf, and dedicated to his great patron Sir Jonathan Trelawny biſhop of Wincheſter; thoſe in the two laſt were publiſhed after his death by Dr Thomas Moore his Lordſhip's chaplain. Four admirable "Viſitation Charges" accompany his "Epiſtolary Correſpondence."

As to Biſhop Atterbury's character, however the moral and political part of it may have been differently repreſented by the oppoſite parties, it is univerſally agreed, that he was a man of great learning and uncommon abilities, a fine writer, and a moſt excellent preacher. His learned friend Smalridge, in the ſpeech he made when he preſented him to the Upper Houſe of Convocation, as prolocutor, ſtyles him *Vir in nullo literarum genere hoſpes, in pleriſque artibus et ſtudiis diu et feliciter exercitatus, in maxime perfectis literarum diſciplinis perfectiſſimus.* In his controverſial writings, he was ſometimes too ſevere upon his adverſary, and dealt rather too much in ſatire and invective: but this his panegyriſt imputes more to the natural fervour of his wit than to any bitterneſs of temper or prepenſe malice. In his ſermons, however, he is not only every way unexceptionable, but highly to be commended. The truth is, his talent as a preacher was ſo excellent and remarkable, that it may not improperly be ſaid, that he owed his preferment to the pulpit; nor any hard matter to trace him, through his writings, to his ſeveral promotions in the church. We ſhall conclude Biſhop Atterbury's character, as a preacher, with the encomium beſtowed on him by the author of "the Tatler;" who, having obſerved that the Engliſh clergy too much neglect the art of ſpeaking, makes a particular exception with regard to our prelate; who, ſays he, "has ſo particular a regard to his congregation, that he commits to his memory what he has to ſay to them; and has ſo ſoft and graceful a behaviour, that it muſt attract your attention. His perſon (continues this author), it is to be confeſſed, is no ſmall recommendation; but he is to be highly commended for not loſing that advantage, and adding to propriety of ſpeech (which might paſs the criticiſm of Longinus) an action which would have been approved by Demoſthenes. He has a peculiar force in his way, and has many of his audience, who could not be intelligent hearers of his diſcourſe were there no explanation as well as grace in his action. This art of his is uſed with the moſt exact and honeſt ſkill. He never attempts your paſſions, till he has convinced your reaſon. All the objections which you can form are laid open and diſperſed before he uſes the leaſt vehemence

hemence in his sermon; but when he thinks he has your head, he very soon wins your heart, and never pretends to show the beauty of holiness, till he has convinced you of the truth of it."—In his letters to Pope, &c. Bishop Atterbury appears in a pleasing light, both as a writer and as a man. In ease and elegance they are superior to those of Pope, which are more studied. There are in them several beautiful references to the classics. The Bishop excelled in his allusions to sacred as well as profane authors.

ATTESTATION, the act of affirming or witnessing the truth of something, more especially in writing.

ATTIC, any thing relating to Attica, or to the city of Athens: thus Attic salt, in philology, is a delicate poignant sort of wit and humour peculiar to the Athenian writers; Attic witness, a witness incapable of corruption, &c.

Attic Order. See ARCHITECTURE.

Attic Base, a peculiar kind of base used by the ancient architects in the Ionic order; and by Palladio, and some others, in the Doric.

Attic Story, in architecture; a story in the upper part of a house, where the windows are usually square.

1 Boundaries extent, &c.

ATTICA, an ancient kingdom of Greece, situated along the north coast of the gulph of Saron, bounded on the west by Megara, mount Cithæron, and part of Bœotia; on the north by the gulph of Euripus, now *Stretto di negro ponte*, and the rest of Bœotia; and on the east by the Europius. It extended in length from north-west to south-east about 60 miles; its breadth from north to south was 56, decreasing as it approached the sea.

2 Inhabitants thought to be produced from the soil.

The soil of this country was naturally barren and craggy, though by the industry of its inhabitants it produced all the necessaries of life. On this account Attica was less exposed to invasions than other more fertile countries; and hence it preserved its ancient inhabitants beyond all the other kingdoms in its neighbourhood; so that they were reputed to be the spontaneous productions of the soil; and as a badge of this, Thucydides tells us, they wore golden grasshoppers in their hair.

3 Cities.

The chief cities in the kingdom of Attica were Athens the capital; next to it Eleusis, situated on the same gulph, near the coasts of Megara; and next to that Rhamnus, famed for the temple of Amphiaraus and the statue of the goddess Nemesis.

4 Cecrops the first king.

The first king of this country, of whom we have any distinct account, was Cecrops. Others indeed are said to have reigned before him, particularly one Actæus, whose daughter Cecrops married, and in her right laid the foundation of his new monarchy. Cecrops is said to have been the first who deified Jupiter, set up altars and idols, and instituted marriage among the Greeks. He is likewise affirmed to have taught his subjects navigation; and for the better administration of justice, and promoting intercourse among them, to have divided them into the first four tribes, called *Cecropis*, *Autochton*, *Actea*, and *Paralia*; and he is also by some said to be the founder of the Areopagus. From this monarch the Athenians affected to call themselves *Cecropidæ* till the reign of Erectheus their sixth king, after whom they took the name of *Erecthydæ*.

5 Cranaus.

Cecrops dying after the reign of 50 years, left three daughters; by marrying one of which, probably, Cranaus a wealthy citizen ascended the throne. He enjoyed his crown peaceably for ten years; till, having married one of his daughters, named *Attis*, to Amphictyon the son of Deucalion, he was by him dethroned, and forced to lead a private life to the last. From this daughter, the country, which before had been called *Actea*, took the name of *Attica*.

6 Whence the country was called Attica.

7 Ericthonius.

After a reign of 10 or 12 years, Amphictyon was himself deposed by Ericthonius, said to be the son of Vulcan and Tethys. Being lame of both his feet, he is said to have invented coaches, or, as others will have it, instituted horse and chariot races in honour of Minerva. He is also reported to have been the first who stamped silver coin. He reigned 50 years, and was succeeded by his son Pandion the father of Progne and Philomela; whose hard fate, so famous among the poets, is supposed to have broke his heart, after a reign of about 40 years. In his time Triptolemus taught the Athenians agriculture, which he had learned from Ceres.

8 Pandion.

9 Erectheus.

Pandion was succeeded by his son Erectheus, who being reckoned the most powerful prince of his time, Boreas king of Thrace demanded his daughter Orithia in marriage, and on being refused carried her off by force. After a reign of 50 years, Erectheus being killed in a battle with the Eleusians, was succeded by his son Cecrops II. who is generally allowed to have been the first who gathered the people into towns; they having till then lived in houses and cottages scattered here and there, without order or regular distance. After a reign of 40 years he was driven out by his brethren Metion and Pandorus, who forced him to fly into Ægialea, where he died.

10 Cecrops II.

11 Pandion II.

Cecrops II. was succeeded by his son Pandion II. and he was likewise driven out by Metion, who assumed the government. Pandion in the mean time fled into Megara, where he married Pelia the daughter of Pylas king of that place, and was appointed successor to the kingdom. Here he had four sons, who returning to Athens, whether with or without their father is uncertain, expelled the sons of Metion, and after the decease of Pandion their father, divided the government among themselves; notwithstanding which the royal dignity did in effect remain with Ægeus the eldest.

12 Ægeus.

Ægeus, when he ascended the throne, finding himself despised by his subjects because he had no sons, and sometimes insulted by his brother Pallas, who had no less than fifty, consulted the oracle of Apollo at Delphi. Receiving here, as was commonly the case, an answer which could not be understood without a commentator, he applied to Pittheus king of Troezen, famous for his skill in expounding oracles. This prince easily prevailed with him to lie with his daughter Æthra, who proved with child; and as none but these three were privy to the secret, Ægeus, before his return to Athens, hid a sword and a pair of shoes under a stone, leaving orders with the princess, that if the child proved a boy, she should send him to Athens with these tokens as soon as he was able to lift up that stone. He charged her moreover to use all imaginable secrecy, lest the sons of his brother Pallas should way-lay and murder him.

13 Theseus born.

Æthra being delivered of a son, Pittheus gave out that Neptune was the father of it. This child was named *Theseus*, and proved one of the most famous heroes of antiquity. Being arrived at the age of 16, his mother brought him to the stone abovementioned; and he having lifted it with ease, was desired to take up the sword and shoes and prepare himself to go to his father. He was advised to go by sea rather than by land, as, ever since the departure of Hercules, the roads had been exceedingly infested by banditti. Theseus, however, who had already begun to discover marks of uncommon strength and courage, no sooner heard the name of Hercules mentioned, than he became desirous of imitating so great a pattern; and after performing a number of glorious exploits, for which see the article Theseus, he arrived safe at his father's capital.

14 Is made known to his father.

The great atchievements of our young hero procured him a welcome reception at the court of Ægeus, though his birth was unknown to all except Medea, to whom the king had lately been married. This queen being a sorceress, it is not to be supposed any thing could be concealed from her: she therefore, by her diabolical penetration, quickly found out that Theseus was the king's son; after which she became so jealous of him on account of his valour, that she persuaded her old husband to invite the young stranger to a banquet, and poison him in a glass of wine. The poison was accordingly prepared, and Theseus invited; but the prince suddenly drawing his sword, it was immediately recognized by Ægeus to be the same he had formerly buried below the stone. Upon this he stepped forward to Theseus, throwing down the poisoned draught in his way; and, embracing him with much tenderness, owned him for his son before all the court.

At this time the king of Athens had great occasion for such a champion as Theseus. The sons of Pallas, who had all along behaved with great insolence, upon Theseus being discovered to be the king's son, and heir apparent to the crown, broke out in open rebellion. They were soon discomfited; but Ægeus and the whole country of Attica were still in great distress on the following account. Some years before, Androgeus, the son of Minos king of Crete, came to Athens to be present at one of their feasts. During this visit he contracted such an intimacy with the fifty sons of Pallas, that Ægeus fearing some fatal consequences, caused him to be privately murdered. According to others, Androgeus having undertaken to encounter the Marathonian bull, was killed by it. Be this as it will, Minos having received news of his son's death, imputed it to the people of Attica; and therefore, after several unsuccessful attempts to revenge his own quarrel, prayed to the gods to do it for him. The Athenians, in consequence of this prayer, were visited with earthquakes, famine, and pestilence; on account of which they applied to the oracle. Here they were informed, that no relief was to be had till they were reconciled to the Cretan king. Minos resolving to make them pay dear for their deliverance, imposed upon them a tribute of seven young men and as many virgins, whom he condemned to be devoured by the Minotaur, a monster feigned by the poets to have been half man and half bull. This bloody tribute had been twice paid, and Minos had already sent his messengers the third time, when Theseus willingly offered himself to be one of the unhappy victims; and embarking with them in one ship, he gave the pilot two sails, the one black to sail with, and the other white to be hoisted up at his return in case he came off victorious.

15 He kills the Minotaur.

Our hero had all the success he could wish: he killed the Minotaur, prevailed with Minos to remit the tribute, and his daughter Ariadne to run away with him; but her he left with child in the isle of Naxos.

16 Death of Ægeus.

Unfortunately, however, for Ægeus, the joy of Theseus and his company was so great, that at their return they forgot to hoist the white flag in token of their victory: upon which the old king, taking for granted that his son was killed, threw himself into the sea, which ever since has from him been called the *Ægean Sea*.

17 Theseus king of Attica.

Theseus being thus left in possession of the kingdom of Attica, began immediately to think of indulging his warlike genius, and rendering the civil affairs of his kingdom as little troublesome as possible.

18 New models the government.

To accomplish this purpose, he began with gathering most of the people of Attica into the old and new town, which he incorporated into one city. After this he divested himself of all his regal power, except the title of king, the command of the army, and the guardianship of the laws. The rest he committed to proper magistrates chosen out of three different orders of the people, whom he divided into nobles, husbandmen, and artificers. The first he invested with the power of interpreting and executing the laws, and regulating whatever related to religion. The other two chose their inferior magistrates from among themselves, to take care of whatever related to their separate orders: so that the kingdom was in some measure reduced to a commonwealth, in which the king had the greatest post, the nobles were next to him in honour and authority, the husbandmen had the greatest profit, and the artists exceeded them in number. He likewise abolished all their distinct courts of judicature, and built one common council-hall called *Prytaneum*, which stood for many ages afterwards.

Having thus new-modelled the government, his next care was to join to his dominions the kingdom of Megara, in right of his grandfather Pandion II. who had married the daughter of Pylas, as abovementioned. On this occasion he erected the famous pillar in the isthmus, which showed the limits of the two countries that met there. On the one side of this pillar was inscribed, "This is not Peloponnesus, but Ionia;" and on the other, "This is Peloponnesus, not Ionia."

19 Defeats the Amazons, kills the Centaurs, and carries off Helena.

After this he undertook an expedition against the Amazons, whom he overcame, took their queen Hippolita, and afterwards married her. Soon after this, Theseus contracted an intimacy with Perithous the son of Ixion; and being invited to his nuptials, assisted him in killing a number of Centaurs, or rather Thessalian horsemen (who in their cups had offered violence to their female guests), and drove the rest out of the country. Our two associates then proceeded to Sparta, where Theseus fell in love with the famed Helena, at that time not above nine years old, while he himself was upwards of fifty. Her they carried off: and of the rape there are various accounts; but the following one, which is given by Plutarch, is generally allowed to be the most authentic.

According to that historian, they stole this beauty, the greatest in the world at this time, out of the temple of Diana Ortia, where Helena happened to be dancing. They were pursued as far as Tegea, but made

their

Attica.

their eſcape out of Peloponneſus; and thinking themſelves now ſecure of their prey, they agreed to caſt lots for her, upon condition that he to whoſe lot ſhe fell ſhould aſſiſt the other in procuring ſome celebrated beauty. Fortune having declared for Theſeus, he aſſiſted his companions in the like attempt upon Proſerpina daughter of Aidonius king of the Molloſſi in Epirus; who, being the next beauty to Helena, was guarded by the dog Cerberus, which had three heads, and was conſequently a very formidable enemy. Her father, however, underſtanding that they deſigned to ſteal away his daughter, threw Perithous to be torn in

20 Impriſoned by the king of Epirus.

pieces by Cerberus, and put Theſeus in priſon, from whence he was afterwards relieved at the interceſſion of Hercules.

After this misfortune, Theſeus at length returned to Athens, but found himſelf very coolly received by his ſubjects. Mneſtheus, the ſon of Peteus, and great-grandſon of Erectheus, had made uſe of the king's abſence to ingratiate himſelf with the people; and upon the commencment of a war with Caſtor and Pollux, the two brothers of Helena, he perſuaded the people of Athens to open their gates to the two brothers. Up-

21 Driven out of Athens.

on this, Theſeus was under the neceſſity of conveying away himſelf and family with all poſſible privacy. This he luckily accompliſhed; and deſigned to have ſailed to Crete, to have obtained aſſiſtance from Deucalion ſon of Minos, and now brother-in-law to Theſeus himſelf, he having lately married Phædra ſiſter to Deucalion. Unfortunately, however, our hero was ſhipwrecked on the iſland of Scyros. Here he he was at firſt kindly re-

22 His death.

ceived by Lycomedes the king of that iſland, but was ſoon after killed by a fall from a high rock, over which ſome ſay he was puſhed by Lycomedes himſelf, who had been prevailed upon to deſtroy Theſeus in that manner by Mneſtheus, that he might with the more ſecurity enjoy the kingdom of Athens.

23 Mneſtheus, Demophon, &c.

Mneſtheus reigned 24 years, but loſt his life at the ſiege of Troy; and was ſucceeded by Demophon one of the ſons of Theſeus by Phædra, who was likewiſe at the ſiege of Troy, but had the good fortune to return in ſafety. In his reign was erected the famous court of the Ephetæ; conſiſting originally of 50 Athenians and as many Argives, for trying of wilful murders. By this court the king himſelf afterwards ſubmitted to be tried for having accidentally killed one of his ſubjects. He reigned 33 years, and was ſucceeded by his ſon, according to ſome, or according to others his brother, Oxyntes, who reigned 12 years. Oxyntes was ſucceeded by his ſon Aphydas, who was murdered by Thymætes the baſtard ſon of Oxyntes.

24 Thymætes depoſed.

This king diſcovered many baſe qualities unworthy of his dignity; and at laſt was depoſed by his ſubjects on the following occaſion. Xanthus king of Bœotia had a conteſt with the Athenians about one of their frontier towns. He offered to decide the matter by ſingle combat with the king; but this was declined by Thymætes. It happened, that at that time one Melanthus a Meſſenian, who had been driven out of his country by the Heraclidæ, was come to Athens; who accepted the king of Bœotia's challenge. At the firſt onſet, Melanthus aſked his adverſary, why he had, contrary to the articles, brought a ſecond into the field with him? and as Xanthus immediately looked about to ſee who was behind him, Melanthus run him through with his lance. The victory, though it did little honour to him who gained it, was ſo agreeable to the Athenians, that they depoſed their cowardly king Thymætas, after he had reigned 8 years; and appointed Melanthus in his ſtead, who after a reign of 37 years left the kingdom to his ſon Codrus.

25 Melanthus

This prince reigned about 21 years; during which time the Dores and Heraclidæ had regained all Peloponneſus, and were upon the point of entering into Attica. Codrus, being informed that the oracle had promiſed them victory provided they did not kill the king of the Athenians, came immediately to a reſolution of dying for his country. Diſguiſing himſelf, therefore, like a peaſant, he went into the enemy's camp, and, quarrelling with ſome of the ſoldiers, was killed by them. On the morrow, the Athenians knowing what was done, ſent to demand the body of their king; at which the invaders were ſo terrified, that they decamped without ſtriking a blow.

26 Codrus the laſt king ſacrifices himſelf for his country

Upon the death of Codrus, a diſpute which happened among his ſons concerning the ſucceſſion, furniſhed the Athenians with a pretence for ridding themſelves of their kings altogether, and changing the monarchial form of government into a republican one. It was improbable, they ſaid, that they ſhould ever have ſo good a king as Codrus; and to prevent their having a worſe, they reſolved to have no king but Jupiter. That they might not, however, ſeem ungrateful to the family of Codrus, they made his ſon Medon their ſupreme magiſtrate, with the title of *archon*. They afterwards rendered that office decennial, but continued it ſtill in the family of Codrus. The extinction of the Medontidæ at laſt left them without reſtraint; upon which they not only made this office annual, but created nine archons. By the latter invention they provided againſt the too great power of a ſingle perſon, as by the former they took away all apprehenſion of the archons having time to eſtabliſh themſelves, ſo as to change the conſtitution. In a word, they now attained what they had long ſought, viz. the making the ſupreme magiſtrates dependent on the people.

27 Republican government introduced.

We have a liſt of theſe archons for upwards of 600 years, beginning with Creon, who lived about 684 years before Chriſt, to Herodes, who lived only 60 years before that time. The firſt archon of whom we hear any thing worth notice, is named *Draco*. He reigned in the ſecond, or, as others ſay, in the laſt year of the 39th Olympiad, when, it is ſuppoſed, he publiſhed his laws: but though his name is very frequently mentioned in hiſtory, yet no connected account can be found either of him or his inſtitutions; only, in general, his laws were exceedingly ſevere, inflicting death for the ſmalleſt faults; which gave occaſion to one Demades an orator to obſerve, that the laws of Draco were written with blood, and not with ink. For this extraordinary ſeverity he gave no other reaſon, than that ſmall faults ſeemed to him to be worthy of death, and he could find no higher puniſhment for the greateſt. He was far advanced in years when he gave laws to Athens; and to give his inſtitutions the greater weight, he would not ſuffer them to be called *nomoi*, or laws, but *theſmoi*, or ſanctions proceeding from more than human wiſdom. The extreme ſeverity of theſe laws, however, ſoon made the Athenians weary both of them and the author of them; upon which Draco was obliged

28 Draco legiſlator of Athens.

29 Expelled the city.

Attica.

obliged to retire to Ægina. Here he was received with the highest honours: but the favour of the inhabitants of this place proved more fatal to him than the hatred of the Athenians; for coming one day into the theatre, the audience, to show their regard, threw, as the custom

30 His death.

then was, their cloaks upon him; and the multitude of these being very great, they stifled the old man, who was too weak to disengage himself from their load.

After the expulsion of Draco, nothing remarkable happened at Athens till the year before Christ 606,

31 Mityleni-an war.

when we find the republic engaged in a war with the Mitylenians about the city Sigæum, situated near the mouth of the river Scamander. The Athenian army was commanded by Phrynon, a person equally remarkable for the comeliness of his person and the generosity of his mind. The Mitylenians were commanded by Pittacus, one of the celebrated sages of Greece. As the commanders looked upon the honour of their respective countries to be concerned, they exerted themselves to the utmost. At last they met in single combat: wherein Phrynon depended on his valour only; but Pittacus concealed behind his shield a net, wherewith he suddenly entangled his antagonist, and easily slew him. This, however, not putting an end to the war, Periander tyrant of Corinth interposed; and both parties having submitted to his arbiration, he decreed that Sigæum should belong to the Athenians.

32 Cylon's conspiracy.

About seven years after this war, a conspiracy was formed by Cylon son-in-law to Theagenes tyrant of Megara, who, having by his affable behaviour procured many friends, formed a design of seizing the sovereignty of Athens. Having consulted the oracle as to the most proper time, he was directed to make the attempt when the citizens of Athens were employed in celebrating the highest feast to Jupiter. When many of the citizens therefore were gone to the Olympic games, Cylon and his associates made themselves masters of the citadel. Here they were instantly besieged by Megacles at that time archon, and soon reduced to great distress for want of water. The chief together with his brother found means to make their escape, but the meaner sort were left to shift for themselves. In this extremity they fled to the temple of Minerva; from whence Megacles with much ado prevailed upon them to come down and submit themselves to the mercy of their country. Having at last assented to this, they tied a cord to the image of the goddess, and carried the clue with them, to demonstrate, that though they were out of the temple they were still under Minerva's

33 Conspirators massacred by Megacles.

protection. Unfortunately for them, however, as they passed the temple of the furies, the line snapt of itself; which Megacles construing into a renunciation by the goddess, caused his men fall upon them and dispatch as many as they could find. Such as were without the temple were immediately massacred, and those who fled thither again were murdered in their sanctuary. In short, none escaped but such as bribed the wives of the officers of justice. This carnage, however, did not put an end to the sedition. The remains of Cylon's faction created great disturbances, by insinuating that the violation of Minerva's sanctuary had drawn down the an-

34 Who is execrated by the people.

ger of the gods; and these discourses had such an effect, that Megacles and his officers were styled *execrable*, and held to be persons under the displeasure of heaven.

During the time of this confusion, the Megarensians attacked Nisea, which they took, as well as Salamis; and so completely routed the Athenians in every attempt to recover the latter, that a law was at last passed by which it should be capital for any one to propose the recovery of Salamis.

35 Unsuccessful war with Megara.

About the same time the city was disturbed by reports of frightful appearances, and filled with superstitious fears; the oracle at Delphi was therefore consulted, and an answer returned that the city behoved to be expiated. Upon this, Epimenides the Phestian was sent for from Crete, to perform the necessary ceremonies, he being reputed an holy man, and one that was deeply skilled in all the mysteries of religion. His expiation consisted in taking some black, and some white sheep, turning them all loose, and directing some persons to follow them to those places where they couched, and there to sacrifice them to the local deity.

36 Epimenides's expiation and prophecy.

He caused also many temples and chapels to be erected, two of which have been particularly noted, viz. the chapel of *Contumely* and that of *Impudence*. This man is said to have looked wistfully on the port of Munychia for a long time, and then to have spoke as follows to those that were near him. "How blind is man to future things? for did the Athenians know what mischief will one day be derived to them from this place, they would eat it with their teeth." This prediction was thought to be accomplished 270 years after, when Antipater constrained the Athenians to admit a Macedonian garrison into that place.

37 Solon the wise legislator.

About 597 years before Christ, Solon the famed Athenian legislator began to show himself to his countrymen. He is said to have been lineally descended from Codrus; but left by his father in circumstances rather necessitous, which obliged him to apply to merchandize; it is plain, however, both from his words and writings, that he was a disinterested patriot. The shameful decree, that none under pain of death should propose the recovery of Salamis, grieved him so much, that having composed an elegy of 100 verses, such as he thought would be most proper to inflame the minds of the people, he ran into the market-place as if he had been mad, with his night-cap on his head, repeating his elegy.

38 Salamis recovered by his means.

A crowd being gathered round the pretended madman, his kinsman Pisistratus mingled among the rest, and observing the people moved with Solon's words, he also seconded him with all the eloquence he was master of, and between them they prevailed so far as to have the law repealed, and a war was immediately commenced against the people of Megara. Who was commander in this expedition is not certain; but the city was recovered, according to the most general account, by the following stratagem. Solon coming with Pisistratus to Colias, and finding there the women busy in celebrating, according to custom, the feast of Ceres, sent a confident of his to Salamis, who pretended to be no friend to the people of Attica, telling the inhabitants of Salamis, that if they had a mind to seize the fairest of the Athenian ladies, they might now do it by passing over to Colias. The Megarensians giving easy credit to what the man said, immediately fitted out a ship; which Solon perceiving from the opposite shore, dismissed the women, and having dressed a number of beardless youths in female habits, under which

Attica. which they concealed every one a dagger, he ſent them to the ſea-ſide to dance and divert themſelves as the women are wont to do. When thoſe who came from Salamis ſaw theſe young perſons ſkipping up and down, they ſtrove who ſhould be firſt on ſhore; but were every one of them killed, and their veſſel ſeized; aboard which the Athenians embarking, ſailed immediately to Salamis and took it.

39 Cirrha likewiſe reduced by Solon's wiſdom. On the return of Solon to Athens, he was greatly honoured by the people, to whom another occaſion of admiring his wiſdom was quickly afforded. The inhabitants of Cirrha, a town ſituated in the bay of Corinth, after having by repeated incurſions waſted the territory of Delphi, at laſt beſieged the capital itſelf, with a view of making themſelves maſters of the treaſures contained in the temple of Apollo. Advice of this intended ſacrilege being ſent to the Amphictyons, who were the ſtates-general of Greece, Solon adviſed that the matter ſhould be univerſally reſented, and that all the ſtates ſhould join in puniſhing the Cirrhæans, and ſaving the Delphic oracle. This advice was complied with, and a general war againſt Cirrha declared. Clyſthenes, tyrant of Sicyon, commanded in chief, and Alcmæon was general of the Athenian quota. Solon went as aſſiſtant or counſellor to Clyſthenes, and by following his advice the war was conducted to a proſperous iſſue. For when the Greek army had beſieged Cirrha for ſome time without any appearance of ſucceſs, the oracle at Delphi was conſulted, from whence the following anſwer was returned:

"In vain you hope to take the place before
"The ſea's blue waves roll o'er the hallow'd ſhore."

This anſwer ſtruck the whole army with ſurpriſe, till Solon adviſed Clyſthenes to conſecrate ſolemnly the whole territory of Cirrha to the Delphic Apollo; ſo as that was a maritime country, the ſea muſt then waſh the ſacred coaſt. According to Pauſanius, the city was reduced by the following ſtratagem, likewiſe invented by Solon. He cauſed the river Pliſtus, which run through Cirrha, to be turned into another channel, hoping thereby to have diſtreſſed the inhabitants for want of water: but finding they had many wells within the city, and were not to be reduced by that means, he cauſed a vaſt quantity of roots of hellebore to be thrown into the river, which was then ſuffered to return into its former bed. The inhabitants, overjoyed at the ſight of running water, came in troops to drink of it; whereupon an epidemic flux enſued, and the citizens being no longer able to defend the walls, the town was eaſily taken.

40 Athens in great confuſion. On the return of Solon to Athens he found things again in the utmoſt confuſion. The remnant of Cylon's faction gave out, that all ſorts of misfortunes had befallen the republic on account of the impiety of Megacles and his followers; which clamour was heightened by the retaking of Salamis about this time by the Megarenſians. Solon interpoſed, and perſuaded thoſe who were ſtyled *execrable* to abide a trial, and 300 perſons were choſen to judge them. The event was, that

41 Megacle's party baniſhed. 300 of Megacle's party who were alive were ſent into perpetual baniſhment, and the bones of ſuch as were dead were dug up and ſent without the limits of their country.

Attica. Though this deciſion reſtored the public quiet for the preſent, it was not long before the people were divided

42 Three factions ſtart up. into three factions, contending about the proper form of government. Theſe were called the *Diacrii*, *Pediæi*, and *Parali*: the firſt of theſe were the inhabitants of the hilly country, who declared poſitively for democracy; the ſecond, dwelling in the lower parts, and who were far more opulent than the former, declared for an oligarchy, as ſuppoſing the government would fall moſtly into their hands; the third party, who lived on the ſea-coaſt, were people of moderate principles, and therefore were for a mixed government. Beſides the diſturbances raiſed on this account, others were occaſioned by the rich oppreſſing the poor. According to Plutarch, the poor being indebted to the rich, either tilled their grounds and paid them the ſixth part of the produce, or engaged their bodies for their debts, ſo that many were made ſlaves at home, and many ſold into other countries; nay, ſome were obliged to ſell their children to pay their debts, and others in deſpair quitted Attica altogether. The greateſt part, however, were for throwing off the yoke, and began to look about for a leader, openly declaring that they intended to change the form of government, and make a repartition of lands. In this extremity, the eyes of all the citizens were caſt upon Solon. The moſt prudent were for offering him the ſovereignty; but he perceiving their intentions, behaved in ſuch a manner as to cheat both parties, and ſhewed a ſpirit of patriotiſm perhaps never equalled. He refuſed the ſovereignty as far as it might have benefited himſelf; and yet took upon himſelf all the care and trouble of a prince, for the ſake of his people.

43 Solon choſen archon. He was choſen archon without having recourſe to lots, and after his election diſappointed the hopes of both parties. It was Solon's fundamental maxim, That thoſe laws will be beſt obſerved which power and juſtice equally ſupport. Wherever, therefore, he found the old conſtitution conſonant to juſtice in any tolerable degree, he refuſed to make any alteration at all, and was at extraordinary pains to ſhow the reaſon of the changes he did make. In ſhort, being a perfect judge of human nature, he ſought to rule only by ſhowing his ſubjects that it was their intereſt to obey, and not by forcing upon them what he himſelf eſteemed beſt. Therefore, to a perſon who aſked whether he had given the Athenians the beſt laws in his power, he replied, "I have eſtabliſhed the beſt they could receive."

44 Settles all diſorders. As to the main cauſe of ſedition, viz. the oppreſſed ſtate of the meaner ſort Solon removed it by a contrivance which he called *ſiſachthia*, i. e. *diſcharge*; but what this was, authors are not agreed upon. Some ſay that he releaſed all debts then in being, and prohibited the taking any man's perſon for payment of a debt for the future. According to others the poor were eaſed, not by cancelling the debts, but by lowering the intereſt, and increaſing the value of money; a mina, which before was made equal to 73 drachms only, being by him made equal to 100; which was of great advantage to the debtor, and did the creditor no hurt. It is, however, moſt probable that the ſiſachthia was a general remittance of all debts whatever, otherwiſe Solon could not have boaſted in his verſes that he

he had removed so many marks of mortgages (B) as were every where frequent; that he had freed from apprehension such as were driven to despair, &c.

45 Infamous behaviour of his three friends.

But in the midst of all Solon's glory, an accident befel him, which, for a time, hurt his reputation, and had almost entirely ruined his schemes. He had consulted Conon, Clinias, and Hipponicus, his three friends, on an oration prepared with a view to engage the people's consent to the discharge; and these three men, thus knowing there was to be a general discharge of debts, basely took the opportunity of borrowing vast sums before the law was promulgated, in consequence of which they were never obliged to return them.

This was thought at first to have been done with Solon's consent, and that he had shared in the money; but this aspersion was quickly wiped off when it appeared that the lawgiver himself was a very considerable loser by his own law. His friends, however, could never recover their credit, but were ever afterwards stigmatized with the opprobrious appellation of *chreocopidæ*, or *debt-sinkers*.

46 Solon blamed at first, but afterwards applauded and chosen legislator.

The Athenians were as little pleased with Solon's management as with their former condition; the rich thinking he had done too much in cancelling the money-debts due to them, and the poor that he had done too little, because he had not divided the lands of Attica equally. In a short time, however, they acquiesced in the new institutions, and gave a more public token of their repentance than they had before shown of their displeasure, instituting a solemn sacrifice under the name of *Sisacthia*, at the same time that Solon was unanimously elected legislator of Athens, with full power to make laws, and alter or new model the constitution as he thought fit.

47 Compiles a new body of laws.

Solon being now invested with unlimited authority, set about the arduous task of compiling new laws for the turbulent people of Attica; which having at last completed in the best manner he was able, or in the best manner the nature of the people would admit, he procured them to be ratified for 100 years. Such as related to private actions were preserved on parallelograms of wood, with cases which reached from the ground, and turned about upon a pin like a wheel. These were thence called *Axones;* and were placed first in the citadel, and afterwards in the prytaneum, that all the subjects might have access to them when they pleased. Such as concerned public institutions and sacrifices were contained in triangular tables of stone called *cyrbes*. The Athenian magistrates were sworn to observe both; and in process of time these monuments of Solon's wisdom became so famous, that all public acts were from them named *Axones* and *Cyrbes*.

48 He goes abroad for ten years.

After the promulgation of the laws, Solon found himself obliged to leave Athens, to prevent his being continually teazed for explanations and alterations of them. He therefore pretended an inclination to merchandize, and obtained leave to absent himself for 10 years, during which time he hoped the laws would be grown familiar. From Athens Solon travelled into Egypt, where he conversed with Psenophis the Heliopolitan, and Sonchis the Saite, the most learned priests of that age. From these he learned the situation of the island Atlantis, of which he wrote an account in verse, which Plato afterwards continued*. From Egypt he went to Cyprus, where he was extremely well received by one of the petty kings. This prince lived in a city called *Apeia*, built by Demophon the son of Theseus, on an eminence near the river Clarius, but in a soil craggy and barren. Solon observing a very pleasant plain below, engaged the king to remove thither; assisted in executing the scheme he had formed; and succeeded so well, that a new city was formed, which soon became populous, and out of gratitude to the Athenian legislator was called *Solos*.

* See *Atlantis*.

49 Things fall into disorder in his absence.

But while Solon was thus travelling in quest of wisdom, and with a view to benefit those among whom he came, his countrymen, who seem to have resolved on being dissatisfied at all events, had again divided themselves into three factions. Lycurgus put himself at the head of the country people; Megacles the son of Alcmæon was at the head of those who lived on the sea-coast; and Pisistratus put himself at the head of the poorer sort, to protect them, as he pretended, from tyranny, but in reality to seize on the sovereignty for himself. All the factions pretended to have a vast regard for Solon and his laws, at the same time that they were very desirous of a change; but how they were to be bettered, none of them knew, or pretended to know.

50 He returns to Athens, but refuses to resume his office.

In the midst of this confusion the legislator returned. Each of the factions paid their court to him, and affected to receive him with the deepest reverence and respect; beseeching him to reassume his authority, and compose the disorders which they themselves kept up. This Solon declined on account of his age, which, he said, rendered him unable to speak and act for the good of his country as formerly: however, he sent for the chiefs of each party, beseeching them in the most pathetic manner not to ruin their common parent, but to prefer the public good to their own private interest.

Pisistratus, who of all the three had perhaps the least intention to follow Solon's advice, seemed to be the most affected with his discourses; but as Solon perceived he affected popularity by all possible methods, he easily penetrated into his designs of assuming the sovereign power. This he spoke of to Pisistratus himself, at first privately; but as he saw that his admonitions in this way had no effect, he then said the same things to others, that the public might be on their guard against him.

51 Pisistratus assumes the sovereignty

All the wise discourses of Solon, however, were lost upon the Athenians. Pisistratus had got the meaner sort entirely at his devotion, and therefore resolved to cheat them out of the liberty which they certainly deserved to lose. With this view he wounded himself, and, as Herodotus says, the mules that drew his chariot; then he drove into the market-place, and there showed his bleeding body, imploring the protection of the people from those whom his kindness to them had ren-

(B) The Athenians had a custom of hanging up billets to show that houses were engaged for such and such sums of money.

rendered his implacable enemies. A concourſe of people being inſtantly formed, Solon came among the reſt, and, ſuſpecting the deceit, openly taxed Piſiſtratus with his perfidious conduct; but to no purpoſe. A general aſſembly of the people was called, wherein it was moved by one Ariſton, that Piſiſtratus ſhould have a guard. Solon was the only perſon preſent who had reſolution enough to oppoſe this meaſure; the richer Athenians, perceiving that the multitude implicitly followed Piſiſtratus, and applauded every thing he ſaid, remaining ſilent through fear. Solon himſelf, when he ſaw he could prevail nothing, left the aſſembly, ſaying he was *wiſer* than ſome, and *ſtouter* than others. A guard of 400 men was now unanimouſly decreed to Piſiſtratus, as we are told by Solon himſelf. This inconſiderable body he made uſe of to enſlave the people, but in what manner he accompliſhed his purpoſe is not agreed. Certain it is, that with his guard he ſeized the citadel; but Polyænus hath given an account of a very ſingular method which he took to put it out of the power of the Athenians to defend themſelves even againſt ſuch a ſmall number. He ſummoned an aſſembly to be held at the Anacium, and directed that the people ſhould come thither armed. They accordingly came; and Piſiſtratus harangued them, but in a voice ſo low that they could not tell what he ſaid. The people complaining of this, Piſiſtratus told them that they were hindered from hearing him by the clangour of their arms; but if they would lay them down in the portico, he would then be heard diſtinctly. This they did; and while they liſtened very attentively to a long and eloquent oration, Piſiſtratus's guard conveyed away their arms, ſo that they found themſelves deprived of all power of reſiſtance.

52 Solon leaves Athens.

During the confuſion which followed this event, another aſſembly was held, wherein Solon enveighed bitterly againſt the meanneſs of his countrymen, inviting them to take up arms in defence of their liberty. When he ſaw that nothing would do, he laid down his own arms, ſaying, that he had done his utmoſt for his country and his laws. According to Plutarch, he refuſed to quit the city; but the moſt probable opinion is, that he immediately retired from the dominions of Athens, and refuſed to return, even at the ſolicitation of Piſiſtratus himſelf.

53 Piſiſtratus governs with great moderation

Piſiſtratus having thus obtained the ſovereignty, did not overturn the laws of Solon, but uſed his power with the greateſt moderation. It is not to be expected, however, that ſo turbulent a people as the Athenians could be ſatisfied by any method of government he could lay down. At the beginning of his adminiſtration, Megacles and his family retired out of Athens to ſave their own lives, yet without deſpairing of being able ſome time or other to return. With this view Megacles and his aſſociates entered into a treaty with Lycurgus; and having brought him and his party into a ſcheme for depoſing Piſiſtratus, they concerted matters ſo well, that Piſiſtratus was ſoon obliged to ſeek for ſhelter ſomewhere elſe, and, on his departure, the Athenians ordered his goods to be ſold. Nobody, however, except one perſon *(Callias)*, would venture to buy any of them, from an apprehenſion, no doubt, that they would ſoon be reſtored to their proper owner, which accordingly happened in a very ſhort time.

54 Driven out by Megacles.

As Megacles and his party had negociated with Lycurgus to turn out Piſiſtratus, ſo they now entered into a treaty with Piſiſtratus to reinſtate him in his principality, as ſoon as they found Lycurgus would not be implicitly governed by them.

55 Who ſoon after reinſtates him.

To accompliſh this, they fell upon a very ridiculous project; which, however, was attended with the deſired ſucceſs. They found out a woman whoſe name was *Phya*, of a mean family and fortune, but of a great ſtature, and very handſome. Her they dreſſed in armour, placed her in a chariot, and having diſpoſed things ſo as to make her appear with all poſſible advantage, they conducted her towards the city, ſending heralds before, with orders to ſpeak to the people in the following terms: "Give a kind reception, O Athenians, to Piſiſtratus, who is ſo much honoured by Minerva above all other men, that ſhe herſelf condeſcends to bring him back to the citadel." The report being univerſally ſpread that Minerva was bringing home Piſiſtratus, and the ignorant multitude believing this woman to be the goddeſs, addreſſed their prayers to her, and received Piſiſtratus with the utmoſt joy. When he had recovered the ſovereignty, Piſiſtratus married the daughter of Megacles as he had promiſed, and gave the pretended goddeſs to his ſon Hipparchus.

56 Driven out a ſecond time.

Piſiſtratus did not long enjoy the kingdom to which he had been reſtored in ſo ſtrange a manner. He had married the daughter of Megacles, as already obſerved; but having children by a former wife, and remembering that the whole family of Megacles was reprobated by the Athenians, he thought proper to let his new ſpouſe remain in a ſtate of perpetual widowhood. This ſhe patiently bore for ſome time, but at laſt acquainted her mother. An affront ſo grievous could not fail to be highly reſented. Megacles inſtantly entered into a treaty with the malcontents, of whom there were always great plenty at Athens whatever was the form of government. This Piſiſtratus being apprized of, and perceiving a new ſtorm gathering, he voluntarily quitted Athens, and retired to Eretria. Here having conſulted with his ſons, it was reſolved to reduce Athens by force. With this view he applied to ſeveral of the Greek ſtates, who furniſhed him with the troops he deſired, but the Thebans exceeded all the reſt in their liberality; and with this army he returned to Attica,

57 But returns with an army.

according to Herodotus, in the 11th year of his baniſhment. They firſt reduced Marathon, the inhabitants of which had taken no meaſures for their defence, tho' they knew that Piſiſtratus was preparing to attack them. The republican forces in the mean time marched out of Athens to attack him; but behaving in a ſecure and careleſs manner, they were ſupriſed by Piſiſtratus, and totally routed. While they were endeavouring to make their eſcape, he cauſed his two ſons ride before him with all ſpeed, and tell thoſe they came up with that nobody had any thing to fear, but that they might every one return to his own home. This ſtratagem ſo effectually diſperſed the republican army, that it was impoſſible to rally them, and Piſiſtratus became a third time abſolute maſter of Attica.

58 He takes poſſeſſion of the city.

59 His ſubjects ſtill diſcontented notwithſtanding his moderation.

Piſiſtratus being once more in poſſeſſion of the ſovereignty, took a method of eſtabliſhing himſelf on the throne directly oppoſite to what Theſeus had done. Inſtead of collecting the inhabitants from the country into cities, Piſiſtratus made them retire from the cities into the country, in order to apply themſelves

 ſelves to agriculture. This prevented their meeting together, and caballing againſt him in ſuch bodies as they had been accuſtomed to do. By this means alſo the territory of Athens was greatly meliorated, and great plantations of olives were made over all Attica, which had before not only been deſtitute of corn, but alſo bare of trees. He alſo commanded, that, in the city men ſhould wear a kind of ſheep-ſkin veſt, reaching to the knees; but ſo intolerable were the laws of Piſiſtratus to his ſubjects, that this kind of garment in ſucceeding times became proverbially the habit of ſlavery.

As prince of Athens, Piſiſtratus received the tenth part of every man's revenues, and even of the fruits of the earth; and this alſo, though for the ſervice of the ſtate, ſeemed to the Athenians a moſt grievous burden. In ſhort, though Piſiſtratus behaved in all reſpects as a moſt excellent prince, his ſubjects fancied themſelves oppreſſed by tyranny, and were perpetually grumbling from the time he firſt aſcended the throne to the day of his death, which happened about 33 years after he had firſt aſſumed the ſovereignty, of which time, according to Ariſtotle, he reigned 17 years.

60
Hipparchus and Hippias.

Piſiſtratus left behind him two ſons named *Hipparchus* and *Hippias*, both men of great abilities, who ſhared the government between them, and behaved with lenity and moderation. But though by the mildneſs of their government the family of the Piſiſtratidæ ſeemed to be fully eſtabliſhed on the throne of Athens, a conſpiracy was unexpectedly formed againſt both the brothers, by which Hipparchus was taken off, and Hippias narrowly eſcaped. The moſt material facts relating to this conſpiracy are what follow.

61
Conſpiracy of Harmodius and Ariſtogiton.

There were at that time in Athens two young men called *Harmodius* and *Ariſtogiton*; the former of theſe was exquiſitely beautiful in his perſon, and on that account, according to the infamous cuſtom of the Greeks, violently beloved of the other. This Harmodius was alſo beloved of Hipparchus; who, if we may believe Thucydides, forced him. This was grievouſly reſented, and revenge determined on; to haſten which, another accident concurred. Hipparchus finding that Harmodius endeavoured to avoid him, publicly affronted him, by not ſuffering his ſiſter to carry the offering of Minerva, as if ſhe was a perſon unworthy of that office. The two young men, not daring to ſhow any public ſigns of reſentment, conſulted privately with their friends; among whom it was reſolved, that at the approaching feſtival of Panathenæa, when the citizens were allowed to appear in arms, they ſhould attempt to reſtore Athens to its former liberty. In this they imagined that they ſhould find themſelves ſeconded by the whole body of the people. But when the day appointed was come, they perceived one of their number talking very familiarly with Hippias; and fearing that they were diſcovered, they immediately fell upon Hipparchus, and diſpatched him with a multitude of wounds.

62
Hipparchus killed.

In this exploit the people were ſo far from ſeconding them, as they expected, that they ſuffered Harmodius to be killed by Hipparchus's guards, and ſeizing Ariſtogiton themſelves, delivered him up to Hippias. Some time afterwards, however, the reſpect they paid to theſe two young men exceeded all bounds. They cauſed their praiſes to be ſung at the Panathenæa, forbid any citizen to call a ſlave by either of their names, and erected brazen ſtatues to them in the forum; which ſtatues were afterwards carried into Perſia by Xerxes, and ſent back from thence by Alexander the Great, Antiochus, or Seleucus, for authors are not agreed by which. Several immunities and privileges were alſo granted to the deſcendants of theſe two patriots, and all poſſible means were taken to render their memory venerable and reſpected by poſterity.

63
The conſpirators extravagantly honoured.

64
Cruelty of Hippias.

Hippias being now ſole maſter of Athens, and probably exaſperated by the murder of his brother, began to alter his conduct greatly, and treat his ſubjects in an oppreſſive and cruel manner. He began with torturing Ariſtogiton, in order to make him confeſs his accomplices: but this proved fatal to his own friends; for Ariſtogiton impeaching ſuch as he knew to be beſt affected to Hippias, they were immediately put to death; and when he had deſtroyed all thoſe he knew, at laſt told Hippias, that now he knew of none that deſerved to ſuffer death except the tyrant himſelf. Hippias now vented his rage on a woman named *Leæna*, who was kept by Ariſtogiton. She endured the torture as long as ſhe could; but finding herſelf unable to bear it any longer, ſhe at laſt bit off her tongue, that ſhe might not have it in her power to make any diſcovery. To her the Athenians erected the ſtatue of a lioneſs, alluding to her name, without a tongue, on which was engraved a ſuitable inſcription.

After the conſpiracy was, as Hippias thought, thoroughly quaſhed, he ſet himſelf about ſtrengthening his government by all the means he could think of. He contracted leagues with foreign princes, increaſed his revenues by various methods, &c. But theſe precautions were of little avail: the lenity of Piſiſtratus's government had alone ſupported it; and Hippias purſuing contrary methods, was deprived of the ſovereignty in leſs than four years after the death of his brother.

65
He is driven out of Athens.

This revolution was likewiſe owing to the family of Megacles, who were ſtyled *Alcmæonidæ*, and had ſettled at Lipſydrum. In times of diſcontent, which at Athens were very frequent, this family was the common refuge of all who fled from that city; and at laſt they thought of a method of expelling the Piſiſtratidæ altogether. The method they took to accompliſh their purpoſe was as follow. They agreed with the Amphictyons to rebuild the temple at Delphi; and being poſſeſſed of immenſe riches, they performed their engagements in a much more magnificent manner than they were bound to do; for having agreed only to build the front of common ſtone, they built it of Parian marble. At the ſame time they corrupted the propheteſs Pythia, engaging her to exhort all the Lacedemonians that came to conſult the oracle either in behalf of the ſtate, or their own private affairs, to attempt the delivery of Athens. This had the deſired effect: The Lacedemonians ſupriſed at hearing this admonition inceſſantly repeated, at laſt reſolved to obey the divine command, as they imagined it to be; and ſent Anchimolius, a man of great quality, at the head of an army into Attica, though they were at that time in league with Hippias, and accounted by him his good friends and allies. Hippias demanding aſſiſtance from the Theſſalians, they readily ſent him 1000 horſe,

 under

under the command of one of their princes named *Cineas*. The Lacedemonians being landed, Hippias fell upon them so suddenly, that he defeated them with geat slaughter, killed their general, and forced the shattered remains of their army to fly to their ships. The Spartans, incensed at this unfortunate expedition, determined to send another army into Attica; which they accordingly did soon after under their king Cleomenes: and he having, at his entrance into the Athenian territories, defeated the Thessalian horse, obliged Hippias to shut himself up in the city of Athens, which he was soon after forced to abandon altogether. He was, however, in no want of a place of refuge; the Thessalian princes inviting him into their country, and the king of Macedon offering his family a city and territory, if they chose to retire into his dominions.

66 And retires to Sigeum.

But Hippias chose rather to go to the city of Sigeum, which Pisistratus had conquered, and left to his own family.

After the expulsion of the Pisistratidæ, the Athenians did not long enjoy the quiet they had proposed to themselves.

67 Two factions in Athens.

They were quickly divided into two factions; at the head of one was Clysthenes, one of the chiefs of the Alcmæonidæ; and the other, Isagoras, a man of great quality, and highly in favour with the Athenian nobility. Clysthenes applied himself to the people, and endeavoured to gain their affections by increasing their power as much as possible. Isagoras perceiving that by this means his rival would get the better, applied to the Lacedemonians for assistance, reviving at the same time the old story of Megacles's sacrilege, and insisting that Clysthenes ought to be banished as being of the family of Megacles.

68 The Spartans support Isagoras.

Cleomenes king of Sparta readily came into his measures, and suddenly dispatched an herald to Athens with a declaration of war in case all the Alcmæonidæ were not immediately banished. The Athenians did not hesitate to banish their benefactor Clysthenes, and all his relations; but this piece of ingratitude did not answer their purpose. Cleomenes entered Attica at the head of a Spartan army; and, arriving at Athens, condemned to banishment 700 families more than what had been sent into exile before. Not content with this, he would have dissolved the senate, and vested the government in 300 of the chief of Isagoras's faction. This the Athenians would by no means submit to; and therefore took up arms, and drove Cleomenes and his troops into the citadel, where they were besieged for two days. On the third day Cleomenes surrendered, on condition that all those who were in the citadel should retire unmolested. This, though agreed to, was not performed by the Athenians. They fell upon such as were separated from the army, and put them to death without mercy. Among the number of those slain on this occasion was Timesitheus the brother of Cleomenes himself.

69 But without success.

The Spartan king was no sooner withdrawn from Athens, than he formed a strong combination in favour of Isagoras. He engaged the Bœotians to attack Attica on the one side, and the Chalcidians on the other, while he at the head of a powerful Spartan army entered the territories of Eleusina. In this distress, the Athenians, not being able to cope with so many enemies at once, resolved to suffer their territories to be ravaged by the Chalcidians and Bœotians, contenting themselves with opposing the army commanded by Cleomenes in person. But this powerful confederacy was quickly dissolved: the Corinthians, who were allied with Cleomenes, doubting the justice of their cause, returned home; his other allies likewise beginning to waver, and his colleague Ariston, the other king of Sparta, differing in sentiments, Cleomenes was obliged to abandon the enterprise. The Spartans and their allies being withdrawn, the Athenians took a severe revenge of the Bœotians and Chalcidians, totally routing their forces, and carrying off a great number of prisoners. 70

Bœotians and Chalcidians defeated.

The prisoners taken in this war were put in irons, but afterwards set at liberty on paying a ransom of two minæ per head. Their fetters were, however, hung up in the citadel; and the Athenians consecrated the tenth of what they had received for ransom, purchased a statue, representing a chariot and four horses, which they set up in the portico of the citadel, with a triumphant inscription in token of their victory.

These indignities rousing the Bœotians, they immediately vowed revenge, and engaged on their side the people of Ægina, who had an hereditary hatred at the Athenians; and while the latter bent all their attention to the Bœotian war, the Ægenitans landing a considerable army, ravaged the coasts of Attica. 71

Attempt of the Spartans to restore Hippias.

But while the Athenians were thus employed against the Bœotians and Æginetans, a jealousy sprung up on the part of Lacedæmon, which was never afterwards eradicated. Cleomenes, after his unsuccessful expedition against Attica, produced at Sparta certain oracles which he said he had found in the citadel of Athens while he was besieged therein: the purport of these oracles was, that Athens would in time become a rival to Sparta. At the same time it was discovered, that Clysthenes had bribed the priestess of Apollo to cause the Lacedæmonians expel the Pisistratidæ from Athens; which was sacrificing their best friends to those whom interest obliged to be their enemies. This had such an effect, that the Spartans, repenting their folly in expelling Hippias, sent for him from Sigeum, in order to restore him to his principality: but this not being agreed to by the rest of the states, they were forced to abandon the enterprise, and Hippias returned to Sigeum as he came. 72

Cause of the war with Persia.

About this time too, Aristagoras the Milesian having set on foot a revolt in Ionia against the Persian king, applied to the Spartans for assistance; but they declining to have any hand in the matter, he next applied to the Athenians, and was by them furnished with 20 ships under the command of Melanthus, a nobleman universally esteemed. This rash action cost the Greeks very dear, as it brought upon them the whole power of the Persian empire; for no sooner did the king of Persia hear of the assistance sent from Athens to his rebellious subjects, than he declared himself the sworn enemy of that city, and solemnly besought God that he might one day have it in his power to be revenged on them.

The Ionian war being ended, by the reduction of that country again under the Persian government, the king of Persia sent to demand earth and water as tokens of submission from the Greeks. Most of the islanders yielded to this command out of fear, and among the rest the people of Ægina; upon which the Athenians accused

Attica.

accused the inhabitants of this island of treachery towards Greece, and a war was carried on with them for a long time. How it ended we are not informed; but its continuance was fortunate for Greece in general, as, by inuring them to war, and sea-affairs in particular, it prevented the whole of the Grecian states from being swallowed up by the Persians who were now about to invade them.

Besides the displeasure which Darius had conceived against the Athenians on account of the assistance they had afforded the Ionians, he was further engaged to an expedition against Greece by the intrigues of Hippias.

73 Hippias applies to the Persians.

Immediately on his returning unsuccessfully from Lacedemon, as above related, Hippias passed over into Asia, went to Artaphernes governor of the adjacent provinces belonging to the Persian king, and excited him to make war upon his country, promising to be obedient to the Persian monarch provided he was restored to the principality of Athens. Of this the Athenians being apprized, sent ambassadors to Artaphernes, desiring leave to enjoy their liberty in quiet: but that nobleman returned for answer, that if they would have peace with the great king, they must immediately receive Hippias; upon which answer the Athenians resolved to assist the enemies of Darius as much as possible. The consequence of this resolution was, that Darius commissioned Mardonius to revenge him of the insults he thought the Greeks had offered him. But Mardonius having met with a storm at sea, and other accidents, which rendered him unable to do any thing, Datis and Artaphernes the son of Artaphernes abovementioned, were commissioned to do what he was to have done.

74 They invade Greece.

The Persian commanders, fearing again to attempt to double the promontory of Athos, where their fleet had formerly suffered, drew their forces into the plains of Celicia; and passing from thence through the Cyclades to Euboea, directed their course to Athens. Their charge from Darius was to destroy both Eretria and Athens; and to bring away the inhabitants, that they might be at his disposal. Their first attempt was

75 Eretria destroyed.

on Eretria, the inhabitants of which sent to Athens for assistance on the first approach of the Persian fleet. The Athenians, with a magnanimity almost unparalleled at such a juncture, sent 4000 men to their assistance; but the Eretrians were so much divided among themselves, that nothing could be resolved on. One party among them was for receiving the Athenian succours into the city; another, for abandoning the city and retiring into the mountains of Euboea; while a third sought to betray their country to the Persians for their own private interest. Seeing things in this situation, therefore, and that no good could possibly be done, one Æschines, a man of great authority among the Eretrians, generously informed the Athenians commanders that they might return home. They accordingly retired to Oropus, by which means they escaped destruction: for Eretria being soon after betrayed to the Persians, was pillaged, burnt, and its inhabitants sold for slaves.

On the news of this disaster the Athenians immediately drew together all the forces they were able, which after all amounted to no more than 9000 men. These, with 1000 Platæans who afterwards joined them, were commanded by ten general officers, who had equal power; among whom were Miltiades, Aristides, and Themistocles, men of distinguished valour and great abilities. But it being generally imagined that so small a body of troops would be unable to resist the formidable power of the Persians, a messenger was dispatched to Sparta to intreat the immediate assistance of that state. He communicated his business to the senate in the following terms: "Men of Lacedæmon, the Athenians desire you to assist them, and not to suffer the most ancient of all the Grecian cities to be enslaved by the barbarians. Eretria is already destroyed, and Greece consequently weakened by the loss of so considerable a place." The assistance was readily granted; but at the same time the succours arrived so slowly, that the Athenians were forced to fight without them. In this memorable engagement in the plans of Marathon, whither Hippias had conducted the Persians, the latter were defeated with the loss of 6300 men, while the Greeks lost only 192. The Persians being thus driven to their ships, endeavoured to double Cape Sunium, in order to surprize Athens itself before the army could return: but in this they were prevented by Miltiades; who leaving Aristides with 1000 men to guard the prisoners, returned so expeditiously with the other 9000, that he was at the temple of Hercules, which was but a small way distant, before the barbarians could attack the city.

76 Persians defeated at Marathon.

After the battle, Aristides discharged the trust reposed in him with the greatest integrity. Though there was much gold and silver in the Persian camp, and the tents and ships they had taken were filled with all sorts of riches, he not only forbore touching any thing himself, but to the utmost of his power prevented others from doing it. Some, however, found means to enrich themselves; among the rest, one Callias, cousin-german to Aristides himself. This man being a torch-bearer, and, in virtue of his office, having a fillet on his head, one of the Persians took him for a king, and, falling down at his feet, discovered to him a vast quantity of gold hid in a well. Callias not only seized, and applied it to his own use, but had the cruelty to kill the poor man who discovered it to him, that he might not mention it to others; by which infamous action he entailed on his posterity the name of *Laccopluti*, or *enriched by the well*.

77 Integrity of Aristides.

After the battle of Marathon, all the inhabitants of Platæa were declared free citizens of Athens, and Miltiades, Themistocles, and Aristides, were treated with all possible marks of gratitude and respect. This, however, was but very short-lived; Miltiades proposed an expedition against the island of Paros, in which having been unsuccessful, through what cause is not well known, he was, on his return, accused, and condemned to pay 50 talents, the whole expence of the scheme; and being unable to pay the debt was thrown into prison, where he soon died of a wound received at Paros.

78 Miltiades ungratefully treated by the Athenians.

If any thing can exceed the enormity of such a proceeding as this, it was the treatment Aristides next received. Miltiades had proposed an expedition which had not proved successful, and in which he might possibly have had bad designs; but against Aristides not so much as a shadow of guilt was pretended. On the contrary, his extraordinary virtue had procured him the title of *Just*, and he had never been found to swerve from

79 As likewise Aristides.

from the maxims of equity. His downfal was occaſioned by the intrigues of Themiſtocles: who being a man of great abilities, and hating Ariſtides on account of the character he deſervedly bore among his countrymen, took all opportunities of inſinuating that his rival had in fact made himſelf maſter of Athens without the parade of guards and royalty. "He gives laws to the people (ſaid he); and what conſtitutes a tyrant, but giving laws?" In conſequence of this ſtrange argument, a ſtrong party was formed againſt the virtuous Ariſtides, and it was reſolved to baniſh him for 10 years by the oſtraciſm. In this caſe, the name of the perſon to be baniſhed was written upon a ſhell by every one who deſired his exile, and carried to a certain place within the forum incloſed with rails. If the number of ſhells ſo collected exceeded 6000, the ſentence was inflicted; if not, it was otherwiſe. When the agents of Themiſtocles had ſufficiently accompliſhed their purpoſe, on a ſudden the people flocked to the forum deſiring the oſtraciſm. One of the clowns who had come from a borough in the country, bringing a ſhell to Ariſtides, ſaid to him, "Write me Ariſtides upon this." Ariſtides, ſurpriſed, aſked him if he knew any ill of that Athenian, or if he had ever done him any hurt? "Me hurt! (ſaid the fellow), no, I don't ſo much as know him; but I am weary and ſick at heart on hearing him every where called *the juſt*." Ariſtides therefore took the ſhell, and wrote his own name upon it; and when informed that the oſtraciſm fell upon him, modeſtly retired out of the forum, ſaying, "I beſeech the gods that the Athenians may never ſee that day which ſhall force them to remember Ariſtides."

After the battle of Marathon, the war with Ægina was revived with great vigour; but the Æginetans

80 Themiſtocles adviſes the building of a fleet.

generally had the ſuperiority, on account of their great naval power. Themiſtocles obſerving this, was continually exhorting his countrymen to build a fleet, not only to make them an equal match for the Æginetans, but alſo becauſe he was of opinion that the Perſians would ſoon pay them another viſit. At laſt, he had the boldneſs to propoſe, that the money produced by the ſilver mines, which the Athenians had hitherto divided among themſelves, ſhould be applied to the building of a fleet: which propoſal being complied with, 100 galleys were immediately put upon the ſtocks; and this ſudden increaſe of the maritime power proved the means of ſaving all Greece from ſlavery.

81 Xerxes invades Greece.

About three years after the baniſhment of Ariſtides, Xerxes king of Perſia ſent to demand earth and water: but Themiſtocles deſiring to make the breach with that monarch ſtill wider, put to death the interpreter for publiſhing the decree of the king of Perſia in the language of the Greeks; and having prevailed upon the ſeveral ſtates to lay aſide their animoſities, and provide for their common ſafety, got himſelf elected general of the Athenian army.

When the news arrived that the Perſians were advancing to invade Greece by the ſtraits of Thermopylæ, and that they were for this purpoſe tranſporting their forces by ſea, Themiſtocles adviſed his countrymen to quit the city, embark on board their galleys, and meet their enemies while yet at a diſtance. This they would by no means comply with; for which reaſon Themiſtocles put himſelf at the head of the army, and having joined the Lacedemonians, marched towards Tempe. Here, having received advice that the ſtraits of Thermopylæ were forced, and that both Bœotia and Theſſaly had ſubmitted to the Perſians, the army returned without doing any thing.

In this diſtreſs the Athenians applied to the oracle at Delphi: from whence they received at firſt a very ſevere anſwer, threatening them with total deſtruction; but after much humiliation, a more favourable one was delivered, in which, probably by the direction of Themiſtocles, they were promiſed ſafety in *walls of wood*. This was by Themiſtocles and the greateſt part of the citizens interpreted as a command to abandon Athens, and put all their hopes of ſafety in their fleet. Upon 82

82 Athens abandoned by its inhabitants.

this, the opinion of Themiſtocles prevailing, the greateſt part began to prepare for this embarkation; and had money diſtributed among them by the council of the Areopagus, to the amount of eight drachms per man; but this not proving ſufficient, Themiſtocles gave out that ſomebody had ſtolen the ſhield of Minerva; under pretence of ſearching for which, he ſeized on all the money he could find. Some, however, there were who refuſed to embark with the reſt, but raiſed to themſelves fortifications of wood; underſtanding the oracle in its literal ſenſe, and reſolving to wait the arrival of the Perſians, and defend themſelves to the laſt. In the mean time Ariſtides was recalled, when the Athenians ſaw it their intereſt, leſt he ſhould have gone over to the Perſians and aſſiſted them with his advice. 83

83 And deſtroyed by the Perſians.

The Perſians having advanced to Athens ſoon after the inhabitants had deſerted it, met with no oppoſition except from the few juſt now mentioned; who, as they would hearken to no terms of accommodation, were all cut in pieces, and the city utterly deſtroyed. Xerxes,

84 They are totally defeated at Salamis.

however, being defeated in a ſea-fight at Salamis, was forced to fly with prodigious loſs. See Salamis. Themiſtocles was for purſuing him, and breaking down the bridge he had caſt over the Helleſpont; but this advice being rejected, he ſent a truſty meſſenger to Xerxes, acquainting him that the Greeks intended to break down his bridge, and therefore deſired him to make all the haſte he could, leſt by that means he ſhould be ſhut up in Europe. According to Herodotus, he a ſo adviſed the Athenians to quit the purſuit and return home, in order to build their ruined houſes. This advice, though miſinterpreted by ſome, was certainly a very prudent one, as Xerxes, though once defeated, was ſtill at the head of an army capable of deſtroying all Greece; and had he been driven to deſpair by finding himſelf ſhut up, or warmly purſued, it was impoſſible to ſay what might have been the event. After this, Themiſtocles formed a ſcheme, for the aggrandiſement of Athens indeed, but a moſt unjuſt and infamous one. It was, in ſhort, to make Athens miſtreſs of the ſea by burning all the ſhips except thoſe belonging to that republic. He told his countrymen that he had ſomething to propoſe of great conſequence, but which could not be ſpoken publicly: whereupon he was deſired to communicate it to Ariſtides, by whom the propoſal was rejected; and Ariſtides having informed the Athenians that what Themiſtocles had ſaid was very advantageous but very unjuſt, they deſired him to think no more of it. 85

85 Themiſtocles honoured by the Lacedemonians.

When the fleet returned to Salamis, extraordinary honours were paid to Themiſtocles by the Lacedemonians. On his entering that city, they decreed him a wreath

Attica.

wreath of olive as the prize of prudence; preſented him with the moſt magnificent chariot in Sparta; and when he returned to Athens, he was eſcorted by 500 horſe, an honour never paid to any ſtranger but himſelf. On his arrival at Athens, however, there were not wanting ſome who inſinuated that the receiving ſuch honours from the Lacedemonians was injurious to the republic; but Themiſtocles confiding in his innocence, treated theſe clamours with contempt, and exhorted his countrymen to entertain no doubts of their allies, but rather endeavour to preſerve the great reputation they had acquired throughout all Greece.

The defeat of Xerxes at Salamis made Mardonius, who was left to carry on the war by land, more ready to treat with the Athenians than to fight them; and with this view he ſent Alexander king of Macedon to Athens to make propoſals of alliance with that republic, excluſively of all the other Grecian ſtates. This proposal, however, was rejected; and the conſequence was, that Athens was a ſecond time deſtroyed, the Spartans ſending aſſiſtance ſo ſlowly, that the Athenians were forced to retire to Salamis: but they were ſoon freed from all apprehenſions by the total defeat and death of Mardonius at Platæa; where Ariſtides, and the body of troops under his command, diſtinguiſhed themſelves in a moſt extraordinary manner.

86 Athens a ſecond time deſtroyed.

87 The Perſians defeated at Platæa and Mycale.

The ſame day that the battle of Platæa was fought, the Perſians were defeated in a ſea-fight at Mycale in Ionia, wherein it was allowed that the Athenians who were there behaved better than any of the other Greeks; but when it was propoſed to tranſport the Ionians into Europe, that they might be in perfect ſafety, and give them the territories of ſuch Grecian ſtates as had ſided with the Perſians, the Athenians refuſed to comply, fearing the Ionians would rival them in trade, or refuſe the obedience they uſed to pay them: beſides which, they would then loſe the opportunity of plundering the Perſians in caſe of any quarrel with Ionia. Before they returned home, however, the Athenians croſſed over to the Cherſoneſus, and beſieged Seſtos. The ſiege was long and troubleſome: but at laſt the garriſon, being preſſed with hunger, and having no hopes of relief, divided themſelves into two bodies, and endeavoured to make their eſcape; but were purſued, and all either killed or taken. *Oibazus*, one of their commanders, was ſacrificed to a Thracian god; and the other, called *Artyactes*, impaled alive, and his ſon ſtoned before his face, becauſe he had rifled the ſepulchre of Proteſilaus.

88 Seſtos taken by the Athenians.

89 They rebuild their city.

After the victories at Platæa and Mycale, the Athenians returned without any apprehenſion, and began to rebuild their city in a more magnificent manner than before. Here they were no ſooner arrived than a diſpute was ready to be commenced about the form of government. The commons, with Themiſtocles at their head, were for a democracy; to which Ariſtides, rather than hazard the raiſing diſturbances, conſented. It was therefore propoſed, that every citizen ſhould have an equal right to the government; and that the archons ſhould be choſen out of the body of the people, without preference or diſtinction: and this propoſal being agreed to, put an end to all diſcontents for the preſent.

At this time alſo Themiſtocles propoſed that the city of Athens ſhould be fortified in the beſt manner poſſible, that it might not be liable to be again deſtroyed, when the Perſians ſhould take it into their heads to invade Greece. At this propoſal the Lacedemonians were exceedingly alarmed; and therefore remonſtrated, that ſhould Athens once be ſtrongly fortified, and the Perſians become poſſeſſed of it, it would be impoſſible to get them out of it again. At laſt, ſeeing theſe arguments had no effect, they abſolutely forbid the Athenians to carry their walls any higher. This command gave great offence; but Themiſtocles, conſidering the power of Sparta at that time, adviſed the Athenians to temporize; and to aſſure the ambaſſadors, that they ſhould proceed no farther in their work, till by an embaſſy of their own, ſatisfaction ſhould be given to their allies. Being named ambaſſador at his own deſire to Sparta, with ſome other Athenians, Themiſtocles ſet out alone, telling the ſenate that it would be for the intereſt of the ſtate to delay ſending the other ambaſſadors as long as poſſible. When arrived at Sparta, he put off from time to time receiving an audience, on account of his colleagues not being arrived: but in the mean time the walls of Athens were building with the utmoſt expedition; neither houſes nor ſepulchres being ſpared for materials; and men, women, children, ſtrangers, citizens and ſervants, working without intermiſſion. Of this the Lacedemonians having notice, and the reſt of the Athenian ambaſſadors being arrived, Themiſtocles and his colleagues being ſummoned before the ephori, who immediately began to exclaim againſt the Athenians for their breach of promiſe. Themiſtocles denied the charge: he ſaid his colleagues aſſured him of the contrary: that it did not become a great ſtate to give heed to vague reports, but that deputies ought to be ſent from Sparta to inquire into the truth of the matter, and that he himſelf would remain as a hoſtage, to be anſwerable for the event. This being agreed to, he engaged his aſſociates to adviſe the Athenians to commit the Spartan ambaſſadors to ſafe cuſtody till he ſhould be releaſed; after which he publicly avowed the whole tranſaction, took the ſcheme upon himſelf, and told the Lacedemonians that "all things are lawful for our country." The Spartans ſeeing no remedy, concealed their reſentment, and ſent Themiſtocles home in ſafety.

Attica.

90 Themiſtocles adviſes to fortify Athens, and deceives the Spartans who oppoſe it.

The next year, being the laſt of the 75th Olympiad, Themiſtocles obſerving the inconvenience of the port Phalerum, thought of making the *Pyræum* the port of Athens. This he did not at firſt think proper to mention publicly; but having ſignified to the people that he had ſomething of importance to communicate, they appointed Xantippus and Ariſtides to judge of his propoſal. They readily came into his meaſures, and told the people that what Themiſtocles propoſed would be of the utmoſt advantage to the ſtate, at the ſame time that it might be performed with eaſe. Upon this they were deſired to lay the matter before the ſenate; who coming unanimouſly into their meaſure, ambaſſadors were diſpatched to Sparta to inſinuate there how proper it would be for the Greeks to have ſome great port, where a fleet might always watch the deſigns of the Perſians; and thus having prevented any umbrage from their firſt undertakings, the work was ſet about with ſuch expedition, that it was finiſhed before the Lacedemonians knew well what they were about.

91 Makes the Pyræum the port of Athens.

At this time alſo the ſovereignty of the ſea was tranſ-

Attica.

92 Sovereignty of the ſea transferred to Athens.

transferred from Sparta to Athens, through the haughty behaviour of Pauſanius the Lacedemonian. He had commanded at Platæa, and ſtill enjoyed the ſupreme authority in the war which was all this time carrying on againſt the Perſians; but being elated with his ſucceſs at Platæa, and having entered into a treaſonable correſpondence with the enemy, he treated the captains under his command with the greateſt haughtineſs, giving the preference to the Spartans in ſuch a manner that the reſt of the Greeks could no longer bear his inſolence. On the contrary, Ariſtides, and Cimon the ſon of Miltiades, who commanded the Athenians, by their obliging behaviour gained the favour of every body; ſo that the allies, having publicly affronted Pauſanias, put themſelves under the protection of the Athenian republic; and thenceforward the Athenians, and not the Lacedemonians, had the ſupreme command.

93 Ariſtides taxes Greece with extraordinary applauſe.

The Greeks being now ſenſible that they would always have occaſion to be on their guard againſt the Perſians, and that it was neceſſary to eſtabliſh a fund by a common taxation of all the ſtates, Ariſtides was pitched upon as the only perſon that could be truſted with the power of allotting to each of the ſtates its proper quota. This difficult taſk he undertook, and executed in a manner unparalleled in the annals of hiſtory. All parties were pleaſed, and his taxation was ſtyled *the happy lot of Greece.* The groſs amount of it was 450 talents.

94 Themiſtocles baniſhed.

It now came to the turn of Themiſtocles to experience the ingratitude of his countrymen. His ſervices had been ſo eſſential, that the treatment he received may perhaps be a ſufficient excuſe for modern patriots when they connect their own intereſt with the ſervice of their country. Themiſtocles had plainly ſaved the ſtate from ruin by his advice; he had diſtinguiſhed himſelf by his valour; had rendered Athens, by his policy, ſuperior to the other ſtates of Greece; and entirely ſubverted the Lacedemonian ſcheme of power. Yet notwithſtanding all this he was baniſhed by the oſtraciſm, without the ſmalleſt crime pretended, unleſs that he was hated by the Lacdemonians, and that he had erected a temple, near his own houſe, dedicated to *Diana, the giver of the beſt counſel;* intimating that he himſelf had given the beſt council for the ſafety both of Athens and of all Greece, which was no more than the truth. Nay, he was not only driven out of Athens, but out of all Greece; ſo that he was forced to ſeek ſhelter from the king of Perſia, againſt whom he had fought with ſo much valour. That monarch gave him a gracious reception; and he was never recalled, becauſe the Greeks had no occaſion for his ſervices.

95 Succeſs of Cimon againſt the Perſians.

The war with Perſia was not yet diſcontinued; the Greeks found their advantage in plundering and enriching themſelves with the ſpoils of the king of Perſia's ſubjects. For this reaſon, in the end of the 77th Olympiad, they equipped a navy, under a pretence of relieving ſuch of the Greek cities in Aſia as were ſubject to the Perſians. Of this fleet Cimon, the ſon of Miltiades by the daughter of the king of Thrace, was appointed commander in chief. He had already taſted the juſtice and generoſity of his countrymen, having been thrown into priſon for his father's fine, from which he was releaſed by *Callias,* whom his ſiſter Elpinice married on account of his great wealth procured by no very honourable means. He accepted of the command, however; and gained ſuch immenſe booty in this expedition, that the Athenians were thereby enabled to lay the foundation of thoſe long extended walls which united the port to the city. The foundation was laid in a mooriſh ground; ſo that they were forced to ſink it very deep, and at a great expence; but to this Cimon himſelf contributed out of his own ſhare of the ſpoils, which was very conſiderable. He alſo adorned the forum with palm trees, and beautified the academy with delightful walks and fountains.

96 He ſubdues the Cherſoneſus.

The Perſians having ſoon after this expedition invaded Cherſoneſus, and with the aſſiſtance of the Thracians made themſelves maſters of it, Cimon was ſent againſt them in a great hurry. He had only four ſhips; but nevertheleſs with theſe he took 13 of the Perſian galleys, and reduced the whole of the Cherſoneſus. After this he marched againſt the Thracians, who revolting againſt the Athenians, had made themſelves maſters of the gold mines lying between the rivers Nyſſus and Strymon. The Thracians were quickly obliged to yield; after which the Athenians ſent a great colony to Amphipolis a city of Thrace, which for ſome time made a conſiderable figure, but afterwards attempting to penetrate into the country of the *Edones,* great part of them were deſtroyed.

97 Makes Athens irreſiſtable at ſea.

Cimon alſo fell upon the following expedient to make Athens irreſiſtable at ſea by the other ſtates of Greece. Many of the Greek ſtates, by virtue of Ariſtides's taxation, were bound to furniſh men and galleys, as well as to pay the tax for their ſupport. But when they ſaw themſelves out of danger from the Perſians, moſt of them were very unwilling to furniſh their quota of men. This the Athenian generals being offended with, were for having recourſe to force; but Cimon permitted ſuch as were deſirous of ſtaying at home to do ſo, and accepted a ſum of money in lieu of a galley completely manned. By this means he inured the Athenians, whom he took on board his galleys, to hardſhip and diſcipline; while the allies who remained at home became enervated through idleneſs, and from being confederates, dwindled into tributaries, and almoſt ſlaves. In the laſt year of the 77th Olympiad, Cimon was ſent to aſſiſt the Lacedemonians againſt the Helotes, who had revolted from them. In this he was attended with his uſual ſucceſs; but, ſome time after, the Lacedemonians being engaged in the ſiege of Ithome, ſent again to the Athenians for ſuccour, and Cimon was a ſecond time ſent to their relief; but the Spartans having received a ſufficient ſupply of troops from other quarters before the arrival of the Athenian general, he and his men were diſmiſſed without doing any thing. This grievouſly offended the people of Athens, who thenceforward hated not only the Lacedemonians, but all their own citizens who were thought to be friends to that ſtate.

98 He is baniſhed.

It was not poſſible, however, that any perſon who had ſerved the ſtate ſhould eſcape baniſhment at Athens. Cimon had gained great wealth both to the public and to himſelf. In his public character he had behaved with unimpeached honeſty, and as a private citizen he dedicated his wealth to the moſt excellent purpoſes. He demoliſhed the incloſures about his grounds and gardens, permitting every one to enter and take what fruits they pleaſed; he kept an open table,

Attica.

table, where both rich and poor were plentifully entertained. If he met a citizen in a tattered suit of clothes, he made some of his attendants exchange with him; or if the quality of the person rendered that kindness unsuitable, he caused a sum of money to be privately given him. All this, however, was not sufficient: he did not concur with every measure of the commonalty; and therefore the popular party determined not to banish him, but to put him to death. The crime laid to his charge was, that by presents from the Macedonians he was prevailed upon to let slip a manifest opportunity of enlarging his conquests, after taking from the Persians the gold mines of Thrace. To this accusation Cimon replied, that to the utmost of his power he had prosecuted the war against the Thracians and other enemies of the state of Athens; but that it was true he had not made any inroads into Macedonia, because he did not imagine he was to act as a public enemy of mankind, and because he was struck with respect for a nation modest in their carriage, just in their dealings, and strictly honourable in their behaviour towards him and the Athenians: that if his countrymen looked upon this as a crime, he must abide their judgment; but, for his part, he could never be brought to think such conduct amiss. Elpinice, Cimon's sister, used all her interest in his behalf, and amongst others spoke to Pericles the celebrated statesman and orator. He was indeed Cimon's rival, and had no doubt assisted in stirring up the prosecution against him; but he did not desire his death: and therefore, though appointed to accuse him, Pericles spoke in such a manner that it plainly appeared he did not think him guilty; and, in consequence of this lenity, Cimon was only banished by the ostracism.

The Athenian power was now risen to such an height, that all the other states of Peloponnesus looked upon this republic with a jealous eye, and were continually watching every opportunity of making war upon it when the state was engaged in troublesome affairs, and seemed to be less able to resist. These attempts, however, so far from lessening, generally contributed to increase the power of the Athenians; but in the year before Christ 458, the republic entered into a war with Sparta, which was scarce put an end to but by the destruction of the city of Athens. For this war, there was no recent provocation on the part of the Spartans. They had sent a great army to assist the Dorians against the Phocians, and the Athenians took this opportunity to revenge themselves of former quarrels. Having therefore drawn in the Argives and Thessalians to be their confederates, they posted themselves on the Isthmus, so that the Spartan army could not return without engaging them. The Athenians and their confederates amounted to 14,000, and the Spartans to 11,500. The Spartan general, however, not very willing to hazard a battle, turned aside to Tanagra, a city in Bœotia, where some of the Athenians who inclined to aristocracy entered into a correspondence with him. But before their designs were ripe for execution, the Athenian army marched with great expedition to Tanagra, so that a battle became inevitable. When the armies were drawing up in order of battle, Cimon presented himself before his countrymen in complete armour, and went to take post among those of his own tribe; but the popular party raised such a clamour against him, that he was forced to retire. Before he departed, however, he exhorted Euthippus and the rest of his friends to behave in such a manner that they might wipe off the aspersion thrown upon him, as if he had designed to betray his country's cause to the Lacedemonians. Euthippus desired him to leave his armour, which he did; and a battle ensuing, the Athenians were defeated with great loss, and Euthippus with the rest of Cimon's friends were all killed in defence of his armour which they had surrounded. Another engagement soon followed, wherein both armies suffered so much, that they were glad to conclude a short truce, that each might have time to recruit their shattered forces.

99 War between Athens and Sparta.

100 Athenians defeated.

101 They gain great advantages over the Spartans.

The scale of fortune now seemed to turn in favour of the Athenians. The Thebans, who had been deprived of the command of Bœotia on account of their having sided with Xerxes, were now restored to it by the Lacedemonians. At this the Athenians were so displeased, that they sent an army under Myronides the son of Callias into Bœotia to overturn all that had been done. That general was met by the Thebans and their allies, who composed a numerous and well-disciplined army. Nevertheless, though the Athenian army was but an handful in comparison of their enemies, Myronides gained a complete victory over the allies, in some sense more glorious than either that of Marathon or Platæa. In these battles they had fought against effeminate and ill-disciplined Persians, but now they encountered and defeated a superior army composed of the bravest Greeks. After this victory, Myronides marched to Tanagra; which he took by storm, and razed to the ground: he then plundered Bœotia; defeated another army which the Bœotians had drawn together to oppose him; then fell upon the Locrians; and, having penetrated into Thessaly, chastised the inhabitants of that country for having revolted from the Athenians, and from thence returned to Athens laden with riches and glory.

The next year Tolmides the Athenian admiral invaded Laconia, where he made himself master of several places; and on the back of this, Pericles invaded Peloponnesus with great success, burning, spoiling, or taking whatever places he attempted. On his return he found the people greatly out of humour on account of Cimon's banishment; so he was immediately recalled. 102 Cimon recalled.

Cimon was no sooner returned than he fell to his old employment of plundering the Persians; and, according to Plutarch, he had now nothing less in view than the conquest of the whole Persian empire. The Persian monarch finding he could have no rest, at last sent orders to Artabazus and Megabizus, his commanders, to conclude a treaty; which was done on the following conditions: 1. That the Greek cities in Asia should be free, and governed by their own laws. 2. That the Persians should send no army within three days journey of the sea. 3. That no Persian ship of war would sail between Thesalis and Cyrene, the former a city of Pamphylia, and the latter of Lycia.

103 His death.

While this treaty was carrying on Cimon died, whether of sickness or of a wound he had received is not known; and after his death the Athenian affairs began to fall into confusion. It was now the misfortune of this state to be alike hated by her enemies and allies; the consequence of which was, that the latter were perpetually

petually revolting whenever they thought they had an opportunity of doing so with impunity. The Megarians, at this time, who had been long under the protection or dominion of Athens, thought proper for some reason or other to disclaim all dependence on their former protectors, and have recourse to Sparta, with which state they entered into a strict alliance. This the Athenians revenged by ravaging the country of the Megarians; which soon brought on a renewal of the Lacedemonian war that had been for a little time suspended. Pericles, however, procured the return of the first Lacedemonian army, without bloodshed, by bribing Chandrides the young king of Sparta's tutor. In the winter, Tolmides resolved to undertake an expedition into Bœotia with a small body of troops; which design he put in execution contrary to the advice of

104 *A thirty years truce with the Lacedemonians.*

Pericles, and his rashness was soon punished by his own death and the total defeat of his army. Notwithstanding this misfortune, however, Pericles soon after invaded and reduced Euboea; and the Lacedemonians, finding it was not for their interest to carry on the war, concluded a truce with the Athenians for 30 years.

About this time Psammiticus, king of Egypt, sent by way of present to the people of Athens 40,000

105 *Cruelty of Pericles.*

bushels of wheat; which proved a great misfortune to the city: for Pericles, out of spite to Cimon, who had children by an Arcadian woman, had preferred a law whereby the Athenians of the half-blood were disfranchised; and this law, on account of the distribution of the corn abovementioned, was prosecuted with such severity, that no less than 5000 persons, who till then

106 *Number of the Athenian citizens.*

had been considered as free-men, were sold for slaves. This piece of cruelty has been of great service to the critics, as by means of it we know exactly the number of Athenian citizens, which at this time amounted to no more than 14,040 persons, though Athens was now aiming at no less than erecting an universal monarchy.

Six years after the conclusion of the peace between Athens and Sparta, a war broke out between the Samians and Milesians about the city of Priene, seated

107 *Samos reduced by Pericles.*

under mount Mycale in Ionia. How this war came to affect the Athenians is not certainly known: but somehow or other, this republic was induced to take the part of the Milesians; and the island of Samos was reduced by Pericles, who established there a democracy, and left an Athenian garrison. He was no sooner gone, however, than the Samians, disliking their new form of government, drove out the garrison he had left; but Pericles quickly returning, besieged and took their city, demolished their walls, and fined them of the whole expence of the war; part of which he obliged them to pay down, and took hostages for the remainder. When Pericles returned, he procured himself to be appointed to pronounce the public oration in honour of those who fell; which he did with such eloquence, that when he came down from the pulpit the women gathered about him, took him by the hand, and crowned him with garlands.

108 *War between the Corcyrians and Corinthians.*

A little after this commenced the war between the Corcyrians and Corinthians, which by degrees brought the Athenians into those engagements that proved the ruin of their state. The causes of this war were the following. An intestine war breaking out in the little territory of Epidamnum, a city of Macedonia founded by the Corcyrians, one party called in to their assistance the Illyrians, and the other the Corcyrians. The latter neglecting the matter, Corinth was applied to, as the Corcyrians were a colony from that place. The Corinthians, partly out of pity to the Epidamnians, and partly out of spleen to the Corcyrians, sent a very great fleet to the assistance of the former, by which means that party which had applied to Corinth was thoroughly established. This being resented by the Corcyrians, they sent a fleet to Epidamnum to support the exiles; and accordingly this fleet began to act offensively on its entering the port, the chief commanders having instructions to propose terms of accommodation, to which the Corinthians would by no means agree. The next year the Corcyrians defeated at sea the Corinthians and their allies, and took Epidamnum by storm; after which they wasted the territories of the allies of the Corinthians, which greatly exasperated the latter. At Corinth, therefore, they began to make great preparations for carrying on the war, and pressed their confederates to do the same, that they might be in a condition to retrieve the honour they had lost, and humble this ungrateful colony which had thus insulted her mother-city.

The Corcyrians were no sooner acquainted with these proceedings, than they dispatched ambassadors to Athens with their complaints; and these were quickly followed by others from Corinth on the same errand. At first the people of Athens inclined to favour the Corinthians; but they soon changed their minds, and took part with the Corcyrians: they contented themselves, however, with entering into a defensive alliance with that little state, whereby they promised to assist each other, in case either party should be attacked; and in consequence of this treaty, they furnished the Corcyrians with ten galleys, under Lacedæmonius the son of Cimon, with whom were joined Diotenes and Proteus as colleagues.

109 *Athens sides with the Corcyrians.*

As soon as the season of the year permitted, the Corinthians sailed for the coast of Corcyra with a fleet of 150 ships, under the command of Xenoclides assisted by four other Corinthian admirals; each squadron of their allies being commanded by a chief of their own. The Corcyrian and Athenian fleet amounted to 120, but the Athenians had orders to give as little assistance as possible. The action was very brisk for some time: the Corcyrian right wing broke the left of the Corinthian fleet; and forcing some of the ships on shore, landed, pillaged their camp, and made a great number of them prisoners: on the other hand, the Corinthian ships in their right wing beat the Corcyrian ships there, they being but very faintly assisted by the Athenians, till the latter were at last obliged to defend themselves, which they did so well, that the Corinthians were glad to retire. The next day preparations were made on both sides for another engagement; but 20 ships coming from Athens to the assistance of the Corcyrians, the Corinthians declined the combat.

110 *Potidæa besieged by the Athenians.*

As soon as the Corcyrian war broke out, the Athenians sent orders to the citizens of Potidæa to demolish a part of their wall, to send back the magistrates they had received from Corinth, and to give hostages for their own behaviour. Potidæa was a town in Macedonia,

donia, founded by the Corinthians, but at that time in alliance with the Athenians. Perdiccas king of Macedon, who hated the Athenians, took this opportunity to perſuade the Potidæans to revolt. Accordingly they ſent ambaſſadors to Athens to intreat the revocation of theſe orders: but at the ſame time ſent deputies to Sparta, to join with the Corinthians and Megarians in their complaints againſt the Athenians. The Athenians upon this ſent a conſiderable fleet againſt Potidæa under the command of Calias, a nobleman of great courage. The Corinthians on their part diſpatched one Ariſteus with a conſiderable body of troops to the aſſiſtance of that city. An engagement following, the Athenians were victors, but with the loſs of their general. Phormio, who ſucceeded in the command, inveſted the city in form, and ſhut up its port with his fleet; but the Potidæans dreading to fall into the hands of the Athenians, made a moſt obſtinate defence, while in the mean time they warmly ſolicited the Corinthians to perform their promiſes, and engage the reſt of the ſtates of Peloponneſus in their quarrel.

111
The Spartans demand reparation for the injuries offered to the ſtates of Greece.

The Lacedemonians having heard what the Corinthians, and other little ſtates of Greece had to ſay againſt the Athenians, ſent ambaſſadors to the latter, demanding reparation for the injuries, with orders, in caſe of a refuſal to declare war. The terms demanded were, in the firſt place the expulſion of thoſe Athenians who were allied to the family of Megacles ſo often mentioned. This article was on account of Pericles; for he was the ſon of Xanthippus the Athenian commander at Mycale, by Agariſte niece to the famous Clyſthenes, who corrupted the prieſteſs of Apollo in order to procure the expulſion of the Piſiſtratidæ. They next inſiſted that the ſiege of Potidæa ſhould be raiſed; thirdly, that the inhabitants of Ægina ſhould be left free; and, laſtly, that a decree made againſt the Megarians, whereby they were forbid the ports and markets of Athens, ſhould be revoked, and all the Grecian ſtates under the dominion of Athens ſet at liberty.

112
Their terms rejected by advice of Pericles.

Theſe terms the Athenians were perſuaded by Pericles to reject. The arguments uſed by him were in ſubſtance as follows: That whatever the Lacedemonians migh pretend as to the juſtice of the complaints of the allies, the true ground of this reſentment was the proſperity of the Athenian republic, which the Spartans always hated, and now ſought an opportunity of humbling; that it muſt be owing to the Athenians themſelves if this deſign ſucceeded, becauſe for many reaſons Athens was better able to engage in a long and expenſive war than the Peloponneſians. He then laid before the people an exact account of their circumſtances; putting them in mind, that the treaſure brought from Delos amounted to 10,000 talents; and that tho' 4000 of theſe had been expended on the ſtately gate of their citadel, yet that 6000 were ſtill in hand; that they were alſo intitled to the ſubſidies paid by the confederate ſtates; that the ſtatues of their gods, the Perſian ſpoils, &c. were worth immenſe ſums; that private men were arrived at vaſt fortunes; and that, conſidering their trade by ſea, they had a certain annual increaſe of wealth; that they had on foot an army of 12,000 men, and in their colonies and garriſons 17000; that their fleet conſiſted of 300 ſail; whereas the Peloponneſians had no ſuch advantages. For theſe reaſons he propoſed as the moſt feaſible, and likewiſe the moſt equitable ſatisfaction that could be given, that they would reverſe their decree againſt Megara, if the Lacedemonians would allow free egreſs and regreſs in their city to the Athenians and their allies; that they would leave all thoſe ſtates free who were free at the making of the laſt peace with Sparta, provided the Spartans would alſo leave all ſtates free who were under their dominion; and that future diſputes ſhould be ſubmitted to arbitration. In caſe theſe offers ſhould be rejected, he adviſed them to hazard a war; telling them, that they ſhould not think they ran that hazard for a trifle, or retain a ſcruple in their minds as if a ſmall matter moved them to it, becauſe on this ſmall matter depended their ſafety, and the reputation of their conſtancy and reſolution; whereas, if they yielded in this, the next demand of the Lacedemonians would be of a higher nature; for having once diſcovered that the Athenians were ſubject to fear, they would thence conclude that nothing could be denied to Sparta, whereas a ſtiff denial in this caſe would teach them to treat Athens for the future on terms of equality. He enforced theſe reaſons by ſhowing that their anceſtors had always acted on the like principles, and in all caſes preferred their glory to their eaſe, and their liberty to their poſſeſſions.

This was the origin of the Peloponneſian war, which makes ſo great a figure in ancient hiſtory. The immediate preliminary to general hoſtilities was an attempt of the Thebans to ſurpriſe Platæa. With this 113
Attempt of the Thebans on Platæa.

view they ſent Eurymachus with 300 Thebans to aſſiſt ſuch of the Platæans as they had drawn over to their intereſt, in making themſelves maſters of the place. In this deſign they ſucceeded very well at firſt, the Platæans who had promiſed to open the gates keeping their words exactly, ſo that they were inſtantly in poſſeſſion of the city. The other party, however, perceiving how ſmall a number they had to contend with, unanimouſly roſe upon them, killing a great many, and forced the reſt to ſurrender themſelves priſoners of war. Another party came from Thebes to aſſiſt their countrymen; but they arrived too late: the Platæans, however, foreſeeing that they would waſte their country, promiſed to releaſe their priſoners if they 114
They are maſſacred.

would forbear to ſpoil their lands. On this the Thebans withdrew; and the Platæans cruelly put to death all their priſoners, to the number of 180, with Eurymachus their chief, alledging that they had not promiſed their releaſe but in caſe of peace. The Athenians, as ſoon as they had notice of this attempt of the Thebans, cauſed all the Bœotians in their territory to be arreſted; and when they underſtood how the Platæans had delivered themſelves, they ſent a great convoy of proviſions to that city, and a numerous body of troops to eſcort their wives and children to Athens.

115
Account of the allies on both ſides.

Both parties now prepared in earneſt for war, both ſent ambaſſadors to the Perſians, and both ſought to rouſe their allies. Moſt of the Greek ſtates inclined to favour the Spartans, becauſe they acted on this occaſion as the deliverers of Greece, and becauſe they either had been, or feared that they would be, oppreſſed by the Athenians. With the Spartans joined all the Peloponneſians, except the Argives and part of the A-

Attica.

chæans; without Peloponneſus, the Megarians, Phocians, Locrians, Bœotians, Ambraciots, Leucadians, and Anactorians, declared themſelves on their ſide. On the other hand, the Chians, Leſbians, Platæans, Meſſenians, Acarnanians, Corcyrians, Zacynthians, Carians, Dorians, Thracians, moſt part of the iſlands, and all the Cyclades excepting Melos and Thera, with Eu-

116 bœa and Samos, joined the Athenians.

First year of the war.

The Peloponneſian war commenced 431 years before Chriſt. The Lacedemonian army was aſſembled at the Iſthmus, and conſiſted of no leſs than 60,000 men; but before Archidamus king of Sparta, who commanded in chief, would enter Attica, he diſpatched a herald to Athens. The herald was ſent back without any anſwer, by which all hopes of peace were cut off. As Archidamus was a friend to Pericles, the latter apprehended that he might forbear plundering his eſtates. With this he immediately acquainted the people; telling them at the ſame time, that in ſuch a caſe he made a preſent of his lands to the public. He then adviſed the citizens to take no care of defending their country-ſeats, but to attend only to the city, buſy themſelves in the equipping of ſhips, and ſettle a thorough reſolution not to be intimidated with the firſt evils of war. This propoſal the Athenians readily complied with, and appointed Pericles commander in chief, with nine more generals to aſſiſt him.

The firſt year; the Spartan army committed great ravages in Attica, Pericles having no force capable of oppoſing it, and refuſing to engage on diſadvantageous terms, notwithſtanding prodigious clamours were raiſed againſt him by his countrymen. The allies, however, had no great reaſon to boaſt of the advantages they gained this year: an Athenian fleet ravaged the coaſts of Peloponneſus; another infeſted the Locrians, drove out the inhabitants of Ægina, and repeopled the iſland from Athens. They likewiſe reduced Cephalenia, and ſome towns in Acarnania and Leucas which had declared for the Lacedemonians; and in the autumn, when the Peloponneſians were retired, Pericles entering the Megarian territory, did all the miſchief that

117 could be expected from a provoked enemy.

Second year. A dreadful plague at Athens.

The ſpring of the ſecond year was very fatal to Athens by a dreadful plague which deſtroyed great numbers of the citizens, while the Peloponneſians under Archidamus waſted every thing abroad. In the midſt of theſe diſtreſſes, however, Pericles retained his courage, and would ſuffer none of his countrymen to ſtir without the city, either to eſcape the plague or infeſt the enemy. He cauſed a great fleet to be equipped, on board which he embarked 4000 foot and 300 horſe, with which he ſailed to Epidaurus. Upon this the enemy withdrew their forces out of Attica; but Pericles was able to do no great matter on account of the plague, which made ſo great havock among his men,

118 that he brought back to Athens only 1500 of the 4000

Athenians ſue for peace.

he carried out. By this misfortune the Athenians were thrown into deſpair; they immediately ſued for peace, which the Spartans were now too proud to grant; then turning their rage upon Pericles, they diſmiſſed and fined him. Soon after, Pericles's children and almoſt all his relations died of the plague; ſo that this great ſtateſman was overwhelmed with melancholy, and for ſome time ſhut himſelf up from public view: at laſt, through the perſuaſion of Alcibiades and ſome others, he ſhowed himſelf to the people. They received him with acclamations, and at his requeſt repealed the un- 119

Pericles requeſts the repeal of his law.

juſt law he had made, whereby all the Athenians of the half blood were disfranchiſed, and then reinſtated him in all his former honours. Hereupon he inrolled the only ſon he had left, who before had been counted a baſtard on account of his mother being a Mileſian.

This year alſo the iſland of Zacynthus was waſted by the Peloponneſians; and the city of Potidæa ſubmitted to the Athenians, after the inhabitants had been driven to ſuch extremity as to feed upon human fleſh. The Athenians permitted the men to depart with one garment, and the women with two; after which, the town was repeopled by a colony from Athens. 120

Third year. Pericles dies.

The third year of the Peloponneſian war was remarkable for the death of the great Pericles, who was taken off by the plague. Platæa was alſo beſieged by Archidamus; but without ſucceſs, even though the 121

Platæa beſieged.

greateſt part of it was ſet on fire, the Platæans reſolving to ſubmit to every kind of miſery rather than abandon the Athenian cauſe. In the end, therefore, the king of Sparta was obliged to turn the ſiege into a blockade; and having thrown up an entrenchment fortified with a deep ditch, he left a ſufficient number of men to guard his lines, and then returned back to Peloponneſus. 122

Fourth year. Deſperate attempt of the Platæans.

The following ſummer the Peloponneſians under the command of Archidamus invaded Attica, where they waſted every thing with fire and ſword; at the ſame time the whole iſland of Leſbos, except the diſtrict of Methymna, revolted from the Athenians, who hereupon inveſted the city of Mitylene. All this time the city of Platæa was blocked up by the Peloponneſians; and its inhabitants being now greatly diſtreſſed for want of proviſions, the garriſon, conſiſting of 400 natives and 80 Athenians, came to the deſperate reſolution of forcing a paſſage through the enemy's lines. When they came to attempt this, however, many of them were intimidated: but 300 perſiſted in their reſolution; and of theſe 212 got ſafe through and marched to Athens, but the reſt were compelled to retire. 123

Fifth year. Mitylene, &c. taken by the Athenians.

In the beginning of the fifth year, the Peloponneſians ſent 40 ſhips to the relief of Mitylene; but without effect, for the place had ſurrendered before the fleet could come to its aſſiſtance. Paches, the Athenian commander, likewiſe chaſed away the Peloponneſian fleet upon its arrival; and returning to Leſbos ſent the Lacedemonian miniſter, whom he found in Mitylene, together with a deputation, to Athens. On their arrival the Lacedemonian was immediately put to death; and in a general aſſembly of the people, it was reſolved, that all the Mitylenians who had arrived at man's eſtate ſhould be put to death, and the women and children ſold for ſlaves. The next day, however, this cruel decree was reverſed, and a galley ſent with all expedition to countermand theſe bloody orders. This laſt veſſel, however, could not get before the other: but Paches, being a man of great humanity, had taken a day to conſider on the orders he had received; during which time the laſt mentioned galley arrived; in conſequence of which, only about 1000 of the moſt forward rebels were put to death; the walls of the city were alſo demoliſhed, their ſhips taken away, and their lands divided among the Athenians, who let them again to their old maſters at very high rents. The ſame ſummer

mer the Athenians seized the island of Minoas, lying over against the territory of Megara: and likewise the port Nisæa, which last they fortified, and it proved afterwards a place of the utmost importance to them.

124 **Platæa taken and razed.**

At this time also the Platæans, driven to the last extremity, surrendered to the Lacedemonians, by whom they were, to the number of 208, including 25 Athenians, put to death, and their women sold for slaves. Their city was soon after razed by their implacable enemies the Thebans, who left only an inn to show where it stood. The fame of Platæa, however, induced Alexander the Great afterwards to rebuild it.

125 **Sedition of Corcyra.**

In this year happened the famous sedition of Corcyra, whence other seditions, when their effects rendered them terrible, have been called *Corcyrian*. It hath been already observed, that the war between the Corcyrians and Corinthians brought on the general war throughout Peloponnesus. A great number of Corcyrians were in the beginning of this war carried away prisoners into Peloponnesus, where the chief of them were very well treated, but the rest sold for slaves. The reason of this conduct of the Corinthians was a design they had formed of engaging these Corcyrians to influence their countrymen to side with them and their allies. With this view they treated them with all imaginable lenity and tenderness, instilling into them by degrees an hatred of democratic government; after which they were told, that they might obtain their liberty upon condition of using all their influence at home in favour of the allies, and to the prejudice of Athens. This the Corcyrians readily promised, and endeavoured to perform. At first, those who were for an aristocracy prevailed, and murdered all those of the opposite party that fell into their hands, in which they were assisted by a fleet of Peloponnesians: but the Athenians sending first one fleet and then another to the assistance of the distressed party, the Peloponnesians were forced to withdraw; after which, the democratic party sufficiently revenged themselves, and destroyed their antagonists without mercy. The worst of all was, that, this example once set, the several states of Greece felt in their turns the like commotions, which were always heightened by agents from Sparta and Athens; the former endeavouring to settle aristocracy, and the latter democracy, wherever they came.

126 **Athenians engage in a war with Sicily.**

While the Athenians were thus engaged in a war wherein they were already overmatched, they foolishly engaged in a new one, which in the end proved more fatal than all the rest. The inhabitants, of Sicily were split into two factions; the one called the *Doric*, at the head of which was the city of Syracuse; the other the *Ionic*, which owned the Leontines for their chiefs: the latter perceiving themselves too weak without foreign aid, sent one Georgias, a celebrated orator, to apply to Athens for relief; and he by his fine speeches so captivated the giddy and inconstant Athenians, that they ran headlong into a war which they were unable to maintain, while engaged with all the Peloponnesians. Enticed by this new prospect, therefore, and grasping at the conquest of Sicily, as well as of all Greece, they sent a fleet to the assistance of the Leontines, under the command of Lachetes and Chabrias; and they were no sooner sailed, than another fleet for the same purpose was begun to be fitted out. All this time the plague continued to rage with great violence at Athens, cutting off this year 4000 citizens, besides a much greater number of the meaner sort of people.

127 **Sixth year.**

The sixth year of the Peloponnesian war was remarkable for no great exploit: Agis the son of Archidamus, king of Sparta, assembled an army in order to invade Attica, but was prevented from so doing by many great earthquakes which happened throughout Greece.

128 **Seventh year.** **Pylus fortified by the Athenians.**

The next year, however, he entered Attica with his army, while the Athenians on their part sent a fleet under the command of Demosthenes, to infest the coasts of Peloponnesus. As this fleet passed by Laconia, the commander took notice that the promontory of Pylus, which was joined to the continent by a narrow neck of land, had before it a barren island about two miles in circumference, in which, however, there was a good and safe port, all winds being kept off by the headland, or by the isle. These advantages made him apprehend, that a garrison left here would give the Peloponnesians so much trouble, that they would find it more adviseable to protect their own country than to invade that of their neighbours. Accordingly, having raised a strong fortification, he himself with five ships staid to defend it, while the rest of the fleet proceeded on their intended expedition.

129 **Besieged.**

On the news of this event, the Peloponnesian army immediately returned to besiege Pylus. When they arrived before the place they took possession of the harbour, and then caused a chosen body of Spartans to take possession of the island of Sphacteria, after which they attacked the fort with great vigour. Demosthenes and his garrison defended themselves with great valour; and an Athenian fleet arriving very seasonably, offered battle to the Peloponnesian fleet.

130 **Spartan fleet destroyed.**

This being refused, the Athenians boldly sailed into the harbour, broke and sunk most of the vessels therein, after which they besieged the Spartans in Sphacteria. The Peloponnesians now began to treat with their enemies, and a truce was concluded during the time that negociations were carried on at Athens. One of the articles of this truce was, that the Peloponnesians should deliver up all their ships, on condition of having them punctually returned in case the treaty did not take effect. The Athenians having heard the Spartan ambassadors, were inclined to put an end to this destructive war: but Cleon, one of their orators, a warm and obstinate man, persuaded his countrymen to insist on very unreasonable terms; upon which the ambassadors returned, and by so doing put an end to the truce.

131 **Treachery of the Athenians.**

The Peloponnesians then demanded their vessels; but the Athenians refused to deliver them, under pretence of their having broke the truce.

132 **They attack Sphacteria.**

Hostilities being thus recommenced on both sides, the Lacedemonians attacked the Athenians at Pylus, while the latter attacked the Spartans at Sphacteria. The Spartans, though but an handful of men and under every imaginable discouragement, behaved with such bravery, that the siege proceeded very slowly, so that the people of Athens became very uneasy.

133 **Cleon the orator appointed general.**

They began then to wish they had embracced the offers of the Spartans, and to rail vehemently against Cleon, who, to excuse himself, said, it would be easy for the general of the forces they were at that time sending, to attack the Spartans in the isle, and reduce them at once. Nicias, who had been appointed to this command, replied, that if Cleon believed he could do such great things, he

he would do well to go thither in person: the latter, imagining this only meant to try him, said he was ready to go with all his heart; whereby Nicias catched him, and declared that he had relinquished his charge. Cleon thereupon said, that he was no general: but Nicias told him that he might become one; and the people, pleased with the controversy, held the orator to his word. Cleon then advancing, told them he was so little afraid of the enemy, that, with a very inconsiderable force, he would undertake, in conjunction with those already at Pylus, to bring to Athens the Spartans
134 who gave them so much trouble in 20 days. The people laughed at these promises: however, they furnished him with the troops he desired; and to their surprise, Cleon brought the Spartans prisoners to Athens within the time appointed.

He takes the place.

135 This summer, likewise, an Athenian fleet was sent to Sicily, with instructions to put in at Corcyra, and assist the government against the Lacedemonian faction which still subsisted in that island. This they effectually performed; for by their means the exiles fell into the hands of the other party: these they imprisoned; and then drew them out by 20 at a time, to suffer death, which was inflicted with all the circumstances of cruelty that party-rage could suggest. When only 60 remained, they intreated the Athenians to put them to death, and not to deliver them up to their countrymen: but upon this the Corcyrians surrounded the place where they were confined, endeavouring to bury them under their darts; upon which the unhappy captives all put an end to their own lives.

End of the Corcyrian sedition.

136 In the eighth year Nicias reduced the isle of Cythera on the coast of Laconia; as likewise Thyræa, on the confines of that country. The latter had been given to the Æginetans when expelled from their own country by the Athenians: and they were now condemned to death, as inveterate enemies of the Athenian state and nation.—In Sicily, one Hermocrates of Syracuse persuaded all the inhabitants of the island to adjust their differences among themselves; upon which the Athenian generals returned home, and for so doing two of them were banished, and the third sentenced to pay a heavy fine.

Eighth year. Success of the Athenians.

The Athenians next laid siege to Megara under the conduct of Hippocrates and Demosthenes; but Brasidas a Spartan general coming to its relief, a battle en-
137 sued, by which, though neither party got the better, the Lacedemonian faction prevailed in Megara, and many who favoured the Athenians were forced to withdraw. After this, such as had been banished for adhering to the Lacedemonians were allowed to return, on their taking an oath to forget what was past, and attempt nothing that might disturb their country. As soon as they were settled, however, they forgot their oath; and causing 100 of those who were most obnoxious to be apprehended, forced the people to condemn them to death. They then changed the whole form of government, introduced an oligarchy, and possessed
138 themselves of the supreme power.

Spartan party prevails in Megara.

In Bœotia some commotions were raised in favour of the Athenians; but their generals Hippocrates and Demosthenes being defeated by the opposite party, all hopes ceased of the Athenian power being established in Bœotia. In the mean time Brasidas reduced the city of Amphipolis, which greatly alarmed the Athenians, who thereupon sent new supplies of men, money, and ships to the Macedonian coast; but all their care could not prevent a great desertion from their interest in those parts, where the valour and conduct of Brasidas carried all before him. 139

Athenians lose their power in Bœotia.

In the ninth year, the Spartans made new proposals of peace, which the Athenians were now more inclined to accept than formerly; and finding their affairs very much unsettled by the loss of Amphipolis, a truce for a year was quickly agreed on, while negociations were in the mean time carrying on for a general peace. This pacific scheme, however, was very soon overthrown by the following accident in Thrace. The city of Scione, and that of Menda, revolted to Brasidas; who, knowing nothing of the truce, sought to draw over Potidæa also. The Athenians, pretending that Scione revolted two days after the truce was concluded, made heavy complaints, asserting that this was a breach of the truce, and that both it and Menda should be restored to them. This not being effected by negociations, an army was sent against the two cities, by which Menda was reduced; but Scione making an obstinate defence, the siege was turned into a blockade. 140

Ninth year. A truce concluded and broken.

In the tenth year, Brasidas made an attempt upon Potidæa; which having failed, the Athenians began to recover some courage. The truce expiring on the day of the Pythian games, Cleon persuaded the Athenians to send an army into Thrace under his command. It consisted of 1200 foot and 300 horse, all Athenian citizens, who embarked on board 30 galleys. Brasidas had an army much inferior; but observing that the Athenian general was become careless, and neglected discipline, he attacked him. In this engagement Cleon was killed, and the Athenians defeated with the loss of 600 men, while the Spartans lost only seven; but among these was their great commander Brasidas, whose death affected them almost as much as the loss of their army did the Athenians. 141

Tenth year Cleon defeated and killed by Brasidas.

As the death of Cleon deprived the Athenians of one of their best speakers, and one who had been very industrious in promoting the war, they were now much more disposed than formerly to hearken to terms of accommodation. Amongst the Spartans, too, there was a party, at the head of whom was Plistonax their king, who earnestly wished for peace; and as Nicias laboured no less assiduously at Athens to bring about this desirable event, a peace was at last concluded for fifty years between the two nations. The conditions were, that a restitution of places and prisoners should be made on both sides; excepting that Nisœa should remain to the Athenians, who had taken it from the Megarians; and that Platæa should continue with the Thebans, because they absolutely would not give it up. The Bœotians, Corinthians, and Megarians, refused to be included in this peace: but the rest of the allies yielded to it; and it was accordingly ratified, receiving the name of the *Nician* peace, from Nicias who had so vigorously promoted it. 142

A fifty years peace

By this means, however, tranquillity was far from being restored. Such of the states of Peloponnesus as were dissatisfied, began immediately to league among themselves, and to set on foot a new confederacy, the head of which was to be the state of Argos. The Lacedemonians, too, found it impossible to perform exactly the articles of agreement; the city of Amphipolis in

New discontents.

in particular, absolutely refused to return under the Athenian government; for which reason the Athenians refused to evacuate Pylus. In the winter, new negociations were entered into on all sides, but nothing determined, and universal murmuring and discontent took place.

143 Heightened by Alcibiades.

These discontents were not a little heightened by Alcibiades, who now began to rival Nicias, and, perceiving the Lacedemonians made their court mostly to his rival, took all opportunities to incense his countrymen against that nation. Nicias, on the other hand, who wished for nothing so much as a peace, used all his endeavours to bring about a reconciliation. The artifices of Alcibiades, however, added to the turbulent and haughty disposition of both nations, rendered this impossible; so that though Nicias went on purpose to Sparta, he returned without doing any thing.

144 His measures for the safety of Attica.

Alcibiades having thus disposed every thing according to his wishes, and a war being inevitable, he began to take the most prudent methods for preserving his country in safety. With this view he entered into a league for 100 years with the Argives, which he hoped would keep the war at a distance: he next passed over into the territories of Argos, at the head of a considerable army; and laboured, both at that city and at Patræ, to persuade the people to build walls to the sea, so that they might the more easily receive assistance from the Athenians. But though great preparations for war were now made, nothing was undertaken this year; only the Argives thought to have made themselves masters of Epidaurus, but were hindered by the Lacedemonians putting a garrison into it.

145 Fourteenth year. War renewed.

The next year, (the 14th after the Peloponnesian war was first begun) a Spartan army, under the command of Agis, entered the territory of Argos where the confederate army lay; but just as the engagement was about to begin, a truce was suddenly concluded by two of the Argive generals and the king of Sparta. With this neither party was pleased, and both the king and generals were very ill treated by their citizens.

146 Athenians, &c. defeated at Mantinea.

On the arrival of some fresh troops from Athens, therefore, the Argives immediately broke the truce: but the allied army was soon after defeated with great slaughter by Agis; notwithstanding which, however, the Eleans and Athenians invested Epidaurus. In the winter, a strong party in Argos joined the Lacedemonians; in consequence of which that city renounced her alliance with Athens, and concluded one with Sparta for 50 years. In compliment to their new allies, also, the Argives abolished democracy in their city, establishing an aristocracy in its place, and assisted the Lacedemonians with a considerable body of troops to force the Sicyonians to do the same.

147 Fifteenth year.

In the beginning of the 15th year, the Argives, with a levity seemingly natural to all the Greeks, renounced their alliance with Sparta, abolished aristocracy, drove all the Lacedemonians out of the city, and renewed their league with Athens. The Athenians, in the mean time, being convinced of the treachery of Perdiccas king of Macedon, renounced their alliance with him, and declared war against him.

148 Sixteenth year. Melos reduced by the Athenians.

Next year Alcibiades terminated the disputes in the city of Argos, by the banishment of the Spartan faction; after which he sailed to the island of Melos, whose inhabitants had acted with the greatest inveteracy against his countrymen: perceiving, however, that the reduction of the island would be a work of time, he left a considerable body of forces there, and returned to Athens. In his absence the capital of Melos surrendered at discretion, and the inhabitants were treated with the utmost cruelty; all the men capable of bearing arms being slaughtered, and the women and children carried into captivity.

149 Seventeenth year. Athenian army in Sicily lost, and Alcibiades flies to Sparta.

In the beginning of the 17th year, Nicias was appointed commander of an expedition against the Syracusans, along with Alcibiades and Lamachus as colleagues. But while the necessary preparations were making, all things were thrown into confusion by the defacing of the Hermæ, or statues of Mercury, of which there was a great number in the city. The authors of this sacrilege could by no means be discovered, though rewards were offered for this purpose; at last the suspicion fell upon Alcibiades; and for this weighty reason he was commanded to return from Sicily to take his trial. Alcibiades, however, knew the temper of his countrymen too well to trust himself to their mercy; and therefore, instead of returning to Athens, he fled immediately to Sparta, where he met with a gracious reception; while the infatuated Athenians were severely punished by the loss of their armies, generals, and fleet, in Sicily, which the superior abilities of Alcibiades would in all probability have prevented.

150 Nineteenth and twentieth years, &c.

The 19th and 20th years of the war were spent by the Athenians in equipping a new fleet in order to repair their vast losses: but Alcibiades hurt their interests very much, by persuading Tissaphernes the Persian to league with the Spartans against them; at the same time he persuaded several of the Ionian states to revolt from Athens, but they were in a short time obliged again to submit.

151 Alcibiades flies to Persia.

Notwithstanding all these services, however, Alcibiades had rendered himself so hateful to Agis by debauching his wife, that he soon found himself obliged to fly to the Persians, where Tissaphernes gave him a very favourable reception, and profited much by his advice, which was to let the Greeks weaken one another by their mutual wars, and that the Persians ought never to see one state totally destroyed, but always to support the weaker party.

152 Proposes the abolition of democracy at Athens.

When Tissaphernes had acquiesced with these counsels, Alcibiades privately wrote to some of the officers in the Athenian army at Samos, that he had been treating with the Persians in behalf of his countrymen, but did not choose to return till the democracy should be abolished; and to incline the citizens to comply with this measure, he told them that the Persian king disliked a democracy, but would immediately assist them if that was abolished, and an oligarchy erected in its stead.

On the arrival of Pisander and other deputies from the army, with the proposals of Alcibiades, the Athenians without hesitation resolved to overturn that democracy which they had all along so strenuously defended. The issue of their present debates was, that Pisander with ten deputies should return to Alcibiades, in order to know on what terms the king of Persia would make an alliance with them; but that cunning Athenian having perceived that Tissaphernes was by no means disposed to assist the Athenians on account of their having been lately successful, he set up such high demands in the king of Persia's name, that the Athenians of themselves broke off the treaty, and

and thus Alcibiades preserved the friendship of both parties.

Pisander having engaged the army at Samos in his scheme of overturning democracy, that form of government was abolished first in the cities subject to Athens, and lastly in the capital itself. Pisander's new scheme was, That the old form of government should be totally dissolved: that five prytanes should be elected: that these five should choose 100; and that each of the hundred should choose three: that the 400 thus elected should become a senate with full power; but should occasionally consult with 5000 of the most wealthy citizens, who should thenceforward be esteemed only *the people;* and that no authority should remain with the lowest class. Though the people were not very fond of this change, those who conducted it, being men of great parts found means to establish it by force; for when the people were gone out of the city to their ordinary employments, the 400, having each a dagger concealed under his vest, attended by a guard of 120 men, entered the senate-house, dissolved the old senate, and without ceremony turned them out; after which the commons, not knowing whom to submit to, or to whom to apply, made no opposition.

153 New form of government established.

The first step of the new governors was to destroy all their enemies; who, however, were not very numerous, so that little blood was shed. They next sent ambassadors to Agis to sue for peace; but he, taking for granted that the Athenians would never defend an oligarchy, gave no answer to the ambassadors, but immediately marched towards the capital with a design to attack it. On his arrival, however, he was quickly convinced of his mistake, being repulsed with loss, and obliged to retire to his old post.

154 The army declare for democracy, and recall Alcibiades.

In the mean time the Athenian army declared again for a democracy, and having recalled Alcibiades, invested him with full power, and insisted on his immediate return to Athens to restore the ancient government. This measure he refused to comply with, and persuaded them to stay where they were, in order to save Ionia: he also prevailed on them to allow some deputies, who had been sent from the new governors of Athens, to come and deliver their message. To these deputies Alcibiades replied, that they should immediately return to Athens, and acquaint the 400, that they were commanded immediately to resign their power and restore the senate; but that the 5000 might retain theirs, provided they used it with moderation.

155 Great confusion at Athens.

By this answer the city was thrown into the utmost confusion; but the new government party prevailing, ambassadors were dispatched to Sparta with orders to procure peace on any terms. This, however, was not to be effected; and Phrynicus, the head of the embassy, and likewise of the new government party, was murdered on his return. After his death, Theramenes the head of the other party, seized the chiefs of the 400; upon which a tumult ensued that had almost proved fatal to the city itself. The mob, however, being at last dispersed, the 400 assembled, though in great fear, and sent deputies to the people, promising to set all things to rights. In consequence of this deputation, a day was appointed for convoking a general assembly, and settling the state; but when that day came, news was brought that the Lacedemonian fleet appeared in view, and steered directly for Salamis. Thus all was again thrown into confusion; for the people, instead of deliberating on the subject proposed, ran in crowds down to the port, and perceiving the Spartans made towards Euboea, a fleet of 36 ships was immediately dispatched under the command of Thymochares, to engage the enemy. This fleet was utterly defeated, 22 of the Athenian ships being taken, and most of the others sunk or disabled; but what was worse, this defeat was followed by the revolt of all the country of Euboea except Orcus.

156 Athenian fleet destroyed by the Spartans.

When these dismal tidings arrived at Athens, every thing was given up for lost; and had the Lacedemonians taken this opportunity of attacking the city, they had undoubtedly succeeded, and thus put an end to the war: but being at all times slow, especially in naval affairs, they gave the Athenians time to equip a new fleet, and to retrieve their affairs. One good effect of this disaster, however, was the putting an end for a time to the internal dissensions of this turbulent people; insomuch that Thucydides the historian is of opinion, that the republic never enjoyed so much quiet as at this time.

157 Exploits of Alcibiades.

Alcibiades now showed his abilities and inclination to serve his country in an eminent manner. By his intrigues he so effectually embroiled the Persians and Peloponnesians with each other, that neither party knew whom to trust. Thrasybulus, with 55 ships, gained a victory over the Peloponnesian fleet consisting of 73: after which he took 8 galleys coming from Byzantium; which city had revolted from the Athenians, but was soon after taken, and the inhabitants severely fined. The fleet being afterwards joined by Alcibiades, nine more of the Peloponnesian galleys were taken, the Halicarnassians were constrained to pay a large sum of money, and Cos was strongly fortified; which transactions ended the 21st year of the Peloponnesian war.

In the succeeding years of this famous war, the Athenians had at first great advantages. Thrasybulus gained a signal victory at sea; and Alcibiades gained two victories, one by sea and another by land, in one day, took the whole Peloponnesian fleet, and more spoil than his men could carry away. The Spartans were now humbled in their turn, and sued for peace; but the Athenians were so intoxicated with their success, that they sent back the ambassadors without an answer; which they soon had sufficient reason to repent of. The beginning of the Athenians misfortunes was the taking of Pylus by the Spartans. The Athenians had sent a fleet under the command of one Anytus to its defence: but he was driven back by contrary winds; upon which he was condemned to death, because he could not cause the wind blow from what quarter he pleased: this sentence, however, was remitted on his paying a vast sum of money. This misfortune was quickly followed by another. The Megarians surprised Nisaea; which enraged the Athenians so much, that they immediately sent an army into that country, who defeated the Megarians who opposed them, with great slaughter, and committed horrid devastations.

158 The Spartans sue for peace.

159 They take Pylus.

These misfortunes as yet, however, were overbalanced by the great actions of Alcibiades, Thrasybulus, and

Attica.

and Theramenes. When Alcibiades returned, he

160 Alcibiades enters Athens in triumph.

brought with him a fleet of 200 ſhips, and ſuch a load of ſpoils as had never been ſeen in Athens ſince the concluſion of the Perſian war. The people left their city deſtitute, that they might crowd to the port, to behold Alcibiades as he landed; old and young bleſſed him as he paſſed; and the next day when he made a harangue to the aſſembly, they directed the record of his baniſhment to be thrown into the ſea, abſolved him from the curſes he lay under, and created him general with full power. Nor did he ſeem inclined to indulge

161 He is diſgraced.

himſelf in eaſe, but ſoon put to ſea again with a fleet of 100 ſhips. He had not been long gone, however, before all this was forgot. Alcibiades ſailed to the Helleſpont with part of his fleet, leaving the reſt under the command of Antiochus his pilot, but with ſtrict orders to attempt nothing before his return. This command the pilot paid no regard to, but provoked Lyſander the Lacedemonian admiral to an engagement, and in conſequence of his temerity was defeated with the loſs of 15 ſhips, himſelf being killed in the engagement. On the news of this defeat Alcibiades returned, and endeavoured to provoke the Lacedemonians to a ſecond battle: but this Lyſander prudently declined; and in the mean time the Athenians, with unparalleled ingratitude and inconſtancy, deprived Alcibiades of his command, naming ten new generals in his room.

162 The Athenians gain a great victory and put ſix of their generals to death.

This was the laſt ſtep the Athenians had to take for perfecting their ruin. Conon, who ſucceeded to the command, was defeated by Callicratidas Lyſander's ſucceſſor; but being afterwards ſtrongly reinforced, the Lacedemonians were entirely defeated with the loſs of 77 ſhips. Such a victory might at this time have inſpired the Athenians with ſome kind of gratitude towards the generals who gained it: but inſtead of this, on pretence of their not having aſſiſted the wounded during the engagement, eight of them were recalled; two were wiſe enough not to return; and the ſix who truſted to the juſtice of their country were all put to death.

163 They are utterly defeated by Lyſander;

The next year Lyſander was appointed commander of what fleet the Peloponneſians had left, with which he took Thaſus and Lampſacus. Conon was diſpatched againſt him with 180 ſhips, which being greatly ſuperior to Lyſander's fleet, that general refuſed to come to an engagement, and was blocked up in the river Ægos. While the Athenians lay there, they grew quite idle and careleſs; inſomuch that Alcibiades, who had built a caſtle for himſelf in the neighbourhood, intreated them to be more on their guard, as he well knew Lyſander's abilities. They anſwered, that they wondered at his aſſurance, who was an exile and a vagabond, to come and give laws to them; telling him, that if he gave them any farther trouble, they would ſeize and ſend him to Athens. At the ſame time they looked on victory as ſo certain, that they conſulted what they ſhould do with their priſoners; which, by the advice of Philocles their general, was, to cut off all their right hands, or according to Plutarch, their right thumbs; and Adiamantus one of their officers rendered himſelf very obnoxious by ſaying, that ſuch idle diſcourſe did not become Athenians. The conſequences of ſuch conduct may be eaſily imagined. Lyſander fell unexpectedly upon them, and gained a moſt complete victory; Conon, with eight galleys only, eſcaping to Cyprus; after which Lyſander returned to Lampſacus, where he put to death Philocles with 3000 of his ſoldiers, and all the officers except Adiamantus. This execution being over, he reduced all the cities ſubject to Athens; and with great civility ſent home their garriſons, that ſo the city might be overſtocked with inhabitants, and deſtitute of proviſions, when he came to beſiege it; which he did ſoon after by ſea, while Agis with a great army inveſted it by land.

164 Who takes Athens.

For a long time the Athenians did not ſo much as deſire a peace; but at laſt were forced to ſend deputies to Agis, who ſent them to Sparta, where no terms could be granted except they conſented to demoliſh their walls. They next ſent to Lyſander, who after a long attendance referred them to Sparta; and thither Theramenes with ſome other deputies was immediately ſent. On their arrival, they found the council of the confederates ſitting, who all except the Spartans gave their votes that Athens ſhould be utterly deſtroyed; but they would not conſent to the ruin of that city,

165 Terms of peace.

which had deſerved ſo well of Greece. On the return of Theramenes, peace was concluded, on condition, that the long walls and the fortifications of the port ſhould be demoliſhed; that they ſhould give up all their ſhips but 12, receive all they had baniſhed, and follow the fortune of the Lacedemonians. Theſe ſevere terms were punctually executed. Lyſander cauſed the walls to be pulled down; all the muſic in his army playing, on that very day of the year on which they had beat the Perſians at Salamine. He likewiſe eſtabliſhed an oligarchy expreſsly againſt the will of the people; and thus the ruin of Athens ended the 27th year of the Peloponneſian war, and the 404th before Chriſt.

166 The thirty tyrants.

As ſoon as Lyſander had demoliſhed the long walls, and the fortifications of the Piræum, he conſtituted a council of thirty, with power, as was pretended, to make laws, but in truth to ſubjugate the ſtate. Theſe are the perſons ſo famous in hiſtory, under the title of *the thirty tyrants*. They were all the creatures of Lyſander; who, as they derived their riſe from conqueſt and the law of the ſword, exerciſed their offices in a ſuitable manner; that is, with the higheſt teſtimonies of pride, inſolence, and cruelty. Inſtead of making laws, they governed without them; appointed a ſenate and magiſtrates at their will; and, that they might do all things without danger of controul, they ſent for a garriſon from Lacedemon; which was accordingly granted them, under the command of Callidius, upon their promiſe to pay the ſoldiers regularly. One of the firſt ſteps they took was to puniſh all informers; which, though ſevere, was popular: but when, through flattery and bribes, they had wholly drawn over Callidius to their party, they ſuffered bad men to live in quiet, and turned their rage againſt the good.

167 Critias and Theramenes, their oppoſite characters.

Critias and Theramenes were at the head of the thirty, men of the greateſt power and abilities in Athens. The former was ambitious and cruel without meaſure; the latter was ſomewhat more merciful: the former puſhed on all the bloody ſchemes framed by his confederates, and carried into execution many of his own; the latter always oppoſed them, at firſt with moderation, at laſt with vehemence. He ſaid, that power was given them to rule, and not to ſpoil, the com-

Attica.

commonwealth; that it became them to act like shepherds, not like wolves; and that they ought to beware of rendering themselves at once odious and ridiculous, by attempting to domineer over all, being such a handful of men as they were. The rest, disliking much the former part of his discourse, catched hold of the latter, and immediately chose out 3000, whom they made the representatives of the people, and to whom they granted this notable privilege, that none of them should be put to death but by the judgment of the senate, thereby openly assuming a power of putting any other of the Athenian citizens to death by their own authority. A glorious use they made of this new-assumed privilege; for as many as they conjectured to be no friends to the government in general, or to any of themselves in particular, they put to death, without cause, and without mercy. Theramenes openly opposing this, and absolutely refusing to concur in such measures, Critias accused him to the senate as a man of unsteady principles, sometimes for the people, sometimes against them, always for new things and state-revolutions. Theramenes owned, that he had sometimes changed his measures, but alledged that he had always done it to serve the people. He said that it was solely with this view he made the peace with Sparta, and accepted the office of one of the thirty: that he had never opposed their measures while they cut off the wicked; but when they began to destroy men of fortune and family, then he owned he had differed with them, which he conceived to be no crime against the state.

168 Theramenes put to death.

While Theramenes was speaking, Critias withdrew, perceiving that the senate were thoroughly convinced of the truth of what Theramenes had said: but he quickly returned with a guard, crying out, that he had struck Theramenes's name out of the list of the 3000; that the senate had therefore no longer cognizance of the cause, which the thirty had already judged, and condemned him to death. Theramenes perceiving that they intended to seize him, fled to the altar, which was in the midst of the senate-house, and laying his hands thereon, said, "I do not seek refuge here because I expect to escape death or desire it; but that, tearing me from the altar, the impious authors of my murder may interest the gods in bringing them to speedy judgment, and thereby restore freedom to my country." The guards then dragged him from the altar, and carried him to the place of execution, where he drank the poison with undaunted courage, putting the people in mind with his last breath, that as they had struck his name out of the 3000, they might also strike out any of theirs. His death was followed by a train of murders, so that in a short time 60 of the worthiest and most eminent citizens of Athens fell by the cruelty of the thirty. Amongst these, the most pitied was Niceratus the son of Nicias; a man universally beloved for his goodness, and universally admired for his virtues. As for the Spartans, they, losing their former generosity, were extremely pleased with these things, and by a public decree commanded that such as fled from the thirty tyrants should be carried back bound to Athens: which extraordinary proceeding frightened all Greece; but the Argives and Thebans only had courage to oppose it: the former received the Athenian exiles with humanity and kindness; the latter punished with a mulct such of their citizens as did not rise and rescue the Athenian prisoners, who in pursuance of the Lacedemonian decree were carried bound through their territories.

Thrasybulus, and such as with him had taken shelter in the Theban territory, resolved to hazard every thing, rather than remain perpetual exiles from their country; and though he had but 30 men, on whom he could depend, yet considering the victories he had heretofore obtained in the cause of his country he made an irruption 169
into Attica, where he seized Phyla, a castle at a very small distance from Athens, where in a very short space his forces were augmented to 700 men; and though the tyrants made use of the Spartan garrison in their endeavours to reduce him and his party, yet Thrasybulus prevailed in various skirmishes, and at last obliged them to break up the blockade of Phyla, which they had formed. The thirty and their party conceiving it very advantageous for them to have the possession of Eleusina, marched thither, and having persuaded the people to go unarmed out of their city, that they might number them, took this opportunity most inhumanly to murder them. The forces of Thrasybulus increasing daily, he at length possessed himself of the Piræum, which he fortified in the best manner he could; but the tyrants being determined to drive him from thence, came down against him with the utmost force they could raise. Thrasybulus defended himself with great obstinacy; and in the end they were forced to retreat, having lost before the place not only a great 170
number of their men, but Critias the president of the thirty, another of the same body, and one who had been a captain of the Piræum.

Thrasybulus seizes Phyla.

Critias killed.

When they came to demand the dead from Thrasybulus, in order for their interment, he caused a crier he had with him to make a short speech in a very loud voice to the people, intreating them to consider, that as they were citizens of Athens without, so those against whom they fought, and those who fought to preserve themselves within the fort, were Athenian citizens also; wherefore, instead of thinking how to ruin and destroy their brethren, they ought rather to consult how all differences ought to be composed, and especially ought to rid themselves of those bloody tyrants, who, in the short time they had had the administration in their hands, had destroyed more than had fallen in the Peloponnesian war. The people, though moved by these discourses, differed among themselves; the consequence of 171
which was, that they expelled the thirty, and chose ten men out of each tribe to govern in their stead, whereupon the tyrants retired to Eleusina. The citizens, however, though they changed the government, made no agreement with those in the Piræum; but sent away deputies to Sparta, as did also the tyrants from Eleusina, complaining, that the Athenians had revolted, and desiring their assistance to reduce them. The Spartans 172
sent thereupon a large sum of money to encourage their confederates, and appointed Lysander commander in chief, and his brother to be admiral; resolving to send sea and land forces to reduce Athens a second time; intending, as most of the Greek states suspected, to add it now to their own dominions. It is very probable that this design of theirs would have taken effect, if Pausanias king of Sparta, envying Lysander, had not resolved to obstruct it. With this view, he procured another army to be raised against the Athenians,

The tyrants expelled.

Attempt of the Spartans to reduce Athens a second time.

nians, of which himſelf had the command, and with which he marched immediately to beſiege the Piræum. While he lay before the place, and pretended to attack it, he entered into a private correſpondence with Thraſybulus, informing him what propoſitions he ſhould make in order to force the Lacedemonians, who were ſuſpected by their allies, to grant them peace.

173 How fruſtrated.

The intrigues of Pauſanias had all the ſucceſs he could wiſh. The Ephori who were with him in the camp concurred in his meaſures, ſo that in a ſhort ſpace a treaty was concluded on the following terms: That all the citizens of Athens ſhould be reſtored to their houſes and privileges, excepting the thirty, the ten which had ſucceeded them and who had acted no leſs tyrannically than they, and the eleven who during the time of the oligarchy had been conſtituted governors or keepers of the Piræum; that all ſhould remain quiet for the future in the city; and that if any were afraid to truſt to this agreement, they ſhould have free leave to retire to Eleuſina. Pauſanias then marched away with the Spartan army, and Thraſybulus at the head of his forces marched into Athens, where, having laid down their arms, they ſacrificed with the reſt of the citizens in the temple of Minerva, after which the popular government was reſtored. Yet quiet was not thoroughly eſtabliſhed. The exiles at Eleuſina having endeavoured by the help of money to raiſe an army of foreigners, by whoſe aid they might recover the authority they had loſt: but firſt depending on their friends in the city, they ſent ſome of the principal perſons amongſt them as deputies, to treat with the citizens; but ſtrictly inſtructed them to ſow jealouſies and excite diſcords among them. This the latter quickly perceiving, put theſe perſons to death; and then remonſtrating to thoſe at Eleuſina, that theſe contentions would undoubtedly end either in their own or the deſtruction of their country, they offered immediately to paſs an act of oblivion, which they would confirm with an oath.

This being accepted, thoſe who had withdrawn returned to the city, where all differences were adjuſted, and both parties moſt religiouſly obſerved the agreement they had made, and thereby thoroughly reſettled the ſtate.

174 Virtue of Thraſybulus.

In this whole tranſaction, the virtue of Thraſybulus deſerves chiefly to be admired. When he firſt ſeized the caſtle of Phyla, the tyrants privately offered to receive him into their number inſtead of Theramenes, and to pardon at his requeſt any 12 perſons he ſhould name: but he generouſly anſwered, That his exile was far more honourable than any authority could be, purchaſed on ſuch terms; and by perſiſting in his deſign, accompliſhed, as we have ſeen, the deliverance of his country. A glorious deliverance it was; ſince, as Iſocrates informs us, they had put 1400 citizens to death contrary to and without any form of law, and driven 5000 more into baniſhment; procuring alſo the death of Alcibiades, as many think, tho' at a great diſtance from them.

From this time to the reign of Philip of Macedon, the Athenians continued in a pretty proſperous ſituation, though they never performed any ſuch great exploits as formerly. By that monarch and his ſon Alexander all Greece was in effect ſubdued; and the hiſtory of all the Grecian ſtates from that time becomes much leſs intereſting. Of the hiſtory of Athens from that time to the preſent, the following elegant abridgment is given by Dr Chandler†. "On the death of Alexander, the Athenians revolted, but were defeated by Antipater, who gariſoned Munychia. They rebelled again, but the garriſon and oligarchy were reinſtated. Demetrius the Phalerean, who was made governor, beautified the city, and they erected to him 360 ſtatues; which on his expulſion they demoliſhed, except one in the Acropolis. Demetrius Poliorcetes withdrew the garriſon, and reſtored the democracy; when they deified him, and lodged him in the Opiſthodomos or the back part of the Parthenon, as a gueſt to be entertained by their goddeſs Minerva. Afterwards they decreed, that the Piræus, with Munychia, ſhould be at his diſpoſal; and he took the Muſeum. They expelled his garriſon, and he was perſuaded by Craterus a philoſopher to leave them free. Antigonus Gonatas, the next king, maintained a garriſon in Athens: but, on the death of his ſon Demetrius, the people, with the aſſiſtance of Aratus, regained their liberty; and the Piræus, Munychia, Salamis, and Sunium, on paying a ſum of money.

† *Travels in Greece*, p. 28, &c.

175 Hiſtory of Athens from the time of Alexander the Great to the preſent.

"Philip, ſon of Demetrius, encamping near the city, deſtroying and burning the ſepulchres and temples in the villages, and laying their territory waſte, the Athenians were reduced to ſolicit protection from the Romans and to receive a garriſon, which remained until the war with Mithridates king of Pontus, when the tyrant Ariſtion made them revolt.

176 Athens beſieged and taken by Sylla.

"Archelaus the Athenian general, unable to withſtand the Roman fury, relinquiſhed the *long walls*, and retreated into the Piræus and Munychia. Sylla laid ſiege to the Piræus and to the city, in which Ariſtion commanded. He was informed that ſome perſons had been overheard talking in the Ceramicus, and blaming Ariſtion for his neglect of the avenues about the Heptachalcos, where the wall was acceſſible. Sylla reſolved to ſtorm there, and about midnight entered the town at the gate called *Dypylon* or *the Piræan*; having levelled all obſtacles in the way between it and the gate of the Piræus. Ariſtion fled to the Acropolis, but was compelled to ſurrender by the want of water; when he was dragged from the temple of Minerva, and put to death. Sylla burned the Piræus and Munychia, and defaced the city and ſuburbs not ſparing even the ſepulchres."

The civil war between Cæſar and Pompey ſoon followed, and their natural love of liberty made them ſide with Pompey. Here again they were unfortunate, for Cæſar conquered. But Cæſar did not treat them like Sylla, with that clemency which made ſo amiable a part of his character, he dimiſſed them by a fine alluſion to their illuſtrious anceſtors, ſaying, that he ſpared the living for the ſake of the dead.

Another ſtorm followed ſoon after this; the wars of Brutus and Caſſius with Auguſtus and Antony. Their partiality for liberty did not here forſake them: they took part in the conteſt with the two patriot Romans, and erected there ſtatues near their own ancient deliverers Harmodious and Ariſtogiton, who had ſlain Hipparchus. But they were ſtill unhappy, for their enemies triumphed.

"They next joined Antony, who gave them Ægina and Cea, with other iſlands. Auguſtus was unkind to them; and they revolted four years before he died. Under Tiberius the city was declining, but free, and regarded as an ally of the Romans. The high privi-

Attica. lege of having a lictor to precede the magistrates was conferred on it by Germanicus; but he was censured as treating with too much condescension a mixture of nations instead of genuine Athenians, which race was then considered as extinct.

"The emperor Vespasian reduced Achaia to a province paying tribute and governed by a proconsul. Nerva was more propitious to the Athenians; and Pliny, under Trajan his successor, exhorts Maximus to be mindful whether he was sent, to rule genuine Greece, a state composed of free cities. 'You will revere the gods and heroes their founders. You will respect their pristine glory, and even their age. You will honour them for the famous deeds, which are truly, nay for those which are fabulously recorded of them. Remember, it is Athens you approach.' This city was now entirely dependent on Rome, and was reduced to sell Delos and the islands in its possession.

"Hadrian, who was at once emperor and an archon of Athens, gave the city laws, compiled from Draco, Solon, and the codes of other legislators; and displayed his affection for it by unbounded liberality. Athens reflourished, and its beauty was renewed. Antoninus Pius who succeeded, and Antoninus the Philosopher, were both benefactors.

The barbarians of the north, in the reign of Valerian, besieging Thessalonica, all Greece was terrified, and the Athenians restored their city-wall, which had been dismantled by Sylla, and afterwards neglected.

"Under the next emperor, who was the archon Gallienus, Athens was besieged, the archontic office ceased; and the Strategus or general, who had before acted as overseer of the agora or market, then became the supreme magistrate. Under Claudius his successor, the city was taken, but soon recovered.

"It is related, that Constantine, when emperor, gloried in the title of *general of Athens*; and rejoiced exceedingly on obtaining from the people the honour of a statue with an inscription, which he acknowledged by a yearly gratuity of many bushels of grain. He conferred on the governor of Attica and Athens the title of *grand duke* μεγας δουξ. That office was at first annual, but afterwards hereditary. His son Constans bestowed several islands on the city, to supply it with corn.

"In the time of Theodosius the First, 380 years after Christ, the Goths laid waste Thessaly and Epirus; but Theodore, general of the Achæans, by his prudent conduct preserved the cities of Greece from pillage, and the inhabitants from being led into captivity. A statue of marble was erected to him at Athens by order of the city; and afterwards one of brass, by command of the emperor, as appears from an inscription in a church dedicated to a saint of the same name, not far from the French convent. It is on a round pedestal, which supports a flat stone serving for the holy table. Eudocia the wife of Theodosius the second was an Athenian.

177 By Alaric the Goth.

"The fatal period now approached, and Athens was about to experience a conqueror more savage even than Sylla. This was Alaric king of the Goths; who under the emperors Arcadius and Honorius, over-ran Greece and Italy, sacking, pillaging, and destroying. Then the Peloponnesian towns were overturned, Arcadia and Lacedemon were laid waste, the two seas by the Isthmus were burnished with the flames of Corinth, and the Athenian matrons were dragged in chains by barbarians. The invaluable treasures of antiquity, it is related, were removed; the stately and magnificent structures converted into piles of ruin; and Athens was stripped of every thing splendid or remarkable. Synesius a writer of that age, compares the city to a victim, of which the body had been consumed, and the hide only remained.

"After this event, Athens became an unimportant place, and as obscure as it once had been famous. We read that the cities of Hellas were put into a state of defence by Justinian, who repaired the walls, which at Corinth had been subverted by an earthquake, and at Athens and in Bœotia were impaired by age: and here we take a long farewel of this city. A chasm of near 700 years ensues in its history, except that, about the year 1130, it furnished Roger the first king of Sicily with a number of artificers, whom he settled at Palermo, where they introduced the culture of silk, which then passed into Italy. The worms had been brought from India into Constantinople in the reign of Justinian.

"Athens as it were, re-emerges from oblivion in the 13th century, under Baldwin, but besieged by a general of Theodorus Lascaris, the Greek emperor. It was taken in 1427 by Sultan Morat. Boniface, marquis of Montferrat, possessed it with a garrison; after whom it was governed by Delves, of the house of Arragon. On his death, it was seized, with Macedonia, Thessaly, Bœotia, Phocis, and the Peloponnesus, by Bajazet; and then, with the island Zante, by the Spaniards of Catalonia in the reign of the Greek emperor Andronicus Palæologus the elder. These were dispossessed by Reinerius Acciaioli, a Florentine; who, leaving no legitimate male issue, bequeathed it to the state of Venice. His natural son, Antony, to whom he had given Thebes with Bœotia, expelled the Venetians. He was succeeded in the dukedom by his kinsman Nerius, who was displaced by his own brother named *Antony*, but recovered the government when he died. Nerius leaving only an infant son, was succeeded by his wife. She 178
By the Turks.
was ejected by Mahomet on a complaint from Francus son of the second Antony, who confined her at Megara and made away with her; but her son accusing him to Mahomet the Second, the Turkish army under Omar advanced, and he surrendered the citadel in 1455; the Latins refusing to succour him unless the Athenians would embrace their religious tenets. Mahomet, it is related, when he had finished the war with the despot of the Morea, four years after, surveyed the city and Acropolis with admiration. The janizaries informed him of a conspiracy; and Francus Acciaioli, who remained lord of Bœotia, was put to death. In 1464 the Venetians landed at the Piræus, surprised the city, and carried off their plunder and captives to Eubœa.

"It is remarkable, that after these events Athens was again in a manner forgotten. So lately as about the middle of the 16th century, the city was commonly believed to have been utterly destroyed, and not to exist, except a few huts of poor fishermen. Crusius, a learned and inquisitive German, procured more authentic information from his Greek correspondents residing in Turky, which he published in 1584, to awaken curiosity and to promote farther discoveries. One of these letters is from a native of Nauplia, a town near Argos in

Attica.

in the Morea. This writer says, that he had been often at Athens, and that it still contained many things worthy to be seen, some of which he enumerates, and then subjoins: "But why do I dwell on this place? It is as the skin of an animal that has been long dead."

It now remains to give some idea of the character, government, and religion of this once so famous people.

179 Character of the ancient Athenians.

The Athenians, says Plutarch, are very subject to violent anger; but they are soon pacified. They are likewise easily impressed with humanity and compassion. That this was their temper, is proved by many historical examples. We shall produce a few. The sentence of death pronounced against the inhabitants of Mitylene, and revoked the next day: The condemnation of Socrates, and that of the ten chiefs, each followed by quick repentance and most pungent grief.

The minds of the same people adds Plutarch, are not formed for laborious researches. They seize a subject, as it were by intuition; they have not patience and phlegm enough to examine it gradually and minutely. This part of their character may seem surprising and incredible. Artisans, and and other people of their rank, are in general slow of comprehension. But the Athenians of every degree were endowed with an inconceivable vivacity, penetration, and delicacy of taste. Even the Athenian soldiers could repeat the fine passages of the tragedies of Euripides. Those artisans and those soldiers assisted at public debates, were bred to political affairs, and were equally acute in apprehension and in judgment. We may infer the understanding of the hearers of Demosthenes from the genius of his orations, which were laconic and poignant.

As their inclination, continues Plutarch, leads them to assist and support people of low condition, they like discourse seasoned with pleasantry, and productive of mirth. The Athenians patronize people of low degree; because from them their liberty is in no danger, and because such patronage tends to support a democratical constitution. They love pleasantry; which turn of mind proves that they are a humane social people, who have a taste for raillery and wit, and are not soured with that reserve which marks the despot or the slave.

They take pleasure in hearing themselves praised; but they can likewise patiently bear raillery and censure. We know with what art and success Aristophanes and Demosthenes applied their praise and their irony to the Athenian people. When the republic enjoyed peace, says the same Plutarch in another place, it encouraged the adulation of its orators: but when it had important affairs to discuss, when the state was in danger, it became serious; and preferred, to its eloquent sycophants, the honest orators who opposed its follies and its vices: such ingenious and bold patriots as a Pericles, a Phocion, and a Demosthenes.

The Athenians, continues Plutarch, often make their governors tremble, and show great humanity to their enemies. They were very attentive to the information and instruction of those citizens who were most eminent for their policy and eloquence; but they were on their guard against the superiority of their talents; they often checked their boldness, and repressed their exuberant reputation and glory. That this was their temper, we are convinced by the ostracism; which was established to restrain the ambition of those who had great talents and influence, and which spared neither the greatest nor the best men. The detestation of tyranny and tyrants, which was inherent in the Athenians, rendered them extremely jealous of their privileges, made them zealous and active in defence of their liberty, whenever they thought it was violated by men in power.

As to their enemies, they did not treat them with rigour. They did not abuse victory by a brutal inhumanity to the vanquished. The act of amnesty, which they passed after the usurpation of the 30 tyrants, proves that they could easily forgive injuries. It was this mildness, this humanity of disposition, which made the Athenians so attentive to the rules of politeness and decorum. In their war with Philip, having seized one of his couriers, they read all the letters he bore, except one from Olympias to her husband, which they sent back unopened. Such was their veneration of love and conjugal secrecy; those sacred rights, which no enmity, no hostility, warrants us to violate!

The views of conquest cherished by a small republic, were extensive and astonishing; but this people, so great so ambitious in their projects, were, in other respects, of a different character. In the expences of the table, in dress, in furniture, in houses, in short, in private life, they were frugal, simple, modest, poor; but sumptuous and magnificent whenever the honour of the state was concerned. Their conquests, their victories, their riches, their connections with the inhabitants of Asia Minor, never reduced them to luxury, to riot, to pomp, to profusion. Xenophon remarks, that a citizen was not distinguished from a slave by his dress. The wealthiest citizen, the most renowned general, was not ashamed, to go himself to market.

The taste of the Athenians, for all the arts and sciences, is well known. When they had delivered themselves from the tyranny of Pisistratus, and after this had defeated the vast efforts of the Persians, they may be considered as at the summit of their national glory. For more than half a century afterwards they maintained, without controul, the sovereignty of Greece; and that ascendant produced a security, which left their minds at ease, and gave them leisure to cultivate every thing liberal or elegant. It was then that Pericles adorned the city with temples, theatres, and other beautiful public buildings. Phidias, the great sculptor, was employed as his architect, who, when he had erected edifices, adorned them himself; and added statues and basso-relievo's, the admiration of every beholder. It was then that Polignotus and Myro painted; that Sophocles and Euripides wrote; and not long after, that they saw the divine Socrates.

Human affairs are, by nature, prone to change; and states, as well as individuals, are born to decay. Jealousy and ambition insensibly fomented wars, and success in these wars, as in others, was often various. The military strength of the Athenians was first impaired by the Lacedemonians; after that, it was again hu-

humiliated, under Epaminondas, by the Thebans: and last of all it was wholly crushed by the Macedonian, Philip.

Nor, when their political sovereignty was lost, did their love of literature and arts sink along with it. Just at the close of their golden days of empire flourished Xenophon and Plato, the disciples of Socrates, and from Plato descended that race of philosophers called the *Old Academy*. Aristotle, who was Plato's disciple, may be said, not to have invented a new philosophy, but rather to have tempered the sublime and rapturous mysteries of his master with method, order, and a stricter mode of reasoning. Zeno, who was himself also educated in the principles of Platonism, only differed from Plato in the comparative estimate of things, allowing nothing to be intrinsically good but virtue, nothing intrinsically bad but vice, and considering all other things to be in themselves indifferent. He too and Aristotle accurately cultivated logic, but in different ways; for Aristotle chiefly dwelt upon the simple syllogism; Zeno upon that which is derived out of it, the compound or hypothetic. Both too, as well as other philosophers, cultivated rhetoric along with logic; holding a knowledge in both to be requisite for those who think of addressing mankind with all the efficacy of persuasion. Zeno elegantly illustrated the force of these two powers by a simile, taken from the hand: the close power of logic he compared to the fist, or hand compreſt: the diffuse power of logic, to the palm, or hand open.

The new academy was founded by Arcesilas, and ably maintained by Carneades. From a mistaken imitation of the great parent of philosophy Socrates (particularly as he appears in the dialogues of Plato), because Socrates doubted some things, therefore Arcesilas and Carneades doubted all.—Epicurus drew from another source; Democritus had taught him atoms and a void: by the fortuitous concourse of atoms he fancied he could form a world; while by a feigned veneration he complimented away his gods, and totally denied their providential care, left the trouble of it should impair their uninterrupted state of bliss. Virtue he recommended, though not for the sake of virtue, but pleasure: pleasure, according to him, being our chief and sovereign good. See Aristotle, Epicurus, Plato, Socrates, &c.

We have already mentioned the alliance between philosophy and rhetoric. This cannot be thought wonderful, if rhetoric be the art by which men are persuaded, and if men cannot be persuaded without a knowledge of human nature: for what but philosophy can procure us this knowledge? It was for this reason the ablest Greek philosophers not only taught, but wrote also treatises upon rhetoric. They had a farther inducement, and that was the intrinsic beauty of their language as it was then spoken among the learned and polite. They would have been ashamed to have delivered philosophy, as it has been too often delivered since, in compositions as clumsy as the common dialect of the mere vulgar.

The same love of elegance, which made them attend to their style, made them attend even to the places where their philosophy was taught. Plato delivered his lectures in a place shaded with groves, on the banks of the river Ilissus; and which, as it once belonged to a person called *Academus*, was called after his name, the Academy. Aristotle chose another spot of a similar character, where there were trees and shade; a spot called the Lycæum. Zeno taught in a portico or colonnade, distinguished from other buildings of that sort (of which the Athenians had many) by the name, the *Variegated Portico*, the walls being decorated with various paintings of Polygnotus and Myro, two capital masters of that transcendent period. Epicurus addressed his hearers in those well known gardens, called, after his own name, *The gardens of Epicurus*.

These places of public institution were called among the Greeks by the name of *Gymnasia*; in which, whatever that word might have originally meant, were taught all those exercises, and all those arts, which tended to cultivate not only the body but the mind. As man was a being consisting of both, the Greeks could not consider that education as complete, in which both were not regarded, and both properly formed. Hence their Gymnasia, with reference to this double end, were adorned with two statues, those of Mercury and of Hercules, the corporeal accomplishments being patronised (as they supposed) by the god of strength, the mental accomplishments by the god of ingenuity.

It was for the cultivation of every liberal accomplishment that Athens was celebrated (as we have said) during many centuries, long after her political influence was lost and at an end.

She was the place of education, not only for Greeks but for Romans. It was hither that Horace was sent by his father; it was here that Cicero put his son Marcus under Cratippus, one of the ablest philosophers then belonging to that city.—The sects of philosophers, which we have already described, were still existing when St Paul came thither. We cannot enough admire the superior eloquence of that apostle, in his manner of addressing so intelligent an audience. We cannot enough admire the sublimity of his exordium; the propriety of his mentioning an altar which he had found there; and his quotation from Aratus, one of their well-known poets. Nor was Athens only celebrated for the residence of philosophers, and the institution of youth: men of rank and fortune found pleasure in a retreat, which contributed so much to their liberal enjoyment.

We shall finish this picture of the Athenians by the addition of one object more, to which every one will admit they have a right; an object which was prominent and striking, in all their actions and in all their enterprizes: we mean their ardent love of liberty. This was their predominant quality; the main spring of their government. From the beginning of the Persian war they sacrificed every thing to the liberty of Greece. They left, without hesitation, their cities, their houses, to fight at sea the common enemy, from whom they were in danger of servitude. What a glorious day was it for Athens, when all her allies, growing flexible to the advantageous offers which were made to them by the king of Persia, she replied by Aristides, to the ambassadors of that monarch,—"That it was impossible for all the gold in the world to tempt the republic of Athens: to prevail with her to sell her liberty, and that of Greece." It was by these generous senti-

Attica.

sentiments that the Athenians not only became the bulwark of Greece, but likewise guarded the rest of Europe from a Persian invasion.

These great qualities were blended with great failings, seemingly incompatible with Patriotism. For the Athenians, notwithstanding their tenacious jealousy of the rights of their country, were a volatile, inconstant capricious people.

180 Religion.

There never was a people more attentive to the worship of the gods than the Athenians. The worship of their principal deities was diffused over all Greece, and even beyond its limits.

Each temple had its particular religious rites: the pomp, the ceremonies, the duration, and the succession of the solemn feasts, were all appointed by fixed rules. The worship paid to each divinity, whether public or private, was founded on traditions, or on laws constantly obeyed. The feast of Bacchus, the Panathenæa, the feast of the mysteries of Eleusis, were celebrated according to established rules, most of which were as ancient as the feasts themselves. The old customs, of which the priests were the guardians, were observed in the temples. It is probable that the priests were consulted on affairs in which the worship of a deity was interested, and that their answer was decisive. We are certain that the Eumolpidæ had this authority. They were the interpreters of the ancient laws on which the worship of Ceres was founded, its magnificence, and its mode—laws which were not written, as Lysias informs us, but were perpetuated by a constant observation. The abuses which had gradually crept into the celebration of those feasts, had given rise to several new regulations; to that of the orator Lycurgus, for example, and to the law of Solon, which enjoined the senate to repair to Eleusis on the second day of the feast; but neither these nor the other particular regulations which we find in Samuel Petit's collection of Attic laws, could make a religious code. There was no general system which comprehended all the branches of their religion, which, by combining all its articles, might regulate their belief and conduct, and direct the judges in their decisions.

181 Crimes against religion why sometimes punished with severity.

Crimes against religion were only punished as they affected the state; and consequently they were tried by the magistrate. Mere raillery, though somewhat profane, was thought productive of no worse consequence than offending the ministers of the gods. The Athenians acknowledged no other religion than the hereditary public worship; no other gods than those they had received from their ancestors; no other ceremonies than those which had been established by the laws of the state, and practised by their country from time immemorial. They were only solicitous to preserve this worship, which was closely interwoven with their government, and made a part of its policy. They were likewise attentive to the ceremonial pomp; because order, the regular vigour of legislation, depends greatly on the awe impressed by externals. But as to the inconsistent and monstrous romance of fables, foreign opinions, popular traditions, and poetical fictions, which formed a religion quite different from that of the state —in it they were very little interested, and allowed every one to think of it as he pleased.

This explanation will reconcile a seeming contradiction in the conduct of the Athenians, who gave great licence to their poets, and severely punished the citizens who were guilty of impiety. Aristophanes, who made as free with the gods as with the great, was applauded by the Athenians. They condemned Socrates to death, who revered the deity, but disapproved the public manner of worshipping him. The life of Æschylus was in danger from a suspicion that he had revealed some of the secrets of Eleusis in one of his pieces. The wit of Aristophanes's drama was unpunished.

182 Priests their duty.

The priests were not confined to the care of the altars; they who were vested with the sacerdotal dignity, which was only incompatible with professions merely useful and lucrative, might likewise hold the most important offices of the commonwealth. This we could prove by a great number of examples; we shall cite that of Xenophon the illustrious historian and philosopher: he was likewise a famous general, and he was a priest. He was performing the sacerdotal function when he received the news of his son's death, who was killed at the battle of Mantinea.

The sacred ministry was not only compatible with civil offices, but likewise with the profession of arms. The priest and the soldier were often blended. Callias, the priest of Ceres, fought at Platæa. This custom was not peculiar to the Athenians. The Lacedemonians, after the battle which we have just mentioned, made three graves for their slain; one for the priests, one for the other Spartans, and one for the Helots.

183 Sacred revenues, &c.

As every mean employment was incompatible with the sacerdotal dignity, the priests had a revenue fixed to their office. We know that a part of the victims was their right, and that apartments were assigned them near the temples. But, beside these advantages, they had a salary proportioned to the dignity of their functions and to the rank of the deities whom they served. Their salary was probably paid from the revenue of the temples. Those revenues, which kept the temples in repair, and defrayed the sacrificial expences, were very considerable. They were of many different kinds.

A great part of the sacred revenues arose from fines, which individuals were condemned to pay for various offences; fines, of which the tenth part was appropriated to Minerva Polias, and the fiftieth to the other gods and to the heroes whose names their tribes bore. Besides, if the Prytanes did not hold the assemblies conformably with the laws, they were obliged to pay a fine of 1000 drachms to the goddess. If the Proedri, *i. e.* the senators whose office it was to lay before the assembly the matters on which they were to deliberate, did not discharge that duty according to the rules prescribed to them, they were likewise condemned to pay a fine, which, as the former, was applied to the use of Minerva. By these fines her temple must have been greatly enriched.

Besides this revenue, which was the common property of the gods, and which varied according to the number and degrees of the misdemeanors, the temples had their permanent revenues: We mean the produce of the lands which were consecrated to the deities. We do not here allude to the lands consecrated to the gods, which were never to be cultivated; such as the territory of Cirrha, proscribed by a solemn decree of the

Attica. the Amphictyons; the land betwixt Megara and Attica, which was consecrated to the goddesses of Eleusis, and many others. We would speak only of those which were cultivated, the fruits of which enriched the temples.

There were likewise lands belonging to the state, the produce of which was destined to defray the expence of the sacrifices which were offered in the name of the republic. There were likewise first-fruits which the public officers levied on all lands, for the use of the gods. All these emoluments made a part of the revenue of the temples.

The gods, besides the revenues immediately appertaining to their temples, had certain rights which were granted them by particular compact. The Lepreatæ, for instance, were obliged to pay every year a talent to Olympian Jupiter, on account of a treaty of alliance which they made with the Eleans in one of their wars. The inhabitants of Epidaurus, to obtain leave from the Athenians to cut down olive-trees for statues, which the Pythian priestess had commanded them to make, engaged to send deputies every year to Athens, to offer sacrifices in their name to Minerva and to Neptune. But this prerogative was rather honorary than lucrative.

The tenth part of the spoils taken in war was likewise the property of Minerva. Sacred vessels were bought with the effects of the 30 tyrants. In short, the gods were profited by almost every public accident. But what contributed most to enrich the famous temples of Greece, was the money which was constantly brought to them by individuals, in consequence of vows they had made, or to pay for sacrifices which were offered in their names. The credulity of the people was an inexhaustible fund. That credulity enriched the temples of Deli and Eleusis, and supported the magnificence of Delphi. And those immense treasures which were the fruit of superstition, were often a prey to avarice.

These revenues were not deposited with the priests; nor did they expend them. A moderate salary was all their gain; and to offer sacrifices to the deities whose ministers they were, was all their employment.

It is very probable that all the sacred revenues were paid into the hands of officers who were appointed to receive them, and who were to give an account of the discharge of their trust. Nay, we cannot doubt of this, after reading a passage in Aristotle, who, speaking of the officers of the temples, expresly mentions those who were entrusted with the money appertaining to the gods. Citizens, without doubt, of approved integrity, were chosen to this office; and their duty must have been, to keep the temples in repair and order, and to disburse and keep an account of the ordinary sacred expences.

As to the solemn feasts, which were incredibly magnificent, such as the feast of Bacchus, and the Panathenæa, they were celebrated at the expence of the Chorègus; *i. e.* of the chief of the choir of each tribe: for each tribe had its poet and its musicians, who sung, emulating each other, hymns in honour of the deity. The richest citizens were appointed chiefs of the different choirs; and as their office was very expensive, to indemnify them in some degree, the Chorègus of the victorious tribe had the privilege of engraving his name on the tripod which that tribe suspended to the roof of the temple. This office, though ruinous, was eagerly solicited; and naturally, in a republican state. It led to honours, like the Curule dignity at Rome; and it greatly tended to ingratiate its possessor with a people, who were more affected with pleasures than with essential services, and who, consequently, would more highly esteem a profuse Chorègus than a victorious general.

With regard to the fines, which were in the whole, or in part, the property of Minerva and of the other deities, there were at Athens public treasurers appointed to receive them. They were ten in number, and they were nominated by lot. They were called *Treasurers of the Goddess*, or *Receivers of the sacred money*. That money they received in the presence of the senate; and they were empowered to diminish or to annihilate the fine, if they thought it unjust. The statue of Minerva, that of the victories, and the other invaluable pledges of the duration of the state, were deposited with them.

The treasury in which the money consecrated to the gods was kept, was in the citadel, behind the temple of Minerva Polias; and from its situation it was termed *Opistodomus*. It was surrounded with a double wall. It had but one door, the key of which was kept by the Epistates, or chief of the Prytanes: his dignity was very considerable; but it lasted only one day. In this treasury a register was kept, in which were written the names of all those who were indebted to the state: he who owed the smallest fine was not omitted. If the debtors proved insolvent, they were prosecuted with extreme rigour, and often punished with a cruelty which religion could not excuse; though the interest of the gods was the motive, or rather the pretext. The sacred treasurers held a considerable rank among the magistrates, who received the public finances. Of these magistrates there were many kinds, as there were many sorts of revenues.

The Athenian priests did not compose an order distinct and separate from the other orders of the state. They did not form a body united by particular laws, under a chief whose authority extended to all his inferiors. The dignity of sovereign pontiff was unknown at Athens; and each of the priests served his particular temple, connected with his brethren. The temples, indeed, of the principal deities; those of Minerva, for instance, of Neptune, of Ceres, and of Proserpine, had many ministers; and in each of them a chief presided, who had the title of *High-Priest*. The number of subaltern ministers was in proportion to the rank of the deity; but the priests of one temple were altogether a separate society from those of another. Thus at Athens there was a great number of high priests, because many deities were worshipped there, whose service required many ministers. The power of each priest was confined to his temple; and there was no sovereign pontiff, the minister general of the gods, and the president at all the feasts.

It naturally follows from this account, that the ministers of the gods at Athens were not judges in matters of religion. They were neither authorised to take cognisance of crimes committed against the deity, nor to punish them. Their function was to offer sacrifices to the gods, and to intreat their acceptance of the ado-

Attica. adorations of the people. But the punishment of impiety, of sacrilege, of the profanation of mysteries, and of other irreligious crimes, was not entrusted to their zeal.

The priests were not only incapable of avenging crimes against religion by a temporal process; they even could not, without an express order either from the senate or the people, exercise their right of devoting criminals to the infernal gods. It was in consequence of a civil sentence pronounced against Alcibiades, that the Eumolpidæ launched their anathema against him. It was in virtue of another decree that they revoked their imprecations, when his countrymen wanted his service, and therefore restored him to their favour.

Religious causes, according to M. de Bougainville, fell under the jurisdiction of the Heliastæ.

The government, though often altered, continued pretty much on the plan established by Solon.

184
People divided into different tribes, &c.

The people of Athens were freemen, sojourners, or slaves. The citizens, called in Greek *Politai*, were very numerous; but what may seem strange, were as many in the time of Cecrops as in the most flourishing state of the commonwealth, hardly ever exceeding 20,000. It was Solon who decreed that none should be accounted free but such as were Athenians both by father and mother. After his time it fell into desuetude, till revived by Pericles, and again at his instance repealed. After the expulsion of the 30 tyrants, Solon's law was restored. A person born of a stranger was styled *Nothos*, a bastard; whereas the son of a free woman was called *Cnesios*, i. e. *legitimate*. There was in Cynosarges a court of judicature, to which causes of illegitimacy properly belonged; and the utmost care was taken to prevent any from being inrolled Athenian citizens, who had not a clear title thereto. The citizens were divided by Cecrops into four tribes: the first called *Cecropes*, from Cecrops; the second, *Autochthon*, from a king of that name; the third, *Actai*, from Acteus another king of Athens, or rather from *Acte*, which signifies a *shore*: the fourth, *Pluralia*: these names were altered by Cranaus, and again by Ericthonius. In the reign of Ericthеus, they were again changed: the soldiers were called *Oplitai*, the craftsmen *Ergatai*, the farmers *Georgoi*, the graziers and shepherds *Aigicorai*: in this state they were when Solon settled the commonwealth, and appointed the senate to be composed of 400, 100 out of each tribe. Clysthenes increased the number of the tribes to 10; and made the senate consist of 500, taking 50 out of each tribe. In succeeding times, two other tribes were added. Each tribe was subdivided into its *Demoi* or wards; and with respect to these it was that Solon instituted the public feasts beforementioned, at which sometimes the whole tribe assembled, sometimes several wards, and sometimes only the inhabitants of one ward.

The second sort of inhabitants we mentioned were called *Metoicoi*, i. e. *sojourners*; these were persons who lived always at Athens, yet were not admitted free denizens; as for such as did not constantly reside in Athens, they were styled *Xenoi*; i. e. *strangers*. The sojourners were obliged to choose out of the citizens protectors, who were styled *Patrons*: they paid services to the state, and besides these an annual tribute of 12 drachms for every man, and six for every woman; but such as had sons, and paid for them, were exempted. If people fell to poverty, and were not able to pay the tribute, they were seized by the taxmasters, and actually sold for slaves: which, as Diogenes Laertius tells us, was the fate of Xenocrates the philosopher. The sojourners in Attica were under the same law as those in Athens. As to servants, they were freemen, who through indigency were driven to receive wages, and while they were in this state had no vote in the assembly. As to slaves, they were absolutely the property of their masters, and as such were used as they thought fit: They were forbidden to wear clothes, or to cut their hair like their masters; and which is indeed amazing, Solon prohibited them to love boys, as if that had been honourable: They were likewise debarred from anointing or perfuming themselves, and from worshipping certain deities: They were not allowed to be called by honourable names; and in most other respects were used like dogs. They stigmatized them at their pleasure, that is, branded them with letters in the forehead and elsewhere. However, Theseus's temple was allowed them as a sanctuary, whither, if they were exceedingly ill used, they might fly, and thereby oblige their owners to let them be transferred to another master. In this and many other respects the Athenian slaves were in a much better condition than those throughout the rest of Greece: they were permitted to get estates for themselves, giving a small premium to their masters, who were obliged to make them free if they could pay their ransom; they likewise obtained the same favour from the kindness of their masters, or for having rendered military services to the state. When they were made free, they were obliged to choose patrons; and had likewise the privilege of choosing a curator, who, in case their patrons injured them, was bound to defend them.

185
General assembly of the people.

The general assembly of the people, which Solon made the dernier resort, was called the *Ecclesia*; and consisted of all the freemen of Athens, excepting such as were *atimoi* or infamous. The meetings of these assemblies were either ordinary or extraordinary. The ordinary were such as were appointed by law, the extraordinary such as necessity required. Of the first there were four in 35 days. In the first assembly they approved or rejected magistrates, heard proposals for the public good, and certain causes. In the second they received petitions, and heard every man's judgement on the matters that were before them. In the third they gave audience to foreign ambassadors. The fourth was employed altogether in affairs relating to the gods and their worship. The extraordinary meetings were appointed by the magistrates when occasion required, whereas to the ordinary assemblies the people came of their own accord. The first were held either in the market-place, in the Pnyx, a place near the citadel, or in the theatre of Bacchus; as to the latter, the magistrates who appointed the extraordinary meeting appointed also the place where they should be held. If any sudden tempest arose, or any earthquake happened, or any sign notoriously inauspicious appeared, the assembly was immediately adjourned, to prevent the people from apprehending unhappy consequences from their deliberations. But if the weather was fair and serene, and nothing happened out of the ordinary course of things, they proceeded to purify the place where the

the assembly was held, which was done by sprinkling it round with the blood of young pigs: then the crier made a solemn prayer for the prosperity of the republic, and that heaven would bestow a happy issue on their counsels and undertakings; he then pronounced a bitter execration against any who should in that assembly propound what might be disadvantageous to the state. These ceremonies being over, they proceeded to business.

186 Method of giving their opinions.

There were several magistrates who had the overseeing and regulating these assemblies. These were, first, the Epistate, or president of the assembly, who was chosen by lot out of the Proedri: his office was to give the signal for the people's voting. Next to him were the Prytanes, *i. e.* a committee of the senate, who of course were present on this occasion: by their order a programma, or scheme of the business to be proposed at the assembly, was previously set up in some public place, that every man might know what business to apply his thoughts to. The Proedri were nine in number, appointed by lots out of all the tribes to which the Prytanes did not belong: they had the right of proposing to the people what they were to deliberate upon, and their office ended with the assembly; there sat with them assessors, who were to take care that nothing they proposed was detrimental to the commonwealth. The first step to business was the crier's reading the decree of the senate whereon the assembly was to deliberate; when he had finished this, he made proclamation in these words: *Who of the men above 50 will make an oration?* When the old men had done speaking, the crier made proclamation again that any Athenian might then offer his sentiments, whom the law allowed so to do; that is, all such as were above 30 years old, and were not infamous. If such a one rose up to speak, the Prytanes interposed, and bid him be silent; and if he did not obey them, the lictors pulled him down by force. When the debates were over, the president permitted the people to vote; which they did by casting first beans, but in after-times pebbles, into certain vessels: these were counted, and then it was declared that the decree of the senate was either rejected or approved: after which, the Prytanes dismissed the assembly.

187 The senate.

The senate was instituted by Solon to prevent the dangerous consequences of leaving the supreme power in the people. At the time of his institution, it was to consist of 400, 100 out of each tribe; it was increased to 500, when the tribes were augmented to 10; and when they came to 12, it was also swelled to 600. They were elected by lots after this manner: At a day appointed, towards the close of the year, the president of each tribe gave in a list of such persons belonging thereto, as were fit for and desired to appear for this dignity: these names were engraven on tablets of brass, and a number of beans equal to the number of the amount of them, among which were 100 white ones, put into a vessel; and then the names of the candidates and the beans were drawn one by one, and such as were drawn by the white beans were received into the senate. After the senate was elected, they proceeded to appoint the officers who were to preside in the senate: these were the Prytanes beforementioned, and they were elected thus: The names of the ten tribes were thrown into one vessel, and nine black beans and a white one into another vessel. Then the names of the tribes were drawn with the beans. The tribe to which the white bean answered, presided first; and the rest according to the order in which they were drawn.

188 Prytanes.

The Prytanes, while the senate consisted of 500, were 50 in number. For the farther avoiding of confusion therefore, 10 of these presided a week, during which space they were called *Proedri;* and out of these an Epistate or president was chosen, whose office lasted but one day, and by law no man could hold it more than once: the reason of this was, that he had in his custody the public seal, the keys of the citadel, and the charge of the exchequer. The reader must distinguish between the Epistates and Proedri last-mentioned, and those spoken of in the former paragraph, because, though their titles were the same, their office were perfectly distinct. The senate assembled by direction of the Prytanes once every day, excepting festivals, and sometimes oftner in the senate-house, which was thence called *Prytaneum.*

189 Laws how established, &c.

When a member of the senate made a motion for a new law, it was immediately engraven on tablets, that the members when they came next might be prepared to speak to it. At the subsequent assembly the Epistates opened the matter, after which every senator that pleased delivered his sentiments; then any of the Prytanes drew up the decree, and repeated it aloud: after which they proceeded to vote, and if there was a majority of white beans, then it became *psephisma,* and was afterwards propounded to the people: if they approved it, it became a law; otherwise it was of no force longer than the senate who decreed it subsisted. The power of the senate was very great: for they took the account of magistrates at the expiration of their offices; they directed the provisions made for poor citizens out of the public treasure; they had the superintendancy of public prisons, and a power of punishing such as committed acts morally evil, though not prohibited by any law; they had the care likewise of the fleet; and besides all these they had many other branches of authority, which it is not necessary for us to mention. Before they took their seats, they were constrained to undergo a very strict examination, wherein the whole course of their lives was inquired into; and if the least slur on their reputation appeared, they were set aside. When this examination was over, they took an oath, whereby they bound themselves to promote in all their councils the public good, to advise nothing contrary to the laws, and to execute their functions exactly. The highest fine the senate could impose was 500 drachms: if they thought the offender deserved a heavier mulct, they then transmitted the cause to the Thesmothetæ, who punished them as they thought fit. The senators, when their year was out, gave an account of their management to the people: but that they might have the less to do, they always punished such of their number as they found had offended, by expulsion; and in this they were mighty exact. Yet an expelled senator was notwithstanding eligible to any other office, the most trivial omission being sufficient to occasion a dismission from the senatorial dignity; and therefore, when the tribes chose their senators, they also chose a certain number of subsidiaries, out of which, when a senator was expelled, another was substituted in his place. Each senator was allowed a drachm every day: for it was a constant rule with the Athenians, that the public ought

ought to pay for every man's time; and therefore such of the poor Athenians as thought fit to demand it, had three oboli for going to the assembly. If during their administration any ships of war were built, the senators had crowns decreed them; but if not, they were forbid to sue for them.

Next to the senate was the court of AREOPAGUS,
200 for a description of which see that article.

Archons, Nomophylaces, &c.

The chief magistrates of Athens were Archons, and inferior to them there were many others; of whom it will be necessary to mention some. In the first place they had Nomophylaces, who were also styled *the eleven*, because they were so many in number, one chosen out of each tribe, and a clerk or secretary who made up the eleventh. Their duty it was to look to the execution of the laws: they had authority to seize robbers and other capital offenders; and if they confessed, to put them to death. Dr Potter thinks they resembled our sheriffs. The Phylarchi were the presidents of the Athenian tribes; but in time this became a military title. The Philobasileus was an officer in each tribe, who did the same things within his jurisdiction as the Basileus did with respect to the state. The Demarchi were the principal magistrates in wards. The Lexarchi were six in number, and were bound to take care that the people came duly to the assemblies; in their custody was the public register of the citizens names. They had under them Toxotæ, who were lictors or bailiffs; they were sometimes 1000 in number: these men were necessary: but, like most of their sort, were in a manner infamous, as may be gathered from the comedies of Aristophanes; they were generally Scythians, raw-boned, brawny fellows, ready to execute any thing they were commanded. The Nomothetæ were 1000 in number; their business was to watch over and inspect into the laws. There were two sorts of orators in the service of the state, some were appointed to defend an old law, when a motion was made to repeal it; these had their fee from the state, but the same man was incapable of being elected twice. Besides these, there were 10 settled orators called *Rhetores*, elected by lot; their business was to plead public causes in the senate-house.
201 For this they had their stated fees; and with respect to

Laws regarding orators.

their qualifications, the law run thus: "Let no one be a public orator who hath struck his parents, denied them maintenance, or shut them out of his doors; who hath refused to serve in the army; who hath thrown away his shield; who hath been addicted to lewd women, notoriously effeminate, or who has run out his patrimony. If any man who has been guilty of these crimes dare to deliver an oration, let him be brought to trial upon the spot. Let an orator have children lawfully begotten, and an estate within Attica; if in his oration he talks impertinently, makes idle repetitions, affects an unbecoming raillery, digresses from the point in question, or after the assembly is over, abuses the president, let the Proedri fine him 50 drachms; and if that is not thought enough, let him be brought before
202 the next assembly and fined again."

Courts of justice.

We shall conclude this draught of the Athenian government with an account of their courts of justice, which, exclusive of the Areopagus, were 10 in number; four had cognisance of criminal, and six of civil causes. These 10 courts were numbered with the 10 first letters of the alphabet, and were thence styled, *Alpha*, *Beta*, *Gamma*, &c. When an Athenian was at leisure to hear causes, he wrote his own name, that of his father, and the ward to which he belonged, upon a tablet; this he presented to the Thesmothetæ, who returned it again to him with another tablet, with the letter which fell to his lot; then he went to the crier of the court, who presented him a sceptre, and gave him admission. When the causes were over, every judge went and delivered his sceptre to the Prytanes, and received a stated fee for every cause that was tried. But as this was intended only to compensate their loss of time, so that there might be no appearance of covetousness, a man was forbid to sit in two courts on the same day. The first criminal court after the Areopagus, was that of the *Ephetæ*. It consisted of 51 members, all upwards of 51 years old. Draco gave it a very extensive jurisdiction; but Solon took away from them the power of judging in any other causes than those of manslaughter, accidental killing, and lying in wait to destroy: the Basileus entered all causes in this court. The second criminal court was called *Delphinium*, because it was held in the temple of Apollo Delphinius; it had cognisance of such murders as were confessed by the criminal, but at the same time justified under some pretence or other. The *Prytaneum* was the third criminal court. It held plea of such cases where death ensued from inanimate things: causes were heard here with the same solemnity as in other courts; and on judgment given, the thing, or whatever it was, that had occasioned the death of a man, was thrown out of the territory of Athens. The last criminal court was styled *Phreatum*. It sat in a place not far from the sea-shore; and such persons were brought before this court as had committed murders in their own country and fled to Attica: the proceedings of this court were so severe that they did not permit the criminal to come on shore, but obliged him to plead his cause in his vessel; and if he was found guilty, he was committed to the mercy of the wind and seas.

Of the judicatures for hearing civil causes, the first was the *Parabaston*, so called, as some think, because in it no matter could be heard if the cause of action was above one drachm. The *Cainon*, or new court, was the second tribunal. The third was styled the *court of Lycus*, because it assembled in a temple dedicated to that hero, whose statue, represented with the face of a wolf, was set up in all courts of justice. The *Trigonon* was so called, because it was triangular in its form. The court of *Metidius* derived its appellation from the architect who built it. The sixth and last court was called *Heliæa*; it was by far the greatest, and is generally conceived to have derived its name from the judges sitting in the open air exposed to the sun. All the Athenians who were free citizens were allowed by law to sit in these courts as judges; but before they took their seats were sworn by Apollo Patrius, Ceres, and Jupiter the king, that they would decide all things righteously and according to law, where there was any law to guide them; and by the rules of natural equity, where there was none. The Helæastic court consisted at least of 50, but its usual number was 500, judges: when causes of very great consequence were to be tried, 1000 sat therein, and now and then the judges were increased to 1500, and even to 2000. There were many inferior courts in Athens for the decision of tri-

Atticus, Attila.

vial causes; but of these there is no necessity of speaking, since we design no more than a succinct view of the Athenian republic, as it was settled by and in consequence of Solon's laws.

ATTICUS (Titus Pomponius), one of the most honourable men of ancient Rome. He understood the art of managing himself with such address, that, without leaving his state of neutrality, he preserved the esteem and affection of all parties. His strict friendship with Cicero did not hinder him from having great intimacy with Hortensius. The contests at Rome between Cinna's party and that of Marius induced him to go to Athens, where he continued for a long time. He was very fond of polite learning, and kept at his house several librarians and readers. He might have obtained the most considerable posts in the government; but chose rather not to meddle, because in the corruption and faction which then prevailed he could not discharge them according to the laws. He wrote Annals. He married his daughter to Agrippa; and attained to the age of 77.

ATTILA, king of the Huns, surnamed *the scourge of God*, lived in the 5th century. He may be ranked among the greatest conquerors, since there was scarcely any province in Europe which did not feel the weight of his victorious arms.

Gibbons's Rome, vol. iii. p. 357.

Attila deduced his noble, perhaps his regal, descent from the ancient Huns, who had formerly contended with the monarchs of China. His features, according to the observation of a Gothic historian, bore the stamp of his national origin; and the portrait of Attila exhibits the genuine deformity of a modern Caulmuck; a large head, a swarthy complexion, small deep-seated eyes, a flat nose, a few hairs in the place of a beard, broad shoulders, and a short square body, of nervous strength, though of a disproportioned form. The haughty step and demeanour of the king of the Huns expressed the consciousness of his superiority above the rest of mankind; and he had a custom of fiercely rolling his eyes, as if he wished to enjoy the terror which he inspired. Yet this savage hero was not inaccessible to pity; his suppliant enemies might confide in the assurance of peace or pardon; and Attila was considered by his subjects as a just and indulgent master. He delighted in war: but, after he had ascended the throne in a mature age, his head, rather than his hand atchieved the conquest of the north; and the fame of an adventurous soldier was usefully exchanged for that of a prudent and successful general. The effects of personal valour are so inconsiderable, except in poetry or romance, that victory, even among barbarians, must depend on the degree of skill, with which the passions of the multitude are combined and guided for the service of a single man. The Arts of Attila were skilfully adapted to the character of his age and country. It was natural enough, that the Scythians should adore, with peculiar devotion, the god of war; but as they were incapable of forming either an abstract idea, or a corporeal representation, they worshipped their tutelar deity under the symbol of an iron scimitar. One of the shepherds of the Huns perceived, that a heifer, who was grazing, had wounded herself in the foot; and curiously followed the track of the blood, till he discovered, among the long grass the point of an ancient sword; which he dug out of the ground, and presented to Attila. That magnanimous, or rather that artful prince, accepted with pious gratitude this celestial favour; and, as the rightful possessor of the *sword of Mars*, asserted his divine and indefeasible claim to the dominion of the earth. If the rites of Scythia were practised on this solemn occasion, a lofty altar, or rather pile of faggots, 300 yards in length and in breadth, was raised in a spacious plain; and the sword of Mars was placed erect on the summit of this rustic altar, which was annually consecrated by the blood of sheep, horses, and of the hundredth captive. Whether human sacrifices formed any part of the worship of Attila, or whether he propitiated the god of war with the victims which he continually offered in the field of battle, the favourite of Mars soon acquired a sacred character, which rendered his conquests more easy and more permanent; and the barbarian princes confessed, in the language of devotion or flattery, that they could not presume to gaze with a steady eye on the divine majesty of the king of the Huns. His brother Bleda, who reigned over a considerable part of the nation, was compelled to resign his sceptre and his life. Yet even this cruel act was attributed to a supernatural impulse; and the vigour with which Attila wielded the sword of Mars, convinced the world that it had been reserved alone for his invincible arm. But the extent of his empire affords the only remaining evidence of the number and importance of his victories; and the Scythian monarch, however ignorant of the value of science and philosophy, might perhaps lament that his illiterate subjects were destitute of the art which could perpetuate the memory of his exploits.

Attila.

If a line of separation were drawn between the civilized and the savage climates of the globe; between the inhabitants of cities who cultivated the earth, and the hunters and shepherds who dwelt in tents; Attila might aspire to the title of supreme and sole monarch of the Barbarians. He alone, among the conquerors of ancient and modern times, united the two mighty kingdoms of Germany and Scythia; and those vague appellations, when they are applied to his reign, may be understood with an extensive latitude. Thuringia, which stretched beyond its actual limits as far as the Danube, was in the number of his provinces: he interposed, with the weight of a powerful neighbour, in the domestic affairs of the Franks; and one of his lieutenants chastised, and almost exterminated, the Burgundians of the Rhine. He subdued the islands of the ocean, the kingdoms of Scandinavia, encompassed and divided by the waters of the Baltic; and the Huns might derive a tribute of furs from that northern region, which has been protected from all other conquerors by the severity of the climate, and the courage of the natives. Towards the east, it is difficult to circumscribe the dominion of Attila over the Scythian deserts: yet we may be assured, that he reigned on the banks of the Volga, that the king of the Huns was dreaded, not only as a warrior, but as a magician; that he insulted and vanquished the Khan of the formidable Geougen: and that he sent ambassadors to negociate an equal alliance with the empire of China. In the proud review of the nations who acknowledged the sovereignty of Attila, and who never entertained during his lifetime the thought of a revolt, the Gepidæ and the Ostrogoths

were

were distinguished by their numbers, their bravery, and the personal merit of their chiefs. The renowned Ardaric king of the Gepidæ, was the faithful and sagacious councellor of the monarch; who esteemed his intrepid genius, whilst he loved the mild and discreet virtues of the noble Walamir king of the Ostrogoths. The crowd of vulgar kings, the leaders of so many martial tribes, who served under the standard of Attila, were ranged in the submissive order of guards and domestics round the person of their master. They watched his nod; they trembled at his frown; and at the first signal of his will, they executed without murmur or hesitation his stern and absolute commands. In time of peace, the dependent princes, with their national troops, attended the royal camp in regular succession; but when Attila collected his military force, he was able to bring into the field an army of five, or, according to another account, of seven hundred thousand Barbarians.

For an account of his exploits and death, see the article HUNS.

ATTIRE, in hunting, signifies the head or horns of a deer. The attire of a stag, if perfect, consists of bur, pearls, beams, gutters, antler, sur-antler, royal, sur-royal, and crotches; of a buck, of the bur, beam, brow-antler, advancer, palm, and spellers.

ATTITUDE, in painting and sculpture, the gesture of a figure or statue; or it is such a disposition of their parts as serves to express the action and sentiments of the person represented.

ATTIUM, (anc. geog.) a promontory on the north-west of Corsica, (Ptolemy). It still retains some traces of its ancient name, being now called *Punta di Acciuolo* (Cluverius).

ATTLEBURY, a town in the county of Norfolk in England. E. Long. 0. 40. N. Lat. 52. 23.

ATTOLLENS, in anatomy, an appellation given to several muscles otherwise called *levatores* and *elevatores*. See ANATOMY, *Table of the Muscles*.

ATTORNEY AT LAW, answers to the Procurator, or Proctor of the civilians and canonists: And he is one who is put in the place, stead, or turn of another, to manage his matters of law. Formerly every suitor was obliged to appear in person, to prosecute or defend his suit (according to the old Gothic constitution), unless by special licence under the king's letters patent. This is still the law in criminal cases. And an idiot cannot to this day appear by attorney, but in person; for he hath not discretion to enable him to appoint a proper substitute; and upon his being brought before the court in so defenceless a condition, the judges are bound to take care of his interests, and they shall admit the best plea in his behalf that any one present can suggest. But, as in the Roman law, *cum olim in usu fuisset, alterius nomine agi non posse, sed, quia hoc non minimam incommoditatem habebat, cœperunt homines per procuratores litigare;* so, in England, on the same principle of convenience, it is now permitted in general, by divers ancient statutes, whereof the first is statute West. 2. c. 10. that attorneys may be made to prosecute or defend any action in the absence of the parties to the suit. These attorneys are now formed into a regular corps; they are admitted to the execution of their office by the superior courts of Westminster-hall; and are in all points officers of the respective courts in which they are admitted; and as they have many privileges on account of their attendance there, so they are peculiarly subject to the censure and animadversion of the judges. No man can practise as an attorney in any of those courts, but such as is admitted and sworn an attorney of that particular court; an attorney of the court of king's bench cannot practise in the court of common pleas; nor *vice versa*. To practise in the court of chancery, it is also necessary to be admitted a solicitor therein; and by the statute 22 Geo. II. c. 46. no person shall act as an attorney at the court of quarter-sessions, but such as has been regularly admitted in some superior court of record. So early as the statute 4 Henry IV. c. 18. it was enacted, that attorneys should be examined by the judges, and none admitted but such as were virtuous, learned, and sworn to do their duty. And many subsequent statutes have laid them under farther regulations.

Letter of attorney pays by different acts, 6s. By 25 Geo. III. c. 80. the following duties are to be paid by every solicitor, attorney, notary, proctor, agent or procurator, viz. for every warrant to prosecute for a debt of 40s. or to defend, a stamp duty of 2s. 6d. And they are to take out certificates annually; and if resident in London, Westminster, the bills of mortality, or Edinburgh, they are now obliged to pay L. 5 for the same; and in every other part of Great Britain, L. 3. The duties are under the management of the commissioners of stamps: and every acting solicitor, and other person as above, shall annually deliver in a note of his name and residence, to the proper officer of the court in which he practises; the entering officers are to certify notes delivered, and issue annual certificates, stamped as above, which must be renewed ten days before the expiration. Refusing to issue, or improperly issuing certificates, is a penalty of L. 50, and damages to the party aggrieved. Acting without a certificate, or giving in a false place of residence, is a penalty of L. 50, and incapacity to sue for fees due. A stamped memorandum shall be given to the proper officer, of the names of the parties in every action; and in such cases as used to require precipes. Officers who receive stamped memorandums, are to file the same, on penalty of L. 50; and persons not acting conformable to this act forfeit L. 5.

ATTORNEY General, is a great officer under the king, made by letters patent. It is his place to exhibit informations, and prosecute for the crown, in matters criminal; and to file bills in the exchequer, for any thing concerning the king in inheritance or profits; and others may bring bills against the king's attorney. His proper place in court, upon any special matters of a criminal nature, wherein his attendance is required, is under the judges on the left hand of the clerk of the crown; but this is only upon solemn and extraordinary occasions; for usually he does not sit there, but within the bar in the face of the court.

ATTOURNMENT, or ATTORNMENT, in law, a transfer from one lord to another of the homage and service a tenant makes; or that acknowledgment of duty to a new lord.

ATTRACTION, in natural philosophy, a general term used to denote the cause by which bodies tend towards each other, and cohere till separated by some other power.

The principle of attraction, in the Newtonian sense of it, seems to have been first surmised by Copernicus. "As for gravity," says Copernicus, "I consider it as nothing more than a certain natural appetence (*appetentia*) that the Creator has impressed upon all the parts of matter, in order to their uniting or coalescing into a globular form, for their better preservation; and it is credible that the same power is also inherent in the sun and moon, and planets, that those bodies may constantly retain that round figure in which we behold them." *De Rev. Orb. Cœlest.* lib. i. cap. 9. And Kepler calls gravity a corporeal and mutual affection between similar bodies, in order to their union. *Ast. Nov. in Introd.* And he pronounces more positively, that no bodies whatsoever were absolutely light, but only relatively so; and consequently, that all matter was subjected to the law of gravitation. *Ibid.*

The first in Britain who adopted the notion of attraction, was Dr Gilbert, in his book *De Magnete;* and the next was the celebrated Lord Bacon, *Nov. Org.* lib. ii. aphor. 36. 45. 48. *Sylv.* cent. i. exp. 33. In France it was received by Fermat and Roberval; and in Italy by Galileo and Borelli. But till Sir Isaac Newton appeared, this principle was very imperfectly defined and applied.

It must be observed, that though this great author makes use of the word attraction, in common with the school philosophers; yet he very studiously distinguishes between the ideas. The ancient attraction was supposed a kind of quality, inherent in certain bodies themselves, and arising from their particular or specific forms. The Newtonian attraction is a more indefinite principle; denoting not any particular kind or manner of action, nor the physical cause of such action; but only a tendency in the general, a *conatus accedendi*, to whatever cause, physical or metaphysical, such effect be owing; whether to a power inherent in the bodies themselves, or to the impulse of an external agent. Accordingly, that author, in his *Philosoph. Nat. Prin. Math.* notes, "that he uses the words *attraction*, *impulse*, and *propension* to the center, indifferently; and cautions the reader not to imagine that by attraction he expresses the modus of the action, or the efficient cause thereof, as if there were any proper powers in the centres, which in reality are only mathematical points; or, as if centres could attract." Lib. i. p. 5. So he "considers centripetal powers as attractions, though, physically speaking, it were perhaps more just to call them impulses. Ib. p. 147. He adds, "that what he calls attraction may possibly be effected by impulse, though not a common or corporeal impulse, or after some other manner unknown to us." *Optic.* p. 322.

Attraction, if considered as a quality arising from the specific form of bodies, ought, together with sympathy, antipathy, and the whole tribe of occult qualities, to be exploded. But when we have set these aside, there will remain innumerable phenomena of nature, and particularly the gravity or weight of bodies, or their tendency to a centre, which argue a principle of action seemingly distinct from impulse, where at least their is no sensible impulsion concerned. Nay, what is more, this action in some respects differs from all impulsion we know of; impulse being always found to act in proportion to the surfaces of bodies, whereas gravity acts according to their solid content, and consequently must arise from some cause that penetrates or pervades the whole substance thereof. This unknown principle, unknown we mean in respect of its cause, for its phenomena and effects are most obvious, with all the species and modifications thereof, we call *attraction;* which is a general name, under which all mutual tendencies, where no physical impulse appears, and which cannot therefore be accounted for from any known laws of nature, may be ranged.

And hence arise divers particular kinds of attraction; as, *Gravity*, *Magnetism*, *Electricity*, &c. which are so many different principles acting by different laws, and only agreeing in this, that we do not see any physical causes thereof; but that, as to our senses, they may really arise from some power or efficacy in such bodies, whereby they are enabled to act even upon distant bodies, though our reason absolutely disallows of any such action.

Attraction may be divided, with respect to the law it observes, into two kinds.

1. That which extends to a sensible distance. Such are the attraction of gravity, found in all bodies; and the attraction of magnetism and electricity, found in particular bodies. The several laws and phenomena of each, see under their respective articles.

The attraction of gravity, called also among mathematicians the *centripetal force*, is one of the greatest and most universal principles in all nature. We see and feel it operate on bodies near the earth, and find by observation that the same power (*i. e.* a power which acts in the same manner, and by the same rules, *viz.* always proportionably to the quantities of matter, and as the squares of the distances reciprocally) does also obtain in the moon, and the other planets, primary and secondary, as well as in the comets; and even that this is the very power whereby they are all retained in their orbits, &c. And hence, as gravity is found in all the bodies which come under our observation, it is easily inferred, by one of the settled rules of philosophizing, that it obtains in all others: and as it is found to be as the quantity of matter in each body, it must be in every particle thereof; and hence every particle in nature is proved to attract every other particle, &c. See the demonstration hereof laid down at large, with the application of the principle to the celestial motions, under the article ASTRONOMY, Sect. IV.

From this attraction arises all the motion, and consequently all the mutation, in the great world. By this heavy bodies descend, and light ones ascend; by this projectiles are directed, vapours and exhalations rise, and rains, &c. fall. By this rivers glide, the air presses, the ocean swells, &c. In effect, the motions arising from this principle make the subject of that extensive branch of mathematics, called *mechanics* or *statics*, with the parts or appendages thereof, hydrostatics, pneumatics, &c.

2. That which does not extend to sensible distances. Such is found to obtain in the minute particles whereof bodies are composed, which attract each other at or extremely near the point of contact, with a force much superior to that of gravity, but which at any distance from it decreases much faster than the power of

of gravity. This power a late ingenious author chooses to call the *attraction of cohesion*, as being that whereby the atoms or insensible particles of bodies are united into sensible masses.

This latter kind of attraction owns Sir Isaac Newton for its discoverer; as the former does for its improver. The laws of motion, percussion, &c. in sensible bodies under various circumstances, as falling, projected, &c. ascertained by the later philosophers, do not reach to those more remote, intestine motions of the component particles of the same bodies, whereon the changes of the texture, colour, properties, &c. of bodies depend: so that our philosophy, if it were only founded on the principle of gravitation, and carried so far as that would lead us, would necessarily be very deficient.

But beside the common laws of sensible masses, the minute parts they are composed of are found subject to some others, which have been but lately taken notice of, and are even yet imperfectly known. Sir Isaac Newton, to whose happy penetration we owe the hint, contents himself to establish that there are such motions in the *minima naturæ*, and that they flow from certain powers or forces, not reducible to any of those in the great world. In virtue of these powers, he shows, "That the small particles act on one another even at a distance; and that many of the phenomena of nature are the result thereof. Sensible bodies, we have already observed, act on one another divers ways; and as we thus perceive the tenor and course of nature, it appears highly probable that there may be other powers of the like kind: nature being very uniform and consistent with herself. Those just mentioned reach to sensible distances, and so have been observed by vulgar eyes; but there may be others which reach to such small distances as have hitherto escaped observation; and it is probable electricity may reach to such distances, even without being excited by friction."

The great author just mentioned proceeds to confirm the reality of these suspicions from a great number of phenomena and experiments, which plainly argue such powers and actions between the particles, *e. g.* of salts and water, oil of vitriol and water, aquafortis and iron, spirit of vitriol and saltpetre. He also shows, that these powers, &c. are unequally strong between different bodies; stronger, *e. g.* between the particles of salt of tartar and those of aquafortis than those of silver, between aquafortis and lapis calaminaris than iron, between iron than copper, copper than silver or mercury. So spirit of vitriol acts on water, but more on iron or copper, &c.

The other experiments which countenance the existence of such principle of attraction in the particles of matter are innumerable.

These actions, in virtue whereof the particles of the bodies abovementioned tend towards each other, the author calls by a general indefinite name, *attraction*; which is equally applicable to all actions whereby distant bodies tend towards one another, whether by impulse or by any other more latent power: and from hence he accounts for an infinity of phenomena, otherwise inexplicable, to which the principle of gravity is inadequate.

"Thus (adds our author) will nature be found very conformable to herself, and very simple; performing all the great motions of the heavenly bodies by the attraction of gravity, which intercedes those bodies, and almost all the small ones of their parts, by some other attractive power diffused through the particles thereof. Without such principles, there never would have been any motion in the world; and without the continuance thereof, motion would soon perish, there being otherwise a great decrease or diminution thereof, which is only supplied by these active principles."

We need not say how unjust it is in the generality of foreign philosophers to declare against a principle which furnishes so beautiful a view, for no other reason but because they cannot conceive how one body should act on another at a distance. It is certain, philosophy allows of no action but what is by immediate contact and impulsion (for how can a body exert any active power there where it does not exist? to supppose this of any thing, even the Supreme Being himself, would perhaps imply a contradiction): yet we see effects without seeing any such impulse; and where there are effects, we can easily infer there are causes whether we see them or no. But a man may consider such effects without entering into the consideration of the causes, as indeed it seems the business of a philosopher to do: for to exclude a number of phenomena which we do see, will be to leave a great chasm in the history of nature; and to argue about actions which we do not see, will be to build castles in the air.—It follows, therefore, that the phenomena of attraction are matters of physical consideration, and as such intitled to a share in the system of physics; but that the causes thereof will only become so when they become sensible, *i. e.* when they appear to be the effect of some other higher causes (for a cause is no otherwise seen than as itself is an effect, so that the first cause must from the nature of things be invisible): we are therefore at liberty to suppose the causes of attractions what we please, without any injury to the effects.—The illustrious author himself seems a little irresolute as to the causes; inclining sometimes to attribute gravity to the action of an immaterial cause (*Optics*, p. 343, &c.) and sometimes to that of a material one (Ib. p. 325.)

In his philosophy, the research into causes is the last thing, and never comes under consideration till the laws and phenomena of the effect be settled; it being to these phenomena that the cause is to be accommodated. The cause even of any, the grossest and most sensible action, is not adequately known. How impulse or percussion itself produces its effects, *i. e.* how motion is communicated by body to body, confounds the deepest philosophers; yet is impulse received not only into philosophy, but into mathematics: and accordingly the laws and phenomena of its effects make the greatest part of common mechanics.

The other species of attraction, therefore, in which no impulse is remarkable, when their phenomena are sufficiently ascertained, have the same title to be promoted from physical to mathematical consideration; and this without any previous inquiry into their causes, which our conceptions may not be proportionate to: let their causes be occult, as all causes strictly speaking are, so that their effects, which alone immediately concern us, be but apparent.

Our great philosopher, then, far from adulterating science with any thing foreign or metaphysical, as many have reproached him with doing, has the glory of having thrown every thing of this kind out of his system, and of having opened a new source of sublimer mechanics, which duly cultivated might be of infinitely greater extent than all the mechanics yet known. It is hence alone we must expect to learn the manner of the changes, productions, generations, corruptions, &c. of natural things; with all that scene of wonders opened to us by the operations of chemistry.

Some succeeding philosophers have prosecuted the discovery with laudable zeal: Dr Keil particularly has endeavoured to deduce some of the laws of this new action, and applied them to solve divers of the more general phenomena of bodies, as cohesion, fluidity, elasticity, softness, fermentation, coagulation, &c.; and Dr Friend, seconding him, has made a further application of the same principles, to account at once for almost all the phenomena that chemistry presents: so that some philosophers are inclined to think that the new mechanics should seem already raised to a complete science, and that nothing now can occur but what we have an immediate solution of from the attractive force.

But this seems a little too precipitate: A principle so fertile should have been further explored; its particular laws, limits, &c. more industriously detected and laid down, before we had proceeded to the application. Attraction in the gross is so complex a thing, that it may solve a thousand different phenomena alike. The notion is but one degree more simple and precise than action itself; and, till more of its properties are ascertained, it were better to apply it less and study it more. It may be added, that some of Sir Isaac Newton's followers have been charged with falling into that error which he industriously avoided, viz. of considering attraction as a cause or active property in bodies, not merely as a phenomenon or effect.

Attraction of Mountains. See MOUNTAINS.

Elective Attraction. See CHEMISTRY-*Index*.

ATTREBATII. See ATREBATII.

ATTRIBUTE, in a general sense, that which agrees with some person or thing; or a quality determining something to be after a certain manner. Thus understanding is an attribute of mind, and extension an attribute of body. That attribute which the mind conceives as the foundation of all the rest, is called its *essential attribute*: thus extension is by some, and solidity by others, esteemed the essential attributes of body or matter.

ATTRIBUTES, in theology, the several qualities or perfections of the Divine nature.

ATTRIBUTES, in logic, are the predicates of any subject, or what may be affirmed or denied of any thing.

ATTRIBUTES, in painting and sculpture, are symbols added to several figures, to intimate their particular office and character. Thus the eagle is an attribute of Jupiter; a peacock, of Juno; a caduce, of Mercury; a club, of Hercules; and a palm, of Victory.

ATTRIBUTIVES, in grammar, are words which are significant of attributes; and thus include adjectives, verbs, and participles, which are attributes of substances; and adverbs, which denote the attributes only of attributes. But Harris, who has introduced this distribution of words, denominates the former *attributives of the first order*, and the latter *attributives of the second order*.

ATTRITION, the rubbing or striking of bodies one against another, so as to throw off some of their superficial particles.

ATURÆ, an ancient town in the district of Novempopulana in Aquitania, on the river Aturus; now Aire in Gascony, on the Adour. E. Long. 0. 3. N. Lat. 43. 40.

AVA, a kingdom of Asia, in the peninsula beyond the Ganges. The king is very powerful, his dominions being bounded by Mogulstan on the west, Siam on the south, Tonquin and Cochin-China on the east, and by Tibet and China on the north. Several large rivers run through this country, which annually overflow their banks like the Nile, and thus render it extremely fertile. Here are mines of lead and copper, together with some of gold and silver, besides large quantities of the finest oriental rubies, sapphires, emeralds, &c.

AVA, the metropolis of the kingdom of the same name, is situated in E. Long. 96. 30. N. Lat. 21. 0. It is pretty large; the houses built with timber or bamboo canes, with thatched roofs, and floors made of teak plank or split bamboo. The streets are very straight, with rows of trees planted on each side. The king's palace is an exact quadrangle, each side of which is 800 paces, and is surrounded with a brick wall; but the palace itself is of stone. It has four gates: the golden gate, through which all ambassadors enter; the gate of justice, through which the people bring petitions, accusations, or complaints; the gate of grace, through which those pass who have received any favours, or have been acquitted of crimes laid to their charge; and the gate of state, through which his majesty himself passes when he shows himself to the people.

AVA AVA, a plant so called by the inhabitants of Otaheite, in the South Sea, from the leaves of which they express an intoxicating juice. It is drank very freely by the chiefs and other considerable persons, who vie with each other in drinking the greatest number of draughts, each draught being about a pint: but it is carefully kept from their women.

AVADOUTAS, a sect of Indian Bramins, who in austerity surpass all the rest. The other sects retain earthen vessels for holding their provisions, and a stick to lean on: but none of these are used by the Avadoutas; they only cover their nakedness with a piece of cloth; and some of them lay even that aside, and go stark naked, besmearing their bodies with cow-dung. When hungry, some go into houses, and, without speaking, hold out their hand; eating on the spot whatever is given them. Others retire to the sides of holy rivers, and there expect the peasants to bring them provisions, which they generally do very liberally.

AVAIL OF MARRIAGE, in Scots law, that casualty in ward-holding, by which the superior was intitled to a certain sum from his vassal, upon his attaining the age of puberty, as the value or avail of his tocher.

AVALANCHES, a name given to prodigious snow-balls that frequently roll down the mountains in Savoy

Savoy, particularly Mount Blanc, to the extreme danger of such adventurous travellers as attempt to ascend those stupendous heights. Some of the avalanches are about 200 feet diameter; being fragments of the ice-rocks which break by their own weight from the tops of the precipices. See *Mount Blanc*.

AVALON, a small but ancient city of Burgundy in France, about 500 paces long and 300 broad. E. Long. 3. 5. N. Lat. 47. 38.

AVANIA, in the Turkish legislature, a fine for crimes and on deaths, paid to the governor of the place. In the places wherein several nations live together under a Turkish governor, he takes this profitable method of punishing all crimes among the Christians or Jews, unless it be the murder of a Turk.

AVARICUM, an ancient town of the Bituriges in Gallia Celtica, situated on the rivulet Avara, in a very fertile soil (Cæsar). Now *Bourges* in Berry. E. Long. 2. 30. N. Lat. 47. 10.

AVAST, in the sea-language, a term requiring to stop, or to stay.

AVAUNCHERS, among hunters, the second branches of a deer's horns.

AUBAGNE, a town of Provence in France, situated on the river Veaune, on the road from Marseilles to Toulon. The states sometimes hold their sessions at this place. E. Long. 5. 52. N. Lat. 43. 17.

AUBAINE, in the customs of France, a right vested in the king of being heir to a foreigner that dies within his dominions.

By this right the French king claims the inheritance of all foreigners that die within his dominions, notwithstanding of any testament the deceased could make. An ambassador is not subject to the right of aubaine; and the Swiss, Savoyards, Scots, Portuguese, and citizens of the United States of North-America, are also exempted, being deemed natives and regnicoles.

AUBENAS, a town of Languedoc in France, situated on the river Ardesche, at the foot of the mountains called the *Cevennes*, E. Long. 4. 32. N. Lat. 44. 40.

AUBENTON, a town of Picardy in France, situated on the river Aube. E. Long. 4. 25. N. Lat. 49. 51.

AUBETERRE, a town of France in the Angoumois, on the river Dronne. E. Long. 0. 10. N. Lat. 45. 15.

AUBIGNE, a town of Berry in France, situated on the river Verre, in a flat agreeable country. It is surrounded with high strong walls, wide ditches, and high counterscarps. The castle is within the town, and is very handsome. E. Long. 2. 20. N. Lat. 47. 29.

AUBIGNY, a dukedom in France belonging to the Dukes of Richmond in England; confirmed to the present duke, and registered in the parliament of Paris 1777.

AUBIN DU COMIER, a town of Britanny in France. W. Long. 1. 15. N. Lat. 48. 15.

AUBIN, in horsemanship, a broken kind of gate, between an amble and a gallop, accounted a defect.

AUBONNE, a town of Switzerland, in the canton of Bern. E. Long. 5. 54. N. Lat. 48. 30. It is situated near a river of the same name, seven miles north of the lake of Geneva, upon an eminence which has a gentle declivity, at the foot of which runs the river with an impetuous torrent. The town is built in the form of an amphitheatre; on the upper part of which stands a very handsome castle with a fine court, and a portico supported by pillars of a single stone each; above there is a covered gallery that runs round the court; and as the castle stands high, there is a most delightful prospect, not only of the town and neighbouring fields, but of the whole lake of Geneva and the land that surrounds it. At Thonen, in Savoy on the other side of the lake, is a town covered with tin, which makes a glittering appearance when the sun is in a certain position; and the castle of Aubonne has likewise a tower of the same kind, which at certain hours makes a similar appearance to the Savoyards. The balliage of Aubonne contains several villages, which are mostly at the foot of the mountain Jura. In one part of this mountain there is a very deep cave, wherein those that go down find a natural and perpetual ice-house. At the bottom is heard a great noise like that of a subterraneous river, which is supposed to be that of the river Aubonne, because it first appears, with several sources, about 100 paces from the foot of that mountain.

AUBREY (John), a famous English antiquary, descended from an ancient family in Wiltshire, was born in 1626. He made the history and antiquities of England his peculiar study and delight; and contributed considerable assistance to the famous *Monasticon Anglicanum*. He succeeded to several good estates; but law-suits and other misfortunes consumed them all, so that he was reduced to absolute want. In this extremity he found a valuable benefactress in the Lady Long of Draycot in Wilts, who gave him an apartment in her house, and supported him to his death, which happened about the year 1700. He was a man of capacity, learning, and application, a good Latin poet, an excellent naturalist, but somewhat credulous, and tinctured with superstition. He left many works behind him. He wrote, 1. Miscellanies. 2. A Perambulation of the county of Surry, in five volumes, octavo. 3. The Life of Mr Hobbes of Malmsbury. 4. *Monumenta Britannica*, or a discourse concerning Stonehenge, and Roll-Rich stones in Oxfordshire. 5. *Architectonica Sacra;* and several other works still in manuscript.

AUBURN, a market-town in Wiltshire, in England. W. Long. 1. 20. N. Lat. 53. 20.

AUBUSSON, a small town of France, in the province of La Marche, and the government of the Lyonnois. Its situation is very irregular, on the river Creuse, in a bottom surrounded with rocks and mountains. A manufacture of tapestry is carried on here, by which the town is rendered very populous. E. Long. 2. 15. N. Lat. 45. 58.

AUCAUGREL, the capital of the kingdom of Adel in Africa, seated on a mountain. E. Long. 44. 25. N. Lat. 9. 10.

AUCH, a city of France, the capital of the county of Armagnac, and the metropolis of all Gascony. The archbishop assumes the title of primate of Aquitain. It lies on the summit and declivity of a very steep hill, which is surrounded by other hills that rise at a small distance; and through the vale below runs a rivulet, called the *Gers*. The inhabitants are about 6000; the buildings are modern and elegant; the streets, though in general narrow, yet are clean and well

well paved. In the centre of the city ſtands the cathedral, which is one of the moſt magnificent in France, both as to its conſtruction and the internal decorations. The painted windows are only inferior to thoſe of Gouda in Holland. The chapels are of equal beauty, and ornamented at a prodigious expence. The revenues of the ſee of Auch, amount annually to three hundred thouſand livres. The palace is a very handſome building; and its apartments are furniſhed with a voluptuous ſplendor, rather becoming a temporal than a ſpiritual prince. E. Long. 0. 40. N. Lat. 43. 40.

AUCTION, a kind of public ſale, very much in uſe for houſehold goods, books, plate, &c. By this method of ſale the higheſt bidder is always the buyer. This was originally a kind of ſale among the ancient Romans, performed by the public crier *ſub haſta, i. e.* under a ſpear ſtuck up on that occaſion, and by ſome magiſtrate, who made good the ſale by delivery of the goods.

AUDEUS, the chief of the Audeans, obtained the name of an heretic, and the puniſhment of baniſhment, for celebrating Eaſter in the manner of the Jews, and attributing an human form to the Deity. He died in the country of the Goths, about the year 370.

AUDEANISM, the ſame with anthropomorphiſm. See ANTHROPOMORPHITES.

AUDIENCE given to ambaſſadors, a ceremony obſerved in courts at the admiſſion of ambaſſadors or public miniſters to a hearing.

In England, audience is given to ambaſſadors in the preſence-chamber; to envoys and reſidents, in a gallery, cloſet, or in any place where the king happens to be. Upon being admitted, as is the cuſtom of all courts, they make three bows; after which they cover and ſit down; but not before the king is covered and ſat down, and has given them the ſign to put on their hats. When the king does not care to have them covered, and ſit, he himſelf ſtands uncovered; which is taken as a ſlight. At Conſtantinople, miniſters uſually have audience of the prime vizier.

AUDIENCE is alſo the name of a court of juſtice eſtabliſhed in the Weſt-Indies by the Spaniards, anſwering in effect to the parliament in France. Theſe courts take in ſeveral provinces, called alſo *audiences* from the names of the tribunal to which they belong.

AUDIENCE is alſo the name of an eccleſiaſtical court held by the archbiſhop of Canterbury, wherein differences upon elections, conſecrations, inſtitutions, marriages, &c. are heard.

AUDIENDO & TERMINANDO, a writ, or rather a commiſſion to certain perſons, when any inſurrection or great riot is committed in any place, for the appeaſing and puniſhment thereof.

AUDIENTES, or AUDITORES, in church-hiſtory, an order of catechumens; conſiſting of thoſe newly inſtructed in the myſteries of the Chriſtian religion, and not yet admitted to baptiſm.

AUDIT, a regular hearing and examination of an account by ſome proper officers, appointed for that purpoſe.

AUDITOR, in a general ſenſe, a hearer, or one who liſtens and attends to any thing.

AUDITOR, according to the Engliſh law, is an officer of the king, or ſome other great perſon, who, by examining yearly the accounts of the under officers, makes up a general book, with the difference between their receipts and charges, and their allowances to allocations.

AUDITORS of the Receipts, is an officer of the exchequer who files the tellers bills, makes an entry of them, and gives the lord treaſurer a certificate of the money received the week before. He alſo makes debentures to every teller, before they receive any money, and takes their accounts. He keeps the black book of receipts, and the treaſurer's key of the treaſury, and ſees every teller's money locked up in the new treaſury.

AUDITORS of the Revenue, or of the exchequer, officers who take the accounts of thoſe who collect the revenues and taxes raiſed by parliament, and take the accounts of the ſheriffs, eſcheators, collectors, tenants, and cuſtomers, and ſet them down in a book, and perfect them.

AUDITORS of the Preſt and Impreſt, officers of the exchequer, who take and make up the accounts of Ireland, Berwick, the mint, and of any money impreſſed to any man for the king's ſervice. They received poundage on all accounts paſſed by them, which amounted to a prodigious ſum, eſpecially in time of war. But the office is now aboliſhed, and L. 7000 a year given to the incumbents.

AUDITORS Collegiate, Conventual, &c. officers formerly appointed in colleges, &c. to examine and paſs their accounts.

AUDITORES, in church hiſtory. See AUDIENTES.

The auditores formed one branch of the Manichean ſect, which was divided into *elect* and *auditors*; correſponding, according to ſome writers, to *clergy* and *laity*; and according to others, to the *faithful* and *catechumens* among the Catholics. By the Manichean rule, a different courſe of life was preſcribed to the elect from that of the auditors. The latter might eat fleſh, drink wine, bathe, marry, traffic, poſſeſs eſtates, bear magiſtracy, and the like; all which things were forbidden to the elect. The auditors were obliged to maintain the elect, and kneeled down to aſk their bleſſing. Beauſobre obſerves, that the elect were eccleſiaſtics, and in general ſuch as made profeſſion of obſerving certain counſels, called *evangelic*; ſuch as the clergy and Monks; and they were called the *perfect* by Theodoret. The auditors were the laity, and ſo denominated, becauſe they heard in the church whilſt others taught and inſtructed.

AUDITORIUM, in the ancient churches, was that part of the church where the audientes ſtood to hear and be inſtructed.

The auditorium was that part now called *navis eccleſiæ* *. In the primitive times, the church was ſo ſtrict in keeping the people together in that place, that the perſon who went from thence in ſermon-time was ordered by the council of Carthage to be excommunicated.

* See Nave.

AUDITORY, ſomething relating to the ſenſe of hearing.

AUDITORY, or AUDIENCE, an aſſembly of people who attend to hear a perſon that ſpeaks in public.

Auditory ‖ Audran.

AUDITORY is alſo uſed for the bench whereon a magiſtrate or judge hears cauſes.

AUDITORY, in ancient churches. See AUDITORIUM.

AUDITORY Paſſage, (meatus auditorius), in anatomy; the entrance of the ear. See ANATOMY, p. 763, nº 141.

AUDITORY Nerves. See ANATOMY, p. 760.

AUDRAN (Claude), a French engraver, the firſt of the celebrated artiſts of that name, was the ſon of Lewis Audran, an officer belonging to the wolf-hunters in the reign of Henry IV. of France; and was born at Paris in 1592. He never made any great progreſs in the art; ſo that his prints are held in little or no eſtimation. Yet though he acquired no great reputation by his own works, it was no ſmall honour to him to be the father of three great artiſts, Germain, Claude, and Girard; the laſt of whom has immortalized the name of the family for ever. Claude Audran retired from Paris to Lyons, where he reſided, and died in 1677.

AUDRAN (Carl), a very eminent engraver, was brother to the preceding, though ſome aſſert he was only his couſin-german, and was born at Paris in 1594. In his infancy he diſcovered much taſte, and a great diſpoſition for the arts; and to perfect himſelf in engraving, which he appears to have been chiefly fond of, he went to Rome, where he produced ſeveral prints that did him great honour. At his return, he adopted that ſpecies of engraving which is performed with the graver only. He ſettled at Paris, where he died in 1674, without having ever been married. The Abbé Marolles, who always ſpeaks of this artiſt with great praiſe, attributes 130 prints to him: amongſt which, the *annunciation*, a middling-ſized plate, upright, from Annabale Carracci; and the *aſſumption*, in a circle, from Domenichino, are the moſt eſteemed. In the early part of his life he marked his prints with C, or the name of Carl, till his brother Claude publiſhed ſome plates with the initial only of his baptiſmal name; when, for diſtinction ſake, he uſed the letter K, or wrote his name Karl, with the K inſtead of the C.

AUDRAN (Germain), the eldeſt ſon of Claude, mentioned in the preceding article but one, was born in 1631 at Lyons, where his parents then reſided. Not content with the inſtructions of his father, he went to Paris, and perfected himſelf under his uncle Carl; ſo that, upon his return to Lyons, he publiſhed ſeveral prints which did great honour to his graver. His merit was in ſuch eſtimation, that he was made a member of the academy eſtabliſhed in that town, and choſen a profeſſor. He died at Lyons in 1710, and left behind him four ſons, all artiſts; namely, Claude, Benoiſt, John, and Louis.

AUDRAN (Claude), the ſecond of this name, and ſecond ſon to Claude abovementioned, was born at Lyons in 1639, and went to Rome to ſtudy painting, where he ſucceeded ſo well, that at his return he was employed by Le Brun to aſſiſt him in the battles of Alexander, which he was then painting for the king of France. He was received into the Royal Academy in the year 1675, and died unmarried at Paris in 1684. His virtues, (ſays Abbé Fontenai) were as praiſe-worthy as his talents were great. M. Heineken mentions this artiſt as an engraver, without ſpecifying any of his works in that line. Audran.

AUDRAN (Girard, or Gerard), the moſt celebrated artiſt of the whole family of the Audrans, was the third ſon of Claude Audran mentioned in a preceding article, and born at Lyons, in 1640. He learned from his father the firſt principles of deſign and engraving; and following the example of his brother, he left Lyons and went to Paris, where his genius ſoon began to manifeſt itſelf. His reputation there brought him to the knowledge of Le Brun, who employed him to engrave the *battle of Conſtantine*, and the *triumph* of that emperor; and for theſe works he obtained apartments at the Gobelins. At Rome, whither he went for improvement, he is ſaid to have ſtudied under Carlo Maratti, in order to perfect himſelf in drawing; and in that city, where he reſided three years, he engraved ſeveral fine plates. M. Colbert, that great encourager of the arts, was ſo ſtruck with the beauty of Audran's works while he reſided at Rome, that he perſuaded Louis XIV. to recall him. On his return, he applied himſelf aſſiduouſly to engraving; and was appointed engraver to the king, from whom he received great encouragement. In the year 1681 he was named counſellor of the Royal Academy; and died at Paris in 1703. He had been married; but left no male iſſue behind him.

Strutt's Dictionary.

The great excellency of this artiſt above that of any other engraver was, that though he drew admirably himſelf, yet he contracted no manner of his own; but tranſcribed on copper ſimply, with great truth and ſpirit, the ſtyle of the maſter whoſe pictures he copied. On viewing his prints you loſe ſight of the engraver, and naturally ſay, it is Le Brun, it is Pouſſin, it is Mignard, or it is Le Sueur, &c. as you turn to the prints which he engraved from thoſe maſters. Let any one examine the *battles* above-mentioned from Le Brun, the *preſervation of the young Pyrrhus* from Nicholas Pouſſin, the *peſt* from Mignard, and the *martyrdom of St Lawrence* from Le Sueur, and then judge candidly of the truth of this obſervation. The following judicious obſervations by the Abbé Fontenai, taken chiefly from M. Baſan, with ſome ſmall variation and additions, will fully illuſtrate the merits of Gerard Audran. "This ſublime artiſt, far from conceiving that ſervile arrangement of ſtrokes, and the too frequently cold and affected clearneſs of the graver, were the great eſſentials of hiſtorical engraving, gave worth to his works by a bold mixture of free hatchings and dots, placed together apparently without order, but with an inimitable degree of taſte; and has left to poſterity moſt admirable examples of the ſtyle in which grand compoſitions ought to be treated. His greateſt works, which have not a very flattering appearance to the ignorant eye, are the admiration of true connoiſſeurs and perſons of fine taſte. He acquired the moſt profound knowledge of the art by the conſtant attention and ſtudy which he beſtowed upon the ſcience of deſign, and the frequent uſe he made of painting from nature. This great man always knew how to penetrate into the genius of the painter he copied from; often improved upon, and ſometimes even ſurpaſſed him. Without exception, he was the moſt celebrated engraver that ever exiſted in the hiſtorical line. We have several subjects which he engraved from his own designs, that manifested as much taste as character and facility. But, in the *battles of Alexander*, he surpassed even the expectations of Le Brun himself." These consist of three very large prints, length-ways, each consisting of four plates, which join together, from Le Brun, namely, *the passage of the Granicus; the battle of Arbela; Porus brought to Alexander*, after his defeat.—To this set are added two more large prints, length-ways, on two plates each, also from Le Brun, as follow: *Alexander entering the tent of Darius;* and *The Triumphal entry of Alexander into Babylon.* The former was engraved by Girard Edelink, and the latter by Girard Audran. It is to be remarked of all these plates, that those impressions are generally most esteemed which have the name of Goyton the printer marked upon them.—The *Pest*, from Peter Mignard, a large plate, length-ways, also deserves particular notice. In the first impressions, the figure in the clouds is Juno with her peacock behind her; in the latter, the peacock is obliterated, and the wings of an angel are added to the figure.

AUDRAN (Benoit), the second son of Germain Audran, was born at Lyons, in 1661, where he learned the first principles of design and engraving under the instruction of his father. But soon after going to Paris, his uncle Girard Audran took him under his tuition; and Benoit so greatly profited by his instructions, that though he never equalled the sublime style of his tutor, yet he deservedly acquired great reputation. Nay, the Abbé Fontenai adds this eulogium: "We admire in his works a share of those beauties which we find in the engravings of the illustrious Girard." He was honoured with the appellation of the king's engraver, and received the royal pension. He was made an academician, and admitted into the council in 1715. He died unmarried at Louzouer, where he had an estate, in 1721. His manner was founded on the bold clear style of his uncle. His outlines were firm and determined; his drawing correct; the heads of his figures are in general very expressive; and the other extremities well marked. His works, when compared with those of his uncle, appear to want that mellowness and harmony which are so conspicuous in the latter; they are more dry; and the round dots with which he finishes his flesh upon the lights are often too predominant. In his most finished plates, we find the mechanical part of the engraving extremely neat, and managed with great taste and judgment. Among his neatest prints may be reckoned that which represents *Alexander sick*, drinking from the cup which his physician presents to him; a circular plate, from Le Sueur.

AUDRAN (John), the third son of Germain Audran, was born at Lyons in 1667; and, after having received instructions from his father, went to Paris to perfect himself in the art of engraving under his uncle Girard Audran. At the age of 20 years, the genius of this great artist begun to display itself in a surprising manner; and his future success was such, that in 1707, he obtained the title of engraver to the king, and had a pension allowed him by his majesty, with apartments in the Gobelins; and the following year he was made a member of the Royal Academy. He was 80 years of age before he quitted the graver; and near 90 when he died at his apartments assigned him by the king. He left three sons behind him; one of whom was also an engraver, as we shall see below. "The most masterly and best prints of this artist (in Mr Strutt's opinion) are those which are not so pleasing to the eye at first sight. In these the etching constitutes a great part; and he has finished them in a bold rough style. The scientific hand of the master appears in them on examination. The drawing of the human figure, where it is shewn, is correct. The heads are expressive and finely finished; the other extremities well marked. He has not, however, equalled his uncle. He wants that harmony in the effect; his lights are too much and too equally covered; and there is not sufficient difference between the style in which he has engraved his back grounds and his draperies. This observation refers to a fine print by him of Athaliah, and such as he engraved in that style. At other times he seems almost to have quitted the point, and substituted the graver. But here I think he has not so well succeeded. The effect is cold and silvery: see, for example, the *Andromache* from Sylvestre. One of his best finished prints, in this neat style, seems to me to be *Cupid* and *Psyche* from Ant. Coypel."

AUDRAN (Louis), the last son of Germain Audran, was born at Lyons in 1670; from whence he went to Paris, after the example of his brothers, to complete his studies in the school of his uncle Girard. He died suddenly at Paris in 1712, before he had produced any great number of prints by his own hand. He assisted, it is presumed, his brothers in their more extensive works. Among the most esteemed prints by this artist are *the seven acts of mercy*, on seven middling-sized plates, length-ways, from Sebastian Bourdon.

AUDRAN (Benoit), the second engaver of that name, was the son of John Audran, and nephew to the former Benoit; and was also established at Paris. He engraved but a few plates. It is necessary, however, to be careful not to confound him with his uncle. But a little attention will easily prevent this mistake; for the second Benoit is vastly inferior to the first in point of merit. We have some few portraits by this artist; and among other plates, *the descent from the cross*, from a picture of Poussin.

AVEIRO, a considerable city of Portugal, seated near the head of a small gulf formed by the tide at the mouth of the river Vouga. This river forms a small haven with a bar, over which vessels may pass that do not draw above eight or nine feet water. The city stands in a long plain, well watered, and very fertile. This plain is nine miles broad, from Porto to Coimbro; and is bounded on the east by a chain of mountains called *Sara d'Alcoba*, which reach from the one town to the other. Near this city there is salt made in sufficient quantity to serve two or three provinces. Here is a remarkable nunnery, where none are received but the daughters of the ancient nobility. The inhabitants of Aveiro have the singular privilege, that no stranger whatever can pass a night there without leave of the magistrate. W. Long. 9. 8. N. Lat. 40. 30.

AVELLANE, in heraldry, a cross, the quarters of which somewhat resemble a filbert-nut. Sylvanus Morgan says, that it is the cross which ensigns the mound of authority, or the sovereign's globe.

AVELLINO, a city of Italy, in the kingdom of Naples, with a bishop's see. It was almost ruined by an an earthquake in 1694. It is, however, at present a pretty considerable place, extending a mile in length down the declivity of a hill, with ugly streets but tolerable houses. The churches have nothing to recommend them, being crowded with monstrous ornaments in a barbarous style, which the Neapolitans seem to have borrowed from the Spaniards. The cathedral is a poor building, in a wretched situation, with little to attract the eye. The good people here need not run to Naples to see the blood of St. Januarius; for they have a statue of St Lawrence, with a phial of his blood, which for eight days in August entertains them with a similar miraculous liquefaction. Their only edifice of note is a public granary, of the Composite order, adorned with antique statues, and a very elegant bronze one of Charles II. of Spain, while a boy, cast by Cavalier Cosimo. The number of inhabitants amounts to 8000, some say 10,000. The bishop's revenue is about 6000 ducats (L. 1125) a-year. The magistracy consists of a Syndic and four Eletti, all annual; which offices are engrossed by a certain number of families of some distinction, that neither intermarry nor associate with the rest of the burghers. There is a considerable manufacture of cloth here of various qualities and colours, but chiefly blue. Many wealthy merchants have a concern in this business, some with a capital of eighty thousand ducats (L. 15,000). The poor women who spin the wool must work very hard to earn above four grana a-day. The second article of trade is maccaroni and paste of many kinds, which being of an excellent quality, are in high repute all over the country. Wooden chairs are also made and sold here in great quantities. Avellino abounds with provisions of every sort; each street is supplied with wholesome water; the wine is but indifferent. The soil of this district, which consists chiefly of volcanic substances, produces little corn, but fruit in abundance, of which the apple is deservedly held in great esteem. The most profitable, however, of all its fruit-trees is the hazel. Nut bushes cover the face of the valley, and in good years bring in a profit of sixty thousand ducats (L. 11,250). The nuts are mostly of the large round species of filbert, which we call *Spanish*. These bushes were originally imported into Italy from Pontus, and known among the Romans by the appellation of *Nux Pontica*, which in process of time was changed into that of *Nux Avellana*, from the place where they had been propagated with the greatest success. The proprietors plant them in rows, and by dressing, form them into large bushes of many stems. Every year they refresh the roots with new earth, and prune off the straggling shoots with great attention.

AVE-MARIA, the angel Gabriel's salutation of the Virgin Mary, when he brought her the tidings of the incarnation.—It is become a prayer or form of devotion in the Romish church. Their chaplets and rosaries are divided into so many ave-marias, and so many pater-nosters, to which the Papists ascribe a wonderful efficacy.

AVENA, OATS: A genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx has a double valve, and the awn on the back is contorted. The species are 13; six of them natives of Britain: *viz.* 1. The nuda, or naked oats. 2. The fatua, or bearded oat-grass. 3. The pratensis, or meadow oat-grass. 4. The pubescens, or rough oat-grass. 5. The elatior, or tall oat-grass. 6. The flavescens, or yellow oat-grass. It is remarkable, that the native place of the sativa, or common oat, cultivated in our fields, is almost totally unknown. Anson says, that he observed it growing wild or spontaneously in the island of Juan Fernandez. But a vague observation from an author of that kind is not to be depended on.—For the culture, see AGRICULTURE, n° 137.

Oats are an article of the materia medica. Gruels made from them have a kind of soft mucilaginous quality; by which they obtund acrimonious humours, and prove useful in inflammatory diseases, coughs, hoarseness, and exulcerations of the fauces.

AVENACEOUS, something belonging to or partaking of the nature of oats.

AVENAGE, in law, a certain quantity of oats paid by a tenant to a landlord, instead of rent or some other duties.

AVENCHE, an ancient city of Switzerland, in the canton of Bern, formerly the capital of all Switzerland, but now shows its former greatness only by its ruins. E. Long. 7. 7. N. Lat. 46. 50.

AVENES, a small but strong town in French Flanders, in the county of Hainalt, seated on the river Thespes. It contains about 2500 inhabitants; but the houses are wretchedly built, and the streets irregular. It was fortified by M. Vauban in a strong regular manner. About this place are a prodigious number of white stones proper for building, and used by sculptors for statues: they are known by the name of *Stones of Avenes*. E. Long. 3. 40. N. Lat. 50. 10.

AVENIO, an ancient town of the Cavares, and one of the most opulent in Gallia Narbonensis; now *Avignon*, in Provence. See AVIGNON.

AVENOR, an officer belonging to the king's stables, who provides oats for the horses. He acts by warrant from the master of the horse.

AVENS, in botany. See CARIOPHILLUS.

AVENTINE (John, author of the Annals of Bavaria, was born of mean parentage, in the year 1466, at Abensperg in the country just named. He studied first at Ingoldstadt, and afterwards in the university of Paris. In 1503, he privately taught eloquence and poetry at Vienna; and in 1507, he publicly taught Greek at Cracow in Poland. In 1509, he read lectures on some of Cicero's pieces at Ingoldstadt; and in 1512, was appointed to be preceptor to prince Lewis and prince Ernest, sons of Albert the Wise, duke of Bavaria; and travelled with the latter of those two princes. After this he undertook to write the Annals of Bavaria, being encouraged by the dukes of that name, who settled a pension upon him, and gave him hopes that they would defray the charges of the book. This work, which gained its author great reputation, was first published in 1554, by Jerome Zeiglerus, professor of poetry in the university of Ingoldstadt; and afterwards at Brasil in 1580, by Nicholas Cisner. An affront which Aventine received in the year 1529, stuck by him all the rest of his life: he was forcibly taken out of his sister's house at Abensperg, and hurried to a jail; the true cause of which violence was never known: but it would probably have been carried to a much greater length, had not the Duke of Bavaria interposed, and taken this learned man into his protection. Mr Bayle remarks, that the incurable melancholy which from this time possessed Aventine, was so far from determining him to lead a life of celibacy, as he had done till he was 64, that it induced him perhaps to think of marrying. The violence of his new passion was not, however, so great, but that it suffered him to advise with two of his friends, and consult certain passages of the bible relative to marriage. The result was, that it was best for him to marry; and having already lost too much time, considering his age, he took the first woman he met with, who happened to be his own maid, ill-tempered, ugly, and extremely poor. He died in 1534, aged 68; leaving one daughter, who was then but two months old. He had a son, who died before.

AVENTINUS MONS, one of the seven hills on which ancient Rome stood. The origin of the name *Aventinus* is uncertain: but this hill was also called *Murcius*, from Murcia the goddess of sloth, who had a little chapel there; and *Collis Dianæ*, from the temple of Diana; likewise *Remonius*, from Remus, who wanted to build the city and who was buried there. It was taken within the compass of the city by Ancus Marcius. To the east it had the city walls; to the south the Campus Figulinus; to the west, the Tiber; and to the north, Mons Palatinus, in circuit two miles and a quarter.

AVENTURE, in law-books, means a mischance causing the death of a person without felony.

AVENUE, in gardening, a walk planted on each side with trees, and leading to an house, garden-gate, wood, &c. and generally terminated by some distant object.

All avenues that lead to a house ought to be at least as wide as the whole front of the house, if wider they are better still; and avenues to woods and prospects ought not to be less than 60 feet wide. The trees should not be planted nearer to one another than 35 feet, especially if they are trees of a spreading kind; and the same ought to be the distance, if they are for a regular grove.

The trees most proper for avenues with us, are the English elm, the lime, the horse-chesnut, the common chesnut, the beach, and the abele. The English elm will do in all grounds, except such as are very wet and shallow; and this is preferred to all other trees, because it will bear cutting, heading, or lopping in any manner, better than most others. The rough or smooth Dutch elm is approved by some, because of its quick growth; this is a tree which will bear removing very well, it is also green almost as soon as any plant whatever in spring, and continues so as long as any, and it makes an incomparable hedge, and is preferable to all other trees for lofty espaliers. The lime is valued for its natural growth and fine shade. The horse-chesnut is proper for all places that are not too much exposed to rough winds. The common chesnut will do very well in a good soil; and rises to a considerable height, when planted somewhat close; though, when it stands single, it is rather inclined to spread than to grow tall. The beech is a beautiful tree, and naturally grows well with us in its wild state; but it is less to be chosen for avenues than the before-mentioned, because it does not bear transplanting well, but it is very subject to miscarry. Lastly, the abele is fit for any soil, and is the quickest grower of any forest-tree. It seldom fails in transplanting; and succeeds very well in wet soils, in which the others are apt to fail. The oak is but little used for avenues, because of its slow growth.

The old method of planting avenues was with regular rows of trees, and this has been always kept to till of late: but we have now a much more magnificent way of planting avenues; this is by setting the trees in clumps, or platoons, making the opening much wider than before, and placing the clumps of trees at about 300 feet distant from one another. In each of these clumps there should be planted either seven or nine trees; but it is to be observed, that this is only to be practised where the avenue is to be of some considerable length, for in short walks this will not appear so sightly as single rows of trees. The avenues made by clumps are fittest of all for parks. The trees in each clump should be planted about 30 feet asunder; and a trench should be thrown up round the whole clump, to prevent the deer from coming to the trees to bark them.

AVENZOAR, ABU MERWAN ABDALMALEC EBN ZOHR, an eminent Arabian physician, flourished about the end of the eleventh or the beginning of the twelfth century. He was of noble descent, and born at Seville, the capital of Andalusia, where he exercised his profession with great reputation. His grandfather and father were both physicians. The large estate he inherited from his ancestors, set him above practising altogether for gain: he therefore took no fees from the poor, or from artificers, though he refused not the presents of princes and great men. His liberality was extended even to his enemies; for which reason he used to say, that they hated him not for any fault of his, but rather out of envy. Dr Friend writes, that he lived to the age of 135; that he began to practise at 40, or (as others say) at 20; and had the advantage of a longer experience than almost any one ever had, for he enjoyed perfect health to his last hour. He left a son, known also by the name of *Ebn Zohr*, who followed his father's profession, was in great favour with Al Manzûr emperor of Morocco, and wrote several treatises of physic.

Avenzoar was cotemporary with Averroes, who, according to Leo Africanus heard the lectures of the former, and learned physic of him; this seems the more probable, because Averroes more than once gives Avenzoar a very high and deserved encomium, calling him *admirable*, *glorious*, *the treasure of all knowledge*, and *the most supreme in physic from the time of Galen to his own*. Avenzoar, notwithstanding, is by the generality of writers reckoned an empiric: But Dr Friend observes, that this character suits him less than any of the rest of the Arabians. "He was bred," continues that author, "in a physical family, his father and grandfather being both practitioners, whom he always remembers with great gratitude and honour. We have his own testimony that he had a regular education; and that he not only learned what properly belongs to a physician, but, out of a great desire of knowledge, every thing besides which relates to pharmacy or surgery." Dr Friend afterwards observes, "that he was averse to quackery, and rejects the idle superstitions of astrologers; and throughout all his work professes himself

ſelf ſo much of the dogmatical or rational ſect, which was directly oppoſite to the empirical, that he has a great deal of reaſoning about the cauſes and ſymptoms of diſtempers; and as in his theory he chiefly, if not only, follows Galen, ſo he quotes him upon all occaſions, oftener than the reſt of the Arabians do. Notwithſtanding he is ſo Galenical, there are ſeveral particulars in him which ſeldom or never occur in other authors; and there are ſome caſes which he relates from his own experience, which are worth peruſing." He wrote a book entitled, *Tayaſſir fi'lmadâwât w'altadbîr*, i. e. "The method of preparing medicines and diet:" which is much eſteemed. This work was tranſlated into Hebrew, in the year of Chriſt 1280, and thence into Latin by Paravicius, whoſe verſion has had ſeveral editions. The author added a ſupplement to it, under the title of *Jâmé*, or *a Collection*. He alſo wrote a treatiſe *Fi'ladwiyat wa'laughdiyat*, i. e. "Of Medicines and Food;" wherein he treats of their qualities.

AVERAGE, in commerce, ſignifies the accidents and misfortunes which happen to ſhips and their cargoes, from the time of their loading and ſailing to their return and unloading; and is divided into three kinds. 1. The ſimple or particular average, which conſiſts in the extraordinary expences incurred for the ſhip alone, or for the merchandizes alone. Such is the loſs of anchors, maſts, and rigging, occaſioned by the common accidents at ſea; the damages which happen to merchants by ſtorm, prize, ſhipwreck, wet, or rotting; all which muſt be borne and paid by the thing which ſuffered the damage. 2. The large and common average, being thoſe expences incurred, and damages ſuſtained, for the common good and ſecurity both of the merchandizes and veſſels, conſequently to be borne by the ſhip and cargo, and to be regulated upon the whole. Of this number are the goods or money given for the ranſom of the ſhip and cargo, things thrown overboard for the ſafety of the ſhip, the expences of unloading for entering into a river or harbour, and the proviſions and hire of the ſailors when the ſhip is put under an embargo. 3. The ſmall averages, which are the expences for towing and piloting the ſhip out of or into harbours, creeks or rivers, one-third of which muſt be charged to the ſhip, and two-thirds to the cargo.

AVERAGE is more particularly uſed for a certain contribution that merchants make proportionably to their loſſes, who have had their goods caſt into the ſea in the time of a tempeſt. It alſo ſignifies a ſmall duty which thoſe merchants, who ſend goods in another man's ſhip, pay to the maſter for his care of them over and above the freight. Hence it is expreſſed in the bills of lading, paying ſo much freight for the ſaid goods, with primage and *average* accuſtomed.

AVERDUPOIS. See AVOIRDUPOIS.

AVERNUS, a lake of Campania in Italy, near Baiæ, famous among the ancients for its poiſonous qualities. It is deſcribed by Strabo as lying within the Lucrine bay, deep and darkſome, ſurrounded with ſteep banks that hang threatening over it, and only acceſſible by the narrow paſſage through which you ſail in. Black aged groves ſtretched their ~~boughs over~~ the watry abyſs, and with impenetrable foliage excluded almoſt every ray of wholeſome light; mephitic vapours aſcending from the hot bowels of the earth, being denied free paſſage to the upper atmoſphere, floated along the ſurface in poiſonous miſts. Theſe circumſtances produced horrors fit for ſuch gloomy deities; a colony of Cimerians, as well ſuited to the rites as the place itſelf, cut dwellings in the boſom of the ſurrounding hills, and officiated as prieſts of Tartarus. Superſtition always delighting in dark ideas, early and eagerly ſeized upon this ſpot, and hither ſhe led her trembling votaries to celebrate her diſmal orgies; here ſhe evoked the manes of departed heroes—here ſhe offered ſacrifices to the gods of hell, and attempted to dive into the ſecrets of futurity. Poets enlarged upon the popular theme, and painted its awful ſcenery with the ſtrongeſt colours of their art. Homer brings Ulyſſes to Avernus, as to the mouth of the infernal abodes; and in imitation of the Grecian bard, Virgil conducts his hero to the ſame ground. Whoever ſailed thither, firſt did ſacrifice; and endeavoured to propitiate the infernal powers, with the aſſiſtance of ſome prieſts who attended upon the place, and directed the myſtic performance. Within, a fountain of pure water broke out juſt over the ſea, which was fancied to be a vein of the river Styx; near this fountain was the oracle, and the hot waters frequent in thoſe parts were ſuppoſed to be branches of the burning Phlegethon. The poiſonous effluvia from this lake were ſaid to be ſo ſtrong, that they proved fatal to birds endeavouring to fly over it. Virgil aſcribes the exhalation not to the lake itſelf, but to the cavern near it, which is called *Avernus*, or *Cave of the Sibyl*, and through which the poets feigned a deſcent to hell. Hence the proper name of the lake is *Lacus Averni*, the "lake near the cavern," as it is called by ſome ancient authors.

The holineſs of theſe ſhades remained unimpeached for many ages: Hannibal marched his army to offer incenſe at this altar; but it may be ſuſpected he was led to this act of devotion rather by the hopes of ſurpriſing the garriſon of Puteoli, than by his piety. After a long reign of undiſturbed gloom and celebrity, a ſudden glare of light was let in upon Avernus; the horrors were diſpelled, and with them vaniſhed the ſanctity of the lake; the axe of Agrippa brought its foreſt to the ground, diſturbed its ſleepy waters with ſhips, and gave room for all its malignant effluvia to eſcape. The virulence of theſe exhalations, as deſcribed by ancient authors, has appeared ſo very extraordinary, that modern writers, who know the place in a cleared ſtate only, charge theſe accounts with exaggeration: but Mr Swinburn thinks them entitled to more reſpect; for even now, he obſerves, the air is feveriſh and dangerous, as the jaundiced faces of the vine-dreſſers, who have ſucceeded the Sibyls and the Cimmerians in the poſſeſſion of the temple, moſt ruefully teſtify. Boccaccio relates, that during his reſidence at the Neapolitan court, the ſurface of this lake was ſuddenly covered with dead fiſh, black and ſinged, as if killed by ſome ſubaqueous eruption of fire.

At preſent the lake abounds with tench; the Lucrine with eels. The change of fortune in theſe lakes, is ſingular: In the ſplendid days of imperial Rome the Lucrine was the choſen ſpot for the brilliant parties of pleaſure of a voluptuous court; now, a ſlimy bed of ruſhes covers the ſcattered pools of this once

Averrhoa. beautiful sheet of water; while the once dusky Avernus is clear and serene, offering a most alluring surface and charming scene for similar amusements. Opposite to the temple is a cave usually styled the Sybil's grotto; but apparently more likely to have been the mouth of a communication between Cumæ and Avernus, than the abode of a prophetess; especially as the sybil is positively said by historians to have dwelt in a cavern under the Cumean citadel.

AVERRHOA in botany: A genus of the decandria order, belonging to the pentagynia class of plants; and in the natural method ranking under the 14th order, *Gruinales* The calyx has 5 leaves, the petals are 5, opening at top; and the apple or fruit is pentagonous, and divided into 5 cells. There are 3 species, viz. the blimbi, the carambola, and the acida, all natives of the Indies.

Phil. Transf. vol. 75. part 2. The second of these, the carambola, called in Bengal the *camrue* or *camrunga*, is remarkable for possessing a power somewhat similar to those species of Mimosa which are termed *sensitive plants;* its leaves, on being touched, moving very perceptibly. In the mimosa the moving faculty extends to the branches; but from the hardness of the wood, this cannot be expected in the camrunga. The leaves are alternately pinnated, with an odd one; and in their most common position in the day-time are horizontal, or on the same plane with the branch from which they come out. On being touched, they move themselves downward, frequently in so great a degree that the two opposite almost touch one another by their under sides, and the young ones sometimes either come into contact or even pass each other. The whole of the leaves of one pinna move by striking the branch with the nail of the finger or other hard substance; or each leaf can be moved singly, by making an impression that shall not extend beyond that leaf. In this way the leaves of one side of the pinna may be made to move, one after another, whilst the opposite continue as they were; or you may make them move alternately, or in short in any order you please, by touching in a proper manner the leaf you wish to put in motion. But if the impression, although made on a single leaf, be strong, all the leaves on that pinna, and sometimes on the neighbouring ones, will be affected by it. Notwithstanding this apparent sensibility of the leaf, however, large incisions may be made in it with a pair of sharp scissars, without occasioning the smallest motion; nay, it may even be cut almost entirely off, and the remaining part still continue unmoved, when by touching the wounded leaf with the finger or point of the scissars, motion will take place as if no injury had been offered. The reason of this is, that although the leaf be the ostensible part which moves, it is in fact entirely passive, and the petiolus is the seat both of sense and action: for although the leaf may be cut in pieces, or squeezed with great force, provided its direction be not changed without any motion being occasioned; yet if the impression on the leaf be made in such a way as to affect the petiolus, the motion will take place. When, therefore, it is wanted to confine the motion to a single leaf, you either touch it so as only to affect its own petiolus, or without meddling with the leaf, touch the petiolus with any small-pointed body, as a pin or knife. By compressing the universal petiolus near the place where a partial one comes out, the leaf moves in a few seconds in the same manner as if you had touched the partial petiolus. Averrhoa.

Whether the impression be made by puncture, percussion, or compression, the motion does not instantly follow: generally several seconds intervene, and then it is not by a jirk, but regular and gradual. Afterwards, when the leaves return to their former situation, which is commonly a quarter of an hour or less, it is in so slow a manner as to be almost imperceptible.

On sticking a pin into the universal petiolus at its origin, the leaf next it, which is always on the outer side, moves first; then the first leaf on the opposite side, next the second leaf on the outer, and so on. But this regular progression seldom continues throughout; for the leaves on the outer side of the pinna seem to be affected both more quickly, and with more energy, than those of the inner; so that the fourth leaf on the outer side frequently moves as soon as the third on the inner; and sometimes a leaf, especially on the inner side, does not move at all, whilst those above and below it are affected in their proper time. Sometimes the leaves at the extremity of the petiolus move sooner than several others which were nearer the place where the pin was put in. On making a compression with a pair of pincers on the universal petiolus, between any two pair of leaves, those above the compressed part, or nearer the extremity of the petiolus, move sooner than those under it, or nearer the origin; and frequently the motion will extend upwards to the extreme leaf, whilst below it perhaps does not go farther than the nearest pair. If the leaves happen to be blown by the wind against one another, or against the branches, they are frequently put in motion; but when a branch is moved gently, either by the hand or the wind, without striking against any thing, no motion of the leaves takes place.

When left to themselves in the day-time, shaded from the sun, wind, rain, or any disturbing cause, the appearance of the leaves is different from that of other pinnated plants. In the last a great uniformity subsists in the respective position of the leaves on the pinna; but here some will be seen on the horizontal plane, some raised above it, and others fallen under it; and in an hour or so, without any order or regularity which can be observed, all these will have changed their respective positions.

Cutting the bark of the branch down to the wood, and even separating it about the space of half an inch all around, so as to stop all communication by the vessels of the bark, does not for the first day affect the leaves, either in their position or their aptitude for motion. In a branch, which was cut through in such a manner as to leave it suspended only by a little of the bark no thicker than a thread, the leaves next day did not rise so high as the others; but they were green and fresh, and, on being touched, moved, but in a much less degree than formerly.

After-sun-set the leaves go to sleep, first moving down so as to touch one another by their under sides; they therefore perform rather more extensive motion at night of themselves than they can be made to do in the day-time by external impressions. With a convex lens the rays of the sun may be collected on a leaf, so as as to burn a hole in it, without occasioning any motion. But upon trying the experiment on the petiolus, the motion is as quick as if from strong percussion, although the rays be not so much concentrated as to cause pain when applied in the same degree on the back of the hand. The leaves move very fast from the electrical shock, even although a very gentle one.

AVERROES, one of the most subtile philosophers that ever appeared among the Arabians, flourished at the end of the 11th and beginning of the 12th century. He was the son of the high-priest and chief judge of Corduba in Spain: he was educated in the university of Morocco; and studied natural philosophy, medicine, mathematics, law, and divinity. After the death of his father, he enjoyed his posts; but notwithstanding his being exceeding rich, his liberality to men of letters in necessity, whether they were his friends or his enemies, made him always in debt. He was afterwards stripped of all his posts, and thrown into prison, for heresy; but the oppressions of the judge who succeeded him, caused him to be restored to his former employments.

He died at Morocco in the year 1206. He was excessively fat, though he eat but once a-day. He spent all his nights in the study of philosophy; and when he was fatigued, amused himself with reading poetry or history. He was never seen to play at any game, or to partake in any diversion. He was extremely fond of Aristotle's works, and wrote commentaries on them; whence he was styled, *The commentator*, by way of eminence. He likewise wrote a work on the whole art of physic, and many amorous verses; but when he grew old, he threw these last into the fire. His other poems are lost, except a small piece, in which he says, "That when he was young, he acted against his reason; but that when he was in years, he followed its dictates:" upon which he utters this wish; "Would to God I had been born old, and that in my youth I had been in a state of perfection!" As to religion, his opinions were, that Christianity is absurd; Judaism, the religion of children; Mahometanism, the religion of swine.

AVERROISTS, a sect of peripatetic philosophers, who appeared in Italy some time before the restoration of learning, and attacked the immortality of the soul. They took their denomination from AVERROES, the celebrated interpreter of Aristotle (see the preceding article), from whom they borrowed their distinguishing doctrine.

The Averroists who held the soul was mortal, according to reason or philosophy, yet pretended to submit to the Christan theology, which declares it immortal. But the distinction was held suspicious; and this divorce of faith from reason was rejected by the doctors of that time, and condemned by the last council of the Lateran under Leo X.

AVERRUNCI (DEI); certain gods, whose business it was, according to the Pagan theology, to avert misfortunes. Apollo and Hercules were of the number of these gods, among the Greeks; and Castor and Pollux, among the Romans.

AVERSA, a town of Italy, in the kingdom of Naples, with a bishop's see. It is situated in a very fine plain, in E. Long. 14. 20. N. Lat. 41. 0.

AVERSION, according to Lord Kames, is opposed to *affection*, and not to *desire*, as it commonly is. We have an affection to one person; we have an aversion to another: the former disposes us to do good to its object, the latter to do ill.

AVERTI, in horsemanship, is applied to a regular step or motion enjoined in the lessons. In this sense they say *pas averte*, sometimes *pas ecouté*, and *pas d'ecole*, which all denote the same. The word is mere French, and signifies *advised*.

AVES, one of the Caribbee islands, 451 miles south of Porto Rico, with a good harbour for careening of ships. It is so called from the great number of birds that frequent it. There is another of the same name lying to the northward of this, in N. Lat. 15. 0.; and a third near the eastern coast of Newfoundland, in N. Lat. 50. 5.

Aves, *Birds*, the name of Linnæus's second class of animals. See ZOOLOGY, n° 8. and ORNITHOLOGY.

AVESBURY, (Robert), an English historian, of whom little more is known than that he was keeper of the registry of the court of Canterbury in the reign of Edward III. and consequently that he lived in the 14th century. He wrote, *Memorabilia gesta magnifici regis Angliæ domini Edwardi tertii post conquestum, procerumque; tactis primitus quibusdam gestis de tempore patris sui domini Edwardi secundi, quæ in regnis Angliæ, Scotiæ, et Franciæ, ac in Aquitannia et Britannia, non humana sed Dei potentia, contigerunt, per Robertum de Avesbury.* This history ends with the battle of Poictiers, about the year 1356. It continued in manuscript till the year 1720, when it was printed by the industrious Thomas Hearne at Oxford, from a manuscript belonging to Sir Thomas Seabright. It is now become very scarce.

AVEZZANO, a town of Italy in the kingdom of Naples in the Farther Abruzzo. It is built on an almost imperceptible declivity, one mile from the lake of Celano, to which an avenue of poplars leads from the baronnial castle. This edifice stands at a little distance from the town, is square, and flanked with towers; it was erected by Virginio Orsini, to which family this and many other great lordships belonged, before they were wrested from them in times of civil war, and transferred to the Colonnas. Avezzano was founded in 860, and contains 2700 inhabitants, and two religious communities within its walls, which are indeed in a ruinous condition. The houses are in general mean; but there are some large buildings and opulent families of the class of gentlemen, not possessed of fees held *in capite*.

AGUE, a territory of Normandy in France, which gives title to a viscount. It extends from Falaise and Argenton as far as the sea, between the rivers Dives, Vie, and Tougues. The arable land is stiff, and produces but little good corn: but they sow sainfoin; which succeeds so well that they have five good crops successively: they likewise sow flax and hemp; and have a vast quantity of apples, with which they make cyder. Horses are bred here in great numbers; and the inhabitants fatten the oxen which come from Poictou and Brittany.

AUGEAS, in fabulous history, was king of Elis, and particularly famed for his stable, which contained 3000 oxen, and had not been cleaned for 30 years. Hercules was desired to clear away the filth from this stable in one day; and Augeas promised, if he performed

formed it, to give him a tenth part of the cattle. This taſk Hercules is ſaid to have executed by turning the courſe of the river Alpheus through the ſtable; when Augeas refuſing to ſtand by his engagement, Hercules ſlew him with his arrows, and gave his kingdom to Phyleus his ſon, who had ſhown an abhorrence of his farther's inſincerity.

AUGMENT, in grammar, an accident of certain tenſes of Greek verbs, being either the prefixing of a ſyllable, or an increaſe of the quantity of the initial vowels.

AUGMENTATION, in a general ſenſe, is the act of adding or joining ſomething to another with a deſign to render it large.

AUGMENTATION is alſo uſed for the additament or thing added.

AUGMENTATION was alſo the name of a court erected 27 Hen. VIII. ſo called from the augmentation of the revenues of the crown, by the ſuppreſſion of religious houſes; and the office ſtill remains, wherein there are many curious records, tho' the court has been diſſolved long ſince.

AUGMENTATION, in heraldry, are additional charges to a coat-armour, frequently given as particular marks of honour, and generally borne either in the eſcutcheon or a conton; as have all the baronets of England, who have borne the arms of the province of Ulſter in Ireland.

AUGRE, or AWGRE, an inſtrument uſed by carpenters and joiners to bore large round holes; and conſiſting of a wooden handle, and an iron blade terminated at bottom with a ſteel bit.

AUGSBURG, a city of Germany, capital of the circle of Suabia, ſeated near the confluence of the Ardech and Lech, in one of the moſt beautiful plains that can be imagined. It is one of the largeſt and handſomeſt cities of the empire; but the fortifications are after the old manner, and very irregular; the ſtreets are broad and ſtraight; the houſes moſtly of timber, plaſtered and whitened without, or adorned with paintings; the reſt are of free-ſtone; the churches and fountains are generally ornamented with fine figures of braſs. Many of the churches are ſtately, and adorned within with curious workmanſhip and paintings. That part of the city erected by the noble family of the Fuggers, who are lords of the adjacent country, conſiſts of ſeveral ſtreets croſs-wiſe, containing 106 houſes: the poor people that inhabit them are maintained by an annual penſion. Its magnificent town-houſe is little inferior to that of Amſterdam, it being a vaſt ſquare ſtone-building, with a marble portico; at the top of the front, within the pediment, is a large ſpread eagle, holding a ſceptre and globe in its talons, of braſs, gilt, ſaid to weigh 2200 weight; the great portal is of a very beautiful reddiſh marble; over which is a balcony of the ſame colour, ſupported by two pillars of white marble; over the gate there are two large griffins of braſs; moſt of the rooms are wainſcotted and ceiled with very fine timber: the great hall is very magnificent, and paved with marble; it is 110 feet long, 58 broad, and 52 high, and its roof is ſupported by eight columns of red marble; the ceiling of the upper wall is of very curious workmanſhip of poliſhed aſh, conſiſting of compartments, the ſquares and pannels of which are enriched with gilded ſculptures, and filled with pictures and other ornaments; this is likewiſe ſupported by eight pillars with baſes and chapiters of braſs: the other rooms are handſomely adorned with very fine paintings.

In the ſquare, near the town-houſe, is the fountain of Auguſtus, which is a marble baſon, ſurrounded with iron balluſtrados finely wrought: at the four corners are four braſs ſtatues as big as the life, two of which are women and two men; in the middle of the baſon is a pedeſtal, at the foot of which are four large ſphinxes ſquirting water out of their breaſts; a little above theſe are four infants holding four dolphins in their arms, which pour water out of their mouths; and over theſe infants are feſtoons of pine-apples all of braſs; upon the pedeſtal is the ſtatue of Auguſtus as large as the life. The fountain moſt remarkable next to this is that of Hercules, which is a hexagon baſon with ſeveral braſs figures, particularly Hercules engaging the hydra. Another curioſity is the ſecret gate, which was contrived to let in perſons ſafely in time of war: it has ſo many engines and diviſions with gates and keys, and apartments for guards at ſome diſtance from each other, where paſſengers are examined, that it is impoſſible for the town to be ſurpriſed this way; the gates are bolted and unbolted, opened and ſhut, by unſeen operators, inſomuch that it looks like enchantment. The water-towers are alſo very curious, of which there are three ſeated on a branch of the river Lech, which runs through the city in ſuch a torrent as to drive many mills, which work a number of pumps that raiſe the water in large leaden pipes to the top of the towers; one of theſe ſends water to the public fountains, and the reſt to near 1000 houſes in the city.

The Lutherans have a college here, which is a vaſt ſquare building, with a fine clock on the top of the front. In this there are ſeven different claſſes, a hall for public diſputations, and a theatre for dramatic repreſentation. The cathedral is a large, gloomy, Gothic building, with two ſpire ſteeples; it is adorned with paintings upon whimſical ſubjects, and has a great gate all of braſs, over which are ſeveral ſcripture paſſages well repreſented in baſſo relievo. The Jeſuits had a ſplendid college here, with a church full of gilding, painting, and carving; and a fine library. Tho' half the inhabitants are Lutherans, there are a great many Popiſh proceſſions. There are no Jews in the town, nor are they ſuffered to lie there; but they inhabit a village at about a league diſtance, and pay ſo much an hour for the liberty of trading in the day-time. The Benedictine abbey is a vaſt Gothic building, the ceiling of which is ſaid to be the higheſt in Germany, and overlooks all the reſt of the churches; it is adorned with ſeveral ſtatues, and has one very grand altar. The church of St Croix is one the handſomeſt in Augſburg for architecture, painting, ſculpture, gilding, and a fine ſpire.

The inhabitants look upon Auguſtus Cæſar as the founder of the town: it is true, that that emperor ſent a colony there; but the town was already founded, though he gave it the name of *Auguſta Vindelicorum*. Augſburg, indeed, is one of the oldeſt towns in Germany, and one of the moſt remarkable of them, as it is there and at Nuremberg that you meet with the oldeſt marks of German art and induſtry. In the 14th and 15th centuries, the commerce of this town was the

the most extensive of any part of south Germany, and contributed much to the civilization of the country by the works of art and variety of necessaries to the comfort and convenience of life which it was the means of introducing. Many things originated in this town which have had a great influence on the happiness of mankind. Not to mention the many important diets of the empire held here; here, in 952, did a council confirm the order for the celibacy of priests; here, in 1530, was the confession of faith of the Protestants laid before the emperor and other estates of Germany; and here, in 1555, was signed the famous treaty of peace, by which religious liberty was secured to Germany.

Though the Protestants were very powerful at Augsburg, they could not keep their ground; for the Bavarians drove them from thence: but Gustavus Adolphus restored them again in 1632; since which time they have continued there, and share the government with the Catholics. In 1703, the elector of Bavaria took the city after a siege of seven days, and demolished the fortifications: however, the battle of Hochsted restored their liberty, which they yet enjoy under the government of their own magistrates, the bishop having no temporal dominion in the city. The chapter is composed of persons of quality, who are to bring proofs of their nobility. The canons have a right of electing their own bishop, who is a sovereign, in the same manner as several other of the German bishops.

The police of the place is very good; and though the town has no territory, it has no debts. Augsburg is, however, no longer what it was. It no longer has a Fugger and a Welser in it to lend the emperor millions. In this large and handsome town, formerly one of the greatest trading towns in Germany, there are no merchants at present to be found who have capitals of more than L. 20,000. The others, most of whom must have their coaches, go creeping on with capitals of L. 3,000 or L. 4,000, and do the business of brokers and commissioners. Some houses, however, carry on a little banking trade; and the way through Tyrol and Graubundten occasions some little exchange between this place and Germany. After these brokers and doers of business by commission, the engravers, statuaries, and painters, are the most reputable of the labouring part of the city. Their productions, like the toys of Nuremberg, go every where. There are always some people of genius amongst them; but the small demand for their art affords them so little encouragement, that to prevent starving they are mostly confined to the small religious works which are done elsewhere by Capuchin monks. They furnish all Germany with little pictures for prayer books, and to hang in the citizens houses. There is an academy of arts instituted here under the protection of the magistrates: the principle aim of which is to produce good mechanics, and preserve the manufactures of the city.

This town, which is 9½ miles in circumference, contains, according to Mr Riesbeck, hardly 30,000 inhabitants; but Mr Nicolai makes them about 35,000 and says there are 28,000 houses.

The city has its drinking water from the river Lech, which runs at some distance from it; and the aqueducts which convey the water are much to be admired. As the court of Bavaria has it in its power to cut off this indispensable necessary, by threatening the town with doing so, it often lays it under contribution. But as it has, besides this, other means of keeping the high council in a state of dependance, to secure itself from this oppression, the city seeks the emperor's protection, upon whom it makes itself as dependant on the other side, so as to be indeed only a ball which both courts play with. The emperor's minister to the circle of Suabia generally resides here, and by so doing secures to his court a perpetual influence. There are always Austrian and Prussian recruiting parties quartered here, and the partiality of the government to the former is very remarkable. In the war of 1756, the citizens were divided into equal parties for the two courts. The Catholics considered the emperor as their god, and the Protestants did the same by the king of Prussia. The flame of religion had almost kindled a bloody civil war amongst them.—The bishop takes his name from this town, but resides at Dillingen. He has an income of about L. 20,000 *per annum*. As a proof of the catholicism of this place, the Pope throughout his whole progress met no where with such honours as he did here. This he owed to his friends the Jesuits, who have still great influence. E. Long. 10. 58. N. Lat. 48. 24.

Augsburg Confession, denotes a celebrated confession of faith drawn up by Luther and Melancthon, on behalf of themselves and other ancient reformers, and presented in 1530 to the emperor Charles V. at the diet of Augusta or Augsburg, in the name of the evangelic body. This confession contains 28 chapters; of which the greatest part is employed in representing, with perspicuity and truth, the religious opinions of the Protestants, and the rest in pointing out the errors and abuses that occasioned their separation from the church of Rome.

AUGUR, an officer among the Romans appointed to foretel future events, by the chattering, flight, and feeding, of birds. There was a college or community of them, consisting originally of three members with respect to the three Luceres, Rhamnenses, and Tatienses: afterwards the number was increased to nine, four of whom were patricians and five plebeians. They bore an augural staff or wand, as the ensign of their authority; and their dignity was so much respected, that they were never deposed, nor any substituted in their place, though they should be convicted of the most enormous crimes. See Augury.

AUGURAL, something relating to the augurs.—The augural instruments are represented on several ancient medals.

Augural Supper, that given by a priest on his first admission into the order, called also by Varro *Adjicialis*.

Augural Books, those wherein the discipline and rules of augury were laid down.

AUGURALE, the place in a camp where the general took auspicia. This answered to the *Auguratorium* in the city.

Augurale is also used in Seneca for the ensign or badge of an augur, as the *lituus*.

AUGURATORIUM, a building on the Palatine mount where public auguries were taken.

AUGURY, in its proper sense, the art of foretelling future events by observations taken from the chattering, ſinging, feeding, and flight of birds; though it was uſed by ſome writers in a more general ſignification, as compriſing all the different kinds of divination.

Augury was a very ancient ſuperſtition. We know from Heſiod, that huſbandry was in part regulated by the coming or going of birds; and moſt probably it had been in uſe long before his time, as aſtronomy was then in its infancy. In proceſs of time, theſe animals ſeem to have gained a greater and very wonderful authority, till at laſt no affair of conſequence, either of public or private concern, was undertaken without conſulting them. They were looked upon as the interpreters of the gods; and thoſe who were qualified to underſtand their oracles were held among the chief men in the Greek and Roman ſtates, and became the aſſeſſors of kings, and even of Jupiter himſelf. However abſurd ſuch an inſtitution as a college of Augurs may appear in our eyes, yet, like all other extravagant inſtitutions, it had in part its origin from nature. When men conſidered the wonderful migration of birds, how they diſappeared at once, and appeared again at ſtated times, and could give no gueſs where they went, it was almoſt natural to ſuppoſe, that they retired ſomewhere out of the ſphere of this earth, and perhaps approached the ethereal regions, where they might converſe with the gods, and thence be enabled to predict events. It was almoſt natural for a ſuperſtitious people to imagine this; at leaſt to believe it, as ſoon as ſome impoſtor was impudent enough to aſſert it. Add to this, that the diſpoſition in ſome birds to imitate the human voice, muſt contribute much to the confirmation of ſuch a doctrine. This inſtitution of augury ſeems to have been much more ancient than that of aruſpicy; for we find many inſtances of the former in Homer, but not a ſingle one of the latter, tho' frequent mention is made of ſacrifices in that author. From the whole of what has been obſerved, it ſeems probable, that natural augury gave riſe to religious augury, and this to aruſpicy, as the mind of man makes a very eaſy tranſition from a little truth to a great deal of error.

Stillingfleet's *Calendar of Flora.*

A paſſage in Ariſtophanes gave the hint for theſe obſervations. In the Comedy of the Birds, he makes one of them ſay this: 'The greateſt bleſſings which can happen to you, mortals, are derived from us; firſt, we ſhow you the ſeaſons, viz. Spring, Winter, Autumn. The crane points out the time for ſowing, when ſhe flies with her warning notes into Egypt; ſhe bids the ſailor hang up his rudder and take his reſt, and every prudent man provide himſelf with winter-garments. Next the kite appearing, proclaims another ſeaſon, *viz.* when it is time to ſhear his ſheep. After that the ſwallow informs you when it is time to put on ſummer clothes. We are to you, (adds the chorus), Ammon, Dodona, Apollo: for, after conſulting us, you undertake every thing; merchandize, purchaſes, marriages, &c.' Now, it ſeems not improbable, that the ſame tranſition was made in the ſpeculations of men which appears in the poet's words; and that they were eaſily induced to think, that the ſurpriſing foreſight of birds, as to the time of migration, indicated ſomething of a divine nature in them; which opinion Virgil, as an Epicurean, thinks fit to enter his proteſt againſt, when he ſays,

Haud equidem credo, quia ſit divinitus illis
Ingenium.

But to return to Ariſtophanes. The firſt part of the chorus, from whence the fore-cited paſſage is taken, ſeems, with all its wildneſs, to contain the fabulous cant, which the augurs made uſe of in order to account for their impudent impoſitions on mankind. It ſets out with a coſmogony; and ſays, That in the beginning were Chaos and Night, and Erebus and Tartarus: That there was neither water, nor air, nor ſky: That Night laid an egg, from whence, after a time, Love aroſe: That Love, in conjunction with Erebus, produced a third kind; and that they were the firſt of the immortal race, &c.

AUGUST, (*Auguſtus*), in a general ſenſe, ſomething majeſtic, venerable, or ſacred. The appellation was firſt conferred by the Roman ſenate upon Octavius, after his being confirmed by them in the ſovereign power. It was conceived as expreſſing ſomething divine, or elevated above the pitch of mankind, being derived from the verb *augeo*, "I increaſe," *tanquam ſupra humanam ſortam auctus*. See AUGUSTUS.

AUGUST, in chronology, the eighth month of our year, containing 31 days. Auguſt was dedicated to the honour of Auguſtus Cæſar, becauſe, in the ſame month, he was created conſul, thrice triumphed in Rome, ſubdued Egypt to the Roman empire, and made an end of civil wars: being before called *Sextilis*, or the ſixth month from March.

AUGUSTA, the capital of the ſtate of Georgia, in North America, on the river Savannah, 134 miles from the ſea, ſeated on a fine plain, it contains about 200 houſes, and from the advantage of its central ſituation between the upper and lower counties is riſing faſt into importance.

AUGUSTA, or *Auſta*, an iſland in the Adriatic ſea, on the coaſt of Dalmatia, near Raguſa, ſubject to Venice. E. Long. 17. 50. N. Lat. 42. 35.

AUGUSTA Auſciorum, a town of Aquitania. In the middle age, it took the name of the people, *Auſci*; and is now called *Auch*, the capital of Gaſcony.

AUGUSTA Emerita, a town of Luſitania on the river Anas, the capital of the province; a colony of the Emeriti, or ſuch ſoldiers as had ſerved out their legal time, were men of experience, or had received marks of favour. The colony was founded by Auguſtus; and is now called *Merida*, a city of Spain, in Eſtremadura, on the river Guadiana. See MERIDAN.

AUGUSTA Prætoria, a town and colony of Gallia Ciſalpina, and capital of the Salaſſi; ſeated at the foot of the Alps Graiæ on the Duria. Now *Aouſte* in Piedmont. See AOUSTE.

AUGUSTA Rauracorum, a town of Gallia Belgica; now a ſmall village called *Auguſt*, at the bend of the Rhine northwards, but from the ruins, which are ſtill to be ſeen, appears to have been a conſiderable colony, at the diſtance of ſix miles from Baſil to the eaſt.

AUGUSTA Sueſſonum, a town of Gallia Belgica on the Axona. Now *Soiſſons*, on the river Aiſne, in the Iſle of France. See SOISSONS.

AUGUSTA Taurinorum, a town of the Taurini at the foot of the Alps where the Duria Minor falls into the Po; now *Turin*, the capital of Piedmont.

AUGUSTA Treba, a town of the Æqui, near the ſprings of the river Anio in Italy; now *Trevi*, in Umbria, or in the eaſt of the Campagna di Roma.

Augusta Trevirorum, a town of the Treviri, a people inhabiting between the Rhine and the Meuse, but especially about the Moselle; now *Triers*, or *Treves*, in the circle of the Lower Rhine on the Moselle.

Augusta Vindelicorum, a town of the Licates on the Licus; called by Tacitus a noble colony of *Rhætia*; now *Augsburg*, capital of Suabia.

Augusta Historia, is the history of the Roman emperors from the time of Adrian to Carinus, that is, from the year of our Lord 157 to 285, composed by six Latin writers, Æl. Spartianus, Julius Capitolinus, Æl. Lampridius, Vulcatius Gallicanus, Trebellius Pollio, and Flavius Vopiscus.

AUGUSTALES, in Roman antiquity, an epithet given to the flamens or priests appointed to sacrifice to Augustus after his deification; and also to the ludi or games celebrated in honour of the same prince on the fourth of the ides of October.

AUGUSTALIA, a festival instituted by the Romans in honour of Augustus Cæsar, on his return to Rome, after having settling peace in Sicily, Greece, Syria, Asia, and Parthia; on which occasion they likewise built an altar to him, inscribed *Fortunæ reduci*.

AUGUSTALIS PRÆFECTUS, a title peculiar to a Roman magistrate who governed Egypt, with a power much like that of a proconsul in other provinces.

AUGUSTAN CONFESSION. See AUGSBURG *Confession*.

AUGUSTIN, or AUSTIN, (St), the first archbishop of Canterbury, was originally a monk in the convent of St Andrew at Rome, and educated under St Gregory, afterwards Pope Gregory I. by whom he was dispatched into Britain with 40 other monks of the same order, about the year 596, to convert the English Saxons to Christianity. They landed in the isle of Thanet; and having sent some French interpreters to king Ethelbert with an account of their errand, the king gave them leave to convert as many of his subjects as they could, and assigned their place of residence at Dorovernum, since called *Canterbury*; to which they were confined till the king himself was converted, whose example had a powerful influence in promoting the conversion of his subjects; but though he was extremely pleased at their becoming Christians, he never attempted to compel them. He dispatched a priest and a monk to Rome, to acquaint the pope with the success of his mission, and to desire his resolution of certain questions. These men brought back with them a pall, and several books, vestments, utensils, and ornaments for the churches. His holiness, by the same messengers, gave Augustin directions concerning the settling of episcopal sees in Britain; and ordered him not to pull down the idol-temples, but to convert them into Christian churches; only destroying the idols, and sprinkling the place with holy water, that the natives, by frequenting the temples they had been always accustomed to, might be the less shocked at their entrance into Christianity. Augustin resided principally at Canterbury, which thus became the metropolitan church of England; and having established bishops in several of the cities, he died on the 26th of May, 607. The Popish writers ascribe several miracles to him. The observation of the festival of St Augustin was first enjoined in a synod held under Cuthbert archbishop of Canterbury, and afterwards by the pope's bull in the reign of king Edward III.

AUGUSTINE (St), an illustrious father of the church, was born at Thagaste, a city Numidia, on the 13th of November 354. His father, a burgess of that city, was called *Patricius*; and his mother, *Monica*, who being a woman of great virtue, instructed him in the principles of the Christian religion. In his early youth he was in the rank of the catechumens; and falling dangerously ill, earnestly desired to be baptized; but the violence of the distemper ceasing, his baptism was delayed. His father, who was not yet baptized, made him study at Thagaste, Madaura, and afterwards at Carthage. Augustine having read Cicero's books of philosophy, began to entertain a love for wisdom, and applied himself to the study of the holy scriptures; nevertheless, he suffered himself to be seduced by the Manicheans. At the age of 19, he returned to Thagaste, and taught grammar, and also frequented the bar; he afterwards taught rhetoric at Carthage with applause. The insolence of the scholars at Carthage made him take a resolution to go to Rome, tho' against his mother's will. Here also he had many scholars; but disliking them, he quitted Rome, and settled at Milan, and was chosen public professor of rhetoric in that city. Here he had opportunities of hearing the sermons of St Ambrose, which, together with the study of St Paul's epistles, and the conversion of two of his friends, determined him to retract his errors, and quit the sect of the Manicheans; this was in the 32d year of his age. In the vacation of the year 386, he retired to the house of a friend of his, named *Verecundus*, where he seriously applied himself to the study of the Christian religion, in order to prepare himself for baptism, which he received at Easter, in the year 387. Soon after this, his mother came to see him at Milan, and invite him back to Carthage; but at Ostia, whether he went to embark in order to his return, she died. He arrived in Africa about the end of the year 388; and having obtained a garden-plot without the walls of the city of Hippo, he associated himself with 11 other persons of eminent sanctity, who distinguished themselves by wearing leathern girdles, and lived there in a monastic way for the space of three years, exercising themselves in fasting, praying, study, and meditation, day and night: from hence sprung up the Augustine friars, or eremites of St Augustine, being the first order of mendicants; those of St Jerome, the Carmelites, and others, being but branches of this of St Augustine. About this time, or before, Valerius bishop of Hippo, against his will, ordained him priest: nevertheless, he continued to reside in his little monastery, with his brethren, who, renouncing all property, possessed their goods in common. Valerius, who had appointed St Augustine to preach in his place, allowed him to do it in his presence, contrary to the custom of the churches in Africa. He explained the creed, in a general council of Africa, held in 393. Two years after, Valerius, fearing he might be preferred to be bishop of another church, appointed him his coadjutor or colleague, and caused him to be ordained bishop of Hippo, by Megalus bishop of Calame, then primate of Numidia. St Augustine died the 28th day of August, 430, aged 76 years, having had the misfortune to see his country invaded by the

Vandals, and the city where he was biſhop beſieged for ſeven months.

The works of St Auguſtine make ten volumes; the beſt edition of them is that of Maurin, printed at Antwerp, in 1700. They are but little read at this time, except by the clergy of the Greek church and in the Spaniſh univerſities. The bookſellers of London receive frequent commiſſions for them, and indeed for the moſt of the fathers, from Ruſſia, and alſo from Spain.

AUGUSTINE (St) a fort of North America, on the eaſt coaſt of Cape Florida, ſituated in W. Long. 81. 10. N. Lat. 30. 0. This fort was built by the Spaniards; who were ſcarce well eſtabliſhed there when they were attacked by Sir Francis Drake in 1586, who reduced and pillaged the fort and town adjacent. In 1665, it underwent a ſimilar fate, being attacked by Captain Davis at the head of a conſiderable company of bucaneers. In 1702 an attempt was made by Colonel More to annex St Auguſtine to the Britiſh dominions. He inveſted it with only 500 Engliſh and 700 Indians; which ſmall force, however, would have been ſufficient to reduce the place, had not ſuccours arrived when it was on the point of ſurrendering. Even then, it is thought that he might have defeated the reinforcement which arrived; but he choſe to raiſe the ſiege, and retire with precipitation. In 1740, another unſucceſsful attempt was made on this fort by general Oglethorpe: it was, however, together with the whole country of Florida, ceded to Great Britain by the treaty of Paris in 1763; but has ſince been reſtored to Spain by the treaty of peace 1783.

AUGUSTINE, a cape of South America. W. Long. 35. 4. S. Lat. 8. 30.

AUGUSTINS, or AUGUSTINIANS, an order of religious; thus called from St Auguſtin, whoſe rule they obſerve. The Auguſtins, popularly alſo called Auſtin friers, were originally hermits, whom pope Alexander IV. firſt congregated into one body, under their general Lanfranc, in 1256. Soon after their inſtitution, this order was brought into England, where they had about thirty-two houſes at the time of their ſuppreſſion.

The Auguſtins are clothed in black, and make one of the four orders of mendicants. From theſe aroſe a reform, under the denomination of *bare-foot Auguſtins*, or *Minorites*, or *Friers minor*.

There are alſo canons regular of St Auguſtin, who are clothed in white, excepting their cope, which is black. At Paris they are known under the denomination of *religious of* GENEVIEVE; that abbey being the chief of the order. There are alſo nuns and canoneſſes, who obſerve the rules of St Auguſtin.

AUGUSTINIANS are alſo thoſe divines who maintain, on the authority of St Auguſtin, that GRACE is effectual from its nature, abſolutely and morally, and not relatively and gradually. They are divided into rigid and relaxed.

AUGUSTOBONA, a city of the Tricaſſers in ancient Gaul, from whom it was afterwards called *Tricaſſes*, and *Trecaſſæ;* and ſtill further corrupted to *Thracæ or Treci;* whence the modern name *Troyes*, in Champaigne on the Seyne. See TROYES.

AUGUSTODUNUM, the capital of the Ædui, where there was a famous academy or ſchool for the education of youth; now Auſtun, or *Autun*, in the duchy of Burgundy on the Arroux. See AUTUN.

AUGUSTOMAGUS, an ancient town of Gallia Belgica; now *Sentis*, in the Iſle of France. E. Long. 2. 30. N. Lat. 49. 10.

AUGUSTORITUM (anc. geog.), according to ſome authors the capital of the Pictones, afterwards called *Pictavi;* now *Poictiers*. But by Antonine's Itinerary from Burdigala to Argantomagus (or Argenton, as it is interpreted by many), it can be no other but the capital of the Lemovices, now *Limoges*, ſituate between Veſunna of the Petrocorii, or Perigueux, and Argantomagus. E. Long. 1. 22. Lat. 45. 52.

AUGUSTOW, a ſmall but ſtrong town of Poland, in the duchy and Palatinate of Polakia, ſeated on the river Narieu. E. Long. 24. 2. N. Lat. 53. 25.

AUGUSTUS (Fort), a ſmall fortreſs ſeated on a plain at the head of Lochneſs in Scotland, between the rivers Taarf and Orich; the laſt is a conſiderable ſtream, and has over it a ſtone bridge of three arches. The fort conſiſts of four baſtions; within is the governor's houſe, and barracks for 400 men: it was taken by the rebels in 1746, who immediately deſerted it, after demoliſhing what they could. The name of this fort in Erſe is *Kill chuimin*, or *the burial place of the Cummins*. It lies on the road to the Iſle of Sky, which is about 52 miles off; but on the whole way there is not a place fit for the reception of man or horſe.

AUGUSTUS, the appellation conferred upon Cæſar Octavianus, the firſt Roman emperor. See OCTAVIANUS and ROME.

The obſcure name of *Octavianus*, Mr Gibbon obſerves, he derived from a mean family, in the little town of Aricia. It was ſtained with the blood of the proſcription; and he was deſirous, had it been poſſible, to eraſe all memory of his former life. The illuſtrious ſurname of *Cæſar* he had aſſumed, as the adopted ſon of the dictator; but he had too much good ſenſe either to hope to be confounded or to wiſh to be compared with that extraordinary man. It was propoſed in the ſenate, to dignify their miniſter with a new appellation; and after a very ſerious diſcuſſion, that of *Auguſtus* was choſen among ſeveral others, as being the moſt expreſſive of the character of peace and ſanctity, which he uniformly affected. *Auguſtus* was therefore a perſonal, *Cæſar* a family, diſtinction. The former ſhould naturally have expired with the prince on whom it was beſtowed; and however the latter was diffuſed by adoption and female alliance, Nero was the laſt prince who could alledge any hereditary claim to the honours of the Julian line. But at the time of his death, the practice of a century had inſeparably connected thoſe appellations with the imperial dignity, and they have been preſerved by a long ſucceſſion of emperors, Romans, Greeks, Franks, and Germans, from the fall of the republic to the preſent time. A diſtinction was, however, ſoon introduced. The ſacred title of *Auguſtus* was always reſerved for the monarch; the name of *Cæſar* was more freely communicated to his relations; and from the reign of Hadrian at leaſt, was appropriated to the ſecond perſon in the ſtate, who was conſidered as the preſumptive heir of the empire.

AVIARY, a place ſet apart for feeding and propagating birds. It ſhould be ſo large as to give the birds ſome freedom of flight; and turfed, to avoid the appearance of foulneſs on the floor.

Avicena.

AVICENA, or Avicenes, the prince of Arabian philosophers and physicians, was born at Assena, a village in the neighbourthood of Bokhara. His father was from Balkh in Persia, and had married at Bokhara. The first years of Avicenes were devoted to the study of the Koran and the Belle Lettres. He soon showed what he was likely to become afterwards; and the progress he made was so rapid, that when he was but ten years old, he was perfectly intelligent in the most hidden senses of the Koran.

Abou-Abdoullah, a native of Napoulous in Syria, at that time professed philosophy at Bokhara with the greatest reputation. Avicènes studied under him the principles of logic; but soon disgusted with the slow manner of the schools, he set about studying alone, and read all the authors that had written on philosophy, without any other help than that of their commentators. Mathematics had no fewer charms for him; and after reading the first six propositions of Euclid, he got alone to the last, having made himself perfect master of them, and treasured up all of them equally in his memory.

Possessed with an extreme avidity to be acquainted with all sorts of sciences, he likewise devoted himself to the study of medicine. Persuaded that this divine art consists as much in practice as in theory, he sought all opportunities of seeing the sick; and afterwards confessed, that he had learned more from experience than from all the books he had read. He was now in his 16th year, and already was celebrated for being the light of his age. He resolved at this age to resume his studies of philosophy, which medicine had made him neglect: and he spent a year and a half in this painful labour, without ever sleeping all this time a whole night together. If he felt himself oppressed by sleep, or exhausted by study, a glass of wine refreshed his wasted spirits, and gave him new vigour for study; if in spite of him his eyes for a few minutes shut out the light, it then happened to him to recollect and meditate upon all the things that had occupied his thoughts before sleep. At the the age of 21, he conceived the bold design of incorporating, in one work, all the objects of human knowledge; and carried it into execution in an Encyclopedie of 20 volumes, to which he gave the title of the *Utility of Utilities*.

Several great princes had been taken dangerously ill, and Avicènes was the only one that could know their ailments and cure them. His reputation increased daily, and all the kings of Asia desired to retain him in their families.

Mahmud, the son of Sabektekin, the first sultan of the Dynasty of the Samanides, was then the most powerful prince of the east. Imagining that an implicit obedience should be paid by all manner of persons to the injunctions of his will, he wrote a haughty letter to Mamun sultan of Kharazm, ordering him to send Avicènes to him, who was at his court, with several other learned men. Philosophy, the friend of liberty and independence, looks down with scorn on the shackles of compulsion and restraint. Avicènes, accustomed to the most flattering distinctions among the great, could not endure the imperious manner of Mahmud's inviting him to his court, and refused to go there. But the sultan of Kharazm, who dreaded his resentment, obliged the philosopher to depart with others whom that prince had demanded to be sent to him.

Avicènes pretended to obey; but instead of repairing to Gazna, he took the rout of Giorgian. Mahmud, who had gloried in the thoughts of keeping him at his palace, was greatly irritated at his flight. He dispatched portraits done in crayons of this philosopher to all the princes of Asia, with orders to have him conducted to Gazna, if he appeared in their courts. But Avicènes had fortunately escaped the most diligent search after him. He arrived in the capital of Giorgian, where under a disguised name he performed many admirable cures.

Cabous then reigned in that country. A nephew, whom he was extremely fond of, being fallen sick, the most able physicians were called in, and none of them were able to know his ailment, or give him any ease. Avicènes was at last consulted. So soon as he had felt the young prince's pulse, he was confident with himself, that his illness proceeded from a violent love, which he dared not to declare. Avicènes commanded the person who had the care of the different apartments in the palace, to name them all in their respective order. A more lively motion in the prince's pulse, at hearing mentioned one of these apartments, betrayed a part of his secret. The keeper then had orders to name all the slaves that inhabited that apartment. At the name of one of these beauties, the young Cabous could not contain himself; an extraordinary beating of his pulse compleated the discovery of what he in vain desired to keep concealed. Avicènes, now fully assured that this slave was the cause of this prince's illness, declared, that she alone had the power to cure him.

The Sultan's consent was necessary, and he of course was curious to see his nephew's physician. He had scarce looked at him, when he knew in his features those of the crayoned portrait sent him by Mahmud; but Cabous, far from forcing Avicènes to repair to Gazna, retained him for some time with him, and heaped honours and presents on him.

This philosopher passed afterwards into the court of Nedjmeddevle, Sultan of the race of the Bouides. Being appointed first physician to that prince, he found means to gain his confidence to so great a degree, that he raised him to the post of Grand Visir. But he did not long enjoy that illustrious dignity. Too great an attachment for pleasures, especially those of love and the table, made him lose at the same time his post and his master's favour. From that time Avicènes felt all the rigours of adversity, which he had brought upon himself by his ill conduct. He wandered about as a fugitive, and was often obliged to shift the place of his habitation to secure his life from danger. He died at Hamadan, aged 58 years, in the 428th year of the Hegira, and of Christ 1036.

The perfect knowledge he had of physic did not secure him from the ailments that afflict human nature. He was attacked by several maladies in the course of his life, and particularly was very subject to the colic. His excesses in pleasure, and his infirmities, made a poet say, who wrote his epitaph, that the profound study of philosophy had not taught him good morals, nor that of medicine the art of preserving his own health.

No

No one composed with greater facility than Avicènes, writing, when he sat down to it, 50 pages generally in a day, without fatiguing himself. The doctors of Chiras, having made a collection of objections against one of his metaphysical works, sent it to him at Ispahan by Casem. This learned man, not arriving till towards evening, came to Avicènes's house, with whom he sat discoursing till midnight. When Casem was retired, he wrote an answer to the objections of the Chirazians, and finished it before sun-rise. He immediately delivered it to Casem, telling him, that he had made all possible dispatch in order not to detain him any longer at Ispahan.

Avicènes, after his death, enjoyed so great a reputation, that till the 12th century he was preferred for the study of philosophy and medicine to all his predecessors. His works were the only writings in vogue in schools, even in Europe. The following are the titles. 1. Of the Utility and Advantage of Sciences, XX books. 2. Of Innocence and Criminality, II books. 3. Of Health and Remedies, XVIII books. 4. On the Means of preserving Health, III books. 5. Canons of Physic, XIV books. 6. On Astronomical Observations, I book. 7. On Mathematical Sciences. 8. Of Theorems, or Mathematical and Theological Demonstrations, I book. 9. On the Arabic Language, and its Proprieties, X books. 10. On the Last Judgment. 11. On the Origin of the Soul, and the Resurrection of Bodies. 12. Of the End we should propose to ourselves in Harangues and Philosophical Argumentation. 13. Demonstration of the collateral Lines in the Sphere. 14. Abridgment of Euclid. 15. On Finity and Infinity. 16. On Physics and Metaphysics. 17. On Animals and Vegetables, &c. 18. Encyclopedie, 20 volumes.—Some, however, charge him with having stolen what he published, from a celebrated physician who had been his master. This man had acquired so much honour and wealth, that he was solicited by many to take their sons to be his scholars, or even his servants; but being resolved not to discover the secrets of his art, he would receive none of them. Avicènes's mother formed the following stratagem: she offered him her son as a servant, pretending he was naturally deaf and dumb; and the youth, by his mother's instructions, counterfeited these defects so well, that the physician, after making several trials to discover the reality of them, took the boy into his service, and by degrees trusted him so far as to leave his writings open in his room when he went abroad: Avicènes took that opportunity to transcribe them, and carried the copies to his mother; and after the death of his master he published them under his own name. Indeed if we reflect that he lived but 58 years, that he was a wanderer and a fugitive, and that he was much addicted to his pleasures, we shall have some difficulty to conceive how he could find time to compose so many works. Physic, however, is indebted to him for the discovery of cassia, rhubarb, mirabolans, tamarinds; and from him also, it is said, came to us the art of making sugar.

AVICENIA, Eastern Anacardium: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personatæ*. The calyx is quinquepartite; the corolla is bilabiated, the upper lip squared; the capsule is leathery, romb-like, and monospermous. There are two species; the tomentosa or downy, and the nitida or shining. The seeds of the first are said to be the Malacca beans formerly kept in the shops (though this is doubtful), the kernels of which were eaten as almonds. The plant producing the Malacca bean, as it is called, is rather thought to be the Bontia *Germinans*.

AVIGATO pear. See Laurus.

AVIGLIANO, a small town of Piedmont in Italy. E. Long. 7. 5. N. Lat. 44. 40.

AVIGNON, a city of Provence in France, the capital of the county of Venaissin, and seated on the banks of the Rhone. It is an archbishop's see, and the residence of several popes at this place for 70 years has rendered it considerable. It still belongs and is subject to the pope, who sends a vice-legate every three years, who in some sense is the governor: and Mr Swinburn is of opinion the ecclesiastical government here is more for the benefit of the people than if they were subject to the king of France. Near the Rhone there is a large rock, within the circumference of the walls, upon which is a platform, from whence may be had a prospect of the whole city and the places about it. This city is about three miles and two furlongs in circumference, and is in general ill built, irregular, and devoid of beauty. But it is surrounded by handsome battlemented walls and turrets, not unlike those of Rome; and its public edifices are large, solid, and grand as the taste of the fourteenth century could make them. Several popes and anti-popes, who during their lives shook the Romish church with violence and mutual altercation, repose quietly near each other in the various monasteries of the place. The church of the Cordeliers contains, in an obscure corner, the almost defaced tomb of Petrarch's Laura and her husband Hugh de Sade; and nearly opposite is the tomb of the brave Gullon, so well known for his invincible courage as well as for his inviolable attachment to his sovereign Henry IV. Many productions of Reré of Anjou are to be seen in the city; whose inhabitants amount to above 30,000, of which 1000 are ecclesiastics and some hundreds of Jews. The palace of the vice-legate is composed of several large square towers, and he gives audience in a great hall which is full of fine paintings, as is also the chapel and the apartments. The arsenal is near the palace.

The church of Notre Dame is ancient, but not large, and is one of the best adorned in the city. After having ascended about 50 steps, you come to a very ancient portico, which sustains a great tower; as you enter the church on the left hand, you see paintings which equal the finest in Italy. The great altar is very magnificent, and is adorned with a shrine that contains the relics of we know not how many saints. The treasure of the sacristy is worthy of the curiosity of the traveller. The little palace where the archbishop resides is formed of three bodies of lodgings, accompanied with courts and small pavilions. It overlooks the Rhone, the city, and the fields. These buildings and the mint adorn a large square, which is the common walk of the inhabitants.

In Avignon they reckon seven gates, seven palaces, seven colleges, seven hospitals, seven monasteries, seven nunneries, and seven popes who have lived there in in 70 years. The steeples are numerous, and the bells are never at rest; one of silver is rung only on the death of a pope. The church of the Celestines is very magnificent, and full of fine monuments, and the rest are not without their curiosities. The university has four colleges; and the place where the Jews, live is a distinct quarter, from whence the Jews, who pay tribute, dare not stir out without yellow hats, and the women must have something yellow about their heads, to distinguish them from the Christians. Their number is very considerable in a very confined place, where the only way of enlarging their abodes is by building their houses higher. Their synagogue is so dark, that they are obliged to light lamps. However, they are forced to hear a monk preach a sermon every week. Across the Rhone, here, extend the ruinous and decayed arches of that bridge against which Madame de Grignan was so near being lost, and of which Madame de Sevignè makes terrified mention. It was demolished in 1699 by one of the inundations common to the Rhone. When entire, it was not less than a quarter of a mile in length; but being so narrow as not to permit two carriages to pass in any part, it had previously become almost useless; and motives of policy prevent the construction of a new bridge, while Avignon belongs to the papal see. The curious that travel this way go to see the fountain of Vaucluse, where the river Sorgues, which passes through this city, has its source; and whither Petrarch so often retired to indulge his grief and hopeless love. It is situated in a valley five miles distant from the city. The sides of the river are skirted by meadows of the most lively green; above which rise abrupt and lofty rocks, that seem designed to seclude it from human view. The valley becomes gradually narrower toward the extremity, and winding continually describes the figure of a horse-shoe. The view is at length terminated by an enormous mass of rock, forming a barrier across it, of a prodigious height, and absolutely perpendicular. Through its vast recesses run the streams which supply the fountain of Vaucluse, and at its foot appears a bason of water, several hundred feet in circumference, stretched like an expanse, silent and quiet. The sides are very steep, and it is said that in the middle no bottom can be discovered, though attempts have been often made for that purpose; a circumstance probably resulting from the violence with which the springs bubble up, which prevents any weight from descending beyond a certain depth. Though the fountain is clearer in itself than crystal, yet the incumbent rock casts a continual shade, approaching to black, over its surface. The water escaping from this state of inaction by a narrow passage, is immediately precipitated in a cascade down a rocky channel, where it foams over a number of vast detached stones, which intercept and impede its progress. They are covered with a deep green moss of many ages, and have probably tumbled from the mountains that overhang the torrent. The rocks themselves, which surround and invest this romantic spot, are worn by time and the inclemency of the weather into a thousand extraordinary and fantastic forms, to which imagination gives shape and figure. On one of the pointed extremities, and in a situation which appears almost inaccessible, are seen the remains of an ancient castle, projecting over the water. The peasants call it *Il castelle di Petrarca*, and add, with great simplicity, that Laura lived upon the opposite side of the river, under the bed of which was a subterranean passage by which the two lovers visited each other. Nothing is however more certain than that these are the ruins of the chateau belonging to the Lords or Seigneurs of Avignon; and the bishop of Cavaillon resided in it during the frequent visits which he used to make to Petrarch.—The poet's dwelling was much lower down, and nearer to the bank of the Sorgues, as evidently appears from his minute description of it, and the relation he gives of his quarrel with the Naiads of the stream, who encroached during the winter on his little adjoining territory. No remains of it are now to be discerned. Below the bridge there is an island where the Sorgues joins the Rhone, in which are several houses of pleasure. E. Long. 4. 59. N. Lat. 43. 57.

Avignon-Berry, the fruit of a species of lycium; growing plentifully near Avignon and in other parts of France. The berry is somewhat less than a pea; its colour is green, approaching towards a yellow; and is of an astringent and bitter taste.—It is much used by the dyers, who stain a yellow colour with it, and by the painters, who also make a fine golden yellow of it.

AVILA, a city of Old Castile, in Spain, seated on an eminence on the banks of the river Adaja, and in sight of the mountains of Pico. It is fortified both by nature and art, having a wall 9075 feet in circumference, adorned with 26 lofty towers, and 10 handsome gates. There are 17 principal streets, the houses in which are generally good, and some of them stately. It hath nine squares, 2000 houses, nine parishes, as many monasteries, seven nunneries, two colleges, nine hospitals, 18 chapels, and an allowance of 10,000 ducats yearly for the maintenance of orphans and other poor people. It has an university, and a considerable bishopric; besides a noble cathedral, which has eight dignitaries, 20 canons, and the same number of minor canons. It stands in the middle of a fine large plain, surrounded with mountains, and covered with fruit-trees and vineyards. There is likewise a manufacture of cloth. W. Long. 4. 13. N. Lat. 40. 35.

AVIS, a small town of Alentejo in Portugal, seated on an eminence, with a castle, near the river Avis. Hence the military order of the knights of Avis have their name. W. Long. 7. 0. N. Lat. 38 40.

Avis *(Knights d'Avis)*, an order of knighthood in Portugal established about the year 1162. When the city of Evora was taken from the Moors, in the reign of the first king of Portugal, it was garrisoned by several persons who assumed the title of knights of St Mary of Evora, which was soon after changed for that of knights d'Avis, which the king gave them, and whither they removed from Evora. The badge of the order is a green cross flory, and they observe the rule of St Benedict.

AVISO, a term chiefly used in matters of commerce to denote an advertisement, an advice, or piece of intelligence.

AVISON (Charles), organist of Newcastle, and a disciple of Geminiani, was the author of an essay on musical expression, published in the year 1752, in which are some judicious reflections on music in general, but his division of the modern authors into classes is rather fanciful than just. Throughout his book he celebrates Marcello and Geminiani; the latter frequently in prejudice to Mr. Handel. In the year 1753 came out remarks on Mr. Avison's essay on musical expression, the author whereof first points out sundry errors against the rules of composition in the works of Avison. In the same year Avison republished his essay, with a reply to the author of the remarks; and a letter, containing a number of loose particulars relating to music collected in a course of various reading, unquestionably written by Dr Jortin. Avison promoted and assisted in the publication of Marcello's music to the psalms adapted to English words. Of his own composition there are extant five collections of concertos for violins, 44 in number; and two sets of sonatas for the harpsichord and two violins, a species of composition little known in England till his time. The music of Avison is light and elegant, but it wants originality; a necessary consequence of his too close attachment to the style of Geminiani, which in a few particulars only he was able to imitate.

AUK, in ornithology. See ALCA.

BISHOP'S AUKLAND, a town in the bishopric of Durham in England, situated on the river Were. It is a sanctuary for debtors; and here the bishop has a princely palace and a noble park. W. Long. 0. 57. N. Lat. 54. 44.

AULA, is used for a court baron, by Spelman; by some old ecclesiastical writers, for the nave of a church, and sometimes for a court-yard.

AULA Regia or *Regis*, a court established by William the Conqueror in his own hall, composed of the king's great officers of state, who resided in his palace, and were usually attendant on his person. This court was regulated by the article which forms the eleventh chapter of Magna Charta, and established in Westminster-hall, where it hath ever since continued. See *King's Bench*.

AULCESTER, a town of Warwickshire in England. W. Long. 1. 47. N. Lat. 52. 15.

AULETES, in antiquity, denotes a flute-player. One of the Ptolemies, kings of Egypt, father of Cleopatra, bore the surname or denomination of *Auletes*.

AULIC, an epithet given to certain officers of the empire, who compose a court which decides, without appeal, in all processes entered in it. Thus we say, *aulic council*, *aulic chamber*, *aulic counsellor*.

The aulic council is composed of a president, who is a catholic; of a vice-chancellor, presented by the archbishop of Mentz; and of 18 counsellors, nine of whom are protestants and nine catholics. They are divided into a bench of lawyers, and always follow the emperor's court; for which reason they are called *justitium imperatoris*, the emperor's justice, and aulic council. The aulic court ceases at the death of the emperor; whereas the imperial chamber of Spire is perpetual, representing not only the deceased emperor, but the whole Germanic body, which is reputed never to die.

AULIC, in the Sorbonne and foreign universities, is an act which a young divine maintains upon being admitted a doctor in divinity. It begins by an harangue of the chancellor, addressed to the young doctor, after which he receives the cap, and presides at the aulic, or disputation.

AULIS (anc. geog.), a town of Bœotia, over against Chalcis of Eubœa, on the Euripus, where that strait is narrowest; and which were sometimes joined together by a mole or causeway, (Diodorus Siculus): a craggy situation, (Homer, Nonnus); and a village of the Tanagraei, (Strabo), distant from Chalcis three miles: A harbour famous for the rendezvous of a thousand ships under Agamemnon, previous to the Trojan expedition, (Livy, Virgil, Pliny). Now entirely destroyed.

AULNEGER. See ALNAGER.

AULON, anciently a town and dock or station for ships in Illyricum, on the Adriatic; now *Valona*, or *Volana*, a port-town in the duchy of Ferara on one of the mouths of the Po, on the gulf of Venice. E. Long. 13. Lat. 44. 50.

AULON, or *Aulona*, anciently a town of Elis, in Peloponnesus, on the confines of Messenia. Here stood a temple of Æsculapius; hence the epithet *Aulonius* given that divinity, (Pausanias).

AULOS, a Grecian long measure, the same with stadium.

AULPS, a town of Provence in France, in the diocese of Trejus, with the title of a Vigueria. E. Long. 6. 25. N. Lat. 43. 40.

AULUS GELLIUS. See GELLIUS.

AUMBRY, a country-word denoting a cup-board.

AUME, a Dutch measure for Rhenish wine, containing 40 English gallons.

AUNCEL-WEIGHT, an ancient kind of balance now out of use, being prohibited by several statutes, on account of the many deceits practised by it. It consisted of scales hanging on hooks, fastened at each end of a beam, which a man lifted up on his hand. In many parts of England, auncel-weight signifies meat sold by the hand, without scales.

AUNE, a long measure used in France to measure cloths, stuffs, ribbons, &c. At Rouen, it is equal to one English ell; at Calais, to 1.52; at Lyons, to 1.061; and at Paris, to 0.95

AUNGERVYLE (Richard), commonly known by the name of *Richard de Bury*, was born in 1281 at St Edmund's Bury in Suffolk, and educated at the university of Oxford: After which he entered into the order of Benedictine monks, and became tutor to Edward prince of Wales, afterwards king Edward III. Upon the accession of his royal pupil to the throne he was first appointed cofferer, then treasurer of the wardrobe, archdeacon of Northampton, prebendary of Lincoln, Sarum, and Litchfield, keeper of the privy seal, dean of Wells, and last of all was promoted to the bishoprick of Durham. He likewise enjoyed the offices of lord high chancellor, and treasurer of England; and discharged two important embassies at the court of France. Learned himself, and a patron of the learned, he maintained a correspondence with some of the greatest geniuses of the age, particularly with the celebrated Italian poet Petrarch. He was also of a most humane and benevolent temper, and performed many signal acts of charity. Every week he made eight quarters of wheat into bread, and gave it to the poor. Whenever he travelled between Durham and Newcastle, he distributed eight pounds sterling in alms; between Durham and Stockton five pounds, between Durham and Aukland five marks, and between Durham and

Middleham five pounds. He founded a public library at Oxford, for the use of the students, which he furnished with the best collection of books then in England; and appointed five keepers, to whom he granted yearly salaries. At the dissolution of religious houses in the reign of Henry VIII. Durham college, where he fixed the library, being dissolved among the rest, some of the books were removed to the public library, some to Baliol college, and some came into the hands of Dr George Owen, a physician of Godstow, who bought that college of king Edward VI. Bishop Aungervyle died at his manor of Aukland, April 24, 1345, and was buried in the south part of the cross isle of the cathedral church of Durham, to which he had been a benefactor. He wrote, 1. *Philobiblos*, containing directions for the management of his library at Oxford, and a great deal in praise of learning, in bad Latin. 2. *Epistolæ familiarium;* some of which are written to the famous Petrarch. 3. *Orationes ad principes*; mentioned by Bale and Pitts.

AUNIS, the smallest province in France, bounded on the north by Poictou, on the west by the ocean, on the east and south by Saintogne, of which it was formerly a part It is watered by the rivers Seure and Sarente, the former of which has its source at Seure in Poictou. The coast of this small district has the advantage of several ports, the most remarkable of which are Rochefort, Rochelle, Brouge, St Martin de Re, Tremblade, Tonnai, and Charente. The soil of this country is dry, yet produces good corn and plenty of wine. The marshes feed a great number of cattle, and the salt marshes yield the best salt in Europe.

AVOCADO, or AVIGATO, *Pear*. See LAURUS.

AVOCATORIA, a mandate of the emperor of Germany, addressed to some prince, in order to stop his unlawful proceedings in any cause appealed to him.

AVOIDANCE, in the canon law, is when a benefice becomes void of an incumbent; which happens either in fact, as by the death of the person; or in law, as by cession, deprivation, resignation, &c. In the first of these cases, the patron must take notice of the avoidance at his peril; but in avoidance by law, the ordinary is obliged to give notice to the patron, in order to prevent a lapse.

AVOIRDUPOIS. This is the weight for the larger and coarser commodities, such as groceries, cheese, wool, lead, &c. Bakers, who live not in corporation towns, are to make their bread by avoirdupois weight, those in corporations by troy weight. Apothecaries buy by avoirdupois weight, but sell by troy. The proportion of a pound avoirdupois to a pound troy is as 17 to 14.

AVOSETTA, in ornithology. See RECURVIROSTRA.

AVOWEE, one who has a right to present to a benefice. He is thus called in contradistinction to those who only have the lands to which the advowson belongs for a term of years, or by virtue of intrusion or disseisin.

AVOWRY, in law, is where a person distrained sues out a replevin; for then the distrainer must vow, and justify his plea, which is called his *avowry*.

AURA, among physiologists, an airy exhalation or vapour. The word is Latin, derived from the Greek, *αυρα, gentle wind.*

AURACH, a town of Germany with a good castle, in the south part of Suabia, in the duchy of Wirtemberg. It is the usual residence of the youngest sons of the house of Wirtemberg, and is seated at the foot of a mountain on the rivulet Ermst. E. Long. 9. 20. N. Lat. 48. 25.

AURÆ, in mythology, a name given by the Romans to the nymphs of the air. They are mostly to be found in the ancient paintings of ceilings; where they are represented as light and airy, generally with long robes and flying veils of some lively colour or other, and fluttering about in the rare and pleasing element assigned to them. They are characterised as sportive and happy in themselves, and well-wishers to mankind.

AURANCHES, the capital of a territory called *Auranchin*, about 30 miles in length, in Lower Normandy in France. The city is mean; but its situation very fine, being on an eminence, near which the river See runs, about a mile and a half from the ocean. The cathedral stands on a hill, which terminates abruptly; the front of the church extending to the extreme verge of it, and overhanging the precipice. It bears the marks of high antiquity; but the towers are decayed in many places, though its original construction has been wonderfully strong. Here, you are told, the English Henry II. received absolution from the Papal nuncio for the murder of St Thomas-a-Becket in 1172; and the stone on which he knelt during the performance of that ceremony is shown to strangers. Its length is about 30 inches, and the breadth 12. It stands before the north portal, and on it is engraved a chalice in commemoration of the event.—The ruins of the castle of Auranches are very extensive, and beneath lies a rich extent of country, abounding in grain and covered with orchards, from the fruit of which is made the best cyder in Normandy. W. Long. 1. 20. N. Lat. 48. 51.

AURANTIUM, in botany. See CITRUS.

AURAY, a small seaport town of Lower Brittany in France, situated in the gulph called *Morbian.* It is nothing, properly speaking, but a large quay, and a handsome street, being chiefly known for its trade. W. Long. 2. 25. N. Lat. 47. 48.

AURELIA, in natural history, the same with what is more usually called *chrysalis*, and sometimes *nymph*. See CHRYSALIS.

AURELIANUS (Lucius Domitius), emperor of Rome, was one of the greatest generals of antiquity, and commanded the armies of the emperor Claudius with such glory, that after the death of that emperor all the legions agreed to place him on the throne: this happened in the year 270. He carried the war from the east to the west, with as much facility, says a modern writer, as a body of troops marches from Alsace into Flanders. He defeated the Goths, Sarmatians, Marcomanni, the Persians, Egyptians, and Vandals; conquered Zenobia queen of the Palmyrenians, and Tetricus general of the Gauls; both of whom were made to grace his triumph, in the year 274. He was killed by one of his generals in Thrace in the year 275, when he was preparing to enter Persia with a great army. See ROME.

AURELIUS VICTOR. See VICTOR.

AURENGABAD, a city in the East Indies, capital of the province of Balagate, in the dominions of the Great Mogul. It is furnished with handsome mosques and caravanseras. The buildings are chiefly of free-stone, and pretty high, and the streets planted on each side with trees. They have large gardens well stocked with fruit-trees and vines. The soil about it is also very fertile, and the sheep fed in its neighbourhood are remarkably large and strong. E. Long. 75. 30. N. Lat. 19. 10.

AURENG-ZEBE, the Great Mogul. See INDOSTAN.

AUREOLA, in its original signification, signifies a jewel, which is proposed as a reward of victory in some public dispute. Hence the Roman schoolmen applied it to denote the reward bestowed on martyrs, virgins, and doctors, on account of their works of supererogation; and painters use it to signify the crown of glory with which they adorn the heads of saints, confessors, &c.

AUREUS, a Roman gold coin, equal in value to 25 denarii.—According to Ainsworth, the aureus of the higher empire weighed near five pennyweights; and in the lower empire, little more than half that weight. We learn from Suetonius, that it was customary to give aurei to the victors in the chariot-races.

AUREUS MONS (anc. geog.), a mountain in the north-west of Corsica, whose ridge runs out to the north-east and south-east, forming an elbow—Another mountain of Moesia Superior, or Servia (Peutinger), to the south of the Danube, with a cognominal town at its foot on the same river. The emperor Probus planted this mountain with vines (Eutropius).

AURICK, a city of Germany; in East Friesland, in the circle of Westphalia; to which the king of Prussia claims a right. It is situated in a plain surrounded with forests full of game. E. Long. 6. 50. N. Lat. 53. 28.

AURICLE, in anatomy, that part of the ear which is prominent from the head, called by many authors *auris externa*.

AURICLES are likewise two muscular bags situated at the basis of the heart, and intended as diverticula for the blood during the diastole.

AURICULA, in botany. See PRIMULA.

AURIFLAMMA, in the French history, properly denotes a flag or standard belonging to the abbey of St Dennis, suspended over the tomb of that saint, which the religious, on occasion of any war in defence of their lands or rights, took down, with great ceremony, and gave it to their protector or advocate, to be borne at the head of their forces.

AURIFLAMMA is also sometimes used to denote the chief flag or standard in any army.

AURIGA, *the WAGGONER*, in astronomy, a constellation of the northern hemisphere, consisting of 23 stars, according to Tycho; 40, according to Hevelius; and 68, in the Britannic catalogue.

AURILLAC, a town of France in the Lower Auvergne, seated on a small river call *Jordane*. It is one of the most considerable towns of the province, has six gates, is very populous, and yet has but one parish. The castle is very high, and commands the town. The abbot is lord of Aurillac, and has episcopal jurisdiction; he is also chief justice of the town. This place is remarkable for having produced several great men. E. Long. 2. 33. N. Lat. 44. 55.

AURIPIGMENTUM, ORPIMENT, in natural history. See ORPIMENT.

AURISCALPIUM, an instrument to clean the ears, and serving also for other operations in disorders of that part.

AURORA, the morning twilight, or that faint light which appears in the morning when the sun is within 18 degrees of the horizon.

AURORA, the goddess of the morning, according to the Pagan mythology. She was the daughter of Hyperion and Theia, according to Hesiod; but of Titan and Terra, according to others. It was under this name that the ancients deified the light which foreruns the rising of the sun above our hemisphere. The poets represent her as rising out of the ocean, in a chariot, with rosy fingers dropping gentle dew. Virgil describes her ascending in a flame-coloured chariot with four horses.

AURORA, one of the New Hebrides islands in the South Sea, in which Mr Forster supposes the *Peak d'Etoile* mentioned by Mr Bouganville to be situated. The island is inhabited; but none of its inhabitants came off to visit Captain Cook. The country is woody, and the vegetation seemed to be excessively luxuriant. It is about 12 leagues long, but not above five miles broad in any part; lying nearly north and south. The middle lies in S. Lat. 15. 6. E. Long. 168. 24.

AURORA BOREALIS, NORTHERN TWILIGHT, or *Streamers;* a kind of meteor appearing in the northern part of the heavens, mostly in the winter-time, and in frosty weather. It is now so generally known, that no description is requisite of the appearance which it usually makes in this country. But it is in the arctic regions that it appears in perfection, particularly during the solstice. In the Schetland islands, the *merry dancers*, as they are there called, are the constant attendants of clear evenings, and prove great reliefs amidst the gloom of the long winter-nights. They commonly appear at twilight near the horizon, of a dun colour, approaching to yellow; sometimes continuing in that state for several hours without any sensible motion; after which they break out into streams of stronger light spreading into columns, and altering slowly into ten thousand different shapes, varying their colours from all the tints of yellow to the obscurest russet. They often cover the whole hemisphere, and then make the most brilliant appearance. Their motions at these times are most amazingly quick; and they astonish the spectator with the rapid change of their form. They break out in places where none were seen before, skimming briskly along the heavens; are suddenly extinguished, and leave behind an uniform dusky tract. This again is brilliantly illuminated in the same manner, and as suddenly left a dull blank. In certain nights they assume the appearance of vast columns, on one side of the deepest yellow, on the other declining away till it becomes undistinguished from the sky. They have generally a strong tremulous motion from end to end, which continues till the whole vanishes. In a word, we, who only see the extremities of these northern phenomena, have but a faint idea

Aurora Borealis.

ideas of their splendor and their motions. According to the state of the atmosphere, they differ in colours. They often put on the colour of blood, and make a most dreadful appearance. The rustic sages become prophetic, and terrify the gazing spectators with the dread of war, pestilence, and famine. This superstition was not peculiar to the northern islands; nor are these appearances of recent date. The ancients called them *Chasmata*, and *Trabes*, and *Bolides*, according to their forms or colours.

In old times they were extremely rare, and on that account were the more taken notice of. From the days of Plutarch to those of our sage historian Sir Richard Baker, they were supposed to have been portentous of great events, and timid imaginations shaped them into aerial conflicts:

Fierce fiery warriors fight upon the clouds
In ranks and squadrons and right form of war.

1 This meteor formerly very rare.

Dr Halley tells us, that when he saw a great aurora borealis in 1716, he had begun to despair of ever seeing one at all; none having appeared, at least in any considerable degree, from the time he was born till then. Notwithstanding this long interval, however, it seems that in some periods the aurora borealis had been seen much more frequently; and perhaps this, as well as other natural phenomena, may have some stated times of returning.

2 History by Dr Halley.

The only thing that resembles a distinct history of this phenomenon, is what we have from the learned Dr Halley, Phil. Transf. n° 347. The first account he gives, is of the appearance of what is called by the author *burning spears*, and was seen at London on January 30th, 1560. This account is taken from a book intitled, *A description of Meteors*, by *W. F.* D. D. and reprinted at London in 1654. The next appearance, on the testimony of Stow, was on October 7th, 1564. In 1574 also, according to Camden, and Stow abovementioned, an aurora borealis was observed two nights successively, *viz.* on the 14th and 15th of November, with much the same appearance as desciribed by Dr Halley in 1715-16, and which we now so frequently observe. Again, the same was twice seen in Brabant, in the year 1575; *viz.* on the 13th of February and 28th of September. Its appearances at both these times were described by Cornelius Gemma, professor of medicine in the university of Lovain, who compares them to spears, fortified cities, and armies fighting in the air. After this, Michael Mæstlin, tutor to the great Kepler, assures us, that at Baknang in the county of Wurtemberg in Germany, these phenomena, which he styles *chasmata*, were seen by himself no less than seven times in 1580. In 1581, they again appeared in an extraordinary manner in April and September, and in a less degree at some other times of the same year. In 1621, September 2d, this phenomenon was observed all over France, and described by Gassendus, who gave it the name of *aurora borealis:* yet neither this, nor any similar appearances posterior to 1574, are described by English writers till the year 1707; which, as Dr Halley observes, shows the prodigious neglect of curious matters which at that time prevailed. From 1621 to 1707, indeed, there is no mention made of an aurora borealis being seen by any body: and considering the number of astronomers who during that period were in a manner continually poring on the heavens, we may very reasonably conclude that no such thing did make its appearance till after an interval of 86 years. In 1707, a small one was seen in November; and during that year and the next, the same appearances were repeated five times. The next, on record is that mentioned by Dr Halley in March 1715-16, the brilliancy of which attracted universal attention, and by the vulgar was considered as marking the introduction of a foreign race of princes. Since that time those meteors have been so common, that no accounts have been kept of them.

It was for a long time a matter of doubt whether this meteor made its appearance only in the northern hemisphere, or whether it was also to be observed near the south pole. This is now ascertained by Mr Forster; who in his late voyage round the world along with Captain Cook, assures us, that he observed them in the high southern latitudes, though with phenomena somewhat different from those which are seen here. On Feb. 17, 1773, as they were in Lat. 58° south, "A beautiful phenomenon (says he) was observed during the preceding night, which appeared again this and several following nights. It consisted of long columns of a clear white light, shooting up from the horizon to the eastward, almost to the zenith, and gradually spreading on the whole southern part of the sky. These columns were sometimes bent sideways at their upper extremities; and though in most respects similar to the northern lights *(aurora borealis)* of our hemisphere, yet differed from them in being always of a whitish colour, whereas ours assume various tints, especially those of a fiery and purple hue. The sky was generally clear when they appeared, and the air sharp and cold, the thermometer standing at the freezing-point."

3 Mr Forster's account of similar appearances in the southern hemisphere.

Dr Halley observed that the aurora borealis described by him arose to a prodigious height, it being seen from the west of Ireland to the confines of Russia and Poland on the east; nor did he know how much farther it might have been visible; so that it extended at least 30 degrees in longitude, and from lat. 50° north it was seen all over the northern part of Europe; and what was very surprising, in all those places where it was visible, the same appearances were exhibited which Dr Halley observed at London. He observes, with seeming regret, that he could by no means determine its height for want of observations made at different places; otherwise he might as easily have calculated the height of this aurora borealis, as he did of the fiery globe in 1719*. To other philosophers, however, he gives the following exhortation. "When therefore for the future any such thing shall happen, all those that are curious in astronomical matters are hereby *admonished* and *intreated* to set their clocks to the apparent time at London, for example, by allowing so many minutes as is the difference of meridians; and then to note, at the end of every half hour precisely, the exact situation of what at that time appears remarkable in the sky; and particularly the azimuths of those very tall pyramids so eminent above the rest, and therefore likely to be seen furthest: to the intent that, by comparing these observations taken at the same moment in distant places, the difference of their azimuths may serve to determine how far these pyramids are distant from us." This advice of Dr Halley seems to have been totally neglected by all the philosophical people in Britain. In other countries, however, they have

4 Rises very high.

* See *Atmosphere*.

Aurora Borealis.

have been more industrious. Father Boscovich has determined the height of an aurora borealis, observed on the 16th of December 1737 by the Marquis of Poleni, to have been 825 miles high; the celebrated Mr Bergman, from a mean of 30 computations, makes the average height of the aurora borealis to be 70 Swedish, or upwards of 460 English miles. Euler supposes it to be several thousands of miles high; and Mairan also assigns them a very elevated region. In the 74th volume of the philosophical transactions, Dr Blagden, when speaking of the height of some fiery meteors, tells us, that the "aurora borealis appears to occupy as high, if not a higher region above the surface of the earth, as may be judged from the very distant countries to which it has been visible at the same time." The height of these meteors, however, none of which appear to have exceeded or even arrived at the height of a hundred miles, must appear trifling in comparison of the vast elevations abovementioned. But these enormous heights, varying so exceedingly, show that the calculators have not had proper data to proceed upon; and indeed the immense extent of space occupied by the aurora borealis itself, with its constant motion, must make it infinitely more difficult to determine the height of it than of a fiery globe, which occupies but a small portion of the visible heavens. The most certain method of making a comparison betwixt the aurora borealis and the meteors already mentioned, would be, if a ball of fire should happen to pass through the same part of the heavens where an aurora borealis was; when the comparative height of both could easily be ascertained. One instance of this only has come under our observation, where one of the small meteors, called *falling stars*, was evidently obscured by an aurora borealis; and therefore must have been higher than the lower part of the latter at least. A singularity in this meteor was, that it did not proceed in a straight line through the heavens, as is usual with falling stars, but described a very considerable arch of a circle, rising in the northwest, and proceeding southward a considerable way in the arch of a circle, and disappearing in the north. Its edges were ill defined, and five or six corruscations seemed to issue from it like the rays painted as issuing from stars. The aurora borealis was not in motion, but had degenerated into a crepusculum in the northern part of the hemisphere. Indeed in some cases this kind of crepusculum appears so plainly to be connected with the clouds, that we can scarcely avoid supposing it to proceed from them. We cannot, however, argue from this to the height of the aurora borealis when it moves with great velocity, because it then may, and very probably does, ascend much higher. Dr Blagden, indeed, informs us, that instances are recorded, where the northern lights have been seen to join, and form luminous balls, darting about with great velocity, and even leaving a train like the common fire-balls. It would seem therefore, that the highest regions of the aurora borealis are the same with those in which fireballs move.

5 Conjectures concerning the cause of this meteor.

With regard to the cause of the aurora borealis, many conjectures have been formed. The first which naturally occurred was, that it was occasioned by the ascent of inflammable sulphureous vapours from the earth. To this supposition Dr Halley objects the immense extent of such phenomena, and that they are constantly observed to proceed from north to south, but never from south to north. This made him very reasonably conclude, that there was some connection between the poles of the earth and the aurora borealis; but being unacquainted with the electric power, he supposed, that this earth was hollow, having within it a magnetical sphere, which corresponded in virtue with all the natural and artificial magnets on the surface; and the magnetic effluvia passing through the earth, from one pole of the central magnet to another, might sometimes become visible, in their course, which he thought was from north to south, and thus exhibit the beautiful corruscations of the aurora borealis. Had Dr Halley, however, known that a stroke of electricity would give polarity to a needle that had it not, or reverse the poles of one that had it before, he would undoubtedly have concluded the electric and magnetic effluvia to be the same, and that the aurora borealis was this fluid performing its circulation from one pole of the earth to the other. In fact, this very hypothesis is adapted by S. Beccaria; and by the supposed circulation of the electric fluid he accounts for the phenomena of magnetism and the aurora borealis in a manner perfectly similar to that of Dr Halley, only changing the phrase *magnetic effluvia* for *electric fluid*. The following is the account given us by Dr Priestley of Beccaria's sentiments on this matter.

"Since a sudden stroke of lightning gives polarity to magnets, he conjectures, that a regular and constant circulation of the whole mass of the fluid from north to south may be the original cause of magnetism in general.

"That this etherial current is insensible to us is no proof of its non-existence, since we ourselves are involved in it. He had seen birds fly so near a thunder-cloud, as he was sure they would not have done had they been affected by its atmosphere.

"This current he would not suppose to arise from one source, but from several, in the northern hemisphere of the earth; and he thinks that the aurora borealis may be in this electric matter performing its circulation in such a state of the atmosphere as renders it visible, or approaching the earth nearer than usual. Accordingly very vivid appearances of this kind have been observed to occasion a fluctuation in the magnetic needle.

A direct disproof of this circulation, however, is furnished by the observation of Mr Forster already mentioned; with which, though neither Dr Halley nor S. Beccaria could be acquainted, they might have thought of it as a final proof either of the truth or falsehood of their hypothesis.—If the aurora borealis is no other than the electric fluid performing the abovementioned circulation, it ought to dart from the horizon towards the zenith in the northern hemisphere, and from the zenith to the horizon in the southern one: but Mr Forster plainly tells us, that the columns shot up from the horizon towards the zenith as well in the southern hemisphere as in the northern; so that if the aurora borealis is to be reckoned the flashings of electric matter, its course is plainly directed from both poles towards the equator, and not from one pole to the other.

Concerning the cause of this phenomenon, Mr Canton has the following query: "Is not the aurora borealis

Aurora Borealis

realis the flashing of electrical fire from positive towards negative clouds at a great distance, through the upper part of the atmosphere where the resistance is least?" But to this we must reply in the negative; for in this case it would flash in evey direction according to the position of the clouds, as well as from north to south. Besides this query, he conjectures, that when the needle is disturbed by the aurora borealis, that phenomenon proceeds from the electricity of the heated air; and supposes the air to have the property of becoming electric by heat, like the tourmalin. But neither does this hypothesis appear at all probable; because, in such a case, the aurora borealis ought to be most frequent in summer when the air is most heated, whereas it is found to be the reverse.——Lastly, with these electrical hypotheses we shall contrast that of Mr Mairan, who imagined this phenomenon to proceed from the atmosphere of the sun, particles of which were thrown off by its centrifugal force acquired by his rotation on his axis; and that these particles falling upon the atmosphere of the earth near its equatorial parts, were from thence propelled by the diurnal motion of the earth towards the polar regions, where they formed the aurora borealis. This hypothesis, besides its being a mere supposition unsupported by one single appearance in nature, is liable to the objection already mentioned; for in this case the light should dart from the equator to the poles, and not from the poles to the equator: or if we should suppose this matter to be gradually accumulated at each of the poles, we must then make other suppositions equally vague and ill founded, concerning its getting back with such surprising rapidity in direct opposition to the power which once brought it thither.

The first person that seems to have endeavoured to find any positive proof for the electrical quality of the aurora borealis, is Dr Hamilton of Dublin. He observes, that though this phenomenon is commonly supposed to be electrical, yet he had not seen any attempt to prove that it is so: but the only proof he himself brings is an experiment of Mr Hawksbee, by which the electric fluid is shown to put on appearances somewhat like the aurora borealis, when it passes through a vacuum. He observed, that when the air was most perfectly exhausted, the streams of electric matter were then quite white; but when a small quantity of air was let in, the light assumed more of a purple colour. The flashing of this light therefore from the dense regions of the atmosphere into such as are more rare, and the transitions through mediums of different density, he reckons the cause of the aurora borealis, and of the different colours it assumes.

Dr Hamilton's proof, then, of the electricity of the aurora borealis, consists entirely in the resemblance the two lights bear to one another; and if to this we add, that, during the time of an aurora borealis, the magnetic needle hath been disturbed, electric fire obtained from the atmosphere in plenty, and at some times different kinds of rumbling and hissing sounds heard, we have the sum of all the positive evidence in favour of the electric hypothesis.

Was the aurora borealis the first natural phenomenon the solution of which had been attempted by electricity, no doubt the proofs just now adduced would be very insufficient: but when it is considered, that we have indisputable evidence of the identity of the phenomena of thunder and of electricity; when we also consider, that the higher parts of our atmosphere are continually in a strongly electrified state; the analogy becomes so strong, that we can scarce doubt of the aurora borealis arising from the same cause. The only difficulty is, to give a good reason why the electricity of the atmosphere should be constantly found to direct its course from the poles towards the equator, and not from the equator to the poles; and this we think may be done in the following manner.

Aurora Borealis.

1. It is found that all electric bodies, when considerably heated, become conductors of electricity; thus hot air, hot glass, melted rosin, sealing wax, &c. are all conductors, till their heat is dissipated, and then they again become electrics.

See *Electricity passim.*

2. As the converse of every true proposition ought also to be true, it follows from the above one, that if electrics when heated become conductors, then non-electrics when subjected to violent degrees of cold ought to become electric. In one instance this has been verified by experience; water, which is a conductor when warm or not violently cooled, is found to become electric when cooled to 20° below 0 of Fahrenheit's thermometer. With regard to metallic substances, indeed, no experiments have as yet been made to determine whether their conducting power is affected by cold or not. Very probably we might not be able to produce such a degree of cold as sensibly to lessen their conducting power; but still the analogy will hold; and, as we are by no means able to produce the greatest degree of cold possible, reason will always suggest to us, that if a certain degree of cold changes one conductor into an electric, a sufficient degree of it will also change all others into electrics.

3. If cold is sufficient to change conducting substances into electrics, it must also increase the electric power of such substances as are already electric; that is to say, very cold air, glass, rosin, &c. provided they are dry, will be more electric than when they are warmer. With regard to air, which is most to our present purpose, this is rendered extremely probable, by considering that clear frosty weather is of all others the most favourable for electric experiments. They may be made indeed to equal advantage almost in any state of the atmosphere, provided sufficient pains is used, but in dry hard frosts they will succeed much more easily that at any other time.

These three axioms being allowed, the cause of the aurora borealis is easily deduced from them. The air, all round the globe, at a certain height above its surface, is found to be exceedingly cold, and, as far as experiments have yet determined, exceedingly electrical also. The inferior parts of the atmosphere between the tropics, are violently heated during the day-time by the reflection of the sun's rays from the earth. Such air will therefore be a kind of conductor, and much more readily part with its electricity to the clouds and vapours floating in it, than the colder air towards the north and south poles. Hence the prodigious appearances of electricity in these regions, showing itself in thunder and other tempests of the most terrible kind. Immense quantities of the electric fluid are thus communicated to the earth, and the inferior warm atmosphere having once exhausted itself, must ne-

cessarily

Aurora Borealis.

cessarily be recruited from the upper and colder region. This becomes very probable from what the French mathematicians observed when on the top of one of the Andes. They were often involved in clouds, which, sinking down into the warmer air, appeared there to be highly electrified, and discharged themselves in violent tempests of thunder and lightning; while, in the mean time, on the top of the mountain, they enjoyed a calm and serene sky. In the temperate and frigid zones, the inferior parts of the atmosphere never being so strongly heated, do not part with their electricity so easily as in the torrid zone, and consequently do not require such recruits from the upper regions; but notwithstanding the difference of heat observed in different parts of the earth near the surface, it is very probable that at considerable heights the degree of cold is nearly equal all round it. Were there a like equality in the heat of the under part, there could never be any considerable loss of equilibrium in the electricity of the atmosphere: but as the hot air of the torrid zone is perpetually bringing down vast quantities of electric matter from the cold air that lies directly above it; and as the inferior parts of the atmosphere lying towards the north and south poles do not conduct in any great degree; it thence follows, that the upper parts of the atmosphere lying over the torrid zone will continually require a supply from the northern and southern regions. This easily shows the necessity of an electric current in the upper parts of the atmosphere from each pole towards the equator: and thus we are also furnished with a reason why the aurora borealis appears more frequently in winter than in summer; namely, because at that time the electric power of the inferior atmosphere is greater on account of the cold than in summer; and consequently the abundant electricity of the upper regions must go almost wholly off to the equatorial parts, it being impossible for it to get down to the earth: hence also the aurora borealis appears very frequent and bright in the frigid zones, the degree of cold in the upper and under regions of the atmosphere being much more nearly equal in these parts than in any other. In some parts of Siberia particularly, this meteor appears constantly from October to Christmas, and its corruscations are said to be very terrifying. Travellers agree, that here the aurora borealis appears in greatest perfection; and it is to be remarked, that Siberia is the coldest country on earth. In confirmation of this, it may also be observed, that, from the experiments hitherto made with the electrical kite, the air appears considerably more electrical in winter than in summer, though the clouds are known to be often most violently electrified in the summer time; a proof, that the electricity naturally belonging to the air is in summer much more powerfully drawn off by the clouds than in the winter, owing to the excess of heat in summer, as already observed.

A considerable difficulty, however, still remains, from the upright position which the streams of the aurora borealis are generally observed to have; whereas, according to the hypothesis abovementioned, they ought rather to run directly from north to south. This difficulty occured to Dr Halley: but he answers it by supposing his magnetic effluvia to pass from one pole to another in arches of great circles, arising to a vast height above the earth, and consequently darting from the places whence they arose almost like the radii of a circle; in which case, being sent off in a direction nearly perpendicular to the surface of the earth, they must necessarily appear erect to those who see them from any part of the surface, as is demonstrated by mathematicians. It is also reasonable to think that they will take this direction rather than any other, on account of their meeting with less resistance in the very high regions of the air than in such as are lower.

But the greatest difficulty still remains: for we have supposed the equilibrium of the atmosphere to be broken in the day-time, and restored only the night; whereas, considering the immense velocity with which the electric fluid moves, the equilibrium ought to be restored in all parts almost instantaneously; yet the aurora borealis never appears except in the night, although its brightness is such as must sometimes make it visible to us did it really exist in the day-time.

In answer to this it must be observed, that though the passage of electricity through a good conductor is instantaneous, yet through a bad conductor it is observed to take some time in passing. As our atmosphere therefore, unless very violently heated, is but a bad conductor of electricity; though the equilibrium in it is broken, it can by no means be instantaneously restored. Add to this, that as it is the action of the sun which breaks the equilibrium, so the same action, extending over half the globe, prevents almost any attempt to restore it till night; when flashes arise from various parts of the atmosphere, gradually extending themselves with a variety of undulations towards the equator.

It now remains to explain only one particularity of the aurora borealis, namely, that its streams do not always move with rapidity, sometimes appearing quite stationary for a considerable time, and sometimes being carried in different directions with a slow motion. To this indeed we can give no other reply, than that weak electric lights have been sometimes observed to put on the same appearance at the surface of the earth; and much more may we suppose them capable of doing so at great heights above it, where the conductors are both fewer in number and much more imperfect. When M. de Romans was making experiments with an electric kite in Italy, a cylinder of blue light about four or five inches diameter was observed surrounding the string. This was in the day-time; but had it been night, he imagined it must have been four or five feet in diameter; and as the string was 780 feet long, it would probably have seemed pyramidal, pointing upwards like one of the streams of the aurora borealis. A still more remarkable appearance, Dr Priestly tells us, was observed by Mr Hartman. He had been making electrical experiments for four or five hours together in a very small room; and upon going out of it, and returning with a light in his hand, walking pretty quick, he perceived a small flame following him at about three feet distance. Being alarmed at this appearance, he stopped to examine it, upon which it vanished. This last instance is very remarkable, and singular in its kind: from both, however, we are sufficiently warranted to conclude, that small portions of our atmosphere may by various causes be so much electri-

fied

Aurora Borealis. fied as to ſhine, and likewiſe be moved from one place to another without parting with the electricity they have received, for a conſiderable time.

The corona, or circle, which is often formed near the zenith by the aurora borealis, is eaſily accounted for in the ſame manner. As this corona is commonly ſtationary for ſome time, we imagine it would be a very proper mark whereby to determine the diſtance of the meteor itſelf. If an aurora borealis, for inſtance, was obſerved by two perſons, one at London, and the other at Edinburgh; by noting the ſtars among which the corona was obſerved at each place, its true altitude from the ſurface of the earth could eaſily be determined by trigonometry.

Under the article ATMOSPHERE it was ſuggeſted, that no good proof had been as yet brought for the extreme rarity of the air uſually ſuppoſed to take place at no very great heights above the earth. The brightneſs of the meteor there mentioned at 70 miles perpendicular from the ſurface, as alſo its figure, ſeemed to prove the air conſiderably denſer at that diſtance from the earth. Though the height of the aurora borealis has never been determined, we can ſcarce imagine it to be greater than that of this meteor, or indeed ſo great: but although its ſtreams reſemble the paſſage of electric light through a vacuum, it cannot be from thence inferred, that the air is at all in a ſtate ſimilar to the vacuum of an air-pump in thoſe places where the aurora borealis is produced; ſeeing we have inſtances of ſimilar appearances being produced in very denſe air. The plate of an electrophorus is often ſo highly electrified, as to throw out flaſhes from different parts as ſoon as it is lifted up, and by proper management it may be always made to emit long and broad flaſhes which ſhall ſcarcely be felt by the finger, inſtead of ſmall, denſe, and pungent ſparks; ſo that, though long flaſhes may be produced in rarefied air, it by no means follows that the ſame may not alſo be produced in denſer air. As little can we infer any thing from the colours; for we obſerve the electric ſpark ſometimes white, ſometimes blue, and ſometimes purple, in the very ſame ſtate of the atmoſphere, and from the ſame ſubſtance.

The aurora borealis is ſaid to be attended with a peculiar hiſſing noiſe in ſome very cold climates; Gmelin ſpeaks of it in the moſt pointed terms, as frequent and very loud in the north-eaſtern parts of Siberia; and other travellers have related ſimilar facts. Gmelin's account is very remarkable. "Theſe northern lights (ſays he) begin with ſingle bright pillars, riſing in the N. and almoſt at the ſame time in the N. E. which gradually increaſing comprehend a large ſpace of the heavens, ruſh about from place to place with incredible velocity, and finally almoſt cover the whole ſky up to the zenith. The ſtreams are then ſeen meeting together in the zenith, and produce an appearance as if a vaſt tent was expended in the heavens, glittering with gold, rubies, and ſaphire. A more beautiful ſpectacle cannot be painted; but whoever ſhould ſee ſuch a northern light for the firſt time, could not behold it without terror. For however fine the illumination may be, it is attended, as I have learned from the relation of many perſons, with ſuch a hiſſing, cracking, and ruſhing noiſe throughout the air, as if the largeſt fireworks were playing off. To deſcribe what they then hear, they make uſe of the expreſſion, *Spolochi chodjat*, that is, the ranging hoſt is paſſing. The hunters who purſue the white and blue foxes in the confines of the Icy Sea, are often overtaken in their courſe by theſe northern lights. Their dogs are then ſo much frightened, that they will not move, but lie obſtinately on the ground till the noiſe has paſſed. Commonly clear and calm weather follows this kind of northern lights. I have heard this account, not from one perſon only, but confirmed by the uniform teſtimony of many, who have ſpent part of ſeveral years in theſe very northern regions, and inhabited different countries from the Yeneſei to the Lena; ſo that no doubt of its truth can remain. This ſeems indeed to be the real birth-place of the *aurora borealis*."

The hiſſing or ruſhing noiſe above deſcribed, Dr Blagden is inclined to attribute to ſmall ſtreams of electric matter running off to the earth from the maſſes or accumulations of electricity by which the northern lights are ſuppoſed to be produced. 6

Aurora borealis ſucceeded by ſouth-weſt winds. We ſhall conclude this article with an account of a paper preſented to the Royal Society by Mr Winn, in 1772, wherein he ſays that the appearance of an aurora borealis, is a certain ſign of an hard gale of wind from the ſouth to ſouth-weſt. This he never found to fail in 23 inſtances; and even thinks, that from the ſplendor of the meteor, ſome judgment may be formed concerning the enſuing tempeſt. If the aurora is very bright, the gale will come on within twenty-four hours, but will be of no long duration; if the light is faint and dull, the gale will be leſs violent, and longer in coming on, but will alſo laſt longer. His obſervations were made in the Engliſh channel, where ſuch winds are very dangerous; and by attending to the auroræ, he ſays he often got eaſily out of it, when others narrowly eſcaped being wrecked. This is an exceeding uſeful obſervation for ſailors: but it cannot be expected that the winds ſucceeding theſe meteors ſhould in all places blow from the ſouth-weſt; though no doubt a careful obſervation of what winds ſucceed the aurora borealis, and other meteors, in different parts of the world, might contribute in ſome meaſure to leſſen the dangers of navigation. 7

Conjecture concerning the reaſon. That the aurora borealis ought to be ſucceeded by winds, may be eaſily deduced from the hypotheſis laſt mentioned. If this phenomenon is occaſioned by the vaſt quantity of electric matter conveyed to the equatorial parts of the earth, it is certain that the earth cannot receive any great quantity of this matter at one place without emitting it at another. The electricity, therefore, which is conſtantly received at the equator, muſt be emitted nearer the poles, in order to perform its courſe, otherwiſe there could not be a conſtant ſupply of it for the common operations of nature. It is obſerved, that electrified bodies are always ſurrounded by a blaſt of air, which is ſent forth from them in all directions; hence, if the electric matter find a more ready paſſage through one part of the earth than another, a wind will be found to blow from that quarter. If therefore one of theſe places happens to be in the Atlantic ocean near the coaſt of France, or in the bay of Biſcay, the electric matter which has been received at the equator during an aurora borealis will be diſcharged there ſome time after, and conſequently a wind will blow from that quarter, which will be from the ſouth-weſt to thoſe ſhips which are in the Engliſh channel.

channel. It cannot be imagined, however, that all the matter can be difcharged from one place; and therefore according to the different fituations of thofe electrical vents, winds may blow in different directions; and thus the fame aurora borealis may produce a fouth-weft wind in the Englifh channel, and a north-weft one in Scotland.

AURUM. See GOLD, CHEMISTRY, and METALLURGY.

This metal was introduced into medicine by the Arabians, who efteemed it one of the greateft cordials and comforters of the nerves. From them Europe received it without any diminution of its character; in foreign pharmacopœias it is ftill retained, and even mixed with the ingredients from which fimple waters are to be diftilled. But no one, it is prefumed, at this time expects any fingular virtues from it, fince it certainly is not alterable in the human body. Mr Geoffroy, though unwilling to reject it from the cordial preparations, honeftly acknowledges that he has no other reafon for retaining it than complaifance to the Arabian fchools. The chemifts have endeavoured, by many elaborate proceffes, to extract what they call a fulphur or anima of gold: but no method is as yet known of feparating the component parts of this metal; all the tinctures of it, and aurum potabile, which have hitherto appeared, are real folutions of it in aqua regia, diluted with fpirit of wine or other liquors, and prove injurious to the body rather than beneficial. A place, however, is now given in fome of the foreign pharmacopœias to the aurum fulminans; and it has of late been recommended as a remedy in fome convulfive difeafes, particularly in the chorea fancti viti.

AURUM Fulminans. See CHEMISTRY-*Index*.

AURUM Mofaicum. See CHEMISTRY-*Index*.

AURUNCI (anc. geog.), a people of Latium, towards Campania; the fame with the Aufones, at leaft fo intermixed as not to be eafily diftinguifhable, though Pliny feparates them.

AUSA, a town of Terraconenfis, in the middle age called *Aufona*; now *Vich de Ofona*, a town of Catalonia in Spain. E. Long. 2. N. Lat. 41. 50.

AUSCH. See AUCH.

AUSI, an ancient and very favage people of Libya. Herodotus tells us that they were unacquainted with marriage, and had all their women in common. The children were brought up by their mothers till they were able to walk: after which they were introduced to an affembly of the men, who met every three months; and the man to whom any child firft fpoke, acknowledged himfelf its father. They celebrated annually a feaft in honour of Minerva, in which the girls divided into two companies, fought with fticks and ftones, and thofe who died of their wounds were concluded not to have been virgins.

AUSIMUM, or AUXIMUM, an ancient Roman colony in the Picenum; now *Ofimo* or *Ofmo*, in the March of Ancona in Italy. E. Long. 15. N. Lat. 43. 20.

AUSITÆ, or ÆSITÆ, a tribe of ancient Arabs, fuppofed by Bochart to have inhabited the land of Uz mentioned in fcripture.

AUSONA (anc. geog.), a town of the Aufones, a people who anciently occupied all the Lower Italy, from the Promontorium Circæum down to the ftraits of Sicily (Livy), but were afterwards reduced to a much narrower compafs; namely, between the Montes Circæi and Maffici: nor did they occupy the whole of this, but other people were intermixed. Concerning Aufona or its remains there is nothing particular recorded.

AUSONIA, the ancient name of Italy, from its moft ancient inhabitants the Aufones, (Virgil, Servius).

AUSONEUM MARE (anc. geog.), a part of the Ionian fea, extending fouthwards from the promontory Japygium to Sicily, which it wafhes on the eaft, as it does the Brutii and Magna Græcia on the fouth and eaft. It is feparated from the Tufcan fea by the ftrait of Meffina.

AUSONIUS (in Latin *Decius*, or rather *Decimus*, Magnus Aufonius), one of the beft poets of the fourth century, was the fon of an eminent phyfician, and born at Bordeaux. Great care was taken of his education, the whole family interefting themfelves in it, either becaufe his genius was very promifing, or that the fcheme of his nativity, which had been caft by his grandfather on the mother's fide, made them imagine that he would rife to great honour. He made an uncommon progrefs in claffical learning, and at the age of 30 was chofen to teach grammar at Bourdeax. He was promoted fome time after to be profeffor of rhetoric; in which office he acquired fo great a reputation, that he was fent for to court to be preceptor to Gratian the emperor Valentinian's fon. The rewards and honours conferred on him for the faithful difcharge of his office prove the truth of Juvenal's maxim, that when fortune pleafes fhe can raife a man from a rhetorician to the dignity of a conful. He was actually appointed conful by the emperor Gratian, in the year 379, after having filled other confiderable pofts; for befides the dignity of queftor, to which he had been nominated by Valentinian, he was made prefect of the Prætorium in Italy and Gaul after that prince's death. His fpeech returning thanks to Gratian on his promotion to the confulfhip is highly commended. The time of his death is uncertain; he was ftill living in 392, and lived to a great age. The emperor Theodofius had a great efteem for Aufonius, and preffed him to publifh his poems. There is a great inequality in his works; and in his manners and his ftyle there is a harfhnefs which was perhaps rather the defect of the times he lived in than of his genius. Had he lived in Auguftus's reign, his verfes, according to good judges, would have equalled the moft finifhed of that age. He is generally fuppofed to have been a Chriftian: fome ingenious authors indeed think otherwife, but, according to Mr Bayle, without juft reafon. The beft edition of his poems is that of Amfterdam in 1671.

AUSPEX, a name originally given to thofe who were afterwards denominated *augurs*. In which fenfe the word is fuppofed to be formed from *avis*, "bird," and *infpicere*, "to infpect;" *aufpices*, q. d. *avifpices*. Some will therefore have aufpices properly to denote thofe who foretold future events from the fight of birds.

AUSPICIUM, AUSPICY, the fame with augury.

AUSTER, one of the four cardinal winds, as Servius

vius calls them blowing from the south, (Pliny, Ovid, Manilius).

AUSTERE, rough, astringent. Thus an austere taste is such a one as constringes the mouth and tongue; as that of unripefruits, harsh wines, &c.

AUSTERITY, among moral writers, implies severity and rigour. Thus we say *Austerity of manners, austerities of the monastic life, &c.*

AUSTIN, (St). See *St* AUGUSTIN.

AUSTRAL, AUSTRALIS, the same with southern. The word is derived from *auster*, "south wind." Thus austral signs are the six last signs of the zodiac; so called because they are on the south side of the equinoctial.

AUSTRALIS PISCES, the SOUTHERN FISH, is a constellation of the southern hemisphere, not visible in our latitude; whose stars in Ptolemy's catalogue are 18, and in the Britannic catalogue 24.

AUSTRIA, one of the principle provinces of the empire of Germany towards the east; from which situation is takes its name *Oost-ryck*, in the German language signifying the *East Country*. It is bounded on the north by Moravia; on the east by Hungary; on the south by Stiria; and on the west by Bavaria. It is divided into *Upper* and *Lower*. Upper Austria is situated on the south, and Lower Austria on the north, side of the Danube. Vienna the capital is in the Upper Austria, which contains several other very considerable towns. The country is very fertile, has a great many mines, and produces vast quantities of sulphur.

In the ninth and tenth centuries, Austria was the frontier of the empire against the barbarians. In 928, the emperor Henry the Fowler, perceiving that it was of great importance to settle some person in Austria who might oppose these incursions, invested Leopold, surnamed the *Illustrious*, with that country. Otho I. erected Austria into a marquisate in favour of his brother-in-law Leopold, whose descendant Henry II. was created duke of Austria by the emperor Frederic Barbarossa. His posterity became extinct in 1240, the states of the country, in order to defend themselves from the incursions of the Bavarians and Hungarians, resolved to put themselves under the protection of Henry marquis of Misnia; but Othogar II. king of Bohemia, being likewise invited by a party in the duchy took possession of it, alledging not only the invitation of the states, but also the right of his wife, heiress of Frederic the last duke. The emperor Rodolphus I. pretending a right to this duchy, refused to give Othogar the investiture of it; and afterwards killing him in battle, procured the right of it to his own family. From this Rodolphus the present house of Austria is descended, which for several centuries past has rendered itself so famous and so powerful, having given 14 emperors to Germany, and six kings to Spain.

In 1477, Austria was erected into an archduchy by the emperor Frederic the Pacific, for his son Maximilian, with these privileges: That these shall be judged to have obtained the investiture of the states, if they do not receive it after having demanded it three times; that if they receive it from the emperor, or the imperial ambassadors, they are to be on horseback, clad in a royal mantle, having in their hand a staff of command, and upon their head a ducal crown of two points, and surrounded with a cross like that of the imperial crown. The arch-duke is born privy-counsellor to the emperor, and his states cannot be put to the ban of the empire. All attempts against his person are punished as crimes of lesemajesty, in the same manner as those against the king of the Romans, or Electors. No one dared to challenge him to single combat. It is in his choice to assist at the assemblies, or to be absent; and he has the privilege of being exempt from contributions and public taxes, excepting 12 soldiers which he is obliged to maintain against the Turk for one month. He has rank immediately after the electors; and exercises justice in his states without appeal, by virtue of a privilege granted by Charles V. His subjects cannot even be summoned out of his province upon account of lawsuits, to give witness, or to receive the investiture of fiefs. Any of the lands of the empire may be alienated in his favour, even those that are feudal; and he has a right to create counts, barons, gentlemen, *poets*, and notaries. In the succession to his states, the right of birth takes place; and, failing males, the females succeed according to the lineal right; and if no heir be found, they may dispose of their lands as they please.

Upper Austria, properly so called, has throughout the appearance of a happy country; here are no signs of the striking contrast betwixt poverty and riches which offends so much in Hungary. All the inhabitants, those of the capital only excepted, enjoy that happy mediocrity which is the consequence of a gentle and wise administration. The farmer has property; and the rights of the nobility, who enjoy a kind of lower judicial power, are well defined. The south and south-west parts of the country are bounded by a ridge of hills, the inhabitants of which enjoy a share of prosperity unknown to those of the interior parts of France. There are many villages and market-towns, the inhabitants of which have bought themselves off from vassalage, are now their own governors, and belong some of them to the estates of the country. The cloisters, the prelates of which belong to the estates of the country, are the richest in Germany, after the immediate prelacies and abbacies of the empire. One of the great convents of Benedictines is worth upwards of 4000 millions of French livres, half of which goes to the exchequer of the country.

Lower Austria yearly exports more than two millions worth of guilders of wine to Moravia, Bohemia, Upper Austria, Bavaria, Saltzburg, and part of Stiria and Carinthia. This wine is sour, but has a great deal of strength, and may be carried all over the world without danger; when it is ten or twenty years old it is very good. This country is very well peopled. Mr Schlosser, in his political journal, which contains an account of the population of Austria, estimates that of this country at 2,100,000 men. The revenue of this country is about 14,000,000 florins; of which the city of Vienna contributes about five, as one man in the capital earns as much as three in the country.

The southern parts of Austria are covered with hills, which rise gradually from the banks of the Danube to the borders of Stiria, and are covered with woods. They lose themselves in the mass of mountains which run to the south of Germany, and stretch through all Stiria, Carniola, Carinthia, and Tyrol, to the Swiss Alps; and are probably, after Savoy and Switzerland, the higheſt part of the earth. The inhabitants of this extenſive ridge of mountains are all very much alike; they are a ſtrong, large, and, the GOITRES excepted, a very handſome people.

The characteriſtic of the inhabitants of all this country is ſtriking bigotry, united with ſtriking ſenſuality. You need only ſee what is going forwards here to be convinced that the religion taught by the monks is as ruinous for the morals as it is repugnant to Chriſtianity. The Ciciſbeos accompany the married women from their bed to church, and lead them to the very confeſſional. The bigotry of the public in the interior parts of Auſtria, which from the mixture of gallantry with it, is ſtill to be found even amongſt people of rank, degenerates amongſt the common people into the groſſeſt and moſt abominable buffoonery. The Windes, who are mixed with the Germans in theſe countries, diſtinguiſh themſelves by a ſuperſtitious cuſtom that does little honour to the human underſtanding, and would be incredible if we had not the moſt unequivocal proofs of the fact before our eyes. Many years ago, they ſet out in company with ſome Hungarian enthuſiaſts to Cologne on the Rhine, which is about 120 German miles diſtant, to cut off the beard of a crucifix there. Every ſeven years this operation is repeated, as in this ſpace of time the beard grows again to its former length. The rich perſons of the aſſociation ſend the poorer ones as their deputies, and the magiſtrates of Cologne receive them as embaſſadors from a foreign prince. They are entertained at the expence of the ſtate, and a counſellor ſhews them the moſt remarkable things in the town. This farce brings in large ſums of money at ſtated times, and may therefore deſerve political encouragement; but ſtill, however, it is the moſt miſerable and meaneſt way of gain that can be imagined. Theſe Windes have alone the right to ſhave our Saviour, and the beard grows only for them. They firmly believe, that if they did not do this ſervice to the crucifix, the earth would be ſhut to them for the next ſeven years, and there would be no harveſts. For this reaſon they are obliged to carry the hair home with them, as the proof of having fulfilled their commiſſion, the returns of which are diſtributed amongſt the different communities, and preſerved as holy reliques. The Imperial court has for a long time endeavoured in vain to prevent this emigration, which deprives agriculture of ſo many uſeful hands. When the Windes could not go openly, they would go clandeſtinely. At length the court thought of the expedient of forbidding the regency of Cologne to let them enter the town. This happened ſix years ago, and the numerous embaſſy was obliged to beg its way back again without the wonderful beard; which without doubt the Capuchins, to whom the crucifix belonged, uſed to put together from their own. The trade which the monks carry on with holy ſalves, oils, &c. is ſtill very conſiderable; a prohibition of the court, lately publiſhed has rather leſſened it, but it cannot be entirely ſuppreſſed till next generation. It is now carried on ſecretly, but perhaps to nearly as great an amount as formerly.

AUSTROMANCY, AUSTROMANTIA, properly denotes foothſaying, or a vain method of predicting futurity, from obſervations of the winds.

AUTERFOITS ACQUIT. *AUTERFOITS Attaint.* *AUTERFOITS Convict.* } See the article *PLEA to Indictment.*

AUTHENTIC, ſomething of acknowledged and received authority. In law, it ſignifies ſomething clothed in all its formalities, and atteſted by perſons to whom credit has been regularly given. Thus we ſay, *authentic papers, authentic inſtruments.*

AUTHOR, properly ſignifies one who created or produced any thing. Thus God, by way of eminence, is called the *Author of nature,* the *Author of the univerſe.*

AUTHOR, in matters of literature, a perſon who has compoſed ſome book or writing.

AUTHORITY, in a general ſenſe, ſignifies a right to command, and make one's ſelf obeyed. In which ſenſe, we ſay, *the royal authority, the epiſcopal authority, the authority of a father,* &c. It denotes alſo the teſtimony of an author, ſome apophthegm or ſentence of an eminent perſon quoted in a diſcourſe by way of proof.

Authority is repreſented, in painting, like a grave matron ſitting in a chair of ſtate, richly clothed in a garment embroidered with gold, holding in her righthand a ſword, and in her left a ſceptre. By her ſide is a double trophy of books and arms.

AUTOCHTHONES, an appellation aſſumed by ſome nations, importing that they ſprung, or were produced, from the ſame ſoil which they ſtill inhabited. In this ſenſe, *Autochthones* amounts to the ſame with *Aborigines.* The Athenians valued themſelves on their being Autochthones, *ſelf-born,* or γηγενεις, *earth-born;* it being the prevailing opinion among the ancients, that, in the beginning, the earth, by ſome prolific power, produced men, as it ſtill does plants. The proper Autochthones were thoſe primitive men who had no other parent beſides the earth. But the name was alſo aſſumed by the deſcendants of theſe men, provided they never changed their ancient ſeat, nor ſuffered other nations to mix with them. In this ſenſe it was that the Greeks, and eſpecially the Athenians, pretended to be Autochthones; and, as a badge thereof, wore a gold graſshopper woven in their hair, an inſect ſuppoſed to have the ſame origin.

AUTOCRATER, a perſon veſted with an abſolute independent power, by which he is rendered unaccountable to any other for his actions. The power of the Athenian generals, or commanders, was uſually limited; ſo that at the expiration of their office, they were liable to render an account of their adminiſtration. But, on ſome extraordinary occaſions, they were exempted from this reſtraint, and ſent with a full and uncontroulable authority: in which caſe they were ſtyled Αυτοκρατορες. The ſame people alſo applied the name to ſome of their ambaſſadors, who were veſted with a full power of determining matters according to their own diſcretion. Theſe were denominated Πρεσβεις Αυτοκρατορες, and reſembled our plenipotentiaries.

AUTO DA FE, act of faith. See ACT *of Faith.*

AUTODIDACTUS, a perſon ſelf-taught, or who has had no maſter, or aſſiſtant of his ſtudies, beſides himſelf.

AUTOGRAPH, denotes a perſon's hand-writing, or the original manuſcript of any book, &c.

AUTOLITHOTOMUS, he who cuts himself for the stone. Of this we have a very extraordinary instance given by Reiselius, in the Ephemerides of the Academy *Naturæ Curiosorum*, dec. 1. an. 3. obs. 192.

AUTOMATE, called also *Hiera*, one of the Cyclades, an island to the north of Crete (Pliny), said to have emerged out of the sea, between the islands Thera and Therasia, in the fifth year of the emperor Claudius; in extent thirty stadia, (Orosius).

AUTOMATON (from αυτος, *ipse* and μαομαι *excitor*), a self-moving machine, or one so constructed, by means of weights, levers, pullies, &c. as to move for a considerable time, as though endued with animal life. According to this description, clocks, watches, and all machines of that kind, are automata.

Under the article ANDROIDES, we observed that the highest perfection to which automata could be carried was to imitate exactly the motions and actions of living creatures, especially of mankind, which are more difficultly imitated than those of other animals. Very surprising imitations, however, have been made of other creatures. So long ago as 400 years before Christ, Archytas of Tarentum is said to have made a wooden pigeon that could fly; nor will this appear at all incredible, when we consider the flute-player made by M. Vaucanson, and the chess-player by M. Kempell. Dr Hook is also said to have made the model of a flying chariot, capable of supporting itself in the air. But M. Vaucanson abovementioned hath distinguished himself still more eminently. That gentleman, encouraged by the favourable reception of his flute-player, made a duck, which was capable of eating, drinking, and imitating exactly the voice of a natural one. Nay, what is still more surprising, the food it swallowed was evacuated in a digested state; not that it was really in a state of natural excrement, but only considerably altered from what it was when swallowed; and this digestion was performed on the principles of solution, not of trituration. The wings, viscera, and bones, of this artificial duck, were also formed so as very strongly to resemble those of a living animal. Even in the actions of eating and drinking, this resemblance was preserved; the artificial duck swallowed with avidity and vastly quick motions of the head and throat; and likewise muddled the water with his bill, exactly like a natural one.

M. Le Droz of La Chaux de Fonds in the county of Neufchattel, hath also executed some very curious pieces of mechanism, which well deserve to be ranked with those already mentioned. One was a clock, which was presented to his Spanish majesty; and had, among other curiosities, a sheep, which imitated the bleating of a natural one; and a dog watching a basket of fruit: when any one attempted to purloin the fruit, the dog gnashed his teeth and barked; and if it was actually taken away, he never ceased barking till it was restored. Besides this, he made a variety of human figures, which exhibited motions truly surprising; but all inferior to Mr Kempell's chess-player, which may justly be looked upon as the greatest master-piece in mechanics that ever appeared. See ANDROIDES.

AUTONOMIA, a power of living or being governed by our own laws and magistrates. The liberty of the cities which lived under the faith and protection of the Romans, consisted in their autonomia, *i. e.* they were allowed to make their own laws, and elect their own magistrates; by whom justice was to be administered, and not by Roman presidents or judges, as was done in other places which were not indulged the autonomia.

AUTOPYROS, from αυτος, and πυρος, *wheat*; in the *Ancient diet*, an epithet given to a species of bread, wherein the whole substance of the wheat was retained, without retrenching any part of the bran. Galen describes it otherwise, viz. as bread where only the coarser bran was taken out.—And thus it was a medium between the finest bread, called *similagineus*, and the coarsest called *furfuraceus*. This was also called *autopyrites* and *syncomistus*.

AUTRE-EGLISE, a village of Brabant, in the Austrian Netherlands; to which the left wing of the French army extended, when the confederates obtained the victory at Ramillies, in 1706. E. Long. 4. 50. N. Lat. 50. 40.

AUTRICUM, the capital of the Carnutas, a people of Gallia Celtica; afterwards called *Carnotena*, *Carnotenus*, and *Civitas Carnotenum*: Now *Chartres*, in the Orleanois on the Eure. E. Long. 1. 32. N. Lat. 48. 47.

AUTUMN, the third season of the year, when the harvest and fruits are gathered in. Autumn is represented, in painting, by a man at perfect age, clothed like the vernal, and likewise girded with a starry girdle; holding in one hand a pair of scales equally poised, with a globe in each; in the other hand, a bunch of divers fruits and grapes. His age denotes the perfection of this season; and the balance, that sign of the zodiac which the sun enters when our autumn begins.

Autumn begins on the day when the sun's meridian distance from the zenith, being on the decrease, is a mean between the greatest and the least; which in these countries is supposed to happen when the sun enters Libra. Its end coincides with the beginning of winter. Several nations have computed the years by autumns: the English Saxons, by winters. Tacitus tells us, the ancient Germans were acquainted with all the other seasons of the year, but had no notion of Autumn. Lidyat observes of the beginning of the several seasons of the year, that

Dat Clemens hyemem, dat Petres ver cathedratus,
Æstuat Urbanus, autumnat *Bartholomæus.*

Autumn has always been reputed an unhealthy season. Tetullian calls it *tentator valetudinum*: and the satyrist speaks of it in the same light, *Autumnus Libitinæ quæstus acerbæ*.

AUTUMNAL POINT, is that part of the equinox from which the sun begins to descend towards the south pole.

AUTUMNAL Signs, in astronomy, are the signs Libra, Scorpio, Sagittarius, through which the sun passes during the autumn.

AUTUMNAL Equinox, that time when the sun enters the autumnal point.

AUTUN, an ancient city of France in the duchy of Burgundy, the capital of the Autonois, with a bishop's see. The length of this city is about three quarters of a mile, and its breadth nearly equal. The river Arroux washes its ancient walls, whose ruins are so firm, and the stones so closely united, that they seem almost to be cut out of the solid rock. In this city are the ruins

of

of three ancient temples, one of which was dedicated to Janus, and another to Diana. Here are likewise a theatre and a pyramid, which last is probably a tomb; it stands in a place called the *field of urns*, because several urns had been found there. Here are also two antique gates of great beauty. The city lies at the foot of three great mountains, in E. Long. 4. 15. N. Lat. 45. 50.

AUTURA, or AUDURA, a river of Gallia Celtica, only mentioned in the lives of the saints. Now the *Eure*, which falls into the Seine, on the left-hand or south side.

AUVERGNE, a province of France, about 100 miles in length and 75 in breadth. It is bounded on the north, by the Bourbonnois; on the east, by Torez and Velay; on the west, by Limosin, Quercy, and La Marche; and on the south, by Rovergne and the Cevennes. It is divided into upper and lower; the latter, otherwise called *Limagne*, is one of the finest countries in the world. The mountains of Higher Auvergne render it less fruitful; but they afford good pasture, which feeds great numbers of cattle, which are the riches of that country. Auvergne supplies Lyons and Paris with fat cattle, makes a large quantity of cheese, and has manufactures of several kinds. The capital of the whole province is Clermont.

AUVERNAS, a very deep-coloured heady wine, made of black raisins so called, which comes from Orleans. It is not fit to drink before it is above a year old; but if kept two or three years, it becomes excellent.

AUXERRE, an ancient town of France in the duchy of Burgundy, and capital of the Auxerrois, with a bishop's see. The episcopal palace is one of the finest in France, and the churches are also very beautiful. This town is advantageously situated for trade with Paris, on the river Yone. E. Long. 3. 35. N. Lat. 47. 54

AUXESIS, in mythology, a goddess worshipped by the inhabitants of Egina, and mentioned by Herodotus and Pausanias.

AUXESIS, in rhetoric, a figure whereby any thing is magnified too much.

AUXILIARY, whatever is aiding or helping to another.

AUXILIARY Verbs, in grammar, are such as help to form or conjugate others; that is, are prefixed to them, to form or denote the moods or tenses thereof: as, *to have* and *to be*, in the English; *etre* and *avoir*, in the French; *ho* and *sono* in the Italian, &c. In the English language, the auxiliary verb *am* supplies the want of passive verbs.

AUXO, in mythology, the name of one of two Graces worshipped by the Athenians. See HEGEMONE.

AUXONNE, a small fortified town of France, in the duchy of Burgundy; seated on the river Saone, over which there is a bridge of 23 arches, to facilitate the running off of the waters after the overflowing of the river. At the end of the bridge is a causway 2250 paces long. E. Long. 5. 22. N. Lat. 47. 11.

AUXY; the French give the name of *auxy wool* to that which is spun in the neighbourhood of Abbeville, by those workmen who are called *houpiers*. It is a very fine and beautiful wool, which is commonly used to make the finest stockings.

AWARD, in law, the judgment of an arbitrator, or of one who is not appointed by the law a judge, but chosen by the parties themselves for terminating their differences. See ARBITER and ARBITRATION.

AWL, among shoemakers, an instrument wherewith holes are bored through the leather, to facilitate the stitching or sewing the same. The blade of the awl is usually a little flat and bended, and the point ground to an acute angle.

AWLAN, a small imperial town of Germany, in the circle of Suabia, seated on the river Kochen. E. Long. 11. 15 N. Lat. 48. 52.

AWME, or AUME, a Dutch liquid measure containing eight steckans, or 20 verges or verteels, equal to the tierce in England, or to one-sixth of a ton of France.

AWN, in botany. See ARISTA.

AWNING, in the sea-language, is the hanging a sail, tarpawling, or the like, over any part of the ship, to keep off the sun, rain or wind.

AX, a carpenter's instrument, serving to hew wood. The ax differs from the joiner's hatchet, in that it is made larger and heavier, as serving to hew large stuff; and its edge tapering into the middle of its blade. It is furnished with a long handle or helve, as being to be used with both hands.

Battle-AX. See CELT.

AXAMENTA, in antiquity, a denomination given to the verses or songs of the *salii*, which they sung in honour of all men. The word is formed, according to some, from *axare*, q. d. *nominare*. Others will have the *carmina saliaria* to have been denominated *axamenta*, on account of their having been written in *axibus*, or on wooden tables.

The *axamenta* were not composed, as some have asserted, but only sung by the *salii*. The author of them was Numa Pompilius; and as the style might not be altered, they grew in time so obscure, that the *salii* themselves did not understand them. Varro says they were 700 years old. Quint. Inst. Or. lib. i. c. 11.

AXAMENTA, or *Assamenta*, in ancient music, hymns or songs performed wholly with human voices.

AXAYACATL, the name of a species of fly, common in Mexico, about the Lake; the eggs of which being deposited in immense quantities, upon the rushes and corn-flags, form large masses, which are taken up by fishermen and carried to market for sale. This caviare, called *ahuauhtli*, which has much the same taste with the caviare of fish, used to be eat by the Mexicans, and is now a common dish among the Spaniards. The Mexicans eat not only the eggs, but the flies themselves, made up together into a mass, and prepared with saltpetre.

AXATI, a town of ancient Bætica, in the Bœtis; now *Lora*, a small city of Andalusia, in Spain, seated on the Guadalquivir. W. Long. 5. 20. N. Lat. 37. 20.

AXBRIDGE, a town of Somersetshire in England, consisting of one long narrow street. W. Long. 2. 20 N. Lat. 51. 30.

AXEL, a small fortified town in Dutch Flanders. E. Long. 3. 40. N. Lat. 51. 17.

AXHOLM, an island in the north-west part of Lincolnshire in England. It is formed by the rivers Trent, Idel, and Dan; and is about ten miles long and five broad. The lower part is marshy, but produces an odoriferous

odoriferous shrub called *gall*; the middle is rich and fruitful, yielding flax in great abundance, as also alabaster which is used for making lime. The principal town is called *Axey*, and is now thinly inhabited.

AXIACE, an ancient town of Sarmatia Europea; now *Oxakow*, the capital of Budziac Tartary. E. Long. 32. 30. N. Lat. 46. 0.

AXILLA, in anatomy, the arm-pit, or the cavity under the upper part of the arm.

AXILLA, in botany, is the space comprehended between the stems of plants and their leaves. Hence we say those flowers grow in the axillæ of the leaves; *i. e.* at the base of the leaves, or just within the angle of their pedicles.

AXILLARY, something belonging to or lying near the axilla. Thus, *axillary artery* is that part of the subclavian branches of the ascending trunk of the aorta which passeth under the arm-pits; *axillary glands* are situated under the arm-pits, enveloped in fat, and lie close by the axillary vessels; and *axillary vein* is one of the subclavians which passes under the arm-pit, dividing itself into several branches, which are spread over the arm.

AXIM, a small territory on the gold-coast in Africa. The climate here is so excessively moist, that it is proverbially said to rain 11 months and 29 days of the year. This excessive moisture renders it very unhealthy; but it produces great quantities of rice, water melons, lemons, oranges, &c. Here are also produced vast numbers of black cattle, goats, sheep, tame pigeons, &c. The whole country is filled with beautiful and populous villages, and the intermediate lands well cultivated; besides which, the natives are very wealthy, from the constant traffic carried on with them by the Europeans for their gold. The capital which is also called *Axim*, by some *Achombone*, stands under the cannon of the Dutch fort St Antonio. Behind, it is secured by a thick wood that covers over the whole declivity of a neighbouring hill. Between the town and the sea runs an even and spacious shore of beautiful white sand. All the houses are separated by groves of cocoa and other fruit trees, planted in parallel lines, each of an equal width, and forming an elegant vista. The little river Axim crosses the town; and the coast is defended by a number of small pointed rocks, which project from the shore, and render all access to it dangerous. The capital is situated in W. Long. 24. 0. N. Lat. 5.0. This canton is a kind of republic, the government being divided between the Caboceroes or chief men, and Manaceroes or young men. It must be observed, however, that in their courts there is not even a pretence of justice: whoever makes the most valuable presents to the judges is sure to gain his cause, the judges themselves alledging the gratitude due for the bribes received as a reason: and if both parties happen to make presents of nearly equal value, they absolutely refuse to give the cause a hearing.

AXINOMANCY, AXINOMANTIA, from αξινη, *securis*, and μαντεια, *divinatio*; an ancient species of divination, or a method of foretelling future events by means of an ax or hatchet.—This art was in considerable repute among the ancients; and was performed, according to some, by laying an agate-stone on a red-hot hatchet; and also by fixing a hatchet on a round stake so as to be exactly poised; then the names of those that were suspected were repeated, and he at whose name the hatchet moved was pronounced guilty.

AXIOM, AXIOMA (from αξιοω, *I am worthy*); a self-evident truth, or a proposition whose truth every person receives at first sight. Thus, that the whole is greater than a part; that a thing cannot be and not be at the same time; and that from nothing, nothing can arise; are axioms.

AXIOM is also an established principle in some art or science. Thus, it is an axiom in physics, that nature does nothing in vain; that effects are proportional to their causes, &c. So it is an axiom in geometry, that things equal to the same thing are also equal to one another; that if to equal things you add equals, the sums will be equal, &c. It is an axiom in optics, that the angle of incidence is equal to the angle of reflection, &c.

AXIOPOLIS, a town of the Triballi in Mæsia Inferior; now *Axiopoli*, in Bulgaria. E. Long. 34. 0. N. Lat. 55. 40.

AXIS, in geometry, the straight line in a plain figure, about which it revolves, to produce or generate a solid. Thus, if a semicircle be moved round its diameter at rest, it will generate a sphere, the axis of which is that diameter.

AXIS, in astronomy, is an imaginary right line supposed to pass through the centre of the earth and the heavenly bodies, about which they perform their diurnal revolutions.

AXIS, in conic-sections, a right line dividing the section into two equal parts, and cutting all its ordinates at right angles.

AXIS, in mechanics. The axis of a balance is that line about which it moves, or rather turns about. *Axis of oscillation*, is a right line parallel to the horizon, passing through the centre about which a pendulum vibrates.

Axis in Peritrochio, one of the six mechanical powers, consisting of a peritrochium or wheel concentric with the base of a cylinder, and moveable together with it about its axis.

AXIS, in optics, is that particular ray of light coming from any object which falls perpendicularly on the eye.

AXIS, in architecture. *Spiral axis*, is the axis of a twisted column drawn spirally in order to trace the circumvolutions without. *Axis of the Ionic capital*, is a line passing perpendicularly through the middle of the eye of the volute.

Axis of a Vessel, is an imaginary right line passing through the middle of it perpendicularly to its base, and equally distant from its sides.

AXIS, in botany, is a taper column placed in the centre of some flowers or catkins, about which the other parts are disposed.

AXIS, in anatomy, the name of the second vertebra of the neck; it hath a tooth which goes into the first vertebra, and this tooth is by some called the *axis*.

AXMINSTER, a town of Devonshire, situated on the river Ax, in the great road between London and Exeter in W. Long. 3. 15. N. Lat. 50. 40. It was a place of some note in the time of the Saxons, but now contains only about 200 houses. Here is a small manufactory of broad and narrow cloths, and some carpets are also manufactured after the Turky manner.

AXOLOTLF. See LACERTA.

AXUMA, formerly a large city, and capital of the whole kingdom of Abyssinia in Africa, but now reduced to a miserable village scarce containing 100 inhabitants. E. Long. 36. 4. N. Lat. 14. 13.

AXUNGIA, in a general sense, denotes old lard, or the driest and hardest of any fat in the bodies of animals: but more properly it signifies only hog's lard.

AXUNGIA Vitri, Sandiver, or *Salt of Glass*, a kind of salt which separates from the glass while it is in fusion. It is of an acrimonious and biting taste. The farriers use it for cleansing the eyes of horses. It is also made use of for cleansing the teeth; and it is sometimes applied to running ulcers, the herpes, or the itch, by way of desiccative.

AXYRIS: A genus of the triandria order, belonging to the monœcia class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. The calyx of the male is tripartite; it has no corolla. The calyx of the female consists of two leaves; it has two styli and one seed. The species are four, none of them natives of Britain.

AY, a town of France in Champagne, near the river Mame, remarkable for its excellent wines. E. Long. 2. 15. N. Lat. 49. 4.

AYAMONTE, a sea-port town of Andalusia in Spain, with a strong castle built on a rock; seated on the mouth of the river Guadiana. It has a commodious harbour, fruitful vineyards, and excellent wine. W. Long. 8. 5. N. Lat. 37. 9.

AYENIA, in botany: A genus of the pentandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 37th order, *Columniferæ*. The calyx has two leaves; the petals are in the form of a star, with long ungues; and the capsule has five cells. There are three species, all natives of the West-Indies.

AYLESBURY. See AILESBURY. This place gave title of Earl to the noble family of Bruce, now to a branch of the Brudenals by succession.

AYLMER (John), bishop of London, in the reign of Queen Elizabeth, was born in the year 1521, at Aylmer-hall in the parish of Tilney, in the county of Norfolk. Whilst a boy, he was distinguished for his quick parts by the Marquis of Dorset afterwards Duke of Suffolk; who sent him to Cambridge, made him his chaplain, and tutor to his children. One of these children was the unfortunate Lady Jane Gray, who soon became perfectly acquainted with the Latin and Greek languages. His first preferment was to the Archdeaconry of Stow in the diocese of Lincoln, which gave him a seat in the convocation held in the first year of Queen Mary, where he resolutely opposed the return to Popery, to which the generality of the clergy were inclined. He was soon after obliged to fly his country, and take shelter among the Protestants in Switzerland. On the accession of Queen Elizabeth, he returned to England. In 1562, he obtained the archdeaconry of Lincoln; and was a member of the famous synod of that year, which reformed and settled the doctrine and discipline of the church of England. In the year 1576, he was consecrated bishop of London. He died in the year 1594, aged 73; and was buried in St Paul's. He was a learned man, a zealous father of the church, and a bitter enemy to the Puritans. He published a piece intitled, *An harbrowe for faithful and trewe subjects against the late blowne blaste concerning the government of wemen*, &c. This was written whilst he was abroad in answer to Knox, who published a book at Geneva under this title, *The first blast against the monstrous regiment and empire of women*. He is by Strype supposed to have published Lady Jane Gray's letter to Harding. He also assisted Fox in translating his History of Martyrs into Latin.

AYRY, or AERY, *of Hawks*, a nest or company of hawks; so called from the old French word *aire*, which signified the same.

AYSCUE (Sir George), a gallant English admiral, descended from a good family in Lincolnshire. He obtained the honour of knighthood from King Charles I. which, however, did not with-hold him from adhering to the parliament in the civil war: he was by them constituted admiral of the Irish seas, where he is said to have done great service to the Protestant interest, and to have contributed much to the reduction of the whole island. In 1651 he reduced Barbadoes and Virginia, then held for the king, to the obedience of the parliament; and soon after the restoration behaved with great honour in the war with the Dutch. In the famous engagement in the beginning of June 1666, when Sir George was admiral of the white squadron, his ship the Royal Prince ran upon the Gallop-sand; where being surrounded with enemies, his men obliged him to strike. He went no more to sea after this, but spent the rest of his days in retirement.

AYMOUTH. See EYMOUTH.

AYTONIA, in botany: A genus of the monadelphia order, belonging to the pentandria class of plants; the characters of which are: The calyx is quinquepartite; the corolla consists of four petals; the berry is dry, quadrangular, unilocular, and many-seeded. There is but one species, the capensis, a native of the Cape, but of which we have found no particular description.

AZAB, in the Turkish armies, a distinct body of soldiery, who are great rivals of the Janissaries.

AZAI, a town of Touraine in France, seated on the river Indre. E. Long. 10. 35. N. Lat. 47. 18.

AZALEA, AMERICAN UPRIGHT HONEYSUCKLE: A genus of the monogynia order, belonging to the pentandria class of plants: and in the natural method ranking under the 18th order, *Bicornes*. The corolla is bell-shaped; the stamina are inserted into the receptacle; and the capsule has five cells. There are six species, of which the most remarkable are the following. 1. The viscosa, with a white flower, is a low shrub, arising with several stems to the height of two or three feet. The leaves come out in clusters without any order at the end of the shoots, and their edges are set with very short teeth which are rough. The flowers come out in clusters between the leaves, have much the appearance of honeysuckle, and are as well-scented. 2. The nudiflora, or red American upright honeysuckle, grows taller than the first; and in its native country will sometimes arrive at the height of 12 feet, but in Britain never rises to above half that height. It hath several stems with oblong smooth leaves. The flower-stalks arise from the division of the branches, which are long and naked,

naked, supporting a cluster of red flowers: these are divided at the top into five equal segments which spread open. Another species with bright red flowers was found by Mr Lightfoot upon the tops of many mountains in the Highlands of Scotland.—The first two species require a moist soil and a sandy situation, and can only be propagated from slips, as they never produce good seeds in Britain. The autumn is the best time to remove the plants, and their roots ought to be covered in winter. They are most beautiful plants, and well worth cultivating.

AZAMOR, a small sea-port town of the kingdom of Morocco in Africa. It is situated on the river Morbeya, in the province of Duguella, at some considerable distance from its mouth. This town, though formerly very considerable, is not proper for maritime commerce, because the entrance of the river is dangerous. It was unsuccessfully besieged by the Portuguese in 1508; it was taken, however, in 1513 by the Duke of Braganza, but abandoned about the end of the 16th century. W. Long. 7. 0. N. Lat. 32. 50.

AZARAKITES, a sect of Mahometan Arabs. See ARABIA, n° 143, *et seq.*

AZARIAH, or UZZIAH, king of Judah, succeeded his father Amaziah, 810 years before Christ. He assembled an army of above 300,000 men, with which he conquered the Philistines, and demolished the walls of Gath, Jabniel, and Ashdod; built up the walls of Jerusalem; furnished the city with conduits; and planted gardens and vineyards: but at last, being elated with his prosperity, and resolving to usurp the office of high priest, he was struck with a leprosy, which obliged him to remain shut up in his palace for the rest of his days. He died about 759 years before the Christian æra, and was succeeded by Jonathan his son.—There are several other persons of this name mentioned in the sacred Scriptures.

AZAZEL. The word relates to the scape-goat, under the Jewish religion. Some call the goat itself by this name, as St. Jerom and Theodoret. Dr Spencer says, the scape-goat was to be sent to Azazel; by which is meant the devil. M. le Clerc translates it *præcipitium*, making it to be that steep and inaccessible place to which the goat was sent, and where it was supposed to perish.

AZEKA, (anc. geog.) a city of the Amorrhites, in the lot of Judah; situated between Eleutheropolis and Aelia, (Jerome); where the five kings of the Amorrhites and their army were destroyed by hailstones from heaven, (Joshua).

AZEM, ASEM, ASSAM, or ACHEM, a country of Asia to the north of Ava, but which is very little known to Europeans. It is said to be very fertile, and to contain mines of gold, silver, iron, and lead, all which belong to the king, who, in consequence of enjoying the produce, requires no taxes from his people. They have also great quantities of gum lac, and coarse silk. It is also thought that the inhabitants of Azem were long ago the inventors of cannon and gun-power; and that from them the invention passed to the inhabitants of Pegu, and from thence to the Chinese.

AZIMUTH, in astronomy, an arch of the horizon, intercepted between the meridian of the place and the azimuth, or vertical circle passing through the centre of the object, which is equal to the angle of the zenith, formed by the meridian and vertical circle: or it is found by this proportion. As the radius to the tangent of the latitude of the place, so is the tangent of the sun's or star's altitude, for instance, to the cosine of the azimuth from the south, at the time of the equinox.

Magnetical AZIMUTH, an arch of the horizon intercepted between the azimuth, or vertical circle, passing through the centre of any heavenly body, and the magnetical meridian. This is found by observing the object with an azimuth-compass.

AZIMUTH-*Compass*, an instrument for finding either the magnetical azimuth or amplitude of an heavenly object.

The learned Dr Knight invented some time since a very accurate and useful sea-compass, which is at present used in the navy, and will be described under the article COMPASS. This instrument, with the following contrivance added by the ingenious Mr Smeaton, answers the purposes of an azimuth and amplitude compass.

The cover of the wooden box being taken off, the compass is in a condition to be made use of in the binnacle, when the weather is moderate; but if the sea runs high, as the inner box is hung very free upon its centre (the better to answer its other purposes), it will be necessary to slacken the milled nut, placed upon one of the axes that support the ring, and to lighten the nut on the outside that corresponds to it. By this means, the inner box and ring will be lifted up from the edges, upon which they rest, when free; and the friction will be increased, and that to any degree necessary, to prevent the too great vibrations, which otherwise would be occasioned by the motion of the ship.

To make the compass useful in taking the magnetic azimuth or amplitude of the sun and stars, as also the bearings of headlands, ships, and other objects at a distance, the brass edge designed at first to support the card, and throw the weight thereof as near the circumference as possible, is itself divided into degrees and halves; which may be easily estimated into smaller parts, if necessary. The divisions are determined by means of a catgut line, stretched perpendicularly with the box, as near the brass edge as may be, that the parallax, arising from a different position of the observer, may be as little as possible.

Underneath the card are two small weights, sliding on two wires, placed at right angles to each other; which being moved nearer to, or farther from, the centre, counterbalance the dipping of the card in different latitudes, or restore the equilibrium of it, where it happens by any other means to be got too much out of level.

There is also added an index at the top of the inner box, which may be put on and taken off at pleasure; and serves for all altitudes of the object. It consists of a bar equal in length to the diameter of the inner box, each end being furnished with a perpendicular stile, with a slit parallel to the sides thereof: one of the slits is narrow, to which the eye is applied; and the other is wider, with a small catgut stretched up the middle of it, and from thence continued horizontally from the top of one stile to the top of the other. There is also a a line drawn along the upper surface of the bar. These four, viz. the narrow slit, the horizontal catgut thread, the perpendicular one, and the line on the bar, are in the same plane, which disposes itself perpendicular to the horizon, when the inner box is at rest, and hangs free. This index does not move round, but is always placed on, so as to answer the same side of the box.

When the sun's azimuth is desired, and his rays are strong enough to cast a shadow, turn about the wooden box, till the shadow of the horizontal thread, or (if the sun be too low) till that of the perpendicular thread, in one stile, or the light through the slit on the other, falls upon the line in the index bar, or vibrates to an equal distance on each side of it, gently touching the box, if it vibrates too far: observe, at the same time, the degree marked upon the brass edge by the catgut line. In counting the degree for the azimuth, or any other angle that is reckoned from the meridian, make use of the outward circle of figures upon the brass edge; and the situation of the index bar, with regard to the card and needle, will always direct upon what quarter of the compass the object is placed.

But if the sun does not shine out sufficiently strong, place the eye behind the narrow slit in one of the stiles, and turn the wooden box about, till some part of the horizontal or perpendicular thread appears to intersect the centre of the sun, or vibrate to an equal distance on each side of it, using smoked glass next the eye, if the sun's light is too strong. In this method, another observer will be generally necessary, to note the degree cut by the nonius, at the same time that the first gives notice that the thread appears to split the object.

From what has been said, the other observations will be easily performed; only, in case of the sun's amplitude, take care to number the degree by the help of the inner circle of figures on the card, which are the complements of the outer to 90″; and, consequently, show the distance from east to west.

The azimuth of the stars may also be observed by night; a proper light serving equally for one observer to see the thread, and the other the degree upon the card.

It may not be amiss to remark farther, that, in case the inner box should lose its equilibrium, and, consequently, the index be out of the plane of a vertical circle, an accurate observation may still be made, provided the sun's shadow is distinct; for, by observing first with one end of the index towards the sun, and then the other, a mean of the two observations will be the truth.

Plate LXXVII. is a perspective view of the compass, when in order for observation; the point of view being the centre of the card, and the distance of the eye two feet. AB is the wooden box. C and D are two milled nuts; by means whereof the axis of the inner box and ring are taken from their edges, on which they move, and the friction increased, when necessary. E F is the ring that supports the inner box. GH is the inner box; and I is one of its axes, by which it is suspended on the ring E F. The magnet or needle appears passing through the centure, together with a small brace of ivory, that confines the cap to its place. The card is a single varnished paper, reaching as far as the outer circle of figures, which is a circle of thin brass; the edge whereof is turned down at right angles to the plane of the card, to make it more stiff. O is a catgut line, drawn down the inside of the box for determining the degree upon the brass edge. PQRS is the index bar, with its two stiles and catgut threads; which being taken off from the top of the box is placed in two peices, T and V, notched properly to receive it. W is a place cut out in the wood serving as an handle.

Azimuth Circles, called also *azimuths* or *vertical circles*, are great circles of the sphere intersecting each other in the zenith and nadir, and cutting the horizon at right angles. These azimuths are represented by the rhumbs on common sea-charts, and on the globe they are represented by the quadrant of altitude, when screwed in the zenith. On these azimuths is reckoned the height of the stars and the sun when not in the meridian.

AZMER, a town of the East Indies in the dominions of the Great Mogul, capital of a province of the same name, with a very strong castle. It is pretty large, and is sometimes visited by the Mogul himself. It is about 62 leagues distant from Agra. The principal trade of this province is in saltpetre.

AZOGA SHIPS, are those Spanish ships commonly called the *quicksilver ships*, from their carrying quicksilver to the Spanish West Indies, in order to extract the silver out of the mines of Mexico and Peru. These ships, strictly speaking, are not to carry any goods unless for the king of Spain's account.

AZONI, in ancient mythology, a name applied by the Greeks to such of the gods as were deities at large, not appropriated to the worship of any particular town or country; but acknowledged in general by all countries, and worshipped by every nation. These the Latins called *dii communes*. Of this sort were the Sun, Mars, Luna, &c.

AZORES, islands in the Atlantic ocean, lying between 25 and 33 degrees of west longitude, and between 36 and 40 degrees of north latitude. They belong to the Portuguese, and are also called the *western isles*, on account of their situation. They were discovered by the Flemings in the 15th century. They are seven in number, viz. Tercera, St Michael's, St Mary's, Graciosa, St George's Island, Pico, and Fayal.

AZOTH, in ancient chemistry, the first matter of metals, or the mercury of a metal; more particularly that which they call the *mercury of philosophers*, which they pretended to draw from all sorts of metallic bodies.

AZOTUS, AZOTH, or ASHDOD, one of the five cities of the Philistines, and a celebrated sea-port on the Mediterranean, situated about 14 or 15 miles south of Ekron, between that and Ascalon. It was in this city that the idol Dagon fell down before the ark; and so strong a place it was, if we may believe Herodotus, that it sustained a siege of 29 years by Psammiticus king of Egypt. It was, however, taken by the Maccabees in a much shorter time; who burnt both city and temple, and with them about 8000 men. The town is now called by the Arabs *Hasaneyun*. It is but thinly inhabited, though the situation

tion is very pleaſant: with regard to the houſes, thoſe that were built in the time of Chriſtianity, and which are now inhabited by Mahometans, ſtill preſerve ſome claim to admiration; but the modern buildings, tho' generally of ſtone, have nothing in them which can attract the notice of a traveller. The ſtreets are pretty broad, the inhabitants moſtly Mahometans, with a few Chriſtians of the Greek communion, who have a church under the juriſdiction of the archbiſhop of Gaza. The town is about a mile and a half in circumference; and has in it a moſque, a public bath, a market-place, and two inns. The number of the inhabitants is between two and three thouſand. The moſt remarkable things in this place are an old ſtructure with fine marble pillars, which the inhabitants ſay was the houſe that Sampſon pulled down; and to the ſouth-eaſt, juſt out of the town, the water in which the eunuch of Candace was baptized by the apoſtle Philip: beſides theſe two, there are ſeveral ancient buildings, with capitals and pillars ſtanding.

AZURE, in a general ſenſe, the blue colour of the ſky. See SKY and BLUE.

AZURE, among painters. This word, which at preſent ſignifies in general a fine blue colour, was formerly appropriated to *Lapis Lazuli*, called *azure ſtone*, and to the blue prepared from it. But ſince a blue has been extracted from cobalt, cuſtom has applied to it the name of *azure*, although it differs conſiderably from the former, and is incapable of being uſed for the ſame purpoſes, and particularly for painting in oil. The former at preſent is called *lapis lazuli;* or only *lapis;* and the blue prepared from it for painting in oil, is called *ultramarine*.—The name *azure* is generally applied to the blue glaſs made from the earth of cobalt and vitrifiable matters. This glaſs, which is called *ſmalt* when in maſſes, is called *azure* only when it is reduced to a fine powder. Several kinds of azure are diſtinguiſhed, according to its degrees of beauty, by the names of *fine azure, powdered azure,* and *azure of four fires*. In general, the more intenſe the colour, and the finer the powder, the more beautiful and dear it is. Azure is employed to colour ſtarch; hence it has alſo been called *ſtarch-blue*. It is uſed for painting with colours, and for a blue enamel.

AZURE, in heraldry, the blue colours in the arms of any perſon below the rank of a baron. In the eſcutcheon of a nobleman, it is called *ſapphire*; and in that of a ſovereign prince, *Jupiter*. In engraving this colour is expreſſed by lines or ſtrokes drawn horizontally. —This colour may ſignify Juſtice, Perſeverance, and Vigilance; but according to G. Leigh, if it is compounded with

Or	it ſignifies	Chearfulneſs.
Arg.		Vigilance.
Gul.		Readineſs.
Ver.		Enterprize.
Pur.		Goodneſs.
Sab.		Mournfulneſs.

French Heralds, *M. Upton*, and his followers, rank this colour before gules.

AZYGOS, in anatomy, a vein riſing within the thorax, on the right ſide, having no fellow on the left; whence it is called *azygos*, or *vena ſine pari.*

AZYMITES, in church-hiſtory, Chriſtians who adminiſter the euchariſt with unleavened bread. The word is formed from the Greek, α priv. and ζυμη *ferment*.—This appellation is given to the Latin by the Greek church, becauſe the members of the former uſe fermented bread in the celebration of the euchariſt. They alſo call the Armenians and Maronites by the ſame name, and for the ſame reaſon.

AZYMOUS, ſomething unfermented, or made without leaven; as unleavened bread. Sea-biſket is of this kind; and therefore, according to Galen, leſs wholeſome than bread that has been fermented.

B.

B, THE ſecond letter of the Engliſh and moſt other alphabets. It is the firſt conſonant, and firſt mute, and in its pronunciation is ſuppoſed to reſemble the bleating of a ſheep; upon which account Pierius tells us in his hieroglyphics, that the Egyptians repreſented the ſound of this letter by the figure of that animal.

B is alſo one of thoſe letters which the eaſtern grammarians call *labial*, becauſe the principal organs employed in its pronounciation are the lips. It is pronounced by preſſing the whole length of them together, and forcing them open with a ſtrong breath. It has a near affinity with the other labials P and V, and is often uſed for P both by the Armenians and other orientals, as in *Betrus* for *Petrus*, *apſens* for *abſens*, &c.; and by the Romans for V, as in *amabit* for *amavit*, *berna* for *verna*, &c. whence aroſe that jeſt of Aurelian on the emperor Bonoſus, *Non ut vivat natus eſt, ſed ut bibat*.

Plutarch obſerves, that the Macedonians changed Φ into B, and pronounced *Bilip*, *Berenice*, &c. for *Philip*, *Pherenice*, &c.; and thoſe of Delphos uſed B inſtead of Π, as βαθειν for παθειν, βικρον for πικρον, &c.—The Latins ſaid *ſuppono, oppono*, for *ſubpono, obpono*; and pronounced *optinuit*, though they wrote *obtinuit*, as Quintilian has obſerved.—They alſo uſed B for F or PH: thus, in an ancient inſcription mentioned by Gruter, OBRENDARIO is uſed for OFRENDARIO.

As a numeral, B was uſed by the Greeks and Hebrews to denote 2; but among the Romans for 300, and with a daſh over it (thus $\bar{B}$) for 3000.

B is also used as an abbreviation. Thus B. A. stands for bachelor of arts; B. L. for Bachelor of laws; and B. D. for bachelor of divinity. B. F. in the preface to the decrees or senatus-consulta of the old Romans signified *bonum factum*. In music, B stands for the tone above A; as B♭, or ♭B, does for B flat, or the semitone major above A. B also stands for bass; and B. C. for *basso continuo*, or thorough bass.

BAAL, the same as BEL, or BELUS; an idol of the Chaldeans and Phœnicians, or Canaanites. The former worshipped Mars under this name, according to Josephus*; who, speaking of Thurus the successor of Ninus says, "To this Mars the Assyrian erected the first statue, and worshipped him as a god, calling him *Baal*." It is probable the Phœnicians worshipped the sun under the name of Baal; for Josiah, willing to make some amends for the wickedness of Manasseh, in worshipping Baal and all the host of heaven, *put to death the idolatrous priests that burnt incense unto Baal, to the sun, and to the moon, and to the planets, and to all the host of heaven. He likewise took away the horses that the kings of Judah had given to the sun, and burnt the chariots of the sun with fire* †.

* Antiquit. lib. viii. cap. 7.

† 2 Kings xxiii. 5. 11.

The temples consecrated to this god, are called in the Scripture *Chamanim*, which signifies *places inclosed with walls*, in which was kept a perpetual fire. Maundrell, in his journey from Aleppo to Jerusalem, observed some traces of these inclosures in Syria. In most of them were no statues; in a few there were some, but of no uniform figure.

The word *baal* (in the Punic language), signifies *lord* or *master*; and doubtless meant the supreme Deity, the Lord and Master of the universe. It is often joined with the name of some false god, as *Baal-berith*, *Baal-peor*, *Baal-zephon*, and the like. This deity passed from the Phœnicians to the Carthaginians, who were a colony of the Phœnicians; as appears from the Carthaginian names, Hannibal, Asdrubal, &c. according to the custom of the east, where kings and great men added to their own names those of their gods.

This false deity is frequently mentioned in Scripture in the plural number (*Baalim*): which may signify, either that the name *Baal* was given to several different gods; or that there were many statues, bearing different appellations, consecrated to this idol. Arnobius tells us, that Baal was of an uncertain sex; and that his votaries, when they called upon him, invoked him thus: *Hear us, whether thou art a god or a goddess*.

Some learned men think, that the Baal of the Phœnicians is the Saturn of the Greeks; which is probable enough from the conformity there is between the human sacrifices offered to Saturn and those which the Scripture tells us were offered to Baal. Others are of opinion, that Baal was the Phœnician or Tyrian Hercules, a god of great antiquity in Phœnicia.

BAAL-BERITH, the god of the Shechemites. Bochart conjectures, that Berith is the same as *Beroe*, the daughter of Venus and Adonis, who was given in marriage to Bacchus; and that she gave her name to the city of Berith in Phœnicia, and became afterwards the goddess of it. Baal-berith signifies *Lord of the Covenant*, and may be taken for the god that presides over alliances and oaths, in like manner as the Greeks had their Ζευς ορκιος, and the Romans their *Deus Fidius*, or *Jupiter Pistius*. The idolatrous Israelites, we are told, *made Baal-berith their god*, Judg. viii. 33.

BAAL-PEOR, *Baal-phegor*, or *Beel-phegor*, an idol of the Moabites and Midianites. We are told, that *Israel joined himself to Baal-peor*; and that Solomon erected an altar to this idol upon the mount of Olives. Baal-peor has been supposed to be no other than a Priapus, and that the worship of him consisted in the most obscene practices. Others have thought, that, as Baal is a general name signifying *Lord*, Peor may be the name of some great prince deified after his death. Mede imagines, that, *Peor* being the name of a mountain in the country of Moab, on which the temple of Baal was built, Baal-peor may be only another name of that deity, taken from the situation of his temple; in like manner as Jupiter is styled *Olympius*, because he was worshipped in a temple built on mount Olympus. Selden, who is of this latter opinion, conjectures likewise, that Baal-peor is the same with Pluto; which he grounds upon these words of the Psalmist*; *They joined themselves unto Baal-peor, and eat the offerings of the dead*; though by the *sacrifices* or *offerings of the dead*, in this passage, may be meant no more than sacrifices or offerings made to idols, or false gods, who are very properly called *the dead*, in contradistinction to the true God, who is styled in Scripture the *living God*.

* Psalm cvi.

BAAL-ZEBUB, *Beel-zebub*, or *Belzebub*; the idol, or god, of the Ekronites. In Scripture he is called the *Prince of Devils*. His name is rendered the *Lord of Flies*, or the *God-fly*; which some think was a mock appellation bestowed on him by the Jews. He had a famous temple and oracle at Ekron. Ahaziah king of Israel, having fallen from the terrass of his house into a lower room, and being dangerously hurt, sent to consult this deity, to know if he should be cured of his wounds. The worship of this false god must have prevailed in our Saviour's time, since the Jews accused him of driving out devils in the name of *Belzebub* their prince. Scaliger derives the name of this deity from *Baalim-zebahim*, which signifies the *Lord of sacrifices*.

BABBLING, among hunters, is when the hounds are too busy after they had found a good scent.

BABEL, a city and tower undertaken to be built by the whole human race soon after the flood, and remarkable for the miraculous frustration of the attempt by the confusion of languages. As to the situation of ancient Babel, most authors are of opinion that it was, exactly in the place where the celebrated city of Babylon afterwards stood. That it was in the same country, appears indisputably from Scripture; but that it was exactly in the same place is what cannot be proved, nor is it a matter of any consequence.

Authors have been much divided about the motive by which the whole race of mankind were induced to join as one man in such an undertaking. Some have imagined that it was out of fear of a second deluge; others, that they knew beforehand that they were to be dispersed through all the different countries of the world, and built this tower in order to defeat the design of the Deity, because having a tower of such vast height as they proposed, those who were at a distance could easily find their way back again. Had either of these been their design, however, it is probable they would have chosen an eminence rather than a plain for

Babel.

the situation of their tower, or indeed that they would have chosen some high mountain such as Ararat for their mark, rather than any tower at all: for though it is said that they designed the top of their tower to reach to heaven, we can scarce suppose them to have been so absurd, as to imagine this possible in the sense we understand it; and must therefore rather take it in the limited sense in which it is often used by Moses and his countrymen, where they speak of cities walled up to heaven. Others there are who imagine that the top of this tower was not to reach up to heaven, but to be consecrated to the heavens, *i. e.* to the worship of the sun, moon, and stars; of the fire, air, &c. and other natural powers as deities; and therefore that the true Deity interposed in order to prevent a total and irrecoverable defection. Certain it is, that the species of idolatry which takes for the objects of its worship those natural agents, as it is the most ancient, so it is by far the most rational, and the most difficult to be disproved. It is much more difficult, for instance, to prove that the sun, which by his enlivening beams gives vigour to the whole creation, is not a deity, than that a log of wood is not one; and hence, if such a system of religion became universally established among mankind, it would be impossible ever afterwards to eradicate it. Indeed that the scheme of Babel, whatever it was, could have been put in execution by man, seems evident from the interposition of the Deity on the occasion; for we cannot suppose that he would have worked a miracle on purpose to defeat that which would have defeated itself if he had let it alone: and he expressly says, That now nothing could be restrained from them; which intimates very plainly, that, had this scheme gone on, the plan which God had laid for the government of the world would have been totally frustrated: and agreeable to this hypothesis Dr Tennison supposes that the tower was of a pyramidal form, in imitation of the spires of flame; and that it was erected in honour of the sun, as being the most probable cause of drying up the flood.

As to the materials made use of in the building of this tower, the Scripture informs us that they were bricks and slime or bitumen. According to an eastern tradition, three years were taken up in making the bricks, each of which was 13 cubits long, 10 broad, and five thick. Oriental writers say, that the city was 313 furlongs in length, and 151 in breadth; that the walls were 5533 fathoms high, and 33 in breadth; and that the tower itself was no less than 10,000 fathom, or 12 miles high. Even St Jerome affirms from the testimony of eye-witnesses, who as he says had examined the remains of the tower, that it was four miles high; but Ado makes the height to have been no less than 5000 miles. The only account of its dimensions which can be at all depended upon (supposing it to have been the same which afterwards stood in the midst of the city of Babylon, and round which Nebuchadnezzar built the temple of Belus), is that given under the article BABYLON.

BABEL-MANDEL, the GATE OF MOURNING; a famous strait in the Indian ocean, between the coast of Arabia Felix in Asia, and that of Adel and Zeila in Africa, at the entrance into the Red Sea. By some it is also called the *Straits of Moka*. It is narrow, and difficult to sail through, on account of the sand-banks.

See History of the "Bible"
" Dictionary of the Bible

Babenhausen || Babington.

At the mouth of the strait is a small island called also *Babel-Mandel*, which is little else than a barren rock. E. Long. 44. 30. N. Lat. 12. 40.

BABENHAUSEN, a town of Germany in Suabia. E. Long. 9. 16. N. Lat. 48. 39.

BABINA (*Commonwealth* of), a society ludicrously so called, which was founded in Poland in the reign of Sigismund-Augustus, in the 16th century. It took its rise from a set of gentlemen, inhabitants of Lublin, who had agreed to meet at a place called *Babina*, merely for the purposes of mirth and jollity. In time their number increased, and they formed themselves into a regular government, under the presidency of a king, senate, and chief magistrates. The magistrates were elected from something which appeared ridiculous in the character or conduct of any of the members. For instance, if any person was meddling or officious, he was immediately created an archbishop; a blundering or disputatious member was promoted to the speaker's chair; a boaster of his own courage, and vainglorious *Thraso*, was honoured with the commission of generalissimo, which was presented him with great ceremony by the subordinate heroes. Those who declined the office for which they were declared qualified, were persecuted with hissings, and abandoned by the society. Thus every vice and every foible was attacked with ridicule; and Babina became in a short time the terror, the admiration, and the reformer, of the Polish nation: genius flourished, wit was cultivated, and the abuses which had crept into government and society were corrected by the judicious application of good-humoured satire. Never did any institution of this nature become so general or so useful; but at length it degenerated into a seat of buffoons, and banterers of every thing sacred or profane. For several years it was patronised by the kings of Poland, and Sigismund himself became a member; the starosta of Babina telling him jocularly, That "His majesty had certain qualities which intitled him to the first dignity in the commonwealth." Not the least remnant of this society now remains, though it was honoured with extraordinary privileges by kings and emperors.

BABINGTON (Gervase), bishop of Worcester, was born, according to Fuller, in Nottinghamshire; but in what year is uncertain. He was sent to Trinity College, Cambridge, of which he was made fellow; and, in 1578, was incorporated master of arts at Oxford. He appears, however, to have made Cambridge the place of his residence, where he became an eminent preacher; and, being now doctor of divinity, was made domestic chaplain to Henry Earl of Pembroke. In this station he is supposed to have assisted the countess in her translation of the Psalms. In 1588 he was installed prebend of Hereford, and in 1591 consecrated bishop of Landaff. In 1594 he was translated to the see of Exeter, and thence to Worcester in 1597. About this time, or soon after, he was made queen's counsel for the marshes of Wales. He was a considerable benefactor to the library belonging to the cathedral of Worcester, where he was buried in May 1610 without a monument. The several historians who have mentioned this prelate agree in giving him the character of a learned and pious man. His writings, like those of most of his cotemporaries, abound with puns and quaint expressions. His works were printed both in folio and quarto in 1615, and again in folio in 1637, under this title; *The works of the right reverend father in God Gervaſe Babington, late biſhop of Worceſter, containing comfortable notes upon the five books of Moſes, viz.* *Geneſis, &c. As alſo an expoſition upon the Creed, the Ten Commandments, the Lord's Prayer; with a conference betwixt man's frailtie and faith, and three ſermons, &c.*

BABOON, in zoology. See Simia.

BABYLON, the capital of the ancient kingdom of Babylonia or Chaldæa, and ſuppoſed to have ſtood in E. Long. 44. 0. N. Lat. 32. 0. Semiramus is ſaid by ſome, and Belus by others, to have founded this city. But, by whomſoever it was founded, Nebuchadnezzar was the perſon who put the laſt hand to it, and made it one of the wonders of the world. The moſt famous works in and about it were the walls of the city, the temple of Belus, Nebuchadnezzar's palace, the hanging-gardens, the banks of the river, the artificial lake, and canals.

1 City deſcribed.

The city was ſurrounded with walls, in thickneſs 87 feet, in height 350 feet, and in compaſs 480 furlongs or 60 of our miles. Thus Herodotus, who was himſelf at Babylon; and though ſome diſagree with him in theſe dimenſions, yet moſt writers give us the ſame, or near the ſame, as he does. Diodorus Siculus diminiſhes the circumference of theſe walls very conſiderably, and takes ſomewhat from the height of them, as in Herodotus; tho' he ſeems to add to their breadth, by ſaying, that ſix chariots might drive abreaſt thereon; while the former writes, that one chariot only might turn upon them; but then he places buildings on each ſide of the top of theſe walls, which, according to him, were but one ſtory high; which may pretty well reconcile them together in this reſpect. It is obſerved, that thoſe who give the height of theſe walls but at 50 cubits, ſpeak of them only as they were after the time of Darius Hyſtaſpis, who had cauſed them to be beaten down to that level. Theſe walls formed an exact ſquare, each ſide of which was 120 furlongs, or 15 miles, in length; and were all built of large bricks cemented together with bitumen, which in a ſhort time grows harder than the very brick and ſtone which it cements. The city was encompaſſed, without the walls, with a vaſt ditch filled with water, and lined with bricks on both ſides; and, as the earth that was dug out of it ſerved to make the bricks, we may judge of the depth and largeneſs of the ditch from the height and thickneſs of the walls. In the whole compaſs of the wall there were 100 gates, that is, 25 on each of the four ſides, all made of ſolid braſs. Between every two of theſe gates, at proper diſtances, were three towers, and four more at the four corners of this great ſquare, and three between each of theſe corners and the next gate on either ſide, and each of theſe towers was ten feet higher than the walls. But this is to be underſtood only of thoſe parts of the walls where towers were needful for defence. For ſome parts of them being upon a moraſs, and inacceſſible by an enemy, there the labour and coſt was ſpared, which tho' it muſt have ſpoiled the ſymmetry of the whole, muſt be allowed to have ſavoured of good œconomy; though that is what one would not have expected from a prince who had been ſo determined, as Nebuchadnezzar muſt have been, to make the city complete both for ſtrength and beauty. The whole number, then, of theſe towers amounted to no more than 250; whereas a much greater number would have been neceſſary to have made the uniformity complete all round. From the 25 gates on each ſide of this ſquare, there was a ſtraight ſtreet, extending to the correſponding gate in the oppoſite wall; whence the whole number of the ſtreets muſt have been but 50; but then they were each about 15 miles long, 25 of them croſſing the other 25 exactly at right angles. Beſides theſe whole ſtreets, we muſt reckon four half-ſtreets, which were but rows of houſes facing the four inner ſides of the walls. Theſe four half-ſtreets were properly the four ſides of the city within the walls, and were each of them 200 feet broad, the whole ſtreets being about 150 of the ſame. By this interſection of the 50 ſtreets, the city was divided into 676 ſquares, each of four furlongs and a half on each ſide, or two miles and a quarter in compaſs. Round theſe ſquares on every ſide towards the ſtreets ſtood the houſes, all of three or four ſtories in height, and beautified with all manner of ornaments; and the ſpace within each of theſe ſquares was all void, and taken up by yards, or gardens, and the like, either for pleaſure or convenience.

A branch of the Euphrates divided the city into two, running through the midſt of it, from north to ſouth; over which, in the very middle of the city, was a bridge, a furlong in length, or rather more, and indeed much more, if we hearken to others, who ſay it was no leſs than five ſtades or furlongs in length, tho' but 30 feet broad, a difference we ſhall never be able to decide. This bridge, however, is ſaid to have been built with wonderful art, to ſupply a defect in the bottom of the river, which was all ſandy. At each end of this bridge were two palaces; the old palace on the eaſt ſide, the new one on the weſt ſide of the river; the former of which took up four of the ſquares abovementioned, and the latter nine. The temple of Belus, which ſtood next to the old palace, took up another of the ſame ſquares.

The whole city ſtood in a large flat or plain, in a very fat and deep ſoil: that part or half of it on the eaſt ſide of the river was the old city, and, the other on the weſt was added by Nebuchadnezzar, both being included within the vaſt ſquare bounded by the walls aforeſaid. The form of the whole was ſeemingly borrowed from Nineveh, which was alſo 480 furlongs; but though it was equal in dimenſions to this city, it was leſs with reſpect to its form, which was a parallelogram, whereas that of Babylon was an exact ſquare. It is ſuppoſed, that Nebuchadnezzar, who had deſtroyed that old ſeat of the Aſſyrian empire, propoſed that this new one ſhould rather exceed it; and that it was in order to fill it with inhabitants, that he tranſported ſuch numbers of the captives from other countries hither; though that is what may be diſputed, ſeeing he therein only followed the conſtant practice of the kings of Aſſyria, who thought this the moſt certain means of aſſuring their conqueſts either to themſelves or their poſterity.

2 Was never fully peopled.

But it plainly appears, that it was never wholly inhabited; ſo that, even in the meridian of its glory, it may be compared with the flower of the field, which flouriſhes to-day, and to-morrow is no more. It never had time to grow up to what Nebuchadnezzar viſibly intended to have made it; for, Cyrus removing the

the seat of the empire soon after to Shushan, Babylon fell by degrees to utter decay; yet it must be owned, that no country was better able to support so vast and populous a city, had it been completed up to its first design. But so far was it from being finished according to its original design, that, when Alexander came to Babylon, Q. Curtius tells us, "No "more than 90 furlongs of it were then built:" which can be no otherwise understood, than of so much in length; and, if we allow the breadth to be as much as the length (which is the utmost that can be allowed), it will follow, that no more than 8100 square furlongs were then built upon: but the whole space within the walls contained 14,400 square furlongs; and therefore there must have been 6300 square furlongs remaining unbuilt, which, Curtius tells us, were plowed and sown. And, besides this, the houses were not contiguous, but all built with a void space on each side, between house and house.

3
Temple of Belus.

The next great work of Nebuchadnezzar was the temple of Belus. The wonderful tower, however, that stood in the middle of it, was not his work, but was built many ages before; that, and the famous tower of Babel, being as is commonly supposed, one and the same structure. This tower is said to have been composed of eight pyramidal ones raised above one another, and by Herodotus said to have been a furlong in height, but as there is an ambiguity in his expression, it has been disputed whether each of the towers was a furlong in height, or the whole of them taken together. On the latter supposition, which is the most probable, this tower must have exceeded the highest of the Egyptian pyramids by 179 feet, though it fell short of its breadth at the basis by 33. The way to go up was by stairs on the outside round it; whence it seems most likely, that the whole ascent was, by the benching in, drawn in a sloping line from the bottom to the top eight times round it; and that this made the appearance of eight towers, one above the other. Till the times of Nebuchadnezzar, it is thought that this tower was all the temple of Belus; but as he did by the other ancient buildings of the city, so he did by this, making great additions thereto, by vast edifices erected round it, in a square of two furlongs on every side, and just a mile in circumference, which exceeded the square at the temple of Jerusalem by 1800 feet. On the outside of these buildings was a wall, which inclosed the whole; and, in consideration of the regularity wherewith this city was to all appearance marked out, it is supposed that this wall was equal to the square of the city wherein it stood, and so is concluded to have been two miles and an half in circumference. In this wall were several gates leading into the temple, and all of solid brass; which it is thought may have been made out of the brasen sea, and brasen pillars, and other vessels and ornaments of the kind, which Nebuchadnezzar had transported from Jerusalem; for in this temple he is said to have dedicated his spoils from that of Jerusalem.

4
Idols of gold, &c.

In this temple were several images or idols of massy gold, and one of them, as we have seen 40 feet in height; the same, as supposed, with that which Nebuchadnezzar consecrated in the plains of Dura. For though this last is said to have been 60 cubits, or 90 feet high, these dimensions appear so incredible, that it has been attempted to reconcile them into one, by supposing that in the 90 feet the height of the pedestal is included, and that the 40 feet are for the height of the statue without the pedestal; and, being said to have weighed 1000 talents of Babylon, it is thence computed, that it was worth three millions and an half of our money. In a word, the whole weight of the statues and decorations, in Diodorus Siculus, amounting to 5000 and odd talents in gold, the whole is estimated at above one and twenty millions of our money; and a sum about equal to the same, in treasure, utensils, and ornaments, not mentioned is allowed, for.

Next to this temple, on the east side of the river, stood the old palace of the kings of Babylon, being four miles in circumference. Exactly opposite to it, on the other side of the river, was the new palace built by Nebuchadnezzar, eight miles in cirumference, and consequently four times as big as the old one.

5
Hanging gardens.

But nothing was more wonderful at Babylon than the hanging gardens, which Nebuchadnezzar made in complaisance to his wife Amyte; who, being a Mede, and retaining a strong inclination for the mountains and forests of her own country, was desirous of having something like them at Babylon. They are said to have contained a square of four plethra, or 400 feet, on each side; and to have consisted of terraces one above another, carried up to the height of the wall of the city, the ascent from terrace to terrace being by steps ten feet wide. The whole pile consisted of substantial arches upon arches, and was strengthened by a wall surrounding it on every side, 22 feet thick; and the floors on each of them were laid in this order: first, on the tops of the arches was laid a bed or pavement of stones 16 feet long, and four feet broad; over this was a layer of reed mixed with a great quantity of bitumen; and over this two courses of brick, closely cemented together with plaster; and over all these were thick sheets of lead, and on these the earth or mould of the garden. This floorage was designed to retain the moisture of the mould; which was so deep, as to give root to the greatest trees which were planted upon every terrace, together with great variety of other vegetables pleasing to the eye. Upon the uppermost of these terraces was a reservoir, supplied by a certain engine with water from the river, from whence the gardens on the other terraces were supplied.

6
Banks of the river, canals, &c.

The other works attributed to Nebuchadnezzar by Berosus and Abydenus, were the banks of the river, the artificial canals, and the great artificial lake said to have been sunk by Semiramis. The canals were cut out on the east side of the Euphrates, to convey the waters of that river, when it overflowed its banks, into the Tigris, before they reached Babylon. The lake was on the west side of Babylon; and, according to the lowest computation, 40 miles square, 160 in compass, and in depth 35 feet, as we read in Herodotus, or 75, as Megasthenes will have it; the former, perhaps, measured from the surface of the sides, and the latter from the tops of the banks that were cast up upon them. This lake was dug to receive the waters of the river, while the banks were building on each side of it. But both the lake, and the canal which led to it, were preserved after that work was completed, being found of great use, not only to prevent

vent all overflowings, but to keep water all the year, as in a common reservoir, to be let out on proper occasions, by sluices, for the improvement of the land.

The banks were built of brick and bitumen, on both sides of the river, to keep it within its channel; and extended on each side throughout the whole length of the city, and even farther, according to some, who reckon they extended 160 furlongs, or twenty miles; whence it is concluded they must have begun two miles and an half above the city, and have been continued an equal distance below it, the length of the city being no more than 15 miles. Within the city they were built from the bottom of the river, and of the same thickness with the walls of the city itself. Opposite to each street, on either side of the river, was a brazen gate in the said wall, with stairs leading down from it to the river: these gates were open by day, and shut by night.

Berosus, Megasthenes, and Abydenus, attribute all these works to Nebuchadnezzar; but Herodotus tells us, the bridge, the banks, and the lake, were the work of a queen after him, called *Nitocris*, who may have finished what Nebuchadnezzar left imperfect, and thence have had the honour this historian gives her of the whole.

The tower or temple stood till the time of Xerxes. But that prince on his return from the Grecian expedition, having first plundered it of its immense wealth, demolished the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, proposed to rebuild it, and accordingly set 10,000 men on work to clear away the rubbish. But his death happening soon after, a stop was put to all further proceedings in that design. After the death of that conqueror, the city of Babylon began to decline apace; which was chiefly owing to the neighbourhood of Seleucia, built by Seleucus Nicator, as is said, out of spite to the Babylonians, and peopled with 500,000 persons drawn from Babylon, which by that means continued declining till the very people of the country were at a loss to tell where it had stood.

Such is the description we have by ancient historians of the grandeur of this city; which, if these accounts are not exaggerated, must have exceeded every piece of human grandeur that hath yet appeared. Many of the moderns, however, are of opinion that these magnificent descriptions are very far from being true; although it is certain that few other arguments can be brought against the reality of them, than that we do not see things of a similar kind executed in our own days. The following are the arguments used on this subject by the president Goguet.

7
Goguet's arguments against the truth of the foregoing relation.

"Authors have greatly extolled the public works and edifices which once rendered Babylon one of the wonders of the world. We may reduce all these objects to five principal heads; 1. The height of its walls; 2. the temple of Belus; 3. the hanging gardens; 4. the bridge built over the river Euphrates, and the quays which lined that river; 5. the lake and canals dug by the hands of man to distribute the waters of the Euphrates.

"All these works so marvellous in the judgment of antiquity, appear to me to have been extremely exaggerated by the authors who have spoken of them. How can we conceive, in effect, that the walls of Babylon could have been 318 feet high, and 81 in thickness, in a compass of near ten leagues?

"I shall say the same of that square building, known under the name of *the temple of Belus*. It was composed of eight towers placed one above another, diminishing always as they went up. Herodotus does not tell us what was the height of this monument. Diodorus says, that it surpassed all belief. Strabo fixes it at one stadium, a measure which answers nearly to 600 of our feet. For in the time of this geographer the stadia were much more considerable than in the first ages. The entire mass of this building ought to have been answerable its excessive height; and this is also the idea that the ancients designed to give us of it. We may judge by the following fact. Xerxes had entirely demolished this temple. Alexander undertook to rebuild it. He designed to begin by clearing the place and removing the ruins. Ten thousand workmen who were employed two months in this work, were not, say they, able to finish it.

"The riches inclosed in the temple of Belus were proportioned to its immensity. Without speaking of the tables and censers, the cups, and other sacred vases, of massy gold, there was a statue 40 feet high, which alone weighed 1000 Babylonish talents. In short, according to the inventory that the ancients have given us of the riches contained in this temple, the total sum would amount to two hundred and twenty millions and a half of French livres. Exaggerations like these destroy themselves.

"As to the hanging gardens, according to all appearance they never existed. The silence of Herodotus on a work so singular and so remarkable, determines me to place in the rank of fables all that the other writers have delivered upon this pretended wonder. Herodotus had carefully visited Babylon. He enters into such details as prove that he has omitted none of the rarities of that city. Can we presume that he would have passed over in silence such a work as the hanging gardens? All the authors who have spoken of it are of much later date than this great historian. None of them except Berosus speaks on his own testimony. It is always on the report of others. Diodorus had extracted from Ctesias what he says of these famous gardens. There is also great appearance that Strabo had drawn from the same source. In a word, the manner in which Quintus Curtius expresses himself, sufficiently shows how much the existence of these gardens appeared to him suspicious. He judged they owed the greatest part of it to the imagination of the Greeks.

"Let us now speak of the bridge of Babylon, which the ancients have placed in the number of the most marvellous works of the east. It was near 100 fathoms in length, and almost four in breadth. We cannot deny but that a great deal of art and labour was necessary to lay the foundations, which it could not be easy to settle in the bed of an extremely deep and rapid river, which also rolls along a prodigious quantity of mud, and whose bottom is entirely sandy. They had therefore taken many precautions to secure the piers of the bridge of Babylon. They were built of stones joined and fastened together with cramps of iron, and their joints filled with melted lead. The front of the piers, turned towards the current of the Euphrates, was

was defended by buttresses extremely advanced, which diminished the weight and force of the water, by cutting it at a great distance. Such was the bridge of Babylon.

"While we do justice to the skill of the Babylonians in conducting these works, we cannot help remarking the bad taste which at all times reigned in the works of the eastern nations. The bridge of Babylon furnishes a striking instance of it. This edifice was absolutely without grace, or any air of majesty. The breadth of it was in no sort of proportion to its length. The distance between the piers was also very ill contrived. They were distant from each other only 11 feet and a half. Finally, this bridge was not arched. We may judge of its effect on the view.

"The Babylonians, however, were not the only people who were ignorant of the art of turning an arch. This secret, as far as I can find, was unknown to all the people of remote antiquity, who, generally speaking, do not appear to have been very skilful in stone-cutting.

"As for the quays which lined the Euphrates, we may believe that they were grand and magnificent: but I shall not easily believe that they surpassed those which we have daily under our eyes. In this respect, I believe Paris may dispute it for magnificence, and for the extent of the work, with all the cities of the universe."

Babylon, a town of Egypt near the eastmost branch of the river Nile, now supposed to be *Grand Cairo*, or this city to stand near its ruins. E. Long. 31. 12. N. Lat. 30. 5.

BABYLONIA, or Chaldæa, a kingdom of Asia and the most ancient in the world, being founded by Nimrod the grandson of Ham, who also, according to the margin of our Bibles, founded Nineveh the capital of the kingdom of Assyria. Indeed, these two kingdoms seem to have always continued in such a state of friendship, that we can scarce help thinking they must have been the same, or perhaps Babylonia was for some time a province of Assyria. Nothing certain is known concerning either of them, except what may be gathered from Scripture. From thence we learn, that in the days Abraham there was a king of *Shinar*, called *Amraphel*, who, under the king of Elam or Persia made war upon the Canaanites. From this time we have nothing that can be depended upon till the days of Nabonassar, the first king of Babylon mentioned in Ptolemy's canon. It is plain indeed, both from Scripture and profane history, that Babylonia subsisted as a distinct kingdom from Assyria even when the latter was in all its glory. The most probable account of the matter is this: The empire of Assyria was founded by Pul, on the ruins of that of Damascus or Syria, in the days of Menahem king of Judah. This king left two sons, Tiglath-Pileser, and Nabonasser. To the former he bequeathed the empire of Assyria, and to the latter that of Babylon. Tiglath-Pileser resided at Nineveh, the original seat of the Assyrian empire; while Nabonasser, who was the younger brother, held his residence at Babylon. As the two kingdoms were governed by princes of the same family, we may well suppose a perfect harmony to have reigned between them, the younger branch at Babylon acknowledging a kind of subjection to the elder at Nineveh. That the Babylonian empire was of Assyrian origin, we are assured by the prophet Isaiah, in the following words: "Behold the land of the Chaldeans: this people was not till the Assyrian founded it for them that dwelt in the wilderness; they set up the towers thereof: they built the palace thereof." As to the kingdom of Assyria, the Scripture mentions only five kings, *viz.* Pul, Tiglath-Pileser, Shalmanaser, Sennacharib, and Esarhaddon; whose history, as related by the sacred writers, it is needless to mention particularly here. From the days of Nabonasser, to Nabopolasser, that is, from the year before Christ 747 to 626, the kings of Babylon made no figure, and were therefore probably in a state of dependence on the kings of Assyria; but at that time, in the reign of *Chyniladan*, the Sardanapalus of the Greeks, Nineveh was taken and destroyed by the Medes and Babylonians, and the seat of the empire transferred to Babylon. This Nabopolasser was the father of the famous Nebuchadnezzar, for whose history we must refer to the sacred writers: and from his time to that of the *Belshazzar* of Daniel, and *Nabonadius* of other authors, the history of Babylon is little better than a mere blank. Of the reduction of Babylon by Cyrus, which happened at this time, we have the following account.

War had been begun betwixt the Medes, Persians, and Babylonians, in the reign of Neriglissar the father of Nabonadius, which had been carried on with very bad success on the side of the Babylonians. Cyrus, who commanded the Median and Persian army, having subdued the several nations inhabiting the great continent from the Ægean sea to the Euphrates, bent his march towards Babylon. Nabonadius, hearing of his march, immediately advanced against him with an army. In the engagement which ensued, the Babylonians were defeated; and the king, retreating to his metropolis, was blocked up and closely besieged by Cyrus. The reduction of this city was no easy enterprise. The walls were of a prodigious height, the number of men to defend them very great, and the place stored with all sorts of provisions for 20 years. Cyrus, despairing of being able to take such a city by storm, caused a line of circumvallation to be drawn quite round it, with a large and deep ditch; reckoning, that if all communication with the country were cut off, the besieged would be obliged to surrender through famine. That his troops might not be too much fatigued, he divided his army into twelve bodies, appointing each body its month to guard the trenches; but the besieged, looking upon themselves to be out of all danger by reason of their high walls and magazines, insulted him from the ramparts, and looked upon all the trouble he gave himself as so much unprofitable labour.

After Cyrus had spent two whole years before Babylon, without making any progress in the siege, he at last thought of the following stratagem, which put him in possession of it. He was informed, that a great annual solemnity was to be held at Babylon; and that the inhabitants on that occasion were accustomed to spend the whole night in drinking and debauchery. This he therefore thought a proper time for surprising them; and accordingly sent a strong detachment to the head of the canal leading to the great lake, with orders, at a certain time, to break down the great bank which was between the lake and the canal, and to turn the whole current into the lake. At the same time he appointed one body of troops at the place where the river entered the city, and another where it came out; ordering them to march in by the bed of the river as soon as they should find it fordable. Towards the evening he opened the head of the trenches on both sides the river above the city, that the water might discharge itself into them; by which means, and the breaking down of the great dam, the river was soon drained. Then the two abovementioned bodies of troops, according to their orders, entered the channel; the one commanded by Gobryas and the other by Gadates: and finding the gates all left open by reason of the disorders of that riotous night, they penetrated into the very heart of the city without opposition; and meeting, according to agreement, at the palace, they surprised the guards, and cut them in pieces. Those who were in the palace opening the gates to know the cause of this confusion, the Persians rushed in, took the palace, and killed the king, who came out to meet them sword in hand. Thus an end was put to the Babylonian empire; and Cyrus took possession of Babylon for one called in Scripture *Darius the Mede*, most probably *Cyaxares* II. uncle to Cyrus. From this time Babylonia never was erected into a distinct kingdom, but hath always followed the fortune of those great conquerors who at different times have appeared in Asia. It is now frequently the object of contention between the Turks and Persians. See ASSYRIA.

Concerning the nature of the country, manners, customs, &c. of the ancient Babylonians, the following account is collected by M. Sabbathier.

"As all the nations under the dominion of Cyrus, beside the ordinary tributes, were obliged to maintain him and his army, the monarch and his troops were supported by all Asia. The country of Babylon alone was obliged to maintain him four months of the year; its fertility, therefore, yielded a third of the produce of Asia. The government of this country, which the Persians termed *satrapy*, was richer, and more extensive, than any of the rest. It maintained for the king, besides the war-horses, a stud of 800 stallions, and 16,000 mares. So great a number of Indian dogs were likewise bred in this province for the king, that four of its cities kept those animals; and in return, they were exempted from all taxes and tributes.

"It rained very seldom in this country, according to Herodotus. The earth was watered by the river, which was here diffused by human industry, as the Nile is over Egypt by nature: for all the country of Babylon was divided by canals, the greatest of which was navigable, and flowed from south to north, from the Euphrates to the Tigris. In short, it was one of the finest countries for corn in the world; but for producing trees, the fig-tree, the vine and the olive, it was not famous. It was so luxuriant in grain, that it commonly yielded a hundred times more than what was sown; and in its good years it yielded three hundred times more than it received. The leaves of its wheat and barley were four inches broad. 'Though I know,' says Herodotus, 'that the millet and the sesame of that country grow to the size of trees, I will not describe them particularly; lest those who have not been in Babylonia should think my account fabulous.'

"They had no oil but what they made from Indian corn. The country abounded with palm-trees, which grew spontaneously; and most of them bore fruit, of which the inhabitants made bread, wine, and honey. They cultivated these trees and their fig-trees in the same manner. Some of them, as of other trees, the Greeks called *male ones*. They tied the fruit of the male to the trees which bore dates; that the mosquito, leaving the male, might cause the date to ripen, by penetrating it; for without that assistance it came not to maturity. Mosquitos bred in the male palms as in the wild fig-trees.

"But we must not here omit to give an account of the peculiar and surprising construction of their boats of skins, in which they sailed along the river to Babylon. These boats were invented by the Armenians, whose country lay north from Babylonia. They made them with poles of willow, which they bent, and covered with skins: the bare side of the skins they put outwards; and they made them so tight, that they resembled boards. The boats had neither prow nor stern, but were of a round form like a buckler. They put straw on the bottom. Two men, each with an oar, rowed them down the river, laden with different wares, but chiefly with palm-wine. Of these boats some were very large, and some very small. The largest carried the weight of 500 talents. There was room for an ass in one of their small boats; they put many into a large one. When they had unloaded, after their arrival at Babylon, they sold the poles of their boats and the straw; and loading their asses with the skins, returned to Armenia: for they could not sail up the river, its current was so rapid. For this reason they made their boats of skins, instead of wood; and on their return to Armenia with their asses, they applied the skins to their former use.

"As to their dress, they wore a linen shirt, which came down to their feet. Over it they wore a woollen robe; their outer garment was a white vest. Their shoes resembled those of the Thebans. They let their hair grow. On their heads they wore a turban. They rubbed their bodies all over with fragrant liquors. Each man had a ring on his finger, and an elegant cane in his hand, with an apple at the top, or a rose, a lily, or an eagle, or some other figure; for they were not suffered to use canes without devices.

"With regard to their policy, Herodotus thinks that their best law was one which the Heneti, an Illyrian people, likewise observed in every town and village. When the girls were marriageable, they were ordered to meet in a certain place, where the young men likewise assembled. They were then sold by the public crier; but he first sold the most beautiful one. When he had sold her at an immense price, he put up others to sale, according to their degrees of beauty. The rich Babylonians were emulous to carry off the finest women, who were sold to the highest bidders. But as the young men who were poor could not aspire to have fine women, they were content to take the ugliest with the money which was given them: for when the crier had sold the handsomest, he ordered the ugliest of all the women to be brought; and asked, if any one was willing to take her with a small sum of money. Thus she became the wife of him who was most easily satisfied; and thus the finest women were sold; and from the money

money which they brought, small fortunes were given to the ugliest, and to those who had any bodily infirmity. A father could not marry his daughter as he pleased; nor was he who bought her allowed to take her home, without giving security that he would marry her. But, after the sale, if the parties were not agreeable to each other, the law enjoined that the purchase-money should be restored. The inhabitants of any of their towns were permitted to marry wives at these auctions. Such were the early customs of the Babylonians.

"But they afterwards made a law, which prohibited the inhabitants of different towns to intermarry, and by which husbands were punished for treating their wives ill. When they had become poor by the ruin of their metropolis, fathers used to prostitute their daughters for gain. There was a sensible custom among the Babylonians, worthy to be related. They brought their sick into the forum, to consult those who passed on their diseases; for they had no physicians. They asked those who approached the sick, if they ever had the same distemper? if they knew any one who had it? and how he was cured? Hence, in this country, every one who saw a sick person was obliged to go to him, and inquire into his distemper.

"They embalmed their dead with honey; and their mourning was like that of the Egyptians.

"There were three Babylonian tribes, who lived only upon fish, and who prepared them in the following manner: they dried them in the sun, and then beat them in a mortar to a kind of flour, which after they had sifted through linen, they baked it in rolls.

"The Babylonians at first worshipped only the sun, and the moon; but they soon multiplied their divinities. They deified Baal, Bel, or Belus, one of their kings, and Merodach-Baladan. They also worshipped Venus, under the name of *Mylitta*. She and Belus were the principal deities of the Babylonians. They counted their day from sun-rise to sun-rise. They solemnized five days of the year with great magnificence, and almost the same ceremonies with which the Romans celebrated their Saturnalia.

"The Babylonians were very much addicted to judicial astrology. Their priests, who openly professed that art, were obliged to commit to writing all the events of the lives of their illustrious men; and on a fancied connection between those events and the motions of the heavenly bodies, the principles of their art were founded. They pretended that some of their books, in which their historical transactions and revolutions were accurately compared with the courses of the stars, were thousands of years old. This assertion of their judicial astrologers we may reasonably dispute; but that their astronomers had made a long series of observations, is incontestably true. It is certain that some of those observations were extant in the days of Aristotle, and that they were older than the empire of the Babylonians. See *History of* ASTRONOMY.

BABYLONIAN, BABYLONIUS, is used in some ancient writers, for an astrologer, or any thing related to astrology. Hence *Babylonia cura*, the art of casting nativities; and *numeri Babylonii*, the computation of astrologers.

BABYLONICA TEXTA, a rich sort of weavings, or hangings, denominated from the city of Babylon, where the practice of interweaving divers colours in their hangings first obtained. Hence also Babylonic garments, Babylonic skins, Babylonic carpets, housings, &c. *Babylonica solana*, coverings laid over couches, &c. painted with gold, purple, and other colours.

BABYLONICS, BABYLONICA, in ancient history, a fragment of the history of the world, ending at 267 years before Christ; and composed by Berosus, or Berossus, a priest of Babylon, about the time of Alexander. Babylonics are sometimes also cited in ancient writers by the title of *Chaldaics*. The Babylonics were very consonant with scripture, as Josephus and the ancient Christian chronologers assure; whence the author is usually supposed to have consulted the Jewish writers. Berosus speaks of an universal deluge, an ark, &c. He reckons ten generations between the first man and the deluge; and marks the duration of the several generations by *saroi*, or periods of 223 lunar months; which, reduced to years, differ not much from the chronology of Moses.—The babylonics consisted of three books, including the history of the ancient Babylonians, Medes, &c. But only a few imperfect extracts are now remaining of the work; preserved chiefly by Josephus and Syncellus, where all the passages of citations of ancient authors out of Berosus are collected with great exactness, Annius of Viterbo, to supply the loss, forged a complete Berosus out of his own head. The world has not thanked him for the imposture.

BABYROUSSA, in zoology, a synomine of a species of sus. See SUS.

BAC, in navigation, is used for a praam, or ferry-boat.

BAC, in brewing, a large flat kind of tub, or vessel, wherein the wort is put to stand and cool before boiling. The ingredients of beer pass through three kinds of vessels. They are masked in one, worked in another, and cooled in a third, called *bacs* or *coolers*.

BAC, in distillery, vessels into which the liquor to be fermented is pumped from the cooler, in order to be worked with the yest.

BAC-Maker, is one who makes liquor-bacs, underbacs, coolers, mash-tons, working-tons, &c. for the brewers. The workmanship is partly carpentry, in a particular manner, for it must be tight enough to hold liquor; and partly cooperage, *viz.* the mash-tun, or vat, which is hooped. There are not many of this trade; and it requires chiefly strength, with a little art. A small stock of stuff, besides tools, will set a man up tolerably well; but, with 200l. or 300l. he will make a good figure in business.

BACA, or BAZA, a town of Spain, in the kingdom of Granada. W. Long. 3. 6. N. Lat. 37. 18. It is situated in a valley called *Hoya de Baza*. It is encompassed with old walls, and has a castle half ruined. It contains about 4000 houses, but has nothing remarkable except the church dedicated to the Virgin Mary. The land about it is well cultivated for half a league round, and is fertile in wheat, wine, honey, hemp, and flax, being watered by the little river Guadalantin.

BACACUM, a town of the Nervii in Gallia Belgica; now *Bavay*, in Hainault. E. Long. 3. 30. N. Lat. 50. 25.

BACAIM, a handsome sea-port town of the kingdom of Visapour on the Malabar coast in Asia. It is subject to the Portuguese; and stands in E. Long. 73. 10. N. Lat. 19. 0.

BACASERAY, a town in the peninsula of Crim Tartary, and, as the khan usually takes up his residence there, it may be considered as the capital of the country. E. Long. 35. 10. N. Lat. 45. 30.

BACCA, BERRY, in botany, is used to signify such fruits as consist of a pericarpium full of juice and seeds, without any valves.

BACANTIBI, in ecclesiastical antiquity, wandering clerks, who strolled from church to church.—— The word seems formed by corruption from *vacantivi*.

BACCALARIA, in middle age writers, denotes a kind of country-farms, consisting of several manses.

Bacalaria dominicaria, or *indominicata*, was more particularly used for a farm belonging to the lord, and kept in his own hands.

BACCARACH, a town of Germany in the lower Palatinate; formerly imperial and free, but now subject to the elector Palatine. It is famous for excellent wine; and is situated on the Rhine, in E. Long. 7. 5. N. Lat. 49. 57.

BACCHÆ, in antiquity, the priestesses of Bacchus, who celebrated the *orgia*, or mysteries of that god.— The word was also used for the ivy crowns or garlands worn by the priests of Bacchus, in offering sacrifices to him.

BACCHANALIA, feasts celebrated in honour of Bacchus by the ancients. The two most remarkable were called the *greater* and *lesser*. The latter, called *lenæa*, from a word signifying a *wine-press*, were held in the open fields about autumn; the greater, called *Dionysia*, from one of the names of Bacchus, were celebrated in the city, about the spring-time. Both these feasts were accompanied with games, spectacles, and theatrical representations, and it was at this time the poets contended for the prize of poetry. Those who were initiated into the celebration of these feasts, represented some Silenius; others, Pan; others, Satyrs; and in this manner appeared in public, night and day, counterfeiting drunkenness, dancing obscenely, and committing all kinds of licentiousness and debauchery. See the article Bacchus.

BACCHARIS, PLOUGHMAN'S SPIKENARD: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ discoides*. The characters are: It has a naked receptacle, and hairy papus; with a cylindrical imbricated calyx, and feminine florets mixed with the hermaphrodite ones. There are seven species, all natives of warm climates; but none of them merit notice except the two following. 1. The ivæfolia, or African tree-groundsel, is a native of the Cape of Good Hope, as also of Peru and other warm parts of America. It grows to the height of five or six feet; and though there is little beauty in the flower, has been long admitted into the gardens of the curious. It is pretty hardy, and will live abroad in moderate winters in England, but is usually kept in green-houses and placed abroad only in summer. It may be propagated either by cuttings or seeds, which ripen well in this country. 2. The Halimifolia, or Virginia groundsel-tree, is a native of Virginia and other parts of North-America. It grows about seven or eight feet high, with a crooked shrubby stem; and flowers in October: the flowers are white, and not very beautiful; but the leaves continuing green, has occasioned this shrub to be admitted into many curious gardens. It may be propagated by cuttings; and will live very well in the open air, though severe frosts will sometimes destroy it.

BACCHI, in mechanics, a kind of ancient machines, in form of goats, used by Jupiter, in his wars against the giants. Rudbeck describes two kinds of bacchi, one made like the battering-ram, wherewith Jupiter demolished the enemy's fortifications; the other contrived to cast fire out of, from whence the Greeks are conjectured to have framed their idea of chimera.

BACCHIC, something relating to the ceremonies of Bacchus. The celebrated *intaglio*, called Michael Angelo's ring, is a representation of a bacchic feast.

Bacchic song, is sometimes used for a *chanson à boire*, or composition to inspire jollity. But in a more proper sense, it is restrained to a dithyrambic ode or hymn.

BACCHINI (Benedict), a Benedictine monk, and one of the most learned men in his time, was born at Borgo San Domino in 1651; and wrote a great number of books in Latin and Italian, the most considerable of which is a Literary Journal. He died at Bologna in 1721, aged 70.

BACCHIUS, a follower of Aristoxenus, supposed by Fabricius to have been tutor to the emperor Marcus Antoninus, and consequently to have lived about A. C. 140. He wrote in Greek a very short introduction to music in dialogue, which, with a Latin translation thereof, Meibomius has published. It seems it was first published in the original by Mersennus, in his Commentary on the first six chapters of Genesis; and that afterwards he published a translation of it in French, which Meibomius, in the preface to his edition of the ancient musical authors, censures as being grossly erroneous.

Bacchius, in ancient poetry, a kind of foot composed of a short syllable, and two long ones; as the word [ăvārī]. It takes its name from the god Bacchus, because it frequently entered into the hymns composed in his honour. The Romans called it likewise *ænotrius*, *tripodius*, *saltans*.

BACCHUS, in Heathen mythology, the god of wine, with whose fabulous adventures every school-boy is acquainted. This personage is seldom named in modern times, but as a sensual encourager of feast and jollity; but he was regarded in a more respectable light by the ancients, who worshipped him in different countries under the following appellations: In Egypt, he was called *Osiris*; in Mysia, *Fanaces*; in India; *Dionysius*; *Liber*, throughout the Roman dominions; *Adoneus*, in Arabia; and *Pentheus*, by the Lucanians. Mythologists furnish reasons for all these different names given to the same god, which may be seen in the second volume of Banier's Mythology.

It is natural to suppose that the Greeks and Romans, as usual, bestowed upon the one Bacchus which they wor-

worshipped, the several actions and attributes of the many divinities known by that name, and by other equivalent denominations in different countries. However, antiquity chiefly distinguished two gods under the title of *Bacchus:* that of Egypt, the son of Ammon, and the same as Osiris; and that of Thebes in Bœotia, the son of Jupiter and Semele.

The Egyptian Bacchus was brought up at Nysa, a city of Arabia Felix, whence he acquired the name of *Dionysius*, or the God of Nysa; and this was the conqueror of India. Though this Bacchus of the Egyptians was one of the elder gods of Egypt, yet the son of Semele was the youngest of the Grecian deities. Diodorus Siculus tells us, that Orpheus first deified the son of Semele by the name of Bacchus, and appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious.

The great Bacchus, according to Sir Isaac Newton, flourished but one generation before the Argonautic expedition. This Bacchus, says Hermippus, was potent at sea, conquered eastward as far as India, returned in triumph, brought his army over the Hellespont, conquered Thrace, and left music, dancing, and poetry there. And, according to Diodorus Siculus, it was the son of Semele who invented farces and theatres, and who first established a music-school, exempting from all military functions such musicians as discovered great abilities in their art; on which account, says the same author, musicians formed into companies have since frequently enjoyed great privileges.

Dr Burney * observes, that the dithyrambics which gave birth to dramatic representations, are as ancient as the worship of Bacchus in Greece; and there is little doubt but that the ceremonies of his mysteries gave rise to the pomp and illusions of the theatre. Many of the most splendid exhibitions upon the stage for the entertainment of the people of Athens and Rome, being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, *servants of Bacchus*.

* *History of Music.* p. 298. *et seq.*

Pausanias, in his Attics, speaks of a place at Athens consecrated to *Bacchus the singer;* thus named, he says, for the same reason as Apollo is called the *chief* and *conductor* of the muses. Whence it should seem that Bacchus was regarded by the Athenians not only as the god of wine, but of song; and it must be owned, that his followers, in their cups, have been much inclined to singing ever since. Indeed we are certain, that in none of the orgies, processions, triumphs, and festivals, instituted by the ancients to the honour and memory of this prince of *bons vivans*, music was forgotten, as may be still gathered from ancient sculpture, where we find not only that musicians, male and female, regaled him with the lyre, the flute, and with song; but that he was accompanied by fawns and satyrs playing upon timbrels, cymbals, bagpipes, and horns: these Suidas calls his minstrels; and Strabo gives them the appellations of *Bacchi*, *Sileni*, *Satyri*, *Bacchæ*, *Lenæ*, *Thyæ*, *Mamillones*, *Naiades*, *Nymphæ*, and *Tityri*. These representations have furnished subjects for the finest remains of ancient sculpture; and the most voluptuous passages of ancient poetry are descriptions of the orgies and festivals of Bacchus. See ORGIA.

BACCHYLIDES, a famous Greek poet, was the nephew of Simonides, and the cotemporary and rival of Pindar. Both sung the victories of Hiero at the public games. Besides odes to athletic victors, he was author of Love Verses; Prosodies; Dithyrambics; Hymns; Pæans; Hyporchemes, Parthenia, or songs to be sung by a chorus of virgins at festivals. The chronology of Eusebius places the birth of Bacchylides in the 82d Olympiad, about 450 B. C.

BACCIO, or BACCIUS, (Andrew), a celebrated physician of the 16th century, born at St Elpideo. He practised physic at Rome with great reputation, and was first physician to pope Sixtus V. The most scarce and valuable of his works are, 1. *De thermis*. 2. *De naturali vinorum historia*. 3. *De venenis et antidotis*. 4. *De gemmis ac lapidibus pretiosis*.

BACCIO (Fra. Bartolomeo), called *Bartolemi di S. Marco*, a celebrated painter of history and portrait, was born at Savignano near Florence in 1469, and was a disciple of Cosimo Roselli; but his principal knowledge in the art of painting was derived from Leonardo da Vinci. He understood the true principles of design better than most masters of his time, and was also a considerable painter in perspective; which induced Raphael to have recourse to him after he had quitted the school of Perugino; and under his direction likewise Raphael studied the art of managing and uniting colours, as well as the rules of perspective. Some years after the departure of Raphael from Florence, Baccio visited Rome; and by the observations he made on the antiques, and the works of Raphael which were then the admiration of the whole world, he was extremely improved, and manifested his acquired abilities by a picture of S. Sebastian, which he finished at his return to Florence. It was so well designed, so naturally and beautifully coloured, and had so strong an expession of pain and agony, that it was removed from the place where it was publicly seen (in the chapel of a convent), as it had been observed to have made too strong an impression on the imaginations of many women who beheld it. He was very laborious, and made nature his perpetual study; he designed the naked correctly; his figures had a great deal of grace, and his colouring was admirable. He is accounted to have been the first inventor of that machine called a *layman* by the artists, and which to this day is in general use. Upon that he placed his draperies, to observe with greater exactness their natural and their more elegant folds. A capital picture of the ascension by Baccio, is in the Florentine collection. He died in 1517.

BACHELOR, or BATCHELOR, a common term for a man not married, or who is yet in a state of celibacy.—The Roman censors frequently imposed fines on old bachelors. Dion Halicarnasseus mentions an old constitution, by which all persons of full age were obliged to marry. But the most celebrated law of this kind was that made under Augustus, called the *lex Julia de maritandis ordinibus*; by which bachelors were made incapable of legacies or inheritances by will, unless from their near relations. This brought many to marry, according to Plutarch's observation, not so much

 much for the ſake of raiſing heirs to their own eſtates, as to make themſelves capable of inheriting thoſe of other men.—The rabbins maintain, that, by the laws of Moſes, every body, except ſome few particulars, is obliged in conſcience to marry at 20 years of age: this makes one of their 613 precepts. Hence thoſe maxims ſo frequent among their caſuiſts, that he who does not take the neceſſary meaſures to leave heirs behind him, is not a man, but ought to be reputed a homicide.—Lycurgus was not more favourable: by his laws, bachelors are branded with infamy, excluded from all offices civil and military, and even from the ſhows and public ſports. At certain feaſts they were forced to appear, to be expoſed to the public deriſion, and led round the market-place. At one of their feaſts, the women led them in this condition to the altars, where they obliged them to make *amende honourable* to nature, accompanied with a number of blows and laſhes with a rod at diſcretion. To complete the affront, they forced them to ſing certain ſongs compoſed in their own deriſion.—The Chriſtian religion is more indulgent to the bachelor ſtate: the ancient church recommended it as in ſome circumſtances preferable to, and more perfect than, the matrimonial. In the canon law, we find injunctions on bachelors, when arrived at puberty, either to marry or to turn monks and profeſs chaſtity in earneſt.—In England, there was a tax on bachelors, after 25 years of age, 12 l. 10s. for a duke, a common perſon 1 s. by 7 Wil. III. 1695. In Britain, at preſent, they are taxed by an extra-duty on their ſervants. Every man of the age of 21 years and upwards, never having been married, who ſhall keep one male ſervant or more, ſhall pay 1 l. 5 s. for each above or in addition to the ordinary duties leviable for SERVANTS. Every man of the age of 21 years and upwards, never having been married, keeping one female ſervant, ſhall pay 2 s. 6 d. in addition to the former 2 s. 6 d.; 5 s. in addition for each, if he has two female ſervants; and 10s. in addition for each for three or more female ſervants.

BACHELOR, was anciently a denomination given to thoſe who had attained to knighthood, but had not a number of vaſſals ſufficient to have their banner carried before them in the field of battle; or if they were not of the order of Bannerets, were not of age to diſplay their own banner, but obliged to march to battle under another's banner. It was alſo a title given to young cavaliers, who, having made their firſt campaign, received the military girdle accordingly. And it ſerved to denominate him who had overcome another in a tournament, the firſt time he ever engaged.—The word *bachelor*, in a military ſenſe, is derived by Cujas from *buccellarius*, a kind of cavalry, anciently in great eſteem. Du Cange deduces it from *baccalaria*, a kind of fees or farms, conſiſting of ſeveral pieces of ground, each whereof contained 12 acres or as much as two oxen would plough; the poſſeſſors of which baccalaria were called *bachelors*. Caſeneuve and Altaſerra derive bachelor from *baculus* or *bacillus*, "a ſtaff," becauſe the young cavaliers exerciſed themſelves in fighting with ſtaves. Martinius derives it from *baccalaureus*, i. e. *bacca laurea donatus*, in alluſion to the ancient cuſtom of crowning poets with laurel, *baccis lauri*, as was the caſe with Petrarch at Rome in 1341. Alciat and Vives are of the ſame opinion: nor is this etymology improbable.

Knights-BACHELORS, the moſt ancient, but the loweſt order of knights in England; known by the name of *knights* only. They are ſtyled *knights bachelors*, either (according to ſome) as denoting their degree, *quaſi bas chevaliers*; or, according to others, becauſe this title does not deſcend to their poſterity.

The cuſtom of the ancient Germans was to give their young men a ſhield and a lance in the great council: this was equivalent to the *toga virilis* of the Romans. Before this, they were not permitted to bear arms, but were accounted as part of the father's houſehold; after it, as part of the public. Hence ſome derive the uſage of knighting, which has prevailed all over the weſtern world, ſince its reduction by colonies, from thoſe northern heroes. Knights are called in Latin *equites aurati*: *aurati*, from the gilt ſpurs they wore; and *equites*, becauſe they always ſerved on horſeback: for it is obſervable, that almoſt all nations call their knights by ſome appellation derived from an horſe. They are alſo called in our law *milites*, becauſe they formed a part, or indeed the whole, of the royal army, in virtue of their feodal tenures; one condition of which was, that every one who held a knight's fee (which in Henry II.'s time amounted to 20 l. *per annum*) was obliged to be knighted, and attend the king in his wars, or pay a fine for his non-compliance. The exertion of this prerogative, as an expedient to raiſe money in the reign of Charles I. gave great offence, though warranted by law and the recent example of Queen Elizabeth. At the Reſtoration, it was, together with all other military branches of the feodal law, aboliſhed: and it now only exiſts as an honorary title; though, on account of its indiſcriminate attainment, not very generally regarded. It is conferred indiſcriminately upon gownſmen, burghers, and phyſicians, by the king's lightly touching the perſon, who is then kneeling, on the right ſhoulder with a drawn ſword, and ſaying, *Riſe, Sir*. See the articles KNIGHT and NOBILITY.

BACHELORS, in an univerſity ſenſe, are perſons that have attained to the baccalaureate, or who have taken the firſt degree in the liberal arts and ſciences.

The degree of bachelor was firſt introduced in the 13th century by Pope Gregory IX. but it remains ſtill unknown in Italy. At Oxford, before a perſon is intitled to the degree of *bachelor of arts*, he muſt have ſtudied there four years; three years more to become maſter of arts; and ſeven more to commence bachelor of divinity.—At Cambridge, to commence bachelor of arts, he muſt have been admitted near four years; and above three years more before he commences maſter; and ſeven more ſtill to become bachelor of divinity. He may commence bachelor of law after having ſtudied it ſix years.—At Paris, to paſs bachelor in theology, a perſon muſt have ſtudied two years in philoſophy and three years in theology, and held two acts of examination in the Sorbonne.—Bachelors in the canon law are admitted after two years ſtudy in the ſame, and ſuſtaining an act according to the forms. A bachelor of phyſic muſt have ſtudied two years in medicine after having been four years maſter of arts in the univerſity, and have ſtood an examination; after which he is inveſted with the fur, in order to be licenſed.—In the univerſity of Paris, before the foundation of divinity-profeſſorſhips, thoſe who had ſtudied divinity ſix years were admitted to go through their courſe, whence they were called *baccalarii curſores*; and as there were two courſes, the firſt employed in explaining the Bible during three ſucceſſive years, the ſecond for explaining the maſter of the ſentences for one year, thoſe who were in the Bible-courſe were called *baccalarii Biblici*, and thoſe arrived at the ſentences *baccalarii ſententiarii*. And, laſtly, thoſe who had gone through both were denominated *baccalarii formati*, or *formed bachelors*.

At preſent, *formed bachelor* denotes a perſon who has taken the degree regularly after the due courſe of ſtudy and exerciſes required by the ſtatutes; by way of oppoſition to a *current bachelor*, who is admitted in the way of grace, or by diploma.

We alſo find mention of bachelors of the church, *baccalarii eccleſiæ*. The biſhop with his canons and *baccalarii, cum conſilio et conſenſu omnium canonicorum ſuorum et baccalariorum.*

Bachelors, in the Livery companies of London, are thoſe not yet admitted to the livery. Theſe companies generally conſiſt of a maſter, two wardens, the livery, and the bachelors, who are yet but in expectation of dignity in the company, and have their function only in attendance on the maſter and wardens. They are alſo called *yeomen*.

Bachelor is alſo a name given in the ſix companies of merchants at Paris to the elders, and ſuch as having ſerved the offices, have a right to be called by the maſters and wardens to be preſent with them, and aſſiſt them in ſome of the functions, particularly in what relates to the *chef-d'oeuvres* or maſter-pieces, of ſuch as are candidates for being admitted maſters.

BACHERAC, a town of the Palatine of the Rhine, ſituated on the weſtern ſhore of that river, in E. Long. 7°. and N. Lat. 58°. It is remarkable for excellent wine, from thence called *Bacherac*.

BACHIAN, one of the Molucca iſlands, belonging to the Dutch; ſituated under the Equator, in E. Long. 125°.

BACHU, a city of Shirvan in Perſia, and the beſt haven in the Caſpian ſea. It is defended by a double wall, as alſo by a ditch and redoubts, made by the Ruſſians when they were maſters of the place. It had a ſumptuous caſtle, but it is reduced to a ruinous ſtate by the Ruſſians. Formerly many merchants reſided here, and carried on a conſiderable traffic in raw ſilk; but that commerce is now given up. All the country round is much impregnated with ſulphur, which renders the water very unpleaſant. The neighbourhood of this city ſupplies the countries adjacent with naphtha, brimſtone, and rock-ſalt; and is the only place thereabouts which produces ſaffron. Round Bachu are ſeveral very ſteep craggy mountains, on which are ſtrong watch towers. E. Long. 49. 5. N. Lat. 40. 0

BACK, *Back-Bone*, or Spine. See Anatomy, n° 30.

Back, in the menage, and among farriers. A horſe's back ſhould be ſtraight, not hollow, which is called *ſaddle-backed*: horſes of this kind are generally light, and carry their heads high, but want in ſtrength and ſervice. A horſe with a weak back is apt to ſtumble.

In the French riding-ſchools, to mount a horſe *a dos*, is to mount him bare-backed, without a ſaddle.

Back-Gammon; an ingenious game played with dice, upon a table, by two perſons.

Manner of playing the game. The table is divided into two parts, upon which there are 24 black and white ſpaces, called points. Each adverſary has 15 men, black and white, to diſtinguiſh them; and they are diſpoſed of in the following manner: Suppoſing the game to be played into the right-hand table, two are placed upon the ace point in the adverſary's table, five upon the ſix point in the oppoſite table, three upon the cinque point in the hithermoſt table, and five on the ſix point in the right-hand table. The grand object in this game is for each player to bring the men round into his right-hand table, by throwing with a pair of dice thoſe throws that contribute towards it, and at the ſame time prevent the adverſary doing the like. The firſt beſt throw upon the dice is eſteemed aces, becauſe it ſtops the ſix point in the outer table, and ſecures the cinque in the thrower's table; whereby the adverſary's two men upon the thrower's ace point cannot get out with either quatre, cinque, or ſix. This throw is an advantage often given to the antagoniſt by the ſuperior player.

When he carries his men home in order to loſe no point, he is to carry the moſt diſtant man to his adverſary's bar point, that being the firſt ſtage he is to place it on; the next ſtage is ſix points farther, viz. in the place where the adverſary's five men are firſt placed out of his tables. He muſt go on in this method till all his men are brought home, except two, when by loſing a point, he may often ſave the gammon, by throwing two fours or two fives.

When a hit is only played for, he ſhould endeavour to gain either his own or adverſary's cinque point; and if that fails by his being hit by the adverſary, and he finds him forwarder than himſelf, in that caſe he muſt throw more men into the adverſary's tables; which is done in this manner: He muſt put a man upon his cinque or bar point; and if the adverſary neglects to hit it, he may then gain a forward game inſtead of a back game: but if the adverſary hits him, he ſhould play for a back game; and then the greater number of men which are taken up makes his game the better, becauſe by theſe means he will preſerve his game at home: and then he ſhould endeavour to gain both his adverſary's ace and the trois points, or his ace and deuce points, and take care to keep three men upon the adverſary's ace point, that in caſe he hits him from thence, that point may remain ſtill ſecure to himſelf.

A back game ſhould not be played for at the beginning of a ſet, becauſe it would be a great diſadvantage, the player running the riſk of a gammon to win a ſingle hit.

Rules for playing at ſetting out all the throws on the dice, when the player is to play for a gammon or for a ſingle hit (A). 1. Two aces are to be played on the cinque point and bar point, for a gammon or for a hit. 2. Two ſixes, to be played on the adverſary's bar

(A) The rules marked thus are for a gammon only; thoſe marked thus * are for a hit only.

Backgammon.

bar point and on the thrower's bar point, for a gammon or for a bit. 3. † Two trois, to be played on the cinque point, and the other two on the trois point in his own tables, for a gammon only. 4. † Two deuces, to be played on the quatre point in his own tables, and two to be brought over from the five men placed in the adversary's tables for a gammon only. 5. † Two fours, to be brought over from the five men place in the adversary's tables, and to be put upon the cinque point in his own tables for a gammon only. 6. Two fives, to be brought over from the five men placed in the adversary's tables, and to be put on the trois point in his own tables, for a gammon or for a hit. 7. Size ace, he must take his bar point for a gammon or for a hit. 8. Size deuce, a man to be brought from the five men placed in the adversary's tables, and to be placed in the cinque point in his own tables, for a gammon or for a hit. 9. Six and three, a man to be brought from the adversary's ace point, as far as he will go, for a gammon or for a hit. 10. Six and four, a man to be brought from the adversary's ace point, as far as he will go, for a gammon or for a hit. 11. Six and five, a man to be carried from the adversary's ace point, as far as he can go, for a gammon or for a hit. 12. Cinque and quatre, a man to be carried from the adversary's ace point, as far as he can go, for a gammon or for a hit. 13. Cinque trois to make the trois point in his table, for a gammon or for a hit. 14. Cinque deuce, to play two men from the five placed in the adversary's tables, for a gammon or for a hit. 15. † Cinque ace, to bring one man from the five placed in the adversary's tables for the cinque, and to play one man down on the cinque point in his own tables for the ace, for a gammon only. 16. Quatre trois, two men to be brought from the five place in the adversary's tables, for a gammon or for a hit. 17. Quatre deuce, to make the quatre point in his own tables, for a gammon or for a hit. 18. † Quatre ace, to play a man from the five placed in the adversary's tables for the quatre; and for the ace, to play a man down upon the cinque point in his own tables, for a gammon only. 19. † Trois deuce, two men to be brought from the five placed in the adversary's tables, for a gammon only. 20. Trois ace, to make the cinque point in his own tables, for a gammon or for a hit. 21. † Deuce ace, to play one man from the five men placed in the adversary's table for the deuce; and for the ace to play a man down upon the cinque point in his own tables, for a gammon only. 22. * Two trois, two of them to be played on the cinque point in his own tables, and with the other two he is to take the quatre point in the adversary's tables. 23. * Two deuces, two of them are to be played on the quatre point in his own tables, and with the other two he is to take the trois point in the adversary's tables. By playing these two cases in this manner, the player avoids being shut up in the adversary's tables, and has the chance of throwing out the tables to win the hit.

24. * Two fours, two of them are to take the adversary's cinque point in the adversary's tables, and for the other two, two men are to be brought from the five placed in the adversary's tables. 25. * Cinque ace, the cinque should be played from the five men placed in the adversary's tables, and the ace from the adversary's ace point. 26. * Quatre ace, the quatre to be played from the five men placed in the adversary's ace point. 27. * Deuce ace, the deuce to be played from the five men placed in the adversary's tables, and the ace from the adversary's ace point.

The three last chances are played in this manner; because an ace laid down in the adversary's tables, there is a probability of throwing deuce ace, trois deuce, quatre trois, or size cinque, in two or three throws; either of which throws secures a point, and gives the player the best of the hit.

Cautions, &c. The player must understand by the directions given to play for a gammon, that he is to make some blots on purpose, the odds being in his favour that they are not hit; but if it should happen that any blot is hit, as in this case there will be three men in the adversary's tables, he must then endeavour to secure the adversary's cinque, quatre, or trois point, to prevent a gammon, and must be very cautious of his fourth man's not being taken up.

He must not crowd his game at any time if he can help it; that is to say, he should not put many men either upon the trois or deuce points in his own tables, being the same as losing those men not having them in play. Besides, by crowding the game, and attempting to save a gammon, the player is often gammoned. His game being crowded in his own tables, the adversary has room to play as he thinks proper.

The following calculations will show the odds of entering a single man upon any certain number of points; and accordingly the game should be played.

It is necessary to know that there are thirty-six chances upon two dice, and the points that are upon these thirty-six chances are as follow.

Viz.	Points.
2 Aces - -	4
2 Deuces - -	8
2 Trois - -	12
2 Fours - -	16
2 Fives - -	20
2 Sixes - -	24
6 And 5 twice -	22
6 And 4 twice -	20
6 And 3 twice -	18
6 And 2 twice -	16
6 And 1 twice -	14
5 And 4 twice -	18
5 And 3 twice -	16
5 And 2 twice -	14
5 And 1 twice -	12
4 And 3 twice -	14
4 And 2 twice -	12
4 And 1 twice -	10
3 And 2 twice -	10
3 And 1 twice -	8
2 And 1 twice -	6

Divide by 36)294(8

and it proves, that upon an average the player has a right to 8 points each throw. 288

6

The

Back-gammon.

The chances upon two dice calculated for back-gammon are as follow.

	2 Sixes	1
	2 Fives	1
	2 Fours	1
	2 Trois	1
	2 Deuces	1
†	2 Aces	1
	6 And 5 twice	2
	6 And 4 twice	2
	6 And 3 twice	2
	6 And 2 twice	2
†	6 And 1 twice	2
	5 And 4 twice	2
	5 And 3 twice	2
	5 And 2 twice	2
†	5 And 1 twice	2
	4 And 3 twice	2
	4 And 2 twice	2
†	4 And 1 twice	2
	3 And 2 twice	2
†	3 And 1 twice	2
†	2 And 1 twice	2
		36

As it may seem difficult to find out by this table of thirty-six chances what are the odds of being hit upon a certain or flat die, let the following method be pursued.

The player may observe in the table that what are thus † marked are,

† 2 Aces	1
† 6 And 1 twice	2
† 5 And 1 twice	2
† 4 And 1 twice	2
† 3 And 1 twice	2
† 2 And 1 twice	2
Total	11
Which deducted from	36
There remain	25

So that it appears it is twenty-five to eleven against hitting an ace upon a certain or flat die.

The above method holds good with respect to any other flat die. For example, what are the odds of entering a man upon 1, 2, 3, 4, or 5 points?

Answer.

To enter it upon	for	against		for	ag.
1 point is	11 to	25	Or about	4 to	9
2 points	20	16		5	4
3	27	9		3	1
4	32	4		8	1
5	35	1		35	1

The following table shows the odds of hitting with any chance, in the reach of a single die.

To hit upon	for	against		for	ag.
1 is	11 to	25	Or about	4 to	9
2	12	24		1	2
3	14	22		2	3
4	15	21		5	7
5	15	21		5	7
6	17	19		$8\frac{1}{2}$	$9\frac{1}{2}$

The odds of hitting with double dice are as follow.

To hit upon	for	against		for	ag.
7 is	6 to	30	Or about	1 to	5
8	6	30		1	5
9	5	31		1	6
10	3	33		1	11
11	2	34		1	17
12	1	36		1	35

How to find out the odds of being hit upon a six, by the tables of thirty-six chances.

2 Sixes	1
2 Trois	1
2 Deuces	1
6 And 5 twice	2
6 And 4 twice	2
6 And 3 twice	2
6 And 2 twice	2
6 And 1 twice	2
5 And 1 twice	2
4 And 2 twice	2
	17
Which deducted from	36
There remains	19

By which it appears to be 19 to 17 against being hit upon a six.

The odds on the hits.

2 Love is about	5 to	2
2 to 1 is	2	1
1 Love is	3	2

Directions for the player to bear his men. If a player has taken up two of the adversary's men, and happens to have two, three, or more points made in his own tables, he should spread his men, that he either may take a new point in his tables, or be ready to hit the man which the adversary may happen to enter. If he finds upon the adversary's entering, that the game is upon a par, or that the advantage is on his own side, he should take the adversary's man up whenever he can, it being 25 to 11 that he is not hit: except when he is playing for a single hit only; then, if playing the throw otherwise gives him a better chance for it, he ought to do it.

It being five to one against his being hit with double dice, he should never be deterred from taking up any one man of the adversary's.

If he has taken up one of the adversary's men, and should happen to have five points in his own tables, and forced to leave a blot out of his tables, he should endeavour to leave it upon doublets preferable to any other chance, because in that case the odds are 35 to one that he is not hit; whereas it is only 17 to one but he is hit upon any other chance.

When the adversary is very forward, a player should never move a man from his own quatre, trois, or deuce points, thinking to bear that man from the point where he put it, as nothing but high doublets can give him any chance for the hit. Instead of playing an ace or a deuce from any of those points, he should play them from his own size or highest points, so that throwing two fives, or two fours, his size and cinque-points being eased, would be a considerable advantage to him; whereas

Back-gammon.

whereas had they been loaded, he must have been obliged to play otherwise.

It is the interest of the adversary to take up the player as soon as he enters. The blot should be left upon the adversary's lowest point; that is to say, upon his deuce point, rather than upon his trois point; or upon his trois point rather than his quatre point; or upon his quatre point preferable to his cinque point, for a reason before mentioned; all the men the adversary plays upon his trois, or his deuce points, are deemed lost, being greatly out of play; so that those men not having it in their power to make his cinque point, and his game being crowded in one place and open in another, the adversary must be greatly annoyed by the player.

If the player has two of the adversary's men in his tables, he has a better chance for a hit than if he had more, provided his game is forwarder than that of his antagonist's; for if he had three or more of the adversary's men in his tables, he would stand a worse chance to be hit.

When a player is running to save the gammon, if he should have two men upon his ace point, and several men abroad, although he should lose one point or two in putting his men into his tables, it is his interest to leave a man upon the adversary's ace point, because it will prevent his adversary from bearing his men to the greatest advantage, and at the same time the player will have a chance of his adversary's making a blot, which he may chance to hit. However, if a player finds upon a throw, that he has a probability of saving his gammon, he should never wait for a blot, as the odds are greatly against his hitting it, but should embrace that opportunity.

How to calculate the odds of saving or winning the gammon. Suppose the adversary has so many men abroad as require three throws to put them into his tables, and at the same time that the player's tables are made up, and that he has taken up one of the adversary's men; in this case, it is about an equal wager that the adversary is gammoned. For in all probability the player has bore two men before he opens his tables, and when he bears the third man, he will be obliged to open his size or cinque point. It is then probable, that the adversary is obliged to throw twice before he enters his men in the player's tables, twice more before he puts that man into his own tables, and three throws more to put the men which are abroad into his own tables, in all seven throws. Now the player having 12 men to bear, he may be forced to make an ace or a deuce twice before he can bear all his men, and consequently will require seven throws in bearing them; so that, upon the whole, it is about equal whether the adversary is gammoned or not.

Suppose a player has three men upon his adversary's ace point and five points in his own tables, and that the adversary has all his men in his tables, three upon each of his five highest points, Has the player a probability of gammoning his adversary or not?

	Points.
For bearing three men from his 6th point is	18
From his 5th point	15
	33
Carried forward	33
From his 4th point	12
From his 3d point	9
From his 2d point	6
In all	60
Bringing his three men from the adversary's ace point to his size point in his own tables, being 18 points each, and making together.	54
There must remain	6

It is plain from this calculation, that the player has much the best of the probability of the gammon, exclusive of one or more blots which the adversary is liable to make in bearing his men, supposing at the same time the throws to be upon an equality.

Suppose two blots are left, either of which cannot be hit but by double dice; one must be hit by throwing eight and the other by throwing nine; so that the adversary has only one die to hit either of them. What are the odds of hitting either of them? The chances of two dice being in all 36

The chances to hit 8 are 6 and 2 twice	2
5 and 3 twice	2
2 Deuces	1
2 Fours	1
The chances to hit 9 are 6 and 3 twice	2
5 And 4 twice	2
2 Trois	1
For hitting, in all	11
Chances for not hitting, remain	25

So that the odds are 25 to 11 against hitting either of these blots.

This method may be taken to find out the odds of hitting three, four, or five blots upon double dice; or blots made upon double and single dice at the same time. After knowing how many chances there are to hit any of those blots, they must be added all together, and then subtract from the number 36, which are the chances of the two dice, and the question is solved.

A critical case for a Back-game. Suppose the foregame to be played by A, and that all his men are placed as usual; B has fourteen of his men placed upon his adversary's ace point, and one upon his adversary's deuce point, and B is to throw. Who has the best of the hit?—*Answer:* A has the best of it, gold to silver: because, if B does not throw an ace to take his adversary's deuce point, which is 25 to 11 against him, A will take up B's men in his tables, either singly or to make points; and then if B secures either A's deuce or trois point, A will put as many men down as possible, in order to hit, and thereby get a back-game. It is evident that the back-game is very powerful; consequently, whoever practises it must become a greater proficient at the game than he could by any other means.

Another critical case. Suppose A to have five men placed upon his size point, as many upon his quatre point, and the same number upon his deuce point, all in his own tables. At the same time, let us suppose B to have three men placed upon A's ace point, as many upon A's trois point, and the same number upon

upon A's cinque point, in his own tables, and three men placed as usual out of his tables. Who has the best of the hit?—*Answer:* The game is equal, till B has gained his cinque and quatre points in his own tables; which if he can effect, and by playing two men from A's cinque point, in order to force his adversary to blot by throwing an ace, which should B hit, he will have the best of the hit.

A case of curiosity and instruction; in which is shewn the probability of making the hit last by one of the players for many hours, although they should both play as fast as usual.—Suppose B to have bore 13 men, and that A has his fifteen men in B's tables, *viz.* three men upon his size point, as many upon his cinque point, three upon his quatre point, the same number upon his trois point, two upon his deuce point, and one upon his ace point. A in this situation can prolong it, as aforesaid, by bringing his 15 men home, always securing six close points till B has entered his two men, and brought them upon any certain point; as soon as B has gained that point, A will open an ace, deuce, or trois point, or all of them; which done B hits one of them, and A taking care to have two or three men in B's tables, is ready to hit that man; and also he being certain of taking up the other man, has it in his power to prolong the hit almost to any length, provided he takes care not to open such points as two fours, two fives, or two sixes, but always to open the ace, deuce, or trois points, for B to hit him.

A critical game to play. Suppose A and B place their men for a hit in the following manner: A to have three men upon the size point in his own tables, three men out of his tables upon the usual point, and nine men upon his adversary's ace, deuce, and trois points; that is, three upon each; and suppose B's men to be placed in his own and his adversary's tables in the same order. So situated, the best player should win the hit. The game being so equal, that in this case the dice should be thrown for. Now if A throws first, he should endeavour to gain his adversary's cinque point: this being done, he should lay as many blots as possible, to tempt B to hit him, as it puts him backward, and A thereby gains an advantage. A should always endeavour to have three men upon each of his adversary's ace and deuce points; because when B makes a blot, these points will remain secure, and when A has bore five, six, or more men, A yet may secure six close points out of his tables, in order to prevent B from getting his man home, at which time he should calculate who has the best of the hit. If he finds that B is foremost, he should then try to lay such blots as may be taken up by his adversary, that he may have a chance of taking up another man, in case B should happen to have a blot at home.

Laws of Backgammon. 1. If a man is taken from any point, it must be played; if two men are taken from it, they also must be played. 2. A man is not supposed to be played till it is placed upon a point and quitted. 3. If a player has only fourteen men in play, there is no penalty inflicted, because by his playing with a lesser number than he is intitled to, he plays to a disadvantage for want of the deficient man to make up his tables. 4. If he bears any number of men before he has entered a man taken up, and which of course he was obliged to enter, such men so borne must be entered again in the adversary's tables as well as the man taken up. 5. If he has mistaken his throw and played it, and his adversary has thrown, it is not in the choice of either of the players to alter it, unless they both agree so to do.

Back-Painting, the method of painting mezzotinto prints, pasted on glass, with oil-colours. See Mezzotinto.

The art consists chiefly in laying the print upon a piece of crown-glass, of such a size as fits the print.

In order to do this, take your print, and lay it in clean water for two days and two nights, if the print be on very strong, close, and hard gummed paper; but if upon an open, soft, spungy paper, two hours will sometimes suffice, or more, according as the paper is.

The paper or picture having been sufficiently soaked, take it out and lay it upon two sheets of paper, and cover it with two more; and let it lie there a little to suck out the moisture.

In the mean time, take the glass the picture is to be put upon, and set it near the fire to warm; take Strasburg turpentine, warm it over the fire till it is grown fluid, then with a hog's-hair brush spread the turpentine very smoothly and evenly on the glass.

When this has been done, take the mezzotinto print from between the papers, and lay it upon the glass; beginning first at one end, rubbing it down gently as you go on, till it lie close, and there be no wind bladders between.

Then, with your fingers, rub or roll off the paper from the back side of the print, till it looks black, *i. e.* till you can see nothing but the print, like a thin film, left upon the glass, and set it by to dry.

When it is dry, varnish it over with some white transparent varnish, that the print may be seen through it; and then it is fit for painting.

The utmost care will be necessary in rubbing or rolling the paper of the print, so as not to tear it, especially in the light parts.

You may, instead of soaking your prints two days and two nights, roll them up and boil them for about two hours, more or less, according to the quality of the paper, in water; and that will render it as fit for rubbing, rolling, or peeling, as the other way.

This being done, and your oil-colours prepared, ground very fine, and tempered very stiff, lay on the back-side of the transparent prints such colours as each particular part requires; letting the master-lines of the print still guide your pencil, and so each particular colour will lie fair to the eye on the other side of the glass, and look almost as well as a painted piece, if it be done neatly.

The shadows of the print are generally sufficient for the shadow of every colour; but if you have a mind to give a shadow by your pencil, then let the shadows be laid on first, and the other colours afterward.

In laying on colours in this kind of back-painting, you need not be curious as to the laying them on smooth. This is not at all requisite here, where the chief aim is only to have the colours appear well on the fore side of the print; and therefore the only care to be used in this work, is to lay the colours on thick enough, that its body may strike the colour of it plainly through the glass.

Back-Staff, a name formerly given to a sea-quadrant

drant invented by Captain Davis: because the back of the artist is turned towards the sun at the time of observation. See QUADRANT.

BACK-Stays, of a ship, are ropes belonging to the main-mast and fore-mast, and the masts belonging to them; serving to keep them from pitching forwards or overboard.

BACK-Tack, in Scots law: When a wadsetter, instead of possessing the wadset-lands, grants a tack thereof to the reverser for payment of a certain sum in name of tack-duty, that tack is called a *back-tack*.

BACK-Worm. See FILANDERS.

BACKER, or BAKKER, (Jaques), a painter of history, was born at Antwerp in 1530; and learned the principles of painting from his father, who was an artist very knowing in his profession, though his works were in no great estimation. After the death of his father, he lived in the house of Jacopo Palermo, a dealer in pictures, who avariciously took care to keep him incessantly employed, and sent his paintings to Paris to be disposed of, where they happened to be exceedingly admired. The judicious were very eager to purchase them; and though the transactor sold them at a great price, yet the poor artist was not proportionably rewarded, but continued in the same obscure and depressed condition. His merit, indeed, was universally allowed, but his name, and the narrowness of his circumstances, were as universally unknown. He had a clean light manner of pencilling, and a tint of colour that was extremely agreeable.—He died in 1560.

BACKER, or BAKKER, (Jacob), painter of portrait and history, was born at Harlingen in 1609, but spent the greatest part of his life at Amsterdam; and by all the writers on this subject, he is mentioned as an extraordinary painter, particularly of portraits, which he executed with strength, spirit, and a graceful resemblance. He was remarkable for an uncommon readiness of hand and freedom of pencil; and his incredible expedition in his manner of painting, appeared even in one portrait of a lady from Haerlem, that he painted at half length, which was begun and finished in one day, though he adorned the figure with rich drapery and several ornamental jewels. He also painted historical subjects with good success; and in that style there is a fine picture of Cimon and Iphigenia, which is accounted by the connoisseurs an excellent performance. In designing academy figures his expression was so just, and his outline so correct, that he obtained the prize from all his competitors; and his works are still bought up at very high prices in the Low Countries. In the collection of the Elector Palatine there is an excellent head of Brouwer, painted by this master; and in the Carmelites church at Antwerp is preserved a capital picture of the Last Judgment, which is well designed and well coloured. He died in 1651.

BACKEREEL, called BACQUERELLI, (William) a painter of history, was born at Antwerp, and was a disciple of Rubens, at the same time that Vandyck was educated in that school. When each of them quitted that master and commenced painters, Backereel was very little inferior to Vandyck, if not nearly his equal. And this may be manifestly seen in the works of the former, which are in the church of the Augustin Monks at Antwerp; where those two great artists painted in competition, and both were praised for their merit in their different ways; but the superiority was never determined in favour either of the one or the other. He had likewise a good taste for poetry; but, by exercising that talent too freely, in writing satires against the Jesuits, these ecclesiastics pursued him with unremitted revenge, till they compelled him to fly from Antwerp; and by that means deprived his own country of such paintings as would have contributed to its perpetual honour.—Sandrart took notice, that in his time there were seven or eight painters, who were very eminent, of the name of Backereel, in Italy and the Low Countries.

BACKHUYSEN (Ludolph), an eminent painter, was born at Embden in 1631, and received his earliest instruction from Albert Van Everdingen; but acquired his principal knowledge by frequenting the painting rooms of different great masters, and observing their various methods of touching and colouring. One of those masters was Henry Dubbels, whose understanding in his art was very extensive; and he was as remarkably communicative of his knowledge to others. From him Backhuysen obtained more real benefit than from all the painters of his time, either by studying their works, or personally conversing with them. His subjects were sea-pieces, ships, and sea-ports. He had not practised very long when he became the object of general admiration; so that even his drawings were sought after, and several of them were bought up at 100 florins a-piece. It was observed of him, that while he was painting, he would not suffer even his most intimate friends to have access to him, lest his fancy might be disturbed, and the ideas he had formed in his mind be interrupted. He studied nature attentively in all her forms; in gales, calms, storms, clouds, rocks, skies, lights, and shadows; and he expressed every subject with so sweet a pencil, and such transparence and lustre, as placed him above all the artists of his time in that style, except the younger Vandervelde, who is deservedly esteemed the first in that manner of painting. It was a frequent custom with Backhuysen, whenever he could procure resolute mariners, to go to sea in a storm, in order to store his mind with grand images, directly copied from nature, of such scenes as would have filled any other head and heart with terror and dismay; and the moment he landed, he always impatiently ran to his palette to secure these incidents, of which the traces might by delay be obliterated.—He perfectly understood the management of the Chiaro-Scuro, and by his skill in that part of his art, he gave uncommon force and beauty to his objects. He observed strictly the truth of perspective, in the distances of his vessels, the receding of the grounds on the shores, and the different buildings which he described in the sea-ports; whether they were the result of his own imagination, or sketched, as he usually did, after nature. His works may easily be distinguished by an observant eye, from the freedom and neatness of his touch; from the clearness, and natural agitation or quiescence of the water; from a peculiar tint in his clouds and skies; and also from the exact proportions of his ships, and the gracefulness of their position. For the Burgomasters of Amsterdam he painted a large picture, with a multitude of vessels, and a view of the

city

city at a distance, for which they gave him thirteen hundred guilders, and a considerable present; which picture they afterwards presented to the king of France, who placed it in the Louvre. No painter was ever more honoured by the visits of the kings and princes than Backhuysen; the king of Prussia was one of the number; and the Czar Peter the Great took delight to see him paint, and often endeavoured to draw after vessels which he had designed. He was remarkably assiduous, and yet it seems astonishing to consider the number of pictures which he finished, and the exquisite manner in which they are painted. He died in 1709.

BACKING, in horsemanship. See HORSEMANSHIP.

BACKING *the Sails*, in navigation; to arrange them in a situation that will force the ship to retreat, or move backwards. This is, however, only done in narrow channels, when a ship is carried along sidewise by the tide or current, and wants to avoid any thing that may interrupt her progress, as shoals, vessels at anchor, &c. or in the line of battle, when a ship wants to be immediately opposite to another with which she is engaged.

BACKS, among dealers in leather, denote the thickest and best tanned hides, used chiefly for soles of shoes.

BACKS, in brewing and distilling. See BAC.

BACULARIUS, in writers of the middle age, an ecclesiastical apparitor, or verger; who carries a staff, *baculus*, in his hand, as an ensign of his office.

BACON, swines flesh salted, and dried in the chimney.—Old historians and law-writers speak of the *service of the bacon*, a custom in the manor of Whichenacre in Staffordshire, and priory of Dunmore in Essex; in the former of which places, by an ancient grant of the lord, a flitch of bacon, with half a quarter of wheat, was to be given to every married couple who could swear, that, having been married a year and a day, they would never within that time have once exchanged their mate for any other person on earth, however richer, fairer, or the like. But they were to bring two of their neighbours to swear with them that they believed they swore the truth. On this the lord of another neighbouring manor, of Rudlow, was to find a horse saddled, and a sack to carry the bounty in, with drums and trumpets, as far as a day's journey out of the manor: all the tenants of the manor being summoned to attend, and pay service to the bacon. The bacon of Dunmore, first erected under Henry III. was on much the same footing; only the tenor of the oath was, that the parties had never once repented, or wished themselves unmarried again.

BACON (Roger), a Franciscan friar of amazing genius and learning, was born near Ilchester in Somersetshire, in the year 1214. He began his studies at Oxford; but in what school, or college is uncertain. Thence he removed to the university of Paris, which, in those times, was esteemed the centre of literature. Here, we are told, he made so rapid a progress in the sciences, that he was esteemed the glory of that university, and was much caressed by several of his countrymen, particularly by Robert Grouthead, afterwards bishop of Lincoln, his singular friend and patron. About the year 1240, he returned to Oxford; and assuming the Franciscan habit, prosecuted his favourite study of experimental philosophy, with unremitting ardor and assiduity. In this pursuit, in experiments, instruments, and in scarce books, he tells us, he spent, in the space of 20 years, no less than L. 2000; which it seems, was given him by some of the heads of the university, to enable him to prosecute his noble inquiries. By such extraordinary talents, and astonishing progress in sciences, which, in that ignorant age, were totally unknown to the rest of mankind, whilst they raised the admiration of the more intelligent few, could not fail to excite the envy and malice of his illiterate fraternity; who found no difficulty of possessing the vulgar with the notion of Bacon's dealing with the devil. Under this pretence, he was restrained from reading lectures; his writings were confined to his convent; and finally, in 1278, he himself was imprisoned in his cell. At this time he was 64 years of age. Nevertheless, being permitted the use of his books, he went on in the rational pursuit of knowledge, corrected his former labours, and wrote several curious pieces. When he had been 10 years in confinement, Jerom de Ascoli being elected pope, Bacon solicited his holiness to be released; in which, it seems, he did not immediately succeed. However, towards the latter end of that pope's reign, he obtained his liberty, and spent the remainder of his life in the college of his order, where he died in the year 1294, in the 80th year of his age, and was buried in the Franciscan church. Such are the few particulars which the most diligent researches have been able to discover concerning this very great man; who, like a single bright star in a dark hemisphere, shone forth the glory of his country, and the pride of human nature. His works are, 1. *Epistola fratris Rogeri Baconis de secretis operibus artis et naturæ, et de nullitate magiæ*. Paris, 1542, 4to. Basil, 1593, 8vo. 2. *Opus majus*. Lond. 1733, fol. published by Dr Jebb. 3. *Thesaurus chemicus*. Francf. 1603, 1620. This was probably the editor's title; but it contains several of our author's treatises on this subject. These printed works of Bacon contain a considerable number of essays, which, in the catalogue of his writings by Bale, Pits, &c. have been considered as distinct books; but there remain in different libraries several manuscripts not yet published. By an attentive perusal of his works, the reader will be astonished to find, that this great luminary of the 13th century was a great linguist and a skilful grammarian; that he was well versed in the theory and practice of perspective; that he understood the use of convex and concave glasses, and the art of making them; that the *camera obscura*, burning-glasses, and the power of the telescope, were known to him; that he was well versed in geography and astronomy; that he knew the great error in the kalendar, assigned the cause, and proposed the remedy; that he understood chronology well; that he was an adept in chemistry, and was really the inventor of gun-powder; that he possessed great knowledge in the medical art; that he was an able mathematician, logician, metaphysician, and theologist.

BACON (Sir Nicholas), lord keeper of the great seal in the reign of Queen Elizabeth, was born at Chislehurst, in Kent, in 1510, and educated at the university of Cambridge; after which he travelled into France, and made some stay at Paris. On his return, he settled in Gray's-inn, and applied himself with such assiduity to the study of the law, that he quickly distinguished him-

himſelf ſo, that on the diſſolution of the monaſtery of St Edmund's Bury, in Suffolk, he had a grant from King Henry VIII. in the 36th year of his reign, of ſeveral manors. In the 38th of the ſame king, he was promoted to the office of attorney in the court of Wards, which was a place both of honour and profit. In this office he was continued by King Edward VI.; and in 1552 he was elected treaſurer of Gray's-inn. His great moderation and conſummate prudence preſerved him through the dangerous reign of Queen Mary. In the very dawn of that of Elizabeth he was knighted; and on the 22d of December 1558, the great ſeal of England, being taken from Nicholas Heath archbiſhop of York, was delivered to him with the title of *lord keeper*, and he was alſo made one of the Queen's privy council. He had a conſiderable ſhare in the ſettling of religion: as a ſtateſman, he was remarkable for a clear head and deep counſels: but his great parts and high preferment were far from raiſing him in his own opinion, as appears from the modeſt anſwer he gave Queen Elizabeth, when ſhe told him his houſe at Redgrave was too little for him: "Not ſo, madam, (returned he); but your majeſty has made me too great for my houſe." After having had the great ſeal more than 20 years, this able ſtateſman and faithful counſellor was ſuddenly removed from this life, as Mr Mallet informs us, by the following accident: he was under the hands of the barber, and thinking the weather warm, had ordered a window before him to be thrown open, but fell aſleep as the current of freſh air was blowing in upon him, and awakened ſome time after diſtempered all over. He was immediately removed into his bed-chamber, where he died a few days after, on the 26th of February 1578-9, equally lamented by the Queen and her ſubjects. He was buried in St Paul's, where a monument was erected to him, which was deſtroyed by the fire in London in 1666. Mr Granger obſerves, that he was the firſt lord keeper that ranked as lord chancellor; and that he had much of that penetrating genius, ſolidity, and judgment, perſuaſive eloquence, and comprehenſive knowledge of law and equity, which afterwards ſhone forth with ſo great a luſtre in his ſon, who was as much inferior to his father in point of prudence and integrity as his father was to him in literary accompliſhments.

Bacon (Francis), lord high chancellor of England under king James I. was ſon of Sir Nicholas Bacon lord keeper of the great ſeal in the reign of Queen Elizabeth, by Anne daughter of Sir Anthony Cook, eminent for her ſkill in the Latin and Greek tongues. He was born in 1560; and ſhowed ſuch marks of genius, that he was particularly taken notice of by Queen Elizabeth when very young. He was educated at Trinity-college, Cambridge; and made ſuch incredible progreſs in his ſtudies, that, before he was 16, he had not only run through the whole circle of the liberal arts as they were then taught, but began to perceive thoſe imperfections in the reigning philoſophy, which he afterwards ſo effectually expoſed, and thereby not only overturned that tyranny which prevented the progreſs of true knowledge, but laid the foundation of that free and uſeful philoſophy which has ſince opened a way to ſo many glorious diſcoveries. On his leaving the univerſity, his father ſent him to France; where, before he was 19 years of age, he wrote a general view of the ſtate of Europe; but Sir Nicholas dying, he was obliged ſuddenly to return to England; when he applied himſelf to the ſtudy of the common law, at Gray's-inn. At this period the famous Earl of Eſſex, who could diſtinguiſh merit, and who paſſionately loved it, entered into an intimate friendſhip with him; zealouſly attempted, though without ſucceſs, to procure him the office of queen's ſolicitor; and, in order to comfort his friend under the diſappointment, conferred on him a preſent of land to the value of 1800l. Bacon, notwithſtanding the friendſhip of ſo great a perſon; notwithſtanding the number and power of his own relations; and, above all, notwithſtanding the early prepoſſeſſion of her majeſty in his favour; met with many obſtacles to his preferment during her reign. In particular, his enemies repreſented him as a ſpeculative man, whoſe head was filled with philoſophical notions, and therefore more likely to perplex than forward public buſineſs. It was not without great difficulty that lord treaſurer Burleigh obtained for him the reverſion of regiſter to the ſtar-chamber, worth about 1600 l. a-year, which place fell to him about 20 years after. Neither did he obtain any other preferment all this reign; though if obedience to a ſovereign in what muſt be the moſt diſagreeable of all offices, viz. the caſting reflections on a deceaſed friend, intitled him, he might have claimed it. The people were ſo clamorous even againſt the Queen herſelf on the death of Eſſex, that it was thought neceſſary to vindicate the conduct of the adminiſtration. This was aſſigned to Bacon, which brought on him univerſal cenſure, nay his very life was threatened. Upon the acceſſion of King James, he was ſoon raiſed to conſiderable honours; and wrote in favour of the union of the two kingdoms of Scotland and England, which the King ſo paſſionately deſired. In 1616, he was ſworn of the privy-council. He then applied himſelf to the reducing and recompoſing the laws of England. He diſtinguiſhed himſelf, when attorney-general, by his endeavours to reſtrain the cuſtom of duels, then very frequent. In 1617, he was appointed lord keeper of the great ſeal. In 1618, he was made lord chancellor of England, and created Lord Verulam. In the midſt of theſe honours and applauſes, and multiplicity of buſineſs, he forgot not his philoſophy, but in 1620 publiſhed his great work intitled *Novum Organum*. We find by ſeveral letters of his, that he thought convening of parliaments was the beſt expedient for the king and people. In 1621, he was advanced to the dignity of Viſcount St Albans, and appeared with the greateſt ſplendour at the opening of the ſeſſion of parliament. But he was ſoon after ſurpriſed with a melancholy reverſe of fortune. For, about the 12th of March, a committee of the houſe of commons was appointed to inſpect the abuſes of the courts of juſtice. The firſt thing they fell upon was bribery and corruption, of which the lord chancellor was accuſed. For that very year complaints being made to the houſe of commons of his lordſhip's having received bribes, thoſe complaints were ſent up to the houſe of lords; and new ones being daily made of a like nature, things ſoon grew too high to be got over. The King found it was impoſſible to ſave both his chancellor, who was openly accuſed of corruption, and Buckingham his favourite, who was ſecretly and therefore more dangerouſly attacked as the encourager of whatever

whatever was deemed most illegal and oppressive: he therefore forced the former to abandon his defence, giving him positive advice to submit himself to his peers, and promising upon his princely word to screen him in the last determination, or, if that could not be, to reward him afterwards with ample retribution of favour. The chancellor, though he foresaw his approaching ruin if he did not plead for himself, resolved to obey; and the house of peers, on the 3d of May 1621, gave judgment against him, "That he should be fined 40,000l. and remain prisoner in the tower during the king's pleasure; that he should for ever be incapable of any office, place, or employment, in the state or commonwealth; and that he should never sit in parliament, or come within the verge of the court." The fault which, next to his ingratitude to Essex, thus tarnished the glory of this illustrious man, is said to have principally proceeded from his indulgence to his servants, who made a corrupt use of it. One day, during his trial, passing through a room where several of his domestics were sitting, upon their rising up to salute him, he said, "Sit down, my masters; your rise hath been my fall." *Stephens*, p. 54. And we are told by Rushworth in his historical collections, "That he treasured up nothing for himself or family, but was over-indulgent to his servants, and connived at their takings, and their ways betrayed him to that error; they were profuse and expensive, and had at their command whatever he was master of. The gifts taken were for the most part for interlocutory orders; his decrees were generally made with so much equity, that though gifts rendered him suspected for injustice, yet never any decree made by him was reversed as unjust." It was peculiar to this great man (say the authors of the Biogr. Brit.) to have nothing narrow and selfish in his composition: he gave away without concern whatever he possessed; and believing other men of the same mould, he received with as little consideration. He retired, after a short imprisonment, from the engagements of an active life, to which he had been called much against his genius, to the shade of a contemplative one, which he had always loved. The King remitted his fine, and he was summoned to parliament in the first year of King Charles I. It appears from the works composed during his retirement, that his thoughts were still free, vigorous, and noble. The last five years of his life he devoted wholly to his studies. In his recess he composed the greatest part of his English and Latin works. He expired on the 9th of April, 1626; and was buried in St Michael's church at St Albans, according to the direction of his last will, where a monument of white marble was erected to him by Sir Thomas Meautys formerly his secretary, and afterward clerk of the privy council under two kings. A complete edition of this great man's works was published at London in the year 1740.—Addison has said of him, That he had the sound, distinct, comprehensive knowledge of Aristotle, with all the beautiful light graces and embellishments of Cicero. The honourable Mr Walpole calls him the *Prophet of Arts* which Newton was afterwards to reveal; and adds, that his genius and his works will be universally admired as long as science exists. "As long as ingratitude and adulation are despicable, so long shall we lament the depravity of this great man's heart. Alas! that he who could command immortal fame, should have stooped to the little ambition of power."

Bacon (Sir Nathaniel), knight of the bath, and an excellent painter, was a younger son of the lord keeper, and half brother to the great Sir Francis. He travelled into Italy, and studied painting there; but his manner and colouring approaches nearer to the style of the Flemish school. Mr Walpole observes, that at Culford, where he lived, are preserved some of his works; and at Gorhambury, his father's seat, is a large picture by him in oil, of a cook-maid, with a dead fowl, admirably painted, with great nature, neatness, and lustre of colouring. In the same house is a whole length of him, by himself, drawing on a paper, his sword and pallet hung up, and a half length of his mother by him.

BACONTHORP (John), called the *resolute doctor*, a learned monk, was born towards the end of the 13th century, at Baconthorp a village in Norfolk. He spent the early part of his life in the convent of Blackney, near Walsingham in the same county; whence he removed to Oxford, and from thence to Paris; where being distinguished for his learning, he obtained degrees in divinity and laws, and was esteemed the principal of Averroists*. In 1329 he returned to England, and was immediately chosen twelfth provincial of the English Carmelites. In 1333 he was sent for to Rome; where, we are told, he first maintained the pope's sovereign authority in cases of divorce, but that he afterwards retracted his opinion. He died in London in the year 1346. Leland, Bale, and Pits, unanimously give him the character of a monk of genius and learning. He wrote, 1. *Commentaria seu quæstiones super quatuor libros sententiarum*; and, 2. *Compendium legis Christi, et quodlibeta*: both which underwent several editions at Paris, Milan, and Cremona. Leland, Bale, and Pits, mention a number of his works never published.

* See *Averroes*.

BACTRIA, or Bactriana, now *Chorassan* or *Khorasan*, an ancient kingdom of Asia, bounded on the west by Margiana, on the north by the river Oxus, on the south by mount Paropismus, and on the east by the Asiatic Scythia and the country of the Massagetæ. It was a large, fruitful, and well-peopled country, containing according to Ammianus Marcellinus 1000 cities, though of these only a few are particularly mentioned by historians, of which that formerly called *Maracanda*, now *Samarcand*, is the most considerable.

Of the history of this country we know but little. Authors agree that it was subdued first by the Assyrians, afterwards by Cyrus, and then by Alexander the Great. Afterwards it remained subject to Seleucus Nicator and his successors till the time of Antiochus Theos; when Theodotus, from governor of that province, became king, and strengthened himself so effectually in his kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus king of Egypt, that he could never afterwards dispossess him of his acquisitions. His posterity continued to enjoy the kingdom for some time, till they were driven out by the Scythians, who reigned in Bactria at the time of Adrian, Antoninus Pius, &c. The Scythians were in their turn driven out by the Huns or Turks, and these often conquered by the Saracens and Tartars; nevertheless

theless they continued in possession of this country in the time of Ladislaus IV. king of Hungary.

In early times the Bactrians differed little in their manners from the Nomades; and being near neighbours of the Scythians, who were a very warlike people, the Bactrian soldiers were reckoned the best in the world. Their appearance was very savage; being of an enormous stature, having a terrible aspect, rough beards, and long hair hanging down their shoulders. Some authors assert that they kept dogs on purpose to devour such as arrived at extreme old age, or who were exhausted by long sickness. They add, that for all their fierceness, the Bactrian husbands were such dupes to their wives, that they durst not complain of them even for conjugal infidelity, to which it seems the latter were very much addicted.

BACTROPERATA, an ancient appellation given to philosophers by way of contempt, denoting a man with a staff and a budget.

We suppose it is of the same people that Pauchasias Radbertus speaks under the corrupt name of *Baccoperitæ*, or *Bacchionitæ*, whom he describes as philosophers who had so great a contempt for all earthly things, that they kept nothing but a dish to drink out of; and that one of this order seeing a peasant scooping up the water in his hand, threw away the cup as a superfluity: which is nothing but the old story of Diogenes the cynic.

BACULE, in fortification, a kind of portcullis, or gate, made like a pit-fall with a counterpoise, and supported by two great stakes. It is usually made before the corpade-guard, not far from the gate of a place.

BACULOMETRY, the art of measuring accessible or inaccessible heights, by the help of one or more baculi, staves, or rods. See GEOMETRY.

BACURIUS, or BATURIUS, king of the Iberians, a people on the side of the Caspian sea. One day being a hunting, he lost sight of his company, through a great storm and sudden darkness; upon which he vowed to the God of his Christian slave, that if he were delivered he would worship him alone: the day breaking up immediately, he made good his promise, and became the apostle of his country.

BADAGSHAN, a very ancient city of Great Bukharia, in the province of Balkh, situated at the foot of those high mountains which separate Indostan from Great Tartary. The city is exceedingly strong by its situation; and belongs to the khan of proper Bukharia, who uses it as a kind of state-prison to secure those he is jealous of. The town is not very big, but well built, and very populous. It stands on the north side of the river Amu, about 100 miles from its source, and is a great thoroughfare for the caravans designed for little Bukharia. The inhabitants are enriched by mines of gold, silver, and rubies, which are in the neighbourhood; and those who live at the foot of the mountains gather a great quantity of gold and silver dust brought down in the spring by torrents occasioned by the melting of the snow on the top.

BADAJOZ, a large and strong town, capital of Estremadura in Spain. It is seated on the river Guadiana, over which there is a fine bridge built by the Romans. On this bridge the Portuguese were defeated in 1661, by Don John of Austria. W. Long. 7. 3. N. Lat. 38. 35.

BADELONA, a town of Catalonia in Spain, seated on the Mediterranean. Lord Peterborough landed here in 1704, when, with Charles then king of Spain, he laid siege to Barcelona, from which it is ten miles distant. E. Long. 2. 20. N. Lat. 41. 12.

BADEN (the district of), in Swisserland, has three cities, Baden, Keisers-Stoul, and Klingnaw, besides a town that passes for a city, namely, *Zurzach*. It is one of the finest countries in Swisserland; and is watered with three navigable rivers, the Limmet, Russ, and Are. The land is fertile in corn and fruit, and there are places on the sides of the Limmet which produces wine. It maintains a communication between the cantons of Zurich and Bern, being seated between their north extremities. It extends on one side to the Are, as far as the place where it falls into the Rhine, and on the other side beyond the Rhine, where there are some villages which depend thereon. Most of the inhabitants are Papists. By the treaty of peace at the conclusion of the war which broke out in 1712 between the Protestant and Popish cantons, this country was yielded to the Protestant cantons of Zurich and Bern. Before, it was the property of the eight old cantons; however, as the canton of Glaris had taken no part in this war, by the consent of both parties its right was still continued.

BADEN, the capital of the above district, is an agreeable city, moderately large, seated on the side of the Limmet, in a plain flanked by two high hills, between which the river runs. This city owes its rise to its baths, which were famous before the Christian æra. Several monuments of antiquity have been found here from time to time, particularly in 1420. When they were opening the large spring of the baths, they found statues of several heathen gods, made of alabaster; Roman coins, made of bronze, of Augustus, Vespasian, Decius, &c.; and several medals of the Roman emperors, of gold, silver, copper, and bronze. There are two churchs in Baden; one of which is collegiate, and makes a good appearance; the other is a monastery of the Capuchins, near the town-house. This last building serves not only for the assemblies of their own council, but also for those of the cantons. The diet assembles there in a handsome room made for that purpose; the deputies of Zurich sit at the bottom behind a table, as the most honourable place; the ambassadors of foreign powers are seated on one side to the right, and the deputies of the other cantons are ranged on each side the room. The bailiff of Baden resides in a castle at the end of a handsome wooden bridge, which is covered in. Before this castle there is a stone pillar, erected in honour of the emperor Trajan, who paved a road in this country 85 Italian miles in length. The inhabitants are rigid Roman catholics, and formerly behaved in a most insolent manner to the Protestants, but they are now obliged by their masters to be more submissive. The baths which are on each side the river are a quarter of a league from the city. Joining to the small baths there is a village, and to the large a town which may pass for a second Baden. It is seated on a hill, of which the ascent is steep. There the baths are brought into inns and private houses, by means

means of pipes, which are about 60 in all. There are alſo public baths in the middle of the town, from a ſpring which riſes in the ſtreet, where the poor bathe *gratis*, but they are expoſed quite naked to all that paſs by. All the baths are hot, and one to ſo great a degree as to ſcald the hand; and they are impregnated with a great deal of ſulphur, with ſome alum and nitre. They are uſeful for drinking as well as bathing; and are ſaid to cure all diſeaſes from a cold cauſe, head-achs, vertigos, &c. They ſtrengthen the ſenſes, cure diſeaſes of the breaſt and bowels, aſthmas, and obſtructions. They are peculiarly excellent for women's diſeaſes. E. Long. 8. 25. N. Lat. 47. 27.

Baden (the Margravate of), in the circle of Swabia, in Germany, is bounded by the Palatinate of the Rhine, on the north; by the Black Foreſt, on the eaſt; by Swiſſerland, on the ſouth; and by the Rhine, which divides it from Alſace, on the eaſt: and is about 90 miles in length, from north to ſouth; but not above 20 in breadth, where it is wideſt. It is a very populous and fruitful country, abounding in corn and wine. Veniſon and wild fowl are ſo plentiful, that they are the common diet of the peaſants. The rivers that water this territory, are the Rhine, Ens, Wirmbs, and Phints, which yield plenty of fiſh. They feed their hogs with cheſnuts, which make the bacon excellent. They have free-ſtone for building, and marble of all colours. They have ſome agate, and great quantities of hemp and flax for exportation. The chief towns are Baden, Durlach, Stolhafen, Raſtadt, Gerſbach, Pforſheim, and Horchberg.

Baden, the chief city of the above margravate, has a caſtle that ſtands on the top of a hill, which is the reſidence of a prince. The town is ſeated among hills, on rocky and uneven ground, which renders the ſtreets inconvenient and crooked. It is famous for its baths, the ſprings of which are ſaid to be above 300. Some of them are hot, and accounted to be very good in nervous caſes. They partake of ſalt, alum, and ſulphur. E. Long. 9. 24. N. Lat. 48. 50.

Baden, a town of Germany, in the arch-duchy of Auſtria, ſeated on the Little Suechat, is a neat little walled town, ſtanding in a plain not far from a ridge of hills which run out from the mountain Cetius. It is much frequented by the people of Vienna, and the neighbouring parts, on account of its baths. The ſprings ſupply two convenient baths within the town, five without the walls, and one beyond the river. They are good for diſtempers of the head, the gout, dropſy, and moſt chronic diſeaſes. E. Long. 17. 10. N. Lat. 48. 0.

BADENOCH, the moſt eaſterly part of Inverneſs-ſhire, in Scotland, extending about 33 miles in length from eaſt to weſt, and 27 from north-eaſt to ſouth-weſt where broadeſt. It has no conſiderable town, and is very barren and hilly, but abounds with deer, and other kinds of game.

BADEN-weiller, a town of Germany, belonging to the lower Margravate of Baden. E. Long. 7. 50. N. Lat. 47. 55.

BADENS (Francis), hiſtorical and portrait painter, was born at Antwerp in 1571, and the firſt rudiments of the art were communicated to him by his father, who was but an ordinary artiſt. However, he viſited Rome, and ſeveral parts of Italy, and there formed a good taſte of deſign, and a manner exceedingly pleaſing. When he returned to his own country his merit procured for him great employment, and ſtill greater reputation, and he was uſually diſtinguiſhed by the name of the Italian painter. His touch was light and ſpirited, and his colouring warm; and he had the honour of being the firſt who introduced a good taſte of colouring among his countrymen. While his acknowledged merit was rewarded with every public teſtimony of eſteem and applauſe, unhappily he received an account of the death of his brother, who had been aſſaſſinated on a journey; and the intelligence affected him ſo violently, that it occaſioned his own death, to the inexpreſſible regret of every lover of the art, in 1603.

BADGE, in naval architecture, ſignifies a ſort of ornament placed on the outſide of a ſmall ſhips, very near the ſtern, containing either a window for the convenience of the cabin, or a repreſentation of it. It is commonly decorated with marine figures, martial inſtruments, or ſuch like emblems.

BADGER, in zoology, the Engliſh name for a ſpecies of urſus. See Ursus.

Badger, in old law-books, one that was licenſed to buy corn in one place and carry it to another to ſell, without incurring the puniſhment of an engroſſer.

BADIA, an ancient town of Bætica on the Anas; now ſuppoſed to be Badajoz on the Guadiana.

BADIAGA, in the materia medica, the name of a ſort of ſpongy plant, common in the ſhops in Moſcow, and ſome other northern kingdoms. The uſe of it is the taking away the livid marks from blows and bruiſes, which the powder of this plant is ſaid to do in a night's time.

BADIANE, or Bandian, the ſeed of a tree which grows in China, and ſmells like aniſe-ſeed. The Chineſe, and the Dutch in imitation of them, ſometimes uſe the badiane to give their tea an aromatic taſte.

BADIGEON, a mixture of plaſter and free-ſtone, well ground together, and ſifted; uſed by ſtatuaries to fill up the little holes, and repair the defects in ſtones, whereof they make their ſtatues and other work.

The ſame term is alſo uſed by joiners, for ſaw-duſt mixed with ſtrong glue, wherewith they fill up the chaps and other defects in wood, after it is wrought.

BADILE (Antonio), hiſtory and portrait painter, was born at Verona in 1480, and by great ſtudy and application acquired a more extenſive knowledge of the true principles of painting than any of his predeceſſors. He was confeſſedly a moſt eminent artiſt; but he derived greater honour from having two ſuch diſciples as Paolo Veroneſe and Baptiſta Zelotti, than he did even from the excellence of his own compoſitions. He died in 1560. His colouring was admirably good; his carnations beautiful; and his portraits preſerved the perfect reſemblance of fleſh and real life; nor had he any cauſe to envy the acknowledged merit of Titian, Giorgione, or the beſt of his cotemporaries.

BADIS, a fortreſs of Livonia, ſubject to Ruſſia. E. Long. 23. 10. N. Lat. 59. 15.

BADIUS (Conrad), and (Stephen Robert), his brother; French refugees; celebrated as printers at Geneva, and Conrad as an author. The latter died in 1566.

BÆCKEA, in botany: A genus of the octandria order, belonging to the monogynia class of plants. The calyx is a permanent perianthium, consisting of a single funnel-shaped leaf, cut in five segments at the brim; the corolla consists of five roundish spreading petals inserted into the calyx; the pericarpium is a globose capsule, made up of four valves, and containing four cells, in which are a few roundish angular seeds.

BÆTERRÆ, an ancient town of the Tertosages in Gallia Narbonensis; now *Besiers*, on the east bank of the Obris, now *Orbis*, or *Orbe*, in Lower Languedoc.

BÆTICA, a province of ancient Spain, so called from the famed river Bætis, afterwards *Tartessus*, now *Guadalquiver*, or the great river. It was bounded on the west by Lusitania; on the south, by the Mediterranean, and Sinus Gaditanus; on the north, by the Cantabric sea, now the Bay of Biscay. On the east and north-east, its limits cannot be so well ascertained, as they are very reasonably thought to have been in a continual state of fluctuation, as each petty monarch had an opportunity of encroaching upon his neighbour. The province was divided in two by the river Bætis already mentioned. On the one side of which, towards the Anas, were situated the Turdetani, from whence the kingdom was called *Turdetania*, though more generally known by the name of *Bæturia*. On the other side were situated the Bastuli, Bastetani, and Contestani, along the Mediterranean coasts. The Bastuli were supposed to be of Phœnician extract, and dwelt along the coasts of the Mediterranean, till driven from thence by the Moors, they fled into the mountainous parts of Galicia, which they then called from their own name *Bastulia*. The Bastetani were seated higher up, on the same coasts. The territories of both these made part of what has since become the kingdom of *Granada;* in which there is a ridge of very high mountains called from the abovementioned people, the *Bastetanian mountains*. Mention is also made of their capital *Bastetana;* a place of such strength, that King Ferdinand was six months besieging it before he could take it from the Moors.—The whole province of Bætica, according to the most probable account, contained what is now called *Andalusia*, part of the kingdom of Grenada, and the outward boundaries of Estremadura.

BÆTIS. See Bætica.

BÆTULO, a town of ancient Spain, in the Terraconensis; now *Badelona* in Catalonia.

BÆTYLIA, anointed stones, worshipped by the Phœnicians, by the Greeks before the time of Cecrops, and by other babarous nations. They were commonly of a black colour, and consecrated to some god, as Saturn, Jupiter, the Sun, &c.—Some are of opinion that the true original of these idols is to be derived from the pillar of stone which Jacob erected at Bethel, and which was afterwards worshipped by the Jews.

These *bætylia* were much the object of the veneration of the ancient heathens. Many of their idols were no other. In reality, no sort of idol was more common in the eastern countries, than that of oblong stones erected, and hence termed by the Greeks, *κιονες*, *pillars*. In some parts of Egypt they were planted on both sides of the highways. In the temple of of Heliogabulus, in Syria, there was one pretended to have fallen from heaven. There was also a famous black stone in Phrygia, said to have fallen from heaven. The Romans sent for it and the priests belonging to it with much ceremony, Scipio Nasika being at the head of the embassy.

BÆZA, a city of Andalusia in Spain, seated on a high hill three miles from the Gaudalquiver; it is the see of a bishop, and has a kind of university founded by John d'Avila. It was taken from the Moors about the end of the 15th century. E. Long. 3. 15. N. Lat. 37. 45.

BAFFETAS, or Bastas, a cloth made of coarse white cotton-thread, which comes from the East Indies. That of Surat is the best.

BAFFIN's bay, a gulph of North America, running north-east from Cape Farewel in West Greenland, from 60° to 80° of north latitude.

BAFFO, a considerable town in the island of Cyprus, with a fort built near ancient Paphos, of which some considerable ruins yet remain, particularly some broken columns, which probably belonged to the temple of Venus. E. Long. 32. 20. N. Lat. 34. 50.

BAG, in commerce, a term signifying a certain quantity of some particular commodity: a bag of almonds, for instance, is about 300 weight; of aniseseeds, from 300 to 400, &c.

Bags are used in most countries to put several sorts of coin in, either of gold, silver, brass, or copper. Bankers, and others, who deal much in current cash, label their bags of money, by tying a ticket or note at the mouth of the bag, signifying the coin therein contained, the sum total, its weight, and of whom it was received. Tare is allowed for the bag.

Bag, among farriers, is when, in order to retrieve a horse's lost appetite, they put in an ounce of asa-fœtida, and as much powder of savin, into a bag, to be tied to the bit, keeping him bridled for two hours, several times a-day; as soon as the bag is taken off, he will fall to eating. The same bag will serve a long time.

BAGAMADER, or Bagamedri, a province of the kingdom of Abyssinia in Africa. It is said to receive its name from the great number of sheep bred in it; *meder* signifying land or earth, and *bag* a sheep. Its length is estimated about 60 leagues, and its breadth 20: but formerly it was much more extensive; several of its provinces having been dismembered from it, and joined to that of Tigre. A great part of it, especially towards the east, is inhabited by wandering Gallas and Caffres.

BAGAUDÆ, or Bacaudæ, an ancient faction of peasants, or malecontents, who ravaged Gaul. The Gauls being oppressed with taxes, rose about the year of Christ 290, under the command of Amand and Elian; and assumed the name *bagaudæ*, which, according to some authors, signified in the Gallic language *forced rebels;* according to other, *tribute;* according to others, *robers;* which last signification others allow the word had, but then it was only after the time of the *bagaudæ*, and doubtless took its rise from them.

BAGDAD, a celebrated city of Asia in Irak Arabi, seated on the eastern banks of the Tigris, in E. Long. 43. 40. N. Lat. 33. 15. By many authors this city is very improperly called *Babylon*. The latter stood on the Euphrates at a considerable distance.

This city, for many years the capital of the Saracen empire,

empire, was founded by the khalif Al Manſur, the ſecond of the houſe of Al Abbas, after an attempt by the Rawandians to aſſaſſinate him, as already mentioned. See ARABIA, n° 184.

1 Why the city was built.

The reaſons aſſigned by the Arabian hiſtorians for building the city of Bagdad are, That the abovementioned attempt to aſſaſſinate the khalif had diſguſted him at his Arabian ſubjects in general, and that the ſpot where Bagdad ſtood was at a conſiderable diſtance from the city of Cufa particularly; the inhabitants of which were remarkable for their treachery and inconſtancy, Al Manſur himſelf having felt ſeveral inſtances of it. Beſides, the people of Irak, who had always continued faithful to him, repreſented, that by building his capital near the confluence of the Euphrates and Tigris, it would be in a great meaſure ſecured from the inſults and attacks of thoſe who ſhould have an inclination to diſpute the kalifat with him; and that by being ſituated as it were in the middle of the tract comprehending the diſtricts of Baſra, Cufa, Waſet, Mawſel, and Swada, at no great diſtance from thoſe cities, it would be plentifully ſupplied with proviſions by means of the aforeſaid rivers.

2 Ancient city deſcribed.

Concerning the origin of the name *Bagdad*, there are various accounts, which being equally uncertain and trifling, merit no attention. The firſt city that went by this name was ſituated on the weſtern bank of the Tigris; from whence Al Manſur diſpatched his ſon Al Mohdi with a body of Moſlem troops, to the oppoſite bank. Here the young prince took poſt, and fortified the place on which he had encamped with a wall, in order to cover his troops, as well as the workmen employed by his father on the other ſide of the river, from the incurſions of the Perſians, who ſeemed to have taken umbrage at the erection of a new metropolis ſo near the frontiers of their dominions. Hence that part of the city ſoon afterwards built on the eaſtern banks of the Tigris, received the name of the *Camp*, or *Fortreſs of Al Mohdi*. The khalif had a ſuperb and magnificent palace both in the eaſtern and weſtern part of the town. The eaſtern palace was ſurrounded on the land-ſide by a ſemicircular wall that had ſix gates; the principal of which ſeems to have been called *the gate of prefects*, whoſe entrance was generally kiſſed by the princes and ambaſſadors that came to the khalif's court. The weſtern part of the city was entirely round, with the khalif's palace in the centre, and having the great moſque annexed to it. The eaſtern part conſiſted of an interior and exterior town, each of which was ſurrounded by a wall. For ſome time the building of the city went but ſlowly on, owing to a ſcarcity of materials for building; for which reaſon the khalif was ſometimes inclined to remove the materials of Al Madayen the ancient metropolis of the Perſian empire. But, upon trial, he found the ſtones to be of ſuch an immenſe ſize, that the removal of them to Bagdad would be attended with great difficulty and expence; beſides, he conſidered that it would be a reflection upon himſelf to have it ſaid that he could not finiſh his metropolis without deſtroying ſuch a pile of building as perhaps could not be paralleled in the whole world; for which reaſons he at length gave over his deſign, and erected the city of Bagdad, moſt probably out of the ruins of the ancient cities of Seleucia and Cteſiphon, putting an end to his undertaking in the 149th year of the Hegira, or four years after the city was begun.

From the building the city of Bagdad to the death of Al Manſur, nothing very remarkable happened, excepting ſome irruptions made into the territories of the Greeks, and by the Arabs into ſome of the khalif's other territories. In the 157th year of the Hegira alſo, a grievous famine was felt in Meſopotamia, which was quickly after followed by a plague that deſtroyed great numbers. This year likewiſe, the Chriſtians, who had been all along very ſeverely dealt with by Al Manſur, were treated with the utmoſt rigour by Muſa Ebn Moſaab the khalif's governor; every one who was unable to pay the enormous tribute exacted of them being thrown into priſon without diſtinction.

3 Death of Al Manſur.

The next year being the 158th of the Hegira, the khalif ſet out from Bagdad, in order to perform the pilgrimage to Mecca: but being taken ill on the road, he expired at Bir Maimun, whence his body was carried to Mecca; where, after 100 graves had been dug, that his ſepulchre might be concealed, he was interred, having lived, according to ſome 63, according to others 68 years, and reigned 22. He is ſaid to have been extremely covetous, and to have left in his treaſury 600,000,000 dirhems, and 24,000,000 dinars. He is reported to have paid his cook by aſſigning him the heads and legs of the animals dreſſed in his kitchen, and to have obliged him to procure at his own expence all the fuel and veſſels he had occaſion for.

4 Succeeded by Al Mohdi.

When Al Manſur expired at Bir Maimun, he had only his domeſtics and Rabi his freedman with him. The latter of theſe, for ſome time, kept his death concealed, and pretended to have a conference with him; in which, as he gave out, the khalif commanded him to exact an oath of allegiance to Al Mohdi his ſon, as his immediate ſucceſſor, and to Iſa Ebn Muſa his couſin-german, as the next apparent heir to the crown. He then diſpatched a courier to Bagdad with the news of Al Manſur's death; upon which Al Mohdi was unanimouſly proclaimed khalif. Iſa Ebn Muſa, however, no ſooner heard this news, than he began to entertain thoughts of ſetting up for himſelf at Cufa, where he then reſided; and in order to facilitate the execution of his ſcheme, fortified himſelf in that city. but Al Moluda being apprized of his defection, ſent a detachment of 1000 horſe to bring him to Bagdad; which being done, Al Mohdi not only prevailed upon him to own his allegiance to him, but alſo to give up his right to the ſucceſſion for 10,000 according to ſome, or, according to others, for 10,000,000, dinars.

5 Rebellion of Al Mokanna.

From the acceſſion of Al Mohdi to the 164th year of the Hegira, the moſt remarkable event was the rebellion of Al Mokanna. This impious impoſtor, whoſe true name was *Hakem Ebn Heſham*, came originally from Khoraſan, and had been an under ſecretary to Abu Moſlem governor of that province. He afterwards turned ſoldier, and paſſed thence into Mawaralnah, where he gave himſelf out for a prophet. The name of Al Mokanna, as alſo that of Al Borkai, that is, the *veiled*, he took from his cuſtom of covering his face with a veil or girdle maſk, to conceal his deformity; he having loſt an eye in the wars, and being otherwiſe of a deſpicable appearance; though his followers pretended he did this for the ſame reaſon that

Bagdad.

Moſes did, viz. leſt the ſplendor of his countenance ſhould dazzle the eyes of his beholders. In ſome places he made a great many proſelytes, deluding the people with a number of juggling tricks which they ſwallowed as miracles, and particularly by cauſing the appearance of a moon to riſe out of a well for many nights together; whence he was alſo called in the Perſian tongue, *Sazendeh mak*, or the *moon-maker*. This wretch, not content with being reckoned a prophet, arrogated to himſelf divine honours; pretending that the Deity reſided in his perſon, having proceeded to him from Abu Moſlem, in whom he had taken up his reſidence before. At laſt this impoſtor raiſed an open rebellion again the khalif, and made himſelf maſter of ſeveral fortified places in Khoraſan, ſo that Al Mohdi was obliged to ſend one of his generals with an army againſt him. Upon the approach of the khalif's troops, Al Mokanna retired into one of his ſtrong fortreſſes which he had well provided for a ſiege; and ſent his emiſſaries abroad to perſuade the people that

6 he raiſed the dead to life, and foretold future events.

Dreadful cataſtrophe of him and his family.

But being cloſely beſieged by the khalif's forces, and ſeeing no poſſibility of eſcaping, he gave poiſon in wine to his whole family and all that were with him in the caſtle; when they were dead, he burnt their bodies, together with all their furniture, proviſions, and cattle; and laſtly, he threw himſelf into the flames, or, as others ſay, into a tub of aqua-fortis, or ſome other preparation, which conſumed every part of him except the hair. When the beſiegers therefore entered the place, they found no living creature in it, except one of Al Mokanna's concubines, who, ſuſpecting his deſign, had hid herſelf, and now diſcovered the whole matter. This terrible contrivance, however, failed not to produce the deſired effect. He had promiſed his followers, that his ſoul ſhould tranſmigrate into the form of an old man, riding on a greyiſh coloured beaſt, and that after ſo many years he would return and give them the earth for their poſſeſſion; which ridiculous expectation kept the ſect in being for ſeveral years.

7 Harun Alraſhid's ſucceſs againſt the Greeks.

All this time war had been carried on with the Greeks, but without any remarkable ſucceſs on either ſide. In the 164th year of the Hegira, however, Al Mohdi ordered his ſon Harun Al Raſhid to penetrate into the Greek territories with an army of 95,000 men. Harun, then, having entered the dominions of the empreſs Irene, defeated one of her commanders that advanced againſt him; after which he laid waſte ſeveral of the imperial provinces with fire and ſword, and even threatened the city of Conſtantinople itſelf. By this the empreſs was ſo terrified, that ſhe purchaſed a peace with the khalif by paying him an annual tribute of 70,000 pieces of gold; which, for the preſent at leaſt, delivered her from the depredations of theſe barbarians. After the ſigning of the treaty, Harun returned

8 home laden with ſpoil and glory. This year, according to ſome of the oriental hiſtorians, the ſun, one day,

Unaccountable darkneſs.

a little after his riſing, totally loſt his light in a moment, without being eclipſed, when neither any fog nor any cloud of duſt appeared to obſcure him. This frightful darkneſs continued till noon, to the great aſtoniſhment of the people ſettled in the countries where it happened*.

In the 169th year of the Hegira, Al Mohdi was poiſoned, though undeſignedly, by one of his concubines named *Haſanah*. She had deſigned to deſtroy one of her rivals, whom ſhe imagined to have too great an aſcendant over the khalif, by giving her a poiſoned pear. This the latter, not ſuſpecting any thing, gave to the khalif; who had no ſooner eaten it than he felt himſelf in exquiſite torture, and ſoon after expired.

9 Al Mohdi poiſoned.

10 As likewiſe his ſucceſſor Al Hadi.

On the death of Al Mohdi, he was ſucceeded by his eldeſt ſon Al Hadi; who having formed a deſign to deprive his younger brother Harun Al Raſhid of his right of ſucceſſion, and even to aſſaſſinate him, was poiſoned by his vizier in the 170th year of the Hegira; and on his death the celebrated khalif Harun Alraſhid aſcended the throne.

11 Harun Al Raſhid khalif.

This was one of the beſt and wiſeſt princes that ever ſat on the throne of Bagdad. He was alſo extremely fortunate in all his undertakings, tho' he did not much extend his dominions by conqueſt. In his time the Moſlem empire may be ſaid to have been in its moſt flouriſhing ſtate, though, by the independency of the Moſlems in Spain, who had formerly ſet up a khalif of the houſe of Ommiyah, his territories were not quite ſo extenſive as thoſe of ſome of his predeceſſors. He poſſeſſed the provinces of Syria, Paleſtine, Arabia, Perſia, Armenia, Natolia, Media or *Aderbijan*, Babylonia, Aſſyria, Sindia, Sijiſtan, Khoraſan, Tabreſtan, Jorjan, Zableſtan, or *Sableſtan*, Mawaralnahr, or *Great Bukharia*, Egypt, Lybia, Mauritania, &c.; ſo that his empire was by far the moſt powerful of any in the world, and extended farther than the Roman empire ever had done.

12 Extent of his empire.

13 He finds a ring he had thrown into the Tigris.

The firſt inſtance of Harun's good fortune, and which was taken for a preſage of a proſperous and happy reign, was his finding a valuable ring which he had thrown into the Tigris to avoid being deprived of it by his brother Al Hadi. He was able to give the divers no other direction than by throwing a ſtone from the bridge of Bagdad, about the ſame place of the river in which he had thrown the ring: notwithſtanding which, they found it without any great difficulty.

14 Divides the empire among his ſons, and ſettles the ſucceſſion.

In the 186th year of the Hegira, beginning January 10th, 802, the khalif divided the government of his extenſive dominions among his three ſons in the following manner: To Al Amin the eldeſt, he aſſigned the provinces of Syria, Irak, the three Arabias, Meſopotamia, Aſſyria, Media, Paleſtine, Egypt, and all that part of Africa extending from the confines of Egypt and Ethiopia to the ſtraits of Gibraltar, with the dignity of khalif; to Al Mamun the ſecond, he aſſigned Perſia, Kerman, the Indies, Khoraſan, Tabreſtan, Cableſtan and Zableſtan, together with the vaſt province of Mawaralnahr; and to his third ſon Al Kaſem, he gave Armenia, Natolia, Jorjan, Georgia, Circaſſia, and all the Moſlem territories bordering upon the Euxine ſea. As to the order of ſucceſſion, Al Amin was to aſcend the throne immediately after his father's deceaſe; after him Al Mamun; and then Al Kaſem, whom he had ſurnamed *Al Mutaman*.

15 His ſucceſsful wars with the Greeks.

The moſt conſiderable exploits performed by this khalif were againſt the Greeks, who by their perfidy provoked him to make war upon them, and whom he always overcame. In the 187th year of the Hegira, the khalif received a letter from the Greek emperor Neciphorus

* See *Aſtronomy*, n° 57 and 486.

Bagdad. Nicephorus soon after he had been advanced to the imperial dignity, commanding him to return all the money he had extorted from the empress Irene, though that had been secured to him by the last treaty concluded with that princess, or expect soon to see an imperial army in the heart of his territories. This insolent letter so exasperated Harun, that he immediately assembled his forces and advanced to Heraclea, laying the country through which he passed waste with fire and sword. For some time also he kept that city straitly besieged; which so terrified the Greek emperor, that he submitted to pay an annual tribute. Upon this Harun granted him a peace, and returned with his army. But a hard frost soon after happening in these parts, Nicephorus took for granted that Al Rashid would not pay him another visit, and therefore broke the treaty he had concluded. Of this the khalif receiving advice, he instantly put himself in motion; and, notwithstanding the inclemency of the weather, forced the emperor to accept of the terms proposed. According to a Persian historian, before the hostilities at this time commenced, Nicephorus made the khalif a present of several fine swords, giving him thereby plainly to understand that he was more inclinable to come to blows than to make peace with him. All these swords Harun cut asunder with his famous sword *Samsamah*, as if they had been so many radishes, after which severe proof there did not appear the least flaw in the blade; a clear proof of the goodness of the sword, as the cutting the others with it was of the strength of Harun's arm. This sword had fallen into Al Rashid's hands among the spoils of Ebn Dakikan, one of the last Hamyaritic princes of Yaman; but is said to have belonged originally to a valiant Arab named *Amru Ebn Maadi Carb*, by whose name it generally went among the Moslems. This man is said to have performed very extraordinary feats with his sword, which induced a certain prince to borrow it from him; but he not being able to perform any thing remarkable with it, complained to Amru that it had not the desired effect: upon which that brave man took the liberty to tell him, that he had not sent his arm along with his sword.

In the 188th year of the Hegira, war was renewed with the Greeks, and Nicephorus with a great army attacked the khalif's forces with the utmost fury. He was, however, defeated with the loss of 40,000 men, and received three wounds in the action; after which the Moslems committed terrible ravages in his territories, and returned home laden with spoils. The next year Harun invaded Phrygia; defeated an imperial army sent to oppose him; and having ravaged the country, returned without any considerable loss. In the 190th year of the Hegira, commencing November 27th, 805, the khalif marched into the Imperial territories with an army of 135,000 men, besides a great number of volunteers and others who were not inrolled among his troops. He first took the city of Heraclea, from whence he is said to have carried 16,000 prisoners; after which he made himself master of several other places; and, in the conclusion of the expedition, he made a descent on the island of Cyprus, which he plundered in a terrible manner. This success so intimidated Nicephorus, that he immediately sent the tribute due to Harun, the withholding of which had been the cause of the war; and concludes a peace upon the khalif's own terms; one of which was, that the city of Heraclea should never be rebuilt. This perhaps Harun would not have so readily granted, had not one Rafe Ebn Al Leith revolted against him at Samarcand, and assembled a considerable force to support him in his defection. Bagdad. 16 Rebellion in Khorasan.

The next year, being the 191st of the Hegira, the khalif removed the governor of Khorasan from his employment because he had not been sufficiently attentive to the motions of the rebel Rafe Ebn Al Leith. As this governor had also tyranized over his subjects in the most cruel manner, his successor no sooner arrived than he sent him in chains to the khalif: but notwithstanding all Harun's care, the rebels made this year a great progress in the conquest of Khorasan.

Next year, the khalif found it necessary to march in person against the rebels, who were daily becoming more formidable. The general rendezvous of his troops was in the plains of Rakka, from whence he advanced at the head of them to Bagdad. Having at that place supplied the troops with every thing necessary, he continued his march to the frontiers of Jorjan, where he was seized with an illness which grew more violent after he had entered that province. Finding himself therefore unable to pursue his journey, he resigned the command of the army to his son Al Mamun, retiring himself to Tus in Khorasan. We are told by Khondemir, that, before the khalif departed from Rakka, he had a dream wherein he saw a hand over his head full of red earth, and at the same time heard a person pronouncing these words, "See the earth where Harun is to be buried." Upon this he demanded where he was to be buried; and was instantly answered, "At Tus." This dream greatly discomposing him, he communicated it to his chief physician, who endeavoured to divert him, telling the khalif that the dream had been occasioned by the thoughts of his expedition against the rebels. He therefore advised him to pursue some favourite diversion that might draw his attention another way. The khalif accordingly, by his physician's advice, prepared a magnificent regale for his courtiers, which lasted several days. After this, he put himself at the head of his forces, and advanced to the confines of Jorjan, where he was attacked by the distemper that proved fatal to him. As his disorder increased, he found himself obliged to retire to Tus; where being arrived, he sent for his physician, and said to him, "Gabriel, do you remember my dream at Rakka? we are now arrived at Tus, the place, according to what was predicted in that dream, of my interment. Send one of my eunuchs to fetch me a handful of earth in the neighbourhood of this city." Upon this, *Masrur*, one of his favourite eunuchs, was dispatched to bring a little of the soil of the place to the khalif. He soon returned, and brought a handful of red earth, which he presented to the khalif with his arm half bare. At the sight of this, Harun instantly cried out, "In truth this is the earth, and this the very arm, that I saw in my dream." His spirits immediately failing, and his malady being greatly increased by the perturbation of mind ensuing upon this sight, he died three days after, and was buried in the same place. According to Abul Faraj, Bashir Ebn Al Leith the arch-rebel's brother, was brought in chains to the khalif, who was then at the point of death. At the sight of whom Harun declared, that if

17 The khalif's death predicted by a dream.

18 He dies according to the prediction.

 if he could ſpeak only two words he would ſay *kill him;* and immediately ordered him to be cut to pieces in his preſence. This being done, the khalif ſoon after expired, in the year of the Hegira 193, having reigned 23 years. The diſtemper that put an end to his days

19 is ſaid to have been the bloody flux.

Succeeded by his ſon Al Amin.

Upon the arrival of a courier from Tus, with the news of Al Raſhid's death, his ſon Al Amin was immediately proclaimed khalif; and was no ſooner ſeated on the throne, than he formed a deſign of excluding his brother Al Mamun from the ſucceſſion. Accordingly he deprived him of the furniture of the imperial palace of Khoraſan; and in open violation of his father's will, who had beſtowed on Al Mamun the perpetual government of Khoraſan; and of all the troops in that province, he ordered theſe forces to march directly to Bagdad. Upon the arrival of this order, Al Mamun expoſtulated with the general Al Fadl Ebn Rabi who commanded his troops, and endeavoured to prevent his marching to Bagdad; but without effect, for he punctually obeyed the orders ſent by the khalif. Al Mamun, however, took care not to be wanting in fidelity to his brother. He obliged the people of Khoraſan to take an oath of fidelity to Al Amin, and reduced ſome who had actually excited a conſiderable body of the people to revolt, while the general Al Fadl having ingratiated himſelf with the khalif by his ready compliance with his orders, was choſen prime vizir, and go-

20 verned with an abſolute ſway; Al Amin abandoning himſelf entirely to drunkenneſs.

Infamous behaviour of the new khalif.

Al Fadl was a very able miniſter; though fearing Al Mamun's reſentment if ever he ſhould aſcend the throne, he gave Al Amin ſuch advice as proved in the end the ruin of them both. He told him that his brother had gained the affection of the people of Khoraſan by the good order and police he had eſtabliſhed among them; that his unwearied application to the adminiſtration of juſtice had ſo attracted their eſteem, that the whole province was entirely at his devotion; that his own conduct was by no means reliſhed by his ſubjects, whoſe minds were almoſt totally alienated from him; and therefore that he had but one part to act, which was to deprive Al Mamun of the right of ſucceſſion that had been given him by his father, and transfer it to his own ſon Muſa, though then but an infant. Agreeable to this pernicious advice, the khalif ſent for his brother Al Kaſem from from Meſopotamia, and recalled Al Mamun from Khoraſan, pretending he had occaſion for him as an aſſiſtant in his councils.

21

Al Mamun takes up arms againſt his brother.

By this treatment Al Mamun was ſo much provoked, that he reſolved to come to an open rupture with his brother, in order, if poſſible, to fruſtrate his wicked deſigns. Inſtead, therefore, of going to Bagdad as he had been commanded, he cut off all communication between his own province and that capital; pretending, that as his father Harun had aſſigned him the lieutenancy of Khoraſan, he was reſponſible for all the diſorders that might happen there during his abſence. He alſo coined money, and would not ſuffer Al Amin's name to be impreſſed upon any of the dirhems or dinars ſtruck in that province. Not content with this, he prevailed upon Rafe' Ebn Al Leith, who had been for ſome time in rebellion, to join him with a body of troops; whoſe example was ſoon after followed by Harthema Ebn Aafan; which put him in poſſeſſion of all the vaſt territory of Khoraſan. Here he governed with an abſolute ſway, officiated in the moſque as *Iman*, and from the pulpit conſtantly harangued the people.

The following year, being the 195th year of the Hegira, beginning October 4th, 810, the khalif Al Amin, finding that his brother ſet him at defiance, declared war againſt him, and ſent his general Ali Ebn Iſa with an army of 60,000 men to invade Khoraſan. Al Mamun, being informed that Ali was advancing againſt him with ſuch a powerful army, put on foot all the troops he could raiſe, and gave the command to Thaher Ebn Hoſein, one of the greateſt generals of his age. Thaher being a man of undaunted reſolution, choſe only 4000 men, whom he led againſt Al Amin's army. Ali, ſeeing ſo ſmall a number of troops advancing againſt him, was tranſported with joy, and promiſed himſelf an eaſy victory. Deſpiſing his enemies, 22

therefore, he behaved in a ſecure and careleſs manner; the conſequence of which was, that his army was entirely defeated, and himſelf killed, his head being afterwards ſent as a preſent to Al Mamun, who amply rewarded Thaher and Harthema for their ſervices.

Al Amin's forces defeated.

After this victory, Al Mamun aſſumed the title of *khalif*, ordered Al Amin's name to be omitted in the public prayers, and made all neceſſary preparations for carrying the war into the very heart of his brother's dominions. For this purpoſe he divided his forces into two bodies, and commanded them to march into Irak by different routes. One of them obeyed the orders of Thaher, and the other of Harthema. The firſt directed his march towards Ahwas, and the other towards Holwan, both of them propoſing to meet in the neighbourhood of Bagdad, and after their junction to beſiege that city. 23

Al Mamun's rapid conqueſts.

In the 196th year of the Hegira, Thaher Ebn Hoſein made a moſt rapid progreſs with the troops under his command. Having advanced towards Ahwas, he there defeated a body of the khalif's forces; and though the victory was by no means deciſive, it ſo intimidated the commander of Ahwas, that he thought fit to ſurrender that fortreſs to him. This opened him a way to Waſet upon the Tigris, and facilitated the conqueſt of that place. After this he marched with his army to Al Madayen; the inhabitants of which immediately opened their gates to him. The rapidity of theſe conqueſts, and the infamous conduct of Al Amin, excited the people of Egypt, Syria, Hejaz, and Yaman, unanimouſly to declare for Al Mamun; who was accordingly proclaimed khalif in all theſe provinces. 24

Siege of Bagdad.

The next year, Al Mamun's forces under Thaher and Harthema laid ſiege to Bagdad. As the khalif was ſhut up in that place, and it had a numerous garriſon, the beſieged made a vigorous defence, and deſtroyed a great number of their enemies. The beſiegers, however, inceſſantly played upon the town with their catapults and other engines, though they were in their turn not a little annoyed by the garriſon with the ſame ſort of military machines. The latter likewiſe made continual ſallies, and fought like men in deſpair, though they were always at laſt beaten back into the town with conſiderable loſs. In ſhort, the ſiege continued during the whole of this year, in which the greateſt part of the eaſtern city, called the *Camp of Al Mohdi*, was demoliſhed or reduced to aſhes. The citizens, as well

Bagdad.

well as the garrison, were reduced to the last extremity by the length and violence of the siege.

In the beginning of the 198th year of the Hegira, Al Amin finding himself deserted by his troops, as well as by the principal men of Bagdad, who had kept a private correspondence with Thaher, was obliged to retire to the old town on the west bank of the Tigris. He did not, however, take this step, before the inhabitants of the new town had formally deposed him, and proclaimed his brother Al Mamun khalif. Thaher, receiving advice of this, caused the old town to be immediately invested, planted his engines against it, and at last starved it to a surrender. Al Amin being thus reduced to the necessity of putting himself into the hands of one of the generals, chose to implore the protection of Harthema, whom he judged to be of a more humane disposition than Thaher. Having obtained this, he embarked in a small vessel in order to arrive at that part of the camp where Harthema was posted; but Thaher being informed of his design, which, if put in execution, he thought would eclipse the glory he had acquired, laid an ambush for him, which he had not the good fortune to escape. Upon his arrival in the neighbourhood of Harthema's tent, Thaher's soldiers rushed upon him, drowned all his attendants, and put himself

25 Al Amin murdered.

in prison. Here he was soon after massacred by Thaher's servants, who carried his head in triumph to their master, by whose order it was afterwards exposed to public view in the streets of Bagdad. Thaher afterwards sent it to Al Mamun in Khorasan, together with the ring or seal of the khalifat, the sceptre, and the imperial robe. At the sight of these, Al Mamun fell down on his knees, and returned thanks to God for his success; making the courier who brought them a present of a million of dirhems, in value about L. 100,000 Sterling.

26 Succeeded by Al Mamun.

The same day that Al Amin was assassinated, his brother Al Mamun was proclaimed khalif at Bagdad. He had not been long seated on the throne when he was alarmed by rebellions breaking out in different

27 Khorasan dismembered from the empire.

parts of the empire. These, however, were at last happily extinguished; after which, Thaher Ebn Hosein had the government of Khorasan conferred upon him and his descendants with almost absolute and unlimited power. This happened in the 205th year of the Hegira, from which time we may date the dismemberment of that province from the empire of the khalifs.

During the reign of this khalif nothing remarkable happened; only the African Moslems invaded the island of Sicily, where they made themselves masters of several

28 Death of Al Mamun

places. He died of a surfeit in the 218th year of the Hegira, having reigned 20, and lived 48 or 49 years.

On the death of Al Mamun, his brother Al Motasem, by some of the oriental historians surnamed *Billah*, was saluted khalif. He succeeded by virtue of Al Mamun's express nomination of him to the exclusion of his own son Al Abbas and his other brother Al Kasem who had been appointed by Harun Al Rashid. In

29 War between the new khalif Al Motasem and Babec.

the beginning of his reign he was obliged to employ the whole forces of his empire against one Babec, who had been for a considerable time in rebellion in Persia and Persian Irak. This Babec first appeared in the year of the Hegira 201, when he began to take upon him the title of a *prophet*. What his particular doctrine was, is now unknown; but his religion is said to have differed from all others then known in Asia. He gained a great number of proselytes in Aderbijan and the Persian Irak, where he soon grew powerful enough to wage war with the khalif Al Mamun, whose troops he often beat, so that he was now become extremely formidable. The general sent by Al Motasem to reduce him was Haider Ebn Kaus, surnamed *Asshin*, a Turk by nation, who had been brought a slave to the khalif's court, and having been employed in disciplining the Turkish militia there, had acquired the reputation of a great captain. By him Babec was defeated with prodigious slaughter, no fewer than 60,000 men being killed in the first engagement. The next year, being the 220th of the Hegira, he received a still greater overthrow, losing 100,000 men either killed or taken prisoners. By this defeat he was obliged to retire into the Gordyæan mountains; where he fortified himself in such a manner, that Asshin found it impossible to reduce him till the year of the Hegira 222. This commander having reduced with invincible patience all Babec's castles one after another, the impostor was obliged to shut himself up in a strong fortress called *Casbabad*, which was now his last resource. Here he defended himself with great bravery for several months; but at last finding he should be obliged to surrender, he made his escape into a neighbouring wood, from whence he soon after came to Asshin, upon that general's promising him pardon. But Asshin no sooner had him in his power, than he first caused his hands and feet, and afterwards his head, to be cut off. Babec had supported himself against the power of the khalifs for upwards of 20 years, during which time he had cruelly massacred 250,000 people; it being his custom to spare neither man, woman, nor child, of the Mahometans or their allies. Amongst the prisoners taken at Casbabad there was one Nud, who had been one of Babec's executioners, and who owned that in obedience to his master's commands he had destroyed 20,000 Moslems with his own hands; to which he added, that vast numbers had also been executed by his companions, but that of these he could give no precise account.

30 Babec defeated.

31 Taken prisoner and put to death

32 He destroyed vast numbers of Moslems.

In the 223d year of the Hegira, the Greek emperor Theophilus invaded the khalif's territories, where he behaved with the greatest cruelty, and by destroying Sozopetra the place of Al Motasem's nativity, notwithstanding his earnest intreaties to the contrary, occasioned the terrible destruction of *Amorium* mentioned under that article. The rest of this khalif's reign is remarkable for nothing but the execution of Asshin, who was accused of holding correspondence with the khalif's enemies. After his death a great number of idols were found in his house, which were immediately burned, as also several books said to contain impious and detestable opinions.

33 Death of Al Motasem.

In the 227th year of the Hegira died the khalif Al Motasem, in the 48th or 49th year of his age. He reigned eight years eight months and eight days, was born in the eighth month of the year, fought eight battles had 8000 slaves, and had 8,000,000 dinars and 80,000 dirhems in his treasury at his death, whence the oriental historians give him the name of *Al Mothamen*, or the *Octonary*. He is said to have been so robust, that he once carried a burden of 1000 pounds weight several paces. As the people of Bagdad disturbed him with

Badgad.

34 He built the city of Sarra Manray.

frequent revolts and commotions, he took the resolution to abandon that city, and build another for his own residence. The new city he built was first called *Samarra*, and afterwards *Sarra Manray*, and stood in the Arabian Irak. He was attached to the opinion of the Motazalites, who maintain the creation of the Koran; and both he and his predecessor cruelly persecuted those who believed it to be eternal.

35 His successors Al Wathek and Al Motowakkel.

Al Motasem was succeeded by Al Wathek Billah, who the following year, being the 228th of the Hegira, invaded and conquered Sicily. Nothing remarkable happened during the rest of his reign; he died in the 232d year of the Hegira, and was succeeded by his brother Al Motawakkel.

56 Monstrous cruelty of Al Motowakkel.

The new khalif began his reign with an act of the greatest cruelty. The late khalif's vizir having treated Al Motawakkel ill in his brother's lifetime, and opposed his election to the khalifat, was on that account now sent to prison. Here the khalif ordered him to be kept awake for several days and nights together: after this, being suffered to fall asleep, he slept a whole day and night; and after he awoke was thrown into an iron furnace lined with spikes or nails heated red hot, where he was miserably burnt to death. During this reign nothing remarkable happened, except wars with the Greeks, which were carried on with various success. In the year 859 too, being the 245th of the Hegira, violent earthquakes happened in many provinces of the Moslem dominions; and the springs at Mecca failed to such a degree, that the celebrated well Zemzem was almost dried up, and the water sold for 100 dirhems a bottle.

37 He is assassinated.

In the 247th year of the Hegira, the khalif was assassinated at the instance of his son Al Montaser; who succeeded him, and died in six months after. He was succeeded by Al Mostain, who in the year of the Hegira 252 was forced to abdicate the throne by his brother Al Motazz, who afterwards caused him to be privately murdered. He did not long enjoy the dignity of which he had so iniquitously possessed himself; being deposed by the Turkish militia (who now began to set up and depose khalifs as they pleased) in the 255th year of the Hegira. After his deposition, he was sent under an escort from Sarra Manray to Bagdad, where he died of thirst or hunger, after a reign of four years and about seven months.

38 Hard fate of Al Motazz a succeeding khalif.

The fate of this khalif was peculiarly hard: the Turkish troops had mutinied for their pay; and Al Motazz, not having money to satisfy their demands, applied to his mother named *Kabiha* for 50,000 dinars. This she refused, telling him that she had no money at all, although it afterwards appeared that she was possessed of immense treasures. After his deposition, however, she was obliged to discover them, and even deposite them in the hands of the new khalif Al Mokhtadi. They consisted of 1,000,000 dinars, a bushel of emeralds, and another of pearls, and three pounds and three quarters of rubies of the colour of fire.

Al Mokhtadi, the new khalif, was the son of one of Al Wathek's concubines named *Korb*, or *Karb*, who is by some supposed to have been a Christian.

39 Irruption of the Zenjians in the reign of Al-Mokhtadi.

The beginning of his reign is remarkable for the irruption of the Zenjians, a people of Nubia, Ethiopia, and the country of Caffres, into Arabia, where they penetrated into the neighbourhood of Basra and Cufa. The chief of this gang of robbers, who according to some of the Arab historians, differed but little from wild beasts, was Ali Ebn Mohammed Ebn Abdalrahman, who falsely gave himself out to be of the family of Ali Ebn Abu Taleb. This made such an impression upon the Shiites in those parts, that they flocked to him in great numbers; which enabled him to seize upon the cities of Basra and Ramla, and even to pass the Tigris at the head of a formidable army. He then took the title of *Prince of the Zenjians*, in order to ingratiate himself with those barbarians, of whom his army was principally composed.

Bagdad.

In the 256th year of the Hegira, Al Mokhtadi was barbarously murdered by the Turks who had raised him to the throne, and was succeeded by Al Montamed the son of Al Motawakkel. This year the prince of the Zenjians, Ali, or as he is also called, *Al Habib*, made incursions to the very gates of Bagdad, doing prodigious mischief wherever he passed. The khalif therefore sent against him one Jolan with a considerable army; he was overthrown, however, with very great slaughter by the Zenjian, who made himself master of 24 of the khalif's largest ships in the bay of Basra, put a vast number of the inhabitants of Obolla to the sword, and seized upon the town. Not content with this, he set fire to it, and soon reduced it to ashes, the houses mostly consisting of the wood of a certain plane-tree called by the Arabians *Saj*. From thence he marched to Abadan, which likewise surrendered to him. Here he found an immense treasure, which enabled him to possess him of the whole district of Ahwaz. In short, his forces being now increased to 80,000 strong, most of the adjacent territories, and even the khalif's court itself, were struck with terror.

30 Al Habib's success.

In the 257th year of the Hegira, Al Habib continued victorious, defeated several armies sent against him by the khalif, reduced the city of Basrah, and put 20,000 of the inhabitants to the sword. The following year, the khalif, supported by his brother Al Mowaffek, had formed a design of circumscribing the power of the Turkish soldiery, who had for some time given law to the khalifs themselves. But this year the Zenjians made so rapid a progress in Persia, Arabia, and Irak, that he was obliged to suspend the execution of his design, and even to employ the Turkish troops to assist his brother Al Mowaffek in opposing these robbers. The first of the khalif's generals who encountered Al Habib this year, was defeated in several engagements, and had his army at last entirely destroyed. After this Al Mowaffek and another general named *Mosleh* advanced against him. In the first engagement Mosleh being killed by an arrow, the khalif's troops retired; but Al Mowaffek put them afterwards in such a posture of defence, that the enemy durst not renew the attack. Several other sharp encounters happened this year, in which neither party gained great advantage; but, at last, some contagious distempers breaking out in Al Mowaffek's army, he was obliged to conclude a truce, and retire to Waset to refresh his troops.

In the 259th year of the Hegira, commencing Nov. 7th, 872, the war between the khalif and Al Habib still continued. Al Mowaffek, upon his arrival at Bagdad, sent Mahammed, surnamed *Al Mowalled*, with a powerful army to act against the Zenjians: but he could not hinder them from ravaging the province of Ahwaz,

Bagdad.

cutting off about 50,000 of the khalif's subjects, and dismantling the city of Ahwas; and notwithstanding the utmost efforts of all the khalif's generals, no considerable advantages could be gained either this or the following year.

41 Rebellion in Fars, Ahwas, and Basra.

In the 261st year of the Hegira, beginning October 16th, 874, Mohammed Ebn Wasel, who had killed the khalif's governor of Fars, and afterwards made himself master of that province, had several engagements with Al Habib, but with what success is not known. The khalif, having been apprized of the state of affairs on that side, annexed the government of Fars, Ahwas, and Basra, to the prefecture he had given to Musa Ebn Boga, whom he looked upon as one of the best generals he had. Musa, soon after his nomination to that post, sent Abdalrahman Ebn Mosleh as his deputy to Ahwas, giving him as a colleague and assistant one Tisam, a Turk. Mohammed Ebn Wasel, however, refusing to obey the orders of Abdalrahman and Tisam; a fierce conflict ensued, in which the latter were defeated, and Abdalrahman taken prisoner. After this victory, Mohammed advanced against Musa Ebn Boga himself; but that general, finding he could not take possession of his new government without a vast effusion of blood, recalled the deputies from their provinces, and made the best of his way to Sarra Manray. After this, Yakub Ebn Al Leit, having taken Khorasan from the descendants of Thaher, attacked and defeated Mohammed Ebn Wasel, seizing on his palace, where he found a sum of money amounting to 40,000,000 dirhems.

42 Rebels defeated, but cannot be reduced.

The next year Yakub Ebn Al Leit being grown formidable by the acquisition of Ahwas and a considerable portion of Fars, or at least the Persian Irak, declared war against the khalif. Against him Al Motamed dispatched Al Mowaffek; who having defeated him with prodigious slaughter, plundered his camp, and pursued him into Khorasan; where meeting with no opposition, he entered Nisabur, and released Mahomet the Thaherian, whom Yakub had detained in prison three years. As for Yakub himself, he made his escape with great difficulty, tho' he and his family continued several years in possession of many of the conquests he had made. This war with Yakub proved a seasonable diversion in favour of Al Habib, who this year defeated all the forces sent against him, and ravaged the district of Waset.

43 Al Habib still victorious.

The following year, being the 263d of the Hegira, beginning September 24th, 876, the khalif's forces, under the command of Ahmed Ebn Lebuna, gained two considerable advantages over Al Habib; but being at last drawn into an ambuscade, they were almost totally destroyed, their general himself making his escape with the utmost difficulty; nor were the khalif's forces able, during the course of the next year, to make the least impression upon these rebels.

44 Rebellion in Egypt which cannot be suppressed.

In the 265th year of the Hegira, beginning September 3d, 878, Ahmed Ebn Tolun rebelled against the khalif, and set up for himself in Egypt. Having assembled a considerable force, he marched to Antioch, and besieged Sima the governor of Aleppo, and all the provinces known among the Arabs, by the name of *Al Awasem* in that city. As the besieged found that he was resolved to carry the place by assault, they thought fit, after a short defence, to submit, and to put Sima into his hands. Ahmed no sooner had that officer in his power, than he caused him to be beheaded; after which he advanced to Aleppo, the gates of which were immediately opened unto him. Soon after, he reduced Damascus, Hems, Hamath, Kinnisrin, and Al Rakka, situated upon the eastern bank of the Euphrates. This rebellion so exasperated Al Motamed, that he caused Ahmed to be publicly cursed in all the mosques belonging to Bagdad and Irak; and Ahmed on his part ordered the same malediction to be thundered out against the khalif in all the mosques within his jurisdiction. This year also a detachment of Al Habib's troops penetrated into Irak, and made themselves masters of four of the khalif's ships laden with corn; then they advanced to Al Nomanic, laid the greatest part of it in ashes, and carried off with them several of the inhabitants prisoners. After this they possessed themselves of Jarjaraya, where they found many prisoners more, and destroyed all the adjacent territory with fire and sword. This year there were four independent powers in the Moslem dominions, besides the house of Ommiyah in Spain; viz. The African Moslems, or Aglabites, who had for a long time acted independently; Ahmed in Syria and Egypt; Al Leit in Khorasan; and Al Habib in Arabia and Irak.

45 Four independent powers in the khalif's nominal dominions.

In the 266th year of the Hegira, beginning August 23d, 879, Al Habib reduced Ramhormoz, burnt the stately mosque there to the ground, put a vast number of the inhabitans to the sword, and carried away great numbers, as well as a vast quantity of spoil.— This was his last successful campaign; for the year following, Al Mowaffek, attended by his son Abul Abbas, having attacked him with a body of 10,000 horse, and a few infantry, notwithstanding the vast disparity of numbers (Al Habib's army amounting to 100,000 men), defeated him in several battles, recovered most of the towns he had taken, together with an immense quantity of spoil, and released 5000 women that had been thrown into prison by these barbarians. After these victories, Al Mowaffek took post before the city of Al Mabiya', built by Al Habib, and the place of his residence, burnt all the ships in the harbour; thoroughly pillaged the town; and then entirely dismantled it. After the reduction of this place, in which he found immense treasures, Al Mowaffek pursued the flying Zenjians, put several of their chiefs to the sword, and advanced to Al Mokhtara, a city built by Al Habib. As the place was strongly fortified, and Al Habib was posted in its neighbourhood, with an army, according to Abu Jaafer Al Tabari, of 300,000 men, Al Mowaffek perceived that the reduction of it would be a matter of some difficulty. He therefore built a fortress opposite to it, where he erected a mosque, and coined money. The new city, from its founder, was called by the Arabs *Al Mowaffekkia*, and soon rendered considerable by the settlement of several wealthy merchants there. The city of Al Mokhtara being reduced to great straits was at last taken by storm, and given up to be plundered by the khalif's troops; after which Al Mowaffek defeated the numerous forces of Al Habib in such a manner, that they could no more be rallied during that campaign.

46 Al Habib's bad success and death.

The following year, being the 268th of the Hegira, Al Mowaffek penetrated again into Al Mabiya', and demolished the fortifications which had been raised since its former reduction, though the rebels disputed every

every inch of ground. Next year he again attacked Al Habib with great bravery; and would have entirely defeated him, had he not been wounded in the breast with an arrow, which obliged him to sound a retreat. However, as soon as he was cured of his wound, Al Mowaffek advanced a third time to Al Mabiya', made himself master of that metropolis, threw down the walls that had been raised, put many of the inhabitants to the sword, and carried a vast number of them into captivity.

The 27th year of the Hegira, commencing July 11th, 883, proved fatal to the rebel Al Habib. Al Mowaffek made himself a fourth time master of Al Mabiya', burnt all Habib's palace, seized upon his family, and sent them to Sarra Manray. As for the usurper himself, he had the good fortune to escape at this time; but being closely pursued by Al Mowaffek into the province of Ahwas, where the shattered remains of his forces were entirely defeated, he at last fell into the hands of the victor, who ordered his head to be cut off, and carried through a great part of that region which he had so long disturbed. By this complete victory Al Mowaffek obtained the title of *Al Nasir Lidmilbah*, that is, *the protector of Mahometanism*. This year also died Ahmed Ebn Tolun, who had seized upon Egypt and Syria, as we have already observed; and was succeeded by his son *Khamarawiyah*.

47 Success of the sultan of Egypt.

The next year, a bloody engagement happened between the khalif's forces commanded by Al Mowaffek's son, and those of Khamarawiyah, who had made an irruption into the khalif's territories. The battle was fought between Al Ramla and Damascus. In the beginning, Khamarawiyah found himself so hard pressed, that his men were obliged to give way; upon which, taking for granted that all was lost, he fled with great precipitation, even to the borders of Egypt; but, in the mean time, his troops being ignorant of the flight of their general, returned to the charge, and gained a complete victory. After this, Khamarawiyah, by his just and mild administration, so gained the affections of his subjects, that the khalif found it impossible to gain the least advantage over him. In the 276th year of the Hegira, he overthrew one of the khalif's generals named Abul Saj, at Al Bathnia near the city of Damascus; after which he advanced to Al Rakka on the Euphrates, and made himself master of that place. Having annexed several large provinces to his former dominions, and left some of his friends in whom he could confide to govern them, he then returned into Egypt, the principal part of his empire, which now extended from the Euphrates to the borders of Nubia and Ethiopia.

48 Al Mowaffek dies.

The following year, being the 278th of the Hegira, was remarkable for the death of Al Mowaffek. He died of the elephantiasis or leprosy; and while in his last illness, could not help observing, that of 100,000 men whom he commanded, there was not one so miserable as himself. This year is also remarkable for the first disturbances raised in the Moslem empire by the Karmatians.

49 Origin of the Karmatians.

The origin of this sect is not certainly known; but the most common opinion is, that a poor fellow, by some called *Karmata*, came from Khuzestan to the villages near Cufa, and there pretended great sanctity and strictness of life, and that God had enjoined him to pray 50 times a-day; pretended also to invite people to the obedience of a certain Imam of the family of Mahomet; and this way of life he continued till he had made a very great party, out of whom he chose twelve as his apostles to govern the rest, and to propagate his doctrines. He also assumed the title of *prince*, and obliged every one of his earlier followers to pay him a dinar a-year. But Al Haidam, the governor of that province, finding men neglected their work, and their husbandry in particular, to say those 50 prayers a-day, seized the fellow, and having put him in prison, swore that he should die. This being overheard by a girl belonging to the governor, she, out of compassion, took the key of the dungeon at night from under her master's head, released the man, and restored the key to its place while her master slept. The next morning the governor found his prisoner gone; and the accident being publicly known, raised great admiration; Karmata's adherents giving out that God had taken him into heaven. After this he appeared in another province, and declared to a great number of people he got about him, that it was not in the power of any person to do him hurt; notwithstanding which, his courage failing him, he retired into Syria, and was never heard of any more. After his disappearance, the sect continued and increased; his disciples pretending that their master had manifested himself to be a true prophet, and had left them a new law, wherein he had changed the ceremonies and form of prayer used by the Moslems, &c. From this year, 278, these sectaries gave almost continual disturbance to the khalifs and their subjects, committing great disorders in Chaldæa, Arabia, and Mesopotamia, and at length established a considerable principality.

50 Sultan of Egypt's daughter married to the khalif Al Motaded.

In the 279th year of the Hegira died the khalif Al Motamed; and was succeeded by Al Motaded, son to Al Mowaffek. The first year of his reign, Al Motaded demanded in marriage the daughter of Khamarawiyah, sultan, or khalif, in Egypt; which was agreed to by him with the utmost joy, and their nuptials were solemnized with great pomp in the 282d year of the Hegira. He carried on a war with the Karmatians; but very unsuccessfully, his forces being defeated with great slaughter, and his general Al Abbas taken prisoner. This khalif also granted to Harun, son to Khamarawiyah, the perpetual prefecture of Awasam and Kinnisrin, which he annexed to that of Egypt and Syria, upon condition that he paid him an annual tribute of 45,000 dinars. He died in the year of the Hegira 289, and was succeeded by his son Al Moctasi.

51 Egypt, &c. recovered by the khalif Al Moctasi.

This khalif proved a warlike and successful prince. He gained several advantages over the Karmatians, but was not able to reduce them. The Turks, however, having invaded the province of Mawarnalnahr, were defeated with great slaughter; after which, Al Moctasi carried on a successful war against the Greeks, from whom he took Seleucia. After this he invaded Syria and Egypt, which provinces he recovered from the house of Ahmed Ebn Tolun.

52 Distressed state of the khalifs after his death.

The reduction of Egypt happened in the 292d year of the Hegira, after which the war was renewed with success against the Greeks and Karmatians. The khalif died in the 295th year of the Hegira, after a reign of about six years and a half. He was the last of the khalifs who made any figure by their warlike exploits. His successors Al Moktader, Al Kaher, and Al Radi,

were

Bagdad. were so distressed by the Karmatians and numberless usurpers who were every day starting up, that by the 325th year of the Hegira, they had nothing left but the city of Bagdad. In the 324th year of the Hegira, commencing November 30th, 935, the khalif Al Radi, finding himself distressed on all sides by usurpers, and having a vizir of no capacity, instituted a new office superior to that of vizir, which he intitled *Emir Al Omra*, or *Commandant of Commandants*. This great officer was trusted with the management of all military affairs, and had the entire management of the finances in a much more absolute and unlimited manner than any of the khalif's vizirs ever had. Nay, he officiated for the khalif in the great mosque at Bagdad, and had his name mentioned in the public prayers throughout the kingdom. In short, the khalif was so much under the power of this officer, that he could not apply a single dinar to his own use without the leave of the Emir Al Omra. In the year 325, the Moslem empire, once so great and powerful, was shared among the following usurpers:

53 New office of Emir Al Omra instituted by Al Radi.

54 Division of the Moslem empire in the 325th year of the Hegira.

The cities of Waset, Basra, and Cufa, with the rest of the Arabian Irak, were considered as the property of the Emir Al Omra, though they had been in the beginning of the year seized upon by a rebel called *Al Baridi*, who could not be driven out of them.

The country of Fars, Farsestan, or *Persia*, properly so called, was possessed by Amado'ddawla Ali Ebn Buiya, who resided in the city of Shiraz.

Part of the tract denominated *Al Jebal*, together with Persian Irak, which is the mountainous part of Persia, and the country of the ancient Parthians obeyed Rucno'ddawla, the brother of Amado'ddawla, who resided at Ispahan. The other part of that country was possessed by Washmakin the Deylamite.

Diyar Rabia, Diyar Becr, Diyar Modar, and the city of Al Mawsel, or Mosul, acknowledged for their sovereign a race of princes called *Hamdanites*.

Egypt and Syria no longer obeyed the khalifs, but Mahomet Ebn Taj, who had formerly been appointed governor of these provinces.

Africa and Spain had long been independent.

Cicily and Crete were governed by princes of their own.

The provinces of Khorasan and Marawalnahr were under the dominion of Al Nasr Ebn Ahmed, of the dynasty of the Sammarians.

The provinces of Tabrestan, Jorjan or Georgiana, and Mazanderan, had kings of the first dynasty of the Deylamites.

The province of Kerman was occupied by Abu Ali Mahomet Ebn Eylia Al Sammani, who had made himself master of it a short time before. And,

Lastly, the provinces of Yamama and Bahrein, including the district of Hajr, were in the possession of Abu Thaher the Karmatian.

Thus the khalifs were deprived of all their dominions, and reduced to the rank of sovereign pontiffs; in which light, though they continued for some time to be regarded by the neighbouring princes, yet their power never arrived to any height. In this low state the khalifs continued till the year of the Hegira 656, commencing January 8th, 1258. This year was rendered remarkable by the taking of Bagdad by Hulaku the Mogul or Tartar; who likewise abolished the khalifat, putting the reigning khalif Al Mostasem Billah to a most cruel death. These diabolical conquerors, after they had taken the city, massacred, according to custom a vast number of the inhabitants; and after they had plundered it, set it on fire. The spoil they took from thence was prodigiously great, Bagdad being then looked upon as the first city in the world.

55 Bagdad taken by the Tartars.

56 History of the city since that time.

Bagdad remained in the hands of the Tartars or Moguls to the year of the Hegira 795, of Christ 1392, when it was taken by Tamerlane from Sultan Ahmed Ebn Weis; who being incapable of making head against Tamerlane's numerous forces, found himself obliged to send all his baggage over the Tigris, and abandon his capital to the conqueror. He was, however, hotly pursued by his enemy's detachments to the plain of Karbella, where several skirmishes happened, and a considerable number of men were lost on both sides. Notwithstanding this disaster, he found means to escape the fury of his pursuers, took refuge in the territories of the Greek emperor, and afterwards repossessed himself of the city of Bagdad. There he remained till the year of the Hegira 803, when the city was taken a second time by Tamerlane; who nevertheless restored it to him, and he continued sovereign of the place till driven from thence by Miram Shah. Still, however, he found means to return; but in the 815th year of the Hegira was finally expelled by Kara Yusef the Turkman. The descendants of Kara Yusef continued masters of Bagdad till the year of the Hegira 875, of Christ 1470, when they were driven out by Usun Cassun. The family of this prince continued till the year of the Hegira 914, of our Lord 1508, when Shah Ishmael, surnamed *Sufi* or *Sofi*, the first prince of the royal family reigning in Iran or Persia, till the dethroning of the late Shah Hosein, made himself master of it. From that time to this Bagdad has continued to be a bone of contention between the Turks and Persians. It was taken by Soliman surnamed the *magnificent*, and retaken by Shah Abbas the great, king of Persia: but being at last besieged by Amruth or Morad IV. with a formidable army, it was finally obliged to surrender to him in the year 1638; since which time the Persians have never been able to make themselves masters of it for any length of time.

57 Its present state.

The city is large and populous; and the advantage of the Tigris is so considerable, with regard to commerce, that although the climate is excessive hot, and in other respects far from being agreeable, yet the number of its inhabitants is computed at 300,000; but before the plague broke out there, they were supposed to be four times that number. It is governed by a bashaw, whose authority extends as far as Courdistan. The revenues would be immense was the government mild; but instead thereof, oppression rules here with the most despotic sway. The bashaw is continually extorting money from the poor inhabitants, and none suffer more than the unfortunate Jews and Christians, many of whom are put to the most cruel tortures in order to force their property from them. This series of tyranny and oppression has almost entirely drove them out of the city, in consequence of which the trade must suffer very considerably, they being generally the principal merchants in the place. In the months of June, July, and August, the weather is so extremely hot, as to oblige the inhabitants to live for

Bagdad. these months in subterraneous apartments, which are arched over, to admit the freer circulation of the air. The houses are generally large, built of brick and cement, and are arched over; many of the windows are made of elegant Venetian glass; the ceilings are mostly ornamented with a kind of chequered work, which has generally a noble appearance; most of the houses have a court-yard before them, in the middle of which is a little plantation of orange trees, &c. that has a very pleasing effect. The soil, which would produce not only every conveniency in life, but almost every luxury, is through the natural indolence of the Turks, and the many faults in the government of the country, in a great measure uncultivated and neglected. The revenues are computed at 125 lacks of piastres, or 1,562,500l. sterling; but a quarter part of this is not collected, owing to the slothfulness of the Turks, who suffer the Arabs to plunder them of the remainder. This in some measure accounts for the cruelties and extortions that are continually practised here. As the bashaw lives in all the splendor of a sovereign prince, and maintains a very large army, he could not be able to defray his expences, was he not to have recourse to oppression and injustice; and he, by his extensive power, acting almost independent of the Porte, only acknowledging it to bring in a balance from thence yearly in his favour.

The bazars or markets here are large and extensive; being covered over with arches built of masonry, and divided into different streets, filled with shops of all kinds of merchandize, to the number of 12,000. Every thing a person can have occasion for may be had there. The number of houses in the city is computed at near 80,000; and each house and shop pay an annual tribute to the bashaw, which is calculated to produce the sum of 300,000l. sterling. Besides these immense revenues that are collected, the bashaw pretends, that by repairs on the fortifications 30,000l. or 40,000l. are annually expended, when not so many hundreds are taken out of his coffers for that purpose. Likewise clearing the river and mending the bridge become a charge greater than their income, and probably not the value of an English shilling is expended. —To support the expence of the seraglio, their clothes, caparisons of their horses, and every outward pomp, the amount is considerable.

On the north side of the town stands the citadel, which commands the river; and consists of curtains and bastions, on which some very long cannon are mounted, with two mortars in each bastion, placed no other beds than the ground, and in very bad condition. The carriages of the guns are likewise so unwieldy, and in such a shattered condition, that from their appearances they would not support one firing, but would be shaken in pieces. Their elevations were from 30 to 40 degrees, but they had no quoins to level them. There are besides, a number of small towers, and loop-holes for musquetry, placed at certain distances, all well encompassed by a ditch of 27 feet deep, which can be filled at any time by the waters of the Tigris. The citadel is so close to the houses, that it might be easily taken if possession was once gained of the town; but an attack made towards the land would not probably be succesful, as sluices might with the greatest facility be cut into the ditch, and so overflow the country for miles round; but it is said an advantageous attack might be made from the water.

The city, which is fortified by lofty thick walls of brick covered with earth, and strengthened by great towers much resembling cavalier bastions, the whole being surrounded by a deep ditch, is in the form of an irregular square; but the walls in many places are broken down, occasioned by the disputes which happened on the death of Abdulla Basha a few years ago, when two competitors arose in Bagdad for the bashawic, who fought several times in the town and citadel, and laid great part of it in ruins. In the interim, the governor of Mussool and Nineveh being appointed Bashaw by the Porte, came hither with a considerable army, and took possession of the sovereignty, vanquishing his two opponents. Opposite to the city, on the other side of the river, are very extensive suburbs, from whence shells might be thrown into the town, which would have a dreadful effect on a place so closely built. There is a communication beween the city and suburbs by a bridge of boats; the only kind of bridge which that river will admit of, as it is broad and deep, and in its ordinary course very rapid. At certain seasons it swells to a prodigious height, and overflowing the country occasions many morasses on that side opposite to the city. Among these are several towns and villages, whose inhabitants are said to be the ancient Chaldeans: they are of a particular religion, which they pretend is that of Seth. The inhabitants of this city are composed chiefly of Persians, Armenians, Turks, Arabs, and Jews, which last act in the capacity of schroffs, or bankers, to the merchants. The Jews, notwithstanding the severe treatment they meet with from the government, are induced to live here from a reverence to the prophet Ezekiel, whose mausoleum they pretend is a day's journey from the city. Besides the Jews who reside here, there are many that come every year out of devotion to visit the prophet's tomb. There are also two European gentlemen, a Venetian and a Frenchman, with five Romish priests, who are Frenchmen and Italians. Two chapels are permitted for those of the Romish and Greek persuasions; at the former the five priests officiate. In the city are several large beautiful mosques, but into which Christians are never suffered to enter, if known to be such, for fear it should defile them. The Mahometan women are very richly dressed, wearing bracelets on their arms and jewels in their ears: the Arabian women have the partition between their nostrils bored, wherein they wear rings.

There are also a number of antique buildings. At the distance of about ten miles stand the ruins of an ancient tower called the *Tower of Nimrod*. Whether this tower was at first of a square or round form is now difficult to determine; though the former is most probable, because all the remaining bricks are placed square, and not in the least circular. The bricks are all twelve inches square and four and an half thick. The cement is of mud or slime, mixed with broken reed, as we mix hair with mortar; which slime might either have been had from one of the great rivers, or taken out of one of the swamps in the plain, with which the country hereabout very much abounds. The height of the ruin is 126 feet; the diameter of the largest

largest and middle part about 100 feet. It would appear to be solid to the centre; yet near the top there is a regular opening of an oval form. The circumference of that part of the tower which remains, and is above the rubbish, is about 300 feet; but probably, could the foundation be come at, it would be found of far greater extent. The present Turks, Jews, and Arabians, are fond of believing this to be the identical ruin of the ancient tower of Babel, for which they assign a variety of reasons; but all so void of the appearance of truth, that to set about confuting them would be losing time in trifles. It appears to have been a beacon or watch-tower, to give notice of the approach of an enemy: or perhaps was used as an observatory to inspect the various motions of the heavenly bodies; which science was so much cultivated among the ancient inhabitants of this country, that even the Grecians, though desirous of being esteemed the inventors of all arts and sciences, could never deny the Babylonians the honour of having laid the foundations of astronomy.

BAGGAGE, in military affairs, denotes the clothes, tents, utensils of divers sorts, provisions, and other necessaries belonging to the army.

Before a march, the waggons with the baggage are marshalled according to the rank which the several regiments bear in the army; being sometimes ordered to follow the respective columns of the army, sometimes to follow the artillery, and sometimes to form a column by themselves. The general's baggage marches first; and each waggon has a flag, showing the regiment to which it belongs.

Packing up the BAGGAGE, *vasa colligere*, was a term among the Romans, for preparing to go to war, or to be ready for an expedition.

The Romans distinguished two sorts of baggage; a *greater* and *less*. The lesser was carried by the soldier on his back, and called *sarcina;* consisting of the things most necessary to life, and which he could not do without. Hence *colligere sarcinas*, packing up the baggage, is used for decamping, *castra movere*. The greater and heavier was carried on horses and vehicles, and called *onera*. Hence *onera vehiculorum, sarcinæ hominum*. The baggage-horses were denominated *sagmentarii equi*.

The Roman soldiers in their marches were heavy loaden; insomuch, that they were called by way of jest *muli mariani*, and *ærumnæ*. They had four sorts of luggage, which they never went without, *viz.* corn, or *buccellatum*, utensils, valli, and arms. Cicero observes, that they used to carry with them above half a month's provisions; and we have instances in Livy, where they carried provisions for a whole month. Their utensils comprehended those proper for gathering fuel, dressing their meat, and even for fortification or intrenchment; and what is more, a chain for binding captives. For arms, the foot carried a spear, shield, saw, basket, rutrum, hatchet, lorum, falx, &c. Also stakes or pales, *valli*, for the sudden fortifying a camp; sometimes seven or even twelve of these pales were carried by each man, though generally, as Polybius tells us, only three or four. On the Trajan column we see soldiers represented with this fardle of corn, utensils, pales, &c. gathered into a bundle and laid on their shoulders. Thus inured to labour, they grew strong, and able to undergo any fatigue in battle; the greatest heat of which never tired them, or put them out of breath. In after-times, when discipline grew slack, this luggage was thrown on carriages and porters shoulders.

The Macedonians were not less inured to hardship than the Romans; when Philip first formed an army, he forbid all use of carriages; yet, with all their load, they would march, in a summer's day, 20 miles in military rank.

BAGLANA, or BUGLANA, a province of the kingdom of Dekkan in the Mogul's empire. It is bounded on the north and east by Guzerat and Ballagat; and on the south and west by that part of Viziapur called *Konkan*, belonging to the Marattas. It ends in a point at the sea-coast between Daman and Balsora, and is the least province in the kingdom. The Portuguese territories begin in this province at the port Daman, 21 leagues south of Surat; and run along the coast by Bassaim, Bombay, and Chawl, to Dabul, almonst 50 leagues to the north of Goa.

BAGLIVI (George), a most illustrious physician of Italy, was a native of Apulia, and born about the year 1668. He studied at Padua, where he became doctor; and then went to Rome, where he was chosen professor of anatomy. He was a man of most uncommon force of understanding, of which he gave ample proofs in many curious and accurate productions, philosophical as well as medicinal. He died at Rome 1706, in the flower of his age, and when he was no more than 38. A collection of his works were printed first in 1710, quarto; and have since been reprinted, in the same size, at various places. His *Praxis Medica*, and *De Fibra Matricis*, are the principal pieces. He wrote a Dissertation upon the Anatomy, Bite, and Effects, of the Tarantula, which is the production of his country; and gave a particular account of the earthquake at Rome and the adjacent cities in 1703. His works are all in Latin.

BAGNAGAR, a town of Asia, in the dominions of the Great Mogul, and capital of the kingdom of Golconda in the peninsula on this side the Ganges. The inhabitants within the town are the better sort; the merchants and meaner people inhabiting the suburbs, which is three miles long. It is chiefly remarkable for a magnificent reservoir of water, surrounded with a colonnade supported by arches. It is seated on the river Newa, in E. Long. 96. 0. N. Lat. 15. 30.

BAGNARA, a sea-port town of Italy in the kingdom of Naples, in the farther Calabria, with the title of a duchy. E. Long. 16. 8. N. Lat. 38. 15.

BAGNAREA, a town of Italy in St Peter's patrimony, and in the territory of Orvieta, with a bishop's see. E. Long. 12. 10. N. Lat. 42. 36.

BAGNERES, a town of France in Gascony, and in the county of Bigorre, so called from its mineral waters. It is seated on the river Adour, in E. Long. 0. 12. N. Lat, 43. 3.

BAGNIALACK, a large town of Turkey in Europe, in the province of Bosnia. E. Long. 18. 10. N. Lat. 44. 0.

BAGNIO, an Italian word, signifying *a bath*. We use it for a house with conveniences for bathing, cupping, sweating, and otherwise cleansing the body; and sometimes for worse purposes. In Turkey it is become

come a general name for the prisons where the slaves are inclosed, it being usual in these prisons to have baths.

BAGNOLAS, a town of Lower Languedoc in France. It has a very handsome square, and two fountains which rise in the middle of the town; the waters of which, being received in a bason, are conveyed by a canal out of town, and from thence to the lands about it. E. Long. 4. 43. N. Lat. 44. 10.

BAGNOLIANS, or BAGNOLANSES, in church-history, a sect of heretics, who in reality were Manichees, though they somewhat disguised their errors. They rejected the Old Testament and part of the New; held the world to be eternal; and affirmed that God did not create the soul when he infused it into the body.

BAGOI, among the ancient Persians, were the same with those called by the Latins *spadones, viz.* a species of eunuchs, in whom the canal of the penis was so contorted by a tight vinculum, that they could not emit the semen.

BAG-PIPE, a musical instrument, of the wind kind, chiefly used in Scotland and Ireland. The peculiarity of the bag-pipe, and from which it takes its name, is, that the air which blows it is collected into a leathern bag, from whence it is pressed out by the arm into the pipes. These pipes consist of a bass, and tenor or rather treble; and are different according to the species of the pipe. The bass part is called the *drone*, and the tenor or treble part the *chanter*. In all the species, the bass never varies from its uniform note, and therefore very deservedly gets the name of *drone;* and the compass of the chanter is likewise very limited. There is a considerable difference between the Highland and Lowland bag-pipe of Scotland; the former being blown with the mouth, and the latter with a small bellows: though this difference is not essential, every species of bag-pipe being capable, by a proper construction of the reeds, of producing music either with the mouth or bellows. The following are the species of bag-pipes most commonly known in Britain.

1. The *Irish Pipe*. This is the softest, and in some respects the most melodious of any, so that music-books have been published with directions how to play on it. The chanter, like that of all the rest, has eight holes like the English flute, and is played on by opening and shutting the holes as occasion requires; the bass consists of two short drones, and a long one. The lowest note of the chanter is D on the German flute, being the open note on the counter-string of a violin; the small drone (one of them commonly being stopped up) is tuned in unison with the note above this, and the large one to an octave below; so that a great length is required in order to produce such a low note, on which account the drone hath sometimes two or three turns. The instrument is tuned by lengthening or shortening the drone till it sounds the note desired.

2. The *Highland Bag-Pipe*. This consists of a chanter and two short drones, which sound in unison the lowest note of the chanter except one. This is exceedingly loud, and almost deafening if played in a room; and is therefore mostly used in the fields, for marches, &c. It requires a prodigious blast to sound it; so that those unaccustomed to it cannot imagine how Highland pipers can continue to play for hours together, as they are often known to do. For the same reason, those who use the instrument are obliged either to stand on their feet or walk when they play. This instrument hath but nine notes; its scale, however, hath not yet been reduced to a regular standard by comparing it with that of other instruments, so that we can say nothing about its compass. Those who are best acquainted with it, however, affirm that it plays only the natural notes, without being capable of variation by flats or sharps.

3. The *Scots Lowland Pipe*. This is likewise a very loud instrument, though less so than the former. It is blown with bellows, and hath a bass like the Irish pipe. This species is different from all the rest, as it cannot play the natural notes, but hath F and C sharp. The lowest note of a good bag-pipe of this kind is unison with C sharp on the tenor of a violin tuned concert-pitch; and as it hath but nine notes, the highest is D in alt. From this peculiar construction, the Highland and Lowland bag-pipes play two species of music essentially different from one another, as each of them also is from every other species of music in the world. Hence these two species of bag-pipes deserve notice as curiosities; for the music which they play is accompanied with such peculiar ornaments, or what are intended as such, as neither violin, nor even organ, can imitate, but in a very imperfect manner.

This kind of bag-pipe was formerly very much used in Scotland at weddings and other festivals: being indeed extremely well calculated for playing that peculiar species of Scots music called *reels*. It has been often a matter of surprise how this was possible, as the instrument has only a compass of nine or ten notes at the utmost, and which cannot be varied as in other instruments. In this respect, however, it has a very great compass, and will play an inconceivable variety of tunes. As its notes are naturally so high, there is scarce any one tune but what is naturally transposed by it, so that what would be a flat note on the key proper for the violin, may be a sharp one on the bag-pipe; and though the latter cannot play any flat note, it may nevertheless in this manner play tunes which on other instruments would be flat, to as great perfection as these instruments themselves.

4. *The Small Pipe*. This is remakable for its smallness, the chanter not exceeding eight inches in length; for which reason, the holes are so near each other, that it is with difficulty they can be closed. This hath only eight notes, the lower end of the chanter being commonly stopped. The reason of this is, to prevent the slurring of all the notes, which is unavoidable in the other species; so that in the hands of a bad player they become the most shocking and unintelligible instruments imaginable: but this, by having the lower hole closed, and also by the peculiar way in which the notes are expressed, plays all its tunes in the way called by the Italians *staccato*, and cannot slur at all. It hath no species of music peculiar to itself; and can play nothing which cannot be much better done upon other instruments; though it is surprising what vollubility some performers on this instrument will display, and how much they will overcome the natural disadvantages of it. Some of this species, instead of having drones like the others, have their bass parts consisting of a winding cavity in a kind of

of short case, and are tuned by opening these to a certain degree by means of sliding covers; from which contrivance they are called *shuttle-pipes*.—Besides these, there are a variety of others, called *Italian*, *German*, *Organ*, &c. bag-pipes, which have nothing different in their construction from those above described, nor any good quality to recommend them.

As to the origin of bag-pipe music, some are of opinion that it is to be derived from the Danes; but Mr Pennant thinks differently, and gives the following reasons for deriving it ftom Italy.

Voyage to the Hebrides, p. 302.

" Neither of these instruments (the Highland and Lowland bag-pipes above described) were the invention of the Danes, or, as is commonly supposed, of any of the northern nations; for their ancient writers prove them to have been animated by the *clangor tubarum*. Notwithstanding they have had their foeck-pipe long amongst them, as their old songs prove, yet we cannot allow them the honour of inventing this melodious instrument; but must assert, that they borrowed it from the invaded Caledonians. We must still go farther, and deprive even that ancient race of the credit; and derive its origin from the mild climate of Italy, perhaps from Greece.

" There is now in Rome a most beautiful bas relievo, a Grecian sculpture of the highest antiquity, of a bag-piper playing on his instrument, exactly like a modern Highlander. The Greeks had their Ασκαυλης, or instrument, composed of a pipe and blown-up skin: the Romans in all probability borrowed it from them, and introduced it among their swains, who still use it under the names of *piva* and *cornu-musa*.

" That master of music, Nero, used one; and had not the empire been so suddenly deprived of that great artist, he would (as he graciously declared his intention, have treated the people with a concert, and, among other curious instruments, would have introduced the *utricularius* or bag-pipe. Nero perished; but the figure of the instrument is preserved on one of his coins, but highly improved by that great master: it has the bag and two of the vulgar pipes; but was blown with a bellows like an organ, and had on one side a row of nine unequal pipes resembling the syrinx of the god Pan. The bag-pipe, in the unimproved state, is also represented in an ancient sculpture; and appears to have had two long pipes or drones, and a single short pipe for the fingers. Tradition says, that the kind played on by the mouth was introduced by the Danes: as theirs was wind-music, we will admit that they might have made improvement; but more we cannot allow: they were skilled in the use of the trumpet; the Highlanders in the piohb, or bag-pipe,

Non tuba in usu illis, conjecta at tibia in utrum
*Dat belli signum, et martem vocat horrida in arma**."

* *Melvini* Topogr. Scotiæ.

The bag-pipe appears to have been an instrument of great antiquity in Ireland, though it is uncertain whence they derived it. Mr Pennant, by means of an antique found at Richborough in Kent, has determined that the bag-pipe was introduced at a very early period into Britain; whence it is probable that both Irish and Danes might borrow the instrument from the Caledonians, with whom they had such frequent intercourse. Aristides Quintilianus informs us, that it prevailed in the Highlands in very early ages; and indeed the genius of the people seems to render the opinion highly probable. The attachment of that people to their music called pibrachs is almost incredible, and on some occasions is said to have produced effects little less marvellous than those ascribed to the ancient music. At the battle of Quebec in 1760, while the British troops were retreating in great disorder, the general complained to a field-officer in Fraser's regiment of the bad behaviour of his corps. " Sir (said he with some warmth), you did very wrong in forbidding the pipers to play this morning; nothing encourages the Highlanders so much in the day of action. Nay, even now they would be of use."—" Let them blow like the devil, then (replies the general), if it will bring back the men." The pipers were then ordered to play a favourite martial air; and the Highlanders, the moment they heard the music, returned and formed with alacrity in the rear. In the late war in India, Sir Eyre Coote, aware of the attachment of the Highlanders to their favourite instrument, gave them L. 50 to buy a pair of bag-pipes after the battle of Porto Nuovo.

Formerly there was a kind of college in the island of Skie where the Highland bag-pipe was taught; the teachers making use of pins stuck into the ground instead of musical notes. This college, however, has been for some time entirely dissolved, and the use of the Highland pipe became much less general than before. At last a society of gentlemen, thinking it perhaps impolitic to allow the ancient martial music of the country to decline, resolved to revive it by giving an annual prize to the best peformers on the instrument. These competitions were first held at Falkirk, but for a good number of years at Edinburgh; where the only surviving member of the ancient college of Skie is now *professor* of bag-pipe music.

The Lowland pipe, as has been already observed, is an instrument essentially different from the Highland pipe; it was reformed and the music improved by George Mackie, who is said to have attended the college of Skie seven years. He had before been the best performer on that instrument in that part of the country where he lived; but, while attending the college at Skie, he adapted the graces of the Highland music to the Lowland pipe. Upon his return, he was heard with astonishment and admiration; but unluckily, not being able to commit his improvements to writing, and indeed the nature of the instrument scarce admitting of it, the knowledge of this kind of music hath continued to decay ever since, and will probably soon wear out altogether. What contributes much to this is, that the bag-pipers, not content with the natural nine notes which their instrument can play easily, force it to play tunes requiring higher notes, which disorders the whole instrument in such a manner as to produce the most horrid discords; and this practice brings, though undeservedly, the instrument itself into contempt.

BAGUETTE, in architecture, a small round moulding, less than an astragal, and so called from the resemblance it bears to a ring.

BAHAMA, or Lucaya, Islands, are the eastermost of the Antilles, lying in the Atlantic ocean. They are situated to the south of Carolina, between 22 and 27 degrees N. Lat. and 73 and 81 degrees W. Long. They extend along the coast of Florida quite down to the

the isle of Cuba, and are said to be 500 in number, some of them only mere rocks; but twelve of them are large, fertile, and in nothing different from the soil of Carolina: all are, however, uninhabited except Providence, which is 200 miles east of the Floridas; though some others are larger and more fertile, on which the English have plantations. Between them and the continent of Florida is the gulf of Bahama, or Florida, through which the Spanish galeons sail in their passage to Europe.

These islands were the first fruits of Columbus's discoveries; but they were not known to the English till 1667, when Captain Seyle, being driven among them in his passage to Carolina, gave his name to one of them; and being a second time driven upon it, gave it the name of *Providence*. The English, observing the advantageous situation of these islands for being a check on the French and Spaniards, attempted to settle them in the reign of Charles II. Some unlucky accidents prevented this settlement from being of any advantage; and the isle of Providence became an harbour for the buccaneers or pirates, who for a long time infested the American navigation. This obliged the government in 1718 to send out Captain Woodes Rogers with a fleet to dislodge the pirates, and for making a settlement. This the captain effected; a fort was erected, and an independent company was stationed in the island. Ever since this last settlement these islands have been improving, though they advance but slowly. In time of war, people gain considerably by the prizes condemned there; and at all times by the wrecks which are frequent in this labyrinth of rocks and shelves. The Spaniards and Americans captured these islands during the last war; but they were retaken by a detachment from St Augustine April 7, 1783.

BAHAR, or Barre, in commerce, weights used in several places in the East Indies.

There are two of these weights; one the great bahar, with which they weigh pepper, cloves, nutmegs, ginger, &c. and contains 550 pounds of Portugal, or about 524 lb. 9 oz. averdupois weight. With the little bahar, they weigh quicksilver, vermilion, ivory, silk, &c. It contains about 437 lb. 9 oz. avoirdupois weight.

BAHAREN, an island in the Persian gulf, situated in E. Long. 50. 0. N. Lat. 26. 0. This island is chiefly remarkable for its pearl-fishery, and has often changed its masters. It fell with Ormus under the dominion of the Portuguese, was again restored to Persia by Thamas Khouli Kan; and after his death the confusion into which his empire was thrown, gave an opportunity to an enterprizing and ambitious Arab of taking possession of the island, where he still maintains his authority. Baharen was famous for its pearl-fishery even at the time when pearls were found at Ormus, Karek, Kashy, and other places in the Persian gulf; but it is now become of much greater consequence; all the other banks having been exhausted, while this has suffered no sensible diminution. The time of fishing begins in April, and ends in October. It is confined to a tract four or five leagues in breadth. The pearls taken at Baharen, though not so white as those of Ceylon or Japan, are much larger than those of the former place, and more regularly shaped than those of the latter. They have a yellowish colour; but have also this good quality, that they preserve their golden hue, whereas the whiter kind lose much of their lustre by keeping, especially in hot countries. The annual revenue from the Baharen pearl-fishery is computed at about L.157,500. The greatest part of the pearls that are uneven, are carried to Constantinople and other parts of Turkey, where the larger go to compose ornaments for head-dresses, and the smaller are used in embroideries. The perfect pearls must be reserved for Surat, whence they are distributed through all Indostan.

BAHI, a province of Lucon or Manila, one of the Philippine islands in the East Indies, belonging to the Spaniards. It is remarkable for producing excellent betel, which the inhabitants, Spaniards as well as natives, perpetually chew from morning till night. It is also the place where most of the ships are built. But the natives suffer much from this work; several hundreds of them being constantly employed in it, on the mountains, or at the port of Cavite. The king allows these labourers a piece-of-eight per month, with a sufficient quantity of rice. The whole province contains about 6000 tributary natives.

BAHIA, de todos los sanctos, a province of Brasil in South America, belonging to the Portuguese, and the richest in the whole country; but unhappily the air and climate do not correspond with other natural advantages: yet so fertile is the province in sugar and other commercial articles, that the Portuguese flock hither not only as it is the seat of affluence, but also of pleasure and grandeur. The capital, called *St Salvador*, or *Cividad de Bachia*, is populous, magnificent, and beyond comparison the most gay and opulent city in Brasil. It stands on a bay in S. Lat. 12. 11. is strong by nature, well fortified, and always defended by a numerous garrison. It contains 12,000 or 14,000 Portuguese, and about three times as many negroes, besides people of different nations who choose to reside in that city.

BAHIR, a Hebrew term signifying *famous or illustrious*; but particularly used for a book of the Jews, treating of the profound mysteries of the caballa, being the most ancient of the Rabinical works.

BAHUS, a strong town of Sweden, and capital of a government of the same name, seated on a rock in a small island, in E. Long. 11. 10. N. Lat. 57. 52.

BAJA, Bayjah, or Begia, a town of the kingdom of Tunis in Africa, supposed to be the ancient *Vacca* of Sallust, and *Oppidum Vaggense* of Pliny. It was formerly, and still continues to be, a place of great trade, and the chief market of the kingdom for corn; of which the adjacent territories produce such abundance, that they can supply more than the whole kingdom with it; and the Tunesians say, that if there was in the kingdom such another town as this for plenty of corn, it would become as cheap as sand. Here is also a great annual fair, to which the most distant Arabian tribes resort with their families and flocks. Notwithstanding all this, however, the inhabitants are very poor, and great part of the land about the town remains uncultivated, through the cruel exactions of the government, and the frequent incursions of the Arabs who are very powerful in these parts. The town stands on the declivity of a hill on the road to Constantina, about 10 leagues

Baja, Baiæ.

leagues from the northern coast, and 36 south-west from Tunis; and hath the convenience of being well watered. On the highest part is a citadel that commands the whole place, but is now of no great strength. The walls were raised out of the ruins of the ancient Vacca, and have some ancient inscriptions.

BAJA, a populous town of Hungary, seated on the Danube, in E. Long. 19. 50. N. Lat. 46. 40.

BAIÆ, an ancient village of Campania in Italy, between the promontory of Misenum and Puteoli, on the Sinus Baianus: famous for its natural hot baths, which served the wealthier Romans for the purposes both of medicine and pleasure.—The variety of those baths, the softness of its climate, and the beauty of its landscape, captivated the minds of opulent nobles, whose passion for bathing knew no bounds. Abundance of linen, and disuse of ointments, render the practice less necessary in modern life; but the ancients performed no exercise, engaged in no study, without previous ablutions, which at Rome required an enormous expence in aqueducts, stoves, and attendants: a place therefore, where waters naturally heated to every degree of warmth bubbled spontaneously out of the ground, in the pleasantest of all situations, was such a treasure as could not be overlooked. Baiæ was this place in the highest perfection; its easy communication with Rome was also a point of great weight. Hither at first retired for a temporary relaxation the mighty rulers of the world, to string anew their nerves and revive their spirits, fatigued with bloody campaigns and civil contests. Their habitations were small and modest: but soon increasing luxury added palace to palace with such expedition and sumptuosity, that ground was wanting for the vast demand: enterprising architects, supported by infinite wealth, carried their foundations into the sea, and drove that element back from its ancient limits: it has since taken ample revenge, and recovered much more than it ever lost. From being a place of resort for a season, Baiæ now grew up to a permanent city: whoever found himself disqualified by age, or infirmity, for sustaining any longer an active part on the political theatre; whoever, from an indolent disposition, sought a place where the pleasures of a town were combined with the sweets of a rural life; whoever wished to withdraw from the dangerous neighbourhood of a court, and the baneful eye of informers flocked hither, to enjoy life untainted with fear and trouble. Such affluence of wealthy inhabitants rendered Baiæ as much a miracle of art as it was before of nature; its splendor may be inferred from its innumerable ruins, heaps of marbles, mosaics, stucco, and other precious fragments of taste.—It flourished in full glory down to to the days of Theodoric the Goth, but the destruction of these enchanted palaces followed quickly upon the irruption of the northern conquerors, who overturned the Roman system, sacked and burnt all before them, and destroyed or dispersed the whole race of nobility. Loss of fortune left the Romans neither the means, nor indeed the thought, of supporting such expensive establishments, which can only be enjoyed in perfection during peace and prosperity. No sooner had opulence withdrawn her hand, than the unbridled sea rushed back upon its old domain; moles and buttresses were torn asunder and washed away; whole promontories, with the proud towers that once crowned their brows, were undermined and tumbled headlong into the deep, where, many feet below the surface, pavements of streets, foundations of houses, and masses of walls may still be descried. Internal commotions of the earth contributed also largely to this general devastation; mephitic vapours and stagnated waters have converted this favourite seat of health into the den of pestilence, at least during the estival heats: yet Baiæ in its ruined state, and stripped of all its ornaments, still presents many beautiful and striking subjects for the pencil. E. Long. 14. 45. N. Lat. 41. 6.

Swinburn's Sicily.

Bajador ‖ Bajazet.

BAJADOR, a cape on the west coast of Africa, south of the Canary Islands. W. Long. 15. 20. N. Lat. 27. 0.

BAIANUS SINUS, a bay so called from *Baiæ*, (Suetonius); *Portus Baiarum*, (Pliny); which was enlarged by Augustus, by giving entrance to the sea into the Lacus Lucrinus, and Averni, ordering it to be called *Portus Julius apud Baias*, (Suetonius). We also read *Baianus Lacus* in Tacitus, which some interpret the *Lucrinus*. The modern name is *Golfo di Pozzuolo*. From the highest point that forms the bay, a large castle commands the road, where foreign ships of war usually ride at anchor, the harbour of Naples not being spacious enough for the reception of a fleet: here they enjoy good sheltering, watering, and victualing; but in summer risk the health of their crews, on account of the unwholesomeness of the air.

BAJAZET I. sultan of the Turks, a renowned warrior, but a tyrant, was conquered by Tamerlane, and exposed by him in an iron cage; the fate he had destined (it is said) for his adversary if he had been the victor.

The iron cage, however, so long and so often repeated as a moral lesson, has been rejected as a fable by modern writers, who smile at the vulgar credulity. They appeal to the Persian history of Sherefeddin Ali, of which a French version has been given, and from which Mr Gibbon has collected the following more specious narrative of this memorable transaction. "No sooner was Timour informed that the captive Ottoman was at the door of his tent, than he graciously stepped forwards to receive him, seated him by his side, and mingled with just reproaches a soothing pity for his rank and misfortune. 'Alas!' said the Emperor, 'the decree of fate is now accomplished by your own fault: it is the web which you have woven; the thorns of the tree which yourself have planted. I wished to spare, and even to assist, the champion of the Moslems: you braved our threats, you despised our friendship; you forced us to enter your kingdom with our invincible armies. Behold the event. Had you vanquished, I am not ignorant of the fate which you reserved for myself and my troops. But I disdain to retaliate: your life and honour are secure; and I shall express my gratitude to God by my clemency to man.' The royal captive showed some signs of repentance, accepted the humiliation of a robe of honour, and embraced with tears his son Mousa, who at his request was sought and found among the captives of the field. The Ottoman princes were lodged in a splendid pavilion; and the respect of the guards could be surpassed only by their vigilance. On the arrival of the haram from Boursa, Timour restored the queen Despina and her daughter to their father and husband; but he piously

ously required, that the Servian princess, who had hitherto been indulged in the profession of Christianity, should embrace without delay the religion of the prophet. In the feast of victory, to which Bajazet was invited, the Mogul Emperor placed a crown on his head and a sceptre in his hand, with a solemn assurance of restoring him with an increase of glory to the throne of his ancestors. But the effect of this promise was disappointed by the sultan's untimely death: amidst the care of the most skilful physicians, he expired of an apoplexy at Akshehr, the Antioch of Pisidia, about nine months after his defeat. The victor dropped a tear over his grave; his body, with royal pomp, was conveyed to the mausoleum which he had erected at Boursa; and his son Mousa, after receiving a rich present of gold and jewels, of horses and arms, was invested by a patent in red ink with the kingdom of Anatolia.

Such is the portrait of a generous conqueror, which has been extracted from his own memorials, and dedicated to his son and grandson, 19 years after his decease; and, at a time when the truth was remembered by thousands, a manifest falsehood would have implied a satire on his real conduct. On the other hand, of the harsh and ignominious treatment of Bajazet there is also a variety of evidence. The Turkish annals in particular, which have been consulted or transcribed by Leunclavius, Pocock, and Cantemir, unanimously deplore the captivity of the iron cage; and some credit may be allowed to national historians, who cannot stigmatize the Tartar without uncovering the shame of their king and country."—From these opposite premises, Mr Gibbon thinks a fair and moderate conclusion may be deduced. He is satisfied that Sherefeddin Ali has faithfully described the first ostentatious interview, in which the conqueror, whose spirits were harmonised by success, affected the character of generosity. But his mind was insensibly alienated by the unseasonable arrogance of Bajazet; the complaints of his enemies, the Anatolian princes, were just and vehement; and Timour betrayed a design of leading his royal captive in triumph to Samarcand. An attempt to facilitate his escape by digging a mine under the tent, provoked the Mogul Emperor to impose a harsher restraint; and in his perpetual marches, an iron cage on a waggon might be invented, not as a wanton insult, but as a rigorous precaution. Timour had read in some fabulous history a similar treatment of one of his predecessors, a king of Persia; and Bajazet was condemned to represent the person and expiate the guilt of the Roman Cæsar. But the strength of his mind and body fainted under the trial, and his premature death might without injustice be ascribed to the severity of Timour. He warred not, however, with the dead; a tear and a sepulchre were all that he could bestow on a captive who was delivered from his power; and if Mousa, the son of Bajazet, was permitted to reign over the ruins of Boursa, the greatest part of the province of Anatolia had been restored by the conqueror to their lawful sovereigns.

BAIKAL, a great lake in Siberia, laying between 52 and 55 degrees north latitude. It is reckoned to be 500 wersts in length; but only 20 or 30 broad, and in some places not above 15. It is environed on all sides by high mountains. In one part of it, which lies near the river Bargusin, it throws up an inflammable sulphureous liquid called *Maltha*, which the people of the adjacent country burn in their lamps. There are likewise several sulphureous springs near this lake. Its water at a distance appears of a sea-green colour: it is fresh; and so clear, that objects may be seen in it several fathoms deep. It does not begin to freeze till near the latter end of December, and thaws again about the beginning of May: from which time till September, a ship is seldom known to be wrecked on it; but by the high winds which then blow, many shipwrecks happen. This lake is called by the neighbouring people *Swiatoie More*, or the *Holy Lake;* and they imagine, that when storms happen on it, they will be preserved from all danger by complimenting it with the title of *Sea*. When it is frozen over, people travel upon it in the road to China; but they must be very sharp-shod, otherwise they cannot stand upon the ice, which is exceedingly smooth. Notwithstanding that the ice on this lake is sometimes two ells thick, there are some open places in it to which tempestuous winds will often drive those who are crossing it, in which case they are irrecoverably lost. The camels that pass along have a particular kind of shoes sharp at bottom, and the oxen have sharp irons driven through their hoofs, without which it would be impossible for them to pass. Here are plenty of large sturgeon and pike; with many seals of the black, but none of the spotted kind. It contains several islands; and the borders are frequented by black sables and civet-cats.

BAIL, Ballium, from the French *bailler*, which comes of the Greek βαλλειν, and signifies to deliver into hands), is used in our common law for the freeing or setting at liberty of one arrested or imprisoned upon any action, either civil or criminal, on surety taken for his appearance at a day and place certain.

The reason why it is called *bail*, is because by this means the party restrained is delivered into the hands of those that bind themselves for his forthcoming, in order to a safekeeping or protection from prison; and the end of bail is to satisfy the condemnation and costs, or render the defendant to prison.

With respect to bail in civil cases, it is to be observed, that there is both common and special bail. Common bail is in actions of small concernment, being called *common*, because any sureties in that case are taken; whereas in causes of greater weight, as actions upon bonds, or specialty, &c. where the debt amounts to 10l. *special* bail or surety must be taken, such as subsidy men at least, and they according to the value.

The commitment of a person being only for safe custody, wherever bail will answer the same intention, it ought to be taken; as in most of the inferior crimes: but in felonies, and other offences of a capital nature, no bail can be a security equivalent to the actual custody of the person. For what is there that a man may not be induced to forfeit, to save his own life? and what satisfaction or indemnity is it to the public, to seize the effects of them who have bailed a murderer, if the murderer himself be suffered to escape with impunity? Upon a principle similar to which, the Athenian magistrates, when they took a solemn oath never to keep a citizen in bonds that could give three sureties of of the same quality with himself, did it with an exception to such as had embezzled the public money, or been guilty of treasonable practices.

Bail may be taken either in court, or, in some particular cases, by the sheriff or other magistrate; but most usually by the justices of the peace. To refuse or delay to bail any person bailable, is an offence against the liberty of the subject, in any magistrate, by the common law; as well as by the statute Westm. 1. 3. Edw. I. c. 15. and the *habeas corpus* act, 31 Car. II. c. 2. And, lest the intention of the law should be frustrated by the justices requiring bail to a greater amount than the nature of the case demands, it is expressly declared by statute 1 W. & M. st. 2. c. 1. that excessive bail ought not to be required; though what bail shall be called *excessive*, must be left to the courts, on considering the circumstances of the case, to determine. And on the other hand, if the magistrate takes insufficient bail he is liable to be fined, if the criminal doth not appear.

In *civil* cases, every defendant is bailable. But it is otherwise in

Criminal matters. Regularly, all offences either against the common law or act of parliament, that are below felony, the offender ought to to be admitted to bail unless it be prohibited by some special act of parliament.—By the ancient common law, before and since the conquest, all felonies were bailable, till murder was excepted by statute: so that persons might be admitted to bail almost in every case. But the statute West. 1. 3 Ed. I. c. 15. takes away the power of bailing in treason, and in divers instances of felony. The statutes 23 Hen. VI. c. 9. and 1 and 2 Ph. and Mar. c. 13. gave farther regulations in this matter: and upon the whole we may collect, that no justices of the peace can bail, 1. Upon an accusation of treason: nor, 2. Of murder: nor 3. In case of manslaughter, if the prisoner be clearly the slayer, and not barely suspected to be so; or if any indictment be found against him; nor 4. Such as, being committed for felony, have broken prison; because it not only carries a presumption of guilt, but is also superadding one felony to another: 5. Persons outlawed: 6. Such as have abjured the realm: 7. Persons taken with the mainour, or in the fact of felony: 8. Persons charged with Arson: 9. Excommunicated persons, taken by writ *de excommunicato capiendo*: all which are clearly not admissible to bail by the justices. Others are of a dubious nature, as, 10. Thieves openly defamed and known: 11. Persons charged with other felonies, or manifest and enormous offences, not being of good fame: and, 12. Accessories to felony, that labour under the same want of reputation. These seem to be in the discretion of the justices, whether bailable or not. The last class are such as *must* be bailed upon offering sufficient surety; as, 13. Persons of good fame, charged with a bare suspicion of manslaughter, or other infamous homicide; 14. Such persons being charged with petit larceny or any felony, not before specified: or, 16. With being accessory to any felony. Lastly, it is agreed, that the court of king's bench (or any judge thereof in time of vacation) may bail for any crime whatsoever, be it treason, murder, or any other offence, according to the circumstances of the case. And herein the wisdom of the law is very manifest. To allow bail to be taken commonly for such enormous crimes, would greatly tend to elude the public justice: and yet there are cases, though they rarely happen, in which it would be hard and unjust to confine a man in prison, though accused even of the greatest offence. The law has therefore provided one court, and only one, which has a discretionary power of bailing in any case: except only, even to this high jurisdiction, and of course to all inferior ones, such persons as are committed by either house of parliament, so long as the session lasts; or such as are committed for contempts by any of the king's superior courts of justice. See Law, Part III. N° xxxvi. 42.

Clerk of the Bails, is an officer belonging to the court of the King's Bench: he files the bail-pieces taken in that court, and attends for that purpose.

Bail, or Bale, in the sea-language. The seamen call throwing the water by hand out of the ship's or boat's hold, *bailing*. They also call those hoops that bear up the tilt of a boat, its *bails*.

BAILIE, in Scots law, a judge anciently appointed by the king over such lands not erected into a regality as happened to fall to the crown by forfeiture or otherwise, now abolished. It is also the name of a magistrate in royal boroughs, and of the judge appointed by a baron over lands erected into a barony. See Law, Part III. N° cxviii. 6, 7.

BAILIFF *(ballivus)*, from the French word *bayliff*, that is, *præfectus provinciæ*: and as the names, so the office itself was answerable to that of France; where there are eight parliaments, which are high courts from whence there lies no appeal, and within the precincts of the several parts of that kingdom which belong to each parliament there are several provinces to which justice is administered by certain officers called *bailiffs*; and in England there are several counties in which justice hath been administered to the inhabitants by the officer who is now called *sheriff* or *viscount* (one of which names descends from the Saxons, the other from the Normans); and though the sheriff is not called *bailiff*, yet it is probable that was one of his names also, because the county is often called *balliva*. And in the statute of Magna Charta, cap. 28. and 14 Ed. 3. c. 9. the word *bailiff* seems to comprise as well sheriffs as bailiffs of hundreds. As the realm is divided into counties, so every county is divided into hundreds; within which in ancient times the people had justice ministered to them by the officers of every hundred. But now the hundred courts, except certain franchises, are swallowed in the county-courts; and the bailiff's name and office is grown into contempt, they being generally officers to serve writs, &c. within their liberties. Though, in other respects, the name is still in good esteem: for the chief magistrates in divers town are called *bailiffs* or *bailies*; and sometimes the persons to whom the king's castles are committed are termed *bailiffs*, as the *bailiff of Dover castle*, &c.

Of the ordinary bailiffs there are several sorts, *viz.* sheriff's bailiffs, bailiffs of liberties, &c.

Sheriff's bailiffs, or sheriff's officers, are either bailiffs of hundreds, or special bailiffs. Bailiffs of hundreds are officers appointed over those respective districts by the sheriffs, to collect fines therein; to summon juries; to attend the judges and justices at the assises, and quarter-sessions; and also to execute writs and process in the ſeveral hundreds. But as theſe are generally plain men, and not thoroughly ſkilful in this latter part of their office, that of ſerving writs, and making arreſts and executions, it is now uſual to join ſpecial bailiffs with them; who are generally mean perſons employed by the ſheriffs on account only of their adroitneſs and dexterity in hunting and ſeizing of their prey.

Bailiffs of liberties are thoſe bailiffs who are appointed by every lord within his liberty, to execute proceſs and do ſuch offices therein as the bailiff errant doth at large in the county; but bailiffs errant or itinerant, to go up and down the county to ſerve proceſs, are out of uſe.

There are alſo bailiffs of foreſts, and bailiffs of manors, who direct huſbandry, fell trees, gather rents, pay quit-rents, &c.

Water Bailiff, an officer appointed in all port-towns, for the ſearching of ſhips, gathering the toll for anchorage, &c. and arreſting perſons for debt, &c. on the water.

BAILII (David), painter of perſpective views and portraits, was the ſon of Peter Bailii, an artiſt of ſome note; and was born at Leyden in 1584. From his father he learned to draw and deſign: but he was afterwards placed under the care of Adrian Verburg, and continued with him for ſome time; and when he quitted that maſter, he ſtudied to much greater advantage with Cornelius Vandervoort, an excellent portrait painter, and with him he ſpent above ſix years. As Vandervoort poſſeſſed many capital paintings of ſome great maſters, Bailii, for his own improvement, copied them with critical care and obſervation; and particularly copied one perſpective view of the inſide of a church, originally painted by Stenwyck, which he finiſhed with ſuch accuracy, that even Stenwyck himſelf could ſcarce determine which was the original, or which the copy, when both were placed before him. He travelled through ſeveral parts of Italy, to ſee the works of the celebrated maſters of that country, and for a few years reſided at Rome; and abroad, as well as in his own country, the correctneſs of his drawing, and the delicate handling and finiſhing of his pictures, procured him employment, admirers, and friends. In the latter part of his life he diſcontinued painting, and only drew portraits on vellum with a pen, which he heightened with black lead, and gave them wonderful force and roundneſs. He died in 1638.

BAILIWICK, that liberty which is exempted from the ſheriff of the county; over which liberty the lord thereof appoints his own bailiff, with the like power within his precinct as an under ſheriff exerciſes under the ſheriff of the county: Or it ſignifies the precinct of a bailiff, or the place within which his juriſdiction is terminated.

BAILLET (Adrian), a very learned French writer and critic, born in 1649, at the village of Neuville near Beauvais in Picardy. His parents were too poor to give him a proper education, which however he obtained by the favour of the Biſhop of Beauvais, who afterwards preſented him with a ſmall vicarage. In 1680, he was appointed librarian to M. de Lamoignon, advocate general to the parliament of Paris; of whoſe library he made a copious index in 35 vols folio, all written with his own hand. He died in 1706, after writing many works, the principal of which are, *A Hiſtory of Holland from* 1609, *to the peace of Nimeguen in* 1679, 4 vols 12mo; *Lives of the Saints*, 3 vols folio, which he profeſſed to have purged from fables; *Jugemens des Sçavans*, which he extended to 9 vols 12mo; and *The Life of Des Cartes*, 2 vols 4to, which he abridged, and reduced to 1 vol. 12mo.

BAILLEUL, a town of France, in the earldom of Flanders, formerly very ſtrong, but now without any fortifications. It has been ſeveral times burnt by accident, and contains now only about 500 houſes. E. Long. 2. 55. N. Lat. 40. 35.

BAILMENT, in law, is a delivery of goods in truſt, upon a contract, expreſſed or implied, that the truſt ſhall be faithfully executed on the part of the bailee. As if cloth be delivered, or (in our legal dialect) bailed, to a taylor to make a ſuit of clothes, he has it upon an implied contract to render it again when made, and that in a workmanly manner. If money or goods be delivered to a common carrier, to convey from Oxford to London, or from Glaſgow to Edinburgh, &c. he is under a contract in law to pay, or carry them to the perſon appointed. If a horſe or other goods be delivered to an inn-keeper or his ſervants, he is bound to keep them ſafely, and reſtore them when his gueſt leaves the houſe. If a man takes in a horſe, or other cattle, to graze and depaſture in his grounds, which the law calls *agiſtment*, he takes them upon an implied contract to return them on demand to the owner. If a pawnbroker receives plate or jewels as a pledge or ſecurity for the repayment of money lent thereon at a day certain, he has them upon an expreſs contract or condition to reſtore them if the pledger performs his part by redeeming them in due time: for the due execution of which contract, many uſeful regulations are made by ſtatute 30 Geo. II. c. 24. And ſo, if a landlord diſtrains goods for rent, or a pariſh officer for taxes, theſe for a time are only a pledge in the hands of the diſtrainers, and they are bound by an implied contract in law to reſtore them on payment of the debt, duty, and expences, before the time of ſale; or when ſold, to render back the overplus. If a friend delivers any thing to his friend to keep for him, the receiver is bound to reſtore it on demand: and it was formerly held, that in the mean time he was anſwerable for any damage or loſs it might ſuſtain, whether by accident or otherwiſe; unleſs he expreſsly undertook to keep it only with the ſame care as his own goods, and then he ſhould not be anſwerable for theft or other accidents. But now the law ſeems to be ſettled on a much more rational footing; that ſuch a general bailment will not charge the bailee with any loſs, unleſs it happens by groſs neglect, which is conſtrued to be an evidence of fraud: but if the bailee undertakes ſpecially to keep the goods ſafely and ſecurely, he is bound to anſwer all perils and damages that may befal them for want of the ſame care with which a prudent man would keep his own.

BAILO; thus they ſtyle at Conſtantinople the ambaſſador of the republic of Venice, who reſides at the Porte. This miniſter, beſides his political charge, acts there the part of a conſul of Venice.

BAINBRIDGE (Dr John), an eminent phyſician and aſtronomer, born at Aſhby de la Zouche in Leiceſterſhire, in 1582. He taught a grammar ſchool for ſome years, and practiſed phyſic, employing his leiſure

hours

hours in astronomy, which was his favourite study: at length he removed to London, was admitted a fellow of the college of physicians, and raised his character by his description of the comet in 1618. The next year Sir Henry Savile appointed him his first professor of astronomy at Oxford; and the masters and fellows of Merton-college made him first junior, and then superior, reader of Linacre's lecture. He died in 1643, having written many works, some of which have never been published: but the MSS. are preserved in the library of Trinity-college, Dublin.

BAIOCAO, a copper-coin, current at Rome, and throughout the whole state of the church, ten of which make a Julio, and an hundred a Roman crown.

BAIRAM, or BEIRAM, a Turkish word which signifies a solemn feast. The Mahometans have two Bairams, the *Great* and the *Little*. The *Little* Bairam is properly that held at the close of the fast Ramazan, beginning with the first full moon in the following month Shawal. This is called in Arabic *Id al Fetz, or the Feast of breaking the fast;* by European writers, *the Turkish Easter*, because it succeeds Ramazan, which is their Lent, more usually the *Great Bairam*, because observed with great ceremony and rejoicing at Constantinople, and through Turkey, for three days, and in Persia for five or six days, at least by the common people, to make themselves amends for the mortification of the preceding month.—The feast commencing with the new moon, the Mahometans are very scrupulous in observing the time when the new moon commences; to which purpose, observers are sent to the tops of the highest mountains, who the moment they spy the appearance of a new moon, run to the city, and proclaim *Muzhdaluk*, "welcome news;" as it is the signal for beginning the festivity.—The *Great Bairam*, is properly that held by the pilgrims at Mecca, commencing on the tenth of Dhu Ihajia, when the victims are slain, and lasting three days. This is called by the Arabs, *Id al adha*, that is, *the feast of sacrifice*, as being celebrated in memory of the sacrifice of Abram, whose son God redeemed with a great victim. By European writers it is called the *Lesser Bairam*, as being less taken notice of by the generality of the people, who are not struck with it, because the ceremonies, it is observed withal, are performed at Mecca, the only scene of the solemnity.——On the feast of Bairam, after throwing little stones, one after another, into the valley of Mina, they usually kill one or more sheep, some a goat, bullock, or even a camel; and after giving a part thereof to the poor, eat the rest with their friends. After this, they shave themselves. The second is a day of rest. On the third, they set out on their return home.

BAIROUT. See BEEROOT.

BAIT, among fishermen, implies a substance proper to be fastened to a hook, in order to catch the different sorts of fish. See FISHING.

BAITING, the act of smaller or weaker beasts attacking and harassing greater and stronger. In this sense we hear of the baiting of bulls or bears by mastiffs, or bull-dogs with short noses, that they may take the better hold.

Utility is pled in justification of *bull-baiting*. This animal is rarely killed without being first baited; the chaffing and exercise whereof makes his flesh tenderer and more digestible. In reality, it disposes it for putrefaction; so that, unless taken in time, baited flesh is soon lost. But a spirit of barbarism had the greatest share in supporting the sport: bulls are kept on purpose, and exhibited as standing spectacles for the public entertainment. The poor beasts have not fair play: they are not only tied down to a stake, with a collar about their necks, and a short rope, which gives them not above four or five yards play; but they are disarmed too, and the tips of their horns cut off, or covered with leather, to prevent their hurting the dogs. In this sport, the chief aim of the dog is to catch the bull by the nose, and hold him down; to which end, he will even creep on his belly: the bull's aim, on the contrary, is, with equal industry, to defend his nose; in order to which, he thrusts it close to the ground, where his horns are also in readiness to toss the dog.—Bull-baiting was first introduced into England as an amusement in the reign of king John, about 1209.

BAJULUS, an ancient officer in the court of the Greek emperors. There were several degrees of bajuli; as, the grand *Bajulus*, who was preceptor to the emperor; and the simple *bajuli*, who were sub-preceptors. The word is derived from the Latin verb *bajulare*, "to carry or bear a thing on the arms or the shoulders;" and the origin of the office is thus traced by antiquaries. Children, and especially those of condition, had anciently, besides their nurse, a woman called *gerula*, as appears from several passages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about and take care of them, who were called *geruli* and *bajuli*, *a gerendo et bajulando*. Hence it is, that governors of princes and great lords, were still denominated *bajuli*, and their charge or government *bajulatio*, even after their pupils were grown too big to be carried about. The word passed in the same sense into Greece.

BAJULUS is also used by Latin writers in the several other senses wherein BAILIFF is used among us.

BAJULUS was also the name of a conventual officer in the ancient monasteries, to whom belonged the charge of gathering and distributing the money and legacies left for masses and obits; whence he was also denominated *bajulus obituum novorum*.

BAKAN, a large and handsome town of Asia in the East Indies, in the kingdom of Ava. E. Long. 98. 0. N. Lat. 19. 35.

BAKER (Sir Richard), author of the Chronicle of the kings of England, was born at Sissingherst, in Kent, about the year 1568. After going through the usual course of academical learning at Hart-hall, in Oxford, he travelled into foreign parts; and upon his return home was created master of arts, and soon after, in 1603, received from king James I. the honour of knighthood. In 1620, he was high sheriff of Oxfordshire; but engaging to pay some of the debts of his wife's family, he was reduced to poverty, and obliged to betake himself for shelter to the Fleet prison, where he composed several books; among which are, 1. Meditations and Disquisitions on the Lord's Prayer. 2. Meditations, &c. on several of the Psalms of David. 3. Meditations and Prayers upon the seven days of the Week. 4. *Cato Variegatus*, or Cato's Moral Distichs varied, &c.—Mr Granger observes, that his Chronicle of the Kings of England was ever more esteemed

by

Baker.

by readers of a lower class than by such as had a critical knowledge of history. The language of it was, in this reign, called polite; and it long maintained its reputation, especially among country gentlemen. The author seems to have been sometimes more studious to please than to inform, and with that view to have sacrificed even chronology itself to method. In 1658, Edward Philips, nephew to Milton, published a third edition of this work, with the addition of the reign of Charles I. It has been several times reprinted since, and is now carried as low as the reign of George I. Sir Richard also translated several works from the French and Italian; and died very poor, in the Fleet prison, on the 18th of February 1645.

Baker (Thomas), an eminent mathematician, was born at Ilton in Somersetshire, about the ye r 1625, and entered at Magdalen-hall, Oxon, in 1640; after which he was vicar of bishop's-Nymmet, in Devonshire, where he wrote The Geometrical Key, or the Gate of Equations unlocked; by which he gained a considerable reputation. A little before his death, the members of the Royal Society sent him some mathematical queries, to which he returned so satisfactory an answer, that they presented him a medal, with an inscription full of honour and respect. He died at Bishop's-Nymmet on the 5th of June 1690.

Baker (Thomas), a very ingenious and learned antiquary, descended from a family ancient and well esteemed, distinguished by its loyalty and affection for the crown, was born at Crook in 1656. He was educated at the free school at Durham, and thence removed to St John's college Cambridge in 1674. He proceeded B. A. 1677; M. A. 1681; was elected fellow March 1679-80; ordained deacon by Bishop Compton of London December 20. 1685; priest by Bishop Barlow of Lincoln December 19. 1686. Dr Watson, tutor of the college, who was nominated, but not yet consecrated bishop of St David's, offered to take him for his chaplain, which he declined, probably on the prospect of a like offer from Lord Crew bishop of Durham, which he soon after accepted. His Lordship collated him to the rectory of Long-Newton in his diocese, and the same county, June 1687; and, as Dr Grey was informed by some of the bishop's family, intended to have given him that of Sedgefield, worth L. 600 or L. 700 a-year, with a golden prebend, had he not incurred his displeasure and left his family for refusing to read King James II.'s declaration for liberty of conscience. The bishop, who disgraced him for this refusal, and was excepted out of King William's pardon, took the oaths to that king, and kept his bishopric till his death. Mr Baker resigned Long-Newton August 1. 1690, refusing to take the oaths; and retired to his fellowship at St John's, in which he was protected till January 20, 1716-17, when, with one and twenty others, he was dispossessed of it. After the passing the Registering Act 1723, he was desired to register his annuity of L. 40, which the last act required before it was amended and explained. Though this annuity, left him by his father for his fortune, with L. 20 *per annum* out of his collieries by his elder brother from the day of his death August 1699, for the remaining part of the lease, which determined at Whitsuntide 1723, was now his whole subsistence, he could not be prevailed on to secure himself against the act. He retained a lively resentment of his deprivations; and wrote himself in all his books, as well as in those which he gave to the college library, *socius ejectus*, and in some *ejectus rector*. He continued to reside in the college as commoner-master till his death, which happened July 2. 1740, of a paralytic stroke, being found on the floor of his chamber. In the afternoon of June 29, being alone in his chamber, he was struck with a slight apoplectic fit; which abating a little, he recovered his senses, and knew all about him, who were his nephew Burton, Drs Bedford and Heberden. He seemed perfectly satisfied and resigned; and when Dr Bedford desired him to take some medicine then ordered, he declined it, saying, he would only take his usual sustenance, which his bed-maker knew the times and quantities of giving: he was thankful for the affection and care his friends showed him; but, hoping the time of his dissolution was at hand, would by no means endeavour to retard it. His disorder increased, and the third day from this seizure he departed. Being appointed one of the executors of his eldest brother's will, by which a large sum was bequeathed to pious uses, he prevailed on the other two executors, who were his other brother Francis and the hon. Charles Montague, to lay out L. 1310 of the money upon an estate to be settled upon St John's college for six exhibitioners. He likewise gave the college L. 100 for the consideration of L. 6 a-year (then only legal interest) for his life; and to the library several choice books, both printed and MS. medals, and coins; besides what he left to it by his will; which were "all such books, printed and MS. as he had, and were wanting there." All that Mr Baker printed was, 1. Reflections on Learning, showing the insufficiency thereof in its several particulars, in order to evince the usefulness and necessity of Revelation, Lond. 1709-10" (which went through eight editions, and Mr Boswell, in his "Method of Study," ranks it among the English classics for purity of style); and, 2. The Preface to Bishop Fisher's Funeral Sermon for Margaret Countess of Richmond and Derby, 1708;" both without his name. Dr Grey had the original MS. of both in his own hands. The latter piece is a sufficient specimen of the editor's skill in antiquities to make us regret that he did not live to publish his "History of St John's college, from the foundation of old St John's house to the present time; with some occasional and incidental account of the affairs of the university, and of such private colleges as held communication or intercourse with the old house or college: collected principally from MSS. and carried on through a succession of masters to the end of Bishop Gunning's mastership, 1670." The original, fit for the press, is among the Harleian MSS. N° 7028. His MS. collections relative to the history and antiquities of the university of Cambridge, amounting to 39 volumes in folio and three in quarto, are divided between the British Museum and the public library at Cambridge; the former possesses 23 volumes, which he bequeathed to the Earl of Oxford, his friend and patron; the latter 16 in folio, and three in quarto, which he bequeathed to the university. Dr Knight styles him "the greatest master of the antiquities of this our university;" and Hearne says, *Optandum est ut sua quoque collectanea de antiquitatibus Cantabrigiensibus juris faciat publici Cl. Backerus, quippe qui eruditione*

Baker. *tione summa judicioque acri et subacto polleat.* Mr Baker intended something like an *Athenæ Cantabrigienses*, on the plan of the *Athenæ Oxonienses*.

BAKER (Henry), an ingenious and diligent naturalist, was born in Fleet-street London, either near the end of the last, or very early in the beginning of the present century. His father's profession is not known; but his mother was, in her time, a midwife of great practice. He was brought up under an eminent bookseller who preceded the elder Dodsley to the business of a bookseller; in which, however, he appears not to have engaged at all after his apprenticeship; or, if he did, it was soon relinquished by him: for though it was in his power to have drawn away all his master's best customers, he would not set up against him. Mr Baker being of a philosophical turn of mind, and having diligently attended to the methods which might be practicable and useful in the cure of stammering, and especially in teaching deaf and dumb persons to speak, he made this the employment of his life. In the prosecution of so valuable and difficult an undertaking, he was very successful; and several of his pupils, who are still living, bear testimony to the ability and good effect of his instructions. He married Sophia, youngest daughter of the famous Daniel Defoe, who brought him two sons, both of whom he survived. On the 29th of January 1740, Mr Baker was elected a fellow of the Society of Antiquaries; and, on the 12th of March following, the same honour was conferred upon him by the Royal Society. In 1744, Sir Godfrey Copley's gold medal was bestowed upon him, for having, by his microscopical experiments on the crystallizations and configurations of saline particles, produced the most extraordinary discovery during that year. Having led a very useful and honourable life, he died at his apartments in the Strand on the 25th of November 1774, being then above 70 years of age. His wife had been dead some time before; and he only left one grandson, William Baker, who was born February 17. 1763, and to whom, on his living to the age of 21, he bequeathed the bulk of his fortune, which he had acquired by his profession of teaching deaf and dumb persons to speak. His furniture, printed books (but not MSS.), curiosities, and collections of every sort, he directed should be sold, which was accordingly done. His fine collection of native and foreign fossils, petrifactions, shells, corals, vegetables, ores, &c. with some antiquities and other curiosities, were sold by auction March 13. 1775, and the nine following days. He was buried, as he desired, in an unexpensive manner, in the church-yard of St Mary-le-strand; within which church, on the south wall he ordered a small tablet to be erected to his memory. "An inscription for it (he said) would probably be found among his papers; if not, he hoped some learned friend would write one agreeably to truth." This friendly office, however, remains as yet to be performed. Mr. Baker was a constant and useful attendant at the meetings of the Royal and Antiquarian Societies, and in both was frequently chosen one of the council. He was peculiarly attentive to all the new improvements which were made in natural science, and very solicitous for the prosecution of them. Several of his communications are printed in the Philosophical Transactions; and, besides the papers written by himself, he was the means, by his extensive correspondence, of conveying to the Society the intelligence and observations of other inquisitive and philosophical men, both at home and abroad. The Society for the encouragement of arts, manufactures, and commerce, is under singular obligations to our worthy naturalist. As he was one of the earliest members of it, so he contributed in no small degree to its rise and establishment. At its first institution he officiated for some time *gratis* as secretary. He was many years chairman of the committee of accounts; and he took an active part in the general deliberations of the Society. He drew up a short account of the original of this society, and of the concern he himself had in forming it; which was read before the society of antiquaries, and would be a pleasing present to the public. Mr Baker was a poetical writer in the early part of his life. His *Invocation of Health* got abroad without his knowledge; but was reprinted by himself in his *Original Poems, serious and humorous*, Part I. 8vo, 1725. Part II. came out in 1726. Among these poems are some tales as witty and as loose as Prior's. He was the author likewise of *The Universe*, a poem intended to restrain the pride of man; which has been several times reprinted. His account of the water polype, which was originally published in the Philosophical Transactions, was afterwards enlarged into a separate treatise, and hath gone through several editions. But his principal publications are, *The Microscope made Easy*, and *Employment for the Microscope*. The first of these, which was originally published in 1742, or 1743, hath gone through six editions. The second edition of the other, which to say the least of it, is equally pleasing and instructive, appeared in 1764. These treatises, and especially the latter, contain the most curious and important of the observations and experiments which Mr Baker either laid before the Royal Society or published separately. It has been said of Mr Baker that *he was a philosopher in little things*. If it was intended by this language to lessen his reputation, there is no propriety in the stricture. He was an intelligent, upright, and benevolent man, much respected by those who knew him best. His friends were the friends of science and virtue: and it will always be remembered by his cotemporaries, that no one was more ready than himself to assist those with whom he was conversant in their various researches and endeavours for the advancement of knowledge and the benefit of society.

BAKER (David-Erskine), son to the former, was a young man of genius and learning. Having been adopted by an uncle, who was a silk-throwster in Spitalfields, he succeeded him in the business; but wanted the prudence and attention which are necessary to secure prosperity in trade. He married the daughter of Mr Clendon, a reverend empiric. Like his father, he was both a philosopher and a poet; and wrote several occasional poems in the periodical collections, some of which were much admired at the time; but so violent was his turn for dramatic performance, that he repeatedly engaged with the lowest strolling companies, in spite of every effort of his father reclaim him. The public was indebted to him for "The Companion to the

the Play-house," in two volumes, 1764, 12mo; a work which, though imperfect, had considerable merit, and showed that he possessed a very extensive knowledge of our dramatic authors; and which has since (under the title of "Biographia Dramatica") been considerably improved by the attention of a gentleman in every respect well qualified for the undertaking.

BAKER, a person whose occupation or business is to bake bread. See the articles BAKING and BREAD.

The learned are in great doubt about the time when baking first became a particular profession and bakers were introduced. It is however generally agreed, that they had their rise in the east, and passed from Greece to Italy after the war with Pyrrhus, about the year of Rome 583. Till which time every housewife was her own baker; for the word *pistor*, which we find in Roman authors before that time, signified a person who ground or pounded the grain in a mill or mortar to prepare it for baking, as Varro observes. According to Athenæus, the Cappadocians were the most applauded bakers, after them the Lydians, then the Phœnicians.—To the foreign bakers brought into Rome, were added a number of freed-men, who were incorporated into a body, or as they called it, a *college*; from which neither they nor their children were allowed to withdraw. They held their effects in common, and could not dispose of any part of them. Each bake-house had a patronus, who had the superintendency thereof; and these patroni elected one out of their number each year, who had superintendence over all the rest, and the care of the college. Out of the body of the bakers were every now and then one admitted among the senators.—To preserve honour and honesty in the college of bakers, they were expresly prohibited all alliance with comedians and gladiators; each had his shop or bake-house, and they were distributed into fourteen regions of the city. They were excused from guardianships and other offices, which might divert them from their employment.—By our own statutes bakers are declared not to be handicrafts. No man for using the mysteries or sciences of baking, brewing, surgery, or writing, shall be interpreted a handicraft. The bakers were a brotherhood in England before the year 1155, in the reign of king Henry II. though the white bakers were not incorporated till 1337, by king Edward III. and the brown bakers not till 1621, in king James I.'s time. Their hall is in Harp-lane, Thames-street; and their court-day on the first Monday of the month.—They make the 19th company; and consist of a warden, 4 masters, 30 assistants, and 140 men on the livery, besides the commonalty.—The French had formerly a great baker, *grand panetier de France*, who had the superintendency of all the bakers of Paris. But since the beginning of this century, they have been put under the jurisdiction of the lieutenant-general *de police*. In some provinces of France, the lord is the only baker in his seigneury; keeping a public oven, to which all the tenants are obliged to bring their bread. This right is called *furnagium*, or *furnaticum*, and makes part of the *bannalite*.

BAKEWELL, a pretty large town of Derbyshire, in England, seated on the river Wye, on the North-side of the Peak. It has a considerable trade in lead. W. Long. 2. 30. N. Lat. 55. 15.

BAKING, the art of preparing bread, or reducing meals of any kind, whether simple or compound, into bread. See the article BREAD.

The various forms of baking among us may be reduced into two, the one for unleavened, the other for leavened bread. For the first, the chief is manchet-baking; the process whereof is as follows. The meal, ground and boulted, is put into a trough; and to every bushel are poured in about three pints of warm ale, with barm and salt to season it. This is kneaded well together, with the hands through the brake; or, for want thereof, with the feet, through a cloth: after which, having lain an hour to swell, it is moulded into manchets; which, scorched in the middle, and pricked up at top, to give room to rise, are baked in the oven by a gentle fire.—For the second, sometimes called *cheat-bread baking*, it is thus: Some leaven (saved from a former batch) filled with salt, laid up to sour, and at length dissolved in water, is strained through a cloth into a hole made in the middle of the heap of meal in the trough; then it is worked with some of the flour into a moderate consistence: this is covered up with meal, where it lies all night; and in the morning the whole heap is stirred up, and mixed with a little warm water, barm, and salt, by which it is seasoned, softened, and brought to an even leaven: it is then kneaded, moulded, and baked, as before.

Method of raising a bushel of flour, with a tea-spoonful of barm; by James Stone, of Amport, in Hampshire.—Suppose you want to bake a bushel of flour, and have but one tea-spoonful of barm. Put your flour into your kneading-trough or trendle; then take about three quarters of a pint of warm water, and take the tea-spoonful of thick steady barm and put it into the water, stir it until it is thoroughly mixed with the water: then make a hole in the middle of the flour large enough to contain two gallons of water, pour in your small quantity; then take a stick about two feet long, (which you may keep for that purpose), and stir in some of the flour, until it is as thick as you would make batter for a pudding: then strew some of the dry flour over it, and go about your usual business for about an hour: then take about a quart of warm water more, and pour in; for in one hour you will find that small quantity raised so, that it will break through the dry flour which you shook over it; and when you have poured in the quart of warm water, take your stick as before, and stir in some more flour, until it is as thick as before; then shake some more dry flour over it, and leave it for two hours more, and then you will find it rise and break through the dry flour again; then you may add three quarts or a gallon of water more, and stir it in the flour and make it as thick as at first, and cover it with dry flour again; in about three or four hours more you may mix up your dough, and then cover it up warm; and in four or five hours more you may put it into the oven, and you will have as light bread as though you had put a pint of barm. It does not take above a quarter of an hour more time than the usual way of baking, for there is no time lost but that of adding water three or four times.

The author of this method assures us, that he constantly bakes this way in the morning about six or seven o'clock, puts the flour out, and puts this small quantity of barm into the before-mentioned quantity of water, in an hour's time some more, in two hours more

Baking, Bakou. a greater quantity, about noon makes up the dough, and about ſix in the evening it is put into the oven, and he has always good bread, never heavy nor bitter.

When you find, he ſays, your body of flour ſpunged large enough, before you put in the reſt of your water, you ſhould, with both your hands, mix that which is ſpunged and the dry flour altogether, and then add the remainder of warm water, and your dough will riſe the better and eaſier.

The reaſon he aſſigns why people make heavy bread is, not becauſe they have not barm enough, but becauſe they do not know that barm is the ſame to flour as fire is to fuel; that, as a ſpark of fire will kindle a large body by only blowing of it up, ſo will a thimblefull of barm, by adding of warm water, raiſe or ſpunge any body of flour; for warm water gives freſh life to that which is before at work: ſo that the reaſon of making bread heavy is, becauſe the body ſpunged is not large enough, but was made up and put into the oven before it was ripe.

In regard to the difference of ſeaſons, he preſcribes, that in the ſummer you ſhould put your water blood-warm; and in winter, in cold froſty weather, as warm as you can bear your hand in it without making it ſmart; being ſure you cover up your dough very warm in the winter, and your covering of it with dry flour every time you add warm water, will keep in the heat; when you have added ſix or eight quarts of warm water, as before mentioned, in ſuch a gradual way, you will find all that body of flour which is mixed with the warm water, by virtue of that one tea-ſpoonful of barm, brought into great agitation, waxing or fermenting; for it is to the flour what the ſpirit is to the body, it ſoon fills it with motion.

BAKOU, or Baku, a town of Perſia, in the province of Shirvan, ſituated at the extremity of the Gulf of Ghilan on the Caſpian Sea. It is eſteemed the moſt commodious haven in this ſea, as veſſels may there ride ſecurely at anchor in ſeven fathom water; but the number of ſhoals, iſlands, and ſand-banks, render the entrance in ſome places extremely difficult and dangerous, particularly to the Ruſſians, who are not very expert ſailors. Baku is a fortreſs ſurrounded with high brick walls; its inhabitants, like thoſe of Derbent, are Perſians, Tartars, and a few Armenian merchants. The principal articles of exportation which ſupport the trade of this place are naphtha, and the fineſt rock ſalt, of both which there are mines on the eaſt ſide of the bay. The inhabitants cultivate ſaffron and the cotton tree, but not to any conſiderable advantage. The trade of Baku, though more valuable than that of Derbent, is ſtill conſiderable, and chiefly carried on with Shamakee, from whence it draws raw ſilk and ſilken ſtuffs. A Ruſſian conſul is reſident at this place. In 1777 Baku belonged to Melik-Mehmed, who was tributary to Feth Ali, khan of Kuba; the latter poſſeſſed the whole province of Shirvan, and was the moſt powerful prince, next to the khan of Ghilan, upon the coaſt of the Caſpian. Before we quit the province of Shirvan, it may not be improper to mention its capital, the inland town of Shamakee, which is only 66 miles from Baku, and ſupplies that port with raw ſilk and ſilken ſtuffs. It owed its former commercial importance to the ſilk which is cultivated in the neighbouring diſtrict; this rich production ſtill preſerves the town from ruin; though its traffic is greatly reduced by the exorbitant exactions of the khan of Kuba. Formerly the Ruſſians had a factory at this place; and it was alſo crowded with Turkiſh and Greek merchants; but at preſent there are only a few Armenian and Indian traders. The inhabitants manufacture ſilk and cotton ſtuffs, but far inferior to thoſe made at this place in the beginning of the preſent century. The ſilk of this province is exported into the interior part of Perſia, Turkey, Georgia, and Ruſſia. E. Long. 51. 30. N. Lat. 40. 20.

Balaam. BALAAM, a prophet and diviner of the city of Pethor upon the Euphrates, whoſe practices with Balak king of the Moabites are recorded in the book of Numbers, chap. xxii. It is a queſtion much debated among divines, whether Balaam was a true prophet of God, or no more than a magician or fortune-teller. The Jews indeed are generally of opinion, that he was a buſy and pretending aſtrologer, who, obſerving when men were under a bad aſpect of the ſtars, pronounced a curſe upon them; which ſometimes coming to paſs, gained him in ſome neighbouring nations, a reputation in his way. Several of the ancient fathers ſuppoſe him to be no more than a common ſoothſayer, who undertook to tell future events, and diſcover ſecrets, and by no very juſtifiable arts. Origen will needs have it, that he was no prophet, but only one of the devil's ſorcerers, and that of him he went to inquire; but that God was pleaſed to prevent him and put what anſwers he pleaſed into his mouth. It cannot be denied, however, that the ſcripture expreſsly calls him a prophet (2. Pet. ii. 16.); and therefore ſome later writers have imagined that he had once been a good man and true prophet, till loving the wages of iniquity, and proſtituting the honour of his office to covetouſneſs, he apoſtatiſed from God, and betaking himſelf to idolatrous practices, fell under the deluſion of the devil, of whom he learnt all his magical enchantments, though at this juncture, when the preſervation of his people was concerned, it might be conſiſtent with God's wiſdom to appear to him, and vouchſafe his revelations. As to what paſſed between him and his aſs, when that animal was miraculouſly enabled to ſpeak to its maſter; commentators are divided in their opinions concerning this fact, whether it really and literally happened as Moſes relates it; or whether it be an allegory only, or the mere imagination or viſion of Balaam. This indeed is ſo wonderful an inſtance, that ſeveral of the Jewiſh doctors, who, upon other occaſions are fond enough of miracles, ſeem as if they would hardly be induced to aſſent to this. Philo, in his *Life of Moſes*, paſſes it over in ſilence; and Maimonides pretends that it happened to Balaam in a prophetic viſion only. But St Peter (2 Pet. ii. 16.) ſpeaks of this fact as literal and certain, and ſo all interpreters explain it. St Auſtin, who underſtands it exactly according to the letter, finds nothing in the whole account more ſurpriſing than the ſtupidity of Balaam, who heard his aſs ſpeak to him, and anſwered it as if he talked with a reaſonable perſon. He is of opinion, that this diviner was accuſtomed to prodigies like this, or that he was ſtrangely blinded by his avarice, not to be ſtopped by an event of ſo extraordinary a nature. Le Clerc thinks, that Balaam might probably have imbibed the doctrine of tranſmigration of souls, which was certainly very common in the east; and from thence he might be the less astonished at hearing a brute speak. And Dr Patrick thinks, that Balaam was in such a rage and fury at the supposed perverseness of his beast crushing his foot, that for the present he could think of nothing else; though the conciseness of Moses's relation, who must be presumed to have omitted many circumstances, which if rightly known would dispel this and many more difficulties that may be imagined in this transaction, does certainly furnish us with a better and more satisfactory answer. St Austin is of opinion, that God had not given the ass a reasonable soul; but permitted it to pronounce certain words, in order to reprove the prophet's covetousness. Gregory of Nyssa seems to think that the ass did not utter any word articulately or distinctly; but that, having brayed as usual, the diviner, whose practice it had been to draw presages from the cries of beasts and singing of birds, comprehended easily the ass's meaning by its noise; Moses designing to ridicule this superstitious art of augurs and soothsayers, as if the ass really spoke in words articulate.

We must own, says Calmet, that this is a miraculous fact related by an inspired writer, whose authority we are not allowed to call in question in the least particular: but we should study such ways of explaining it as are most conformable to reason, and most proper to solve the difficulties of it, without attacking the truth of the history. Now it is very possible for God to make an ass speak articulately; it is indeed miraculous, and above the ordinary faculty of this animal, but not against the laws of nature.

BALADAN, the scripture name for a king of Babylon (Isa. xxxix. 1. 2 Kings xx. 12.), called by prophane authors *Belesus* or *Belesis*, *Nabonassar* or *Nanybrus*. Baladan at first was no more than governor of Babylon; but entering into a confederacy with Arbaces governor of Media, and rebelling against Sardanapalus king of Assyria, these two generals marched against him with an army of 400,000 men, and were beat in three different battles. But the Bactrians deserting the king, and coming over to Baladan and Arbaces, the rebels attacked the enemy in the night, and made themselves masters of his camp. After this misfortune, Sardanapalus retreated to Nineveh, and left the command of his army to his brother-in-law Salamenes. The conspirators attacked Salamenes, and defeated him in two great battles; after which they laid siege to Nineveh. Sardanapalus sustained the siege for three years; but the Tigris, in the third year, overflowing its banks, beat down twenty furlongs of the walls; whereupon the conspirators entered the city and took possession of it, after Sardanapalus had burnt himself and all his most valuable effects upon a funeral pile erected for that purpose in his palace. Baladan was acknowledged king of Babylon, as Arbaces was of Media. Berodach-baladan, who sent embassadors to Hezekiah (2 Kings xx.), was the son of Baladan.

BALA, a town of Merionethshire in Wales. W. Long. 3. 37. N. Lat. 52. 54.

BALÆNA, or WHALE, in zoology, a genus of the mammalia class, belonging to the order of cete. The characters of this genus are these: the balæna, in place of teeth, has a horny plate on the upper jaw, and a double fistula or pipe for throwing out water. The species are four, *viz.*

1. The mysticetus, or common whale, which has many turnings and winding in its nostrils, and has no fin on the back. This is the largest of all animals; it is even at present sometimes found in the northern seas 90 feet in length; but formerly they there were taken of a much greater size, when the captures were less frequent, and the fish had time to grow. Such is their bulk within the arctic circle; but in those of the torrid zone, where they are unmolested, whales are still seen 160 feet long. The head is very much disproportioned to the size of the body, being one third the size of the fish: the under lip is much broader than the upper. The tongue is composed of a soft spongy fat, capable of yielding five or six barrels of oil. The gullet is very small for so vast a fish, not exceeding four inches in width. In the middle of the head are two orifices, through which it spouts water to a vast height, and with a great noise, especially when disturbed or wounded. The eyes are not larger than those of an ox, and when the crystalline humour is dried, it does not appear larger than a pea. They are placed towards the back of the head, being the most convenient situation for enabling them to see both before and behind; as also to see over them, where their food is principally found. They are guarded by eye-lids and eye-lashes, as in quadrupeds; and they seem to be very sharp-sighted.

1 Common whale.

2 Description, &c.

Nor is their sense of hearing in less perfection; for they are warned at great distances of any danger preparing against them. It would seem as if nature had designedly given them these advantages, as they multiply little, in order to continue their kind. It is true, indeed, that the external organ of hearing is not perceptible, for this might only embarrass them in their natural element; but as soon as the thin scarf-skin after mentioned is removed, a black spot is discovered behind the eye, and under that is the auditory canal, that leads to a regular apparatus for hearing. In short, the animal hears the smallest sounds at very great distances, and at all times, except when it is spouting water; which is the time that the fishers approach to strike it. What is called *whalebone*, adheres to the upper jaw; and is formed of thin parallel laminæ, some of the longest four yards in length: of these there are commonly 350 on each side, but in very old fish more; about 500 of them are of length fit for use, the others being too short. They are surrounded with long strong hair, not only that they may not hurt the tongue, but as strainers to prevent the return of their food when they discharge the water out of their mouths.—The real bones of the whale are hard, porous, and full of marrow. Two great strong bones sustain the upper lip, lying against each other in the shape of an half-moon.

The tail is broad and semilunar; and when the fish lies on one side, its blow is tremendous. The tail alone it makes use of to advance itself forward in the water; and it is surprising to see with what force and celerity its enormous bulk cuts through the ocean. The fins are only made use of for turning in the water, and giving a direction to the velocity impressed by the tail. The female also makes use of them, when pursued, to bear off her young, clapping them on her back, and supporting

ſupporting them by the fins on each ſide from falling. The whale varies in colour; the back of ſome being red, the belly generally white. Others are black, ſome mottled, others quite white; according to the obſervation of Martin, who ſays, that their colours in the water are extremely beautiful, and that their ſkin is very ſmooth and ſlippery. The outward or ſcarf ſkin of the whale is no thicker than parchment; but this removed, the real ſkin appears, of about an inch thick, and covering the fat or blubber that lies beneath: this is from eight to twelve inches in thickneſs; and is, when the fiſh is in health, of a beautiful yellow. The muſcles lie beneath; and theſe, like the fleſh of quadrupeds, are very red and tough. The penis is eight feet in length, incloſed in a ſtrong ſheath. The teats in the female are placed in the lower part of the belly.

3 Mutual fidelity of the male and female.

In copulation, the female joins with the male, as is aſſerted, *more humano;* and once in two years feels the acceſſes of deſire. Their fidelity to each other exceeds whatever we are told of, even the conſtancy of birds. Some fiſhers, as Anderſon informs us, having ſtruck one of two whales, a male and a female, that were in company together, the wounded fiſh made a long and terrible reſiſtance: it ſtruck down a boat with three men in it, with a ſingle blow of its tail, by which all went to the bottom. The other ſtill attended its companion, and lent it every aſſiſtance; till at laſt, the fiſh that was ſtruck, ſunk under the number of its wounds; while its faithful aſſociate, diſdaining to ſurvive the loſs, with great bellowing, ſtretched itſelf upon the dead fiſh, and ſhared his fate.—

4 Offspring; parental affection, &c.

The whale goes with young nine or ten months, and is then fatter than uſual, particularly when near the time of bringing forth. It is ſaid that the embryo, when firſt preceptible, is about 17 inches long, and white; but the cub, when excluded, is black, and about 10 feet long. She generally produces one young one, and never above two. When ſhe ſuckles her young, ſhe throws herſelf on one ſide on the ſurface of the ſea, and the young one attaches itſelf to the teat.

Nothing can exceed the tenderneſs of the female for her offspring; ſhe carries it with her wherever ſhe goes, and, when hardeſt purſued, keeps it ſupported between her fins. Even when wounded, ſhe ſtill claſps her young one; and when ſhe plunges to avoid danger, takes it to the bottom; but riſes ſooner than uſual, to give it breath again. The young ones continue at the breaſt for a year; during which time, they are called by the ſailors, *ſhort-heads*. They are then extremely fat, and yield above 50 barrels of blubber. The mother at the ſame time is equally lean and emaciated. At the age of two years they are called *ſtunts*, as they do not thrive much immediately after quitting the breaſt: they then yield ſcarce above 20 or 24 barrels of blubber; from that time forward they are called *ſkull-fiſh*, and their age is wholly unknown.

5 Are gregarious.

Every ſpecies of whale propagates only with thoſe of its own kind, and does not at all mingle with the reſt: however, they are generally ſeen in ſhoals, of different kinds together, and make their migrations in large companies from one ocean to another. They are gregarious animals; which implies their want of mutual defence againſt the invaſions of ſmaller, but more powerful, fiſhes. It ſeems aſtoniſhing, therefore, how a ſhoal of theſe enormous animals find ſubſiſtence together, when it would ſeem that the ſupplying even one with food would require greater plenty than the ocean could furniſh. To increaſe our wonder, we not only ſee them herding together, but uſually find them fatter than any other animals of whatſoever element. We likewiſe know that they cannot ſwallow large fiſhes, as their throat is ſo narrow, that an animal larger than an herring could not enter.

6 Their food.

How then do they ſubſiſt and grow ſo fat? A certain ſort of ſmall ſnail, or (as Linnæus ſays) the *meduſa* * or ſea-blubber, is ſufficient for this ſupply. Content with this ſimple food, it purſues no other animal, leads an inoffenſive life in its element, and is harmleſs in proportion to its ſtrength to do miſchief.

7 Inoffenſiveneſs.

8 Enemies.

As the whale is an inoffenſive animal, it is not to be wondered that it has many enemies, willing to take advantage of its diſpoſition, and inaptitude for combat. There is a ſmall animal, of the ſhell-fiſh kind, called the *whale-louſe*, that ſticks to its body, as we ſee ſhells ſticking to the foul bottom of a ſhip. This inſinuates itſelf chiefly under the fins; and whatever efforts the great animal makes, it ſtill keeps its hold, and lives upon the fat, which it is provided with inſtruments to arrive at.

The ſword-fiſh †, however, is the whale's moſt terrible enemy. "At the ſight of this little animal," ſays Anderſon, "the whale ſeems agitated in an extraordinary manner; leaping from the water as if with affright: wherever it appears, the whale perceives it at a diſtance, and flies from it in the oppoſite direction. I have been myſelf," continues he, "a ſpectator of their terrible encounter.

6 Conflict with the ſword-fiſh.

The whale has no inſtrument of defence except the tail: with that it endeavours to ſtrike the enemy; and a ſingle blow taking place, would effectually deſtroy its adverſary: but the ſword-fiſh is as active as the other is ſtrong, and eaſily avoids the ſtroke; then bounding into the air, it falls upon its great ſubjacent enemy, and endeavours not to pierce it with its pointed beak, but to cut with its toothed edges. The ſea all about it is ſeen dyed with blood, proceeding from the wounds of the whale; while the enormous animal vainly endeavours to reach its invader, and ſtrikes with its tail againſt the ſurface of the water, making a report at each blow louder than the noiſe of a cannon." In calm weather, the fiſhermen lie upon their oars as ſpectators of this combat, until they perceive the whale at the laſt gaſp: then they row towards him; and his enemy retiring at their approach, they enjoy the fruits of the victory. This account, however, is different in ſeveral reſpects from that commonly given by ſeamen; who report, that a fiſh called the *Threſher* (a ſpecies of SQUALUS), is in league with the *ſword-fiſh;* and that the former keeps on the back of the whale, while the latter wounds it underneath in the belly, which occaſions him to riſe to the ſurface of the water, and to give the threſher an opportunity of aſſiſting in the combat. This he does by throwing himſelf into an erect poſture; and like a *boy* tumbling neck over heels, falls down with aſtoniſhing force on the back of his prey: And thus they go on till the poor whale is deſtroyed. The grampus, and other large fiſhes of the cetaceous order, are attaked and deſtroyed by the ſame enemies in a ſimilar manner.—The whale has another deſperate enemy, a kind of ſhark, of different ſizes from one to three fathoms; ſo voracious, that it

* See *Meduſa*.

† See *Xiphias*.

tears large pieces of fleſh from the whale, as if they had been dug with ſhovels.

10 Anecdotes of the whale-trade.

To view theſe animals in a commercial light, we muſt obſerve, that the Engliſh were late before they engaged in a whale-fiſhery: it appears by a ſet of queries, propoſed by an honeſt merchant in the year 1575, in order to get information in the buſineſs, that they were at that time totally ignorant of it, being obliged to ſend to *Biſkaie for men ſkilful in the catching of the whale, and ordering of the oil, and one cooper ſkilful to ſet up the ſtaved caſk*. This ſeems very ſtrange; for by the account Octher gives of his travels to King Alfred, near 700 years before that period, it is evident that he made that monarch acquainted with the Norwegians practiſing the whale-fiſhery; but it ſeems all memory of that gainful employ, as well as of that able voyager Octher, and all his important diſcoveries in the north, were loſt for near ſeven centuries.

Hackluyt's Col. of Voy. I. 414.

It was carried on by the Biſcayeners long before the Engliſh attempted the trade; and that for the ſake not only of the oil but alſo of the whalebone, which they ſeem to have long trafficked in. The earlieſt notice we find of that article in their trade is by Hackluyt, who ſays it was brought from the Bay of St Laurence by an Engliſh ſhip that went there for the *barbes* and *fynns* of whales and train oil, A. D. 1594, and who found there 700 or 800 *whale fynnes*, part of the cargo of two great *Biſkaine* ſhips, that had been wrecked there three years before. Previous to that, the ladies ſtays muſt have been made of ſplit cane, or ſome tough wood, as Mr Anderſon obſerves in his Dictionary of Commerce; it being certain that the whale fiſhery was carried on, for the ſake of the oil, long before the diſcovery of the uſe of whalebone.

The great reſort of theſe animals was found to be on the inhoſpitable ſhores of Spitzbergen, and the European ſhips made that place their principal fiſhery, and for numbers of years were very ſucceſsful: the Engliſh commenced that buſineſs about the year 1598, and the town of Hull had the honour of firſt attempting that profitable branch of trade. At preſent it ſeems to be on the decline, the quantity of fiſh being greatly reduced by the conſtant capture for ſuch a vaſt length of time: ſome recent accounts inform us, that the fiſhers, from a defect of whales, apply themſelves to ſeal fiſhery, from which animals they extract an oil. This we fear will not be of very long continuance; for theſe ſhy and timid creatures will ſoon be induced to quit thoſe ſhores by being perpetually harraſſed, as the morſe or walrus has already in a great meaſure done. We are alſo told, that the poor natives of Greenland begin even now to ſuffer from the decreaſe of the ſeal in their ſeas, it being their principal ſubſiſtence; ſo that, ſhould it totally deſert the coaſt, the whole nation would be in danger of periſhing through want.

Pennant's Brit. Zool. 8vo, III. 53. &c.

In old times the whale ſeems never to have been taken on the Britiſh coaſts, but when it was accidentally flung aſhore: it was then deemed a royal fiſh, and the king and queen divided the ſpoil; the king aſſerting his right to the head, her majeſty to the tail.—For the manner of taking whales, ſee *Whale Fishery*.

11 Other ſpecies.

2. The phyſalus, or fin-fiſh, is diſtinguiſhed from the common whale by a fin on the back, placed very low and near the tail. The length is equal to that of the common kind, but much more ſlender. It is furniſhed with whale-bone in the upper jaw, mixed with hairs, but ſhort and knotty, and of little value. The blubber alſo on the body of this kind is very inconſiderable. Theſe circumſtances, added to its extreme fierceneſs and agility, which renders the capture very dangerous, cauſe the fiſhers to neglect it. The natives of Greenland, however, hold it in great eſteem, as it affords a quantity of fleſh which to their palate is very agreeable. The lips are brown, and like a twiſted rope: the ſpout-hole is as it were ſplit in the top of its head, through which it blows water with much more violence, and to a greater height, than the common whale. The fiſhers are not very fond of ſeeing it, for on its appearance the others retire out of thoſe ſeas. Some writers conjecture this ſpecies to have been the Φυσαλος, and *phyſeter*, or blowing-whale of Oppian, Ælian, and Pliny: but ſince thoſe writers have not left the leaſt deſcription of it, it is impoſſible to judge which kind they meant; for in reſpect to the faculty of ſpouting out water, or blowing, it is not peculiar to any one ſpecies, but common to all the whale kind. The phyſalus inhabits the European and American oceans: it feeds upon herrings and other ſmall fiſh.

3. The boops, or pike-headed whale, has a double pipe in its ſnout, three fins like the former, and a hard horny ridge on its back. The belly is full of longitudinal folds or rugæ. It frequents the northern ocean. The length of that taken on the coaſt of Scotland, as remarked by Sir Robert Sibbald, was 46 feet, and its greateſt circumference 20. This ſpecies takes its name from the ſhape of its noſe, which is narrower and ſharper-pointed than that of other whales.

4. The muſculus has a double pipe in its front, and three fins; the under jaw is much wider than the upper one. It frequents the Scotch coaſts, and feeds upon herrings.

Linnæus makes the phyſeter and delphinus, which are ranked among the whales by ſome writers, two diſtinct genera. See Physeter and Delphinus.

BALAGATE, a province of the Mogul empire, and the largeſt of the three that compoſe the kingdom of Dekkan. It has Kandiſh and Barar to the north, Tellinga to the eaſt, Baglana with part of Guzerat to the weſt, and Viſiapur to the ſouth. It is a fruitful and pleaſant country, abounding with cotton and ſugar. Here they have ſheep without horns; but ſo ſtrong, that when bridled and ſaddled they will carry boys of ten years of age. Its preſent capital is Aurengabad, but formerly was Dowlet Abad; and from the latter the whole province is ſometimes called *Dowlet-Abad*.

Balagate Mountains, a chain of mountains which divides the coaſt of Malabar from that of Coromandel, running almoſt the whole length of the peninſula on this ſide the Ganges. Some parts of them are covered with fine red earth, which is blown by the ſtrong weſt winds as far as the iſland of Ceylon; and when the rays of the ſun are reflected from theſe mountains, they ſeem to be all on fire. They make ſurpriſing alterations in the ſeaſons; for on the north ſide of cape Comorin, it is winter in May, June, July, Auguſt, and September, in which months it is ſummer on the ſouth ſide of the cape; on one ſide there are continual tempeſts, thunder and lightning, while the other enjoys a conſtant ſerenity. When black clouds are gathered about

about the mountains, they are followed by sudden rain, which causes the overflowing of the rivers, and choaks them up with sand, insomuch that they are unnavigable for some time afterwards. The buildings and clothes of the inhabitants are scarce sufficient to defend them from the weather. They live upon rice, milk, roots, and herbs, with very little meat: they have likewise a sort of small arrac, but are never given to drunkenness; nor do they import foreign vices, for they never travel abroad.

BALAGNIA, a town of Muscovy, in the province of little Novogorod, seated on the Wolga. E. Long. 45. 5. N. Lat. 50. 36.

BALAGUER, a city of Catalonia in Spain, seated on the north bank of the river Segra, at the foot of a high mountain, on which there was formerly a fortress. E. Long. 0. 48. N. Lat 41. 38.

BALAMBUAN, or PADAMBUAN, a strong town of Asia in the Indies on the east end of the island of Java, and capital of a territory of the same name. E. Long. 115. 30. S. Lat. 7. 50.

BALANCE, or BALLANCE, one of the six simple powers in mechanics, principally used in determining the equality or difference of weights in heavy bodies, and consequently their masses or quantity of matter.

The balance is of two kinds: the ancient and the modern. The ancient or Roman called also the *statera Romana*, or steel-yard, consists of a lever or beam, moveable on a centre, and suspended near one of its extremities; the bodies to be weighed or applied on one side of the centre; and their weight is shown by the division marked on the beam, where the weight, which is moveable along the lever, keeps the steel-yard *in equilibrio*. This balance is still frequently used in weighing heavy bodies.

The modern balance now generally used consists of a lever or beam suspended exactly in the middle, having scales or basons hung to each extremity. The lever is called the *jugum* or *beam*; and the two moieties thereof on each side the axis, the *brachia* or *arms*. The line on which the beam turns, or which divides its brachia, is called the *axis*; and when considered with regard to the length of the brachia, is esteemed a point only, and called the *centre of the balance*; the handle whereby it is held, or by which the whole apparatus is suspended, is called *trutina*; and the slender part perpendicular to the beam, whereby either the equilibrium or preponderancy of bodies is indicated, is called the *tongue* of the balance. Thus in fig. 3. *a b* is the beam, divided into two equal brachia or arms by the white spot in the centre, which is the axis or centre of the balance, and *c* is the tongue. The trutina, on which the axis is suspended, is not represented in this figure, in order to render the other parts more conspicuous.

Plate XCI.

It follows, from what has been observed, therefore, that in the Roman balance, the weight used for a counterpoise is the same, but the point of application varies; in the common balance the counterpoise is various, and the point of application the same. The principle on which each is founded, may be very easily understood from the following observations, and the general properties of the lever. See LEVER.

The beam A B (fig. 6), is a lever of the first kind; but instead of resting on a fulcrum, is suspended by something fastened to its centre of motion: consequently the mechanism of the balance depends on the same theorems as the lever.

Hence as the quantity of matter in known weight is to its distance from the centre of motion, so its distance of the unknown weight to its quantity of matter. Hence the nature and use of the steel-yard is easily known. Let AB (fig. 6.) represent an instrument of this kind; *a*, the trutina or handle on which the beam turns; *k*, a ring on which the balance may be supended on a nail or hook; *f*, the hook on which the body to be weighed is hung; *c*, a collar or guard by which the hook *f* is fastened to the beam; *g*, a moveable collar; *h*, a swivel; *i*, the counterpoise. From what has been said it evidently follows, that if the body to be weighed be fastened to the hook *f*, and the whole supended to the ring *k*, the division on which the counterpoise is placed to maintain an equilibrium in the balance, will show the weight of the body required; provided the weight of the counterpoise *i* be known, and the large divisions, 1, 2, 3, &c. be equal to the distance between the centre of the balance and the screw which fastens the guard *c* to the shorter arm of the balance. It will also be necessary that the steel-yard itself, with its whole apparatus, exclusive of the counterpoise, be *in equilibrio*, when suspended on the ring *k*. If the body to be weighed be heavier than the divisions on the longer arm will indicate, the balance is turned the lower side upwards, and suspended on the other ring *b*; by which means the divisions become shorter, because the distance between the trutina *d*, and the screw on which the guard *c* moves, is less: the divisions in the figure on this side extending to 17, whereas they extend only to 6 on the other. It will be unnecessary perhaps to observe, that the same precaution, with regard to the centre of gravity when the balance is suspended, is also necessary when this side of the balance is used, as we before mentioned with regard to the other.

We have already observed, that in the common scales the two brachia or arms of the balance, *e f*, *e g*, fig. 4. are equal to each other, and consequently equal weights placed in the scales *d d*, will be *in equilibrio* when the balance is suspended on its centre *e*, as in the figure, where the ring at the extremity of the trutina is hung on the tapering rod *a b*, fixed in the foot or basis *c*.

The Deceitful BALANCE, or that which cheats by the inequality of its brachia, is founded on the same principle as the steel-yard. Let there be, for example, a balance so constructed, that both the brachia with their scales should equiponderate, but that the length of the one arm should be to that of the other as 10 to 9. In this case, a weight of nine pounds put into the longest arm, will counterpoise one of ten pounds put into the shorter one: but the cheat is immediately discovered by shifting the weight from one scale to the other; in which case, the balance will no longer remain in *equilibrio*.

Assay-BALANCE, a very nice balance used in docimastical operations, to determine exactly the weight of minute bodies; see fig. 7. This balance should be made of the best steel, and of the hardest kind; because

that

that metal is not so easily spoiled with rust as iron; and it is more apt than any other to take a perfect polish, which at the same time prevents the rust.

The structure of the assayer's scale is little different from that of common scales, otherwise than by its nicety and smallness. The longer the beam of it is, the more exact may the weight of a body be found; however, 10 or 12 inches are a sufficient length. Let the thickness of it be so little, that two drams may hardly be hung at either of its extremities without its bending; for the largest weight put upon it seldom exceeds one dram. The whole surface of this beam must be altogether without ornaments, which only increase the weight and gather dust, &c. The beam is suspended in a fork, the two legs of which are steel springs joined at top, but kept together below with a brass pliant clasp, parallel, and two lines and a half distant from each other. This clasp being taken off, and the legs of the fork being stretched out, the axis of the beam may be put into two holes made for that purpose at the ends of the legs, or be taken away from them. Let a very sharp needle be fixed in the head of the fork, standing perpendicularly downwards, if the fork is suspended, and so long, as that it may almost touch the top of the tongue of the beam put into the fork when in equilibrio. This needle is the mark of the equilibrium; and that the artists may be able to observe this, the legs of the fork must be broader in that place, and have an opening two or three lines wide; this fork may be adorned at pleasure, provided the motion of the balance is not hindered by such ornaments; then take two scales made of thin plate of silver, one inch and a half in diameter, hanging on three small silk strings, almost as long as the beam tied together at top, with a silver hook in form of an S, and hang them to the extremities of the beam: a smaller silver dish or blued steel, somewhat less than one inch in diameter, belongs to each of these scales. You first put into these dishes, with a pair of pincers, the bodies to be weighed, or with a spoon or small shovel, when they are pounded, and then you put them into the scales; therefore the small dishes must be perfectly equal in weight. We use them, that bodies may be more conveniently put into and taken out of the scales, and that these which are vastly thin may not be bent or soiled, and thence rendered false by wiping.

This balance is suspended on a moveable brass or copper support, which consists of a pedestal, and of a column set upon it about 20 inches high, at the top of which comes out at right angles an arm one inch long. At the extremity of this arm, put a small pulley three lines in diameter, another at the top of the column, and a third near the bottom of it; all which pullies must turn very easily on their axes. At the distance of one inch and a half below the upper arm, let another arm one inch and a half long come out of the column at right angles, having a hole through it two lines long, a quarter of a line broad, and placed perpendicularly below the pulley of the upper arm, to receive a small plate, one inch and a half long; and of such breadth and thickness as that it may freely move up and down, and yet not have too much play within the hole. This plate must also have a small hook at each extremity.

And as such a balance will hardly stand still in the open air, and becomes false when spoiled with dust; it must be put, together with its supports, into a small case as represented in fig. 7. having glasses, *a*, *a*, *a*, at top, and all round it, that you may see what is within.

*Manner of using the assay-*BALANCE.—Pass a silk string over the three pullies of the support, and tie it at its upper extremity to the small hook introduced into the hole of the inferior arm; then put the support in the middle of the small case, and pass the other extremity of the silk string below, through a hole bored in the middle of the lower part of the frame, containing the window in the fore part of the case, and fasten it to a small weight of a cubic form. Suspend the fork of the balance on the inferior hook of the plate. By this means if you move backwards and forwards the weight fastened to the string, placed upon the top of the drawer jutting out beyond the fore-part of the case, the balance within is either lifted up or let down. But you must put the bodies to be weighed, and the weights themselves, in the small silver dishes; and these, when loaded, into the scales, thro' the side-windows, which must be opened for that purpose. When any thing is to be added to or taken out of them, you do it with the small pincers; or, if it is powder, with the small shovel or spoon: but you must let the balance down every time any thing is to be added or taken away, that the scales may rest upon the bottom of the case; and shut the windows before the balance is lifted up again, especially if the air is not perfectly calm.

Hydrostatic BALANCE, an instrument contrived to determine accurately the specific gravity of both solid and fluid bodies. It is constructed in various forms; but we shall content ourselves here with describing that which appears of all others the most accurate.

VCG, (fig. 5) is the stand or pillar of this hydrostatic balance, which is to be fixed in a table. From the top A, hangs, by two silk strings, the horizontal bar B B, from which it is suspended by a ring *i*, the fine beam of a balance *b*; which is prevented from descending too low on either side by the gently springing piece *txyz*, fixed on the support M. The harness is annulated at *o*, to show distinctly the perpendicular position of the examen, by the small pointed index fixed above it.

The strings by which the balance is suspended, passing over two pullies, one on each side the piece at A, go down to the bottom on the other side, and are hung over the hook at *v*; which hook, by means of a screw P, is moveable about one inch and a quarter, backward and forward, and therefore the balance may be raised or depressed so much. But if a greater elevation or depression be required, the sliding piece S, which carries the screw P, is readily moved to any part of the square brass rod VK, and fixed by means of a screw.

The motion of the balance being thus adjusted, the rest of the apparatus is as follows. HH is a small board, fixed upon the piece D, under the scales d and e, and is moveable up and down in a low slit in the pillar above C, and fastened at any part by a screw behind. From the point in the middle of the bottom of each scale, hangs, by a fine hook, a brass wire *ad* and *ae*. These pass through two holes *m m* in the table

table. To the wire *a d* is suspended a curious cylindric wire, *r s*, perforated at each end for that purpose: this wire *r s* is covered with paper, graduated by equal divisions, and is about five inches long.

In the corner of the board at E, is fixed a brass tube, on which a round wire *h l* is so adapted as to move neither too tight nor too free, by its flat head I. Upon the lower part of this moves another tube Q, which has sufficient friction to make it remain in any position required: to this is fixed an index T, moving horizontally when the wire *h l* is turned about, and therefore may be easily set to the graduated wire *r s*. To the lower end of the wire *r s* hangs a weight L; and to that a wire *p n*, with a small brass ball *g* about one-fourth of an inch diameter. On the other side, to the wire *a c*, hangs a large glass bubble R, by a horse-hair.

Let us first suppose the weight L taken away, and the wire *p n* suspended from S: and, on the other side, let the bubble R be taken away, and the weight F suspended at *c*, in its room. This weight F we suppose to be sufficient to keep the several parts hanging to the other scale in equilibrium; at the same time that the middle point of the wire *p n* is at the surface of the water in the vessel N. The wire *p n* is to be of such a size, that the length of one inch shall weigh four grains.

Now it is evident, since brass is eight times heavier than water, that for every inch the wire sinks in the water it will become half a grain lighter, and half a grain heavier for every inch it rises out of the water: consequently, by sinking two inches below the middle point, or rising two inches above it, the wire will become one grain lighter or heavier. Therefore, if, when the middle point is at the surface of the water in equilibrium, the index T be set to the middle point *a* of the graduated wire *r s*, and the distance on each side *a r* and *a s* contains 100 equal parts; then if, in weighing bodies the weight is required to the hundredth part of a grain, it may be easily had by proceeding in the following manner.

Let the body to be weighed be placed in the scale d. Put the weight X in the scale e; and let this be so determined, that one grain more shall be too much, and one grain less too little. Then the balance being moved gently up or down, by the screw P, till the equilibrium be nicely shown at *o*; if the index T be at the middle point *a* of the wire *r s*, it shows that the weights put into the scale e are just equal to the weight of the body. By this method we find the absolute weight of the body: the relative weight is found by weighing it hydrostatically in water, as follows.

Instead of putting the body into the scale e, as before, let it hang with the weight F, at the hook *c*, by a horse-hair, as at R, supposing the vessel O of water were away. The equilibrium being then made, the index T standing between *a* and *r*, at the 36 division, shows the weight of the body put in to be 1095,36 grains. As it thus hangs, let it be immersed in the water of the vessel O, and it will become much lighter: the scale e will descend till the beam of the balance rest on the support *z*. Then suppose 100 grains put into the scale d restore the equilibrium precisely, so that the index T stand at the 36 division above *a*; it is evident that the weight of an equal bulk of water would, in this case be exactly 100 grains.

After a like manner this balance may be applied to find the specific gravity of liquids as is easy to conceive from what has been said.

Balance of Trade. That which is commonly meant by the balance of trade, is the equal importing of foreign commodities with the exporting of the native. And it is reckoned that nation has the advantage in the balance of trade, which exports more of the native commodities, and imports less of the foreign. The reason of this is, that, if the native commodities be of a greater value than are imported, the balance of that account must be made up in bullion or money: and the nation grows so much richer, as the balance of that account amounts to.

Balance of a Clock, or *Watch,* is that part which regulates the beats. See *Clock-Making.*

Balance-Fish. See Squalus.

BALANCER, in the history of insects, a style, or oblong body, ending in a protuberance or head, found under each wing of the two-winged flies; these serve to poise the body of the fly.

BALANCING, among seamen, the contracting a sail into a narrower compass, in a storm, by retrenching, or folding up a part of it at one corner: this method is used in contradistinction to reefing, which is common to all the principal sails; whereas balancing is peculiar to few, such as the mizen of a ship, and the main-sail of those vessels wherein it is extended by a boom. See Boom and Reef.—The balance of the mizen is thus performed: the mizen yard is lowered a little, then a small portion of the sail is rolled up at the peek or upper corner, and fastened to the yard about one-fifth inward from the outer end or yard-arm toward the mast. See Mizen.—A boom main-sail is balanced, after all its reefs are taken in, by rolling up a similar portion of the hindmost or aftmost lower corner called the *clue*, and fastening it strongly to the boom, having previously wrapped a piece of old canvas round the part (which is done in both cases) to prevent the sail from being fretted by the cord which fastens it.

BALANUS, in zoology, the trivial name of a species of lepas. See Lepas.

BALANSTINES, in botany. See Punica.

BALAYAN, a province of the island of Manila in the East Indies, belonging to the Spaniards.—It lies next to the city of Manila, and extends along the coast on the east side of the island, a little beyond the bay of Batangas. There were formerly gold mines in it, but they have been long since abandoned. It is inhabited by about 2500 tributary Indians, and abounds in cotton, rice, and palm-trees. The province is well cultivated; and the Spaniards, generally speaking, have country-houses in it.

BALBASTRO, a principal town of Spain, in the kingdom of Arragon, and capital of a district of the same name. E. Long. 0. 20. N. Lat. 41. 50.

BALBEC, a city of Asia in Syria, anciently called *Heliopolis*, and by the Arabians the *wonder of Syria.* It is situated at the foot of Anti-Lebanon, precisely on the last rising ground where the mountain terminates in the plain. As we arrive from the south we dis-

Balbec. discover the city only at the distance of a league and a half, behind a hedge of trees over the verdant tops of which appears a white edging of domes and minarets. After an hour's journey we reach these trees, which are very fine walnuts; and soon after, crossing some ill-cultivated gardens, by winding paths, arrive at the entrance of the city. We there perceive a ruined wall flanked with square towers, which ascends the declivity to the right, and traces the precincts of the ancient city. This wall, which is only ten or twelve feet high, permits us to have a view of those void spaces and heaps of ruins which are the invariable appendage of every Turkish city; but what principally attracts our attention is a large edifice on the left, which, by its lofty walls and rich columns, manifestly appears to be one of those temples which antiquity has left for our admiration. These ruins, which are some of the most beautiful and best preserved of any in Asia, merit a particular description.

To give a just idea of them, we must suppose ourselves descending from the interior of the town. After having crossed the rubbish and huts with which it is filled, we arrive at a vacant place which appears to have been a square; there, in front, towards the west, we perceive a grand ruin, which consists of two pavilions ornamented with pilasters, joined at their bottom angle by a wall 160 feet in length. This front commands the open country from a sort of terrace, on the edge of which we distinguish with difficulty the bases of twelve columns, which formerly extended from one pavilion to the other and formed a portico. The principal gate is obstructed by heaps of stones; but, that obstacle surmounted, we enter an empty space, which is an hexagonal court of 180 feet diameter. This court is strewed with broken columns, mutilated capitals, and the remains of pilasters, entablatures, and cornices; around it is a row of ruined edifices which display all the ornaments of the richest architecture. At the end of this court, opposite the west is an outlet, which formerly was a gate through which we perceive a still more extensive range of ruins, whose magnificence strongly excites curiosity. To have a full prospect of these, we must ascend a slope, up which were the steps to this gate; and we then arrive at the entrance of a square court, much more spacious than the former, being 350 wide and 336 in length. The eye is at first attracted by the end of this court, where six enormous and majestic columns render the scene astonishingly grand and picturesque. Another object not less interesting is a second range of columns to the left, which appear to have been part of the peristyle of a temple; but before we pass thither, we cannot refuse particular attention to the edifices which inclose this court on each side. They form a sort of gallery which contains various chambers, seven of which may be reckoned in each of the principal wings, viz. two in a semicircle and five in an oblong square. The bottom of these apartments still retains pediments of niches and tabernacles, the supporters of which are destroyed. On the side of the court they are open, and present only four and six columns totally destroyed. It is not easy to conceive the use of these apartments; but this does not diminish our admiration at the beauty of their pilasters and the richness of the frize of the entablature. Neither is it possible to avoid remarking the singular effect which results from the mixture of the garlands, the large foliage of the capitals, and the sculpture of wild plants with which they are every where ornamented. In traversing the length of the court, we find in the middle a little square esplanade, where was a pavilion, of which nothing remains but the foundation. At length we arrive at the foot of the six columns; and then first conceive all the boldness of their elevation and the richness of their workmanship. Their shafts are 21 feet eight inches in circumference and 58 high; so that the total height, including the entablature, is from 71 to 72 feet. The sight of this superb ruin, thus solitary and unaccompanied, at first strikes us with astonishment; but, on a more attentive examination, we discover a series of foundations which mark an oblong square of 268 feet in length and 146 wide, and which, it seems probable, was the peristyle of a grand temple, the primary purpose of this whole structure. It presented to the great court, that is to the east, a front of ten columns, with 19 on each side, which with the other six make in all 54. The ground on which it stood was an oblong square, on a level with this court, but narrower than it, so that there was only a terrace of 27 feet wide round the colonnade; the esplanade this produces fronts the open country toward the west, by a sloping wall of about 30 feet. This descent as you approach the city becomes less steep, so that the foundation of the pavilion is on a level with the termination of the hill; whence it is evident that the whole ground of the courts has been artificially raised. Such was the former state of this edifice; but the southern side of the grand temple was afterwards blocked up to build a smaller one, the peristyle and walls of which are still remaining. This temple, situated somewhat lower than the other, presents a side of 13 columns by eight in front (in all 34), which are likewise of the Corinthian order; their shafts are 15 feet eight inches in circumference, and 44 in height. The building they surround is an oblong square, the front of which, turned towards the east, is out of the line of the left wing of the great court. To reach it you must cross trunks of columns, heaps of stone, and a ruinous wall by which it is now hid. After surmounting these obstacles you arrive at the gate, where you may survey the inclosure which was once the habitation of a god; but instead of the awful scene of a prostrate people and sacrifices offered by a multitude of priests, the sky, which is open from the falling in of the roof, only lets in light to show a chaos of ruins covered with dust and weeds. The walls, formerly enriched with all the ornaments of the Corinthian order, now present nothing but pediments of niches and tabernacles, of which almost all the supporters are fallen to the ground. Between these niches is a range of fluted pilasters, whose capitals support a broken entablature; but what remains of it displays a rich frize of foliage resting on the heads of satyrs, horses, bulls, &c. Over this entablature was the ancient roof, which was 57 feet wide and 110 in length. The walls which supported it are 31 feet high, and without a window. It is impossible to form any idea of the ornaments of this roof, except from the fragments lying on the ground; but it could not have been richer

Balbec.

richer than the gallery of the periſtyle: the principal remaining parts contain tablets in the form of lozenges, on which are repreſented Jupiter ſeated on his eagle; Leda careſſed by the ſwan; Diana with her bow and creſcent; and ſeveral buſts which ſeem to be figures of emperors and empreſſes. It would lead us too far to enter more minutely into the deſcription of this aſtoniſhing edifice. The lovers of the arts will find it deſcribed with the greateſt truth and accuracy in a work publiſhed at London in 1757 under the title of *Ruins of Balbec.* This work, compiled by Mr Robert Wood, the world owes to the attention and liberality of Mr Dawkins, who in 1751 viſited Balbec and Palmyra. But ſeveral changes, however, have taken place ſince their journey: for example, they found nine large columns ſtanding, and in 1784 Mr Volney found but ſix. They reckoned 29 at the leſſer temple, but there now remain but 20; the others have been overthrown by the earthquake of 1759. It has likewiſe ſo ſhaken the walls of the leſſer temple, that the ſtone of the ſoffit, or croſs ſtone at the top, of the gate was ſlid between the two adjoining ones, and deſcended eight inches; by which means the body of the bird ſculptured on that ſtone is ſuſpended detached from its wings and the two garlands which hung from its beak and terminated in two genii. Nature alone has not effected this devaſtation; the Turks have had their ſhare in the deſtruction of the columns. Their motive is to procure the iron cramps, which ſerve to join the ſeveral blocks of which each column is compoſed. Theſe cramps anſwer ſo well the end intended, that ſeveral of the columns are not even disjointed by their fall; one, among others, as Mr Wood obſerves, has penetrated a ſtone of the temple wall without giving way; nothing can ſurpaſs the workmanſhip of theſe columns; they are joined without any cement, yet there is not room for the blade of a knife between their interſtices. After ſo many ages, they in general ſtill retain their original whiteneſs. But what is ſtill more aſtoniſhing, is the enormous ſtones which compoſe the ſloping wall. To the weſt the ſecond layer is formed of ſtones which are from 28 to 35 feet long, by about nine in height. Over this layer, at the north-weſt angle, there are three ſtones which alone occupy a ſpace of 175½ feet; viz. the firſt 58 feet ſeven inches: the ſecond 58 feet 11, and the third exactly 58 feet; and each of theſe are 12 feet thick. Theſe ſtones are of a white granite, with large ſhining flakes like gypſe; there is a quarry of this kind of ſtone under the whole city and in the adjacent mountain, which is open in ſeveral places, and among others on the right, as we approach the city. There is ſtill lying there a ſtone, hewn on three ſides, which is 69 feet two inches long, 12 feet 10 inches broad, and 13 feet three in thickneſs. By what means could the ancients move theſe enormous maſſes? This is doubtleſs a problem in mechanics curious to reſolve. The inhabitants of Balbec have a very commodious manner of explaining it, by ſuppoſing theſe edifices to have been conſtructed by *Djenoun*, or genii, who obeyed the orders of King Solomon; adding, that the motive of ſuch immenſe works was to conceal in ſubterraneous caverns vaſt treaſures, which ſtill remain there. To diſcover theſe, many have deſcended into the vaults which range under the whole edifice; but the inutility of their reſearches, added to the oppreſſions and extortions of the governors, who have made their ſuppoſed diſcoveries a pretext, have at length diſheartened them; but they imagine the Europeans would be more ſucceſsful, nor would it be poſſible to perſuade them but what we are poſſeſſed of the magic art of deſtroying taliſmans. It is in vain to oppoſe reaſon to ignorance and prejudice: and it would be no leſs ridiculous to attempt to prove to them that Solomon never was acquainted with the Corinthian order, which was only in uſe under the Roman emperors. But their tradition on the ſubject of this prince may ſuggeſt three important obſervations. Firſt, That all tradition relative to high antiquity is as falſe among the Orientals as the Europeans. With them, as with us, facts which happened 100 years before, when not preſerved in writing, are altered, mutilated, or forgotten. To expect information from them with reſpect to events in the time of David or Alexander, would be as abſurd as to make inquiries of the Flemiſh peaſants concerning Clovis or Charlemagne. Secondly, That throughout Syria, the Mahometans, as well as the Jews and Chriſtians, attribute every great work to Solomon: not that the memory of him ſtill remains by tradition in thoſe countries, but from certain paſſages in the Old Teſtament; which, with the goſpel, is the ſource of almoſt all their tradition, as theſe are the only hiſtorical books read or known; but as their expounders are very ignorant, their applications of what they are told are generally very remote from truth: by an error of this kind they pretend Balbec is *the houſe of the foreſt of Lebanon* built by Solomon; nor do they approach nearer probability when they attribute to that king the well of Tyre and the buildings of Palmyra. Thirdly, That the belief in hidden treaſures has been confirmed by diſcoveries which have been really made from time to time. It is not many years ſince a ſmall coffer was found at Hebron full of gold and ſilver medals, with an ancient Arabic book on medicine. In the country of the Druzes an individual diſcovered likewiſe, ſome time ſince, a jar with gold coin in the form of a creſcent; but as the chiefs and governors claim a right to theſe diſcoveries, and ruin thoſe who have made them, under pretext of obliging them to make reſtoration, thoſe who find any thing endeavour carefully to conceal it; they ſecretly melt the antique coins, nay, frequently bury them again in the ſame place where they found them, from the ſame fears which cauſed their firſt concealment, and which prove the ſame tyranny formerly exiſted in theſe countries.

When we conſider the extraordinary magnificence of the temple of Balbec, we cannot but be aſtoniſhed at the ſilence of the Greek and Roman authors. Mr Wood, who has carefully examined all the ancient writers, has found no mention of it except in a fragment of John of Antioch, who attributes the conſtruction of this edifice to Antoninus Pius. The inſcriptions which remain corroborate this opinion, which perfectly accounts for the conſtant uſe of the Corinthian order, ſince that order was not in general uſe before the third age of Rome; but we ought by no means to allege as an additional proof the bird ſculptured over the gate; for if his crooked beak, large claws, and the

the caduceus he bears, give him the appearance of an eagle, the tuft of feathers on his head, like that of certain pigeons, proves that he is not the Roman eagle: besides that the same bird is found in the temple of Palmyra; and is therefore evidently an Oriental eagle, consecrated to the sun, who was the divinity adored in both these temples. His worship existed at Balbec in the most remote antiquity. His statue, which resembled that of Osiris, had been transported there from the Heliopolis of Egypt, and the ceremonies with which he was worshipped there have been described by Macrobius, in his curious work entitled *Saturnalia*. Mr Wood supposes with reason, that the name of Balbec, which in Syriac signifies *City of Bal*, or of the sun, originated in this worship. The Greeks, by naming it *Heliopolis*, have in this instance only given a literal translation of the oriental word; a practice to which they have not always adhered. We are ignorant of the state of this city in remote antiquity; but it is to be presumed, that its situation, on the road from Tyre to Palmyra, gave it some part of the commerce of these opulent capitals. Under the Romans, in the time of Augustus, it is mentioned as a garrison town; and there is still remaining, on the wall of the southern gate, on the right as we enter, an inscription which proves the truth of this, the words KENTURIA PRIMA, in Greek characters, being very legible. One hundred and forty years after, Antoninus built there the present temple, instead of the ancient one, which was doubtless falling into ruins: but Christianity having gained the ascendency under Constantine, the modern temple was neglected, and afterwards converted into a church; a wall of which is now remaining, that hid the sanctuary of the idols. It continued thus until the invasion of the Arabs, when it is probable, they envied the Christians so beautiful a building. The church being less frequented fell to decay; wars succeeded; and it was converted into a place of defence; battlements were built on the wall which surrounded it, on the pavilions and at the angles, which still subsist; and from that time, the temple, exposed to the fate of war, fell rapidly to ruin. The state of the city is not less deplorable. The wretched government of the emirs of the house of Harfoushe had already greatly impared it, and the earthquake of 1759 completed its destruction. The wars of the Emir Yousef and Djezzar have rendered it still more deserted and ruinous. Of 5000 inhabitants, at which number they were estimated in 1751, not 1200 are now remaining; and all these poor, without industry or commerce, and cultivating nothing but a little cotton, some maize, and water-melons.

BALBINUS (Decimus Cœlius), the Roman emperor, being chosen by the senate in 237, was massacred by the soldiers, who had a dislike to such emperors as were elected only by the senators. This prince was eloquent, and wrote pretty good verses.

BALBOA (Vasco Nugnes de), a Castilian; a celebrated navigator, and one of the first discoverers of South America. He was beheaded by the Spanish governor of St Mary, through jealousy of his growing reputation, in 1517, aged 42.

BALBUS (Lucius Cornelius Theophanes), was born at Cadiz, and distinguished himself by his valour in the war carried on by the Romans in Spain against Sertorius and the Lusitanians; on which account Pompey gave him the privileges of a Roman citizen. He was consul in the 714th year of Rome, and was the first foreigner on whom that dignity was conferred. He was the friend of Pompey, Cæsar, Crassus, and Cicero.—There were many other illustrious Romans of the name of *Balbus*.

BALCONY, in architecture, a projecture in the front of a house, or other building, supported by pillars or consoles, and encompassed with a balustrade.

BALDACHIN, or BALDAQUIN, in architecture, a building in form of a canopy, supported by pillars, and frequently used as a covering to insulated altars. Some also use the term *baldachin* for the shell over a door.

BALDINUCCI (Philip), of Florence; a connoisseur in the polite arts, and the continuator of Vasar's lives of the painters. He died in 1696, aged 72.

BALDIVIA, or VALDIVIA, a sea-port town of Chili, in America, belonging to the Spaniards. It is situated between the rivers Callaculles and Portero, where they fall into the South Sea. W. Long. 80. 5. S. Lat. 40. 5. It was built in 1551 by the Spanish general Baldivia, from whom it takes its name. We may judge of its importance from the sum granted annually by the king for maintaining the garrison and keeping the fortifications in repair, being no less than 300,000 pieces of eight. It is defended by four strong castles, mounting 100 pieces of fine brass cannon. Notwithstanding which, however, as the garrison is composed mostly of transported criminals, on whom no dependance can be placed, and generally ill supplied with ammunition, &c. it could make but a poor defence. In 1643 it was easily taken by the Dutch, who would probably have maintained their conquest against all the power of the Spanish viceroy, had they not been obliged to relinquish it through sickness and famine. The inhabitants of Baldivia amount to about 2000. The trade is less considerable than formerly, because the gold mines in the neighbourhood are shut up; yet several large ships are employed in the trade between this port and that of Lima, which consists of gold, corn, hides, and salt provisions, which are exchanged for slaves, sugar, chocolate, and European commodities and manufactures.

BALDNESS, a defect of hair, chiefly on the sinciput. It differs from *alopecia*, *area*, *ophiasis*, and *tinea*, as these all arise from some vice in the nutritious humour; *baldness*, from the defect of it. When the eyelids shed their hair, it is called a *ptilosis*. Among the causes of baldness, immoderate venery is reputed one of the chief: old age usually brings it on of course. Some will have the proximate cause of baldness to be the dryness of the brain, and its shrinking from the cranium; it having been observed, that in bald persons there is always a vacuity or empty space between the skull and the brain.—*Calvus*, *bald-pate*, was a frequent term of reproach among the Romans; among whom this defect was in great discredit. Hence divers arts to conceal it, as false hair, a *galericulus* contrived on purpose. The later Romans, however, seem to have been recon-

reconciled to baldneſs; for we find among them a kind of officers, or ſervants, called *glabratores*, or *glabrarii*, whoſe buſineſs was to take off the hair from all parts, even from the head. In an ancient inſcription, there is mention of one Diophantus, TI. CÆSARIS ORNATOR GLABR. that is, *Ornator Glabrarius*.

BALDOC, a town of Hertfordſhire, in England, chiefly noted for its trading in malt. W. Long. 0. 10. N. Lat. 51. 55.

BALDOCK (Ralph de), biſhop of London in the reigns of Edward I. and II. was educated at Moreton-college, in Oxford; became dean of St Paul's; was afterwards promoted to the ſee of London; and at laſt was made lord high chancellor of England. He had a very amiable character both for morals and learning; and wrote *Hiſtoria Anglica*, or An Hiſtory of the Britiſh Affairs down to his own time; and, A Collection of the Statutes and Conſtitutions of the church of St Paul. Biſhop Baldock died at Stepney, July 24. 1313.

BALDWIN, archbiſhop of Canterbury, was born of obſcure parents at Exeter, where in the early part of his life, he taught a grammar-ſchool; after which he took orders, and was made archdeacon of Exeter: but he reſigned that dignity, and became a Ciſtertian monk in the monaſtery of Ford in Devonſhire, of which in a few years he was made abbot. In the year 1180, he was conſecrated Biſhop of Worceſter. In 1184, he was promoted to the ſee of Canterbury by Pope Lucius III. and, by his ſucceſſor Urban III. was appointed legate for that dioceſe. He laid the foundation of a church and monaſtery in honour of Thomas Becket, at Hackington, near Canterbury, for ſecular prieſts; but, being oppoſed by the monks of Canterbury and the Pope, was obliged to deſiſt. In 1190 he crowned King Richard I. at Weſtminſter; and ſoon after followed that prince to the holy land, where he died at the ſiege of Ptolemais. Giraldus Cambrenſis, who accompanied him in this expedition, ſays he was of a mild diſpoſition, and of great abſtinence. He wrote various tracts on religious ſubjects, which were collected and publiſhed by Bertrand Tiſſier in 1662.

BALE (John), biſhop of Oſſory in Ireland, was born at Cove, near Dunwich in Suffolk, in the year 1495. At 12 years of age he was entered in the monaſtery of Carmelites at Norwich, and was thence ſent to Jeſus-college in Oxford. He was educated a Roman catholic, but was converted to the Proteſtant religion by Thomas Lord Wentworth. On the death of Lord Cromwell, favourite of Henry VIII. who protected him from the perſecutions of the Romiſh clergy, he was obliged to retire into the Low Countries, where he continued eight years. Soon after the acceſſion of Edward VI. he was recalled; and being firſt preſented to the living of Biſhop's Stocke in Hampſhire, in 1552, he was nominated to the ſee of Oſſory. During his reſidence in Ireland he was remakably aſſiduous in propagating the Proteſtant doctrines; but to very little purpoſe, and frequently at the hazard of his life. Once, in particular, they murdered five of his domeſtics, who were making hay in a meadow near his houſe; and would probably have done the ſame by him, if the ſovereign of Kilkenny had not come to his aſſiſtance with 100 horſe and 300 foot. On the acceſſion of Queen Mary, the tide of oppoſition became ſo powerful, that, to avoid aſſaſſination, he embarked for Holland, but was very unfortunate in his eſcape. Firſt he was taken by a Dutch man of war, and robbed by the captain of all his effects. Then, being forced by ſtreſs of weather into St Ive's in Cornwall, he was confined on ſuſpicion of treaſon. Being however releaſed after a few days confinement, the ſhip anchored in Dover road, where he was again ſeized on a falſe accuſation. After his arrival in Holland, he was kept priſoner for three weeks, and at length obtained his liberty on paying 30 l. From Holland he travelled to Baſil in Switzerland, where he continued till Queen Elizabeth aſcended the throne. After his return to England, he was in 1560 made prebendary of Canterbury, probably not chooſing to return to his former flock of wolves. He died in November 1563, at Canterbury, in the 68th year of his age. He was ſo ſevere a writer againſt the church of Rome, that his books are particularly prohibited in the expurgatory index publiſhed at Madrid, in folio, in the year 1667. He is the earlieſt dramatic writer in the Engliſh language, or at leaſt author of the firſt pieces of that kind that we find in print. Of his writings in that way no fewer than 21 have been enumerated; only three of them, however, have been ſeen in print, *viz.* 1. God's Promiſes, an interlude; 2. St John Baptiſt, an interlude; 3. Concerning the Laws of Nature corrupted: the firſt of which has been reprinted by Dodſley in the firſt volume of his collection of old plays, and the only copy extant of the laſt is preſerved in St Sepulchre's library in Dublin. As to the reſt, they are mentioned by himſelf, as his own, in his account of the writers of Britain before mentioned. He alſo tranſlated the tragedies of Pammachius. His other works are very numerous; but the chief is his catalogue of Britiſh Authors: a book of ſome merit, as it contains ſome information which is not elſewhere to be found; but he has deſtroyed his credit by his intemperate Billingſgate abuſe of all thoſe who differed from him in religion. The authentic part of his work is tranſcribed from Leland. The title of it is, *Illuſtrium Majoris Britanniæ ſcriptorum catalogus, a Japheto ſanctiſſimi Noa filio ad an. Dom.* 1557.

BALE, in commerce. Any goods packed up in cloth, and corded round very tight, in order to keep them from breaking, or preſerve them from the weather, is called *a bale*.—A bale of cotton yarn is from 300 to 400 weight; of raw ſilk, is from 100 to 400; of lockram or dowlas, either three, three and a half, or four pieces.

BALE-goods, among the Engliſh merchants are, all ſuch as are imported or exported in bales; but the French give that name to certain hardwares, and other ſorts of merchandize, which come to Paris, and are commonly made by bad workmen of indifferent materials.

BALEARES INSULÆ, or the *Balearic Iſlands*. The apellation is commonly derived from Βαλλειν, becauſe the inhabitants were excellent ſlingers. But Bochart makes the name of Punic or Phœnician original, as were the people: *Baal-jare*, a maſter, or ſkilful at throwing; the Phœnicians and Hebrews being dexterous at the uſe of the ſling. The Greeks called theſe iſlands *Gymneſiae* (Strabo); becauſe in ſummer the inhabitants went naked (Diodorus, Livy), or rather

ther becaufe only armed with a fling in war (Hefychius). They are two in number, the Greater and the Lefs, or Major and Minor; and hence the modern names *Majorca* and *Minorca*. The Major is diftant from the Minor 30 miles to the weft, in length 40 miles, and in circuit 150 (Pliny). They were fubdued by Quintus Metellus, thence furnamed *Balearicus*, in the year 120 B. C. The Baleares, together with the adjacent iflands, were a part of the Provincia Citerior or Tarraconenfis, and of the refort of the Conventus Carthaginienfis of New Carthage. Thefe iflands are called *Choearades* by Apollonius, and *Choeradades* by Strabo, *i. e.* " rocky." See Majorca and Minorca.

BALEARIC islands. See the preceding article.

BALECHOU (John Jofeph), a very celebrated and well known French engraver, flourifhed about 1750. He died, according to Bafan, fome few years fince at Avignon. This extraordinary artift worked entirely with the graver; and he was perfectly mafter of that inftrument. The clearnefs of his ftrokes, and the depth of colour which he produced, are far beyond any production prior to his own. The two large plates which he did from Vernet, one reprefenting a *ftorm*, the other a *calm*, muft ever be confidered as very aftonifhing exertions of the artift. They are too well known, and too much admired, to need any further eulogium; and were never equalled, until they were perhaps furpaffed by an Englifhman, Mr Woollet.

BALEN (Hendrick Van), hiftory and portrait painter, was born at Antwerp, in 1560, and was a difciple of Adam Van Oort; but he quitted that mafter to acquire a better tafte of defign and compofition, by purfuing his ftudies at Rome, where he refided for a confiderable time. He copied the antiques; he attended to the works of the moft memorable modern artifts; and at his return to his own country, the vifible improvement of his tafte recommended him to the favour and efteem of the ableft judges of the art. He diftinguifhed himfelf by a good manner of defigning, and his works are admitted into the cabinets of the curious, among thofe of the principal painters. He particularly excelled in the naked, and gave to his figures fo much truth, roundnefs, and correctnefs of outline, that few of his cotemporaries could enter into competition with him. Several fine portraits of his hand are at the Hague; among which there is one adorned with allegorical figures of Wifdom and Juftice, which extorts commendation from all who attentively confider it. He died in 1632. All the hiftorical fubjects painted by Van Balen have abundant merit. His defigns of the Deluge, of Mofes ftriking the Rock, and the drowning of Pharaoh, are grand and noble compofitions. Houbraken obferves, that Van Balen, with great judgment, hath introduced the Ifraelites in a clear light in the back-ground, but the Egyptians in a ftrong fhadow in the fore-ground, which had a very fine effect; the figures being well defigned, the attitudes and draperies well chofen, and the number of the figures being very confiderable. Of this painter's hand alfo, the judgment of Paris is accounted a mafterly performance; in which the figure of Venus is fo elegantly defigned, fo full of life, and fo round, that it feems to ftand forth from the furface. The landfcapes and back-grounds of the pictures compofed by Van Balen, were generally painted by the Velvet Breughel.

BALEN (John Van), painter of hiftory, landfcapes, and boys, was born at Antwerp in 1611; and derived his knowledge of the art, and his fine tafte of drawing and defign, from his father Hendrick Van Balen; but, as foon as he had made a competent progrefs, he travelled to Rome, and lived for feveral years in that and other cities of Italy. There he acquired a good gufto of defign, though he was fometimes incorrect; and his particular merit was fhown in his naked figures of boys, cupids, nymphs bathing or hunting, of which fubjects he painted a confiderable number; and he procured both praife and riches by his landfcapes and hiftories. His pictures were well handled, his trees touched with fpirit, and his herbage and verdure looked natural and lively. The carnations of his figures were clear and frefh; his colouring in general was tranfparent; and the airs of his heads were in the manner of Albano.

BALES (Peter), a very extraordinary perfon in his way, and fit to be recorded in a work of this nature. He was a moft famous mafter in the art of Penmanfhip, or fair writing; and one of the firft inventors (for there feems to have been more than one) of fhort-hand writers. He was born in 1547, and is ftyled by Anthony Wood " a moft dexterous perfon in his profeffion, to the great wonder of fcholars and others:" who adds, that " he fpent feveral years in fciences among the Oxonians, particularly as it feems in Gloucefter hall: but that ftudy, which he ufed for a diverfion only, proved at length an employment of profit." He is recorded for his fkill in micrography, or miniature-writing, in Hollinfhed's Chronicle, anno 1575; and Mr Evelyn alfo hath celebrated his wonderful fkill in this delicate operation of the hand. " Hadrian Junius fpeaking as a miracle of fomebody, who wrote the Apoftle's Creed, and the beginning of St John's Gofpel, within the compafs of a farthing; what would he have faid," fays Mr Evelyn, " of our famous Peter Bales; who in the year 1575, wrote the Lord's Prayer, the Creed, Decalogue, with two fhort prayers in Latin, his own name, motto, day of the month, year of the Lord, and reign of the Queen, to whom he prefented it at Hampton Court, all of it written within the circle of a fingle penny, inchafed in a ring and borders of gold; and covered with a chryftal fo accurately wrought, as to be very plainly legible, to the great admiration of her Majefty, the whole Privy Council, and feveral ambaffadors then at Court?" He was farther very dexterous in imitating hand-writing, and, about 1586, was employed by Secretary Walfingham in certain political manœuvres. We find him at the head of a fchool, near the Old Bailey, London, in 1590; in which year he publifhed his " Writing Schoolmafter, in three parts: the firft teaching fwift writing, the fecond, true writing, the third, fair writing." In 1595, he had a great trial of fkill in the Black-friars with one Daniel Johnfon, for a golden pen of 20 l. value, and won it; and a contemporary author farther relates, that he had alfo the arms of Caligraphy given him, which are Azure, a Pen, Or, as a prize, at a trial of fkill in this art among the beft penmen in London. In 1597, he republifhed his " Writing Schoolmafter,"

Schoolmafter," which was in fuch high reputation, that no lefs than eighteen copies of commendatory verfes, compofed by learned and ingenious men of that time, were printed before it. Wood fays, that he was engaged in Effex's treafons in 1600; but Wood was miftaken: he was only engaged, and very innocently fo, in ferving the treacherous purpofes of one of that Earl's mercenary dependents. We know little more of this curious perfon, but that he feems to have died about the year 1610.

BALESTRA (Antonio), an excellent hiftorical painter, was born at Verona in 1666. At the age of 21 he went to Venice, where he entered himfelf in the fchool of Antonio Bellucci, and continued for three years under his direction; but from thence he vifited Bologna and Rome, and at the latter became the difciple of Carlo Maratti. Under the tuition of fo eminent a genius, he made a very great proficiency, and exerted himfelf for fome hours of each day, in defigning after the antiques, after Raphael, Correggio, Annibal Carracci and other admired painters; by which conduct he fo effectually confirmed his tafte and freedom of hand, that he obtained the prize of merit in the academy of St Luke, in the year 1694, when he was only 28 years of age. From that time his reputation was eftablifhed, and he received fufficient encouragement; being engaged to work for moft of the churches, and in the palaces of the nobility, and his paintings were admired in every part of Europe. His ftyle is fweet and agreeable, not unlike that of Maratti; and the judicious obferve in the works of Baleftra, a certain mixture of the feveral manners of Raphael, Correggio, and Carracci. He died in 1740. In the Church of Santa Maria Mater Domini at Venice, there is one of the moft capital performances of Baleftra, reprefenting the nativity of our Saviour. It is defigned in a grand ftyle, the compofition is excellent, and has a great deal of grace. The heads are peculiarly fine; and the whole has a noble effect, with remarkable harmony. In a chapel belonging to the church of S. Geminiano, in the fame city, there is a dead Chrift in the arms of the Virgin, painted by this mafter in a grand tafte; and although the compofition confifts but of a few figures, they are finely defigned; and in every part of it there is a fufficient merit to claim and juftify applaufe.

BALEY (Walter), the fon of Henry Baley of Warnwell in Dorfetfhire, was born at Potfham in the fame county, and educated at Winchefter fchool. From thence he was fent to Oxford; and, after two years probation, was admitted perpetual fellow of New College in the year 1550. Having taken his degrees in arts, he practifed phyfic, and in 1558 was proctor of the univerfity. About this time he obtained a prebend of Wells, which he refigned in 1579. In the year 1561 he was appointed queen's profeffor of phyfic, in 1563 proceeded doctor in that Faculty, and afterwards became one of her majefty's phyficians in ordinary. He was thought fkilful in his profeffion, and had confiderable practice. He died in 1592, aged 63; and was buried in the inner chapel of New College. His works are, 1. *A difcourfe of three kinds of pepper in common ufe*, 1588, 8vo. 2. *Brief treatife of the prefervation of the eye-fight*. Firft printed in the reign of Elizabeth, in 12mo; afterwards at Oxford in 1616 and 1654, 8vo. 3. *Directions for health, natural and artificial; with medicines for all difeafes of the eyes*, 1626, 4to. 4. *Explicatio Galeni de potu convalafcentium et fenum*, &c. manufcript, formerly in Lord Aylefbury's library.

BALI, an ifland of Afia, in the Eaft-Indies, forming the north fide of the ftraits of Java, through which the Eaft-India fhips fometimes return from China to Europe: but the paffage is commonly difficult on account of contrary winds. The ifland is extremely populous, and abounds in rice and other productions proper to the climate. The inhabitants are Pagans, and very warlike. E. Long. 115. 30. S. Lat. Lat. 9. 0.

BALIOL, or Balliol, (Sir John de), founder of Baliol-college, in Oxford, was the fon of Hugh Baliol, of Bernard's caftle, in the diocefe of Durham; and was a perfon very eminent for his power and riches. During the contefts and wars between King Henry III. and his barons, he firmly adhered to the king. In 1263, he began the foundation and endowment of Baliol-college, which was afterwards perfected by his widow. He died in the year 1269.

Baliol, Balliol, or Boilliol, (John), the brother of Alexander king of Scotland, and competitor with Robert Bruce for that crown. See Scotland.

BALISORE, a fea-port town of Afia, in the Eaft Indies, to the northweft of the bay of Bengal. It is about four miles from the fea by land, but 20 by the river; feated in a very fruitful foil, producing rice, wheat, aromatic feeds, tobacco, &c. The inhabitants make feveral fort of ftuffs of cotton, filk, and a kind of grafs. The Englifh, French, and Dutch, have factories here; but they are now of no great account. E. Long. 85. 20. N. Lat. 21. 30.

BALISTES, in ichthyology, a genus of fifhes belonging to the order of amphibia nantes. The characters are thefe: The head is flat; there are eight teeth in each fide, and the two anterior ones are longeft; in the place of gills, the baliftes has an aperture immediately above the pectoral fins; the body is flat, the fcales are joined together by the fkin, and the belly is keeled. The fpecies of this genus are eight, *viz.* 1. The monoceros, whofe head-fin confifts of but one ray, and the tail-rays are carinated. It is called the *unicorn-fifh* by Catefby; who informs us, that the guts of this fifh are full of fmall fhells and coralline fubftances, which by the ftrength and hardnefs of its jaws it is enabled to grind very fmall. Thefe fifh, he adds, are not eat, being accounted poifonous. They moft frequent thofe feas, amongft the Bahama iflands, where the corals are in great plenty. 2. The hifpidus, whofe head-fin is uniradiated; and there is a round black fpot in the tail-fin. The body is rough, and briftly towards the tail. The fpine or horn is fituated between the eyes; the fnout is fubulated; and inftead of a belly-fin, it has a jagged fharp fpine. This fpecies is a native of Carolina. 3. The tomentofus, whofe head fin is biradiated, and the body of it towards the hind part is hairy. It is a native of America. 4. The papillofus, has a biradiated back-fin, and a papillous body. 5. The verrucofus, has a triradiated back-fin; and the tail is full of little warts. In the place of a belly-fin, this fpecies has a large, thick, warty ray. It has 25 fmall reverfed fharp fpines at the fide of the tail, difpofed in four rows. It is a native of India. 6. The aculeatus has a triradiated back-fin; and the spines of the tail lean upon each other. It is also a native of India. 7. The vetula, or old wife, has a triradiated back-fin; the belly-fin is longitudinal, and somewhat carinated; and the tail-fin is forked. It is found at Ascension island. 8. The ringens, has a triradiated back-fin; there are three folds on each side of the head, and the tail-fin is forked. This species is likewise found at Ascension island.

BALIVO AMOVENDO, in law, was a writ for removing a bailiff from his office, for want of having sufficient land in his bailiwick to answer the king and his people, according to the statute of Westminster, 2 reg. Orig. 78.

BALK, among builders, is sometimes used for the summer-beam of a house; sometimes for the poles and rafters, which support the roofs of barns, &c.; and sometimes for the beams used in making sea-holds.

BALK, or *Balkh,* a province of Great Buckharia in Asia, about 360 miles long and 250 broad, situated to the south of the province of Samarkand, and to the east of Bukharia Proper. It is the least of the three provinces that make up what is called *Great Buckharia*; but being extremely fertile and well cultivated, the prince draws a great revenue from it. The country particularly abounds with silk, of which the inhabitants make pretty manufactures. The Uzbecks subject to the khan of Balkh are the most civilized of all the Tartars inhabiting Great Bukharia, owing probably to their commerce with the Persians: they are likewise more industrious, and more honest, than the rest; but in other respects have the same customs with the rest of the Tartars. The province is subdivided into several counties; the most remarkable of which are Khotlan or Katlan, Tokharestan, and Badagshan. Its chief cities are Balk, Fariyab, Talkhan, Badagshan, and Anderab.

BALK, the capital of the abovementioned province, situated on the frontiers of Persia, in E. Long. 65. 20. N. Lat. 37. 0. It is probably the ancient Bactra, capital of the kingdom of Bactria; and is said by the Persians to have been founded by Kay-umarraz the first king of Persia, because he met his brother upon the spot where it stood, after he had been lost for a long time; *balkhiden,* or *balghiden,* in the Persic language, signifying to receive and embrace a friend. The first kings of Persia who resided in the province of Media or *Aderbijan,* considered this city as one of their principal frontiers on the side of Scythia. In the 27th year of the Hegira, of Christ 647, Balk was reduced by the Arabs, under the command of Abdallah Ebn Amer. It continued subject to Arab princes till the year of the Hegira 432, of Christ 1041; when it was reduced by Togrol Beg, the Tangrolipix of the Greeks, and prince of the Seljukian dynasty. It was taken by Jenghiz Khan, A. D. 1221, who with his usual and unparalleled cruelty caused all the inhabitants to be brought without the walls and massacred without mercy. In 1369, Sultan Hosein, the last of the race of Jenghiz Khan was driven from Balkh by Tamerlane, whose successors were driven out by the Uzbecks in the 15th century. It was afterwards redeemed by Shah Ismael Sufi; but finally wrested out of his hands by the Uzbeck Tartars, between whom and the Persians it is the occasion of almost continual wars. It was, not long since, the residence of a khan of Tartars. It is the most considerable city possessed in these parts by the Mahometan Tartars, is large, well built and populous, the houses consisting for the most part of stone or brick. The fortifications consist of bulwarks of earth, fenced without with a strong wall high enough to cover the soldiers employed in defence of those fortifications. As this place is the resort of all the business transacted between the Indies and Great Bukharia, trade flourishes extremely at Balkh; especially as it has a fine river passing through its suburbs, which is of vast service to the town. This river falls into the Amu, in N. Lat. 38. 30. upon the confines of Great Bukharia and Kowarazm. The khan's palace, or castle, is a large edifice built after the oriental manner; and consists almost entirely of marble, of which there are fine quarries in the neighbourhood. The khan of Balk, however, was obliged in 1739 to submit to the Persians under Khouli Kan; but since that time has most probably regained his independency.

BALKERS, in the fishery, persons placed on rocks, and eminences at sea, to spy the herring droves, and give notice to the fishermen, by waving boughs, what way they go, and where they may be found.

BALL, in a general sense, a spherical and round body, whether naturally so, or formed into that figure by art.

BALL, in the military art, comprehends all sorts of bullets for fire-arms, from the cannon to the pistol. Cannon-balls are of iron; musket-balls, pistol-balls, &c. are of lead. The experiment has been tried of iron balls for pistols and fusees; but they are justly rejected, not only on account of their lightness, which prevents them from flying straight, but because they are apt to furrow the barrel of the pistol, &c.

BALL of a Pendulum, the weight at the bottom. In shorter pendulums, this is called the *bob.*

BALL, in pyrotechnics, is also a composition of various combustible ingredients, serving to burn, smoke, give light, &c. In this sense we read of fire-balls, light-balls, smoke-balls, stink-balls, sky-balls, water-balls, land-balls.

BALL, among the Cornish miners, signifies a tin-mine.

BALL, among printers, a kind of wooden tunnel stuffed with wool, contained in a leather cover, which is nailed to the wood, with which the ink is applied on the forms to be wrought off. See PRINTING.

Horse-BALLS, among farriers. Horses have a very nice taste; it is therefore proper to give the more disagreeable drugs in the form of balls, and to make drenches of the more palatable. Balls should be of an oval shape, not exceeding the size of a pullets egg; and should be dipped in sweet oil to make them slip down the easier. Some horses have a strait gullet, which makes them very averse to a ball being thrust down their throats; such horses had better have drenches given them, or their medicines may be mixed with bran, or in their mashes. See FARRIERY, *Passim.*

BALL Vein, in mineralogy, a name given by the miners of Sussex to a sort of iron ore, common there, and wrought to considerable advantage. It yields not any great quantity of metal, but what it has runs freely in the fire; it is uſually found in looſe maſſes, not in the form of a ſtratum, and is often covered with one or more cruſts. It generally contains ſome ſparkling particles; and is uſually of a circular form in the perfect maſſes, thickeſt in the middle, and gradually thinner as it approaches the ſides. The ores of Suſſex in general are poor, but they require very little trouble in the working; ſo that a conſiderable profit is made annually from them.

Ball and Socket is an inſtrument made of braſs, with a perpetual ſcrew, ſo as to move horizontally, vertically, and obliquely; and is generally uſed for the managing of ſurveying and aſtronomical inſtruments.

Puff-Ball, the Engliſh name of the lycoperdon. See Lycoperdon.

Martial Balls, in pharmacy, are a mixture of filings of iron and cream of tartar, formed into a ſolid conſiſtence and form of a ball, which is uſed to impregnate water or other liquids with iron diſſolved by the tartareous acid. To make theſe balls, one part of filings of iron and two parts powdered cream of tartar are mixed well together, and put into an earthen or iron veſſel with ſome water. The mixture is to be ſtirred from time to time till it becomes almoſt dry; and then it is to receive more water, and to be ſtirred as before. This treatment is to be continued till it acquires, when nearly dry, ſomewhat of the conſiſtence and tenacity of ſoftened roſin. Then it is to be rolled up in the form of a ball, which is generally kept tied up in a rag; and when intended to be uſed, it is to be infuſed in water, till it gives ſome colour to that liquid. The infuſion of martial balls is tonic, vulnerary, diſcutient and aperitive; and is employed both internally and externally*. Iron being ſoluble in all acids, is attacked in this preparation by the tartareous acid, which reduces it to a kind of neutral ſalt not cryſtallizable. This ſalt would remain liquid, and would form a ſoluble martial tartar, called *tartariſed tincture of Mars*. If proper proportions of filings of iron and cream of tartar be uſed, and treated long enough for an entire and complete combination, nothing would be obtained but a liquor or magma, which could not be preſerved in a ſolid form, but would be continually moiſt. Therefore, in the martial ball there is a good deal of the cream of tartar and filings of iron not combined together, by which its ſolidity is preſerved.

* See *Iron*.

Mercurial Balls, in pharmacy, are an amalgam of mercury and tin, ſufficiently ſolid to be moulded, and to preſerve a given form. The method of making them is by adding mercury to melted tin, and pouring the fluid maſs into a round hollow mould.—Theſe balls are employed to purify water, in which they are boiled; for which purpoſe travellers often carry ſome along with them. Nothing, however, can be more pernicious than ſuch a practice, ſhould the water contain any nitrous acid, which it very often does.

Balls of Silk worms and Spiders, are little caſes or cones of ſilk, wherein thoſe inſects depoſite their eggs. Spiders are extremely tender of their balls, which they carry about with them adhering to the papillæ about their anus. Grew mentions balls or bags of a ſpecies of ſilk-worms in Virginia, as big as hens eggs, and containing each four aurelias.

Zoologiſts ſpeak of a ſort of balls of hair covered over with a ſmooth ſhining coat, or ſhell found in the ſtomachs of oxen, cows, calves, horſes, ſheep, and goats. See the article Bezoar.

Balls of Fire, in meteorology. See Fire (*Balls of*).

Balls in electricity, are two pieces of cork, or pith of elder, nicely turned in a lathe to the ſize of a ſmall pea, and ſuſpended by fine linen threads; intended as electrometers, and of excellent uſe to diſcover ſmall degrees of electricity, to obſerve the changes of it from poſitive to negative, and *vice verſa*; and to eſtimate the force of a ſhock before the diſcharge, ſo that the operator ſhould always be able to tell very nearly before the diſcharge, by knowing how high he has charged his jars, what the exploſion will be.

Fire-Balls, are bags of canvas filled with gunpowder, ſulphur, ſaltpetre, pitch, &c. to be thrown by the ſoldiers, or out of mortars, in order to fire the houſes incommoding trenches, advanced poſts, or the like.—The Greeks had divers kinds of fire-balls, or Πυροβολοι λιθοι; one kind called more particularly, σκυταλια, or σκυταλιδες, made of wood, ſometimes a foot, or even a cubit long; their heads being armed with ſpikes of iron, beneath which were hemp, pitch, and other combuſtibles, which being ſet on fire, they were caſt among the enemy. The preparations of fire-balls, among the moderns, conſiſt of ſeveral operations, viz. making the bag, preparing the compoſition, tying, and, laſtly, dipping the ball. 1. The bags for this purpoſe are either oval or round. 2. The compoſition wherewith fire-balls are filled is various: To ten pounds of meal-gunpowder add two of ſaltpetre, one of ſulphur, and one of colophony; or, to ſix pounds of gunpowder, add four of ſaltpetre, four of ſulphur, one of powdered glaſs, half a pound of antimony, as much camphor, an ounce of ſal-ammoniac, and four of common ſalt, all pulveriſed. Sometimes they even fill fire-balls with hand granadoes. 3. For tying the fire-balls, they prepare two iron rings, one fitted round the aperture, where the ball is to be lighted, the other near its baſe. A cord is tied to theſe rings in ſuch a manner, as that the ſeveral turns repreſent ſemicircles of the ſphere cutting the globe through the poles: over the cords, extended according to the length of the ball, others are tied, cutting the former at right angles, and parallel to each other, making a knot at each interſection: laſtly, after putting in a leaden bullet, the reſt of the ſpace is filled with tow or paper. 4. Thus completed, the fire-ball remains to be dipped in a compoſition of melted pitch four pounds, colophony two, and linſeed oil or oil of turpentine two; after dipping, they cover it round with tow, and dip again, till it be brought to the juſt diameter required.

Light-Balls, are ſuch as diffuſe an intenſe light around; or they are balls which, being caſt out of the hand or a mortar, burn for ſome time, and illuminate the adjacent parts. 1. Luminous or light-balls for the hand, are made of ground powder, ſaltpetre, brimſtone, camphor, and borax, all ſprinkled with oil, and moulded into a maſs with ſuet; and this is wrapped up in tow, with a ſheet of ſtrong paper over it. To fire it, they make a hole into it with a bodkin, into which they put ſome priming that will burn ſlow. Its uſe is to be caſt into any works they would diſcover in the night-time. 2. For the larger light-balls, or thoſe

those to be thrown to a greater distance, they melt equal quantities of sulphur, turpentine, and pitch; and herein dip an earthen or stone-ball, of a diameter much less than that of the mortar out of which the fire-ball is to be cast; then rolling it in gun-powder, and covering it round with gauze, they dip it again, and repeat the rest till it come to fit the cavity of the mortar: lastly, they sprinkle it around with gun-powder. This, being once kindled, will strongly illuminate all around the place where it is thrown, and give opportunity to examine the state and condition thereof.

Smoke or Dark BALLS, those which fill the air with smoke, and thus darken a place to prevent discoveries. To prepare a darkening ball, make an oval or spherical bag, melt rosin over the coals, and add an equal part of saltpetre not purified, also of sulphur, and a fifth part of charcoal. The whole being well incorporated, put in tow first shred, and fill the bags with this composition, and dip it after the same manner as a fire-ball.

Stink-BALLS, those which yield a great stench where fired to annoy the enemy. Their preparation is thus: Melt ten pounds of pitch, six of rosin, twenty of saltpetre, eight of gun-powder, and four of colophony; to these add two of charcoal, six of horse-hoofs cut small, three of assafœtida, one of stinking-saracen, and any other offensive ingredients. The rest as in the former.

Sky-BALLS, those cast on high out of mortars, and which, when arrived at their height, bursting like rockets, afford a spectacle of decoration. Sky-balls are made of a wooden shell, filled with various compositions particularly that of the stars of rockets. These are sometimes intermixed with crackers and other combustibles, making rains of fire, &c.

Water-BALLS, those which swim and burn a considerable time in the water, and at length burst therein. These are made in a wooden shell, the cavity of which is filled with refined saltpetre, sulphur, saw-dust boiled in water of saltpetre, and dried; to which sometimes other ingredients are added, as iron-filings, Greek pitch, amber dust, powdered glass, and camphor. The ingredients are to be ground, mixed up, and moistened with linseed oil, nut oil, olive oil, hempseed oil, or petrol. At the bottom is placed an iron coffin, filled with whole gunpowder, that the ball may at last burst with a greater noise: and, lastly, the ball is, by the addition of lead or otherwise, made of the same specific gravity with water.

Land-BALLS are those which, being thrown out of a mortar, fall to the ground, burn, and burst there. The ingredients are much the same as in the *water-balls*, only the specific gravity is not attended to.

BALLAGHAN, a town of Ireland, in the county of Sligo, and province of Connaught. W. Long. 9. 50. N. Lat. 53. 48.

BALLAN, a town of France, in the diocese of Mons, with the title of a marquisate, seated on the river Orne. E. Long. 0. 20. N. Lat. 48. 10.

BALLAD, a kind of song, adapted to the capacity of the lower class of people; who, being mightily taken with this species of poetry, are thereby not a little influenced in the conduct of their lives. Hence we find, that seditious and designing men never fail to spread ballads among the people, with a view to gain them over to their side.

BALLAST, an heavy matter, as stone, gravel, iron, &c. thrown into the hold of a ship, in order to make her sink a proper depth in the water, that she may be capable of carrying a sufficient quantity of sail without oversetting.

There is often great difference in the proportion of ballast required to prepare ships of equal burden for a voyage; the quantity being always more or less according to the sharpness or flatness of the ship's bottom, which seamen call the *floor*.

The knowledge of ballasting a ship with propriety, is certainly an article that deserves the attention of the skilful mariner: for although it is known, that ships in general will not carry a sufficient quantity of sail till they are laden so deep that the surface of the water will nearly glance on the extreme breadth amidships, yet there is more than this general knowledge required; since, if she has a great weight of heavy ballast, as lead, iron, &c. in the bottom, it will place the centre of gravity too low in the hold; and although this will enable her to carry a great sail, she will nevertheless sail very heavily, and run the risk of being dismasted by her violent rolling.

To ballast a ship, therefore, is the art of disposing those materials so that she may be duly poised, and maintain a proper equilibrium on the water, so as neither to be too *stiff* nor too *crank*, qualities equally pernicious: as in the first, although the ship may be fitted to carry a great sail, yet her velocity will not be proportionably increased; whilst her masts are more endangered by her sudden jerks and excessive labouring: and in the last, she will be incapable of carrying sail, without the risk of oversetting.

Stiffness, in ballasting, is occasioned by disposing a great quantity of heavy ballast, as lead, iron, &c. in the bottom, which naturally places the centre of gravity very near the keel; and that being the centre, about which the vibrations are made, the lower it is placed, the more violent will be the motion of rolling.

Crankness, on the other hand, is occasioned by having too little ballast, or by disposing the ship's lading so as to raise the centre of gravity too high, which also endangers the mast in carrying sail when it blows hard: for when the masts lose their perpendicular height, they strain on the shrouds in the nature of a lever, which encreases as the sine of their obliquity; and a ship that loses her masts is in great danger of being lost.

The whole art of ballasting, therefore, consists in placing the centre of the gravity to correspond with the trim and shape of the vessel, so as neither to be too high nor too low; neither too far forward nor too far aft, and to lade the ship so deep, that the surface of the water may nearly rise to the extreme breadth amidships; and thus she will be enabled to carry a good sail, incline but little, and ply well to the windward.

Ships are said to be *in ballast* when they have no other loading. Masters of vessels are obliged to declare the quantity of ballast they bear, and to unload it at certain places. They are prohibited unloading their ballast in havens, roads, &c. the neglect of which has ruined

ruined many excellent ports.—Ships and veſſels taking in ballaſt in the river Thames, are to pay ſo much a tun to Trinity-houſe, Deptford; who ſhall employ ballaſtmen, and regulate them; and their lighters to be marked, &c. on pain of 10l.

BALLATOONS, large heavy luggage-boats uſed for carrying wood by the river from Aſtracan and the Caſpian ſea from Moſcow. Theſe will carry from 100 to 200 ton, and have from 100 to 120 men employed to row and tow them along.

BALLENDEN (Sir John), a Scottiſh poet, in the reign of James V. of Scotland, was deſcended from an ancient family in that kingdom. His father, Mr Thomas Ballenden of Auchinoul, was director to the chancery in the year 1540, and clerk-regiſter in 1541. Where our poet was educated, we are not informed; but from one of his poems we learn, that in his youth he had ſome employment at the court of king James V. and that he was in great favour with that prince. Having taken orders, and being created doctor of divinity, at the Sorbonne, he was made canon of Roſs, and archdeacon of Murray. He likewiſe obtained the place of clerk-regiſter, but was afterwards deprived of that employment by the factions of the times; however, in the ſucceeding reign, of Mary, he recovered that office, and was one of the lords of ſeſſion. Being a zealous papiſt, he, in conjunction with Dr Laing, was extremely aſſiduous in retarding the progreſs of the reformation; till at laſt, finding the oppoſition too powerful, he quitted Scotland, and went to Rome, where he died in the year 1550. He is generally eſteemed one of the beſt Scottiſh poets of that age. His works are, 1. *The hiſtory and chronicles of Scotland of Hector Boëis* (Boethius), *tranſlated by Mr John Ballenden*, Edinb. 1536. This is not a mere traſlation, Ballenden having corrected ſeveral miſtakes of his author, and made large additions. It is in folio, and black letter. 2. *Coſmography to the hiſtory of Scotland*, with a poetical proem. 3. *A deſcription of Albany*. 4. *Tranſlation of Boethius's deſcription of Scotland*. 5. *Epiſtles to king James* V. Bale ſays he had ſeen theſe letters. 6. Several poems in Carmichael's collection of Scottiſh poems; beſides many others in manuſcript, in private libraries in Scotland. 7. *Virtue and vyce*, a poem addreſſed to king James V.

BALLET, BALET, or BALETTO, a kind of dramatic poem, repreſenting ſome fabulous action or ſubject divided into ſeveral entries; wherein ſeveral perſons appear, and recite things under the name of ſome deity, or other illuſtrious character.

BALLET is more particularly uſed for a kind of comic dance, conſiſting of a ſeries of ſeveral airs of different kinds of movements, which together repreſent ſome ſubject or action. They are performed chiefly by maſks repreſenting ſylvans, tritons, nymphs, ſhepherds, and the like; and conſiſt of three parts, the entry, figure, and the retreat. The word is of Greek origin, formed from βαλλειν, *jacere*, to caſt, throw, or toſs; whence alſo in writers of the middle age, we find *ballationes* for *ſaltationes*, dancings; and *ballare* for *ſaltare*, to dance.

BALLIAGE, or BAILIAGE, in commerce, a ſmall duty paid to the city of London by aliens, and even denizens, for certain commodities exported by them.

BALLICONNEL, a town of Ireland, in the county of Cavan, and province of Ulſter. W. Long. 7. 45. N. Lat. 54. 6.

BALLISHANNON, a large town of Ireland, in the county of Donegal, or Tyrconnel, with a good haven. W. Long. 8. 25. N. Lat. 54. 25.

BALLISTA, a machine uſed by the ancients for ſhooting darts; it reſembled in ſome meaſure our croſs-bow. The word is Latin, ſignifying a croſs-bow; and is derived foom the Greek, βαλλω, to *ſhoot*, or *throw*.

Vegetius informs us, that the balliſta diſcharged darts with ſuch rapidity and violence, that nothing could reſiſt their force: and Athenæus adds, that Agiſtratus made one of little more than two feet in length, which ſhot darts 500 paces.

In Plate XCVII. is repreſented the balliſta uſed in ſieges, according to the chevalier Folard: 2, 2, the baſe of the balliſta; 3, 4, upright beams; 5, 6, tranſverſe beams; 7, 7, the two capitals in the upper tranſverſe beam, (the lower tranſverſe beam has alſo two ſimilar capitals, which cannot be ſeen in this tranſverſe figure); 9, 9, two poſts or ſupports for ſtrengthening the tranſverſe beams; 10, 10, two ſkains of cords faſtened to the capitals; 11, 11, two arms inſerted between the two ſtrands, or parts of the ſkains; 12, a cord faſtened to the two arms; 13, darts which are ſhot by the balliſta; 14, 14, curves in the upright beams, and in the concavity of which cuſhions are faſtened, in order to break the force of the arms which ſtrike againſt them with great force when the dart is diſcharged; 16, the arbor of the machine, in which a groove or canal perfectly ſtraight is formed, and in which the darts are placed in order to their being ſhot by the balliſta; 17, the nuts of the trigger; 18, the roll or windlaſs, about which the cord is wound; 19, an hook, by which the cord is drawn towards the centre, and the balliſta cocked; 20, a ſtage or table on which the arbor is in part ſuſtained.

BALLISTEUM, or BALLISTRÆA, in antiquity, a military ſong or dance uſed on occaſions of victory. Vopiſcus has preſerved the *balliſteum* ſung in honour of Aurelian, who, in the Sarmatian war, was ſaid to have killed 48 of the enemy in one day with his own hand. *Mille, mille, mille, mille, mille, mille decollavimus: Unus homo mille, mille, mille, mille decollavit; mille, mille, mille vivat, qui mille, mille occidit. Tantum vini habet nemo, quantum fudit ſanguinis.* The ſame writer ſubjoins another popular ſong of the ſame kind: *Mille Francos, mille Sarmatas, ſemel occidimus; mille, mille, mille, mille, mille Perſas quærimus.* It took the denomination *balliſteum* from the Greek βαλλω *jacio*, or *jacto*, to caſt or toſs, on account of the motions uſed in this dance, which was attended with great elevations and ſwingings of the hands. The *balliſtea* were a kind of popular ballads, compoſed by poets of the lower claſs, without much regard to the laws of metre.

BALLOON, or BALLON, in a general ſenſe, ſignifies any ſpherical hollow body, of whatever matter it be compoſed, or for whatever purpoſes it be deſigned. Thus, with chemiſts, balloon denotes a round ſhort-necked veſſel, uſed to receive what is diſtilled by means of fire; in architecture, a round globe on the top of a pillar; and among engineers, a kind of bomb made of paſteboard, and played off in fire-works, either in the air or on the water, in imitation of a real bomb.

Air-Balloon. See Aerostation and *Air-balloon.*

Balloon alfo denotes a kind of game fomething refembling tennis. The balloon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and fro with the ftrength of a man's arm, fortified with a brace of wood.

Balloon, or Balloen, is more particularly ufed among voyagers for the ftate-barges of Siam. The balloons are a kind of brigantine, managed with oars, of very odd figures, as ferpents, fea-horfes, &c. but, by their fharpnefs and number of oars, of incredible fwiftnefs. The balloons are faid to be made of a fingle piece of timber, of uncommon length; they are raifed high, and much decorated with carving at head and ftern: fome are gilt over, and carry 120 or even 150 rowers on each fide. The oars are either plated over with filver, or gilt, or radiated with gold; and the dome or canopy in the middle, where the company is placed, is ornamented with fome rich ftuff, and furnifhed with a balluftrade of ivory, or other coftly matter, enriched with gilding. The edges of the balloon juft touch the water, but the extremities rife with a fweep to a great height. Some are adorned with variety of figures, made of pieces of mother of pearl inlaid: the richer fort, inftead of a dome, carry a kind of fteeple in the middle; fo that, confidering the flendernefs of the veffel, which is ufually 100 or 120 feet long, and fcarce fix broad, the height of the two ends, and of the fteeple, with the load of decorations, it is a kind of miracle they are not overfet.

Balloon, in the French paper-trade, is a term for a quantity of paper, containing 24 reams.

Balloon, Ballon, or Ballot, in the French glafs-trade, fignifies a certain quantity of glafs-plates, fmaller or greater according to their quality. The ballon of white glafs contains 25 bundles, of fix plates per bundle; but the ballon of coloured glafs is only of $12\frac{1}{2}$ bundles, and of three plates to a bundle.

BALLOTA, white horehound: A genus of the gymnofpermia order, belonging to the didynamia clafs of plants: and in the natural method ranking under the 42d order, *Verticillatæ.* The calyx has 5 teeth, with 10 ftriæ; and the upper lip of the corolla is crenated. It is a common weed growing on the fides of banks in moft parts of England, as alfo in walk-places near towns and villages in Scotland; fo is feldom admitted into gardens. The flowers grow in whorls, upon branched peduncles, and lean on one fide of the ftalk; they are commonly of a dull red colour, but fometimes white. It was formerly ufed in hyfteric cafes, but is now fallen into difufe. The Swedes reckon it almoft an univerfal remedy in the difeafes of their cattle. Horfes, cows, fheep, and goats, refufe to eat it.

BALLOTADE, in the menage, the leap of a horfe between two pillars, or upon a ftraight line, made with juftnefs of time, with the aid of the hand and the calves of the legs: and in fuch a manner, that when his fore-feet are in the air, he fhows nothing but the fhoes of his hinder-feet without yerking out.

BALLOTING, a method of voting at elections, &c. by means of little balls ufually of different colours, by the French called *ballots;* which are put into a box privately.

BALLS, or Ballets, in heraldry, a frequent bearing in coats of arms, ufually denominated, according to their colours, bezants, plates, hurts, &c.

BALLUSTER, a fmall kind of pillar ufed for ballustrades.

BALLUSTRADE, a feries or row of ballufters, joined by a rail; ferving as well for a reft to the elbows as for a fence or inclofure to balconies, altars, ftaircafes, &c. See Architecture, n° 74.

BALM, in botany. See Melissa.

Balm, or Balsam. See Balsam.

Balm of Gilead. See Amyris.

BALNAVES (Henry), a Scottifh proteftant divine, born in the fhire of Fife, in the reign of James V. and educated at the univerfity of St Andrew's. He went afterwards to France in order to finifh his ftudies; and returning to Scotland, was admitted into the family of the earl of Arran, who at that time governed the kingdom: but in the year 1542 the earl difmiffed him for having embraced the Proteftant religion. In 1564, he joined, fays Mackenzie, the murderers of cardinal Beaton; for which he was declared a traitor, and excommunicated. Whilft that party were befieged in the caftle of St Andrew's, they fent Balnaves to England, who returned with a confiderable fupply of provifions and money; but being at laft obliged to furrender to the French, he was fent with the reft of the garrifon to France. He returned to Scotland about the year 1559; and having joined the congregation, he was appointed one of the commiffioners to treat with the duke of Norfolk on the part of queen Elizabeth. In 1563 he was made one of the lords of feffion, and appointed by the general affembly, with other learned men, to revife the Book of Difcipline. Knox, his cotemporary, and fellow-labourer, gives him the character of a very learned and pious divine. He died at Edinburgh in the year 1579. He wrote, 1. *A Treatife concerning Juftification.* Edinb. 1550. 8vo. 2. *A Catechifm, or Confeffion of Faith.* Edinb. 1584, 8vo.

BALNEARII servi, in antiquity, fervants or attendants belonging to the baths. Some were appointed to heat them, called *fornicatores;* others were denominated *capfarii,* who kept the cloaths of thofe that went into them; others *aliptæ,* whofe care it was to pull off the hair; others *unctuarii,* who anointed and perfumed the body.

BALNEARIUS fur, in antiquity, a kind of thief who practifed ftealing the cloaths of perfons in the baths; fometimes alfo called *fur balnearum.* The crime of thofe thieves was a kind of facrilege; for the hot baths were facred: hence they were more feverely punifhed than common thieves who ftole out of private houfes. The latter were acquitted with paying double the value of the thing ftolen; whereas the former were punifhed with death.

BALNEUM, a term ufed by the chemifts to fignify a veffel filled with fome matter, as fand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire. See Chemistry, n° 79.

BALSA, an ancient town of Lufitania in the Ager, Cunæus; now *Tavira,* capital of Algarva.

BALSAM, or Native Balsam, an oily, refinous, liquid fubftance, flowing either fpontaneoufly, or by means of incifion, from certain plants. There are a great variety of balfams, generally denominated from the

the substances from which they are obtained; and which are explained under their names as they occur.

BALSAMICS. *Balsamica* is a Latin word which signifies *mitigating*. The term *balsamic* is a very lax one; it includes medicines of very different qualities, as emollients, detergents, restoratives, &c. but in medicines of all these kinds there seems to be this requisite in them, *viz.* that they be soft, yielding, and adhesive, also that by their smallness they have a ready disposition to motion. Medicines of this tribe are generally required for complaints whose seat is in the viscera; and as they cannot be conveyed there but by the common road of the circulation, it follows, that no great effects can be expected from them but by their long continuation. Hoffman calls by the name of *balsamics* those medicines which are hot and acrid, also the natural balsams, gums, &c. by which the vital heat is increased.

Motherby's Med. Dict.

BALSORA. See BASSORA.

BALTAGI, among the Turks, porters, and hewers of wood, in the court of the grand signior; who also mount on horseback when the emperor rides out. Part of them also, who, for that purpose, must be castrated, keep watch at the gates of the first and second courts of the seraglio. These last are called *capigi*, and their commander *capigi pascha*.

BALTIC SEA, a great gulph surrounded by Sweden, Russia, Courland, Prussia, Pomerania, and Denmark. The king of Denmark levies a tax at Elsineur on every ship that enters the Baltic sea. It is remarkable that this sea never ebbs nor flows, and there is always a current sets through the sound into the ocean. It is generally frozen over three or four months in the year. Yellow amber is found in plenty on this coast.

BALTIMORA, in botany: a genus of the polygamia necessaria order, belonging to the syngenesia class of plants. The receptaculum is chaffy; there is no pappus; the calyx is cylindrical and polyphyllous; and the ray of the corolla is quinqueflorous. There is but one species, the recta, a native of Maryland.

BALTIMORE, a large and flourishing town of Maryland, in North America, situated on the north side of Patapsco river around the bason, in which the water rises to the depth of about six feet in common tides, but at Fell's Point the water is deep enough for ships of burden to come up. The trade and consequent improvement of Baltimore has been more rapid than that of any town in the United States: the principal trade of Maryland centers here, and its exports to Europe and the West Indies are extensive. The streets are well built and handsome: and the inhabitants are hospitable to strangers, and maintain a friendly social intercourse with one another. The town stands low and was formerly unhealthy, which the great increase of buildings and improvements, particularly the paving of the streets have contributed to remedy. Its situation is favourable for defence against a naval force, as the entrance to the harbour, about a mile below Fell's Point, is not more than a pistol shot across. W. Long. 76. 30. N. Lat. 39. 21.

BALTIMORE, a town of Ireland in the county of Corke, and province of Munster, with the title of a barony. It is seated on a headland which runs into the sea, five miles north-east of Cape Clear. W. Long. 9. 10. N. Lat. 51. 15.

BALTIMORE-*Bird*. See ORIOLUS.

BALUCLAVO, or JAMBOL, a sea-port town of Crimea on the Black Sea, where they build ships for the Grand Signior. E. Long. 35. 15. N. Lat. 44. 50.

BALUZE (Stephen), a French writer, born in 1651, and sometime librarian to M. Colbert. In 1693 he obtained a pension, with the post of director of the royal college, for writing the lives of the popes of Avignon; both which advantages he soon lost in the fluctuation of court parties. M. Baluze is much more noted for collecting ancient MSS. and illustrating them by notes, than famed for his own compositions.

BALYUR, or BALIUR, a sea-port of Africa in the kingdom of Dancali, about 14 hours journey west from Babel-Mandel. It is remarkable only for being the landing place of the Abyssinian Patriarch Alphonsus Mendez, with his Jesuits and Portuguese, on April 3d, 1724. The king, who had received orders from the Abyssinian emperor to give them a proper reception, dispatched his son to meet them and conduct them to him. The royal palace they found to consist of about half a dozen of tents, and a score of huts, fenced about with a thorn hedge, and shaded by some wild kinds of trees. Near the palace was a river, which was then quite dried up, and no water to be found but what was digged for in the channel. The hall of audience was only a large tent about a musket-shot from the rest. At the upper end was a kind of throne made of stones and clay, covered with a carpet, and two velvet cushions. At the other end was his majesty's horse with the saddle and other accoutrements hanging on one side; it being the custom of this country for the master and horse to lie together, whether king or subject. Around the hall were about 50 young men sitting cross-legged; and when the Portuguese ambassadors were admitted, they were made to sit down in the same posture. Soon after came the king preceded by some of his domestics, one having an earthen pitcher full of hydromel, another a cup made of porcelane, a third carrying a cocoa shell full of tobacco, and a fourth bringing a silver tobacco-pipe with some fire. Next to them was the king, dressed in a light silk stuff, having on his head a turban, from the rims of which hung a parcel of rings nicely wrought, which dangled before his face. He had in his hand a short kind of javelin, and was followed by all the chief officers of his court and household. The respect paid him at his coming in was by standing on their feet, and squatting down again twice, after which they went forward to kiss his hand.

BALZAC (John Lewis Guez de), born at Angouleme in 1595. Voltaire allows him the merit of having given numbers and harmony to the French prose, but censures his style as somewhat bombast. The critics of his own time gave him no little disquiet; and he gave them no little advantage over him by his sallies of vanity, and some particular propositions which were a little dangerous. Mr Balzac, getting rid of these disputes by his moderation, settled at his country seat; refined his style and genius; and got by his letters and other writings which he published from time to time, the reputation of being the first writer in France. He was at length drawn from his retirement by the hopes of making his fortune under cardinal Richleu, who

who had formerly courted his friendship; but in a few years he retired again, disgusted with the slavish dependence of a court life. All he obtained from the court was a pension of 2000 livres, with the titles of councellor of state and historiographer of France. He died in 1654; and was buried in the hospital of Notre Dame des Anges, to which he bequeathed 12,000 livres. He left an estate of 100 franks *per ann.* for a gold medal to be bestowed every two years for the best discourse on some moral subject.—Besides his letters, he wrote a work called *Oeuvres Diverses*, i. e. on various subjects; The Prince; The Christian Socrates, &c. and many other pieces; all of which have been published in two volumes folio.

BAMBA, a province of the kingdom of Congo in Africa.—It is situated between the rivers of Ambrisi and Lose; the last of which parts it from Pemba on the east, as the Ambrisi does from the province of Sogno on the north. Along the sea-coasts it extends itself northward to the river Lelunda; and on the south to that of Danda, which parts it from the kingdom of Angola. The governors of this province bear the title of *dukes*, and are always some of the princes of the royal family. They are as despotic and arbitrary as if they were really kings, notwithstanding the care and pains their monarchs have taken to keep them within due bounds. The soil of this province is very fertile; and would produce all the necessaries of life in great plenty, were the inhabitants but industrous in its cultivation. The sea-coasts produce a vast quantity of salt, which could be purified with little trouble, and would yield an extraordinary revenue if the duties were duly paid; but these the governors find means to sink mostly into their own coffers.—Here is also the fishery of the zimbis, or little sea-snail, whose shell is the current coin not only in this and the neighbouring kingdom, but also in the most distant parts of Africa. Here are also said to be mines of gold, silver, quicksilver, copper, tin, and iron; but none except the iron mines are allowed to be worked.

BAMBERG, a large handsome town of Franconia in Germany, and capital of a bishopric of the same name. It was formerly imperial, but is now subject to the bishop. The country about it produces plenty of corn, fruits, and liquorice. It has an university, founded in 1585; and is situated at the confluence of the rivers Main and Reidnitz. E. Long. 10. 15. N. Lat. 50. 10.

BAMBERG, a town of Bohemia, situated at the foot of a mountain. E. Long. 16. 50. N. Lat. 49. 53.

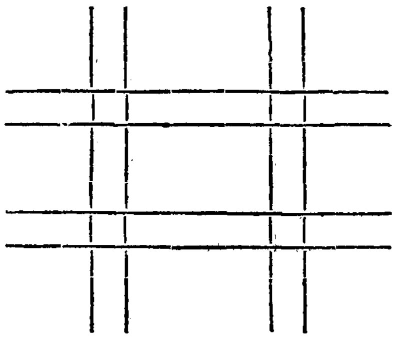
BAMBOCCIO, a celebrated painter of conversations, landscapes, cattle, &c. was born at Laeren, near Narden, in 1613. His name was Peter Van Laer; but in Italy they gave him the name of Bamboccio, on account of the uncommon shape of his body, the lower part being one third part longer than the upper, and his neck so short that it was buried between his shoulders. He had, however, an ample amends for the unseemliness of his limbs, in the superior beauties of his mind: he was endowed with an extensive genius; and, indeed, had an universal taste for every part of painting. He resided at Rome for sixteen years successively; every day studying to improve himself by those beautiful models which were continually open to his observation, and by the lovely scenery in the environs of that city. He was held in the highest esteem by all ranks of men, as well as by those of his own profession; not only on account of his extraordinary abilities, but also for the amiable qualities of his mind. He studied nature incessantly; observing with a curious exactness every effect of light on different objects, at different hours of the day; and whatsoever incident afforded pleasure to his imagination, his memory for ever perfectly retained. His stile of painting is sweet and true; and his touch delicate, with great transparency of colouring. His figures are always of a small size, well proportioned, and correctly designed; and altho' his subjects are taken but from the lower kind of nature, such as plunderings, playing at bowls, inns, farrier shops, cattle, or conversations; yet whatever he painted was so excellently designed, so happily executed, and so highly finished, that his manner was adopted by many of the Italian painters of his time. His works are still universally admired, and he is justly ranked among the first class of the eminent masters. His hand was as quick as his imagination, so that he rarely made sketches or designs for any of his works; he only marked the subject with a crayon on the canvas, and finished it without more delay. His memory was amazing: for whatever objects he saw, if he considered them with any intention to insert them in his compositions, the idea of them was so strongly impressed on his mind, that he could represent them with as much truth as if they were placed before his eyes. Sandrart observes, that although painters who are accustomed to a small size are frequently inaccurate in the disposition of the different parts of their subject, seeming content if the whole appears natural; yet Bamboccio was as minutely exact in having his figures, trees, grounds, and distances, determined with the utmost precision and perspective truth, as the best masters usually are in pictures of the largest size; which is one circumstance that causes the eye to be so agreeably deluded by the paintings of Bamboccio. In the latter part of his life, he was severely tormented with an asthmatic complaint, which he endured with much impatience; and it is reported, that as the disorder seemed to him unsupportable, he threw himself into a canal to shorten his misery, and was drowned. His death happened in 1673.

BAMBOE, in botany, the trivial name of a species of arundo. See ARUNDO.

BAMBOE-Habit; a Chinese contrivance by which a person who does not know how to swim may easily keep himself above water. The following account of it is from a letter to the author of the *Seaman's Preservative*. "In the year 1730, I was passenger in a ship from Batavia to China, burden about 400 tons, called the *Pridae*, Francisco Xavier commander, freighted by English, Chinese, and Portuguese. Near the coast of China we met one of those storms called a *Tuftoon (Tau fong)*, or a great wind, which carried away all our masts, bowsprit, and rudder; and in our hold we had six feet of water, expecting every moment the ship would founder.—We consequently were consulting our preservation: the English and Portuguese stood in their shirts only, ready to be thrown off; but the Chinese merchants came upon deck, not in a cork-jacket, but I will call it a *bamboe-habit*, which had lain ready in their chests against such dangers; and it was thus constructed; four bamboes, two before and

Bambo-rough Bambuck

and two behind their bodies, were placed horizontally, and projected about 28 inches. Theſe were croſſed on each ſide by two others, and the whole properly ſecured, leaving a ſpace for their body; ſo that they had only to put it over their heads, and tie the ſame ſecurely, which was done in two minutes, and we were ſatisfied they could not poſſibly ſink." The ſhape is here ſubjoined.



BAMBOROUGH. See *Holy-Iſland*.

BAMBUCK, a country of Africa, of which the following account is given by the Abbe Raynal, on the credit of a modern traveller whom he does not name. "In the interior part of Africa, under the 12th or 13th degree of north latitude, there is (ſays a modern traveller) a pretty large country, known by the name of *Bambuck*. It is not ſubject to a particular king; but governed by village lords, called *farims*. Theſe hereditary and independent chiefs are all obliged to unite for the defence of the ſtate, when it is either attacked as a community, or only in one of its branches.

"The territory of this ariſtocratical ſtate is dry and barren. It produces neither maize, rice, nor pulſe. The inſupportable heat it is ſubject to, proceeds in part from its being ſurrounded by high mountains, which prevent the wind from refreſhing the air. The climate is as unwholeſome as it is diſagreeable: vapours, which continually iſſue from the bowels of a ſoil replete with minerals, render this country unfit to live in, eſpecially to ſtrangers.

"It is gold that hath made this miſerable country an object worthy of notice: gold, which in the eyes of the covetous man ſeems to compenſate for all the evils of nature, tho' in reality it increaſes them all. This metal is ſo common in this country, that it is found almoſt indiſcriminately every where. To obtain it, ſometimes it is ſufficient to ſcrape the ſurface of the earth, which is clayiſh, light, and mixed with ſand. When the mine is very rich, it is digged only to the depth of a few feet, and never deeper; though it has been obſerved, that the lower it was digged, the more gold the ſoil afforded. The miners are too indolent to purſue a toil which conſtantly becomes more tedious, and too ignorant to perceive the inconveniences it would be attended with. Their negligence and their folly are in this inſtance ſo extraordinary, that in waſhing the gold, in order to ſeparate it from the earth, they only preſerve the larger pieces: the light parts paſs away with the water, which flows down an inclined plain.

"The inhabitants of Bambuck do not work theſe mines at all times, nor are they at liberty to do it when they pleaſe. They are obliged to wait till private or public wants determine the farims to grant this permiſſion. When it is proclaimed, all who are able to avail themſelves of this advantage meet at the appointed place. When their work is finiſhed, a diviſion is made. Half of the gold goes to the lord, and the remainder is equally diſtributed among the labourers. Thoſe who want gold at any other time than that of the general digging, ſearch for it in the beds of the rivers, where it is very common.

"The French and Engliſh have ſucceſſively been deſirous of appropriating to themſelves theſe real or imaginary riches. Some thought they could reach this country by the Niger, others by the Salum. Far from having ſucceeded in their attempts of becoming maſters of this country, they have not yet aſcertained its exiſtence. The unſucceſsfulneſs of paſt efforts hath redoubled the activity of ſanguine minds; ſenſible and judicious merchants have choſen to limit themſelves to a commerce much more important, which is that of ſlaves."

Bamff.

BAMFF, a ſhire of Scotland, comprehending part of Buchan, with the countries of Strathdovern, Boyn, Enzie, Strathaven, and Balvenie, extends 32 miles from eaſt to weſt, and 13 in breadth from north to ſouth. On the ſouth, it is ſeparated from part of Buchan by the river Ugie; on the eaſt it is watered by the Dovern and the German Ocean; on the weſt it is bounded by the Spey and the county of Murray; on the ſouth-weſt, it borders on Badenoch and the Braes of Mar; and on the north, it is confined by the Murray Frith. The face of the country is agreeably diverſified with hill and dale, not without woods, well watered with rivers, and exhibiting many ſeats and plantations. The air is pure and keen, the climate healthy, and the ſoil fertile, producing plentiful crops of corn. The country of Buchan, extending northwards from the river Ugie to the ſea, and weſtward as far as Devron, comprehending a tract of 20 miles in length and nine in breadth, is more free from hills and mountains than any other county of the ſame extent in the kingdom of Scotland. It is inhabited chiefly by Lowlanders, and gives the title of *earl* to the family of Erſkine; of which family, however, Erſkine of Mar is the chief. The county of Bamff abounds with the neceſſaries and comforts of life. The paſture-grounds yield ſheep, cattle, and horſes: the arable lands produce plenty of corn; while the rivers and ſea ſupply great quantities of fiſh. Various minerals have been found in different parts of the ſhire; and a piece of amber, as large as a horſe, was once caſt aſhore on the beach. In the mountainous diſtrict of Balvenie, on the weſtern ſide of the ſhire; watered by the Spey, there is a noted rock, which produces hones and whetſtones ſufficient to ſupply the whole iſland. Here are alſo veins of alum-ſtone, and ſprings of alum water. Strathallan, another diſtrict to the north-eaſt of Balvenie, abounds with ſuch plenty of lime-ſtone, that the inhabitants uſe it as common ſtone in building their houſes; and moreover burn a great quantity of it into lime, which they ſell to good advantage in the village of Keith, on the river Dovern. Along this whole coaſt, there are ancient Daniſh monuments, ſuch as cairns, tumuli, and huge ſtones ſtanding erect. In Strathaven, a hilly country, lying along the limpid

river

river Avin, which falls into the Spey, we meet with Gordon Castle, belonging to the Duke of Gordon, the most princely edifice in the north of Scotland, consisting of noble apartments magnificently furnished, and environed with fine gardens and parks well stored with fallow-deer. The same nobleman possesses several other seats in this county.

Bamff, the capital of the shire of that name in Scotland, is pleasantly situated on the side of a hill, at the mouth of the river Devron. It has several streets; of which that with the town-house in it, adorned with a new spire, is very handsome. This place was erected into a borough by virtue of a charter from Robert II. dated October 7. 1372, endowing it with the same privileges, and putting it on the same footing, with the burgh of Aberdeen; but tradition says it was founded in the reign of Malcolm Canmore. It gives title of *baron* to a branch of the Ogilvie family. The harbour is very bad, as the entrance at the mouth of the Devron is very uncertain, being often stopped by the shifting of the sands, which are continually changing in great storms; the pier is therefore placed on the outside. Much salmon is exported from hence. About Troophead some kelp is made; and the adventurers pay the lord of the manor 50 l. *per annum* for the liberty of collecting the materials. Near the town is a most magnificent seat lately built by the Earl of Fife. It lies in a beautiful plain washed by the Devron, the lofty banks of which clothed with wood on the opposite side, afford a delightful contrast to the soft vale beneath. W Long. 2. 5. N. Lat. 57. 40.

BAMIER, the name of a plant common in Egypt. It produces a pyramidal husk, with several compartments, of the colour of a lemon, and filled with musky seeds. This husk dressed with meat is a wholesome food, and has a very agreeable flavour. The Egyptians make great use of it in their ragouts.

BAMIYAN, a city of Asia, situated in the province of Zablestan, 10 days journey from Balkh, and eight from Gazna. It is remarkable only for its dreadful catastrophe when taken by Jenghiz Khan in 1221. At that time the city belonged to Sultan Jalalladin, the last of the famous Mahmud Gazni's race. Jenghiz Khan was at that time about to attack Gazna, that prince's capital; but was stopped by the garrison of Gazna, which he had hoped would give him no trouble. In this, however, he was disappointed. The people had for a long time expected an attack; and had therefore ruined the country for five or six leagues round, while the peasants had carried away the stones, and every thing that could be of use to the besiegers. Accordingly, Jenghiz Khan having erected wooden towers, and planted his engines upon them, was in a short time obliged to give over his attacks till millstones and other materials could be brought from a great distance. The walls of the city were very strong, so that the engines of the Moguls made but little impression; and the garrison making frequent and furious sallies cut off whole squadrons of their enemies, and frequently overthrew their towers and engines. This exceedingly chagrined Jenghiz Khan; who one day returning from a fruitless attack, and hearing of the defeat of one of his generals by Jalallodin, swore to be revenged on Bamiyan. This fury cost the life of one of his grandchildren; who exposing himself too much, to please his grandfather, was slain with an arrow.—At last, however, by the numberless multitude of the Moguls, who continued the attacks without intermission, the city was taken, after its walls had been ruined in many places, and the bravest soldiers and officers of the garrison slain in its defence. The mother of the young prince who had been killed entering with the troops, and more deserving the name of a fiend than a woman, caused the throats of all the inhabitants to be cut, without excepting one. She even gave orders to rip up the bellies of all the women with child, that not an infant might be left alive. In short, to gratify the rage of this inhuman monster, the buildings were all levelled with the ground; the cattle, and every living creature, destroyed; insomuch that the hardened Moguls themselves gave this place the name of *Maubalig*, which in their language signifies *the unfortunate city*. A strong castle has since been built out of its ruins.

BAMOTH-BALL (anc. geog.), one of the towns of the tribe of Reuben, which seems also to have had a temple of Baal on an eminence; lying eastwards, and not far from the river Arnon, and the territory of Moab. Jerome calls it *Bamoth*, a city of the Amorrites, beyond Jordan, in the possession of the sons of Reuben. Whether the same with that mentioned Numb. xxi. is doubtful, from the disagreement of interpreters; and yet we may admit it to be the place of encampment of the Israelites, and of Balaam's first station, or where he had the first view of the rear of the people.

BAMPTON, a town of Devonshire, situated in a bottom surrounded with high hills. W. Long. 4. 25. N. Lat. 51. 5.

BAN, or BANS. See BANN.

Ban, in commerce, a sort of smooth fine muslin, which the English import from the East Indies. The piece is almost a yard broad, and runs about 20 yards and a half.

BANANA-TREE, a species of the musa or plantain. See MUSA.

BANARES, or BENARES, a handsome town of Asia, in the dominions of the Great Mogul, greatly celebrated for its sanctity, and being the university of the Indian Bramins. See OBSERVATORY. It is seated on the north side of the river Ganges, in E. Long. 82. 30. N. Lat. 26. 20.

BANBURY, a town of Oxfordshire in England, situated on the river Charwell, in W. Long. 1. 20. N. Lat. 52. 0.

BANC, or BENCA, in law, denotes a tribunal, or judgment-seat: hence *king's banc* is the same with the *court of king's bench*, and *common banc* with that of *common pleas*.

BANCI JUS, or the privilege of having a bench, was anciently only allowed to the king's judges, *qui summam administrant justitiam*. Inferior courts, as courts-baron, hundred-courts, &c. were not allowed that prerogative: and even at this day the hundred-court at Freibridge in Norfolk is held under an oak at Gey-wood; and that of Woolfry, in Herefordshire, under an oak near Ashton in that county, called *Hundred-oak*.

BANCA, an island of Asia, in the East Indies, between Sumatra and Borneo; from the first of which it is separated only by a narrow channel. E. Long. 105. 10. N. Lat. 13. 25.

BANCALIS, a sea-port town on the east coast of the island of Sumatra, where the Dutch have a settlement. E. Long. 99. 7. N. Lat. 1. 5.

BANCK (Peter Vander), an engraver of considerable repute, was born at Paris, and received his instructions in the art from the celebrated Francois de Poilly. He came over into England with Gascar the painter about the year 1674; and married the sister of a gentleman of estate in Hertfordshire, named Forester. He was a laborious artist: but the pay he received for his plates being by no means adequate to the time he bestowed upon them, he was reduced to want; and, retiring from business, sought an asylum in the house of his brother-in-law. He died in Bradfield, and was buried in the church there, in 1674; leaving his widow in possession of the chief part of his plates, which she disposed of to Brown, a printseller, to great advantage, and left an easy fortune.—His chief employment was engraving of portraits; and, according to Virtue's account of this artist published by the Hon. Mr Walpole, he was the first in England who engraved them on so large a scale. But even the novelty, it seems, added to their merit, could not sufficiently recommend them to support the artist. Like many of Poilly's disciples, his great merit, according to Mr. Strutt, consists in the laboured neatness and management of the mechanical part of the art. Freedom, harmony, and chasteness of outline, are by no means the characteristic of his prints. However, tho' they cannot rank with the superior productions of Edelink or Nanteuil, &c. they have their share of merit; and doubtless will be always esteemed in England as preserving the best resemblance of many eminent persons who were living at that time.

BANCO, an Italian word which signifies *bank*. It is commonly used to signify the Bank of Venice.

BANCOCK, a town of the kingdom of Siam in Asia, with a fort, which was once in the possession of the French, but they were driven from it in 1688. E. Long. 101. 5. N. Lat. 13. 25.

BAND, in a general sense, some small narrow ligament, wherewith any thing is bound, tied, or fastened.

BAND, in architecture, a general name for any flat low member, or moulding, that is broad but not very deep.

BAND of Soldiers, in military affairs, those who fight under the same flag or ensign.

BAND of Pensioners, a company of 120 gentlemen, who receive a yearly allowance of 100l. for attending on his majesty on solemn occasions.

BAND is also the denomination of a military order in Spain, instituted by Alphonsus XI. king of Castile, for the younger sons of the nobility; who, before their admission, must serve 10 years at least, either in the army or at court; and are bound to take up arms for the catholic faith against the infidels.

BAND, in surgery. See BANDAGE.

BANDA ISLANDS, the general name of five islands in the East-Indies, belonging to the Dutch. Two of them are uncultivated, and almost entirely uninhabited; the other three claim the distinction of being the only islands in the world that produce the nutmeg.

If we except this valuable spice, the islands of Banda, like all the Moluccas, are barren to a dreadful degree. What they produce in superfluities they want in necessaries. The land will not bring forth any kind of corn; and the pith of the sago serves the natives of the country instead of bread.

As this food is not sufficient for the Europeans who settle in the Moluccas, they are allowed to fetch provisions from Java, Massacar, or the extremely fertile island of Bali. The company itself carries some merchandise to Banda.

This is the only settlement in the East-Indies that can be considered as an European colony; because it is the only one where the Europeans are proprietors of lands. The company finding that the inhabitants of Banda were savage, cruel, and treacherous, because they were impatient under their yoke, resolved to exterminate them. Their possessions were divided among the white people, who got slaves from some of the neighbouring islands to cultivate the lands. These white people are for the most part Creoles, or malecontents who have quitted the service of the company. In the small island of Rosinging, there are likewise several banditti, whom the laws have branded with disgrace; and young men of abandoned principles, whose families wanted to get rid of them: so that Banda is called the *island of correction*. The climate is so unhealty, that these unhappy men live but a short time. It is on account of the loss of so great a number of hands, that attempts have been made to transfer the culture of the nutmeg to Amboyna; and the company were likewise probably influenced by two other strong motives of interest, as their trade could be carried on with less expence and greater safety. But the experiments that have been made have proved unsuccessful, and matters remain in their former state.

BANDAGE, in surgery, a fillet, roller, or swath, used in dressing and binding up wounds, restraining dangerous hemorrhagies, and in joining fractured and dislocated bones.

BANDALEER, or BANDELEER, in military affairs, a large leathern belt, thrown over the right shoulder, and hanging under the left arm; worn by the ancient musqueteers, both for the sustaining of their fire-arms, and for the carriage of their musket-charges, which being put up in little wooden cases, coated with leather, were hung, to the number of twelve, to each bandaleer.

BANDELET, or BANDLET, in architecture, any little band, or flat moulding, as that which crowns the Doric architrave.

BANDER-CONGO, a small sea-port town in Asia, seated on the Persian Gulph. E. Long. 54. 10. N. Lat. 19. 0.

BANDERET, a general, or one of the commanders in chief of the forces.—This appellation is given to the principal commanders of the troops of the canton of Bern in Switzerland, where there are four banderets, who command all the forces of that canton.

BANDEROLL, a little flag, in form of a guidon, extended more in length than in breadth, used to be hung out on the masts of vessels, &c.

BANDITTI, from the Italian *bandito*; persons proscribed, or, as we call it, outlawed: sometimes denominated *banniti* or *forris banniti*. It is also a denomination given to highwaymen or robbers who infest the roads in troops, especially in Italy, France, and

and Sicily. Mr Brydone, in his Tour through Sicily, informs us, that in the eastern part, called *Val Demoni* from the devils that are supposed to inhabit Mount Ætna, it has ever been found altogether impracticable to extirpate the banditti; there being numberless caverns and subterraneous passages round that mountain, where no troops could possibly pursue them; besides, they are known to be perfectly determined and resolute, never failing to take a dreadful revenge on all who have offended them. Hence the prince of Villa Franca has embraced it, not only as the safest, but likewise as the wisest and most political scheme, to become their declared patron and protector: and such of them as think proper to leave their mountains and forests, though perhaps only for a time, are sure to meet with good encouragement and a certain protection in his service, where they enjoy the most unbounded confidence, which, in no instance, they have ever yet been found to make an improper or a dishonest use of. They are clothed in the prince's livery, yellow and green, with silver lace; and wear likewise a badge of their honourable order, which intitles them to universal fear and respect from the people.

In some circumstances, these banditti are the most respectable people of the island, and have by much the highest and most romantic notions of what they call their point of honour. However criminal they may be with regard to society in general; yet, with respect to one another, and to every person to whom they have once professed it, they have ever maintained the most unshaken fidelity. The magistrates have often been obliged to protect them, and pay them in court, as they are known to be perfectly determined and desperate, and so extremely vindictive that they will certainly put any person to death that has ever given them just cause of provocation. On the other hand, it never was known that any person who had put himself under their protection, and showed that he had confidence in them, had cause to repent of it, or was injured by any of them in the most minute trifle; but, on the contrary, they will protect him from impositions of every kind, and scorn to go halves with the landlord, like most other conductors and travelling servants, and will defend him with their lives if there is occasion. Those of their number who have thus enlisted themselves in the service of society, are known and respected by the other banditti all over the island; and the persons of those they accompany are ever held sacred. For these reasons, most travellers choose to hire a couple of them from town to town; and may thus travel over the whole island in safety.

BANDORA, the capital of the island of Salset, on the west coast of the peninsula on this side the Ganges. It is separated from the island of Bombay by a narrow channel, and subject to the Portuguese. E. Lon. 72. 30. N. Lat. 19. 0.

BANDORE, the name of a musical instrument with strings, resembling a lute, and said to be invented in the fourth year of Queen Elizabeth, by John Rose, a citizen of London.

BANDY-LEGS, from the French *bander*, 'to bend,' a distortion of the legs, when they turn either inward or outward on either side; arising from some defect in the birth or imprudence in the nurse, endeavouring to make a child stand or walk before his legs were strong enough to sustain the weight of his body. See VALGUS.

BANE (from the Sax. *bana*, a murderer), signifies destruction or overthrow. Thus, "I will be the *bane* of such a man," is a common saying. So, when a person receives a mortal injury by any thing, we say, "it was his *bane*:" and he who is the cause of another man's death, is said to be *le bane*, i. e. a malefactor.

BANFF. See BAMFF.

BANGHIR, a town of Ireland, in king's county in the province of Leinster, seated on the river Shannon. W. Long. 8. 5. N. Lat. 53. 10.

BANGLE EARS, an imperfection in a horse, remedied in the following manner. Place his ears in such a manner as you would have them stand; bind them with two little boards so fast that they cannot stir, and then clip away all the empty wrinkled skin close by the head.

BANGIUS (Thomas), a Danish divine, and an elegant Latin writer on the origin of languages and a variety of other subjects. He died in 1661.

BANGOR, an episcopal city of Carnarvonshire in North Wales. In ancient times it was so considerable, that it was called *Bangor the Great*, and defended by a strong castle: but it is now a very mean place; the principal buildings being the cathedral, the bishop's palace, and a free school. The see is of very great antiquity, and its founder unknown. The church is dedicated to St. Daniel, who was bishop here about the year 516; but for near 500 years afterwards, there is no certainty of the names of his successors. Owen Glendower greatly defaced the cathedral church; but Bishop Dean repaired it again. This see met a still more cruel ravager than Owen Glendower, in the person of Bishop Bulkeley; who not only alienated many of the lands belonging to it, but even sold the bells of the church. This diocese contains the whole of Carnarvonshire except three parishes, the shire of Anglesey, and part of the shires of Denbigh, Merioneth, and Montgomery, in which are 107 parishes, whereof 36 impropriated. It has three archdeaconries, viz. Bangor, Anglesey, and Merioneth; of which the two first are commonly annexed to the bishopric for its better support. This see is valued in the king's books at L. 131 : 16 : 4, and is computed to be worth annually L. 1200. The tenths of the clergy are L. 151 : 14 : 3½. To the cathedral there belong a bishop, a dean, an archdeacon, a treasurer, and two prebendaries, endowed; a precentor, a chancellor, and three canons, not endowed; three vicars coral, an organist, lay-clerks, choristers, and two officers. W. Long. 4. 10. N. Lat. 53. 20.

BANGOR, a town of Ireland, in the county of Down and province of Ulster. It is seated on the south shore of the bay of Carrick Fergus, opposite to the town of that name; and sends two members to parliament. W. Long. 6. N. Lat. 54. 42.

BANGUE, a species of opiate, in great use throughout the east, for drowning cares and inspiring joy.—This by the Persians is called *beng*; by the Arabs, *essrar*; corruptly *asseral*, and *assarth*; by the Turks, *bengitie*, and vulgarly called *mastack*; by the European naturalists, *bangue* or *bange*.—It is the leaf of a kind of wild hemp, growing in the countries of the Levant:

Bangue || Banians.

Levant; it differs little, either as to leaf or seed, from our hemp, except in size. Some have mistaken it for a species of althæa.

There are divers manners of preparing it, in different countries. Olearius describes the method used in Persia. Mr Sale tells us, that, among the Arabs, the leaf is made into pills, or conserves. But the most distinct account is that given by Alexander Maurocordato counsellor and physician of the Ottoman Porte, in a letter to Wedelius. According to this author, bangue is made of the leaves of wild hemp, dried in the shade, then ground to powder; and put into a pot wherein butter has been kept; set in an oven till it begin to torrify; then taken out, and pulverized again; thus to be used occasionally, as much at a time as will lie on the point of a knife. Such is the Turkish bangue.—The effects of this drug are, To confound the understanding; set the imagination loose; induce a kind of folly, and forgetfulness, wherein all cares are left, and joy and gaiety take take place thereof. Bangue in reality, is a succedaneum to wine, and obtains in those countries where Mahometanism is established; which prohibiting the use of that liquor absolutely, the poor musselmans are forced to have recourse to succedanea, to rouse their spirits. The principal are *opium* and this bangue. As to the opinion among Europeans, that the Turks prepare themselves for battle by a dose of bangue, which rouses their courage, and drives them, with eagerness, to certain death; Dr Maurocordato assures us, that it is a popular error: the Turks think they are then going assuredly to receive the crown of martyrdom; and would not, for any consideration, lose the merit of it, which they would do, by eating the bangue, as being held unlawful by their apostle, among other things which intoxicate.

BANIALUCH, or BAGNALUCH, a city of European Turkey, the capital of Bosnia, upon the frontiers of Dalmatia, near the river Setina. E. Long. 18. 20. N. Lat. 44. 20.

BANIANS, a religious sect in the empire of the Mogul, who believe a metempsychosis; and will therefore eat no living creature, nor kill even noxious animals, but endeavour to release them when in the hands of others. The name of *Banian* is used with some diversity, which has occasioned much confusion, and many mistakes. Sometimes it is taken in a less proper sense, and extended to all the idolaters of India, as contradistinguished from the Mahometans: in which sense, Banians include the Bramins and other casts. *Banians*, in a more proper sense, is restrained to a peculiar cast, or tribe, of Indians, whose office or profession is trade and merchandize; in which sense, *Banians* stand contradistinguished from *Bramins*, *Cuttery*, and *Wyse*, the three other casts, into which the Indians are divided. The four casts are absolutely separate as to occupation, relation, marriage, &c. though all of the same religion; which is more properly denominated the religion of the Bramins, who make the ecclesiastical tribe, than of the *Banians*, who make the mercantile. The proper *Banians* are called, in the *shaster*, or book of their law, by the name of *Shuddery*; under which are comprehended all who live after the manner of merchants, or that deal and transact for others, as brokers; exclusive of the mechanics, or artificers, who make another cast, called *Wyse*. These *Banians* have no peculiar sect or religion, unless it be, that two of the eight general precepts given by their legislator Bremaw to the Indian nation, are, on account of the profession of the *Banians*, supposed more immediately to relate to them, viz. those which enjoin veracity in their words and dealings, and avoiding all practices of circumvention in buying and selling.—Some of the *Banians*, quitting their possession, and retiring from the world commence religious, assume a peculiar habit, and devote themselves, more immediately to God, under the denomination of *Vertea*. These, though they do not hereby change their cast, are commonly reckoned as bramins of a more devout kind; much as monks in the Romish church, though frequently not in orders, are reputed as a more sacred order than the regular clergy. The name *Banian* imports as much, in the Bramin language (wherein their law is written), as a people innocent and harmless; void of all guile; so gentle, that they cannot endure to see either a fly or a worm injured; and who, when struck, will patiently bear it, without resisting or returning the blow.—Their mein and appearance is described by Lord *, in terms a little precise, but very significant: "A people presented themselves to my eyes clothed in linen garments, somewhat low descending, of a gesture and garb, as I may say, maidenly, and well nigh effeminate, of a countenance shy and somewhat estranged."—Gemelli Careri divides the Banians into 22 tribes, all distinct, and not allowed to marry with each other. Lord assures us they are divided into 82 casts or tribes, correspondent to the casts or divisions of the Banians or priests, under whose discipline they are, as to religious matters; tho' the generality of the Banians choose to be under the direction of the two Bramin tribes, the Visalnagranaugers and the Vulnagranaugers.

* *Discov. Relig. Banian.*

The Banians are the great factors, by whom most of the trade of India is managed; in this respect, comparable to the Jews and Armenians, and not behind either, in point of skill and experience, in whatever relates to commerce. Nothing is bought but by their mediation. They seem to claim a kind of *jus divinum* to the administration of the traffic of the nation, grounded on their sacred books, as the Bramins do to that of religion. They are dispersed, for this purpose, through all parts of Asia, and abound in Persia, particularly at Ispahan and Gombroon, where many of them are extremely rich, yet not above acting as brokers, where a penny is to be got. The chief agents of the English, Dutch, and French East India companies are of this nation: they are faithful, and are generally trusted with the cash of those companies in their keeping. They act also as bankers, and can give bills of exchange for most cities in the East Indies. Their form of contract in buying and selling is remarkable, being done without words, in the profoundest silence, only by touching each other's fingers: the buyer loosening his pamerin or girdle, spreads it on his knee, and both he and the seller having their hands underneath by the intercourse of the fingers, mark the price of pounds, shillings, &c. demanded, offered, and at length agreed on. When the seller takes the buyer's whole hand, it denotes a thousand; and as many times as he squeezes it, as many thousand pagods, or roupees, according to the species in question are, demanded: when he only takes the five fingers,

fingers, it denotes five hundred, and when only one, one hundred: taking only half a finger, to the ſecond joint, denotes fifty; the ſmall end of the finger, to the firſt joint, ſtands for ten.

BANIER (Anthony), licentiate in laws, member of the academy of inſcriptions and belles lettres, and eccleſiaſtic of the dioceſe of Clermont in Auvergne; died in November 1741, aged 69. He is principally celebrated for his tranſlation of the Metamorphoſes of Ovid, with hiſtorical remarks and explanations; which was publiſhed in 1732, at Amſterdam, in folio, finely ornamented with copperplates, by Picart; and reprinted at Paris, 1738, in two vols. 4to: and for his Mythology, or fables of the ancients explained by hiſtory; a work full of the moſt important information, which was tranſlated into Engliſh, and printed at London in 1741, in 4 vols. 8vo.

BANISHMENT, exile, among us is of two kinds: the one voluntary, and upon oath; the other by compulſion, for ſome offence or crime. The former properly called *abjuration*, is now ceaſed; the latter is chiefly enjoined by judgment of Parliament. Yet outlawing and tranſportation may alſo be conſidered as ſpecies of exile.

BANISTER (John), a phyſician and ſurgeon in the reign of queen Elizabeth, was educated at Oxford where, ſays Anthony Wood, he ſtudied logicals for a time; but afterwards applied himſelf ſolely to phyſic and ſurgery. In 1573 he took the degree of bachelor of phyſic; and obtaining a licence from the univerſity to practiſe, ſettled at Notingham, where he lived many years in great repute, and wrote ſeveral medical treatiſes. His works were collected and publiſhed in 1633, 4to.

BANISTERIA, in botany; a genus of the trigynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 23d order, *Trihilatæ*. The calyx is quinquepartite, with nectarious pores on the outſide of the baſe; the petals are roundiſh and ungulated; the ſeeds are three, with membranaceous wings. There are ſeven ſpecies, all natives of warm countries, but poſſeſſing no remarkable properties.

BANK, in commerce, a common repoſitory, where many perſons agree to keep their money, to be always ready at their call or direction: or, Certain ſocieties or communities, who take the charge of other people's money, either to improve it, or to keep it ſecure.

The firſt inſtitution of banks was in Italy, where the Lombard Jews kept benches in the market-places, for the exchange of money and bills; and *banco* being the Italian name for *bench*, banks took their title from this word.

I. Company-banks.

Banks are of two principal kinds. 1. One ſort is either *public*, conſiſting of a company of monied men, who being duly eſtabliſhed and incorporated by the laws of their country, agree to depoſite a conſiderable fund, or joint ſtock, to be employed for the uſe of the ſociety, as lending money upon good ſecurity, buying and ſelling bullion, diſcounting bills of exchange, &c.: or *private*, i. e. ſet up by private perſons, or partnerſhips, who deal in the ſame way as the former upon their own ſingle ſtock and credit.

The greateſt bank of circulation in Europe, is the *Bank of England*. The company was incorporated parliament in the fifth and ſixth years of king William and queen Mary, by the name of *The Governors and Company of the Bank of England;* in conſideration of the loan of 1,200,000l. granted to the government; for which the ſubſcribers received almoſt 8 *per cent.* By this charter, the company are not to borrow under their common ſeal, unleſs by act of parliament; they are not to trade, or ſuffer any perſon in truſt for them to trade in any goods or merchandize; but they may deal in bills of exchange, in buying or ſelling bullion, and foreign gold and ſilver coin, &c.

Bank of England; its eſtabliſhment, regulations, importance, &c.

By an act of parliament paſſed in the 8th and 9th year of William III. they were empowered to enlarge their capital ſtock to 2,201,171l. 10s. It was then alſo enacted, that bank-ſtock ſhould be a perſonal, and not a real eſtate; that no contract either in word or writing, for buying or ſelling bank-ſtock, ſhould be good in law, unleſs regiſtered in the books of the bank within 7 days, and the ſtock transferred in 14 days; and that it ſhall be felony, without benefit of clergy, to counterfeit the common ſeal of the bank, or any ſealed bank-bill, or any bank-note, or to alter or eraſe ſuch bills or notes. By another act paſſed in the 7th of queen Anne, the company were empowered to augment their capital to 4,402,343l. and they then advanced 400,000l. more to the government; and in 1714, they advanced another loan of 1,500,000l.

In the third year of the reign of king George I. the intereſt in their capital ſtock was reduced to 5 *per cent.* when the bank agreed to deliver up as many exchequer bills as amounted to 2,000,000l. and to accept an annuity of 100,000l. and it was declared lawful for the bank to call from their members, in proportion to their intereſts in the capital ſtock, ſuch ſums of money as in a general court ſhould be found neceſſary. If any member ſhould neglect to pay his ſhare of the moneys ſo called for, at the time appointed by notice in the London Gazette, and fixed upon the Royal Exchange, it ſhould be lawful for the bank, not only to ſtop the dividend of ſuch member, and to apply it towards payment of the money in queſtion, but alſo to ſtop the transfers of the ſhare of ſuch defaulter, and to charge him with an intereſt of 5 *per cent. per annum*, for the money ſo omitted to be paid: and if the principal and intereſt ſhould be three months unpaid, the bank ſhould then have power to ſell ſo much of the ſtock belonging to the defaulter as would ſatisfy the ſame. After this, the bank reduced the intereſt of the 2,000,000l. lent to the government, from 5 to 4 *per cent.* and purchaſed ſeveral other annuities, which were afterwards redeemed by the government, and the national debt due to the bank reduced to L.1,600,000. But in 1742, the company engaged to ſupply the government with 1,600,000l. at 3 *per cent.* which is now called the 3 *per cent. annuities;* ſo that the government was now indebted to the company L.3,200,000, the one half carrying 4, and the other 3 *per cent.*

In the year 1746, the company agreed that the ſum of L.986,800 due to them in the exchequer bills unſatisfied, on the duties for licences to ſell ſpirituous liquors by retail, ſhould be cancelled, and in lieu thereof to accept of an annuity of L.39,442, the intereſt of that ſum at 4 *per cent.* The company alſo agreed to advance the further ſum of L.1,000,000 into the exchequer, upon the credit of the duties ariſing by the malt

Bank.

and land tax at 4 *per cent.* for exchequer bills to be issued for that purpose; in consideration of which, the company were enabled to augment their capital with L.986,800; the interest of which, as well as that of the other annuities, were reduced to 3½ *per cent.* till the 25th of December 1757, and from that time to carry only 3 *per cent.*

And in order to enable them to circulate the said exchequer bills, they established what is now called *bank circulation*. The nature of which may be understood from what follows.

The company of the bank are obliged to keep cash sufficient not only to answer the common, but also any extraordinary demand that may be made upon them; and whatever money they have by them, over and above the sum supposed necessary for the purposes, they employ in what may be called the *trade of the company;* that is to say, in discounting bills of exchange, in buying of gold and silver, and in government securities, &c. But when the bank entered into the abovementioned contract, as they did not keep unemployed a larger sum of money than what they deemed necessary to answer their ordinary and extraordinary demands, they could not conveniently take out of their current cash so large a sum as a million, with which they were obliged to furnish the government, without either lessening that sum they employed in discounting, buying gold and silver, &c. (which would have been very disadvantageous to them), or inventing some method that should answer all the purposes of keeping the million in cash. The method which they chose, and which fully answers their end, was as follows:

They opened a subscription, which they renew annually, for a million of money; wherein the subscribers advance 10 *per cent.* and enter into a contract to pay the remainder, or any part thereof, whenever the bank shall call upon them, under penalty of forfeiting the 10 *per cent.* so advanced; in consideration of which, the bank pays the subscribers 4 *per cent.* interest for the money paid in, and ¼ *per cent.* for the whole sum they agree to furnish; and in case a call shall be made upon them for the whole, or any part thereof, the bank further agrees to pay them at the rate of 5 *per cent. per annum* for such sum till they repay it, which they are under an obligation to do at the end of the year. By this means the bank obtains all the purposes of keeping a million of money by them; and though the subscribers, if no call is made upon them (which is in general the case), receive 6¼ *per cent.* for the money they advance, yet the company gains the sum of L.23,500 *per annum* by the contract; as will appear by the following account:

	£.
The bank receives from the government for the advance of a million - -	30,000
The bank pays the subscribers who advance L.100,000 and engage to pay (when called for) L.900,000 more - -	6,500
The clear gain to the bank therefore is	23,500

This is the state of the case, provided the company should make no call on the subscribers; which they will be very unwilling to do, because it would not only lessen their profit, but affect the public credit in general.

Bank-stock may not improperly be called a *trading stock*, since with this they deal very largely in foreign gold and silver, in discounting bills of exchange, &c. Besides which, they are allowed by the government very considerable sums annually for the management of the annuities paid at their office. All which advantages render a share in their stock very valuable; though it is not equal in value to the East India stock. The company make dividends of the profits half-yearly, of which notice is publicly given; when those who have occasion for their money may readily receive it; but private persons, if they judge convenient, are permitted to continue their funds, and to have their interest added to the principal.

This company is under the direction of a governor, deputy-governor, and 24 directors, who are annually elected by the general court, in the same manner as in the East India company. Thirteen, or more, compose a court of directors for managing the affairs of the company. The officers of this company are very numerous.

The stability of the bank of England is equal to that of the British government. All that it has advanced to the public must be lost before its creditors can sustain any loss. No other banking company in England can be established by act of parliament, or can consist of more than six members. It acts, not only as an ordinary bank, but (as we have already seen) as a great engine of state; receiving and paying the greater part of the annuities which are due to the creditors of the public; circulating exchequer bills; and advancing to government the annual amount of the land and malt taxes, which are frequently not paid up till some years thereafter. It likewise has, upon several different occasions, supported the credit of the principal houses, not only of England, but of Hamburgh and Holland. Upon one occasion it is said to have advanced for this purpose, in one week, about L. 1,600,000, a great part of it in bullion.

Scotch banks, public and private.

In Scotland there are two public banks, both at Edinburgh. The one, called *The Bank of Scotland*, was established by act of parliament in 1695; the other, called *The Royal Bank*, by royal charter in 1727.

Within these 30 years there have also been erected private banking companies in almost every considerable town, and even in some villages. Hence the business of the country is almost entirely carried on by paper-currency, *i. e.* by the notes of those different banking companies; with which purchases and payments of all kinds are commonly made. Silver very seldom appears, except in the change of a twenty-shilling bank-note, and gold still seldomer. But though the conduct of all those different companies has not been unexceptionable, and has accordingly required an act of parliament to regulate it; the country, notwithstanding, has evidently derived great benefit from their trade. It has been asserted, that the trade of the city of Glasgow doubled in about 15 years after the first erection of the banks there; and that the trade of Scotland has more than quadrupled since the first erection of the two public banks at Edinburgh. Whether the trade, either of Scotland in general, or of the city of Glasgow in particular, has really increased in so great a proportion, during so short a period, we do not pretend to know. If either of them has increased in this proportion, it seems to be an effect too great to be accounted for by the

Bank.

the sole operation of this cause. That the trade and industry of Scotland, however, have increased very considerably during this period, and that the banks have contributed a good deal to this increase, cannot be doubted.

Smith's Wealth of Nations, Book II. chap. ii.

The value of the silver money which circulated in Scotland before the Union in 1707, and which immediately after it was brought into the bank of Scotland in order to be recoined, amounted to L.411,117 : 10 :9 Sterling. No account has been got of the gold coin; but it appears from the ancient accounts of the mint of Scotland, that the value of the gold annually coined somewhat exceeded that of the silver. There were a good many people too upon this occasion, who, from a diffidence of repayment, did not bring their silver into the bank of Scotland; and there was, besides, some English coin, which was not called in. The whole value of the gold and silver, therefore, which circulated in Scotland before the Union, cannot be estimated at less than a million Sterling. It seems to have constituted almost the whole circulation of that country; for though the circulation of the bank of Scotland, which had then no rival, was considerable, it seems to have made but a very small part of the whole. In the present times the whole circulation of Scotland cannot be estimated at less than two millions, of which that part which consists in gold and silver most probably does not amount to half a million. But though the circulating gold and silver of Scotland have suffered so great a diminution during this period, its real riches and prosperity do not appear to have suffered any. Its agriculture, manufactures, and trade, on the contrary, the annual produce of its land and labour, have evidently been augmented.

Discounting of bills.

It is chiefly by discounting bills of exchange, that is, by advancing money upon them before they are due, that the greater part of banks and bankers issue their promissory notes. They deduct always, upon whatever sum they advance, the legal interest till the bill shall become due. The payment of the bill, when it becomes due, replaces to the bank the value of what had been advanced, together with a clear profit of the interest. The banker, who advances to the merchant whose bill he discounts, not gold and silver, but his own promissory notes, has the advantage of being able to discount to a greater amount, by the whole value of his promissory notes, which he finds by experience are commonly in circulation. He is thereby enabled to make his clear gain of interest on so much a larger sum.

The commerce of Scotland, which at present is not very great, was still more inconsiderable when the two first banking companies were established; and those companies would have had but little trade, had they confined their business to the discounting of bills of exchange. They invented, therefore, another method of issuing their promissory notes, by granting what they called *cash accounts*; that is, by giving credit to the extent of a certain sum (L. 2000 or L. 3000 for example), to any individual who could procure two persons of undoubted credit and good landed estate to become surety for him, that whatever money should be advanced to him within the sum for which the credit had been given should be repaid upon demand, together with the legal interest. Credits of this kind are

Cash-accounts.

commonly granted by banks and bankers in all different parts of the world. But the easy terms on which the Scots banking companies accept of repayment are peculiar to them, and have perhaps been the principal cause, both of the great trade of those companies and of the benefit which the country has received from it.

Advantages from these;

Whoever has a credit of this kind with one of those companies, and borrows L. 1000 upon it for example, may repay this sum piece-meal, by L. 20 and L. 30 at a time, the company discounting a proportionable part of the interest of the great sum from the day on which each of those small sums is paid in, till the whole be in this manner repaid. All merchants therefore, and almost all men of business, find it convenient to keep such cash-accounts with them; and are thereby interested to promote the trade of those companies, by readily receiving their notes in all payments, and by encouraging all those with whom they have any influence to do the same. The banks, when their customers apply to them for money, generally advance it to them in their own promissory notes. These the merchants pay away to the manufacturers for goods, the manufacturers to the farmers for materials and provisions, the farmers to their landlords for rent, the landlords repay them to the merchants for the conveniences and luxuries with which they supply them, and the merchants again return them to the banks in order to balance their cash accounts, or to replace what they may have borrowed of them; and thus almost the whole money-business of the country is transacted by means of them. Hence the great trade of those companies.

to the banks, and

By means of those cash accounts, every merchant can, without imprudence, carry on a greater trade than he otherwise could do. If there are two merchants, one in London and the other in Edinburgh, who employ equal stocks in the same branch of trade, the Edinburgh merchant can, without imprudence, carry on a greater trade, and give employment to a greater number of people, than the London merchant. The London merchant must always keep by him a considerable sum of money, either in his own coffers, or in those of his banker (who gives him no interest for it), in order to answer the demands continually coming upon him for payment of the goods which he purchases upon credit. Let the ordinary amount of this sum be supposed L. 500. The value of the goods in his warehouse must always be less by L. 500 than it would have been, had he not been obliged to keep such a sum unemployed. Let us suppose that he generally disposes of his whole stock upon hand, or of goods to the value of his whole stock upon hand, once in the year. By being obliged to keep such a great sum unemployed, he must sell in a year L. 500 worth less goods than he might otherwise have done. His annual profits must be less by all that he could have made by the sale of L. 500 worth more goods; and the number of people employed in preparing his goods for the market, must be less by all those that L. 500 more stock could have employed. The merchant in Edinburgh, on the other hand, keeps no money unemployed for answering such occasional demands. When they actually come upon him, he satisfies them from his cash-account with the bank, and gradually replaces the sum borrowed with the money or paper which comes in from the occasional

to the country.

Bank.

casional sale of his goods. With the same stock, therefore, he can, without imprudence, have at all times in his warehouse a larger quantity of goods than the London merchant; and can thereby both make a greater profit himself, and give constant employment to a greater number of industrious people who prepare those goods for the market. Hence the great benefit which the country has derived from this trade.

The late multiplication, of banking companies in both parts of the united kingdom, an event by which many people have been much alarmed, instead of diminishing increases the security of the public. It obliges all of them to be more circumspect in their conduct, and by not extending their currency beyond its due proportion to their cash, to guard themselves against those malicious runs which the rivalship of so many competitors is always ready to bring upon them. It restrains the circulation of each particular company within a narrower circle, and reduces their circulating notes to a smaller number. By dividing the whole circulation into a greater number of parts, the failure of any one company, an accident which, in the course of things, must sometimes happen, becomes of less consequence to the public. This free competition too obliges all bankers to be more liberal in their dealings with their customers, lest their rivals should carry them away. In general, if any branch of trade, or any division of labour, be advantageous to the public, the freer and more general the competition, it will always be the more so. See further, the article *Paper-Money*.

II. Banks of deposit.

2. The other kind of banks consists of such as are instituted wholly on the public account, and are called *Banks of Deposit;* the nature of which not being generally understood, the following particular explanation may not be unacceptable.

Smith's Wealth of Nations. Book IV. chap. iii.

The currency of a great state, such as Britain, generally consists almost entirely of its own coin. Should this currency, therefore, be at any time worn, clipt, or otherwise degraded below its standard value the state by a reformation of its coin can effectually re-establish its currency. But the currency of a small state, such as Genoa or Hamburgh, can seldom consist altogether in its own coin, but must be made up in a great measure, of the coins of all the neighbouring states with which its inhabitants have a continual intercourse. Such a state, therefore, by reforming its coin, will not always be able to reform its currency. If foreign bills of exchange are paid in this currency, the uncertain value of any sum, of what is in its own nature so uncertain, must render the exchange always very much against such a state, its currency being, in all foreign states necessarily valued even below what it is worth. In order to remedy the inconvenience to which this disadvantageous exchange must have subjected their merchants, such small states, when they began to attend to the interest of trade, have frequently enacted, that foreign bills of exchange of a certain value should be paid, not in common currency, but by an order upon, or by a transfer in the books of, a certain bank, established upon the credit and under the protection of the state; this bank being always obliged to pay, in good and true money, exactly according to the standard of the state. The banks of Venice, Genoa, Amsterdam, Hamburgh, and Nuremberg, seem to have been originally established with this view, though some of them may have afterwards been made subservient to other purposes. The money of such banks, being better than the common currency of the country, necessarily bore an agio, which was greater or smaller, according as the currency was supposed to be more or less degraded below the standard of the state. The agio of the bank of Hamburgh, for example, which is said to be commonly about 14 *per cent.* is the supposed difference between the good standard money of the state, and the clipt, worn, and diminished currency poured into it from all the neighbouring states.

Before 1609, the great quantity of clipt and worn foreign coin, which the extensive trade of Amsterdam brought from all parts of Europe, reduced the value of its currency about 9 *per cent.* below that of good money fresh from the mint. Such money no sooner appeared, than it was melted down or carried away, as it always is in such circumstances. The merchants, with plenty of currency, could not always find a sufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of several regulations which were made to prevent it, became in a great measure uncertain. In order to remedy these inconveniences, a bank was established in 1609 under the guarantee of the city. The bank received both foreign coin, and the light and worn coin of the country, at its real and intrinsic value in the good standard money of the country, deducting only so much as was necessary for defraying the expence of coinage, and the other necessary expence of management. For the value which remained after this small deduction was made, it gave a credit in its books. This credit was called *bank-money*; which, as it represented money exactly according to the standard of the mint, was always of the same real value, and intrinsically worth more than current money. It was at the same time enacted, that all bills drawn upon or negociated at Amsterdam of the value of 600 gilders and upwards should be paid in bank-money, which at once took away all uncertainty in the value of those bills. Every merchant, in consequence of this regulation, was obliged to keep an account with the bank in order to pay his foreign bills of exchange, which necessarily occasioned a certain demand for bank-money.

Bank of Amsterdam, one of the most famous.

Its institution, regulation, utility, &c.

Bank-money, over and above both its intrinsic superiority to currency, and the additional value which this demand necessarily gives it, has likewise some other advantages. It is secure from fire, robbery, and other accidents; the city of Amsterdam is bound for it; it can be paid away by a simple transfer, without the trouble of counting, or the risk of transporting it from one place to another. In consequence of those different advantages, it seems from the beginning to have borne an agio; and it is generally believed that all the money originally deposited in the bank was allowed to remain there, nobody caring to demand payment of a debt which he could sell for a premium in the market. Besides, this money could not be brought from those coffers, as it will appear by and by, without previously paying for the keeping.

Those deposits of coin, or which the bank was bound to restore in coin, constituted the original capital of the bank, or the whole value of what was represented by what

Bank.

what is called *Bank-money*. At present they are supposed to constitute but a very small part of it. In order to facilitate the trade in bullion, the bank has been for these many years in the practice of giving credit in its books upon deposits of gold and silver bullion. This credit is generally about 5 *per cent.* below the mint price of such bullion. The bank grants at the same time what is called a *recipice* or receipt, intitling the person who makes the deposit, or the bearer, to take out the bullion again at any time within six months, upon re-transferring to the bank a quantity of bank-money equal to that for which credit had been given in its books when the deposit was made, and upon paying ¼ *per cent.* for the keeping if the deposit was in silver, and ½ *per cent.* if it was in gold; but at the same time declaring, that in default of such payment, and upon the expiration of this term, the deposit should belong to the bank at the price at which it had been received, or for which credit had been given in the transfer books. What is thus paid for the keeping of the deposit may be considered as a sort of warehouse rent; and why this warehouse rent should be so much dearer for gold than for silver, several different reasons have been assigned. The fineness of gold, it has been said, is more difficult to be ascertained than that of silver. Frauds are more easily practised, and occasion a greater loss in the more precious metal. Silver, besides, being the standard metal, the state, it has been said, wishes to encourage more the making of deposits of silver than of those of gold.

Deposits of bullion are most commonly made when the price is somewhat lower than ordinary; and they are taken out again when it happens to rise. In Holland the market price of bullion is generally above the mint price, for the same reason that it was so in England before the late reformation of the gold coin. The difference is said to be commonly from about six to sixteen stivers upon the mark, or eight ounces of silver of eleven parts fine and one part alloy. The bank-price, or the credit which the bank gives for deposits of such silver (when made in foreign coin, of which the fineness is well known and ascertained, such as Mexico dollars), is 22 gilders the mark; the mint price is about 23 gilders; and the market-price is from 23 gilders six to 23 gilders sixteen stivers, or from 2 to 3 *per cent.* above the mint-price. The proportions between the bank-price, the mint-price, and the market-price, of gold bullion are nearly the same. A person can generally sell his receipt for the difference between the mint-price of bullion and the market-price. A receipt for bullion is almost always worth something; and it very seldom happens, therefore, that any body suffers his receipt to expire, or allows his bullion to fall to the bank at the price at which it had been received, either by not taking it out before the end of the six months, or by neglecting to pay the ¼ or ½ *per cent.* in order to obtain a new receipt for another six months. This, however, though it seldom happens, is said to happen sometimes, and more frequently with regard to gold than with regard to silver, on account of the higher warehouse-rent which is paid for the keeping of the more precious metal.

The person who by making a deposit of bullion obtains both a bank-credit and a receipt, pays his bills of exchange as they become due with his bank-credit; and either sells or keeps his receipt, according as he judges that the price of bullion is likely to rise or to fall. The receipt and the bank-credit seldom keep long together, and there is no occasion that they should. The person who has a receipt, and who wants to take out bullion, finds always plenty of bank-credits, or bank money to buy at the ordinary price; and the person who has bank-money, and wants to take out bullion, finds receipts always in equal abundance.

The owners of bank-credits and the holders of receipts constitute two different sorts of creditors against the bank. The holder of a receipt cannot draw out the bullion for which it is granted, without re-assigning to the bank a sum of bank-money equal to the price at which the bullion has been received. If he has no bank-money of his own, he must purchase it of those who have it. The owner of bank-money cannot draw out bullion without producing to the bank receipts for the quantity which he wants. If he has none of his own, he must buy them of those who have them. The holder of a receipt, when he purchases bank-money, purchases the power of taking out a quantity of bullion, of which the mint-price is 5 *per cent.* above the bank-price. The agio of 5 *per cent.* therefore, which he commonly pays for it, is paid, not for an imaginary, but for a real value. The owner of bank-money, when he purchases a receipt, purchases the power of taking out a quantity of bullion, of which the market-price is commonly from 2 to 3 *per cent.* above the mint-price. The price which he pays for it, therefore, is paid likewise for a real value. The price of the receipt, and the price of the bank-money, compound or make up between them the full value or price of the bullion.

Upon deposits of the coin current in the country, the bank grants receipts likewise as well as bank-credits; but those receipts are frequently of no value, and will bring no price in the market. Upon ducatoons, for example, which in the currency pass for three gilders three stivers each, the bank gives a credit of three gilders only, or 5 *per cent.* below their current value. It grants a receipt likewise intitling the bearer to take out the number of ducatoons deposited at any time within six months, upon paying ¼ *per cent.* for the keeping. This receipt will frequently bring no price in the market. Three gilders bank-money generally sell in the market for three gilders three stivers, the full value of the ducatoons if they were taken out of the bank; and before they can be taken out, ¼ *per cent.* must be paid for the keeping, which would be mere loss to the holder of the receipt. If the agio of the bank, however, should at any time fall to 3 *per cent.* such receipts might bring some price in the market, and might sell for 1¾ *per cent.* But the agio of the bank being now generally about 5 *per cent.* such receipts are frequently allowed to expire, or, as they express it, to fall to the bank. The 5 *per cent.* which the bank gains, when deposits either of coin or bullion are allowed to fall to it, may be considered as the warehouse rent for the perpetual keeping of such deposits.

The sum of bank money for which the receipts are expired must be very considerable. It must comprehend the whole original capital of the bank, which, it is generally supposed, has been allowed to remain there from the time it was first deposited, nobody caring

Bank. caring either to renew his receipt or to take out his deposit, as, for the reasons already assigned, neither the one nor the other could be done without loss. But whatever may be the amount of this sum, the proportion which it bears to the whole mass of bank-mony is supposed to be very small. The bank of Amsterdam has for these many years past been the great warehouse of Europe for bullion, for which the receipts are very seldom allowed to expire, or, as they express it, to fall to the bank. The far greater part of the bank-money, or of the credits upon the books of the bank, is supposed to have been created, for these many years past, by such deposits which the dealers in bullion are continually both making and withdrawing.

No demand can be made upon the bank but by means of a recipice or receipt. The smaller mass of bank-money, for which the receipts are expired, is mixed and confounded with the much greater mass for which they are still in force; so that, though there may be a considerable sum of bank-money for which there are no receipts, there is no specific sum or portion of it which may not at any time be demanded by one. The bank cannot be debtor to two persons for the same thing; and the owner of bank-money who has no receipt cannot demand payment of the bank till he buys one. In ordinary and quiet times, he can find no difficulty in getting one to buy at the market price, which generally corresponds with the price at which he can sell the coin or bullion it intitles him to take out of the bank.

It might be otherwise during a public calamity; an invasion, for example, such as that of the French in 1672. The owners of bank-money being then all eager to draw it out of the bank, in order to have it in their own keeping, the demand for receipts might raise their price to an exorbitant height. The holders of them might form extravagant expectations, and, instead of 2 or 5 *per cent.* demand half the bank-money for which credit had been given upon the deposits that the receipts had respectively been granted for. The enemy, informed of the constitution of the bank, might even buy them up in order to prevent the carrying away of the treasure. In such emergencies, the bank, it is supposed, would break through its ordinary rule of making payment only to the holders of receipts. The holders of receipts, who had no bank-money, must have received within 2 or 3 *per cent.* of the value of the deposit for which their respective receipts had been granted. The bank, therefore, it is said, would in this case make no scruple of paying, either with money or bullion, the full value of what the owners of bank-money who could get no receipts were credited for in its books; paying at the same time 2 or 3 *per cent.* to such holders of receipts as had no bank-money, that being the whole value which in this state of things could justly be supposed due to them.

Even in ordinary and quiet times it is the interest of the holders of receipts to depress the agio, in order either to buy bank-money (and consequently the bullion which their receipts would then enable them to take out of the bank) so much cheaper, or to sell their receipts to those who have bank-money, and who want to take out bullion, so much dearer; the price of a receipt being generally equal to the difference between the market-price of bank-money and that of the coin or bullion for which the receipt had been granted. It is the inetrest of the owners of bank-money on the contrary, to raise the agio, in order either to sell their bank-money so much dearer, or to buy a receipt so much cheaper. To prevent the stock-jobbing tricks which those opposite interests might sometimes occasion, the bank has of late years come to a resolution to sell at all times bank-money for currency, at 5 *per cent.* agio, and to buy it again at 4 *per cent.* agio. In consequence of this resolution, the agio can never either rise above 5 or sink below 4 *per cent.* and the proportion between the market-price of the bank and that of current money is kept at all times very near to the proportion between their intrinsic values. Before this resolution was taken, the market-price of money used sometimes to rise so high as 9 *per cent.* agio, and sometimes to sink so low as par, according as opposite interests happened to influence the market.

The bank of Amsterdam professes to lend out no part of what is deposited with it, but, for every gilder for which it gives credit in its books, to keep in its repositories the value of a gilder either in money or bullion. That it keeps in its repositories all the money or bullion for which there are receipts in force, for which it is at all times liable to be called upon, and which, in reality, is continually going from it and returning to it again, cannot well be doubted. But whether it does so likewise with regard to that part of its capital for which the receipts are long ago expired, for which in ordinary and quiet times it cannot be called upon, and which in reality is very likely to remain with it for ever, or as long as the States of the United Provinces subsist, may perhaps appear more uncertain. At Amsterdam, however, no part of faith is better established, than that for every gilder circulated as bank-money there is a correspondent gilder in gold and silver to be found in the treasure of the bank. The city is guarantee that it should be so. The bank is under the direction of the four reigning burgomasters, who are changed every year. Each new set of burgomasters visits the treasure, compares it with the books, receives it upon oath, and delivers it over, with the same awful solemnity, to the set which succeeds it; and in that sober and religious country oaths are not yet disregarded. A rotation of this kind seems alone a sufficient security against any practices which cannot be avowed. Amidst all the revolutions which faction has ever occasioned in the government of Amsterdam, the prevailing party has at no time accused their predecessors of infidelity in the administration of the bank. No accusation could have affected more deeply the reputation and fortune of the disgraced party; and if such an accusation could have been supported, we may be assured that it would have been brought. In 1672, when the French king was at Utrecht, the bank of Amsterdam paid so readily as left no doubt of the fidelity with which it had observed its engagements. Some of the pieces which were then brought from its repositories appeared to have been scorched with the fire which happened in the town-house soon after the bank was established. Those pieces, therefore, must have lain there from that time.

What may be the amount of the treasure in the bank is a question which has long employed the speculations of the curious. Nothing but conjecture can be offered concerning it. It is generally reckoned, that there are about 2000 people who keep accounts with the

the bank; and allowing them to have, one with another, the value of 1500l. lying upon their respective accounts, (a very large allowance), the whole quantity of bank-money, and consequently of treasure in the bank, will amount to 3,000,000l. or, at 21 gilders the pound Sterling, 33,000,000 of gilders; a great sum, and sufficient to carry on a very extensive circulation, but vastly below the extravagant ideas which some people have formed of this treasure.

The city of Amsterdam derives a considerable revenue from the bank. Besides what may be called the *warehouse-rent* above mentioned, each person, upon first opening an account with the bank, pays a fee of 10 gilders; and for every new account, 3 gilders 3 stivers; for every transfer, 2 stivers; and if the transfer is for less than 300 gilders, 6 stivers, in order to discourage the multiplicity of small transactions. The person who neglects to balance his accounts twice in the year forfeits 25 gilders. The person who orders a transfer for more than is upon his account, is obliged to pay 3 *per cent.* for the sum overdrawn, and his order is set aside into the bargain. The bank is supposed too to make a considerable profit by the sale of the foreign coin or bullion which sometimes falls to it by the expiring of receipts, and which is always kept till it can be sold with advantage. It makes a profit likewise by selling bank-money at 5 *per cent.* agio, and buying it at 4. These different emoluments amount to a good deal more than what is necessary for paying the salaries of officers, and defraying the expence of management. What is paid for the keeping of bullion upon receipts, is alone supposed to amount to a neat annual revenue of between 150,000 and 200,000 gilders. Public utility, however, and not revenue, was the original object of this institution. Its object was to relieve the merchants from the inconvenience of a disadvantageous exchange. The revenue which has arisen from it was unforeseen and may be considered as accidental.

Bank, in sea-affairs denotes an elevation of the ground or bottom of the sea, so as sometimes to surmount the surface of the water, or at least to leave the water so shallow as usually not to allow a vessel to remain a-flote over it.—In this sense, *bank* amounts to much the same as flat, shoal, &c. There are banks of sand, and others of stone, called also *shelves*, or *rocks*. In the north sea they also speak of banks of ice, which are large pieces of that matter floating.

BANKER, a person who traffics and negociates in money; who receives and remits money from place to place by commission from correspondents, or by means of bills or letters of exchange, &c.

The ancient bankers were called *argentarii*, and *nummularii*; by the Greeks, τραπεζιται, κολλυβιςαι, and αργυραμοιβοι. Their chief business was to put out the money of private persons to interest: they had their boards and benches, for this purpose, in all the markets and public places, where they took in the money from some, to lend it to others.

BANKING, the making of banks to oppose the force of the sea, rivers, or the like, and secure the land from being overflowed thereby. With respect to the water which is to be kept out, this is called *banking*; with respect to the land, which is hereby to be defended, *imbanking*.

Banking is also applied to the keeping a bank, or the employment of a banker. Banking, in this sense, signifies the trading in money, or remitting it from place to place, by means of bills of exchange. This answers to what the French call *faire le banque*. In France, every body is allowed to bank, whether merchant or not; even foreigners are indulged in this kind of traffic. In Italy, banking does not derogate from nobility, especially in the republic states; whence it is, that most of the younger sons of great families engage in it. In reality, it was the nobility of Venice and Genoa, that, for a long time, were the chief bankers in the other countries of Europe.

BANKISH, a province of the Mogul's dominions, in the north part of the Hither India, lying south-west of the province of Cassimere.

BANKRUPT, (*bancus ruptus*), is so called, because, when the bank or stock is broken or exhausted, the owner is said to be a *bankrupt*. And this word *bankrupt* is derived from the French *banqueroute*, which signifies a breaking or failing in the world: *banque* in French is as much as *mensa* in Latin, and *route* is the same as *vestigium*; and this term is said to be taken originally from the Roman *mensarii*, which were set in public places; and when a tradesman slipped away, with an intention to deceive his creditors, he left only some *vestigia* or signs of his table or shop behind him. But a bankrupt with us, from the several descriptions given of him in our statute-law, may be defined "a trader, who secretes himself, or does certain other acts tending to defraud his creditors." For the better understanding of this article, it will be proper to consider, 1. *Who* may become a bankrupt: 2. What *acts* make a bankrupt: 3. The *proceedings* on a commission of bankruptcy: and, 4. In what manner an estate in goods and chattels may be *transferred* by bankruptcy.—But of these, the two last being treated under the article Commission *of Bankruptcy*, the two first only belong to this place.

1. A bankrupt was formerly considered merely in the light of a criminal or offender; and in this spirit we are told by Sir Edward Coke, that we have fetched as well the name, as the wickedness, of bankrupts from foreign nations. But at present the laws of bankruptcy are considered as laws calculated for the benefit of trade, and founded on the principles of humanity as well as justice; and to that end they confer some privileges, not only on the creditors, but also on the bankrupt or debtor himself. On the creditors; by compelling the bankrupt to give up all his effects to their use, without any fraudulent concealment: on the debtor; by exempting him from the rigor of the general law, whereby his person might be confined at the discretion of his creditor, though in reality he has nothing to satisfy the debt; whereas the law of bankrupts, taking into consideration the sudden and unavoidable accidents to which men in trade are liable, has given them the liberty of their persons, and some pecuniary emoluments, upon condition they surrender up their whole estate to be divided among their creditors.

In this respect the legislature seems to have attended to the example of the Roman law. We mean not the terrible law of the twelve tables; whereby the creditors might cut the debtor's body into pieces, and each of them take his proportionable share: if indeed that law, *de debitore in partes secando*, is to be understood in so very butcherly a light: which many learned men have with

Blackst. Comm. II. 472, &c.

Bankrupt. with reason doubted. Nor do we mean those less inhuman laws (if they may be called so, as *their* meaning is indisputably certain), of imprisoning the debtor's person in chains; subjecting him to stripes and hard labour, at the mercy of his rigid creditor; and sometimes selling him, his wife and children, to perpetual foreign slavery *trans Tiberim* (A): an oppression, which produced so many popular insurrections, and secessions to the *mons sacer*. But we mean the law of cession, introduced by the Christian emperors; whereby, if a debtor *ceded* or yielded up all his fortune to his creditors, he was secured from being dragged to a gaol, "*omni quoque corporali cruciatu semoto.*" For, as the emperor justly observes, "*inhumanum erat spoliatum fortunis suis in solidum damnari.*" Thus far was just and reasonable: but as the departing from one extreme is apt to produce its opposite, we find it afterwards enacted, that if the debtor by any unforeseen accident was reduced to low circumstances, and would swear that he had not sufficient left to pay his debts, he should not be compelled to cede or give up even that which he had in his possession; a law which, under a false notion of humanity, seems to be fertile of perjury, injustice, and absurdity.

The laws of England, more wisely, have steered in the middle between both extremes: providing at once against the inhumanity of the creditor, who is not suffered to confine an honest bankrupt after his effects are delivered up, and at the same time taking care that all his just debts shall be paid, so far as the effects will extend. But still they are cautious of encouraging prodigality and extravagance by this indulgence to debtors: and therefore they allow the benefit of the laws of bankruptcy to none but actual traders; since that set of men are, generally speaking, the only persons liable to accidental losses, and to an inability of paying their debts, without any fault of their own. If persons in other situations of life run in debt without the power of payment, they must take the consequences of their own indiscretion, even though they meet with sudden accidents that may reduce their fortunes: for the law holds it to be an unjustifiable practice, for any person but a trader to encumber himself with debts of any considerable value. If a gentleman, or one in a liberal profession, at the time of contracting his debts, has a sufficient fund to pay them, the delay of payment is a species of dishonesty, and a temporary injustice to his creditor: and if, at such time, he has not sufficient fund, the dishonesty and injustice is the greater. He cannot therefore murmur, if he suffers the punishment which he has voluntarily drawn upon himself. But in mercantile transactions the case is far otherwise. Trade cannot be carried on without mutual credit on both sides: the contracting of debts is therefore here not only justifiable but necessary. And if by accidental calamities, as by the loss of a ship in a tempest, the failure of brother traders, or by the non-payment of persons out of trade, a merchant or trader becomes incapable of discharging his own debts, it is his misfortune and not his fault. To the misfortunes therefore of debtors, the law has given a compassionate remedy, but denied it to their faults: since, at the same time that it provides for the security of commerce, by enacting that every considerable trader may be declared a bankrupt, for the benefit of his creditors as well as himself, it has also, to discourage extravagance, declared that no one shall be capable of being made a bankrupt, but only a trader; nor capable of receiving the full benefit of the statutes, but only an industrious trader.

In the interpretation of the several statutes made concerning English bankrupts, *, it hath been held, that buying only, or selling only, will not qualify a man to be a bankrupt; but it must be both buying and selling, and also getting a livelihood by it: as, by exercising the calling of a merchant, a grocer, a mercer, or, in one general word, a *chapman*, who is one that buys and sells any thing. But no handicraft occupation (where nothing is bought or sold, and therefore an extensive credit, for the stock in trade, is not necessary to be had) will make a man a regular bankrupt; as that of a husbandman, a gardener, and the like, who are paid for their work and labour. Also an inn-keeper cannot, as such be a bankrupt: for his gain or livelihood does not arise from buying and selling in the way of merchandize, but greatly from the use of his rooms and furniture, his attendance, and the like: and though he may buy corn and victuals, to sell again at a profit, yet that no more makes him a trader, than a schoolmaster or other person is, that keeps a boarding-house, and makes considerable gains by buying and selling what he spends in the house, and such a one is clearly not within the statutes. But where persons buy goods, and make them up into saleable commodities, as shoemakers, smiths, and the like; here, though part of the gain is by bodily labour, and not by buying and selling, yet they are within the statutes of bankrupts; for the labour is only in melioration of the commodity, and rendering it more fit for sale.

* 34 Hen. VIII. c. 4. 13 Eliz. c. 7. 21 Jac. I. c. 19. 5 Geo. II. c. 30.

2. To learn what the *acts* of bankruptcy are which render a man a bankrupt, we must consult the several statutes, and the resolutions formed by the courts thereon. Among these may therefore be reckoned, 1. Departing from the realm, whereby a man withdraws himself from the jurisdiction and coërcion of the law, with an intent to defraud his creditors. 2. Departing from his own house, with intent to secrete himself and avoid his creditors. 3. Keeping in his own house, privately, (except for just and necessary cause), so as not to be seen or spoken with by his creditors; which is likewise construed to be an intention to defraud his creditors, by avoiding the process of the law. 4. Procuring or suffering himself willingly to be arrested, or outlawed, or imprisoned, without just and lawful cause; which is likewise deemed an attempt to defraud his creditors. 5. Procuring his money, goods, chattels, and effects, to be attached or sequestrated by any legal process; which is another plain and direct endeavour to disappoint his creditors of their security. 6. Making any fraudulent conveyance to a friend, or secret

(A) In Pegu, and the adjacent countries in East India, the creditor is entitled to dispose of the debtor himself, and likewise of his wife and children: insomuch that he may even violate with impunity, the chastity of the debtor's wife; but then, by so doing, the debt is understood to be discharged.

fecret truftee, of his lands, tenements, goods, or chattels; which is an act of the fame fufpicious nature with the laft. 7. Procuring any protection, not being himfelf privileged by parliament, in order to fcreen his perfon from arrefts; which alfo is an endeavour to elude the juftice of the law. 8. Endeavouring, or defiring, by any petition to the king, or bill exhibited in any of the king's courts againft any creditors, to compel them to take lefs than their juft debts; or to procraftinate the time of payment, originally contracted for; which are an acknowledgment of either his poverty or his knavery. 9. Lying in prifon for two months, or more, upon an arreft or other detention for debt, without finding bail, in order to obtain his liberty. For the inability to procure bail argues a ftrong deficiency in credit, owing either to his fufpected poverty, or his ill character; and his neglect to do it, if able, can arife only from a fraudulent intention: in either of which cafes, it is high time for his creditors to look to themfelves, and compel a diftribution of his effects. 10. Efcaping from prifon after an arreft for a juft debt of L.100, or upwards. For no man would break prifon, that was able and defirous to procure bail; which brings it within the reafon of the laft cafe. 11. Neglecting to make fatisfaction for any juft debt to the amount of L.100, within two months after fervice of legal procefs, for fuch a debt, upon any trader having privilege of parliament.

Thefe are the feveral acts of bankruptcy exprefsly defined by the ftatutes relating to this article; which being fo numerous, and the whole law of bankrupts being an innovation on the common law, our courts of juftice have been tender of extending or multiplying acts of bankruptcy by any conftruction or implication. And therefore Sir John Holt held, that a man's removing his goods privately to prevent their being feized in execution, was no act of bankruptcy. For the ftatutes mention only fraudulent gifts to third perfons, and procuring them to be feized by fham procefs, in order to defraud creditors; but this, though a palpable fraud, yet, falling within neither of thofe cafes, cannot be adjudged an act of bankruptcy. So alfo it has been determined exprefsly, that a banker's ftopping or refufing payment is no act of bankruptcy: for it is not within the defcription of any of the ftatutes; and there may be good reafons for his fo doing, as fufpicion of forgery and the like: and if, in confequence of fuch a refufal, he is arrefted, and puts in bail, ftill it is no act of bankruptcy; but if he goes to prifon, and lies there two months, then, and not before, is he become a bankrupt.

As to the confequences refulting from the unhappy fituation of a bankrupt, fee the article *Commsssion of Bankruptcy*.

BANKS (John), a dramatic writer, was bred to the law, and belonged to the fociety of Gray's Inn; but this profeffion not fuiting his natural difpofition, he quitted it for the fervice of the mufes. Here, however, he found his rewards by no means adequate to his deferts. His emoluments at the beft were precarious, and the various fucceffes of his pieces too feelingly convinced him of the error in his choice. This, however, did not prevent him from purfuing with cheerfulnefs the path he had taken; his thirft of fame, and warmth of poetic enthufiafm, alleviating to his imagination many difagreeable circumftances into which indigence, the too frequent attendant on poetical purfuits, frequently threw him. His turn was entirely to tragedy, his merit in which is of a peculiar kind. For at the fame time that his language muft be confeffed to be extremely unpoetical, and his numbers uncouth and unharmonious; nay, even his characters very far from being ftrongly marked or diftinguifhed, and his epifodes extremely irregular: yet it is impoffible to avoid being deeply affected at the reprefentation, and even at the reading of his tragic pieces. This is owing in the general to an happy choice of his fubjects; which are all borrowed from hiftory, either real or romantic; and indeed the moft of them from circumftances in the annals of our own country, which, not only from their being familiar to our continual recollection, but even from their having fome degree of relation to ourfelves, we are are apt to receive with a kind of partial prepoffeffion, and a predetermination to be pleafed. He has conftantly chofen as the bafis of his plays fuch tales as were in themfelves and their well-known cataftrophes moft truly adapted to the purpofes of the drama. He has indeed but little varied from the ftrictnefs of hiftorical facts; yet he feems to have made it his conftant rule to keep the fcene perpetually alive, and never fuffer the characters to droop. His verfe is not poetry, but profe run mad. Yet will the falfe gem fometimes approach fo near in glitter to the true one, at leaft in the eyes of all but the real connoiffeurs (and how fmall a part of an audience are to be ranked in this clafs will need no ghoft to inform us), that bombaft will frequently pafs for the true fublime; and where it is rendered the vehicle of incidents in themfelves affecting, and in which the heart is apt to intereft itfelf, it will perhaps be found to have a ftronger power on the human paffions than even that property to which it is in reality no more than a bare fuccedaneum. And from thefe principles it is that we muft account for Mr Banks's writings having in the general drawn more tears from, and excited more terror in, even judicious audiences, than thofe of much more correct and more truly poetical authors. The tragedies he has left behind are, 1. *Albion Queens*. 2. *Cyrus the Great*. 3. *Deftruction of Troy*. 4. *Innocent Ufurper*. 5. *Ifland Queens*. This is only the Albion Queens altered. 6. *Rival Kings*. 7. *Virtue betrayed*. 8. *Unhappy Favourite*. The Albion Queens was rejected by the managers in 1604; but was acted by Queen Anne's command in 1706, with great applaufe, and has been feveral times revived. The Unhappy favourite continued till very lately a ftock tragedy at the theatres: but gives way at prefent to the latter tragedies from the fame ftory, by Jones and Brooke.—Neither the time of the birth nor that of the death of this author, are afcertained. His remains, however, lie interred in the church of St James's, Weftminfter.

BANKS's island, a fmall ifland in the South Sea difcovered by Captain Cook in 1770, in S. Lat. 53. 32. W. Long. 186. 30. It is of a circular figure; and about 24 leagues in compafs: it is fufficiently high to be feen at the diftance of 21 or 15 leagues; and the land has a broken irregular furface, with the appearance of barrennefs rather than fertility. It is, however, inhabited, as fome ftraggling favages were obferved upon it.

BANKSIA, in botany; a genus of the monogynia order, belonging to the tetrandia class of plants. The amentum is scaly, the corolla consists of four petals; the antheræ are in the cavity of the folds, and fossile; the capsule is bivalvular; and the seed is solitary, and bipartic. There are four species, the serrata, integrifolia, ericæ folia, and dentata, all natives of New Holland.

BANN, or BAN (from the Brit. *ban*, i. e. clamour), is a proclamation or public notice; any public summons or edict, whereby a thing is commanded or forbidden. It is a word ordinary among the feudists; and there is both *banus* and *banum*, which signify two several things.—The word *banns* is particularly used in England in publishing matrimonial contracts; which is done in the church before marriage, to the end that if any persons can speak against the intention of the parties, either in respect of kindred, precontract, or for other just cause, they may take their exception in time, before marriage is consummated; and in the canon law, Bannæ *sunt proclamationes sponsi et sponæ in ecclesiis fieri solitæ*. But there may be a faculty or licence for the marriage, and then this ceremony is omitted; and ministers are not to celebrate matrimony between any persons without a licence, except the banns have been first published three several times, upon pain of suspension, &c. Can. 62.

The use of matrimonial banns is said to have been first introduced in the Gallican church, though something like it obtained even in the primitive times; and it is this that Tertullian is supposed to mean by *trinundina promulgatio*. The council of Lateran first extended, and made the usage general. By the ordinance of Blois, no person could validly contract marriage, without a preceding proclamation of three banns; nor could any person whatever be dispensed with, except for the two last. But the French themselves have abated much of this severity; and only minors are now under an absolute necessity of submitting to the formality of banns. For majors, or those of age, after publication of the first banns, the two latter are easily bought off.

BANN, is also used to denote proscription or banishment for a crime proved; because anciently published by sound of trumpet; or, as Vossius thinks, because those who did not appear at the abovementioned summons, were punished by proscription. Hence, *to put a prince under the bann of the empire*, is to declare him divested of all his dignities. The sentence only denotes an interdict of all intercourse, and offices of humanity, with the offender; the form of which seems taken from that of the Romans, who banished persons by forbidding them the use of fire and water. Sometimes also cities are put under the imperial bann; that is, stripped of their rights and privileges.

BANN also denotes a pecuniary mulct, or penalty, laid on a delinquent for offending against a bann.

BANN, or BANNUS, a title anciently given to the governor or viceroy of Croatia, Dalmatia, and Sclavonia.

Episcopal BANN, *(Bannus Episcopalis)*, a mulct paid to the bishop by those guilty of sacrilege and other crimes.

BANN, is also used for a solemn anathema, or excommunication, attended with curses, &c. In this sense we read of *papal banns*, &c.

BANN, in military affairs, a proclamation made in the army by beat of drum, sound of trumpet, &c. requiring the strict observance of discipline, either for the declaring a new officer, or punishing an offender.

BANNER denotes either a square flag, or the principal standard belonging to a prince.

We find a multiplicity of opinions concerning the etymology of the word *banner*; some deriving it from the Latin *bandum*, "a band or flag;" others from the word *bann*, "to summon the vassals to appear in arms;" others again from the German *ban*, "a field or tenement," because landed men alone were allowed a banner; and, finally, there are some who think it is a corruption of *panniere*, from *pannus*, "cloth," because banners were originally made of cloth.

The BANNER *of France*, was the largest and richest of all the flags borne by the ancient kings in their great military expeditions. St Martin's cap was in use 600 years as the banner of France; it was made of taffety, painted with the image of that saint, and laid one or two days on his tomb to prepare it for use. About the year 1100 came in a more pompous apparatus. The banner royal was fastened to the top of a mast, or some tall tree, planted on a scaffold, borne on a carriage drawn by oxen, covered with velvet housings, decorated with devices or cyphers of the prince reigning. At the foot of the tree was a priest who said mass early every morning. Ten knights mounted guard on the scaffold night and day, and as many trumpets at the foot of the tree never ceased flourishing, to animate the troops. This cumbersome machine, the mode of which was brought from Italy, continued in use about 130 years. Its post was in the centre of the army. And here it was that the chief feats were performed, to carry off and defend the royal banner; for there was no victory without it, nor was any army reputed vanquished till they had lost their banner.

BANNERETS, an ancient order of knights or feudal lords; who possessing several large fees, led their vassals to battle under their own flag or banner, when summoned thereto by the king. The word seems formed from *banner*, "a square flag;" or from *band*, which anciently denoted a flag.—Bannerets are also called in ancient writers *milites vexilliferi*, and *vexillarii bannerarii*, *bannarii*, *banderisii*, &c.

Anciently there were two kinds of knights, *great* and *little*; the first whereof were called *bannerets*, the second *bachelors*; the first composed the upper, the second the middle, nobility.

The banneret was a dignitary allowed to march under his own flag, whereas the *bachelarius eques* followed that of another. To be qualified for a banneret, one must be a gentleman of family, and must have a power to raise a certain number of armed men, with estate enough to subsist at least 28 or 30 men. This must have been very considerable in those days; because each man, besides his servant, had two horsemen to wait on him armed, the one with a cross-bow, the other with a bow and hatchet. As he was not allowed to be a baron who had not above 13 knights fees, so he was not admitted to be a banneret if he had less than 10.

Banneret, according to Spelman, was a middle order between a baron and a ſimple knight; called ſometimes alſo *vexillarius minor*, to diſtinguiſh him from the greater, that is, from the baron, to whom alone properly belonged the *jus vexilli*, or privilege of the ſquare flag. Hence the banneret was alſo called *bannerettus, quaſi baro minor;* a word frequently uſed by Engliſh writers in the ſame ſenſe as banneret was by the French, though neither of them occur before the time of Edward II.

Some will have bannerets to have originally been perſons who had ſome portion of a barony aſſigned them; and enjoyed it under the title of *baro proximus*, and that with the ſame prerogatives as the baron himſelf. Some, again, find the origin of bannerets in France, others in Brittany, others in England. Theſe laſt attribute the inſtitution of bannerets to Conan, lieutenant of Maximus, who commanded the Roman legions in England under the empire of Gratian in 383. This general, ſay they, revolting, divided England into 40 cantons, and in theſe cantons diſtributed 40 knights; to whom he gave a power of aſſembling, on occaſion, under their ſeveral banners, as many of the effective men as were found in their reſpective diſticts: whence they are called *bannerets*. However this be, it appears from Froiſſart, &c. that anciently ſuch of the military men as were rich enough to raiſe and ſubſiſt a company of armed men, and had a right to do ſo, were called *bannerets*. Not, however, that theſe qualifications rendered them knights, but only bannerets; the appellation of *knight* being only added thereto, becauſe they were ſimple knights before.

Bannerets were ſecond to none but knights of the garter. They were reputed the next degree below the nobility; and were allowed to bear arms with ſupporters, which none elſe may under the degree of a baron. In France, it is ſaid, the dignity was hereditary; but in England it died with the perſon that gained it. The order dwindled on the inſtitution of baronets by King James I. and at length became extinct. The laſt perſon created banneret was Sir John Smith, made ſo after Edghill-fight, for reſcuing the ſtandard of King Charles I.

The form of the banneret's creation was this. On a day of battle, the candidate preſented his flag to the king or general; who, cutting off the train or ſkirt thereof, and making it a ſquare, returned it again, the proper banner of bannerets; who are hence ſometimes called *knights of the ſquare flag*. There ſeems to have been bannerets created either in a different manner, or by others than the ſovereign; ſince King James, in the patent of baronets, gives them precedence to all knights bannerets, except ſuch as are created by the king himſelf in the field; which implies, either that there are ſome of this order created out of the field, or by inferior perſons.

Banneret is alſo the name of an officer or magiſtrate of Rome towards the cloſe of the 14th century.—The people of that city, and throughout the territory of the church, during the diſputes of the antipopes, had formed a kind of republican government; where the whole power was lodged in the hands of a magiſtrate called *ſenator*, and twelve heads of quarters called *bannerets*, by reaſon of the banners which each raiſed in his diſtrict.

BANNOCK, a kind of oat-cake, baked in the embers, or on a ſtone placed before the fire. It is common in the northern parts of Scotland.

BANNUM, in law, ſignifies the utmoſt bounds of a manor or town.

BANQUET, a feaſt or entertainment where people regale themſelves with pleaſant foods or fruits.

Banquet, in the menage, that ſmall part of the branch of a bridle that is under the eye; which being rounded like a ſmall rod, gathers and joins the extremities of the bit to the branch in ſuch a manner that the banquet is not ſeen, but covered by the cope, or that part of the bit that is next the branch.

Banquet-Line, an imaginary line drawn, in making a bit, along the banquet, and prolonged up or down, to adjuſt the deſigned force or weakneſs of the branch, in order to make it ſtiff or eaſy.

Banquet, or *Banquette*, in fortification, a little foot-bank, or elevation of earth, forming a path which runs along the inſide of a parapet, upon which the muſketeers get up, in order to diſcover the counterſcarp, or to fire on the enemy, in the moat or in the covert-way.

BANQUETING room or house. See Saloon. The ancient Romans ſupped in the atrium, or veſtibule, of their houſes; but, in after-times, magnificent ſaloons, or banqueting-rooms, were built, for the more commodious and ſplendid entertainment of their gueſts. Lucullus had ſeveral of theſe, each diſtinguiſhed by the name of ſome god; and there was a particular rate of expence appropriated to each. Plutarch relates with what magnificence he entertained Cicero and Pompey, who went with deſign to ſurpriſe him, by telling only a ſlave who waited, that the cloth ſhould be laid in the Apollo. The emperor Claudius, among others, had a ſplendid banqueting-room named *Mercury*. But every thing of this kind was outdone by the luſtre of that celebrated banqueting-houſe of Nero, called *domus aurea;* which, by the circular motion of its partitions and ceilings, imitated the revolution of the heavens, and repreſented the different ſeaſons of the year, which changed at every ſervice, and ſhowered down flowers, eſſences, and perfumes, on the gueſts.

BANSTICKLE, in ichthyology. See Gasterosteus.

BANTAM, a large town of the iſland of Java, in the Eaſt Indies, ſituated in E. Long. 105. 16. S. Lat. 6. 20. It is the capital of a kingdom of the ſame name, with a good harbour and fortified caſtle. It is divided into two towns ſeparated by a river, and one of them inhabited by the Chineſe. For its hiſtory, &c. ſee Java.

Bantam-work, a kind of painted or carved work, reſembling that of Japan, only more gaudy.

There are two ſorts of Bantam, as well as of Japan work. As, in the latter, ſome are flat, lying even with the black, and others high and emboſſed; ſo, in Bantam-work, ſome are flat, and others in-cut, or carved into the wood, as we find in many large ſcreens: with this difference, that the Japan artiſts work chiefly in gold and other metals; and thoſe of Bantam generally in colours, with a ſmall ſprinkling of gold here and there: for the flat Bantam-work is done in colours, mixed with gum-water, proper for the thing deſigned to be imitated. For the carved, or in-cut kind, the method of performing it is thus deſcribed by an ingenious

genious

Bantry ‖ Baptism.

genious artist: 1. The wood is to be primed with whiting and size, so often, till the primer lie near a quarter of an inch thick; then it is to be water-plained, *i. e.* rubbed with a fine wet cloth, and, some time after, rubbed very smooth, the blacks laid on, varnished up with a good body, and polished well, though with a gentle hand. This done, the design is to be traced out with vermilion and gum-water, exactly in the manner wherein it is intended to be cut; the figures, trees, buildings, &c. in their due proportion: then the graver is applied, with other tools of proper shapes, differing according to the workman's fancy: with these he cuts deep or shallow, as is found convenient, but never deeper than the whiting lies, the wood being never to feel the edge of the instrument. Lines, or parts of the black, are still to be left for the draperies, and other out-lines, and for the distinction of one thing from another; the rule being to cut where the white is, and leave the black untouched. The carving being finished, then take to the pencil, with which the colours are laid into the cut-work: after this, the gold is to be lain in those places which the design requires; for which purpose, a strong thick gum-arabic water is taken and laid with a pencil on the work; and, while this remains wet, leaf-gold is cut with a sharp smooth edged knife, in little pieces, shaped to the bigness and figure of the places where they are to be laid. These being taken up with a little cotton, they daub them with the same close to the gum-water, which affords a rich lustre. The work thus finished, they clear up the black with oil, taking care not to touch the colours. The European workmen ordinarily use brass-dust, which is less bright and beautiful.

BANTRY, a town of Ireland, in the county of Cork, and province of Munster. It is seated on a bay of the same name, in W. Long. 9. 15. N. Lat. 51. 30.

BAOBAB, the name given by Prosper Alpinus to the African calabash-tree, since called ADANSONIA. See that article.

BAPTISM, in matters of religion, the ceremony of washing; or a sacrament, by which a person is initiated into the Christian church.—The word is formed from the Greek βαπτιζω, of βαπτω *to dip*, or *wash*. Baptism is known, in ecclesiastical writers, by divers other names and titles. Sometimes it is called *palingenesia*, or *laver of regeneration;* sometimes *salus*, or *life and salvation;* sometimes σφραγις, *signaculum Domini*, and *signaculum fidei*, or *the seal of faith*; sometimes absolutely *mysterium*, and *sacramentum;* sometimes *the sacrament of faith;* sometimes *viaticum*, from its being administered to departing persons; sometimes *sacerdotium laici*, or *the lay priesthood*, because allowed, in cases of necessity, to be conferred by laymen: sometimes it is called the *great circumcision*, because it was imagined to succeed in the room of circumcision, and to be a seal of the Christian covenant, as that was the seal of the covenant made with Abraham: so, in regard that baptism had Christ for its author, and not man, it was anciently known by the name of Δωρον and χαρισμα Κυριȣ, *the gift of the Lord:* sometimes it was simply called Δωρον, without any other addition, by way of eminence, because it was both a gratuitous and singular gift of Christ: in reference to the making men complete members of Christ's body, the church, it had the name of Τελειωσις, and Τελειη, the *consecration* and *consummation;* because it gave men the perfection of Christians, and a right to partake of the Το Τελειον, which was *the Lord's Supper:* it had also the name of μυησις and μυςαγωγια, the *initiation*, because it was the admittance of men to all the sacred rites and mysteries of the Christian religion.

Various names given to baptism.

Bingham's Orig. Ecclef.

Baptism.

Its origin, &c.

Baptism has been supposed by many learned authors to have had its origin from the Jewish church, in which, as they maintain, it was the practice long before Christ's time, to baptize proselytes or converts to their faith, as part of the ceremony of their admission; a practice which, according to some, obtains among them to this day; a person turning Jew, is first circumcised, and, when healed, is bathed, or baptized in water, in presence of their rabbins; after which he is reputed a good Jew. Others, however, insist that the Jewish proselyte baptism is not by far so ancient, and that John the Baptist was the first administrator of baptism among the Jews. Of this opinion were Deylingius, J. G. Carpzovius, Boernerus, Wernsdorfius, Zeltnerus, Owen, Knatchbull, Jennings, Gill, and others.

Grotius is of opinion, that the rite of baptism had its original from the time of the deluge; immediately after which, he thinks, it was instituted in memory of the world having been purged by water. Some learned men think it was added to circumcision, soon after the Samaritan schism, as a mark of distinction to the orthodox Jews. Spencer, who is fond of deriving the rites of the Jewish religion from the ceremonies of the Pagans, lays it down as a probable supposition, that the Jews received the baptism of proselytes from the neighbouring nations, who were wont to prepare candidates for the more sacred functions of their religion, by a solemn ablution; that, by this affinity of sacred rites, they might draw the Gentiles to embrace their religion, and that the proselytes (in gaining of whom they were extremely diligent) might the more easily comply with the transition from Gentilism to Judaism. In confirmation of this opinion, he observes, first, that there is no divine precept for the baptism of proselytes, God having enjoined only the rite of circumcision for the admission of strangers into the Jewish religion. Secondly, that, among foreign nations, the Egyptians, Persians, Greeks, Romans, and others, it was customary that those who were to be initiated into their mysteries, or sacred rites, should be first purified by dipping their whole body in water. That learned writer adds, as a farther confirmation of his opinion, that the cup of blessing likewise, added to the paschal supper, seems plainly to have been derived from a pagan original: for the Greeks, at their feasts, had one cup called ποτηριον αγαθȣ δαιμονος, *the cup of the good dæmon or god*, which they drank at the conclusion of their entertainment, when the table was removed. Since, then, a rite of Gentile origin was added to one of the Jewish sacraments, viz. the passover, there can be no absurdity in supposing, that baptism, which was added to the other sacrament, namely circumcision, might be derived from the same source. In the last place, he observes, that Christ, in the institution of his sacraments, paid a peculiar regard to those rites which were borrowed from the Gentiles: for, rejecting circumcision and the paschal supper, he adopted into his religion baptism and the sacred cup; thus preparing the way for the conversion and reception of the Gentiles into his church.

The

Baptism.

The design of the Jewish baptism, if baptism be practised by them, is supposed to be, to import a regeneration, whereby the proselyte is rendered a new man, and of a slave becomes free. The effect of it is, to cancel all former relations; so that those who were before akin to the person, after the ceremony ceased to be so. It is to this ceremony Christ is supposed to have alluded, in his expression to Nicodemus, that it was necessary he should be born again, in order to become his disciple.—The necessity of baptism to salvation, is grounded on those two sayings of our Saviour: *He that believeth, and is baptized, shall be saved;* and, *Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God.*—The ancients did not generally think the mere want of baptism, where the procuring it was impracticable, excluded men absolutely from the hopes of eternal salvation. Some few of them, indeed, are pretty severe upon infants dying without baptism; and some others seem also, in general terms, to deny eternal life to adult persons dying without it: but when they interpret themselves, and speak more distinctly, they make some allowances, and except several cases, in which the want of baptism may be supplied by other means. Such are martyrdom, which commonly goes by the name of *second baptism in mens own blood*, in the writings of the ancients; because of the power and efficacy it was thought to have, to save men by the invisible baptism of the Spirit, without the external element of water. Faith, and repentance, were also esteemed a supplement to the want of baptism, in such catechumens as died while they were piously preparing themselves for baptism. Constantly communicating with the church, was thought to supply the want of baptism, in persons who had been admitted to communion, on a presumption of their being duly baptized, though the contrary afterwards appeared. For infants dying without baptism, the case was thought more dangerous; as here, no personal faith, repentance, or the like, could be pleaded, to supply the defect, and wash away original sin: on this account, they who spoke most favourably of them, as Greg. Nazianzen, and Severus bishop of Antioch, only assigned them a middle state, neither in heaven nor hell. But the Latins, as St Augustin, Fulgentius, Marius Mercator, &c. who never received the opinion of a middle state, concluded, as they could not be received into heaven, they must go to hell. Pelagius, and his followers, who denied original sin, asserted, that they might be admitted to eternal life and salvation, though not to the kingdom of heaven; between which they distinguished. Where the fault was not on the side of the child, nor his parents, but of the minister, or where any unavoidable accident rendered baptism absolutely impossible, Hincmar, and others, make an exception, in holding the child saved without baptism.

Opinions concerning the necessity of baptism to salvation.

Of the time place, and subjects of baptism.

The receiving baptism is not limited to any time, or age of life. Some contended for its being administered like circumcision, precisely on the eighth day, as Greg. Nazianzen; and others would have it deferred till the child is three years of age, and able to hear the mystic words, and make answer thereto, though they do not understand them. In the canon law we find divers injunctions against deferring the baptism of infants beyond the 37th day, 30th day, and the 9th day; some of them under pecuniary forfeitures.

Salmasius, and Suicerus from him, deliver it as authentic history, that for the two first ages, no one received baptism, who was not first instructed in the faith and doctrine of Christ, so as to be able to answer for himself, that he believed; because of those words, *He that believeth, and is baptized:* which, in effect, is to say, that no infant, for the first two ages, was ever admitted to Christian baptism. But, afterwards, they own, that pædo-baptism came in, upon the opinion that baptism was necessary to salvation. But Vossius, Dr Forbes, Dr Hammond, Mr Walker, and especially Mr Wall, who has exactly considered the testimony and authority of almost every ancient writer that has said any thing upon this subject, endeavour to evince, that infants were baptised even in the apostolical age. It is certain, Tertullian pleads strongly against giving baptism to infants; which shows, at least, that there was some such practice in his age, though he disapproved of it. It is certain, the ordinary subjects of this sacrament in the first ages were converts from Judaism and Gentilism, who, before they could be admitted to baptism, were obliged to spend some time in the state of catechumens, to qualify them to make their professions of faith, and a Christian life, in their own persons: for, without such personal professions, there were ordinarily no admission of them to the privilege of baptism.—Those baptised in their sick-beds were called *clinici;* and were held in some reproach, as not being reputed true Christians. Hence several censures, in councils and ecclesiastical writers, of clinic baptism. This clinic baptism was not sufficient to qualify the person, in case of recovery, for ordination. Some had their baptism put off by way of punishment, when they fell into gross and scandalous crimes, which were to be expiated by a longer course of discipline and repentance. This was sometimes 5, 10, 20 years, or more; even all their lives, to the hour of death, when their crimes were very flagrant.

In the earliest ages of the church, there was no stated time or place for the reception of baptism. Afterwards, Easter, Whitsuntide, and Epiphany, became solemn seasons, out of which baptism was not administered, except in cases of necessity. The catechumens, who were to receive it at these times, were called *competentes:* and to these it is that St Cyril addresses his catecheses. In the apostolical age, and some time after, before churches and baptisteries were generally erected, they baptized in any place where they had convenience; as John baptized in Jordan, and Philip baptized the eunuch in the wilderness, and Paul the jailor in his own house. But in after ages, baptisteries were built adjoining to the church; and then rules were made, that baptism should ordinarily be administered no where but in these buildings. Justinian, in one of his novels, refers to ancient laws, appointing that none of the sacred mysteries of the church should be celebrated in private houses. Men might have private oratories for prayer in their own houses; but they were not to administer baptism or the eucharist in them, unless by a particular licence from the bishop of the place. Such baptisms are frequently condemned in the ancient councils, under the name παραβαπτισματα, *baptisms in private conventicles.*

Ancient ceremonies.

As to the attendant ceremonies and manner of baptism in the ancient church: The person to be baptised, if

Baptism.

if an adult, was first examined by the bishop or officiating priest, who put some questions to him; as, first, Whether he abjured the devil and all his works; secondly, Whether he gave a firm assent to all the articles of the Christian faith: to both which he answered in the affirmative. If the person to be baptized was an infant, these interrogatories were answered by his *sponsores*, or godfathers. Whether the use of sponsors was as old as the apostles days, is uncertain: perhaps it was not, since Justin Martyr, speaking of the method and form of baptism, says not a word of them.—After the questions and answers, followed exorcism; the manner and end of which was this; The minister laid his hands on the person's head, and breathed in his face, implying thereby the driving away or expelling of the devil from him, and preparing him for baptism, by which the good and holy spirit was to be conferred upon him.—After exorcism, followed baptism itself: and first the minister, by prayer, consecrated the water for that use. Tertullian says, "any waters may be "applied to that use; but then God must be first invocated; and then the Holy Ghost presently comes "down from heaven, and moves upon them, and sanctifies them." The water being consecrated, the person was baptized "in the name of the Father, and of "the Son, and of the Holy Ghost;" by which, "dedication of him to the blessed Trinity, the person "(says Clemens Alexandrinus) is delivered from the "corrupt trinity, the devil, the world, and the flesh." In performing the ceremony of baptism, the usual custom (except in clinical cases, or where there was scarcity of water), was to immerse and dip the whole body. Thus St Barnabas describing a baptized person, says, "We go down into the water full of sin "and filth, but we ascend bearing fruit in our hearts." And this practise of immersing the whole body was so general, that we find no exceptions made in respect either to the tenderness of infants, or the bashfulness of the other sex, unless in case of sickness or other disability. But to prevent any indecency, men and women were baptized apart. To which end, either the baptisteries were divided into two apartments, one for the men, the other for the women, as Bingham has observed; or the men were baptized at one time, and the women at another, as is shown by Vossius, from the *Ordo Romanus*, Gregory's *Sacramentarium*, &c. Add, that there was anciently an order of deaconesses, one part of whose business was to assist at the baptism of women. These precautions, however, rather indicate a scrupulous attention to delicacy, than imply any indecency in the circumstance of immersion itself. From the candidates being immersed, there is at least no reason to infer that they were naked: The present Baptists never baptise naked, though they always immerse. After immersion, followed the unction; by which (says St Cyril) was signified, that they were now cut off from the wild olive, and were ingrafted into Christ, the true olive tree; or else to show, that they were now to be champions for the gospel, and were anointed thereto, as the old athletæ were against their solemn games. With this anointing was joined the sign of the cross, made upon the forehead of the person baptized; which being done, he had a white garment given him, to denote his being washed from the defilements of sin, or in allusion to that of the apostle, "as many as are "baptized into Christ have put on Christ." From this custom the feast of Pentecost, which was one of the annual seasons of baptism, came to be called *Whitsunday*, i. e. *White-sunday*. This garment was afterwards laid up in the church, that it might be an evidence against such persons as violated or denied that faith which they had owned in baptism.—When the baptism was performed, the person baptized, according to Justin Martyr, "was received into the number of the faith"ful, who then sent up their public prayers to God, "for all men, for themselves, and for those who had "been baptized."

The ordinary ministers, who had the right of administering this sacrament, that is, of applying the water to the body, and pronouncing the formula, were presbyters or bishops; though on extraordinary occasions, laymen were admitted to perform the same.

Modern Forms. In the Church of Rome.

As to the present form of administering baptism, the church of Rome uses the following. When a child is to be baptised, the persons who bring it wait for the priest at the door of the church, who comes thither in his surplice and purple stole, attended by his clerks. He begins with questioning the godfathers, whither they promise, in the child's name, to live and die in the true catholic and apostolic faith, and what name they would give the child. Then follows an exhortation to the sponsors; after which the priest, calling the child by its name, asks it as follows: *What dost thou demand of the church?* The godfather answers, *Eternal life*. The priest goes on: *If you are desirous of obtaining eternal life, keep God's commandments, thou shalt love the Lord thy God*, &c. After which he breathes three times into the child's face, saying, *Come out of this child, thou evil spirit, and make room for the Holy Ghost*. This said he makes the sign of the cross on the child's forehead and breast, saying, *Receive the sign of the cross on thy forehead, and in thy heart*. Then taking off his cap, he repeats a short prayer; and laying his hand gently on the child's head, repeats a second prayer: which ended, he blesses some salt; and putting a little of it into the child's mouth, pronounces these words, *Receive the salt of wisdom*. All this is performed at the church-door. The priest, with the godfathers and godmothers, coming into the church, and advancing towards the font, repeat the apostle's creed and the Lord's-prayer. Being come to the font, the priest exorcises the evil spirit again; and taking a little of his own spittle, with the thumb of his right-hand, rubs it on the childs ears and nostrils, repeating, as he touches the right ear, the same word (*Ephatha, be thou opened*) which our Saviour made use of to the man born deaf and dumb. Lastly, they pull off its swaddling-cloaths, or strip it below the shoulders, during which the priest prepares the oils, &c. The sponsors then hold the child directly over the font, observing to turn it due east and west; whereupon the priest asks the child, *Whether he renounces the devil and all his works;* and the godfather having answered in the affirmative, the priest anoints the child between the shoulders in the form of a cross. Then taking some of the consecrated water, he pours part of it thrice on the child's head, at each perfusion calling on one of the Persons of the Holy Trinity. The priest concludes the ceremony of baptism with an exhortation.—The Romish church allows midwives, in cases of danger to baptize a child before it is come entirely out of its mother's womb: where it is to be observed, that some part of the body of

Baptism.

of the child must appear before it can be baptized, and that it is baptized on the part which first appears: if it be the head, it is not necessary to rebaptize the child; but if only a foot or hand appears, it is necessary to repeat baptism. A still-born child, thus baptized, may be buried in consecrated ground.

In the Greek church.

The Greek church differs from the Romish, as to the rite of baptism, chiefly, in performing it by immersion, or plunging the infant all over in the water.

English form in the liturgy of K. Edward.

The forms of administrating baptism among us being too well known to require a particular description, we shall only mention one or two of the more material differences between the form, as it stood in the first liturgy of King Edward, and that in the English Common-Prayer book at present. First, the form of consecrating the water did not make a part of the office, in King Edward's liturgy, as it does in the present, because the water in the font was changed, and consecrated, but once a month. The form likewise itself was something different from that now used; and was introduced with a short prayer, that *Jesus Christ, upon whom (when he was baptized) the Holy Ghost came down in the likeness of a dove, would send down the same Holy Spirit, to sanctify the fountain of baptism*; which prayer was afterwards left out, at the second review.—By King Edward's first book, the minister is to dip the child in the water thrice; first, dipping the right-side; secondly, the left; the third time dipping the face toward the font. This trine immersion was a very ancient practice in the Christian church, and used in honour of the Holy Trinity; though some later writers say, it was done to represent the death, burial, and resurrection, of Christ, together with his three days continuance in the grave. Afterwards, the Arians making an ill use of it, by persuading the people that it was used to denote, that the three Persons in the Trinity were three distinct substances, the orthodox left it off, and used one single immersion.

By the first common-prayer of King Edward, after the child was baptized, the godfathers and godmothers were to lay their hands upon it, and the minister was to put on him the white vestment commonly called the *chrysome*, and to say, "Take this white vesture, as a token of the innocency, which, by God's grace, in this holy sacrament of baptism, is given unto thee; and for a sign, whereby thou art admonished, so long as thou livest, to give thyself to innocence of living, that after this transitory life thou mayest be partaker of the life everlasting. Amen." As soon as he had pronounced these words, he was to anoint the infant on the head, saying, "Almighty God, the Father of our Lord Jesus Christ, who hath regenerated thee by water and the Holy Ghost, and hath given unto thee remission of all thy sins; may he vouchsafe to anoint thee with the unction of his Holy Spirit, and bring thee to the inheritance of everlasting life. Amen." This was manifestly done in imitation of the practice of the primitive church.

The custom of sprinkling children, instead of dipping them in the font, which at first was allowed in case of the weakness or sickness of the infant, has so far prevailed, that immersion is at length quite excluded. What principally tended to confirm the practice of affusion or sprinkling, was, that several of our Protestant divines, flying into Germany and Switzerland during the bloody reign of queen Mary, and returning home when queen Elizabeth came to the crown, brought back with them a great zeal for the Protestant churches beyond sea, where they had been sheltered and received; and having observed, that at Geneva and some other places, baptism was administered by sprinkling, they thought they could not do the church of England a greater piece of service than by introducing a practice dictated by so great an oracle as Calvin. This, together with the coldness of our northern climate, was what contributed to banish entirely the practice of dipping infants in the font.

Notions concerning the effects of baptism.

Many different notions have been entertained concerning the effects of baptism, which it would be endless to enumerate.—The Remonstrants and Socinians reduce baptism to a mere sign of divine grace. The Romanists, on the contrary, exalt its power; holding that all sin is entirely taken away by it; that it absolutely confers the grace of justification, and consequently grace *ex opere operato*. Some also speak of an indelible character impressed on the soul by it, called *character dominicas* and *character regius*: but this is held, by others, a mere chimera; for that the spiritual character, conferred in regeneration, may easily be effaced by mortal sins. Dodwell maintained, that it is by baptism the soul is made immortal; so that those who die without it will not rise again. It must be added, he restrains this effect to episcopal baptism alone. From the effects ordinarily ascribed to baptism, even by ancient writers, it should seem, that the ceremony is as much of heathen as of Jewish origin; since Christians do not restrain the use of it, like the Jews, to the admission of new members into the church, but hold, with the heathens, a virtue in it for the remitting and washing away sins. The Bramins are still said to baptize with this latter view, at certain seasons, in the river Ganges; to the waters whereof they have annexed a cleansing or sanctifying quality; and hence it is that they flock from all parts, even of Tartary, driven by the expectation of their being eased of their load of sins. But, in this point, many Christians seem to have gone beyond the folly of the heathens. It was only the smaller sins of infirmity which these latter held to be expiable by washing; for crimes of a blacker dye, they allowed no water could efface them, no purgation could discharge them. The Christian doctrine of a total remission of sins by baptism could not fail, therefore, to scandalize many among the heathens, and furnished Julian an occasion of satirising Christianity itself: "Whoever (says he) is guilty of rapes, murder, sacrilege, or any abominable crime, let him be washed with water, and he will become pure and holy."

In the ancient church, baptism was frequently conferred on Jews by violence; but the church itself never seems to have allowed of force on this occasion. By a canon of the fourth council of Toledo, it is expressly forbid to baptize any against their wills. That which looks most like force in this case, allowed by law, were two orders of Justinian; one of which appoints the heathens, and the other Samaritans to be baptized, with their wives and children and servants, under pain of confiscation. By the ancient laws, baptism was not to be conferred on image-makers, stage-players, gladiators, *aurigæ* or public drivers, magicians,

cians, or even strolling beggars, till they quitted such professions. Slaves were not allowed the privilege of baptism without the testimony and consent of their masters; excepting the slaves of Jews, Heathens, and heretics, who were not only admitted to baptism, but, in consequence thereof had their freedom. Vossius has a learned and elaborate work *De Baptismo*, wherein he accurately discusses all the questions concerning baptism according to the doctrines of the ancients.

Bingham Orig. Eccl. l. 11. c. 5. §. 4. l. 8. c. 11. §. 17.

Baptism by Fire, spoken of by St John the Baptist, has occasioned much conjecture. The generality of the fathers held, that believers, before they enter paradise, are to pass through a certain fire, which is to purify them from all pollutions remaining on them unexpiated. Others, with St Basil, understand it of the fire of hell; others, of that of tribulation and temptation. Others, with St Chrysostom, will have it denote an abundance of graces. Others suppose it to mean the descent of the Holy Ghost on the apostles, in form of fiery tongues. Lastly, others maintain, that the word *fire* here is an interpolation: and that we are only to read the text, *He that shall come after me will baptize you with the Holy Ghost*. In reality it is not found in divers manuscript copies of St. Matthew.

The ancient Seleucians and Hermians, understanding the passage literally, maintained, that material fire was necessary in the administration of baptism. But we do not find how, or to what part of the body they applied it, or whether they were satisfied with obliging the person baptized to pass through the fire. Valentinus rebaptized all who had received water-baptism, and conferred on them the baptism of fire.

Bis docuit tingi, traductoque corpore flamma.
TERTULL. Carm. contr. Marc. l. 1.

Heracleon, cited by Clemens Alexandrinus, says, that some applied a red-hot iron to the ears of the person baptized, as if to impress some mark upon him.

Baptism of the Dead, a custom which anciently prevailed among some people in Africa, of giving baptism to the dead. The third council of Carthage speaks of it as a thing that ignorant Christians were fond of. Gregory Nazianzen also takes notice of the same superstitious opinion prevailing among some who delayed to be baptized. In his address to this kind of men, he asks, whether they staid to be baptized after death? Philastrius also notes it as the general error of the Montanists or Cataphrygians, that they baptized men after death. The practice seems to be grounded on a vain opinion, that, when men had neglected to receive baptism in their life-time, some compensation might be made for this default by receiving it after death.

Baptism of the Dead, was also a sort of vicarious baptism, formely in use, where a person dying without baptism, another was baptized in his stead.

St Chrysostom tells us, this was practised among the Marcionites with a great deal of ridiculous ceremony; which he thus describes: After any catechumen was dead, they hid a living man under the bed of the deceased; then coming to the dead man, they asked him, whether he would receive baptism? and he making no answer, the other answered for him, and said, he would be baptized in his stead: and so they baptized the living for the dead.

Epiphanius assures us, the like was also practised among the Corinthians. This practice they pretended to found on the Apostle's authority; alledging that text of St. Paul for it, *If the dead rise not at all, what shall they do who are baptized for the dead?* A text which has given occasion to a great variety of different systems and explications. Bosius enumerates no less than nine different opinions among learned divines concerning the sense of the phrase *being baptized for the dead.*

St Ambrose and Walafred Strabo seem clearly of opinion, that the apostle had respect to such a custom then in being; and several moderns have given into the same opinion, as Baronius, Jos. Scaliger, Justellus, and Grotius.

Several among the Roman-catholics, as Bellarmin, Salmeron Menochius, and a number of schoolmen, understand it of the baptism of tears, and penance, and prayers, which the living undergo for the dead; and thus alledge it as a proof of the belief of purgatory in St Paul's days.

Hypothetical Baptism, that formerly administered in certain doubtful cases, with this formula: *If thou art baptized, I do not rebaptize; if thou art not, I baptize thee in the name of the Father*, &c. This sort of baptism, enjoined by some ancient constitutions of the English church, is now fallen into disuse.

Solemn Baptism, that conferred at stated seasons; such, in the ancient church, were the *Paschal baptism*, and that at Whitsuntide. This is sometimes also called *general baptism*.

Lay-Baptism, we find to have been permitted by both the Common-prayer Books of King Edward and that of Queen Elizabeth, when an infant is in immediate danger of death, and a lawful minister cannot be had. This was founded upon the mistaken notion of the impossibility of salvation without the sacrament of baptism: but afterwards, when they came to have clearer notions of the sacraments, it was unanimously resolved in a convocation, held in the year 1575, that even private baptism, in a case of necessity was only to be administered by a lawful minister.

BAPTISM is also applied, abusively, to certain ceremonies used in giving names to things inanimate.

The ancients knew nothing of the custom of giving baptism to inanimate things, as bells, ships, and the like, by a superstitious consecration of them. The first notice we have of this is in the Capitulars of Charles the Great, where it is only mentioned to be censured; but, afterwards, it crept into the Roman offices by degrees. Baronius carries its antiquity no higher than the year 968, when the greatest bell of the church of Lateran was christened by Pope John III. At last it grew to that superstitious height, as to be thought proper to be complained of in the *Centum Gravamina* of the German nation, drawn up in the public diet of the empire held at Nuremberg *anno* 1581; where (after having described the ceremony of baptizing a bell, with godfathers, who make responses as in baptism, and give it a name, and clothe it with a new garment as Christians were used to be clothed, and all this to make it capable of driving away tempests and devils), they conclude against it, not only a superstitious practice, but contrary to the Christian religion, and a mere seduction of the simple people.

BAPTISM, in the sea language, a ceremony in long voyages on board merchant ships, practised both on persons

persons and vessels who pass the tropic or line for the first time. The baptizing the vessel is simple, and consists only in washing them throughout with sea-water; that of the passengers is more mysterious The oldest of the crew, that has past the tropic or line, comes with his face blacked, a grotesque cap on his head, and some sea-book in his hand, followed by the rest of the seamen dressed like himself, each having some kitchen utensil in his hand, with drums beating; he places himself on a seat on the deck, at the foot of the main mast. At the tribunal of this mock magistrate, each passenger not yet initiated, swears he will take care the same ceremony be observed, whenever he is in the like circumstances: Then, by giving a little money by way of gratification, he is discharged with a little sprinkling of water; otherwise he is heartily drenched with streams of water poured upon him; and the ship-boys are inclosed in a cage, and ducked at discretion.—The seamen, on the baptizing a ship, pretend to a right of cutting off the beak-head, unless redeemed by the captain.

BAPTISMAL, something belonging to baptism; thus we say baptismal vow, presents, &c.

Baptismal Vow or *Covenant*, a profession of obedience to the laws of Christ, which persons in the ancient church made before baptism. It was an indispensable part of the obligation on catechumens, before they were admitted to the ceremony of regeneration. It was made by turning to the East; for what mystical reasons, is not well agreed on.

Baptismal Presents are in use in Germany, made by the sponsors to the infant, consisting of money, plate, or even sometimes fiefs of lands; which by the laws of the country are to be kept for the child till of age, the parents having only the trust, not the right, of disposing of them. An anonymous author has published a discourse express on this occasion, intitled *De pecunia lustrica*.

BAPTIST (John), Monnoyer, a painter of flowers and fruit, was born at Lisle in 1635, and educated at Antwerp, where he perfected himself in the knowledge of his art, and in his first years was intended for a painter of history: but having soon observed that his genius more strongly inclined him to the painting of flowers, he applied his talents to those subjects, and in that style became one of the greatest masters. His pictures are not so exquisitely finished as those of Van Huysum, but his composition and colouring are in a bolder style. His flowers have generally a remarkable freedom and looseness, as well in the disposition as in penciling; together with a tone of colouring that is lively, admirable, and nature itself. The disposition of his objects is surprisingly elegant and beautiful; and in that respect his compositions are easily known, and as easily distinguished from the performances of others. He died in 1699.—He left a son, Anthony, who painted flowers in the same style and manner, and had great merit.

BAPTISTS, in eccesiastical history, (from βαπτιζω, *I baptize*); a denomination of Christians, distinguished from other Christians by their particular opinions respecting the mode and the subjects of baptism.

Instead of administering the ordinance by sprinkling or pouring water, they maintain that it ought to be administered only by immersion. Such, they insist, is the meaning of the word βαπτιζω; so that a command to baptize is a command to immerse. Thus it was understood by those who first administered it. John the Baptist, and the apostles of Christ, administered it in Jordan and other rivers, and places where there was much water. Both the administrators and the subjects are described as going down into, and coming up again out of, the water; and the baptized are said to be buried in baptism, and to be raised again: which language could not, they say, be properly adopted on supposition of the ordinance being administered in any other manner than by immersion. Thus also they affirm it was in general administered in the primitive church. Thus it is now administered in the Russian and Greek church: and thus it is, at this day, directed to be administered in the church of England, to all who are thought capable of submitting to it in this manner. With regard to the subjects of baptism, the Baptists say, that this ordinance ought not to be administered to children or infants at all, nor to grown up persons in general, but to adults only of a certain character and description. Our Saviour's commission to his apostles, by which Christian baptism was instituted, is to go and teach all nations, baptizing them: that is, say they, not to baptize all they meet with; but first instruct them—to teach all nations, or to preach the gospel to every creature,—and whoever receives it, him to baptize in the name of the Father, and of the Son, and of the Holy Ghost. To such persons, and to such only, baptism appears to have been administered by the apostles, and the immediate disciples of Christ. They are described as repenting of their sins, as believing in Christ, and as having gladly received the word. Without these qualifications, Peter acquaints those who were converted by his sermon, that he could not have admitted them to baptism. Philip holds the same language in his discourse with the eunuch; and Paul treats Lydia, the jailor, and others, in the same manner. Without these qualifications, Christians in general think it wrong to admit persons to the Lord's supper; and, for the same reasons, without these qualifications, at least a profession of them, the Baptists think it wrong to admit any to baptism. Wherefore they with-hold it, not only from the impenitently vicious and profane, and from infidels who have no faith; but also from infants and children, who have no knowledge, and are incapable of every action civil and religious. They further insist, that all positive institutions depend entirely upon the will and declaration of the institutor; and therefore, that reasoning by analogy from abrogated Jewish rites is to be rejected, and the express commands of Christ respecting the mode and subjects of baptism ought to be our only rule.

The Baptists in England form one of the denominations of Protestant dissenters. They separate from the establishment for the same reasons as their brethren of the other denominations do; and from additional motives derived from their particular tenets respecting baptism. The constitution of their churches, and their modes of worship, are congregational or independent: in the exercise of which they are protected, in common with other dissenters, by the act of toleration. Before this act, they were liable to pains and penalties as nonconformists, and often for their peculiar senti-

ments

ments as Baptists. A proclamation was issued out against them, and some of them were burnt in Smithfield in 1538. They bore a considerable share in the persecutions of the last and of the preceding centuries; and, as it should seem, in those of some centuries before; for there were several among the Lollards and the followers of Wickliff, who disapproved of infant-baptism. There were many of this persuasion among the Protestants and reformers abroad. In Holland, Germany, and the North, they went by the names of ANABAPTISTS and MENNONITES: and, in Piedmont and the south, they were found among the ALBIGENSES and WALDENSES. See the histories of the Reformation, and the above articles in this Dictionary.

The *Baptists* subsist under two denominations, viz. the *Particular* or Calvinistical, and the *General* or Arminian. The former is by far the most numerous. Some of both denominations allow of *mixed communion*, viz. of persons who have been sprinkled in their infancy, and therefore unbaptized in the view of the Baptists; others disallow it: and some of them observe the seventh day of the week as the sabbath, apprehending the law that enjoined it, not to have been repealed by Christ or his apostles. But a difference of opinion respecting these and other matters, is not peculiar to the Baptists: it is common to all Christians, and to all bodies of men who think and judge for themselves.

BAPTISTERY, in ecclesiastical writers, a place in which the ceremony of baptism is performed.

In the ancient church it was one of the exedræ or buildings distinct from the church itself: and consisted of a porch or anti-room where the persons to be baptized made their confession of faith, and an inner room where the ceremony of baptism was performed. Thus it continued till the sixth century, when the baptisteries began to be taken into the church-porch, and afterwards into the church itself.

The ancient baptisteries were commonly called φωτιστηρια, *photisteria*, q. d. places of illumination; an appellation sometimes given to baptism. Or they might have the name for another reason, because they were the places of an illumination, or instruction, preceding baptism: for here the catechumens seem to have been trained up, and instructed in the first rudiments of the Christian faith.

Those baptisteries were anciently very capacious; because, as Dr Cave observes, the stated times of baptism returning but seldom, there were usually great multitudes to be baptized at the same time: and then the manner of baptizing, by immersion, or dipping under water, made it necessary to have a large font likewise. In *Venantius Fortunatus*, it is called *aula baptismatis*, the large hall of baptism; which was indeed so capacious, that we sometimes read of councils meeting and sitting therein. This hall, or chapel, was always kept shut during Lent, and the door sealed up with the bishop's seal, not to be opened till Maunday-Thursday.

The baptistery was always reputed a sacred place. In the Roman order, we find the ceremonies used in the consecration of the baptisteries: they were to be built of a round figure, and distinguished with the image of St John the Baptist; over the bason or font was a figure of a dove in gold or silver; to represent the Holy Ghost.

The name *baptistery* is sometimes also given to a kind of chapel in a large church, which served for the same office. It is an observation of some learned men, that anciently there was but one baptistery in a city, and that at the bishop's church; and that afterwards they were set up in parish churches, with the special allowance however of the bishop.

BAR, in a general sense, denotes a slender piece of wood or iron, for keeping things close together.

BAR, in courts of justice, an inclosure made with a strong partition of timber, where the council are placed to plead causes. It is also applied to the benches where the lawyers or advocates are seated, because anciently there was a bar to separate the pleaders from the attorneys and others. Hence lawyers who are called to the bar, or licensed to plead, are termed *barristers*, an appellation equivalent to *licentiate* in other countries.

BAR, or *Barr*, (Latin *barra*, and in French *barre*), in a legal sense, is a plea or peremptory exception of a defendant, sufficient to destroy the plaintiff's action. And it is divided into bar to common intendment, and bar special; bar temporary, and perpetual. Bar to a common intendment is an ordinary or general bar, which usually disableth the declaration of the plaintiff; bar special is that which is more than ordinary, and falls out upon some special circumstance of the fact as to the case in hand. Bar temporary is such a bar as is good for the present, but may afterwards fail; and bar perpetual is that which overthrows the action of the plaintiff for ever.

BAR, in heraldry, an ordinary in form of the fess, but much less. See HERALDRY.

BAR, in the menage, the highest part of that place of a horse's mouth situated between the grinders and tushes, so that the part of the mouth which lies under and at the side of the bars retains the name of the gum. A horse with sensible bars has a fine light mouth, with an even and firm appui. See APPUI.

To BAR *a Vein*, in farriery, is an operation performed upon the veins of the legs of a horse and other parts, with intent to stop the malignant humours. It is done by opening the skin above it, disengaging it, and tying it both above and below, and striking between the two ligatures.

BAR, in music, a stroke drawn perpendicularly across the lines of a piece of music, including between each two a certain quantity or measure of time, which is various as the time of the music is either triple or common. In common time, between each two bars is included the measure of four crotchets; in triple, three. The principal use of bars is to regulate the beating of time in a concert. The use of bars is not to be traced higher than the time when the English translation of Adrian le Roy's book on the Tablature was published, *viz.* the year 1574; and it was sometime after that before the use of bars became general. To come nearer to the point, Barnard's cathedral music, printed in 1641, is without bars: but bars are to be found throughout in the *Ayres and Dialogues* of Henry Lawes published in 1653; from whence it may be conjectured that we owe to Lawes this improvement.

BAR, in hydrography, denotes a bank of ſand, or other matter, whereby the mouth of a river is in a manner choaked up.

The term *bar* is alſo uſed for a ſtrong beam wherewith the entrance of a harbour is ſecured: This is more commonly called *boom.*

BAR of a tavern or coffee-houſe, the place where the waiters attend to anſwer the calls of the cuſtomers.

BAR, among printers, denotes a piece of iron with a wooden handle, whereby the ſcrew of the preſs is turned in printing. See PRINTING.

BARS of Iron, are made of the metal of the ſows and pigs as they come from the furnace. Theſe paſs thro' two forges called the *finery* and the *chauſery*; where, undergoing five ſeveral heats, they are formed into bars.

BAR, a very ſtrong city of Podolia in Poland, upon the river Kiow. E. Long. 28. 30. N. Lat. 50. 6.

BAR, a duchy of France, bounded on the eaſt by Lorrain, on the north by Luxembourg, on the weſt by Champagne, on the ſouth by part of the ſame country and by Franche Compte. It is croſſed by the river Meuſe from north to ſouth, and watered by ſeveral other rivers, which render it very fertile. It is divided into four balliages, *viz.* Baſſilyni, Bar, St Michael, and Clermont. The chief towns are Bar-le-duc, Clermont, St Michael, Longuey, Pont a Mouſſon, and Stenay. In 1736, it was given to Staniſlaus then king of Poland.

BAR-le-Duc, the capital of the duchy of Bar, ſeated on the declivity of a hill. It is divided into the higher and lower town: the lower is watered by the rivulet Orney, which abounds with excellent trouts. The wines are excellent, and not inferior to thoſe of Champagne. E. Long. 5. 30. N. Lat. 48. 35.

BAR-le-Mont, a town of the French Netherlands, in Hainault, ſituated on the river Sombre. E. Long. 3. 40. N. Lat. 50. 10.

BAR ſur Auche, an ancient town of France, ſeated at the foot of a mountain. E. Long. 4. 50. N. Lat. 48. 14.

BAR ſur Seine, a town of France, in the duchy of Burgundy, ſeated between a mountain which covers it on the weſt, and the river Seine which runs on the eaſt. E. Long. 4. 30. N. Lat. 48. 5.

BAR-Maſter, among miners, the perſon who keeps the gage, or diſh, for meaſuring the ore.

BARA (anc. geog.), a ſmall iſland in the Adriatic, oppoſite to Brunduſium: the *Pharos* of Mela. Alſo a frith, or arm of the ſea of Britannia Secunda (Ptolemy); ſuppoſed to be the Murray-frith.

BARA, one of the Hebrides or Weſtern Iſlands of Scotland. It is a ſmall rock, only a quarter of a mile in circumference, being part of a chain called the *Long Iſland*, the whole cluſter appearing at low water as one iſland. Bara is altogether barren; but abounds with great numbers of ſea-fowl, ſuch as ſolon geeſe, guillamotes, puffins, &c.

BARA, the name of a feſtival celebrated with much magnificence at Meſſina, and repreſenting the aſſumption of the Virgin. The *bara*, though uſed as the general denomination of this feſtival, ſignifies more particularly a vaſt machine 50 feet high, at the top of which a young girl of 14, repreſenting the Virgin, ſtands upon the hand of an image of Jeſus Chriſt. Round him turn vertically, in a circle, 12 little children which repreſent the ſeraphims; below them, in another circle, which turns horizontally, are 12 more repreſenting the cherubims: below theſe a ſun turns vertically, with a child at the extremity of each of the four principal *radii* of his circle, who aſcend and deſcend with his rotation, yet ſtill ſtand upright. Below the ſun is the loweſt circle, about ſeven feet from the ground, in which 12 boys turn horizontally without interruption: theſe are intended for the twelve apoſtles, who are ſuppoſed to ſurround the tomb of the Virgin at the moment when ſhe aſcends into heaven. This complication of ſuperſtitious whirligigs may have already nearly turned the ſtomachs of ſome of our readers, or at leaſt rendered them ſqueamiſh. But think of the poor little cherubims, ſeraphims, and apoſtles, who are twirled about in this proceſſion! for, ſays Mr Houel, "ſome of them fall aſleep, many of them vomit, and ſeveral do ſtill worſe:" but theſe unſeemly effuſions are no drawback upon the edification of the people; and nothing is more common than to ſee fathers and mothers ſoliciting with ardour for their boys and girls the pious diſtinction of puking at the bara. This machine is not drawn by aſſes or mules, but by a multitude of robuſt monks.

Houel's Deſcriptive Travels thro' Sicily, &c.

BARABINZIANS, a tribe of Tartars, living on both ſides the river Iris. They ſeem to derive their name from the *Barabaian* deſart, whoſe lakes ſupply them abundantly with fiſh, on which and their cattle they chiefly ſubſiſt. They have plenty of game and wild-fowl of every kind, particularly ducks and puffins. Moſt of them are heathens, but Mahometaniſm daily gains ground among them. Some of them pay tribute to the Empreſs of Ruſſia, and others to the Khan Taiſha.

BARACOA, a town in the north eaſt part of the iſland of Cuba. W. Long. 76. 10. N. Lat. 21. 5.

BARALIPTON, among logicians, a term denoting the firſt indirect mode of the firſt figure of ſyllogiſm. A ſyllogiſm in baralipton, is when the two firſt propoſitions are general, and the third particular, the middle term being the ſubject in the firſt propoſition, and the predicate in the ſecond. The following is of this kind:

BA. Every evil ought to be feared;
RA. Every violent paſſion is an evil;
LIP. Therefore ſomething that ought to be feared is a violent paſſion.

BARALLOTS, in church-hiſtory, a ſect of heretics at Bologna in Italy, who had all things in common, even their wives and children.—Their facility in complying with all manner of debauchery made them get the name *obedientes*, "compliers."

BARANCA DE MALAMBO, a town of Terra Firma in America, with a biſhop's ſee and a good haven. It is a place of great trade, and is ſeated on the river Magdaleine. W. Long. 75. 30. N. Lat. 11. 10.

BARANGI, officers among the Greeks of the lower empire. Cujas calls them Latin *protectores*, and others give them the name of *ſecurigeri*. It was their buſineſs to keep the keys of the city gates, where the emperor reſided.

BARANWAHR, a town of Lower Hungary, in a county of the ſame name, taken by the emperor of Germany from the Turks in 1684. It is ſeated between

tween Buda and Belgrade, in E. Long. 20. 5. N. Lat. 46. 0.

BARATHRUM, in antiquity, a deep dark pit at Athens, into which condemned perſons were caſt headlong. It had ſharp ſpikes at the top, that no man might eſcape out; and others at the bottom, to pierce and torment ſuch as were caſt in.—Its depth and capaciouſneſs made it to be applied proverbially to a covetous perſon: to a glutton, called *Barathro* by the Romans (Lucretius, Horace), and *Barathrum* in the ſame ſenſe (Horace); and for a common proſtitute (Platus).

BARATIERE (Philip), a moſt extraordinary inſtance of the early and rapid exertion of mental faculties. This ſurpriſing genius was the ſon of Francis Baratiere, miniſter of the French church at Schwobach near Nuremberg, where he was born Jan. 10th 1721. The French was his mother-tongue, together with ſome words of High Dutch; but by means of his father inſenſibly talking Latin to him, it became as familiar to him as the reſt: ſo that, without knowing the rules of grammar, he at four years of age talked French to his mother, Latin to his father, High Dutch to the maid or neighbouring children; and all this without mixing or confounding the reſpective languages. About the middle of his fifth year he acquired Greek in like manner; ſo that in 15 months he perfectly underſtood all the Greek books in the Old and New Teſtament, which he readily tranſlated into Latin. When he was five years and eight months old, he entered upon Hebrew; and in three years time was ſo expert in the Hebrew text, that from a bible without points, he could give the ſenſe of the original in Latin or French; or tranſlate extempore the Latin or French verſions into Hebrew, almoſt word for word; and had all the Hebrew pſalms by heart. He compoſed at this time a dictionary of rare and difficult Hebrew words, with critical remarks and philological obſervations, in about 400 pages in 4to; and, about his tenth year, amuſed himſelf for twelve months with the Rabinical writers. With theſe he intermixed a knowledge of the Chaldaic, Syriac, and Arabic; and acquired a taſte for divinity and ecceſiaſtical antiquity, by ſtudying the Greek fathers, and councils of the firſt four ages of the church. In the midſt of theſe occupations, a pair of globes coming into his poſſeſſion, he could in 8 or 10 days time reſolve all the problems on them; and in about three months, in Jan. 1735, deviſed his project for the diſcovery of the longitude, which he communicated to the Royal Society at London and the Royal Academy of Sciences at Berlin. In June 1731, he was matriculated in the univerſity of Altorf; and at the cloſe of the year 1732, he was preſented by his father at the meeting of the reformed churches of the circle of Franconia; who, aſtoniſhed at his wonderful talents, admitted him to aſſiſt in the deliberations of the ſynod; and to preſerve the memory of ſo ſingular an event, it was ordered to be regiſtered in their acts. In 1734, the Margrave of Brandenburgh Anſpach granted this young ſcholar the uſe of whatever books he wanted from the Anſpach library, together with a penſion of 50 florins, which he enjoyed three years; and his father receiving a call to the French church at Stetin in Pomerania, young Baratiere was, on the journey, admitted maſter of arts, with univerſal applauſe, at the univerſity of Hall: at Berlin he was honoured with ſeveral converſations with the king of Pruſſia, and was received into the royal academy. Towards the cloſe of his life he acquired a taſte for medals, inſcriptions, and antiquities; metaphyſical inquiries, and experimental philoſophy, intervening occaſionally between theſe ſtudies. He wrote ſeveral eſſays and diſſertations; made aſtronomical remarks, and laborious calculations; took great pains towards a hiſtory of the hereſies of the anti-trinitarians, and of the 30 years war in Germany: his laſt publication, which appeared in 1740, was on the ſucceſſion of the biſhops of Rome. The final work he engaged in, and for which he had gathered large materials, was *Inquiries concerning the Egyptian Antiquities*. But the ſubſtance of this blazing meteor was now almoſt exhauſted: he was always weak and ſickly; and died October 5. 1740, aged 19. years 8 months and 16 days. He publiſhed 11 different pieces, and left 26 manuſcripts on various ſubjects, the contents of which may be ſeen in his life written by M. Formey profeſſor of philoſophy at Berlin.

BARATZ (Turkiſh), letters-patent granted by the Turkiſh emperors to the Greek patriarch, biſhops, &c. for the exerciſe of their eccleſiaſtical functions. This *Baratz* gives the biſhops full power and authority to eſtabliſh and depoſe the inferior clergy, and all other religious perſons; to grant licences for marriages, and iſſue out divorces; to collect the revenues belonging to the churches; to receive the pious legacies bequeathed to them; in ſhort, to enjoy all the privileges and advantages belonging to their high ſtation: and all this (as it is expreſſed in the baratz itſelf), "according to the vain and idle ceremonies of the Chriſtians."

BARB, or BARBE, a horſe brought from Barbary. See EQUUS.

BARBA, in botany, a ſpecies of *pubes*, or down, with which the ſurface of ſome plants is covered. The term was invented by Linnæus; and by its application in the *Species Plantarum*, ſeems to ſignify a tuft or bunch of ſtrong hairs terminating the leaves. *Meſembryanthemum barbatum*, furniſhes an example.

The word is alſo often uſed in compoſition with ſome other, to form the trival names of ſeveral plants, as *barba jovis*, *barba capræ*, &c.

BARBACAN, or BARBICAN, an outer defence or fortification to a city or caſtle, uſed eſpecially as a fence to the city or walls; alſo, an aperture made in the wall of a fortreſs, to fire through upon the enemy. See CASTLE.

BARBACAN is alſo uſed to denote a fort at the entrance of a bridge, or the outlet of a city, having a double wall with towers.

BARBADOES, the moſt eaſterly of all the Caribbee Iſlands, ſubject to Great Britain, and, according to the beſt geographers, lying between 59. 50. and 60. 2. of weſt longitude, and between 12. 56. and 13. 16. of north latitude. Its extent is not certainly known: the moſt general opinion is, that it is 25 miles from north to ſouth, and 15 from eaſt to weſt; but theſe menſurations are ſubject to ſo many difficulties and uncertainties, that it will perhaps convey a more adequate idea of this iſland to tell the reader than in reality it does not contain above 107,000 acres. The climate is hot, but not unwholeſome, the heat being qualified by ſea-breezes; and a temperate regimen renders this iſland as ſafe to live in as any climate ſouth of Great Britain; and, according to the opinion of many, as even Great Britain itſelf. This iſland has on its eaſt ſide two ſtreams that are called *rivers*, and in the middle is ſaid to have a bituminous ſpring which ſends forth a liquor like tar, and ſerves for the ſame uſes as pitch or lamp-oil. The iſland abounds in wells of good water, and has ſeveral reſervoirs for rain-water. Some parts of the ſoil are ſaid to be hollowed into caves, ſome of them capable of containing 300 people. Theſe are imagined to have been the lurking-places of runaway negroes, but may as probably be natural excavations. The woods that formerly grew upon the iſland have been all cut down, and the ground converted into ſugar plantations. When thoſe plantations were firſt formed, the ſoil was prodigiouſly fertile, but has ſince been worn out, inſomuch, that about the year 1730, the planters were obliged to raiſe cattle for the ſake of their dung, by which means the profit of their plantations was reduced to leſs than a tenth of its uſual value. Notwithſtanding the ſmallneſs of Barbadoes, its ſoil is different; being in ſome places ſandy and light, in others rich, and in others ſpongy; but all of it is cultivated according to its proper nature, ſo that the iſland preſents to the eye the moſt beautiful appearance that can be imigined. Oranges and lemons grow in Barbadoes in great plenty, and in their utmoſt perfection. The lemon juice here has a peculiar fragrancy. The citrons of Barbadoes afford the beſt drams and ſweetmeats of any in the world, the Barbadoes ladies excelling in the art of preſerving the rhind of the citron fruit. The juice of the limes, or dwarf lemons, is the moſt agreeable ſouring we know, and great quantities of it have of late been imported into Britain and Ireland. The pine apple is alſo a native of Barbadoes, and grows there to much greater perfection than it can be made to do in Europe by any artificial means. A vaſt number of different trees peculiar to the climate are alſo found to flouriſh in Barbadoes in great perfection; ſuch as the aloe, mangrove, calabaſh, cedar, cotton, maſtic, &c. Here likewiſe are produced ſome ſenſitive plants, with a good deal of garden ſtuff, which is common in other places. In ſhort, a native of the fineſt, the richeſt, and moſt diverſified country in Europe, can hardly form an idea of the variety of delicious and at the ſame time nutritive vegetable productions with which this iſland abounds.

When Barbadoes was firſt diſcovered by the Engliſh, few or no quadrupeds were found upon it, except hogs, which had been left there by the Portugueſe. For convenience of carriage to the ſea-ſide, ſome of the planters at firſt procured camels; which undoubtedly would in all reſpects have been preferable to horſes for their ſugar and other works; but the nature of the climate diſagreeing with that animal, it was found impoſſible to preſerve the breed. They then applied for horſes to Old and New England: from the former they had thoſe that were fit for ſhew and draughts; from the latter thoſe that were proper for mounting their militia, and for the ſaddle. They had likewiſe ſome of an inferior breed from Curaſſao, and other ſettlements. They are reported to have had their firſt breed of black cattle from Bonaviſta and the iſle of May; they now breed upon the iſland, and often do the work of horſes. Their aſſes are very ſerviceable in carrying burdens to and from the plantations. The hogs of Barbadoes are finer eating than thoſe of Britain, but the few ſheep they have are not near ſo good. They likewiſe have goats, which when young are excellent food. Racoons and monkies are alſo found here in great abundance. A variety of birds are produced on Barbadoes, of which the humming bird is the moſt remarkable. Wild fowl do not often frequent this iſland; but ſometimes teal are found near their ponds. A bird which they call the *man of war*, is ſaid to meet ſhips at 20 leagues from land, and their return is, to the inhabitants, a ſure ſign of the arrival of theſe ſhips. When the wind blows from the ſouth and ſouth-weſt, they have flocks of curlews, plovers, ſnipes, wild pigeons, and wild ducks. The wild pigeons are very fat and plentiful at ſuch ſeaſons, and rather lager than thoſe of England. The tame pigeons, pullets, ducks, and poultry of all kinds, that are bred at Barbadoes, have alſo a fine flavour, and are accounted more delicious than thoſe of Europe. Their rabbits are ſcarce; they have no hares; and if they have deer of any kind, they are kept as curioſities. The inſects of Barbadoes are not venomous, nor do either their ſnakes or ſcorpions ever ſting. The muſketoes are troubleſome, and bite; but are more tolerable in Barbadoes than on the continent. Various other inſects are found on the iſland, ſome of which are troubleſome, but in no greater degree than thoſe that are produced by every warm ſummer in England. Barbadoes is well ſupplied with fiſh; and ſome caught in the ſea ſurrounding it are almoſt peculiar to itſelf; ſuch as the parrot-fiſh, ſnappers, grey cavallos, terbums, and coney-fiſh. The mullets, lobſters, and crabs, caught here are excellent; and the green turtle is perhaps the greateſt delicacy that ancient or modern luxury can boaſt of. At Barbadoes this delicious ſhell-fiſh ſeldom ſells for leſs than a ſhilling a pound, and often for more. There is found in this iſland a kind of land crab which eats herbs wherever it can find them, and ſhelters itſelf in houſes and hollows of trees. According to report, they are a ſhell-fiſh of paſſage; for in March they travel to the ſea in great numbers. See CANCER.

The inhabitants may be reduced to three claſſes, viz. the maſters, the white ſervants, and the blacks. The former are either Engliſh, Scots, or Iriſh: but the great encouragement given by government to the peopling of this and other Weſt Indian iſlands, induced ſome Dutch, French, Portugueſe, and Jews, to ſettle among them with their eſtates; by which, after a certain time, they acquire the rights of naturalization in Great Britain. The white ſervants, whether by covenant or purchaſe, lead more eaſy lives than the day-labourers in England; and when they come to be overſeers, their wages and other allowances are conſiderable. As to the treatment of the negro ſlaves in this and the other iſlands, that falls to be ſpoken of under the articles NEGRO, SLAVE, WEST-INDIES; which ſee. The manners of the white inhabitants, in general, are the ſame as in moſt polite towns and countries in Europe. The capital of the iſland is called *Bridge-Town*; ſee that article.

As the hiſtory of this iſland furniſhes no very remarkable events, the following ſhort hints concerning it may ſuffice.

When

When the English, some time after the year 1625, first landed here, they found it the most savage and destitute place they had hitherto visited. It had not the least appearance of ever having been peopled even by savages. There was no kind of beasts of pasture or of prey, no fruit, no herb, no root fit for supporting the life of man. Yet as the climate was so good, and the soil appeared fertile, some gentlemen of small fortune in England resolved to become adventurers thither. The trees were so large, and of a wood so hard and stubborn, that it was with great difficulty they could clear as much ground as was necessary for their subsistence. By unremitting perseverance, however, they brought it to yield them a tolerable support; and they found that cotton and indigo agreed well with the soil; and that tobacco, which was beginning to come into repute in England, answered tolerably. These prospects, together with the storm between the king and parliament, which was beginning to break out in England, induced many new adventurers to transport themselves into this island. And what is extremely remarkable, so great was the increase of people in Barbadoes, 25 years after its first settlement, that in 1650 it contained more than 50,000 whites, and a much greater number of negro and Indian slaves. The latter they acquired by means not at all to their honour: for they seized upon all those unhappy men, without any pretence, in the neighbouring islands, and carried them into slavery; a practice which has rendered the Caribbee Indians irreconcilable to them ever since. They had begun a little before this to cultivate sugar, which soon rendered them extremely wealthy. The number of slaves, therefore, was still augmented; and in 1676 it is supposed that their number amounted to 100,000, which, together with 50,000 whites, make 150,000 on this small spot: a degree of population unknown in Holland, in China, or any other part of the world most renowned for numbers. At this time Barbadoes employed 400 sail of ships, one with another, of 150 tons in their trade. Their annual exports in sugar, indigo, ginger, cotton, and citron-water, were above L.350,000, and their circulating cash at home was L.200,000. Such was the increase of population, trade, and wealth, in the course of 50 years. But since that time this island has been much on the decline; which is to be attributed partly to the growth of the French sugar-colonies, and partly to the English establishments in the neighbouring isles. Their numbers at present are said to be 20,000 whites, and 100,000 slaves. Their commerce consists of the same articles as formerly, though they deal in them to less extent.

Barbadoes-Tar, a mineral fluid of the nature of the thicker fluid bitumens, of a nauseous bitterish taste, very strong and disagreeable smell, found in many parts of America trickling down the sides of the mountains, and sometimes floating on the surface of the waters. It has been greatly recommended in coughs, and other disorders of the breast and lungs.

BARBARA, among logicians, the first mode of the first figure of syllogisms. A syllogism in barbara is one whereof all the prepositions are universal and affirmative; the middle term being the subject of the first proposition, and attribute in the second.

Examp. Bar. Every wicked man is miserable;
Ba. All tyrants are wicked men;
Ra. Therefore all tyrants are miserable.

BARBARIAN, a name given by the ancient Greeks and Romans to all who were not of their own country, or were not initated in their language, manners, and customs.—In this sense, the word signified with them no more than foreigner; nor signifying, as among us, a wild, rude, or uncivilized person.

BARBARISM, in a general sense, a rudeness of language or behaviour.

Barbarism, in grammar, an offence against the purity of style or language; or an ungrammatical way of speaking or writing, contrary to the true idiom of any particular language.

BARBAROSSA (Aruch, and Hayradin), two famous corsairs, the sons of a potter in the isle of Lesbos, who, turning pirates, carried on their depredations with such success and conduct, that they were soon possessed of 12 galleys beside smaller vessels. Of this fleet Aruch the elder brother, called *Barbarossa* from the redness of his beard, was admiral, and Hayradin the second in command: they called themselves the *friends of the sea*, and the *enemies of all who sailed upon it*; and their names became terrible from the straits of Dardanelles to those of Gibraltar. With such a power they wanted an establishment; and the opportunity of settling themselves offered in 1516, by the inconsiderate application of Eutemi king of Algiers to them for assistance against the Spaniards. Aurch, leaving his brother to command the fleet, carried 5000 men to Algiers, where he was received as their deliverer; and secretly murdering the prince he came to aid, caused himself to be proclaimed king in his stead. To this usurpation he added the conquest of Tremecen; when his exploits and piracies induced the emperor Charles V. to furnish the Marquis de Gomarez governor of Oran with troops to suppress him; by whom he was defeated and killed near Tremecen. His brother Hayradin, known also by the name of *Barbarossa*, assumed the sceptre at Algiers with the same abilities, and with better fortune; for the Spaniards, sufficiently employed in Europe, giving him no disturbance, he regulated the interior police of his kingdom with great prudence, carried on his naval operations with vigour, and extended his conquests on the continent of Africa. He put his dominions under the protection of the Grand Signior, Solyman the Magnificent; and obtained the command of the Turkish fleet. With so powerful a protector, he acquired the kingdom of Tunis in a manner similar to that by which his brother gained Algiers. Since the time of the Barbarossas, Algiers has been understood to be dependent on the Porte; but this dependence is now little more than merely nominal.
